the end, were in an exceedingly tottering condition. The effect of this change means that, whereas the building would formerly hold about 2,000 persons, it is now capable of accommodating something like 600. The antiquated high-backed pews have disappeared, giving place to benches of a modern description. On the old-fashioned pews there were brass plates, on which were inscribed the names of the families who occupied them Sunday after Sunday. These interesting relics are to be placed together on one of the walls of the church. Perhaps the most interesting relics that have been replaced are the oak pulpit and the organ. A great deal of care has been concentrated on the alterations in the apse of the church, the beautiful chancel being now provided with new choir stalls. By the erection of two rows of oak pillars, the edifice has been divided into aisles. The walls have been treated by the painters in a way that harmonises with the general design of the scheme; the ceiling has been subjected to a thorough renovation; and in various other minor directions have renewals and improvements been carried out. The restoration has been executed under the direction of Messrs. Hicks and Charlewood, of Newcastle. The builders employed were Messrs. Scott, of Sunderland.—*Newcastle Journal*.

U.F. CHURCH, ABERDEEN.—A new U.F. church is to be erected at the corner of King-street and Urquhart-road, Aberdeen. Messrs. D. & J. R. McMillan, Aberdeen, are the architects.

RESTORATION OF FRENZE CHURCH, NORFOLK.—Frenze Church, about two miles from Diss, has just been reopened after restoration. An entirely new oak roof has been constructed, a block floor with concrete bed laid, the pulpit and reading-desk restored, and slabs on the floor have been taken up and rearranged. An altar-stone has been taken up in the body of the church and now forms the Communion table. Other improvements include a new altar-rail and a new entrance door. Messrs. A. R. Barker & Son, Strand, London, were the architects, and the work has been carried out by Mr. William Limmer, builder, Dicketburgh.

RESTORATION OF ELKESLEY CHURCH, NOTTINGHAMSHIRE.—The Duke of Newcastle, who is the proprietor to the living of Elkesley, is shortly, it is stated, to restore this church at an outlay of 1,400. The plans prepared by Mr. Thompson, of London, have been approved. The restoration will include a new roof for both the nave and chancel; new chancel arch; the whole of the nave and chancel will be panelled in oak, prolongation of north aisle west to the extent of the tower; a new north and south porch; the greater part of the north aisle will be rebuilt; a window will be inserted in the east end of the north aisle; the vestry enlarged; and a new organ-chamber built.

UNITED FREE CHURCH, CULTS, N.E.—It is proposed to erect a new United Free church at Cults from the plans of Messrs. D. & J. R. McMillan, architects, Aberdeen. The church is Gothic in design. The gable of the church faces the public square, with a tower on the west. In this tower is situated the main doorway, and there is another doorway leading to the staircase to the east of the gable. The church is cruciform in plan, having a centre seating area, two side seating areas, and, in addition, the transepts. There is also an apse behind the pulpit, where provision is made for an organ. The church is seated to accommodate rather over 600. Immediately adjoining the pulpit is situated the vestry. To the east of the church is situated the hall, accommodation. It consists of 20 ft. by 20 ft., with session house adjoining, 26 ft. by 19 ft., the latter being so arranged that for large meetings it can be thrown into the large hall. There is also a room provided as a ladies' work-room, 26 ft. by 18 ft. 6 in., while a tea kitchen has also been provided. The cost of the buildings is estimated at about 4,000.

RESTORATION OF SKEEFLING CHURCH, YORKSHIRE.—The parish church at Skeffling was re-opened on the 17th ult. after restoration. The work was carried out under the guidance of Mr. F. S. Brodrick, of Hull.

WESLEYAN SCHOOL-CHAPEL, SHIPLEY.—Memorial-stones were laid recently in connexion with the erection of a school-chapel for the Wesleyan denomination in Shipley. Mr. G. F. Danby, of Leeds, is the architect for the school-chapel. His plans provide for a central assembly-room, 58 ft. long by 34 ft. wide, which will be capable of seating 400 persons on the ground floor. A gallery extending round three sides of the building will seat 250 more. At one end will be the rostrum and choir gallery. From the ground and gallery floors access will be obtained to twelve classrooms. There will also be other apartments. All the internal woodwork will be of pitchpine, and the building will be of pitch-faced local wallstones. For heating purposes the low-pressure hot-water system is to be adopted. The cost of the structure is estimated at 3,000. The principal contractors are Messrs. Deacon & Son, Shipley, and Messrs. H. & T. Riddough, Cross Hills.

HARRISVILLE NEW PRESBYTERIAN CHURCH, BELFAST.—On the 21st ult. four foundation stones were laid for the new Presbyterian church in Casement-street, Harrisville. The style of the new building is Gothic. The building will be 85 ft. by 44 ft. There will be a large gallery at the end of the building, and provision is made for extending

the capacity of the church in future by galleries at either side of the building. Provision is made for a committee-room, session-room, cloakroom, library, and lavatories. The whole of the interior of the church will be of pitch pine, and particular attention has been paid to heating and ventilation. The windows are to be fitted with approved wrought-iron ventilators, and the work has been entrusted to Messrs. Ward & Partners, Belfast. Mr. W. C. Gault is the builder; Mr. A. Boyd is the architect.

OXFORD-PLACE CHAPEL, LEEDS.—The trustees of Oxford-place Chapel, Leeds, are about to proceed with the erection of new buildings and a tower adjoining the present structure, and occupying the vacant plot that exists to the north and fronting the Town Hall. This was part of the original building scheme, only that in the place of a projected Synod Hall and classrooms it has been decided to erect a series of office chambers. The tower will rise to a height of 120 ft. At the foot of the tower there will be an entrance vestibule, and the structure is to come forward to the line of the chapel steps, and be connected with the chapel building by what may be termed a curved sweep. At the back an addition is to be made of an octagonal-habed room adapted for the purposes of a girls' club. There will be three floors of offices, and the material used in the erection of the buildings will consist of brick faced with stone. The work is in the hands of Mr. G. F. Danby and Mr. William H. Thorp, architects, of Leeds.

RESTORATION OF PARISH CHURCH, MELKSHAM, WILTSHIRE.—In connexion with the restoration of the parish church at Melksham, a figure of St. Michael has been placed in a niche over the north door. The figure is of Painswick stone and was carved by Messrs. Harry Hems & Sons.

TRINITY PRESBYTERIAN CHURCH, REDLAND, BRISTOL.—On the 21st ult. the foundation-stones were laid of the new Presbyterian church which is being erected at the far end of Cranbrook-road, Redland. The plans have been prepared by Messrs. P. Munro & Son, of Bristol. The church, which is designed in the Perpendicular style, will be built with red Pennan stone and Bath stone dressings, and will contain nave, transepts, aisles, chancel, minister's vestry, choir vestry, church parlour, lecture-hall, classrooms, and caretaker's residence. The corridors, passages, lavatories, and part of the chancel will be laid with encaustic tile pavement, and the chancel steps will be of Red Wilderness Forest of Dean stone. The floor of the church and the whole of the subsidiary buildings will be laid with pitch-pine blocks. The roofs will be covered with red Broseley tiles. The pews will be of selected pitch-pine, and open, and the doors of English oak. The roofs will be open-timbered in pitch-pine, the nave having hammer-beam principals, all the main timbers being moulded. The roof of the chancel will be wagon-shaped, with moulded ribs. The glazing throughout will be in tinted cathedral glass. The heating arrangements for the church and subsidiary buildings will be by means of hot water, low-pressure system, with pipes and radiators. The church will be lit with electric light, and will have seating accommodation for between 600 and 700 worshippers. The site is on the corner of the roadway opposite to the New Church and close to St. Katharine's Church.

LABORATORIES, NONCONFORMIST SCHOOL, BISHOP STORTFORD.—At the Nonconformist Grammar School at Bishop Stortford new laboratories have just been added at a cost of 1,500. The site is on the corner of the roadway opposite to the New Church and close to St. Katharine's Church. The architects, and Messrs. J. L. Glasscock & Sons, Bishop Stortford, were entrusted with the building. There are a physical laboratory, chemical laboratory, and lecture-room, each about 30 ft. by 20 ft., also a preparation room and stores. They are fitted with fume closets, special tables, and apparatus. The building is of red brick, with stone dressing. The engineers were Messrs. Ashwell & Nesbit, Bedford-row, and the fitters Messrs. Hammer & Co., the Strand.

SCHOOL, PRESTON.—The corner stone has just been laid of Plungington-road new school, Preston. Plans of a new school capable of accommodating 300 children, on the west side of Plungington-road, have been prepared by Messrs. Myres, Veivers, and Myres. The total cost is estimated at 2,000. The present structure comprises a schoolroom, 66 ft. by 26 ft., to accommodate 100, and to be divided by moveable partitions to form classrooms. There are also a classroom to hold sixty and a babies' room for a similar number. Adjoining these will be a mistress's room, cloak and lavatory rooms, &c. The materials employed in the building of the school are brick and stone for the outside, the roofs being of open timber. All the rooms will have a glazed brick dado about 4 ft. high. The contractors are Messrs. T. Croft & Sons, Preston.

LIBRARY, LIVERPOOL.—A new branch library is in course of erection at the corner of Windsor-street and Upper Parliament-street from designs by Mr. Thomas Sheldermine, the Corporation Architect and Surveyor. The principal front elevation and leading main entrance will be in Windsor-street. Leading from the main central hall on the right is the ladies' reading-room, 56 ft. 6 in. by 30 ft. On the left is the general or men's reading-room, 66 ft. by 30 ft. In the centre of the building will be the lending department and book store. There will be

* Reported in the *Builder*.

upwards of 25,000 volumes of books in this branch library. From the vestibule there will be a staircase, by which access will be obtained to the basement, where is situated the boys' reading-room, 47 ft. by 30 ft. In addition to the public accommodation above described there will be a mezzanine floor, which will provide accommodation for books, for the repair of books, and for the staff. On the ground floor will be the librarian's-room, and on the first floor an assistants' common-room. The entire building will be of fireproof construction. The main walls will be of red wire-cut Ruabon bricks, with Cefn stone dressings, and the roof will be covered with Cumberland green slates. The style adopted is the English Renaissance. The erection of the building, the contract price for which is upwards of 12,000l., has been in progress now some weeks.

INSTITUTE, WALWORTH.—The new buildings in Larcum-street, Walworth, for St. John's Institute, have just been completed. There are four floors and a basement in the building. In the basement is the store for furniture required for concerts or lectures as well as the heating chamber and apparatus. On the ground floor there are the men's gymnasium, the boys' gymnasium, and boys' reading-room, with an entrance-hall and fireplace. On the mezzanine floor is the gallery to the large gymnasium, to be used as a dressing-room, with shower-bath, lavatories, and secretary's gallery attached. The first floor contains a meeting-room for allied clubs, a reading and writing-room, and a large billiard-room. On the second floor are twelve cubicles 10 ft. long by 5 ft. wide for resident members, each being lighted by a separate window, a bath-room, and separate shower-bath, with a range of lavatories, storeroom, broom, &c., and a dining-room. The kitchen and caretaker's rooms are placed in the attics. There is a lift serving all the floors, and hot and cold water is laid on to the sinks and lavatories on each floor. The furniture is made in oak from designs prepared by the architects, Messrs. Dunn & Watson, of Lincoln's Inn-fields. All the rooms and passages are lighted by electric light. The building has frontage to Larcum-street of about 66 ft., and the front wall is faced with salt-glazed bricks of a warm colour up to the gymnasium windows, over which there are balconies projecting from the billiard-room floor. Above this the walls are faced with yellow stocks with stone dressings. The contractor is Mr. John Marsland, Walworth.

GOLF CLUB-HOUSE, BILSTON, WOLVERHAMPTON.—A club-house for the Wolverhampton District Golf Club has been erected on the club's ground at Bilston. The building has two stories, and was designed by Messrs. Johnson & Baxter, of Wolverhampton. Messrs. Hickin & Sons, of Willenhall, were the contractors.

CRICKET PAVILION, DUNFERMLINE.—A new pavilion for the Dunfermline Cricket Club has just been opened at Lady's Mill. Mr. T. Hyslop Ure was the architect, and the following were the contractors:—Building, Mr. James Stewart; joinery, Messrs. Mitchell & Kinghorn; tile and rough casting, Mr. John Robertson; plumbing, Messrs. Jas. Inglis & Son; plastering, Mr. William Ure; painting, Mr. Andrew Wardlaw.

WORKING MEN'S INSTITUTE, NANTMOEL, GLOUCESTERSHIRE.—The memorial stones have just been laid of a working men's institute to be erected in that part of Nantmoel known as Priceton. The hall will seat 1,000 persons and the cost will be about 4,000l. Mr. Jacob Rees, of Pentre, is the architect, the builder being Mr. Jenkin Phillips, of Nantmoel.

BUILDING IN ARBROATH.—The building trade in Arbroath has been fairly busy during the past year. A large number of plans for new buildings and alterations and additions to existing buildings have been approved and passed by the Commissioners. These include the new joint epidemic hospital; additions to Messrs. D. Fraser & Sons' engineering works; new electric power station in John-street West; reconstruction of Burnside Works; warehouse additions to the Dundee and Arbroath Confectionery Company's premises; and the reconstruction of the Star Hotel in High-street. During the year forty-nine different plans for new buildings and alterations or additions to existing buildings have been presented to and passed by the Commissioners. Among the principal improvements carried out by the Commissioners during the year are the blocking of Helen-street, the alteration of the roadway at the West Links old tollhouse, and the widening and taking off a sharp curve in Montrose-road.

MEMORIAL COTTAGE HOSPITAL, ST. ANDREWS.—The contracts for the new memorial cottage hospital, which is to be built on a site at Abbey Walk, have been fixed as follows:—Mason, Mr. Thomas Liddel; joiners, Messrs. T. Harris & Son; plumber, Mr. J. M. Morris; plasterer, Mr. A. R. McPherson; slater, Mr. Thomas Black—all of St. Andrews. The architect for the building is Mr. C. F. Anderson.

EMPIRE HOTEL, BUXTON.—Messrs. Spiers & Pond, Limited, have erected at Buxton an hotel called the Empire. The hotel is built upon a site in close proximity to the Pump Room, and stands in its own garden and grounds of twelve acres. The hotel possesses accommodation for upwards of 300 guests, and contains dining-hall, banqueting and ball room, a drawing-room, and numerous other

apartments, a spacious hall, and lounge. The architect of the hotel is Mr. Thomas Garner, and the builder is Mr. John Farnell, of Rugby. The furniture and decorations have been carried out by Messrs. Smees & Cobay, of London, W.

POLICE COURTS, BRISTOL.—Bristol Police-courts are to be extended from plans prepared by Mr. Henry Williams, architect. The extension of the courts has been made possible by the acquisition of properties on the north of the present building and at the rear of it. The same chief entrance will be used from Bridewell-street, but the general offices will be on the right hand, and the present general offices will become the office of the magistrate's clerk, &c., a separate entrance being made from the street to the general offices. In the basement there will be ample cell accommodation for males and females, with attendants. Offices will be provided on the first floor, with waiting-rooms; and the second floor will be occupied by the caretaker. On the ground floor two new courts will be provided—a large one, 41 ft. 6 in. by 30 ft., and a small one, 28 ft. by 25 ft.—while the present large court, which is 37 ft. 6 in. by 27 ft., will remain available. The existing small court will be used by the magistrates for an assembly-room. There will be a public waiting-room beyond the principal new court, and easy access will be afforded by corridors and doors to all parts of the building. The new courts will be wainscotted in oak, and the fittings and lighting will be similar to those in the present large court. The extension of the frontage will be made to harmonise with the existing elevation.

VICTORIA ARCADE, LOWESTOFT.—The Victoria Arcade at Lowestoft, which has been built by Mr. George Pitt upon the site of the old Baptist chapel and schools in the London-road, has just been opened. The building contains fourteen shops, with stockrooms over, four suites of offices, an assembly-room, cloakroom, and ladies' and gentlemen's lavatories. There is also a public landing and balcony on the first floor facing London-road, on each side of which is a refreshment buffet approached by a wide staircase from the Arcade. The building has been erected for Mr. George Pitt from designs prepared by Messrs. George Fitt & Co., Limited, architects and surveyors, Norwich and Lowestoft. The brickwork has been done by Mr. E. C. Pipe, of Lowestoft; the constructional ironwork by Messrs. Brooks, Lowestoft; the shop fronts and joinery by Messrs. Lambert Bros., Kirkley; and the painting and glazing by Mr. R. T. Peck, Lowestoft. The whole of the glazed bricks were supplied by Messrs. J. Woodward & Sons, Limited, Swindon; the Arcade roof by the Pennycook Glazing Company, Glasgow; the electric lighting by Messrs. Bush & Dryburgh, Lowestoft; and the whole enclosed by wrought-iron gates supplied and fixed by the B. and S. Folding Gate Company, London. Mr. W. Forster was clerk of works.—*Norfolk News.*

SANITARY AND ENGINEERING NEWS.

EXTENSION OF CALEDONIAN STATION, GLASGOW.—The Caledonian Central Station at Glasgow is to be enlarged. A description of the scheme was recently given in the *Glasgow Herald*. According to this, the extension will involve the construction of a new bridge over the Clyde. This bridge will be one of the broadest in the country. It will take nine additional lines of rails, which, with the four on the present bridge, will bring the total to thirteen. North of the Broomielaw, up to the south side of Argyle-street, the station will be widened to the extent of 175 ft., making an average width of 260 ft., while north of Argyle-street the station will be extended westward until it comes to the building line of Hope-street, making the main part of the station under cover about 340 ft. in width, as against 210 ft. in the present station. The nine lines of rails are furnished with an equal number of platforms, varying from 15 ft. to 22 ft. in width. When the reconstruction is completed there will be thirteen platforms, from 22 ft. to 30 ft. wide. The platforms now vary from 350 ft. to 680 ft. in length; under the new scheme they will run from 426 ft. to 900 ft. On the east side parallel platforms will extend almost to Annet-street, but on the west side the platforms will be carried practically as far south as the north line of the Broomielaw, where there will also be platforms for fish, fruit, and milk traffic extending to the edge of the river. A greater circulating area for passengers at the end of the platforms will be provided. This space will be 2,948 square yards in extent; the present one is only 550 square yards. At present only 100 carriages can be got into the station at a time, but when the extension is completed there will be standing room for 200 carriages. The area of the left luggage office will be 1,400 square yards as against 400 in the present station. The size of the parcels office will also be increased from 500 square yards to 2,300 square yards. This department will be constructed underneath the station at the level of the street, with accesses from Hope-street, where a large parcels hall will be situated in place of the existing premises in Union-street. There will be communication with the several passenger platforms by means of boists, of which there will be eight. A feature of the new station will be a cab rank about 1,000 ft. long, with a

platform at each side 800 ft. in length and 20 ft. wide. The entrance to the cab rank for empty cabs is by an inclined access from Hope-street. The booking office will remain the same in number as at present, but they will be greatly increased in size, more particularly the Union-street office, which will occupy a more important position than at present, and will be one of the chief offices in the station. It will be situated at the north end of the company's property in Union-street, where an access to the station will be given by means of a staircase 18 ft. in width. The intention of the company is to reconstruct all their Union-street property. It has a frontage to the thoroughfare of 200 ft., and a building has been designed by Mr. James Miller, the architect of the contemplated extension of the Central Hotel. The new property will consist of shop and office premises, about six stories in height. At the level of the platforms the rooms will be set apart for the use of the travelling public. There will be waiting and refreshment-rooms and other accommodation, and behind them offices will be constructed facing the street. The existing restaurant on the street floor will be restored. The new portion of the station is to be covered with an arched girder roof, except at the part crossing Argyle-street, where, in order to meet the wishes of the Corporation, it will take the form of a low verandah merely sheltering the platforms, and leaving the lines of rails open to the weather. With this break the arched roof will extend from the hotel at the north end of the station to the south side of Ann-street. The bridge over Argyle-street will have a screen on each side 18 ft. high, constructed of iron, timber, and glass, carrying out the roof work the west wall of the present station will be taken down and the new roof supported on iron columns. The bridge over the river will be 270 yards in length over all, with an average breadth of 40 yards, and will stretch from the north side of the Broomielaw to the south side of Clyde-place. The substructure of the bridge will be of masonry, the piers on the quays and in the river being founded on monoliths constructed of steel caissons built up with concrete and brickwork. The monoliths are to be founded on sand and gravel at a depth of 30 ft. below the bed of the river, the caissons being sunk into position by the pneumatic process. The piers of the bridge will be built of granite ashlar, hearted with blue brickwork. The superstructure is to be of wrought steel, the principal spans, five in number, commencing at the Broomielaw being in the clear 97 ft., 140 ft., 185 ft., 164 ft., and 61 ft. respectively. These will be spanned by steel girders having parallel angles, and placed at about 12 ft. centres. The main girders of the larger spans, those across the river, will be upon webbed girders; those over Clyde Place and the Broomielaw will be plate girders. Above these girders will be an ornamental lattice parapet girder thrown out and supported by ornamental brackets from the main carrying girders, and the bottom flanges of the parapet girder will be encased and finished in ornamental cast iron. The new bridge will differ from the present one, alongside in particular, that the trains will run on the tops of the girders in place of at the bottom. This enables use to be made of all the available space for rails, and it will be possible to have points, crossings, connexions, and junctions of all kinds on the bridge. Externally, the piers will be of ornamental granite ashlar, finished in towers rising above the parapet on the two centre piers. The end piers will be finished at a somewhat lower level, the contour of the line of the tops of the towers being on a curve of a circle. The existing station at Bridge-street will also, to some extent, be remodelled, and the proposal at present is that there should be eight lines running through it in place of four, as at present. It is further intended that the approach lines shall be improved by laying two additional lines of rails through Eglinton-street Station by the construction of another tunnel under Eglinton-street. A Bill for this work has been lodged in Parliament, and has already passed the first House as an unopposed measure. The extension of the Central Station Hotel will be made down Hope-street, in the direction of Argyle-street, and will not interfere in any way with the plan of the station, as the access for the empty cabs will be made beneath the building. In order to obtain ground for the extension, a large quantity of shop, warehouse, and office premises has been cleared away. The engineer for the undertaking is Mr. Donald A. Matheson, engineer-in-chief of the Caledonian Company. The contract for the bridge and relative works has been undertaken by Messrs. Sir William Arrol & Co., Limited, with whom are associated Messrs. Morrison & Mason, Limited. The substructure of the station, from Broomielaw to Argyle-street, is being made by Messrs. James Goldie & Son, and the carriage entrance and substructure of the hotel extension by Messrs. P. & W. Anderson. The work has been begun, and it will probably be finished in two years and a half.

NEW RESERVOIR, LLANELLY.—The Llanelly Urban Council are constructing an additional reservoir at a cost of 67,000l. The Surveyor reported progress to a special meeting of the Waterworks Committee recently, and subsequently the members inspected the work. The contract provides for completion of the work in July of next

year, but the contractor, Mr. Louis P. Nott, is prepared to bring it to a finish in March for a consideration of 1,000l.

ABERDEEN WATER SUPPLY.—Aberdeen Town Council have just appointed Mr. Charles Hawksley, M.Inst.C.E., Westminster, to report as to the best source of a new or additional water supply for the city.

WATER SUPPLY, WALLASEY, CHESHIRE.—On the 21st ult. Mr. E. A. Sandford Fawcett, an inspector to the Local Government Board, attended the public offices, Church-street, Egremont, to inquire into an application by the Wallasey Urban District Council for sanction to borrow 17,500l. for water-supply works, and an application by the Liverpool City Council for permission to borrow 145,000l. The estimated cost of laying a water-main from Hatchmere to the outskirts of the Wallasey district. Applications by the Wallasey Council to borrow 27,225l. for the construction of a reservoir at Gorse Hill, New Brighton, and 3,450l. for the formation of a street from Earlston-road to Sea View-road, Liscard, were considered also. Evidence as to the water-supply scheme was given by Mr. John Henry Crowther, engineer to the District Council. Several persons were heard in opposition, one opposing on behalf of a local water company. The application for a loan for the construction of a new street was then considered, evidence being given by Mr. H. W. Cook, the solicitor to the Wallasey District Council.

STAINED GLASS AND DECORATION.

HAMMERSMITH SYNAGOGUE.—The work of decorating the interior of the Hammersmith and West Kensington Synagogue has just been carried out in accordance with a scheme prepared by Mr. Percy L. Marks, architect, who has superintended the execution of the work. The walls generally are of a light green, separated by a suitable band from the dado, which is painted a warm brown. The strings, cornices, arches, &c., are finished cream colour and the soffits white. The panelled fronts to gallery are painted in dull green for the framing, with pink mouldings and cream panels. The woodwork of rostrum and ark is grained, &c., to imitate American walnut; and the columns, pilasters and their capitals, as well as the corbels are marbled in imitation of Rouge Royale, with Brescia bases and pedestals. The capitals and corbels are picked out in gold. Appropriate Hebrew verses in gold are written on the frieze over the arches of the nave and ark. The work has been executed by Messrs. Chamberlain Brothers, of Hammersmith, at an approximate cost of 150l.

FOREIGN.

FRANCE.—M. Marcel Lambert, the architect to the Château of Versailles, is carrying on, along with the restoration of the main building and the two Trianons, the repair of the fountain basins in the park. Those of the Trianon and the south parterres are already restored, and after the usual summer fêtes the repair of the large basins will be undertaken. A new Colonial Institute has been opened at Bordeaux. The Service des Bâtimens Civils, having restored the chapel of St. Germain-en-Laye, is now occupied with the repair of the upper stories of the façade of the Château, which are in a dangerous condition. The Municipal Council of Lous-le-Saunier has organised a competition limited to architects of the Departments of Ain, Doubs, Jura, and Haute-et-Loire, for the design of a new theatre for Lous-le-Saunier. Important works of repair are shortly to be commenced in the interior of the Madeleine at Paris, at an estimated cost of 330,000 fr.—A new Mairie has been inaugurated at Juvisy in the old chateau of the XVIIIth. century, which has been altered and laid out for the purpose, under the direction of M. Thauront, architect. The death is announced, at the age of 32, of M. Irenée, architect, of Courbevoie. On Monday last the five new rooms in the Louvre were opened, in which the finest examples of French furniture have been collected. One room is devoted to Louis XIV. furniture, one to Louis XV., and three to Louis XVI.—At Fontainebleau, a monument has just been erected to the memory of Rosa Bonheur. It is the work of her brother, M. Isidore Bonheur, and of his nephew, M. Peyrol, the sculptor.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. Thos. Durrans, architect, of 71, Baker-street, London, has taken into partnership Mr. Herbert R. Groves, formerly his pupil and subsequently his assistant. The practice will be carried on under the style of "Durrans & Groves."—Messrs. Easton & Co., of Broad Sanctuary, London, have appointed Messrs. Doddrill Bros., of 11, Bothwell-street, Glasgow, as their agents for Scotland, for their Schmidt superheating steam system, electric lifts, and other specialties.

CARDIFF ELECTRIC LIGHTING.—The monthly report of the Cardiff Electrical Engineer (Mr. A. Ellis) shows that the total number of consumers is

401, and the equivalent consumption is 40,022 8-candle-power lamps. This shows an increase on the corresponding period of last year of 48 per cent. During the month 2,668 8-candle-power lamps were connected, and in the same period 72,570 Board of Trade units were generated, which shows an increase of 47 per cent. over the same month of last year. The calculated revenue is 1601 12s. 6d. from street lighting and 557l. 11s. 6d. from private supply, a total of 718l. 4s. This shows an increase of 39 per cent. over the calculated revenue of the same period of last year.

ARCHAEOLOGICAL DISCOVERIES AT DORCHESTER.—An addition to the recent discoveries of Roman remains at Dorchester, Dorset, has just been made. While some workmen were making excavations for a house in the road known as Icen Way, in the eastern suburbs of the town, they came upon a Roman floor more than 20ft. long and about 7 ft. wide.

RUSKIN MEMORIAL CROSS, CONISTON.—To mark the burial place of the late John Ruskin in Coniston Churchyard, a headstone has within the last few days been erected. The monument is a tall cross of the type lately revived from ancient pre-Norman models; the early English type having been adopted in the belief that Mr. Ruskin himself would have wished for some headstone of a quiet and unpretentious, and yet of an artistic and decorative, kind. The cross is of the hard green stone of Coniston, supplied from the quarries of Tiberthwaite, and is not liable to chip or lose its pleasant grey-green colour. It is slender and tall, standing some 9 ft. high, on the site facing the grave, and looking east, is a figure with a lyre, symbolical of Ruskin's earlier works—poems, and the "Poetry of Architecture." Above this, in a panel of interlaced work, is inscribed his name and the dates 1819-1900, the only lettering thought necessary. On the tablet is the figure of an artist sketching, with the pines and range of Mont Blanc indicated and the rising sun, which was the device on his first important work, "Modern Painters." Above is the lion of St. Mark, representing "Stones of Venice," and the candlestick of the Tabernacle for his "Seven Lamps." The south side is filled with clusters of his favourite wild rose, in bud, blossom, and fruit, and on the boughs are three of the creatures about which he wrote—the squirrel, the robin, and the kingfisher—all symbolical of his interest in nature. The west side, looking towards the mountains, represents Ruskin's ethical and social teaching. At the bottom is the parable of the workmen in the vineyard receiving each his penny from the Master—"Unto this Last." Then comes a design of "Sesame and Lilies," and in the middle "Fors Clavigera"—the Angel of Fate holding the club, key, and nail, which will be readily recognised. Over that is the "Crown of Wild Olive," and at the top "St. George and the Dragon." The north side is of a simple interlaced pattern. The cross-head on one side bears the Globe, symbolising in old sculptures the Sun of Righteousness, and the other side has a disc with the Yfylot or revolving cross as the emblem of eternal life. The monument has been designed by Mr. W. G. Collingwood, of Keswick, a relative of Ruskin.

A NEW ELECTRIC LAMP.—Mr. Hewitt, an American electrician, has invented a new electric lamp which, in the laboratory form at least, has an efficiency about ten times greater than that of the ordinary glow lamp. Models of the lamp were exhibited last month at Columbia University to the American Institution of Electrical Engineers and excited the greatest interest. The main principle is the incandescence of mercury vapour contained in a long glass vacuum tube. One terminal sealed in the tube dips into mercury, the other is connected to a piece of iron inside the tube. In the models exhibited the length of the tubes varied from 2 ft. to 4 ft., and their diameter was about 1 in. Their efficiency was exceedingly high, a tube, for example, $\frac{1}{2}$ in. in diameter and 3 ft. long, giving 400 c.p. with a consumption of energy the same as that required by four ordinary 8-c.p. glow-lamps. The light given out by the lamps is practically deficient in red rays, and very numerous attempts have been made to remedy this defect. In a patent for mercury lamps granted in this country last year to the General Electric Company of New York, there are no less than eighty-eight claims. In the specification the efficiency of these lamps is stated to be from three to five times greater than that of the carbon arc-lamp, but it is mentioned that the light is of an unsatisfactory colour. To remedy this defect various substances are introduced into the mercury. Iridium, lithium, sodium, and thallium are a few of the substances mentioned. It is admitted only in the experimental stage at present, but the results already obtained are very promising.

OPEN SPACES (METROPOLITAN).—The grounds, covering about 65 acres, attached to Dollis Hill house, which were opened to the public on Saturday last, have been secured at a cost of 50,000l., and under the name of "Gladstone Park" will be preserved without any curtailment of their natural beauties, as a memorial of the late W. F. Gladstone, who frequently stayed at the house as a guest of Lord Aberdeen when public duties required his residence in London. The estate is being surrounded by the rapidly extending residential localities of Neasden, Hendon, and Willesden. Contributions

towards the purchase moneys have been made by the Middlesex County Council (12,500l.), the London County Council (3,500l.), the Skinners' Company (50 guineas), and the Local Authorities of Hampstead (1,000l.), and Hendon (500l.). Sir William Rowley's Select Committee of the House of Commons have approved of the London County Council's Bill for acquiring the park as an open space—the house remains, for the present, in private occupation.—Some days ago the London County Council formally handed over to the people the Hughes Fields Recreation Ground, with its gymnasium, in the parish of St. Nicholas, Old Deptford, which consists of about three-fifths of an acre, with frontages to Trevithick-street and Butcher's-row, and is part of the surplus land of an insanitary area which had been cleared for the Hughes Fields improvement scheme. The ground is named after Admiral Hughes, who lived, it is believed, in an old adjacent house that fell into decay about fifty years ago.—The Parks Committee, L.C.C., have been authorised to expend a sum of 640l. upon the laying out of the open space of Albert-square, Commercial-road, E., which has been acquired for the sum of 10,500l. upon the award of Mr. J. H. Clutton, who adjudicated as arbitrator in the matter of the purchase from the claimant, who, in 1889, bought the property at Albert-square, comprising thirty-nine houses and the open square, for, it was stated, 22,000l., and preferred a claim of 17,702l. in respect of the vacant ground. With the aid of a further contribution out of the London Parochial Charities Fund the purchase of the 43 acres to be added to Brockwell Park is secured, the whole of the required sum—about 66,800l.—being now subscribed.

THE LONDON AND INDIA DOCKS COMPANY.—In terms of a Bill which the company have introduced this current session it is proposed to carry out an extension on the south side of the Albert Dock, for which plans were prepared by their late engineer-in-chief, Mr. Baggallay, at an estimated cost of from 1,500,000l. to 2,000,000l. The projected works include a new dock, one mile long from east to west and from 260 ft. (at the extreme west end) to 600 ft. (at the entrance) in width, with an entrance lock 750 ft. long, 80 ft. wide, and 38 ft. deep on the sills, and having three pairs of gates. The depth of the dock will range from 33 ft. to 39 ft., and the quays available for ships are to be 10,000 ft. long. At the west end is to be made a new graving dock, about 720 ft. in length, with a width of 86 ft. on the floor and 100 ft. at the quay level, and a depth of 30 ft. on the sills. A cut will be made for the passage into Albert Dock of vessels which are too long to go through the Albert locks, and to enable vessels in the Albert or Victoria Dock to use the proposed graving dock. During twenty years past the company have expended 3,700,000l. upon the enlargement and improvement of their docks and other works.

THE SOUTH-EASTERN AND CHATHAM RAILWAY.—Some extensive alterations are being made near Blackfriars Junction, in Southwark-street, as part of the company's scheme for a reorganisation of their *grande vitesse* parcels service, together with its transfer from London Bridge, and the opening there of additional accommodation for passenger traffic. The new goods station is designed as a terminus for the delivery of Continental parcels, including crates of pigeons from Italy, millinery from Paris and Lyons, and fruit and vegetables from France, Italy, and Spain, which hitherto have been received at the low-level station, London Bridge—the original terminus of the South-Eastern line—which will shortly be rebuilt. It is 600 ft. long with four sets of rails, and has two platforms at the sides of a cart-road, with space for the unloading at one time of sixty railway trucks and standing-room for eighty trucks besides. An incline from George-street carries the road into the station, which is about 45 ft. above the level of the street. The buildings comprise a warehouse with hydraulic lift and storage arches, and offices in Gravel-lane where a large room on the ground floor forms a waiting-room and shelter for the labourers.

ELECTRICAL LIGHTING IN KENSINGTON.—The Kensington Borough Council have now decided to supply electric light in the main thoroughfares, as follows:—Kensington High-street, Brompton-road, Holland Park-avenue, and High-street, Notting Hill. Arc lamps are to be adopted, and the cost is estimated at 3,000l.

YORKSHIRE BUILDING TRADES FEDERATION.—The Yorkshire Federation of Building Trades Employers held its monthly meeting at the Westminster Hotel, Sheffield, on the 24th ult. Mr. J. Langdon, Sheffield, presiding. Representatives were present from Sheffield, Halifax, Bradford, Hull, Scarborough, Selby, Bridlington, Keighley, Spen Valley, Leeds, and Malton. The principal business was the appointment of a secretary to fill the vacancy occasioned by the death of Mr. Sutcliffe Hanson, of Halifax. There were four applicants for the office, and Mr. G. Stanley, Secretary to the Hull Branch, was unanimously elected.

PARK FOR LEVESHAM.—On the 27th ult. Mr. A. M. Torrance, J.P., chairman of the London County Council, opened the new Sydenham Wells Park, which has been secured to the public by the London County Council. The park, which is close to the Crystal Palace, is 17 $\frac{1}{2}$ acres in extent, has

frontages to Wells-road, Longton-avenue, and Taylor's-lane, and has cost 7,000*l.*, with 5,000*l.* for laying-out. Tennis-courts and a quoll-pitch have been provided, and it is intended to form a bowling-green. The land as acquired was very undulating in form, being practically a basin formed by the conjunction of two valleys. Advantage has been taken of the natural undulations and the existing watercourses, and the ground as now laid out presents a series of slopes, intersected by broad foot-paths and ornamented by plantations and a succession of small lakes and rivulets.

SILCHESTER EXCAVATION FUND.—The antiquities found at Silchester during the past year will be exhibited at the Society of Antiquaries' rooms from the 3rd to the 15th inst. The year's work carried out at Silchester was begun early in May, 1900, and continued, with the usual break during the harvest, until December 4. The excavations were confined to the large area, containing in all eight acres, situated between Insula XII. (excavated in 1894) and Insula XXII. (excavated in 1899), and extending up to the north gate and town wall. The area in question contains four insulae, which have been numbered XXIII. to XXVI. Insula XXIII. formed the northernmost of a series of unusually large squares occupying the central portion of the town. A fair-sized house at the south-west corner was uncovered by the late Rev. J. G. Joyce in 1865; the recent excavations have revealed an additional series of chambers on the north-east. Another house of large size with several mosaic pavements was also uncovered on the east side of the insula, and in the mouth of its courtyard was a small square building which may have been devoted to sacred purposes. This had been built up round a small and earlier structure of the same character. The other traces of buildings in this insula, despite its size, were singularly scanty, but the rubbish pits and wells were unusually productive in objects of interest. In pottery these yielded upwards of a hundred whole vessels of all kinds and sizes, and from one of the wells was recovered another great hoard of iron tools, mostly a smith's, similar to that found in 1899 in Insula I., but considerably larger numerically. Insula XXIV. forms a long and narrow triangular strip, bounded on the north by the town wall and its bank. Such strips have hitherto proved more or less empty of buildings, but in this case it contained two houses, one of which was of large size and of exceptional interest from the peculiarity of its plan and the number of mosaic floors in it. Insula XXVI. had in it two houses, a small one on the west, and another in the south-east quarter which was partially uncovered by Mr. Joyce in 1866. Its complete plan has now been revealed. There are also traces of a ruined house near the south-west angle. Besides the houses, Insula XXVI. contained traces of at least three other structures. One of them was represented by a solid circular platform with a cement floor 27 ft. in diameter, enclosed apparently by woodwork or half-timbering. The coins found were as numerous as usual, but not very important.

BERLIN FIRE CONGRESS.—In acceptance of an invitation from the German Government to attend an International Fire Congress, to be held at Berlin next week in connexion with the Fire Exhibition which was opened on Saturday, the British Fire Prevention Committee will be represented by a deputation comprising Mr. Edwin O. Sachs, chairman; Mr. Max Clarke, A.R.I.B.A.; Mr. F. R. Farrow, F.R.I.B.A.; Mr. F. Hammond, F.R.I.B.A., District Surveyor, Hampstead; and Mr. Ellis Marsland, District Surveyor, Camberwell. The deputation will take the opportunity to examine the general arrangements as to the working of the Building Law at Berlin, as well as the influence of the new theatre, factory, and workshop regulations upon modern structures in that capital; and they will, on their return journey, visit Hamburg, with a view to studying the general fire protective arrangements of the port and the more recent forms of warehouse construction which have been adopted in that city. The observations of the deputation, both at Berlin and at Hamburg, at the Exhibition, and in attendance at the lectures of the Fire Congress, will be embodied in a report, each member of the deputation taking up a special chapter dealing with that part of the subject with which he is particularly conversant. The report will be published in due course.

THE INSTITUTE OF SANITARY ENGINEERS (INCORPORATED).—This Institute has taken new offices at No. 19, Bloomsbury-square, W.C.

CAPITAL AND LABOUR.

THE DISPUTES IN THE LEICESTER BUILDING TRADE.—On the 21st ult. Sir William Markby attended at the Town Hall, Leicester, for the purpose of officiating as arbitrator in the dispute which recently occurred at the new Wholesale Market between the bricklayers' labourers and their employers on a question relating to concrete. Sir William heard evidence on both sides, and intimated that he would give his decision in the matter in the course of a few days. Subsequently, upon the suggestion of Councillor T. Smith, the local representative of the Board of Trade, Sir William Markby accepted the position of friendly conciliator in the matter of the dispute

between the Leicester stonemasons and their employers, arising out of the men's demand for an advance of wages and other concessions. Statements representing both sides of the case were placed before him, and it is understood that he will make a recommendation upon the basis of which the dispute may be amicably settled.

PERTH MASONS AND THEIR WAGES.—The operative masons have agreed to accept the terms offered by the masters. Some time ago the employers intimated that they would reduce the men's wages by a $\frac{1}{4}$ d. per hour after the beginning of June. At first there was a strong feeling among the men that they should fight the matter, but after considering the present dulness in the trade, the men have agreed to accept the terms. The agreement commences in June and lasts for a year.

STRIKE IN THE BUILDING TRADE AT NEWARK.—There is no indication at present of a settlement of the dispute in the building trade at Newark which commenced on May 1. Six months' notice prior to this date had been given to the employers for an advance in wages by the operative bricklayers and labourers. Some 200 men were affected. Nearly the whole of these men came out on strike. Negotiations were at once opened with the employers, and as far as the bricklayers were concerned, a settlement was soon arrived at by the bricklayers withdrawing their demands for an increase of $\frac{1}{4}$ d. per hour, and the employers agreeing to sign a code of working rules for the district. With regard to the builders' labourers this section insisted upon an advance in wages of $\frac{1}{4}$ d. per hour, viz. from 5d. to 5 $\frac{1}{4}$ d. per hour, the employers agreeing to a code of working rules for the district. A meeting between representatives of both sides failed to arrive at a settlement, and the strike has been carried on with vigour and determination by both sides. The bricklayers are reported as working with non-society labour, where it has been introduced, although some fifty are unemployed owing to the labourers continuing the strike. Three firms are working, having conceded an advance of $\frac{1}{4}$ d. per hour to the labourers; two others are reported as partially employed. Most of the firms are, however, standing.—*Nottingham Guardian.*

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

1,754.—A CIRCULAR-SAW GUARD: *J. Ingleson.*—The guard consists of two shields pivoted to the end of a plate of which the required height may be adjusted in a bracket, that is secured to the ceiling by means of a counter-weight upon a chain and a clamping screw. Slotted arcs serve for adjustment of the shields at any angle desired, on the forward end of one counter-balanced shield is mounted a roller, and the riving-knife is carried upon an adjustable slide.

1,775.—A CONTRIVANCE FOR SURVEYORS' INSTRUMENTS, &c.: *J. E. Ramsay.*—Between glass plates is pivoted a pendulum-bob, having forked pointers that travel over scales marked upon both sides of the ring, means are provided for securing a spring in position, when the instrument is not being used the released spring is caused to enter a recess in the bob, and so keeps the bob from swinging.

1,776.—ROOFING-TILES: *F. Nölker.*—To obviate leakage of water and the lifting of the tiles by the wind, they are fashioned with singly or doubly rebated, wavy or splayed and interlocking sides, and with upper and lower serrated interlocking undercut ribs; strengthening ribs are made on their under sides, their lower edges are rounded or bevelled, and upper wedge-shaped recesses in them interlock with undercut projections under the side edges of the tiles above. For preventing water from trickling down the end walls diagonal ribs are made upon the outside of half tiles to be used for the gable ends of a roof.

1,802.—CONSTRUCTION OF CEILINGS AND FLOORS: *W. F. Chanl.*—For a temporary centering, boards are laid across wooden ribs nailed to metal plates that are supported upon the lower flanges of the joists, the ceiling being built up with plaster sheets cast about centres of woven wire, and fastened on to iron bars that rest upon the lower flanges of the joists, and the under surface being plastered.

1,828.—CRANES: *R. Williamson.*—The engine and lifting gear are carried upon one end of an arm which, together with the load, they will thereby balance. The arm or jib, constructed of two I-section girders, turns around upon the top of a travelling frame. In operation the load is lifted when the carriage is close in; then the arm is turned and a Y-prop (or, in the case of a railway, a truck upon parallel rails) is put beneath the outer end of the arm when the carriage can be run out for the lowering of the load.

1,915.—ASPHALT PAVEMENT: *C. A. C. Caudenberg.*—Asphalt, 100 kilos, finely powdered is mixed with a solution of from 75 to 100 grammes of India-rubber and 5 litres of petroleum, benzine, or some similar spirit.

1,931.—POTTERY WARES: *H. Werner.*—For a material that is described as possessing a low specific gravity with great strength, and as being a

bad conductor of sound, heat, and electricity, an admixture is made of from 5 to 45 per cent. of crushed basalt and a refractory earth, to which crushed quartz may be added. The basalt is intended to give a glazed surface to the goods when fired.

1,996 and 1,998.—MEANS OF STOPPING LEAKS IN PIPE JOINTS: *S. R. Dresser.*—For gas and other pipes, and more particularly for spigot-and-socket joints, is devised a clamp-ring made in two parts and having stepped ends together with apertures for the bolts, which have polygonal heads and side projections for engagement with the joint-socket, and are retained in their places with flanges or washers. The packing ring fits into an annular groove or recess. (1,998) In the case of a screwed union, the packing ring will fit into annular recesses cut in the clamping rings, each of which consists of two portions that overlap one another and will temporarily engage by means of their apertures and projecting flugs, whilst retaining lugs prevent the turning of the bolts when they are screwed up; the contrivance is available also for leaded pipe joints.

1,997 and 1,999.—PIPE JOINTS AND EXPANSION JOINTS: *S. R. Dresser.*—An expansion joint for plain-ended pipes is made in two sections that when they are screwed up will compress together the ring, of which the ends are shaped as wedges, and the elastic packing. The other invention (1,999) relates to a stuffing-box joint or detachable coupling available for elbows, tees, sleeves, cocks, and valves, and so on, of pipes that are connected with a bell and socket that contain packing; a flange and a wedged extension are fashioned upon the pipe, and the joint, which allows for expansion, is formed by the compression of a covering follower upon the packing when the screwing up is completed.

2,021.—SPIGOT-AND-SOCKET JOINTS FOR CLOSET PIPES: *H. Hurry.*—A connexion between the soil-pipe and the closet outlet consists of a metal tube or collar that is fitted upon the outlet by means of a packing ring, the soil-pipe being inserted into its other end, and an inner tube packs the elastic packing. The packing-ring may be clamped between a clamping-ring and the upper portion of the collar, or a ring can be fitted over the packing-ring between the collar and the outlet pipe, at the end of which is a boss or flange; union or junction pieces may be made in this shape of two or more similar joints formed in pieces.

2,046.—A METHOD OF GLAZING WINDOWS: *E. Glauehl.*—Wrought-iron bars T-shaped in cross-section, constitute the sash-bars and rails or stiles. At the point where one bar crosses another it is cut out and fitted with a flange, being turned back so that the other bar shall be passed through the opening or slot; recesses in the inner flanges of the side-bars take the cross-bars, and the latter are fastened with counter-sunk rivets.

2,071.—A SAFETY APPARATUS FOR LIFTS: *J. W. Holmes.*—At the top of the well is a cross-beam resting upon springs, which under normal conditions remain compressed; on the beam is a pulley over which the lifting-rope is passed; on the guide-posts are a number of pawls, from which rods are hung; if the rope breaks the springs will tend to raise the beam, and the pawls will thereupon be tilted forwards into engagement with rack-plates upon the cage, so as to arrest its fall.

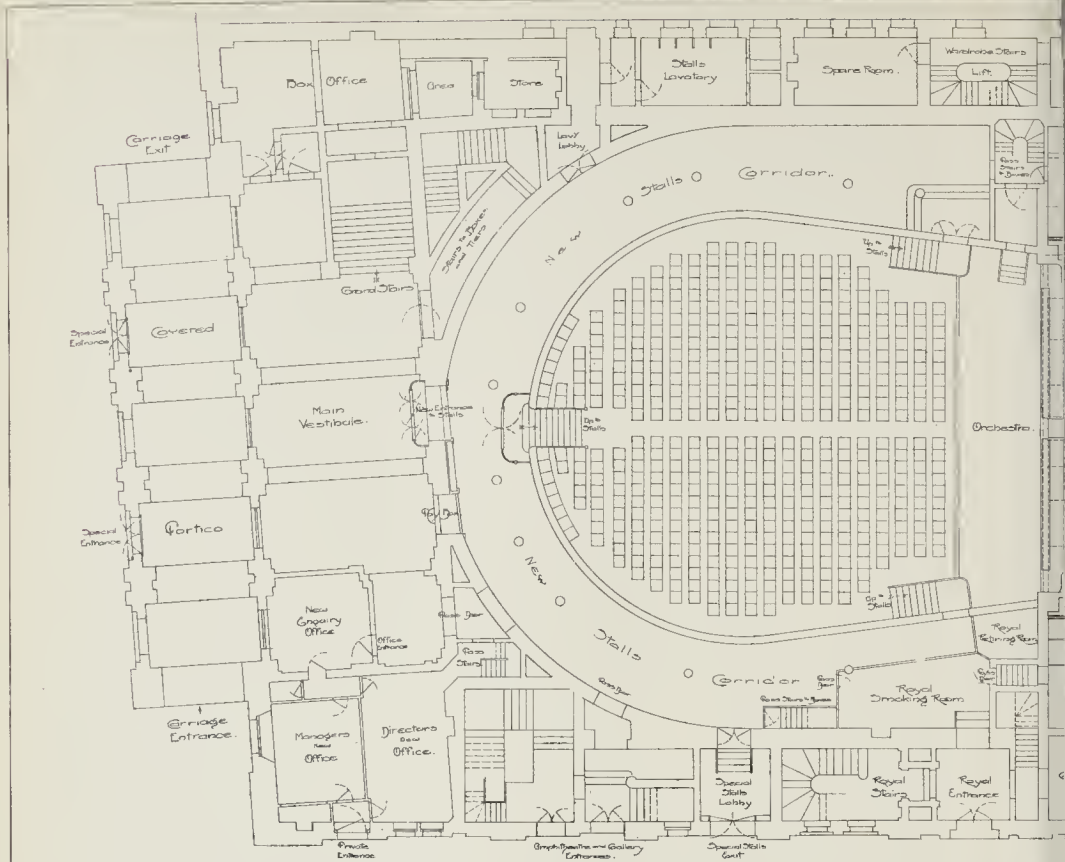

2,074.—ATTACHMENT OF TUBES AND PIPES: *F. W. Barthels and W. Schaefer.*—For facilitating the attachment of the tube to its flange before the operation of brazing the flange is chamfered and is fitted with a collar of which the groove is pierced in several places in the direction of the tube for taking the brazing-material which, when heated, will melt and make the joint without fusing the tube.

2,094.—MEANS OF DETECTING THE PRESENCE OF EXPLOSIVE GAS: *G. A. Lyucher and M. L. F. Mohr.*—The inventors seek to provide for discovering the presence of fire-damp, coal-gas, hydrogen, &c., in mines, gasworks, and so on, by an apparatus which shows an increase of pressure which arises from diffusion into a porous vessel and is exerted upon a flexible diaphragm, whereby an electrical alarm circuit becomes completed; the diaphragm is held in a ring with washers and a ring connected to one binding-post, the former ring holding the porous vessel and its shield. A screw adjusts the contact-point which is connected to the other binding-post; a cover encloses the parts thus described, and the pressure both within and without is equalised with valves. Eyes suspend the apparatus upon the shield, and a set of them can be connected to a central station.

2,103.—FASTENINGS FOR WINDOW-SASHES; ALSO AVAILABLE FOR GATES, DOORS, AND SHUTTERS: *T. Harrison.*—A pin upon a bracket, which is mounted upon the upper sash, engages with a slot cut in the blade spring of a spring-catch carried by a support upon the lower sash, the beveling of the upper portion of the bracket causes the spring to be forced aside with the closing of the sashes and ensures the automatic engagement of the pin, pressure upon a knurled ring will disengage the spring for release of the fastening; in a modification two pins and springs are used.

2,112.—A CONTRIVANCE FOR USE WITH WINDOWS: *R. R. Thom and S. McCall.*—In the frame are grooves and holes that take pivots at the lower corners of the sashes and on the top rails are eccentric cleats or holders through which are passed side

Scale to Section.

chains or cordstbat are attached to the window head and sill, and are to be freed by pressure upon knobs of the eccentricity to admit of the sash being opened or closed, the eccentric can be made to press the cord against a pulley by means of a spring, and pivots can be arranged to slide in metal guide-grooves in substitution for the grooves formed in the frame.

2,110.—JUNCTION-BOXES FOR ELECTRICAL CONDUCTORS: L. M. Waterhouse and Simplex Steel Conduit Company.—A box for conductors that are laid within tubes has main branch nipples together with insulators for the connecting pieces, separating bridge being made in one piece with the insulators, for sweated connexions with the mains the ends of the connecting-pieces, which are made in two parts, are drilled, and for the branches are arranged transverse holes with pinching-screws.

2,120.—ELECTRICAL SWITCHES: L. M. Waterhouse and Simplex Steel Conduit Company.—The inventors device a coupling-contrivance so as to constitute a double-pole switch, by the coupling of two ordinary tumbler switches; the counter-sunk holes of two bars take the spherical heads of the switch handles, and thus make ball-and-socket joints, a distance-piece at the middle keeps the bars apart whilst they are connected by means of screws that provide for an adjustment of the joint.

2,125.—EXTENSION LADDERS: W. Crouson.—The two sections of the ladder are extended with a cord around pulleys and booked, weighted, and cranked levers or catches, which are pivoted on to the upper section, maintain the two sections in their relative places; one end of the cord is secured to a lever, which is pivoted to the upper section as well as to the weighted cranked end of the lever or catch; its other end is fastened to the foot of the upper section; the hooks which fit over the rounds of the lower section are to be turned downwards on the action of a pull upon the lever-end of the cord; to the lower section are attached angular guide-plates, between which the upper section will slide, and upon the upper section are rollers which press against guide-plates upon the lower section.

2,148.—AN APPLIANCE FOR USE WITH THE SCOOFS OR CUPS OF ELEVATORS: H. A. Schmidt.—To obviate any spilling over between an elevator and the scoops the latter are fashioned with continuations turned out at the ends of their front walls. The upper edges of the back wall being turned outwards as well, each back wall has a rounded bottom that lies close against its corresponding wall, is attached to the belt, and is formed continuously with the sides of the scoop.

MEETINGS.

FRIDAY, MAY 31.

Architectural Association.—Annual dinner, Criterion Restaurant, Piccadilly-circus, 7.30 p.m.
Surveyors' Institution.—Country meeting at Southampton (concluded).

SATURDAY, JUNE 1.

Association of Municipal and County Engineers.—Home District meeting, Chichester. Mr. J. Saunders on "St. Paul's Church in Chichester."
St. Paul's Ecclesiastical Society.—Visit to the Parish Church of Enfield. Train leaves Liverpool-street at 8.30 p.m.
Builders' Foremen's Association (Memorial Hall, Farringdon-street).—7.30 p.m.
Devon and Exeter Architectural Society.—Annual meeting at Plymouth.
British Architectural Association.—Visit to Balmoro and Abernethy.

MONDAY, JUNE 3.

Royal Institute of British Architects.—Fourteenth General Meeting (business). (1) To receive the report of the scrutineers appointed by the annual general meeting to direct the election of the Council, Standing Committees, &c., for the year of office 1900-1; (2) election of candidates for membership. 8 p.m.
Surveyors' Institution.—Annual general meeting, 3 p.m.
Society of Engineers.—Mr. A. Taylor Allen on "Concrete Subways for Underground Pipes." 7.30 p.m.

WEDNESDAY, JUNE 5.

Royal Architectural Institute.—(1) Professor W. Boyce Dawkins, F.R.S., F.S.A., on "The Expedition of a Sepulchral Cave at Gop, near Prestatyn, Flintshire." (2) Mr. E. W. Brabrook, C.B., F.S.A., on "Medieval Lavatories." 4 p.m.
Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m.
Society of Biblical Archaeology.—(1) Prof. A. H. Sayce (President) will give a short address on "Recent Discoveries in the East." (2) Prof. Dr. Wiedemann on "Bronze Castles and Purification Vessels in Egyptian Temples." 4.30 p.m.
Edinburgh Architectural Association.—Address by Professor Baldwin Brown on "Durham, Hexham, and Chestery illustrated by lantern transparencies." 8 p.m.
British Archaeological Association.—(1) "Some Aspects of the Life and Times of Alfred the Great." By Dr. W. de Gray Birch, F.S.A. (2) "The Tribunal Prætoris at Rome." By Dr. Russell Forbes. 8 p.m.

THURSDAY, JUNE 6.

Society for the Encouragement of the Fine Arts.—The second convention, at the Galleries of the Royal Institute of Painters in Water Colours, Piccadilly.

SATURDAY, JUNE 8.

British Institute of Certified Carpenters.—Visit to King's Cross, 3 p.m.
Northern Architectural Association.—Visit to Hexham.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.E.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

BURY (Lancs).—For the erection of two shops, Stanley-street, for the executors of the late Mr. T. T. Newbold. Messrs. Openshaw & Gill, architects, Derby Chambers, Fleet-street, Bury. Quantities by Mr. Wm. E. Gill:—

Table with 2 columns: Name and Amount. Includes John Tinline, Thompson & Bierley, Hutchinson & Holt, John Hall, John Inman, James Byrom, Robt. Hall, S. Clough School, Brown, Bury.

CARSHALTON.—For decorations at the Sun Inn. Messrs. Chart, Son, & Reading, architects, Croydon:—

Table with 2 columns: Name and Amount. Includes Smith & Son, Burnand, Wallington.

CATERHAM.—For decorations at the Asylum Tavern. Messrs. Chart, Son, & Reading, architects, Croydon:—

Table with 2 columns: Name and Amount. Includes Cheeseman, Bacon, Card, Vaughan.

CHELSHAM.—For rebuilding the Bull Inn, Chelsham Common. Messrs. Chart, Son, & Reading, architects, Croydon:—

Table with 2 columns: Name and Amount. Includes Worsfold & Son, Cheeseman, Tuetts & Steel, Knight, Quittenton, Bacon, Goulder, Burnand, Smith & Son, don.

CLAY CROSS (Derbyshire).—For the erection of a mission hall for the Methodist New Connexion. Mr. Ernest Oxley, architect, Clay Cross. Quantities by architect:—

Table with 2 columns: Name and Amount. Includes Robert Peck, William Forrest, George Hoyes, Frank Lee, John Madin, Eustace Tinkler, Clay Cross.

KENLEY.—For the erection of a billiard-room at Hillside, for Mr. Geo. Turner. Messrs. Chart, Son, & Reading, architects, Reading:—

Table with 2 columns: Name and Amount. Includes Stewart & Sons, Goulder, Quittenton, J. & J. Ward, Waller, Battley, Son, & Holmes, Cheeseman, Burnand, Horrocks, Smith & Son, Bacon, Heath.

Art at the Glasgow Exhibition.

THE Exhibition is a real triumph for Glasgow. A few weeks ago we gave some description of the buildings, accompanied by some admirable sketches by Mr. A. McGibbon, made especially for our pages, and which will have given our readers some idea of the picturesque and original character of the Exhibition architecture, which, if it does not show all the extraordinary vigour and variety of invention of the Paris Exhibition buildings (for which, of course, there is hardly scope in the far more limited scheme of the Glasgow show), may be said on the other hand to have the virtue of more complete consistency of general style, and of presenting nothing anywhere that can be said to be in bad taste. But a walk through the Exhibition, by way of getting a general idea of its arrangement, leads to the further conclusion that no exhibition of the kind could have been better and more systematically arranged; indeed it may be doubted whether there has ever been one so well arranged. No space is lost, and there are no labyrinths; the whole gives the impression of having been carefully thought out from the first, and arranged on a comprehensive plan. One is struck also with the entire suitability of the construction everywhere, and the degree of original character which we find given even to such minor details as stall railings and barriers, which for the most part seem to have come under the influence of the prevailing spirit of the place.

Taking it as a whole, and considering the value and interest of the works of art collected, and the general artistic spirit which pervades it, it must be admitted that London has never had such an exhibition as is now to be seen at Glasgow.

The connexion of Messrs. Simpson & Allen's fine suite of art galleries with the

Exhibition is of course a great point in its favour; this permanent building forms an architectural centre round which the whole exhibition is grouped; and this and the University building, standing on high ground on opposite sides of the little valley through which the Kelvin runs, form the two dominant features in the scene, and add very much to the general effect of the whole view as seen within the grounds. We may take the opportunity of bestowing a few words of appreciation on the art galleries building itself; a building such as one does not get into every day. Externally, with its fine stone and the reticent but judicious use of sculptural decoration, it gives a very satisfactory impression, which is increased when we make acquaintance with the interior. The plan, with its large hall at right angles with the larger axis of the building, and the side galleries opening from it symmetrically to right and left, is admirably adapted both for interior effect and for the distribution and grouping of works of art. The central hall rises in one height to the ceiling, but with an open gallery round it on the first floor level; and the side galleries occupy both ground and first floor levels, each with an open court in the centre with an arcaded gallery round, outside of which are the suites of rooms in which the various works of art are arranged and classified. Sculpture occupies the central spaces both in the central hall and in the side courts; pictures are arranged in suites of galleries on the first floor; the galleries of the ground floor are parcelled out for various classes of objects of artistic or archaeological interest, of which we will speak in due course.

It is of course our natural duty to look first at the large collection of architectural drawings, which are arranged in the side galleries or bays on the ground floor in the east court. For some reason, these exhibits, though numbered in the catalogue, have not been numbered on the walls, but they nearly all have the title and architect's name appended in print. The Institute of British Architects has a bay to itself, con-

taining objects specially lent for the occasion. These include the busts of Inigo Jones, Wren, Barry, and Street, placed at the four corners of the bay; Mr. Sargent's notable portrait of Mr. Penrose (one of the cleverest things he ever painted), the portraits of Cockerell and Scott, and various drawings of interest which are in the Institute collection. Among these are a sheet of drawings by Scamozzi; two views of the interior of Wren's Greek cross design for St. Paul's, as it should have been if built; an elaborate and well-known study of Donaldson's for a "Temple of Victory according to ancient usages"; and various drawings and designs by Inigo Jones. The present President of the Institute is suitably represented by his competition design for the completion of the South Kensington Museum, and the late Mr. Brydon by the large drawing of his intended circular court for the new Government offices, which we presume was selected and sent when there was no idea that it would have acquired an additional and melancholy interest from the death of the architect.

The remainder of the bays are filled with a very varied collection of drawings representing the work for the most part of living architects, and including many which we recognise as old friends and are glad to see again. In other cases we naturally come across drawings by Scottish architects with whose work we are not so familiar as with that of those who practise south of the Tweed. The next bay to the Institute exhibit is notable for some important ecclesiastical designs; Messrs. Austin & Paley's "St. George's, Stockport," shown in a grand drawing by Mr. Raffles Davison; Messrs. Jas. Brooks & Son's "St. Luke's, Enfield," which in its plain solidity of treatment forms an interesting contrast to the soaring character of Messrs. Austin & Paley's design; and Mr. Leonard Stokes' interior view of Miles Platting Church, which we remember very well at the Academy some little time ago, and which is one of the most original and powerfully treated of modern church interiors. The next bay is marked

by the model of Mr. Belcher's Colchester Town Hall tower, and a large perspective drawing of his design for the Eastern Telegraph offices. Mr. W. Flockhart exhibits his large view of a picturesque mansion called "Rosehaugh," and there are interiors by Messrs. Ernest George and L. Peto and Mr. Baillie Scott, and one of the best drawings of Mr. Arnold Mitchell, a design for a Municipal museum, which some of our readers will remember. We draw attention, however, to some exhibits by the Glasgow brethren; Mr. Honeyman's warehouse in Sauchiehall-street, a narrow front in which sculptural decoration has been very well applied, and which terminates with a gilded cupola (the actual building looks even better than the drawing); and a very peculiar drawing of the *Daily Record* office, by the same architect; this is shown in very sharp perspective, and looks nearly all white and blue; apparently the introduction of some blue glazed facing bricks is actually intended at the upper portion of the ground story; in the rest of the drawing all the shadows are put in blue; the effect is odd enough, but the whole is certainly an original effort in architectural illustration. In the succeeding bay Mr. J. J. Burnet shows photographs of the Gardner memorial church, hardly the best thing he has done—it is in a rather heavy type of quasi-Scottish Gothic. A drawing of the Scottish Legal Life Assurance buildings, by Mr. Skirving, recalls the time when Glasgow cultivated a neo-Greek style, which was then supposed (in Glasgow) to be the thing for giving life and high artistic character to modern architecture, and in which some most admirable buildings were carried out; but it has nevertheless had its day, and is not likely to be revived. The name of Mr. Jas. Salmon is appended to some characteristic interiors, and to a watercolour view of a "Marine Hotel at Trooo," which has the merit of looking very unlike the usual florid type of hotel architecture, and is a really pleasing building in a quiet Gothic style.

Crossing over to the south side of the court, we find in the corresponding bay opposite Mr. Brydon's exterior perspective of the Government Offices, and Mr. Clifford's first premiated design for the Glasgow Royal Infirmary (illustrated in the *Builder* of February 2); and in this bay is also to be found a large exhibit in the round for the "treatment of the end of a room," though whether this is the actual work itself or an imitative reduction of it we do not quite gather; if it is the actual work its title should be "treatment at the end of a room," as it could not occupy the whole end. It is a curious affair, and we presume represents the taste of the latest school of applied art in Glasgow. There is a fireplace and a lofty over-decoration in hammered brass of a type of design which we should call the "ostentatiously naïve," where there is not a line or an angle correct, but all seems as if it had been done by accident; this hammered brass-work mounts aloft and finishes in a clock which strikes the hours on a visible square bell of the sheep-bell type, and into the space above the fireplace is inserted a tile Mosaic figure designed by Mr. Stephen Adam. The brasswork is by the "Holland House Electrical Manufacturing Company." This brass erection is relieved against a mass of dark mottled marble,

dished outward on plan, and cut across, two-thirds up, by an alto-relief plaster frieze modelled by Mr. A. Hodge (who has done so much of the sculpture decoration of the exhibition), and having the appearance of going behind the brasswork and reappearing at the other side. This is an effective piece of work, and there can be no doubt of its novelty of character, but it is rather too odd, and represents a taste (in the treatment of the brass work at least) which can hardly take a permanent hold. Eccentric also is Mr. Edgar Wood's large drawing in the same bay, of a church interior, in thick heavy black ink line, and showing a church with rubble walls, a ponderous framed timber roof, and angels seated on the wood-e corbels. This looks curiously like an old drawing, and is original in that sense, but we should say the executed building would have a rather crude and semi-barbarous effect, like the drawing.

In the next bay is Messrs. Sydney Mitchell & Wilson's drawing of Craig House Asylum for the Insane, a very picturesque group, but with no plan, which is imperative for such a class of building. Their Commercial Bank buildings, Edinburgh, is a powerful and remarkable example of street architecture, with deeply-recessed and boldly-moulded window arches, a parapet standing far out beyond the wall line on very boldly-treated corbelling, and a large circular angle turret corbelled out from the building in the manner which is so peculiarly characteristic of Scottish architecture. There is nothing tame about this building, at all events, and at the same time it is worked out carefully and logically. In the same bay are several of the most striking of Mr. H. Wilson's large architectural drawings, displaying such a mastery of water-colour effect and such inventive fancy, which have from time to time appeared on the walls of the architectural room at the Royal Academy. Logic is the quality which these want; it is difficult to make out what plan or construction is intended for most of them, and the author seems to feel this himself, inasmuch as he has declined to give any titles to them in the catalogue, beyond the general statement that they are architectural drawings. Nevertheless, they are efforts of genius in imaginative architectural effect, and show the hand of a master in the treatment of watercolour, and as such one is always glad to see them; if not constructional, they are at all events suggestive.

An old drawing of the Glasgow Public Hall, by the late Mr. Campbell Douglas and the late Mr. J. Cunningham, of Liverpool, jointly, is an interesting example of old Glasgow taste in classic architecture, a good thing of its kind, and reminding us pleasantly of something that is gone. The late Mr. Young's two drawings of the Staircase of Glasgow Municipal Buildings are here—Classic with a fresher feeling about it; and in the same bay a number of small illustrations of work by Mr. W. Leiper, which will be found of considerable interest, especially his coloured elevation drawings for the decoration of the walls and ceiling of a banqueting-hall, which is an admirable piece of decorative work. The large photograph of his Sun Insurance buildings bears on its frame the label "Médaille d'Argent," so that it has obviously obtained recognition across the Channel. Mr. Rowand Anderson

shows a number of photographs of his executed works (the three monuments to Montrose, Inglis, and Findlay, make a very interesting frame). In the next bay is an original and interesting piece of modern Classic design in the shape of a drawing of Govan Town Hall, designed by Messrs. Thomson & Sandilands; a building very well and effectively grouped, and shown in a fine and freely-handled pen drawing. In the last bay we notice Mr. J. J. Burnet's photographs of Rachan House interiors, also his Public Baths at Alloa, very simply treated, but the long low building stopped by a higher block at the end has its effect nevertheless.

Yet though this is an interesting and varied collection of drawings, one cannot but be struck with the difference when we look at the small collection of French architectural designs which are in the first floor gallery at the south end of the large hall. Here, instead of perspective drawings, we have large-scale elevations and plans. There are those of the New Sorbonne, lent by M. Nénot, and which illustrate the planning and design of one of the largest and most complicated of modern buildings. There are also the plans and a very large-scale elevation of M. Dourgnon's design for the Cairo Museum, the plan of which, very simple in conception, seems very well suited to its purpose, consisting of a central long hall with a series of smaller colonnaded halls opening out of it on the right and left, intended for the classification of exhibits; the whole surrounded by a "galerie de circulation" running all round the building. The elevation is not what one would wish; it is academical French treatment of Roman architecture; the architect might surely have given some suggestion of Egyptian influence or association in the design. There is also a beautiful set of large drawings of antique detail, by M. Henri Eustache, a Villa Medici student, and a fine monochrome drawing of the courtyard façade of the Pitti Palace. Near the end of this gallery is the small architectural show of the United States architects, who for their part have not thought it worth while to do more than send a frame of small photographs of buildings, with a reference list of their names and purposes; a very amateur way of illustrating architecture.

We may devote the remainder of this article to further remarks on the contents of the Art Galleries, which form a department by themselves in the Exhibition, with a separate catalogue, and which comprise a very fine and indeed remarkable collection of art and antiquities; remarkable not so much for its extent (though that is considerable) as for the variety it displays, and the excellent judgment which seems to have been used in getting it together. The sculpture is of course arranged on the ground floor, in the central hall and in the east and west courts; most of the works are known to those of our readers who are interested in English sculpture, and have been commented on before, and many of them illustrated, in our pages, so that it is unnecessary to criticise them over again. We may mention among well-known works, that are present Mr. Onslow Ford's Shelley Monument; Mr. Gilbert's Jubilee Trophy and his beautiful "Perseus Arming," Mr. Stirling Lee's "Dawn of Womanhood," Mr. Pegram's "Fortune," Mr. Luchesi's

"Oblivion" and other figures by him; Mr. Onslow Ford's "Echo"; Mr. Pomeroy's admirable figure "The Potter, Mr. Mullins's "Cain," and Mr. Colton's "Hyde Park Fountain; and many others, forming a very good representation of the present state of English sculpture. There are two or three French works by M. Rodin; his "John the Baptist," in which one is glad for once to see a finished work by this artist, who has lately preferred to leave his work in a fragmentary or half-finished state; this is a fine work, and there is a desire that it should be secured for Glasgow. There is also another powerful figure by M. Rodin, "Un Bourgeois de Calais," who from his costume and the key that he holds is evidently meant to represent one of those unfortunate burghers of Calais who were made to come out and humble themselves before Edward III.; this is a fine and robust work. M. Saint Marceaux's "Première Communion," which also we do not remember to have seen before, is worth remark as a fine and feeling treatment of a religious subject in sculpture.

Pictures are arranged in the first-floor galleries surrounding the east and west courts; two long galleries and one small one are devoted to living British oil-painters, and the same space to those deceased; a long gallery and a small one are given to British water-colour artists, one long gallery to foreign oil-paintings, and one small one to foreign water-colours. A single gallery seems certainly a small provision for representing foreign painters in oil, and of course no figure subjects of great size or of the first importance are there, as there could not be room for them, foreign painters generally occupying larger canvases for this class of work than we do. Yet this one gallery is full of interest, it contains so many small works by remarkable and original painters. There are some very fine Corots; one of the largest and finest we have seen by Diaz (of whom there are several examples); several very fine specimens of Troyon's landscape and cattle scenes; a splendidly built-up forest scene by Rousseau, in his finest manner; two Mauves without a sheep in them (!), and admirable pictures nevertheless; several very good examples of the varied but not always satisfactory art of Maris; and some evidently early works by Millet which are of considerable interest. There is also a fine landscape by M. Harpignies, and an exceptionally good example of Daubigny. What we complain of in the selection is that there are too many examples of Monticelli, an eccentric and irritating painter who does not represent the best paths of art.

The room of foreign water-colours ought to be of interest, also, from the very fact that it represents a kind of art so different from most of English water-colour. There is less finish, far less captivation of colour; but there is perhaps a more distinct intellectual *motif* in these comparatively grey drawings than we should be likely to find in an equally representative collection of British work. The collection is mainly Dutch, including such names as Mauve, Blommers, Neuhys, Artz, Israels, Mollinger (who appears to be a kind of Dutch Boyce), Ter Meulen, and others. There are a few French works, among which is a curious pastel by Millet, "The Sheep Fold," a moonlight scene in which the moon really seems to shine with a luminous effect.

The collection of works of living British artists contains of course a great many well-known works, including some of exceptional interest, which one is always glad to have a fresh opportunity of seeing. We can only mention, among the more important of these works of first-class interest, Mr. Holman Hunt's "Strayed Sheep" and "Christ in the Temple"; Sir L. Alma-Tadema's "The End of a Joyful Day" and "Thou Rose of all the Roses"; Mr. Fildes's "Village Wedding"; Mr. Orchardson's "Hard Hit!" Mr. Abbey's "Trial of Queen Katherine," and Sir E. Poynter's "The Greek Dance"; Mr. Holman Hunt's "Awakened Conscience"; Mr. Watts's "Orpheus and Eurydice"; and Mr. Brett's truly remarkable early work (which we had forgotten), "The Stone-breaker," a painting essentially "pre-Raphaelite" in character, and of a finish and minuteness of execution which even Mr. Holman Hunt has not surpassed. Among Sir Noel Paton's hard and gaudily-coloured paintings that called "The Bludie Tryst," a picture painted many years ago, is a work of some tragic power; Sir George Reid has some exceedingly fine portraits; and there are some landscapes and seascapes by members of the Scottish Academy whose names are less familiar, and which hold their place admirably; more particularly Mr. McTaggart's "The Storm" and "Over the Harbour Bar," Mr. Paterson's "Edinburgh" with a deserted quarry as a foreground; Mr. Henderson's "A Fresh Breeze," and Mr. Beattie Brown's "A Lonely Cot."

The collection, however, of deceased British artists surpasses the other in interest, and reminds one of some reputations nearly forgotten, on this side of the Tweed at any rate. The very first work hung, "Garleton Tower," by the Rev. John Thomson (Thomson of Duddingston), though sadly cracked, is sufficient to show what a really great landscape-painter Scotland possessed in this clerical amateur. All the landscapes bearing the name of Sam Bough are fine; we have seen a complaint somewhere that too many of his were hung, but they are all worth recognition. Few people in England know the name of Tonge, but they will find everything with that name worth looking at. Alexander Fraser is another deceased Scottish painter of great power; witness his picture called "The Margin of the Forest." Milne Donald is the name of a landscape-painter whom we do not remember, but who was no ordinary artist; also James Docharty; also G. P. Chalmers, whose beautiful work "The End of the Harvest," with the evening sky making level lines behind the tree stems, reminds us of some of the best of a living French landscape-painter, M. Lamy. Among other remarkable landscapes is Müller's grand work, "Eel Bucks at Goring," in which, for power and freedom of style, he has almost surpassed his more celebrated contemporary and friend, Constable. Prominent also among landscapes are Poole's "The Dragon's Cavern," David Cox's "Changing Pasture," Turner's "Mercury and Argus," "Linnell's "Vale of Dolwyddelan," Henry Moore's "St. Albans Race," and Alfred Hunt's "Dunstanborough." Some small examples of Etty and William Dyce remind us pleasantly, in very different styles, of two painters once more celebrated than they are now. Wilkie's "Village Politicians" and "Letter of Introduction" are to be seen—the

latter one of the best and most complete things he ever painted. The "Ploughing Match" by Wm. Davis, reminds us of a gifted and conscientious artist who merited better recognition than he met with in his life time. Among the important works of more recent date or better known to fame will be found Millais' "Carpenter's Shop" and "Chill October," Leighton's "Hercules and Death," Millais' "Autumn Leaves," and Rossetti's "Mariana." The collection is indeed one of no ordinary interest.

The south-west gallery is devoted to a most interesting collection of memorials of old Glasgow. Here again Sam Bough is at once topographically careful and artistically fine in his views of "Stockwell Bridge" and "Broomielaw Bridge." Among the interesting relics is the cylinder of the engine of the *Comet*, the first steamer which plied on the Clyde; a cast-iron cylinder about 2 ft. high and 1 ft. diameter. Spinning-wheels in excellent preservation; some old silver Highland plaid brooches; a rams-horn "sneeshing-mull" with a hand-painted miniature in a panel on the top; some fine examples of old Scottish hall-marked silver, perfectly plain but excellent in shape—especially a large punch-bowl with wavy margin, lent by the earl of Breadalbane; these are among the curiosities of this collection.

In the East Gallery is a collection of loan objects, mostly of ancient art. Case L contains two of special interest. One of these is a small circular personal ornament of enamelled gold, enclosing a coloured alto-relief of the adoration of the Magi. This is a most curious little bit of work, lent by Sir T. Gibson-Carmichael, said to be Venetian of the date of 1480. A square silver casket lent by Lord Malcolm of Pottaloch, of French make and probably late seventeenth century, is interesting from its refined semi-architectural treatment; it is divided into bays by playfully treated pilasters, in a form suited to metal work, with panels between enclosing little bas-relief figures. In the small square gallery at south-east angle of the building is the highly creditable work of the Glasgow School of Art students; in the corresponding gallery at the north-east angle are some examples of modern decorative work. Among these is a fine electric light stand in cast silver, by Mr. Alexander Fisher; a stem and table something like the most usual type of sun-dial, with a glass canopy carried on four light shafts above, and under this a nude figure standing on a crystal sphere, and pointing upwards to the light under the glazed dome. A large exhibit against the wall, as to which there is no explanation in the catalogue and no label, is of some interest; it evidently represents one of the latest ideas in Glasgow for a street entry; the lower portion of the opening is flanked by plain black marble jambs with a white marble corbel at the top, from which spring the lines of the wooden erection over it ending in a cornice; over the doorway, on a large repoussé circular plaque of gilt metal, the number "12" is shown in two ways, one for daytime, the other to show at night as a perforated figure in Roman numerals, with a light behind it. This design is, we presume, another example of up-to-date applied art in Glasgow; and if a little eccentric, it is certainly effective and original.

NOTES.

The Liverpool
Cathedral
Question.

An article in the *Liverpool Courier* on this subject last week, in favour of the St. James's Mount site for the Liverpool Cathedral, is headed by a plan of the site, showing the ground plan of Mr. Emerson's design as placed on the site. This plan is at once the strongest possible condemnation of the site on architectural grounds. It shows the cathedral with its side facing down hill towards the principal street adjoining, and its east and west ends facing nothing whatever. A cathedral facing downhill eastward or westward may have a fine effect; one facing downhill sideways has the worst possible effect. No one with a feeling for architectural position and alignment of a large building could ever have recommended such a situation. On architectural grounds, at all events, it will be a complete mistake.

A Note on
Cyprus.

SOME little effort is being made by the Society for the Protection of Ancient Buildings to preserve the singularly interesting remains of the city of Famagusta (the city still retains its ancient walls, cathedral, several churches, &c.), about which there was a considerable correspondence in the *Times* more than a year ago. It is to be hoped this marvellously preserved relic of the Middle Ages may escape its threatened fate, and be preserved for future ages in the way in which Carcassonne has been set apart by the French Government as a national monument. M. Eulart, the author of the great work on Cyprus Medieval art, is at present in the island, engaged on a further study and report as to the condition of the antiquities, which seem to arouse more interest in France than in England, although the island has always had an interest for Englishmen ever since Richard I. conquered it and introduced Western civilisation in the twelfth century.

The Thames
Conservancy and
Sanitation.

THE most satisfactory part of the recently-published annual Report of the Thames Conservancy is that which relates to the sanitation of the districts adjoining the Thames or its tributary streams. That the Thames Conservancy should become a superintending Sanitary Authority for a large district is one of the most curious things in the history of sanitary progress in England. But having had the power conferred on it by the Legislature to keep the Thames and its tributaries from being polluted, it has been enabled to bring great pressure to bear on the Local Authorities who are responsible for the sanitary condition of the districts which are drained by the Thames and its tributary streams. The Conservancy has not hesitated to use the powers entrusted to it, and to put the law in force against the Local Authorities through whose omissions or commission any stream which feeds the Thames is polluted. The result has been a great and continuous improvement in the sanitary condition of the watershed of the Thames. Local Authorities have found that they had no option but to formulate and carry out schemes for the sanitary improvement of the places under their jurisdiction. That in so doing the Thames Conservancy has had a direct influence which was never for a moment

expected goes without saying. But the successful action of the Conservancy shows that County Councils should be armed with the power of compelling the smaller Sanitary Authorities to execute necessary works. In many instances some kind of compulsion is the only means of inducing Local Authorities to carry out their duties.

Municipal
Trading.

It will be remembered that a Committee of the House of Commons was appointed last session to inquire into the subject of municipal trading. It did not complete its inquiries, but it has not been reappointed. As we pointed out last year, the report of a committee of this kind cannot alter the state of affairs. Municipal trading will extend if the ratepayers and Parliament as a body sanction such extension. The limit of this extension will be put by the common-sense of the community. It is impossible, as was said before, to formulate with precision any definition of legitimate municipal trading. But as soon as municipal corporations begin to carry on enterprises which are not for the benefit of the public at large, then we may expect to see the ratepayers and Parliament put a veto on their work. For the moment a kind of languid interest in this respect has made its appearance, but the fact that last session's Committee was not reappointed shows pretty conclusively that the Government is not impressed with the opposition to municipal trading. For the opposition comes largely from powerful trading companies who are anxious to obtain monopolies in electric enterprises and locomotion. The ordinary citizen is inclined to think he would be as well off if his municipality managed these matters as a company whose main object is dividend. We expect therefore not to hear much more of the bugbear of municipal trading.

Electric
Lighting in
Dublin.

IN the "Journal" of the Institution of Electrical Engineers just issued there is an abstract of a paper by Mr. Robert Hammond describing the Dublin Corporation electric light scheme. The paper was read nearly a year ago before the Dublin local section of the Institution, and it seems a pity that it was not published earlier. Mr. Hammond's scheme is so novel and his exposition of it so clear, that it is a distinct loss to the profession that this paper has been so long overlooked. The electricity works are being built on Pigeon House Fort, an island in Dublin Bay, where land is cheap and there are no troublesome neighbours. The system of supply is to be three-phase alternating current, which can be used for either lighting or power purposes. Mr. Hammond's scheme has been subjected to a great deal of severe criticism, most of which comes from those interested in the Dublin Southern Tramway Company, which fears a powerful rival. Three cables, each containing three conductors, will connect the new station on the island with the old station in Fleet-street, a distance of about three miles. The pressure used will be 5,000 volts, and it will be distributed at this pressure to the nineteen sub-stations, where it will be reduced to 240 volts for consumers. Since the station is on an island, cheap coal can be delivered from shipboard, and unlimited water for condensing can be

pumped direct from the sea. Mr. Hammond has arranged most ingeniously for utilising as much of the old plant as possible, and as the frequency of the new alternating current is low, the operation of motors from the mains will be much more satisfactory. The public arc lighting will be done by 500 lamps, which will be run on a circuit of their own. Altogether the scheme is most promising, as the initial capital expenditure has been small and there seems every reason to expect that the subsequent working expenses will be small also.

WE understand that the proprietors of Coutts's Bank have purchased the Crown lease of Lowther Arcade, which was placed in the market three years ago by the trustees under the will of the late Mr. William Bird, and was withdrawn from the sale at auction at 30,000*l.* The Arcade, measuring 245 ft. long and 35 ft. high, and being lighted by a roof glazed with small domes carried by pendentives, was—together with the old Adelaide Gallery along its north side—erected after the plans and designs of Witherden Young, as a part of the extensive improvements effected in that portion of the Strand, the "Bermudas," "Porridge Island," and the neighbourhood of the church of St. Martin-in-the-Fields, in 1829-31, in pursuance of the Act 7 George IV., c. 77—Lord Lowther being Chief Commissioner of Woods and Forests at that time. W. C. Mylne acted as valuer on behalf of the Government, and Decimus Burton was architect of part of the new buildings in the West Strand quarter. The original Arcade had twenty-five shops, with six in West Strand and Adelaide-street, covering a total area of about 16,000 ft. superficial, and is held, under one lease of which 2½ years are still unexpired, at a ground-rent of 1,270*l.* per annum.

Lincoln's Inn-
fields and the
New Street.

IT is stated that for the development of their High Holborn to the Strand improvement scheme the London County Council have already acquired, and will at no distant date clear, the site of Nos. 57-58, on the west side of Lincoln's Inn-fields. The house is distinguished by a balustrade and cornice, a rusticated base, and a semi-circular portico with Doric fluted columns upon a rounded flight of steps. It is one of a block formerly known as Arch or West row, which was designed by Inigo Jones, and is depicted in the oil-colour painting cited as being at Wilton in Cunningham's "Life of Inigo Jones." But whereas the elevation has six Ionic pilasters carried up the upper floors of its front, the façade, built of stone, is apparently of a date somewhat later than Inigo Jones's day. John Forster occupied chambers in the northern half—now numbered "58"—of the house, wherein his rooms have been identified with those of Tulkington, as described in "Bleak House."

Sutton Place,
Guildford.

THE very fine old mansion, Sutton Place, near Guildford, was erected 1520-30 by Sir Richard Weston. The main fronts are built of terra-cotta and red brick. The bay windows, entrance doorways, parapets, and buttresses are elaborately enriched. The interior is as fine as the exterior; the great hall, staircase, and long gallery are all

panelled in oak. The rooms under the Long Gallery are, we are informed, to be decorated or restored; it is to be hoped that this work will be very carefully done, and under proper architectural direction, and in harmony and keeping with that existing, or this fine relic of the old times may suffer considerably. The house is illustrated in Nash's "Mansions."

The exhibition at the Fine Art Society's Gallery, now open, consists of a collection of water-colour drawings of the Holy Land and Egypt by the late Mr. Henry A. Harper. The collection is remarkable in being almost entirely composed of the original drawings made upon the artist's first visit to the East; since then Mr. Harper occupied a unique position as a delineator of that fascinating country. Considering the nature of the exhibition, it is not surprising that there are a great number of sketches that ought never to have been publicly exhibited. It must take more than one visit to catch the evanescent character of the many and changing aspects of the East. The most important drawing is that of Karnak, the Hall of Columns, a work of great imagination and power; it is full of subdued light and delicate colour, nothing being introduced to spoil the harmony and grandeur of the great vista of columns. Except for this drawing, the exhibits of interest are among the smaller sketches, such as the Great Market Place at Hebron and the "Es Sakrah," the Holy Rock in the Mosque of Omar, Jerusalem. No medium other than colour can adequately represent the architecture of the East or the charm of form and colour of the gaily dressed people. The drawing of the Great Market Place at Hebron has caught the peculiarities of the Eastern atmosphere. The cool dark market place with its mysterious shadows and fitting Arabs, while beyond, under the blazing sun, is a glimpse of the white walls and dome of a mosque. "Bedouin and Camels" is another aspect of sky and sunlight, the man and animals strongly drawn. Another sketch of interest is "A Bit of Old Blue," dyeing native stuffs in Damascus. Perhaps the best figure subject is that entitled "In the Bazaars, Jerusalem," which is superior to most of the early figure subjects here exhibited.

ARCHITECTURE AT THE ROYAL ACADEMY.—IV.

The examples of decorative design in the architectural room this year are not numerous nor for the most part important. The two principal ones are hung at opposite ends of the room, and are both on too small a scale to be very well estimated in the position in which they are placed. One of these is a small model of a half dome, showing the design for the mosaic decoration of the dome at Giggleswick school chapel, by Mr. Geo. Murray (1,570). It is hung high up above the line of drawings, and the detail cannot be properly seen. The lower portion of the dome, for rather more than half the height, is occupied by figures of angels with their wings outspread and crossed, arranged in a decorative manner, but not with the stiffness and symmetry of outline which would be found, for instance, in a Byzantine decoration of similar class. One is not certain whether figures of angels arranged in this manner do not rather require that conventional stiffness of treatment, if they are arranged as symmetrical repetitions; whether these figures are not a little too free in line for the kind of treatment adopted. Each figure rises from, or takes a stand on, some

object of a dark colour the nature of which—whether a scroll or a cloud, or what—cannot be quite made out, and the effect is rather ragged, and as if they were standing on footstools. This portion of the dome has a gold ground between the figures; above this the ground is dark blue, with a collection of cherubs with nimbi round the base of the lantern, and at the base of the blue portion what appears to be a collection of birds in flight round the dome in the same horizontal direction. This is a pretty idea, and the general decorative effect of the whole promises well. At the opposite end of the room is hung Mr. Gryll's drawing of the design for the memorial window to the late Duke of Westminster, to fill the whole of the south transept end at Westminster Abbey (1,653). This is a coloured drawing of the stained glass lights, either in body-colour or inserted in cuts made in a very dark paper, so as to give as luminous an effect as possible to the colour. This is a good way of showing a window design on paper, and the general effect is rich and harmonious, but the drawing is a comparatively small one for the extent and elaboration of the design, and it is impossible, as it is hung, to make out anything of the detail. A design of such importance in regard to its effect on the Abbey should have been hung so that one could examine it better.

The other stained glass designs are mostly small windows of single figures. Mr. Leonard Walker's "Design for Stained Glass" (1,587) shows a draped figure with no architectural accessories, depending for effect simply on the design and drapery of the figure, which is rich in colour and in a freer style than is usual in stained glass work of the day; some patches of blue which seem to represent sky above and water at the feet of the figure serve as a colour contrast. This is a very nice little drawing. Mr. Percy Hammond's "Design for Stained Glass Window—St. Nicholas" (1,634) is in the more usual quasi-medieval style of modern stained glass; the figure, wearing a mitre, is clad in robes picked out with bits of rather delicate decorative detail, and relieved by a richly coloured drapery inserted as if hung behind the figure; the face is finely treated. The whole is surrounded with architectural detail and canopy work in white glass, of rather a heavy and lumpy kind of detail, looking like bad medieval work.

Mr. Jas. C. Powell's "East Window, Immanuelkirche, Frankfurt" (1,637) is a design on a very small scale for a large window of five lancet lights. The drawing is minute and carefully finished, and the character of the design is rather out of the common. Figure subjects form the dominating feature, but instead of being based on hard architectural pedestals and surrounded by imitation architectural detail, the figures are interwoven with a flowing scroll design, not symmetrical in line, and completely flat in character. This is much more in accordance with the true æsthetic requirements of stained-glass design than what we generally see, and merits recognition on that account. Mr. Arthur S. McNairn, in his "Design for Stained Glass" (1,662) has also got a rather new idea, composing the design of his three lights entirely of flowers and leaves; a pretty idea, and the colour effect is good, but the upright stems, with their twists and knots, are too realistic, and should have been conventionalised into a more decorative semblance; nevertheless, there is merit in this design. As the strongest possible contrast to this we have in the next drawing, "Design for Stained Glass Window, St. Peter's Church, Bayswater" (1,663), by Mr. Arthur J. Dix, the ordinary conventional treatment of a Renaissance architrave and broken pediment in white glass with yellow ornamental features; it is well and carefully done, and we presume that the style of church requires this style of treatment, or is supposed to do so; but somehow the more richly coloured picture of the Crucifixion, within this framework, gives one a kind of shock, it seems so out of keeping with its decorative surroundings. Mr. J. D. Forsyth's "Design for a Stained Glass Window" (1,668) is rather in the style of fresco than stained glass; a small drawing showing a figure of a woman—perhaps representing "Charity"—with a green drapery and accompanied by two nude children, another small nude figure is seated above in a separate compartment of the design; it is graceful as a whole, but suggests the idea of a design to be painted on glass rather than one put together out of glass with

the colour inherent in it, which is the true stained glass art. Mr. Lavers' "Design for a Stained Glass Window" (1,670), hung as a pendant to this, shows exactly the opposite principle of treatment, all the design being distinctly flat and conventional in character, and such as is especially suggestive of glass. The window contains a figure of St. Paul, the head and shoulders of which are thrown out by being relieved against a rich crimson patch filling the ogee arch of the ground; above this, as well as below the figure, is a form of ornament consisting of a blue tinted scroll design with the spaces between left white; on paper it rather suggests a metal grille, but might not do so in execution in glass; the whole would form a good and rather unusual window design.

Of decorative designs other than glass, a rather important one is shown by a sculptor; Mr. Thornycroft's design (1,555) for the bronze canopy which is to be enshrined, when in position, his group forming the Dean Colet memorial to be erected at St. Paul's School, West Kensington. This is exhibited under Mr. Thornycroft's name, and is, therefore, we presume, his design—possibly his own drawing. We fear it is only one more example of the fact that sculptors, whatever sympathy they may have with architecture in a theoretical sense, rarely understand how to handle architectural detail; certainly most of the detail here is exceedingly bad. The canopy is carried on thin, square, upright rods, coupled, each of which expands at the top into a large kind of cabbage leaf which supports, or rather does not support but finishes underneath a small shrine, with which it has no proper architectural connexion at all. The arched ribs which meet in the middle and give the canopy form to the whole, turn up into another cabbage-leaf on which is another shrine. The only bit of the work which represents good detail from an architect's point of view, is the horizontal band with a decorative filling which runs round above the springing of the canopy and binds the whole together; and that is out of keeping with the rest. We certainly think the sculptor would have acted more wisely, and done better for the school, to have got an architect to design the canopy for him.

Mr. E. M. Atkins's "Design for a Frieze—Wild Hyacinths" (1,549) is rather like some other designs we have seen at the Academy, either by him or others; the delicate blue flowers are treated in strings which form circles round some figures of children incorporated in the design, the general effect is pretty and decorative. Mr. Sidney Smith's designs for ceilings for a new residence in Sussex (1,574) are Classic panelled designs with enrichments, containing nothing new in idea; but which, over rooms which suit that style of ceiling, will have a rich and satisfactory effect; they are apparently for execution in plaster; there is only one tint over the whole of each ceiling, but the tints are varied, probably with reference to some variety in the general treatment of each room. Mr. T. H. Lyon's "Reredos for St. Michael's, Islington" (1,585) is a small drawing apparently executed in coloured crayons, showing a reredos composed of rather thin Gothic tracery (wood?) and a richly carved cornice picked out with gilding; the general effect is pleasing, but the drawing is really too small and too uncertain in execution to show the detail intelligibly. A more important piece of church work, or at least shown in a better and more important drawing, is Mr. A. C. Blomfield's "Memorial to the late Duke of Westminster" (1,652) to be placed in the south transept of Chester Cathedral. This is a tomb with a recumbent effigy, the side of the tomb divided by vertical mullions into four narrow and three square compartments, the latter filled with tracery designs and decorated with a coloured shield in the centre of each compartment; a separate drawing is given of the tomb railing, a good and carefully worked-out design of some originality of character.

Mr. F. L. Pearson's "Reposcè Metal Trip-tych for the Chapel, Cliveden" (1,076), is shown in a small and most minutely finished drawing. It is a kind of modern Romanesque in general character; the centre portion ends with a semi-circular finish, with folding doors with a quadrant finish expanded at each side; the altar below is of marble with pilasters enclosing square compartments which are filled with coloured mosaic designs in circles, with spandrel eyes at the angles. The design is made

the most of by the drawing, which is almost microscopic in delicacy. A much less sumptuous but an original piece of church furniture is the pulpit for All Saints', Leverstock Green (1,692), designed by Mr. Maxwell Ayrton. This, as we read on the drawing, is of English oak inlaid with ivory and pewter. The novel to the steps is treated in these materials, with vertical waving lines of inlay which have a very nice effect, and the whole thing is in excellent taste, but it wants the base to be a little strengthened or marked with a moulding, or in some other way; as it stands, it almost suggests the idea that something has been cut away from the bottom.

It was understood a year or two ago that mere representations of ancient architecture would not be accepted in future; and as to mere pictures of it we quite agree—they are of no architectural value, and take up unfairly the space which ought to be claimed by original designs; but we do not think the disqualification ought to extend to measured drawings of old work, which are often of real value. At all events, this clearance seems to have been made for the present, and one drawing alone of an old building finds place, whether by accident or by special grace—a small pen sketch by Mr. Raftes Davison of "Château Josselin" (1,673), a chateau with three great round towers coming down right into the existing roadway, with curtain walls between, diversified by arched corbel tables and dormers with small crocketed pinnacles. It is a picturesque bit of ancient work, and (needless to say) a very good sketch.

One rather regrets to find that models have dropped out again this year; at all events, if there were any sent they were not accepted. Models add very much to the interest of the architectural room, and are a form of architectural illustration which is on every ground to be encouraged; and as a beginning had been made a year or two ago, we hoped it would be continued. It must be admitted, however, that unless a man can make a model with his own hands, as one well-known architect does, it is a costly way of illustrating your work, and can only be undertaken by those who have a little spare money to lay out on such an object.

LETTER FROM PARIS.

The Grand Palais des Beaux Arts has by a recent decree been transferred from the holding of the Ministre du Commerce to that of the Ministre de l'Instruction Publique et des Beaux Arts, although a certain amount of work on the building still remains to be done under the direction of the former Minister to complete the terms of the contract made in view of the Exhibition of 1900.

M. Nénot, the architect of the new Sorbonne, has been actively pushing forward the interior decoration of his fine building. M. Dagnan-Bouveret has just fixed up in the Amphithéâtre de Richelieu his large fresco representing Apollo and the Muses. The work is not, however, yet complete, the artist promising to finish it for the end of July.

It has been decided partially to restore one of the oldest and also one of the smallest of Parisian churches, that of Saint Severin, almost hidden from public view behind the Boulevard Saint Germain. Although the scaffolding which for some years has surrounded the fine old church of Saint Eustache, near the Halles Centrales, has now been taken down, yet the restoration is far from complete, and will cost another 12,000*l.* as soon as funds are available.

At the last meeting of the Société des Amis des Monuments Parisiens it was decided to enter a protest against the mutilation of the Place de la Bourse and of the Palais de la Bourse itself by the construction of the proposed new wings on either side of the building, which, it is contended, will entirely spoil the aspect of the Bourse and the surrounding square; to support M. Charles Garnier, with his scheme for the formation of a museum of toilette, costume, and public art; to urge the completion of the work of restoring the churches of Saint Eustache and Saint Pierre de Montmartre; and to take into hand the defence of the interesting old houses near the Pont Neuf.

The annual congress of the Société des Architectes Français will be held at Nancy and at Paris from June 23 to 29. The programme will comprise visits to the monuments and artistic works in Nancy and the neighbour-

hood, excursions to several neighbouring towns, and—on the return to Paris—the discussion of several important questions, amongst which will be the rules and regulations of street frontage and their effect on architectural style, architects' fees, and the federation of architectural societies. The annual distribution of awards to architects and builders will take place, as usual, in the amphithéâtre of the Ecole des Beaux Arts.

M. Louis Bonnier, Président de la Société des Architectes Diplômés, architecte en chef des installations de l'Exposition de 1900, has been appointed to the post of architect of the Palais de l'Elysée, left vacant by the death of M. Adrien Chancel.

M. Dubuc, Municipal Councillor, brings forward the evident inferiority of the French artist compared with the English artist on the footing of applied arts. Considering that this inferiority is due to the want of co-operation between the producer and the consumer, he proposes, as a means to elevate the taste of the consumer and bring him more into contact with the best work of the producer, to install each month in the Petit Palais des Beaux Arts small exhibitions of the work of twelve artists chosen from the various categories of applied art, these artists exhibiting not only their complete work, but also the sketches and rough models which formed portion of their work. The general public will be admitted to these exhibitions, and the pupils of the various schools of art will be taken to view and study the works, and thus taking inspiration from their elders, gradually help to create a national style of applied arts. The scheme has received the approval and support of a number of well-known artists.

M. Pascal, the well-known architect, has just taken possession of the piece of ground in the centre of the Place Victor Hugo, destined for the erection of the pedestal of the monument to be erected by Victor Hugo, of which a life-size model by the sculptor Barrias was exhibited in the centre of the hall of the Grand Palais last year. The monument will be inaugurated in the spring of next year, on the date of the centenary of the birth of the poet.

The various offices and administration of the Ecole des Beaux Arts have now been removed to the luxuriously decorated rooms of the old Hôtel de Chimay, next to the Ecole buildings, and acquired by the administration for the sum of 280,000*l.* The portion of the Ecole now left vacant will be arranged as study rooms for the Prix de Rome competitions.

The important case of responsibilities for the accident of the footbridge leading to the Globe Celeste at the late Exhibition, by the fall of which several lives were lost last year, is now before the Court of Justice. It will be remembered that this footbridge was constructed of armed cement according to the system called Matrai. The Public Prosecutor maintains that the pillars of the bridge were of insufficient strength, that the arches were badly constructed, and that the cables under tension at either end of the bridge were not in the same vertical plane, and therefore tended to upset the whole of the construction. The architect, M. Galeron, declines all responsibility, throwing this on the engineer who conducted the work, M. Tedesco; the latter, however, casts the responsibility on to the contractor, M. Matrai, who prepared the plans; this last, however, states that the engineer had the carrying out of the work entirely in his own hands, and modified the plans and scheme of construction without consulting the contractor.

The jury of the section of architecture at the Salon des Artistes Français voted on the 31st ult. the various awards to architects. One round of voting was sufficient for making the unanimous award of the medal of honour to M. Tournaire for his remarkable contribution showing the actual state and the scheme of restoration of the ancient Temple of Delphos. M. Tournaire, a native of Nice, was pupil of M. André at the Ecole des Beaux Arts; he carried off the Grand Prix de Rome in 1888, and was awarded a grand prix and made Chevalier de la Légion d'Honneur at the late Exhibition. M. Tournaire is one of the chief inspectors of the architectural work of the city of Paris. The two first medals were awarded, one to M. Jacques Hermant for his scheme for the Caserne des Celestins, the other to M. Louis Louvet for his designs for a Musée des Arts Décoratifs. M. Hermant was a pupil of M. Vaudremer, and M. Louvet pupil of M.

Gainin. Second medals were awarded to MM. Henri Legrand, Thibouan, and Louis Grandin. There are also a large number of third medals and honourable mentions. In the section of painting the votes were first divided between MM. Gabriel Ferrier, Henri Martin, Wencker, and Bail, but as after further voting none of these artists carried off the necessary majority of votes, no medal of honour was awarded. In the section of sculpture there was no medal of honour awarded, the votes remaining divided between M. Soulé and M. Bequet. In the section of engraving the medal of honour was awarded to M. Mougin, who exhibited an engraving of "The Baptism" after Sadler.

A large number of well-known architects and builders have sent in the following petition to the Senate, protesting against the passing of the proposed law disestablishing the congregations of religious orders and forbidding future unauthorised religious societies and institutions:—"The religious orders of past times have covered France with monuments which are our national glory. The religious societies of our days have raised buildings which are sometimes remarkable, and are always useful to our country, being generously open to the poor and suffering. Every day some new charitable work created by them necessitates new buildings and procures to the whole building corporation and to numerous workmen a considerable amount of work and employment. Full of gratitude and admiration to a past as glorious to French architecture as useful to the country, and reasonably counting on a future not less glorious and profitable to the large army employed in building work; considering the irremediable wrong which the even partial destruction of religious congregations would do to art and construction; we, the undersigned architects on one side, and builders on the other side, petition you to suppress the scheme of the law of associations of which the terms are so unfavourable to religious congregations."

M. Redon, the architect of the Louvre, is now occupied in rearranging the nine large rooms on the first floor of the north wing of the Cour du Louvre for the future installation of the museum of the drawings of old masters, portions of which have been ousted from their places in the five new rooms recently installed and devoted to the museum of furniture.

The subject for the annual Concours Lalbarré at the Ecole des Beaux Arts, was "A Palace for the People." The building was to comprise all the services which would enable the working man to usefully employ his leisure, procure for him the various advantages of co-operative societies, the means of instructing himself, and providing him with every information on questions or events interesting to him. The building was to contain on the ground-floor large stores and shops on the co-operative system, reading-rooms for periodicals, café with billiard-room, large co-operative restaurant, bath establishment, a popular theatre, garden with gymnasium, and a large hall for children's recreation. On the first floor a large library of instructive works, two conference halls, an exhibition hall, and a museum of work to contain models and works of art and industry. On the second-floor a number of small rooms for letting to bachelor workmen, meeting-rooms, and the various offices. The ground was an isolated one of a surface of 5,000 square metres. The Prize was awarded to M. Etienne Coutant, pupil of the atelier Pascal.

On the 19th ult. took place the unveiling of the monument raised at Fontainebleau to the memory of Mme. Rosa Bonheur. The monument is due to the generosity of M. Gambart, Spanish Consul at Nice, a great admirer of the artist and her work. The monument is very simple in style, being composed of an oblong pedestal of Lorraine stone, ornamented with a bronze bas-relief on each side, one a portrait of the late artist, the three others representing reproductions of three of her best-known pictures: "The Horse Market," "The Plough," and "The King of the Forest." On the pedestal is placed the bronze figure of a bull, an enlargement of a model from the hand of the artist herself. The architect is M. Jacob, Architecte des Monuments Historiques.

Next session the Municipal Council of Paris will have to consider, among other important matters, the best way of utilising the Petit Palais. Two schemes are before them: one to consist of a permanent exhibition of ancient art, subject to continual additions. The objection to this is that exhibitions of this

class are already provided for in the Cluny and Carnavalet Museums and at the Louvre, and that we hardly want another. The second scheme, which seems to be the popular one with the Council, is to make of the Petit Palais a sort of municipal Luxembourg, in which will be collected all the objects of art now scattered among the various municipal buildings, and in the repository which the Service des Beaux-Arts possesses at Auteuil. This would form a museum analogous to those in other great towns both in France and abroad; the municipal collection, which is enlarged every year by the purchases made at the Salons, is already rich enough to offer to the public a fine gallery of pictures, marbles, bronzes, tapestries, &c. It is a matter of some interest to Paris to know how this will be settled.

In the meantime the Service des Beaux Arts is organising at the Galleria Museum an exhibition of objects of industrial art, which will probably have some success. Among the things to be included in it are pewter-work by Baffier and Desbois, enamels by Touretti, jewellery by Verbon and Lalique, furniture by Carabin and Lambert, and works by Alexandre Charpentier, &c. This exhibition will be repeated periodically, and will put this beautiful but small building to a better use than has hitherto been found for it.

The Municipal Council will also have to consider in a few days the subject of the new metropolitan railway lines. The only line completed—that from Vincennes to the Bois de Boulogne—has been of such public service that the Town Council are desirous to complete the whole service as soon as possible. Besides the public interest, however, there is a financial bait in the matter, since the railway company is to pay to the City of Paris a rent of '05 centimes per traveller carried, which means a daily revenue of 20,000 fr. to 25,000 fr. for the municipal coffers; so that the Municipality are not only anxious to finish the proposed line, but even to lay out a new one. This latter is proposed to be from east to west of Paris, between the artisan quarters of Menilmontant and the wealthy neighbourhood of the Pleine Monceau, with branches into the business quarters of the Bourse and the Rue du 4 Septembre.

There is much talk at present of the injury done in various ways to the natural beauties of the country. A society has been formed, analogous to that of the Monuments Historiques, the object of which will be to protect forest trees from destruction, and to put a stop to the constant disfigurement of the landscape by the immense advertisements which are now found perpetually along all the railway routes, whether one travels towards the Pyrenees, the Vosges, or the Alps. Messrs. Beauquier and Dubuisson are about to submit to the Chamber of Deputies formal proposals for the official protection of landscape, and we are all hoping that Parliament will be able to do something definite to put down this commercial vandalism.

At the Ecole des Beaux Arts the *ateliers* open for female students have already given most excellent results, and in the section of painting a lady, Mlle. Hevelmans, has obtained a *troisième médaille* in anatomical drawing.

The architectural profession in France has suffered a great loss by the death of M. Gaston Cousin, one of the architects of the Alexandre III. bridge, and a former vice-president of the "Société des Architectes Diplômés," who has died, after a very short illness, at the age of forty-two. M. Cousin was a pupil of MM. Coquart and Gerhardt. On leaving the Ecole des Beaux Arts he entered on the architectural staff of the opera house, under Charles Garnier. In 1893 he took part in the competition for the Opera Comique, and his design, made in collaboration with M. Cassien-Bernard, obtained fifth premium, and the same two architects obtained the second premium in the competition for the Petit Palais. It was in consequence of this that the Government appointed them architects for the Pont Alexandre III., for which each of them received the Cross of the Legion of Honour. M. Cousin was also commissioned to design the Swedish pavilion in the great Exhibition. His early death, following upon that of Adrien Chancel, is a serious loss to the Société Centrale.

ELECTRIC LIGHTING AND PUBLIC BATHS IN LIVERPOOL.—Application has been made to the Local Government Board by the Corporation of Liverpool for sanction to borrow 300,000l. for the purposes of electric lighting, and 24,000l. for the provision of public baths.

WORKS IN WOOD AND WOOD-CARVING AT THE CARPENTERS' HALL.

THE exhibition at the Carpenters' Hall this year is an interesting one. It is typical of both the strength and the weakness of the English building trade, so far as it rests with the carpenters and the carvers. No country in the world, probably, could make such a good show of its carpenters' and joiners' work. In this class the exhibition is confined of necessity to models which from the point of view of execution come more under the title of cabinet-making. The majority have no scale attached to them. They are readable and skillful exercises in construction, explained where necessary by large details of the more important sections, fitted together with such precision that screws or glue are unnecessary, and the visitor may take them to pieces and fit them together again like a Chinese puzzle.

It is unfortunate that the scale is so often omitted; without it there is nothing to indicate whether or not the workman is aware of the scantlings of his timbers, in which case the model he has spent so much time on loses one of its greatest educational values. The model of a hip roof for slates, to a scale of 1½ in. to 1 ft., by Mr. A. Norton is a most complete and workmanlike model. If an architect, during his apprenticeship, were set to such a task, he would learn once and for all that was possible for him to know of a hip roof for slates. Good, also, are the Mansard roof trusses by Mr. E. F. Lay. A model by Mr. J. Colburn of centring for a masonry arch of 150 ft. span has been awarded first prize and special gold medal as the best exhibit in its division. It is a fine design and a fine piece of work, executed with singular patience and exactness. A problem of more abstruse mathematical calculation, if less fatiguing in execution, is the model of vaulting by Mr. W. E. Saunders, an apprentice. The model shows the intersection of two barrel vaults, the centre line of one of which is a curve, while the other vault tapers from a greater to a less diameter; such a problem as you would get in roofing an aisle round the semi-circular apex of a church. Such a problem nowadays would be solved probably by not using barrel vaults, which, in a Renaissance building at least, would be supplanted by a saucer dome. It is, however, an interesting exhibit and well deserves the prize and gold medal awarded it. Of three models for a circular staircase the first prize is taken by Mr. S. Savill; the award was probably influenced by the economy of material and space effected in this design by the shallow depth of the stair and soffit, and by the clever cutting of the miniature handrail, which finishes with the old-fashioned curve without a newel head. In other respects the model by Mr. H. Treais, which wins the second prize, is a superior piece of work.

From these thorough and able exhibitions of skill we turn with something like despair to the furniture and wood carving. So much skilled labour in artistic hands should lead to valuable results; as it is, our labour in this direction is mostly only so much encouragement to showy vulgarity. It is no exaggeration to say that no single piece of furniture, from the point of view of design, is fit for the house of an educated person. Compare the chairs with the beautiful examples of old work lent for the occasion by South Kensington. No craft can have suffered more during the last 100 years than that of furniture-making, mainly because of the separation of the operative from the designer. When we see the operative left to himself and his foreman, his productions are pitiable. In the wood-carving classes the same lack of thought and tradition is noticeable. Unlike our forefathers, or the Japanese or the Italians at the present day, the English wood-carver only does well when he is copying or working from other people's designs. His attention is entirely absorbed by the details, the more variety in which the better he is pleased. He can undercut to perfection; indeed, the best piece of carving in the present exhibition is a study after Grinling Gibbons carved from the solid block by Mr. C. Milson, and is a remarkable work. Mr. W. M. Barnes wins the gold medal and first prize with a group of three exhibits, the principal of which, a "carved walnut casket," is an attempt at design rather in imitation of the clever work of Mr. George Frampton, A.R.A. The design is much more suitable for metal than wood, as, indeed, the title "casket" at once suggests; it is decorated with some clever carved boxwood panels in-

laid, but the less prominent inlays are merely a smearing of wax which spoils it all.

Two hand mirrors by Mr. J. Osmond are very good, as also is a carved oak panel for a door by Mr. J. Phillips, which by contrast is a strong design. Among the loan exhibits, which alone would make the exhibition worth a visit, are two beautiful little panels of the period of Francis I.; a carved pilaster, probably the work of a living Italian, a marvel of minutely skillful execution; two boxwood carvings of cupids laid on a dark plain background, and two pilasters by Noci, lent by Messrs. Gillow & Co.; and of modern English work, a case of little fragments by Mr. G. H. Bull, the gem of which collection is a single spray of acanthus foliage.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A GENERAL meeting (business) of this Institute was held on Monday at No. 9, Conduit-street, Regent-street, Mr. Wm. Emerson, President, in the chair.

The late John McKean Brydon.

The Chairman said that there had been many gloomy announcements to make from that chair during the last year or so of losses which had befallen the Institute by the death of distinguished and respected members, but he thought there had been none sadder than that which it was his duty to mention that day—viz., the loss of their friend and Vice-President, Mr. John Brydon. When a man died full of years and with his work carried out to completion, one felt that his life had seen a fitting ending; but in the case of Mr. Brydon, and in that of Mr. William Young, who died a few months ago, both of whom had made the designs for the largest work they had ever been employed upon, before they could even lay one stone they had been called away. He would ask that an expression of their sorrowful regret for the loss they had sustained be recorded on the minutes, and that a letter of sympathy and condolence be forwarded from the Institute to Mrs. Brydon, his widow.

Mr. Aston Webb, A.R.A., said he was sure they all felt with the President the gloom and solemnity of the occasion. Death had been very present with them lately. At their last meeting it was Arthur Cates; at the present it was John McKean Brydon. They might almost use the words of John Bright on a memorable occasion, "The Angel of Death is present amongst us; you can almost hear the beating of his wings." John Brydon, whom they all knew so well, was so keen, so alert, so genial, and so kindly, that it seemed almost impossible, even for those who saw him laid to rest the other day, to realise that he would never sit in his accustomed place on those benches again. He was a man of strong opinions, and a man who did not shrink from expressing them strongly; but he also had the feeling of give-and-take which was necessary to the carrying on of the work of this life, and he never pressed his opinions beyond what he was entitled to do. As an architect he strenuously advocated breadth and simplicity in architecture, and in his work he endeavoured, and to a great extent succeeded, in carrying out those principles. He (the speaker) had not the privilege of knowing Mr. Brydon as intimately as some of those present, but he knew that when he first came to London his life was not free from struggle and almost hardship. As a man, sorrow and bereavement had fallen to him, perhaps somewhat more than to the average man amongst them; and as at last he grasped the prize it was most pathetic and almost tragic to think that he himself was snatched away and that the prize was to fall to another hand. It made them feel with Burke, "What shadows we are, and what shadows we pursue!" The present was not the time and he (the speaker) was not the man to give a critical notice of his work, or of Brydon as a man, but it was a time for them to express their great regret and sorrow that they should never see him there any more. It was also fitting and right that they should convey to those dear to him whom he had left behind their sincerest sympathy and condolences with them in the great loss which they had sustained, which they his brethren had sustained, and which the Royal Institute, which he had served so long, so faithfully, and so well, had sustained.

Mr. John Belcher, A.R.A., said that the death of Mr. Brydon had come as a great blow

to every member of the Institute, not only because they were not acquainted with his illness, and were not aware that he was seriously ill, but because he was one whom they felt they could ill afford to lose. He was a most conscientious artist, working always on quiet and safe lines. He hated meretricious ornament and highly favoured that which was dignified and monumental in their art. In those respects he set a good example to most of them. But especially did he set them a good example in the interest and affection he showed for the Institute, of which he was so staunch a friend. He never lost an opportunity to favour the Institute and to do what he could to advance its interests. He was also one who assisted greatly the younger members of the profession, both by his interest in them and by his kindly counsel and encouragement. He was, as Mr. Webb had said, a genial companion and a good friend. The members of the Council would long mourn their colleague; he was always so energetic and ready with good and sound advice and practical assistance. There was much more that could be said about his friend Brydon, but their duty that evening was to express their sympathy with his widow and family in their deep sorrow, and the vote which had been moved had his sincerest support.

The vote, having been put from the chair, was passed in silence.

The following gentlemen were then elected:—As Fellows: Messrs. J. C. Hall, London; H. B. Measures, London; E. H. Pritchett, Swindon; and N. Y. Armstrong Wales, Dunedin, New Zealand. As Associate: Mr. J. A. Minty, Leyton. As Honorary Corresponding Member: M. Sainte-Marie Perrin, of Lyons.

The following officers were declared duly elected for the ensuing year:—

President.—Mr. William Emerson.
Hon. Secretary.—Mr. Alexander Graham, F.S.A.

Vice-Presidents.—Messrs. John Belcher, A.R.A.; T. E. Colcutt; and John Slater, B.A.Lond.

Members of Council.—Messrs. F. T. Baggally; G. F. Bodley, A.R.A., F.S.A.; W. D. Caröe, M.A.Cantab., F.S.A.; W. M. Fawcett, M.A.Cantab., F.S.A.; Ernest George; J. A. Gotch, F.S.A.; Kettering; G. E. Grayson, Liverpool; E. A. Gruning; E. T. Hall; H. T. Hare; E. W. Mountford; Professor Beresford Pite; G. H. Fellowes Prynne; P. G. Smith; Leonard Stokes; R. Phené Spiers, F.S.A.; Paul Waterhouse, M.A.Oxon.; Aston Webb, A.R.A., F.S.A.

Associate-Members of Council.—R. S. Balfour; W. H. Bidlake, M.A.Cantab., Birmingham; J. S. Gibson, H. V. Lancheater.

Representatives of Allied Societies.—J. J. Burnet, A.R.S.A., Glasgow Institute of Architects; Frank Caws, Northern Architectural Association; C. H. Chiannon, York Architectural Society; A. Clyne, Aberdeen Society of Architects; Sir Thomas Drew, P.R.H.A., Royal Institute of the Architects of Ireland; F. H. Oldham, Manchester Society of Architects; S. P. Pick, Leicester and Leicestershire Society of Architects; F. W. Wills, Bristol Society of Architects; Butler Wilson, Leeds and Yorkshire Architectural Society.

Representative of the Architectural Association (London).—Mr. W. H. Seth-Smith.

A vote of thanks to the scrutineers was carried by acclamation, and the meeting terminated.

The next meeting will be held on Monday, June 17, when Professor W. R. Lethaby will read a paper on "Education in Building."

THE INCORPORATED GAS INSTITUTE. — The thirty-eighth annual general meeting will be held at the Royal United Service Institution, Whitehall, London, on Tuesday (10.30 a.m.); Wednesday and Thursday (10 a.m.), June 11, 12, and 13, under the presidency of Mr. T. Ormiston Paterson, M.Inst.C.E., who will deliver an address at the commencement of the proceedings. A lecture on "The New Table Photometer and Pentane Ten-Candle Lamp" will be given by Professor Frank Clowes, D.Sc., and the following papers will be read and discussed:—"The Effect of Quality and Pressure of Gas on the Efficiency of Incandescent Gas Lighting, having regard to Economy," by Mr. W. Grafton, of Beckton; "Why I Adopted Water Gas," by Mr. William Langford, of Longton; "British Water Gas Practice," by Mr. Robert Porter, of Elland; "Self Intensifying of Gas Pressure by Means of Waste Heat," by Mr. C. Scott-Snell, of London; "High and Low Pressure Gas Incandescent Lighting," by Mr. William Sugg, of London.

THE ARCHITECTURAL ASSOCIATION: ANNUAL DINNER.

The annual dinner of the Architectural Association was held on Friday evening last week at the Criterion Restaurant, Piccadilly Circus, the President, Mr. W. H. Seth-Smith, occupying the chair, supported by Mr. William Emerson, President of the Royal Institute of British Architects; Mr. A. W. Soames, M.P.; the Rev. H. Russell Wakefield; Rev. Dr. G. H. West; Major-Gen. Sir H. Trotter; Sir George Young; Dr. Isambard Owen; Dr. W. J. Collins, L.C.C.; Professors F. E. Hulme, T. Roger Smith, R. Eley Smith, V.P., and F. M. Simpson; the Master of the Plumbers' Company; Mr. Aston Webb, A.R.A.; Mr. R. M. Beachcroft, L.C.C.; Mr. G. L. Gomme, Clerk to the L.C.C.; Messrs. F. T. Baggally; R. S. Balfour; J. H. Colls; G. B. Carvill; E. Guy Dawber; W. E. Davis; A. Hands; H. T. Hare; Reginald Hart-Dyke; Francis Hooper; W. G. B. Lewis; W. J. Locke; A. E. Murray; F. W. Pomeroy; E. S. Prior; H. A. Satchell; R. W. Schultz; J. Osborne Smith; John Slater; H. Tanner, Sen.; Clyde Young, and others.

The toast of "The King and Royal Family" having been honoured,

The Chairman proposed "The Church and Legislature," coupled with the names of the Rev. H. Russell Wakefield and Mr. A. W. Soames, M.P.

The Rev. H. Russell Wakefield, in response, said that enough care was not taken now as formerly in the erection of church buildings. It was not because there was not the artistic power to design beautiful buildings such as were erected in former days, but because money was not forthcoming for the purpose. There was something inspiring and stirring in the sight of a beautiful church or cathedral, and clergymen preached better sermons in such beautiful surroundings.

Mr. Soames also responded. He said that the House of Commons was more representative of the many classes of the country than it used to be, but, unfortunately, art was very slightly represented indeed. That was probably a reflex of the attitude of the nation at large towards art. If there were greater appreciation of art in the country there would be more representatives of it in the House of Commons. Architects and artists (the spoke as an architect) did not receive much assistance from the Government, but in some Continental countries great opportunities were given to artists: public buildings were decorated with grand schemes of decoration; sites carefully selected for buildings, and money lavishly spent. Such encouragement art in this country had seldom had. It had been said that the interests of art would be better served if there were a Ministry of Fine Art. He thought that that would be a case of exchanging King Log for King Stork, and that it would not be entirely an advantage to artists. There had been a decided improvement in the manner in which recent Governments had treated art questions which had come before Parliament. For instance, he thought the plan adopted in regard to the new public buildings in Whitehall was the right one, viz.: the selection of thoroughly able architects to whom were given a free hand. They must all feel deep regret at the sudden death of Mr. Brydon, whose designs for the buildings in Parliament-street were very fine, the circular court in particular being a masterpiece. It was the duty of artists to do all they could to educate public opinion on the subject of art, for that was the best way to influence the Legislature and thus get a more satisfactory attitude of Governments towards art questions. It rested very largely with artists to bring about an appreciation of what art really meant—it could not come from those who were not artists themselves.

Mr. John Slater then proposed "The Army and Navy," coupled with the name of Major-General Sir H. Trotter. He said the connexion between the Army and architecture was not quite so remote as might be thought, for the War Office had a very great work to do in providing barracks, stores, and other buildings for the accommodation of the Army, and there were several members of the Association and the Royal Institute of British Architects who were engaged at the War Office doing that sort of work. In regard to one man who had his training in the War Office, it could be said that, in conjunction with their friend and colleague,

Mr. Aston Webb, Mr. Ingress Bell had attained a very high position in architecture.

Major-General Sir H. Trotter, in the course of a suitable reply, said he must congratulate the artists on the excellent volunteer art corps under Colonel Edis. The artists had done splendid work at home and splendid work in South Africa.

Mr. F. T. Baggally then gave "The Royal Academy and the Royal Institute of British Architects." These two bodies were subject to a good deal of sporadic criticism amongst architects, but he thought it would be hard to find bodies of men who would do the work these two bodies undertook in a better way. There were many architects who owed much to both bodies, and few who did not owe much to one or the other. There were many architects who had had their first insight into the æsthetic side of architecture in the Academy School, and there were many others (he knew it was rather a delicate point, but he said it with conviction) who had had their first insight into the breadth of architecture and the ground it covered by having to prepare for the Institute examinations. With the toast he coupled the names of Mr. Aston Webb, A.R.A., and Mr. William Emerson.

Mr. Aston Webb, in responding for the Academy, said there was one subject which the Architectural Association and the Royal Academy had equally at heart, and that was the subject of education. Among the thousands who thronged the picture galleries at Burlington House at the present time, probably very few remembered or knew of the silent work which was carried on under their feet, i.e., the education of those young men and women whose ambition it was in future time to hang their works in those galleries. The Association in the same way was very much concerned in the education of young men, and, in fact, was just starting a new scheme. He was one of those who did not believe that a scheme of education would produce good architecture of itself, but he was confident that architecture must be founded on knowledge, and he did not think that any one present that evening who agreed that knowledge was power would deny that that applied to architecture as well as to other arts or sciences. There might be a danger in so many bodies starting some architectural course, and he believed that if they could be concentrated to some extent they would be more likely to do good. Two or three strong, well-attended classes were likely to do far more good than twenty feeble and sparsely-attended classes. He would like to see the educational scheme of the Association and the educational scheme of the Royal Academy working on harmonious lines. The work of the Association was perfectly elementary; the work of the Academy was of a more advanced type, because the Academy did not admit students until they had arrived at a certain stage of proficiency, and it should be one of the objects of the Association to bring pupils up to that stage. Students should remember that with all schemes of education success in life depended upon themselves, and that without energy and great sacrifice they would not achieve success. He sometimes thought it would be fortunate if centres of education could be farther from pleasure-loving London, but in any case they must be prepared for sacrifices in order to achieve their work.

Mr. William Emerson, President of the Royal Institute of British Architects, said he thought such social gatherings had considerable influence for good on the future of architecture—partly by bringing into harmonious intercourse with each other men who did not generally meet (leading to the interchange of views on many subjects), and also by the encouragement that one man gave to the other in the interests of art and architecture. As to the new educational movement started by the Association, it was worthy of all commendation, for however much one might study individually, study in a school was requisite to enable a man to arrive at a proper knowledge of the art or business he followed; and without study and without the knowledge that could be obtained only by study, architects could not arrive at that facility of expression in design and the expeditious mode of working which were absolutely necessary for a man who had a busy professional practice. Of course, architects needed not only to work quickly if they were busy men, but to work thoughtfully; but however much thought they put into their work, if they could not work fairly quickly they

would be left behind in the race. In thinking of this facility of work in art, he had been reminded of a story about Donatello, who was asked once by the Council of Florence how much he would make a certain statue for. Donatello said fifty crowns, which the Council thought was too much, and they gave the work to another and less accomplished sculptor, who charged eighty crowns. The Council declined to pay, and a hot dispute took place. The matter was referred to Donatello, who awarded the other sculptor seventy crowns. This surprised the Council, who pointed out that Donatello was ready to do the work for fifty crowns, and yet he had awarded an inferior artist seventy crowns. Donatello's reply was that he could have done the work in a month or less, and fifty crowns would have paid him well, but that the other sculptor, having taken very much longer to do the work in consequence of his incapacity, seventy crowns was not too much to pay him. He (the speaker) did not mean that the work done in the most expeditious way was necessarily the best, but facility in the execution of work was a great advantage to a man, and it was only obtained by constant study and practice. In addition, an architect had to exercise very considerable forethought and care in his work, which might be either a lasting honour to him or a standing reproach. He could quite enter into the feeling of the painter who changed his profession and became a physician. When asked why he had done so, the physician said: "When I was a painter, I found my work was exposed to the sneers and gibes of every critic, and a great deal of my work was a constant reproach to me; but when I became a physician, I found that the unfortunate sufferers of my blunders were buried, and then they never rose to reproach me later on." Some architects must be sorry they could not bury their work; but that they could not, showed how great was their responsibility. After what the Rev. Russell Wakefield had said about better sermons being preached in beautiful churches it might almost be said that architects won souls by proxy—by building beautiful churches. That was an encouraging thought for church architects. The movement of the Association in starting, in the energetic way it had, the new classes for study was a movement in the right direction, and it would probably result in some lasting benefit to the art of architecture, and in achieving that the Association would be working on all fours with the Institute; in whose charter it is stated that it was established for the sake of fostering the art of architecture. That was what the Association was doing by extending advantages to students in the way of education.

The next toast was "The London County Council," which was ably proposed by Sir George Young, Bart. They had heard that the Church provided a fine field for architects; no one could deny that the State, with its infinite resources, also did so; and behind them both there was the public, who gave architects their opportunities. Another great field for the architect had been those municipalities of the Middle Ages which on the Continent (especially in Belgium, Germany, France, and Italy) had erected great municipal buildings—things of beauty, joys for ever. We in England had created great municipalities, the London County Council being the latest and biggest of them, and it remained in the womb of time whether it should be the greatest. The work it had done so far was mostly of an humble character, and did not at present greatly attract the eye. The work the Architectural Association was doing at Great Marlborough-street had been largely helped by the courtesy and good sense of the London County Council in granting students access to the County Council schools in Regent-street, where students had a chance of learning practical handicraft work in the excellent classes there. No great work could be done by a public body for the good of the public unless it was not only useful, but appealed to the imagination. In appealing to the imagination, a public body acquired that confidence of the public which was so useful and which enabled them to do great things. The London County Council were about to make a great street through one of the unloveliest parts of London, and he hoped they would do something in the direction of an appeal to the imagination. He was glad that the Council had decided to preserve the churches in the Strand, but in the new street itself they would have large frontages to dispose of, and they would be able to

impose their own conditions. We were apt to think that it was best to exercise economy in such matters, but he hoped that when the conditions were settled for building in that new street that they would be settled under artistic guidance, and that an attempt would be made to make the new street a credit to London. If that were done—if something should be produced which was not merely big, but fine—the County Council would hear very little more of that criticism which had been bestowed upon them. He trusted that the new movement in architecture, which had resulted in the erection in some of our streets of buildings which excited admiration, would be extended to something more of a system. The art of architecture was one thing; the business of it was another. To keep them distinct and yet to bind them in a perfect synthesis was the work of a body like the Association, and it was to be hoped that architects would find patrons as intelligent as were those of the Middle Ages, when those beautiful buildings were erected—churches and buildings of State—which were now visited and admired by people. There was no reason why London should not be beautiful as well as vast and opulent, and it was for architects, assisted by the County Council, to make it so.

Dr. Collins, L.C.C., in response, said it might be asked what there could be in common between a profession like the architectural profession and a body such as the London County Council, which was so modern, so matter of fact, so prosaic and so mundane. At any rate there was one common ground upon which the Council and the Association met, and that was in endeavouring to study that masterpiece of legislation, that consolidated simplicity which consisted in the London Building Act. He had only to allude to Sections 8 and 41 to carry that assembly with him when he said that we are fearfully and wonderfully legislated for, and that the London Building Act is a mighty maze, although he believed it was not entirely without plan. In listening to Mr. Emerson's remarks, especially as to burying defective work, he thought there were other analogies between the two professions. He believed it had been said that the ancients tried to make medicine a science and failed, and the moderns had tried to make it a trade and had succeeded. He hoped and trusted that there was no analogy of that sort between the practice of modern architecture and the ideals of ancient architecture. He understood that before the formation of the Association in the middle of last century the equipment for an architect considered necessary then was to have the run of an architect's office. He always regarded that expression as analogous to "walking the hospitals." Both professions had recognised that it was absolutely essential to engraft upon that curious mode of acquiring knowledge some kind of school education, some kind of steady practice, something of that kind of work done in the Arts and Crafts School founded by the Technical Education Board, which had provided some useful opportunities for study to members of the Association. He thought there was an educational relationship which might be usefully established between the municipality of London and the architectural profession, and he regretted that the architectural profession was not represented on the reconstituted Senate of the University of London. The profession which appealed to the harmony of the ear had a faculty all to itself, while the profession which represented the harmony of the eye was not represented. He hoped that a closer identity would be established between the profession and the University. He agreed with what had been said as to the relationship between the arts and the municipality in the Middle Ages, and he hoped that in time there would be a similar relationship between the two. The Council was oppressed by the wealth of London and its power and energy, as well as by its poverty, misery, and ugliness, and to redeem that ugliness they largely looked to the architectural profession.

Mr. W. J. Locke then gave the toast of the Architectural Association. The present year must be marked with a white stone in the annals of the Association as being the year in which they had taken the most important and decisive leap towards progress in their history, *i.e.*, the establishment of day classes in the Association. They had risen from a lower rank to a front rank among educational institutions; and the advance had been steady and certain; and

having overcome many prejudices, they stood the premier body for architectural education in the country, with dreams of premises of their own within sight of realisation. He congratulated the President and the committee on having brought to a successful issue a scheme to which had been devoted so much loving pains and an enthusiasm based on such a clear knowledge of the needs of the profession, for whatever false prophets might say, an academic training was a vital necessity for the pursuit of any art or any profession—whether it be medicine, painting, letters, or architecture. He knew two men of distinction in letters who recently greatly deplored their want of academic training in their youth, that lack of systematic education in thought and expression such as could be attained only by the study of classical methods and models. What was true of letters was true of architecture. This academic education which it was the province and privilege of the Association to give was of the most supreme importance, and the efforts about to be made would be watched with the keenest interest by all those who were concerned in the improvement of the art of architecture. With the toast he coupled the names of Mr. H. T. Hare and the President.

Mr. H. T. Hare, in reply, said that the Institute and the Association were complementary to one another and each was indebted to the other in its own way. The Institute looked to the Association for its future members (it was already indebted to them for many most distinguished members) and it looked to the Association to give such educational facilities to young architects as to prepare them to become in the future members of the senior body. The Association was indebted to the Institute for many specific favours and it looked to the Institute for a continuance of its support, without which it would hardly be able to carry on its work, *i.e.*, the education of architects, especially at the present time when it was taking that important step, perhaps the most important step it had ever taken, *viz.*, the establishment of day classes. Every one, he believed, agreed that the study of architectural education at present left very much to be desired. There was an entire want of system and method and everything appeared to be left to chance. A young man was articled to an architect—was almost pitchforked into the office, it might be said—and obtained "the run of the office," picking up what small crumbs of information he could and at the end of four or five years he probably knew very little more than he did at the time he was articled. The architect was not altogether to blame, because, in the midst of a busy practice it was manifestly impossible for him to devote time to the teaching of his pupils; it was consequently left to the men of the office. It was to remedy this state of things that the Association had established the day classes. The Association wished to give a young man an opportunity to prepare himself to enter an architect's office by teaching him in a methodical and systematic way the A B C of the profession. This would obviously be to the advantage of the student, and it would also be to the advantage of the architect, for from the day the student entered the office he would be useful and capable of considerably helping the architect. The committee were perfectly well aware that other bodies had established schools more or less on the lines the Association proposed to institute them, but it was thought that the Association was better qualified to direct such a school than any other educational body. The organisation of the scheme had exercised the minds of committees of the Association for several years, and a very large amount of consideration had been given to the matter in order to organise the school on a most satisfactory basis. A large number of eminent architects had been consulted, and had placed their advice at the disposal of the Association. The committee believed they were instituting the school on such a basis as would render it of permanent benefit to the profession.

The Chairman also responded. He desired to refer to the death of one or two very distinguished members of the Association, whose loss every one would lament. One was their friend and benefactor, Mr. Arthur Cates, who, only a few months ago, promised 25*l.* to the new premises fund. Only last year Mr. Cates rejoined the Association, paying thirty-four years' subscription in order to do so; and last year he gave them the chairman's hammer—one of those little marks of his kindly feeling towards them. Mr. Cates was honorary secre-

tary of the Association for some years. Another great loss they and the profession had suffered was the unexpected death of Mr. J. M. Brydon, who was on the Advisory Council for the Day School, and was one of the Visitors to the Class of Design. His kindly sympathy and tact in criticising drawings of the students was remarkable. Mr. Brydon was a most popular Visitor, and whenever his name was down for a subject he was sure to have a room full of students. The Association also had to regret the loss of Mr. William Young, who (as did Mr. Brydon) promised very substantial help to the premises fund. It might interest the company to know that the Association had had fifteen of its members in the war in South Africa—mostly Volunteers—and three of them had been lost, while one was dangerously ill. With regard to the scheme which the Association had on hand, they were conducting their educational work on lines which were thoroughly characteristic of England. We were slow to move, but we were proceeding in a scientific way—namely, by experiment, and refraining from adopting any foreign model wholesale. It might be said, "Why should the profession undertake the teaching as well as the examination?" He thought it was a wise plan to do so. Who but architects could know thoroughly the needs of young men training to be architects? It was consequently felt that the training should be kept in the hands of architects. In regard to new premises for the Association, the Committee had the matter deeply at heart, and he felt confident that during the next year a site would be found and a scheme would be before them, which it was hoped, they would subscribe liberally to.

Professor F. M. Simpson proposed the toast of "Lecturers and Instructors." Any one who attempted at the present time architectural education in London laboured under great disadvantages. Architectural education was in its infancy and whether or not the new scheme of the Association would succeed he could not say. If they compared the way in which architectural education was managed in Germany in the big polytechnics, and in America in the big university colleges, and if they thought of the collections of casts, drawings, photographs to be found in those imposing buildings, and of the large staff of instructors—of everything, in fact, which could help and assist architectural education, and then thought of the premises of the Association in Great Marlborough-street, he thought they would agree with him that in London (and the whole of England) any one who attempted architectural education laboured under great disadvantages. Any scheme which was started should be on such a scale that it would command absolute respect from everybody who was interested in this important subject. The lecturers and instructors had laboured earnestly in the cause of architectural education, and it was a fortunate thing for the Association that it had been able to command such good men. He knew of four gentlemen, and there might be others, who had been working in the Association classes from the beginning, viz., Messrs. Pomeroy, Lewis, Farrow, and Hulme. With the toast he coupled the name of Professor F. E. Hulme.

Professor Hulme, in reply, said the labours of the instructors were labours of love. In regard to the new day classes, whatever else might be wanting to make them a success, it would not be the hearty co-operation of the teaching staff.

Professor Roger Smith then gave the toast of "The Guests," coupled with the name of Mr. G. L. Gomme, who responded.

The other toasts were "The Committee and Officers," proposed by Mr. F. T. W. Goldsmith, Mr. G. B. Carvill responding, and "The Press," proposed by Mr. F. G. F. Hooper.

BUILDING IN LEEDS.—The number of plans submitted at a meeting of the Sub-Improvements (Building Plans) Committee of the Leeds City Council, held on the 24th ult., was 158. The number of houses shown upon the plans amounted to 179. Among the larger buildings represented were those of the West Riding Union Bank in Park-row, and a new Baptist chapel and schools in Malvern-road, Holbeck. Plans of the new police-station and branch free library that the Council propose to erect at the junction of Dewsbury-road and Hunslet Hall-road, as well as plans of the last of the buildings projected by the Leeds Estates Company, Limited, were also put in. The Estates Company are about to erect a public-house in Vearlane in place of the Dop-in.

THE SURVEYORS' INSTITUTION:

CONFERENCE AT SOUTHAMPTON.

The Surveyors' Institution held its country conference this year at Southampton, on Thursday and Friday last week. On Thursday the delegates had a sitting at the Hartley Institute, where the Mayor of Southampton (Alderman G. A. E. Hussey), accompanied by the Deputy-Mayor (Alderman G. J. Tilling, J.P.) and the Town Clerk, held an official reception.

His Worship, in welcoming the delegates, said he was sure it was a matter of regret to all of them that their President, Mr. John Shaw, was unable to be present that day owing to indisposition. It was a matter of congratulation to them that the President-elect, Sir John Rolleston, was able to take Mr. Shaw's place.

Sir John Rolleston, on behalf of the members of the Institution, thanked the Mayor for the reception he had given them.

The business of the conference was then proceeded with. Sir John Rolleston presided.

Mr. W. Burrough Hill, Fellow, read a paper on "Southampton, its Past and Present." Southampton 100 years ago was but a small town with possibly about 8,000 inhabitants, and now, as the preliminary report of the new census showed, it had a population of over 103,000. Southampton and district had many indications of prehistoric population, flint implements of the Early and the Late Flint Age having been discovered in the gravel beds of rivers and watercourses. An exceedingly fine and highly-finished specimen was discovered in some drainage works under his superintendence only a year or two since, and an expert in such matters gave it as his opinion that the implement probably dated from about 2000 B.C. The discoveries of Roman pottery and coins had from time to time been very numerous, but he was sorry to say that most of these relics had been sold or bartered away by the finders for a few shillings, and no carefully arranged collection had been made or preserved. He recently discovered when excavating at a depth of some few feet at Portswood, near the ancient landmark "Langhearne Gate," for the construction of roads on the Hampton Park Estate, two very fair specimens of early Roman pottery. No doubt the configuration of the whole district was altogether different in prehistoric times, and it was beyond question that Southampton possessed one of the finest harbours in England, which, owing to its position with reference to the Isle of Wight, enjoys the very exceptional advantage of a second or double tide, which practically ensured four hours of high water out of every twelve. There seemed ground for believing that Southampton existed as a British settlement in pre-Roman times, but this was little more than conjecture. The Romans doubtless first occupied the position known as Clausentum, which they made a fortified station, it being situated on a river which formed a natural highway. After some reference to the ancient history of Southampton, Mr. Burrough Hill said that Southampton was rapidly becoming a seaport of the first importance, principally owing to the enterprise of the London and South-Western Railway Company, who now owned the docks. In addition to the Empress Dock, of about 18½ acres, there was the Prince of Wales dry dock, the largest graving dock in the world. The town had many advantages, such as the parks, the magnificent Common of nearly 370 acres, with its drives, walks, cricket and golf grounds, amid beautiful gorse, fir, oak, elm, and other timber trees, approached through the fine Avenue, which all tend to make it especially attractive as a residential town as well as a seaport. The Sewerage Works, Refuse Destructor, the Electricity Works, the Electric Tram Service, the Docks, the Pier, the Ancient Walls, and many other objects of interest are all well worth a visit. The Southampton High-street, with the Above Bar-street (which was a continuation of the High-street), was one of the finest and most picturesque streets in England. In other respects Southampton enjoyed special advantages. While only about one and three-quarter hours from London, it was within a short drive of the New Forest, with its 92,000 acres of sylvan scenery of almost unrivalled beauty. The Isle of Wight could easily be reached by well-appointed steamers, and Bournemouth and Salisbury could each be reached in about an hour. Attention was called to a magnificently

carved black oak chimney-piece in some business premises in the High-street. A few years since a fire occurred at these premises, and to save it from destruction this chimney-piece was torn down and thrown out of the window. Fortunately, the fire did not reach the apartment, and the greatest pains were taken in restoring the chimney-piece and the panelling to the room, which the owner was always willing to show to antiquaries and others interested in old Southampton. The picturesque and beautiful remains of Netley Abbey and Beaulieu, on the other side of the water, were referred to, and other particulars connected with the town were alluded to.

Mr. Albert Buck (Worcester) proposed a vote of thanks to Mr. Burrough Hill for his very interesting and valuable paper.

Mr. Rees (Swansea) seconded the proposition, which was agreed to.

Mr. F. J. Smith (Chairman of the Reception Committee) then read a paper on "The New Forest." In the course of his paper he stated that to the critical eye of the scientific forester the general aspect of the Forest was somewhat disappointing. Much more was expected in the direction of scientific forestry than could, under existing circumstances, be attained. To an ordinary observer it was one of the most beautiful places on earth, presenting characteristics which could not be equalled elsewhere. Its very antiquity gave it a beauty peculiar to itself. The ancient woods and wide stretches of undulating moorland commanded panoramic views of a charming country, contiguous to, or interspersed with, the well-wooded estates of private owners; but the Forest itself was singularly destitute of those sheets of water which always imparted a special beauty to woodland scenery. The open character of the Forest and its ever-changing scenery offered facilities of great variety for landscapes—over hill and dale or between the lawns and glades; but the woods taken by themselves were not so varied and picturesque, neither of the same uniform growth, nor so grand as those, for instance, at Windsor Forest and Parks, which had the distinct advantage of water in the foreground or distance. The peculiar charm of the New Forest consisted of its old naturally-grown woods, its beeches, with gnarled trunks and many leaders; wide-spreading oaks, which for the time being retain their characteristic beauty, with the constantly changing colour of their surroundings, and of the numerous species of flora. These, together with the furze and heath of several varieties, formed a round of change during spring, summer, and autumn which it would be hard to equal elsewhere. The New Forest existed in primeval times without doubt; and it was believed to be the only relic in England of the pristine forest, where Nature had been permitted to hold her own, unaided and undisturbed by the hand of man. After some historical reference to the New Forest, its physical features, together with its geological aspect, were dealt with, and allusion was made to the modern laws dealing with the Forest, as well as to the general policy of the Crown. In his general conclusions Mr. Smith said popular sentiment had made much more of the enclosing of the forest wastes than was justified by the facts. The public always enjoyed the open spaces of the Forest, and there was no intention, so far as he saw, to enclose the Forest as a whole, nor to exclude the public, who, on the passing of the Act of 1877, gained no more than they enjoyed before in the way of liberty and recreation. But so far as preserving the ancient ornamental woods was concerned, a great loss to the public was incurred, not only as regards the ornamental trees, but the ultimate amenity and value of the national property as a whole. When those trees were gone, of what value was the property without them? By all means, he urged they should preserve and maintain the Forest by sound practical methods as a national property for the benefit of the whole community, if the beneficial interest could be equitably distributed, but where interests were so conflicting and brought into opposition, it was better to sever them and dissolve the partnership, all rights being justly compensated. Preservation of some kind as an open forest was of vital importance to residents within and contiguous to the forest as affecting their interests above those of the general public; and preservation of the open character of the forest was for the purpose of maintaining the rights of the commoners at the expense of the public, which rights were of more value to those commoners

who resided in or near the forest, as compared with those who might exercise rights attached to lands situated at a distance from the forest; and again, the public generally did not derive any advantage by reason of the open ornamental character of the forest, other than that enjoyed before or after the Act of 1877; but indirectly paid very dearly for those privileges. Not only would disafforestation save the forest to the public, but would be a great boon to the commoners, especially to small holders. The paper then referred to the necessity for establishing a School of Forestry, and the exceptional advantages possessed by the Hartley College for the purpose.

Mr. A. Vernon (High Wycombe) proposed a vote of thanks to Mr. Smith for his paper.

Mr. T. A. Dixon (Northampton) seconded the proposition, and Mr. W. Burrough Hill referred to the value of some of the rights of property in the New Forest.

The proposition was carried unanimously. Mr. Philip E. Hilditch next read a paper on "Recent Proposals for an Amendment of the Law and Practice as to Ancient Lights," which we print on another page. Mr. Horsfall (Halifax) proposed a vote of thanks to Mr. Hilditch, and the proposition having been seconded by Mr. Woodward (London) and supported by Mr. Howard Martin (London), was carried by acclamation.

An adjournment for luncheon then took place, the members proceeding to the Royal Pier at the invitation of the Mayor (Alderman G. A. E. Hussey). The Mayor presided, and was supported by Sir John F. L. Rolleston, M.P., and others.

After lunch the members returned to Hartley Institute, when Mr. Charles Pell Hall read a paper on "The Liability of Farm Fires Caused by Sparks from Railway Engines." Fires of considerable extent, involving serious losses to growing crops and plantations, were of more frequent occurrence than most people not concerned as owners or occupiers of land near a railway were aware. He suspected that many members of the Institution had practical experience of the extent of the injuries inflicted, and would be able to add materially to the available information on the subject, and testify to the necessity for the Bill introduced by Mr. Hudson and read a second time in the House of Commons this Session. Reference was made to various cases on the subject, and it was urged that the onus of proof of negligence should be placed upon the companies, instead of as now on the agriculturist.

Mr. E. Pitts Squarey (Salisbury) proposed a vote of thanks to Mr. Hall for his paper.

Mr. R. F. Sturge (Bristol) seconded the proposition, and a discussion followed, in which Messrs. French (Dublin), Jeays (Marlborough), Lynnwood, C. W. Gater (Salisbury), Bowman (Cumberland), Rees and W. E. Mills (Cheshire) took part, and the proposition was carried unanimously.

Mr. Hall having replied, the proceedings terminated.

A numerous company attended the dinner of the Institution, which took place in the evening, at the South-Western Hotel. The President-elect (Sir John F. L. Rolleston, M.P.) occupied the chair in the absence of the President, and was supported by the Mayor (Alderman G. A. E. Hussey), the Deputy-Mayor (Alderman G. J. Tilling, J.P.), Sir Barrington Simcox, Bart., M.P., Colonel D. A. Johnston, R.E. (Director-General, Ordnance Survey), Lieut.-Col. Hellard, R.E., Mr. C. J. Owens (General Manager, London and South-Western Railway Company), the Rev. Canon Durst, the Hon. Gerald Lascelles (Deputy-Surveyor, New Forest), Mr. R. R. Linthorne (Town Clerk), Messrs. A. Vernon and A. Buck (Vice-Presidents), the Hon. E. G. Strutt, and Messrs. Howard Martin, G. Langridge, and W. E. Horne (members of the Council), E. P. Squarey (Past-President), F. J. Smith (Provincial Chairman), J. C. Rogers (Secretary), &c.

The following day was devoted to visits to places of interest in Southampton and neighbourhood.

Annual Meeting.

The annual general meeting of the Institution was held on Monday at No. 12, Great George-street, the President-elect, Sir John F. L. Rolleston, M.P., presiding.

Mr. Rogers, Secretary, read the thirty-third report of the Council, which stated that the number of Fellows remains the same as last year, while the total number of members is 3,200, compared with 3,096 a year ago. The Institution has lost by death during the

year some of its oldest and most respected members, among them Mr. John Cross, of Manchester, who served on the Council of the Institution from 1890 to 1895, and took a large share in the successful launching and subsequent working of the Counties Palatine Provincial Committee; Mr. Edward Smyth, who served for thirteen years on the governing body of the Institution, and acted as unpaid examiner in one of the most difficult and exacting subjects for nearly twenty years; Mr. Jacob Wilson Fair, who served on the Council for several years, and also rendered valuable services as Provincial Chairman for his district; Mr. J. K. Fisher, of Market Harborough, who acted for several years as Chairman of the Leicester, Northampton, and Rutland Committee; Mr. T. D. Smellie, of Glasgow, one of the oldest members of the Institution in Scotland, being one of the first 150 to join it in 1868; Mr. J. W. Kemsley, and Mr. Joseph Goddard. The amount received during the year in Fellows' subscriptions was practically identical with that of last year, while the subscriptions of the two classes of associates and students show together an increase of slightly over 150l. The amount received for "hire of rooms" was about 100l. more than last year. The total investments, calculated at current prices, represent a sum of 13,724l. 19s. The support of the Benedictine Fund has received during the fifteen months since its establishment, while not inconsiderable as regards amount, is not very satisfactory as regards the number of subscribers. The amount received is a little over 7,100l., one-half of which has been subscribed by sixteen members and 74 per cent. by forty-four members, while the total number of contributors falls considerably short of 300 out of a possible 2,800.

The 362 candidates who sat for the different professional examinations in March, 1901, include fifty-three candidates who, having in a previous year passed in the examination as a whole, but failed in passing their 'typical' subject, were required, in order to complete the examination qualifying for election to the class of membership for which they desired to enter, to come up again in the 'typical' subject appertaining to their division and subdivision. The number of these candidates was, in the land agency sub-division seven, all of whom passed; and in the valuation sub-division twenty-nine, of whom twenty-one passed; and in the building sub-division seventeen, of whom ten passed. The number of candidates who, while obtaining the requisite pass marks in the examination as a whole, failed to pass in their 'typical' subject, and were therefore referred back to their studies in that particular subject, was thirty-three. As was the case last year, professional examinations were held contemporaneously with the English examinations, both in Scotland and in Dublin, adjusted as far as possible to special features of practice in those parts of the United Kingdom.

The Council ask the members to again join them in according hearty thanks to the honorary examiners, who have undertaken the onerous duty of setting the papers and awarding the marks in many of the most important subjects. Among these, outside the ranks of the Council, many of whom undertook to act as honorary examiners, special thanks are due to his Honour Judge Philbrick, K.C., Mr. E. J. Castle, K.C., Mr. J. W. Willis Bund, Mr. H. A. Rigg, and Mr. R. F. Colam, who undertook the legal papers, and Mr. F. Lee, Mr. C. John Mann, Mr. J. W. Penfold, Mr. E. B. Panson, Mr. W. Eve, Mr. Gilbert Murray, Mr. A. L. Ryde, and Mr. F. W. D. Theobald. Special thanks are also due to Mr. W. Fraser, of Glasgow, who took upon himself most of the work of organising and carrying through the professional examinations in Scotland.

For some years past the Special Certificate Examinations have fallen into abeyance, the number of candidates who offered themselves being too small to justify the expense involved. In consequence of representations that the uncertainty as to the holding of these examinations in any particular year, discouraged entries, the Council determined to hold these examinations in 1900, irrespective of the number of applications for admission, with the following result:—Three candidates entered for the Forestry Examination and three for the Examination in Sanitary Science, of whom one candidate, in forestry, failed to present himself. Of the five who actually came up, two candidates in forestry and two in sanitary science satisfied the examiners. It is hoped that this result will encourage a larger entry in future years. The examinations will be held again this year, but the Council have decided that in future they shall be held triennially.

The time has arrived when the Council are able to place the members in possession of all the facts relating to the rehousing of the Institution, and, in doing so, they avail themselves of the opportunity of recording, in the briefest possible form, the various steps taken for the purpose. Soon after the building of the old lecture-hall in 1872, it became apparent that a much more comprehensive scheme would shortly have to be considered, should the

Society continue to grow and prosper. For a time there was a prospect that the rehousing of the Institution would be effected, on favourable conditions, under clauses inserted for the purpose in the several Westminster Improvement Bills, but, after many vicissitudes, these bills came to nothing, owing to the intervention of the Government, who took the question of the widening of Parliament-street into their own hands. Early in 1894 the Council felt that action could no longer be deferred. With the growth of the membership and the general enlargement of the scope of the work carried on by the Institution, the accommodation had become totally inadequate. The lecture hall was frequently overcrowded, and the extension of the library was completely stopped for lack of shelf room, while the want of reading and other rooms for general use was much felt by the members. Negotiations were consequently opened with the Ecclesiastical Commissioners, with a view to the acquisition of the two remaining houses in Little George-street, but, on consideration, the Council deemed it advisable to carry out the larger scheme of acquiring the whole block (including the corner house, No. 43, Great George-street), which would provide a site amounting in the aggregate to a little over 6,700 superficial feet. The rents received by the Commissioners for the five houses on this site, including the two already occupied by the Institution, amounted to 1,070l. per annum, but after protracted negotiations, conducted with great skill by the late Mr. Arthur Gaward and Mr. H. T. Steward, an agreement was finally arrived at by which the Institution was to be granted the lease of the whole site for 990 years at a rental of 1,000l. per annum, subject to an undertaking to rebuild the whole block according to plans to be approved by the Commissioners. Before doing so, it was necessary to buy up the intermediate lease of the house No. 4, Little George-street, which was effected for a sum of 750l. It was evident from the sketch plans prepared by Mr. Steward for the use of the Building Committee that a great improvement in the appearance of the new building would result from the removal of the archway and superstructure which spanned the northern end of Little George-street, one-half of it appertaining to No. 14, Great George-street, and an agreement was come to with the adjoining leaseholders, under which they surrendered their interest on consideration of a payment of 500l. towards the cost of rearranging the west side of their building. . . . By September, 1895, the terms of the new lease were formally agreed upon, and designs, based upon the sketch plans prepared by the Building Committee, were invited from several eminent architects, four premiums of 100 gns. each being paid in connexion with the competition. Ultimately the designs of Mr. Alfred Waterhouse, R.A., were accepted, and immediate steps were taken to obtain tenders for the work. These varied from 31,610l. to 27,772l., the latter, that of Messrs. Foster & Dicksee, of London and Rugby, being accepted. The amount was increased later on by additional payments of 700l. in respect of the employment of a special stone of greater durability than that at first specified, and by a sum of 950l. for extra foundations, necessitated by the treacherous nature of the subsoil. The contractors undertook to complete the building in fifteen months, but owing to a number of delays arising from various causes the building was not handed over for occupation until May, 1899—two years and eight months after the signing of the contract. . . . It may be mentioned that the outlay on new furniture and fittings amounted approximately to a sum of 1,000l. It will be satisfactory to the members to know that the whole outlay has been met out of accumulated funds, and that no debt whatever remains upon the building. Everything points to the fact that the policy of rehousing on a comprehensive scale has resulted in a great increase of prestige to the Institution, while from the point of view of material advantage it cannot be doubted that it has become the owner of a property which will in time acquire a greatly increased value, owing to the growing scarcity of building sites in the City of Westminster. . . .

There have been large additions to the library during the year, and a further outlay will shortly be made on the purchase of books. There is shelf accommodation for about 15,000 volumes. The present number of volumes is, approximately, 8,000. During the year the whole of the Law text-books have been replaced by the newest editions, and many other text-books of the kind have been added to the collection. In response to a request from some of the junior members, the Council decided, as an experiment, to open the library on every week-day evening (Saturdays excepted) from October 1 to March 31. This had already been tried on two previous occasions, with not very satisfactory results. The following figures will show to what extent the younger members have availed themselves, during the past session, of the opportunities thus afforded them.

The total number of readers who have used the library during the evening from October to March was 72, of whom 35 (say half) attended once. Twelve—or one-third of the remainder—attended twice, and the remaining 25 averaged 1½ times. The average attendance during the six months was

25 per night. On 16 evenings, out of a total of 112, no one attended. The library catalogue having become difficult for purposes of reference, owing to the great number of interpolations, the whole of the manuscript portion has been rewritten, and will form, with the last printed edition (that of 1893), a complete catalogue to the collections. This is a necessary preliminary step to the republication of the catalogue, which will shortly engage the attention of the Council. The forestry collections have also been carefully rearranged and catalogued, and the Council will be glad to see these collections considerably extended by gifts of timber specimens, which the members are in such an excellent position for contributing. It may be mentioned that the two geological collections, one acquired by the Council many years ago and the other recently presented by Professor C. E. Curtis, have now, with the valuable assistance of Dr. Woodward, of the Natural History Museum, been thoroughly classified and arranged in such a form as to be of real utility to the members.

During the session the Council have promised financial support to, and have nominated two of their members (Mr. A. R. Stenning and Mr. A. Vernon) to act on, a Joint Committee of the Surveyors' Institution and the Royal Institute of British Architects, appointed for the purpose of collecting and tabulating information from all parts of the country as to damage to buildings resulting from lightning, to discover, if possible, how far buildings are rendered lightning-proof by modern systems of protection, and to ascertain what improved methods might be adopted. It is hoped that the members of the Institution in various parts of the country will assist the Committee by agreeing to act as observers, so that actual details, noted on the spot, may be forthcoming. Communications should be addressed to the Secretary of the Lightning Research Committee, 9, Conduit-street, W.

The Council also decided during the session to co-operate with the Royal Institute of British Architects on a Joint Committee with reference to the amendment of the law and practice as to ancient lights, appointing as their representatives on the Committee Mr. H. T. Steward, Mr. A. R. Stenning, Mr. H. Chaffell Clarke, and Mr. G. M. Freeman, K.C., all of whom devoted a great deal of time to the consideration of the subject. As the result of their deliberations, the Committee decided to draft a Bill for introduction into Parliament, and the Council have agreed to share (up to a certain amount) with the Royal Institute of British Architects the expense involved. The draft will come up for consideration very shortly.

The number of applications from members requiring assistants, and from the latter seeking professional employment, has been about the same as last year. The number of names at present on the register is about seventy.

The report and balance-sheet having been adopted, a vote of thanks was accorded to Messrs. H. C. Newmarch and C. P. Hall for their services as auditors.

Mr. Howard Chatefield Clarke moved a vote of thanks to the President, Vice-Presidents, and other members and Associates of Council, for the able manner in which they had carried on the affairs of the Institution.

Mr. King seconded the motion, which was agreed to.

The Chairman (the President-elect) replied and thanked the members for electing him as President for the ensuing year of office; after which Mr. Squarey, past-President, invested the Chairman with the Presidential chain of office.

A hearty vote of thanks was then accorded to Mr. J. W. Penfold, Hon. Secretary, and Mr. Julian C. Rogers, Secretary, for their services during the past year; and these gentlemen having replied, the Chairman delivered the prizes to the successful students, as follows—

The "Institution" Prize of the value of fifteen guineas was awarded to Mr. Montague Price Holmes, a "Valuation" candidate in Division II., who obtained 794 out of a possible 1,000 marks.

The "Special" Prize of the value of ten guineas was gained by Mr. Frederick Stanley Daniell, a candidate in the "Valuation" Sub-Division of Division II., with 765 out of a possible 1,000 marks.

The "Crawter" Prize, awarded for the best work in the subject "Valuations" by a candidate in Division IV., was awarded to Mr. Herbert Andrew Cromartie Warrington, who obtained 86 per cent. of the possible marks.

The "Penfold" Gold Medal was this year won by Mr. William Edward Trent, who, in the "Building" Sub-Division of Division IV., headed the list of Fellowship candidates with a total of 802 out of a possible 1,000.

The "Penfold" Silver Medal, given to the candidate who, in either Division II. or Division III., obtained the highest proportionate number of marks, was awarded to

Mr. David Llewellyn Paton, a candidate in Sub-Division II. of Division III., who also gained

The "Driver" Prize of the value of 15*l.*, awarded to the candidate heading the list in the Division III. (direct Professional Association) examination. This candidate obtained 976 out of a possible 1,200 marks.

The "Daniel Watney" Prize of 10*l.* was awarded in connexion with the Special Certificate Examination in Forestry to Leslie Stuart Wood.

For the "Preliminary" Prize Messrs. W. C. Clemens and A. Salwey were bracketed equal at the head of the list in the Studentship Examination with 468 marks out of a possible 500, and a "Preliminary" Prize in connexion with that examination was awarded to each.

A vote of thanks to the Chairman concluded the proceedings.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A HOME Counties District Meeting of the members of the Association of Municipal and County Engineers was held at Chichester on Saturday, June 1. The members assembled in the Council Chamber of the Town Hall, where they were received and welcomed by the Mayor (Mr. R. Coombe Miller) and the members of the Corporation. Mr. C. H. Lowe (Hampstead), President, occupied the chair, and among those present were Messrs. Radford (Putney), Norrington (Westminster), Winter (Poplar), F. J. C. May (Brighton), R. J. Thomas (Aylesbury), Dyer (Southampton), Catt (Hayling), and others.

The Mayor welcomed the members of the Association, remarking that their work was of the utmost practical utility.

The President briefly acknowledged the reception accorded to the Association on the occasion of their first visit to Chichester, and said they wished to convey their best thanks to the Corporation for the use of the Council Chamber.

Mr. Thomas, district secretary, informed the members that he had received a letter from Mr. Stallard, who was at Bloemfontein, acknowledging the congratulatory message forwarded by the Wimbledon meeting on his departure to South Africa on active service.

Mr. J. Saunders, A.R.I.B.A., City Surveyor, then read a paper on "Municipal Engineering Works in Chichester." He said the question of restoring the Market Cross had been continually under discussion, and the Committee of the Council were now again considering its state and would shortly report on the matter. The Corporation owned a quay situated in the Chichester harbour, and vessels of 350 tons burden could be berthed. There was a very good trade in corn, coal, &c., and about 100*l.* yearly was handed over from the dues in relief of the borough rate. At the request of the Council, the author had prepared a scheme for enlarging the quay, dredging the channel, erecting new stores, and other works, and it was now under consideration. The Corporation also owned a navigable canal, joining the city with the Chichester harbour; it was about $\frac{1}{4}$ miles long, had two locks, and an extensive basin with commodious wharfs and storeyards on the southern side of the city. In 1890 the Corporation erected an isolation hospital at a cost of 2,230*l.*, on lines suggested by the Local Government Board.

There were two large wards, each 24 ft. by 18 ft. by 12 ft. high, and two small wards each 18 ft. by 12 ft. high, with kitchens, caretakers' house, laundry, mortuary, disinfecting rooms, &c. Previously to 1894 the city method of disposal of the sewage being by turning it into soaking cesspools. A scheme by Mr. Baldwin Latham was accepted, the sewers, nineteen miles in length, being designed to take sewage only, the surface water passing through old drains into the Lavant course.

Every house was disconnected from the main sewers by a special form of interceptor trap, having an air inlet in the pavement opposite, the far end of the drain being carried up as a ventilating shaft. A considerable number of complaints respecting these air-inlets had been received, and occasionally, during particular atmospheric conditions, the air-inlets acted as outlets, and the emanations from the house drains offended the pedestrians in the streets. In all fairness, it should however be stated that every case of nuisance arising from the grate-

ings had invariably been found to be caused by the house drains being improperly flushed. The outfall works were about a mile and a half west of the city and occupied about 10 acres of ground.

The sewage first entered a salmon ladder running the whole length of the buildings. In its course lime-water at the rate of three grains of lime per gallon of sewage was added first, to render the sewage slightly alkaline, and further down the salmon ladder alumina ferric at the rate of three grains per gallon was also added, the whole passing then through a rough screen into the precipitation tanks, of which there are three, each measuring 55 ft. 6 in. by 20 ft. by 5 ft. averaged depth. Two of these were worked each day while one was being cleaned, the sludge being pumped up by chain pumps, and lime added in a mixing pit at the rate of 1 cwt. to 100 gallons of sludge. This was afterwards forced with direct-acting pumps into sludge presses. The averaged dry weather flow of sewage was about 300,000 gallons per day, the amount of pressed cake being about 24 tons per week, and about half a ton of rough screenings per day was taken off the gratings. The tank effluent was afterwards passed over about six acres of land, laid out on the ridge and furrow system and retained in a tidal storage tank, holding about 320,000 gallons, until the tide commenced to ebb, when it was discharged. The ground had been cultivated, and last year a very good crop of mangold, cabbages, broccoli, white carrots, &c., was grown, the value realising about 80*l.*, and this about covered the working expenses. The effluent passed into the Chichester harbour through a 21-in. pipe by means of a penstock valve and tidal flap. The harbour is of great extent, and was subject to a tidal change of about 24,000,000 gallons per day.

At the conclusion of the paper Mr. Saunders appealed to the members not to discuss the sewage disposal works in any way, as the Corporation were engaged in litigation in reference thereto, and the case was coming before the Courts in a week's time.

The President promised that the members would respect the wish of Mr. Saunders, and not discuss the sewage question in any way.

Mr. Yabbicomb (Bristol) in moving a vote of thanks to Mr. Saunders for his paper, said that Chichester was to be congratulated upon having a Corporation so energetic and so appreciative of the necessities of modern life as to carry out all the important and useful works which Mr. Saunders had described. He would like to know if the isolation hospital as described in the paper had complied with the Local Government Board requirements (Mr. Saunders: "Yes."). Mr. Yabbicomb said he was interested as he was building an isolation hospital, and he considered that Chichester had a hospital built on very economical lines.

Mr. May (Brighton), who seconded, remarked that the works were so admirably explained that they did not lay themselves open to criticism.

Mr. R. J. Thomas (Aylesbury) congratulated Mr. Saunders upon the state of his roads—their condition and the smoothness of their surface.

Mr. Catt asked why the ancient city gateways had been demolished.

The President congratulated the city upon the preservation of its canals. In many parts of the country sufficient use was not made of the canals. Canal transit was cheap, if it was slow, but there was some transit where time was not an object in the bargain.

Mr. Saunders, in reply, said he believed the gateways were pulled down because their maintenance was an expense to the city. He believed the citizens in those days used to spend their money in riotous living. They could find in the old minute-books entries like this: "The Council made merry," and that was about the time the gateways were pulled down. On the coronation of Queen Anne they made the conduit-pipes which supplied the town with water run with wine.

The members dined together at the Assembly Rooms, under the presidency of Mr. Lowe, and the afternoon was devoted to a round of visits to the various public works.

CARNEGIE PUBLIC LIBRARY, KEIGHLEY.—One hundred and forty-six designs were sent in this competition, and the assessor, Mr. Leonard Stokes, has awarded the first premium to Messrs. McKewan & Swan, Birmingham.

RECENT PROPOSALS FOR AN AMENDMENT OF THE LAW AND PRACTICE AS TO ANCIENT LIGHTS.*

THE purport of this paper is to give a brief account of the efforts that are being made to bring about an amendment on that subject of perennial interest to most surveyors, provincial as well as metropolitan, the law and practice of Ancient Lights, and to discuss the proposals formulated.

It is, I think, generally agreed that the great body of case law which has been built up upon the basis of the simple enactment on the Prescription Act of 1832, that "when the access and use of light to and for any dwelling-house, workshop, or other building shall have been actually enjoyed therewith for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible," includes many judgments difficult to reconcile with one another, and that there is not to be deduced from them anything like a clear or definite rule by which the owner of an ancient light on the one hand, and the owner of property adjoining, upon which buildings are about to be erected or increased in size, on the other, are able to ascertain what are really their respective rights and to what limitations these rights are subject.

The position of the doctrine of the 45 deg.; the claim to a right for a special quantity of light for extraordinary purposes; the definition of what is meant by material and substantial injury to lights; the question as to whether, if sufficient light be left, it matters as to how much, beyond that sufficiency, is taken away—all these questions and others seem apparently to be insoluble by the Courts and constitute a fruitful field for the production of differences and disputes between building-owners and the owners of ancient lights, and the cause of constant recourse to the Courts at considerable expense in money, time, inconvenience, and irritation, by way of injunctions to retain or actions for damages, with, in many cases, results which are satisfactory to neither party. Some have indeed gone further than this in their complaints of the state of the law, and have contended that the power given to the owner of even a very small and unimportant light to restrict or in any case delay the erection of important buildings, has led to serious hardships, and has in some cases opened the door to what can be described as little sort of blackmailing operations. And it is clear to anybody who has much to do with light and air cases in the Courts that it is difficult for the ordinary legal tribunals to deal with these technical questions without great waste of time, and in many cases uncertainty as to substantial justice being done.

Actuated by these considerations, the Royal Institute of British Architects in the beginning of 1900 came to the opinion that an alteration in the law of Ancient Lights was urgently needed, and placed itself in communication with the Surveyors' Institution, and the two bodies appointed a Joint Committee which made a Report on the subject at the end of 1900, which most of those present have probably seen.

The contents of that Report may be summarised as follows:—

In the first place, it is proposed to limit the right of the owner of an ancient light, where such right has not already been acquired, to a right to receive light sufficient for all ordinary purposes, but not to include a right to an extraordinary amount for special purposes.

In the second place, the difficulty which is sometimes experienced of obstructing a light which would otherwise in the course of time gain dominant rights is obviated by it being placed within the power of the owner of adjoining property over which such rights would, if acquired, be exercised, to give a legal notice to have the same effect as though such obstruction had been put up and submitted to for one year.

In the third place, there is a provision for certification and registration of the plans of buildings about to be pulled down, and I suppose, although the Report does not distinctly say so, the identification of ancient lights existent in the old buildings.

In the fourth place, there is a provision that no building erected after January 1, 1905, shall acquire any further rights of light and air

where it abuts on any way used by the public as an access to various tenements.

In the fifth place (and this constitutes one of the most important parts of the Report), provision is made for the settlement of differences arising between a building-owner and the owner of adjoining ancient lights by means of a tribunal formed of the surveyor for either party or of their umpire, with power to the umpire of determining "the right of the building-owner to carry out his intended works, the alteration (if any) necessary to be made in carrying out the proposed new buildings or alterations to prevent or lessen the obstructions complained of, and the amount (if any) of compensation of every description to be made to the owner, lessee, or occupier, the alterations or improvements to the adjoining premises by light-reflecting surfaces, enlargement of lights, heightening of premises, or other means, the amount of costs to be paid by each or either party, and generally all matters required to arrive at a settlement."

And there is a provision for an appeal to a committee consisting of an architect, a surveyor, and a barrister with power to decide whether and to what extent the proposed new buildings shall be amended or the dominant premises altered. In any case in which a larger sum than 500*l.* is awarded either in money, damage, or works, or in which the interference with the proposed works exceeds 500*l.* in value, there is power of appeal to the High Court. Then side by side with the powers just previously described given to the surveyors, the tribunal, and the High Court there is, in the sixth place, a provision that in any action to restrain a building on the ground of its interference with rights of light, and whether an interim injunction has been obtained or not, either party may apply to a judge either to hear the same with an assessor or assessors, or to refer it to arbitration in the manner before provided.

This Report is in process of being drafted as a Bill, which will then be taken into consideration by the Council of the Incorporated Law Society with the view of the co-operation of that body being obtained. It will be seen, therefore, that the proposals which have been made really amount to this:—

The basis of the law is so far defined as to eliminate from the rights of an adjoining owner any right to light for extraordinary purposes, and to limit them to a right to receive light sufficient for all ordinary purposes, and that the settlement of the question which may arise as to whether sufficient light has been left for all ordinary purposes may either proceed in a way similar to that obtaining in the case of party-walls under the London Building Act (except that the third surveyor or architect called in on light and air cases is to be an independent umpire and not to act in conjunction with one or both of the *ex parte* surveyors), with an appeal to a technical committee, and beyond that to the High Court; or apparently he may still proceed in the old way by an application for an injunction to restrain, which may be referred by the judge to the arbitration before described if it appears to him the claim may be satisfied by damages. This, put briefly, is what the present proposals amount to, but before saying a few words upon them, it may be useful to make some remarks upon the more important of the recent cases which have occupied the Courts which exemplify the accuracy of the view that some simplification of the legal basis for our practice in the subject is absolutely essential.

In the Appeal Court case of *Brown v Collings*, which was decided in 1899, the Master of the Rolls, Lords Justices Rigby and Vaughan Williams concurring, said "it was a question of degree whether there had been such obstruction or diminution of light as to render the premises uncomfortable or unfit for the ordinary purposes of habitation or of carrying on business. He came to the conclusion that a considerable quantity of light which had formerly access to the plaintiff's windows had been cut off by reason of the defendant's building. There ought to be an injunction to compel the defendant to pull down so much of his building as obstructed the access of light as previously enjoyed in the plaintiff's buildings." This was a case where the offending building was to be from 60 ft. to 70 ft. distant from the ancient lights, and the extreme height of same from ground to top of gable was 44 ft. and no more. A portion of the offending wall would have been 32 ft. high, and the Master of the Rolls in his judgment said he thought the

defendant's building should not be above 25 ft. high, and subsequent words he used indicated that it was his opinion that it was not enough to consider whether the plaintiff had a sufficient quantity of light left, but that what had to be considered was the amount taken away. This seems to be a strong judgment in favour of the contention that the owner of an ancient light is entitled to all the light he has enjoyed through it for the statutory period.

It was not many months, however, before a decision embodying quite different principles was given by Mr. Justice Wright, who held, in the case of *Warren v. Brown*, that a house is not necessarily entitled "to have all, or substantially all, the same light coming to its windows as during the twenty years," as this would impose on servient tenements an unreasonable burden and might involve grave public inconveniences. Nor, if that were law, could there well be any presumption that so long as 45 deg. of light, or some approximate angle, is left there is no actionable wrong." The judge, therefore, having found that there was sufficient light left for all ordinary purposes of inhabitation or business, nonsuited the plaintiff and apparently resuscitated the 45-deg. angle theory in a great measure.

This judgment was followed by Mr. Justice Joyce, who held in the case of the *Home and Colonial Stores, Limited, v. Cols*, in a case where the back part of rooms enjoying light through an ancient window was so dark as to have needed artificial light on ordinary days, but where the remainder of the plaintiff's premises would, after the erection of the defendant's building, be well and sufficiently lighted for all ordinary purposes, nonsuited the plaintiffs, although it was shown that they would lose a considerable quantity of the light they had previously enjoyed, feeling bound, as he stated, to follow the decision in the case of *Warren v. Brown* until it was upset.

Apparently the Appeal Court case of *Brown v. Collings* did not seem to be available for use by either of these judges in arriving at their decisions; there is no reference to it either in the arguments or judgments. I understand that both judgments are to be appealed against.

A subsequent case in which I was engaged, and which occupied one of the judges above-mentioned the better part of three days, rests at the present moment upon an expression of opinion by the judge, in which a distinction was drawn which appears to modify to a great extent in certain cases the dictum laid down in the last two-mentioned cases, but under the circumstances I cannot say more than that at the moment.

I do not quote these cases as giving in any way an exhaustive description of the tendency of recent cases, but simply as indications of how complicated the question has become and how impossible it is for a layman, even though he possesses the technical knowledge which the practising surveyor or architect should have, to guide his clients as to what he is in building entitled to do, or what, if the owner of an ancient light, he has the power to prevent his neighbour doing; and I think they show very clearly that some such proposals as those now made are very desirable in the interests of all owners of property.

Some of these proposals appear to me to demand consideration. That part of the preliminary proposition which provides that no right may be acquired to an extraordinary amount of light for special purposes would most certainly have been the subject of animadversion on the part of that section of the community who habitually use light for special purposes, such as watchmakers, goldsmiths, precious stone merchants, and those utilising processes necessitating discrimination in the selection of colours, who in some cases might find the amount of light they have enjoyed reduced, much to their disadvantage, but the sting of the proposition is removed by its not being made retrospective, but only to take effect on the acquisition of subsequent rights, and I think upon the whole the proposition is to the public advantage in permitting the utilisation of sites which under the present law may have to remain vacant or only to be built upon in a limited way, though in some instances there is no doubt that it may be the cause of a certain amount of loss on the part of individuals.

The other part of the first proposition, stating that no new rights of light may be acquired beyond a right to receive light for all ordinary purposes, seems to me somewhat ambiguous, as

* A paper by Mr. Philip E. Pilditch read on Thursday last week at the Conference of the Surveyors' Institution at Southampton.

it may be read either in the limited sense of providing for ordinary light only as an antithesis to extraordinary light, or it may be read as providing that if sufficient light be left for all ordinary purposes there can be no claim, even though a substantial and material quantity of the light previously enjoyed be taken away. If the latter be meant, which I think most likely, then the proposition is far-reaching in its character, and extends to a complete alteration of the law as laid down in many cases, and will permit for the future considerable and material obstruction of light in cases where the windows have not yet become ancient, so long as, in the opinion of the tribunal, sufficient light be left for ordinary purposes. It is as well that the full significance of the change should be appreciated, for it would mean that in all cases where a light is less than nineteen years old the rule of law affecting it would be much more stringent in favour of the servient tenement than in the case of a light already ancient.

Upon the whole I think the change is to the public benefit, though at the same time I think any change permitting the building of higher buildings and the filling-up of spaces now kept open by the existence of the present law of Ancient Lights will not necessarily be an un-mixed advantage, as witness the tendency of modern building legislation. Possibly the removal of this restriction upon the right to build may have a sequel in the further strengthening of that legislation, which now bears more lightly upon buildings in settled closely built over districts than in new ones. It is, I think, better that the regulation of buildings in this respect should be a matter of public regulation than of private arrangement, but I am not sure that all property owners will agree with this, or that those most desirous of the proposed change in the law appreciate what the result may be.

The second and third propositions need no recommendation.

The fourth, however, is one which seems to me to need careful consideration, especially the part of it which provides that no further rights of light shall be acquired by a building erected after January 1, 1905, abutting upon a way used "as an access to various tenements," for this apparently would give the right to a building-owner to absolutely obstruct the whole of the light coming to a window only a few feet away, simply because it happened to be on the other side of a passage-way, and the same objection applies, indeed, to such a right being given to the owner of property abutting upon a public way where that way is narrow, and where, consequently, the same state of affairs exists as I have just described.

It appears to me that if this provision limiting the rights of the owner of an ancient light because it abuts upon a way is adopted at all (I hardly see why such a light should be differentiated from all other lights) there ought to be a provision limiting its operation to cases where the way in question is of a certain minimum width. Moreover, unless I have read the second proposition and this inaccurately, this one is not needed, as the second would give the owner of each tenement the right to prevent the other from acquiring rights over his property by notice, unless there be some virtue in the words "not at the time servient to some neighbouring tenement" in the second proposition. I think both suggestions need making clearer, but this will doubtless be done in the Bill.

The most important of the propositions referred to, viz, the 311 is, I think, likely to be very beneficial in its operation.

All of us who have practised in London have had experience of the ease and expedition with which matters concerning party-walls are habitually dealt with under the similar provisions in the party-wall sections of the London Building Act, and I feel convinced there is nothing in the subject of light and air which will render it impossible to do in such cases what has been done with so much advantage to all concerned in party-wall cases.

On most of the large London estates the custom now obtains of reserving all rights to light when granting a new lease, leaving questions of light and air arising between different lessees on the same estate to be settled by the arbitration of the estate surveyor or architect, and on two such estates with which I am so connected the custom has been found in practice to work admirably. No lessee is hampered by trivial objections, and on the other hand a building lessee is not allowed to ride roughshod over his neighbour's rights, but

PULPIT, SANTA CROCE, FLORENCE.

THIS pulpit was the work of Benedetto da Maiano. Vasari, in his life of this artist, thus describes it:—"Returning to Florence, he did the present marble pulpit of S. Croce for Pietro Mellino, a citizen and wealthy merchant, considered a work of rare merit, the very best of its kind. It contains in small marble figures stories of St. Francis, executed with such skill and diligence that nothing better could be desired, as he has carved there trees, rocks, houses, perspectives, and other things marvelously. . . . It is said that while this work was in progress he had difficulties with the wardens, for he wished the pulpit to stand against one of the columns which bear the arches supporting the roof, and to cut away the column to make the steps and entrance to the pulpit, and they would not consent, thinking that this would so enfeeble the column that the destruction of the church would ensue. But after Il Mellino had given security that the work would be finished without any harm being done to the church they were satisfied. Accordingly, Benedetto strengthened the part of the column carrying the pulpit with bronze supports, and introduced the steps to mount into it. In proportion as he hollowed out the interior he strengthened the exterior with hard stone, as may be seen, and he completed the work to the amazement of all who saw it, for it possesses the utmost perfection in every part."

TECHNICAL SCHOOLS, SCARBOROUGH

We give this week several illustrations of the new Technical Schools at Scarborough, of which Messrs. Hall, Cooper, & Davis are the architects.

The plans were selected in an open competition in which thirty-six designs were submitted. The completion of the buildings has occupied about four years.

Its situation rendered it essential that the levels should be very carefully considered, having in view the great fall in the ground. The plan of the schools was arranged with the idea of avoiding, as far as practical, unnecessary cost in the construction of the foundations. The northern side of the site has been levelled, and forms the approach, directly connected with the Valley Bridge-road at the north-east corner. The boys' and girls' main entrances are placed on the approach road, and are connected to the schools by bridges placed across the area which is formed to light the basement. Entrances for both boys and girls are also placed on the south side of the site entering direct from the public park. A portion of the site on the south side of the buildings has been levelled off and asphalted for the purposes of a playground, whilst it is proposed to lay out the remaining portion of the site in terraces, lawns, and walks.

an opportunity is afforded the estate surveyor of seeing substantial justice done.

It will be observed that by the sixth proposal it is still open to an aggrieved owner of an ancient light to apply to the High Court for an injunction, and the Court has it within its discretion, in cases where it considers justice will not be met by a reference to arbitration, to decide what may be done or what compensation should be made, to grant an injunction to prevent the erection of the buildings complained of.

It is in the existence of a tribunal to which, if it appears that the case in question is not of this far-reaching nature, the Courts may have confidence in transferring a settlement of such matters that the proposals now made have their chief value, and it is in my opinion very clear that one consequence will flow from the existence of this tribunal—viz., that a claimant having no solid or serious claim will hesitate before applying for an injunction, which has been so freely done in the past, when the building-owner has so often had to compromise because of the delays to which he would otherwise be subjected, especially as it is now made clear in black and white that if the judge considers an action for an injunction has been commenced unreasonably or unnecessarily he may order the party bringing such action to pay the defendant's expenses and costs on such scale as he may think fit.

In conclusion, I think the proposals made, with some modifications, will, if embodied in an Act, tend to simplify the operations of building and rebuilding in London without any undue interference with the existing rights of individuals, or with the weal of the body politic, and I trust they may soon be given effect to.

COMPETITIONS.

SCHOOL, NEW BROMPTON.—The Gillingham and Grange U.D. School Board advertised in April for designs for a proposed new school in Richmond-road, New Brompton, and in response a number of plans were sent in. The result has just been made known, as follows:—(1) Mr. J. D. Pearson, 27, Chancery-lane, London (1901); (2) Messrs. Newton, Son, and Lawson, 14, Victoria-street, Morecambe (Hotspur); (3) Messrs. Greenhalgh & Brockbank, Broad-street House, London, E.C. (Utility with Economy); (4) Mr. F. M. Kirby, Greenhithe, Kent (North Light). Mr. Pearson has been appointed to carry out the work.

HOUSE AT BARNET GREEN, WORCESTERSHIRE.—Messrs. Bateman & Bateman write to say, in regard to the description and illustration of their house in our last issue, that they had been under the impression that we asked for a description of their design in the Royal Academy, under the same title, but representing another house, and that their description applied to the one in the Academy, not to the one we published last week. The two houses are very similar in general character, and therefore we did not notice any discrepancy.

THE FIRST-FLOOR PLAN

GROUND-FLOOR PLAN

BASEMENT PLAN

Technical Schools, Scarborough. Plans.

The basement is 14 ft. high in the clear, and one of its features is a gymnasium, 20 ft. high, reached from both playgrounds by means of boys' and girls' open porch and a separate staircase. There is also a complete laundry, consisting of ironing and washing rooms, with driers, for the instruction of forty girls in two classes. Immediately adjoining this is the cookery kitchen, with scullery and pantries abutting on the girls' main staircase. There is accommodation in the cooking kitchen for thirty-six girls, and it is fitted with gas stoves and open fireplaces, and all necessary shelving, tables, cooking utensils, and requisites for the instruction classes.

Towards the east side are two dining-rooms for twelve children each, accessible from the respective playgrounds. Adjoining the boys' dining-room is a spare classroom, and immediately adjoining this is a joiner's shop, with accommodation for forty boys. There are also unpacking-rooms, storeroom, cloakroom, and lavatory for each department using this floor. A caretaker's room, a boiler-house, heating chamber, &c., are also provided for.

The ground floor is 15 ft. 9 in. in the clear, and is fireproof. The boys' and girls' main entrances are connected with the new ap-

proach road by bridges spanning the areas. Two cloakrooms adjoin the main entrance each having 500 pegs and lavatory basins. There are on this floor four classrooms with accommodation for forty; there are four with accommodation for fifty; and four with accommodation for sixty, making a total of twelve classrooms with accommodation for a total of 600 children. Each classroom is provided with book cupboards, with sliding doors, arranged in recesses in internal walls. Out of the twelve classrooms provided, ten face the south.*

The central hall, of which we gave a view, covers a superficial area of about 3,600 ft. and can be used for a variety of purposes. The fireplaces (see illustration) are built up of red Sussex brick and white stone, and a panelled white dado, 9 ft. high, runs round the entrance hall, with a dentil cornice on the top. Above this the walls are lined with red Sussex rubber brick, which runs up and joins the ceiling and cornice, which is in plaster. On one side of

the central hall is to be found the headmaster's room, ante-room, packing store, with lift communicating, and on the other side the school lavatory.

On the upper floor there are two rooms for assistant teachers—one for each sex—placed over the cloakrooms, and reaching from the second half-pace of the main stairs. There is also a classroom for pupil teachers' instruction, containing 480 superficial feet. A chemical laboratory is provided, with fifty benches divided by glazed partitions into sections, and a room for honours work, the whole being fitted up to the regulations of the Science and Art Department with fume cupboards, blackboards, and stores for re-agents, &c. There is a small balance-room overlooked from the chemical laboratory properly fitted up with glass cases, working table, and draught closet. A physical laboratory for thirty-two students is provided, and is divided into two sections by a screen. There is a lecture-room to accommodate 100 students, provided with demonstration-table and platform, and lantern platform, with shutters to the windows for darkening the room during the lantern lectures. A preparation room is connected with the lecture theatre. There is a drawing classroom with top and north studio

* This is the architects' description, and we presume the school authorities had an opinion in favour of a south aspect for classrooms. We can only say that we think it a serious mistake. South aspect for dayroom or playroom is quite right, but not for a lesson-room.—Ed.

light to accommodate sixty elementary students, and a small classroom for the same purpose for advanced students. These rooms are placed near the boys' staircase, but are accessible from the other staircases. Besides a spare classroom, with accommodation for sixty, a book store, with lift and caretaker's cupboard, are provided.

The latrines are separated from the school and placed under the roadway adjoining the area. They are well ventilated, and have the latest approved sanitary appliances.

The whole building is warmed by open fires and steam radiators at low pressure, the work having been carried out by Messrs. W. Richardson & Co., of Darlington. The school is ventilated by a system of natural ventilation with extra shafts from each room, with inlets at the ceiling and floor levels, and carried into the roof ventilator. There are fresh air inlets at the window levels direct from the outside, passing through steam radiators, the rooms on the top floors having extractors in the ceilings. The building is lighted by sash windows, all of which are made to open.

So far as the erection of the school is concerned, all the contracts were let locally. Mr. James Gales carried out the excavation, brick, and stone; Mr. Hugh Proctor, the plastering; Mr. Geo. Scates, the carpentry and joinery; Mr. Jos. Hardgrave, the red brick tiling; Mr. Thos. Fidler, the painting; and Messrs. Tindall & Williams, the plumbing and glazing. Mr. G. F. Wells, of Scarborough, installed the electric light; Mr. Harry Pickup, of Scarborough, did the ordinary smith work; Messrs. Homan & Rodgers, of Manchester, have done the whole of the fireproof construction floors; and all the movable screens have been made by the North of England School Furnishing Company, according to their own patent. The fittings of the laboratories and scholars' desks are by the Bennett Furnishing Company, Glasgow. The teachers' desks and the fittings in the manual instruction room were supplied by Messrs. Illingworth, of Leeds, and the laundry was fitted by Messrs. Summerscales, of Halifax.

In addition to the practical building work and fitting, the architects desired to have the building adorned with sculpture having some reference to its objects, and they wisely went to an eminent sculptor, Mr. H. C. Fehr. He modelled the five panels which are illustrated in a separate plate. In that illustrating "Chemistry," the central figure is a likeness of Priestley; in "Engineering," that of James Watt; in "Astronomy," Herschel, and we presume the female figure is meant for that of his indefatigable sister, who with him carried on the business of comet hunting through many laborious night; and in "Architecture" we have Wren as the principal figure. "Literature" the sculptor has chosen to represent entirely by women students, perhaps because it is intended specially for the girls' side of the school; a corresponding panel is to symbolise "Music."

As a separate illustration we give that of one of the capitals of the small order which forms an ornament to a portion of the south elevation; this is also Mr. Fehr's work.

We give also the plans of the three principal floors.

ARCHITECTURAL SOCIETIES.

DEVON AND EXETER ARCHITECTURAL SOCIETY.—The annual meeting of the Devon and Exeter Architectural Society was held at Plymouth on Saturday, the 1st inst. The President, Mr. C. J. Tait, occupied the chair. There were also present Messrs. H. G. Luff, Charles King, Edmund Sedding, M. Alton Bazeley, A. S. Parker, Octavius Ralling, B. P. Shires, A. Heath, W. W. Hitchins, S. Griffin, A. E. Lethbridge, E. Coath Adams, R. A. Mill, A. Tucker, Harold Watts, G. Murray, and Harbottle Reed (Hon. Secretary). It was resolved that a subscription of three guineas and a donation of two guineas be made in response to the special appeal for the Architects' Benevolent Fund. The retiring President (Mr. Tait) then delivered an address. In the course of his remarks he said:—"The event for which this year will be chiefly memorable will be in the minds of us all—the death of the late Queen. . . . Upon anything that occupies a position so near to us as the Victorian era it is impossible to utter the final note of criticism. This can only be accomplished when a period has sufficiently detached itself. Four centuries ago saw a Classic Renaissance in art and letters,

and we can to-day judge of its character and achievements. When we are enabled to view the Victorian age from a perspective point—its hopes and aims for art—we shall, I think, agree that these also found expression in a re-birth, the re-birth of romanticism. This romantic note was heard in its deepest tones, perhaps, at Oxford, and occasioned that upheaval of feeling that is spoken of as the Oxford Movement. In so far as this was a Church movement—and indirectly affected Church architecture—it assisted to bring to the front such men as Augustus Welby Pugin, George Gilbert Scott, and George Edmund Street. But the springs of this movement lay deeper in art than perhaps in anything else, and found therein a more complete expression. Edward Burne-Jones and William Morris, both young Oxford undergraduates and destined for the Church, left the University without their degrees and devoted themselves, the one to painting and the other to architecture. And outside the walls of the University they met with a more paramount influence still—that of Dante Gabriel Rossetti—and the enthusiasms of young men like themselves, such as Madox Brown and Millais. Through the painters, with places for exhibition at their disposal, the new movement gradually reached the public, who was finally convinced, much against its will and not without a hard struggle. To William Morris, in particular, we architects owe more than I can say. He insisted on the importance of colour in architectural accessories; and his commercial undertakings slowly enabled him to force the fashion, that doorway by which alone society is accessible to new ideas. Meanwhile, Burges, Norman Shaw, and E. W. Godwin were grafting a fresher growth on to architecture. But architecture transforms itself with difficulty. Styles have resistant materials to deal with. They are long growing, and they are 'an unconscionable while a-dying.' They further demand specific needs for their true development, and these needs, while our social conditions are in that rapid fluctuation in which we find them to-day, are superseded before they have had time to arrange themselves in definite form. Further, this renaissance of the Medieval, of the romantic sentiment, reveals to us our true position—the position we hold as inheritors of both Classic and Medieval tradition. The claims of Gothic architecture are strong. Nothing can, however, be representative, nothing can be all preceding influences—a something which combines the refinement of the Classic with the freedom of the Gothic. Such a union is no fancy. Something of the kind was achieved by Tudor architecture; and I venture to think that it is also by the combination of these qualities that the most striking successes in modern design have been realised. If this be a principle, as I hold that it is, then it behoves every architect to cultivate a catholicity of taste. His appreciative powers will be quickened, and he will find his life in all respects both fuller and broader. I may be told that specialism is more remunerative. To have your name intimately connected with some particular and limited want or department is the surest way to be recognised by a public who thinks little and whose memory is bad. But the age is not without signs that specialism and cranks in general have enjoyed their most profitable period, and that it is not so patient of the formalist and the pedant as it used to be. Let me quit the events of a century for those of a year. The Strand Improvement scheme resulted in a competition which called forth some half-dozen very interesting designs. The Report upon these, which Mr. Norman Shaw is to make, has not yet been published. It must be noticed, with regret, that the London County Council sought to engage the services of the competitors upon most unreasonable terms, inasmuch as it would give no guarantee that the successful architect should execute his own design; and it was in every way so cavalier in its dealings with the Royal Institute, whom the Council had itself approached, that the Institute was obliged to decline further co-operation. Another circumstance, calling for our attention, was the fact that the County Council had no clear intention as to what it actually required, and hoped, with Mr. Micaewar, that amid the surprises of competition 'something might turn up.' To think that you want to include a municipal building among shops and offices, but are not sure, can lead, one would think, to no very definite

competitive result. Another competition, and one of national importance, at present occupies the public interest—the proposed memorial to the late Queen. It appears to be generally regretted that this endeavour has not been put upon broader lines. The least defensible part of it is undoubtedly the placing, whatever sculpture shall be employed, in the hands of a single sculptor. The only apology that may be made by the initiators of the scheme is that they consider sculpture of such minor importance as to render any multiplication of ideas unnecessary. This, I venture to think, will hardly recommend itself to those who realise the part played by sculpture during the best periods of monumental art. Negotiations have for long been carried on between the Royal Institute and the Builders' Association, with a view to a common understanding upon a form of contract that shall be acceptable to both architect and builder. You are, no doubt, aware that these negotiations have been broken off with their object still unfulfilled. The cause of the failure is apparent. Unless the Builders' Association can obtain a form of contract that is distinctly favourable to it, its members know that they are more safely situated in the hands of the architect directing the work, and prefer to leave matters as they are. The negotiations have, however, been successful in producing an exceedingly fair and thorough arbitration clause, between which and one directing that the architect shall be sole arbitrator there is no half-way house. . . . Mr. Tait was accorded a hearty vote of thanks for his address.—Mr. H. G. Luff was then elected President; Mr. John M. Pinn Vice-President; Mr. Harbottle Reed, Hon. Secretary; Mr. Octavius Ralling, Hon. Treasurer; and Mr. Alton Bazeley, Mr. Charles Cole, and Mr. C. E. Ware members of the Council. Mr. Ralling gave notice that he would move that the Hon. Secretary of the Three Towns branch be *ex officio* member of the Council. Votes of thanks were given to Mr. Tait, Mr. Reed, and Mr. Ralling for their services in the past year.

ARCHITECTURAL ASSOCIATION OF IRELAND.—A general meeting of the members of this Association was held in the Grosvenor Hotel on the 30th ult., the President, Mr. Frederick Batchelor, occupying the chair. Amongst those present were Messrs. J. Rawson Carroll, J. Howard Pentland, W. Kaye Parry (Hon. Sec., Royal Institute of the Architects of Ireland), C. J. MacCarthy, Anthony Scott (Drogheda), F. Shaw (Drogheda), R. M. Butler, T. E. Hudman, G. F. Beckett, J. H. Webb, Fred. G. Hicks, E. Bradbury, &c. This meeting was the concluding meeting for the Session 1900-1901, and the reports of the various classes were read and the results of the several competitions announced. The Class of Design was very satisfactorily attended during the session, and good work is recorded; the prizes in connexion with this class are gained by Mr. W. Connolly (first prize), and Messrs. J. K. Vinycombe and H. J. Leask (tie for second prize). The Hon. Secretary of this class was Mr. G. Lynes. The Architectural History Class (Mr. R. M. Butler, Hon. Sec.) was also well attended, and proved a most useful innovation; in this class the progress and changes in architecture were traced by the lecturers, and illustrated by lantern views of typical examples. In the Building Construction Class the first prize is won by Mr. H. J. Lundy and the second by Mr. W. Connolly. Mr. W. H. Ward was secretary to this class. The report of the Design Club is not so encouraging, and it is hoped that in future better attendances will be maintained. Probably the most satisfactory of all reports is that of the Technical Demonstrations Sub-Committee. The necessity for giving architectural students an opportunity of studying practical details, and of discerning between good and bad materials and workmanship, is one which had not been met heretofore, and early in the session steps were taken to inaugurate what turned out to be a most successful series of practical demonstrations, for the arrangement of which are largely responsible the untiring efforts of the President and of the Hon. Secretary of the Sub-Committee, Mr. H. Allberry. The master-craftsmen of Dublin most readily and generously co-operated in the work, personally conducting the members of the Association over their yards and workshops, and explaining, lecturing, and demonstrating upon the different materials and manners and methods of work. The value of these demonstrations was so very evident, that

many gentlemen became members of the Association in order to avail themselves of them. Prizes were offered for the best series of notes taken, and were awarded in order of merit to Messrs. L. O'Callaghan, H. T. O'Rorke, and F. Morley. The members of the Association have reason to be particularly grateful to those contractors and master-craftsmen who so generously assisted in the work. The Librarian, Mr. J. Geoghegan, submitted a satisfactory report. In addition to the valuable library which Sir Thomas Drew has kindly placed at the disposal of the members of the Association, a lending library has been lately started, the volumes in which have been presented by several gentlemen or purchased from a fund which has been opened for the purpose. The A.A. Travelling Studentship of ten guineas was won by Mr. J. A. Rockett, whose measured drawings of St. Patrick's Cathedral were adjudged by Mr. A. E. Murray, A.R.H.A., as the best of those submitted in competition. The Royal Institute of the Architects of Ireland offered a prize of 10l. 10s. for a design, to be competed for by members of the Association. The subject set for design was "A Technical School," and seven members submitted drawings, under motto, which were kindly assessed by Mr. W. H. Lynn, R.H.A. (Belfast).—Mr. W. Kaye Parry read the assessor's award, which placed first the design submitted under motto "Cui Bono," and upon the President opening the envelope bearing that motto it was announced that the successful competitor was Mr. C. P. Powell. Mr. W. F. Beckett's prize of 2l. 2s. for the best sketch of the campaign in Trinity College is won by Mr. L. O'Callaghan.—The result of the ballot for the officers for the ensuing session (1901-1902) was announced as follows: President, Mr. C. J. McCarthy; Vice-Presidents, Mr. T. E. Hudman and Mr. E. P. Sheridan; Committee, Messrs. H. Alberry, F. Batchelor, R. M. Butler, T. Coleman, F. G. Hicks, J. Holloway, C. H. Mitchell, L. O'Callaghan, R. C. Orpen; Hon. Treasurer, Mr. J. H. Webb; Hon. Librarian, Mr. J. Geoghegan; Hon. Secretaries, Messrs. E. Bradbury and G. F. Beckett; Hon. Auditors, Messrs. M. J. Buckley and J. P. McGrath. The retiring President (Mr. Frederick Batchelor) delivered a short valedictory address, in which he reviewed the work of the Association during the past session, and expressed hopes for the future. He referred to the series of day classes recently inaugurated by the London Architectural Association, and trusted that something of a similar nature, though on different lines, might be started in connexion with this Association. Mr. Kaye Parry proposed a hearty vote of thanks to the retiring President for his valuable services during his term of office, which was seconded by Mr. C. J. McCarthy and carried with applause. A vote of thanks to the retiring hon. secretary, Mr. F. G. Hicks, was proposed and seconded by Mr. H. Alberry and Mr. R. M. Butler respectively, who, as past secretaries, were able to appreciate the arduous nature of his duties. The vote was carried with acclamation, as was also one to Mr. J. H. Webb, Hon. Treasurer, proposed by Mr. T. E. Hudman and seconded by Mr. E. Bradbury. Mr. J. Rawson Carroll having congratulated the Association upon the work done during the past sessions, the meeting terminated.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on the 3rd inst., Mr. Charles Mason, President, in the chair, a paper was read on "Concrete Subways for Underground Pipes," by Mr. Arthur Taylor Allen. In introducing the subject the author referred to the construction of the first subway in England for underground pipes, which took place about the year 1860, in the city of London. This was followed a year or two later by one in the city of Nottingham. He noted the lack of progress there had been in the extension of these new arterial thoroughfares, far beyond one being constructed at St. Helens in 1898, very little had been done in that direction to minimise the evil resulting from the continuous breaking up of roadways for access to the numerous pipes laid under every thoroughfare. He gave a long list of streets broken up in the course of one year for obtaining access to pipes. He also pointed out the danger and inconvenience likely to arise from roadways being laid over a number of gas-

pipes, which might soon prove to be of insufficient capacity or become defective, and over water-mains that were laid years ago when the water supply was very limited. The author referred to the sections of the various Acts in force empowering public companies to break up streets after due notice, causing the total or partial blocking of a thoroughfare, interfering with traffic, and operating temporarily to the prejudice of business-houses, the owners having no claim for any loss sustained thereby. He then alluded to the increasing number of underground pipes, and the possibility of the provisions of the Rivers Pollution Acts being more rigidly enforced, and in the near future throwing upon some authorities the necessity of separate sewers for surface or storm water. The author then described the subways in London, Nottingham, and St. Helens. To relieve doubt as to the possibility of a severe frost affecting the water-mains in the subways he gave satisfactory thermometer readings taken in the Albert-street subway, Nottingham. Turning next to the utility of subways, the author stated that by their construction access could be readily obtained for the purpose of inspection, alteration, or addition to any of the pipes at present hidden and placed beyond inspection. He drew attention to the fact that after works of great magnitude had been undertaken in obtaining a pure water supply to ensure the health and safety of the population, the pipes conveying the supply were hidden. Thus, a defective joint or a burst might remain undiscovered for a length of time, as was the case some years ago, when the first intimation of a leakage in the borough water-mains was reported to him by the sewer men when repairing a sewer in close proximity to the mains. An efficient system of detection and prevention of water pollution or waste would be provided for by subways, and the life of iron pipes would be considerably increased. Electric and telegraph wires need no longer run along poles and roof fixtures; they could be put underground, thus rendering them less dangerous and more reliable and permanent. Having regard to economy of cost, capability of resistance, and rapidity of execution, the author suggested concrete as the most suitable material for such works, and referred to its practical value as exemplified by its extensive use in connexion with works in general. In dealing with subways for large cities and busy thoroughfares where foot passengers experienced difficulty in crossing the street in safety, the author recommended that, in conjunction with the subway, underground conveniences should form a part of the scheme. Entrances would be erected in the centre of the street, so arranged that an easy and ready access (although private) could be gained from the first landing. This might be regarded as a peculiar suggestion, but he alluded to the revenue it was possible for it to bring in, as much as from 200l. to 2,000l. per annum having been cleared as profit for such accommodation. With regard to subways for suburban districts, the author considered all large subways should have lateral ways, about 3 ft. wide by 4 ft. 6 in. high, for the purpose of access and conveyance of gas, water, and other pipes, and he advocated making use of every available space by a specially-designed iron bracket for the pipes. The author submitted a proposal for a subway under each footpath of all new streets to receive the water, gas, and other pipes, the subways to form part of the laying-out of the new street. He considered it necessary that the gas and water mains should be in duplicate; the concrete wall nearest the house would be perforated with 2-in. and 2½-in. holes for the house services, thus obviating the construction and expense of lateral ways. The sewer would be laid under the road with the usual manholes on the principle adopted in the present day, but with the addition of elongated eyes every 20 ft., extending to each subway, the chamber (common to all house drainage) to be constructed in the bottom of the subway by and at the cost of the owner when requiring to connect with the sewer. This method he contended would ensure the surface of the road being kept free from interference. The author gave the cost of some subways constructed in London as 15l. per lineal yard, Nottingham 10l. per lineal yard, and St. Helens 7l. 2s. 4d. per lineal yard. He pointed out, however, that the information was of but little practical value and must be accepted with the greatest caution, it being

impossible to make a useful comparison between the cost of construction at other places without a knowledge of the conditions of each case. Although the initial cost would prove heavy, he pointed out that there might be some compensation if the excavated materials proved suitable for the concrete work. The author considered that the cost of constructing subways should be borne by a loan for a period of fifty years, as the works come under the category of permanent works.

METROPOLITAN ASYLUMS BOARD.

THE fortnightly meeting of this Board was held at the offices, Victoria Embankment, on Saturday, Mr. Hensley presiding. The Works Committee, reporting upon the proposal to erect an isolation hospital at the Darenth Asylum, recommended that Messrs. Newman & Newman be appointed architects, and the Board concurred. The same Committee, reporting with regard to the South Wharf, Rotherhithe, recommended that the tender of Messrs. Veale & Carter, in 5,620l., for the erection of a medical officer's residence and male staff quarters be accepted. The recommendation was adopted. The other tenders were from Messrs. Lawrence & Son, Waltham Cross, 5,949l.; Jno. Appleby, Stamford-street, 6,032l.; F. & H. Higgs, Loughborough Junction, 6,331l.; W. Irwin, Essex-road, N., 6,432l.; B. E. Nightingale, Albert Works, S.E., 6,475l.; Balaam Bros., Shenton-street, S.E., 6,550l.; H. L. Holloway, Deptford, 6,560l.; Walter Wallis, Balham, 6,732l.; W. Pattinson & Son, Parliament-street, 6,784l.; Thomas Edge, Woolwich, 6,850l.; T. G. Sharpington, Nunhead, 6,890l.; Lole & Lightfoot, Chelsea, 6,897l.; G. Godson & Sons, Kilburn-lane, 7,390l.; and A. White & Co., Rotherhithe, 7,450l.

THE LONDON BUILDING ACT, 1894.

TRIBUNAL OF APPEAL CASE.

ON taking the chair at the Tribunal of Appeal under the London Building Act, on Tuesday, Mr. J. W. Penfold, the new Chairman, referred to the death of Mr. Arthur Cates, who was for some years Chairman of the Tribunal. He said he was sure that every one who had been in the habit of practising before the Tribunal would join with him in expressing deep regret at the loss of Mr. Cates. Though this was not the occasion for alluding to personal friendship, he could not help saying, speaking for himself, that it spoke much for the attractive personality of a man whom, after passing the commonly allotted term of life, one greeted with the same cordiality and esteem as when one first took his hand on entering the business of life at twenty-one or twenty-two. The late Mr. Cates' genial presence and unfailing tact and courtesy very efficiently and pleasantly controlled their proceedings. His orderly and business-like habits, his conspicuous impartiality and his firm persuasiveness when he thought the justice of the case might be met by a friendly compromise were doubtless of great advantage to those who submitted their differences to the judgment of the Tribunal, while his unique acquaintance with the details of the Building Act and his quick perception of the essential points in a case were of great value to his colleagues. As to the future, he (Mr. Penfold) said he had no doubt that the Tribunal, as now constituted, could rely on a continuance of that assistance from the representatives of both appellants and respondent which had conducted so much to the order and regularity of their proceedings.

Mr. Andrews (of the London County Council solicitors' department), speaking on behalf of those who practised before the Tribunal, endorsed the chairman's remarks, adding that he believed the traditions of the past would be fully maintained by the Tribunal as newly constituted.

The Tribunal, consisting of Messrs. Penfold, A. H. Hudson, and E. A. Gruning, then heard an appeal which stood adjourned from the 17th ult. in consequence of the death of Mr. Cates.

The appeal was that in which Mr. H. A. Woodington, on behalf of Mr. B. H. Lynch, sought to reverse the decision of the London County Council not to sanction certain deviations from the plans certified by the District Surveyor, under Section 43 of the Act, so far as relates to the proposed rebuilding of 19 and 20, Bateman-street, Soho, as shown upon the plans submitted by Mr. H. A. Woodington, on behalf of Mr. Lynch.

The case for the appellant was conducted by Mr. Woodington, while the London County Council and Superintending Architect were represented by Mr. Andrews, solicitor.

Mr. Woodington explained that on June 29, 1900, he sent to the District Surveyor drawings, which were certified by him. On September 20 he sent to the London County Council plans showing deviations, and a month later he received an intimation

that the Council refused to sanction the deviations proposed. He inquired by letter upon what grounds this refusal was made, but the Superintending Architect wrote back that he was not authorised to add anything to his previous letter, which merely stated that the Council refused to sanction the plans. He duly gave notice of appeal, but he was still unaware of the grounds of the Council's action, and he was at a loss to know how to go on.

Mr. Andrews said he was quite willing, with the view to expediting matters, to make any admission that might be consistent with his duty, but he thought he ought to point out that it was for the appellant to show that the Council had no good grounds for refusing to sanction the plans.

Mr. Woodington said they were proceeding under Section 43, Sub-Section 1.

The Chairman suggested that the appellant might proceed by showing what he regarded as the advantages of his proposals.

Mr. Woodington proceeded to remark that he knew that Section 4 stipulated that there should be an open space in the rear of such a building at least 10 ft. deep, but he proposed to divert this space into the area for light—which would be more than an equivalent of the space suggested under the Act. He contended that the Council should have approved of the plans because the arrangement was a reasonable one.

Mr. Andrews cross-examined Mr. Woodington on the details of the plans, and on the admissions he made, together with the facts gained by the Tribunal on a personal inspection, the Chairman intimated that, without troubling to enter upon the respondents case, they considered the appeal should be dismissed. Without calling upon Mr. Andrews, therefore, they dismissed the appeal, with ten guineas costs.

Correspondence.

To the Editor of THE BUILDER.

HOLIDAYS FOR THE POOR.

STR.—There are few people who work harder, and who deserve to enjoy their holidays more, than your readers, and it is on a question of holidays that I wish, with your permission, to appeal to them. There are thousands of children in the London slums who have never seen the sea, and have never played in a green field. Poverty keeps them tied to their close and unhealthy courts and alleys. The Ragged School Union is "opening up the country" to these children by means of their seaside holiday homes, and each year it provides a fortnight's holiday for some thousands of them. The cost of such a holiday is only 10s. per child—a comparatively small amount in the expenses of the average holiday-maker. Last year we sent over 6,200 children for a holiday; this year we hope to increase the number. Will your readers help us? I shall be happy to receive and acknowledge all subscriptions sent to me.

JOHN KIRK.

72, John-street, Bedford-row, W.C.

DAMP BRICK WALLS.

STR.—Would any of your readers kindly reply, giving a good remedy for dampness of brick walls, to be applied in solution on the outside of bricks that absorb the rain water, which goes through into the house?
A SUFFERER.

CHURCH, TOLL-CROSS, LANARKSHIRE.—St. Margaret's Established Church, Tollcross, which has just been completed, was dedicated on the 31st ult. The church is built on a site south of the railway at Tollcross Station, fronting Braidford-road. The style is Late Gothic. The building will afford accommodation for 322 persons. Ground is also reserved on the north side for nearly doubling this accommodation, and on the east for building a small hall and session-house. The plan consists of a nave with aisle and a chancel or choir raised one step above the floor of the nave. The main entrance is by a porch at the south-west corner, which communicates with nave and aisle. The pulpit is on the north side of the nave, and is of stone. The architect was Mr. W. G. Rowan, Glasgow. The church is intended to cost about 2,300l.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

21.—THE UNSEALING OF TRAPS.

UNDER certain conditions, trap-ventilation is absolutely necessary in order to prevent the seal of the traps being destroyed by the ordinary use of the fittings, but ventilation is of no use in preventing loss of seal in what may be termed extraordinary cases. If a fitting is not used for a long time, the water in the trap may evaporate, and this evaporation will be hastened by the current of air induced by the trap-ventilating pipe. Again, the contents of a trap may be partially or wholly drained away by a piece of rag lying with one end in the trap and the other in the waste-pipe. Evaporation cannot, of course, be prevented, but it can, to some extent, be checked by keeping the plug in the washer in the case of fittings where plug-wastes are adopted, but this destroys the polish and ultimately injures the wood. The retention of pieces of rag in the outlets of traps may be guarded against by having the traps of self-cleansing shape and adequately flushed. The standing water in a trap may also be lowered by strong winds blowing across or down the open end of the ventilating pipe. The most common causes of loss of seal are, however, siphonage and momentum. Strictly speaking, of course, the term "siphonage" ought to be confined to those cases in which the contents of the trap are drawn out below the level of the outlet by siphonic action, and "momentum" to those in which the contents are carried over the outlet by the momentum of the water entering the trap. A round-pipe trap fixed under a valve closet is very liable to unsealing, and in this case the unsealing is largely due to the momentum gained by the water in falling from the valve to the level of the trap. It is obvious that the momentum is not reduced by ventilating the trap. It is equally obvious that a large body of standing water in a trap checks the force of the flush and at once reduces its momentum. If the standing water falls below a certain level it does not offer sufficient resistance, and the trap may be unsealed by momentum. Water-closet traps, which are quite safe under ordinary circumstances, may be unsealed by pouring into them a number of pailfuls of water or slops. The momentum of the first pailful will be considerably reduced by the normal quantity of standing water, with the result that this may be only slightly lowered. The second pailful, meeting with slightly less resistance, will lower the level of the standing water to a still greater extent, and so on until the trap is unsealed. In a wash-down closet with P trap and 1½-in. seal, tested by the writer, the second pailful unsealed the trap. This cumulative effect of successive discharges must be borne in mind in examining water-closets which are also used as slop-hoppers. The effect of a pailful of water rapidly emptied into the basin is much more severe than that of the normal flush discharged through a pipe only 1½ in. or 1¼ in. in diameter.

Although the momentum of the falling water undoubtedly plays a considerable part in lowering the standing water in traps, thorough unsealing is seldom effected unless siphonic action is brought into play, and it is practically impossible to distinguish in every case between the two causes of failure. To avoid unnecessary verbiage, the term "siphonage" will be employed whether the unsealing is due to siphonic action or momentum, or to both.

It cannot be said that a complete series of tests, sufficient to demonstrate the advantages and disadvantages of different forms of traps, has yet been carried out. Tests carried out by the makers of a special trap will naturally be regarded as less authoritative than those carried out by independent witnesses. A committee of the Sanitary Institute* has recently experimented with two forms of water-closet traps—the round-pipe "Dubois" P trap, and the "Anti-D" trap—and as far as these traps are concerned, the tests are fairly complete, and are of sufficient value to merit detailed notice. The apparatus (fig. 1) consisted of a 3½-in. lead soil-pipe 30 ft. 8 in. high, with 3½-in. branches to two short-hopper closets with circular outlets, the upper outlet being 3½ in. and the lower

3½ in. in diameter. The two closets were placed on the ground floor and first floor respectively, and in each experiment both closets were fitted with similar traps. The Dubois ordinary traps were 3½ in. in diameter, with 1½-in. seal, and contained 60 ozs. of water. The Dubois deep-seal traps were of the same diameter, but with a seal of 2½ in. on the lower basin and 2½ in. on the upper basin, the traps containing 60 ozs. and 64 ozs. of water respectively. The Anti-D traps were also 3½ in. in diameter, with seals of 1½ in. on the lower basin and 2 in. on the upper basin, and each contained 40 ozs. of water. The water was emptied into the basins from a pail, six experiments being made in each case. This is, of course, a severer test than would have been obtained by the use of a flushing cistern. Valves were fitted in the anti-siphonage pipes and soil-pipe, as shown in the illustration, so that these could be closed as required for different experiments.

When the soil-pipe and anti-siphonage pipes were open the discharges had practically no effect on the traps, but when these pipes were closed all the traps on the upper basins were unsealed by the discharges through the same basins, while discharges through the lower basins lowered the water in the traps of these basins but did not unseat them. The mean results are shown graphically in fig. 2 by the thick horizontal lines, and the maximum results by the black dots. The normal depth of seal is represented by the vertical dotted lines, and the loss of seal by the vertical full lines; the cross-hatching represents the depth below the dip to which the water was lowered in those cases where the traps were quite unsealed. In the tests marked A the anti-siphonage pipes and soil-pipe were open, in those marked B the anti-siphonage pipes were closed and the soil-pipe open, in those marked C the anti-siphonage pipes were open and the soil-pipe closed, and in those marked D the three pipes were closed.

It will be observed that, with the exception of a single test, the traps attached to the upper closets were the only ones unsealed, and that the unsealing occurred only when the water was poured into the upper basins. The sole exception was in the case of the Anti-D trap, the maximum siphonage (with a three-gallon flush in the upper basin) lowering the water of the lower trap exactly to the bottom of the dip when all the pipes were closed.

The tests were not sufficiently complete to allow a final comparison to be made between the two traps, but as far as they go, they show that neither trap can claim superiority under every condition. When the anti-siphonage pipes and soil-pipe were open both traps retained practically the full depth of seal in every case. When the anti-siphonage pipes were closed and the soil-pipe open there was little difference between the traps under the following conditions—(1) when fitted to the lower basin and tested by discharges through either the lower or upper basin, and (2) when fitted to the upper basin and tested by discharges through the lower basin; but when fitted to the upper basin and tested by discharges through the same basin the Anti-D trap had a decided advantage, the seal remaining practically intact, while the Dubois trap was unsealed time after time. When the anti-siphonage pipes were open and the soil-pipe closed both traps were satisfactory and gave almost identical results. With the anti-siphonage pipes and soil-pipe closed, both traps, when fitted to the upper basin and tested by discharges through the same basin, were unsealed; when the traps were fitted to one basin and tested by discharges through the other basin the Dubois trap gave uniformly better results than the Anti-D trap; but when the traps were fitted to the lower basin and tested by discharges through the same basin the Anti-D trap was decidedly superior.

It would have been more satisfactory if additional tests of the upper traps had been made with the branches from the lower traps closed, and *vice versa*, and also if a complete series of tests had been made with the air-grating at the foot of the soil-pipe closed. The foot-ventilation of the soil-pipe is a feature not often adopted in current practice, and renders the tests less useful than they would otherwise have been.

The tests illustrated in fig. 2 refer to the Dubois trap with ordinary seal. The deep-seal trap fitted to the upper basin and tested

by discharges through the same basin gave better results when the soil-pipe was open and the anti-siphonage pipes closed, but was unsealed time after time when all the pipes were closed. Under other conditions, the ordinary trap gave, on the whole, as good results as the other.

Many old soil-pipes are trapped at the foot. This trap is a source of danger, especially if two or more closets on different floors are connected to the soil-pipe. When the uppermost closet is discharged the water acts as a piston in the soil-pipe, and must expel part of the air in the soil-pipe either through the trap at the foot or through the trap of one of the lower closets. As the latter generally offers less resistance, the air (fouled by the soil-pipe) is driven into the building. The force of the upper discharge is sometimes so great as to eject a considerable portion of the contents of the lower trap on to the floor of the room; in other cases, the water in the trap may be merely raised in the basin, but the momentum gained in falling back will carry part of the water out of the trap into the soil-pipe. Thus the trap may be either partially or wholly unsealed.

It is unnecessary to describe in detail other conditions which lead to the unsealing of traps. The principal points to be borne in mind are the necessity of trap ventilation (especially when the waste-pipes or soil-pipes are of great length or receive the discharges from two or more fittings), the importance of confining the waste-pipes and soil-pipes (but particularly the latter) upwards to serve as ventilation pipes, and the danger arising from trapping the lower parts of waste-pipes and soil-pipes.

The position of the anti-siphonage pipe requires some consideration. According to the by-laws of the London County Council, an anti-siphonage pipe should be connected with the branch pipe at a point not less than 3 in., and not more than 12 in. from the highest part of the trap—of course, on the soil-pipe side of the standing water. If the anti-siphonage pipe is connected too near the highest part of the trap, the end will be fouled, and perhaps ultimately "furred up," by the discharges from the fitting rising into the pipe; if it is connected to the branch pipe at too great a distance from the trap, it will be of little use in preventing siphonage. The Committee of the Sanitary Institute already referred to carried out other experiments with the view of determining the best position for the anti-siphonage pipe. Dubois traps of P and S shape, and $3\frac{1}{2}$ in. and 4 in. in diameter, were tested by fitting them to a short-hopper closet with $3\frac{1}{2}$ -in. circular outlet, and by flushing the closet (1) with 2 gallons of water "thrown into the basin from a pail" and (2) with discharges from a 2-gallon siphon cistern fixed 4 ft. 9 in. above the top of the basin, and connected to it with a $1\frac{1}{2}$ -in. lead flush-pipe. Glass tubes were fitted to the traps in various positions, so that the height to which the water rose could be observed. "Only one tube was fitted at a time, the other openings being carefully closed." Figs. 3 and 4 show the results obtained with $3\frac{1}{2}$ -in. traps, the P-trap having a seal of $2\frac{1}{2}$ in. and the S-trap a seal of 2 in. The shaded portions represent the maximum heights (out of six tests in each case) to which the water rose in the tubes, when the flush was thrown from a pail, and the black portions give the maximum results obtained when the closet was flushed from the cistern. These tests show that, for a closet used as a slop-hopper, the crown of the trap is not a suitable position for the anti-siphonage pipe. The further tests, illustrated diagrammatically in figs. 5 and 6, were made by cutting a slit $1\frac{1}{2}$ in. wide along the top of each trap, and observing the extent of the splashing. The light lines show the results when the closets were flushed from a pail, and the dark lines those obtained when the cistern was used. It is clear from these illustrations that the anti-siphonage pipe will be seriously fouled if it is connected at right angles to any line tangential to the curve of the trap. The thick dotted lines in figs. 5 and 6 show how the anti-siphonage pipes may be connected so that the risk of fouling is minimised.

In concluding this account of the Committee's experiments, it ought to be stated that the bare facts only are recorded in the "Journal" of the Sanitary Institute, and the Committee cannot therefore be held responsible for the deductions which the writer has drawn from these facts.

OBITUARY.

MR. W. J. HOPKINS.—We have to record the death, on the 28th ult. at Sansone Lodge, Worcester, of Mr. William Jeffrey Hopkins, aged eighty, Fellow of the Institute of British Architects, and Diocesan Architect of Worcester. In our issue of November 10, 1898, we recorded the restoration of the ancient wayside cross at Eckington, Worcester, after the design of Mr. Hopkins; the base and a portion of the shaft alone remained, and he renewed the upper portion and added a cross as a finial. He was architect of Hallow Church near Worcester, commenced in 1879, which he completed by the addition of a spire in 1900.

MR. G. E. WALLIS.—Alderman G. E. Wallis, builder and contractor, died on Friday morning, the 31st ult., at his residence, "Elverton," Boxley-road, Maidstone. Mr. Wallis was born at Boxley on August 6, 1823, and came to Maidstone when a boy, starting life as a journeyman plasterer and bricklayer, and when only nineteen years of age entered into matrimony, his wife being the daughter of his then employer, Mr. William Bow, who was the originator of the artificial stone manufacture. Eventually Mr. Wallis succeeded to the business, and in 1860, in partnership with the late Mr. Jas. Clements, started as building contractor, and in the course of nearly thirty years, during which the partnership existed, carried out many important works, including additions to Barming Asylum, and Kingsnorth Industrial Schools, and other works for the county of Kent, mansion at Boxley for Major Best, St. Faith's and St. Phillip's Churches, Maidstone, and schools for most of the parishes of Maidstone and vicinity, Framlingham Brewery, &c. In 1889 the partnership was dissolved, and in conjunction with his three sons the firm of G. E. Wallis & Sons was formed, and a larger sphere of operations entered into, comprising large War-office contracts at Shorncliffe, Aldershot, Lydd, &c., work for the London School Board, &c. The deceased took an active part in municipal affairs, having been a member of the Town Council for the last twenty-five years, also a Guardian of the Poor and a Governor of the Grammar School, and warden of his parish church. He was also a prominent member of the Masonic fraternity, being P.M. of the Belvidere (503) Lodge and P.Z. of the Belvedere Chapter, holding the office of Treasurer at the time of his death. He was also an enthusiastic musical amateur, and performed on the violoncello with quite exceptional ability, his knowledge of the instrument being entirely self-acquired, and his devotion to it remained to the last, he having formed one of a quartette party only the night before his decease.

GENERAL BUILDING NEWS.

PRESBYTERIAN CHURCH, MUSWELL HILL, N.—The design submitted for this church in a recent competition (limited to five architects), under motto "New Era," has been adopted, and the authors of the design, Messrs. George Baines and Reginald Palmer Baines, Clement's-inn, Strand, W.C., have been instructed to proceed with working drawings. The style adopted is a free treatment of the Perpendicular period of Gothic architecture. Externally the building is to be faced with whole white flints, the dressings being of red Costessey work. A square tower, terminating in a spirelet, forms a prominent feature at the angle of the block, the site being at the corner of two roads. There are three moulded doorways in front, flanked by buttresses; a seven-light traceried window is in the central gable, and traceried work in the apex of gable. The plan approximates in form to a Greek cross. The ceilings internally will be vaulted in wood, the large central vault being carried up higher than others for effect and better ventilation, and being carried upon clustered green marble columns, with moulded stone bases and carved stone capitals. These support four main moulded arches, and other smaller ones spanning the in moulded arches, and other will all be filled with ornamental lights. Electric lighting is arranged for, and low-pressure hot-water heating apparatus will be provided. Seating accommodation will be: on ground floor, 750; in front gallery, 100; total, 850, or a mixed congregation of about 1,000 persons.

CHURCH OF ST. JAMES, MUSWELL HILL, N.—The first portion of this church, consecrated on May 25 by the Bishop of London, consists of the chancel and morning chapel, and two bays of nave and aisles, together with vestries and organ transept. When completed the nave will be 96 ft. by 30 ft., inside dimensions, and aisles of same length by 13 ft. wide. The chancel is 40 ft. by 28 ft., and morning chapel 40 ft. by 15 ft. 3 in. The choir and clergy vestries are divided by a movable screen, and will form a parish hall when the screen is folded back. The style of the church is Perpendicular Gothic, which admits of large windows and very ample lighting, and this has been fully availed of in this case, in view of possible gifts of stained glass and the reduction of light which would inevitably follow from its use. The walls are faced inside with sawn Ancaster stone, and similar stone, roughly faced, is used for the outside casing of walls. The moulded pillars, arches,

and traceried windows, doorways, &c., are of selected Bath stone, twice coated with fluate of magnesia, to prevent risk of decay. The roofs are all open-timbered, of pitch-pine, those to nave and chancel and chapel being of circular barrel-shape, and panelled by means of principals and ribs. The floors in chancel and passages are paved with marble mosaic, those under seats with maple wood blocks. Canadian oak seats and clergy and choir stalls are provided. Seating for 950 persons will be provided in the completed church; the present seating is for about 500. The cost of the present portion of the church is about 6,500. The complete church, exclusive of the upper part of the tower and spire, will cost about 13,000, and it is intended to proceed with the erection of the remaining portion of the nave and aisles, and the lower part of the tower as soon as the original old Chapel-of-Ease has been removed. The architect is Mr. J. S. Alder, of Arundel-street, Strand, W.C. The builder is Mr. John Bentley, of Waltham Abbey.

WESLEYAN CHAPEL, BIRKENSHAW.—A new Wesleyan chapel is in course of erection at Westgate-hill, Birkenshaw, on a site close to the old chapel. It is proposed to spend 4,000l. in erecting and completing the new chapel, in addition to which amount 2,000l. is required to convert the old chapel into a schoolroom and to build a caretaker's house. From one of the front corners of the building will rise a decorative spire to a height of 100 ft. The chapel will comprise nave, chancel, and transepts. The two front entrances will communicate with a central vestibule, which will be covered by a small end gallery sufficient to accommodate ninety persons, and the body of the chapel will provide seating for 454 persons. The ceiling of the nave and transepts will be trefoil in form, and all the windows will have stone tracery heads and will be filled with leaded lights. The heating will be by means of hot-water pipes on the low-pressure system. Messrs. Walker & Collinson, Bradford and Morecambe, are the architects, and the work is being carried out by the following firms:—Messrs. John Brown & Sons, Bingley, masons; Messrs. H. & T. Riddiough, Cross Hills, joiners; Messrs. G. & R. Minus, Rawdon, plumbers; Messrs. Charles Howroyd & Son, Bradford, plasterers; Mr. T. Thornton, Shipley, slater; and Mr. T. Batty, Drighlington, painter.

RESTORATION OF ST. PETER'S CHURCH, RINGLAND, NORFOLK.—At St. Peter's Church, Ringland, on the 4th inst., a special service was held to mark the completion of the restoration of the church. The church has just received a new oak pulpit, surmounted on a moulded stone base; the chancel fittings include the ancient poppy-headed bench ends, worked as ends to new choir seats; the old deal communion rail with balustrading has been replaced with a well-designed oak rail on circular columns and supported by traceried spandrels. The work has been designed by Mr. Arthur J. Chambers, architect, of Norwich, and carried out by Mr. Robert Wegg, builder, Norwich.

NEW WING, STAVELEY GRAMMAR SCHOOL, DERBYSHIRE.—A new wing has been added to Staveley Grammar School. It contains manual instruction-room, lecture theatre, cookery-room, physical and chemical laboratories, and balance-rooms. On the main staircase of the new building have been placed the several coats of arms of the respective founders of the institution. The building was designed by Mr. W. Cecil Jackson, architect, Chesterfield, and Mr. Wm. Forrest, of Chesterfield, has had the contract for erection.

NEW BOARD SCHOOL, ABERDEEN.—On Monday there was opened at Mile-end, Stockel, the new public school just finished for Aberdeen School Board. The building is of granite, and is three stories in height, occupying a site in line with Queen's Cross and Fountain-hall-road. The walls of the two lower floors are of hammer-blocked ashlar, and the upper part of the building of picked ashlar. In the basement are a Cornish steam-boiler and a large air-propeller driven by a Tangye gas-engine, and all the arrangements for mechanical ventilation and heating of the entire building have been taken charge of by Mr. J. Ogg Allan, architect for the School Board. The total cost of the building, the architect of which is Mr. A. H. L. Mackinnon, Aberdeen, will be about 12,000l. The school will accommodate 120 pupils, and the contractors have been:—Masonry work, Jas. Gauld; carpentry work, A. Hall; slating work, Adam & Co.; plastering work, Stephen & Gibb; plumbing work, J. F. Adams; painting work, J. Mason & Son; heating work, R. Tindall; desks and furnishings, J. Garvie & Sons; electric lighting, Shirras, Laing, & Co., Limited; tar macadam, J. McAdam & Co., all of Aberdeen.

CHAPEL, COWLEY POOR LAW SCHOOLS, OXFORD.—The new chapel which has recently been erected at the Cowley Poor Law School has just been dedicated. The chapel, the designs for which were executed by Mr. W. H. Castle, the City Estate Surveyor, is situated on the south-west side of the school, and is 47 ft. by 22 ft. The accommodation provided is for 143 children, the construction of the chapel being such that, if necessary at a future date, the building may be enlarged by the addition of a chancel. The main entrance is on the west side, but when the weather will not permit of the children walking in procession, a corridor connecting the school and the chapel will be available. The building is erected with local

stone, similar to that used for the school, the dressings being of Bath stone. The work has been carried out by Messrs. T. H. Kingler & Son.

COUNCIL CHAMBER, WYBBY.—A block of new buildings has just been completed for the Whitley and Monkseaton Urban District Council. The walls of the building are faced with deep red pressed bricks, the dressings being of stone. Upon entering the entrance hall the offices of the clerk and the rate collector are found on the right hand, and those of the surveyor and the sanitary inspector on the left. At the back is a living-room and a kitchen with scullery and the accommodation for the caretaker. On the upper floor is the Council chamber, 30 ft. long by 18 ft. 6 in. wide, and 15 ft. high. Behind the Council chamber is a waiting-room, with lavatory and other accommodation. These rooms take up the space on one side of the staircase, and on the other side are two committee-rooms. Connected with the Council chamber is a cloakroom. Above these rooms there are three attic bedrooms for the caretaker. These constitute the main block; but there are, besides, two separate out-buildings, one being the fire brigade house and the other is to provide storage. The whole of the works have been designed by Mr. J. P. Spencer, architect, of Newcastle and North Shields, under whose supervision they have been carried out by Mr. James Douglas, contractor, of Cullercoats.

BUILDING IN ABERDEEN.—There has recently been a revival in the house-building trade in Aberdeen, and a great many villas and mansion-houses are now being erected in the west-end suburbs, while towards the centre of the city numerous business premises are being rebuilt or improved. There is also a good prospect of work in the construction of public buildings, and the present boom promises to last for three years at least.

ELECTRIC LIGHTING WORKS, ROTHERHAM.—The opening of the electric light and power station erected by the Rotherham Corporation took place on the 23rd ult. at the new works, Rawmarsh-road. The buildings, the architect for which was Mr. J. Platts, are built of pressed bricks, with stone and buff terra-cotta dressings, the insides of the walls having glazed brick dados. The principals are of wrought iron, with pitch-pine boarding, varnished. The engine-room floor is laid with encaustic tiles, the battery-room with acid-resisting asphalt, and the passages and lavatories with terrazzo pavement. The switchboard platform is of white glazed bricks, with wood-block flooring and teak handrail and cast-iron standards. The site is enclosed with a brick boundary wall. The chimney is 162 ft. high. The boiler lodge for condensing purposes is 167 ft. long by 16 ft. wide, with a holding capacity of 220,000 gallons. The terra-cotta was provided by Mr. Jabez Thompson, of Northwich, and iron roofs by Newton, Chambers, & Co.

MIDLAND RAILWAY INSTITUTE AT DERBY.—An extension has just been made to the institute which was erected at Derby by the directors of the Midland Railway Company for the benefit of the staff in 1897. The building, which is situated close to the Midland station, originally included a reading and magazine room, a lending and reference library containing about 14,000 volumes, a restaurant, billiard-room with three tables, and a large concert-hall with proscenium and scenery. The new extension comprises a dining-hall capable of seating about 200, where dinners will be served daily, with an adjoining dining-room of smaller dimensions. On the ground floor is a new restaurant for the salaried staff of the company, and a café for the workmen, with connecting service-rooms and kitchen fitted with the most modern cooking appliances. Lavatories with hot and cold water are annexed. The new extension has been designed and carried out under the direction of the company's architect, Mr. C. Trubshaw.

TECHNICAL COLLEGE, DURHAM.—The new technical college at Durham, which is to be known as the Johnston Institute of Science and Art, was opened on the 22nd ult. The front of the college is in South-street. The building, which is three stories high, occupies a large site, and on the east side overlooks the wooded banks of the River Wear. It has been built on designs by Messrs. Oliver, Leeson, & Wood, architects, of Newcastle, by Messrs. J. G. Graddon & Son, contractors, of Durham. It is of red brick, with a tiled tile roof, and a main entrance in South-street of stone. The upper apartment is intended for the art classes, the middle floor for chemistry and engineering, and the basement for physics, cookery, &c. There are large classrooms and accessory apartments, well equipped for the proper study of science, art, and technical subjects.

NEW PUBLIC HALL FOR HULL.—At a recent meeting of the Hull Corporation Property Committee Mr. Hirst, City Architect, reported that he had interviewed the Corporation's tenants in Waterworks-street, Junction-street, St. John-street, and Charlot-street. It was proposed to take down all the old buildings, to provide a large square close to the Monument, and to erect thirty-four shops, some with ground floor and basement only, and others with four floors. There were also provisions for a public hall, sitting-rooms, and three large reception-halls. The halls were to be on the first floor, with a main entrance from the square, and eight subsidiary entrances and exits in Waterworks-street

and St. John-street. The large hall, which would accommodate 3,000 persons, would have side and rear galleries and an orchestra. It was proposed to carry the buildings out in two portions, commencing at the square. Provision being made during the reconstruction for the older tenants, to whom option of position would be given when the buildings were completed. The square would measure 272 ft. from north to south, and 216 ft. from east to west, and would form an open space in the very heart of the city. The approximate estimate for erecting the building, including the purchase of necessary land, is 92,000*l.* The estimated rentals from the new shops, including two licensed houses to be rebuilt, one of which could be used in connexion with the public hall, is 6,836*l.*, and for the public hall, 1,014*l.*; increase of rents on shops, 632*l.* It was moved by the Chairman and seconded by Councillor Skinner that the scheme be approved, and it was unanimously carried.

TOWER, PARISH CHURCH, BROUGHTON-IN-FURNESS.—The new tower to the ancient parish church of Broughton-in-Furness and the new peal of bells were dedicated on the 27th ult. by the Bishop of Carlisle. The tower was designed by Messrs. Austin & Paley, of Lancaster, and is in keeping with the Norman architecture of the church. The new bells are eight in number.

MISCELLANEOUS.

PROPOSED COUNCIL HALL FOR MARYLEBONE.—We hear that the Improvements Committee of the St. Marylebone Borough Council have recommended the acquisition of a fresh site for a County Hall, to include a hall for public meetings, instead of the present Court House and Vestry offices at the south end of Marylebone-lane, near Oxford-street. The site in question extends over 28,000 ft. superficial, and is situated between Circus-street and Wyndham-street, Marylebone-road, near Bryanston-square.

SPITALFIELDS MARKET.—Mr. Hargreaves Brown's Select Committee of the House of Commons have passed as proved the preamble of the London County Council Bill for the purchase of the freehold and leasehold interests in Spitalfields Market, which is at present held upon an eighty-four years lease from 1882 at an annual rent of 5,000*l.* The Select Committee's decision disposes of the Bill promoted by the Corporation of London for the same purpose. In each case we gather the promoters had made a provisional agreement to acquire all existing rights and franchises of the market and its site for 176,750*l.*, together with 1 per cent. upon the purchase moneys for the costs, as agreed upon, of the vendors. The Committee were of opinion that (1) the rights of Stepney to become the market authority should be preserved; (2) the right of the City of London under their charter of 1267, Edward III. should be preserved as it was by Section 41 of the Act of 1851; and (3) whilst that particular market could be best dealt with by the County Council, the County are not a market authority for the metropolis; and (4) the measure must not be regarded as a precedent in any way.

SHADWELL FISH MARKET.—Mr. Brown's Select Committee of the House of Commons has passed as proved the preamble of the Bill introduced by the Corporation of London for purchasing the riverside fish market at Shadwell. They at the same time agreed to insert a clause which shall stop the Corporation from preventing the West Ham Borough Council from establishing and maintaining a market within the county borough. The market at Shadwell was established by a company under the powers of an Act passed in 1882. Though the Corporation opposed that measure at the time, upon the grounds that their intended improvements at Billingsgate would meet all requirements of the fish trade, they have since become owners of the market, and have agreed to take it over at the price of 175,000*l.* Under their present Bill, against which the London County Council have petitioned, the Corporation take powers for a ratification of their purchase, the widening of the High-street, Shadwell, the improvement and enlargement of the market, and the erection of houses to be let at moderate rents to the working classes.

THE STRAND AND THANET-PLACE.—On Monday, 10th inst., will be offered for sale at auction the site, upon a building lease for eighty years (with the option of acquiring the freehold), of Nos. 231 and 232, Strand, and the whole of Thanet-place in the rear, covering an area of more than 8,500 ft. superficial, opposite the Courts of Justice. The freehold of the nine houses in Thanet-place, occupying an area of 7,800 ft. superficial, and yielding a rental of 550*l.* per annum, was sold on November 30, 1898, for 20,500*l.* Thanet-place, named after the Tuttons, Earls of Thanet, marks the site of the Rose Tavern, cited for its vine-tree and garden in Thomas Fairchild's "City Gardener," 1722; in two letters written to Cole in 1776 Walpole refers to the painted room at the Rose Tavern without Temple Bar.

THE LATE MR. J. M. BRYDON.—The following gentlemen, among others, were present at the funeral of the late Mr. J. M. Brydon on the 20th ult.—Mr. Wm. Emerson, President of the Royal Institute of British Architects; Professor Atclison, past-President; Sir L. Alma-Tadema, R.A.; Sir

John Taylor; Dr. Murray (British Museum); Dr. Rowland Anderson; and Messrs. Aston Webb, A.R.A.; John Belcher, A.R.A.; Leonard Stokes; T. W. Cutler; W. D. Carpe, F.S.A.; H. B. Wheatley, Society of Arts; Edwin T. Harcourt, H. H. W. Seth-Smith, President of the Architectural Association; Ernest George, and W. J. Locke, Secretary R.I.B.A.

THE CARLTON HOTEL, LIMITED.—A subscription list has been opened of 300,000*l.* 4 per cent. first mortgage debenture stock of this Company, which was formed in 1869 for acquiring the Carlton Hotel and adjoining property in the Haymarket and Pall Mall, comprising the Carlton Hotel, His Majesty's Theatre, and the Royal Opera Arcade, which are held under a lease from the Crown to the Company for a term of 72 years from October 10, 1898, at a yearly rent of 4,200*l.*, underleasess of the theatre (at a rent of 3,700*l.* per annum) and of the arcade with other minor parts of the property (at peppercorn rents) having been granted for the whole of that term—a few days excepted. In May last Messrs. Farnbrother, Ellis & Co., acting for the Company, valued the property, with furniture, effects, and other assets, at the sum of 650,000*l.*, and the Company state that their net trading profits during the period July 15, 1899—August 31, 1899, amounted to upwards of 50,000*l.* The Carlton Hotel was opened on July 15, 1899, having been erected upon a site of about 23,500 square feet from drawings made by the late C. J. Phipps; the completion of the fabric (with modified plans for the interior) was carried out by Mr. L. H. Isaacs and Mr. H. L. Florence, the decorations and equipments being by Messrs. Waring & Gillow. His Majesty's Theatre (illustrated in the *Builder*, May 8, 1897) was built from the designs and under the direction of C. J. Phipps, with whom was associated Mr. R. Walker for the internal decoration and scheme of colour; the general builder's work being by Mr. Lovatt. The Arcade was given to the Company by the late King's Theatre or Italian Opera House, as part of the alterations and improvements, made in 1816-17 by John Nash conjointly with G. S. Repton, of the building (1790-1) designed by Michael Novosielski.

LIGHT RAILWAYS IN THE ENVIRONS OF LONDON.—Applications have just been made to the Light Railways Commissioners by the County Council of Middlesex for the construction and working of a large number of light railways in the Counties of London, Middlesex, and Hertford, comprising new lines in the parishes of Islington, Hornsey, Tottenham, Friern Barnet, Southgate, Finchley, Hendon, Willesden, Acton, Brentford, Ealing, Wembley, Harrow, Great Stanmore, Harrow Weald, Hampstead, Chiswick, Staines, Sunbury, Hampton, East Twickenham, Heston, Cranford, Twickenham, and others adjacent. A gauge of 4 ft. 8½ in. is adopted. The motive power proposed to be used is animal power, or electrical power applied upon a system approved by the Board of Trade, or any mechanical power other than steam power. For purposes of power stations, car depots, and other buildings, the promoters seek to acquire sites in Redbourne-avenue, Finchley (about 3 acres), Port-lake, Sunbury (10 acres), at Bull's Bridge, Norwood, Middlesex (10 acres), and on the Bath-road, Heston (8 acres). With two or three exceptions, where fields are to be traversed, the lines will be laid along streets or roads or waste lands by the roadside. For the widening of roads where necessary so much property will be taken as may be needed for making up the metalled portion of the road to a minimum width of 32 ft. between the kerbs, and for providing a footpath along each side of the road from 6 ft. 6 in. to 10 ft. wide. Where fields are crossed (as at Heston, Bedford, Old Oak-lane, Willesden, and the Alexandra Park Estate) permanent way, 24 ft., will be made across them.

EMIGRATION IN THE BUILDING TRADES.—According to the annual report of the Board of Trade on emigration and immigration, the male adults who left the United Kingdom in the year 1900 included 158 builders; 708 bricklayers, masons, plasterers, slaters, &c.; 37 brick and tile makers, potters, &c.; 1,089 carpenters and joiners; and 428 painters, paperhangers, plumbers, and glaziers. Of this total of 2,470, British North America was the destination of 121, Australasia of 245, and the United States of 1,055, whilst 998 went to "other places."

ELECTRIC LIGHT WORKS, PERTH.—The new electric light station buildings, Perth, erected from plans prepared by Mr. R. McKillop, the Burgh Surveyor, under the direction of the consulting engineer, Mr. W. C. C. Hawtayne, M.I.E.E., London, are of red facing brick. They are situated at the harbour road, adjoining the River Tay. They comprise an engine-room, 115 ft. long by 38 ft. wide; a boiler house, 115 ft. long and 42 ft. wide; and an accumulator room, 48 ft. long by 31 ft. wide. The test room and offices are to the front, and over these a dwelling house is provided for the engineer who will look after the works. The cost of the new work and installation is about 40,000*l.*

PROPOSED MEMORIAL TO PROFESSOR ANGEL.—It is proposed to found a prize or scholarship in memory of the late Professor Angel, who was for many years instructor in steam, applied mechanics, and practical plane and solid geometry, at the City of London College City Polytechnic. Former pupils and others who wish to subscribe to the fund are requested to communicate with Mr. P. J. Gillbard, Hon. Secretary to the "Henry Angel

Memorial Fund," City of London College, White-street, E.C.

BERLIN INTERNATIONAL FIRE EXHIBITION.—The attention of the British Fire Prevention Committee having been called to the fact that the lack of enterprise on the part of the English fireproofing and fire appliance trade had resulted in this country being scarcely represented at the Berlin International Fire Exhibition, steps have now been taken to see that Great Britain is at least represented by some scientific exhibits. A large stand has now been retained by the Committee to show photographs, plans, &c., of such materials and systems of construction as have been before the Committee for investigation, and a number of models are also being sent to Berlin. Further, some large plans and drawings of London fires are being shown, together with a very interesting collection of old insurance plates. Although the British Fire Prevention Committee has from patriotic motives tried to step into the breach at short notice with exhibits arranged from a scientific point of view, the lack of enterprise on the part of the trades concerned is highly regrettable, as the natural result can only be that much of the business to which Great Britain might well lay claim must again drift into the hands of the more energetic foreign competitors who have taken the pains to show what they can do in meeting the requirements of fire protection.

NEW PIER, MINEHEAD.—On the 25th ult. a new pier was opened at Minehead. The pier is 700 ft. long and 24 ft. wide at the narrowest width, and it is widened out at the head to a width of 76 ft., the level of the deck being about 20 ft. above high water of ordinary spring tides. In addition to the widening at the head of the pier, there are two embayments on each side, suitable for either kiosks or wind shelters. The pier is built of composite piles of cast iron and steel, and lattice girders. A cast-iron hand-railing surrounds the pier, with seats at frequent intervals, lamp standards being placed at suitable intervals. The work has been carried out from the designs, and under the superintendence, of Mr. John J. Webster, M.Inst.C.E. The whole cost of the works was under 12,000l.

MEMORIAL WINDOW, ST. MARY'S, CHARD.—The fourth of a series of memorial windows at St. Mary's Church, Chard, has just been erected in the north aisle of that church. The subject of the window is that of the three Marys. Beneath the window, on a polished marble slab, is a brass tablet bearing an inscription. Both window and brass are from the studios of Messrs. F. Drake & Sons, of Exeter.

CAPITAL AND LABOUR.

OPERATIVE PAINTERS, NORTH STAFFORDSHIRE.—The operative painters of North Staffordshire having through their trades union sent to the Masters' Association a demand for a penny an hour advance and alteration in the working rules, Mr. T. Blashill, F.R.I.B.A., London, was appointed by the Board of Trade under clause 9 of the working rules to arbitrate upon the matter. He sat at the Grand Hotel, Hanley, recently, to take evidence, and was met by twelve members of the Conciliation Board—six masters and six operatives. The operatives' representative said they made their claim for an advance of wages on the ground that the painters were not adequately paid according to the wages paid in other branches of the building trades, and they were not getting a living wage. The loss of time in the winter months was another reason why they asked for an advance in wages. To this the employers stated that the wage paid to painters in this district was quite up to the average in other towns, and compared favourably with the wages paid to other branches of the building trades. The arbitrator asked for some comparison on this view of the question, and the following figures were supplied:

	Painters	Joiners	Brick-layers.	Plas-terers.
North Staffs...	7½	8½	8½	9
Bolton	8½	9	10	10
Manchester ...	8½	9½	10	10
Wolverhampton	7½	8½	8½	8½
Crewe	7	7	8	9

An operative stated that they had only received one advance in twenty years. The wages at the beginning of 1874 were 6d. per hour. An advance of 3d. per hour was given in April, 1874, making the wages 9d. per hour. This was taken off in 1880, and the wages were raised in 1894 to 7d. per hour. Wages were raised again in 1897 to 7½d. per hour, at which they remain at the present time. (This matter was arbitrated on last year in May, when the arbitrator decided that the wages should remain as at present, not less than 7½d. per hour.) An alteration of working rules was asked for as follows:—Rule 4.—The operatives asked for 6d. per day for expenses on all toiling off jobs on the ground of extra expense and loss of comfort when lodging away from home.—To this the employers plead that there is no precedence for such a course, it not being the custom in the building trades. Rule 5.—That paying on the job be discontinued, and wages paid at the shop, or time being allowed to be at the shop at pay time.—The employers said they would leave it entirely to the arbitrator, as this did not affect many wages,

generally being paid at the shop at 12 o'clock. A vote of thanks to Mr. Blashill closed the inquiry, after two hours' discussion.—*Staffordshire Sentinel.*

BUILDERS' LABOURERS' DISPUTE, LEICESTER.—The award of Sir William Markby in the dispute between the builders' labourers engaged in the new Wholesale Market and their employers has been published. The workmen originally "turned out" mix or lay concrete. But the arbitrator has adopted the view of the employers on the subject, and affirmed their right to employ navvies for this purpose if they choose.

DUNDEE QUARRYMEN'S STRIKE.—The strike of workmen at the quarries in the vicinity of Dundee recently acquired by a syndicate from the trust estate of Messrs. James Morrison & Son, has come to an end. At the Westhall and Duntrune quarries a section of the employees came out on strike against a reduction of 3d. per hour on the rate of wages. The men, or at least the majority of them, have returned to work on the employers' terms.

NORWICH CARPENTERS AND THEIR WAGES.—It will be remembered that on March 1 the carpenters and joiners of Norwich made a demand for an increased rate of wages, giving the three months' notice required by the rules. A conference between the employers and the men took place about three weeks ago, and it was carried on in a very amicable spirit on both sides. Correspondence followed on various matters, and terms were received from the masters. At a special meeting recently of the Amalgamated Carpenters and Joiners' Society it was decided to accept the employers' offer of 3d. an hour advance to begin on January 1 next; time and a quarter for overtime instead of the 3d. per hour previously paid; the settlement to stand for four years.—*Eastern Daily Press.*

FRENCH QUARRIES.—The officials of this quarry are now working as quarrymen, and several charges of molesting them were tried at Bangor Petty Sessions on the 4th, fines being inflicted. The quarry is to be opened to the men on the 11th, but it is not anticipated that many will resume work; it also seems impossible to give effectual police protection to men whose homes lie scattered over a wide mountain district.

LEGAL.

CASE UNDER THE LONDON BUILDING ACT.

DISTRICT SURVEYOR OF EAST HACKNEY (SOUTH) AND NORTH BOV v. GEO. S. SHAW.

This case was heard at the North London police-court, before Mr. Fordham, on the 24th ult. The District Surveyor explained that he found a stove fixed in this house in a dangerous way and served notice on the occupier to amend it. It was amended. He then applied to the occupier for a fee of 10s. for fixing a stove for trade purposes. Meanwhile the occupier left and could not be found. He then applied to the owner (the defendant). The defendant admitted he was the owner, but said that he knew nothing about the stove. The District Surveyor claimed under Section 154. The case was adjourned for seven days in order that the magistrate might consider it.

Mr. Fordham delivered judgment in the case on May 31. He said he felt it was a case that pressed rather hardy on the defendant, but he had examined the sections in the Act and cases bearing on the point, and come to a definite conclusion on the case. He recounted the facts as above stated, and that there was no builder in this case, but Section 5 (3) stated that where no builder is employed the owner becomes the builder. He therefore gave judgment that the fee of 10s. was due and 13s. costs.

The Surveyor remitted the 10s. awarded for his attendance under the circumstances, and 13s. was paid by the defendant.

ALLEGED INFRINGEMENT OF ANCIENT LIGHTS AT FOLKESTONE.

The case of White v. Flude came before Mr. Justice Buckley in the Chancery Division of the High Court of Justice on the 4th inst.

Mr. Henry Terrell, K.C., and Mr. Cave appeared as counsel for the plaintiff; and Mr. Astbury, K.C., and Mr. Watson for the defendant.

It appeared from the opening statement of Mr. Terrell that the action was brought by the plaintiff for an injunction to restrain the defendant from interfering with two ancient lights in the plaintiff's premises, No. 30, Victoria-road, Folkestone. There was no question raised as to the plaintiff's lights being ancient. That was not traversed. The plaintiff's title was also not traversed, and there was no question of acquiescence. The only question was, whether or not defendant's building interfered with the access of light to plaintiff's ancient lights. The defendant had put up a mission hall adjoining the plaintiff's house, and this was said to interfere with the access of light to the basement window, a kitchen window, and with the light of a little window in the outhouse or store shed, at the end of the yard opposite the plaintiff's premises. The plaintiff had enjoyed the light to these windows for upwards of twenty years, and

there was now in consequence of the defendant's building a very substantial diminution of light coming to both windows.

Mr. Andrew George Bromley, an architect and surveyor practising in Folkestone and Canterbury, and Mr. Howard Chatfield Clarke, an architect and surveyor, gave evidence to the effect that the defendant's building had materially affected the access of light to the windows in question.

In the result, his lordship, having heard the evidence of Mr. Ravenscroft Roger Smith, professor of architecture at King's College, and of Mr. Tilton, Tunbridge, a builder, to the effect that the mission hall did not interfere with the light coming to the plaintiff's two windows, characterised the action as a frivolous one, and dismissed it with costs.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

2,177.—**A DEVICE FOR HEATING APPARATUS:** *J. F. Royle.*—The contrivance is intended for regulating the steam or hot-water supply of rooms that are warmed with steam or hot-water pipes and for similar apparatus. The force of expansion due to changes of temperature is utilised to work a valve that controls the flow of a fluid under pressure acting upon a piston or diaphragm which works the valve that regulates the supply; the thermostatic apparatus is available for regulating the temperature of water in a swimming-bath, for working boiler-dampers, or for ventilators. See also Specification No. 19,410, of 1893, for the expandible metal thermostat.

2,209.—**WINDOW-SASH FASTENINGS:** *R. Hine.*—A withdrawing spring is fitted upon a bolt in an arm pivoted to a bracket on the upper sash, a right-angled extension from the base of the bracket is affixed to the face of the meeting-rail, and a tongue projects from the lower side of a handle carried by the front end of the bolt. For fastening purposes one turns the arm downwards between two brackets on the lower sash so as to cause the tongue to engage with ratchet teeth on the faces of the brackets.

2,212.—**ELECTRICAL ARC AND INCANDESCENT ARC-LAMPS:** *W. Peritz.*—To prevent the electrodes from becoming consumed the inventor encloses them in a sealed glass globe that contains an inert gas or is exhausted as entirely as is possible. The electrodes may be movable or have a movable core for striking the arc. For incandescent arc-lamps he encloses the arc in a mantle composed of some refractory material such as rare earths mixed together, and insulates it from the electrodes with glass at some little distance from the arc.

2,220.—**APPLIANCES FOR EXCAVATORS, DREDGERS, &c.:** *E. McGregor.*—The carrying rope, which is passed over supports and is anchored at a distance, can be splined from its normal position with weights and other supports will avail to vary its normal position horizontally. The rope is passed through a cradle carried by a trolley to be traversed along rails upon the support by the turning of a screw. The remotest support may take the shape of a curved rail upon supports; arms and pulleys sustain the scoop, which is drawn along the carrying rope with a sling joined to the hauling rope. The scoop is a spring-catch to which the sling is secured in such a manner that as the hauling rope becomes abnormally strained when the scoop is deeply embedded the sling will fall into the position for release.

2,222.—**ELECTRICITY QUANTITY-METERS:** *A. Wright and Reason Manufacturing Company.*—A mercury voltmeter comprises a stoppered or entirely-sealed glass vessel, wherein is a mercury anode within a pocket at a level higher than that of a mercury cathode, into which platinum connecting wires are sealed, the vessel being filled with a suitable electrolyte—say, a solution of mercurous nitrate; as the mercury cathode increases in volume it flows over a ridge in regulated small quantities into a long vertical tube, which at the outset holds solution only, whereupon the position of the anode induces the dense solution upon its surface to flow down to the cathode; in order that the circulation may not be impeded by the reduction of the anode below the level of the lip upon the edge of its pocket, the vessel is provided with an auxiliary bulb in which an automatical supply of mercury keeps the anode surface at its proper level; the quantity of passing electricity is indicated by an adjacent scale which records the height of the mercury in the vertical tube. The instrument, which is used "shunting," can be reset by being turned over to the left hand and then replaced.

2,249.—**MACHINES FOR TENONING WOOD:** *T. N. Robins.*—A sliding table carries the piece of timber and when it has been fed forward between the rotary cutters a treadle is depressed for throwing the feed mechanism out of gear; brackets which slide upon the vertical face of the pedestal carry the rotary cutters; a hand-wheel that regulates the velocity-ratio of friction discs controls the speed of the feed, the feed being started by means of the pressure—by the treadle—of a friction disc against the friction-wheel; a strap wound around a drum pulls the table forward and weight pull the table backwards again at the liberation of the treadle.

2,364.—A FASTENING FOR DOOR-KNOBS: *M. Solomon*.—The two spindles are fashioned so that they can be screwed into the lock-follower upon different pitches to thread, for example, twelve, and twenty-four, to in., and are joined with a screw of eighteen threads to in.; thus either knob cannot be unscrewed when it is turned, since it becomes locked by the differential threads, but the knobs may be disconnected when they are being unscrewed at suitably relative speeds. The contrivance is described as being also adapted for other articles.

2,375.—A CONTRIVANCE FOR SLIDING WINDOWS: *S. Taylor*.—For a sliding window that can be swung out of its guides the lower sash is arranged to slide within an inner and higher frame, whilst the upper sash slides in an ordinary frame; a stop is fixed at one side of the upper part of the inner frame, and beneath that is hinged a deeper stop; frame-ribs engage with tongues upon the lower sash, their upper ends being cut away so that the lifted sash may be moved inwards and be then lowered and swung into the room when the deeper stop has been turned backwards; two pairs of weights on the inner and outer frames, respectively, balance the lower sash, and another pair on the outer frame balance the upper sash; the upper portion of the outer frame has guiding strips, and the lowered upper sash is guided with pins that run in grooves of which the horizontal parts will admit of the sash being turned downwards; a plate (which also serves as a lock) upon the outside of the lower sash to be forced against one of the frame-ribs with a pin fastened to the plate and passed through the sash to the inside, will prevent it from rattling.

2,420.—AN AUTOMATIC FLUSHING VALVE: *G. E. Ridgway*.—The valve, whilst more particularly devised for the discharge of effluent sewage from filter-beds, is adapted for other flushing purposes; a hinged flap-valve reposes against the inclined seat of the distributing channel, and the sewage will flow through holes in the valve and its seat, respectively, into a vessel mounted upon the valve as soon as the liquid has risen to a certain level. When the vessel is filled it tilts so as to overbalance and open the valve; an outlet or valve of the vessel provides for the escape of the imprisoned fluid. In another form a pipe from the side of the distributing channel conveys the fluid into the containing vessel, which is mounted upon a bracket attached to the valve, and is provided with a siphon or other suitable outlet for determining the times of discharge.

2,450.—AN APPLIANCE FOR USE WITH THE ALARMS OF GAS, WATER, OR ELECTRICITY SUPPLY SYSTEMS: *G. T. Weldon*.—For the turning-on of the supply at any pre-determined time a weight dial hangs upon the winding level of the alarm mechanism is joined with a cord to the tap-cock or electrical switch, and will fall when the alarm has been sounded; the movement of the lever is limited with stop-pins.

2,451.—LIFTING JACKS: *C. Portway and J. T. Graham*.—In order that the operation of the lifting lever shall lower the load step by step, the inventors have devised a two-pronged pivoted lever in such a manner that projecting side-springs engage with the mechanism in front and under surfaces of two clutches as soon as the handle is forced downwards; thereupon the action of the clutches becomes reversed—the one locks the stem, whilst the other becomes disengaged as it moves upwards. The invention embodies an improvement of that described under No. 7,190 of 1880.

2,473.—ELECTRICAL ARC-LAMPS: *E. C. Maray*.—The arc is formed at the free ends of the carbon rod and a surrounding hard carbon helix. If a globe is employed for enclosing the arc and carbons, the latter should be made as incandescent lamp filaments.

2,524.—LIFT-VALVES: *H. Adams*.—For a stop-cock adapted for domestic water supply the inventor fashions the casing with its lower portion enlarged in order to constitute the seating of a ball-valve. Through the top of the casing he inserts a spindle, upon the end of which the ball is screwed. Stops upon the spindle restrict the movement of the valve, which may be seated in the lower extended portion of the casing.

2,534.—AN APPLIANCE FOR USE WITH STEAM PILE-DRIVERS: *H. H. Cochrane and A. H. Cochrane*.—For pile-drivers wherein the cylinder, sliding upon the piston-rod, serves for the monkey the inventors provide upon the piston an upper tubular piston-rod that projects through the upper end of the cylinder, together with a lower solid piston-rod projecting through the lower end of the cylinder so as to rest upon the pile. A plate retains in its place a lug from the cylinder, that moves between two vertical balks, and a tubular valve joins the steam-pipe to the piston-rod. In the sliding part of the valve are two cylinders having different diameters and separated by an annular passage. The diameters are arranged so that the pressure of steam shall maintain the valves as "cut off," and steam from above the piston shall be exhausted through openings, the tubular piston-rod, and the tubular valve. Upon the depression of the valve by the action of a pivoted lever, the steam will flow from a pipe through the openings and the tubular piston-rod into the cylinder.

2,535.—STONE-SAVING MACHINERY: *G. F. Filton*.—Channel-iron is used for the construction of the swinging frame at its ends and sides with distance

corner-pieces, and for the movable heads on to which the ends are secured, the heads being fastened to the ends with double T-headed bolts that are passed between the channels and then turned. For a heavier frame a built-up box section is contrived and a guideway for the movable heads is provided in the shape of angle-irons affixed to it; the swinging water-supply pipes are counter-balanced with weights over their axes, and are fashioned in L instead of J shape. Arrangements for ensuring either a slow or a quick feed or return are made by means of spur-wheel gearing in each instance, upon a pivoted lever.

2,621.—AN INDICATOR FOR USE IN ELECTRICAL LIGHTING: *A. Rührstrat and E. Rührstrat*.—The inventors seek to indicate the occurrence of short circuit in a lighting circuit. In one form they put a lamp in shunt with the main fuse; when the fuse blows at the lighting of the lamp a short circuit is announced, the other lamps becoming dim or extinguished; a fuse may be employed as a protector of the lamp.

2,644.—FLAP AND SLUICE VALVES: *S. H. Adams*.—In order that the valve, which is hinged on to the framework, may be operated apart from the action of the fluid that flows through it, the inventor joins a crosshead to the flap with ears, and provides a screw, or other suitable mechanism, for the lifting or lowering of the crosshead; the valve may be maintained in its closed position by means of the engagement of the extended ends of the crosshead with catches set upon the framework.

2,675.—AIR-HEATING STOVES: *C. Fänger*.—The whole of the stove—the fireplace excepted—is built up with chamotte bricks, and with Dutch tiles for the external facing. Two partitions divide it into three compartments; a plate normally closes the shoot down which the fuel is shot from a fixed scuttle. The flames and products of combustion pass through horizontal passages and apertures into a narrow channel and thence through angle-wise tubes into the escape-pipe. Adjustable openings admit air into the lower part of the stove; a channel and openings conduct it to a space around a coil of tubes, whence, after having been warmed, the air escapes through a pierced plate; fresh air from the lower portion of the stove enters through two pipes, and the draught through the pipes can be regulated by a suitable adjustment.

MEETINGS.

SATURDAY, JUNE 8.

British Institute of Certified Carpenters.—Visit to *Kew Gardens*. 4 p.m.
Northern Architectural Association.—Visit to *Hexham*.

MONDAY, JUNE 10.

Circle of Works Association (Carpenters Hall).—Monthly meeting. 7.30 p.m.

WEDNESDAY, JUNE 12.

Institute of Sanitary Engineers (Incorporated) (19, *Bloomsbury-square, W.C.*). General Purposes and Finance Committee at 4 p.m. Half-yearly general meeting at 7 p.m.

THURSDAY, JUNE 13.

Society for the Encouragement of the Fine Arts.—Dr. *Phené, V.P.*, F.S.A., on "Our Highly Refined Forerunners in Pre-Roman Britain." 8 p.m.

FRIDAY, JUNE 14.

Edinburgh Architectural Association.—Annual excursion, to *Hexham and Durham*.

SATURDAY, JUNE 15.

Edinburgh Architectural Association.—Annual excursion (concluded).

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premiums, and Designs to be delivered. Includes entry for 'Laying out Winter Garden' by Penzance Corporation.

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c., Supplied by, and Tenders to be delivered. Lists various construction projects like 'Electrical Plant', 'Hospitals', and 'School Buildings'.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Application to be in. Lists positions like 'Road Foreman', 'Assistant', and 'Chief Assistant'.

Those marked with an asterisk (*) are advertised in this Number. Competitions, p. iv. Contracts, pp. iv. vi. viii. x. & xxii. Public Appointments, pp. xix. & xxii.

Table with 4 columns: Location, Area/Details, Price, and Remarks. Lists various plots for sale or lease, such as 'Dalston', 'Leyton', and 'Leigh'.

THE BUILDER, JUNE 8, 1901

SANTA CROCE

PULPIT, SANTA CROCE, FLORENCE.—FROM A DRAWING BY MR. W. CURTIS GREEN

PHOTOLITHO SPRAGUE & CO. LITH. 445 EAST MADISON STREET, CHICAGO, ILL. U.S.A.

APRIL 01.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing various materials like Hard Stocks, Rough Stocks, Facing Stocks, Shippers, etc., with prices in £ s. d. and quantities.

NOTE.—The cement and lime is exclusive of the ordinary charge sacks.

STONE.

Table listing stone materials like Ancaster in blocks, Bath, Farleigh Down Bath, Beer in blocks, etc., with prices.

SLATES.

Table listing slate materials like 20x10 best blue Bangor, 11 5 0 per 1000 of 1200 at ry. dep., etc.

TILES.

Table listing tile materials like Best plain red roofing tiles, Hip and valley tiles, etc.

WOOD.

Table listing wood materials like Deals: best 3 in. by 11 in. and 4 in., Hip tiles, etc.

PRICES CURRENT (Continued).

WOOD. At per load of 50 ft. £ s. d. £ s. d.

Large table listing various wood materials like Fir timber, Second yellow deals, White Sea: First yellow deals, etc., with prices.

METALS.

Table listing metal materials like IRON—Common Bars, Staffordshire Crown Bars, etc., with prices.

PRICES CURRENT (Continued).

METALS. Per ton, in London. £ s. d. £ s. d.

Table listing metal materials like LEAD—Sheet, English, 3 lbs. & up., Pipe in coils, etc.

ENGLISH SHEET GLASS IN CRATES.

Table listing glass materials like 15 oz. thirds, fourths, etc., with prices.

OILS, &c.

Table listing oil materials like Raw Linseed Oil in pipes, in barrels, etc.

VARNISHES, &c.

Table listing varnish materials like Fine Elastic Copal Varnish for outside work, etc.

TO CORRESPONDENTS.

The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications...

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday, N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £50, unless in some exceptional cases and for special reasons.]

Table listing tender notices for Bolney (Sussex), Bracknell, and Brighton, with names of architects and dates.

[See also next page.]

LONDON.—For electricity and destructor station for the Borough of Woolwich.—

Table with columns: Foundations, Station, Total, Extra if Portland stone, Saving if Terra-cotta. Lists contractors like E. Proctor, D. Gibb & Co., Martin, Wells, & Co., etc.

BRIGHTON.—For alterations and additions at No. 43, Dyke-road, for Messrs. Beckwith. Mr. W. C. F. Gillam, architect, Brighton:—

EASTBOURNE.—For the Sanatorium extension, for the Borough of Eastbourne. Mr. Wm. Chapman Field, Borough Architect, Eastbourne:—

Table with columns: Original Estimate, Deductions, Amended Total. Lists contractors like Gregar & Co., Johnson & Co., J. C. Lacey, etc.

EASTBOURNE.—For alterations to Town Hall, Eastbourne. Mr. W. Chapman Field, Borough Architect:—

LONDON.—For the erection of shops and offices, Middlesex-street, E.C. Messrs. Dale & Gadsdon, architects, 8, Union-court, Old Broad-street, E.C.:

SANDGATE (Kent).—For the erection of stores, cartshed, and entrance gates, for the Urban District Council. Mr. A. Robert Bowles, Surveyor to the Council. Quantities by Mr. Alfred R. Evans, 8, St. Martin's-place, W.C.:

STEYNING.—For the erection of a pair of villas, for Mr. W. P. Breach. Mr. F. Slaughter, architect, Steyning and Shoreham. Quantities by architect:—

C. B. N. SNEWIN & SONS, Ltd. MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and TIMBER MERCHANT, Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, BACK HILL, HATTON GARDEN, and 29, 30, & 31, RAY STREET, FARRINODON ROAD, E.C.

WALTHAMSTOW.—For erection of shops and office premises, Wood-street, Walthamstow, for the Charity Trustees. Mr. W. A. Longmore, architect, Bridge-chambers, Walthamstow:—

Table with columns: Contractor, Amount. Lists contractors like J. Holliday, West Bros. & Pettit, S. J. Scott, etc.

WEST BRIDGFORD (Notts).—For additions to church, Lady Bay. Mr. William R. Gleave, architect, 18, Low Pavement, Nottingham. Quantities by architect:—

WEST BRIDGFORD (Notts).—For pair of houses, Millicent-road. Mr. William R. Gleave, architect, 18, Low Pavement, Nottingham. Quantities by architect:—

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 10s. per annum (25 numbers) FREE POST. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 25s. per annum. Remittances payable to DOUGLAS FOURDRINIER should be addressed to the publisher of "THE BUILDER," Catherine-street, W.C.

SUBSCRIBERS IN LONDON and the SUBURBS, by prepaying at the Publishing Office, 13s. per annum (25 numbers) or 4s. 6d. per quarter (13 numbers), can ensure receiving "The Builder," by Friday Morning's Post.

J. J. ETRIDGE, Jr. SLATE MERCHANT, SLATER and TILER. Penrhyn - Bangor, Oakeley - Portmadoc.

PLASTERERS' LATHS (HAND-MADE) ALWAYS IN STOCK. Applications for Prices, &c., to BETHNAL GREEN SLATE WORKS, BETHNAL GREEN, LONDON, E.

THE BATH STONE FIRMS, Ltd BATH. FOR ALL THE PROVED KINDS OF BATH STONE. FLUATE, for Hardening, Waterproof and Preserving Building Materials.

HAM HILL STONE. DOULTING STONE. The Ham Hill and Doultling Stone Co (Incorporating the Ham Hill Stone Co. and C. Task The Doultling Stone Co.) Chief Office:—Norton, Stoke-under-Hi Somerset. London Agent:—Mr. E. A. William 16, Craven-street, Strand.

Asphalte.—The Seysel and Metallic Asphalte Company (Mr. H. Glenn), Off Poultry, E.C.—The best and cheapest material for damp courses, railway arches, warehouse flat roofs, stables, cow-sheds and milkgranaries, tun-rooms, and terraces. As Contractors to the Forth Bridge Co.

SPRAGUE & CO., Ltd., PHOTOLITHOGRAPHERS, 4 and 5, East Harding-street, Fetter-lane, 10,000

QUANTITIES, &c., LITHOGRAPHY of almost accurately and with despatch. METCHIM & SON (OR GEORGE WESBY) "QUANTITY SURVEYORS' DIARY AND" For 1901, price 6d. post 7d. In leather 1/- 6d.

DRY PLANKS AND BOARDS In all kinds of Hard Woods. Mahogany, Wainscot, Teak, Wm. MALLINSON & Co. Abstainers. Offices: 136 & 138, Hackney Road, Telephone: 1319 AVENUE.

ASPHALTE For Horizontal & Vertical Damp Courses, For Flat Roofs, Basements, & c. Special attention is given to the above-mentioned work. THE French Asphalt Co. Ltd. Contractors to H.M. Office of Works, The School Board & c. For estimates, quotations, and all information apply at the Offices of the Company, 5, LAURENCE POUNTNEY, CANNON STREET, E.C.

TWELVE GOLD AND SILVER MEDALS AWARDED. IRON CISTERNES F. BRABY & CO. VERY PROMPT SUPPLY. LARGE STOCK READY. PARTICULARS ON APPLICATION. LONDON: 352 to 364, EUSTON-ROAD, N.W., and 218 and 220, HIGH-STREET, BOROUGH, S. LIVERPOOL: 6 and 8, HATTON GARDEN. GLASGOW: 47 and 49, ST. ENOCH-SQUARE. BRISTOL: ASHTON GATE WORKS, CORONA.

The Modern Walls of Jerusalem.

AFTER the disappearance of the Latin feudal kingdom of Jerusalem at the close of the thirteenth century, and the extension of the Egyptian Mohammedan government in the Levant, the famous city seems to have sunk into a very unimportant condition; no monuments of any size or architectural character can be attributed to the fourteenth and fifteenth centuries. The Christians must have been content with such ruins as they were permitted to occupy, and the Egyptians have left very few traces of their presence in the Holy City. This may partly be accounted for by the fact that during these centuries the capital of the district was once more constituted at Ramleh, on the great caravan route by Gaza, where, in the days before the Crusades, the Ommayyeds had founded their centre of government. At the beginning of the sixteenth century Ramleh was falling into the decay in which we now see it, and Jerusalem was restored as a walled city, after two centuries of ruin. The "Aksa" or principal sanctuary of the "Haram" enclosure (this enclosure, occupying the ancient acropolis of the city, is usually known as the "Mosque of Omar") is probably the only monument of any size erected by the Egyptian Government. According to an inscription it seems to have been built, or rebuilt, by the Mamluke Sultan Mohammed *ibn Kalanin* in 1327. It is merely a very poor attempt to copy a Christian church; the materials are all second-hand, and the mode of construction and the few attempts at ornament are probably amongst the poorest and meanest examples of the Mohammedan style. At the north end is an arcaded porch recalling the design of a common Cairene type of mosque of the period. As an example of

Saracenic architecture it is beneath criticism. One or two small monuments scattered about the Haram without order or arrangement also date from this time.

With the beginning of the sixteenth century came a very great change in the condition of Jerusalem. The Osmanli Turks, in the extension of their immense empire, took possession of Palestine, and one of the most important monuments of the reign of the first two Turkish rulers of Palestine is the singular, and in some respects magnificent, wall erected round Jerusalem (see lithographed plan in this issue). This imposing work evidently dates from the commencement of their rule in 1517, as the inscriptions on the north side of the city record the name of Selim I. Suleiman II, his successor, is perhaps to be credited with the greater portion of the work and its completion. The dates on mural tablets inserted in various portions of the wall range over a period of about twenty-five years. At this time the Ottoman Empire was attaining its most splendid development, and the retreat of the Knights of St. John from Rhodes in 1522 marks perhaps its greatest victory over the Western nations. Fifty years later the battle of Lepanto put an end to all Turkish advance westward, and heralded the decay which is associated with the Turkish name at the present day.

The innumerable voyages, travels, and histories written by pilgrims of the sixteenth century on their return from their perilous journey to the Holy Sepulchre naturally contain many references to this then new wall. These worm-eaten volumes may be found on the dusty shelves of all the older European libraries, and a few extracts from them will suffice to give some idea of the Holy City in those days.

Ludovico degli'Agostini, of Pesaro, wrote an account of his pilgrimage about 1550 for the Duke of Urbino. He describes the new wall of Jerusalem as the finest to be seen in the whole world. It was built of fine white stone properly squared, and decorated with merlins and many turrets, &c. As in many Turkish cities, there was also a fine castle

which reminded him of that at Ferrara. The wall was built by Sultan Suleiman, in accordance with his father Selim's intention, as an *ex voto* to the holy Mohammedan city. Selim, in his victorious progress through Syria on the way to Egypt, had camped outside near the gate of St. Stephen or Bab Sitti Mariam, and here he meditated the complete destruction of Jerusalem. But his intentions were changed in consequence of a dream in which he seemed to see the Holy City being devoured by two lions. Instead of destroying it he determined on surrounding the holy places with the present magnificent wall; but he seems to have desired it should not be prepared for artillery. Before leaving Jerusalem he presented rich gifts to the inhabitants, including the Christian communities. The story of the vision of two lions is supposed to be commemorated in the two very conventional attempts to represent such animals which may be seen over the arch of the Bab Sitti Mariam. The Sultan's decision not to regularly fortify the town originated in the policy of previous Mohammedan rulers, who, for fear of having a strong fortress within their borders, which the Christians would desire to secure, had always destroyed the mediæval walls whenever they became masters of the city.

In the middle of the sixteenth century Jerusalem was supposed to contain 15,000 inhabitants within the new wall, which was about three Italian miles in circuit. The guard, called "Tambraçanò" was changed every six hours to the sound of drums and fifes, and this served for a sort of clock in addition to the call of the muezzin from the minarets, bells being, of course, out of use.

The Seigneur de Villamont, who visited Jerusalem in the latter half of the sixteenth century, was surprised to find the city gates without any *pont-levis* or outworks. At the entry of the château were a number of cannon, some in bronze, others in iron, "qui sont braquées pour la défense de la porte." The château was of great extent, similar to those in Italy, but "sans aucunes tours, fors une bien haut élevée, et en forme

de donjon, qui sert pour faire la sentinelle." Evidently this château, or "Castrum Pisanum," as it was known all through the Middle Ages, has been added to since the sixteenth century, for at the present day there are two or three very distinct towers in its construction.

Quaresimus, "Guardian of Mount Sion," at the beginning of the seventeenth century, hardly mentions the city wall in his voluminous "Elucidatio Terræ Sanctæ." He merely states its having been built by Suleiman, and the legend that the architect had his head cut off at the conclusion of the work (a convenient mode of settling his commission), because he had excluded the portion of Zion on which the Cenaculum stood. Quaresimus also gives the Hegira dates, which were inserted at different points on the wall in small stone tablets, as follows:—

St. Stephen's Gate (A.D. 1516) . . . A.H. 921
Gate of Flowers . . (A.D. 1539) . . . A.H. 944
Damascus Gate . . (A.D. 1539) . . . A.H. 944
Sion and Dung

Gates (A.D. 1542) . . . A.H. 947

The materials were partly quarried for the purpose, but Christian buildings furnished the greater part. The Minorites were expelled from the Mount Sion Convent in 1549 (*Gesta Dei per fratres Minores*), but they only occupied the modern convent of S. Salvator in 1559.

Francis I., King of France, seems to have exerted himself on behalf of the dispossessed Minorites, and an interesting brief on the subject addressed to him by the Sultan Suleiman has been published in various books on this chapter of history. The Jews were accused of intriguing with the Mohammedans to turn the Franciscans out of the Cenaculum, who, after their expulsion, were condemned to remain outside the city for years, exposed to the attacks of Arab marauders.

The voyage of the French Ambassador, M. d'Aramon in 1547 contains some references to Jerusalem. His arrival outside the walls of the city is described, and the way in which he was met by all the notables, escorted by a large body of arquebusiers. The city is described as having been enclosed with walls by the Turks, but its aspect seems to have been disappointing. The streets being uninviting and apparently in ruins, the arcades, which had anciently covered them and permitted of one's passing about the city dryshod in wet weather, had fallen down. The market was near the *Porta Speciosa*. M. d'Aramon seems to have been chiefly impressed by the ruinous condition of the interior of the city.

An old semi-devotional description of the Holy City at this period was written by Fra Bonifazio Corsetti in 1553. It is called "*Liber de perenni cultu Terræ Sanctæ*," and contains some curious particulars. From this it would appear that the ancient wood doors of the Golden Gate were removed at the time of rebuilding the walls, and they were presented to the Franciscans as a relic, and placed in the collection of relics preserved in the Church of the Holy Sepulchre. About this time the annual commemoration of Christ's supposed entrance by the Golden Gate, which was celebrated by a procession of the Franciscan monks from *Eetaphage* to the Cenaculum through the valley of *Jehosophat*, was discontinued.

A sort of guide-book for pilgrims, written by Fra Noe, of the Franciscan Order, of uncertain date, but apparently of about the middle of the sixteenth century, states that nothing remained of ancient times except the Golden Gate and some antiquities in the church of the Franciscans of the Cenaculum. The only important fragment of earlier Jerusalem left in the course of reconstructing the mediæval walls in 1516-1542 was the Golden Gateway. This most interesting late Roman monument does not come within the range of the present notice, except in as far as it affords a singular contrast with the characteristic mode of constructing gateways of Levantine cities during the Middle Ages. The old Roman gateway was with two side-by-side archways, with a straight cut through the wall, much in the way of the gates of Aurelian's wall round the capital. In the sixteenth century the Turks had a very different mode of constructing the entrances to their castles and cities. Rey, in his "*Colonies Franques de la Syrie*," draws attention to the great difference in style of design between the Christian and Mohammedan fortresses, and it is curious to find that which he identifies with the Mohammedans (and also with the buildings of the Order of the Temple) surviving at a period about three centuries after the Crusades. In nothing is this curious survival more noticeable than in the mode of constructing the city gateways. In the Mohammedan style the gateway, instead of being a simple archway defended by one or more portcullis, a drawbridge over a moat, a barbican, &c., as in European fortresses, is always planned on a crooked principle, by which the assailants, after forcing the outer gate of wood and iron, found themselves inside a vaulted passage turning either to the right or left, at the end of which was another heavily constructed gate. By this system the assailants were trapped in a small space and at the mercy of the defenders of the fortifications, who could kill them off through loopholes arranged for the purpose. It will be noticed that all the gates of Jerusalem except the "Golden Gate," which was preserved by the Turks as traditionally built by Solomon the Wise, are planned on this principle, a system evidently found sufficient for the purposes of Eastern warfare before the introduction of more scientific gunnery in the seventeenth century. Such a plan for a gateway almost prohibits the entrance of wheeled vehicles into a town, and until the last few years, when the Bab Sitti Mariam and the Jaffa Gate were altered for the purpose, Jerusalem was almost impracticable for carriages, the only entrance to the city large enough for such a purpose being the Damascus Gate, which still remains in the condition in which it was first built, and still affords an opportunity for the Arab "Arbughi," or coachmen, to display their skill in turning corners with the modern carriages, which nowadays have taken the place of horse litters. All the gates of Jerusalem are decorated with scraps of mediæval carving gathered from the ruined Christian churches, and used up in a meaningless manner. Capitals of columns stuck into the walling as brackets, archstones over windows which they do not fit, and odds and ends scattered about on the principle of shell grotto architecture, have a grotesque appearance. Such orna-

ments as seem to have been cut expressly for the position they occupy are of the most meretricious character. And here it may be noted that all over the walls as well as on the gateways a feature presents itself peculiar to the Levant. In the true mediæval fortresses it was the custom to utilise the granite, marble, and stone columns of the old Romano-Greek cities such as *Cæsarea*, *Jerusalem*, *Askalon*, &c., as bond stones in the thickness of the walls. They seem to have been specially adapted to resist the effects of mining and battering. In the sixteenth century walls of Jerusalem this older style of construction has been imitated with a very curious result. But at this period the supply of columns must have come to an end, or the mere appearance of such a system of building was thought sufficient, and so Suleiman the Magnificent was content with a series of round *patere* dotted over the surface, each one of which is generally carved with a different design of the usual interlacing Arabic style, and slightly projecting from the wall to represent the section of column. The result is as unsatisfactory as such a tawdry sham might naturally be expected to produce, and adds to the unreal character of the work as fortifications.

Jerusalem, since the Middle Ages, has never been provided with any regular trenches or other usual elements of fortification. Merely this imposing wall, three miles in length, and of an average height of about 30 ft., has formed for three centuries and a half an enclosure to the Holy City. Since it was built the city has only once been subjected to a hostile attack, and that from the very Turks who built its wall. In 1825 the inhabitants endeavoured to resist an imposition of taxes, but were quickly persuaded in the matter by a slight bombardment.

SCULPTURE AT THE ROYAL ACADEMY.

It can hardly be said that there is any great work in sculpture in this year's Academy. Of the colossal seated statue of the Queen by Mr. Onslow Ford we have already spoken. As a monumental statue it is broad and dignified in treatment, but we can hardly regard this class of work as fulfilling the highest aims of sculpture; still less the large bronze realistic figures of Cromwell and Dean Hook, by Mr. Pomeroy. It is to be supposed that people will have statues of this kind, but it is rather regrettable to see an artist of Mr. Pomeroy's attainments engaged upon them, when he might be so much better employed.

Taking the other works in the octagon in the order of placing, we come first on a piece of decorative work by an Italian artist, Signor Sortini. This is a model of a bell covered with bas-relief subjects, which are well treated in themselves, but the bell is the wrong shape and proportion for producing tone, being too high and narrow in proportion, and a worse fault is that the hanging loop is formed by figures of angels, which are thus put to a function for which they are quite unsuitable, and which is a degradation of the figure from being a source of expression to acting as a mere mechanical connexion. Mr. Toft's "Spirit of Contemplation" represents a nude female figure seated in a rather too

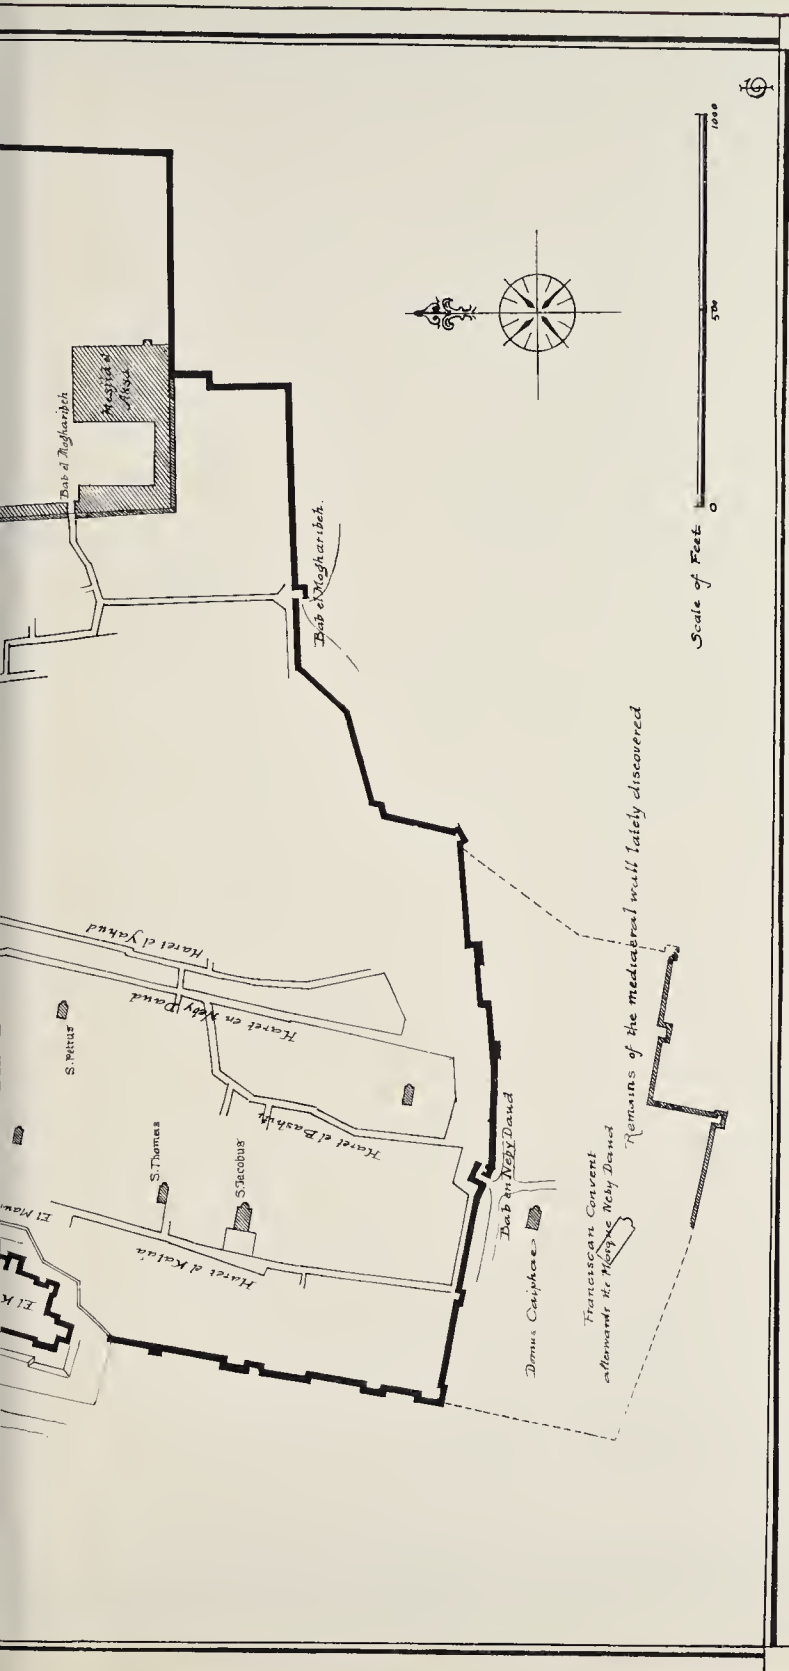

PHOTO-LITHO. SPRAGUE & CO. 44 & 46 EAST HADDON'S STREET, FETTER LANE, E.C.

THE MODERN WALLS OF JERUSALEM.—FROM A PLAN BY MR. GEO. JEFFERY, ARCHITECT
 (See first article in this issue)

in Prescott-street, Goodman's Fields. Having been incorporated in 1758, it was removed to its present site next eastwards of "the Horn-work" or "Mill Mount," one of the earthworks thrown up in the winter of 1642-3, when the King's headquarters were at Oxford. In 1781-3 the buildings were enlarged by James Spiller, and subsequently by Wood, and John Robinson. The "Alexandra" wing, for seventy beds, was added in 1864; in 1876 Queen Victoria opened the "Grocers'" wing, the accommodation being thus raised to a total of 776 beds.

On Friday last week the Archbishop of Canterbury dedicated an open-air pulpit, which has been erected at a cost of 200*l.* in the graveyard of Christ Church, Spitalfields, (Hawkesmoor, 1714-29), as a memorial of the late Dr. Billing, Suffragan Bishop of Bedford for the East End of London, who was rector of the parish for a period of ten years. The old open-air pulpit-cross, where the Spital Sermons used to be preached, was pulled down in the course of the Civil War. It had been rebuilt, 1594, in the place of one which stood in the churchyard—since Spital-square—of the Priory Hospital founded at the close of the twelfth century by Walter Brune and his wife Rohesia, and dedicated to Christ and the Virgin Mary. There are three other open-air pulpits in London: at St. Bartholomew Church, Bethnal Green (Railton, 1843-4); St. Mary Matfelon, Whitechapel (E. C. Aytton-Lee, after the fire of August 26, 1880), built in memory of Dean Champneys, who had been rector during twenty-three years; and, in 1892, in a window in the south wall of Holy Trinity Church, Marylebone-road (Sir John Soane, 1824-8), erected as a memorial of Canon Cadman, a former rector of the parish.

In the May number of the "Proceedings of the American Society of Civil Engineers" will be found an exhaustive paper recording the results of a series of experiments, commenced in 1893 and continued until 1899, by the chief engineer to the Board of Water Commissioners of the City of Detroit, Mich. The purpose of the investigation was to determine the effect of curvature upon the flow of water in closed circular conduits under pressure, and particularly to examine the effect of changes in radius of curvature upon the losses of head in those cases occurring in ordinary waterworks distribution systems. As the paper covers nearly two hundred pages, and includes numerous tables, figures, and plates, we may reasonably abstain from detailed discussion of its contents, and pass on to the most important of the various demonstrations which they afford. The experiments, taken as a whole, appear to prove beyond question that hitherto accepted ideas of the laws governing curve resistance are wholly in error. The resistance due to curvature is shown to be very much less in short than in long radius curve, for the same total length of pipe and angle of deflection. From many experiments upon a 30-in. and a 12-in. pipe, it is apparent that the 90 deg. curve involving the least resistance in a total length of 80 diameters is one between 2 and 2½ diameters radius. This result—or perhaps we ought to say discovery—is sufficiently startling, and, presuming the accuracy of the observations, its meaning is that the theory and

practice regarding curve resistance, as set forth in the hydraulic treatises of all nations up to the present time, are absolutely inaccurate, and are diametrically opposed to the true conditions. The authors do not profess by any means to have exhausted the subject, and as their investigations merely refer to curves of 90 deg., and do not extend to the long radius curves occasionally used, there is ample room for further inquiry.

THE Electrical Review published last week the paper which was recently read to the American Institution of Electrical Engineers by Dr. Kennelly describing a novel storage battery invented by Mr. Edison. This new cell is a very distinct advance on anything that has hitherto been done, and if Mr. Edison can supply it, as he says he can, at the same price as the ordinary lead storage cell of commerce, it will revolutionise many of our methods of electric traction. In practice a good lead battery can be got which will give a horse-power per hour at its terminals for every 150 pounds of its weight. It is stated that the Edison cell gives a horse-power per hour for every fifty-three pounds of its weight, an advance which is in itself quite sufficient to make electric traction for motor cars a commercial success. It will be remembered that the London Electric Cab Company failed because the batteries were ruined by being allowed to run down too far. Dr. Kennelly states that this new cell can be allowed to run down until there is no charge left in it without doing it any harm. In fact, a cell has been discharged and then charged up in the reverse direction without doing it any real damage. The negative pole, that is the one corresponding to the zinc of a primary battery, is iron, and the positive pole is a special superoxide of nickel. It is therefore a nickel-iron cell. The positive and negative plates of the battery are mechanically alike. They consist of plates made of thin sheets of steel 0.024 in. in thickness, out of which rectangular holes are stamped. Each opening is filled with a shallow perforated steel box nickel-plated containing a briquette of the active material. The plates are finally placed in a 20 per cent. solution of potassium hydroxide contained in a vessel made of sheet steel. This electrolyte does not attack any of the parts of the cell, nor are any of the ingredients forming the briquettes soluble in it. The electro-motive force of the cell when fully charged is 1.5 volts, and it is stated that it can be charged in an hour, although the most economical rate of charge is three and a half hours. There is no more important problem at the present time in connexion with electrical engineering than the invention of a light storage battery, and Mr. Edison's invention has naturally aroused the greatest interest.

THE Art for Schools Association has just issued its Annual Report for 1900. The work of the Association, as many of our readers are aware, is to supply elementary schools with good prints and photographs of beautiful and interesting works of art, with the idea of interesting children in pictorial art, and thus prepare the way for the work already being done by loan exhibitions of pictures in poor districts of London and

other large towns. The Association supply these schools at prices allowing a mere nominal profit, and they have, therefore, in order to secure a regular income, started a publishing business supported by annual subscribers, who receive, in return for their subscriptions, copies of all the publications of the Association. These publications are issued annually, and consist of historical subjects, studies of natural objects, and reproductions of standard works of old masters. The usefulness of the Association depends largely on the number of annual subscribers, who by their help enable it to respond to the increasing calls of numberless schools which are anxious to avail themselves of these publications. The number of these sold last year was nearly 5,000.

Fine Art Society's Gallery. THE water-colour drawings by Mr. Arthur Severn, at the Fine Art Society's Gallery, form an interesting collection, some of them very beautiful. A considerable proportion of them may be classified as studies of special effect in landscape. Thus we have "Abbeville by Moonlight" (13), a very moonlight effect except that the towers of the church, with the moon behind them, show rather too much colour for moonlight—this seems to have been purposely done to enhance the cold tone of the moonlit portions of the scene. "Sun effect Cumberland Coast" (23), is good, but open to the objection that the sun is far too large in scale; "Sunset Cloud over the 'Old Man, Coniston'" (28), is fine; "Rain Cloud effect at Sunset, Trouville" (32), and "Early Morning, Cannes" (37), seem rather exaggerated, but may not be so. The finest drawing in the collection is, to our thinking, "Cumulus at Sunset, Cumberland Coast" (18). One or two sea studies, especially "Sea at Alassio," are very free and effective. The "Drawings of Birds and Animals in Motion," by Mr. J. Guille Millais, in the same gallery, are not very artistic in quality; they impress us rather as the observations of a keen sportsman with a talent for drawing, and are in that sense interesting, though disappointing as works of art.

The Modern Gallery. AT the Modern Gallery, 175, Bond-street, is a collection of water-colour drawings by Mr. and Mrs. Albert Stevens—"Gardens at Home and Abroad" and "Sunshine and Shadow in Foreign Lands." The collection includes 130 drawings, many of them of great merit, showing a broad style of work and a good perception of colour effect. The large drawing "In the Olive Woods Cap Martin" (122), by Mr. Stevens, is an admirable work; and many others may be studied with pleasure; we may mention especially Nos. 20, 32, 39, 66, and 69. The work of the two artists is distinguished by the letters "A.S." or "M.S." in the catalogue. We must confess that the artistic honours seem to rest with the gentleman rather than with the lady; at least, we find that nearly all those we had marked as especially good bear the "A.S." initials; but Mrs. Stevens's "Old Vicarage Garden, Norfolk" (7), is an exception, and is a charming bit of colour.

ADDITION TO NEWHILLS CONVALESCENT HOME, ABERDEEN.—Tenders have been accepted for a new wing for sixteen consumptive patients—a new branch of treatment at the institution. Mr. George Coult, Aberdeen, is architect.

THE SAFETY OF ST. PAUL'S CATHEDRAL.

AFTER many years conflict with vested interests and other inimical forces, the tubular railway system has become an accomplished fact and a popular institution. Apart from criticism upon some matters of detail, nothing but praise was awarded to the two first electric subways of the metropolis. When the third was finally opened for traffic, and numerous Bills were deposited for the consideration of Parliament relating to further undertakings of the kind, the inhabitants of London began to feel assured that the true remedy for congested traffic had at last been placed within reach. Moreover, there appeared every reason for believing that the remedy would be unattended by disadvantages, such as sometimes attend the employment of therapeutic agents in the practice of medicine. The solid bed of clay underlying the metropolis to a depth of some 100 ft. was almost universally regarded as affording an ideal matrix for the production of innumerable underground railways. It was assumed that the stiff and tenacious nature of the material would permit of endless burrowing, and that the restless activity of the busy hive below would be unheard and unfeared at the surface. It was with sincere regret that we found reason to doubt the accuracy of the latter assumptions. First came complaints from residents along the line of the Central London Railway of undue vibration and noise, and then suggestions that the stability of buildings might be seriously affected by the same undertaking. Some of us were possibly inclined to regard the contentions of property owners as somewhat fanciful, and no doubt the advocates of such were in duty bound to present their cases in the most forcible manner, but no one now denies the fact that undue disturbance has followed the construction of the railway. Eminent authorities attributed this unfortunate result to defects in the design of the rolling stock, and in the construction of the permanent way, and consoled us by the hope that when these faults had been remedied there would be no further cause for anxiety. Nevertheless, we believe the travelling public must be prepared for an access of watchful opposition on the part of the property owning public to all new lines projected beneath the metropolitan area. Perhaps one of the most serious of the evils apprehended is injury to the historic buildings to be found in various parts of London. Already it is the fact that the spire of Bow Church, in Cheapside, is nearly two feet out of the perpendicular, and this deviation is attributed to excavations in connexion with the Central London Railway. The accuracy of this view has not yet been established, but the fact that it is seriously advanced is sufficient to prove the uneasy feeling that exists with regard to low-level lines in the metropolis. Bearing in mind the previously considered points, we can quite understand the anxiety entertained by the Dean and Chapter of St. Paul's Cathedral as to the possible effects that might attend the construction of the proposed City and Piccadilly Electric Railway. Archdeacon Sinclair, who has doubtless had the benefit of technical advice, recently said that as the soil under Ludgate-hill and the immediate neighbourhood is chiefly made up of loose gravel and sand, any excavations which would tend to drain off the underground water, would, in all probability, cause a crack in the extensive block of concrete upon which the Cathedral rests. In such an event, the authorities believe a collapse or a settlement of the building might result, and the example presented by the Church of St. Mary-le-Bow in no way tends to allay their apprehensions. We observe that the promoters of the new line make the announcement that a deviation will be made in the vicinity of the Cathedral so as to ensure the avoidance of possible injury; but if there is to be any excavation, tapping underground springs at a lower level, the diversion could hardly possess the anticipated virtue.

Our readers will no doubt remember that the pioneers of low-level railways have always spoken of the London clay as a stratum, impervious to water, in which tunnels might be cut as safely and easily as a mite eats its way through cheese. The fact is, however, that the tunnels of tubular lines are not invariably driven at a level where continuity of the clay can be assured. Trouble has before now been caused by the presence of water, coming down through faults in the clay or met with during

occasional penetration of the overlying beds of sand. In such cases, it would naturally be futile for the engineers to attempt draining off the underground water in the manner apparently suggested, or feared, by the authorities of St. Paul's. No engineer in his senses would dream of such a thing, and, as our readers are well aware, operations are conducted in all cases of the kind by the aid of compressed air until the springs are permanently sealed by the finished tube with its impervious grouting. Very likely the proximity of a subway to the upper edge of the clay may tend to accentuate vibration under certain conditions, but we cannot understand how any settlement can be caused so long as the tube remains intact and dry.

The methods adopted by coal and salt miners are constant sources of inconvenience in the North of England, but similar practice does not enter into the philosophy of the deep-level railway engineer, and it is very difficult to understand how injury to surface buildings may be expected to result from his work. At the same time, it must be remembered his operations are conducted in an unknown and unexplored land, where unexpected problems may arise to baffle the most carefully-laid plans. At no distant date we may expect to find the question discussed fully, and we shall then know better than at present how far the fears of the Dean and Chapter may be justified, and whether the safeguards proposed by the railway company may be looked upon as entirely satisfactory.

THE INTERNATIONAL CONGRESS OF FIRE BRIGADES AT BERLIN.

ON Thursday, the 6th instant, the International Congress of those interested in fire brigade work and cognate subjects, which has been organised by "Le Grand Conseil International des Sapeurs Pompiers," was opened at 10 a.m. by a formal and ceremonial meeting under the Presidency of the Minister of the Interior, at the Imperial Houses of Parliament. The House of Representatives in which this meeting, as well as the subsequent business meetings of the Congress, was held could only accommodate a small proportion of the 2,000 members attending the Congress.

After formal addresses of welcome and thanks by representatives of the various nationalities present, the following papers were read—(1) "The Relations between Fire Brigade Work and Building Regulations" by Fire Brigade Inspector Kleber, of Stuttgart; (2) "The Automobile Traction of Fire Engines" by Captain Cazier, of Creil, France, Vice-President of the "Grand Conseil des Sapeurs Pompiers"; (3) "The Organisation of the British Fire Prevention Committee and its Investigations with Fire-resisting Materials" by Mr. Edwin O. Sachs, Chairman of the British Fire Prevention Committee; (4) "Smoke-resisting Apparatus" by Captain Welsch of the Fire Brigade of Ghent.

In the afternoon a visit was made to the highly-interesting and well-organised works of the General Electrical Company, in whose two factories (connected by an underground railway) over 6,000 men are employed in the manufacture of electrical apparatus.

In the evening a formal dinner, attended by about 400 members, was held in the restaurant of the "International Exhibition of Fire-prevention and Fire-combating Appliances," an exhibition organised in connexion with the Congress, and of which we shall give a detailed description in a future number.

On the following day, Friday, the 7th inst., the Congress resumed work at 9 a.m., and the following papers were read—(1) "The Participation of Fire Insurance Companies in the Cost of Fire Protection Generally," by Fire Brigade Inspector Krameyer, of Merseburg. This led to an animated discussion, after which a resolution was carried by a large majority affirming the desirability of fire insurance companies being compelled by law to contribute towards the expense of maintaining fire brigades, a decision by no means surprising seeing that almost every one of those present was a member of a fire brigade, that so realistic opinion is strong in Berlin, and that municipal insurance, rather than underwriting by public companies, is a considerable element in Germany, where, indeed, it may be said that fire insurance companies are to-day fighting for their lives with the odds, in public opinion,

heavily against them. The remaining papers were (2) "Remarkable Fires in Russia, and the Question of Fire Extinction and Water Supply in Extremely Cold Weather," by Lieut.-Colonel E. von Lunds, Fire-Brigade Major, of Odessa; (3) "Fire Protection in Warehouses," by Fire Brigade Director Rabstrat, of Stettin; (4) "The Development of the Carbonic Acid Fire-engine and its use in combination with Steam Fire-engines and Hydrants," by Fire Brigade Director Dittmann, of Bremen; (5) "Electric Lighting Installations as the Cause of Fires, and their Comparison with other Lighting Systems," by Signor Ugo Penné, First Lieutenant of the Milan Fire Brigade; (6) "The Use of Small and Large Hose," by Captain Müller, of Vienna; (7) "Fires on Board Ship and Cotton Fires," by Fire Brigade Officer Präbels, of Hamburg.

The social functions of the Congress for this day comprised a visit in the afternoon to the Royal Palaces; a fire brigade parade in the courtyard of the head fire station, where the methods of training firemen and of turning out on receipt of a call were illustrated; and in the evening a popular concert in the Zoological Gardens. There were besides several semi-private dinner parties, including that given by Mr. E. O. Sachs and the Executive of the British Fire Prevention Committee at the Hotel Bristol, which included amongst the guests the British Ambassador, Sir Frank Lascelles; Herr Hinckeldey, Director of Public Works, the Prussian Ministry of Works, President of the Berlin Architekten-Verein; Captain Gamble, of the London Fire Brigade; Major Fox, of the London Salvage Corps; Herr Westphalen, Chief Officer of the Hamburg Fire Brigade; Herr Dittmann, Chief Officer of the Bremen Fire Brigade; Herr Müller, Chief Officer of the Vienna Fire Brigade; Herr Meier, Chief Officer of the Amsterdam Fire Brigade; Count Komarovsky, of St. Petersburg; and Count Fernandez, of Oporto.

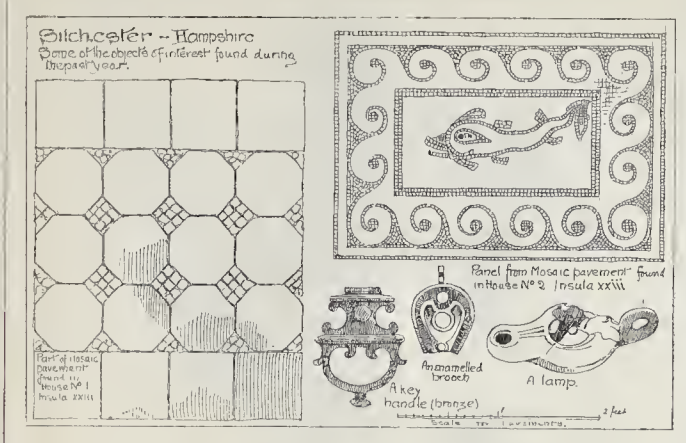

On Saturday, the 8th instant, the following papers were read (1) "The Benevolent Funds of the German Fire Brigade Unions," by Fire Brigade Director Weigand, of Chemnitz; (2) "Spontaneous Combustion," by Professor Dr. Madem, of Greifswald; (3) "Fire-resisting Construction and Materials," by Fire-brigade Director Prinz, of Altona; (4) "First Aid to the Injured, more especially in Relation to Accidents occurring at Fires," by Dr. Leu, Army Surgeon, of Berlin; (5) "Hydrants," by Fire-brigade Inspector Bahrdt, of Berlin; (6) "Description of the Installation of Fire Alarms in a Street in Amsterdam, by which each House can give an Alarm to the Fire Brigade," by Fire Brigade Director Meier, of Amsterdam; (7) "New Forms of Fire-alarm Apparatus," by Herr Grebel, of Berlin.

On the social side were visits to the establishment of Messrs. Wertheim, the Whiteleys of Berlin, and to the factory of the Berlin Electrical Company, whilst in the evening a reception, attended by some 800 members of the Congress, was given by the Mayor and Corporation of Berlin in the Town Hall.

On Monday, the 10th inst., pleasure alone was the object of the Congress in the form of a steamboat excursion and a visit to the cable factory of the General Electrical Company.

From the nature of the papers read and the fact that some 2,000 members attended the Congress from all parts of Germany, from Austria, France, Russia, Italy, Denmark, Holland, Belgium, and the United States, it can be seen that the occasion was one of considerable importance as well as usefulness, in which England was represented by officers of the London Fire Brigade and Salvage Corps, the fire brigades of Manchester, Liverpool, and Birmingham, and several members of the National Fire Brigades Union and of the executive of the British Fire Prevention Committee.

COAL SMOKE ABATEMENT.—We are informed that the Coal Smoke Abatement Society are about to make a series of tests upon domestic grates, with the object of ascertaining the following facts:—1. The amount of fuel consumed when burning under ordinary conditions. 2. The amount of smoke emitted. For the present the lists will be limited to open sitting-room grates burning either bituminous coal or coke. The society invite manufacturers and patentees to submit a grate for this purpose. The only condition imposed is that the grate should be fixed and taken away by them at their own cost. The tests will be made in the Westminster district. Application to be made to Mr. E. Jackson, Secretary of the Coal Smoke Abatement Society, 59, Chancery-lane.

SILCHESTER.

AMONG the many objects of interest found in the excavations at Silchester during the past year a small proportion only are of strictly architectural character. Apart from the houses themselves, the planning of which is always interesting, some pavements have been discovered in the houses Nos. 1 and 2 in Insula No. xxiii, near the north gate. The most ornate was found in house No. 2, and consisted of four panels surrounded by an ornamental border. Of these panels one is destroyed, two have a conventional pattern, and the fourth has a dolphin. The groundwork of the pavement was of chalk tesserae, the dolphin and border being in grey tesserae, with a few red fragments introduced into the fins, head, and tail. Of considerable interest is a plainer pavement found in house No. 1, an example of *opus sectile* and *opus tessellatum*. A small piece of the original is exhibited in a frame, and here illustrated. The squares and octagonal pieces are of brick, the intermediate spaces being filled with chalk tesserae. These pavements have all been carefully drawn to scale by Mr. G. Fox, and his beautiful measured and coloured drawings are hung on the walls. A great deal of pottery was found, many of the objects being in a very perfect state; and in one of the numerous pits was a horde of iron tools, including smiths' tools, a scaber, or buttrice (an instrument used by farriers), a shoemaker's anvil, carpenters' tools, armourers' scythes, anvils, and a remarkable fragment of a ladder. There are likewise many padlocks, chains, and handles, a bronze steelyard weight in the form of a bust, a bronze key handle, several examples of brooches (one or two enamelled) and other personal ornaments, fragments of glass, a lamp, and many pieces of painted plaster from the walls of the houses.

Other details will be found in the *Builder* for June 7, p. 544.
The exhibition closes to-day.

MAGAZINES AND REVIEWS.

THE *Art Journal* is almost entirely occupied with reviews and illustrations of the Academy, the New Gallery, and the Glasgow Exhibition. The article on the Academy is more remarkable for verbiage than critical insight, as may be gathered from the mere fact that the writer omits all mention of Mr. Wyllie's sea picture of the Bay of Biscay, perhaps the most powerful work of the year.

The *Magazine of Art* is also largely occupied with reviews of contemporary exhibitions; but it includes an interesting article on "Artists' Studios—as they were and as they are," though this article is apparently entirely occupied with studios "as they were," illustrated by representations of studios by the artists themselves; some of them perhaps realistic, some obviously imaginative. Possibly the subject is to be continued for the consideration of studios "as they are," though there is no intimation of this. An article on the "New Salon of 1901," by M. Henri Frenet, is an absurdly optimistic estimate of a very weak exhibition.

The *Studio* contains two articles of considerable interest on two special forms of artistic work: "The Medallist's Art," by Mr. Roger Marx, and "The Art of True Enamelling upon Metals" by Mr. Alexander Fisher; the latter partly practical, partly philosophical; the philosophic element is indeed rather too predominant, and includes a good deal of rhapsodising which is of no particular value. However, the article is to be continued, and will perhaps take a more practical turn in the sequel.

In the *Architectural Record* Mr. Montgomery Schuyler, writing under the heading "Nouveautés de Paris," draws attention to some recently erected Paris house fronts which go out of the usual very conventional line of Paris street mansion architecture. Yet, while we certainly agree that the average street architecture of the better streets in Paris is far too much conceived on one model, the one or two examples of this conventional Paris style which are given in the article are superior in architectural dignity and in the quality of style to the exceptional examples which are illustrated. One or two public buildings of Paris are included in the survey, and the author, we are glad to see, does full justice to the Musée Galliera, which he rightly estimates as "one of the most beautiful things in Paris." The illustrations of "Some Recent American Designs" are occupied with two buildings, a millionaire's residence designed by Messrs. McKim, Mead, & White, and the New York Yacht Club, designed by Messrs. Warren & Wetmore. The illustrations of the mansion are all interiors, which owe their effect as much to the general treatment of furniture and embellishments (which may however be the architects' work) as to architectural design in the stricter sense; the exterior is not illustrated. In the Yacht Club House the exterior façade is exceedingly French in type, except in the curious and most unsatisfactory treatment of the loggia story at the top, with apparently an open timber joisting as its only cover, the ends of the joists projecting over like so many spikes; the appearance of this, at the top of a very substantial stone elevation, is most absurd, unless indeed it represents something which is unfinished, in which case the photograph should have been deferred till the building was completed. The interiors show a bold variety of treatment; the "model-room" has a most "robustious" marble fireplace, also exceedingly French in design; the grill-room is designed in imitation of the "between decks" of a ship—a little architectural joke which however seems out of keeping with the remainder of the interiors. "Recent Domestic Architecture" is chiefly occupied with the illustration of another very costly mansion, very dignified and satisfactory in exterior design; in this case plans are given, which are of some interest as showing the arrangement of the principal or reception floor in a first-class American mansion. What is called the breakfast-room is a very large bay opening out of the dining-room, and apparently (from the dotted lines) capable of being curtained off from or thrown into the main room, at pleasure; there is something in this suggestion.

The aspect compass of the plan is not given. Signor Melani contributes an article (translated) on "Modern Italian Architecture," a subject on which no Italian architect can be trusted to write, as his view of the subject is sure to be so merely local, national, and partial. The structures illustrated, and named with praise, include Signor Antonelli's "Mole" at Turin, an illustration of which was sent to us some time since, which we refused, not thinking it worth while to publish so hideous a monstrosity. The Ponte Nuovo at Pisa is a pleasing and well-proportioned bridge structure, and the modern synagogue at Florence has the merit of architectural unity of conception.

The illustrations of the *Berliner Architekturwelt* are still extensively occupied with the recent competition designs for the Charlottenburg bridge, which show some very fine and bold conceptions; it is in designs of this class that the architectural genius of modern Germany shows at its best. A children's hospital (Kinderasyl) in the Kürassier-Strasse at Berlin, by Herr Hoffmann, is a very pleasing building, both in general character and in many of the details.

In the *Artist* there is published a plan, by a "correspondent" whose name is not given, for a site for the proposed monument to Queen Victoria, in the centre of a proposed double crescent laid out to east and west of the new Holborn to Strand street, the memorial to be placed in the axis of the street. We do not think the idea has anything to recommend it. The neighbourhood is not the right one for such a memorial, and it would form a serious cause of delay that all the traffic should have to circulate round the great curve proposed, instead of taking the shortest route.

Feilden's Magazine continues Mr. Maxwell's useful and fully illustrated essay on "The Town Refuse Problem"; and there is also a valuable article by Mr. Archibald Little on "The Automatic Transmission of Material."

The *Engineering Magazine* contains Mr. Phillips's second article on "Competition in Iron and Steel Making," the main point of which is to consider how England is to hold her own against American enterprise and competition in this department of industry. And the conclusion is that if the men and their unions, will not co-operate with the employers in working with the best and newest labour-saving methods, successful competition is impossible. The same number contains an interesting article on personal recollections of Ericsson.

In the *Nineteenth Century* Mr. H. Hamilton Fyfe writes a short article on "Mr. Sargent at the Royal Academy." He commences by assuming that every one is wearied and depressed by a visit to the Academy exhibition, a position which we deny, and which is a mere piece of cant of the day; it is the fashion to sneer at the Academy, but for those who can find no interest at all in the annual Academy exhibitions we should say that the fault lies in themselves. The further argument is that the reason for this lack of interest lies in the fact that the painters have nothing original or striking to give us; that this is only not true in regard to Mr. Sargent; but that his failure lies in the fact that, though original he is not beautiful; in which there is truth. Burne-Jones's fame, as Mr. Fyfe says, lay in the fact that he had a clear ideal of what constituted beauty in art, and pursued it without swerving; and the one thing needed, he thinks, in Mr. Sargent's art is this quality of the ideal—"of imagination striving towards the noble and the beautiful, shrinking from the common-place and from all that is not lovely and of good report." He regards Mr. Sargent's sculpture in this year's Academy as an exception, and we agree with him in so far as that this work shows a distinct endeavour after beauty of design; but when he says that "the ideas which this fine work conveys are of the first order," we must again take exception. The idea of the work seems to us to be that of a repellent and painful superstition, but it is a fine work in a decorative sense. In regard to Mr. Sargent's pictures, however, we think he has hit the truth. They are remarkable for immense power of execution, without the sentiment of the beautiful; and it is as well that this should be recognised.

The *Pall Mall Magazine* contains an article by Mr. F. Wedmore on the French painter Chardin, which is a piece of fine and superior criticism. He contrasts Chardin with William Hunt, whose imitations of facts in Nature are

so clever, yet they are "never nobly seen." "Clever man as Hunt was, when you have tasted Chardin's art the savour of the art of William Hunt has gone out for ever." This may be a little too strongly put, but there is no doubt that too much has been made of Hunt's realism, which rarely if ever went beyond realism.

Scribner, in "The Field of Art," gives a criticism of the buildings and sculpture of the Buffalo Exhibition, but in default of illustrations one cannot gather anything special from it, except that we note that it had been determined that, in view of the picturesque quality of the park in which the exhibition was situated, the exhibition buildings themselves should be laid out on strictly symmetrical lines as a contrast; which seems a right view to take.

In the *Century* "Cole's Engravings of Old Masters" is represented by an engraving from Wilkie's "Boys Digging for Rats"; the light and shade effect of the picture is admirably translated in Mr. Cole's broad woodcut style, and it is surprising how well he has got the character and expression of the faces, on so small a scale, without departing from the prevalent texture of execution of the whole engraving. "The Centre of the World of Steel" (or what an American magazine calls the "center") is an interesting illustrated article by Mr. Waldon Fawcett on the work at the Pittsburg foundries.

We have received also *Harper*, the *Revue Générale*, the *Gentleman's Magazine*, and *Knowledge*.

THE SETTING OF PORTLAND CEMENT.*

BY GAVIN J. BURNS, B.Sc., F.S.I.

PORTLAND cement, as commonly manufactured, consists of a fine powder composed of grains of irregular shape, varying in size from $\frac{1}{100000}$ th to $\frac{1}{2500}$ th of an inch, and averaging about $\frac{1}{20000}$ th of an inch. The grains are mostly transparent and crystalline in structure. A few opaque grains are interspersed among the others.

The specific gravity of the grains is 2.7. A bushel measure of cement weighs about 112 lbs. when loosely filled. This is equivalent to a specific gravity of 1.4. Consequently, in a bushel of cement about one-half the bulk is cement and one-half interstices. The weight of a bushel of cement, however, is of no scientific value, because the apparent heaviness of the cement depends on the capacity of the measure. A small measure filled with cement is only a trifle heavier than the same measure filled with water. When mixed with water and allowed to set, the powder absorbs 30 per cent of water and yields a pat having a specific gravity when wet of 1.92 to 2.01. Briquettes made for testing, which have been allowed to soak for a week in water after being made, have a specific gravity of 1.95 to 2.15 when dry. A high specific gravity generally denotes a high tensile strength, as the following examples show:—

Specific Gravity.	Breaking Strength in lbs. per sq. inch.
2.04	295
2.05	325
2.05	440
2.08	460
2.10	550

The above specific gravities refer to the samples when dry. If they were saturated with water the figures would be 4 or 5 per cent higher.

In ascertaining the specific gravity of an absorbent substance like a briquette of Portland cement allowance has to be made for the absorption of water during the process. This can be easily done in the following manner:—Weigh the specimen in air; call weight in air *a*. Weigh again in water; call weight in water *b*. Take the specimen out of water immediately, and weigh while still wet a second time in air; call this weight *c*. Then specific gravity equals $a/(c-b)$.

It appears from the foregoing figures that if a bushel of cement weighs 112 lbs., it shrinks about 10 per cent, in bulk when set.

Part of the water used in mixing is simply held mechanically in the pores of the cement. This water evaporates on drying in a warm

* This is reprinted from the "Professional Notes" of the Surveyors' Institution; but the diagram showing the microscopic appearance of Portland cement in setting has been specially made by the author for this publication.

Microscopic View of Portland Cement in Course of Setting.

place. The remainder of the water enters into chemical combination with the cement in the form of a hydrate. The amount of water in chemical combination varies with the time the cement has been mixed. If a sample of cement is mixed and allowed to dry at once, the amount of water chemically retained is about 7 per cent. After the sample has been kept under water a week, the proportion increases to 17 per cent. The chemically-combined water is driven off at a dull red heat. Decomposition begins, however, at a lower temperature. This is shown by the fact that a briquette loses its strength when heated. Some sample briquettes which had been heated for four hours to a temperature estimated at 500 deg. were found to have been reduced to one-half their original strength.

So far as I am aware, the process whereby cement, on setting, is converted into a solid mass has never been fully investigated. The cement itself is known to be a compound of silica, alumina, and lime, or a mixture of several compounds of these substances. It is also known that setting consists essentially in the formation of a hydrate. But it is not known precisely why the formation of a hydrate should cause the cement to set. Quicklime combines with water and forms a hydrate, but does not set; and there are many other substances which form hydrates, but do not show the phenomena of "setting." Why, then, should the combination of cement with water convert it into a substance harder and more durable than many kinds of stone?

Such being the case, I have tried to ascertain what information on the subject could be obtained by means of the microscope. A thin slice cut from a briquette of cement is easily seen to be a kind of conglomerate composed of opaque particles intermingled with transparent doubly-refracting crystals. In order to watch the process of setting a little cement may be dusted on a slide, an ordinary cover glass placed over it and fastened down, and the whole put into a dish of water. On examining the slide with a power of about 200 from time to time, it will be found that the grains of cement become covered with tufts of acicular crystals, which begin to make their appearance some times in half an hour, sometimes not for two days. The crystals are much too minute for their form to be observed, but they appear to be of uniform width, so may be assumed to be prismatic. The crystals appear to grow only in length, the width remaining constant. The greatest length I have observed is $\frac{1}{10000}$ th of an inch. The width was too small a quantity to be measured with the powers I have used, but is probably under

$\frac{1}{10000}$ th of an inch. The tufts of crystals generally spring from angles or prominences on the grains of cement. The crystals, in fact, somewhat resemble tufts of grass growing on rough ground. One can readily understand how the growth of these crystals on adjoining grains of cement, by interlacing with one another, unites the whole into a solid mass.

Let us consider a little more closely the manner of formation of these crystals. It may be safely assumed that they are produced by the combination of water with some constituent of the cement, and it is probable that this constituent is the active ingredient which causes the cement to set. Moreover, the definite form of the crystals implies that they have a definite chemical composition. It is also clear that the crystals are deposited from their solution in water, but that when once deposited they cannot be again dissolved. It appears, consequently, that Portland cement (or, rather, some one of its constituents) exists in two forms, one of which is soluble in water and the other an insoluble hydrate. In my opinion, it is to this fact that cement owes its power of setting.

In conclusion I may observe, as a matter of practical importance in the testing of cement, that the setting is greatly retarded by a low temperature. A briquette which has been kept in water only a few degrees above the freezing point will only stand about three-fourths of the stress which another briquette will stand which has been kept for the same time in water at 60 deg.

The accompanying sketch shows the appearance presented by Portland cement while setting, as seen under the microscope.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—A special meeting of this Association was held in the Royal Institution on the 5th inst. Mr. Henry F. Kerr, the President, in the chair. The Chairman referred in fitting terms to the death of Mr. John M. Brydon, London, and it was resolved that an expression of the Association's regret and sympathy be sent to the relatives of the deceased. Votes of thanks were awarded to all who had contributed directly to the success of the recent visitations, Mr. J. G. Goodchild, of the Geoloical Survey, being specially mentioned in connexion with the "geological ramble" in the Queen's Park. Professor Baldwin Brown addressed the meeting on Durham, Hexham, and Chesters, with the view of conveying a general idea of the character and aspect of the principal buildings,

&c., to be visited on the occasion of the Association's annual excursion on the 14th and 15th inst. His remarks were illustrated by lantern transparencies.

ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.—A special meeting of the Council of the Royal Institute of the Architects of Ireland was held at the Institute Rooms, 20, Lincoln-place, on the 5th inst., Sir Thomas Drew, the President, in the chair. The following resolution was passed unanimously:—"The attention of the Council of the Royal Institute of the Architects of Ireland has been directed to recurring instances in which county surveyors, under the new establishment of county councils, are engaging in private practice, both in architectural and engineering work. This Council are of opinion that in the interests of the public service it is desirable that the county councils should avail themselves of the powers conferred upon them by Section 115, Sub-section 18, of the Local Government (Ireland) Act, 1898, for the purpose of making such arrangements with the county surveyors as will enable them to devote the whole of their time to their official duties."

ARCHÆOLOGICAL SOCIETIES.

ROYAL ARCHÆOLOGICAL INSTITUTE.—At the general meeting, Wednesday, June 5, Sir Henry H. Howarth, President, in the chair, Professor W. Boyd Dawkins gave an account of the exploration of the cairn at Gop, near Prestatyn, on the east side of the Vale of Clwyd, and of the cave discovered close by. The cairn, called in local talk the tomb of Queen Boadicea, consisted of a pile of blocks of limestone 330 ft. long, 223 ft. wide, and 46 ft. high. A shaft was sunk in the centre to the level of the solid rock, and from this three drift ways were carried along the line of the rock to a distance of 30 ft. with but negative results, the only remains met with being a few bones of sheep or goat, hog, and ox or horse of the usual prehistoric refuse-heap type. The stones were too loose to allow the exploration to be carried on further without timbering, and it was found impossible satisfactorily to explore the heap without removing the whole of the stones. The cairn probably marks the position of the sepulchral cave which was discovered below at a distance of 141 ft. The site of this cave was marked by a fox earth, which completely covered the entrance. On cutting into it, the broad opening of the cave was revealed, filled with three distinct deposits. On the rocky floor of the interior of the cave was a stiff yellow clay, from one to two feet thick, belonging to the glacial period, and without any fossil remains. Above this was a layer of grey clay—2 ft.—containing the remains of the cave hyæna, bison, stag, reindeer, roe deer, horse, and woolly rhinoceros. Above this, extruding to the roof of the cavern, was a prehistoric accumulation about 6 ft. thick, containing bones of the domestic animals used for food by man, proved by the associated pottery to belong to the Bronze Age. It was largely a refuse heap accumulated during the time it was occupied by man. As this was worked away towards the inside a large number of bones were met with underneath slabs of stone, and when these were removed a wall became visible, built of rubble stone, about 4 ft. high and 4 ft. long. This proved to be one of three walls of a sepulchral chamber, the fourth being formed by the inner wall of the cave. Inside were the remains of upwards of thirteen skeletons of various ages, which had been buried in successive times in a contracted posture. Associated with them were fragments of pottery of the Bronze Age, two links of jet or kimmeridge coal, and a carefully ground flint flake, looking almost like the blade of an ivory paper knife. The examination of the skulls proved that the predominant type was that of the long oval-headed inhabitants of the district in the Neolithic Age, while two were round heads belonging to the later Goidelic conquerors of Britain in the Bronze Age. One of these was a female skull. This association of the two races in one family vault affords clear proof that at this time the fusion of peoples had begun, which has been going on ever since, a fusion in the course of which the Iberic tongue gradually became obliterated. In later times the arrival of the Brythonic peoples caused in its turn Gaelic to yield place to the Welsh tongue, and to be represented mainly by isolated names of places and rivers.

Professor Dawkins thought it very probable that the cairn was made to mark the site of the family sepulchre.—Mr. E. W. Brabrook read a paper on "Mediæval Lavatories," illustrating his subject with a drawing of the twelfth century example at Christ Church, Canterbury. He gave a list of remaining examples, chiefly monastic, divided into two classes—those with circular or octagonal plan, and those with rectangular plan. Of these the first class contained all the earlier examples. Referring to the lavatories at Canterbury and at Mellifont, visited in 1900 by the Institute, he noted the persistency of the opinion held by a former generation of antiquaries, that these buildings were baptistries; at Canterbury the authorities went so far as to place a font in the upper chamber there, by way of restoring the building to its original use. The description of the great lavatory at Durham, from the "Rites of Durham," gave an excellent idea of the magnificence of these structures in the larger monastic houses. Of the second class with rectangular plan, a very fine specimen existed at Gloucester in the north wall of the cloister, complete except for the lead linings of the water-trough. This form was the usual one for domestic lavatories, which were sometimes very large, as in the case of one of which it is recorded that a hundred knights and ladies could wash there at the same time.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The concluding meeting of the session was held on the 5th inst., Mr. Blashill, Vice-President, presiding, Mr. E. W. Fry, of Dover, sent photographs of the Romano-British pottery recently discovered at Walmer and a plan of the site, with some interesting notes. Among the exhibits were two antique candlesticks of iron of peculiar construction, probably of Dutch origin, shown by Dr. Winstone, who also exhibited some leaf-shaped and some barbed arrow-heads with modern mounts. Dr. W. de Gray Birch read a paper on "Some Aspects of the Life and Times of King Alfred the Great," in which he pointed out that the celebration of the millenary of Alfred would have been one of the more prominent events of the year had it not been for other imperial causes which had acted adversely in this respect. As it was, however, London by a special exhibition in the British Museum, and Winchester by a special congress, were preparing to honour Alfred's name and fame, and thus the two cities with which Alfred was very closely connected would be doing something to remind us of his time. Dr. Birch recapitulated, at some length and in well-chosen words, the familiar story of the King's life, his youthful years, his afflictions, his predilections, his wars, and his occupations, brushing away, as he did so, many apocryphal stories that have grown up round the hero, and devoted considerable time to a critical exposition of the archaeology of the "Alfred Jewel" and other cognate relics of the Anglo-Saxon goldsmiths' and enamellers' arts, and to a description of the numerous literary works on which Alfred occupied himself.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—A visit was made by the members and associates of this Society on the 12th inst. to the air-compressing station for the Shone system of sewage ejection at the Sewage disposal works, Erith, Kent, and the engineering works of Messrs. Fraser & Chalmers, which are also situated at Erith. The party first visited the air-compressing station of the Erith sewage disposal works, where there are four gas-engine air-compressors, two sets in duplicate. All four engines have automatic arrangements for throwing the air-cylinders out of work when the working pressure in the receiver is reached. The Shone ejector system has been fully described in our columns on former occasions. The party subsequently visited the works of Messrs. Fraser & Chalmers, which have been in operation for about ten years, and are well equipped with modern tools and appliances. The manufactures carried on are gold and silver mining machinery, hoisting and pumping engines. Riedler patent mechanically controlled valves are used for pumps and air compressors. In the machine and fitting shop is a pit 80 ft. long by 20 ft. wide and 8 ft. deep, covered with a removable floor, so that in erecting vertical engines there is a vertical height under the crane of 45 ft. The works are connected by rail with the South-Eastern

railway, and cars can be loaded direct from the machine shop cranes.

THE INSTITUTION OF JUNIOR ENGINEERS.—On Saturday afternoon, June 8, a large party of the members were, by the courtesy of the engineers, Sir John Wolfe Barry and Mr. C. A. Brereton, enabled to inspect the Kew Bridge works. They were shown over by the resident engineer, Mr. R. W. Dana, and on behalf of the contractor by his son, Mr. Alexander Gibb. The work of reconstructing Kew Bridge consists of three distinct parts.—1. Construction of a temporary bridge; 2. Removal of the old bridge; 3. Construction of the new bridge. The temporary bridge was begun in March, 1899, and was opened for traffic on October 12 of the same year. It consists of an 18 ft. roadway, with two 5-ft. footways carried on timber trestles and piles, and is about 300 yards in length. For the river traffic three openings are provided, a central one of 75 ft., a northern one of 40 ft., and a southern one of 50-ft. clear span, the roadway being carried across these by trough flooring resting on plate girders, from which the footpaths are bracketed out. The roadway is wood paved throughout. The removal of the old seven-arched bridge was begun directly the temporary bridge had been thrown open to traffic. The parapets, roadway, and filling above the arches were first removed, then centres were successively placed under the arches and the latter were removed course by course. The old pier foundations, which have given some trouble to get out, are laid on timber platforms sunk from 3 ft. to 10 ft. below low water line. The old bridge is now all removed, with the exception of the foundations of the two central piers and a portion of the approach viaduct and piers. The new bridge consists of three elliptical spans, a central one of 133 ft. and two side spans of 116 ft. 6 in. each, with a central roadway of 20 ft. above T.H.W. The width between parapets is 55 ft., or more than double that of the old bridge, and the gradient of the approaches is 1 in 40. The arches are of granite throughout, and in the piers and abutments the granite is backed with brindle brickwork in cement. Over the piers there are to be four shields, carved in granite, bearing the arms of Middlesex and Surrey respectively. The outline of the voussoirs is brought into relief by heavy rock facing with rusticated joints. Both pier and abutment foundations were put in by means of whole timber (single row) sheet piling cofferdams, tongued and grooved, and driven 5 ft. below the finished foundation level, which for the piers is 16 ft. below the bed of the river or 14 ft. into the London clay. A month ago the north abutment had been built up to springing level, and three courses of arching had been laid before the centering ribs, which are to carry the arching during construction, are erected. The north pier is built up to springing level; the south pier foundation is excavated, and the concrete is being put in; and the south abutment cofferdam is being driven preparatory to excavating. The granite is obtained from Cornwall and Scotland, that from the latter being exclusively used for the parapets and finer work. The bridge is expected to be completed in the course of next year (1902). The contractor is Mr. Easton Gibb, of Aberdeen.

ARCHITECTURE AT THE ROYAL ACADEMY.—By a mistake, in our last issue we attributed the design for the memorial to the Duke of Westminster (No. 1,552 in the Royal Academy) to Mr. A. C. Blomfield; it is by his brother, Mr. C. J. Blomfield.

CATHOLIC CHURCH, NEWTOWN, HUNTINGDON.—A Catholic church, to be known as St. Michael's, has been erected at Newtown, Huntingdon. It is from designs by Mr. S. Croote, of Brampton, the building work being in the hands of Mr. M. Allen of the same village. The stone carving has been accomplished by Mr. Baxter. The building is in the Romanesque style. The main entrance is facing the road, by way of a porch. In plan the building is cruciform, the sanctuary being apsidal, the arms of the cross being formed by the Lady chapel and a small sacristy. By a convenient extension the latter can be entered under cover from the priest's residence. Adjoining the sacristy is the confessional. The small gallery over the porch provides accommodation for the organ and choir. Ancaster stone is used in the interior of the building, and the quoins and dressings outside are of Weldon stone, while the structure is covered with Broseley tiles. The aisle, sanctuary and Lady chapel are paved with encaustic tiles, but under the seats the flooring is of wood. The steps to the sanctuary are of the hard grey York stone. A low-pressure hot-water apparatus warms the building.

TRADE CATALOGUES.

THE Simplex Steel Conduit Company, Limited, of Coventry-street, Birmingham, have sent us an illustrated price-list of their steel conduits and fittings for installing the electric light in buildings. The conduit system of wiring has many points in its favour, and is being extensively adopted all over the country. We notice that there has been a reduction in the prices of the smaller sizes of fittings, and many improved forms of accessories are described. They have also sent us a small book on "Conduit Wiring and Erection," by Mr. Waterhouse, which contains a clear description of the method of installing the "Simplex" system of steel conduits. This book is a thoroughly practical one, containing many valuable hints on points connected with electric wiring which it would be difficult to find described elsewhere. We would mention specially the diagrams given for "looping in" and "looping back," and the description of the methods of getting the conduits round obstructions like cornices, iron girders or beams.

The General Electric Company, of Queen Victoria-street, have sent us their illustrated catalogue of electric fire-alarms. They seem to have worked out a very efficient system of fire-brigade calls, which can be seen in operation at Walthamstow and Tottenham. The alarm-pull is so constructed that when it is pulled out the handle is locked, and a bell rings, showing that the signal has been received at the station. This is also a great assistance in the detection of false alarms. When the signal is received at the station the attendant puts the plug in the hole underneath the fallen shutter on the switchboard, and listens to the telephone. If it is a real alarm he will hear the bell ringing in the post, but if it is merely a short circuit of the wires no sound will be heard, and hence the brigade will not be called out unnecessarily. In addition, the General Electric Company provide a most ingenious pocket telephone containing a combined transmitter and receiver with a telescopic action, which can be readily attached to the fire-alarm pillar, so that communication can be made by a fireman with headquarters directly, and further help summoned or countermanded. This pocket telephone will also be of the greatest use to inspectors, who will be able to make periodic rounds and test all the street posts without any risk of calling out the brigade.

—We have also received from the General Electric Company a catalogue describing their "Gecko" telephones. We think that this telephone will prove a great boon to householders. The use of telephones for private inter-communication is far too much neglected in this country. Probably this is due to the mistaken notion that the National Telephone Company hold a monopoly for the erection of telephones. The telephones illustrated in this catalogue are low-priced, and the cheap bell-push telephone which can be added to any system of electric bells ought to popularise telephony for household purposes. Both on the Continent and in America private telephones are used, and we might almost say universally, and it seems a pity that such a great convenience should not be more widely used in this country.

—They have also sent us their catalogue of "Freezor" electric fans and small-power motors for continuous and alternating currents. The desk and table fans only take the same current as an 8 c.p. lamp, and by a simple regulating switch they can be made to run at three different speeds. The small bracket-fans being provided with lugs for screwing on the wall, can easily be placed in the most advantageous places for dealing with vitiated air. The "Freezor" slow-speed ceiling-fans are very similar to a type of fan that is very extensively used in America. In India, where electric power is available, ceiling-fans have entirely superseded hand-driven punkahs. From a sanitary point of view there is no doubt that they are very desirable. "The Edison" electric-motor fan is a small cheap combined fan and motor, which works very well with a primary battery. The catalogue also contains descriptions of electric blowers for smiths' fires, brazing forges, forcing the draught of boilers, and for ship and mine use. The motors can be made for either direct or alternating current supply, but to obtain a slow speed with alternating currents of high frequency is more difficult than with direct currents, and the motors are therefore more costly.

Messrs. Mather & Platt, Limited, of Salford Ironworks, Manchester, send us a copy of the fourth edition of their "Pocket Catalogue and Tables of Useful Information." Part I. of this little book is devoted chiefly to the description and illustration of electrical machines, and there is a good deal of information in tabular form which ought to be of service to architects and engineers. Part II. contains a selection of tables and notes of the kind to be found in most engineering note-books. Some of the matter is clearly original, and the whole of this part appears to be thoroughly up to date. Many of the tables naturally bear upon electrical engineering, but others, especially those relative to the economisation of steam and power transmission, are of general interest.

Messrs. Easton & Co., Limited, of Erith and London, send us a pamphlet descriptive of the "Schmidt system of utilising highly superheated steam." It has been recognised for many years by engineers that the condensation of steam in various parts of an engine must necessarily occasion considerable loss, and the attempt was made long ago to reduce such condensation by the use of superheated steam. Serious difficulties were encountered in connexion with early applications of high superheating, occurring partly in the superheater and partly in the engine. In the case of the engine trouble was found that the tubes were apt to be burnt out rapidly, and in the case of the engine trouble was experienced owing to the construction being unsuitable for high temperatures, and to the difficulty of procuring lubricants capable of withstanding the degree of heat involved. In Mr. Schmidt's system of superheating the difficulties in question have been successfully overcome, and owing to the production of mineral lubricants with a very high flash-point, no difficulty is now experienced in maintaining efficient lubrication. As a matter of fact, some hundreds of engines are in operation on the Schmidt system with steam at the high temperature of 600 deg. Fahr. in the cylinders, and without undue wear and tear of the working parts. A full account of the system is given in the book, to which we refer our readers for further particulars. In it will also be found some interesting records of investigations by Professor Ewing, F.R.S., of Cambridge University, and Professor Lewicki, of Dresden, and some reports by Mr. Bryan Donkin, of London. The Schmidt system has hitherto been chiefly employed on the Continent, but it is now to be exploited in the British Empire by the company that has acquired the works and business carried on for many years by Messrs. Easton, Anderson, & Goolden, at the Erith Ironworks, Kent.

The Steel Armoured Insulating Conduit and Accessories Company, of 63, Queen Victoria-street, have sent us their illustrated catalogue of conduits for electric wiring. They state that the cost of their system is only 5 per cent. more than that of the ordinary total expenditure for a complete electric installation. As shown from the full instructions given in this catalogue, the piping can be installed by any ordinary plumber who has the assistance of a wireman to indicate the size of the conduits required. Its erection is carried out in the same way as the pipes for gas and water; the best time for putting them in is before any plastering has been done. The wires and porcelain connexion fittings are put in when the main building operations are completed, but before the final decorations are finished. For high-class wiring we think that this system is very desirable.

Husson's Safety Acetylene Syndicate sends us a catalogue of generators, purifiers, and fittings for acetylene lighting installations. The generator made by this syndicate is one of the non-automatic description, and is used in connexion with a gasholder large enough to contain all the gas made from a charge of carbide. Non-automatic generators are, in our opinion, decidedly preferable to the automatic class, although the comparatively large gasholder required for the former adds considerably to the initial cost of the installation. The gasholder should always be of sufficient capacity to contain more gas than will be consumed during any one evening. The prices for large gasholders vary from 130*l.* for one of 500 cubic feet capacity to 310*l.* for one of 2,000 cubic feet capacity. The price quoted for carbide is 2*s.* to 2*s.* 7*d.* per cwt. A list of prices is given for installations of various sizes, the price of a generator, gasholder, and purifier to supply for eight hours twenty 12-candle power flames,

each consuming $\frac{1}{4}$ cubic foot of gas per hour, being 3*s.* The prices quoted for the installations do not include prices for the pipe connexions between the generator, purifier, and gasholder.

Messrs. Homan & Rodgers, of Gracechurch-street, London, send us a copy of "Standards and Tables of Constructional Steelwork," compiled by Ernest Homan and Leopold Mensch. This work, in pocket-book form, is an excellent production, giving sections of and particulars relative to girders, joists, stanchions, and columns, as well as full information as to the bases adopted for all the calculations involved. We are pleased to observe that due prominence is given to the important questions of deflection in girders, and the effects of eccentric loading in connexion with stanchions and columns. The book is one of the few similar works published in this country which contain such details as every architect ought to possess relative to constructional steel.

Mr. William Key sends us a pamphlet containing a description and recommendation of his system of mechanical ventilation on the Plenum principle. While we agree with much that he says, and especially as to the inefficiency of what is called "natural ventilation," he does not benefit his case by decrying every other system. There are cases in which extract ventilation is better than plenum. It is absurd, also, to try to persuade people that mechanical ventilation is cheaper than any other.

Mr. W. Duncan Tucker sends us an illustrated catalogue of his horticultural buildings, conservatories, winter gardens, ferneries, &c. The illustrations for the most part represent buildings actually erected. The catalogue includes also plant frames, boilers, and hot-water pipes and connexions.

Mr. E. G. Herbert, Cornbrook Park Works, Manchester, sends a sheet containing description and illustrations of his "Eccentric Sawing Machine," "Girder Saw," and "Vertical Sawing Machine." In all these a special principle is acted on, to the effect that "few teeth in action make fast cutting," because in cutting a wide section the weight of the saw is distributed over so many teeth that they tend to slip over the work without cutting. This is, in fact, only common sense, though Mr. Herbert may be right in saying that it is often not acted on. In describing the "Eccentric" sawing machine he says:—

"The guides of the saw frame are mounted on an eccentric on the main shaft, the eccentric being so geared as to make a portion of a revolution after every twenty strokes of the saw. The effect is to periodically change the inclination of the saw, causing it to constantly cut on a 'corner' instead of bearing on the whole width of the work. This greatly increases the cutting speed, and permits of the use of a thin fast cutting blade under a light weight, with consequent freedom from buckling."

Messrs. Craker & Dunmore (Harrow) send a leaflet describing their "Harrovian" water waste preventor. Forender it intelligible they should have appended a larger and clearer diagram. The following is their own description of its working:—

"The operation of the apparatus is as follows:—When the float is down the valve is open and water flows freely into the upper cistern, and when nearly full overflows by the pipe and charges the lower cistern to such a level that the float rises sufficiently to close the valve, whereupon the supply of water ceases.

But after the valve is closed there remains temporarily in top cistern a quantity of water which passes through the after flush-hole arranged in pipe and descends into the lower cistern, filling it to a higher level, therefore giving the float greater buoyant force, so that it keeps the valve closed when the pressure in the service-pipe is considerably raised."

Messrs. E. & F. N. Spon send a catalogue of books published by them in connexion with architectural and building subjects.

Mr. C. D. Phillips sends us a catalogue of the productions of the Emlyn works at Newport (Mon.), including portable and semi-portable engines, and some specially designed mortar-mills, intended to resist the hard wear from efficiently grinding such materials as old bricks, clinkers, ashes, &c. There is also the Emlyn mortar mill, in which the mill is combined with engine and boiler, for economy of space and convenience in moving it from one situation to another. The catalogue also includes the "Acme" stone-breaker and brick-breaker, travelling cranes, crab-winch, &c.

Messrs. Moffatt & Eastmead, Limited, send us some sheets illustrative of their hydraulic

and electric lifts of different types. Attention is specially directed to the patent safety self-sustaining lifts of this firm, in which the hoisting machine is fitted with a self-sustaining shaft in place of the usual worm gear, and has an automatic mechanical stop action to prevent over-winding. Moffatt's feed-water heater for steam boilers forms the subject-matter of another sheet issued by the same firm.

The Otis Elevator Company send us a small pamphlet briefly describing the main features of the principal forms of their lifts. In addition to the usual safeguards against various forms of accident, the Otis Elevators are fitted with a speed-governor limiting the speed of the car to the velocity for which the governor has been set, and the action of this device is quite independent of the ropes. In case these should break, the governor would bring into action the safety apparatus attached to the lift cage. An Otis speciality is a very neat type of electric lift for private houses. This lift is operated by push-buttons at the landing doors and in the car. The car stops automatically at the landing corresponding with the button pressed, and the door cannot be opened until it at landing has been reached, while the car cannot be removed until the door has again been closed.

Messrs. Pilkington Bros. (St. Helens) send us a pamphlet containing a description of their wired rolled glass, which has before been referred to in our columns, and a description of the result of a test of its fire-resisting qualities, apparently made at their own works. A reprint of a test by an independent authority would, however, have been more to the purpose.

Mr. John Jones (Chelsea) sends a new descriptive catalogue of his drain testing and cleaning appliances, to the excellent character of which we have borne testimony on former occasions. Among articles under the head of sewage-cleaning apparatus are some which we believe we have not before mentioned: the double sewage scraper, with a backward and forward action, for penetrating the collected sludge and then drawing it back; and the "crow's toe" or grappling hook, with a wheel for running along the invert of the sewer, and which is for use in searching for lools or in dragging sewers. Mr. Jones sends also a sheet of small illustrations of sanitary specialities.

Messrs. J. Sagar & Co. send a list (not illustrated) of their woodworking machinery. They are quite right in their suggestion that the lowest-priced machine is not necessarily the cheapest.

The British Uraltite Company send a sheet of particulars as to the fireproof and non-conducting material which they have named Uraltite, and which is composed of asbestos fibre and mineral substances only. We have already mentioned it with approval in connexion with the exhibit at the Building Trades' Exhibition.

Messrs. Joseph Sandell & Co. send us an illustrated catalogue of their doors, balusters, closet-fittings, &c., and full-size sections of skirtings, handrails, and other mouldings.

Messrs. Mason (Manchester) send a prospectus and illustration of their "Runwell" patent lavatory, which has a siphonic discharge instead of the usual waste and overflow, the action of which operates in cleansing the waste outlet and keeping it clear, and does away with the brass plug and washer, &c. When not in action the siphon bell forms a trap with a 2-in. seal.

The B. & S. Folding Gate Company send us an illustrated catalogue of the steel rolling doors, shutters, and partitions made by the Kinnear Manufacturing Company, of Columbus, Ohio (for whom we presume the Folding Gate Company are the British agents). The steel shutters seem to be made of a great size, one illustration showing a single shutter covering an opening 35 ft. 6 in. wide by 20 ft. high. An illustration is shown of the interior of the Art Institute at Chicago, the internal openings in which are fitted with Kinnear steel rolling doors, thus isolating any room at pleasure, and without any difficulty. Attention is also drawn to the building on the Knox estate, at St. Louis, which is furnished with twenty-six Kinnear steel rolling shutters which close automatically in case of fire. Then there are external shutters shown in another illustration, which are always open except in case of fire, when they close automatically at 150 deg. of heat. But can they be depended on to act in this way after a long period of inaction? That is the important

question. The catalogue includes directions for erecting the Kinnear doors and shutters. We are certainly disposed to believe in their high protective qualities, with the above reservation in regard to the limit of endurance.

Mr. John P. White sends us an illustrated catalogue of garden furniture of the excellent and artistic quality for which his firm is now famous. This includes designs for trellis-work, doveots, sundials, seats, &c., all designed in a good and sensible style, and illustrated in artistic drawings.

Correspondence.

To the Editor of THE BUILDER.

GLASGOW ROYAL INFIRMARY COMPETITION.

SIR,—The enclosed cutting may, I think, find a place in your journal. Dr. Anderson's straightforward protest is a fine example to some of our weak-kneed assessors.

But it is only just to the committee to say that their action has been consistent, for from the first they have declined any obligation to accept their assessor's award. It was owing to their refusal to give any satisfactory undertaking on this point that I felt myself unable to accept their invitation to compete.

Is it not remarkable how business men (in this case gentlemen of the highest ability) who would never in the management of their own affairs slight the well-considered opinion of their trusted advisers, whether in medicine, law, or art, will yet as a committee take the grave responsibility of rejecting the expert advice themselves have sought?

Cheerfully dismissing doubt, they will attack problems requiring for their solution the nicest consideration by men who, with an ability not less than their own, have spent their lives in studying them. Yet, were conditions reversed, they would deem it folly to entrust the decision of technical matters affecting their manufactures or finance to the judgment of an amateur committee were its members never so brilliant.

I have the greatest admiration for the work of the distinguished architect selected by the Committee, and he has my heartiest congratulations on his success. Nevertheless, it is not for the ultimate good, or of himself, or of the brethren, that matters should have so fallen out. If the result of all the care and anxious thought bestowed by an assessor of Dr. Anderson's attainments and standing be naught, how hardly shall the younger man obtain respect? A new reading is given to the old appeal "Quis custodiet ipsos custodes!"

JOHN W. SIMPSON, F.R.I.B.A.

* * The following is Dr. Rowand Anderson's published protest, referred to in Mr. Simpson's letter. Dr. Anderson's letter appeared in a Glasgow daily paper:—

"ROYAL INFIRMARY RECONSTRUCTION.

SIR,—In consequence of absence from home, I have only now seen the statement formulated and published by the Executive Committee detailing and justifying the steps they have taken and the course pursued by them in dealing with the plans. As my name has been introduced into this statement, I beg you will allow me a few words of explanation.

The committee, in referring to me, say that my function, as I frankly acknowledge, was to 'guide and not to select.' Sir David Richmond stated publicly that I was engaged as 'Technical Adviser, not Assessor.' My appointment, as stated in the minutes, is in the following terms:—'The Sub-Committee thereupon agreed to appoint and hereby appoint Dr. Anderson as Assessor to the Committee.' In the printed terms and conditions of competition issued to architects it is stated that the Committee 'will appoint a neutral architect of standing as assessor, and will give the fullest consideration to his advice.'

The Committee then proceeded to say that one of the two plans which most nearly conformed to the sketch plans issued for the guidance of competitors was not included by me in the short list, and 'that further interviews with me satisfied them that its exclusion arose from no failure on the part of the selected plans in regard to vital or essential particulars, but chiefly from a difference of opinion in regard to the style of architecture and the general elevation, matters on which the Executive Committee ventured to think they were quite entitled to follow their own opinion, and the minority cordially acquiesced in the selection of the majority.'

From the above statement it appears that the Executive Committee considered themselves quite competent to judge not only of the technicalities of the building as an infirmary, but also of its architecture; that being so, one naturally asks why they called in an Assessor.

In proof of their competency to judge and decide on all matters connected with the building, they state that 'the minority cordially acquiesced in the selection of the majority'—which majority consisted of one. This majority would have been converted into a minority but for most unfair canvassing of the committee before I gave my final explanation.

Had I known of this in time I would have thrown up my commission.

It is entirely wrong to lead the public to believe that it was solely on account of the architectural treatment of the design they selected that I did not include it in the short list. I gave the most minute and searching examination to every plan submitted in the competition, and in arriving at a decision I attached supreme importance to those qualities which constituted, according to my view, a scientific building, and one adapted to its purpose, and I maintain that the one I placed first embodies a greater number of merits than any of the others.

The committee believe that they have shown discretion in approving the architectural style of the adopted plan, and they say it is distinctly Scottish—the natural art of the fifteenth and sixteenth centuries, of which we have examples in Heriot's Hospital, Holyrood, Linlithgow, and Falkland Palaces, and in our own old College lately in the High-street. 'It is, therefore, not only appropriate to the historical associations of the site upon which stood the castellated Bishop's Palace, but permitting, as it does, a limited use of Gothic forms, as in Heriot's College, Edinburgh, it is more in harmony with the Cathedral itself than any classic or modern style.'

Rancker architectural nonsense that this was never penned, and whoever composed it is absolutely ignorant of the meaning of the terms he uses. I fail to see what associations there can or should be between a building dedicated solely to the relief of suffering humanity and one erected in a semi-barbarous age, and built with appliances for dealing death and suffering outside and cruelties and torture inside.

If the relief of the sick and the hurt is to be the one paramount object of this building, that can only be accomplished by utilising to the utmost the beneficent and curative forces of Nature and the teachings of science, and not by erecting and wasting money on the glibly absurdity of a Baronial Infirmary.—I am, &c.,

R. ROWAND ANDERSON.

16, Rutland-square, Edinburgh, June 4."

BOARD SCHOOLS, KNOWLE, BRISTOL.—These buildings comprise the large mixed school, which provides accommodation for 500 children, and provision is also made for an extension of classroom accommodation for 100 additional children. The infants' school accommodates 250, with future extension for another 100, and a separate caretaker's house is provided. Owing to the sloping nature of the site a basement has been obtained under a portion of the mixed school, where is placed the technical instruction department, comprising a combined cookery school and laundry, bonnet-room, and model sitting-room and bedroom for the teaching of housewifery subjects. Divided from this portion by a playshed is a manual instruction workshop for the boys. The architect is Mr. H. Dore Bryan, of Bristol. The building has stone walls faced with red Cattybrook brick, with Bath stone dressings. The roofs are covered with red tiles, and the floors generally are of wood blocks on concrete. The playgrounds are asphalted and surrounded by a dwarf wall, with railings and gates of wrought iron. One of the chief features of the scheme is the central hall of the mixed school, 80 ft. by 35 ft. The general contractors were Messrs. R. Wilkins & Sons. The buildings are warmed on the low-pressure hot-water system. The work has been done by Messrs. Crispin & Son. The sanitary arrangements are in separate buildings for the three departments, and the fittings have been executed by Mr. G. F. Tuckey.

WESLEYAN CHURCH, ST. LEONARDS.—A new Wesleyan church is being erected in Norma-road, St. Leonards, to take the place of the church that was demolished by fire on Good Friday in last year. The building has been erected by Mr. W. G. Morgan, of St. Leonards, from plans by Mr. J. Weir, of London, and the total outlay will amount to about 5,500.

Illustrations.

ILLUSTRATIONS OF SCULPTURE AT THE ROYAL ACADEMY.

ALL the examples of sculpture contained in the two plates we publish this week are from works exhibited at the Royal Academy, and all are referred to in the second article in the present issue. Mr. Schenck's "Summer" and "Autumn" are, however, treated as separate illustrations on a larger scale, because they are more especially architectural sculpture, intended for the decoration of a building, and therefore more closely related to the central subject of this journal.

A COUNTRY CHURCH.

This church is proposed to be built in the suburbs of a Yorkshire town. The plan is unique in form, the centre portion between the nave and chancel being a spacious low tower, with open timbered roof filled with tracery, above which is a *flèche* with stained glass windows, shedding a very subdued light amongst the tracered timbers. This *flèche* forms an extract for vitiated air in the winter, aided by eight fresh-air inlets distributed throughout the church.

On the south side a morning chapel is divided from the tower by an arcade and oak screen, and is to contain a large Jacobean monument of the family of the principal donor (who is Lord of the Manor) at the west end. Under the east window a small altar is to be placed.

Between the central tower and the chancel an oak rood screen will be placed, and the choir stalls and pulpit are of oak. The lectern is an old Jacobean desk restored, and is a gift together with stained glass east window for the chancel. Some interesting remains (the property of the donor) of a thirteenth century window, are to be inserted in the chancel in the form of a *sedilia*.

The fresh air during the winter months will be admitted by way of the channels for the heating pipes, in such a manner as will not interfere with the action of the extract in tower roof.

A bell turret, containing one bell, will stand at the south-east corner of the tower. The south porch is of open tracery and open timber roof, the doors into the church being double, a pair hung on the outside of the wall and a pair inside, the single doors opening in the thickness of the wall. The north porch is enclosed.

The walls are proposed to be built of rough coursed rubble and Whitby dressings with occasional six-inch courses of red sandstone. The roofs to the tower and porches would be covered with oak shingles, and the main roofs with stone tiles.

The estimate for the church (excluding all the oak work and the *eredos*) amounts to 5,600*l.*, and there is accommodation for 480 worshippers. This price does not include the small altar and furniture in the chapel.

The drawing was hung in the Royal Academy Exhibition of 1898. E. B. LAMB.

ST. SIMON'S, SALTRAM-CRESCENT, W.

This design was selected in limited competition some time ago, but was not carried out. Below the church the whole of the space was arranged for parochial purposes; the site was irregular and unsuitable. The designs were prepared by Mr. William A. Pite.

PLAN OF THE WALL OF JERUSALEM.

This plan of the wall built around Jerusalem in the sixteenth century—the comparatively "modern" wall—was prepared by Mr. Geo. Jeffery, an English architect who has taken much interest in eastern architectural remains, and who has himself carried out some modern buildings at Jerusalem.

The plan is intended as an accompaniment to and illustration of the first article in the present issue.

ARCHITECTURAL PHOTOGRAPHS.—We have received from Mr. C. R. H. Pickard, photographer, of Leeds, a number of specimens of photographs of architectural subjects, which we can cordially praise. They are especially clear in definition of detail, which is a most important point in architectural photography.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.
22.—JOINTS IN PIPES.

THE plumber has now to deal not only with lead, but also with brass, iron, copper, pottery, and other materials, and must be able to make perfect joints not only between two pieces of the same material, but also between any two different materials. Skilled workmanship is essential in this department of the plumber's duties, as, however good the sanitary fittings in a building may be, the exclusion of foul air will not be ensured unless every joint in the internal waste-pipes, ventilation-pipes, and soil-pipes, is absolutely watertight and airtight. It is often thought that the same care is not necessary in the case of external pipes, such as soil-pipes, but when it is remembered that these generally serve also as ventilation-shafts for the drains, and are therefore conduits for foul air, and that air escaping from defective joints may be drawn into the building through open windows, it must be admitted that even in external pipes the workmanship must be of the best.

Lead to Lead.—The joint which the plumber is most frequently called upon to make is that between two pieces of lead pipe. Two kinds of joint are in common use—the copper-bit joint and the wiped joint. In both cases the two pipes are united by solder, which is a mixture of tin and lead. The proportions vary according to the work in hand. "Plumber's solder" contains about two parts (by weight) of lead to one of tin, and is generally used for wiped joints; "fine solder" is composed of lead and tin in equal quantities, and is used for copper-bit joints and seams and for "tinning" brass-work preparatory to making a wiped joint; "strap solder" is often made of one and a half parts of lead to one of tin, and is used for copper-bit joints. Into the practical details of shaving, tarnishing, &c., we need not enter. It will be sufficient for our purpose to describe the joints in a general way. Copper-bit joints are easily made, and require only a small quantity of solder. They are therefore often used by incompetent workmen, and by the worst sort of speculating builders. The lower of the two pipes has its upper end dressed out to form a tapering socket (fig. 1), and the lower end of the upper pipe is rasped outside and slightly opened to fit closely into the bottom of the socket. A piece of strap solder is then placed in the socket around the upper pipe and melted by the heated copper-bit or by the blow-pipe, so as to flow down to the bottom of the socket and adhere to the surfaces of the two pipes. As tin melts at a very much lower temperature than lead, there is a danger of the tin in the solder running through the joint and solidifying inside the pipe. To prevent this, the end of the inner pipe is sometimes "smudged over." In any case the copper-bit joint is weak and is easily damaged by the weight of the pipes and by their expansion and contraction. It ought never to be used in internal waste-pipes or soil-pipes, and is, indeed, prohibited by some sanitary authorities. The joint is, however, often made between the brass tail-pipes of lavatories, baths or flushing cisterns, and the lead traps and flush-pipes, as in many cases the tail-pipes are too short for wiped joints to be made. It is obvious that joints in these positions are not as important as joints in waste-pipes and soil-pipes.

The "overcast" copper-bit joint is strengthened by a thin flat band of solder, which is not wiped but brought to a smooth surface with the copper-bit. It is sometimes used for making the connexions to short tail-pipes. The copper-bit joint when used for external soil-pipes is often strengthened and ornamented by means of a lead astragal and fillet, as shown at A in fig. 2. Lead tacks B B for supporting the pipe are generally soldered to the back of the pipe immediately below the joint, and a second or dummy astragal, C, is soldered round the pipe close to the bottom of the tacks. A similar appearance is obtained by the use of the cast-lead socket (fig. 3), but this involves the making of two joints, one at each end of the socket. The "century" patent lead socket (fig. 4) is strengthened by tinned perforated copper (24 B. W. G.) bedded in the middle of the lead both in the socket and tacks. This copper core is shown in elevation at A, the dotted lines representing the outline of the tacks; B is a horizontal section to a larger scale; and C a vertical sec-

tion, showing the tacks in elevation with the four nail-holes at *n n n n*. The copper is continued into the recesses at the ends of the socket, so that the solder connects the pipe directly to the copper core, thus ensuring a stronger joint. The sockets are made either with flat backs for pipes fixed on the face of a wall, or with angular backs for pipes fixed in angles, and in sizes as follows:—

Internal Diameter.	Long Sockets.				Short Sockets.			
	Flatback. Width over all.	Angular. Width from angle.	Height.	Flatback. Width over all.	Angular. Width from angle.	Height.	Height.	
in. 1½	in. 2½	in. 4½	in. 5½	in. 6½	in. 4½	in. 6½	in. 2½	
2	7	4½	5½	7½	4½	7½	3½	
2½	7½	5	6½	8½	5	8½	3½	
3	8½	5½	7	9½	5½	9½	4½	
3½	9½	6	7½	10½	6	10½	4½	
4	10½	7	8	11½	7	11½	5½	

Cast gun-metal round-headed nails, 2½ in. long, are supplied for fixing the tacks to the walls; the nails are made with ½ in., 1 in., or 1½ in. heads, left dull or "bright turned." The lead tacks can also be obtained of sufficient width to fold over the heads of the nails.

The *wiped joint*, also known as the "plumber's" or "round" joint, is the most generally useful joint for lead pipes. It may be used for connecting two pipes in the same straight line, when it is often known as an "underhand" wiped joint, and also for uniting one pipe to the side of another, when it is known as a "branch" wiped joint. In the underhand joint (fig. 5) the ends of the two pipes are formed in a somewhat similar manner to those in a copper-bit joint, but the whole of the joint is covered with a mass of solder, wiped with a cloth to a round shape. The joint is therefore much stronger than the copper-bit joint, and if properly made is perfectly watertight and airtight. It is undoubtedly the best form of soldered joint for lead waste-pipes and soil-pipes. Fig. 6 shows a wiped branch joint suitable for a soil-pipe. Considerable skill is required to make a perfect wiped joint; notwithstanding the mass of solder weeping often occurs, especially in service-pipes conveying water under great pressure. Some plumbers therefore "overcast" their wiped joints by running the copper-bit over them, as this gives a smoother and closer surface to the solder, but the practice is not looked upon with favour in this country.

The "block" joint (fig. 7) is a soldered joint used for vertical lead soil-pipes fixed in chases. It takes its name from the wood or stone blocks which support the joint. The upper end of the lower pipe is passed through a lead flange, A, resting on the block B, and is then opened out to form a socket, into which the lower end of the upper pipe is fitted. The joint is then completed with the solder C. Two methods of finishing the end of the lower pipe are shown. The upper edges of the blocks ought to be rounded to prevent cracking of the lead. A similar joint is often made in pipes passing through a floor, the floorboards taking the place of the block.

An inferior form of joint is made by taping back the upper end of the lower pipe so as to form a flange. The upper pipe is fitted to this as in fig. 7, and the joint completed with solder. The lead is often seriously weakened in taping it back, and a separate flange is therefore much better.

The "slip" joint is made by slightly opening out a short portion of the lower pipe to form a cylindrical socket into which the upper pipe is slipped, a coat of red and white lead or a little putty being relied upon to make the joint tight. Needless to say, joints of this kind are absolutely unsuitable for sanitary work.

Long lead waste-pipes from fittings discharging hot and cold water, such as sinks and baths, sometimes crack in consequence of the alternate expansion and contraction. To prevent this expansion joints are used. Two simple forms are shown in fig. 8. In that marked A the end of the lower pipe is formed into a socket about 5 in. deep by means of a hardwood mandrel; a vulcanised indiarubber ring is sprung on to the upper pipe close to the end,

Illustrations to Student's Column. Chapter 22.

and when this pipe is pushed into the socket the ring closes the annular space between them and is rolled to its final position. In the joint marked B an indiarubber cone with beaded edge is used, and the socket is conical, the upper pipe being slightly tapered to fit. Lead tacks are often soldered to the lower pipe at the joint for the purpose of fixing the pipe to the wall. The expansion joint shown in fig. 9 is formed by means of a lead socket and tacks with copper core like that illustrated in fig. 4, but with a tinned gun-metal screw-gland stuffing box, A, riveted to the copper body and tacks; the socket is made in sizes to receive 1½-in., 2-in., 2½-in., and 3-in. pipes. It is doubtful whether any of these joints will remain permanently tight.

Lead to Brass and Copper.—Joints between lead and brass or copper present no peculiar difficulty. After the end portion of the brass or copper pipe has been "tinned," it can be united to the lead pipe either by a copper bit or a wiped joint.

Lead to Iron.—In uniting lead to iron, a flanged brass or copper thimble or "sleeve" is generally used, as shown in figs. 10 and 11. In fig. 10 the lead pipe is united to the upper end of the thimble by a wiped joint, while in fig. 11 the lead pipe is passed through the top sleeve-piece, the two being united at the top by a wiped joint. This is by far the better arrangement. In both cases the lower end of the brass or copper is placed in the socket of the iron pipe, and the joint completed by running the socket full of molten lead and thoroughly caulking it. A few strands of yarn must be caulked into the bottom of the socket to prevent the lead running through the joint into the iron pipe. The thimbles must be strong enough to resist the strains caused by the caulking tools. Brass thimbles can be obtained in two thicknesses, known as "light" and "medium," and in sizes increasing by ¼ in. from 2 in. to 4 in. Brass sleeves are generally made ¼ in. larger in diameter to allow the lead pipe to pass through. As a rule thimbles and sleeves are of cast brass, but solid-drawn brass ferrules are now made in sizes varying by ¼ in. from 1½ in. to 4½ in. The brass connexions ought to be of sufficient length, so that the wiped joint will be quite clear of the iron socket. Connexions 1½ in., 2¼ in., and 2½ in. in diameter can be obtained from 3½ in. to 6 in.

long, and larger sizes from 4 in. or 4½ in. to 6 in. Heavy cast-brass sleeves for uniting lead to iron soil-pipes (4 in. in diameter) are made 4½-in. bore, 4½ in. over the flange, and 6½ in. long.

Another form of joint (fig. 12), known as Taylor's, is intended for uniting a lead branch to an iron soil-pipe. The iron junction-pipe is cast with an oval flanged opening, A, and a loose iron collar, B, is supplied of the same shape as the flange. The oval opening allows the branch to be made at various angles. The end of the lead branch must be cut to the required bevel, passed through the loose iron collar, and tacked back about three-quarters of an inch all round. The face of the iron flange is then covered with red-lead putty, and the joint is completed as shown at C by tightening the four bolts, the lead flange on the end of the branch being compressed between the iron flange and collar. This joint has been approved by the Sanitary Authorities in Manchester and other towns in the North of England, and has the advantage of being easily disconnected for the purpose of repairing the closet or soil-pipe. The same sizes of junction and collar are used for connecting a lead anti-siphonage pipe to an iron soil-pipe, but in this case a wide flange of sheet-lead must be wiped to the end of the lead pipe.

Robinson's "Enable" caulking thimble (fig. 13) is of iron covered inside with lead, which is also turned over to the outside of the iron at the top and bottom. A soldered joint can be made between the lead pipe and the lead covering of the thimble, and the annular space between the thimble and the socket of the iron pipe can be caulked with lead in the usual way. The thimble is of smaller diameter than the iron pipe to which it is connected.

When the position of the lead and iron pipes is reversed—that is to say, when the flow of water is from the iron to the lead pipe—a different form of joint is required. A brass socket may be used with tinned tail. The spigot end of the iron pipe or trap is placed in the socket, and the joint completed with gasket and neat cement or (better, if the brass is of sufficient strength) with gasket and caulked lead. The tinned tail is united to the lead pipe by means of a wiped joint. Sometimes a flange is cast on the outlet of the iron trap, and a corresponding flange is

formed on this lead pipe by tacking; the two flanges are then bolted together with an indiarubber washer between. A loose collar of brass or iron is placed outside the lead flange, after the manner shown in fig. 12.

23.—JOINTS IN PIPES (continued).

LEAD TO POTTERY.—For connecting a lead soil-pipe to a stoneware drain, a brass sleeve, similar to those shown in figs. 8 and 9 of the preceding chapter, but with a wider flange for fitting into the stoneware socket, should be wiped to the lead pipe. The joint is completed by running the socket full of neat Portland cement, a few strands of gasket being first inserted to prevent the cement running through into the drain.

For connecting lead flush-pipes to the inlet horns of water-closets, slop-sinks, &c., indiarubber cones are generally used; both straight and elbow cones are made as shown in fig. 1. No paint or putty must be used in contact with the rubber, as these destroy its peculiar properties. Twyford's patent rubber connexion (fig. 2) makes a water-tight joint without having to wrap cord around it, as is often necessary when ordinary cones are used. The objections to the use of india-rubber have led to the introduction of a new form of joint, known as Fullerton's "Full-flush," shown in fig. 3. For lead flush-pipes the connexion is of lead. The spigot A is passed into the socket of the inlet horn of the closet, and the lugs BB are then bent till they come in contact with the outside of the horn; they are kept in position by copper wire wrapped round the horn, as shown at C. Red lead is spread on the contiguous surfaces to make the joint tight. The socket at D is intended for the reception of the flush-pipe, the joint being made with solder or red lead.

When the flow of water is from the pottery to the lead pipe, different forms of joint must be used. Brass washers and unions with tinned linings or tails are generally used for the outlets of pottery sinks, lavatories, and baths, and details of these have been given in the chapters on these fittings. The principal joint remaining to be considered is that between the trap of a water-closet or slop-hopper and the lead branch of a soil-pipe. The joint specified by the London County Council

Illustrations to Student's Column, Chapter 23.

(fig. 4) is made by means of a brass connexion A, into the socket of which the outlet of the trap is fitted, the annular space between the pottery and brass being then filled with neat Portland cement; the tail of the brass connection is tinned, and is united to the lead branch by means of a wiped joint. It is a good plan to have the socket of greater diameter at the bottom than at the top. A patent cast-lead "socket" is now made by Cloughton Bros. to take the place of the brass socket; the socket portion is lined with iron, which is corrugated to offer a firmer attachment for the cement with which the annular space is filled. Sometimes a screw-thread is formed on the pottery outlet, to which a screwed lead socket is attached, but this joint can only be used when the outlet of the closet is specially made for the purpose.

A flanged joint can be made water-tight and air-tight, and has the advantage of allowing the closet to be easily removed in the event of damage being done either to the closet or branch. Flanged joints, however, ought always to be made above (and not at or below) the floor-level, and the screws ought to be tightened periodically. The old method of bringing the lead pipe through a hole in the floor and taping it back to form a flange resting on the boards, and then covering the flange with red lead and screwing the closet through it to the floor, is now generally condemned. Fig. 5 represents a good form of flanged joint. The end of the lead pipe is opened out and tinned back to form a socket and flange; an india-rubber ring A is placed between the lead and pottery flanges, and a brass collar B is fitted under the lead flange to give the necessary rigidity. Three or more brass clips C are placed at intervals around the joint, and the connexion is completed by tightening the set-screws D.

Robinson's "Enable" connexion (fig. 6) consists of an earthenware socket corrugated inside and covered outside with lead. The joint between the socket and lead pipe is made with solder in the usual way, and that between the socket and pottery with neat cement. The socket is $2\frac{1}{2}$ in. deep, and is made in three diameters— $3\frac{1}{4}$ in., $4\frac{1}{2}$ in., and $4\frac{3}{4}$ in.

The pottery outlets of many modern water-closets and slop-hoppers are fitted into lead sockets, so that a wiped joint can be made directly between the latter and the lead branch pipes. The first joint of the kind was Doulton's "Metallo-keramic" joint (fig. 7). The pottery outlet is metalised, so that a lead socket can be united to it by means of a soldered joint; to the tail of this socket the branch pipe can be wiped in the usual way. This and kindred joints have been largely adopted, and are thoroughly satisfactory in the hands of good workmen.

Brass, Copper, &c.—Brass and copper pipes may be united to other pipes of the same materials by screwed ends or by screwed unions, brass and copper pipes to lead by soldered joints, brass and copper to iron by caulked lead joints, as already described, or by screwed joints, and to pottery by cemented joints. A special brass connexion is made for uniting a

brass flush-pipe to the inlet horn of a closet (fig. 8). When the connexion has been placed on the end of the horn, the clips AAA are pressed down over the projecting rim of the horn shown in section at B; the screw C is then tightened and makes a good joint by compressing the rubber ring D between the end of the horn and the brass flange E of the flush-pipe. For further details of connexions between pottery and brass, see the chapters on sinks, lavatories, &c.

Pottery to Pottery.—Joints of this kind occur at the outlets of closets connected directly with the drains. This direct connexion ought never to be made except in outbuildings, as it necessitates the drain being brought inside the building, and as one or more joints must be made below the level of the floor. A few strands of gasket should be gently caulked into the socket, and the socket should then be filled with neat Portland cement. Similar joints may be made in the pottery waste-pipes of laboratory and other sinks.

Iron to Iron.—The most important joints of this kind are those in iron soil-pipes and branches, and are almost invariably socket joints caulked with molten lead. In scamped work putty is sometimes used, but this is certain to lose its plasticity in time, and the joint ceases to be air-tight. A better joint is made by running the socket full of neat Portland cement, after first caulking into it a little yarn or gasket to prevent the cement passing into the pipe. Rust joints are also occasionally used, but the caulked lead joint is the best. A flanged joint is useful when it is required to fix a length of pipe to the top of a stack in such a position that the joint is above the eaves or wall. The flanges are bolted together, red lead or an india-rubber washer being interposed to make the joint tight. Iron sink-traps are sometimes made with screwed outlets for fixing into the screwed sockets of iron waste-pipes. The joint between a cast-iron closet hopper and trap is generally formed by means of flanges bolted together with a rubber washer between.

Iron to other Materials.—Various methods of uniting iron to lead and other metals have already been described. An iron soilpipe may be connected with a stoneware drain by a cemented socket-joint, and a pottery closet outlet may be connected to an iron branch-pipe by a bolted flanged joint with india-rubber washer, or by an iron socket made specially wide to receive the pottery and run with neat cement.

WASTE-PIPES.

The term "waste-pipe" may with advantage be confined to pipes receiving discharges from fittings which are used for personal ablution or for washing crockery, domestic utensils, vegetables, &c., while the term "soil-pipe" may be applied to all pipes receiving discharges from fittings used for the reception of urine and feces. The latter class includes water-closets, slop-hoppers, and urinals. All other fittings will fall into the former class. Certain general rules are applicable to all waste-pipes—that is to say, to all pipes receiving dis-

charges from washing-up sinks, lavatories, and baths.

1. All waste-pipes ought to be disconnected from the drains by being made to discharge over trapped gullies. Whether the end of the pipe may be connected to the side of the drain-trap between the grating and the surface of the water depends to some extent upon circumstances. Some sanitary authorities insist on the point of discharge being not less than 18 in. from the drain-trap; others require it to be immediately over the grating; and others, again, allow the connexion to be made into the side of the trap above the standing water. The first position is the best for the purpose of preventing drain-air passing up the waste-pipe, but unless the channel leading to the trap is protected by a grating, under which the waste-pipe discharges, it is apt to become choked with leaves, &c.

2. Every waste-pipe from a single fitting ought to be provided with a trap, fixed as close to the fitting as possible. In the case of ranges of similar fittings, such as lavatories, a main waste-pipe is often provided with branches to the several fittings, and the main waste only is trapped. The objections to this arrangement will be discussed in the next chapter. As a corollary to this rule, it may be said that waste-pipes must be so arranged that the water from any fitting must not be made to pass through more than one trap on its way to the external gully. Double-trapping is sometimes practised, especially when the waste-pipe is connected directly with the drain, but it is a great mistake. Such an arrangement is shown in fig. 9; the bath A, lavatory B, and sink C are separately trapped and connected to a main waste D, which is trapped at E. When the bath is emptied, the air contained between its trap and the trap at E must escape somewhere, and this will probably be done by forcing the trap of one of the lower fittings; again, the rapid discharge through the trap E will almost inevitably siphon out one or more of the traps above.

3. The traps of all long waste-pipes, and of all waste-pipes receiving discharges from more than one fitting, ought to be ventilated, in order to prevent the water being siphoned out of the traps. If the traps are properly ventilated and the waste-pipes are properly laid and jointed, there can be no objection to connecting two or more fittings to one main waste-pipe. The traps of single fittings with short waste-pipes are often left without anti-siphonage pipes; thus there is little necessity (as far as siphonage is concerned) to ventilate the trap of an ordinary kitchen sink, the waste-pipe of which is, perhaps, less than 3 ft. long. But the more rapid the discharge is from the fitting the more necessity there is for trap ventilation. An old-fashioned lavatory basin with, say, 1-in. plug and $1\frac{1}{2}$ -in. trap and waste-pipe is much less likely to cause siphonic action in the trap than a modern quick-waste lavatory, especially if the latter is fitted with a trap and waste-pipe only $1\frac{1}{4}$ in. in diameter.

4. All long waste-pipes and all waste-pipes receiving the discharges from two or more

fittings ought to be carried up (full-size) as ventilation-pipes, the upper ends to terminate at suitable points above the neighbouring windows and at a sufficient distance from them. This may seem a counsel of perfection, but as waste-pipes often become foul, and unless ventilated contain air more or less impure, it is a good plan to allow a free current of air to pass through them. Waste-pipes from fittings on the upper floors of buildings are sometimes made to discharge over cast-iron rain-water heads, from which cast-iron rain-water pipes lead down to the gully below. The ironheads and pipes are not only quickly corroded, but they are almost certain to be fouled, and the foul air escaping from the head and joints may be drawn into the house through the nearest windows. Even this arrangement is, however, better than a long unventilated waste-pipe fixed inside the building and buried, or half-buried in plaster.

5. Waste-pipes, like soil-pipes, ought to be fixed outside buildings wherever possible. The multiplication of pipes on the outside of a building is undoubtedly in some cases an eyesore, but if the sanitary fittings are grouped together this objection loses much of its force, and it is certainly better, if leaks occur, that they should not contaminate the air within the building, or damage the walls, floors, and ceilings; repairs can also be executed with less annoyance to the occupants of the building if the pipes are fixed outside. There is, of course, a slight additional danger of the pipes being frozen up in severe weather, but if the taps are perfect the danger is less than in the case of external soil-pipes, as the water passing through waste-pipes is often warm. If waste-pipes must be fixed inside the building they ought not to be buried in the plaster or in chimneys, but fixed with clips or tacks to backboards, so that they can be easily inspected and repaired.

6. Waste-pipes ought not to be connected to soil-pipes or drain-ventilating pipes, or to the traps of water-closets or slop-hoppers, but ought to be kept entirely distinct. An exception to this rule may be made in the case of washing-up sinks fixed by the side of slop-hoppers; the wastes from the sink may be connected to an inlet arm provided in the side of the hopper above the standing water of the trap.

7. All waste-pipes ought to be adequately supported so as not to drag heavily on the outlet of the trap. The seal of a trap may be destroyed by the trap being pulled out of shape by the weight of the waste-pipe.

8. Joints within the thickness of walls or floors ought to be avoided wherever possible; if they ought to be in positions where they can be seen and repaired without difficulty. The waste-pipes from baths are often laid under the floors. This can only be avoided in the case of ordinary cast-iron independent baths by placing supports of wood or other material under the cast-iron feet. If these raise the bath too high for children's use, it is an easy matter to provide a movable step. This raising of the bath not only allows the waste-pipe to be laid above the floor, but affords facilities for dusting and washing the floor under the bath.

9. Overflow pipes from storage or flushing cisterns must not be connected with waste-pipes, but must be carried through the nearest external walls in a conspicuous position to serve as warning-pipes. These pipes need not be trapped, as the traps would probably be unsealed by evaporation; but hinged flaps may with advantage be fitted on the ends to prevent the inlet of air and dust. It is a mistake to connect the overflow of a siphon flushing cistern to the flush pipe, even if there are no water company's regulations to prevent it, as such a connexion interferes with the siphonic action of the cistern.

OPEN-AIR BATH, EAST HAM.—Councillor F. G. Francis recently opened the open-air swimming bath which has been constructed by the East Ham Urban Council in the Central Park. The bath has been constructed by the Council's own workmen under the superintendence of the Surveyor, Mr. A. H. Campbell. It is an expenditure of 1,350*l.*, it is 90 ft. in length by 30 ft. in width, and of a depth tapering from 30 in. at the shallow end to 6 ft. at the deep end. The walls and floor are of concrete, finished with a surface facing of mosaic composition. There are fifty private dressing-boxes and two casual spaces for juveniles, and a chamber and water closet for a private bath. The water is supplied direct from the mains of the East London Waterworks Company, and the drainage is into the sewers of the Council.

OBITUARY.

THE LATE MR. HOPKINS.—The following additional particulars in regard to Mr. W. J. Hopkins, the late Diocesan Architect of Worcester, whose death was briefly recorded in our obituary column last week, reached us just too late for insertion in that issue. Mr. Hopkins was, we believe, articulated to the late Mr. Underwood, of Oxford, and early in life settled in Worcester. One of his most important works was the erection of the Corn Exchange, now the Public Hall, in Worcester. He restored the following churches: Norton, Upton Snodsbury, Grafton Flyford, Flyford Flavel, Kingston, Besford, Witford, Dodington, and several others. He designed the following new churches: Sackley, Hallow, Blackheath (near Birmingham), Wilden, Abberton, Holy Trinity, Worcester, and some others. He cleverly adapted the beautiful fourteenth century roof of the Gueston Hall to the new church of Holy Trinity, where it still remains as a standing reproach to the cathedral authority of that day, who caused the removal of the Gueston Hall. Mr. Hopkins was the architect of the new Parsonages of Bradley Green, Norton, and Tibberton, and of many new houses at Sidcup, Ascot, and Malvern; and the mansions of Parkfield (Worcester) and Kildangan (County Kildare). The latter was his last important work.

MR. W. H. LORDEN.—We have to record the death of this well-known contractor, which occurred suddenly at Southsea on the 8th inst. Mr. Lorden was born in 1837, and for many years was with Messrs. Lucas Brothers and carried out a number of their most important works. In 1871 he commenced business in Upper Tooting as a builder and contractor, and was senior partner until 1897 in the firm of W. H. Lorden & Son, retiring on account of declining health. Among the important works he carried out are the Croydon new post-office; soldiers' home, Westminster; several schools for the London School Board; Roman Catholic church, Streatham; St. Anselm's Church, Streatham; St. John's Church, Balham; new tower, &c., Framfield Church, Sussex; large blocks of artisans' dwellings at Marylebone and Wapping; infirmary extension, Kingston; nurses' home, Chelsea; several public libraries; stabling and depot for Wimbledon Urban District Council, &c.

GENERAL BUILDING NEWS.

BATH ABBEY.—The Bishop of Bath and Wells dedicated a few days ago the west front of Bath Abbey, which has just been restored under the advice of Mr. T. G. Jackson, R.A. The cost of renovation, so far as the west front is concerned, has been about 2,000*l.* The more expensive work of repairing the flying buttresses, which was not originally contemplated, is still proceeding.

CHURCH, GREENBANK, BRISTOL.—On the 1st inst. the new mission church of St. Anne's, Greenbank, was dedicated. The room may be arranged to accommodate 400 persons, and has vestry attached to it. The designs were by Mr. G. H. Oatley, and Mr. G. Humphreys was the contractor.

CONGREGATIONAL CHURCH, CHURCHTOWN, SOUTHPORT.—A new Congregational Church, which has been built at Churchtown, and has been erected from the designs of Mr. F. B. Halsall, architect, of Southport, has just been opened. The new building, the foundation stone of which was laid on July 18, 1900, consists of a new church with minister's vestry, Christian Endeavour room, choir vestry, classroom, and organ chamber. The church itself will seat about 700, the greater part of the sittings being on the ground floor, and the remainder in the gallery. Three entrances in the front lead to vestibules, the central doorway and vestibule being of greater width than those at the sides. These side vestibules each have a staircase to the gallery. The one on the north corner is octagonal on plan, and is carried up as a tower. There is also a side entrance leading to the vestry; Endeavour room, and choir gallery, a special staircase being provided for the use of the choir adjoining the vestry. The church is 57 ft. 9 in. by 42 ft. 6 in. inside on ground floor, the length on gallery level being 64 ft., exclusive of choir and organ gallery, which is 18 ft. by 17 ft. The Endeavour room is 20 ft. by 10 ft., and the internal height of the building is 26 ft. The roof is of pitch-pine of an ornamental character, the central portion being carried upon iron columns, the columns also supporting the gallery. The elevations are in pressed brick and Cullington stone. The principal front consists of a large central compartment, with the tower staircase on the north side and a lower structure for the south staircase. A four-light traceried window occupies the central portion of the front, with a single-light window at each side. The octagonal tower has buttresses on each angle, and is finished with flat roof and battlemented parapet. Two sides of the tower contain traceried windows, with hood mould and carved finial. The side elevations are divided into compartments by weathered buttresses, with two stories of windows between. The heating is by low-pressure hot water. The building is fitted with the electric light.

WYCLIFF BAPTIST CHURCH, ELSWICK-ROAD, NEWCASTLE-ON-TYNE.—The foundation stones of this building were laid on the 5th inst. The style is

perpendicular Gothic, freely treated. The accommodation in the church is for 306 adults, or for a mixed congregation of about 360. A future end gallery is provided for, to seat 100 adults or 120 mixed, or an eventual total of 470 mixed. The choir is on the platform in front of the pulpit; and the baptistry is also in the platform, covered when not in use. The organ is in an apse behind the pulpit. The building consists of a wide nave, with hammer beam, open timbered roof, and plastered ceiling, and double transepts on each side, with timber arches supported on iron columns, each transept being lighted by a three-light traceried window. Two two-light traceried windows will be placed in each side wall of the nave. There will be a projecting portico in front, with vestibule and inner lobbies with swing doors; and a vestry on one side and a staircase on the other side in the tower, leading down to the school and up to the gallery in the future. A staircase on each side of the pulpit will lead down to the school below the church and to the minister's and deacons' vestries. A ladies' vestry will be behind the pulpit. The seating is arranged semi-circularly on plan, so that every hearer directly faces the minister. The heating will be by hot water pipes and radiators. There is an exit door from the tower and another from the back into Northbourne street, the two front entrances being from Elswick-road. All doors open outwards. There is a spacious school under the church, and a church parson, 19 ft. by 13 ft., also heating chamber and lavatories, &c. The school will be well lighted by large windows into areas and streets. The windows are glazed with leadlights, and the external walls faced with red pressed facing bricks, with tawny terra-cotta dressings and tracery, &c. The contract for the building is 4,284*l.*, including boundary walls, gates, railings, &c., but exclusive of upper portion of tower. The builder is Mr. Alexander Bruce, Newcastle. The architects are Messrs. George Baines & Reginald Palmer Baines, Clement's Inn, Strand, London, W.C.

BAPTIST CHAPEL, SOUTHEND.—A new Baptist chapel, constructed of red brick with Bath stone dressings, has just been opened at the junction of Avenue-terrace and Milton-road. The chapel is 75 ft. long and 60 ft. across in its widest part, the width at the back, where the side seats are not continued, being 36 ft. At the back of the rostrum is accommodation for the choir. Provision has been made for the erection of galleries along the sides of the chapel and at the end; and the main entrance has been constructed to admit of its being surmounted by a tower. A church parson connected with the chapel, and there are also the minister's and deacons' vestries. A Sunday school has been built, the length being 57 ft. and the width 32 ft. The architect is Mr. F. E. Smee, and the builders Messrs. Davis and Leaney. The contract price, exclusive of the site, is 6,000*l.*

PRESBYTERIAN CHURCH, CARDIFF.—The foundation stones were laid recently of a hall in connexion with the Cardiff forward movement work of the Presbyterian Church of Wales. The new building is being erected on a site at the junction of Keppoch-street and Piane-newydd-square, Mr. W. Beddoe Rees is the architect, and his designs were selected in competition. The new structure will provide seating for 850, and will, when completed, cost about 4,000*l.*

BOARD SCHOOL, CHESTERFIELD.—A new school, to be called the Central School, has been erected by the Chesterfield School Board, at a cost of 15,000*l.* Besides affording accommodation for ordinary teaching, the school building includes provision for a pupil-teachers' centre, sufficient for an average attendance of thirty-six; a cookery centre, for fifty-four girls; a laundry centre, for forty-two girls; and also a swimming-bath. The bath is 75 ft. by 20 ft., and has a depth of water running from 3 ft. to 6 ft. 6 in. There are in connexion with it slipper and foot baths, and forty dressing-boxes. The school is built of Ellistown pressed bricks, with facings of buff terra-cotta. The roof is covered with blue slates, and the woodwork is painted green. There are six entrances, one being set apart for the pupil-teachers' centre. The interior has been planned to accommodate 1,200, and there are three floors, the floor space covering three-quarters of an acre. The basement contains the swimming-bath, the laundry, the cookery centre, and covered playgrounds. The ground floor consists of a central hall, 90 ft. by 30 ft., and eight classrooms, each 24 ft. by 24 ft., and accommodating sixty scholars. A feature has been made of the baby department, which will take in sixty children. The first floor also has a large central hall and a like number of classrooms, which, as below, are divided from the central hall by glass screens. There is a special playground for each department. The furniture has been supplied by the North of England School Furnishing Company, Darlington, and Messrs. Illingworth, Ingham, & Co., Leeds. Messrs. Tiltman (London) and Cecil Jackson (Chesterfield) are the architects, and the contractors were Messrs. Kellett & Co., Leicester.

BANK, LIVERPOOL.—On the 5th inst. the business of Park's Bank, limited, hitherto conducted at 44, Cook-street, was transferred to the new premises, 22, Castle-street. Externally, the lower walls are of unpolished granite from the Kemnay Quarry

Aberdeenshire. The walls of the first floor and upwards are faced with marble quarried at Pavaonazza, relieved by green bands of Cipolino marble. The architraves of the windows and the cornice of the building are of red terra-cotta. Two rows of dormer windows rise through the high-pitched roof, and the building is the highest in Castle-street. The hanking hall is a circular building 60 ft. in diameter, and lighted by a circular cupola 20 ft. in diameter. The walls are wainscotted in oak, and the eight supports are adorned with bands of Cipolino marble, and a cartouch containing an oval slab of Escasia marble. The floor is laid in marble and York stone and asphalt, from the design of Mr. Norman Shaw. The counter is built of Istrian marble, with a mahogany top, the rim being inlaid with boxwood and ebony. The basement is used partly for clerks' cloakrooms and lavatory, and also for the bank's strongrooms. The bank is to occupy the ground floor and basement and entresol; the upper floors are to be let for offices, and have already been partly taken. The architects were Mr. Norman Shaw, R.A. (London), and Messrs. Willink & Thibessence (Liverpool), and the contractors Messrs. Jones & Sons, Liverpool.—*Liverpool Post*.

NEW POLICE STATION, BERWICK.—A new police-station has just been opened at Berwick. The site of the new buildings has a frontage to Church-street of nearly 70 ft. The principal elevation is of polished sandstone, the roof being covered with red Staffordshire tiles. The design is Renaissance in character. The police station, occupied for the most part by the police station, with entrance about the centre of the main front, and consists of charge-room, chief constable's office, parade-room, and seven cells. The upper floor is devoted exclusively to the police court and rooms connected therewith. The court room is 40 ft. long by 21 ft. wide. A public gallery, with direct access from public staircase, occupies one end of the room. A magistrate's room, a magistrate's clerk's room, and room for witnesses are placed opening off an upper hall approached by the public from the staircase entered on the south side of the main building, and by the magistrates from staircase under tower, with entrance from Church-street. In the rear of the site a house for the superintendent is provided. The design was selected in open competition. The contractors were Messrs. Bruce & Sons, Kelso, mason work; Messrs. J. & F. Forrest, Edinburgh, carpentry and joinery; Messrs. Rule & Sons, Tweedmouth, slating and plastering; Mr. Geo. Macadam, Berwick, plumbing; Messrs. J. Turner & Son, Berwick, concrete and cement work; Mr. R. J. Richardson, Berwick, painting; Mr. Thomas Thompson, Berwick, supplied the grates, mantles, and wrought-iron work. Mr. Hugh Steel acted as clerk of works, the architects being Messrs. Cackelt & Burns Dick, Newcastle-on-Tyne. The cost of the new building was estimated at £4,045.

PROPOSED ASSEMBLY BUILDINGS, BELFAST.—The plans of the Assembly buildings it is proposed to erect for the Presbyterian Church of Ireland have been prepared by Messrs. Young & MacKenzie.

WAREHOUSES, BELFAST.—Warehouse buildings are to be erected for Messrs. J. Fulton & Co., Limited, on the site of the old "House of Correction" in Howard-street. The contractors are Messrs. J. Henry & Sons, and the architects are Messrs. Young & MacKenzie.

NEW CO-OPERATIVE PREMISES, ABERDEEN.—The following tenders for new central premises, Gallowgate, for the Northern Co-operative Company, Limited, have been accepted: Mason work, G. Hall; slater work, Alex. Adam & Co.; plaster work, Geo. Gibb; painter work, G. Watt & Son; ironwork, Jas. Abernethy & Sons. The total cost will be about 10,000l., and Messrs. Brown & Watt, Aberdeen, are the architects.

CRICKET PAVILION, NEWPORT, MON.—A cricket pavilion was opened at Newport by Lord Tredegar recently. The building has been erected at a cost of 1,500, from designs by Messrs. Swash & Bayn, architects, and is a two-story building of red brick, roofed with red tiles.

PROPOSED DRILL HALL, GRIMSBY.—It is proposed to erect in Doughty-road, Grimsby, a new drill-hall for the headquarters companies of the new Third Battalion of Lincolnshire Rifle Volunteers. Mr. F. W. Croft is the architect.

NEW INFIRMARY, RICHMOND.—The foundation stone of the new infirmary and nurses' home, in course of erection by the Richmond Board of Guardians, was laid recently. The new premises will consist of six separate buildings, viz., female infirmary block, lying-in ward, nurses' home, male infirmary, lunatic wards and ambulance house and mortuary. The five blocks intended for habitation have been arranged so that they each run longitudinally N.E. and S.W. The female and male infirmary blocks are connected on each floor by corridors, from which short branches connect to the lying-in ward and nurses' home. Along the centre of the ground floor main corridor a trench is formed in which the various mains will be placed. The female block comprises ground, first, and second floors, each containing a large ward, which provides for twenty-four beds, a smaller ward containing three beds, a dayroom and duty-room, besides larder, linen store, brush store, and the necessary sanitary accommodation. Access to the twenty-four bed ward is obtained by folding doors from the landing

at one end, and at the other opens on to an external balcony. The dayroom is 20 ft. in length. Adjoining the larder and stores is a branch passage, leading to the main sanitary annexe, which provides accommodation for each floor. The lying-in ward is placed next to the female infirmary, and is approached by a short branch from the main corridor. The ward has six beds and several duty and labour rooms. The dispensary is in the same block, but is approached by a separate entrance from the corridor. Respecting the nurses' home it may be mentioned briefly that the block consists of three floors, from each of which access is obtained to the main corridor. The block contains nurses' dining and sitting-rooms, with separate dining-room for subordinate nurses or wardmaids, and a private sitting-room, with bedroom attached, reserved for the superintendent nurse. Kitchens, storerooms, and bedrooms are arranged with due regard to comfort and economy of space. The male infirmary is similar in arrangement to the female infirmary, and accommodation, as in the other case, is provided for eighty-one inmates. There is further some small provision for the lunatics—the accommodation being only for cases pending removal to the county asylum, and lastly, a small ambulance house and mortuary. The entire series of buildings is to be in stock brick with brick facings of deep red, and the slating will be green. Mr. S. N. Soble is the builder and Mr. Edward J. Partridge, F.S.I., is the architect, and Mr. A. G. Barley, clerk of the works.

POST-OFFICE, BARNSTAPLE.—A new building to accommodate the post-office is to be erected in Cross-street, Barnstaple. It will be of two stories, and will have an entrance from Castle-street for the mails. The plans have been prepared by Mr. F. W. Petter, of Barnstaple.

SANITARY AND ENGINEERING NEWS.

BALMORAL BRIDGE.—The bridge over the River Dee at Balmoral, the Highland residence of the late Queen Victoria, has, during the past two months, been undergoing repairs under the direction of Sir William Atrol. The piers and structure have been strengthened and improved, and the bridge has now been reopened for traffic.

WISETON, DONCASTER.—A scheme of main sewerage and sewage disposal, prepared by Messrs. D. Balfour & Son, of London and Newcastle-on-Tyne, has been approved, and an immediate start is to be made with the work. The method of sewage disposal consists of treatment in self-acting bacterial tanks, the effluent from which will discharge into the adjoining water-course.

PIER, CROMER.—Lord Claud Hamilton opened a new iron pier at Cromer on the 8th inst. The pier has a deck 500 ft. long and 40 ft. broad, with bays extending to 60 ft. The head extends to a width of 112 ft. The engineers were Messrs. Douglass & Arnott, and the contractors Messrs. A. Thorne, B. Cooke & Co., and A. Faisey & Son.

FOREIGN.

FRANCE.—M. Edouard Aynard has been elected a member of the Academie des Beaux-Arts, in the place of the late M. Philippe Gille. The new academician, who is a Vice-President of the Chamber of Deputies, is the author of a number of interesting studies on the Industrial Arts and on museums.—The Municipal Council of Paris will consider, during next Session, the question of lighting the Tuilleries Gardens, so as to facilitate their being opened to the public at night. The cost of the necessary installation is estimated at 95,000 fr.—The exhibition of the "Peintres Lithographes" at Paris (Rue Daubigny) has excited a good deal of interest. The exhibitors, who number twenty-seven, have not confined themselves to black and white work, but also exhibit studies in coloured lithography and in pastel.—The old church at Coulommiers, built in 1220 by order of Philip Augustus, and which is in a ruinous condition, is to be rebuilt with the funds from a legacy of 350,000 fr. left for the purpose.—A Society of Architects of the Côte d'Or has been founded at Dijon, M. Suisse, the present diocesan architect, being elected president.—The monument to the memory of M. Felix Faure is to be inaugurated shortly at Pêre la Chaise.—The Municipal Council of Paris has under its consideration a proposal to erect M. Saint-Marceau's monument to Daudet, which was in the New Salon, in the Avenue Gabriel, Champs Elysées.—A society has been formed under the title of the "Société des Artistes Decorateurs," presided over by M. Dubure, the object of which is to group together all the decorative artists, and to organise exhibitions of decorative art.—M. Emil Faidt-Dider has been appointed official architect of the Department of the Meuse for the Arrondissement of Commercy, in place of M. Verneau, retired.—The sixty-eighth Congress of the Société Française d'Archéologie is to be held at Agen, and will terminate with an excursion in the Department of Gers. M. Lucas has been appointed delegate to the Congress from the Société Centrale des Architectes.—The city authorities of Marseilles are about to undertake

shortly the important works voted by Parliament for the rebuilding and sanitation of the Bourse quarter. The cost of this undertaking is estimated at 50,000,000 francs.—An exhibition of the works of M. Alexandre Léon, the painter, has been opened at the Georges Petit gallery. M. Léon was a pupil of Puvion de Clavaux, and the collection of paintings, pastels, cartoons, and drawings in this exhibition, show something of the spirit of his eminent teacher, and are remarkable both for power of drawing and nobility of conception.—M. Barrias, the sculptor, has just completed a model for a monumental clock which is to be placed in Rue Vivienne, on the new buildings of the Bibliothèque Nationale. This clock, flanked by two figures symbolising "Day" and "Night," will be also decorated by a seated figure personifying "Study." The clock face will be surrounded by a laurel garland, accompanied by two torches connected by garlands with a helmeted head of Minerva placed above. The sculptures are to be in stone.

GERMANY.—The Emperor Frederick's museum now being erected in Berlin, opposite the Old Castle, will probably be inaugurated in October, 1903. The building is intended to preserve paintings and sculptures of the post-Classic period, especially of the Renaissance, as well as collections of engravings, &c. The site of the museum will be connected with the adjoining streets by two bridges leading to the open square on which the late Emperor Frederick's monument is to be erected. The paintings by Professor Augustus Vogel are approaching completion, and the statues representing the arts are being placed in position.—An art exhibition opened in Berlin contains forty-five designs for the statue of Richard Wagner. One of the most interesting, perhaps, is that representing the composer seated in an arm-chair, as though thinking out a melody. In front of him stands a figure of Music, a majestic woman with a lyre, supporting another woman representing Poetry. The figure of a youth, representing Legend, kneels in front of them, and bands a crown to Poetry as a subject for composition. His symbol, a dragon, is lying in a hollow behind him, and two sphinxes, indicative of the mysteries of Wagner's music, are resting on the two sides of the monument.

MISCELLANEOUS.

ABERDEEN ARCHITECTS AND TRADESMEN.—The Society of Architects, Aberdeen, recently issued a notice to the various master tradesmen in the city, requesting that they should recognise only qualified architects in accepting contracts. In consequence of this, a second association of master slaters, which has been formed, has expressed the opinion that every man in business should have a free hand. The following notice has been issued by the secretary *pro tem*.—"A meeting of those in favour of resisting the action recently taken by the Aberdeen Architects' Society in endeavouring to stifle competition and create a monopoly in the building trades, will be held in the Square Room, Music Hall-buildings."

A PATENT OFFICE GUIDE.—We have received from the Patent Office, where it is published, a "Guide to the Search Department of the Patent Office Library," forming No. 4 of the Patent Office Library Series. This gives directions as to the volumes in the library which may be most usefully consulted in the search after previous specifications, and a list of the headings under which inventions and patents are classified; also a list of trade names for various articles or inventions, with a column giving the definition of the nature of the object to which the trade name is applied.

THE PATENT OFFICE REPORT FOR 1900.—In his official Report for the twelve months ended on December 31 last the Comptroller-General of Patents, Designs, and Trade-Marks, under the Patents and Cognate Acts, 1883-8, sets forth that whereas the number (23,922) of applications for letters patent is again less than that (25,800) for the previous year, the receipts from patents fees amounted to 204,140l., as compared with 202,771l. in 1899, whilst the receipts from designs and trade-marks fees show a decrease in each instance. The total receipts amounted to 226,091l., as compared with 225,700l. in 1899, the increase of the receipts from patents fees, in spite of the falling-off in the number of patent applications, being again due to a continued increase in the number of the annual fees paid for the renewal of patents. The Comptroller-General points out that the number of renewals fees paid in each year bears a more or less constant relation to the number of sealed patents dated from four to thirteen years previously, and that as the number of sealed patents has gradually increased, so the renewal fees have increased in a like ratio. The total expenditure, which includes 21,814l. upon new building works, amounts to 120,667l.; the surplus of receipts above payments is 105,424l. The corresponding totals for 1899 were 123,216l. and 102,484l. respectively. By the end of the year the fabric of the new Patent Office buildings (Messrs. Perry & Co. are the contractors) was completed, with the exception of the roof of the library. The whole cost of the works, together with the site and 8,800l. on account of furniture, is estimated at 102,500l., and of that sum

nearly 130,000, had been expended at the close of the year. The elevation in Southampton-buildings has been designed, we may here mention, by the Office of Works, so as to correspond with that of the block facing the garden-court of Staple Inn, which was designed by Messrs. Wigg & Pownall in 1843, but was modified in its details a few years ago for purposes of the Patent Office. The balance-sheet of income and expenditure enumerates the following items under payments:—Salaries (for a total staff of 306), 61,002l. 10s. 6d.; printing, drawings, &c., 23,500l.; and new building works, 2,817l. There are several other appendices to the Report. One of them tabulates the "countries of origin," and shows that in 1900 the applications derived from England and Wales were 13,775 (a decrease from 15,354 in 1899); the United States, 3,784 (a small increase); Germany, 2,631 (a small decrease); France, 946 (a small decrease); Scotland, 1,154 (a small increase); Austria, 478; Ireland, 371 (a small decrease); Belgium, 184; Canada, 156; Switzerland, 150; Sweden, 104; and Italy, 100; no other country contributed as many as 100. The numbers received from the United States, Austria, Denmark, Norway, and Switzerland exceeded those in any previous year, and there was an increase in the number of applications derived from Queensland, New Zealand, Sweden, China (Hong Kong excluded), Japan, and Egypt as well. The use of invention in the cycle industry, which developed so suddenly in 1896, still continues; inventions affecting acetylene generators have diminished by a ratio exceeding 25 per cent, and there is a decline under the heads of weaving, lacemaking, electrical lamps, drains, hydraulic machinery, and other categories. A remarkable feature of the applications for the year is the large increase in the number of inventions concerning electric traction, and the Report says that more than a hundred applications were made by one firm of electrical engineers alone. There is, moreover, a marked improvement in the class-divisions for out-door seats for trams, &c., motor-cars, air and gas engines, automatic and non-automatic couplings for vehicles, rotary engines (including turbines), dynamo-electrical generators, switches, cut-outs, couplings, &c.; and electrical telegraphs and telephones. There are several apparatus, machine tools, and photography, which attained its highest point since 1883. Of the applications themselves 549, or nearly 23 per cent, were made by women. Some calculations demonstrate that fifty patents have been sealed upon every 100 applications received, that out of every 100 patents sealed the number kept alive and allowed to lapse respectively are, after thirteen years, five and two; and that out of the 9466 patents of 1887 were maintained 529, or 5.6 per cent, by the payment of annual renewal fees for the full period of fourteen years.

ELECTRIC LIGHTING, HOYLAKE, CHESHIRE.—On the 6th inst., Mr. H. P. Boulnois, inspector under the Local Government Board, held an inquiry at Hoylake regarding an application by the Hoylake and West Kirby District Council for permission to borrow 13,500l. for the extension of electric lighting works and cables. Mr. Roderick Williams, Clerk to the Council, explained that the Council had already received sanction to borrow 27,000l., but owing to the great demand for electric light they had expended this, and had really exceeded it by 3,000l. Mr. T. L. Miller, consulting electrician, gave evidence as to the plant and mains, and Mr. Thomas Foster, surveyor, detailed the construction of the buildings. There was no opposition.

PROPERTIES FOR SALE.—In the course of this month will be offered for sale by auction, at the Mart, the Tower Estate at Pangbourne, and the Ealing Theatre, together with the adjoining Lyric Restaurant and Assembly Rooms. The former property consists of about 340 acres, including Upper Bowden Farm and 148 acres of arable land. The mansion house, known as "The Towers," was built for the late Mr. John Donaldson by Messrs. Foster & Dicksee, after Mr. Belcher's plans and designs. It is described and illustrated in the *Builder* of November 26, 1898; July 8, 1899; and January 13, 1900. The theatre, restaurant, and assembly-rooms at Ealing, forming one block having a frontage to the Broadway, were built about two years ago upon the site of the old Lyric Hall, and cover an area of nearly half an acre. The designs and plans were prepared by Mr. G. H. Fargeter and Mr. Walter Emden (who was the consulting architect for the theatre portion). The contractors for the whole block were Messrs. Beer & Gash, of Wharf-road, City-road.

A NEW BURNER FOR INCANDESCENT GAS LIGHTING.—"The Self-Intensifying Kern Burner" is the name of a new burner for lighting streets and industrial works by incandescent gas light, which is being introduced by the Wel-lach Incandescent Gas Light Company. The burner is a Kern burner so modified that with the comparatively large gas consumption of 10 cubic feet per hour, the head of the burner is made sufficiently small to fit into a No. 4 high-pressure Kern mantle, a slight alteration being made in the internal construction of the burner head. A glass chimney suspended from the lower end of a metal chimney in the upper part of the lantern surrounds the mantle, and the elongated chimney thus produced enables the so-called "self-intensification" to be effected without the aid of a

greater gas pressure than that under which gas is usually supplied to consumers from the gasworks. A series of these new burners, arranged in lanterns of various designs, has been exhibited this week at the Niagara Hall, Westminster, and it is claimed that an illuminating power of 300 candles is obtained with a consumption of 10 cubic feet of gas per hour—a result very little inferior to that obtained from gas under 10 in. pressure, the use of which entails the provision of costly compressing apparatus.

St. AUGUSTINE'S CHURCH, THOMAS-STREET, DUBLIN.—The decoration and carving of the Chapel of the Sacred Heart, which has been in progress for some time past, has just been completed in this church. The whole of the work has been carried out from the designs of Mr. George C. Ashlin, R.H.A., Dublin, and the supervision of the work for him was done by Mr. Thomas A. Coleman.

LEGAL.

EMPLOYERS' LIABILITY ACT.

SOME QUESTIONS AS TO THE CARRYING OF CEMENT.

AT Brompton County Court, on Monday, before Judge Stonor and a jury, Ingram Munday, a builder's labourer, Peabody-buildings, S.W., brought an action, under the Employers' Liability Act, against Messrs. Squire & Potter, builders and contractors, 17, Walton-street, Port street, S.W., claiming damages in respect of personal injury sustained owing, it was said, to negligence on the part of the defendants or their servants.

Mr. W. M. Thompson, counsel, appeared for the plaintiff, and Mr. E. F. Leaver, counsel, for the defendants.

Mr. Thompson explained that the plaintiff, last November, was employed by the defendants upon a job at 95, Sloane-street. A large quantity of cement was being used, and for a time the bags were brought in by the back entrance. On November 10, it was found that some planks had been taken away from the back, making it difficult for any one to cross some excavations, and the general foreman on the job directed the plaintiff and other men to carry in bags of cement by the front entrance in Sloane-street, down some stone steps into the basement. The first thirteen steps went down perfectly straight and were well lighted, but two return steps at the bottom—at right angles to the thirteen—were in darkness. While carrying a bag of cement upon his back the plaintiff slipped or stumbled upon the first of these two bottom steps and fell, breaking his left leg. The plaintiff was kept in St. George's Hospital from the day of the accident until January 2, and from that date until March 6 he stayed at the hospital's convalescent home at Wimbledon. He (the learned counsel) submitted that the defendants' foreman had been guilty of negligence (1) in ordering the plaintiff to carry the cement down the steps when there was no handrail there, and when they were in semi-darkness, and (2) in not providing sufficient planks for the men to cross the excavations at the back, as they had done prior to the day of the accident.

The plaintiff bore out his counsel's opening statement.

Mr. Leaver said that he admitted his clients' liability under the Workmen's Compensation Act, but denied that there had been any negligence with respect to the accident for which the defendants were responsible.

In cross-examination, the plaintiff said that he had taken two bags of cement down the steps in question before the accident occurred. It was not a fact that he slipped from one of the first thirteen steps, which were well lighted. He held the bag with one hand, and was not aware that the proper way to carry a bag of cement was to hold it with both hands. Some men, in fact, preferred not to hold the sack at all, but allow it to simply rest upon the back and shoulders.

Mr. Arthur Morley, M.R.C.S., &c., formerly house-surgeon at the hospital, spoke as to the man's injuries, and said that the plaintiff would not be able to resume his ordinary work for probably two or three months.

Charles Smith, the general foreman on the job at the time of the accident, said that as it would have taken a considerable time to put down fresh planks at the back, he thought it best to tell the men to take the cement in by the front entrance. He would not, however, have sent the plaintiff down the steps with the cement if he had not considered the work perfectly safe.

For the defence, Frederick Henry Symes, another general foreman in the employ of the defendants, said that he considered it perfectly safe for the men to carry bags of cement down the steps in question; in fact, the remainder of the bags, after the accident, were taken into the basement by the same steps. When witness saw the plaintiff in the hospital, the man said: "It was a pure accident—no one was to blame. I stepped too far forward, and went down two steps instead of one."

William Horton, a labourer in the defendants' employ, stated that the plaintiff had said to him that it was a pure accident, and that he must have slipped. The witness went on to say that he would

have preferred to carry the cement down the steps in question than along the planks at the back of the premises.

Cross-examined: After the accident a light was placed at the bottom of the steps.

Frederick Farthing, a scaffolder, stated that he carried the remainder of the cement down the steps after the accident.

Mr. Benjamin Banyard, a builder, said that he had inspected the steps in question, and had he been on the job he would not have hesitated in directing the men to carry the cement down the steps.

Cross-examined: Owing to a man, when carrying a bag of cement, having his head down, it was desirable that he should have "a certain amount" of light.

Joseph Green, a builder's foreman, said that he also saw the steps in question, and considered it quite safe for a man to carry bags of cement down them.

Mr. William D. Squire, one of the partners in the defendant firm, said that he considered it perfectly safe for a man to carry cement down the steps in question. A handrail was not necessary, indeed, his experience went to show that had there been a handrail the men would not have used it. There would have been no difficulty whatever in the men having more planks at the back had they asked for them.

The jury found that the way down the steps was not safe for the plaintiff when carrying a bag of cement; that he was not guilty of contributory negligence; that he did not thoroughly understand the risk he ran, and voluntarily undertake the risk, but that he carried the cement down the steps simply in obedience to orders. This was a verdict for the plaintiff, in whose favour the jury assessed damages at 50l.

His Honour gave judgment accordingly, and allowed costs.

ACTION TO RESTRAIN ALLEGED OBSTRUCTION IN VILLIERS-STREET.

The case of W. H. Chaplin & Co., Limited, v. the Mayor, Aldermen, and Council of Westminster came before Mr. Justice Buckley in the Chancery Division on the 17th and 12th insts.

This was an action by the plaintiffs, a firm of wire merchants, for an injunction to restrain the defendants from erecting or placing any structure or post on the west side of Villiers-street, Strand, in such a position as to cause an obstruction to the plaintiffs as occupiers of No. 10, Villiers-street. It appeared that the plaintiffs had offices and very extensive cellars in Villiers-street leased from the South-Eastern Railway, and the defendants were proposing to put up a standard for carrying an electric light which the plaintiffs contended would materially interfere with the loading and unloading of their vans.

Mr. Henry Terrell, K.C., and Mr. Hatfield Green appeared for the plaintiffs, and Mr. Astbury, K.C., and Mr. Eustace Smith for the defendants.

His Lordship in giving judgment said he thought it was obvious that to place a post where it was proposed to place one would affect the elasticity of the plaintiffs' proceedings, but the only right the plaintiffs could claim was a right as members of the public, and they could not assert their individual convenience against the convenience of the public in general. It had not been proved that the defendants were acting unreasonably in placing a post where they proposed to place it. Both in law and in fact, therefore, the plaintiffs failed, and the action must be dismissed with costs.

IMPORTANT POINT AS TO DILAPIDATIONS UNDER A COVENANT.

The case of Terrell v. Murray came before a Divisional Court of King's Bench composed of justices Bruce and Phillimore on the 17th inst., on a motion by defendant to set aside the judgment of the Official Referee in an action brought by Mr. Alfred Terrell against the defendant, Lady Murray, to recover a sum of money alleged to be due in respect of dilapidations under a lease of premises at No. 20, Harcourt-terrace, South Kensington. The lease was dated August 9, 1893, and granted to the defendant by a Mr. Taylor, and was for a term of seven years from September 29, 1893. The lease contained no covenant to repair, but the tenant covenanted to deliver up at the expiration, or sooner determination, of the lease, the premises with all fixtures attached thereto, in as good repair and condition "as it now is, reasonable wear and tear and damage by fire excepted." The plaintiff acquired the reversion of the lease from Taylor, and at the expiration of the term made a claim for 112l. under the above covenant. The action was referred to the Official Referee, who found that the sum of 39l. was due from the defendant, which included 12l. for painting the brick-work, and 5l. for repointing certain of the kitchen-floor which had become damaged by dry rot. The Official Referee held that the fact that the mischief which necessitated the above items of repair had arisen through lapse of time did not excuse the defendant from executing the repairs. From this decision the defendant now appealed.

For the appellant it was contended that the effect of the covenant was that the tenant was liable only for commissive waste and not for permissive waste, and that reasonable wear and tear included deterioration due to weather or to lapse of time, and that the items in question were not properly chargeable to the defendant under the covenant.

For the respondent it was contended that the tenant would be liable for commissive waste apart from the covenant, and also that under the covenant the tenant was liable to do such repairs as would prevent damage by time or weather, and that such repairs would include the painting of outside wood-work.

Mr. Justice Bruce, in giving judgment, said his opinion was that the meaning of the covenant was that the tenant was bound at the end of the tenancy to deliver up the premises in as good condition as they were in at the beginning, subject to the following exceptions, viz., dilapidations caused by the friction of air, dilapidations caused by exposure, and dilapidations caused by ordinary use. He did not think that outside painting was a thing the tenant was bound to do under the covenant, and as the amount due to the plaintiff would thus be reduced to the amount paid into court, there must be judgment for the defendant.

Mr. Justice Phillimore concurred, and the appeal was accordingly allowed and judgment entered for the defendant.

Mr. Shearman appeared as counsel for the appellant (defendant), and Mr. Bonsey for the respondent (plaintiff).

ACTION BY FOREMAN CARPENTER FOR PERSONAL INJURIES.

THE case of *Simons v. The Birkbeck Building Society* came before Mr. Justice Douglas and a common jury in the King's Bench Division on the 11th inst., an action by the plaintiff, a foreman carpenter in the employ of Messrs. Nichols & Co., for damages for personal injuries sustained through the alleged negligence of the defendants.

It appeared from the opening statement of Mr. Kemp, K.C., that the plaintiff, prior to the accident, had been earning 55s a week. He had saved some money, and was desirous of buying a house, but not having a sufficient sum laid by, he borrowed some money from the Birkbeck Building Society. The loan was returned in monthly payments, his wife being in the habit of taking the money to the Society. On August 13, however, the plaintiff took the money to the bank. Never having been there before, the plaintiff asked where he should go, and understood the porter to say, "Third floor on the lift." The plaintiff looked round, and seeing the entrance to the lift walked towards it. There was no light, and the plaintiff, instead of walking into the lift, fell down the shaft, a distance of some 15 ft., sustaining severe injuries. For over a month he was laid up and unable to do any work, and now he could only earn 45s a week instead of 55s. In these circumstances he claimed damages for the injuries he suffered and for the loss of ability to earn the old rate of wages.

For the defendants it was contended that the lift door was only open some 8 in. or 10 in. at most, and that the plaintiff had opened it further so as to enter. The defendants alleged that the plaintiff had not suffered very serious injuries, having only sprained his ankle and bruised his ribs, and not broken them, as had been said.

John Valdey, a fireman in the employ of the defendants said that the plaintiff on the occasion in question asked him where ground-rent loans were repaid, and he replied, "On the fourth floor; the lift will be down in a minute." Soon after witness heard the lift door open, and he thought the lift had come down. Then he heard the plaintiff fall, and he went and helped him up.

Cross-examined: The lift-attendants' orders were to keep the lift door locked. It was not locked on this occasion.

In the result the jury awarded the plaintiff 150*l.* damages.
Judgment accordingly.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

2,702.—A BRAKE DYNAMOMETER: *E. H. Rieter*.—A ring that will make a slightly rocking movement, limited with stops, carries a series of magnetic poles; a heavy metal ring is caused to rotate within the rocking ring, with the shaft, and the amount of weight upon an extended arm which may be needed for preventing the rocking ring from being moved under the induced currents will give a measure of the power employed. In another form the ring may be fixed and the poles may rotate.

2,711.—A DEVICE FOR USE WITH WATER-HEATERS: *H. T. Fenlon*.—In order that the gas supply of a geyser or some similar water-heater shall not be turned on, or the water supply be turned off, independently the one from the other, the handle of the gas-tap is fastened in the closed position by means of its engagement with a pierced plate upon the handle of the water-tap. When the water-tap is opened the gas supply can be turned on and the water-tap handle cannot be closed beyond

a certain limit. For use with a geyser the water-tap is connected to the boiler and the gas-tap to the burners, vessels being provided for the circulation of products of combustion to the chimney.

2,719.—TRIPOD STANDS: *W. Greenwood*.—Each leg consists of three rods, the two outer rods being joined at their lower ends with a clip through which the third rod will slide, and having two bands with guide-wings that hold the three rods together. When the two outer rods are caused to spring apart the bands will grip the inner rod, its action being aided by the spring portion of the clip. In the case of round rods the wings upon the bands are not required. Reference should be made to No. 14,652 of 1898 for the means of separating the group of three rods.

2,739-40.—CONSTRUCTION OF FIREPROOF AND SOUNDPROOF ROOFS, CEILINGS, FLOORS, &c.: *J. W. Green*.—Ribs are fashioned upon tiles for floors, ceilings, &c., so as to form insulating air-spaces beneath the girders, and in their undersides are dovetailed grooves which will take the plaster. Swivelling clips, or some such fasteners, secure the tiles to the lower flanges of the girders, and concrete is filled in over arches of sheet-iron. The spaces will serve for preventing the transmission of sound and for the laying of wires, pipes, and so on. For fireproof and soundproof floors and roofs are devised hollow blocks of terra-cotta, of which the V-shaped interlocking sides and dovetailed grooves will engage with the plaster and concrete, and the recessed ends with the flanges of the girders. The placing of the blocks is facilitated by the cutting away of their opposed diagonal corners.

2,759.—A COMBINED GAS AND COAL STOVE: *W. Youlton*.—In one form the gas-stove consists of two halves, right and left, each half being hinged upon its separated gas-supply pipe in order that it may be turned either in front of the coal fire or into recesses at the sides, which are provided with screens upon hinges. In another shape the gas-stove is pivoted on to its supply-pipe that it may be turned either up in front of the coal-stove or down into a box below the hearth. In another shape the two halves of the gas-stove are arranged in the recesses at the sides, in which case their screens can be folded in front of the coal-grate when the latter is not being used. Their flues are set by the side of the coal-fire flue, and the respective flues are cut off from the chimney with a register.

2,763.—A DRAWING-BOARD: *J. F. Gjellerud*.—A base, or underlayer, composed of two cards and or similar sheets pasted together, is fitted between two parallel guides attached to the drawing-board. The upper surface of the underlayer is finish with the upper surfaces of the guides. To its top sheet is fastened a drawing-block, which is made up of a set of sheets held together with glued paper-strips, and is retained in its place within the guides with a small spring lock, whilst an elastic band holds a sheet of horizontal or other paper that may be secured to the lower sheet of the underlayer.

2,774.—MANUFACTURE OF WHITE LEAD: *G. Bischof*.—The white lead, having been washed and pressed in a filter-press, is ground in oil without having been previously dried. White lead, about one-third, is pugged with oil, about two-thirds, the separated water is drawn off, then the remainder of the white lead and oil are added and pugged, and the superfluous water is abstracted by means of a current of heated air directed over the mixture when it is in the pugging mill. The white lead employed is obtained by the process specified in No. 11,002 of 1890.

2,775.—A DOOR-CHECK: *N. O. Bond*.—Blocks pivoted to rotating arms form a centrifugal block, the blocks being mounted so that they shall be free from an enclosing flange until the centrifugal force throws them out and, by causing them to rub against a leather lining of the flange, checks the motion of the door. A link joins the end of a lever to the door, and a pawl upon the lever engages with a ratchet-wheel set in connexion with the rotating arms of the brake.

2,812.—AN APPLIANCE FOR USE WITH ELECTRICAL CONNEXIONS: *E. F. Woodman and H. A. Fiske*.—In one form of the invention, which is devised for effecting a change of connexion when the temperature exceeds a certain limit, a cup or controller made of solder or some other fusible material is retained loosely upon a non-conducting cover by its flange. In the cup rests the lower end of a spring, which under normal conditions keeps the two contacts asunder. As the cup becomes melted the spring contributes to its disintegration, whereupon another spring falls upon one of the contacts so as to complete an alarm circuit. In another adaptation a different kind of spring is used for normally pressing the contacts together, the circuit being broken with the fusing of the cup.

2,867.—THE MOULDING OF BRICKS, PIPES, TILES, &c.: *C. Schlickeisen*.—In order that one machine may produce at the same time two or more different articles, the inventor provides side openings or dies as well as the customary mouthpiece or die at the end of the extrusion machine or pug-mill shaft. The lateral dies direct the clay by means of inclined or curved blades, which are set between the screw-blades, and may be extended parallel to the shaft. The mechanism allows for the changing of the dies and the mouthpieces can be lengthened or shortened so as to control the amount of pressure exerted.

2,871.—A KEY-LOCK: *H. Loose*.—In order that one or the other of two keys may serve the lock is made with two keyholes upon one side or upon both; the bolt is fashioned with two double keyways, and has notches for engagement with a spring-controlled and vertically-sliding tumbler which either of the keys can operate, as its lower edge is inclined so as to ensure engagement with the key that fits one of the two keyholes.

2,876.—MECHANISM FOR CRANES: *W. H. Morgan and A. D. Taylor*.—In the case of cranes used in foundries the inventors contrive that the upper portion of the trolley shall be rotated upon a round truck by means of a motor-driven pinion that is set in gear, with and will run around a fixed rack upon the lower portion of the trolley; either one of a pair of endless lifting-chains is passed over either one of a pair of sprocket-wheels and hangs in two loops, the forging being hung in a short endless chain laid over a sprocket-wheel, which is driven with spur-gearing from two sprocket-wheels, over which the two lifting chains are passed. Or the two motors the one serves to drive the first-named sprocket-wheels in only the same direction, whereby the forging is turned simply upon its own axis; the other motor will drive those sprocket-wheels in opposed directions for raising or lowering purposes. If both motors are worked together the forging can be turned, and lowered or raised, at one and the same time.

2,886.—MANUFACTURE OF PORTLAND CEMENT: *J. O. Walk*.—Burned lime mixed with water holding sodium nitrate in solution is added to ground blast-furnace slag to compensate for its deficiency of lime and soda and to neutralise its too large amount of sulphide of calcium; for sodium nitrate may be used nitrates or chlorates of potash, lime, strontia, baryta, and so on, which will serve, albeit in a less degree, to convert the calcium sulphide into calcium sulphate, as oxidation ensues when the mixed slag and lime is burned in the shape of powder or bricks.

2,933.—EXTENSIBLE LADDERS: *A. Müller*.—At the back of the ladder is a cross-bar on to which the pivoted metal plates, to which are secured the back legs or supports of the ladder, the last-named parts being joined with links, whereof the common pivot works within a slot cut vertically in the cross-bar. With the extension of the ladder recesses on brackets take the plates, which then become locked with a pivoted catch to be turned down over the links; a cross-rod joins the brackets, which may have holding pins or recesses. For the employment of the steps of a folding ladder the back supports are rendered detachable, and one pivot of the main cross-bar will fit into a slot in one of the side brackets where a pivoted catch retains it in position.

2,938.—AN AUTOMATICAL MACHINE FOR SHARPENING CIRCULAR SAWS: *C. H. Clifton*.—A pivot which can be adjusted both horizontally and vertically with slides and screws holds the saw, across which a cam or crank upon a shaft feeds a grinding-disc that is carried upon the end of a swinging arm; two friction-discs—one of which a spring forces against the saw—feed the grinding-disc forwards; during the process of sharpening the saw is stopped from time to time through the action of a pawl which a lever forces aside out of the way; the pawl, upon its return, again stops the saw as it is being fed by the friction-discs; a stop upon the swinging arm, which impinges against a bell-crank lever, raises the grinding-disc at its stroke backwards, and a modified shape of the machine provides for a vertical raising of the pawl out of gear with the teeth of the saw, instead of its movement to one side.

2,964.—MOULDING OF PIPES, CONDUITS, &c.: *A. H. Howard*.—Pipes, conduits for electrical conductors, and similar goods are composed of a bituminous substance, which is moulded, when in a hot plastic or liquid condition, in a metal casing or around a skeleton of wire network or coil, which, together with the heated material, is placed within a closed mould; the mould is then rotated quickly in one direction, through centrifugal action, the material may become spread evenly. The mould consists of two parts joined together with wedges forced between the claws of rounded and hinged straps; the rounded and recessed ends of the tubes are connected by the insertion of a hot dish block of iron between their adjacent ends and the pressure of the pipes together after melted bitumen has been laid over the joint.

2,989.—BURNERS FOR GAS-STOVES: *R. Oehme*.—A gas-inlet, a conical rim turned inwards, and a shallow casing of metal with feet constitute the burner. Upon the rim is laid a cone-shaped ring, having two other rings above it, a middle disc, or plug, is laid upon the uppermost ring, being tightly screwed into the base with a screw and a key that fits two holes; notches cut in the upper edges of the rings, the central disc, and the outer rim form the gas-outlets for burning purposes.

2,996.—AN APPARATUS FOR USE IN DRYING, BURNING, AND SIMILAR FURNACES: *H. Hersfeld*.—For charging and discharging a drying-oven or furnace the goods are to be loaded upon the tray of a truck which runs upon rails into the oven, and when the truck has been pushed into the tray is lowered on to ledges with lever-worked cams; the tray is again lifted by the same means; screws, however, may be used for that purpose.

3,005.—TRAPS FOR GULLIES: *F. Staincliffe*.—For an improvement upon the contrivance specified in No. 4,528 of 1896 the inventor places the outlet on the side of the gully and fashions the trapping dish in a detachable form; he also adds a grating which is to be sprung into its place at the top of the gully, being made of a zig-zag spring of steel. Other modifications are available for use in stables and streets; in the latter instance he makes the trapping vessel rectangular in shape, and provides it with four supports.

MEETINGS.

FRIDAY, JUNE 14.
Edinburgh Architectural Association.—Annual excursion to Hexham and Durham.

SATURDAY, JUNE 15.
Architectural Association.—Summer visit to Godalming and District to view some works by Mr. Lutyns.
Edinburgh Architectural Association.—Annual excursion (concluded).

St. Paul's Ecclesiastical Society.—Visit to the Church of Sarraz. Train to Rickmansworth from Baker-street at 10.40 p.m.

MONDAY, JUNE 17.
Royal Institute of British Architects.—Professor W. R. Lethaby on "Education in Building." 8 p.m.

WEDNESDAY, JUNE 19.
Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m.

SATURDAY, JUNE 22.
British Institute of Certified Carpenters.—Visit to Hampton Court Palace. 3 p.m.

SOME RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

May 30.—By I. FARLOW (at Gipsy Hill). Sydenham—2 and 3, Porthcaw-road, r. 4,375 By J. R. EVE & SON (at Ampthill). Ampthill, &c., Beds.—The Morris Estate, comprising about 600 ac. f. numerous 193, 25,182 May 31.—By E. HOLSWORTH (at Stoke Newington). COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Nature of Work.	By whom Advertised.	Premiums.	Designs to be delivered
Bridge Widening.....	Hamilton (N.B.) Corporation.....	15 guineas and 10 guineas.....	June 30
*Laying out Winter Garden.....	Penzance Corporation.....	21 <i>l.</i> and 10 <i>l.</i> 10 <i>s.</i>	Sept. 1

CONTRACTS.

Nature of Work or Materials.	By whom Required.	Forms of Tender, &c., Supplied by	Tenders to be delivered
*Draining, Kerbing, &c.....	Hendon U.D.C.....	Engineer, Public Offices, Hendon, N.W.....	June 17
Offices and Tea Rooms, Kirkcaldy.....	Leeds Corporation.....	City Engineer, Municipal Buildings, Leeds.....	do.
Waterworks, Much Wenlock, Salop.....	Madeley & Brosley Water Comte.....	Mr. Stooke, Civil Engineer, Severn Villas, Shrewsbury.....	do.
Seven Houses, Osborne-street, Barnsley.....	L. & N. W. Railway Company.....	Wade & Turner, Engineers, 10, Pitt-street, Barnsley.....	June 18
Eighty Houses, Bradford, Manchester.....	Edinburgh Corporation.....	Estate Offices, Exchange Station, Manchester.....	do.
Additions to Public Library.....	Rotherham Corporation.....	R. Morham, Architect, City Chambers, Edinburgh.....	do.
Brick Tank, &c.....	Bradford-on-Avon U.D.C.....	H. H. Copnall, Town Hall, Rotherham.....	do.
Pumping Station, &c.....	Longtown Agricultural Society.....	S. Howard, Surveyor, Town Hall, Bradford-on-Avon.....	do.
Farmhouse, Carlogas, near St. Columb.....	Nelson Corporation.....	J. Smith, Churchtown, Graupound-road, Cornwall.....	do.
Showyard Buildings, Longtown, near Carlisle.....	Dover Hospital.....	J. S. Hewitson, Randalinton, Lom-town.....	do.
Electric Light Station.....	Rev. J. J. Lewis.....	B. Ball, Civil Engineer, Town Hall, Nelson.....	do.
*Alterations, &c., to Dover Hospital.....	North-Eastern Railway Company.....	See Advertisement.....	June 19
Church, Tynte, Penrhyn-waiber, Wales.....	Plymouth Corporation.....	Rev. W. Johnston, The Manse, Holywell Green.....	do.
Additions to Club Buildings, Crossland Moor.....	Hove Corporation.....	E. M. Bruce Vaughan, Architect, Cardiff.....	do.

"May Morning"—Relief for Decoration of a Fireplace. Miss Edith Maryon, Sculptor.

cramped attitude in a chair, which latter is a good piece of design; the figure has not the dignity either of design or expression which the subject seems to call for; but it is at all events not commonplace. Mr. Pegram's monument to Mme. Michallis seems to have been inspired by some of the monument designs of Chapu and Mercié; it shows a simple but well-designed flat stele or tombstone, in the head of which is a medallion portrait of the deceased person commemorated, while beneath is a mourning figure, life size and draped, in high relief on the stele as a ground. There is pathetic intention in this, but in a sculptural sense the figure is somewhat commonplace in design, and appears more so from the rather pronounced alto-relief in which it is treated. A French sculptor would almost certainly have kept it in low relief, perhaps just emphasising the head by raising it further from the ground; such a treatment would have tended to give a refinement of sculptural effect which the work as it stands seems to lack; it is altogether too *prononcé* and too crude in its large rounded forms.

In Mr. Arthur Walker's recumbent group, "Sleep," representing a mother and child, the sleeping infant is natural and touching in expression; the attitude of the figure of the mother, with legs drawn up, is rather awkward and undecorative in line, but the work as a whole is one to be regarded with interest, and is in a very good style, free in execution and not over-finished. Mr. Fehr's "Hesitation," a bronze figure of a female tempted by "Ambition's crown," yet shrinking from putting it on her head since it is "fraught with pain," is one of those symbolical subjects which are peculiarly suitable for sculpture, but the interpretation is a little too matter-of-fact and prosaic—the figure holding up the crown and twisting her head away from it as if it would sting, looks so like a shrinking from bodily pain, besides resulting in an uncomfortable and strained attitude; the *motif* of the work should surely have been conveyed through the expression of the face rather than through muscular movement. Mr. Lucchesi's "The Victory of Peace," to be erected in marble in a Park at Auckland, is a half-draped female figure of fine lines clasping a dove on her bosom but also holding in the other hand a drawn sword, so that the allegory is rather confused, and one can only regard the work as satisfactory from a decorative point of view. Mr. Alfred Turner's short-skirted and robust

"Fisher Girl," one of a pair to be placed in Fishmongers' hall, is not decorative, but is a good healthy symbol of open-air physical toil. Mr. Thornycroft's "Dean Colet, Founder of St. Paul's School," with a scholar kneeling on each side of him, is the group to be placed under the not very happily designed metal canopy of which the drawing is shown in the architectural room. The sculptor is here helped, in treating the principal figure, by the flowing costume which is not of to-day, and which therefore has a certain sculptural and abstract effect; Colet's thin and ascetic head is finely treated, and the innocent and unworn faces of the boys make an effective contrast with his figure. The last thing we have to mention in the octagon room is the nude marble figure "Solitude," by a French sculptor, M. Mégrét, of which an illustration will be found in one of the plates in this issue. The figure has not the sentiment implied in the title; indeed, any name such as "Nymph" or "Etude" would do equally well for it; but it has the merit of being an exceedingly pretty and well-modelled figure, which would have had more justice done to it by a central position, as it seems satisfactory in line from all points of view.

In the Lecture-room we may first notice M. Schenck's two alto-relief subjects, "Summer" and "Autumn," which are placed against the wall over the door, and of which, as they are in a special sense architectural sculpture, being intended for the decoration of a building, we have given illustrations on a large scale (see lithograph plates). As will be seen, they are figures composed specially to fill a space of peculiar shape, and also to act as corbels. This latter function explains and justifies their high relief; otherwise we prefer decorative sculpture on a building to be kept in low relief, in order to be duly subordinate to the architectural lines of the building.

The works placed in the centre of the floor in the lecture-room are at all events curiously diverse in style and motive. In the centre of the room is the bronze of Mr. Swan's "Puma and Macaw," of which a plaster model was in a former exhibition. As a representation of animal form and action this is a remarkably truthful and spirited work; what one questions is whether the result is really worth the ability and pains expended on it; for animal sculpture can never take anything but a secondary rank in the productions of the art; it lacks the

higher interest of intellectual meaning and expression. Mr. Simonds's curious design for a fountain, called "Song and Dance," is original and piquant enough; it is based on a triangle plan, and consists of a gilded nude figure placed aloft in the centre and playing on an old-fashioned bow instrument, while three flamingoes dance solemnly at the three angles of the triangle. No doubt the subject arose from a wish to work into sculpture the peculiar form and movement of the flamingo, an experiment which was worth trying, though one fails to see what connexion the birds have with a fountain. It is a graceful and original fancy, however; we should have liked it better if the centre pedestal had presented a formal design and not a piece of naturalistic rockwork; and there is nothing to show whence the water flows, an important detail in a fountain, and which should always form a point in the design. Mr. Frampton's "Edward VI." is a realistic costume statue for Giggleswick School, with the foundation of which we presume the young King had some connexion, and which is intended to represent him in his habit as he lived, with the stiff frock covered with embroidery. For a school this is the right thing, as it gives the boys a correct historical idea of the person and dress of a historical personage, and the sculptor has contrived to impart a good deal of individual character to the head; it cannot be said, however, that this is a kind of work which is interesting as sculpture. Mr. Wheatley's recumbent figure "Awakening," of which a small illustration will be found in one of our plates, is a work of considerable interest; it represents a nude female figure, who by the design of the small harp by her side and of the ornament on her forehead is to be classified as Egyptian, though there is nothing in her physiognomy to suggest that nationality; she is just awakening with a smile, her disordered hair partly covering one side of the face; the figure, in its lax attitude of repose, is very well modelled, and there is something very pleasing about the whole work, though it is not conceived in a very serious spirit.

Mr. Reynolds-Stephens's "Castles in the Air" and Mr. Onslow Ford's "Glory to the Dead," which are placed symmetrically on opposite sides of the room, may in one sense be classed together, as they both represent that kind of work which is as much decorative as purely sculptural; both are small bronze figures on specially

treated pedestals. In "Castles in the Air" the figure of a young girl with a book across her knee, not reading but dreaming, and with the right hand slightly raised in a very pretty and natural action, belongs essentially to real life; the pedestal is symbolical, the projection which forms the cap being decorated with little projecting turrets each with a bit of ruby glass in the top; the "castle" idea is again symbolised in the crowning ornament of the plaque which forms a background to the figure. Mr. Ford's work, though as we said, it belongs to the same class, is a far more delicate and refined production; the nude figure holding the wreath and torch is of exquisite grace and finish; the bronze pedestal which forms her immediate support is surrounded by little terminal figures of winged children, and small and delicately executed emblems—hearts, serpents, &c. This stands on a well-designed marble pedestal with fluted pilaster-like features which are stopped at the foot by acanthus leaves. As an *objet d'art* with a symbolical intent the whole is charming, but is it quite equal to the serious thought suggested by the title? When one thinks of Mercie's "Gloria Victis" in the court of the Paris Hôtel de Ville, one feels this to be rather small in comparison, and that not only in the sense of material dimensions.

Mr. Brock's bust of Queen Victoria, which stands between the two last-named works, is a masterly piece of portraiture in marble-cutting, bold and broad in execution and exceedingly dignified in character. Mr. Armstead's small-scale marble figure "Remorse," a woman running headlong down some steps with a woeful expression and attitude, the head and body thrown forward and the hands clasped convulsively, is pathetic in expression but rather violent in movement for sculpture. Mr. Colton's "The Wavelet," a gilt figure of a young girl supposed to be looking down on a stream, is clever and original, like all his work, but not beautiful, and has hardly character or point enough to atone for the absence of beauty.

Of the works placed round the walls there are as usual a good many busts, some of no interest, others which are of value either as characteristic portraits or as ideal suggestions. Among the latter class are two charming works by Miss Gwendolen Williams: "Doris," a head oddly mounted on a narrow pedestal decorated with striated lines, and "Pandora," a more important work of which we give an illustration. This is rather too *genre* a treatment of a Greek legend, but the bright and joyous expression of the head, and Pandora's obviously happy unconsciousness as to the nature of the uncanny things she is letting out of the casket, give it a point and piquancy more than arises from mere modelling. Mr. Richard Garbe's "L'Inconnue" is another imaginary head, white marble on a veined marble base, of which we give an illustration, and which is noticeable both for its fine expression and for its style of execution. Among portrait busts may be specially mentioned Mr. Goscombe John's marble bust of a lady; Mr. Hope-Pinker's low relief medallion portrait of the late J. J. Tayler, in a small architectural frame of green marble, and Mr. Onslow Ford's medallion bas-relief of Lady Elliott Drake, framed in carved wood. Mr. Goscombe John's colossal bronze

seated statue of the late Duke of Devonshire is a dignified work of this class, which, as before observed, is we suppose inevitable, but which can hardly make any sculptor happy.

Mr. Sargent appears this year as a sculptor, with a life-size crucifixion group, or rather a crucifix on a large scale, we presume intended for a Catholic place of worship, or a private oratory. The suggestion of the blood streaming from the outstretched hands into a cup held up by a figure at each side is to our thinking most painful and repellent, though we presume there are people of morbid religious excitability to whom it appeals. As a matter of design, the grouping of the two subsidiary figures with the Christ, to whom they are as it were connected by a band of drapery which winds round their figures and round His, is very fine, and the contrast of the lines of these figures and the strongly-marked vertical lines of the cross and the central figure is in a decorative sense very effective. Nevertheless, it is a thing we should never wish to see again. Mr. F. Lynn Jenkins's metal and ivory frieze for the vestibule at Lloyd's, which hangs below this, is a very clever and effective piece of work in which the associations of Lloyd's with sea and ships are symbolised in a decorative manner by the suggestion of ships and waves and clouds, with no kind of naturalism; the small alto-relief figures which are introduced at the salient points of the design are expressive and well designed. Among other decorative work in the Lecture-room is Mr. Mark Rogers's upper part of a cabinet in oak, of which we give an illustration; Mr. F. H. Steele's "Design for a Casket" in silver, which has the merit of avoiding that eccentricity of line and detail which seems too much an object in recent silver design, but for a casket it is perhaps a little too decidedly architectural in character; and Mr. Onslow Whiting's board of bell-pushes, finger-plates, &c., in which the figure is gracefully worked into some of the designs. M. Clovis Delacour's Andromeda statuette in ivory, with a bronze dragon, and waves of alabaster, is well done after its way, but is a kind of work we do not desire to see encouraged; it savours more of the "article de Paris" than of the art of sculpture. On the other hand, Miss Emmeline Halse's three little alto-reliefs of babies, in bronze, a small and very unpretending work, is by no means to be passed over; it is very clever and humorous. We should also mention the spirited panel in relief by another lady, Miss Edith Maryon, called "May Morning," and intended as a portion of the decoration of a fireplace. Of this we give an illustration from a small photograph sent to us by the artist; too small unfortunately to do justice to the work.

Although we have seen better sculpture years at the Royal Academy than this one, it cannot be denied that the proportion of good work to bad and indifferent is much higher in the sculpture galleries than among those devoted to painting.

NOTES.

The Report of the Council of the City and Guilds of London Institute, dated April of the present year, draws attention (in the special Report of the Principal, Professor

Sylvanus Thompson) to the necessity for carrying out the completion of the College buildings first suggested in the Report of 1884. Plans were prepared by Mr. Robins in 1887 for additions to include an engineering drawing office, a library, reading room, waiting rooms and lunch room, and the Institute is now in possession of the site for which these additions were designed. As Professor Thompson observes, if the need for these additions existed sixteen years ago, it has certainly not diminished since. Mr. Sparkes's Report of the art work is very encouraging, especially as showing the after results of the training, for it appears that at the Paris Exhibition of last year, sculptors who were former students at the Institute obtained six of the English and Colonial awards for sculpture, viz.: one out of three Grand Prix awarded, two gold medals out of five, and three silver medals out of eight awarded. In the Art Department, we are told, the enamelling class is doing good work under the superintendence of Mr. Fisher, than whom there could not be a more competent instructor.

WE are glad to be able to announce that the resolution to "fluate" the Poultry Cross at Salisbury, which would have involved the initiatory process of scraping off all the lichen and getting a raw surface, was formally rescinded at the meeting of the Salisbury Town Council last week on the motion of Mr. Haskins, who made a very sensible speech on the occasion, and quoted in support the opinion of the Secretary of the Society of Antiquaries, Mr. Read. Of course, as we pointed out in a former reference to the subject, (page 336 *ante*), the Poultry Cross was so much restored half a century ago that it has ceased to be much of a genuine relic, though some of the old stones were worked up in the restoration. But as the portions then new have now acquired a picturesque weathering, this at least might as well be left.

At a special court of the governors held on June 5, it was announced that the building of the new isolation block (towards which an anonymous donor gave 20,000*l.*) is now practically completed. The new buildings, together with the new pathological department and *post mortem* room, have been erected after the plans and designs of Mr. Rowland Plumbe, who has been engaged during some years past as architect for extensive improvements and additions at the hospital. The governors propose to expend a total sum of about 250,000*l.* during the next four years, of which amount they will devote 60,000*l.* to the new block fronting White-chapel-road; for the Jews' wards they set aside 10,000*l.* contributed by Mr. Edward L. Raphael; for a new out-patients' department, 60,000*l.*; laundry, 15,000*l.*; alterations of the interior, 20,000*l.*, and a children's ward, 7,000*l.* Mr. Rowland Plumbe's work comprises the block, opened on June 26, 1891, which contains an operating theatre, a theatre for clinical instruction, students' rooms and lavatories, nurses' rooms, storerooms, &c.; the recent remodelling of the sanitary arrangements, by the recommendation of Dr. Louis Parkes; an extension of the Nursing Home (1895); and the freezing chamber. The hospital was originally established in 1740, as the "London Infirmary," at a house

PRICES CURRENT (Continued). BRICKS, &c.

Table listing prices for Quoins, Bullnose, Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Squints, Second Quality, White and Dipped, Salt Glazed, Thames and Pit Sand, Thames Ballast, Best Portland Cement, Best Ground Blue Lias Lime, Grey Stone Lime, and Stourbridge Fire-clay in sacks.

STONE.

Table listing prices for Ancaster in blocks, Bath, Farleigh Down Bath, Beer in blocks, Grishall, Brown Portland in blocks, Darley Dale in blocks, Red Corsehill, Red Mansfield, Hard York in blocks, and Hard York 6 in. sawn both sides landings.

SLATES.

Table listing prices for slates in various sizes and quantities, including 20x10 best blue Bangow, 16x8 best, 20x10 best blue Portman, 16x8 best blue Portman, 20x10 best Eureka, 16x8 best Eureka, 20x10 Permanent green, and 16x8 best.

TILES.

Table listing prices for Best plain red roofing tiles, Hip and valley tiles, Best Broseley tiles, Hip and valley tiles, Best Rainbow Red, brown or brindled Do., Do. ornamental Do., Hip tiles, Valley tiles, Best Red or Mottled Staffordshire Do., Hip tiles, and Valley tiles.

WOOD.

Table listing prices for BUILDING WOOD - YELLOW, Deals (best 3 in. by 11 in. and 4 in. by 9 in. and 11 in.), Deals (best 3 by 9, 4 by 9, 5 by 9, 6 by 9, 7 by 9, 8 by 9, 9 by 9, 10 by 9, 11 by 9, 12 by 9, 13 by 9, 14 by 9, 15 by 9, 16 by 9, 17 by 9, 18 by 9, 19 by 9, 20 by 9), Battens (best 2 1/2 in. by 7 in. and 8 in. and 3 in. by 7 in. and 8 in.), Deals seconds, Battens (seconds), Foreign Sawm Boards, Fir timber (Best middling Dazzig Bracket (average specification)), Seconds, Small timber (8 in. to 10 in.), Swedish hdk's., Pitch pine timber (3 1/2 ft. averages), JOINERS' WOOD, White Sea (First yellow deals, 3 in. by 11 in., 3 in. by 9 in., 2 in. by 11 in., 2 in. by 9 in., 2 in. by 7 in., 2 in. by 5 in.), Second yellow deals (3 in. by 11 in., 3 in. by 9 in., 2 in. by 11 in., 2 in. by 9 in., 2 in. by 7 in., 2 in. by 5 in.), Third yellow deals (3 in. by 11 in., 3 in. by 9 in., 2 in. by 11 in., 2 in. by 9 in., 2 in. by 7 in., 2 in. by 5 in.), White Sea (First white deals, 3 in. by 11 in., 3 in. by 9 in.), and Blowpipe.

PRICES CURRENT (Continued). WOOD.

Table listing prices for White Sea and Petersburg (Hattens, Second white deal, Pitch pine, Under 2 in. thick extra, Yellow Pine), First, regular sizes, Brails (12 in. and up), Oddments, Seconds, regular sizes, Yellow Pine Oddments, Kauri Pine, Danzig and Stettin Oak Logs, Large, per ft. cube, Wainscot Oak Logs, Dry Wainscot Oak, per ft. sup., Inch, in. do., Honduras, Talsaco, per ft. sup., Selected, Figury, per ft. sup., Dry Walnut, American, per ft. sup., as inch, Teak, per load, American Whitewood Planks, Per ft. cube, Prepared Flooring, 1 in. by 6 in. and 7 in. yellow, planned and shot, 1 in. by 6 in. and 7 in. yellow, planned and matched, 1 1/2 in. by 6 in. and 7 in. yellow, planned and matched, 1 in. by 6 in. and 7 in. white, planned and shot, 1 1/2 in. by 6 in. and 7 in. white, planned and matched.

JOISTS, GIRDERS, &c.

Table listing prices for Rolled Steel Joists, ordinary sections, Compound Girders, Angles, Tees and Channels, ordinary sections, Flitch Plates, Cast Iron Columns and Stanchions, including ordinary patterns.

METALS.

Table listing prices for Iron, Common Bars, Staffordshire Crown Bars, merchant quality, Staffordshire "Market" Bars, Mild Steel Bars, Hoop Iron, best price, galvanized, Sheet Iron, Black, Ordinary sizes to 20 g., 20 g. and 24 g., Sheet Iron, Galvanised, flat, ordinary quality, Ordinary sizes, 6 ft. by 2 ft. to 12 ft. by 2 ft., Sheet Iron, galvanised, flat, best quality, Ordinary sizes to 20 g., Galvanised Corrugated, Ordinary sizes, 6 ft. to 8 ft., Best Soft Steel Sheets, 6 ft. by 2 ft. to 3 ft. by 20 g. and thicker, Cut nails, 3 in. to 6 in., (Under 3 in. usual trade extras).

PLASTER, &c.

Table listing prices for Coarse Plaster, Coarse Knees and Paris cement, Fine do., Robinson's Fireproof Cement, Do. Finishing, Whiting.

LEAD, &c.

Table listing prices for LEAD - Sheet, English, 3 lbs. & up, Pipe in coils, Soft Pipe, ZINC - Sheet, Vieille Montagne, Silesian, COVERS, Strong Sheet, Brass, Copper nails, Strong Sheet, Thin, Tin - English Ingots, Solger - Plumbers', Tilmers', Blowpipe.

PRICES CURRENT (Continued). ENGLISH SHEET GLASS IN CRATES.

Table listing prices for 15 oz. thirds, 21 oz. thirds, 26 oz. thirds, 31 oz. thirds, 35 oz. thirds, Fluted sheet, 15 oz., Hartley's Rolled Plate, Extra Fair, OILS, &c., Raw Linseed Oil in pipes, Best Elastic Copal Varnish for inside work, Best Elastic Copal Varnish for outside work, Best Elastic Carriage Varnish for outside work, Best Hard Oak Varnish for inside work, Best Extra Hard Church Oak Varnish for inside work, Fine Hard Copal Varnish for inside work, Best Hard Copal Varnish for outside work, Extra Fair Paper Varnish, Best Japan Gold Size, Best Black Japan, Oak and Mahogany Stain, Berlin Black, Knotting, Best French and Brush Polish.

VARNISHES, &c.

Table listing prices for Fine Elastic Copal Varnish for outside work, Best Elastic Copal Varnish for inside work, Best Elastic Carriage Varnish for outside work, Best Hard Oak Varnish for inside work, Best Extra Hard Church Oak Varnish for inside work, Fine Hard Copal Varnish for inside work, Best Hard Copal Varnish for outside work, Extra Fair Paper Varnish, Best Japan Gold Size, Best Black Japan, Oak and Mahogany Stain, Berlin Black, Knotting, Best French and Brush Polish.

TO CORRESPONDENTS.

J. P. B. (Received too late). S. T. (Amounts should have been stated). E. B. (Too late next week). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the article, which, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.] Denotes accepted. † Denotes provisionally accepted.

BRIDLINGTON QUAY.—For alterations to No. 30, King-street, for Mr. J. R. Collinson. Mr. J. Earnshaw, architect, Bridlington Quay: F. Cornet £150 0 0 S. Atkin £110 0 0 F. Kneeshaw 123 14 Barr & Booth 106 0 C. Simon 118 0 A. Gattard 100 10 F. Flintoff 115 0 [All of Bridlington.]

BUCKERELL (Devon).—For the erection of a house, for Mr. A. M. Read. Mr. E. H. Harbottle, architect, County Chambers, Exeter. Quantities by Mr. F. E. Simpson, Heavitree, near Exeter: Linscombe & C. Turner £1,923 0 0 Son £1,602 0 0 W. J. Granger 1,780 0 0 E. Harris 2,285 15 0 Nichols 110 0 Mings & Boon 2,101 0 0 Bradnich 1,854 19 0 Stephens & Son, Ltd., 1,975 0 0

BUCKNELL (Salop).—For additions to schools for the managers, Bucknell Schools. Mr. T. Evans, architect, Market Buildings, Groven Arms, Quantities by architect: G. Bullock £189 0 0 Weale & Lloyd £163 5 0 G. Chadwallader 179 0 0 Anthony & Roberts, Overton & Sans 176 0 0 Knighton 157 0 [Architect's estimate £180]

CARLISLE.—For the erection of stabling, stores yard, workshops, &c., for the Corporation. Mr. H. C. Marks, C.E., City Engineer and Surveyor, 36, Fisher-street, Carlisle. Quantities by City Engineer and Surveyor: Tom Scott £4,881 7 1 James Bealy £4,455 0 George Black 4,794 16 3 Joseph Hindson 4,430 0 Beaty Bros. 4,660 0 John H. Reed 4,369 0 Wm. Dady 4,597 0 J. & R. Bell, John Laing 4,425 0 Carlisle 4,361 0 [Surveyor's estimate, £4,551.]

[See also next page.]

CHATHAM.—For the erection of laundry buildings, Boster's Hill. Mr. H. H. Dunstall, architect, 9, New-road-avenue, Chatham. Quantities by the architect:—
 W. C. Snow £1,519 0 0
 G. West 1,225 0 0
 West Bros. 1,324 0 0
 W. Coker 1,322 0 0
 Chatham* 1,219 0 0

EASTBOURNE.—For alterations at the Town Hall for the Corporation. Mr. W. C. Field, Borough Architect and Building Surveyor, Town Hall, Eastbourne:—
 Thomas Glover £220 0 0
 Dennis & Co. .. 263 0 0
 Cole & Son .. 250 18 6

The Great Fire at Antwerp and its Effects.

THE conflagration by which the greater part of the Royal bonded warehouses at Antwerp was destroyed on the 5th inst. ranks amongst the remarkable fires of modern times, as much from the rapidity which marked its progress as from the completeness of the destruction in which it resulted.

The Royal bonded warehouses consisted, as may be seen from the plan which we give, of an extensive group of buildings in three main blocks, facing the Quai de l'Entrepôt on the west, and partly connected at the rear, towards the Avenue du Commerce, by buildings of less height on the east. The main blocks consisted of six stories above the basement, and the central block had a large internal courtyard. The connecting buildings on the east side were partly one story and partly four stories in height. In the courtyards, and particularly to the south of the main blocks, were a number of detached one-story buildings, indicated on the plan by crossed diagonal lines. The central and southern main blocks, as well as the connecting buildings on the east side and all the one-story buildings except the group at the extreme south-west corner, have been completely destroyed.

The fire started on the 5th inst. at 2.30 p.m.; at 2.40 p.m. the fire brigade were called out; at 4.30 p.m. the buildings were all alight; at 5 p.m. the first roof fell, and by 6 p.m. the whole of the roofs and floors had fallen in and the fire was under control for the first time. The efforts of the fire brigade to keep under the conflagration were practically impotent until the roofs and floors had fallen in and the fire to this extent had burnt itself out. Complete extinction of the fire was not, of course, at that time possible, and, indeed, has not up to the time of writing this

been effected, but the fire was from that time prevented from spreading.

The whole of the buildings were not occupied by bonded goods alone, but some of the upper floors were let out to private tenants, and it was in one of these tenancies that the fire started, on the top floor of the central block over the point marked A on plan. It is believed that the outbreak was due to the spontaneous combustion of some old sacks which were tightly tied up in bundles and had become damp. The division or party walls did not extend higher than the plate level of the roofs of the main blocks, and the fire quickly travelled through the roof and top floor of the central block, then burnt downwards, and, with a strong northerly breeze blowing from the sea with a rising tide, leaped across to the one-story building on the east side, then to the four-story building and the southern block.

The warehouses contained a miscellaneous stock of goods—coffee, sugar, wool, tobacco, &c., with wine and spirits in the basement; but the stocks were below the average, the amount of sugar, for example, being only one-fortieth of that usually stored. One factor in the rapidity of the fire could be readily comprehended from an inspection of the northern block which has not been consumed, and that is the remarkably dirty condition in which the warehouses were kept, judging from this building, to which the others are said to have been similar. The floors were coated with sugar; dirt and dust, fragments of straw and other combustible matter were widely spread, so that ample food for a rapidly-extending conflagration was present.

The construction of the buildings also was eminently suited to a quick communication of the flames. The division or party walls, as we have already noticed, did not divide the roofs and had many openings in them, some closed by open lattice-work wooden doors, others by single iron doors of thin plate, about ½ in. thick and badly fitting. The floors were constructed of 1½-in. deal boarding on 11-in. by 3-in. fir joists, 10 in. apart, carried on wrought-iron plate

girders. These girders were of very light construction, consisting merely of ¼-in. web, 1 ft. 11½ in. deep, with, for flanges, two angle irons, 2½ in. by 2½ in., of ¼-in. metal. The girders were supported by cast-iron columns, 10½ in. outside diameter and ½-in. metal (on upper floors). As stays from column to column transversely were rolled iron joists 7½ in. by 3¼ in. of ¼-in. metal. This construction is shown in detail on our plan. The weight of the floor was not carried on the walls, although the ends of joists and of iron girders were built in, but upon a row of the cast-iron columns with girders supported upon them, placed close to the walls, as shown on the plan. The various stories had free communication by open skeleton staircases of wood, and also by lifts for goods, so that the whole of the main blocks destroyed and the adjacent buildings on the east side were, in fire insurance parlance, "in one risk."

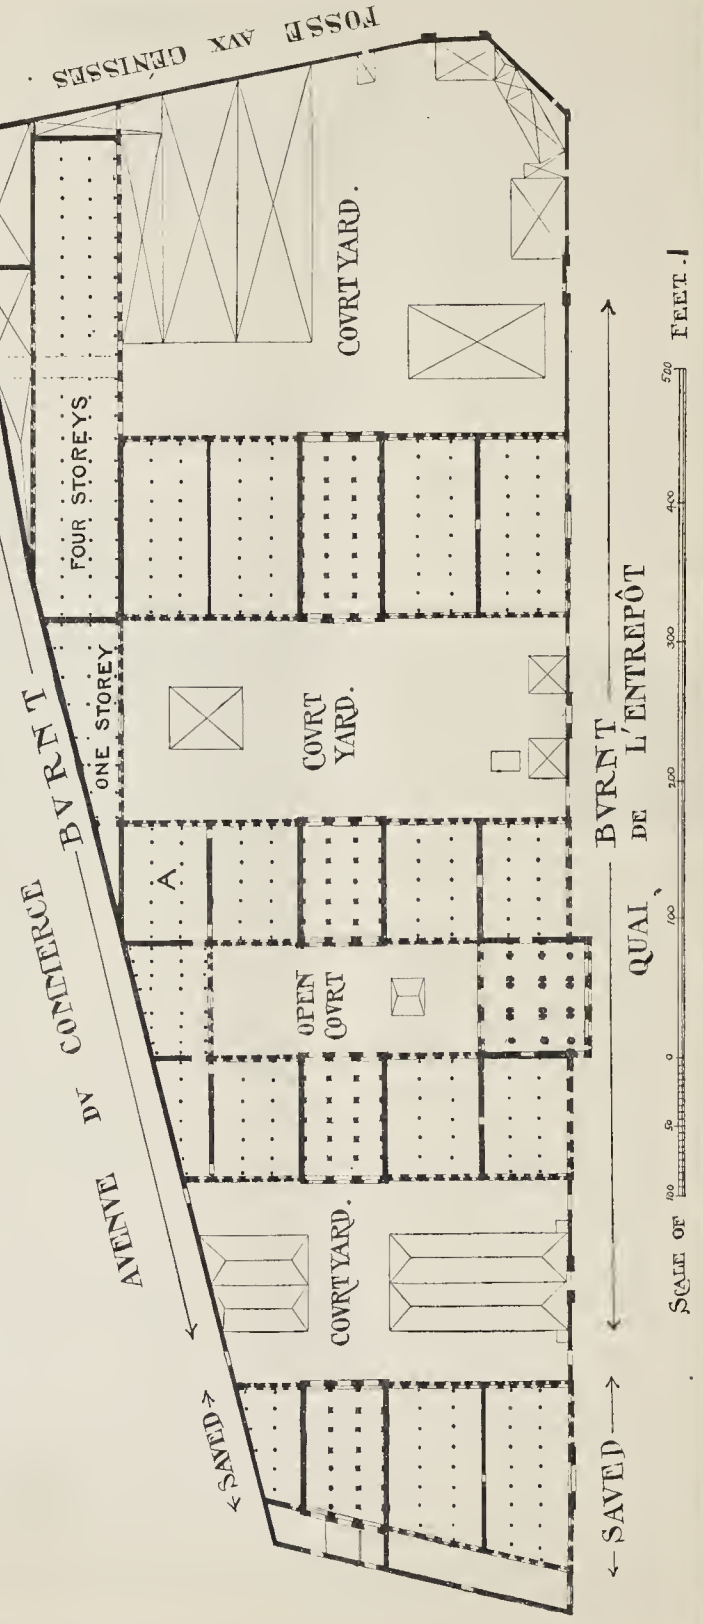

The walls were well built of brick, but, measured by the standard of our own Building Acts, too thin for their height and length. The lower parts of the façades to the sill of the first floor windows were faced partly with a cream-coloured limestone and partly with what is locally called "blue granite."

The avenues through the centre of each block were vaulted in brick, and on some of the upper floors were brick arches carried by cast-iron girders, but beyond this there was no pretence of fire-resisting construction or sub-division of areas except for the futile iron doors already mentioned. The date at which the buildings were erected, A.D. 1831, was, of course, anterior to the general idea of non-combustible construction, to say nothing of so-called fireproof or fire-resisting work. Even the window frames and sashes were of wood.

Everything, therefore, was prepared for the rapid development of a fierce heat, and the heat attained was in some cases sufficient to fuse parts of the cast-iron columns (cast iron melts at from 2,000 deg. to 2,800 deg. Fahr.), whilst the radiated heat from the central block was, in spite of the

strong northerly breeze, sufficient to fire the northernmost block, although to windward. The efforts of the fire brigade, however, prevented this building from serious injury. Isolated one-story buildings to leeward, although a considerable distance away, as may be seen from the plan, were completely burnt.

The facilities for coping with so great a conflagration were unfortunately insufficient. The whole fire brigade of Antwerp, 100 men, were on duty, and after about 4 p.m. the Malines fire brigade were summoned also, and sent eighty men and engines, whilst the Brussels fire brigade sent a detachment at about 7 p.m., who, however, soon returned, the fire being then under control. Town hydrants were situated all round the building and in the courtyards, as well as a system of six hydrants from the hydraulic mains supplying the motive power for the lifts. The pressure of water was for some time insufficient to enable the brigade to reach higher than the third floor, and to add to the list of misfortunes, of the two powerful steam floats belonging to the town, one was under repair, whilst the other was outside the lock gates and could not reach the fire as the tide was low.

The effects of the fire on the materials used in construction were in accordance with previous experience. All woodwork, even to lintels and frames, built into brickwork was destroyed, except in the case of massive beams of oak, and in some instances fir, though there were examples of even heavy timbers 12 in. by 12 in. completely burnt through. Wrought-iron girders were bent and twisted into corkscrew form, and light iron trusses of one-story buildings suffered likewise. Cast-iron columns and girders were snapped cleanly across, and in some cases, as previously mentioned, partly fused, apparently after fracture. Stonework was deeply spalled and shivered. Brickwork was uninjured, except where walls were pushed out or pulled over by expansion or twisting of ironwork, and this was the fate of many of the lofty walls. Brick vaulting also stood well, except where it bodily collapsed by the failure of its supports or abutments. Glass was shivered or melted, although note should be made of an exception in one low-story building which, built of brick walls with the upper part lighted by side windows some 4 ft. high, glazed with wired glass in wood frames and covered with corrugated-iron sheeting on light iron trusses with fir purlins, was wholly burnt out, except one window, of which sufficient of the woodwork remained to support the glass, whilst the remainder, although scintered, as is the one still left, appear to have fallen out bodily after the combustion of the wood frames.

It is interesting in connexion with the rapidity and intensity of the Antwerp conflagration to compare the most recently adopted form of construction exemplified in the bonded warehouses at Hamburg, at present being constructed. Here all beams and stanchions or story [posts] are of massive oak timbers, bolted together (and this, we think, is a weak point) with heavy wrought-iron bolts. The buildings are in several stories, five or six above the basement, and two of the floors have light steel joists, embedded in and protected, both above and below, by concrete, so that the extent of a conflagration is hoped to be limited. The floor areas

are of moderate size, and staircases are constructed of iron joists wholly encased in concrete, on which the steps are formed.

The openings to the stairs are closed by single doors formed of two plates of sheet-iron, with about 2 in. or 2½ in. of non-conducting material between. To minimise damage by water, which is rightly regarded everywhere in Germany as being only one degree less to be dreaded than that by fire, the floors are laid with a fall to the external walls, and provided with scuppers.

The success of the Hamburg method has yet to be proved by actual experience, but the principle appears sound, to minimise the extent of a conflagration and to resist the fire by slow-burning construction rather than by the use of non-combustible material, recognising that, as all experience shows, unprotected ironwork is the least trustworthy of all fire-resisting substances.

Had such a treatment of the building existed at Antwerp, it is hardly probable that the fire brigade would have been so hopelessly handicapped as to be unable to obtain control of the fire until assisted by the destruction of the buildings.

The loss in money value is, of course, tremendous, the buildings alone being insured for 20,000,000 fr., whilst the total loss is estimated, perhaps roughly, at some five or six million pounds sterling. In the loss several of our English companies have been severely hit, amongst them especially the Norwich Union, the Royal, the Phoenix, and the North British and Mercantile.

NOTES.

WHILE we fully sympathise with the healthy tone of Professor Lethaby's lecture at the Institute of Architects, it appears to us to be pervaded by two fallacies. In the first place, he seems to take no account of anything in the past except mediæval architecture; and because he does not find the name of architect there, he wishes us to conclude that there was no person whose function was the same as that of architect. The argument apparently runs thus: Mediæval cathedrals were built by workmen. Mediæval cathedrals are the finest buildings. *Ergo*: the finest buildings can be best produced by workmen. Apparently Greek, Roman, and Renaissance architecture go for nothing; but it is certain that on Greek and Roman buildings architects were employed, and even the name was there as well as the function. Some of the Renaissance mansions in England seem to have built themselves as the result of a desultory correspondence between the owner and the master-builder or foreman; but in Italy the important buildings of the Renaissance were the work of individual architects, and we have their name in most cases. And in English mediæval buildings there is, in many cases, ample internal evidence of the guiding mind of an architect. Professor Beresford Pite, in the discussion, coupled in one sentence Salisbury and Peterborough together; but we should regard them as essentially distinct in regard to the architectural element. The west front of Salisbury, with its clumsy mixing up of detail and its want of a prevailing unity of conception, may well have been the work of Professor Lethaby's masons: Peterborough front is the concep-

tion of an architect. Secondly, Professor Lethaby seems to ignore the altered requirements of modern architecture. A Norman castle with its naïve and inconvenient arrangements for living, might have been put together by a troop of masons; but let him give over a modern mansion to the workmen to build as they like, and see what the owner will say to the result!

WE print on another page an admirable Report of a special meeting of the Liverpool Architectural Society, convened on the 13th inst. to consider the question of the site for the proposed Liverpool Cathedral. We are glad to find that the Society have come to the same conclusion which we have more than once expressed, in favour of the Monument-place site as decisively the best from an architectural point of view. We hope their Report will receive the consideration it merits. It appears that the Bishop has formally approved of the St. James's Mount site, but we presume nothing that is irrevocable can have been done yet, and we hope the matter will be reconsidered. If the St. James's Mount site is actually taken, we are of opinion that a serious mistake will have been made, as will probably be discovered when it is too late to rectify it.

A POINT of some interest to those concerned with building estates was recently decided in the case of *Whitbread & Co. v. Watt*. The plaintiffs contracted to buy what is called a public-house plot from a building speculator when the latter had built three hundred houses on the estate, and they deposited a sum on the signing of the agreement. Subsequent to this event the vendors mortgaged the estate, and the mortgagee under his power of sale sold it to a third person. But by the end of the time within which the three hundred houses were to be erected they were still unbuilt. In accordance with their contract the plaintiffs rescinded the agreement, and claimed to have a lien on the estate in respect of their deposit. The contention was upheld by the judgment, the defence that the deposit could only be recovered as a personal debt being overruled. With the legal discussion which preceded the judgment we are not concerned, but the practical point is important, since it is clear from the decision that a person might buy an estate burdened with an obligation which might, in some cases, make a considerable difference as to the ultimate profit to be obtained from the transaction. The decision is the more important when it is borne in mind how frequently building estates are mortgaged and how often the original plan is not carried out.

THE result of the appeal in *Portsmouth v. Seward*, reported in our legal column in this issue, is important for architects to note, in regard to questions arising out of the transference of a professional business or connexion. Mr. Seward, the well-known architect, of Cardiff, had a branch office at Swansea, where Mr. Portsmouth, the plaintiff in the case, represented him; but he eventually made over the Swansea connexion to the plaintiff (we are not informed for what, if any, pecuniary consideration), undertaking not to keep an office

"Education in Building."

Portsmouth v. Seward.

or practice as an architect there, but reserving the right to act in any cases in which he might be called upon. Mr. Seward competed for and gained the Swansea Harbour Offices, for which the plaintiff was an unsuccessful competitor, whereupon the latter obtained from Mr. Justice Kekewich an injunction to restrain Mr. Seward from carrying out the building. Seeing that the plaintiff obtained no premium in the competition, and would not in any case have been employed to carry out the building, this was not either a very logical or a very generous way of acting; and we are surprised that a judge so shrewd and so generally well acquainted with architectural matters should have granted an injunction at all. At all events, the Appeal Court reversed the decision without calling on the appellant's counsel for a reply: and rightly. Mr. Seward undertook not to practise as an architect in Swansea; *i.e.*, not to have an office there; but he was within his rights in competing. A London architect who designs and superintends a building, say in Birmingham, is not therefore "practising in Birmingham." If it is desired, in such a case, that the vendor of the practice should never erect any building in the same town, it should be "so nominated in the bond."

The annual general meeting of the Gas Institute was held in London last week, and after the delivery of the President's address a number of papers relating to carburetted water gas, and incandescent lighting with gas under high pressure, were read; and a lecture was delivered by Dr. Frank Clowes on the table photometer and standard pentane lamp, which have recently replaced the old forms of candle photometer in all the testing stations of the London County Council and City Corporation. The President, Mr. T. Ormiston Paterson, in his address, pointed out that gas is being more generally and extensively used for cooking, heating, and power purposes, as is evidenced by the continued approximation of the day to the night load in consumption, and expressed the opinion that gas will soon be valued according to its heating value instead of by its illuminating power. Experiments made by the President at Birkenhead confirmed the statement that the duty (in lighting power) per cubic foot of gas consumed in incandescent burners is dependent upon the calorific power of the gas. This statement is commonly accepted in this country as correct, but we should like to know how British gas engineers explain the claim of Dr. Strache, of Vienna, that plain, non-luminous water-gas made by his process, having a much lower calorific value than coal gas, and consumed in burners without admission of air before the point of ignition, is giving as high a lighting value per cubic foot of gas consumed as is obtained from ordinary coal gas. Dr. Bunte also has shown that a mixture of coal gas with 20 per cent. water gas, having an illuminating power of only 3.1 Hefner candles, has fully as great a lighting value for incandescent gas lighting as the coal gas *per se* which had a higher calorific value and an illuminating power of 15 Hefner candles. If the lighting value of gas for incandescent lighting be dependent solely upon its heating value, and the statements of Dr. Strache and Dr. Bunte are also

correct, the inference to be drawn is that a much higher light efficiency than that commonly obtained should be procurable from coal gas with its high calorific value. Extensive investigation is yet required of the relationship between light and heat in the Welsbach system.

THE Electric Lighting Act of 1882 gave the Local Authority the power of purchasing the works of any supply company in its area at the end of a period not exceeding forty-two years. Corporations therefore stand in much the same relation to supply companies as landlords do to tenants. It is clearly then their duty to safeguard their interests, so that when the time comes for the purchase they may be able to exercise their rights to the best advantage. Mr. Mordey's report on electricity supply in Newcastle illustrates this point most forcibly. At the present time there are two supply companies in Newcastle, and their provisional orders have about twenty years to run. One of these companies obtained an Act of Parliament in 1900, empowering it to construct a new generating station outside the municipal area for the purpose of supplying electricity "in bulk." This new station is now in successful operation, and the company naturally want to supply part of their Newcastle system from it. The Board of Trade, before granting them permission, wished to hear the opinion of the Corporation, who have retained Mr. Mordey as their adviser. Mr. Mordey points out the multiplicity of supply systems in Newcastle, and that if each company develops on its own lines, then it will be practically out of the power of the Corporation to exercise its right of purchase at the end of twenty years, as the system of each company will only be part of a large general system which could be profitably supplied from the outside generating station, but which could not be supplied by a municipal station inside the area. He therefore strongly recommends the Corporation to purchase the supply systems inside their area by arrangement, and then interconnect all the networks so that one station would be able to supply all the demand during periods of light load. It seems to us that the right of compulsory purchase will be very little use to corporations if all they can purchase is merely a special network of very much depreciated cables. Judging from recent events, it looks as if the supply companies had found a way of evading the spirit of the Electric Light Act of 1882.

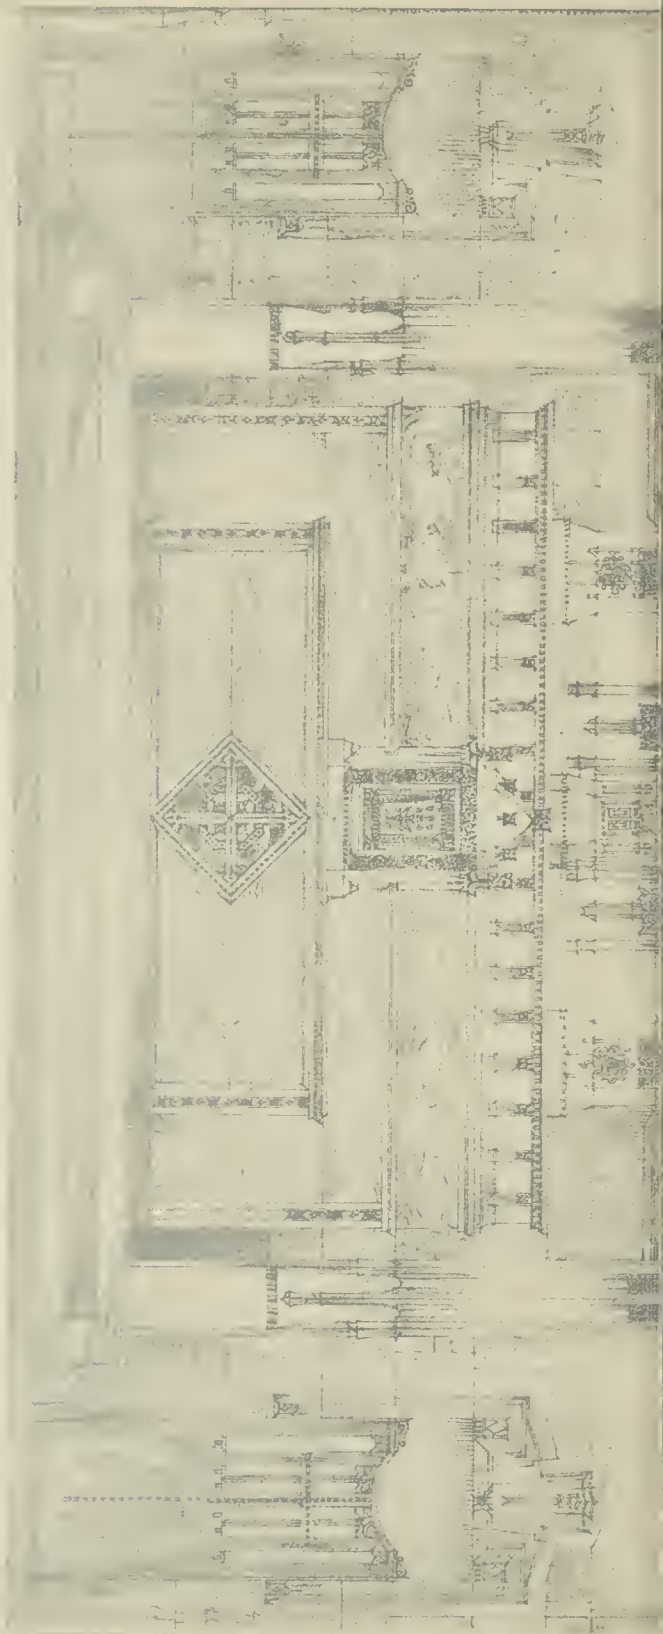

An exhibition of the art and manual training given by the London School Board was opened on Tuesday at the Examination Hall, Victoria Embankment. The work shown has been executed in day schools and in evening continuation classes, and also in the schools of special instruction for the blind and deaf. The teaching given is not of a technical nature, and does not interfere with the technical schools and classes of other bodies. The art and manual training in the day schools is calculated to awaken the interest and intelligence of the children both in art and in manufacture. If, for instance, a child has a leaning towards cabinet-making or modelling, the tendency receives some impulse, and the boy is in the right direction towards earning a livelihood as a useful member of

society. Much of the work at the present exhibition is done at the evening continuation schools by amateurs, who find recreation after their day's work in drawing or carpentry. Of all the classes, that of woodwork shows the best results. Before a student may construct an article, he has to make a working drawing of it, besides large details in wood of the more difficult parts or joints; he may then make the object itself. We should like to see the taste educated by having better designs to execute, and the hand restrained from the liberal use of sandpaper. The teachers should as far as possible insist upon simplicity of design and directness of execution. These remarks are also applicable to the wood-carving. The drawing and design is not so interesting as last year—at least there are fewer exhibits of merit. The exhibition as a whole is a wonderful evidence of the liveliness of the School Board in a certain direction.

LORD AVEBURY, in opening the exhibition of practical work executed at the Institute's technological and manual training examinations—now on view at the Imperial Institute—emphasised the value of technological education to the welfare of this country and the colonies, and pleaded for a more general recognition of the claims of science in the public schools. We think more systematic training in natural science in our schools would be a direct gain to the industries of this country. One of the most important factors in success in any undertaking is a mind trained to concentration, and accustomed to ascertain facts, not content with suppositions current as truth. It is pitiable to think of the amount of waste incurred annually through misdirected labour. Science as part of a general education is, however, a different thing to the teaching of science in its application to special industries, and the Institute, in their efforts to secure for the teaching of technology some recognised State aid similar to that given to the teaching of science and art, are endeavouring to prevent any overlapping in the organisation of their classes and examinations. During the last year teaching in several industries has been extended and strengthened by co-operation with trade associations. Silk spinning and weaving have been placed on a better educational footing. Paper manufacture, an industry of a scientific nature, in which the stress of foreign competition is largely felt, will now be dealt with by the Institute in conjunction with the Paper Makers' Association. The exhibition of candidates' work is of a very representative kind, including joinery, cabinet-making, building and carriage construction, mechanical engineering and drawing, metal-plate work, practical bookbinding, basket-making, needlework and millinery, beaten metal work and enamelling (from the Northampton Institute, London), weaving, plumbing and painters' work. It is, as it were, complementary to the exhibition of the London School Board manual training classes referred to above.

In a short letter to the *Times* Mr. Arthur Evans reports fresh and important discoveries at Knossos, which he considers throw an entirely new light on the architecture of Homeric Greece. East of the great central

court he has found a suite of chambers with walls descending 20 ft. (that is, we presume, rising 20 ft. from the ancient ground level), and including the remains of upper stories. It is probably these "upper stories" which Mr. Evans especially regards as giving us a new idea in regard to Homeric architecture. In one of the chambers were fallen fragments of human figures in high relief and of splendid execution, "the rendering of veins and muscles showing a naturalistic skill never again rivalled till the Italian Renaissance." Explorers are, however, a little inclined to rhapsodise about the beauty of the works they discover, and we should be disposed to wait and see the figures or their photographs before concluding that they rival Renaissance art.

It is stated that in consequence of the decease of Catherine, Duchess of Cleveland, who died on May 19 last, the Battle Abbey property will shortly be placed in the market. It had been purchased from the Webster family by Lord Harry Vane, who afterwards succeeded as fourth Duke of Cleveland, and died on August 21, 1891. Lord Harry Vane had married, in 1854, Lord Dalmeny's widow (*née* Lady Catherine Stanhope), to whom he bequeathed Battle Abbey for her dower house. During her residence there the late Duchess devoted many years to the compilation of her last work, "The Battle Abbey Roll, with Some Account of Norman Lineages," which John Murray published in 1889. Reputed copies only are now extant of the original muster-roll of the names of knights who followed the Conqueror from Normandy, but the accomplished authoress of the book spared no pains in her endeavours to trace out their histories and pedigrees. After the Dissolution, the monastery at Battle, formerly Epiton, and then valued at 987*l.* os. 10*d.* per annum, was bestowed by Henry VIII. upon his Master of the Horse, Sir Anthony Browne, K.G., who began the building of the house. His son, elevated Viscount Montague, removed from Battle to Cowdray. In the earlier years of the eighteenth century Sir Thomas Webster, Bart., bought the property at Battle from the then Viscount Montague, his descendant sold it to Lord Harry Vane in 1857. The fine gateway of the Benedictine abbey, founded by William I., forms a conspicuous feature near the high street of the town, and several portions of the conventual buildings were incorporated in the mansion-house. The ruined altar of the abbey church marks, it is believed, the central position of the English camp; the supposed remains of the chapter-house were discovered in 1817. The estate extends over about 3,600 acres.

If a sharp look-out is not kept on the proceedings of Tramways Companies, as well as Local Authorities, every stone bridge over the Thames, within the London district, will be spoiled. Kingston Bridge, a fine and dignified structure built by Lassidge in 1825, is now threatened by the London United Tramways Company, who want powers to widen it. The Chairman of the Select Committee of the House of Commons put the question—"You would not propose that the widening should be carried out by means of cantilevers?" to which an evasive answer

was returned, to the effect that "there were two or three ways of doing it." From the nature of the reply we should conclude that the company do intend to use cantilevers if they can get permission to do what they like with the bridge; but that, knowing the proposal is likely to be opposed, they will not say so. Kingston Bridge is at present one of the adornments of that portion of the Thames; it is to be feared it will soon cease to be so.

THE exhibition of the Pastel Society at the Institute Gallery in Piccadilly contains rather too much of landscape and too little of figure work, which latter is what pastel is best suited for. The infinite gradations of landscape effect can hardly be followed out with a material so little plastic, though it affords a good medium for the record of special effects in special lights. M. Ménard, in "Le Soir" (1) has been very successful in doing just what pastel can do with landscape, when the minute details of colour are lost in a half-light. So with Mr. Austen Brown's "A Grey Evening" (5) and "On a Potato Field" (6), where composition rather than colour is the main object. In "At the Ferry" Mr. Padgett has made a brilliant suggestion of sun-lit water seen from under the shade of trees; and he has confined himself to suggestion, which is all that pastel can really do with such a subject. Mr. Nettleship's animals (73 to 76) come out exceedingly well in pastel, as also Mr. Livens's fowls (100); and M. René Billotte has succeeded admirably in his moonrise effects (142, 143) and in his "Une Rue de Village" (144), though it does not answer to the sub-title, "La Nuit"; there is too much light and too much colour for that. Mr. Aumonier, in "On a Common" (159), and Mr. Peppercorn, in "A Note" (183), illustrate very happily the capacity of pastel for giving a brief memorandum of the general effect of a scene, on a small scale. M. Prouvé's life-size nude, "Ondine" (230), is too green in colour (this may be intentional) and has the waist of a Parisian fashion-plate figure. Mrs. Sutro, in "The Ploughman's Home" (233), and Mrs. Stanhope Forbes in "L'Ombreuse Allée" (122) and "L'Avenue des Sapins" (124), show the capacity of pastel for giving the effect of bright dashes of light in a scene. Mr. Arthur Tomson's "August Night" (200) shows a great power in handling the materials so as to produce depth of tone by cross hatching in different colours. M. Guignard's "Le Dune près d'Étaples" (272) is one of the most admirable works in the gallery—exactly the kind of scene which pastel can best render, and which is treated with the greatest artistic feeling for composition and tone. The exhibition is a very interesting one.

FURTHER NOTES AT THE GLASGOW EXHIBITION.

In our first article in the *Builder* of the 8th inst. we dealt with the general effect of the exhibition from an artistic point of view, and the contents of the Fine Art section. In this article we will give some further notes touching on the objects illustrating decorative and applied art, as well as on some other exhibits which cannot be grouped with any special class.

We may begin with a word on some of the subsidiary buildings in the grounds. The Great Hall, as it is called, suits its purpose very well as a concert-room, but in other

respects is one of the least attractive of the erections. It is difficult however to treat a circular building in merely temporary architecture; a circular plan does not lend itself to picturesque effect, and seems to require a monumental treatment. The exterior appearance of the building is shown in Mr. McGibbon's sketch in our issue of April 6; the rotunda is kept exceedingly plain externally, while internally the colour decoration is rather too gaudy. The interior architectural design shows an arcade on columns all round, the columns cut in two by a gallery on the soffit of which an apparent capital is given to that portion of the column, to take away the bald appearance of the columns going right through the gallery. The iron dome is under-drawn by a ceiling treated in ribs and with somewhat the general appearance of a velarium, though not actually such. Not the slightest attempt has been made to render the organ a decorative object, which is to be regretted, considering how easily an organ-case lends itself to decorative effect, nor is there the slightest break in the general design at the point where the organ comes in, so that it looks as if it got there as an afterthought; yet it surely must have been known that there was an intention to have an organ there.

The Canadian pavilion is a much more gratifying erection; as a temporary structure it shows excellent taste as well as originality and piquancy in design. The Indian theatre pavilion, though less original, is also picturesque, with its centre picked out in bright colours, its side walls in horizontal bands of alternate red and yellow, and small turrets at the angles crowned by little metal cupolas. The Agricultural pavilion is treated with a strongly marked wooden modillion cornice; the higher central compartment has a small dome, flanked by pillars with vase terminals rising above the roof line. One of the best and most picturesque erections in the grounds is the Van Houten Cocoa pavilion, designed by Mr. A. N. Prentice. The Japanese pavilion is a mistake; instead of any attempt at a characteristic exterior, we find a commonplace pilastered building, its nationality only marked by a kind of trophy of Japanese curly clouds and sunrays above the entrance door, behind which the conventional figure of Britannia presents a most absurd contrast. If however Japan lacks character in her pavilion, this is amply made amends for by Russia, whose four pavilions, which at the time these notes were made were still in process of internal arrangement and not open to visitors, are certainly, in their exterior architecture, racy of the soil, and about as curious and fantastic erections as it would be possible to see—somewhat too fantastic, but at all events they are not commonplace, and there is a good deal about their treatment that is very clever.

Near the west end of the main exhibition building, and between it and the Art Gallery, is the special pavilion erected by Messrs. Templeton for the exhibition of carpets woven in Glasgow. They have chosen to make their pavilion in the form of a Moorish mosque with a cupola covered with Saracenic strap ornament; the imitation is a very crude one externally, and hardly worth carrying out, but internally it produces a building very well suited for its purpose, giving a series of large recesses for the exhibition of separate classes of carpets, and an effective top lighting. The compartment to the left on entering is devoted to carpets designed by Mr. Walter Crane, some of which are exceedingly fine; that at the left, a dark neutral green carpet with light-coloured flowers connected by sprays of a lighter green; that on the floor, a fine geometric-pattern carpet, very large in scale, and such as could only be used in a very large room; and, facing the spectator, one of beautiful design hung on the wall. On the right are one or two designs which, fine in themselves, we object to as carpets, because they are distinctly upright designs, growing in one direction, and therefore properly only fitted for a vertical position as hangings; a carpet should be the same design every way, with no right or wrong way up. The excuse offered by the makers is that it is a matter of economy in weaving, and that it costs less to work a design all one way than to work it in symmetrical repeats in opposite directions; this one can quite understand, but when one comes to carpets of the sumptuous class of work shown here, economy of this kind seems out of place and hardly worth consideration. Other bays of the building contain very fine carpets of different types of design; in the

furthest bay is a large and grand carpet of French Renaissance type of design; on the right is a bay of Oriental carpets. All the work is of the first class, and most of the designs are fine and artistic, and no visitor should omit inspecting the interior of this pavilion, which forms one of the best artistic points in the exhibition.

Coming to the interior of the main building, officially called the "Industrial Hall," we find the principal portion of the space east of the central dome devoted to foreign and colonial exhibits, and the bulk of the floor space westward of the centre to British exhibits. Commencing at the portion nearest the central dome, we find ourselves among silversmiths' exhibits; but there is nothing to be seen here worth special comment; the cases represent the usual average product of first-class silversmiths' establishments. Two furniture exhibits with special houses to themselves, which we come to next, stand in a different category. Messrs. Wylie & Lochhead, of Glasgow, are really artistic cabinet-makers, and their suite of rooms presents a collection of furniture and other objects marked everywhere by good taste and refinement, and with a certain amount of originality, though of course there is to some extent a repetition of the characteristics which we meet with elsewhere as representing the taste of the most recent school of applied art design in this country; there is some appearance too of the influence of the new German school of furniture design, though fortunately not carried to the excess of sinosity which one sees in German up-to-date art publications. This however is a most satisfactory exhibit as a whole; among the best things we may mention the settee in the dining-room, and the fireplace with repousse brass fender and surroundings. Next to this Messrs. Heal & Son have erected a room with a characteristic exterior wall, of dark grey bricks below and white picked out with green above; and inside they show a suite of bedroom furniture, of admirable design and make. The ornament is chiefly in the way of simple forms of inlay; the wardrobe with a central curved bay, decorated in this way, is a most pleasing piece of work. Of the whole exhibit it may be said that, though people may differ as to preferring this or that form of furniture for their bedrooms, we think that it would be impossible to pick out any detail in this exhibit which could be said to be in bad or wrong taste. That is a great thing to say for a manufacturing firm which (we believe) produces all its designs within its own doors, and it shows what real progress has been made in the understanding of applied art in this country, that such a show as this can be produced by a London trading firm.

The Irish Peasant Industries Association have got a well-arranged stand with a Moorish front to it (why Moorish?); the contents it does not come within our province to describe, we only mention it as a decoratively-arranged stall. The same may be said of the Morocco exhibit which faces the end of the central avenue; a stall or house of Moorish design and gorgeous in colour, containing an assortment of Oriental textiles such as we are familiar with. For the present we may quit the Industrial Hall, having reached its western boundary, whence we emerge into the long annex called the Grand Avenue, which starts off in a quadrant curve southwards, and then continues in a straight line in a north-westerly direction. Down the centre of this avenue, for the greater part of its length, is arranged an immense collection of large and minutely-finished models of ships built on the Clyde; and though it does not come within our province to notice these in detail, we cannot refrain from a word of recognition in regard to the splendid manner in which this great Clyde industry is illustrated. The sides of this avenue are lined with booths or stalls largely devoted either to furniture or to materials or processes connected with building; and these we may pass in review as far as space allows.

Taking the left-hand side first, the Pilkington Pottery Company, just at the angle turning into the quadrant, have a good exhibit in the shape of an erection in which the piers and main part of the walls are covered with green glazed facing tiles, and the walls at the back lined with decorative panels and tile pictures; the decorative designs are generally in good style and the colour effect satisfactory. A good many of the succeeding exhibits on the same side we can merely mention briefly.

Messrs. John Finlay & Co. (Glasgow) exhibit some furnishing metal-work among which are some metal utensils of simple character but good form; they also exhibit a range. Messrs. Woyka & Co. have a show of decorative mouldings in woodwork; Messrs. Wilson & Boyd, cabinet makers, exhibit furniture which cannot exactly be called artistic, but which is good in its way and on pleasing lines; the Bennett Furnishing Company, of Glasgow and London, show school desks of solid and practical design. Then we have another succession of ornamental cabinet-makers' work, of which the first in order, that of Messrs. H. Gardner & Son (Glasgow), includes a bedstead which is worth attention for its good lines and careful execution in detail; the end shows a curved rail dropping between two square angle posts and supported by thinner upright rails between. There is style in this; and here as in some of the other furniture exhibits one finds that some things have style and some have not. Messrs. Taggart's furniture is what is called "handsome" furniture, but has not the quality of style; nor has the work of the Furniture Union Company, nor that of Messrs. Jebb & Sons, though there is a solid dignity and sumptuousness about their large leather-covered furniture which is praiseworthy. Messrs. Stewart Pollock & Co., who have a large exhibit, show some good inlaid and brass-finished bedroom furniture, somewhat too pretentious for our liking, but good of its kind and admirably finished; and there is a bedstead in a simple classic style which is better than the more ornamental work. We should not omit to mention the exhibit of Messrs. Francis Smith (Glasgow) of office furniture, not decorative (nor intended to be so) but exceedingly well made, especially in the attention which is bestowed on the forms of handles and pulls to the drawers, which form part of the structure and will not come off; a frequent source of annoyance with drawer handles.

After passing the side entrance we come to a few exhibits of a more practical nature. Messrs. Chubb exhibit the actual safe door, of Harveyd armour plate, which was tested by a blow from a hundred-pound shell fired at it, as before mentioned in our columns. The door hardly shows any confusion. This door, when closed and locked with its clutch bolts on each margin, is without handle, and a magnet is provided to pull it open. They show also a safe intended to hold large drawings, with large shallow drawers, such as are generally used in architects' and engineers' offices, but which are here enclosed within a steel safe. Messrs. Milner, in the next stall, exhibit the construction and working of their "banker's door," in which a strong steel framing is pushed out at all the margins simultaneously, working into a rebate all round, by the turn of a single lever in the centre of the door. Messrs. Hope have an exhibit of very good metal sashes, and Messrs. Macfarlane a show of their steel ware, viz. cups and saucers, candlesticks, &c., made in thin steel and enamelled in colours; these form unbreakable ware of very pleasing effect. Messrs. Ritchie (Belfast) have an exhibit of their roof sheathing felt, showing the raw material and its application on a model wooden roof.

Opposite to these exhibits, and in the centre line of the avenue, are some articles of decorative character. Messrs. Erard have a small show of their pianos, with which we are only concerned here in regard to outward appearance and design, and on this head we may compliment them on the treatment of the inlaid grand piano which they exhibit, and which stands on well-designed framed legs which are a satisfactory contrast to the ordinary piano support. Messrs. Paterson, who are we believe a Glasgow firm dealing in pianos, have some fine examples, among them the Broadwood piano designed by Mr. A. C. Blomfield and illustrated in our issue of March 23; it looks even better in reality than in illustration, and is perhaps the best grand piano case which has been designed in this country. A Steinway in the same exhibit, decorated with rich and flowing inlay designs, though perhaps a little exuberant, is a fine piece of work; the weak point in it is the treatment of the legs, which are not well joined on to the rest, and look as if they had originally belonged to another design. The British Carrier Wood-carving Company have a well got-up exhibit of their machine-carved ornament, chiefly in the shape

of lengths of repeating ornament and enriched mouldings; in a notice affixed to the exhibit they maintain that this is really "carved" wood; but unless it is gone over by the hand (which is not asserted), it is no use saying this; machine work is not carving in the proper sense of the word. They show a small room completely fitted up, as far as woodwork is concerned, with their products, and the general effect is pleasing enough, but it can never have the artistic value of hand carving. It may be worth while, however, to employ this method for the simpler types of repeating ornament. The exhibit of Messrs. Burroughs & Watts, the celebrated billiard-table makers, forms the close of the central series of exhibits, the *pièce de résistance* being a most elaborately carved billiard-table in unvarnished wood; an exceedingly good piece of work as far as execution goes, but it falls in point of design; it is an attempt to produce effect by sheer richness of ornament, without having had good general lines of design as a basis to work on.

Returning in the contrary direction, along the north-east side of the avenue, we find in the centre line, next to the billiard-table exhibit, a very characteristic little room fitted up by Messrs. George Walton & Co. "designers and manufacturers"—so their *affiche* reads. The iron grille gates which close their small house are excellent specimens of effective but unpretentious metal design; they were closed at the time of our visit, but as far as one could judge by looking through, the whole of the objects exhibited seem to show original and artistic character. On the other side of the alley the Tynecastle Company have a fine show of their embossed and gilt wall coverings, rich in effect and all in good style; they also show a room representing a part of a steamer's cabin, showing the application of their work to cabin decoration. After this we come again to various furniture exhibits, of varied merit. Messrs. Campbell & Co. (Glasgow) take up two bays with carved walnut furniture of good type but with no special quality of style. Messrs. Archibald Stewart & Co.'s office furniture is good of its kind, their decorative furniture pleasing but presenting no special quality. The Greenwich Linoleum Company exhibit a number of specimens of their material, some with geometric patterns which are really good and suitable to the material and its purpose; the floral patterns are not. The Silicate Paint Company exhibit various articles painted with silicate paint; there is nothing special in the designs; it serves to show the application of the paint. The furniture exhibit of Messrs. James Simpson (Glasgow) has some special character; they show a large cabinet in which the stiles are of nearly black wood and the veneer panels of figured wood; we are told that it is entirely walnut wood, of different types; the effect is good, though there is no specially artistic quality in the designs. Mr. John Crawford (Glasgow), wood carver, has got up a spirited and original piece of work, a kind of carved wood frontal, filling up the bay which he occupies; some of the details are rather odd, but it is a clever bit of work. Messrs. G. Rome & Co. (Glasgow) exhibit their fibrous plaster by means of an architectural front with Louis Quinze plaster wall decoration in the rear. Messrs. Hampton & Sons have a small but very rich exhibit, one may say in all styles; we prefer to see a firm choose a style and work it out, instead of trying to provide something for all tastes. The best thing in their collection is the small cabinet with inlays in line, and a front on an oval plan; there is character and refinement in that.

Messrs. Donlon have an exhibit near the east entrance, containing examples of their well-known glazed stoneware, as also sanitary fittings and materials (which will be considered under a separate heading). At the east end of the building, in the Danish section, there is an interesting exhibit of the work of the Royal porcelain manufacture at Copenhagen. This consists of two or three distinct classes of production. There is a china with light bluish grey ornament, floral or animal, on a white glazed ground; in this class also are numerous well modelled animal forms in porcelain, realistic in form though not in colour. Then there is a pretty and more rustic variety of work, with thin-lined blue patterns on white ground, and open-work borders; and there is a more decorative type, with a good deal of colour and gilding, and also with open-work rims. This exhibit is worth attention, as it introduces us to a special class

of work which is of considerable artistic interest. There is a considerable exhibition of Glasgow porcelain and pottery ware. Messrs. Cochran & Fleming make a large show of work with no special character; Messrs. MacDongall & Sons a somewhat similar exhibition, containing work which has, however, a certain Parisian stamp about it, with a clever use of the figure as ornament; and Messrs. Sneddon & Sons, among the numerous articles they exhibit, show what they call the "new Worcester Pottery" of James Hadley & Sons, for whom we presume Messrs. Sneddon are the northern agents. The characteristics of this ware are that it has a semi-porcelain "body" of exceptional strength, enabling it to retain the exact form of the original model during the first firing process; a new application of colouring clays during the "casting" stage of manufacture; and a leadless glaze, said to be "of exceptional brilliance"; this exceptional character we do not recognise, but the ware is a good one and worth attention.

We shall continue our notes in future numbers.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Ordinary meeting of members of the Royal Institute of British Architects was held on Monday at No. 9, Conduit-street, Regent-street, Mr. Wm. Emerson, President, in the chair.

Death of Mr. J. A. Russel Inglis.

Mr. Alex. Graham, Hon. Secretary, said he had to announce with deep regret the death of Mr. J. A. Russel Inglis, of Edinburgh, who was elected an Associate in 1894, and who was the Soane medallist in 1897. Mr. Inglis was one of their younger colleagues of great promise. He was known both in Oxford and Edinburgh, and was for a long time in the office of Mr. Hippolyte Blanc. There were a good many of their students who had come across Mr. Inglis in his earlier days, and he was sure they would join in their regret at losing so distinguished and promising a colleague under such tragic circumstances. Poor Inglis had suffered from insomnia, and he took an overdose of a sleeping draught and died suddenly last Sunday night. They could ill afford to lose a young man of such promise as Mr. Inglis.

The Architects' Benevolent Society.

The President said he had the pleasure to announce that the appeal which he made at the annual meeting of the Architects' Benevolent Society had been successful, inasmuch as he had already received 1,189*l.* The Society was greatly indebted to the gentlemen of the allied societies who had so promptly and so liberally responded, and they were particularly indebted to Mr. Macvicar Anderson. He hoped the announcement he had made would not stop the flow of subscriptions as the demands upon the charity were large and ever increasing, and the donations and pensions which it was able to give were eagerly sought for. No one knew better the needs of the Society than the late Mr. Arthur Cates. He was for many years its treasurer, and at the time of his death was a trustee. He had seen it announced in the *Times* that Mr. Cates had left the Society a legacy of 1,500*l.*, and that in itself was sufficient to show that the Society needed more liberal support, and that the money entrusted to the Committee was wisely distributed. They had received no official announcement at present with regard to Mr. Cates' bequest, and therefore he simply mentioned it as from the *Times*.

Professor W. R. Lethaby then read a paper on

Education in Building.

Professor Lethaby said he was sure that all the usual apologies would apply to his paper. He had had very little time, and one of the chief difficulties was that in writing he tried to have in view his audience and he found he could not, and so he had written it to himself. He wanted his title, "Education in Building," to suggest something which was usually meant by architecture, but also to cover the whole range of activities associated with the art of building. Their current use of the word architecture was likely to be very ambiguous—it meant anything or nothing, according to the verbal needs of the moment. Attempts were frequently made to give the word architecture a definition, but it was essentially one

of that class of words which had suffered by shifting its meaning and by decay—it was almost one of the words which folk-loreists could treat as a myth-making word. The word architect was very infrequently found in the Middle Ages, and then only as a loan from the Latin, meaning "master in building craft"—the master mason or master carpenter. In the fourteenth century a carpenter was called an architect, and there was a later example of a man called Harrison, who arranged the pageants for James I. in 1603, and who signed himself "joiner and architect." The use of the word "architecture" was just as infrequent. The words in use for architecture in the Middle Ages were "carpentry," or "masonry," or "mason's craft." Each new effort in castle or cathedral was called the "Work." The great Royal Palace in Paris obtained in this way its name of Louvre, which was handed down to the present time. Everything was known in France and Germany of the manner of production of their mediæval buildings, but in England they knew little. There was a curious reserve in England as to the architects of mediæval cathedrals, although the facts lay ready at hand for any investigator. Vague theory still held the field; they went on repeating that the architects were unknown, or that these cathedrals were the works of monks or travelling freemasons, or were designed by clerks like Edward of Westminster or William of Wykeham. But he believed the main facts were ascertainable. Carpenters and smiths and masons were early organised into distinct guilds. In the twelfth century the carpenters were spoken of before masons, but in the thirteenth century the workmen were generally spoken of as masons and carpenters. These crafts organised the education of the body by an apprenticeship system, which, while placing the youth with a given master, did it under the sanction of the guild in general, and even of the community. Practically, in London, to be entered as apprentice was to be apprenticed to City life. Mastership in craft and the freedom of citizenship were taken up together; a mason's or carpenter's boy passing through his seven years' course was received into the guild as master. He believed that the curious thing called the freedom of the City, which was now handed about in gold and silver caskets, was merely the natural right of every London craftsman who, having gone through seven years' apprenticeship, should receive the freedom of his mother city. "Master" was a definite degree of craftsmanship, and granted exactly like the Mastership degree at a University after apprenticeship in letters. There was, in fact, an exact parallel in the taking up of the gown and hood; and the master craftsman in the Middle Ages stood in degree alongside with the master of letters, and the master of masonry and the master baker stood with the master of letters or physic. His fur robe and his distinct cap marked his mastership in craft. The word master did not mean an employer, but a graduate of the guild. The real explanation of mediæval art was to be found in the fact that by his guild the workman claimed an honourable place in life. The craftsman prided himself on his tools, as the knight on his sword, and workmen even set themselves to gain coats of arms for their guild, which arms were engraved on their own tools. They could hardly realise the airs the craftsman of London gave himself. He was part owner of the City, and he would have no lord's man in his guild, and he set himself against the handling of goods for profit. This guild organisation was a chief factor in the Middle Ages. At the end of the thirteenth century in Italy and Belgium, and to some degree in England, there was a great struggle between the two powers—the nobles and the organised guilds. As now, if a shed was to be built the carpenter was called in, and if they wanted a wall to be built the mason was called in. So, in the Middle Ages, if a house was to be built it was left to the chief carpenter, and if it was a church to the mason. The employer had, of course, a considerable say in the matter, and some barons very closely laid down the lines on which their castles were to be constructed. With works of great importance, like a cathedral, an agent might be employed to represent the employer—such a man as William of Wykeham. When such a work as a cathedral was going forward a resident mason and carpenter were employed. The title of Abbey Master at Westminster was changed only last century, and it was quite probable that there

had been an unbroken succession of masons at Westminster from the time of Henry III. He spoke of normal conditions, of course, as cases might be found where some mason, recognised as a great master, would advise by consultation, and the resident mason would work under his advice. It was often said that there must have been some co-ordinating authority, or the carpenter would wish to put the roof upside down; but the reply to that was that the carpenter did not wish to do so, and the employer would have dismissed him if he had. Moreover, the chief master employed, like an officer to-day, would be the general consulting leader. "Instead of vaulting this," the mason would then say to the employer, "we will get Bob to put couples on." There was no artistic nous about it, but it was in the directness of the work that the interest of old buildings lay. It was a matter of true evolution; it was just doing work "as it ought to be done in the craft of masonry." It was a disgrace to their scholarship and interest in their own country that not one name of the old English master carpenters or master masons were to be found in the new "Dictionary of National Biography." There was an enormous amount of material at hand which was hardly ever looked over. The rolls of Westminster Abbey had specially interested him, as they dealt with their greatest work of art. He found that the term master mason was in general use in the twelfth century, which implied that they had already in existence the organised guild which defined what a master was. Professor Lethaby proceeded to quote liberally from the rolls of Westminster Abbey in support of his contention that the real architects of the Abbey were the master craftsmen employed by the King. Thus in 1244 they found that preparations were being made for rebuilding the Abbey by Henry III., and in that year there was a mandate from the King that the Sheriff of York should confer with Simon the Carpenter and Henry the Mason. The King's Carpenter then in charge of the work at Windsor was Master Simon, and Henry the Mason may have been associated with him there. Probably this Henry the Mason became the first master of Westminster Abbey. Edward of Westminster, the King's Clerk at the time, with another represented the money side of the business. Four years after the commencement of the work they found from the accounts that Master Henry received 60*l.*, and Master Alexander received a sum of money for timber, and there was not much doubt that Alexander was the architect carpenter with Henry the Mason. Later the King ordered 600 or 800 men to be put on the work, and a mandate was addressed to Henry, the master mason of the works. Master Henry was succeeded by John of Gloucester in 1254, but although they knew more about Master John of Gloucester than of Master Henry, the character of the work was laid down in the ten years of Master Henry, and they must call him the mason architect of Westminster Abbey. In 1256 there was an order that the work should be overlooked by John, the King's mason, and Alexander, the King's Carpenter, and the rolls showed that they received fur robes. In 1256 the ancient gateway of Guildford Castle was constructed by John and Alexander, and there was mention of work done at Woodstock by the same mason. In 1258 the King rewarded John of Gloucester by giving him a house; he died in 1260. John of Gloucester was succeeded by Robert of Beverley, whose name occurred in 1259, when Robert of Beverley seemed to have been associated with John of Gloucester, and after the death of John there was probably an interruption in the work and it was at the time of the Barons' wars. In 1263 the name of Master Robert of Beverley appeared, but there was no mention of Abbey works until 1267. About this time John of St. Albans was the King's Sculptor, and he probably carved the fine figures in the interior. The accounts of 1269 and 1272 still mentioned Robert the Mason. Robert was employed on the work on the accession of Edward I. The great work of Edward I. was the completion of the Tower of London, and in 1274 they found Robert of Beverley mentioned in connexion with that, and again in 1276 in connexion with the Royal Mews at Charing, and in 1278, Robert the Mason, with the Aldermen of London conferred as to what damage would arise if part of the old city wall in Ludgate was pulled down so as to provide for the old Blackfriars

Church. About this time records showed that the annual expenditure on the Tower was 2,000 marks, an enormous sum in those days. In 1278 the accounts of the King's Clerk were audited by Master Robert of Beverley, and in 1279 Master Robert of Beverley was still Keeper of the King's Works. Robert the Mason was evidently a great favourite of the King, who on one occasion gave him a tun of wine. He was succeeded by Richard Crundal, the King's Mason, who was responsible for the Cross at Charing to Queen Eleanor. He died in 1204 before the cross was finished, and it was carried out by his brother Roger. At this time also Richard of Witham was working at a cross. In 1322 they still met the name of Master Witham, as King's Mason, and he was succeeded by Master Thomas of Canterbury. In 1326, William of Ramsay worked as mason at the Royal Works and he was a great London master. He built the beautiful chapter house of St. Paul's, begun in 1332, and in 1338 he was appointed Chief Mason and Chief Surveyor of the King's Works. He was probably the William of Ramsay who was on the Common Council of London in 1348. Professor Lethaby then gave the names of other King's Architects from the time of the Black Death. He believed that the accounts of the Greek building customs were much the same as those he had referred to in England, and in Persia, India, and Italy the thing was practically the same. Everywhere building developed by experiments of practical masons and carpenters. It might be impracticable to bring back that state of affairs, but it was necessary to recognise that the evolution of masterly building was what was meant by the words "ancient architecture." In considering the future and the present in the light of the past the question was, What was there left for them to do? Should they aim at reviving the forms of some still untaught style—the style of Mycenæ or of Mexico, for instance? They had had quite recently the evolution of perspectives, "architectural printing," and base ornamentation. If he might suggest a name for it at all he would suggest the Syndicate Style. They must turn in a practical way to the art of building to-day supported by the experience of the past. Archaeology was a very amusing study, but in its present form it was only a branch of history. As to proportion, nobody knew anything more about that than that work done with a large reasonableness looked well. Nothing was better proportioned than a North-Western engine to its driver or a bit of plumbing to the plumber. As to the principles of design, one architect used to boast that he never used iron girders in his life, and another said that modern architecture would be born of iron and glass. With regard to beauty—that subtle and elusive essence which spoke through man's nature and work—no general reasoning could be adduced on it save so far as a man might try and explain what moved and touched him. Work certainly was a serious part of life, and it was work they had to teach. Nothing really new or beautiful could spring in architecture except from reasonable work. It was sometimes said that if they were only ignorant there would be hope, but instead of the blankness of ignorance he thought it would be better to have the fulness of knowledge, which voluntarily went its own way. How far should the study of building go?—all the way or part. He thought they should study it in all ways. They could spend more time at the work and less in the office. They could learn much about building by mixing with the men who still handed on amongst themselves the traditions of their craft. One man knew how one thing was done in a locality, and another knew something else. One remembered how stone was axed; one remembered that they put two coatings of skimmed milk on ceilings; and another that hearthstones should be better set in fireclay, and so on. They were living through a period of quick change in those things, but probably the most valuable work they could do was to gather together the old recipes of the workmen which had survived through ages. These rough men, the "so-called British workmen," represented the mediæval architect, and it was absolutely necessary that there should be some common relations between the architect and them. As it was, he had never gone on a building and watched them work but what he had wished to beg their pardon for his own ignorance.

From the organised trades one might get advice as to local materials and labour. Those unions in a much changed form represented the old guilds, and he felt certain that in time to come they would assume more and more the functions of the old guilds. At present they were fighting the war of wages, but he felt that with the almost entire failure of the apprenticeship system the teaching would come back to the men themselves. Masons would again have to teach masons, carpenters carpenters, and plasterers plasterers. Even at this moment the plasterers were attempting to make those entering the trade go to the technical schools which existed. If they got back the definition of mastership in craft once more, and if a connexion between the organised trades and the organised technical schools be set up they would get the mediæval theory of the boy being apprenticed to his guild. The art of the monasteries was the flowing out in illuminated books, illuminated glass, illuminated wall surfaces of the security and discipline of the cloister—religion if they liked, but still peace in work. The art of Florence, Bruges, Paris, and London in the thirteenth century was the art of the organised crafts—call it civil government if they liked, but the workers' pride and reward was in the work of their hands. He was certain that where labour was honoured there art would be found, for honourable labour was art, and that proposition must stand. They must try and encourage workmen by every means in their power. He had often wondered whether it would not be possible for the men on a given work to elect a spokesman who would have access to the architect, but he supposed the builder would say it would never do for one of his own men to report; but the answer was that it was the work which paid the worker, and not the agent. Again, they must have schools of practice and theory and experiment and research. Building schools existed already in several foreign cities. It seemed to him that such schools, representing a very large and important industry, should be established and assisted out of the public funds. In a big London institution he would like to see all building crafts carried on side by side experimentally, where experiments might be made in brick-arching and stone-cutting and timber-framing, and so on. The question of education in building to be solved must reach all classes of men engaged in building, and it must set itself to improve the whole mass of building done in England. If they were to claim public help, he felt they should get rid of visionary ideals and sectarian narrowness, and stand to gain with the common gain. It would have been well if they could have been ready with a scheme in which all might have joined a dozen years ago, when technical education was first being practically dealt with, but he fancied, unless they were less vague in their aims, nothing would be done for another dozen years, and that would be a calamity. To sum up, natural living architecture would have to be refounded on common building—it could stand on nothing else.

Mr. Paul Waterhouse, in moving a vote of thanks to Professor Lethaby, said that before they entered the room doubts were expressed as to whether it would be an education for the young, or the ancient, or the middle-aged, and they found that all their fears had been realised. The lesson had been meant for all of them, and he hoped it would do them all good. He confessed that when he saw a man of intelligence and learning approaching the Middle Ages he had fears that the veil which hung over the Middle Ages was about to be removed. But though they had learned much from Professor Lethaby that evening, there were some mysteries which still remained. Professor Lethaby had insisted once more on the importance of the guild system in the Middle Ages, and had shown them, by examples to which none of them could take exception, how successful that system was. Of course, he might have carried his arguments further, and insisted on the existence of guilds at a much earlier date. They had had the architect knocked out altogether as he had been knocked out before, but it still seemed to him that the question was partly unanswered. There still seemed to be a doubt as to who designed these things. They had ample evidence that to superintend was one thing and to design was another, and they were brought face to face once more with the conclusion that the buildings of the Middle Ages, however they might look at it, somehow or other conducted themselves; that

was to say that, looking at a building like Westminster Abbey, they were reminded once more in the evidence they had had that evening that some Divine Providence designed the building, and that man was more an instrument than an originator. In fact, he believed that was the conclusion which Professor Lethaby would bring them to, and it brought out the great contrast between the architect-to-day and the architect of the Middle Ages. It brought it out so strongly that he thought they would feel it was impossible for them to revive, even with the help of the trades-unions—who hardly looked like giving help—the condition of the Middle Ages. The great contrast of the architect-to-day with the architect of the Middle Ages was that they found themselves faced by new inventions, and no doubt the true answer of the problem-to-day of design might be, as was the design of the Middle Ages, simply skilful continuance. All the same, it seemed impossible at this period of history to neglect design as a preliminary study for architecture. In fact, he was sure Professor Lethaby did not mean them to take the view that the past could be disregarded. It might be the duty of the architect to reject the traditions of the past, but he could only do his duty after he had learned what had been done. When he was a master of that he could turn it over and go on his own way. The New Testament did not make mention of an architect, but in the Greek Testament the word architect was applied to St. Paul as a "wise master builder" who laid the foundation. From that it appeared that at all events in one period of history there was an architect who could do so useful a thing as to lay a foundation. He would like to make one remark with reference to a form of contract he found some years ago in a book—Gardener's "History of Dunwich," which was one of the towns submerged by the sea on the East Coast. In that book there was a reference to the contract for building a tower. The tower was built by two men paid much in the same way as they had had described that evening. They were paid in tithe, and got fish and a coat a year if they were good men. But if one read the contract carefully one realised how extremely simple was the problem laid before the men. They were simply bound down to do a certain number of things, and most of them were to be imitations of other buildings in the neighbourhood. It taught one once more the lesson that in the Middle Ages, whatever they did—and they knew they produced excellent results—there was no question of striving for originality.

Professor Pite, in seconding the motion, said it really was a very extraordinary paper and one which he imagined none of them were able to anticipate, and at times they did not quite know to what conclusion they were being skilfully driven by the serious and ascertained facts with regard to mediæval building, which had been so thoroughly laid before them. That mediæval architecture evolved itself step by step was a fairly self-evident proposition, but he thought he must join issue with Mr. Waterhouse inasmuch as they did not find in the work the architect as they knew him, the architect as they trained him, or the architect as they thought of him. One could imagine there coming into the scheme of Westminster Abbey a man with a fine idea of what a cathedral should be—an idea based on something outside the narrow limits. The development seemed invariably to proceed from impulse, and sudden impulse, and an impulse which existed, at all events, unchecked until the time of the Black Death. They saw the process of development arrested in the western end of the nave of Westminster Abbey, and arrested in a singular way. They found development arrested, and the previous work at the eastern end was nearly copied. There were other instances of this view of mediæval architecture, which certainly brought before them the spectacle of a mind burdened with that originality with which they all suffered in this new century. He was thinking of such a work as the west front of Salisbury Cathedral or the west front of Peterborough Cathedral. One looked at that and felt that they were altogether out of the tide of development. A new element had come upon the scene. A poetic thinker had dealt with the material at hand. When they thought about that and sought to understand how it was arrived at they found that there was one bit on another of Romanesque. The types of the Romanesque

abbeys and churches in England were undoubtedly original—the intention was manifest; for instance, the west front of Lincoln, with the three great arches, which he found suggested the great arches of Peterborough, and the great mass of arcade walls, which might have suggested Salisbury. They found this poetic element at work, but it seemed to have been introduced from outside and set aside from the regular development of mediæval building as such. They came to the Renaissance, and a new world was set up for the world that then was—a world of antique art and discovery. It was then that the architect as we now know him arose—the man who, without being trained in the handwork of the crafts with which he dealt, yet dealt with the material as so much a part of the picture, and so in that way he dealt with the new architectural forms which had been discovered, and arranged them and applied proportions to them, and watched the effect. Time moved on, and they found that the mysterious Spirit of Art slackened in her grasp of the building arts. The arts became dead, and as the artistic instinct seems to lose power over the architectural, somehow it seemed to give power to the craftsman. If they looked to the eighteenth century in England they found that imagination had lapsed, but the perfect skill of the domestic builder was in their midst. They used the Renaissance forms and arranged them as the early architects arranged them. That was killed at the end of the eighteenth century again by what was called the Gothic revival. Here they would do well to contemplate the problem of future style—to ask where they were and how they were to design this building and that. Professor Lethaby's position was a logical one, but it would be a difficult one to work under; but if the position was sound it would sooner or later assert itself, and they could not afford as a profession and as architects to go on arguing in the quagmire of styles. They could not with self-respect retreat back upon Victorian development; they could not pick up any of the lost threads of the last century and start again with them. There was a time when they were threatened with a Chinese revival shortly after the time of Horace Walpole. What was the new century to be threatened with? That brought them to a point, which was the position they held as an Institute with regard to education in art. They could, of course, only work with the existing traditions of the profession. Could they in their excellent wisdom insist on a knowledge of one style or another? Was the time yet come when they could dispense with the channel which existed between the art of design and the art of construction, and dispossess themselves of the idea, which, unfortunately, was a fact, that men who were good at design were bad in construction, and those who were good in construction were bad in design. Until they had attained that point Professor Lethaby would have been preaching to them in vain; that time must be arrived at they all admitted. They admitted that a properly-qualified architect was the man who should be a good constructor and a good designer. But they could not be content with that idea. They must do their best to get some solid doctrine of architecture into their own system, and he only hoped the paper they had had that night would lead them to heart-searching in this matter. In that Institute they were in a very curious position. They would remember the circumstances connected with a manual drawn up ten or twelve years ago, with regard to the examinations in architecture, when it was pointed out that examination in the art of design and the art of architecture was hardly possible. It was not considered to be at all events proper and desirable, and the Institute at that time had all its examinations in design conducted in a different way from that in which they had previously been conducted. But the position generally was unchanged, and when they came to consider the admission of Fellows to the Institute the policy of the Institute offered a complete reversal. The principle was accepted with regard to Fellows provided they were good constructors and provided they were accepted and reputable practitioners. This body did not examine them in design, but examined them in those parts of their professional life and work which affected the good of the country. He thought the time was coming for the sound sanity of that policy to be applied to the Associate of the Institute

as well as the Fellow, and he would like to suggest that a further modification might be arrived at by the Board of Examiners with regard to examinations in architectural style. Architectural style was altogether worn out and played out, and they did themselves no good by perpetuating it. They might ask for a proper acquaintance with the forms of certain buildings, as a matter of example, and as a matter of example alone, but they ran the risk in doing that of diverting the attention of the student to the outside of the building rather than to the main principles which underlay it. The paper was a very interesting one, and it opened on all sides interesting possibilities for discussion, and he hoped it would bring forward effective results in their daily practice.

Mr. Leonard Stokes said he sympathised with Professor Lethaby in his views, but at the same time he was bound to say that he could not quite follow them out to a logical conclusion, and he really doubted whether Professor Lethaby did himself. The old days were very charming days, and one wished one could live in them, when John the mason started by scratching his head, and called in Bob the carpenter, and consulted whether to put a wooden or a stone roof on the top. He joined issue completely with Professor Lethaby there. He did not believe that sort of thing ever existed. He thought there was some scheme from the very first that the building should have a vaulted roof. He admitted that frequently John the mason made a mistake, and before he got the top on found the building would not carry one of stone, and then he would call in Bob the carpenter and ask him to put on a wooden roof. Bob would do it; but it was not a design—it was a muddle, and there were lots of them all over the country. They made those muddles still; but two blacks did not make a white. He gathered that Professor Lethaby wanted them to go back to the old muddle, when they began to do something they did not know, and ended by doing something they did not want. He thought the architect was made out to be more ignorant than he really was. Professor Lethaby assumed that the architect did not know what a block of stone was or the best timber to use, but they all knew far more than the ordinary bricklayer or carpenter what could be done with the stone or timber. Professor Lethaby wanted them to go and learn from the bricklayer. That was all very well, but the bricklayer was a dunderhead in nine cases out of ten, and made all sorts of silly mistakes. "Bond" was everything to the bricklayer, and they would do anything to get that, and make the whole design subservient to some recognised rule of "bond." He did sympathise with Professor Lethaby when he said that honest work was everything, and that style had been bandied about as a sort of nightmare, and which he had described very excellently as the syndicate style—as to that class of work being honest work, it was not. He did think, however, that the lecturer did the modern architect an injustice, inasmuch as he assumed him to be so horribly ignorant.

Mr. Thomas Blashill said that one of the comforts we had in listening was that one could accept the lecturer's premises without coming to his conclusions. He thought what had been said by Professor Lethaby was most instructive as far as it enlarged the information of what was done in early times, but when he dealt with the Abbey of Westminster he was bound to say he was unable to think that that particular building—French in its design, although English in detail—could have been designed at any time by Robert the mason, or any of those men whose names had been mentioned. It was true they did not know who it was did it, but there might be reason for that. There was not that anxiety in olden time in a man to have it known for all time that he himself had done this. Few people then put their names to that which they did. He might be wrong in suggesting another reason, for no one else had suggested it, and probably, therefore, he was wrong. It was that the class of men who worked upon these buildings with their hands or as designers had not, as a rule, a second name or a distinctive surname. No doubt there were fifty other Johns of Gloucester and Roberts of Beverley—they were names that were useful, and indicated a man on a particular job. But with the great statesmen and warriors of the Middle Ages, such as the Salisburys and Beauchamps and Warwicks, there they had distinctive names; but without that distinctive name, how

little would their deeds have been known or remembered or recorded. He believed there was something in it. If these men had had specific names which distinguished them from their fellow-men, it was more likely they would have come down to posterity. He thought they reckoned too much upon what they found in the Renaissance time. Men like Inigo Jones and a few names of that sort posed now and then as joiners and now and then as architects. They thought because in such cases the actual designer was also the worker it must have been so in all time. He did not think it was so. For a long time—a hundred years after the Reformation and after the destruction of the monasteries and owing to the political changes—hardly any building was done at all. No buildings of any consequence were erected, and the upshot of it was that when the time came that new buildings were required they had to go to the workmen who knew all about building and who were most fitted to take up the new duties. He did not think they could argue from that that there had been no special architects in the Middle Ages. He agreed that they should go the workmen for knowledge, for there was too much time spent in school and over books. There were too many details thrust upon them, too many ways of doing a thing. In the olden times there were very few ways known of doing the same thing, but now they were burdened with half-a-dozen ways and were expected to know them all. So far he agreed with Professor Lethaby, but he could not go so far as to agree that a building like Westminster Abbey grew up from a combination, however close, of superior workmen. There must have been one master mind who, from the laying of the very first course of stones, had decided and was able, either by drawings or some other way, to teach the workmen what was to be done from the bottom to the top. They knew that if they saw a plan either of a French thirteenth-century building or an English building, they could tell everything of the important parts of the structure from the very bottom to the top; and they could not suppose that a work of that kind was carried out by a chance combination of able workmen who changed from year to year and did the thing, however cleverly and however well.

Mr. Vacher remarked that a man who designed a beautiful building like Westminster Abbey must have been a highly educated gentleman and have mixed with the highest in the land, and, therefore, he thought they might take it that in those days, like the present, the man who designed these beautiful things was acknowledged to be a clever individual and no common man. He could have been no common mason or carpenter, but a man who could talk and read and a man who knew what was going on and what was wanted.

The Chairman, in closing the discussion, said that all he would say on the question was as to the points Professor Lethaby made about the work being done by the master mason or the master craftsman. If they went to India at the present time they would find the same thing being done. Some few years ago he was in India and went to Gwalia where they were building a tomb for the Maharajah, and he asked to see the drawings. The work was being done by natives and they had no drawings. They showed him a model of a dome and that was the only thing they could show. This was an enormous building and he asked how it was all arranged and the man pointed to his head and said it was there. He supposed, as a matter of fact, the cathedrals in the middle ages were built very much like that. Masters handed down to their sons certain rules and certain details, and when a building so many feet long and so many feet wide had to be built they knew what piers they would have to put in, and the master masons arranged the stones for the other masons to work on. He imagined their cathedrals were erected something like that, but he also thought there must have been some person who made some sort of drawings—some master hand which guided in the planning. That the foundations were put in and bore the building by mere chance he did not think could have been the case. That system might apply in India now, and might have applied in the Middle Ages, but with their present complicated wants in London if a big City building was left in the hands of a master bricklayer or mason or carpenter he hardly thought it would meet with the wishes of the client.

Hogarth's House, Chiswick: From the Garden.

The vote of thanks having been heartily agreed to,

Professor Lethaby, in reply, said he did not say that the building was not done in accordance with a scheme. All he said was that the work was done by the men. These men did become very great men, and became friends of their King and equal to any man in the kingdom. There was a curious assumption that a mason must be a common man, but that was a mere assumption, and when he spoke of mediæval art he tried to show that it was possible for a mason not to be a common man—he could graduate from the boy who cleaned out the shop and mixed the mortar and became the equal of any man in the land.

The proceedings then ended.

Visit to Glasgow, and Annual Dinner.

The Glasgow Institute of Architects are making arrangements for a visit of the Royal Institute to Glasgow early in October this year, and during the visit the annual dinner of the Institute will be held. The date fixed for the dinner is Thursday, October 3. The programme of the visit as at present arranged is as follows:—Thursday, October 3, Royal Institute of British Architects' dinner. Friday, October 4, (1) lunch in the Exhibition grounds, given by the Glasgow Institute to the Royal Institute visitors; (2) Visit to the Glasgow University (tea); (3) conversation given in honour of the Royal Institute by the Corporation of Glasgow. Saturday, October 5, visits to Exhibition, &c. At all Friday's functions the presence of ladies will be welcome.

BAYONNE SLATES AND MARBLE.—Writing from Bayonne recently, Mr. Paul Schoedelin, the British Vice-Consul, remarks that the trade in slates for roofing has considerably increased during the past year. No fewer than from eight to ten small sailing vessels, each carrying about 150 tons, were cleared for London, Plymouth, and ports in the Bristol Channel. It is only profitable to ship by sailing vessels, owing to the time required for loading. The same correspondent states that in several parts of the Pyrenees there are marble quarries, but the exportation is very small owing to the expensive cartage, and more particularly to the want of a powerful crane at Bayonne. The local Chamber of Commerce, however, have decided to buy a crane capable of raising from thirty to forty tons as soon as the new quay is entirely completed. Of late years a large quantity of this marble has been used for public buildings and churches. The new church of St. Eugénie at Biarritz is built entirely of unpolished marble.

HOGARTH'S HOUSE, CHISWICK.

A good deal of attention has recently been drawn to the house, formerly the residence of the great painter, in Hogarth-lane, Chiswick, and steps have been taken to preserve this historical building. In the *Builder* of February 8, 1890, a view of the house, taken from the opposite side of the road, was given. The view given to-day is from the west or garden side. The house has a frontage of about 44 ft., but, as will be seen, has but little depth. The roughness of the walling at the south-west angle seems to indicate that a wing projected southwards. Beyond some panelling there is but little of architectural detail in the interior, but the house and its surroundings are, apart from their historical associations, of a type now too seldom found, and the scheme for its preservation as a museum deserves all encouragement.

THE ARCHITECTURAL ASSOCIATION: VISIT TO GODALMING.

On Saturday, June 15, the first summer visit of the Architectural Association was paid to some of Mr. E. L. Lutyens' work near Godalming. Members left Waterloo by the 10.5 a.m. train and on arriving at Witley Station, walked to Tigbourne-court, the property of Mr. E. Horne. Mr. Lutyens was unable to be present and Mr. Horne very kindly met the party and himself showed the way over the house and garden.

The house is a striking one, and the arrangement of plan and elevations most original and interesting. Built of the local Bargate stone laid in small courses, the central portion of the house facing the main road, sets back with a shallow court, the wings of which terminate in semi-elliptical screen walls, with very charming doorways on either side. The main entrance is in the centre through an open portico. A great feature in the elevations is bands of roofing tiles laid flat in a kind of herring-bone pattern, which forms a pleasant and effective contrast with the warm yellow of the stone. The roofs have been covered with old tiles. On the garden side a small balcony with some very effective metal work was especially admired. A charming garden has been laid out round the house under the direction of Miss Jekyll and Mr. Lutyens.

Internally the house perhaps hardly comes

up to the great promise and originality of the exterior, but, though space does not permit of a detailed description, mention must be made of some very good detail in the drawing-room and in the entrance lobby. Mr. Horne most kindly entertained the party at luncheon in his own house, The Hill, which at one time belonged to Birket Foster.

Munstead Wood, belonging to Miss Jekyll, was next visited. Here the general arrangement, though not quite so striking as at Tigbourne Court, is very pleasing. The same materials are employed—Bargate stone, tile bands, and tile roofs, with oak frames and leaded lights set flush with the wall face—but large oak beams enter into the construction showing in the ceilings, in the porch, and in the first-floor corridor; great effect is obtained by means of these open timbers. The details of doors and fireplaces are very good, the fireplace in the hall especially. The whole house is full of thought and care and is, in fact, almost an ideal example of what can be made of a small house. The garden is too well-known to need description, but is indeed a joy.

Half a mile from Munstead Wood is Orchards, belonging to Mr. W. Chance, which was next visited. The house forms two sides of a courtyard, the south side containing the principal rooms, entered from a porch and doorway in the centre, approached through the courtyard under a large gateway on the north side. The east wing contains the offices and is continued out beyond the north side as stable and coachhouse. The north side consists of coachman's house, the open gateway, with some delightful detail in the roof, and on the right of this is placed a studio, which has a very interesting fireplace, all in red brick and red tile bands carried right up to the ceiling. The remaining western side of the courtyard is an arcade connecting the studio with the western part of the south front. A large garden to the east and south-east is full of interest and has some fascinating work in the walls and terraces.

Externally the same materials have been employed, and internally the house seems well nigh perfect. There are the same general features as at Munstead Wood; a large first-floor corridor on the north side of the south block has here been still further developed and is doubtless the chief factor in the plan. It is certainly successful, and the way the upper part of the porch is made to serve as a

sort of transept to the corridor, gives a character to the house, all its own. Every room has been carefully planned and each one has some quiet and refined bit of thoughtful detail. It is, perhaps, almost correct to say that the chief charm lies in what has been left out, rather than what has been put in; but turn where you will, something fresh and interesting is to be found, though all effect is obtained in the simplest manner. Mr. Lutyens has been fortunate in his clients and he has succeeded to the full in producing a perfect country home.

A peep into Busbridge Church to see Mr. Lutyens' fine bronze chancel screen brought a very successful day to a close.

SITE FOR THE LIVERPOOL CATHEDRAL.

A SPECIAL meeting of the members of the Liverpool Architectural Society was held in the Law Library, on Thursday, June 13, the President, Professor Simpson, in the chair. There was a large attendance of members, and the following Report was adopted:—

"The question of the site for the new cathedral of Liverpool is naturally one of great interest to all architects, and especially to those practising in Liverpool.

The first essential of a cathedral for Liverpool is, that it shall be a cathedral of the diocese, and not of the city only. The most central position for the diocese is that in closest touch with the railway stations. Four sites have been suggested—

- (1) St. Peter's Church.
- (2) Monument-place.
- (3) St. Luke's Church.
- (4) St. James's Mount.

These are placed in order of centrality. Of these four sites, Nos. 1 and 3 are not considered, as for various strong reasons they are regarded as inferior to the other two.

The advantages of the Monument-place site are as follows—Its position and approach are unrivalled in Liverpool. There is an opportunity here for a west front which might be the finest in Europe. The proximity of the site to the great public buildings of Liverpool is of the utmost importance. Its relation to St. George's Hall in view of state processions, civic or otherwise, is of great advantage. It is near to, or in direct communication with, the principal railway stations, and is passed by cars from the pierhead as well as by those from the north and the south of the city. The site is a very high one, the level of the ground at the west end being the same—132 ft. above the datum line—as that of the St. James's Mount site, and any building, therefore, erected thereon would be as visible from the river and the Cheshire side as one placed in the latter position. The foundation is rock. The removal of many of the buildings at present on the site would be of distinct advantage to the welfare of the city. Finally, the orientation would be that customary in English cathedrals and churches.

The disadvantages which have been urged against it are: The cost of the site; the noise from passing cars and traffic generally; and the surroundings. As regards the first, this is undoubtedly very great. The question of noise is not a serious one, owing to the construction necessary for so large a building. St. Paul's, London, is very similarly placed, and the sound of the traffic outside is hardly, if at all, perceptible inside. The surroundings, it is true, are not all that could be desired; but cathedrals ought to be equally accessible for all classes of the community, and the most favoured quarters are not necessarily the best for these buildings.

The advantages of the St. James's Mount site are as follows: The site itself would be much less expensive than that of Monument-place. The situation is a quiet one, and the surroundings are picturesque. Any building erected here would stand out well, and could be seen from the river and Birkenhead.

Its disadvantages, in our opinion, are much greater than its advantages. Its inaccessibility is perhaps its greatest; it is far removed from the main lines and centres of traffic. The site is a very narrow one, and it would be difficult to obtain a good near view of any large building placed upon it. The approach, in an architectural sense, is very bad indeed, and no vistas would be obtainable from any point. The cost of the foundations would be very heavy; either the present mound would have to be removed, or else the foundations would require

to be carried down very deep. The suggested suspension bridge over the cemetery would be exceedingly costly and possibly unsightly. If the cathedral is placed as has been suggested, the orientation will be contrary to the immemorial traditions of the English Church. A practical objection to this proposal is that the sunlight striking through the window or windows at the end of the chancel, which would be south, would be a very serious inconvenience to the congregation.

In conclusion, we consider that questions of economy ought not to be allowed to override every other consideration in placing a building which is to stand for all time. A cathedral need not be built in one life time or by one set of donors. We suggest that it would be possible and sufficient for this generation to make the commencement of an entirely worthy work by acquiring a part of what we consider to be the best site (Monument-place), and erecting a portion of the building upon it. This portion might be either the grand west front and nave, taking up the frontage to Monument-place, and extending back to Anson-street, or it might be the chapel and transept portion which would stand on the cheaper land, eastwards, with a temporary west entrance from Anson-street.

In matters of vast importance such as this, the only thing worth aiming for is the best, and it is our experience that, in the long run, this is the most easily obtainable.

Signed on behalf of the Society,
 FRED M. SIMPSON, President,
 HASTWELL GRAYSON, } Joint
 GILBERT FRASER, } Hon. Secretaries."

THE LONDON COUNTY COUNCIL.

The London County Council reassembled on Tuesday at Spring-gardens after the usual Whitson recess, the Chairman, Mr. A. M. Torrance, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Chelsea Borough Council 6,920*l.* for paving works, and 2,000*l.* for street improvement; Hackney Borough Council 50,000*l.* for electric light installation and street lighting; Hammer-smith Borough Council 2,510*l.* for paving works; St. Pancras Borough Council 50,000*l.* for electric light installation; Southwark Borough Council 13,980*l.* for electric light installation; Hampstead Borough Council 9,525*l.* for similar purposes; Kensington Borough Council 19,920*l.* for paving works; Stepney Borough Council 380*l.* for electric light installation; Fulham Borough Council 30,000*l.* for erection of baths and washhouses; and Hampstead Borough Council 15,000*l.* for extension of cemetery.

Richmond Hill View.—Mr. Burns, M.P., asked whether, in view of the probable loss to London and the suburbs of the beautiful view from Richmond Hill, the Committee would take into consideration the advisability of co-operating with the Richmond Corporation, the Middlesex County Council, the City Corporation, or the Metropolitan Public Gardens Association in order that the people of London might have secured to them for all time the permanent enjoyment of that view.

Mr. H. Clarke said that Richmond Park itself was saved in the early part of last century by the City Corporation.

Lord Monkswell, Chairman of the Parks Committee, said the Committee and the Council had the question of open spaces quite as much at heart as the City Corporation.

New Open Space.—The Parks Committee reported that they had purchased the garden at Albert-square, Commercial-road, under compulsory powers, for 10,500*l.*, the amount of the umpire's award. The valuations on behalf of the Council ranged from 7,603*l.* to 8,250*l.*, the scaled offer amounting to 8,750*l.*

Improvements.—The following recommendations of the Improvements Committee were agreed to:—

"That the estimate of 1,300*l.* submitted by the Finance Committee be approved, and that, subject to an agreement to be prepared by the solicitor, and to the Council of the Metropolitan Borough of Wandsworth agreeing to contribute one-third of the net cost, the freehold interest in the strip of land needed for widening Garratt-lane to 54 ft. at St. Andrew's Church be acquired by the Council.

That the estimate of 1,000*l.* submitted by the Finance Committee be approved; that the Council's statutory consent be given to the widening of

Streatham High-road at the Drew estate, proposed to be undertaken by the Council of the Metropolitan Borough of Wandsworth; and that a contribution be made by the Council on the usual conditions of one-half of the net cost.

That the supplemental estimate of 1,436*l.* 13*s.* 4*d.* submitted by the Finance Committee be approved, and that in connexion with the widening of Russell-street, Drury-lane, now being undertaken by the Council of the City of Westminster, an additional contribution of 1,436*l.* 13*s.* 4*d.* be made by the London County Council.

That the estimate of 375*l.* submitted by the Finance Committee be approved, and that a contribution be made on the usual conditions of one-half of the net cost of the widening of Shattisbury-avenue at its junction with New Oxford-street, proposed to be undertaken by the Council of the Metropolitan Borough of Holborn."

By-law as to Flash Lights.—The Local Government and Taxation Committee reported as follows:—

"We report, for the information of the Council, that at the Clerkenwell Police-court, on May 22, Messrs. Baker & Co., tobacconists, of Pentonville-road, were summoned by the police for 'unlawfully exhibiting a flash light so as to be visible from Pentonville-road, and to cause danger to the traffic,' contrary to the Council's by-laws. The flash light in question was an advertisement which took the form of a block of letters across the front of the shop, 10 ft. above the footway. Each letter was flashed in turn until the whole sign was illuminated, and then the light suddenly went out, and the process was repeated. The only evidence of 'danger to the traffic' was that given by the police. In the result, the magistrate found that the flash light was a source of danger, and imposed a fine of 40*s.* This is, we believe, the first case in which proceedings have been taken under the Council's by-law as to flash lights, and it is of interest, in view of the fears which were entertained that the words 'to cause danger to the traffic,' which were added at the instance of the Home Secretary, would render the by-law inoperative."

Common Lodging-houses.—The Public Health Committee submitted a Report recommending:—

"That the Parliamentary Committee be instructed to seek legislation in the next Session of Parliament to provide—

(a) That no person shall keep a common lodging-house in London without obtaining annually a licence from the Council.

(b) That, for the purpose of making and amending the regulations or by-laws within the County of London from time to time, the provisions of the Public Health Act, 1875 (Section 80), be substituted for those of the Public Health Act, 1848 (Section 66), mentioned in Section 9 of the Common Lodging Houses Act, 1851, and that words be added to enable the Council to make by-laws for the inspection and enforcing of proper drainage in common lodging-houses.

(c) That Section 3 of the Common Lodging Houses Act, 1853, be amended so that, when a registered keeper dies, his widow or other relation, or person acting in the care or management of the house after his death, shall, as a condition of being allowed to keep the house for four weeks as in the section provided, give immediate notice of such death to the Council.

(d) That the Council shall have the like powers as are conferred by the Public Health (London) Act, 1891, upon sanitary authorities for examining as to the existence in a common lodging-house of any nuisance, and for obtaining closing orders or otherwise abating any nuisance which may be found to exist therein.

(e) That all penalties imposed shall, notwithstanding any provision contained to the contrary in the Act 2 and 3 Vict., cap. 71, or in any other Act or Acts, be paid to the Council."

The recommendations were agreed to.

Theatres, &c.—On the recommendation of the Theatres and Music Halls Committee the following applications were agreed to:—

Seating on ground floor of the Grand Hall, Clapham Junction (Mr. E. A. E. Woodrow).
 Plan in regard to the Great Eastern Hotel (Mr. T. Holloway).

Imperial Hall, Dulwich (Mr. J. W. Brooker).

Plans in regard to the entertainment hall in Picturesque England at the London Exhibitions, Earl's Court (Mr. A. O. Collard).

Proposed extension of the East London Technical College at the People's Palace, Mile End-road, E. (Mr. C. Reilly).

Proposed addition to the meter-room in Sadler's Wells Theatre, Rosebery-avenue (Mr. Andrew).

Plans submitted by Messrs. Fladgate & Co. in regard to the Savoy Theatre, Strand.

Greenwich Tunnel Works.—The Bridges Committee reported as follows:—

"We have to inform the Council that on the 26th ult. the shield at Greenwich tunnel reached the Greenwich shaft, and an opening was made

Plan of St. John's Church, Westminster. Measured and Drawn by Mr. A. Wyatt Papworth.

to allow a passage from the tunnel to the shaft, and by the end of the month the junction was made perfectly secure. The actual tunnelling work is now complete, save for the special ring at the junction with the inside plates of the Greenwich shaft. The rate of progress from the commencement of the work, including time lost for holidays, has been 5 ft. 6 in. per day, or 33 ft. per week, for a period of thirty-six weeks. It is very satisfactory to have to report that the work has been carried on with very few accidents, and there were only three cases of compressed air sickness of sufficient gravity to deserve compensation from the Council."

The Supply of Electricity in Bulk.—The Highways Committee recommended that the Council should instruct the Parliamentary Committee to prepare the draft of a Bill, on the lines of the suggested clause agreed to at the recent conference of local bodies, relative to the purchase by local authorities in combination with each other, or by the London County Council, of undertakings for the supply within the county of London of electricity in bulk; and that such Bill should be submitted in draft for the consideration of the Corporation of the City of London and the respective Councils of the City of Westminster and of the several metropolitan boroughs.

This was adopted.
Having transacted other business, the Council adjourned.

ELECTRIC LIGHT EXTENSION, BECKENHAM.—An inquiry was held at the Beckenham Council Offices recently by Mr. M. K. North, A.M.Inst.C.E., one of the Local Government Board Inspectors, into the application of the Beckenham Council to borrow 20,000*l.* for the extension of the electric light at Beckenham, 780*l.* for purposes of street improvement, and 275*l.* for the public baths. Mr. Reginald P. Wilson, consulting electrical engineer, presented the details of the proposed extension.

Illustrations.

PROPOSED HIGH ALTAR, REREDOS, AND BALDACCHINO, ST. ANNE'S CATHEDRAL, LEEDS.

THE reredos, of which we give an illustration, is divided into niches with richly carved canopies over them. In the centre is the throne for exposition and benediction, approached by a staircase from the ambulatory. Above the throne is a panel with the coronation of the Virgin carved in low relief and decorated. Over the whole is a lofty baldacchino supported on two columns.

The altar itself is to be executed in purple Breccia marble, with a frame of white alabaster inlaid with mother of pearl; the cross in the centre inlaid with porphyry and lapis lazuli.

The tabernacle is to be in white alabaster with beaten copper door.

The super-altar is to have Bianca, Nero, and Connemara green marbles, and the whole will be on a plinth of black marble.

The reredos is to be executed in first quality pine, with canopies and carved posterns in very fine kauri pine. The baldacchino is to be executed in the same material, but the columns to have iron slanchions cased in kauri pine. The whole of the woodwork will be painted and decorated.

ST. JOHN'S CHURCH, WESTMINSTER.

We publish an elevation and section of Archer's celebrated church of St. John at Westminster, the plan of which is also subjoined. The drawings are by Mr. A. Wyatt Papworth, and form a portion of a set for which he was awarded a medal of merit and five

guineas in the last silver medal competition for measured drawings at the Institute of Architects.

The church stands in the centre of the site proposed to be dealt with under a Westminster improvement scheme, and should, from its position, form almost the central and governing point of any plan for the laying out of that portion of Westminster. On the other hand, one never knows what destructive measures may be carried out in these days in connexion with so-called improvement schemes, and therefore we may as well take an opportunity of putting a record of the church in our pages in case of the worst.

The history of the fabric is noteworthy. It is the second of the "fifty churches" erected by the Commissioners to whom Sir John Vanbrugh (*obit* 1726) was surveyor. He entrusted the design to his pupil, Thomas Archer. The church was built in 1721-8 (see the Act 1 Geo. II., 2nd Session, c. 15) for a parish which had been taken out of St. Margaret's, at a cost of 40,000*l.* (*este* Allen's "London," vol. iv., 1828). In the "Crowle" Pennant are two prints, cut down for mounting, but lettered as follows:—

"Mr. Archer's design of St. John's Church in Westminster, as it was resolved upon by the Commissioners. The alterations made since to this design [both to the steps and pinnacles] were done without the consent or knowledge of Mr. Archer."

Elmes records that Archer had in mind to build also a central tower with spire; but the plan and structure of the building present no foundation for a feature of that kind, unless we may suppose that Archer intended to supplement the four towers with a timber spire or flèche rising from the roof. The two prints when contrasted with the existing church show that the departure from Archer's own designs

THE BUILDER, JUNE 22, 1901.

HOSPITAL FOR EPILEPSY
AND PARALYSIS
PROPOSED NEW BUILDING, MAINDA VALLE
ZOUSS AND KILBY ARCHT.
BLOOMINGTON, ILL.

HIGHER GRADE SCHOOL
 CASSLAND ROAD
 HACKNEY
 FOR THE
 LONDON SCHOOL
 BOARD
 T. J. BAILEY & SONS, ARCHT.
 1901

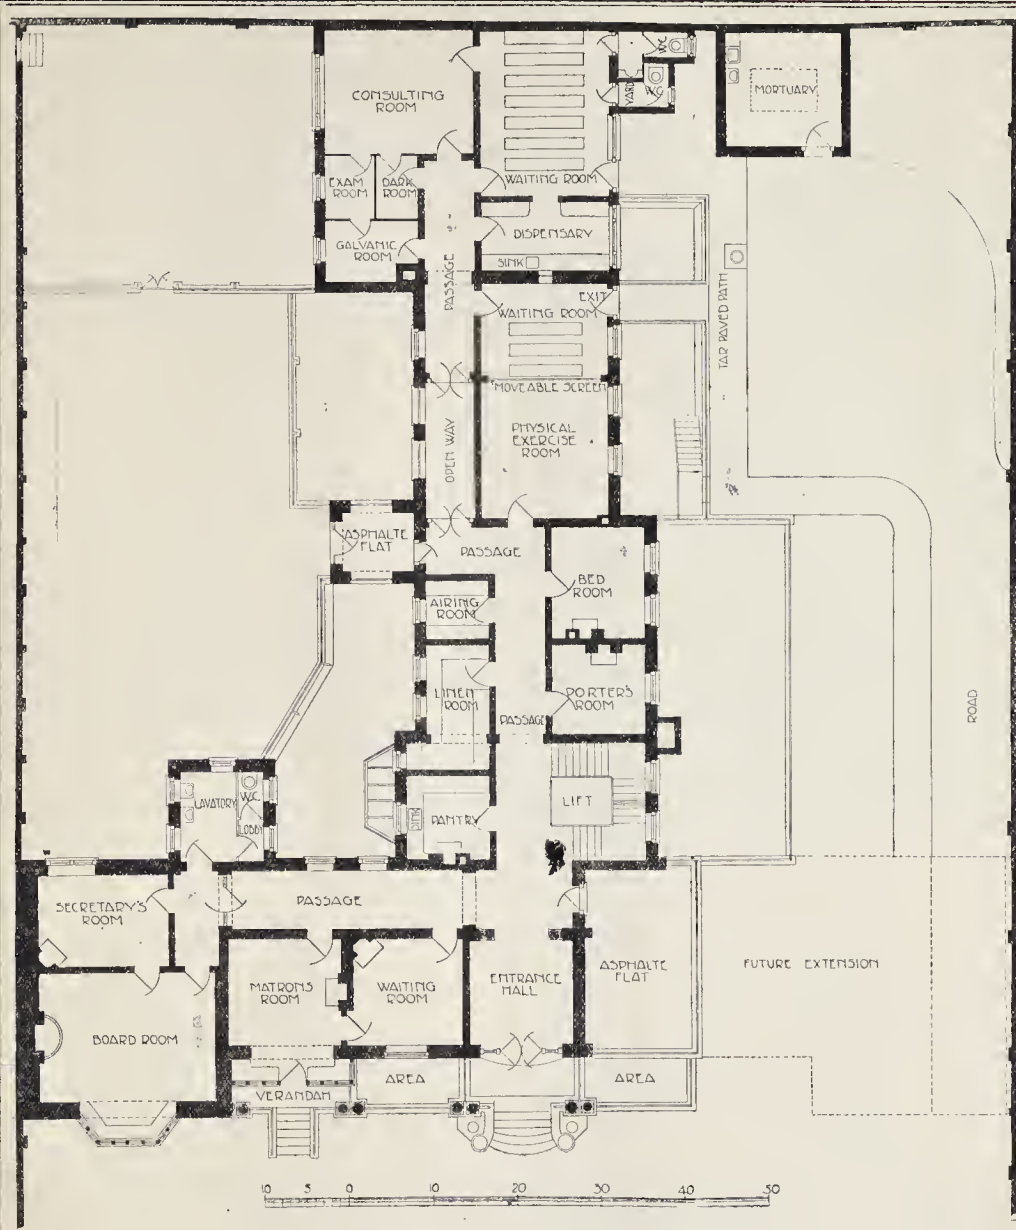

PHOTO-LITHO SPRAGUE & CO. BY 4 & 5 EAST HARDING STREET, PETER LANE E.C.

Hospital for Epilepsy and Paralysis, Maida Vale. Ground Plan.

[See next page.]

mainly affected the treatment of the broken pediments above the porticos; the four towers, which are now rounded on plan; and the stylobate and steps. A story has gained currency that the four towers were added through necessity to give stability to the fabric, as the work of its building proceeded, and did not form part of the original design. But it is quite clear that they did. In respect of the altered towers, Archer's design shows them as square on plan; his arrangement of columns and entablature for the towers has been modified, whilst instead of the present bell-shaped leaden cupolas capped with cones he has at their four angles turrets with pilasters connected by a balustrade, and each of them is terminated with an obelisk finial. The model was deposited in the collection stored over Henry V.'s monument in Westminster Abbey. The structure was tied together with iron bars

passed through the walls and columns both internally and externally. The latter bars have been retained.

Allen cites a painting, preserved in the vestry, of the fabric as it appeared after the interior had been destroyed by a fire that broke out on September 26, 1742. The flames consumed the roof, together with the grouped columns at the angles. The House of Commons voted 4,000*l.* for a reparation of the building; the grouped columns, however, were not replaced. William Inwood effected some alterations and re-arrangements; he removed the columns for supporting the ceiling, and increased the seating capacity in the galleries, added in 1758, and on the floor, for from 1,200 to 1,800 persons. A partial restoration, with re-decoration of the interior, was carried out subsequently by P. C. Hardwick and Sir Arthur Blomfield. Then, in 1885, the interior

fittings were re-modelled and the old pews taken away, at a cost of about 800*l.*, under Butterfield's directions and superintendence.

About ninety years ago, Mr. T. Green, of Millbank-row, gave some old painted glass, brought from Normandy, for the side lights of the east window; in 1827 a copy of the picture of Christ carrying the Cross, variously attributed to Moralez or Ribalta, over the altar-piece in the chapel of Magdalen College, Oxford, was presented to the church. In 1840 Hill rebuilt the organ (1727); the font (April, 1847) was sculptured by John Thomas, after a design by Barry.

HOUSE, "THE TOWERS," DEVONSHIRE.

This house is built of red brick and tiles; the half-timbering is of oak unpainted, portions of this being filled in with herring-bone brick-

work. The stone dressing is of Portland stone. Leaded lights are used throughout in the windows.

Internally the decoration is of a simple character. The woodwork is pine, stained a very dark green.

Messrs. C. R. Dibdin and H. F. Waring are joint architects.

HOSPITAL FOR EPILEPSY AND PARALYSIS, MAIDA VALE.

THE new building which is in course of erection in Maida Vale is intended to take the place of the house now occupied by the Charity in Portland-terrace, Regent's Park. Ultimately it is intended to provide accommodation for some fifty-four patients, but the scheme at present in hand provides only for thirty-five, and for lack of funds the Committee are only able at present to enter into a contract for the completion of the building up to the first floor level.

The whole of the kitchen offices and stores are in the basement. The ground floor contains the administrative offices and the out-patient department. The first and second floor will each contain a ward for seven beds, one for eight beds, and four wards of one bed each, together with ward kitchen, bathroom, and the usual sundry offices, a dayroom for epileptic patients, and a wide balcony on to which patients in bed can be wheeled. On the top floor are the quarters for nurses and servants, together with the sitting-room for the nurses.

The architects are Messrs. Young & Hall; the contractors Messrs. Prestige & Co.; and Mr. Gathergood acted as clerk of works.

CASSLAND-ROAD HIGHER GRADE SCHOOL.

THIS school is being erected by the School Board for London, for the purpose of higher grade teaching, on a site adjoining Hackney Common, and will provide accommodation for 816 children.

Halls and classrooms occupy the ground and first floors.

A drawing classroom with modelling-room, lecture-room, physical laboratory, needlework-rooms, chemical laboratory, gymnasium with dressing-rooms attached, are provided on the second floor.

The school is to be heated and ventilated on the plenum system by Messrs. Stott, of Oldham, the towers being used as extract shafts.

A manual training-room is provided adjoining the school and will accommodate forty boys.

The building is designed in a free treatment of French Renaissance, the walls being faced with red brick relieved by buff terra cotta dressings, and the roofs covered with Broseley tiles.

Mr. Thos. J. Bailey, the Architect to the Board, has designed the building, and it is being carried out under his superintendence by Messrs. Lawrence & Sons, of City-road, E.C., at a cost of 30,594l.

COMPETITIONS.

PUBLIC LIBRARY, KEIGHLEY.—As we have already announced, Mr. Leonard Stokes, the assessor in this competition, awarded the first premium to Messrs. McKewan & Swan, 3, Newhall-street, Birmingham. The second premiated design was by Mr. James S. Gibson, 4, Gray's Inn-square, London, W.C., and the third by Mr. Thomas Dawson, 28, Great Ormond-street, London, W.C.

SHOPS AND HOUSES, DARLINGTON.—In a competition for a row of shops and houses, Park-gate, Darlington, the design by Mr. F. Turner Waddington, Beech-avenue, Blackpool, has been placed first. The second premiated design was by Mr. J. H. Holmes, West End Buildings, Darlington.

BATHS FOR OLD TRAFFORD.—A special meeting of the Stretford District Council was held on the 11th inst. for the purpose of selecting plans for the new baths at Old Trafford. The estimated cost of the baths is about 12,500l., and they will be erected at the junction of Northumberland-road and Hullah Hall-lane. In response to the advertisement for competitive plans, twenty-one sets were sent in, and it was found necessary to appoint an assessor to make the awards, which were confirmed by the Council as follows:—Mr. Charles Thos. Taylor, Clegg-street, Oldham,

and Mr. Arthur Warburton, of Warrington, thirty guineas; Mr. Arthur R. Groom, architect, Manchester, twenty guineas; and Messrs. Farrar & Woodhouse, architects, Manchester, ten guineas. On the motion of Mr. Talbot (Chairman of the Baths Committee), seconded by Mr. Walthew, it was resolved to erect the baths from plans submitted by Messrs. Farrar & Woodhouse.

BOARD SCHOOL, LOUGHBOROUGH.—At the last monthly meeting of the Loughborough School Board, the clerk laid before the committee the report of Mr. Evans on the plans sent in for the proposed new Board school, cookery school, and pupil teachers' centre, from which it appeared that Mr. Evans had awarded the first place to Alpha No. 1, and the second place to Alpha No. 2. The clerk reported that both these plans were sent in by Messrs. Barrowcliff & Alcock. It was thereupon resolved to award the premium offered of 25l. to Messrs. Barrowcliff & Alcock. The further consideration of the plans was adjourned, and it was resolved, with the consent of the architects competing, to invite the ratepayers to inspect the plans, and to place the same on view in the board-room.

ARCHITECTURAL SOCIETIES.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.—A deputation from the Council of the Royal Institute of the Architects of Ireland waited on the Local Government Board on the 14th inst. The deputation consisted of Sir Thomas Drew, J. Rawson Carroll, R. Caulfield Orpen, Charles A. Owen, and W. Kaye Pary, Hon. Secretary. The object of the deputation was to bring under the notice of the Local Government Board the appointments of unqualified men as architects by the Urban and Rural District Councils in connexion with the expenditure of public funds. The deputation was courteously received by the Vice-President, Sir Henry Robinson, K.C.B., and other members of the Board. Sir Thomas Drew stated shortly the position occupied by the Royal Institute in connexion with the profession which it represented. Mr. W. Kaye Pary then read a statement embodying the views of the Council, and suggested that the Local Government Board should endeavour to secure increased powers to make regulations regarding the qualifications of architects employed by Urban and Rural District Councils. The Chairman thanked the deputation for having brought this matter under the notice of the Board, and added that the suggestions of the Council would be very carefully considered. The deputation then withdrew.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

AT the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage and Projections.

Kensington, South.—One-story shops at Nos. 28, 30, and 32, Harrington-road, Kensington, at the corner of Queensberry-place (Mr. F. E. Williams for Lord Ashburton).—Consent.

Hampstead.—Residential flats, with projecting one-story shops and bay-windows, on the west side of Finchley-road and east side of Fortune Green-lane, Hampstead (Mr. G. H. Green for Mr. W. H. Pearce).—Consent.

Hammersmith.—A theatre building on the north side of Hammersmith-road, Hammersmith, at the corner of Rowan-road (Mr. W. G. R. Sprague for Mr. J. B. Mulholland).—Consent.

Camberwell, North.—A one-story addition on part of the forecourt of No. 243, Camberwell-road, Camberwell (Mr. W. V. Goad for the executors of the late Mr. C. Goad).—Consent.

Chelsea.—That the application of Mr. J. Ross for an extension of the periods within which the erection of buildings upon plots Nos. 1 to 4, Cheyne-walk, Chelsea, to abut upon Beaufort-street, was required to be commenced and completed, be granted.—Agreed.

Marylebone, West.—A porch at the entrance to No. 33A, Montagu-square, St. Marylebone, to abut upon Upper Montague-street (Mr. L. Stokes for Mr. J. Roskill).—Consent.

Strand.—A projecting metal sign at the Peninsular and Oriental Steam Navigation Company's premises on the North side of Northumberland-avenue, Charing-cross (Mr. T. E. Colcutt for the company).—Consent.

Greenwich.—A house on the south side of Manor-way, Lee-road, Greenwich (Mr. L. V. Hunt).—Consent.

Dulwich.—A one-story shop on the east side of Crystal Palace-parade, Dulwich, near Anerley-road (Mr. W. Harbrow for Messrs. T. Prime & Sons).—Consent.

Kensington, South.—A wooden oriel window at the ground floor level in front of No. 10, Albert-place, Victoria-road, Kensington (Mr. T. W. Heath for Colonel J. P. Westmoreland).—Consent.

Lewisham.—Two houses on the west side of Shell-road, Lewisham, at the corner of Sandrock-road (Messrs. Hodson & Whitehead for Messrs. Hodson Brothers).—Consent.

Pekham.—One-story shops on the forecourts of Nos. 20, 22, 24, and 26, Atwell-road, Rye-lane, Peckham (Mr. A. E. Mullins for Mr. W. Monks).—Consent.

Rotherhithe.—A gangway to connect, at the second floor level, No. 27, St. Thomas-street, Bermondsey, with the viaduct forming the approach to London Bridge Railway Stations, and spanning Joiner-street (Messrs. De Clermont & Donner).—Consent.

St. George's, Hanover-square.—Retention of a one-story office building erected on the forecourt of Victoria Wharf, Buckingham Palace-road, Piccadilly (Messrs. Humphreys, Limited).—Consent.

St. Pancras, East.—An addition to No. 86, King's-road, Camden Town, to abut upon Camden-road (Messrs. Taperell & Haase, for Mr. A. Hilger).—Consent.

Hammersmith.—That the application of Messrs. Dale & Gadsden for an extension of the periods within which the erection of thirteen one-story shops on the east side of Balham High-road, between Nos. 207 and Elmfield-road, was required to be commenced and completed, be granted.—Agreed.

Woolwich.—That the application of Mr. R. Stewart for an extension of the periods within which the erection of eighteen houses on the north side of Bexley-road, Ethham, eastward of Elderside-road, was required to be commenced and completed, be granted.—Agreed.

Hampstead.—That the application of Messrs. Boehmer & Gibbs for an extension of the period within which the erection of one-story shops on part of the forecourts of Nos. 1 to 13 inclusive, College-brescent, Finchley-road, Hampstead, was required to be completed, be granted.—Agreed.

Brixton.—The rebuilding of the Russell public-house and No. 114, Brixton-road, Lambeth (Messrs. J. A. J. Woodward & Sons for Mr. A. White).—Refused.

Hammersmith.—Buildings on the site of Nos. 1 to 12, Theresa-terrace, King-street, Hammersmith (Messrs. Boehmer & Gibbs for Messrs. H. & E. Lea).—Refused.

Strand.—An iron and glass hood over the entrance to Nos. 17 and 19, Old Compton-street, Sobo (Mr. R. H. Kerr for Mr. C. Brice).—Refused.

Wandsworth.—Two-story houses on the north-west side of North-street, Wandsworth (Mr. H. Bignold for Mr. S. B. Jones).—Refused.

Width of Way.

Bermondsey.—Buildings on the site of Nos. 30 to 42, Bermondsey-square, and No. 58, Long-walk, Bermondsey, at less than the prescribed distance from the centre of Long-walk (Mr. E. Crosse for Messrs. W. Pettitt & Sons).—Consent.

Southwark, West.—A building on the open yard on the north-east side of Mansfield-street, Borough-road, Southwark, at less than the prescribed distance from the centre of the street (Mr. C. H. Shoppee for Messrs. R. How & Co.).—Consent.

Islington, West.—A three-story building, to be inhabited by persons of the working class, on the south side of George-street-mews, Holloway, at less than the prescribed distance from the centre of the street (Mr. W. L. Kellaway for Mr. S. Allen).—Refused.

Woolwich.—A one-story building at Warren-lane Works, High-street, Woolwich, at less than the prescribed distance from the centre of the street (Messrs. Kirk & Randall).—Refused.

Width of Way, Lines of Frontage, and Projections.

Hackney, North.—Buildings, with one-story shops in front, on the west side of High-street, Stoke Newington, and of buildings on the south side of Victoria-road (Messrs. N. S. Joseph, Son, & Smithless, for the Four Per Cent. Industrial Dwellings Company, Limited).—Consent.

Marylebone, East.—The retention of a wood and zinc pent over the entrance to No. 22, Devonshire-place-mews, St. Marylebone (Mr. A. G. Langdon for Messrs. R. Hardy & Son).—Consent.

Woolwich.—The re-erection of the Duke of York and Fortune of War public-houses, and Nos. 16 to 38 (even numbers only, inclusive), New-road, Woolwich (Messrs. Church, Quick & Whincop for Mr. E. H. de Bertodano, Mr. A. Fort and Mr. T. Sturgeon).—Refused.

Fulham.—An open shed and a coal store at the rear of No. 14, Fulham Palace-road, Fulham, to abut upon Waldo-avenue (Mr. H. Bignold for Mr. F. Jenkins).—Refused.

Notwood.—A one-story addition at the rear of No. 6, Gloucester-street, Notwood, to abut upon Eadman-street (Mr. H. Bignold for Mr. J. F. Wheeler).—Refused.

Width of Way and Space at Rear.

Southwark, West.—A block of dwelling-houses, intended to be inhabited by persons of the working class, on the site of Nos. 32, 34, 36, 38, and 40, Holland-street, Southwark (Mr. E. Hoole for Miss Octavia Hill).—Consent.

Woolwich.—Four houses on the west side of Barnfield-road, Plumstead (Mr. H. Roe for Mr. W. Sutch).—Refused.

Projectious and Construction of Gangways.

Bow and Bromley.—That the application of Mr. Max Clarke for an extension of the periods within which the erection of four iron gangways across Fawcett-street, Poplar, to connect warehouses on the opposite sides of that street, was required to be commenced and completed, be granted.—Agreed.

Poplar.—An overhead transporter, to be constructed of steel and wood, across East Ferry-road, Poplar, near its junction with Giellang-rod, with an iron roof over such transporter (the Millwall Dock Company).—Consent.

Lines of Frontage and Construction of Building.

Hackney, Central.—The retention of a wood and glass show-case on the forecourt of No. 54, Mare-street, Hackney (Mr. T. Fisher).—Consent.

Width of Way and Construction of Gangway.

Southwark, West.—A warehouse building on the west side of Valentine-place, Southwark, at less than the prescribed distance from the centre of Pontypool-place, and of a gangway to connect such building with a warehouse building on the south side of Pontypool-place (Messrs. J. Hoare & Son for Messrs. J. Pascall, Limited).—Refused.

Formation of Streets.

St. Pancras, North-†.—That an order be issued to Messrs. Boehmer & Gibbs refusing to sanction the formation or laying-out of streets for carriage traffic on the Clevedon estate, Highgate-road, St. Pancras (for Mr. A. W. Armstrong).—Agreed.

Hackney, South.—That an order be issued to Messrs. Gordon & Gunton refusing to sanction the widening and adaptation for carriage traffic of a footway leading out of the west side of Gomer-terrace, Upper Clapton-road, Hackney, and known as Cassimer-terrace (for Messrs. Abbott).—Agreed.

Deviations from Certified Plans.

St. George, Hanover-square.—Certain deviations from the plan certified by the District Surveyor so far as relates to the proposed erection of a stable building, with a warehouse over, on a site at the rear of No. 47 and 48, Wilton-road, Pimlico (Messrs. J. Bartholomew & Co. for Mr. C. T. Cowley).—Retained.

Artisans' Dwellings.

Hackney, North.—Dwelling-houses, to be inhabited by persons of the working class, and proposed to be situated on a street, on a site on the west side of High-street, Stoke Newington, at the corner of Victoria-road (Messrs. N. S. Joseph, Son, & Smithem for the Four Per Cent. Industrial Dwellings Company, Limited).—Consent.

Hackney, North.—Dwelling-houses, to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a site at the rear of houses on the south side of an unauthorised street, known as Gibson's-buildings, Northwold-road, Stoke Newington (Mr. R. L. Cole for the Metropolitan Association for Improving the Dwellings of the Industrial Classes).—Refused.

Height of Buildings.

Whitechapel.—Two buildings of the warehouse class on the north-west side of Tripe-street, Middlesex-street (formerly Sandy's-row), Whitechapel, to exceed in height the width of Tripe-street (Messrs. D. Cubitt Nichols, Sons, & Chuter for Messrs. G. H. & A. Bywaters).—Consent.

Battersea.—Three warehouses, to exceed 80ft. in height, at Messrs. Hampton & Sons' premises, Queen's-road, Battersea (Messrs. Hesketh & Stokes for Mr. G. Hampton).—Refused.

Buildings for the Supply of Electricity.

Woolwich.—An addition to the generating station and works at Globe-lane, High-street, Woolwich (Messrs. Church, Quick, & Willcock for the Woolwich District Electric Light Company, Limited).—Consent.

Means of Escape from Top of High Buildings.

Holborn.—Means of escape in case of fire on the fifth and sixth floors of the Kingsley Hotel, Hart-street, Bloomsbury, for the persons dwelling or employed therein (Mr. C. F. Doll for Mr. J. Truslove).—Consent.

The recommendations marked † are contrary to the views of the Local Authorities.

THE STUDENT'S COLUMN.—Our Student's Column article, "Sanitary Fittings and Plumbing," is unavoidably held over until next week.

GENERAL BUILDING NEWS.

ST. LUKE THE EVANGELIST'S, WALTON, LIVERPOOL.—The new church of St. Luke the Evangelist, Goodison-road, Walton, was dedicated on the 13th inst. The plan of the church consists of nave, north and south aisles, north and south transepts, chancel, organ chamber, and choir and clergy vestries. The chancel aisle is not built at present. There are two entrances from Goodison-road, one from the north-west and the other from the south, leading into a narthex, separated from the nave by a glazed screen. The font is at the west end of the nave adjoining the narthex screen. The total length of the church is 123 ft. 2½ in., and the total width 52 ft. 6 in. across nave and aisle and 60 ft. across transepts. The church is built of local brick with red stone jambs and mullions in windows, with Runcorn brick plinth quoins and bands, and terra cotta finials, &c. The columns to the nave arcade are of Runcorn stone. The whole of the constructional woodwork is of pitch pine. The choir pews, reading-desk, and altar table are of oak. The reredos is only a part of what is to be in the future, the central panel being a gift. The church throughout is seated with chairs, and will accommodate nearly 600 worshippers. The flooring of the church is of pitch pine wood block, with the aisles or passages of oak. The chancel and sacristy are laid with mosaic pavement. The church has been erected by Mr. S. Webster, builder and contractor, of Bootle; the heating by Messrs. J. R. Cooper & Sons; the mosaic pavement in chancel by Rust's Vitreous Mosaic Co., London; and the choir seats, &c., by Jones & Willis. The clerk of works was Mr. Gilbert Morris. The architect was Mr. J. Francis Doyle.

RE-OPENING OF CHANCEL, ST. PETER'S CHURCH, DERBY.—The chancel of this church was re-opened recently after renovation and decoration. The roof has been repaired under the direction of the architect, Mr. W. Hawley Lloyd, all the decayed boarding and timber having been renewed. The large timbers, which, in the main, were in sound condition, has been hoisted throughout with oak. The old lead has been recast by Messrs. Cox & Co., and relaid. Defects in the vestry and eastern parapet have been repaired. A tile pavement and Hopton-Wood stone steps have been laid by Mr. W. E. Lomas. In the course of the preparation for this work, two black Derbyshire marble slabs with Latin inscriptions were discovered. These were buried beneath the old pavement of the church, and have now been relaid at the east ends of the north and south aisles. The decoration of the church has been carried out by Mr. J. H. Ottewill, from designs by the architect.

RESTORATION OF HADDON CHURCH, NORTHAMPTONSHIRE.—This church was recently reopened after restoration. Mr. J. C. Traylen, of Stamford, was the architect, and Mr. F. G. Halliday, of Stamford, was the contractor. A new north aisle roof has been erected with transept roof and nave roof; the interior cleaned down, and the tower restored and one bell recast. All the woodwork was done with English oak, and in the rebuilding of the nave roof the old characteristics are being preserved. The windows were reglazed. A stained

glass window, in memory of Lieut. Trewer, has been inserted. The design, which is by Kemp, represents the Crucifixion and St. George and St. Michael. After the walls had been cleaned and several layers of whitewashing removed, a number of frescoes were discovered on the east walls, but unfortunately the treatment to which they had been subjected has made them indecipherable.

NEW CHURCH, PLYMOUTH.—On Wednesday, the 12th inst., the foundation stone was laid of St. Simon's Parish Hall, Plymouth, which will be temporarily used for services while the new church of St. Simon (to seat 1,000) is being erected. The contractor is Mr. Ambrose Andrews, of Plymouth, and the architect Mr. Harbottle Reed, of Exeter, who has also prepared the plans for the new church, the foundation stone of which will shortly be laid.

WESLEYAN CHURCH, WEST BRIDGFORD, NOTTINGHAMSHIRE.—The foundation-stones were laid on the 6th inst. of a new Wesleyan church on Trent Boulevard, West Bridgford. The building will be 58 ft. long by 31 ft. wide, and is to accommodate 300 worshippers. At the rear church parlour is being erected, the measurement of which will be 34 ft. by 17 ft. 6 in., with two vestries, over which there are to be two classrooms. Every provision has been made for a heating-chamber, kitchen accommodation, and other offices. Access to these at the back of the structure will be obtained from the church by means of a specially-arranged hall at the side. The roof of the church will be partially open, and the whole of the internal finishings, including the pews, are to be of Canadian pine. At the main entrance to the church will be a porch, 21 ft. by 9 ft. The main front is faced with Cobden stone, and dressings of white Hollington stone, while a special feature will be that of a large tracery window. At the angles of the building it has been arranged to have stone ornamental buttresses, terminating with stone pinnacles. The church, it is expected, will cost 2,000. Mr. A. E. Lambert is the architect, and Mr. T. Barlow the builder.

WESLEYAN SCHOOL CHAPEL, BASFORD, STAFFORDSHIRE.—The foundation-stones of the new Wesleyan chapel, Basford, were laid recently. It is proposed to erect ultimately buildings to cost about 7,000, but at present the schools only will be proceeded with, at a cost of about 2,500. Pending the erection of the church, the schools will also serve the purpose of a chapel, the seating accommodation being for about 300. The architects, whose designs were selected in open competition, are Messrs. Ford & Slater, of Burslem, and the builder is Mr. J. H. Broadhurst, of Burslem. The school is planned in the form of a cross, and comprises an assembly-room, four classrooms, entrance porches, heating vault, &c. The assembly-room is 52 ft. by 33 ft. Externally, the building will be faced with red-facing bricks, and have moulded terra-cotta dressings.

METHODIST FREE CHURCH, NEWCASTLE.—The foundation stones of a new church for the Methodist Free Church communion were laid recently, in connexion with the Gloucester-street Circuit, at the corner of Simonside-terrace and Heaton-road, Heaton, Newcastle. The church is cruciform, with two transepts and a nave. There will be two gables, and a vestibule giving entrances in Heaton-road, into a vestibule giving access to the body of the church. The galleries will be entered from separate doors, one from Simonside-terrace and the other at the side from Heaton-road. The church is designed in the Late Gothic style. The walls of the buildings will be of sneaked rubblestonework, with dressed and rubbed mouldings. The internal fittings, including gallery fronts, rostrum, seats, &c., will be of pitch pine, and the roof will be an open timber one. The galleries will occupy each arm of the cross shape of the church, that at the back being for the accommodation of the choir and organ. At the corner of the building at Heaton-road and Simonside-terrace, will rise to a height of 65 ft. an octagonal tower and spire, with buttresses and pierced tracery. The church will provide accommodation for 700 persons. The Sunday schools are arranged with the whole of the classrooms on the ground floor, with separate entrances to the different sections, including boys' and girls' rooms and infants-room. On the first floor is the school hall. The buildings will be lighted throughout by electricity, and will be heated by hot water on the low pressure system. The architects for the buildings are Messrs. Hope & Maxwell, Newcastle, and the builder is Mr. Alexander Bruce.

WESLEYAN CHURCH, RADSTOCK, SOMERSETSHIRE.—On the 13th inst., the memorial stones were laid of a new Wesleyan church at Radstock. The site of the new church is close to the two railway stations, the main frontage facing Fortescue-road. The church itself will consist of a nave and aisles on either side. The chancel is 59 ft. 9 in. long by 37 ft. 3 in. wide, with a choir at the back raised above the nave, and in front of which will be placed the rostrum. There will be a gallery all round supported by iron columns, and approached by three staircases—two on either side of the church at the front and one from the back. There are six entrances to the church, all of which command the ground floor. Three of these entrances lead to the gallery. The chapel roof will be in one span, and will rise to a height of 50 ft. 6 in. to the ceiling, and 30 ft. to the ridge of the roof.

The building will be lighted by a four-light traceried window in the front gable over the entrance, and by ten two-light tracery windows of somewhat similar design at the sides above the gallery, and also eight two-light square-headed windows in the aisles under the gallery, all of which are to be filled in with cathedral glass. The chancel will be divided from the nave by a semi-circular moulded arch resting on stone columns, with moulded caps and bases. It will be lighted from a three-light traceried window. The school is entered from Church-street by a door at the base of a small tower and slate spirette. Its dimensions are 48 ft. long by 27 ft. wide. There is a second entrance from the side road which leads to the school, school gallery, classrooms, and the church. There will be five classrooms, four on the ground-floor and one upstairs, a ladies' classroom, 20 ft. by 14 ft., and a men's classroom upstairs, 30 ft. by 13 ft., with a platform at one end. Sittings for 536 persons will be provided, 280 of whom will occupy the body of the church and 256 the gallery. The schoolroom will accommodate 266 children apart from the end gallery, which will hold eighty-four more, making a total of 353. The floors will be of wood except in the entrance, where tiles will be laid. The walls throughout are to be of stone obtained from a local quarry. The dressings will be of Bath stone. The roofs are to be covered with Bangor slates and finished with red ridge tiles. Mr. Robert Curwen, London, is the architect, and Mr. Tom Keeling, of Tisbury, near Bath, is the builder; while Mr. S. G. Gregory, Radstock, is acting as clerk of works.

CHURCH, ORDSALL, RETFORD—It is proposed to erect a new church for the parish of Ordsall in the borough of Retford. Mr. Hodgson Fowler, architect, had been entrusted with the work of preparing plans and estimates for the new church. Instead of starting with the nave, as at first suggested, it is now determined to build the side chapel and organ chamber and a temporary nave.

METHODIST FREE CHURCH, EASTVILLE PARK, BRISTOL—Memorial stones for the new Eastville Park Methodist Free Church were laid on the 13th inst. The building is to be in the Gothic style, with turrets on each front corner. The main entrance will be by a large central door, and the size of the interior is 60 ft. by 40 ft. In the gallery running round there will be an organ loft and choir. Pennant stone is being employed in the building, with free-stone dressings, and the accommodation will include a preacher's vestry and a choir vestry. At the rear are a lecture room and two classrooms. The architect is Mr. H. M. Bennett, of Bristol, and the builder Mr. E. Clark, of Fishponds.

WESLEYAN CHURCH, SUDBURY—The foundation stones of a Wesleyan Methodist Church were laid at Sudbury recently. At present the scheme is confined to the erection of a church only, but eventually it is projected to add a church Sunday-school, a church parlour, and vestries, at a further cost of 1,500l. The architects are Messrs. Gordon & Gunton, of London. The new chapel will be situated at the junction of North-street and Melford-road, and will be built with flint walling and Bath stone dressings. The plan of the building at present contemplated consists of a church, with nave, transepts, chancel, organ-chamber, and minister's vestry. There are four entrances and exits, two of them, in the main street, being provided with porches. The builder is Mr. H. Feast, of Haddenham, Cambs.

CHURCH, GRAVELLY HILL, BIRMINGHAM—A church, which will be known as All Saints', has been erected at Gravelly Hill. The building was commenced about twelve months ago by Mr. T. Johnson, Mr. R. B. Morgan being the architect. The church as at present will accommodate 350 worshippers, and in due course it is intended to extend it to seat 500. The cost so far has been 2,200l. It is built of Leicester red bricks with white brick facings, and is roofed with Broseley tiles.

RE-OPENING OF MERTHYR PARISH CHURCH—After restoration at a cost of upwards of 8,000l., the Parish Church of St. Tydfil, Merthyr, was re-opened recently. The work of restoration has been carried out from the designs of the late Mr. J. L. Pearson, R.A., by Messrs. W. Cowling & Son, of Bristol. The church, which is built of stone, is Romanesque in style.

PRIMITIVE METHODIST CHURCH, HANDSWORTH—A new Primitive Methodist Church is now being erected at Handsworth, Yorkshire, with seating accommodation for about 300 persons. The building is to be of Yorkshire stone in the Gothic style and to be heated on the low-pressure hot-water system, the total cost being 3,075l. Mr. Fidler, of Eclington, is the contractor, and the work is being carried out under the superintendence of the architect, Mr. J. P. Earle, of Sheffield.

CHURCH, WADSLEY BRIDGE, YORKSHIRE—The foundation stone has just been laid of the new church which is being built on the Ecclesfield-road at Wadsley Bridge, to take the place of the old iron structure. The cost of the site has been about 1,000l., and the church, not including the organ, will cost a further 2,500l. The new edifice is designed to provide accommodation for 250 worshippers. The church will contain chancel, nave, small north transept, organ chamber, and vestry. The length of the chancel is 27 ft. 6 in. and the breadth 20 ft. The nave is 61 ft. long and 26 ft. wide. The entrance is by a porch on the south

side. At the south-west corner there is a turret, to contain two bells. Some progress has already been made with the building of the outer walls, in which Top Hill stone, from Oughtibridge, is being used, with Stoke Hall dressings. Bath stone is being employed for the interior generally. The east window will be of five lights, with tracery head. There will be an open timber roof of pitch pine, and the church will be seated with pitch-pine benches and a few chairs. The church will be heated with hot water, the heating chamber being in the basement. Messrs. Ellis Brothers, of Sheffield, are the architects.

METHODIST CHURCH AND SCHOOL, DOLPHIN'S BARN, DUBLIN—On the 15th inst. the corner-stones of a new Methodist church were laid at Dolphin's Barn. The church is being built from plans prepared by W. G. F. Beckett, of Dublin, by Mr. John Pemberton, by whom also the schools adjoining.

CHURCH, EASTBOURNE—The foundation stone has just been laid of a new church at Ocklynge. The architect is Mr. Granville E. S. Streetfield.

WAKEFIELD CATHEDRAL EXTENSION—The Archbishop of Canterbury laid the memorial stone on Tuesday of the cathedral extension now in progress as a memorial of the late Dr. W. Walsham How, first Bishop of the Diocese of Wakefield. The plans prepared by the late Mr. J. L. Pearson, R.A., shortly before his death, and continued by his son, Mr. Frank Pearson, of London, provide for an extension of the chancel eastward, adding to the length of the choir. There is in addition to be a retro-choir, the approach to the same, and forming a continuation of it, being a chapel, which will afford accommodation for morning and special services. The chancel aisles are to be extended to the same length as the retro-choir. This extension will take the form of north and south transepts with eastern aisles. By this arrangement, too, a chapter-house and a couple of vestries are also provided underneath. The communion table will be removed one bay eastward, and it will be separated from the chapel by a screen. Under an arch on the north side of the sanctuary it is proposed to place a canopied tomb, with a recumbent effigy of the late Bishop How. The position of the bishop's throne and choir stalls will also be altered, and various other internal improvements effected. The whole of the work was originally estimated at 20,700l., but in addition to this being exceeded by 10,000l. another 10,000l. had to be expended in enlarging the site. Messrs. Armitage & Hodgson, of Leeds, received the contract for the cathedral extension, and they have now made fairly satisfactory progress with the masonry work of the new chapter-house and vestries.

CO-OPERATIVE PREMISES, READING—The Reading Industrial Co-operative Society, Limited, have opened a branch establishment in the east end of the town on a site at the junction of London, King's, and Wokingham roads. The premises have a frontage of 50 ft. and a depth of 140 ft. The building has a lofty front elevation and a clock tower, being erected with stone from the Morley quarries, Yorkshire, by Mr. McCarthy E. Fitt, the carving being executed by Mr. Rosser. The clock tower surmounts the central entrance, and is 70 ft. in height, the distance from the pavement to the clock being 54 ft. The clock was supplied by Messrs. J. Smith & Son, of Derby. The ground floor of the premises comprises two shops, one for the sale of grocery and provisions, and the other for drapery and boots, &c. The shops are separated by a corridor entrance to the rear of the building. At the back is a yard with the stores and offices. On the floor above the shops is a room, 53 ft. by 52 ft., which will be used as a furniture showroom, and above and in the rear are also storerooms. Mr. W. G. A. Hambling, of Reading, was the architect, and Mr. T. R. Whiting, of Reading, the contractor. The shop fittings were carried out by Messrs. George Lewis Bros., of Reading, and the window fittings by Messrs. Potter, of London.

OFFICES FOR PERTH PARISH COUNCIL—Recently the Parish Council of Perth purchased property in York-place, one of the main thoroughfares in the city, for the purpose of having it altered so as to render it suitable for offices required for Parish Council business. The premises in York-place have a frontage of 55 ft., and have entrances both from the main street and from Kinross Causeway. On the ground floor are the Inspector's room and the Collector's room, with clerks' offices, together with Medical Officer's room, waiting-room, storeroom, small storeroom, and lavatory accommodation. Underneath there is a storage cellar. On the upper floor are the Council-room, which measures 30 ft. by 25 ft. and the caretaker's house. The contractors are:—Mason work, Mr. William Tait, Errol; joiners, Messrs. Peter Johnstone & Son, Perth; plumber, Mr. Peter Duffie, Perth; slater, Messrs. James Duchan & Son, Perth; plasterer, Mr. John Sharp, Perth; and glazier, Mr. Charles Alexander, Perth. The plans were prepared by Mr. James Marshall, architect, Perth.

SWIMMING BATH, BROAD-STREET, HOLBORN—The foundation-stone of a swimming bath in Broad-street, Holborn, was laid on Wednesday by the Duke of Bedford, Mayor of Holborn. The new swimming bath is an extension of the public baths and wash-houses erected in Endell-street by the Commissioners for Public Baths and Wash-houses

for the Parishes of St. Giles-in-the-Fields and St. George, Bloomsbury, in the year 1852. The design of Messrs. John & S. Flint Clarkson, of Great Ormond-street, having been accepted from several others submitted, a contract with Messrs. F. Gough & Co., of Hendon, for the erection of the baths was entered into. It is anticipated that the total cost of the land and baths will amount to the sum of 25,000l. The extension, which will have a frontage in Broad-street of 55 ft., and a depth from north to south of 150 ft., will provide a swimming bath 90 ft. in length, with closed dressing-boxes entered from the platforms. The bath will be paved with mosaic, the walls faced with glazed bricks, and domed ceilings of fibrous plaster will be formed above the lantern lights; a gallery will run round all four sides of the bath-hall. There will also be subways all round. The bath-hall will be entered through a vestibule, &c. from Broad-street. The height of the bath-hall will be about 20 ft. from the bottom of the bath to the domes. The elevation towards Broad-street will be four stories in height, of Portland stone, red Bracknell bricks being used for the upper floors. The elevation will resemble the existing front in Endell-street, the resemblance being intentionally made so strong that it will be clear that the two frontages are parts of one building. There will also be provided rooms for clubs and a general supplementing of the existing accommodation. All the floors will be constructed of fire-resisting material. The water in the swimming-bath will be heated by steam. Arrangements will also be made for the steam-heating of the atmosphere, so as to counteract condensation and to enable the bath to be kept in use in chilly weather. The building will be lighted by electricity.

THEATRE ROYAL, YORK—A scheme for improving the Theatre Royal, York, based upon a report by Mr. Frank A. Tugwell, architect, has just been agreed to. The cost is estimated at 5,200l. **OPERATION THEATRE, CARDIFF INFIRMARY**—Mr. Edmund Owen, senior surgeon at St. Mary's Hospital, London, formally opened the new operation theatre of the Cardiff Infirmary recently. The new room has two entrances, one for students and the other being the accident entrance, with anaesthetising room and lobby adjoining the chamber used by the surgical staff. The whole of the northern portion of the roof of the building is of glass. The ventilation is controlled by a motor fan in the upper portion of the roof, operated by electricity, fresh air being admitted and warmed by a special arrangement of swing radiators, provided by Messrs. John Williams & Son, Cardiff. The rooms are lighted by electricity. The work has been carried out by the architect of the infirmary, Mr. E. Seward. The contract has been carried out by Messrs. Lattey & Co., of Cardiff, the terrazzo pavements being by Messrs. B. Ward & Co., and the special sinks and fittings by Messrs. Cross Bros. The electrical fitting of the ventilating fan was entrusted to Messrs. Chy Bros., the fan being provided by Mr. Wilkinson, of Cardiff, whilst the electric lighting has been carried out by Mr. Nance, of London.

COTTAGE HOMES, PONTELAND, NEWCASTLE-ON-TYNE—Cottage homes are being erected at Ponteland by the Newcastle Board of Guardians for the accommodation of destitute children. About seventy acres of ground have been secured. Entering from the Kirkcaldy-road by a new thoroughfare that is being constructed across the fields, the first building will be the superintendent's house, which will also contain the stores and offices. Four double blocks of cottages will be constructed and one half-block, the latter being intended at first as an isolation hospital in the event of any outbreak of disease amongst the children; but in the event of more accommodation being required later on it can be converted into a home and another building erected as a hospital. It is also part of the scheme to erect a workshop for the teaching of trades, such as plumber, joiner, shoemaker, &c., the instruction being given by qualified tradesmen who will be appointed under the title of foster fathers to each block. The intention is to appoint respectable married tradesmen to these positions. Then there are stables and out-offices to be used in connection with the working of the land, part of which will be laid out as kitchen gardens, part as a plantation, and part as arable land. A plentiful supply of spring water has been obtained by boring. The buildings will be of red brick with slated roofs. The larger block of cottages will accommodate forty children, and the three smaller blocks thirty each. The architects are Messrs. Oliver, Leeson, & Wood, and the builder is Mr. Henderson, of Ponteland. Mr. Humphrey Atkinson has been appointed clerk of the works.

EXTENSION OF THE EDINBURGH CITY CHAMBERS—On the 7th inst. the foundation-stone was laid of the north-west portion of the north front of the City Chambers, Edinburgh. It is several years ago since the plans by Mr. Morham, City Architect, for the extension of the City Chambers were sanctioned. About 200,000l. are to be spent on the extension and improvement of the buildings. The work has gone on in sections. The portion now arranged for will be continued along Warriston Close, and will have a frontage to Lockhart-street and the north. On that side it takes the place of the

tioned, is held at University College, and the exhibition is under the auspices of the Board of Architecture and Applied Art. There are architectural designs, modelling, decorative designs, examples of stained glass, copper work, some examples of enamels, which branch was only started this year, and also some examples of wood carving, wrought iron, and other crafts. Councillor John Lea, Chairman of the Board, presided, and there were also present Professor Simpson (University College), director of the school, and Messrs. Allen, John, J. McNair, Rathbone, instructors. The Chairman having expressed pleasure at seeing the Lord Mayor present, Professor Simpson said there were seventy-three students attending the day classes at the school and 171 the evening classes, a total of 244 during the past session. This was fairly satisfactory, considering the limited accommodation at their disposal for students. The principal aim of the school was the special attention given to arts and crafts allied to architecture, and it was of the utmost importance nowadays that students, apprentices, and others should have an opportunity of obtaining an insight into the secrets of their crafts and their methods of working them, which in the old days of apprenticeship system were learned only in the workshop. A point he wished to emphasise was the great advantage of such a school to architects, manufacturers, and others, and he felt that persons in these walks of life who had the power of placing work should take advantage of the skill and ability of students who had been trained in such a school as this. On the Continent manufacturers and others were closely in touch with the higher technical schools, and it was due to this fact that great strides commercially had been made in Continental countries.—The Lord Mayor said that his connexion with that school was very small. For three years he served on the Technical Instruction Committee, and amongst the money grants which that Committee gave to various portions of the University was one of 1,000l. annually towards this special department of the University, viz., architecture and applied art. He also found that an additional grant of 400l. had been given this year consequent on the very great work the school was doing. The number of students in the school was very satisfactory, and the attendance good. The classes included no fewer than twenty different crafts, which showed that they were really trying to embrace all the objects which would be beneficial to the trade of the city.

CAPITAL AND LABOUR.

THE BRADFORD BUILDING TRADE DISPUTE.—So far, says the *Bradford Observer*, there is no sign of either the Master Builders' Association or the various operative societies giving way on the points at issue, and to this extent the situation remains practically unchanged. If anything, both sides appear to be even more uncompromising in their attitude than when the trouble first arose. The employers still express their willingness to refer the whole subject to arbitration, but there appears to be no prospect as yet of their offer being accepted. When this proposal was originally introduced the refusal to entertain it was practically unanimous. On May 1, when the notices came into operation, the approximate number of men thrown out of employment was 1,300, comprising 700 masons, 300 joiners and carpenters, 150 labourers, 50 bricklayers, and 100 non-union men. During the course of the dispute, however, this total has almost been diminished to half the number, especially in the case of the societies which have the advantage of a complete organisation throughout the country. Speaking generally, the building trades are reported to be in a tolerably flourishing condition, and through the agency of branches of the operative societies in other centres, the workmen affected by the dispute are gradually being drafted out of the town. In only a comparatively few instances have they returned to Bradford. Accordingly, the Society of Operative Masons had yesterday about 350 names on their books instead of the 700 of six weeks ago. The union officials state that in all these cases the men have no difficulty in obtaining the conditions which they are advocating in Bradford. The Amalgamated Society of Carpenters and Joiners report a similar exodus, though in this case the proportion of departures does not appear to be quite so large as amongst the masons. However, instead of 300 or 350 members, the roll-call does not now show more than about 250. Not only are the men taking up employment elsewhere as opportunity occurs, but what is still more satisfactory from the point of view, a very large number of applications for "clearance" are being dealt with, so that evidently the operatives are settling down to their new employment, with no immediate idea of returning to Bradford. The members of the Amalgamated Society of Carpenters and Joiners regard the situation with some degree of equanimity. According to the returns for the current month, the society have a total membership of over 67,000, and a general fund of 250,000l., whilst last year, without any special levy, they expended about 35,000l. in a similar conflict against the employers at Belfast. In the case of the branches of the building trade which are not so highly organised, the percentage of

transfers to other towns is naturally not so great, but in the aggregate the total, week by week, steadily becomes less. A few of the operatives have resumed work in Bradford, but all the public works of the city remain at a standstill, these including the Cartwright Memorial Hall, the Corporation Markets extension, the new Conditioning-house, and the new Central Fire Station.

THE BRICKLAYERS' STRIKE, NORWICH.—Taking the carpenters' settlement as a precedent, the masters have recently offered the bricklayers, whose strike is now in its second year, an advance of a halfpenny an hour, to begin on January 1 the settlement to be operative for four years, dating from June 1 last. This offer, however, was accompanied by various conditions designed mainly to prevent those vexatious disputes which have formerly arisen among different classes of workmen, notably bricklayers and plasterers, as to the line of demarcation between their respective duties. The men would prefer that the halfpenny per hour should begin with the resumption of work; and that the conditions, some of which they are strongly averse to, should be settled by conference afterwards. However, they have held a meeting on the subject at their headquarters, the Pigeons, Charing Cross, and we are informed unofficially that they practically agreed to accept the masters' terms. The result has not yet been communicated to the masters, but we believe the strike may be regarded as ended.—*Eastern Daily Press.*

LABOURERS' STRIKE, CLEVEDON, SOMERSETSHIRE.—The masons' labourers have struck for an advance of wages from 44d. to 5d. per hour. The masters have offered 44d., making a weekly wage, full time, of 11. 1s. 6d.—which, they assert, is as much as can at present be paid for unskilled labour. The labourers urge that the pay in Bristol is 5d. per hour, and that certain contractors in Clevedon, who come from a distance, pay that sum. About forty labourers are involved.

LEGAL.

DISPUTE BETWEEN ARCHITECTS.

THE case of Portsmouth v. Seward came before the Court of Appeal, composed of Lords Justices Rigby and Collins on the 14th inst., on the appeal of the defendant from an order of Mr. Justice Kekewich in the Chancery Division, dated May 14, 1901.

Mr. Warrington, K.C., in opening the case, said this was an appeal by the defendant from an interlocutory order of Mr. Justice Kekewich granting an injunction until judgment or further order restraining the defendant from carrying on business as an architect at Swansea. The order was founded on an agreement entered into by the defendant, and made on January 9, 1899, by the defendant and his then partner upon the sale by them to the plaintiff of a business which they were then carrying on at Swansea, and the question their lordships had to determine was a question on the construction of the agreement, the facts being admitted. The facts were these:—Prior to January 9, 1889, the defendant, Mr. Edwin Seward, and Mr. George Thomas were practising as architects and surveyors at Swansea and at Cardiff, and the plaintiff Henry Charles Portsmouth was employed by them in their Swansea business. In that state of things Messrs. Seward & Thomas agreed to make over to the plaintiff their Swansea business, they continuing their Cardiff business, and the agreement of January 9, 1889 was entered into for that purpose. By the agreement Messrs. Seward & Thomas bound themselves to discontinue practising in Swansea, and not to open or encourage any one to open an office for the carrying on of their practice as architects and surveyors in Swansea so long as Portsmouth should remain in practice there, except only that they reserved the right to act in all cases in which they might be called upon or specially invited to act in either branch of their profession. There was no stipulation that they were not to ask for business in Swansea, but they were not to open any office there, immediately after that agreement Messrs. Seward & Thomas gave up their business in Swansea, and they had never had an office there since, and they had never since practised in Swansea. But in August of last year the Swansea Harbour Trust, which was an important public body in the town, issued an advertisement which went broadcast over the whole of the country, asking for architects to send in designs for new offices which they were proposing to erect. Mr. Seward, who was then carrying on business alone, saw the advertisement in one of the building trade papers. The effect of the advertisement was that two premiums were offered, the first 100l. and the second 50l., and that the architect's commission would be 5 per cent. on the outlay, to include all sketches, estimates, and specifications, and to involve personal superintendence of the work as architect. It was also provided that should the premium be made over to the architect, Mr. Seward sent in designs in accordance with the conditions and the plaintiff also sent in designs, there being ninety-seven altogether sent in. The committee to whom they were referred selected six designs, amongst them being the defendant's,

but the plaintiff's design was not accepted. Ultimately, the committee accepted the defendant's design. Having accepted his design on February 6 last, the clerk wrote requesting him to send in his detailed drawings, specifications and quantities. There for the moment the matter ended. The defendant would probably be employed to do the work, and unless he was restrained from doing it, he intended to do it if he was employed. The question to be determined was whether that agreement prevented Mr. Seward from undertaking this business. Mr. Justice Kekewich had granted an injunction which would prevent him from undertaking the work, and it was from that order that he appealed.

Lord Justice Collins: Is there any evidence as to how long the work will take?

Mr. Warrington: No, there is no evidence as to that.

Lord Justice Collins: It does not involve his taking an office to do it?

Mr. Warrington: No, he does not intend to open an office. He would merely be the superintending architect. It clearly does not hurt the plaintiff because he competed and was not accepted, and, therefore, the defendant is not preventing the plaintiff from getting work he otherwise would have got. I ask your lordship to say that the agreement does not apply to this case. I request that all the agreement is to restrain the defendant from holding himself out as a local practitioner, and that is what the defendant has not done.

Mr. Renshaw, K.C. (with him Mr. Christopher James), submitted that the decision of the learned judge in the Court below was right. One of the conditions was that the architect was to personally superintend the work, and by so doing Mr. Seward would be practising as an architect in Swansea in breach of the agreement. It could not be said that he was ever called upon or specially invited to act in the matter, and therefore this did not come within the exception.

Their lordships, without calling upon counsel for a reply, said the agreement expressly provided that if any one wished the defendant to act for him in Swansea he was not to be restrained from acting. There was nothing to prevent the defendant from sending in designs in the competition, and if he was successful there was nothing to prevent him from undertaking the work if he was requested to do so. The appeal was accordingly allowed, and the order of the Court below discharged.

ACTION BY A VENDOR AGAINST PURCHASER FOR SPECIFIC PERFORMANCE OF CONTRACT.

MR. JUSTICE FARWELL, in the Chancery Division on the 13th inst., delivered a considered judgment in the case of Greenhalgh v. Brindley, which raised the somewhat important question as to the duty of a vendor to disclose to a purchaser a contract with reference to the access of light and air to the premises sold.

The material facts were these:—The action was by a vendor for specific performance of a contract in writing, dated October 4, 1900, for the purchase by the defendant of twelve houses in Florence-street, Stockport. The contract was an open one, and in the course of the negotiations which led up to it, the plaintiff wrote to the defendant on August 27 stating that the houses were four years old, and in September the defendant visited and saw the houses for herself. The property abuts on Florence-street, and contains windows looking over the street on to public recreation grounds which were vested in the Corporation of Stockport under a conveyance dated in 1873, and subject to covenants which prevent the erection of buildings thereon and their use for any other purpose than recreation grounds without the consent of the grantors. Nothing was said either in the negotiations or in the contract with reference to the access of light to the windows. After the contract the defendant ascertained that the plaintiff had entered into a deed of covenant with the Corporation dated February 10, 1900, and on this ground declined to perform the contract. The deed of covenant was made between the Corporation of Stockport of the first part, a Mr. Wainwright, the mortgagee of the houses, of the second part, and the plaintiff (the owner) of the third part, under which the plaintiff as owner covenanted with the Corporation to pay them the yearly sum of 1s. on March 25th in each year, the plaintiff and his mortgagee declaring that each of such payments was a fresh acknowledgment that the plaintiff was not as owner entitled as of right to the uninterrupted flow of light or air to any windows or lights in the southerly walls of the said houses over or from the recreation ground. It was also declared that in case of the non-payment of the said sum of 1s. in any year, the fact of such non-payment should not be taken as an abandonment of the rights of the Corporation to obstruct on their own land the admission of the light and air to the said lights or windows of the houses in question. No purchaser would be bound by the covenant to pay contained in this deed but as against a purchaser with notice, the deed would have the effect of a consent in writing within Section 3 of the Prescription Act granted by the Corporation and accepted by the purchaser and continuing until determined

by notice of repudiation. The defendant, as purchaser, contended that she was prejudiced by the deed by losing four years of the statutory period, and by being compelled to give notice of repudiation with the consequent probability of exciting the Corporation to block the lights at once.

Mr. Justice Farwell held that a contract for the sale of a house with windows looking over the land of a third person implies no representation of warranty that the windows were entitled to the access of light over such land. If such access had in fact been enjoyed for the statutory period, then the property had the easement of light; but an access for ten years created nothing at all. He found, therefore, that there was no ground on which he could refuse to grant specific performance or on which he could give the defendant compensation. He, however, made no order as to costs, because he thought that the plaintiff ought to have informed the defendant before the contract of his covenant with the Corporation, and left her to judge for herself whether it was or was not advantageous to the property.

Judgment was accordingly entered for the plaintiff without costs.

Mr. W. H. Upjohn, K.C., and Mr. T. T. Methold appeared for the plaintiff, and Mr. C. E. Jenkins, K.C., and the Hon. Frank Russell for the defendant.

THE VIBRATION CASE AT LEYTON.

THE case of *Hawkes v. the Leyton Urban District Council* was in the list to be mentioned to Mr. Justice Buckley in the Chancery Division on Monday, the 17th inst.

Mr. H. Terrell, K.C., on behalf of the defendants, said that the matter was before his Lordship on the last occasion on May 14, on an application by the defendants to suspend the operation of a writ of sequestration granted by his Lordship and confirmed by the Court of Appeal, for breach of an injunction to restrain a nuisance caused to the plaintiff in the use by the defendants of gas plant in connexion with their electric lighting works. His Lordship then made an order staying the operation of the writ over that day. The learned counsel read affidavits to the court which showed what the defendants were doing to substitute steam plant for gas plant, and by the consent of the other side his Lordship further stayed the operation of the sequestration for eighteen months, with liberty to either party to apply in the meantime. It was stated that the gas plant had been disconnected and the defendants were ordered to pay the costs of the present and the last application, which were directed to be included in the same taxation as the costs of the order for sequestration.

WORKMEN'S COMPENSATION ACT:

WHAT IS AN "ACCIDENT"?

A JUDGMENT of considerable importance was delivered on Monday by Judge Stonor at Marylebone County Court. The applicant in the case was Richard Perry, a carpenter and joiner, 14, Napier-road, College Park, N.W., and he had brought an action under the Workmen's Compensation Act against Mr. Leach & Sons, Hylle-road, Works, and High-road, Willesden Green, N.W., the claim being in respect of personal injuries said to have been sustained by the applicant while in the respondents' service.

The facts of the case are clearly stated in the judgment, which was to the following effect:—

The applicant in this case is a carpenter and joiner, and was on September 18 last in the employment of the respondents. At the trial the applicant deposed that on September 18 last he was working at the respondents' works making a large oak seat or bench. He had got the seat together, and while lifting it up, to see if a joint was right underneath, he suddenly felt a pain in his side. He could not straighten himself nor continue his work, but had to go home. In consequence of the accident he was in bed for three weeks or a month, and he was still suffering from the result of the accident. The applicant's appearance at the hearing—continued his Honour—corresponded with his evidence. There was no evidence of any actual disease in the applicant. It was contended on the part of the respondents that the accident, or at all events the effects of it, were partly caused by the applicant's stoutness and unyieldiness—in other words, his general condition of body—and that the applicant was therefore barred from recovering in the action. The case of *Lloyd v. Sugg & Co.*, 1900, 1 Q.B., 481, *Senhouse's Cases II.*, p. 5, however, shows clearly that such is not the case, supposing that the accident had been caused partly by the applicant's condition of body or even by actual disease. There could, therefore, be no reasonable doubt that the applicant was entitled to compensation under the Act if the "accident" came within the Act, and it was, in fact, regularly paid to him until January 5—more than three months—by the respondents with the concurrence of the insurance company in which the latter were insured. The only question, therefore, to be decided in this action is whether the injuries which the applicant received arose from an "accident" within the meaning of the Act. Now, according to the natural meaning of the word "accident,"

its definition in every dictionary, and its use in common parlance, and in the absence—as far as I can see—of any provision in the Workmen's Compensation Act, indicating its significance, or requiring it to be narrowed, I should have no hesitation in finding that the fact of being disabled from work by simply lifting a seat through straining or injuring the muscles of the back without any unusual or unreasonable exertion was an "accident" within the meaning of the Act; and the breaking or injuring a muscle or other portion of the human frame in the due execution of the employer's work appears to me to be the same as the breaking or injuring any tool or instrument under the like circumstances; and, therefore, that the employer would be equally liable under the Act in both cases for any consequent evil results to the workmen employed. If, therefore, the point were untouched by judicial decisions, I should certainly find for the applicant. There are, however, several recent decisions of the Court of Appeal which point to a different conclusion, and show that the learned Judges of that Court are of opinion that a narrower construction ought to prevail, but the exact ground of that opinion, I regret to say, I have failed to discover. I refer particularly to the cases of *Hensley v. White*, 1900, 1 Q.B., 481, *Senhouse's Workmen's Compensation Cases II.*, p. 1; *Walker v. The Lillieshall Coal Company*, 1900, 2 Q.B., 401, *Senhouse's Workmen's Compensation Cases 21*; and *Timmins v. Leeds Forge Company*, 16 T.L.R., 517, *Senhouse's Workmen's Compensation Cases II.*, p. 10. In the first two cases the Court decided in favour of the respondents, and in the last case in favour of the applicant, but on the ground that some planks had been unexpectedly frozen to each other, and consequently required unforeseen and unusual exertions from the applicant in lifting them. Independently of special circumstances like those I have just mentioned, the Court of Appeal in these and other cases has held, as I understand, that to come within the meaning of the Act an "accident" must be from some external cause, resulting directly in injury; e.g., a blow through a miss hit (*Lloyd v. Sugg*), or a sudden frost (*Timmins v. The Leeds Forge Company*), and not from internal causes directly, as in the cases of reasonable personal exertions in working engines (*Hensley v. White*) or the handling of usual materials and appliances (*Walker v. The Lillieshall Coal Company*). In the present case the accident—for accident it was, whether within the meaning of the Act or not—was the internal injury to the applicant in the muscles of his back, through the movements of his body in the usual and reasonable exertion of lifting a bench under perfectly ordinary circumstances, and I can see no material distinction between it and the cases of *Hensley v. White* and *Walker v. The Lillieshall Coal Company*, and I feel bound by the decisions of the Court of Appeal in those, and also in other cases, to find for the respondents.

DISPUTE ON A CONTRACT.

THE case of the *Brush Electrical Engineering Company v. the Governor of Malta* came before a specially constituted Court of King's Bench, composed of Justices Bruce, Kennedy, and Phillimore, on judgment on the 17th inst. The case was argued before Justices Kennedy and Phillimore a few weeks ago, but as their Lordships differed, an additional Judge (Mr. Justice Bruce) was called in and the matter re-argued.

The case came before the Court in the form of a special case, from which it appeared that differences having arisen between the *Brush Electrical Engineering Company, Limited*, and the Governor of Malta in respect of claims made against the latter under a contract of March 22, 1895, the matter was referred, under the arbitration clause in the contract, to Mr. E. Manville. It appeared that the claimants undertook to execute certain works for the supply of electricity in Malta, and Sir W. H. Preece, K.C.B., acted as consulting engineer from time to time, when certificates were given for the work and payments made for work done. On November 20, 1897, the consulting engineer gave the claimants two final certificates, the first certifying the sum due to the claimants, being the final balance less one-fifth of the total amount for the contract price deducted therefrom; and the second certifying that the whole of the works had been completed and had worked satisfactorily for six months from completion, and that the other obligations of the claimants had been performed, and that the above-mentioned one-fifth of the total amount of the contract price was then due to the claimants. In ascertaining the amounts so certified, the consulting engineer deducted from the total price of the work as determined by him the sum of 450*l.* as damages for delays under the contract. The respondent, the Governor of Malta, had offered to pay the total amount certified by the engineer, less a sum of 1,000*l.* (in addition to the 450*l.* already deducted), which he claimed to be entitled to set off as liquidated damages for delay. On June 1, 1900, the parties appeared before the arbitrator, when the claimants pressed to give evidence in support of their claim for the total amount of the invoices sent by them to the engineer, less certain deductions which they had

allowed. In particular they proposed to give evidence to show that the engineer had not correctly estimated the value of additions and deductions in accordance with paragraph 55 of the contract. The respondent contended that such evidence was not admissible. On his part the respondent proposed to give evidence to show that he was entitled to deduct the further sum of 1,000*l.* as liquidated damages for delay as provided under the contract. The claimants contended that such evidence was not admissible. The questions of law for the opinion of the Court were (1) whether the engineer's certificate was a condition precedent to the claimants' right to recover under the contract; (2) whether the engineer's certificate was binding and conclusive between the parties with regard to the points raised in the statement; (3) whether the engineer's certificate was binding and conclusive between the parties with regard to the amount due to the claimants apart from the question of damages for delay; (4) whether the engineer's certificate was binding and conclusive between the parties with regard to the amount due to the respondent in respect of damages for delay.

Mr. Justice Bruce and Mr. Justice Kennedy in giving judgment, having stated the facts, said it was unnecessary to answer question (1) of the special case because their subsequent answers showed their opinion. Their answer to the second question was "No." The answer to the third "Yes," and the answer to the fourth "No."

Mr. Justice Phillimore dissented with the majority of the Court on its finding as to the third question. No order was made as to costs.

ACTION BY BRIGHTON BUILDERS AGAINST BUILDING-OWNER.

A DIVISIONAL COURT of King's Bench, composed of Justices Bruce and Phillimore, on the 12th inst. disposed of the case of *Sattin* and another *v. Poole* on the appeal of the plaintiffs, a firm of builders carrying on business in Brighton, from a decision of Mr. Verey, the Official Referee, in an action brought by the plaintiffs against the defendant, Mr. Geo. Thomas Poole, also of Brighton, on a contract under which the plaintiffs carried out certain building work on the St. James's Restaurant, in St. James's-street, Brighton, of which the defendant was the owner.

It appeared that by the terms of the contract in question the plaintiffs undertook to reconstruct the building within a specified time limit, the penalty of exceeding which was 12*l.* a week should the architect (Mr. Clayton Botham, of Brighton) not give the usual certificate for extension of time. The defendant paid for everything in connexion with the work except a balance of 681*l.* due to the plaintiffs, but in regard to this he claimed 231*l.* by way of penalties, and paid 450*l.* into court as being sufficient to meet the plaintiffs' claim. The case went before the Official Referee upon the point as to whether the penalties could be deducted under Clause 24 of the contract. The Official Referee held that the contractor had failed to complete within the time that the architect certified that the work could have been reasonably completed, and that the defendant under Clause 24 of the contract was entitled to deduct from the sum due from him to the plaintiffs a sum exceeding 231*l.*, the balance of the claim, after payment into court of 450*l.* He accordingly entered judgment for the defendant. From this decision the plaintiffs appealed on the grounds that the Official Referee had refused to hear the evidence offered on the part of the plaintiffs to show that the delay was caused by the owner, or by his architect, in ordering extras, in supplying material after the specified date, in delay in the selection of stone to be used, and in the alteration of plans.

In the result their lordships upheld the decision of the Official Referee and dismissed the appeal. Judgment accordingly.

Mr. Frank Dodd appeared as counsel for the plaintiffs (appellants), and Mr. Herbert Reid, K.C., and Mr. Kissin for the defendant (respondent).

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

3,009.—PENDANT, BRACKET, AND SIMILAR LAMPS. *H. Faldmisch*.—In order that the hanging pipes and fittings may be partially hidden with the globes or shades by way of giving the dropping effect of electrical lamps, and that the metal fittings may be placed out of the course of the products of combustion, it is arranged that the globe or shade shall be joined to the holder, or clips, by means of an engagement between a flange upon its upper end and screw bolts or screws, whilst the burner is joined to the arm, or arms, of the gasifier or pendant with rods or tubes. For a globe which has an open lower end a thumb-piece is provided for the turning of the gas-cock, but for a globe that is closed beneath, the gas-cock should be mounted upon one of the bracket or pendant arms, side openings being made near the base of the globe for supplying air and facilitating access to the burner.

3,023.—LIFTING APPARATUS FOR CRANES: *J. Fielding*.—One end of the hoisting chain is passed around a pulley and another pulley upon the shaft, for attachment to the jib; the other end is passed around a pulley and another pulley upon the shaft, and so to the end of the jib, and the crane hook; the jib is thereby partly sustained by the load and stays at a constant level when the load is lifted; to the jib is attached a rope that is passed around a double fusee and has at its one end a weight for balancing the jib, a part of the rope is upon the smaller diameter and the other part is upon the larger diameter of the fusee when the jib is at its highest position; but they will have changed their relative places at the extension of the jib, with which the balancing moment of the weight is thereby increased.

3,064.—JOINTS OF CORRUGATED SHEETS: *F. Smith*.—The inventor devises angular corrugated strips for joining, angle-wise, corrugated sheets for roofs and similar structures; he forms ridges upon one side of the strip which will meet grooves at its other side, and in some cases inclines the corrugations to the edges of the sheets and strips.

3,094.—LIME AND OTHER KILNS: *W. Spencer*.—In the case of shaft-kilns, air or other combustion-supporting gas is admitted at points near the openings through which the fuel is charged. Vertical passages are made in the wall of the lower chamber and communicate between an annular channel and converging ducts which lead into the narrower part of the kiln over the opening for the charge of the fuel, whilst additional air-passages may be made at or near the narrowed part of the kiln. If the lower chamber is built into, or surrounded with earth, the annular channel is formed so as to lead into the draw-hole.

3,123.—A CONTRIVANCE FOR WINDOWS: *S. C. Taylor*.—For sliding-sashes that can be liberated from their guides, the tongues of strips joined to the lower sash will engage with grooves which guide the lower sash, diagonal slots cut in the strips engage with pins upon the sash so that one can move the tongues into or out of the grooves by moving the strips and bolts provided with handles and screwed through nuts will lock the strips, and spring-controlled hinged guide-strips can also be employed.

3,144.—ELECTRICAL TELEPHONES: *E. W. Brown*.—The apparatus will serve for a transmitter and a receiver either combined or separate, a laminated core is wound with primary and secondary wires of which the latter is connected through the core and diaphragms with a battery, or the former may be connected to line instead, a microphone is made of lamp-black or granulated carbon, or the diaphragms may be treated chemically; the apparatus, provided in a case; a tube, having at one end a contact for cutting in the battery when the telephone is being used, and leading to a mouthpiece, is pivoted in the case.

3,227.—A METHOD OF VENTILATION: *G. B. Dye*.—For producing moistened air strips of fabric are wetted in a range of superimposed ring-troughs wherein float-valves keep the water at a certain level, air flows through a casing of gauze and the strips into a middle shaft whence a fan or pump draws it for distribution by cones and trays which will serve for purposes of ventilation independently from the humidifier; in another shape a wetting-apparatus is disposed between the fan and the distributing trays and cones.

3,262.—TREATMENT OF WOOD: *American Wood Fireproofing Co.*—The object of the invention is to prevent deliquescence of the salts with which the prepared wood is impregnated. A fire-proofing solution containing borates, sulphates, and phosphates of the alkalis is recommended, with which is mixed casein rendered insoluble with the action of formaldehyde or carbonic-acid gas; or some water-repelling substance, such as an oil emulsion, or else a soluble soap may be used—fatty acids being precipitated with carbonic-acid gas, &c.

3,305.—A CIRCULAR-SAW GUARD: *D. Rigby*.—An adjustable guard that will serve for saws, and timber, of different sizes consists of a radial arm that can be raised or lowered, and has at its end a slotted plate on to which the riving-knife is adjustably bolted. A slotted plate (which can be set back accordingly with the size of the timber) and a lower end-piece having a roller hinged to the slotted plate constitute a front guard, which is to be folded backwards when the entire depth of the saw is needed for use.

3,331.—A CONTRIVANCE FOR USE WITH WATER PIPES: *A. Niesch-Saxer and R. Niesch*.—To obviate freezing of water in pipes they are emptied by means of a double valve which is mounted upon a hollow spindle that is joined to the service pipe with a connecting-box, as water from the main supply flows through the upper part of the valve and an aperture between the valve-faces it reaches the spindle, which can be lifted with a handle so as to close that portion of the valve whereupon the water flows away from the service pipe through the lower part of the valve.

3,340.—PAINTERS' AND SIMILAR BRUSHES: *Verlignig Pinsel-fabrik*.—The lower ends of the bristles are clamped with a cap or ferrule made of sheet-metal which is then secured within the fixed

socket of the handle with a wire that squeezes the sides of the socket into a groove fashioned in the cap.

3,371.—A SWITCH FOR ELECTRICAL HEATING: *E. F. Porter*.—A compound switch is devised for regulating air-heating mechanism which embodies a fan driven by electricity and electrically-heated wires (as specified in No. 2,505 of 1901) wherein the heated wires are carried by the fan. The current is caused to flow to an insulated pivot on which are mounted two hand-switches, whereof one, being jointed, and having a spring, can be moved with its handle towards the right so as to effect a quick break between its inner portion and a contact-stud connected with the heating wires; when that switch is moved to the contact for conducting current to the heating-wires, it impels the other switch to the first of a set of studs that will make contact with the other switch and so starts the motor of the fan. The latter switch can be moved to form contact with the set of studs that are connected through resistances to the motor of the fan, the former switch being left unmoved. When the latter switch has been moved towards the right hand for a disconnection of the motor it at the same time moves a lever that projects from the first-named contact-stud, and a spring which forces the two switches asunder thereupon establishes a quick break.

3,378.—A VENTILATING-DEVICE FOR WASTE WATER PIPES: *C. Fitter*.—In order that the water may not be drawn out from the intercepting trap, an air inlet valve which will open automatically is provided for a tapped ventilating-device; the valve casing is mounted upon the free leg of an angular pipe which is inserted into the waste pipe at the rear of the water seal and is fitted with a bell valve dipped into glycerine or a non-volatile liquid contained in a groove of the casing open underneath for the maintenance of a vapour-tight seal, the entrance of water is obstructed with a plate, and gas-tight joints are made.

3,413.—COMBINED STOVES AND FIREPLACES: *H. Steven and J. Colquhoun*.—For a close stove and an open range combined a part of the fire-cover is hinged at the back and will fall down the inclined flanges of another plate when the cover is pushed backwards, so as to afford a free passage for the flue, but when it is drawn forwards the hinged part will, by reason of the incline, assume a horizontal position, and the entrance to the flue will be covered by the vertical flange of the plate or cover; other inclines cause the entire fire-cover to rise as it is being forced backwards and to fall when it is pulled forwards, rebated diagonal guide-slides upon the underside of the hot-plates at either side of the fire keep it in its place; the invention, which may be applied also to portable ranges, provides for a closing of the lower portion of the stove with a plate that runs in slotted brackets so as to form a rest shelf, or toasting-rack, and for directing the ashes into the ashpit by means of the inclination of the hinged upper part of the door that controls the air supply.

3,423.—A DISCHARGE-VALVE AND OTHER FITTINGS FOR WATER-CLOSETS: *W. F. Probert*.—In order to ensure the discharge and flushing of the basin at the same time the inventor joins a collapsible chamber (at the bottom of the basin) which carries a valve to a diaphragm or piston pump by means of one pipe, and with another pipe joins the piston pump to the flushing pipe. Under normal conditions a spring keeps the diaphragm depressed, but as the latter rises it exhausts the air from within the chamber so as to impel either water or air into the flushing pipe and to start the siphon, with the gradual return of the valve upon its seating is effected by means of an auxiliary time-valve placed beneath the piston pump.

3,436.—A METHOD OF PAINTING UPON SURFACES: *H. Ruseck*.—The invention relates to the painting of designs in vertical lines upon walls and other extended surfaces; a stand is fitted with horizontal shafts, having sleeves in which slide rods arranged in pairs and carrying yokes for pattern-rollers, the rods being joined together with links and sockets; the colour is supplied to the rollers from brushes on the yokes, and the rollers are fitted with raised porous surfaces made of cloth or felt, or of felt laid upon embossed rollers.

3,472.—APPARATUS FOR HEATING BATHS: *T. Law*.—A hot-air or vapour-heating contrivance for cabinet baths comprises a gas or spirit lamp or stove of which the cover is closed at its top, and which has a horizontal pierced diaphragm. If the appliance is to be put in the bath some radial tubes are inserted into the hood of the heater. When it is used from without a pierced pipe that is held up inside the bath conveys the hot air or vapour, both the hood and the delivery pipe being jacketed.

3,528.—TUBES FOR LEVELS: *J. F. Hicks*.—The inventor seeks to obviate the bursting of the tube through the expansion of the contained fluid by heat. He fills it in part with solid matter such as balls, beads, &c. of metal, pottery, glass, and other resistant materials.

MEETINGS.

SATURDAY, JUNE 22.
British Institute of Certified Carpenters.—Visit to Hampton Court Palace. 3 p.m.

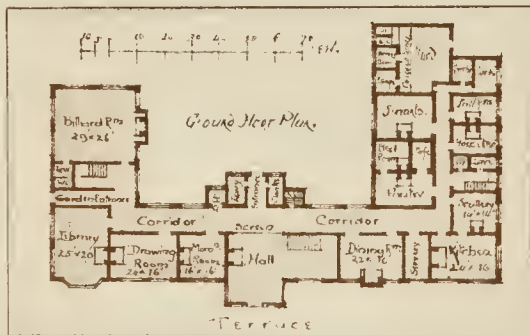

WEDNESDAY, JUNE 25.
Builders' Foremen and Clerks of Works' Institution.—Half-yearly meeting of the directors. 8 p.m.
SATURDAY, JUNE 29.
Architectural Association.—Visit to Colney Chape Convent, St. Albans.

The committee recommend the acceptance of the lowest tender.

C. B. N. SNEWIN & SONS, LD.

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and TIMBER MERCHANT, Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, BACK HILL, HATTON GARDEN, and 29, 30, & 31, BAY STREET, FAREINGDON ROAD, E.C.

THE LARGEST STOCK OF ALL KINDS OF WOODS IN EVERY THICKNESS, DRY, AND FIT FOR IMMEDIATE USE. Telephone, No. 274 Holborn. Tele. Address: "SNEWIN, LONDON."

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 12s. per annum (52 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 26s. per annum. Remittances (payable to DOUGLAS FOURDRINIER) should be addressed to the publisher of "THE BUILDER," Catherine-street, W.C.

SUBSCRIBERS IN LONDON and the SUBURBS, by preparing at the Publishing Office, 12s. per annum (52 numbers) or 4s. 9d. per quarter (13 numbers), can ensure receiving "The Builder," by Friday Morning's Post.

J. J. ETRIDGE, JR. SLATE MERCHANT, SLATER and TILER.

Penrhyn - Bangor, Oakeley - Portmadoc,

And every other description of Slates, except American, Ready for immediate delivery to any Railway Station.

PLASTERERS' LATHS (HAND-MADE) ALWAYS IN STOCK.

Applications for Prices, &c., to BETHNAL GREEN SLATE WORKS, BETHNAL GREEN, LONDON, E.

THE BATH STONE FIRMS, Ltd. BATH, FOR ALL THE PROVED KINDS OF BATH STONE. FLUATE, for Hardening, Waterproofing, and Preserving Building Materials.

HAM HILL STONE. DOULTING STONE. The Ham Hill and Doulting Stone Co. (Incorporating the Ham Hill Stone Co. and C. Trask & Son The Doulting Stone Co.) Chief Office:—Norton, Stoke-under-Ham, Somerset. London Agent:—Mr. E. A. Williams, 16, Craven-street, Strand.

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 42 Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds and milk-rooms granaries, tun-rooms, and terraces. Asphalte Contractors to the Forth Bridge Co.

SPRAGUE & CO., Ltd., LITHOGRAPHERS AND PRINTERS. Estate Plans and Particulars of Sale promptly executed. 4 & 5, East Harding-st., Fetter-lane, E.C.

QUANTITIES, &c., LITHOGRAPHED accurately and with despatch. METCHIM & SON (INCORPORATED IN ENGLAND) QUANTITY SURVEYORS' DIARY AND TABLES, For 1901, price 6d. post 7d. In leather 1/- Post 1/1.

DRY PLANKS AND BOARDS

In all kinds of Hard Woods. Mahogany, Wainscot, Teak, &c. &c. Wm. MALLINSON & Co. Offices: 136 & 138, Markney Road, London, N. E. Telephone: 1319 AVENUE.

ASPHALTE

For Horizontal & Vertical Damp Courses. For Flat Roofs, Basements, & other Floors.

Special attention is given to the above by THE French Asphalte Co. Contractors to H.M. Office of Works, The School Board for London, &c.

For estimates, quotations, and all information, apply at the Offices of the Company, 5, LAURENCE POUNTNEY HILL, GANNON STREET, E.C.

TWELVE GOLD AND SILVER MEDALS AWARDED.

COPPER AND ZINC ROOFING. F. BRABY & CO.

LONDON, LIVERPOOL, GLASGOW, BRISTOL. 352 to 364, Euston-rd., N.W. 6 & 8, Hatton Garden. 47 & 49, St. Enoch-square. Ashton Gate Works, Coronation-rd

The Fire Prevention Exhibition at Berlin.

THE very interesting exhibition of all matters connected with the prevention and combating of fire which is now open at Berlin, and which will remain open until the end of

September, is well worthy of a visit from all those who are interested either in the prevention of conflagrations or in dealing with them when they arise.

The Exhibition is situated in the suburb of Charlottenburg, on the Kurfürstendamm, just outside the limits which the expansion of Berlin in the western direction has already reached, and between the city and the charming suburb of Grönewald. The buildings for the Exhibition have been specially erected for the occasion on a site with an area of rather more than 80,000 square metres, the average width being 230 metres with an average length of 410. The buildings were erected from the designs of Herr Franz Jaffé, the whole of the work being carried out in seventy-four days, at a cost of 450,000 marks, and are constructed in temporary fashion only, with a view to an ephemeral existence, of fir quartering strengthened with light iron construction, and covered with wire lathing and plaster. The Exhibition building proper, including a reception-hall, occupies only some 9,000 square metres. There is therefore a considerable space of ground around the building, which in front, towards the boulevard, is very pleasantly laid out as a garden, with band stands, kiosks, and restaurants; while the area at the rear of the building is devoted to exhibits of various forms of fire-resisting building construction, and spaces for the display of the working of fire-engines and their appliances, including a full-size wooden model intended to represent a lofty building with a tower, such as a fire brigade might be called upon to deal with in the event of a conflagration.

There is also space still further in the rear on which are erected isolated huts where exhibition tests can be given of various forms of fire-resisting construction.

The main entrance from the boulevard is through a well-designed portal flanked by two lofty towers partly decorated in colour, in which the architect has adopted forms of ornament which we are accustomed to associate with our very newest anti-historical school of design. Extending right and left from the main portal in quadrant form are restaurant buildings, which lead gradually up to, though they do not reach, the main Exhibition building. This latter is in the form of a long and comparatively narrow plan, with transeptal ends, thus forming a double T, in the centre of which is a domed assembly-hall of 253 square metres in area, containing seats for 366 persons and standing room for 759. This assembly-hall has a stage on one side, which would permit of the standing room being increased to 1,017. The Exhibition is divided into six sections—1. Fire extinction; 2. Assistance in case of need and danger; 3. Street cleansing, street paving, and cognate works; 4. Fire prevention; 5. The well-being of the personnel of fire brigades; 6. Art, literature, and education.

Section 1, "Fire Extinction," naturally occupies a very large part of the space embraced in the exhibition, and may for convenience of description be subdivided by us under the two headings of Organisation and Equipment of Fire Brigades. The organisation of fire brigades has been particularly the point to which the official exhibitors have directed their efforts. The following cities are represented:—Berlin, Breslau, Cologne, Dortmund, Hamburg, Munich, Nuremberg, Potsdam, Rome, Stuttgart, Turin, Vienna, Augsburg, Bremen, Dantzic, Frankfurt-on-Main, Amsterdam, Posen, Wiesbaden. The various methods in which alarms are arranged, and communications made to the fire brigade, as well as the intercommunication between the various head stations and sub-stations in different towns, are illustrated by plans, and examples

of the various forms of apparatus favoured in each instance.

Particularly noticeable in this respect is the system adopted in Amsterdam, where a very complete installation of telegraphic alarms is in vogue, which has received its latest development in the equipment of every house in one street with a fire alarm communicating with the brigade. In most Continental systems it appears that a tape recording instrument is used rather than semaphores in the stations, though semaphores are automatically displayed in Amsterdam on an alarm being operated either in the street or in a building. Next in the department of organisation comes the arrangement of the fire stations and their inter-communication, which is indicated in plans of the various towns. After this comes a record of the water supply available for the use of the fire brigade and the position of the hydrants. Then the uniform adopted in different localities is illustrated by full-size dressed dummies. One article of the costume of firemen found almost universally on the Continent—although not used with us—is the spring snaphook attached to the belt, by which the men hook themselves on the ladders.

The fitting up of fire stations is well shown in several instances, as, for example, in the full-size model contributed by the town of Bremen, where engine and horses, with stable doors and doors to the engine-house, are all shown by working models.

Various forms of engines and other vehicles are very completely exhibited, both by examples of machines in actual use in different towns as well as by numerous manufacturers who are doing their best, and successfully, to outstrip our English makers—Messrs. Shand, Mason, & Co. and Messrs. Merryweather—from the Continental market.

In the equipment of fire engines a very considerable use appears now to be made on the Continent of carbonic acid machines and of smoke-resisting helmets and dress for enabling firemen to approach very close to the actual seat of the fire. To a far greater extent than with us continental fire brigades

are usually furnished with waggons having ladders capable of being extended to a very considerable height, and a ladder-waggon of this kind appears to be almost invariably an accompaniment to each fire engine section. These ladder-waggons are used by the firemen for approaching the seat of the fire, and in some instances also as fire-escapes. An extensive collection of ladders and escapes is shown by Lieb, of Biberach, one of the largest makers in Germany of this class of equipment. The Electric Railway Carriage Building Company, of Bautzen, exhibit a fine collection of fire engines and fire-brigade vehicles of various kinds, of which they are to-day the largest makers in Germany; but even more interesting than these is the new alloy of aluminium, called "magnalium," which they are introducing for branches, couplings, and other fittings for fire-brigade equipment, and which, whilst possessing almost the lightness of aluminium, is said to be free from the disadvantages of that metal. Certainly the new alloy has met with much favour, and is already in use by several of the leading fire brigades on the Continent.

Fire-alarms are, as exemplified in the Exhibition, almost entirely electrical in the method of communication, whether they are put into operation by hand or automatically. The automatic alarms usually depend on the expansion of metal to make contact and complete the circuit of electric bell systems, as, for example, in that shown by Schöppe, of Leipzig, which can be set to any desired temperature between 10 deg. and 100 deg. Centigrade. At the opposite pole of heat measurement we have an example of a mercurial pyrometer, in which the capability of measurement is extended above the boiling point of mercury by the use of carbonic acid gas under a pressure of 20 atmospheres, so that the instrument will record temperatures up to 550 deg. Centigrade (1,022 deg. Fahr.). This is shown by Schultze, of Berlin.

Section 2, "Assistance in Case of Need and Danger," is exemplified by completely equipped buildings constructed in temporary and portable fashion, and fitted as ambulance stations and temporary hospitals. Conspicuous amongst these are the buildings of the Red Cross Society in Berlin, an organisation somewhat on the lines of our St. John's Ambulance Association, whose buildings are constructed on the Döcker system, made by Christoph & Umnack, of Niesky, of light fir framing filled in with boarding, and put together with screw bolts finished with winged nuts, so as to be capable of easy removal. Internal partitions are chiefly constructed in two thicknesses of painted canvas fitted in wood frames made in sections, so that they also are easily put up and as easily taken down. One of the most interesting exhibits in this section is that of Scherrer's fire escape, shown in an elaborately designed six-story tower, which illustrates how a building of any height can be fitted with casement windows opening outwards, on the inside of which are permanent wrought-iron ladders with movable sections of ladder sufficient to cover the distance between window and window. By operating a single lever, the whole of the casement windows are easily opened, the movable sections of the ladder lowered into position, and thus a complete ladder from the top of the building to the ground is at once put into position at right angles to the building ready for use as a fire escape for persons

within the building or as a means of access for firemen to mount. This invention is exhibited by the Deutsche Rettungsfenster Aktien-Gesellschaft of Beuel-am-Rhein. A somewhat similar invention is exhibited by Rohloff & Possekell on what is called the Giersberg system, but in this instance light wooden balconies and a step-ladder are permanently fixed outside the building, and the windows opening on them are operated by a single lever from the bottom. The balconies and step-ladder can, of course, be, if desired, made of iron instead of wood.

Section 3, "Street Cleansing, Street Paving, and Cognate Works," embraces numerous forms of asphalt and street paving, as well as hydrants and street conveniences, but there is in this section naturally not a great deal of novelty, if we except the very clever suggestion for the use of glass as paving made by the Dresden firm, Aktien-Gesellschaft für Glasindustrie. The question of the cost of glass for such purposes is another matter, and, as stated in the maker's circular, depends upon the quantity. Included in this section is the question of dust and garbage removal, and cleverly designed examples of waggons for these purposes are exhibited by the Salubritä Company of Cologne, in which city the Corporation have seventy of these waggons in use, the merits of which have been also admitted and approved by the police authorities of Berlin.

Section 4, "Fire Prevention," is both one of the most interesting and one of the most extensive sections in the Exhibition, and a great deal of ingenuity has been devoted to the production of novel forms of fire-resisting construction, some undoubtedly valuable from a scientific point of view, others valuable only from a commercial point of view, being merely excuses for building up trade. The use of iron in fire-resisting construction is very generally adopted, and its adequate protection not always sufficiently carried out. There are numerous examples of so-called fire-proof floors, for example, in which the lower flanges of rolled iron joists are left exposed, but there are on the other hand many others in which the protection of the iron is rightly regarded as an imperative necessity.

One material which is largely employed for the protection of iron, especially in columns and stanchions, but also in girders and joists, is cork-stone, a material made of cork dust and various kinds of cement and plaster. As a non-conductor of heat and a slow-burning material this undoubtedly is not without value. Asbestos, in combination with lime, cement, and plaster, is also largely employed in various forms. Kiesel-Guhr or fossil meal, on account of its valuable non-conductive property, is also used in various forms for the protection of iron, in bricks, sheets, and slabs, formed by a combination of Kiesel-Guhr with some cementing compound. Several firms show iron protected by rope made of asbestos, cork, or Kiesel-Guhr and jute, the chief advantage being apparently the ready application of the material, which is then usually finished with a plastered surface.

Besides these slow-conductive materials, brick and concrete in various forms and arrangements are also employed. Very considerable use is made by many patentees of porous brick, that is brick which has been made of clay mixed with sawdust which is

consumed in the process of burning the brick, thus rendering it lighter and almost as easily receptive of nails as coke breeze concrete. Hollow bricks either of ordinary brick earth or of the porous manufacture are not uncommon. Dovetailed and keyed bricks or blocks are in bewildering variety, and very considerable spans are shown constructed in this way. Examples of floors of 6 ft. and even 8 ft. span and only 4 in. thick are frequent. In some cases light iron rods or bars, one might almost say laths, for their thickness scarcely exceeds that of hoop iron, are used in the joints of the brickwork to give increased tensile strength to the lower part of the floor's section. An interesting development of this brick construction is seen in self-supported or hanging partition walls, some of which are quite startling, as, for example, the exhibit of Prüss & Koch, of Berlin, who show a structure of two self-supporting parallel walls, 13 ft. span and 18 ft. high, with a cross wall 21 ft. span and 18 ft. high between them, with a doorway cut out in the middle of it. One of the side walls is 2½ in. thick, the other of two thicknesses each 2½ in. thick, with a space between of 6 in. The cross wall is 2½ in. thick. These walls depend largely upon hoop-iron vertical ties; but in another instance, shown by Lorenc, of Berlin, we see walls 12 in. thick and close on 15 ft. span, with a height of 7 ft. 6 in. built of keyed brick alone, without iron. These walls, moreover, carry a brick roof 6 in. thick. Thus the whole structure in this case forms a hut 15 ft. square internally, carried only on four angle piers.

Combinations of iron and concrete are numerous, and in many the construction has but a small amount of iron which is embedded in the lower part of the concrete. As an example of this, we may instance the flooring shown by Paul Zöllner & Co., of concrete 4½ in. thick, 14 ft. span, with ¾ in. iron rods 4½ in. apart. Another example is that by M. Czarnikow & Co., a floor nearly 20 ft. span, of concrete 9 in. thick, with iron bars 1½ in. by ¼ in. 2 in. apart. As a *tour de force* showing what can be done with glass, the Aktien-Gesellschaft für Glasindustrie, of Dresden, have erected a considerable sized pavilion wholly of glass—walls, roof, and floor. Glass bricks, hollow and solid, and wired glass of various thicknesses and patterns are the chief components of this remarkable structure.

Section 5, "The Well-being of the Personnel of Fire Brigades," comprises but few exhibits, and these chiefly statistics of provisions for sick funds, pensions, and the like, but in the charming exhibit of the City of Vienna are included pictures and sculptures showing incidents in firemen's lives, and there are also examples of gymnasia and baths especially intended for fire-brigade men.

Section 6, "Art, Literature, and Education," affords an opportunity for the German love of statistics, and elaborately compiled tables, plans, and maps are contributed by various official bodies. In this section are also the exhibits of the insurance companies. The "private," or, as we should call them, public companies, numbering forty-five, including our own Commercial Union, Phoenix, Liverpool London and Globe, and the North British and Mercantile, unite in an imposing show, and attract interest by a fine and valuable

engineers who still insist on specifying specially rolled sections for their designs.

Radio-active Substances.
THE new element "radium," traces of which were first discovered by M. and Mme. Curie

three years ago, is apparently, judging from papers published this month in the *Comptes Rendus* by MM. Becquerel and Curie, by far the most radio-active substance yet discovered. The chloride of radium makes a photographic negative in a few seconds, whilst uranium and its compounds take hours. It also makes a film of platinum-cyanide of barium brilliantly phosphorescent in the dark, even although an opaque substance be interposed between the radium and the film. The effect of Becquerel rays in making air electrically conducting is most strongly exhibited by this element. It has been discovered also that these rays produce most unpleasant physiological effects. It was noticed that those who had to work with these active preparations got sores on their fingers which took months to heal. M. Becquerel placed a radium preparation contained in a celluloid case in his waistcoat pocket for six hours. A sore developed on his skin underneath which took forty days to heal. Mme. Curie performed a similar experiment on herself. She put the preparation in a metallic case and applied it for half an hour, the radiation causing a severe burn which took a fortnight to heal. It was found that when the radium was enclosed in lead no rays came through, but when enclosed in aluminium the rays came through practically without hindrance. By photographing the rays, M. Becquerel has proved that some of them can be deflected by a magnet, but those that are not deflected have the greatest penetrative power. It is probable that substances will be discovered in the immediate future which will have a greater radio-activity than radium, but it will be seen that experimenting on such substances is not unaccompanied with risk to the scientist.

ON and after Monday next the South Metropolitan Gas Company will reduce the standard illuminating power of the gas supplied by them from sixteen to fourteen candles, and concurrently the price will be reduced from 2s. 8d. to 2s. 3d. per 1,000 cubic ft. The Act of 1900 gave this company power to reduce the standard illuminating power to fifteen candles on July 1 next, and to fourteen candles on July 1, 1905, or to make an immediate reduction to fourteen candles on July 1 next on condition that the standard price be simultaneously reduced to 3s. 2d. for fifteen-candle gas or 3s. 1d. for fourteen-candle gas. The company have decided to make an immediate reduction to the fourteen-candle standard, and have given public notice to that effect. It must not be imagined that the reduction of 5d. per 1,000 cubic ft. is wholly due to the reduction in illuminating power. Only 2d. of this reduction is enforced as a condition of the lower standard, and the remaining reduction of 3d. would probably have been made in any case as coal is much less costly now than it was last year. Gas consumers within the South Metropolitan district may be congratulated upon the change to be effected, for the reduction in price is a large one, while the difference in the value of the

lower quality gas for heating, cooking, or lighting will probably not be noticeable to the ordinary consumer. For flat-flame burners the fourteen-candle gas is not so valuable as the sixteen-candle gas, but for incandescent gas lighting the difference between the light efficiency obtained from the two qualities of gas is inappreciable even on the photometer. In accordance with the requirements of the new Act every consumer may have his old burners exchanged for new burners, *free of charge*, upon application to the company. The difference in price between gas supplied north of the Thames and that supplied on the south side will now be even greater than in former years.

The Physic Garden, Chelsea.
IN pursuance of a scheme formulated by the Charity Commissioners for the control and maintenance of this endowment, designs have been made, with the approval of the London County Council, for the erection of a new laboratory-house, a new greenhouse, and other structures at the Physic Garden in Queen's-road, Chelsea. The Apothecaries' Society originally leased the ground, 3½ acres (near the old Swan Tavern in Paradise-row), from Lord Cheyne, for purposes of a summer garden and their barge-house. By an indenture dated February 28, 1721-2, Sir Hans Sloane conveyed it in trust to the Society upon the condition that "it should at all times be continued as a physic garden for the manifestation of the power and wisdom and goodness of God in creation. . . ." Three years ago the Apothecaries' Company sought relief from their trusteeship, finding their resources unequal to the yearly charges of maintenance. They are represented upon the recently constituted governing body for the charitable trust, of whom, being fifteen in all, eight are nominated by the London Parochial Charities' Trustees. In terms of the new scheme, an annual sum not exceeding 800l. for up-keep is appropriated out of the funds of the City Parochial Foundation, and provision is made for the erection of new buildings and for rendering the garden generally available for scientific study of systematical botany and vegetable physiology, together with instruction in technical pharmacology as it concerns the cultivation and uses of medicinal plants. The old greenhouse was built in 1732 by Edward Oakley.

The Royal Caledonian Orphan Asylum.
THE Royal Caledonian Asylum will shortly migrate from London to the site, covering seven acres, which the Governors have acquired at Bushey, in Hertfordshire, where their new buildings are in course of erection after the plans and designs of Mr. W. Emerson. The institution was established in 1813, and two years afterwards was incorporated by Act of Parliament. The asylum was first opened, for about twelve inmates, in Cross-street, Hatton-garden, and was then removed to Copenhagen-fields, and subsequently to the present premises in the Caledonian-road, where 130 children receive maintenance and education. The London County Council have recently purchased the property at Holloway, which stands upon a site of nearly two acres, and has a frontage of 248 ft. to the Caledonian-road, for 16,500l. Under Part III. of the Housing of the Working Classes Act, 1890, the Housing Committee of the London

County Council intend to use the ground for the building thereon of dwellings that will accommodate 1,400 persons of the industrial classes.

The Drainage of Zermatt.

It is satisfactory to be informed that the local authorities at Zermatt have laid down a new arterial system of drainage. It is to be hoped, however, that the individual hotels and pensions will be properly connected with this system, and that the apparatus in these houses will be up to date. There is no use in a local authority establishing a good main system if individual houses are not equally well supplied with sanitary apparatus. Fortunately, the Swiss hotel-keeper has a very high idea of the necessity of good sanitation for his English customers, who are often better supplied in Switzerland than in the hotels in their own country. Yet there are many so-called health resorts in Switzerland where the drainage is by no means satisfactory, not from indifference on the part of the inhabitants, but from the rapidity with which a mountain village is transformed for three months of the year into a resort of persons from all parts of the world. When a place has grown to the size and importance of Zermatt sanitary matters are coped with; but in the intermediate stage between the unknown mountain village and the established fashionable tourist resort travellers have to run a good many risks from imperfect sanitation, from which they would suffer more than they do were it not for the beneficial effects of the mountain air in which most of their time is passed.

FURTHER NOTES AT THE GLASGOW EXHIBITION.

IN going through the British exhibits in applied and industrial art in our last issue, we passed over the important exhibit of the Anaglypta Decorations Company—pardonably, since it is in rather an out-of-the-way corner, and was still in course of setting up at the time our notes were taken. The majority of exhibits of this class are ranged, as already noticed, in what is called the "Grand Avenue"; but the Anaglypta exhibits are at the end of the bridge leading from this to the machinery hall. They occupy two small rooms on each side of the bridge end, and are now we believe completed. They include various designs for wall decorations and friezes, designed by Mr. Geo. C. Haité, Mr. Owen W. Davis, Mr. O. P. Moller, and others; and a ceiling by the last named artist. We have no doubt the exhibit is a good one, and should not be passed over. They have also a frieze in the gallery front of the Ceremonial Hall.

The Women's Section of the Exhibition, in the north-east portion of the main building, includes an Applied Art division containing a very interesting collection of objects, ancient and modern, lent by different owners and artists. There is a small collection of lace, where we can contrast the sumptuous old Spanish point with the feathery delicacy of modern Devonshire lace, beautiful in its way, but weak in comparison with the magnificence of the Spanish work. A piece of old Milanese lace is of considerable interest from a designer's point of view, it is so curiously architectural in character, the design consisting of symmetrical scrolls made of bands about ¼ in. wide, and enclosing decorative leaf forms. Symmetrical design is perhaps, in reality, out of place in lace, but it is interesting to see an exceptional type of work. The north partition of the apartment is lined with a long row of cases of textile embroidery and other textile work, many of them very fine. The cases in the centre of the room contain a considerable variety of articles of ornament designed and mostly executed by women, of which we may notice some of the best. Among these is a silver openwork book-cover by the late Miss Simpson, with nude figures

in the centre compartment and angels at the corners—a charming piece of work. Mrs. Arthur Gaskin exhibits some pretty jewellery in open silverwork and enamel. Among the bookbindings are some worth special notice. The Working Ladies' Guild exhibit a copy of the "Canterbury Poets" with a gold and grey embroidery of Renaissance character on a dark ground. A small book-cover worked in gold thread and embroidered geometrically arranged, by Miss Walker, has a character of its own. In another case a small book with a horizontal gold pattern tooled on a red ground, by Miss Alice Pattinson, merits the same praise. A small volume, "The Little Mermaid," designed and made by Miss Birkenruth, makes its effect with a plain leather centre stamped in relief with a figure, and a margin in which decorative fish seem to play amid a gold tooled diaper. Another noticeable volume is "Ver Lyrae," tooled in gold, with three circles of white vellum inlaid down the centre, on a dark green ground; this is designed by D. S. M'Coll, and made by E. M. M'Coll. Among other objects which have character and originality is a silver rosebowl and stand by G. C. Law Adam; various enamel ornaments by Mrs. Mure; a pearl necklace by Miss E. Newton, with enamel ornaments by Miss Cockerell—a beautiful and delicate design; various silver and enamelled objects by Miss Gertrude Smith, especially a panel with a blue enamel centre representing a night effect (but the lines of Miss Smith's silver work are rather too contorted); and some cloisonné enamel buttons for ladies' wear, by Mrs. Arthur Mure, which are very effective. The collection includes some important pieces of work which have been shown in London at Arts and Crafts exhibitions; Mrs. Walter Crane's embroidery design of The Zodiac among others.

When we come to the Foreign Section, however (occupying the greater part of the floor of the main hall east of the dome), it must be admitted that the French surpass all other exhibitors in the variety, delicacy, and finish of their silver and jewellery work. Of this there is a great deal to be seen, and of course the taste displayed in it is not always of the best, from an English point of view at all events; there is a little too much of the mere "article de Paris"; but the variety of invention shown in this class of work, and the innate faculty of making a thing look pretty and attractive, is remarkably illustrated in the Paris stalls. In the exhibit of M. Sandoz, for instance, which is described as "modern style French novelties," there is a brooch consisting of a little carved ivory head, the gold hair of which goes off into a reversed scroll from the lower curve of which hangs a small pearl; the whole thing is quite ethereal in its fancy and delicacy. M. Sandoz's exhibit as a whole is one of the best—perhaps the best; a flat gold chain with seed pearls at intervals and an oval pendant with a figure in enamel, is another exquisite bit of work and in perfect taste; but the diamond ornaments, in this as in other collections, run far too much in the direction of naturalistic sprays and leaves, as in most English jewellers' work at present, nor are they in this sort of work superior to the English. Messrs. Etlinger frères have a collection of bronzes and other articles of ornament which no doubt have too much of mere *chic*, as the French call it (there is no English word with exactly the same shade of meaning), but they are so very clever; the rather large grey vase, for instance, with spiralled handles and a gold nude figure in relief on it, is quite a kind of inspiration in its way. Mossand's imitation jewellery articles mounted with crystals and Mexican stones, of which there is a profuse exhibit, though it is not exactly what can be called artistic work, is really very pretty, and has a charm which one would not find in the same kind of work in this country. M. Bergeotte's polished iron work and chased and gilt copper work is very good; more classic and reserved in line and style than is at present the fashion either in France or England. He shows a very fine scroll railing designed in clean and precise curves with gilt leafage; some fine door-knockers too, with the figure worked into them; though in these there is the same fault that we so often find in artistic knocker designs, that the portion which knocks does not seem specially designed for that purpose.

There is a good deal of French furniture exhibited also, of various merit, and on the whole not equal to what we can now produce

in England. A good deal of it, like that of MM. Richard frères, consists of imitation Louis Quatorze or Louis Quinze furniture, all very well executed, but not very original. M. Paul Lefebvre shows small plaster relief models of the decorative treatment of the sides of two rooms, one Classic and one Louis XVI.; they show good general treatment, though the models are rather rough—indeed they are described in the catalogue as "sketches" only. Messrs. Depoilly & Fleury's exhibit of what may be called artistic ironmongery is interesting; some of their doorplates and lockplates are very good, and they exhibit also small steel cabinets or coffers of a peculiar type, which have a delicate surface ornament apparently etched on them. Messrs. Charpentier have a large display of furniture; modern work of Louis Seize type mostly, and one or two exceedingly fine reproductions of old work, especially a copy of a grand cabinet at Chantilly, which in point of execution and finish is really equal to the original. Among other French furniture exhibits is that of M. Jansen, excellent work but of rather regulation pattern; that of M. Maxime Clair, a light type of drawing-room furniture in which a considerable use is made of inlay of different coloured woods; and that of MM. Plumet and Selmerheim, who alone (as far as we observed) exhibit furniture exhibiting the new school of design in Paris (borrowed we think from Germany), in which all the lines of the furniture take free and unexpected curves. We do not feel much sympathy with the style, but there is a certain element of originality in it, and, as far as the work exhibited here is concerned, it has the merit of being complete and consistent in style throughout. Among the less important exhibits those of M. Joannot and M. Latouche, side by side, which consist of toilet articles, dressing bags &c., &c., are worth notice for the shapeliness which they give to ordinary articles of use, such as brushes, combs, &c.; things not ornamented, but which derive a certain element of style from merely the trouble taken to shape them well and give a flowing line to them. Messrs. Parison & Cie. have an excellent exhibit of velvets for upholstery, noticeable for a fine style in their patterns and an arrangement making a very good show of colour. M. Sidore Leroy's wall-papers arranged in panels, on the other hand, serve only to show how much behind us the French are at present in this particular branch of applied art; the designs are too spotty in effect and too realistic in detail; there is only one good conventional design, and even that would not count for much among the best of English wall-papers of the present day. Of dress there is a large number of exhibits, which it is not within our scope to comment on in detail; there are some beautiful costumes to be seen, but it is melancholy to find, in one case, the dress exhibited on a beautifully executed wax figure with that horrible thin waist which the French lady of fashion aims at cultivating even more than her English sister, and which is a perfect travesty of the true and healthy form of the figure as made and intended by Nature.

The other foreign countries represented do not contribute much in the way of applied art, and the Colonies still less. In the small section devoted to Austria the firm of Lötz show some good lustre-ware with surface diapers of sinuous lines, and MM. Jacob and Josef Kohn exhibit some bent wood furniture of the well-known type, accompanied however by upholstery of an artistic character. Their room also contains a fireplace of some originality; the opening has an elliptical head and an archivolte round, formed in dark striated tiles; beneath this is a brass front, partly enclosing a hooding of green tiling; there are plain firedogs in white metal: the whole is effective while perfectly simple. The firm of Moritz Hacker have a large show of vessels, figures, and ornaments, in a bright white metal which turns out to be oxidised pewter. It is too bright for the best effect, and moreover destroys that particular tone of surface which, to English artists at least, is one of the special attractions of pewter, and it will hardly be popular in this country.

As already observed, there is next to nothing in the way of applied art in the Colonial exhibits, the Colonies and their agents being more occupied in bringing forward the material resources of their countries than in exhibiting artistic work. There is a little furniture in the Canadian exhibit, but of no

particular consequence. In the Western Australia section are some good examples of the practical and at the same time more or less picturesque employment of Jarrah and Karri pine in fencing; and also a large inlaid table showing a design made of a veneer of Jarrah, curly Jarrah, Karri, Banksia, and Sheoak woods; these include a plain red and a mottled red surface, and a light yellowish mottled wood; the workmanship is very good, but the design is not remarkable.

The Indian section, of which the stalls are effectively designed, makes a good show of textiles and silver-work in a style which is now, however, so familiar to us that it hardly calls for comment. The Russian section in the main hall contains some curious and rather barbaric enamelled work of peculiar character—spoons, small bowls, &c., with enamels of very bright colour, and some curious little frames for sacred pictures, with the face in the picture sunk below the level of the ornament; this seems to be a form of popular art. A cloisonné enamel cup, with a gold granular ground, is pretty though gaudy; and Messrs. Sosnowski, of the Jablonna glassworks, have a considerable exhibit of a peculiar glassware, slightly coloured and with a gilt leafage on it—also evidently a popular Russian article, but not interesting except in that sense; it is but a gimcrack kind of work. Of the special pavilions of Russia we shall have something to say separately.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The Association will hold its fifty-eighth annual Congress at Newcastle, from Thursday, July 18, to Wednesday, July 24, with the following Thursday and Friday as "extra days." The President will be Mr. Thomas Hodgkin, D.C.L., F.S.A. On the 18th members of the Congress will assemble at the Council Chamber of the Town Hall at 11 a.m., where they will be received and welcomed by the Mayor. Afterwards the antiquities of the city will be inspected and described. The President's address will be delivered at the evening meeting, at the Natural History Museum. On the 19th members will leave by train for Warwick for inspection of the Castle, Hermitage, Bridge Tower, and Church. The drive will then be continued to Alnwick, where the Castle will be inspected; and a visit will be paid also to the remains of the Præmonstratensian Abbey of Alnwick and of the Carmelite Abbey of Hulne. On the 20th the Congress will visit Jarrah and Monkwearmouth Churches, and Tynemouth Priory. On the 22nd the Congress will visit Chesters (Clurnum) and Housesteads (Borcovicus), two of the stations on the Roman Wall. On the 23rd, Holy Island and the ruins of the later Benedictine Priory. On the 24th a visit will be made to Durham, and in the evening the concluding meeting will be held at 8.30 in the Committee-room of the Museum of the Literary and Philosophical Society. On the 25th those who remain for the extra days will visit Flodden, in the north of the county, under the guidance of the President, Dr. Hodgkin, who will give an account of the battle, and describe the field, of which he has made a special study; Ford and Etal Castles will probably also be visited. On the 26th there will be an excursion to Hexham and Corbridge. Besides the opening and closing meetings, there will be evening meetings at 8.30 on July 19 and 20, for the reading of papers on archaeological subjects. The following papers have already been promised:—"The Inaugural Address," by the President; "Flemish Brasses in England, with special reference to the Brass at All Saints, Newcastle," by Mr. Andrew Oliver; "The Archiepiscopal Mint at York," by the Rev. Caesar Caine; "The Resemblance between the Religious and Magical Ideas of Modern Savage Peoples and those of the Pre-historic Non-Celtic Races of Europe," by the Rev. H. J. Dukinfield Astley; "The President and Council of the North," by Mr. C. H. Compton; "The Galilee as a Place of Sanctuary, with a Suggestion as to the term 'Galilee,'" by the Rev. C. H. Evelyn-White, F.S.A.; "The Boy Bishop," by the Rev. C. H. Evelyn-White, F.S.A.; "Earthworks at Barwick-in-Elmet, Yorks," by the Rev. F. S. Colman; "The History of the Cathedral Statutes," by the Very Rev. Dr. Kitchin, Dean of Durham; and "Canterbury's Ancient Coinage," by Mr. S. W. Kershaw, F.S.A. Detailed information can be

Piano forte in Oak. Designed by Mr. E. L. Lutyens.

obtained from the Hon. Secretaries, Mr. Geo. Patrick, 16, Red Lion-square, London, W.C., and the Rev. H. J. Dukinfield Astley, East Rudham Vicarage, King's Lynn.

DESIGN FOR A PIANOFORTE.

THIS piano is made of oak, put together in rather a solid way, so as to suit a room which I built, and in which it is going.

The case, and the table on which it stands, are made independent of each other. Part of the lid forms the book desk, and is supported by the candle-holders. E. L. LUTYENS.

NEW THEATRE OF VARIETIES, LEICESTER.—A theatre of varieties, which has been erected at Leicester at a cost of about \$0,000, was opened a few days ago. The building is situated in Belgrave Gate on the site of the old Floral Hall, and has been erected from the designs of Mr. Frank Matcham.

LONDON TOPOGRAPHICAL SOCIETY: ANNUAL MEETING.

THE third annual meeting of the London Topographical Society was held in the rooms of the Society of Antiquaries, Burlington House, W., on Monday evening. Mr. Henry B. Wheatley, F.S.A. (Vice-President), occupied the chair, and among those present were Sir Henry Smythe, Messrs. E. A. de M. Rudolf, J. W. Hunt, Rev. W. J. Loftie, Mr. E. J. Barron, Mr. Oswald Barron, Mr. Hilton Price, Mr. Philip Norman, Mr. John Tolhurst, Mr. T. F. Ordish, Major Claude Alexander, Mr. J. C. Webb, and Mr. Jones M. Gomme.

The Council, in their third annual Report, stated:—The outcome of the Society's work in 1900 was the issue of eight sheets of the Kensington Turnpike plan, covering (with the two sheets issued in the previous year) one-third of the whole work, besides the plan of Whitehall presented to the Society by Lord Welby. Good progress has been made with the remaining sections of the Kensington plan, and arrange-

ments have been made for the completion of the work. The Council have expressed to Mr. Griggs their appreciation of the high quality of his reproduction, and in doing so they believe they have interpreted the general feeling of the Society. The accounts have been audited up to Lady-day. Subscriptions amounting to 120*l.* 15*s.* were received in respect of the publications for the year 1900, and in the current year the subscriptions already to hand amount to 100*l.* 16*s.*, making a total of 221*l.* 11*s.*

It was pointed out in the last report of the Council that the strength of the Society is not to be measured by its membership alone. The subscriptions received for back publications continue to be a great support in the new undertakings of the Society. From this source the amount of 50*l.* 10*s.* was placed on the credit side of the Society's banking account in the course of the year 1900, and during the present year a further amount of 44*l.* 16*s.* has come in, making a total of 104*l.* 6*s.* for back publications, as compared with 221*l.* 11*s.* for current subscriptions received during the same period. The greater part of the Society's income for this and the coming year must inevitably be absorbed by the reproduction of the Kensington Turnpike plan, but when in due course this work takes its place among the back publications there will be a remunerative return on the outlay; it will become a source of revenue in aid of future undertakings. It was this consideration that emboldened the Council to put the whole work in hand for completion, although this step involved the postponement of the letterpress issues. These, however, cannot be longer deferred, and it is hoped that the first part of the Society's "Record" will be issued in the autumn.

Our difficulty is to make our objects known and obtain sufficient members to enable the Society to cope with it. There are maps and views awaiting reproduction which are as interesting and instructive as any that we have published. To name only those that stand next in order for consideration there is the picture of London in the beginning of the eighteenth century—"A Prospect of the City of London and Westminster and St. James's Park," by John Kip, 1710. There is the large map by Ralph Aggas, showing London as it was in the reign of Queen Elizabeth, the earliest known map of London as a whole, a really satisfactory reproduction of which is much needed as a companion to our view by Van den Wyngaerde of the same period. Then there are the pictorial representations by Hollar of a later date than the views of Van den Wyngaerde and Visscher, which members of the Society already possess. Concerning these views by Hollar, an interesting discovery was recently made by that excellent topographer, Mr. Lethaby, a member of our Society. He found that when placed in juxtaposition the two views of Hollar form one complete panoramic picture of the whole of London in the time of Charles I. As soon as possible—that is to say, as soon as we have sufficient members—both these views will be reproduced and copies will be in the hands of the members, and they will be able to see for themselves how much Mr. Lethaby's observation has enhanced the interest of these beautiful pictures. . . .

One of the principal objects for which the Society was started was to make a record, more complete than could otherwise be accomplished, of all those changes which are so constantly and so rapidly taking place in the topography of London. We make no proposition for the preservation of buildings, although we rejoice at every public-spirited effort made in this direction. Our concern is only to make and publish a yearly record of the demolitions and changes, and of the alteration of street names. In the case of the more interesting houses and buildings our desire is to have accurate drawings made, as in the three parts of the "Illustrated Topographical Record" already published. It is felt by the Council—and no doubt it will be felt by the Society generally—that in this work we have a claim to the good will and assistance of the public bodies of London and their official representatives. There is probably no ward in the City, no borough within the county of London, which is destitute of people who take an intelligent interest in the history of their locality. What is wanted is that the Society should get into communication with such people, many of whom would doubtless be found on or connected with the local governing

bodies, and show them how, by the simple process of sending in to the hon. secretary of this Society timely and reliable information concerning impending demolitions and changes, they can contribute to a yearly record which, by such a system of co-operation, would cover the whole of London. The Council are convinced that in every district there are those whose culture and position will cause them to feel themselves morally bound to assist in this disinterested work, which will preserve as history so much that must inevitably disappear from the ground of London."

The Chairman, in moving the adoption of the report, said that the report was to some extent satisfactory, because it showed that much had been done, but it was disappointing to feel that the subscription list was not so large as it should be. The Council felt that much could be done if the number of subscriptions increased, and that they had hitherto been hampered. There was no doubt that the popular interest in London was increasing. It was to be seen on all sides, and it was hoped that it would take the practical form of helping societies and individuals to increase their knowledge of the history of this great city. This Society should be at the head of the movement. It did not interfere with the work of other societies. It was, to a great extent, a registering society, and therefore it could help to bring together the work done by other societies and individuals. It was found that in these times so much was done by individuals and societies which did not come to the knowledge of those who wished for the information. It was so important to have some centre where persons could find all information they required on the subject. With regard to the constant demolitions and changes which were taking place in London, they could not but feel that a great number of them were inevitable. He thought that perhaps too much complaint was made about demolitions which were inevitable, and it would be better to use their resources to prevent what could be prevented rather than to try to prevent the inevitable. Of course, one very great difficulty in respect to the changes in London resolved itself in the point that property was so valuable. For instance, there was the old South Sea House in Threadneedle-street—an interesting building and associated with Charles Lamb, who for so many years acted as clerk there. They all regretted that this structure should be pulled down and rebuilt, but what could they do? When the South Sea House was purchased in 1856 by the Baltic Exchange, the price was 55,700*l.*, and it was sold last year for 350,800*l.*! What could be done when this amount was given for a building? The matter was, indeed, hopeless. It was said that about 4*l.* per superficial foot was paid—the highest amount which had ever been given for land, even in the City of London. Christ's Hospital was another building which they felt most grieved should be destroyed. The building was most interesting, and took us back to the Grey Friars. But while the associations of the place were full of the deepest interest to all, he had heard some say with regard to the building itself, "It is nothing; the hall was built in 1825, in the Gothic of that time. There is nothing to regret about its loss." He, however, did not agree with these people, because the building was very effective. When one looked through the grating and saw the boys playing, and the buildings behind, one felt that it was a place of very great interest. Not only was there a façade by Wren, which was as fine a piece of building as any in London, but there were some old parts which were not generally seen, and which were full of interest. Of course, they had always known that the time would come when the building would have to go, but surely it was a matter of sufficient interest for Parliament to consider as to its treatment. He hoped that some strong feeling would be shown in order that we might have some portion of it left, or at all events that it should not be cleared away and warehouses put in its place. It was difficult to say what could be done, but surely all those who felt an interest in London and in the history of England—for really it took that position—should do something to see that the treatment it received should be the very best that was possible. There were many things they could prevent, and fortunately many would be demolitions had been prevented, such, for instance, as the proposed demolition of the churches of St. Mary-le-Strand, St. Clement, and the

church at Bow. It did seem a most monstrous thing now that any one could have thought of destroying these buildings, because they were in a decidedly advantageous position, dividing the traffic, and the view looking down the Strand toward St. Mary-le-Strand formed a most charming picture. Whether there would be a stop to the wanton destruction of other City churches he did not know, but he hoped we should not altogether lose those beautiful views of Wren's steeples that gave character and charm to the City of London. It seemed a great pity that so many had already been lost, and even if the superstructure was obliged to go, the crypts and underground work might have been allowed to remain. With regard to the skyline of buildings, they could not very well deal with private property, but Parliament might do something to prevent the spoiling of a building by raising the height of another. In all parts of London handsome buildings were spoiled by the erection of neighbouring structures which were greater in height. That was very much to be regretted. Looking from Charing Cross Bridge towards St. Paul's, one saw the Joint Examination Hall first, which he thought was built too low; then the Savoy Hotel, very much higher; and then the Hotel Cecil, higher still. Of course, however, a certain amount of variety in the sky-line was a great advantage, and added to the picturesqueness of many of our cities. It was very much wanted in Paris, especially in the Rue de Rivoli, but still there should be some regulation. It seemed a practical suggestion that an Act should be passed dealing with the matter, and there was a precedent, because after the Fire of London an Act was passed dealing with the erection of streets of first, second, and third class, the houses in which were to be of a certain height. Something of the kind should be done now, and it was certainly necessary that the height of the houses should be relative to the width of the road. They must feel that, in spite of all the demolitions, London was very much improved in beauty. There were some fine effects in London, and better could not be found in any other great city. The making of the Embankment was one great improvement, because London owed its chief beauty to the river; and another beautiful view was from Oxford-circus looking down Oxford-street. With regard to the future of this Society, the question of the registration of the changes in London was of great importance. The changes were so many and so great that it was impossible for them to be properly registered without some arrangement being made with the various authorities, and the Council of the Society felt that they would be able to do this if there was an increase in the subscription list. Another task which was of great interest to the public, and which the Council would like to take in hand, was to make a record of the large number of manuscripts, &c., connected with the history of London which were to be found in the British Museum, the Record Office, and other places, many of which were not made use of at all. This would be a great work and would be deeply appreciated.

Mr. Jackson Barron, who seconded the motion for the adoption of the report, remarked that the members had during the year had an exceedingly good return for their subscriptions. He cordially endorsed the chairman's views as to the necessity for guarding historical buildings, and said he desired to refer particularly to the buildings on the west side of Lincoln's Inn Fields, which he understood were threatened by the London County Council. The space was not required for a new street, but merely for recoupment purposes. He presumed the County Council would want to build up some monstrosities of which they in London already had too many. He hoped every one who might have influence with the County Council would endeavour to save the west side of Lincoln's Inn Fields, even for the sake of the three or four particularly interesting houses there.

Mr. J. Wickstead, of Canada, said that as a visitor to this country he had derived pleasure and profit in hearing the chairman's outspoken remarks. He was anxious to get photographs of interesting and ancient buildings, and he recently was much amazed to find how few authenticated photographs of interesting old dwellings existed. He mentioned the old Hanover Club as an instance.

Mr. Oswald Barron, in supporting the motion for adoption, thought the Society should prepare a schedule of historical build-

ings, which should be regarded as the irreducible minimum, and be defended against all attacks. They ought, in other words, to find out London's bulwarks in this respect, and say, "These cannot be touched." There was Staple Inn, for instance. He hoped the time would never arrive when the dismal performance of demolishing this quarter would be gone through. Its disappearance would surely be a pathetic thing; it was an interesting example of 1600 architecture. Sooner or later, no doubt, it would be assaulted, and he thought a society such as this should be on its guard against it, rather than to attempt to shut the stable-door when the horse had gone. He was glad that Lincoln's Inn's gateway had been saved, though he doubted the wisdom of placing it in the custody of a learned society. If the practice of scheduling suggested had been introduced before this, they would probably have saved one, at least, of the perfect specimens of wooden galleried inns which were the precursors of theatres in London. They might have saved one of these a few years ago in Austinfriars—a place unique in its associations with Dutch merchants of the past. As to compiling records, he pointed out that here was a plan whereby they could produce a Kelly's Directory applying to the Restoration period. When the hearth tax was imposed, records were taken from alley to alley and street to street in an amazing manner, and these returns were still preserved at the Record Office. This, he thought, would be a very worthy object for the record department of the society to interest itself in.

The Chairman remarked that as a member of the Council he would bring the suggestion forward, and he was sure it would receive every consideration.

The motion for the adoption of the report was put and carried.

The hon. treasurer's balance-sheet having, on the motion of Mr. Tolhurst seconded by Mr. P. Norman, been approved, the Council was elected, among those chosen to fill the seats being Lord Belhaven and Stenton, Viscount Dillon (President of the Society of Antiquaries), Sir John Taylor, Messrs. C. Lawrence Gomme, Alexander Graham, A. Harben, W. J. Hardy, W. R. Lethaby, P. Norman, T. F. Ordish, F. G. Hilton Price, J. E. Smith, J. Tolhurst, and Warwick Wroth.

Mr. J. F. Gomme was re-elected hon. treasurer, and Mr. Bernard Gomme hon. secretary.

Votes of thanks were accorded to the retiring members of the Council, to the Chairman for presiding, and to the Society of Antiquaries for the loan of their room for the meeting.

ROYAL ARCHITECTURAL MUSEUM AND WESTMINSTER SCHOOL OF ART:

ANNUAL MEETING.

The annual general meeting of this institution was held at the Museum, Tufton-street, Westminster, on Friday the 21st inst. The chair was occupied by Mr. W. Emerson, the President of the Royal Institute of British Architects, and he was supported by Messrs. J. P. Seddon, Forster Hayward, Maurice B. Adams, William Pain, and others.

The first business was the election of president, and Mr. J. P. Seddon, in moving that Mr. Emerson be re-elected to the position, said it was preferable that they should have at their head a professional gentleman, and of all professional gentlemen he regarded Mr. Emerson as most worthy of their support.

The motion, which was seconded by Mr. W. Lee, was adopted unanimously.

The Chairman said he was very much obliged for the honour they had done him. He should very much like to see the Museum and School in a more flourishing condition. They were now, so to speak, in a state of transition, and he was confident that later their hopes for a more flourishing state of things would be realised.

Mr. Adams then read the report of the Council. In it the Council gave expression to their participation in the world-wide sorrow occasioned by the death of Queen Victoria, who had been patron of the institution since 1860. An address of condolence was sent to his Majesty the King, who had since graciously consented to become patron. The Council also recorded with regret the death, since the last anniversary, of the Marquess of Bute, one

of the vice-presidents, and of Mr. Arthur Cates, who for some years acted as one of the auditors, and always took considerable interest in the welfare of the Museum. Through the good offices of the newly-elected President, Mr. Wm. Emerson, the Council had the satisfaction of stating that a closer connexion had been brought about between the Museum and the Institute of Architects, and the Institute had kindly promised an annual donation of 20s. to the funds, on condition that the Institute shall be adequately represented on the Council, and that members of the Institute and of the Architectural Association be permitted to sketch from the examples in the Museum without payment of a fee, during the hours when it is open to the public. The finances of the institution were in a satisfactory state, but a heavy and immediate outlay was in contemplation, the Council having resolved to renew the roofs of the older portions of the buildings, which had of late been a constant source of expenditure for repairs, and to replace the present glass by patent glazing. Tenders had been obtained for this important and necessary work, which would involve an outlay of something like 700l. The Council hoped that not only the old friends of the Museum, but the profession generally, would make individual efforts to assist in meeting this exceptional expenditure, and subscriptions would be gladly received by the Hon. Treasurer or Hon. Secretary.

The Westminster School of Art (added the Council) well maintained its high reputation, and gained a constant accession of new students through the recommendation of artists of repute and others who had become personally familiar with its work. In the evening classes (with the exception of the men's life class) there had been a gradual falling-off, which was attributed mainly to the increase in the number of art classes opened in London of late years at nominal fees, or even without any payment whatever.

There was, Mr. Adams remarked, an entirely mistaken idea prevalent among persons who should be better informed as to the intrinsic value of the casts at the Museum. He would like to point out that by far the greater number were unique, and could not be obtained again. They were secured under very difficult circumstances when cathedrals and churches were being restored. In many instances scaffolding had to be erected to obtain access to the originals. So much as to their value, from an artistic standpoint. As to their money value, he believed that if they were put up for sale they would realise an enormous sum, as they would, in all probability, be sought for by German and American institutions and universities and colleges abroad, where the public had a far keener appreciation of art than in this country. In keeping the collection together, therefore, the Museum was doing the country a very good turn. At the present moment, as was well known, the taste in architecture had not turned towards the mediæval style, but he was convinced that before long the taste would revert to that style, even though it did not go to the extent of what might be called a Gothic revival. During the past few months a number of books had been published dealing with Gothic architecture. One issued that week dealt with the Gothic crypt of Glasgow Cathedral. There must be some people sufficiently confident that the taste had not gone away from mediæval work, or they would not have embarked upon so expensive a task as producing a book of that character. As to the Museum not being in a flourishing state, he would remind them that the institution had never been what might be called popular. Nevertheless, the institution, if not popular, was highly practical, and had done excellent work in the past in affording students a knowledge for which surely they could never cease to be thankful. He concluded by moving the adoption of the report.

Mr. W. Pain seconded. The Chairman remarked that the balance in hand was smaller than last year, but against that they must set the fact that they had been to a considerable expense in repairs. One of the classes was certainly not remunerative, but seeing the enormous competition to which the School was in that particular phase of art subjected, he could hardly wonder. As to the Museum not being popular, he certainly had noticed a feeling that there should be a larger assortment of specimens dealing not only with Gothic, but with Renaissance architecture.

The Royal Institute of British Architects would, no doubt, be inclined to give a donation if the Council could find means to rearrange the casts and provide some other styles of architecture. This was a matter of considerable importance to students who required to study closely the details of all sorts of work. He thought they ought to interest their friends in the attainment of this end. He would give 20 gs. towards this object if others would take up the endeavour. When the roof had been repaired and all necessary alterations completed the casts might be rehung and the place made to look very much more "taking." Moreover, the balance-sheet next year would be more favourable because this year they had had to pay the last amount due to the London County Council.

The motion for the adoption of the report was then carried.

On the motion of the chairman, the following were re-elected vice-presidents:—The Dukes of Norfolk and Rutland, the Marquis of Ripon, Earl Fortescue, the Earl of Wemyss and March, Lord Grimthorpe, Messrs. Aston Webb, John Belcher, G. F. Bodley, Geo. Frampton, and J. P. Seddon.

The following were, on the motion of Mr. Adams seconded by Mr. Seddon, also elected:—Vice-presidents: Messrs. J. P. Seddon and Aston Webb; members of council: Messrs. C. Forster Hayward, Sydney W. Lee, William Pain, L. H. Hayer, W. R. Lethaby, Lieut. Colonel Ford, and Mr. Leon, the latter four representing the London County Council; and Messrs. W. M. Fawcett, W. H. Seth-Smith, and T. H. Watson, representatives of the Royal Institute of British Architects. The hon. treasurer'ship was again taken by Mr. E. L. Somers Cocks; Messrs. W. M. Pain and P. D. Leake were reappointed auditors.

A vote of thanks to the chairman for presiding concluded the meeting. Mr. Seddon intimated his willingness to contribute ten guineas to the fund started by the president.

THE ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

The annual meeting of the Incorporated Association of Municipal and County Engineers was opened in the Council Chamber of the Town Hall, Leicester, on Thursday, June 27, the new President (Mr. E. G. Mawbey, C.E.) presiding, and there was a large attendance of members of the Association from all parts of the country.

A hearty vote of thanks was accorded to Mr. C. H. Lowe, of Hampstead, the retiring President, for his services to the Association during the past year.

President's Address.

The President then delivered his address. After some preliminary remarks, he said that few, if any, towns had shown more enterprise and public spirit, or had made greater progress, than Leicester in recent years. The population twelve years ago, in 1889, was 138,000. In 1891, when their Borough Extension Scheme was promoted and won, it was 174,624. At this 1901 census it had risen to 211,574—an increase of 21.16 per cent. in the decade. The rateable value in 1889 was 522,307l.; in 1891, after the extension, 649,583l.; and it was now 841,307l.—an increase of 29.51 per cent. in the decade. In the twelve years 4½ miles of new streets had been made and sewered on the duplicate system, bringing the total length of streets and roads up to 178 miles, against seventy-six miles before the extension of the borough. Plans had been approved since 1889 for 15,535 dwelling houses, 167 warehouses, 179 factories, 313 workshops, 314 special buildings, 10,968 miscellaneous alterations and additions, new drains, &c., and for 386 new streets, the whole covering over 500 acres of additional built area and involving an expenditure of about 7,000,000l. sterling, which speaks with a peculiar eloquence of the progressive commercial prosperity of the town. During this period Local Government Board inquiries had been held upon 226 subjects for new works and improvements involving the expenditure of about one and a quarter millions sterling, and he had, at the present time, schemes in hand representing a cost of nearly a million sterling, for most of which the loans had not yet been obtained, and the routine expenditure by the various committees in matters affecting his office amounted to about 80,000l. per annum.

Regarding their everyday work, he could not speak too strongly on the great necessity, as one of the best practicable means of safeguarding the health of the community, for Local Authorities being liberal in providing an adequate number of well-qualified and properly remunerated Building and Sanitary Inspectors, working under able administration.

The good effect of the great sanitary works and efforts of this Corporation was vividly shown by the steady and maintained diminution of the death rate. The average from all causes during the decade of 1861-71 was 25.95, 1871-81 24.47, 1881-91 19.38, and during the last decade to 1901 only 17.54. With regard to the designing of the various classes of public buildings, in some towns a separate architectural department had been organised. In Leicester the ordinary architectural work was done by his staff, and the most important public buildings by architects in private practice. Nevertheless, in connexion with all these an immense amount of preliminary work necessarily falls upon the Borough Engineer in advising and assisting various committees, preparing preliminary plans and estimates with detailed conditions for competitors, and outlining the schemes before the work reaches the architects. This was, however, he thought, a far preferable plan than to set up an architectural department outside the control of the Borough Engineer, and much more fair to the architectural profession.

Referring, in passing, to other departments, the town owned the gas, electric light, and water undertakings, and Parliamentary powers had been just recently obtained jointly with Derby, Nottingham, and Sheffield for carrying out the great Derwent Water scheme. Since 1889, 120 miles of public and private foul and storm water sewers had been laid in the Borough. Mr. Gordon's intercepting sewerage scheme and pumping station had been carried out at a cost of about 163,000l. and had proved very successful; and his storm outfall scheme, which many of them saw in progress and which had cost about 80,000l. had also been completed. It was, however, one regretted to say, not unusual for municipalities, after having provided ample intercepting sewers, to leave in use in old and densely populated parts of the towns defective and dangerous sewers of the worst type, such as used to be designed and laid before the days of the Association.

Several years ago he drew attention to the existence of many miles of defective sewers in Leicester and the probable ill-effect of them upon the inhabitants living in those districts. He was promptly instructed to examine and report upon them, with the result that he condemned thirty-two miles and was now carrying out a scheme to replace them, which he had designed and which was estimated to cost 128,000l. Although they had not yet arrived at a unanimity of opinion, on the question of sewer ventilation, the chief trend of practice had been in the direction of the abolition or reduction in number of surface grids and the increase of shaft ventilation. In Leicester he carried out tests during a period of between five and six years and made over 3,000 observations of the velocities obtained in the shafts, besides very numerous records of temperature, humidity, wind velocity, barometrical pressure, and the like. These practical experiments convinced him that sewers could be efficiently ventilated by pipe shafts alone in conjunction with very ample means of flushing. After the results of these experiments had been submitted at an inquiry, the Local Government Board passed the first section, namely, of eight miles of the tributary sewerage scheme, with ventilation provided by shafts, without any surface grids whatever—a new departure in the requirements of the Board. No surface grids were now provided on any new public or private sewers laid down in Leicester. The purification of sewage was one of the greatest and most perplexing questions that had confronted municipal engineers.

The investigations of the present Royal Commission on Sewage Disposal had already been very extensive, and would doubtless prove the most exhaustive and valuable research on record. Some thought that the Local Government Board might now relax their requirements, and pass schemes for bacterial treatment alone. This was not surprising, having regard to the success which had been obtained by bacterial methods. He had, however, maintained that until sufficient experience

had been gained to prove that the sewage of the manufacturing towns could be successfully and permanently purified without application to land, the Board were justified, in the main, in adhering to their present attitude, for land was an immense safeguard in connexion with any sewage scheme. Still, in cases where it was almost impossible, except at a prohibitive cost, to obtain it, he believed that the requirements of the Board might reasonably be modified. In fact, leniency had already been shown in special cases, and they might probably expect greater facilities when the eagerly-awaited Report of the Royal Commission had been issued.

Some of the main questions at issue were—(a) whether the sewage of manufacturing towns and districts could be successfully treated with maintained efficiency without application to land; (b) whether it was better to adopt the fullest anaerobic preliminary treatment in covered septic tanks with final purification in contact beds, or whether only to employ a partial anaerobic treatment in open or closed tanks with a maximum aerobic purification in contact beds; (c) further, whether preliminary chemical treatment might not also be necessary in some instances where strong trade liquids obtain. The question of intermittent or continuous treatment in the contact beds was also a debatable point, but the extreme aspect was whether, even where suitable land was available, it would not, if admissible, be more desirable to adopt bacterial treatment entirely than a combination of it and land treatment. Again, what was to-day the best course to adopt where existing sewage farms, for want of sufficient area, means of preliminary clarification, or other causes, yield more or less unsatisfactory effluents?

The local conditions and the character of the sewage varied so considerably in different towns and districts that it was obviously impossible to determine upon any one system which would be universally applicable. These questions could, however, be more reliably dealt with by giving them facts as to how they had successfully solved the problem for Leicester than by mere expression of opinion. Twelve years ago, when he came there, and up to 1891, the River Soar in summer-time was a black stream of horribly offensive sewage matter, which, in that highly putrefactive condition, reached miles down the river, although everything was done, at unlimited cost, in chemical treatment at the old works. In consequence of the difficulty of obtaining porous land in sufficient quantity, and suitable locality, his predecessor had, much against his will and advice, to fall in with the adoption of their present exceedingly dense clay farm at Beaumont Leys, which it was widely prophesied would result in failure. The first contract, amounting to 10,400l., for receiving tanks, carriers, culverts, &c., for part of the farm was well in hand when he succeeded Mr. Gordon. The total cost of laying-out had been 59,025l., or about 43.50l. per acre, for the 1,355 acres actually prepared for receiving sewage.

The great problem then before them was how to so lay out, prepare, and under-drain the land for broad irrigation as to ensure efficient purification and to prevent the foul effluent, which always reached the drains of a clay sewage-farm, from getting away to the watercourses. This they succeeded in doing by providing for each field a separate system of drainage, so designed that the foul drain effluent could be brought on to the surface of the sloping land and treated over and over again until fit to send away. This, with other arrangements, together with the services of an exemplary committee and efficient farm bailiff resulted in their dense sewage being purified for over nine years to the satisfaction of the Leicestershire County Council.

The increase of the population and the trade had been very great, and these factors, together with the conversion of 6,700 pail-closets into water-closets and the proposal to pump the sewage from the 12,000 population of the added area of Belgrave, rendered it necessary to either increase the area of the farm or to adopt some means of preliminary clarification.

He had been allowed to carry out very extensive bacteriological experiments. Altogether seventeen different processes were tried, with two chief objects in view. 1. The preliminary clarification of the sewage before application to old pasture land and rye-grass for final purification, without fouling the crops. 2.

Complete bacterial purification without application to land. For preliminary clarification, the system found most successful and suited to their requirements was to pass the screened and pumped sewage through a detritus tank of comparatively large capacity, then through a coarse-grained first contact bacteria-bed on the intermittent system, the effluent therefrom being finished on grass. By this process eminently satisfactory effluents were uniformly obtained, notwithstanding the heavy nature of the land, and much less than half the land was required to be used than when crude sewage was applied. The final purification on the old pasture was at once a most reliable and effective process and entirely free from offensive smell. The process for complete bacterial treatment which gave the best results was the passing of the screened and pumped sewage through the detritus tank as before, then through treble contact beds, and the effluents from this process were only just equal to those obtained from the detritus tank, single contact, and irrigation on grass land. The detritus tank and double contact process was not quite equal to either.

These results were only determined by very numerous and exhaustive observations and analyses. He consequently advised the Corporation to purchase 1,270 acres of the land now leased to them, in addition to the 100 acres of freehold they already possessed, and prepared a bacterial clarification scheme to assist the land, consisting of open detritus tanks with a capacity equal to one-sixth of the present eight million gallons dry-weather flow to be dealt with, and 12 acres of first contact bacteria-beds, which, together with the effluent pumping plant, new sewerage, and pumping station for the added area of Belgrave, was estimated to cost 168,000l. This scheme had been unanimously adopted, and application had been made to the Local Government Board for sanction to borrow this amount.

Great inconvenience had been experienced throughout the country for want of a general Act of Parliament giving Local Authorities greater facilities for improving small rivers, brooks, and ordinary watercourses in their districts, particularly where improvement works necessary for the prevention of flooding of lands and dwellings were too small to justify the obtaining of a local Act of Parliament, and too great to be defrayed out of the Revenue Account.

The flood which occurred at Leicester on the last day of the nineteenth century was the greatest there within living memory. Their great floods prevention works, which were mostly designed and carried out by Mr. Gordon and Mr. Griffith, and brought to a completion by himself, at a cost of about 352,000l., were constructed to carry off a volume equal to the whole of a rainfall of 1½ in. in twenty-four hours from the 147 square miles of drainage area, and the volume of the flow which was actually discharged and also successfully carried off during that flood was equal to a rate of rainfall of nearly 1½ in. in twenty-four hours. This was valuable and useful data in connexion with the preparing of floods prevention works.

The rapid growth of large towns demanded, for the sake of the health and vigour of all classes of workers with muscle or brain, for the children, and for those to whom they were so indebted for home comforts, that ample open spaces and conveniently located parks and recreation-grounds be provided. In Leicester they had now 410 acres of parks, recreation-grounds, and children's playgrounds, altogether twelve in number, including their beautiful Abbey Park, which was opened in May, 1882, by our present King and his beloved Consort, and which had proved a great boon to the people. Including the above, and the 1,270 acres of land of the Beaumont Leys Sewage Farm now being purchased by arbitration, and the different estates, the Corporation would own altogether no less than 2,442 acres of land and properties for various purposes, exclusive of gas and water; and so convinced were they of the advantages which would accrue, both in health and financially, with more power to acquire surrounding land, which was ever increasing in value, that they were far from satisfied with the facilities present legislation afforded.

They had now three public baths and two open-air bathing stations, and were about to build another set, involving altogether an expenditure of about 50,000l., exclusive of land.

In electric traction for streets and roads there

was now opened out an immense field and future for municipal engineers. In conjunction with electrical engineers they had already played a very prominent part in the designing and carrying out of schemes in the large towns. There had been much greater enterprise and progress abroad than in this country, both in manufacture and construction, and from which they had derived much advantage; but all this was being rapidly changed, and to-day they possessed, in some of their cities and towns, overhead trolley systems, power stations, depôts, and various accessories of the very best types, with approximately about a thousand miles of electrically equipped tramway track now in operation, mostly put down within the last decade, and several hundred miles under construction. But perhaps nearly twenty times as much as this had been electrically equipped in the United States, and a vast aggregate mileage throughout the Continent. It was high time we moved. Foreign companies and capitalists were not only reaping the benefit of our traction trade, but were exploiting this country for the purpose of financing and carrying out tramway undertakings which our countrymen, who in the past had been great pioneers in railways and other engineering works, ought, for the honour and prosperity of the Kingdom, to rouse up and do for themselves, while, at the same time, encouraging and fostering such interchange of trade with other countries as was mutually advantageous.

Leicester, although usually in the front, was at present behind in electric traction, chiefly because the tramways were still in the hands of a company, but it was intended to come into line at least very soon. Although the overhead system had been chosen by every provincial town in the United Kingdom which had hitherto carried out a scheme, the objections to it had been so deeply rooted, that a most exhaustive investigation had been made by them in the hope of finding something better, but they found nothing, except the overhead trolley, which sufficiently combined reliability, safety, economy, and efficiency for a town like Leicester. They therefore recommended it, and also a separate and independent central power station. No detailed estimate had yet been prepared, but the present scheme embraced twenty-two miles of route and about thirty-eight miles of track, and as to cost, half a million sterling was a guess which went unchallenged, without including the purchase amount of the present undertaking.

He felt convinced that in provincial towns much more would be done to solve the question of the housing of the working classes by electric tramways than by the erection of blocks of workmen's dwellings in thickly-populated centres. Small separate dwellings on the extreme outlying parts of a town conducted greatly to the improved physique and respectability of the people, especially when allotment grounds were available within easy reach. They found that the experience in Brussels had been that it was not necessary to wait for the growth of a suburb before making a tramway, but that when a tramway was put down it made a suburb, and that, as unhealthy houses had been demolished in the centre of the city, the working classes gladly availed themselves of the cheap and rapid tramway transit, and went out to the healthy dwellings which were soon provided, at reasonable rents, by private enterprise.

There was undoubtedly a great future for the auto-car for light work and swift and convenient transit, and as greater perfection with regard to fuel, engines, gearing, and reduction of noise was attained, it would gradually effect a great sanitary improvement, and would considerably diminish the wear and tear of their roads and streets in comparison with horse traffic. Smart men would be their own drivers and mechanics; they could live long distances from their business and could have their railway station in their own back yard. Notwithstanding its great promise, the motor-car was not likely, however, to supersede electric traction for public service, although very useful for feeders and auxiliary traffic. In the principal thoroughfares of large cities with electric tramcars, a one-minute service running each way was no unusual thing. This meant something like 7,000 persons passing a given point to and fro every hour, in an undeviating course, swiftly, smoothly, and almost noiselessly and without any confusion whatever, and even three or four times that number was quite practicable without inconvenience. The present use of

horseflesh for transporting more or less heavy loads, especially on steep gradients, was in these days hardly worthy of science.

In conclusion, he said it would be almost impossible to overrate the extent to which their Association had improved the status of municipal engineers—largely by the great facilities afforded for the interchange of opinions and the obtaining of knowledge and information so willingly imparted by their members to each other in every sphere of their work. Neither could one over-estimate the advantages accruing to Local Authorities from the experience gained by their officers attending their meetings and inspecting the numerous and varied works of their confreres, especially when one considered that a very large proportion of the sanitary works of the country had, of late years, been done by the stipendiary officials of municipalities.

THE LONDON COUNTY COUNCIL.

The usual meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Camberwell Borough Council 8,000*l.*, towards the cost of extending Brockwell Park, and Lambeth Borough Council 20,000*l.* for the same purpose; Hampstead Borough Council 12,500*l.* for the purchase of a site for electric light station, and 7,898*l.* for the purchase of a site for a stone-yard for jarrah wood paving works; the Shoreditch Borough Council 4,060*l.*, the Camberwell Borough Council 14,200*l.*, and the Hampstead Borough Council 3,865*l.* for paving works; the Islington Borough Council 3,236*l.* for an electric light installation; the Stepney Borough Council 26,507*l.* for the same purpose; the Bethnal Green Board of Guardians 7,940*l.* for the erection, &c., of the infirmary; and the Wandsworth and Clapham Guardians 2,280*l.* for alterations to the board-room.

List of Rates of Wages and Hours of Labour.—The same Committee reported as follows, the recommendation being agreed to:—

"We have ascertained that by an agreement between the Amalgamated Society of Engineers and the London and District Association of Engineering Employers the rates of wages of workmen in the engineering trades have been increased 1*s.* a week, or 3*d.* per hour (according to the custom of the firm concerned), as from May 11 last. We therefore recommend—

"That the Council's list of rates of wages and hours of labour be amended, and that the rates of wages of the following trades be increased as follows—

	Increased Rate of Pay per Hour.
Brass finishers	8 <i>½</i> d. to 9 <i>½</i> d.
Coppersmiths	8 <i>½</i> d. to 9 <i>½</i> d.
Turners	8 <i>½</i> d. to 9 <i>½</i> d.
Fitters and erectors	8 <i>½</i> d. to 9 <i>½</i> d.
Millwrights	8 <i>½</i> d. to 9 <i>½</i> d.
Smiths	8 <i>½</i> d. to 9 <i>½</i> d.
Fatern makers	8 <i>½</i> d. to 9 <i>½</i> d.
Boyers	8 <i>½</i> d. to 9 <i>½</i> d.
Slotters and planers	8 <i>½</i> d. to 9 <i>½</i> d.

Conditions of Contracts—Variations in Rates of Wages, &c.—The General Purposes Committee brought up a report containing the following:—

"We have had under consideration the question of the insertion in contracts of provisions relating to alterations of wages and hours of labour during the continuance of such contracts.

The present standing order (No. 220, clause 7) relating to the matter is as follows:—

(7) Committees of the Council before inviting tenders are empowered in any case in which they consider it desirable to direct the insertion at the head of the schedule of rates of wages and hours of labour in the form of contract the following provision, but such provision shall not be inserted except by express direction of a committee—

"The lists of wages and hours of labour in Part I. and Part II. of this schedule are severally to be binding on the contractor subject to the following proviso which is to be considered as included in each part of the schedule, that is to say—

Provided always that if at any time or times and so often as the same may happen during the continuance of this contract in any trade mentioned or referred to in this part of this schedule a different rate of wages or different hours of labour from the rate of wages or hours of labour respectively provided for in this part of this schedule shall after the date of this contract be agreed to between the associations of employers and the union of work-

men in such trade in the district in which the work is being or is to be done then and from the date of any such agreement, and so long only and to such extent only as the same shall be in force, the rates of wages or hours so agreed upon shall be considered as substituted in this part of the schedule for the rates of wages or hours provided for in this part of this schedule for the same class of labour, and Stipulations 1 and 2 in Clause A of this contract shall be construed and have force and effect in all respects as if the substituted rate of wages or hours had originally been provided for in this part of this schedule instead of the rate of wages or hours therein provided for, and for this purpose any such agreement as aforesaid between the associations of employers and the union of workmen in any trade in the London district shall be considered as applying to all work done in that trade at the site mentioned in the specification in the 1st Schedule or within the radius mentioned in Part I. of this schedule.

The clause was first framed in 1893, but in August of that year there was an instruction from the Council that the clause should as a rule be omitted from contracts, but the Council at the same time empowered committees in any case where they considered it desirable to insert the clause before inviting tenders. The reason for the above instruction arose from an objection raised by the Thames Ironworks and Shipbuilding Company to the provision being inserted in their contract for the reconstruction of swing bridges and approaches at the Isle of Dogs. The Improvements Committee's report on the subject was as follows:—

"It is clear that a grave responsibility is cast upon contractors by the foregoing clause which the Council, on March 10, 1893, decided should be included in all contracts. The decision of the Council to include this clause was come to, not upon the recommendation of a committee, but by the adoption of an amendment moved upon a report, and we are therefore led to believe that the Council was not at the moment in a position to realise the effect of its decision. There is no doubt that if the clause is retained, contractors will endeavour to cover their liability by considerably increasing the amount of their tenders, and this increase will fall upon the Council, a result which we cannot think the Council desires to encourage. So convinced are we of the injurious effect of the clause that we have decided to recommend its withdrawal. If the Council agree with this, we think that in fairness to other contractors the work should be re-advertised. We recommend—

(a) That the words above quoted, beginning with "Provided always that," and ending with "Part I. of this schedule," be withdrawn from the form of tender and contract for the reconstruction of the four bridges at the Isle of Dogs.

(b) That fresh tenders be invited by advertisement for the reconstruction of the four bridges at the Isle of Dogs.

The recommendations of the Committee were adopted, and it was further resolved to refer the matter to the Fair Wages Committee with a view to their considering the expediency of omitting from forms of tender the clause in question. The Fair Wages Committee in due course reported in the following terms:—

"It will be remembered that, in consequence of representations made by the Thames Ironworks and Shipbuilding Company, whose tender for the reconstruction of the four bridges at the Isle of Dogs was the lowest, it was decided on the recommendation of the Improvements Committee to withdraw the clause from the form of tender and contract for that work. The clause had been inserted with the object of giving effect to an amendment, adopted by the Council on March 10 last, of the recommendation of the Works Committee submitting a list of rates of wages and hours of labour in pursuance of No. 1 of the Standing Orders made by the Council on December 16, 1892. The amendment provided for the list being altered from time to time, in accordance with variations agreed upon between the recognised unions of employers and workmen. We think that there has been a misapprehension of the intention of this amendment, which was only moved with reference to the list under consideration by the Council at the time and did not necessarily involve the insertion in forms of tender and contracts of such a clause as that in question, which would appear to be contrary to the provision in No. 2 of the Council's Standing Orders with regard to rates of wages and hours of labour, that "as regards each contract the list shall be that in force at the date of the tender." We are of opinion that it is desirable as far as possible to adhere to the principle laid down in this Standing Order, but as we desire above all that the Standing Orders shall be capable of application to all contracts, and there appear to be some contracts in which the insertion of a clause providing for variations of rates, &c., may be a matter of practical necessity, we have thought it well that committees should have a discretionary power of inserting it in exceptional cases. We accordingly recommend—

"That the clause quoted above be as a rule omitted from contracts, but that the Council do empower committees in any case where they consider it desirable to insert the clause before inviting tenders."

Consequent on the adoption by the Council of the above recommendation it has been the practice until quite recently to omit the clause from the form of tender and contract. Recently, however, upon the attention of the Committee being called to the matter, instructions were given for the insertion of the clause, and in these cases the Committees concerned in reporting upon the tenders have referred to the result of the insertion of the provision. In one case, viz., that of the tenders for the erection of a fire station, the Fire Brigade Committee reported that the architect was of opinion that the insertion of the stipulation largely accounted for the lowest tender being in excess of his estimate. In another case, viz., that of the tenders for the erection of artisans' buildings, the Housing Committee reported that the architect was of opinion that the insertion of the stipulation had some effect in damping competition. The above reports tend to bear out the view expressed by the Improvements Committee in 1893, that, if the clause was retained, contractors would endeavour to cover their liability by considerably increasing the amount of their tenders, and that that increase would fall upon the Council.

After careful consideration, we have arrived at the conclusion that it would be advisable if the provision were omitted from the contracts. We accordingly recommend—

"That Standing Order No. 220 be amended by the omission of Clause (7), relating to variations in the rates of wages and hours of labour during the continuance of a contract."

Alderman Dew moved to refer the recommendation back, in order that the representatives of the various associations of workmen and employers might be consulted in the matter. He could not see sufficient reason for the omission of the clause.

Mr. Taylor seconded, remarking that employers were satisfied with the existing clause.

Mr. E. White said there was no reason why either employers or employed should be consulted, as it was a matter entirely for the Council, who found that work cost more because in order to provide for a contingency contractors tendered higher than they would but for the clause.

Mr. Howell J. Williams said he thought the clause was absolutely superfluous, and there was no such clause in private contracts.

After further discussion, the amendment was agreed to and the report was referred back.

Tramway Extension.—The following recommendation of the Highways Committee was agreed to:—

"That application be made, in the next Session of Parliament, for powers for the construction by the Council of the undermentioned new tramways:—

1. Seven Sisters-road (existing lines), via Amburst Park, to Upper Clapton-road (existing lines).
2. Chelsea Bridge (north end) via Grosvenor-road, to a point near Lambeth Bridge.
3. Hampstead-road (tramways terminus), across Easton-road and along Tottenham Court-road, to a point near Oxford-street.
4. Edgware-road (from a point near the Marble Arch), to the county boundary at Cricklewood.
5. Harlesden (near the county boundary), via Scrubbs-lane, Wood-lane, Shepherd's Bush-road, Brook Green-road, and Fulham Palace-road to Putney Bridge.
6. Uxbridge-road (near the railway station), via Richmond-road, Netherwood-road, and Westwick-gardens to Shepherd's Bush-road.
7. A—Clapham Common, south side (L.C.C. Tramways) via Clapham Common, Battersea Rise, Wandsworth Common, north side, and East Hill to West Hill; B—West Hill, via Kingston-lane, to the county boundary.
8. A—Deptford (L.C.C. Tramways) via Blackheath-road and Hill and Shooter's Hill-road, to the Herbert Hospital; B—Herbert Hospital, via Woolwich Common-road, the road to the west of St. George's (garrison) church into New-road, and thence along Thomas-street and Green's End, to Beresford-square, Woolwich, and returning along New-road and Mill-lane, to a point in Woolwich Common-road near Nightingale-place.
9. New Cross-road (L.C.C. Tramways) via Lewisham High-road, Loampit Hill and Vale, Lee High-road and Eltham-road, to a point near Wellhall-lane at Eltham.
10. Streatham High-street (L.C.C. Tramways terminus) via Streatham High-road, to the county boundary at Norbury."

Improvements.—The Improvements Committee submitted the annual list of county improvements. The improvements are:—1. Scrubbs-lane, Brook Green-road, and Fulham Palace-road (Harlesden to Putney Bridge tramway). 2. Richmond-road (Uxbridge-road to Shepherd's Bush-road tramway). 3. Wandsworth Common, north side, East Hill, High-street, West Hill, and Kingston-lane (Clapham Common to Kingston-lane and the county boundary). 4. Shooter's Hill-road (Deptford to

the Herbert Hospital). 5. Lewisham High-road, Loampit Hill, Loampit-vale, Lee High-road, and Eltham-road (New Cross to Eltham). 6. Streatham High-road (Streatham Hill to the county boundary). 7. Queen's-road, Peckham. The various proposals were agreed to.

The "Rookery," Clapham Common.—Upon the recommendation of the Parks Committee, an estimate of 6,000*l.* was approved, and it was agreed to ask Parliamentary powers next Session to purchase at that price the property known as the "Rookery," Clapham Common, for addition to the open space on the common.

The Works Department.—The Housing of the Working Classes Committee brought up the following report:—

"We submit working drawings, specification, bills of quantities, and estimate of 23,932*l.* 5*s.* 4*d.* in respect of Seymour and Somerset buildings, which it is proposed to erect on the two sites cleared under the Churchway scheme, St. Pancras, which lie to the east of Churchway. The buildings will be both five stories in height, and will provide accommodation for 472 persons in two tenements of one room, 64 tenements of two rooms, 30 tenements of three rooms, and 4 tenements of four rooms. The estimate of the total cost of the buildings is made up as follows:—Erection of buildings, 22,507*l.* 10*s.* 2*d.*; provision for articles to be purchased direct, and for architect's expenses, quantity surveyor's fees, supervision and contingencies, 1,364*l.* 15*s.* 2*d.* We have referred the drawings, specifications, quantities, and estimate of 22,507*l.* 10*s.* 2*d.* to the manager of works. He has reported that he is prepared to undertake the work of erecting the dwellings, and we therefore propose that the drawings, &c., shall be referred to him for that purpose. We may mention that we are satisfied that the erection of these buildings at the amount of the architect's estimate will not involve any charge upon the county rate. We recommend

—That the working drawings, specification, and bills of quantities, together with the estimate of 23,932*l.* 5*s.* 4*d.* submitted by the Finance Committee, in respect of Seymour and Somerset buildings, Churchway, St. Pancras, be approved; that the work of erecting the dwellings be carried out by the Council without the intervention of a contractor; and that the working drawings, specification, bills of quantities, and architect's estimate of 22,507*l.* 10*s.* 2*d.* be referred to the manager of works for that purpose."

Sir John Dickson Poynder moved an amendment to the effect that the work be put out to contract, and quoted figures to show that whereas in twenty-one buildings carried out by the Works Department there was an excess over the architect's estimates of 25,571*l.*, in the case of sixteen works carried out by contractors the difference in favour of the Council was 17,576*l.*

Mr. Waterlow, Chairman of the Housing Committee, said he could not dispute the figures. Some of the excessive cost on the part of the Works Department brought with it lower tenders from the contractors. That was a feather in the cap of the Works Department. Contractors were now struggling to do the Council's work as cheaply as possible, so that they might wipe out the department. Under the old management there was an excess of 7 per cent., and under the new management there was an excess of 6 per cent. That was far from satisfactory, and he could not help thinking that the department ought to be able to do the work as cheaply as the contractor. At all events, they ought to be able to do it as efficiently as the contractor. The department were now showing small savings on some of their buildings. If that were not so he should not have been disposed to hand over the new buildings in St. Pancras to the department.

Mr. Frank Smith contended that they got full value for money in the work done by the Works Department, and therefore they had no reason to complain.

Mr. Burns, M.P., said that of all the builders who had done work for the Housing Committee only one (Messrs. Holloway) had had a second dose—the supervision exercised over the work broke the back of nearly every jerry builder. The losses alluded to occurred at the commencement of the Works Department, and the loss was diminishing, while it was more than counterbalanced by the excellence of the work and the pulling down of the builders' prices.

Lord Ribblesdale said it appeared to him that the Works Department was a source of perpetual but perfectly honest disagreement between several sections of the Council. In the case of the War Office, they had seen a perfectly independent body called in to say whether the administration was an advantage to the public or not, and he would like to see

the Council follow the example of Mr. Brodrick, and get together a perfectly independent committee to see whether the Works Department was an advantage to the ratepayer or not.

Mr. P. Harris said what Sir J. Dickson Poynder feared was that, if the work went to the Works Department, the estimates would be largely exceeded, and he wished that the work should be economically carried out.

Mr. E. White hoped that Lord Ribblesdale would succeed in inducing his Progressive friends to consent to a further inquiry as to whether the Works Department was a benefit to the ratepayers, but he did not think he would get them to consent. He contended that they had given the Works Department a fair trial, and it had failed. It was evident that the present system of the Works Department could not be allowed to continue much longer, for in three years they had added 62,000*l.* to the loss. They were spending 20,000*l.* per annum in management expenses on a concern turning over 200,000*l.* or 300,000*l.*, and nothing but disaster could follow.

Lord Welby said Mr. White had charged the present management with adding 62,000*l.* to the loss in three years, but it was not the fair way of looking at it. The present management ought not to be judged by the works they only completed, and were in no way responsible for accepting. As a matter of fact, the works for which the present management were wholly responsible showed a saving on the architect's estimates of 6,000*l.*

On a division, the voting was:—For the amendment, 28; against, 79; majority against, 51. The recommendation was then carried.

Tender.—It was agreed to accept the tender of Messrs. Ingram & Sons (139*l.* 8*s.* 6*d.*) for works to Mayford Industrial School buildings. The Council, having transacted other business, adjourned.

COMPETITIONS.

TECHNICAL COLLEGE, GLASGOW.—The Governors of the Glasgow and West of Scotland Technical College have accepted the design of Mr. David Barclay for the new buildings to be erected in George-street, and have appointed him architect for the carrying out of the work. Mr. Barclay's plan shows a floor area of about 144,000 square feet, and the cost of the building will be about 150,000*l.*

APPLICATIONS UNDER THE 1894 BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage.

Clapham.—One-story shops on part of the forecourts of Nos. 2 to 10, inclusive, Pennsbury-terrace, Wandsworth-road, Clapham (Mr. G. Sherrin for Mrs. C. E. Wigmore).—Consent.

Hammersmith.—A block of residential flats, with bay-windows and an angle turret, on the north side of Coldhawk-road, Shepherd's Bush, at the corner of Pennard-road (Mr. G. F. Grover for Mr. A. Yates).—Consent.

Hampstead.—A block of residential flats on the north side of West End-lane, Hampstead, at the corner of a footway adjoining West End Green (Mr. E. Bates for Mr. H. A. Rayner).—Consent.

Width of Way.

Westminster.—A building on the west side of Great Smith-street, Westminster, at less than the prescribed distance from the centre of Orchard-street (Mr. G. A. Hall for the Mutual Tontine Association, Limited).—Consent.

Bermondsey.—A one-story addition to a factory building on the east side of Wood's-place, Grange-road, Bermondsey, at less than the prescribed distance from the centre of the street (Messrs. Gordon & Gunton for Messrs. Ross & Co., Limited).—Consent.

Width of Way and Lines of Frontage.

Clapham.—A block of tenement houses on the east side of Gaskell-street, Clapham, at the corner of Union-road (Mr. S. A. White for the vicar and churchwardens of St. John the Divine, Clapham-rise).—Consent.

Formation of Streets.

Poplar.—That an order be issued to Mr. H. Hooper sanctioning the formation or laying out of a new street for carriage traffic in continuation of Cahir-street, West Ferry-road, Millwall (for Lady Cahir-street Charteris). That the name Cahir-street (in continuation) be approved for the new street.—Consent.

Chelsea.—That an order be issued to Mr. W. Murray sanctioning the formation or laying out of a new street for carriage traffic to lead from Fulham-road to King's-road, Chelsea (for Messrs. J. Veitch & Sons, Limited).—That the name Hortensia-road be approved for the new street.—Consent.

Hackney, North.—That an order be issued to Mr. C. Cheston sanctioning the formation or laying out of a new street for carriage traffic to lead from Upper Clapton-road to Portland-avenue, Hackney (for Lord Amherst).—That the name Leweston-place be approved for the new street.—Consent.

Means of Escape from Top of High Buildings.
St. George, Hanover-square.—The means of escape in case of fire on the sixth and seventh floors of No. 15, Berkeley-street, Piccadilly, for the persons dwelling or employed therein (Messrs. J. T. Wimperis & Arber for the Hotel and Club Investment Company, Limited).—Consent.

Space at Rear.

Kensington, South.—A modification of the provisions of Section 41 (1) (vi) of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of a block of residential flats on the south-east side of Brompton-road, Kensington, at the corner of New-street, with an irregular open space at the rear (Mr. C. W. Stephens for Margaret's Stores, Limited).—Consent.

Deviations from Certified Plan.

St. George, Hanover-square.—Deviations from the plan certified by the District Surveyor, under such Section of the Act, so far as relates to the proposed erection of a stable, with warehouse over, on a site at the rear of Nos. 45 to 48, Wilton-road, Pimlico (Messrs. J. Bartholomew & Co. for Mr. C. T. Cowley).—Consent.

The recommendation marked † is contrary to the views of the Local Authority.

Books.

English Cathedrals: A Description and Itinerary. By the Rev. T. PERKINS, M.A., F.R.A.S. London: George Bell & Sons 1901.

THIS is a volume of less than 100 pp., giving a very short description of the chief points of interest in the English cathedrals, illustrated with reproductions of photographs of each. The work, according to the preface, was originally intended by its compiler, Dr. Gilchrist, of Iowa University, for the use of Americans, and the map at the end of the book suggests a circular tour of the cathedrals, beginning and ending at Liverpool. An introductory chapter is given dealing with the general architectural features of the buildings and pointing out those which have always been served by secular clergy as distinct from the monastic foundations which became cathedral establishments after the Dissolution. The "typical plan" given on p. 15 is not very satisfactory; it would have been better to have given two plans of cathedrals— one of each type. Salisbury or Wells and Chester or Durham would have explained the difference well. The book, however, is, like those of Messrs. Bell's series, capably printed, and, apart from one or two errors—the whole of the nave and western towers at Bristol are modern, not only the "greater part"—seems to have been carefully edited and brought up to date. Although the larger books will probably appeal more to the average visitor to our cathedrals, the book before us will no doubt be found of value to those whose desire is to see and learn as much as possible in a limited time.

The Cathedral Church of St. David's. By PHILIP A. ROBSON, A.R.I.B.A. London: George Bell & Sons. 1901.

A RECENT addition to Messrs. Bell's Cathedral Series is the one dealing with St. David's, the most inaccessible of the cathedrals of England and Wales, and undoubtedly one of the most interesting. Mr. Robson acknowledges his indebtedness to Jones & Freeman's well-known book and others, and has used some illustrations from other books, but the majority

of the views are reproductions of photographs taken by the author. The photograph facing p. 3 well shows the west front before its re-building in 1862, and is of additional interest as in the foreground is a group including the late Sir G. G. Scott, Dean Allen, and Professor E. A. Freeman, all well known, apart from their connexion with the work that has been carried on for some years in repairing the church. We have not space for a detailed description of the book before us; it is, however, excellent both in matter and illustration, and we are glad to note that the ground plan is a good one—lent by Mr. T. Taylor Scott—and a great advance on some others of this series, where the ground plans have not been worthy of the book or subject. There is an excellent view of the interior of the presbytery taken in 1895, showing the stallwork and the remarkable screen east of the stalls; a part of the Rood screen showing the earlier work on the north side of the central doorway; a general view of the interior of the nave, and several picturesque views of the still unrestored Lady Chapel. In an appendix is a copy of the interesting report of the late Sir G. G. Scott, describing the means adopted to save the central tower from collapse, a work that caused all concerned great anxiety, but was happily in the end crowned with success. To those who know St. David's and its romantic situation and surroundings this little book will bring back many pleasant recollections; to those who have not been there it can be recommended as a capital handbook to the Cathedral and Palace.

The Benedictine Abbey of SS. Mary, Peter, and Paul at Pershore, Worcestershire. By FRANCIS B. ANDREWS, A.R.I.B.A. Midland Educational Company, Limited, 1901.

THE quarto monograph just published with the above title is a welcome addition to the already numerous works dealing with our monastic churches. In a space of less than fifty pages Mr. Andrews has written a concise account of the history and architecture of one of the most beautiful fragments of a Benedictine church in the Midlands. Less fortunate than Gloucester and Tewkesbury, it has lost its fine Norman nave, but the transept and eastern part of the church are fine examples of Norman and Early English date, and the central lantern tower is one of the most beautiful things of its kind in the country. The illustrations are for the most part all that could be desired, but the value of the ground-plan is lessened by the absence of any indication of difference in date apart from one or two notes. In addition to the plan are a valuable series of the elevations (north and west) and two sections (cross and longitudinal), two plates of details of mouldings and windows, and two reproductions of photographs, a south-east exterior view and an interior view looking east. In the cross section the east elevation of the south transept might have been shown with advantage—in many ways it is one of the most interesting portions of the exterior. The blocks in the text are numerous, and include photographs of impressions of seals and monuments, and drawings of various details of the building, a plan of the Grange at Broadway, and a reduced copy of encaustic tiles—some now in the Abbey church and others in a neighbouring cottage. Those from the church are not, however, quite sufficiently careful in their drawing—the author does not seem to have fully appreciated the amount of careful draughtsmanship that these tiles exhibit. On p. 19 is a very interesting illustration, giving measured elevations of a portion of the bellries at Pershore and Salisbury. Apart from the ball-flower ornament on the latter and the difference in the date the resemblance in the design is very striking.

The letterpress, which is full of interesting matter, is divided into two parts, the first dealing with the history and the second with the architectural details of the church. In the Addenda are copies of the Charter of Edgar, Domesday notes, and other documentary evidence, and the whole is well printed on good paper, and artistically bound in cloth boards.

In the *Builder* of October 2, 1897, was given a ground plan showing the various dates, a south-east view of the church, and measured drawings of the effigies, and other features which supply some omissions in Mr. Andrews' monograph.

New Tables for the Complete Solution of Ganguillet and Kutter's Formula for the Flow of Liquid in Open Channels, Pipes, Sewers, and Conduits. By Colonel E. C. S. MOORE, R.E., M.S.I. London: B. T. Batsford, 1901.

AMONGST the various more or less complicated formulas for calculating the flow of liquids, that of Ganguillet and Kutter is probably the most accurate and reliable, but its use involves a very considerable tax upon the time and patience of those who invoke its aid. The tables prepared by Colonel Moore practically cover all cases of roughness and inclination likely to occur in practice, and they supply values for expressions in the numerator and denominator of the equation as modified by the author. For use with the tables Colonel Moore presents what he terms an "abbreviated" form of his modification of the formula, but it would be more correct to describe it as a condensed form, inasmuch as all the essentials are included, some factors remaining as stated in the modified form, whilst other groups are represented by single symbols whose values are readily found from the tables. Part I. of the volume has been calculated for fifteen different values of (n) the co-efficient for roughness, and for 1,080 inclinations. Part II. has been added for use in special cases, and a diagram for the graphic solution is given at the end of the work. The tables present a complete solution of the Ganguillet and Kutter formula, they are of wide application, and should be much appreciated by hydraulic and sanitary engineers as tending to reduce calculations to the lowest possible limits.

Journal of the Sanitary Institute. Vol. XXII., Part I. April, 1901.

WITH the new century the Sanitary Institute commences a "New Series of Transactions." The size of the "Journal" is increased to super-royal 8vo (10½ in. by 6½ in.), and a smaller supplement is issued in which lists of new members and other matters of current interest are published. The pages of the "Journal" are therefore occupied almost exclusively by the papers read before the Institute and by the discussions thereon. The change is especially welcome in these days of rapid accumulation of printed matter. The first number of the new series is particularly interesting to architects. With the exception of the first paper, on "The State of London Streets," by Mr. Thomas Blashill, F.R.I.B.A., which is of general rather than professional interest, all the papers deal with matters connected with building. Dr. Christopher Childs communicates a valuable paper entitled "Ventilation: Success and Failure of Methods at Present in Use." Basing his opinion to a large extent on the oft-quoted researches of Drs. Carnelley and Haldane, but to some extent also on later work and on his own experience, he arrives at the conclusion that "for the ventilation of large schoolrooms having less than 16 square feet area per head, the plenum system is by far the best, and should be instituted wherever it is practicable." For small schoolrooms the so-called "natural ventilation" will probably be retained, but Dr. Childs thinks it necessary "to warm the incoming air." Although he considers the plenum system by far the best for large schoolrooms, he is "strongly inclined to the conviction" that it is not the best for hospitals. The paper gave rise to considerable discussion, which is well worth reading. Two lectures to sanitary officers, by Mr. W. C. Tyndale, M.Inst.C.E., on "Sanitary Appliances" and "House Drainage," are necessarily somewhat superficial, but are good as far as they go. The Report of a Committee of the Institute on "The Siphoning of Closet Traps" contains a record of numerous experiments in which reference has been already made in our "Student's Column" articles. Obituary notices of Professors Pelttenkofer and Fodor conclude the number.

Fergusson's Surveying Circle and Percentage Tables. A Book for Engineers, Surveyors, &c. By JOHN C. FERGUSSON, M.Inst.C.E. London: Published by the Author, 1901.

LIKE other engineers who have spent many years abroad, Mr. Fergusson has returned, bringing with him useful suggestions for the simplification of field-work. The object of the brief treatise under notice is to describe and

exemplify the uses and advantages of the surveying circle devised by the author when living in British Columbia in the year 1893. The circle in question is in the form of a dial with centesimal divisions, to be attached to magnetic compasses in place of the ordinary dial, which, as our readers are aware, is only divided into degrees. Various eminent mathematicians have attempted in the past to find a centesimal division of the circle worked with the quadrant. The author found it was impossible to establish any ratio between the tangential functions and the radius when working with so large a sector as the quadrant, but he claims to have solved the centesimal division of the circle by the idea that the tangent of an octant is equal to the radius, he found that, by dividing the tangent into 100 equal divisions, lines might be drawn from the points so obtained, to form divisions on the octant that would always subtend an equal space on an offset laid out at right angles to the quadrantal radius; these spaces being always equal to one-hundredth portion of the radius. When angles are read in the units of the octant, it is claimed that all trigonometrical problems can be solved by simple arithmetic. In the ordinary method, where the unit of angular measurement is the degree, the actual value of that division as a measure of departure from a fixed point can only be expressed by a formulae which represent values of the trigonometrical functions. In the case of the Fergusson circle it is clear that each separate division of the octant will always cover the same space upon an offset laid out at right angles to the quadrantal base-line; and as the space so covered is one-hundredth of the quadrantal base-line, it becomes evident that a ready means is afforded for the determination of distances in the required direction. Examination of the examples given in succeeding chapters of the book will show that the new surveying circle, used in conjunction with the percentage tables prepared by Mr. Fergusson, ought to result in a considerable saving both of field-work and of calculations. Arrangements have already been made for the manufacture of the new circle, which can be attached either in azimuth or vertically to old or new instruments at a moderate cost.

Correspondence.

To the Editor of THE BUILDER.

ARE BRICKLAYERS "DUNDERHEADS"?

SIR,—In your journal of the 22nd Inst. a report appears of a meeting of the members of the Royal Institute of British Architects, when a paper was read by Professor Letby entitled "Education in Building," and a discussion followed, in which Mr. Leonard Stokes joined. Mr. Stokes, in his criticism of the interesting paper, after a joke with ancient John the mason and Bob the carpenter, pays a high compliment to the bricklayer (though not intended as such), whom he calls a "dunderhead," which means a silly blockhead, a dunce, a thickskull, and this in nine cases out of ten. Mr. Stokes says the bricklayer makes all sorts of silly mistakes. "Bond was everything to the bricklayer, who would do anything to get that, and make the whole design subservient to some recognised rule of bond."

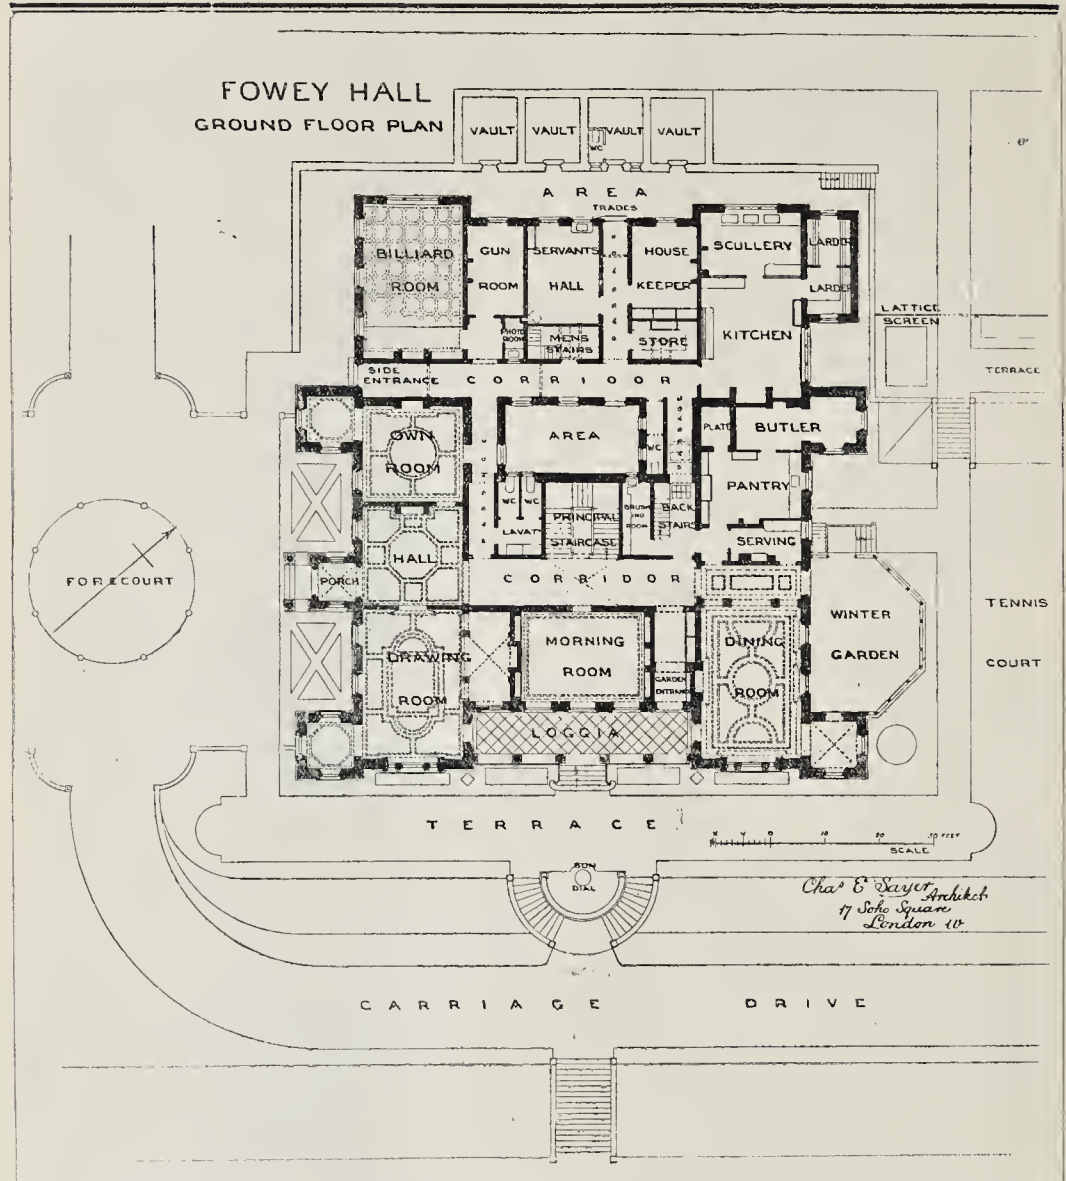

Mr. Stokes must know better. Evidently he was excited and ran away with himself, and lost proper control of words to express his views. The idea of properly bonded brickwork upsetting the design of a building is absurd. My experience is this:—I cannot persuade some bricklayers to take an interest and pride in their work, especially bond. "Good work and perpend kept" (as no doubt Mr. Stokes has it in his specification) looks well, even in a badly-designed building, and in a prettily-designed structure, whether cottage, church, or palace, it adds beauty thereto.

A BRICKLAYER CLERK OF WORKS.

WHAT CONSTITUTES A NEW STREET?

SIR,—I own a field in a borough town, and in front of this field runs an old road, 20 ft. wide at large. I prepared plans for dwelling-houses to be built in this field, along the old road on one side, showing 24 ft. roadway in front, the required distance from the opposite side as required by the by-laws.

These plans were presented to the Town Council, and the Clerk to that body ruled that they could not be built, as the building of such houses would be tantamount to the laying out of a new street, and that the width of such new street must be 35 ft.,

this being the specified width of all new streets, according to the by-laws.

I should be glad if any kind reader of your valuable paper would answer the following questions:—

1. What defines a new street?
 2. Was the Town Clerk correct in ruling that building such houses on one side would be tantamount to laying out a new street?
 3. Should the Clerk be correct by such ruling, can I be compelled to give up the required 16 ft. to make such new street, taking into consideration that the opposite side is a field and not built upon?
- I should think that the centre of the old road should be taken and each party to set back one half of the required width, viz., 18 ft. from the centre. An early reply will greatly assist.
- ONE IN DIFFICULTIES.

REVOLVING ENTRANCE DOORS.

SIR—Referring to the letter in the correspondence column of your last issue, signed "Entrance Doors," we beg to state that we are the manufacturers of the patent revolving draught-proof doors in question, and shall be glad to furnish full particulars of them to your correspondent on application.—For the Van Kannel Revolving Door Company, Limited,

T. J. STODDART, Secretary.

Illustrations.

THE ASHBURTON MEMORIAL, CHARTERHOUSE.

HIS fireplace and overmantel were placed in the armoury of the Charterhouse School in 1892 to commemorate the winning of the Ashburton Shield in three successive years—*ter deinceps reportati*, as the legend records.

Success still laid her laurels on succeeding teams, and it became necessary to provide more escutcheons to bear the winning names; the horizontal band was therefore inserted, as a retable, under the original framing. This accounts for the difference in tone shown in the illustration. The colour scheme is rich and harmonious, the materials used being statuary marble (slightly stained) and Spanish mahogany (dull polished), inlaid with a fret of holly enclosing the escutcheons of repoussé bronze, which bear the names of each team in raised silver letters. The arms and crest of the school are emblazoned.

The larger escutcheons are provided for the names of winners of the Spencer Cup, which is shot for after the Ashburton by the leading

marksman in each team. Tradition has it that to be victor in both trials is too severe a test for youthful nerve, and, at present, this escutcheon bears but one name.

The memorial and all its details, except the copy of the shield itself in the centre, is designed by Mr. Howard Ince.

FOWEY HALL, CORNWALL.

THIS house has been built for Mr. C. A. Hanson, on the cliffs above Fowey, on the south coast of Cornwall, and enjoys magnificent views of sea and coast on three sides.

It is built of brick rough cast, with Douling stone dressings and tiled roofs. Owing to its position, exposed to the full force of the south-west gales, most elaborate precautions were necessary to keep out the weather.

These circumstances also considerably influenced the design, and the four towers are intended to give an appearance of strength by a suggestion of a castellated character.

The internal decorations are somewhat elaborate, and were carried out by Messrs. Gillows from the architect's designs. The general contractors were Messrs. Pethick Bros., of Plymouth. Messrs. Merryweather did the water supply; Messrs. Drake & Gor-

the sectional area of the anti-siphonage pipe (A, fig. 1) need not be much more than half that of the waste-pipe, as follows:—

1½-in. waste-pipe,	1-in. A.S. pipe,
1¼ " " "	1 " " "
1¼ " " "	1¼ " " "
2 " " "	1½ " " "

When a number of fittings on different floors are connected to a main waste-pipe of great height, especially if the fittings are of modern quick-waste type, the branch anti-siphonage pipes ought not to be less than the branch waste-pipes to which they are connected, and the main anti-siphonage pipe not less than the main waste-pipe. It cannot be too often insisted upon that quick-waste fittings subject traps to very severe strains, the effect of which must be mitigated as much as possible by ample ventilation. Anti-siphonage pipes connected with waste-pipes are generally fixed inside the buildings, and although it is better to fix them outside, there is not the same objection in this case as in the anti-siphonage pipes of soil-pipes, as the waste-pipes are disconnected from the drains, whereas the soil-pipes, as a rule, are not, and drain-air will therefore pass through the soil-pipes and through the anti-siphonage pipes connected with them. The main anti-siphonage pipe is generally connected to the upper continuation of the waste-pipe above the highest fitting; this economises piping, and is quite as effective as carrying it up independently to the same height as the waste-pipe vent.

Fig. 1 represents the waste-pipes and anti-siphonage pipes from the fittings of an ordinary terrace house, having a kitchen sink on the ground floor and a bath and lavatory on the

first floor. The basement sink A is not connected with the main system of pipes, but has a separate waste-pipe discharging into the same gully, and a separate anti-siphonage pipe. The lavatory waste is often connected with the branch from the bath, but it is much better to connect it directly with the main waste and above the point where the bath waste is connected, as shown in the illustration; there is then less risk of the lavatory trap being unsealed by a discharge from the bath, and the water from the lavatory cannot possibly enter the bath.

In the case of ranges of fittings the same principles can be applied as shown in fig. 2, each fitting being separately trapped and each trap being ventilated. Ranges of lavatories, however, are often supplied with cast-iron or brass traps and waste-pipes, and many of these are seriously defective, the horizontal pipe being fixed perfectly level, and the waste-pipes being exactly vertical. The result is that the discharge from a basin flows in both directions along the horizontal pipes and then drains slowly away to the outlet, leaving a soapy deposit behind. Such pipes ultimately become very foul. In many cases no provision is made for ventilating either the traps or waste-pipes. Sometimes the traps under the basins are omitted and a single trap is fixed at the outlet of the horizontal pipe. Fig. 3 shows such a range in cast-iron, the tops and basins and the inside of the waste-pipe being porcelain-enamelled; the trap is below the floor. This trap is often 2½ in. in diameter, and is never thoroughly flushed by the ordinary usage of the basins, as the volume of the discharges is too small and as the force is lost in the

horizontal pipe. Both pipe and trap, therefore, become foul, and some of the foul air contained in the pipe is forced out through one basin whenever another basin is discharged.

Ranges of lavatories supported on glazed-ware piers are often fitted with glazed-ware horizontal waste-pipes passing through holes in the piers; these look clean outside, but as the pipes are dead level they cannot be recommended.

All waste-pipes of the kinds mentioned ought to be supported on separate brackets quite independent of the standards or brackets carrying the basins, or ought to be attached to these standards or brackets by adjustable bearers, so that sufficient slope can be given to them, and the branch-pipes from the basins ought to be of varying lengths to correspond. The main waste-pipes ought also to be ventilated, and ought not to be too large.

Instead of the closed horizontal waste-pipe an open channel is sometimes fixed under the basins, so that it can be easily inspected and cleaned. In this case the basins need not be trapped, a single trap at the end of the channel sufficing for the whole range. Glazed-ware horizontal wastes are also made with inspection slits as shown in fig. 4. Frequently a glazed-ware channel is laid in the floor, and a separate pipe is taken from each basin to the channel. The great objection to this arrangement is the splashing of the water, although this can be to a great extent avoided by turning the end of each waste-pipe in the direction of the flow, and by making the channel of sufficient depth and with a slightly-projecting rim. Floor channels are generally used for ranges

of wash-tubs, and frequently also for ranges of baths. Of course the floors ought to be of impervious materials, and laid to fall towards the channels. The floors and channels can then be easily washed with a hose-pipe.

URINAL PIPES.

According to the definition already given, all pipes from sanitary fittings intended for the reception of urine and feces may be regarded as soil-pipes. In other words, soil-pipes are pipes (other than drains) receiving discharges from water-closets, slop-hoppers, and urinals. Just as different kinds of fittings may be connected to one main waste-pipe, so different kinds of fittings may be connected to one main soil-pipe. No objection can be raised to a single soil-pipe serving both water-closets and slop-hoppers, provided that the traps are properly ventilated. Nor can there be much objection to connecting the single trap (2½ in. or more in diameter) of a range of stall-urinals to the main soil-pipe, provided again that the trap is ventilated. But a single urinal-basin with small trap ought to be kept separate, as the seal of the small trap will almost inevitably be destroyed by the large and rapid discharges from water-closets and slop-hoppers, if all are served by a single soil-pipe.

Some experiments carried out by Mr. Hellver are interesting in this connexion. To the side of a stack of 3-in. lead soil-pipe about 9 ft. high, open at the top, and with the drain ventilated at a distance of 40 ft. from the foot, a branch-pipe was attached at the height of about 30 ft. To this branch-pipe traps of various kinds were fitted in turn, and each trap was tested by simultaneous discharges from four water-closets connected to the soil-pipe at various points above the branch. The total flush at each test was about fifteen gallons. When the branch-pipe was not ventilated, nearly every small trap fixed to the branch was siphoned out at the first discharge, including 1½ in. and 2 in. "Bower" traps, 1½ in. Dubois trap, 1½ in. and 2 in. cast-lead siphon traps, 2 in. "Eclipse" trap, and 1½ in. "Anti-D" trap. A narrow band D trap, measuring 1½ in. between the cheeks, and with 1½ in. outgo was unsealed at the fourth discharge. Larger traps gave better results, but were generally unsealed by a succession of discharges. A second series of tests was carried out on exactly similar lines, but with the branch pipe ventilated by a 2 in. pipe connected with the trap-ventilation pipes of the water-closets. This large ventilation pipe did not render all the traps proof against siphonage; a 1½ in. Dubois trap was unsealed by two discharges, a 2 in. half S cast lead trap by four discharges, a 2 in. Eclipse trap by six, and a 1½ in. anti-D trap lost 1½ in. of seal in three discharges, but ten successive discharges had no further effect on it. A 4 in. Eclipse trap was unsealed by ten discharges, but twenty-two discharges failed to lower the seal of a 4 in. siphon trap more than ¼ in.

These experiments show clearly the danger of connecting a small trap and branch to a soil-pipe serving a number of closets and slop-hoppers, although it must be admitted that the tests were much more severe than any likely to occur in the ordinary usage of the fittings. Cases may indeed occur where the choice must apparently be made between connecting a single urinal to a soil-pipe or providing a separate pipe of great length. The latter alternative involves a long pipe inadequately flushed, and certain to become coated with foul urates, while the former involves some risk of unsealing the urinal trap; but this risk is very small if (1) the soil-pipe serves only one or two other fittings, (2) the urinal is above these fittings, and (3) the traps are properly ventilated. In many cases, however, a third course is possible—namely, the fixing of a water-closet instead of the urinal basin. This will at once get over the difficulty, and will serve the purpose almost equally well if a proper type of closet is selected. Certainly this course is by far the best in private houses.

Pipes receiving the discharges from urinal basins only may be treated in the main as waste-pipes, but the pipes (including the trap-ventilating pipes) ought to be fixed outside the building, as the air passing through them is certain to be fouled by the accumulations of "fur." The pipes ought to be disconnected at the foot. In the case of a single urinal on the ground floor, the arrangement shown for the sink A in fig. 1 is often adopted, although it is defective in making no provision for floor droppings. Where two or more urinals on

different floors are connected to a main soil-pipe, the latter ought to be carried up as a ventilation-pipe to a suitable point above the eaves, and the traps ventilated after the manner shown in the upper part of the same figure. A range of urinal basins is sometimes treated in the manner shown in fig. 2, but with an additional ventilated branch and trap leading from the floor-channel which must be provided to receive droppings; part of the flush ought to be diverted into this channel in order to clean it and to keep the trap charged with water.

The pipes leading from ranges of basin-urinals are generally concealed behind the marble or slate backs, and cannot be inspected or repaired without pulling down the backs and basins. Damage to these will almost certainly result, but a still graver objection is that such an arrangement is directly opposed to one of the most important principles of modern plumbing, namely, that all pipes connected with sanitary fittings shall be exposed to view. For these reasons it is much better to adopt wastes of the kinds shown in fig. 3, chapter 19, discharging into a floor-channel from which a single trap and pipe are fitted. Exactly the same arrangement may be adopted for a single basin, the whole of the discharges passing through the floor-grate and trap.

Lead is the best material for urinal pipes. As the amount of water generally allowed for flushing urinals is so small, the trap and pipe from each basin ought not to exceed 1½ in. in diameter; a 1½ in. main pipe will be sufficient for a range of half a dozen basins as ordinarily flushed.

25.—SOIL-PIPES, &c.

 OIL-PIPES are pipes receiving discharges from water-closets and slop-hoppers, and sometimes from urinals, and, like Goldsmith's bed and chest of drawers, they pay a double debt, being in most cases used also as drain-ventilators. They ought not to be made to serve as rainwater-pipes, as such an arrangement results in the discharge of foul air under the eaves, whence it will in most cases find its way into the building through defective beam-filling or through adjacent windows. The ventilating action of the pipes is also seriously reduced in wet weather, if not entirely stopped, and in winter there is a danger of the pipes being choked with snow or ice. Nor ought soil-pipes to be made to receive the wastes from any other kinds of fittings than those mentioned above.

Ventilation.—Every soil-pipe, whether used as a drain-ventilator or not, ought to be carried up full-size to "such a height and in such a position as to afford, by means of the open end of such soil-pipe, a safe outlet for foul air." Many hard-and-fast rules have been laid down as to the distance between the open end of soil-pipe and the nearest windows, skylights, chimneys, &c., but like all Draconian laws, they are more honoured in the breach than in the observance. Some Sanitary Authorities have a by-law to the effect that the top of the soil-pipe must be above the highest part of the roof of the building to which the pipe is attached; this, in many cases, involves bends both at the eaves and ridge, and these bends seriously diminish the air-extracting power of the pipes, and also retard the inrush of air which is so necessary for the prevention of trap-siphonage. A certain amount of latitude ought to be allowed by Sanitary Authorities, and a little common-sense brought to bear in each case. If the drains are short and self-cleansing and disconnected from the sewer, the air in the soil-pipe will never be very foul, as the sewage will not have time to decompose before it has passed the disconnecting trap. In such cases there would be no danger in terminating the soil-pipe a little above the eaves even if this were only 3 ft. or 4 ft. above the nearest window and about 6 ft. distant from it. If, however, the soil-pipe is also a sewer-ventilator, or if the drains are long and foul, the greatest possible distance ought to be interposed between the soil-pipe and the nearest opening.

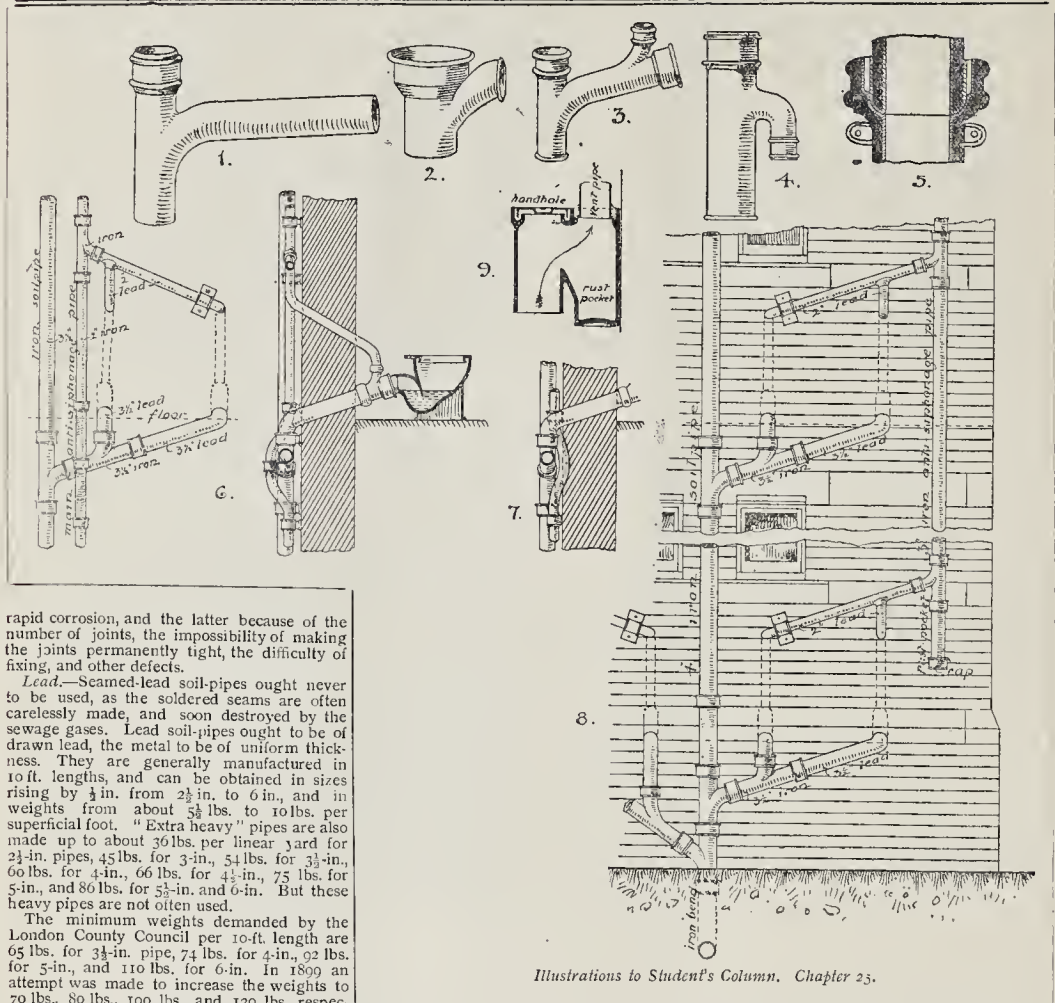

It is a mistake to fix an air-extracting cowl on the top of a soil-pipe, as this checks the upward current in still weather, and in high winds prevents the inrush of air required by the trap-ventilating pipes when a fitting is discharged. A simple conical or mushroom top of galvanised iron, copper, or lead is better, but the open wire guard is now generally used. This may be of "dome" or

"globe" shape, and can be obtained in sizes to fit pipes from 2 in. to 6 in. in diameter. The wire may be either galvanised iron or copper, but the latter ought always to be used, as galvanised wire is soon corroded.

Some years ago, the system of disconnecting soil-pipes from drains was introduced and was strongly advocated by many sanitarians. If the drains are long and foul, or if they are not disconnected from the sewer, a strong case can undoubtedly be made out in favour of the disconnection and foot-ventilating of the soil-pipes discharging into the drains; if the soil-pipes are not disconnected, the unsealing of a single trap will at once allow the foul air of the drains or sewers to enter the house, and how foul this sometimes is, all who have had any experience in sanitary work know. But if the drains are self-cleansing and are disconnected from the sewer, and if proper precautions are taken to prevent the closet and hopper traps being siphoned, there can be no objection to utilising the soil-pipes as drain-ventilators. The cost of a separate drain-ventilating pipe is saved, and the disadvantages which are almost inseparable from disconnection will be avoided. These disadvantages include splashing, retardation of the flow due to the additional trap at the foot of the soil-pipe, and occasional puffs of foul air through the grating over the trap. The latter may be to some extent obviated by substituting for the grating an air-inlet pipe carried to a suitable position and fitted with a mica-flap ventilator arranged to prevent the egress of air. The disconnection of soil-pipes has not come into general favour, and is at the present time explicitly prohibited by nearly all Sanitary Authorities, including the London County Council.

Diameter.—Until recently, soil pipes 4 in. in diameter were almost invariably used, except in stacks serving a number of fittings, when still larger pipes were fixed, but pipes 3½ in. in diameter are now considered large enough for ordinary stacks, and many sanitarians advocate still smaller pipes, as being more thoroughly cleansed by the small flush allowed and as being also less unsightly and less costly. There is, however, a greater risk of trap-siphonage when small pipes are used, and it is unwise to reduce the diameter below 3 in.; 3½ in. pipes are the smallest allowed by the London County Council. The outlets of many siphonic closets are only 3 in. in diameter, and the branch-pipes may be of the same size. Very long soil-pipes subject the traps of the fittings to greater strains than short pipes, and ought therefore to be of larger diameter, but it is very seldom indeed that pipes larger than 4-in. are required even for lofty stacks serving a number of fittings.

Materials.—The materials now almost invariably used for soil-pipes are cast-iron and lead, and opinions have been sharply divided as to their relative merits, but there can be no doubt that cast-iron is now in greater favour than lead. The fact is that neither material is perfect. Cast-iron soil-pipes, unless thoroughly protected inside by an impervious coating, are certain to corrode, and if the joint at the foot is improperly made the rust may accumulate there and ultimately choke the pipe. The pipes must be painted outside every year or two to prevent external corrosion. Cast-iron is also a brittle material, and may be broken or cracked by a heavy blow, and the damaged pipe will be difficult to remove, and will be of no value when removed. Again, every junction in a cast-iron soil-pipe necessitates three joints, one for the branch-pipe and one at each end of the junction-pipe, while only one joint is required for each branch in a lead soil-pipe. More joints are also required in the straight portions, as cast-iron pipes are made in 6 ft. lengths, and drawn-lead pipes in 10-ft. lengths. On the other hand, lead pipes, on account of their softness, are easily dented by blows, and dragged and twisted by the sun and by gravitation; they are more costly, and require more skill in fixing. They are, however, practically incombustible, and a cracked pipe can be repaired with solder or can be cut out and replaced by a new length without much difficulty, and the old pipe will fetch a fair price. A few years ago a lead-lined iron pipe was designed to combine the advantages of the two materials, and has already been extensively used. Some Sanitary Authorities allow either lead or iron pipes to be used externally, but insist on internal pipes being of drawn lead. Zinc and stoneware have also been used for soil-pipes, but are quite unsuitable for the purpose, the former on account of it

Illustrations to Student's Column, Chapter 23.

rapid corrosion, and the latter because of the number of joints, the impossibility of making the joints permanently tight, the difficulty of fixing, and other defects.

Lead.—Seamed-lead soil-pipes ought never to be used, as the soldered seams are often carelessly made, and soon destroyed by the sewage gases. Lead soil-pipes ought to be of drawn lead, the metal to be of uniform thickness. They are generally manufactured in 10-ft. lengths, and can be obtained in sizes rising by $\frac{1}{4}$ in. from $2\frac{1}{2}$ in. to 6 in., and in weights from about $5\frac{1}{2}$ lbs. to 10 lbs. per superficial foot. "Extra heavy" pipes are also made up to about 30 lbs. per linear yard for $2\frac{1}{2}$ -in. pipes, 45 lbs. for 3-in., 54 lbs. for $3\frac{1}{2}$ -in., 60 lbs. for 4-in., 66 lbs. for $4\frac{1}{2}$ -in., 75 lbs. for 5-in., and 80 lbs. for $5\frac{1}{2}$ -in. and 6-in. But these heavy pipes are not often used.

The minimum weights demanded by the London County Council per 10-ft. length are 65 lbs. for $3\frac{1}{2}$ -in. pipe, 74 lbs. for 4-in., 92 lbs. for 5-in., and 110 lbs. for 6-in. In 1899 an attempt was made to increase the weights to 70 lbs., 80 lbs., 100 lbs., and 120 lbs. respectively, but the suggested alterations have not yet come into force. The minimum weights required by the existing by-laws give a thickness of metal equal to sheet-lead weighing about 65 lbs. per square foot, which the suggested alterations would have increased to about $7\frac{1}{2}$ lbs. per square foot. The latter weight is sufficient for all ordinary purposes, although some sanitarians think that metal, weighing less than 8 lbs. per square foot, ought never to be used for soil-pipes; where the money can be afforded, pipes with metal weighing 10 lbs. per square foot are often used. As a ready means of calculating the thickness and weight of the metal, it is convenient to remember that a square foot of lead 1 in. thick weighs about 50 lbs.; the weight of metal $\frac{1}{4}$ in. thick is therefore very nearly $7\frac{1}{2}$ lbs. per square foot.

The joints in lead soil-pipes and between lead and iron, lead and pottery, &c., have been described and illustrated in chaps. 22 and 23. The method of fixing remains to be considered. Pipes in chases are fixed on blocks by means of lead flanges soldered to the pipes; the joints may be of the flange type (fig. 5, chap. 23), and an additional flange with blocks should be provided between each pair of joints, so that the pipes will be supported every 5 ft. Pipes fixed to the face of a wall may be united by wiped joints and supported by lead tacks soldered to the back of the pipes. The lead should be of the same thickness as the substance of the pipe, and should be about 4 in. wide if not to be folded, and double this width if folded to protect the nail-heads; the height should be 9 in. or 10 in., so that three nails can be driven through each tack into the joints of the brickwork. Tacks are sometimes placed singly and alternately on

opposite sides of the pipe; at least three ought to be allowed for each 10-ft. length. Greater strength with neater appearance is obtained by fixing them in pairs, allowing two pairs to each length. The nails may be of iron, 3 in., $3\frac{1}{2}$ in., or 4 in. long, or of copper or gun-metal, the two latter metals being more expensive but much more durable; the heads are often rounded. Copper-bit joints are sometimes used, the pipes being fixed with tacks and ornamented at the joints with lead beads, as shown in fig. 2, chap. 22. Cast-lead sockets (fig. 3, chap. 22) or cast-lead sockets strengthened with copper (fig. 4, chap. 22) are also good methods of fixing. Additional support ought to be given by a pair of tacks at the middle of each length.

Cast-lead sockets (fig. 1), $3\frac{1}{2}$ in. and 4 in. in diameter, with arms from 15 in. to 30 in. long, are now made, so as to avoid the "branch" wiped joint close to the wall. The arm can be connected to the closet by a brass socketted ferrule (fig. 2), in which a 2-in. branch is formed for the lead anti-siphonage pipe. If the anti-siphonage pipe is of iron, a socket is cast on the end of the curved branch, so that the end of the pipe can be caulked into it. The feet of lead soil-pipes may with advantage be connected to cast-iron bends, which ought to have foot-rests cast on and to be supported on flags or concrete; iron bends are better able to resist the impact of the falling liquids and solids, and also allow a good connexion to be made with the drain.

Iron.—Wrought iron is seldom used for soil-pipes, although it is well adapted for the purpose. As a rule, cast-iron pipes are used in 6-ft. lengths with socket joints caulked with lead. Special lengths can, of course, be cast

to order. The great defect of the material is its liability to corrosion, particularly in that part of the pipe above the highest branch. Unprotected iron pipes ought, therefore, never to be used. A coat of paint applied to the outside is of no use in preventing internal corrosion. Pipes galvanised inside and out can be obtained, but the cost is about double that of plain pipes and the protection is only temporary. Dr. Angus Smith's solution, applied at the foundry, is the cheapest preservative, and is fairly durable but not by any means permanent. The Bower-Barff process is not so often used for soil-pipes, and is not always successful. Glass-enamelling affords, perhaps, the best protection, but care must be observed that the enamel is perfect throughout the pipe and that it is not damaged by cutting or jointing the pipes.

Light rainwater pipes must *not* be used as soil-pipes, as it is impossible to make a proper caulked joint in them on account of the narrowness of the sockets and the thinness of the metal. The least weights now allowed by the London County Council are as follows, for each 6 ft. length:— $3\frac{1}{2}$ -in., 48 lbs.; 4-in., 54 lbs.; 5-in., 69 lbs.; and 6-in., 84 lbs. These weights give a thickness of metal ranging from about $\frac{1}{8}$ in. for $3\frac{1}{2}$ -in. pipes to $\frac{1}{4}$ in. for 6-in. pipes. Pipes much lighter than these are made and sold as soil-pipes, but cannot be recommended. Heavier pipes, weighing about half as much again as the London County Council pipes, can also be obtained. For $3\frac{1}{2}$ -in. or 4-in. pipes, the metal ought to be not less than $\frac{1}{4}$ in. thick, and slightly more for larger pipes. The sockets in cast-iron soil-pipes ought to be at least $2\frac{1}{2}$ in. deep, and the annular space allowed in the sockets for caulking not

less than $\frac{1}{4}$ in. wide for the two smallest pipes, and $\frac{3}{8}$ in. for the others.

Cast-iron pipes may be fixed with ears or clips nailed to the walls. Special projecting ears or sockets are now made so that the pipes will stand well clear of the wall; these are a great improvement, as they allow the pipe to be painted all round. If special ears are not provided, the same result can be obtained by using longer nails and driving them through short distance-pieces of wrought-iron pipe (1 in. or $1\frac{1}{2}$ in. long) placed behind the nail-holes of the ears or clips. External corrosion is certain to occur if the pipes are fixed close to the wall, as the back parts cannot be painted.

Special junctions, bends, &c., are now cast for almost every conceivable requirement. A junction ought always to be formed with the branch rising slightly from the pipe, and curved at the point of junction. The branch can be cast of any length from 6 in. to 36 in., so that it is unnecessary to make a joint in the thickness of the wall. Fig. 3 shows such a junction and branch $\frac{3}{4}$ in. or 4 in. in diameter, with a 2-in. socket for the trap-ventilating pipe; a socket is cast on the end of the branch to receive the outlet of the P-trap of the closet. The end of the branch is sometimes cast with an upward bend to receive the outlet of an S-trap. Junctions for the upper ends of trap-ventilating pipes are cast as shown in fig. 4. Bends for the feet of soil-pipes ought to be well rounded, and with foot-rests cast on to give them firm bearing on flags or beds of concrete. Set-offs or double bends to fit base-courses, eaves-troughs, &c., are also made, but ought to be used as sparingly as possible, as all bends obstruct the currents of air.

Lead-lined Iron.—Lead-lined iron pipes are manufactured by the Sanitary Lead-lining and Pipe-bending Company, and consist of an outer pipe of iron and an inner lining of lead. The lead is smooth and practically incorrodible by ordinary domestic sewage, and the iron protects the lead from external injury and gives it the firmness which is so lacking in ordinary drawn-lead pipes of large diameter. The cast-iron pipes are carefully made, and are smoothed inside by means of emery rubbers on a rotating spindle. The drawn-lead tube, of a substance equal to sheet-lead 5 lbs. per square foot, is then inserted, and is tightly pressed against the iron by means of a smooth steel bobbin, which is pulled slowly through the double pipe. The upper end of the lead tube is opened out to fit the special shape of the cast-iron socket, and the lead is turned outwards round the spigot-end of the iron pipe to form a kind of lead collar, as shown in fig. 5. When two pipes are fitted together, the joint can be completed by filling the annular space with molten lead, or by caulking it with cold lead rings, or by inserting a brass caulking-ring and caulking the lead lining on to it. The lead lining of junctions, &c., is introduced by casting, special cores being used for the purpose. Bends and junctions of almost every kind can be made. The invention is decidedly useful. The pipes and fittings are admirably adapted for soil-pipes, waste-pipes, and drain-ventilating shafts. They are naturally more expensive than ordinary iron pipes, but the extra cost is a trifling item in the total cost of a building. On the other hand, they are clean, durable, strong, and easily fixed. The lugs are of a special kind, so that the pipes can be fixed at any distance from the wall up to 24 in.

Anti-siphonage Pipes.—As already stated, soil-pipes and the trap-ventilating pipes connected with them ought, where possible, to be fixed outside the building, as all the pipes contain air more or less impure. In the case of stacks serving only one or two fittings, this presents no difficulty; but when ranges of closets on two or more floors are connected to one soil-pipe, the various pipes are not so easily arranged. If the soil-pipe and main anti-siphonage pipe are fixed near each other, bends must be introduced so that the soil-pipe branches and the main anti-siphonage pipe can pass each other. It is generally considered best to form the bends in the anti-siphonage pipes, but as these bends interfere with the free rush of air to the branches, the anti-siphonage pipes may with advantage be made somewhat larger than the usual 2 in. The anti-siphonage pipes may be bent round in front of the soil-pipe branches (fig. 6), but if the soil-pipes are fixed 14 in. or 2 in. clear of the wall, the bends will be somewhat quick and unsightly, and it is, on the whole, better under such circumstances to bend the anti-siphonage pipes behind the soil-pipe

branches (fig. 7), cutting small chases in the walls where required.

Another and better method of overcoming the difficulty consists in fixing the main anti-siphonage pipe at such a distance from the soil-pipe that it will pass quite clear of the soil-pipe branches, as shown in fig. 8. This illustration shows an arrangement for hospital or other building of two or more stories, with two fittings on each floor. The main soil-pipe and external branches are of cast-iron 4 in. in diameter, with 1-in. metal, while the branch pipes passing through the wall are of drawn lead of a substance equal to sheet lead $\frac{7}{8}$ lbs. per square foot. The main anti-siphonage pipe is 3 in. in diameter, and is also of cast-iron, the branches being of lead 2 in. in diameter. The main pipe is carried down a short distance below the lowest branch to form a rust-pocket; if the pipe is glass-enamelled inside, the rust-pocket will not be required. The top of the main anti-siphonage pipe is not connected to the soil-pipe, but is terminated at or about the same level, and covered with a copper-wire guard. If there are fittings on both sides of the soil-pipe two anti-siphonage pipes will be required, one for the fittings on the right and the other for those on the left.

In the best of circumstances two or more bends are required in an anti-siphonage pipe, and when iron pipes are used it is difficult to avoid having one of the joints within the thickness of the wall. For this reason it is certainly better to use lead for the internal pipes, even if the external pipes are of iron, as fewer joints are required with the former material.

Drain-ventilating pipes are required at the heads of long drains when soil-pipes are not available for the purpose. They ought to be not less than $\frac{3}{4}$ in. in diameter, but are all the better if made of the same sizes as the drains to which they are connected, that is to say (in the majority of cases) 4 in. They must be fixed outside the building, and treated like soil-pipes. If the pipe is of cast iron, and not glass enamelled, a rust pocket of iron or pottery (fig. 9) must be fixed at the foot, as the damp air from the drain soon corrodes unprotected iron, and the rust falling from the pipe may choke the bend at the foot, and so render the pipe utterly useless. The pocket illustrated is known as the "Loco" rust pocket.

Safes under sanitary fittings are not now fixed as frequently as in former years. When the fittings are badly designed and the plumbing executed by ignorant and careless workmen, safes may be considered necessary in order to prevent damage being done by leaks to the floors and ceilings below, but in such cases the safes are a source of danger, especially if the fittings are enclosed, as leaks may pass unnoticed or unremedied for a long time. The proper course is to use fittings of good design and to fix them in such a manner that safes are unnecessary. If a safe is fixed, it must not be connected to the waste-pipe or soil-pipe, but must be drained by a separate untrapped pipe carried through the nearest wall and terminated by a hinged brass or copper flap to prevent to some extent the ingress of air. Slabs of marble, slightly dished, are sometimes fixed under unenclosed lavatories and other fittings to catch droppings, but these do not require waste-pipes; the droppings can easily be wiped up with a cloth.

ST. THOMAS'S HOSPITAL.

Two new operating theatres and a new children's ward have just been completed in St. Thomas's Hospital.

In the hospital, as built in 1870, there were but two operation theatres. For many years that was ample accommodation, and it was a rare event for the two theatres to be in use at the same time. In 1890 the theatres were renovated and a mosaic floor added, and at the same time arrangements were made by which both theatres were available for operations every afternoon. In 1899 it became obvious that more theatres were needed, the number of operations having increased from 791 in 1890 to 2,810 in 1898. The original theatres were very large, very lofty, and provided with a spacious auditorium, which was necessary in the days of few operations and large audience, but unnecessary at the present time when operations are many and the spectators few in number. The size of the theatres made many difficulties in adequate cleaning, and these were enhanced by the fact of having an open roof supported by many tie rods. From measurements it was found that two theatres of sufficient size could be formed on the area occupied formerly by one, and as the form of roof had to be altered it

was decided to raise this, put the theatres on the next story, and provide on the old theatre level a new children's ward. By building on the opposite side of the corridor to the theatre, room has also been found for the addition of much needed extra theatre offices. The two new theatres, and the various rooms in connexion with them, are built round the theatre corridor. The theatres proper, anaesthetising and sterilising rooms are placed on the west side, and on the east side the dressing-room for the surgeons and dressers, recovery-room for the patients, and sister's storeroom. The two theatres are parallel to one another, side by side, and opening at the back into a common lobby, from which they lead out on either side an anaesthetising room for each theatre, and also a passage which permits the withdrawal of patients after operations without the necessity of taking them through the anaesthetising room in sight of a still conscious patient. On the south side of the west anaesthetising room is the sterilisation room which will be used to supply both theatres. This will contain a pressure steam steriliser for dressings, a water steriliser for the supply of germ-free saline fluid, and a large copper boiler for the cleansing of mackintoshes.

One description will serve for both theatres, as the arrangements and fittings are identical. The light is obtained from the skylight facing north, and beneath this at the north end of the theatre is the auditorium, consisting of four raised tiers, the bottom one of which is 9 in. above the floor level, and made broader than the succeeding tiers; it is intended for the accommodation of a hospital staff. The remaining tiers are intended for the students and visitors, and are made, as usual, narrow and of considerable height, so that a good view of the operation can be obtained even from the top step. The whole auditorium is made solid and of white marble, it having been decided that skeleton staging was objectionable on account of the difficulty of keeping it adequately clean and free from dust. The auditorium is separated from the floor of the theatre by white enamelled rails.

On one side of the theatre and running the whole length of the wall are two shelves, destined for the reception of lotions, sterilised fluids, hand towels, operation blouses, &c. Beneath these is a series of five sinks, the first two for hand washing, the third for the reception of the filters, the fourth as a cool-tray for porringers and operation trays, and the fifth as a slop-sink for the use of the theatre sister. The shelves and sinks are all carried on cantilevers, a space being left between them and the wall, thereby avoiding angles that must necessarily occur if the sinks and shelves are bedded against the wall. On the wall facing the auditorium are arranged the sterilisers for instruments, porringers, and operation trays as well as rose burners for the boiling of slabs containing normal saline. Opposite to the slabs a large glazed earthenware slab is provided for the mixing of plaster and the making of plaster splints, and above this is another shelf for the reception of hypodermic injections and various articles that may be required on emergency. In the surgeons' room there are sinks for the preliminary washing of the hands, and here will be kept the operation boots or overshoes and the sterilised operation blouses. In this room the operator and his assistants will remove their outer clothing and boots, and substitute in their stead the clean blouses and boots, so that no dirt is carried into the theatre proper. In the theatres proper and the rooms immediately opening out of them the walls have been covered with a dado of marmorite, which is a form of tough opaque glass, and offers a preference to complicated washing basins, and the drainage from these has been provided by an open channel on the floor, which has only one trap when it passes out of the theatre. Instead of pedal taps simple taps have been fixed. These are fitted with roses, so that they deliver a spray of water at the required temperature, and are kept running the whole time during which the operations are in progress. The surgeon can, therefore, wash his hands without being compelled to touch the taps, and in addition he washes his hands in constantly changing water. It is believed that this arrangement is much to be preferred to basins fitted with pedal-action taps, which can only be worked by a rather complicated system of pipes, valves, and actuating rods. The usual practice of rounding out all angles has been adopted, but the radii of the circles are much larger than usual, thus rendering cleaning even easier than is commonly the case. The theatre furniture is of the usual glass and iron pattern.

The Pienum system of ventilation and heating has been adopted for the theatres and children's ward. The work has been carried out by Mr. Key, of Glasgow, on his well-known system.

The New Children's Ward.—The tiling in the children's ward has been executed by Messrs. Doulton & Co., in accordance with a scheme drawn up by Mr. Stephen G. Holland, a governor of the

Hospital. All the tiles have been specially made for the ward, the angles being made of a rounded section, and the junction with floor and ceiling is formed with concave mouldings. The series of picture panels deals with various well-known nursery stories. The panels are of large size, and have been executed in "under-glaze faience." The whole of the designs were made by one of Messrs. Douillon's artists—Mr. W. Rowe—and were carried out at their Lambeth works.

The architect for the whole of the works is Mr. Percival Curry, of London.

GENERAL BUILDING NEWS.

PROPOSED NEW CHURCH, BYLEET, SURREY.—Mr. W. D. Carie, of Whitehall, has been appointed architect of the proposed new church at Byleet Corner. The church will be built externally of flint and stone, and internally of stone only, and will accommodate 350 persons.

METHODIST CHAPEL, WESTGATE HILL, BIRSTALL.—The memorial stones of a new Methodist chapel were laid at Westgate Hill, Birstall, recently. The new chapel will be built from plans prepared by Messrs. Walker & Collinson, of Bradford. Two front entrances will give access to a central vestibule, over which will be an end gallery. In the nave, chancel, and transepts there will be accommodation on the ground floor for 450 people, and for ninety in the gallery. It will cost about 4,000l.

ADDITIONS TO PRESBYTERY, DUBLIN.—For some time past additions to the Presbytery of St. Francis Xavier's Church, Upper Gardiner-street, have been in progress. The architect is Mr. William H. Byrne, and Mr. James Kiernan was entrusted with the contract. The new building, which is five stories high, is 50 ft. long by 47 ft. in depth. In the basement are situated a recreation-room for the community, a servants'-room, cooks'-room, with grocery store, vegetable store, larder, butlers'-room, pantry, china-closet, &c. From the basement upwards there are thirty-five apartments, including a reception-room, waiting-rooms, parlours, &c. A library is placed in the top floor. A reading and copying room are also provided, and various rooms and corridors are off the library. The building is constructed of Dublin brick and Ballyknockan granite.

NEW BOARD SCHOOLS, LOUGHBOROUGH.—The plans of Messrs Barrowcliff & Allcock have, as we have already stated, been selected in the competition for the new schools which are to be erected in Rendall-street on the Toothill-road estate, Loughborough. Mr. Evans, of Nottingham, acted as the assessor. The site upon which the schools are to be built is about an acre in extent, with a frontage to Howard-street, Rendall-street, and Charles-street. The schools are to be built on the central hall system—on the ground floor—with one exception, the pupil teachers' centre being a two-storied building at the Charles-street end. Accommodation is to be provided for 570 scholars in the mixed school. From the large central hall, measuring 74 ft. by 35 ft., there will be an entrance to eight different classrooms. On either side of the hall there will be a long clearstory window, with smaller ones at each end. Rooms for the accommodation of male and female teachers are to be provided between the mixed school and the infants' school with a separate entrance from Howard-street. At the rear of these there will be the girls' cloak-room and stores for general use. The infant school, accommodating 260 children, will have a central hall 53 ft. by 25 ft., with four classrooms and a room for the volunteer scholars. Defective children will be accommodated in a room, capable of seating twenty-five, at the south-west angle of the building. There will also be classrooms and a playground separate from the infants' school. On the north side of the infants' central hall cookery classrooms are to be erected. The gallery will accommodate fifty-five, and there will be floor space for demonstration and practical work. The pupil teachers' centre buildings will be at the corner of Charles and Rendall-streets, with a separate entrance for boys and girls. These will command a view of both central halls. The lecture-hall will be 45 ft. by 25 ft., and it is so designed that it can be divided into two classrooms. Each of the two classrooms will accommodate forty-two scholars. There will be a playground for each of the three departments. Drinking fountains are also to be provided. Near the entrance to each department there will be cloakrooms. The scheme provides for the external facing of the building with local red bricks with dressings of tawned terracotta. The roofs are to be covered with Broseley tiles.

BOARD SCHOOL, STONE NEWINGTON.—A new board school in Stoke Newington-road, which has been built at a cost (including the site) of more than 40,000l., was formally opened on the 17th inst. by the Hon. E. Lyulph Stanley, Vice-Chairman of the School Board for London. The new school has a frontage to the main road, and gives accommodation for 608 boys and girls and 308 infants. There is also a separate building for deficient children. Mr. T. J. Bailey is the Board's Architect.

DRILL HALL, HORNCASTLE, LINCOLNSHIRE.—The foundation-stone of the new drill hall was laid at Horncastle on the 13th inst. The site of the new hall is at the south-east corner of the Wong, a

public recreation-ground fronting the Boston-road. The total cost of the new hall will be about 2,500l. The building will comprise a hall, an orderly-room, armory, officers' room, sergeants' room, men's recreation-room, canteen, magazine, and bandroom. The contractors are Mr. J. S. Heath and Mr. G. Y. Pike, of Horncastle, and the architect is Mr. Butcher, of Spilsby.

MARKEET, LYNTON.—The new market for Lynton has now been completed. The building, which is of local stone, with Bath stone dressings, consists of a market hall, shop, lavatories, and waiting-room. Contiguous to the market hall is a depot for the Urban District Council, the front elevation of which is designed to allow for any future extension of the Market Hall without much alteration. At the extreme end of the block is a public convenience. The whole of the building is lit by incandescent electric lamps. Messrs Woolway & Sons, of Barnstaple, were the contractors. The building is from designs prepared by Mr. W. H. Chowins, Surveyor to the Council.

RADCLIFFE LIBRARY, OXFORD.—The degree of D.C.L. *honoris causa* conferred in a Convocation held on the 18th inst. upon Cornelius Neale Dalton, C.B., Master of the Drapers Company, on the occasion of the conveyance to the University of the New Radcliffe Library, which has been built by that Company at a cost of more than 21,000l. The building has been erected from designs by Mr. T. G. Jackson, R.A. It forms a projecting wing of the museum, and consists of two upper rooms about 80 ft. in length, fitted up as libraries with all accommodation for readers, as well as a basement for the storage of books.

EXTENSION OF GLASGOW UNIVERSITY BUILDINGS.—The additions being made to the buildings of Glasgow University on the eastern side are now nearing completion. The buildings, of white sandstone, are in the Scotch Baronial style. They are for anatomical purposes, and will be fitted throughout in the most modern manner. There are two basement floors, the first being occupied with boiler, engine, and fan rooms. On the second there are very large laboratory, lecture theatre, and preparatory-room, besides necessary engine and boiler accommodation. The ground floor provides for a laboratory about 140 ft. by 60 ft., adjoining which are the lecture theatre, museum gallery, and modelling-rooms. In addition there are the professors' rooms and cloakrooms. The first floor contains a practical mechanics' laboratory, drawing-room, and usual professors' rooms and cloakroom accommodation. Photographic darkroom and tank, &c., occupy the attic space above this. The buildings have been designed by Messrs. John Burnet & Son, architects, Glasgow, and have been superintended during progress by Mr. Thomas Douglass, clerk of works.

BUILDING IN BELFAST.—The last batch of tenders in connexion with the proposed municipal electric lighting system has now been given away. The total of this batch comes to 60,500l. The contract for the nineteen small substations around the city has been given to Messrs. J. & W. Stewart, of Belfast, who are at present building the electric lighting station at the Pigeon House. There is a considerable amount of building work being done in Dublin at present by Northern firms. In several cases the firms referred to have taken large plots of ground in the suburbs, and have started erecting residential houses by the score, according to the system which they have pursued in Belfast. If this continues for a few years, possibly the high rents which are such an unpleasant feature of life in Dublin may be somewhat reduced. Within the last ten years upwards of 4,000 houses have been erected in and around Dublin, but the demand was so much in excess of the supply that rents are, if anything, dearer than they were a decade back. If building continues at the present rate the increase for the next ten years will probably be nearer 8,000 than 4,000.—*Northern Whig.*

HOSPITAL, KINGSWOOD, NEAR BRISTOL.—A new hospital is to be erected at Kingswood Hill, from plans prepared by Mr. F. Bligh Bond. The building will have beds for about fifty, and will cost about 20,000l.

HOTEL, SOUTH SHIELDS.—The new West End Hotel, Stanhope-road, South Shields, was recently opened. The hotel is lighted throughout with electricity. Mr. T. E. Davidson was the architect.

VARIETY THEATRE, LINCOLN.—The Masonic Hall, Lincoln, is about to be adapted as a variety theatre under the title of "The Empire Theatre of Varieties and Hippodrome." The architects are Messrs. W. Mortimer & Son.

CATHOLIC SCHOOL, ABERDEEN.—A new school building is in course of erection in Summer-street, Aberdeen, for the Roman Catholic authorities. On the ground floor there is a large hall, which may be used as a gymnasium or otherwise. Immediately above are two rooms partitioned off by a sliding glass screen. On the upper floor a similar arrangement has been provided for. The architect is Mr. R. G. Wilson.

DECORATIVE ART EXHIBITION IN ITALY.—An International Exhibition of Modern Decorative Art is to be held at Turin from April to November next year. The movement is under the patronage of the King of Italy.

SANITARY AND ENGINEERING NEWS.

BRIDGE, ST. PHILIP'S, BRISTOL.—A new foot-bridge has been placed across the feeder from Silverthorne-lane, St. Philip's. The cost of land, bridge, and approaches has been about 4,000l. The contract was let to Mr. Krauss, and the bridge has been constructed from plans prepared by the City Engineer, Mr. Yabbicom.

FARINGDON (BERKS) WATER SUPPLY.—These works have recently been completed, at a cost of about 5,700l., from plans prepared by Mr. Geo. Winship, Assoc. M. Inst. C.E., Oxford, and comprise a pumping scheme, with deep well pumps and oil engines, both in duplicate, and service reservoir. The contractors were, for reservoir engine-house, mains, &c., Mr. H. Roberts, West Bromwich; for engines and pumps, Messrs. Hornsby & Sons, Grantham.

FOREIGN.

FRANCE.—M. Jean Boucher, the sculptor of the fine group "Antique et Moderne," which was illustrated in the *Builder* two years ago, has received the Prix National of the Salon in respect of this work, the marble edition of which is in this year's Salon. In the Section of Architecture, travelling studentships have been awarded to M. Faure-Dugarrie for his "Monument aux héros de l'Indépendance," and to M. Paquet for his "Projet d'École de l'Art Décoratif."—At the Ecole des Beaux-Arts a lady student, Mlle. Rondenay, has obtained the Huguier prize, a circumstance which justifies the action of the authorities in admitting women to the schools.—The remains of President Faure have been transferred to the monument in Père Lachaise, designed by M. Saint-Marceaux, which bears a bronze figure of the late President on a pedestal of grey marble, partly draped by a French and a Russian flag, folds of both of which are grasped.—The decoration of the larger Art Palace on the Champs Elysées is to be completed shortly by the addition of two quadrigas in hammered copper, which have been commissioned by the Government from M. Reipon.—The Municipal Council of Paris has decided on the rebuilding of the ancient church of St. Antoine des Quinze-Vingts, at the estimated cost of about 80,000 francs.—The Council of Paris has also under consideration a scheme for the acquisition of the celebrated Hôtel of Mme. de Paiva in the Champs Elysées, in order to transfer to it the mairie of the Eighth Arrondissement, at present installed in an old and inconvenient house in the Rue d'Anjou. The Paiva Hôtel is well known for its artistic collections, especially the decorative paintings by Baudry.—M. Ulysse Gravigny, architect to the Administration Centrale at the Prefecture of the Seine, has died, after a long illness, at the age of fifty-seven. He was a pupil of Constant-Dufeux, and had collaborated on the greater part of the works of architecture carried out for the municipality during twenty years. He undertook last year the pavilion on the Cours la Reine and the arrangement of the Municipal Exhibition. He was Chevalier of the Legion of Honour.—We have to record the death, at the age of fifty, of the sculptor André Massoule, whose fine monument to Jean Macé formed a central feature in the sculpture court of the Salon this year, and is to be erected in Paris on the Place Armand Carrel. Massoule was a pupil of M. Salmon and M. Cavelier. He had obtained various medals at successive Salons, including the Gold Medal in 1900. The statue of Mme. de Sevigné which decorates the house of the Legion of Honour at St. Denis is by his hand, also the group of "Aurora et la Rosée," much remarked in the Salon of 1896; also the Carnot monument at Chalons-sur-Marne, and a decorative figure on the Pont Alexandre III.

AUSTRALIA.—The Institute of Architects of New South Wales have sent us (rather late in the day) their programme of meetings for next session, several of which however are now over; but it may be of interest to give the list of meetings and papers, as showing what subjects are interesting this Colonial Architectural Society:—March 6, inaugural meeting, President's address; March 28, business meeting; April 17, ordinary meeting, paper by A. F. Evans, Associate, on "Quantity Surveying in Australia"; May 23, business meeting, nomination and election of members, followed by ordinary meeting, two or three short papers on the subject of "Decoration as Applied to Architecture"; June 20, ordinary meeting, paper by Cyril Blacket, Fellow, entitled "A Building Book of Standards," papers on "The Institute of Australasian Architects"; July 18, business meeting, nomination and election of members, followed by ordinary meeting, papers on "The Electric Lighting of Houses"; August 22, ordinary meeting, paper on "Theatre Construction," by R. Charles Backhouse; September 10, business meeting, followed by ordinary meeting, two or three short papers on the subject of "The Improvement of Sydney"; and October 17, annual general meeting.

OFFICIAL APPOINTMENT, LOCAL GOVERNMENT BOARD.—It is announced that, consequent upon the retirement of Mr. P. Gordon Smith, the President has appointed Mr. Brook Taylor Kitchin to be Architect to the Local Government Board.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The address of the Institution of Junior Engineers, on and after July 1, will be 39, Victoria-street, Westminster, rooms having been taken there on the first floor for offices, reading-room, library, &c. —Messrs. Walter J. Pearce, of Manchester, workers in stained glass, have appointed Mr. Leonard Laskey, to Newman-street, London, as their representative. —Mr. James C. Gibson, lock manufacturer, Wolverhampton, has appointed Mr. W. Harvey Stringer, of 9, Southampton-row, Holborn, as his London agent.

ELECTRIC LIGHTING FOR HACKNEY.—On the 19th inst. the members of the Hackney Borough Council paid a visit of inspection to the works now in course of construction at Millfields-road, Clapton, from which a supply of electricity is to be generated for the lighting of the streets, houses, and shops of Hackney. The engines will be worked from two boiler houses, in one of which the dust and refuse of the borough will be consumed; the other set of boilers will be worked by coal. The party was shown over the buildings by Mr. Robert Hammond, the Council's electrical engineer.

HOUSING QUESTION, BIRMINGHAM.—The City Council of Birmingham devoted a sitting recently to discussing problems affecting the housing of the poorer classes, and rejected a scheme, on which the Health Committee had spent much time, to erect 600 workmen's dwellings on a site on the outskirts of the city. The arguments against the proposal were chiefly the distance of the proposed site, and the objection to dealing with the housing question piecemeal, and several councillors advocated provision of cheap flats in the centre of the city.

SOCIETY FOR PROMOTING THE BUILDING OF CHURCHES AND CHAPELS.—This Society held its usual monthly meeting on Thursday, the 20th inst., at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., the Hon. Richard Strutt in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Great Bard, St. John the Evangelist, Essex, 150*l.* for the first portion; Hornsey, St. Luke, Middlesex, 75*l.* for the first portion; and Palfrey, St. Mary and All Saints, Walsall, Staffs, 1,000*l.*; towards rebuilding the Church of St. Mary, Swaffham Prior, near Cambridge, 100*l.*; and towards enlarging the Church of St. Faith, Stoke Newington, Middlesex, 25*l.* A grant was also made from the special Mission Buildings Fund towards building St. Luke's Mission Church, Leyton, Essex, 20*l.* The following grants were also paid for works completed.—Knowle, St. Martin, Bristol, 500*l.* on account of a grant of 1,000*l.*; New Found Pool, St. Augustine, Leicester, 100*l.* (making in all 600*l.*); on account of a grant of 1,000*l.*; Hammersmith, Holy Innocents, Middlesex, 125*l.*; Gillingham, St. Barnabas, New Brighton, Kent, 50*l.*, balance of a grant of 150*l.*; Clapham Rise, St. John, Surrey, 15*l.*; and Arlesey, St. Andrew, near Hitchin, 25*l.* In addition to this, the sum of 122*l.* was paid towards the repairs of fourteen churches from trust funds held by this Society. The grants made at this meeting have exhausted the funds at the disposal of the Committee, and they appeal for subscriptions and donations to enable the Committee to meet more adequately the many pressing applications for aid, which are being continually brought before them.

ITALIAN MARBLE AND ALABASTER.—Reporting on the trade and commerce of Italy for the year 1900, the British Consul-General states that, as compared with 1899, there was a falling off in the marble and alabaster production, due to decreased exportation to the United Kingdom and the United States, which are the chief purchasers. The figures for 1900 were, nevertheless, above the average, the quantities for the last five years having been: 1896, 1,340,372 cwts.; 1897, 1,236,182 cwts.; 1898, 1,342,562 cwts.; 1899, 1,617,440 cwts.; 1900, 1,430,598 cwts.

YORKSHIRE FEDERATION OF BUILDING TRADE EMPLOYERS.—The monthly meeting of the Yorkshire Federation of Building Trade Employers was held at the Savings Bank, Scarborough, recently. Mr. Longin, its president (Sheffield), occupied the chair, and the members of the executive present included Councillor Mansfield (York), Messrs. Good, Umphey, Townsley, Goat, and Hebblethwaite (all of Hull), Thompson (Dewsbury), Dawson (Huddersfield), Mavson (Bradford), Judge (Wakefield), Lyon (Malton), Kennard and Gardham (Bridlington), A. W. St. Clair (Scarborough), and G. Sinfild (Hull), newly appointed secretary. The Scarborough Association was represented by Mr. A. W. St. Clair (president), Councillor Bland (ex-president), and Messrs. W. Malton, A. Moore, T. Garam, T. E. Jowsey, R. Hunter, J. Atkinson, A. Bell, W. Coultas, S. Manson, and R. H. Carr (hon. secretary). During the last seven months the Federation has suffered the loss by death of both presidents (Mr. J. Spink, Sheffield) and secretary (The Rev. H. Howland). It was reported that the master builder of Malton had joined the Federation, and that steps were being taken to form a branch there. The meeting lasted nearly four hours, the principal question for discussion being the Bradford dispute. The representatives from Bradford explained the position of the dispute with the masons and joiners, and reported that the Mayor had tried his best to

settle the various questions in dispute, and that they were exceedingly sorry that he had not been successful. The meeting resolved unanimously to support the Bradford and Shipley employers by every legitimate means during the dispute.

APPOINTMENT OF SANITARY OFFICERS.—The Local Government Board has sanctioned the appointment of the following sanitary officers: Dr. W. Collingridge, medical officer of health, City of London; Mr. A. H. Walker, sanitary inspector in St. Pancras; Mr. G. A. Smith, sanitary inspector in Hampstead; Messrs. G. F. Clark and G. J. Gregory, sanitary inspectors in Holborn; Mr. C. T. Bacon, sanitary inspector in Islington; Messrs. J. R. Bagshaw, E. J. Bennett, G. W. McQuinn, and A. A. Lindon, and Miss G. A. Looker, sanitary inspectors in Kensington; Miss G. D. Bevan, sanitary inspector in Camberwell.

SOCIETY OF ARTS.—The annual general meeting of the Society of Arts was held on Wednesday, the 26th inst., at the Society's house in the Adelphi. Fifty-seven members were elected, this making the total elected during the present session of the Society 376. The Report of the Council was read by the Secretary. It summarised the proceedings of the Society during the last twelve months, giving an account of the various papers which had been read, and the work of the Society's different Committees. Amongst other matters referred to was the resignation of the Presidency of the Society by the King, who, as Prince of Wales, held the office from 1863. His Majesty, however, while ceasing to be President has become Patron of the Society. During the year a committee of the Society has produced an important report on Leather for Bookbinding, which will be published in a few days. This committee has determined the causes which produce decay in modern leather bookbindings, and recommends a method of manufacture which ought to be free from the usual defects. Over 15,000 candidates entered for the Society's annual examinations, the results of which are now in course of issue. At the conclusion of the reading of the Report the result of the ballot for the election of the new Council was announced, the President for the coming year being Sir Frederick Bramwell, Bart., F.R.S.

CAPITAL AND LABOUR.

THE BUILDING TRADE DISPUTE IN BRADFORD.—Another meeting of the master and operative joiners was held at the Town Hall, Bradford, on the 22nd inst., the Mayor (Mr. W. C. Lupton) presiding. A long discussion on the point at issue took place, but neither party being willing to consent to any modification of its terms, the meeting was concluded without any definite results being arrived at. The negotiations, however, have not been entirely broken off, and the Mayor has expressed himself as being still hopeful of bringing about a settlement.

LEGAL.

BUILDER'S SUCCESSFUL APPEAL.

The case of Matthews v. Strachan came before a Divisional Court of King's Bench, composed of Justices Ridley and Bigham, on the 20th inst., on the appeal of Mr. Matthews from a conviction of Justices under Section 25 of the Public Health Act, 1875. It appeared from the special case which had been stated that an information had been laid by the respondent Strachan, the Clerk to the Harrow Urban District Council, against the appellant for erecting a house in Lyon-road, Harrow, without constructing such covered drains thereto as on the report of the Council's Surveyor appeared to the Council necessary for the effectual drainage of the house contrary to Section 25 of the Public Health Act, 1875. The Council had laid two sewers in Lyon-road North within 100 ft. of the site of the house, one being for the reception and conveyance of surface water only, and the other for the conveyance of sewage only. Before erecting the house the appellant deposited plans in accordance with the bye-laws under Section 157 of the Public Health Act, 1875. The Council approved the appellant's plans, subject to the requirements contained in the report of their Surveyor as to the requirements for the effectual drainage of the house. The next day the respondent wrote to the appellant enclosing a copy of the Surveyor's report, and calling upon the appellant to lay the drains in accordance with the report. The appellant did not lay two drains as required by the notice and report, but one only in the manner shown in his deposited plans. The Surveyor for the Council before the Justices admitted that the drain laid by the appellant would have been effectual if there had been only one sewer in Lyon-road, and that his reason for reporting that separate drains ought to be laid—one for sewage and the other for surface water—was that it was desirable that sewage only should be discharged into the sewage sewer and surface water only into the surface-water sewer, and that there were separate sewers for sewage and for surface water in Lyon-road. The Justices held that they had no jurisdiction to question the reasonableness of the requirements for the effectual drainage of the house, and convicted the appellant.

At the conclusion of the arguments of counsel that the Justices allowed the appeal and quashed the conviction, holding that Section 25 of the Act only empowered the Local Authority to take into consideration certain matters, viz., the size, material, level, and fall, in order to satisfy themselves whether the drain proposed was effectual for draining the house.

Mr. McCall, K.C., and Mr. A. F. Jenkin appeared for the appellant, and Mr. Macmorran, K.C., and Mr. S. G. Lushington for the respondent.

EMPLOYERS' LIABILITY ACT.

'FACING BOARDS' ON A SPINDLE MACHINE—A QUESTION OF A FOREMAN'S DUTY.

AT Brompton County Court on Monday, before Judge Stonor and a jury, William Ernest Parkes, described as a machinist's improver, 43, Whitecliff-road, Lavender Hill, S.W., suing through his father, William Robert Parkes, sought to recover damages under the Employers' Liability Act, from Messrs. Allen & Norris, builders, &c., Ashcombe House, Wandsworth Bridge-road, S.W., the claim being in respect of personal injuries sustained by the plaintiff, owing, it was said, to negligence on the part of the defendants or their servants.

Mr. W. M. Thompson, counsel, appeared for the plaintiff, and Mr. Kisch, counsel, defended.

Mr. Thompson explained that the plaintiff, who was twenty years of age, entered the employment of the defendants last October as a machinist's improver, receiving 7*d.* an hour. On January 14 the plaintiff was working a vertical spindle machine which had two knives, and was worked at 4,000 revolutions a minute. The plaintiff was told by the foreman to hevel some meeting sash rails, which he had almost completed the work, one of the rails having a large knot near the end, first coming in contact with the knives, suddenly flew out, causing the knotty end to get in between the "fences," and in a second all four fingers of the plaintiff's left hand were off.

The plaintiff bore out his counsel's opening statement. He added that, just before the accident, he asked the foreman, Page, whether he ought to put on a "facing board" as a protection, but the foreman said that he should not do so, as they never used such boards for working meeting rails. Since the accident he had only been able to earn 4½*d.* per hour.

Cross-examined: It was not a fact that he was engaged by the defendants as a fully-qualified machinist. He added that, just before the accident, he asked the foreman, Page, whether he ought to put on a "facing board" as a protection, but the foreman said that he should not do so, as they never used such boards for working meeting rails. Since the accident he had only been able to earn 4½*d.* per hour.

Mr. William Robert Parkes, the plaintiff's father, a carpenter and machinist, maintained that the spindle machine being so "complex and dangerous," was the last for an improver to be put to, and that it should always have a facing board.

Mr. Cyril F. R. Johnston, an Inspector under the Factory Acts, said he considered that a spindle machine ought not to be worked without a fence or guard of some kind.

The Judge: Do you think that the machine could be worked safely without a facing-board? Witness: It might be, but I certainly think that it ought to have a fence or guard.

For the defendant, Mr. Thomas S. Page, 78, Chaybrook-road, S.W., the foreman referred to by the plaintiff, denied that he had ever told Parkes that it was unnecessary to use a facing-board for bevelling work. It was not true that plaintiff asked him, just before the accident, whether he ought to use a facing-board. He did not consider it a foreman's duty to see that the men under him used a facing-board or guard on their machines. The adjusting of a machine, and the question of using a knotty piece of wood was left to the men's own discretion. There were plenty of pieces of wood lying about which the plaintiff might have used as facing-boards.

Mr. Arthur Foales, manager of the defendant's Joinery department, said that when he engaged the plaintiff he father said that the young fellow had been working four and a half years as a machinist. The word "improver" was not used. He did not think it a foreman's duty to tell the men to put facing-boards on their machines.

Mr. William S. Page, a foreman machinist, said that he did not think the facing board was much protection on a spindle machine. He considered that the foreman's duty was to let the men use their own discretion as to the use of the facing board.

Mr. J. Davis, M.R.C.S., &c., gave evidence as to the injuries.

Mr. Richard Goodfellow, manager to Messrs. Jay, timber merchants, said that he had had a good deal of experience with wood working machinery, and he considered that it was a foreman's duty to leave to the men the question of using a facing board. The jury found (1) that a facing board was a necessary and proper precaution in connection with the work in question; (2) that the foreman, Page, actually told the plaintiff on the day of the accident not to use the facing board; (3) that the foreman did not tell the plaintiff to use the board or not at his discretion; (4) that the foreman was guilty of negligence as to the performance of his duty in so doing; (5) that the plaintiff did not know the full

risk of not using the facing board; (6) that he did not willingly accept the risk; (7) that the plaintiff incurred his injuries through the misdirection of the foreman. This was a verdict for the plaintiff, in whose favour the jury assessed the damages at 200l.

His Honour gave judgment accordingly, and allowed full costs.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

3,545.—AN INSULATING CONDUCTOR: M. Frank.—An insulating conductor for electrical purposes consists of spun or other waste silk fibre which has been separated from a mixture of vegetable and silk fibres by means of a carbonising process whereby hydrochloric acid destroys the vegetable fibre that is subsequently removed.

3,584.—A CONTRIVANCE FOR KILNS: J. W. Briggs.—The inventor seeks to utilise the waste heat in brick and tile kilns after the "Scott" or "Dutch" kind, the flues of the kiln with glass tubes or pipes which join the chimneys of one kiln and the inside of another kiln and causes the flues to discharge on the floor of the kiln in which the waste heat is to be utilised; he also provides supplementary flues that extend from some of the chimneys into a main shaft, so as to set up a draught.

3,588.—A TEST FOR ELECTRICAL PURPOSES: F. de Mare.—A change in the colour of a liquid at electrodes will indicate a direction of current; the contrivance embodies a tube of boron or other insulating material, near one end of which are side openings covered with glass, together with a partition that lies between the ends; the ends and side pieces are closed with plugs, upon two of which are mounted electrodes; different lengths of liquid resistance between the electrodes are to be obtained by partly filling the tube (which can be used with either end uppermost) with liquid; the electrodes may be fashioned as wire forks, and two parallel glass tubes joined at the ends may be substituted for the partition, set lengthwise, in glass tubes.

3,590.—WATER-WASTE APPLIANCES: F. Wangelin.—In the case of ball-valves, the screwing of a disc in either the one or the other direction will serve to control the stroke of the plug as the pressures vary in amount, and a screwed stem or a screw in a lug upon the float area is used for further adjustments; a loop upon the inner end of a lever carries a glass bell, from the crown of which the stand-pipe is also hung in a loop; the lower end of the pipe moves between guide-rods, and is weighted. The pipe will adapt itself as an overflow when the glass bell is not used.

3,611.—FACING OF TILES, PLATES, AND SLABS: I. H. Storey and W. E. McCalla.—Enamel which contains sawdust or some such combustible substance is applied to the backs of the tiles or plates (for ceilings, floors, walls, sinks, baths, &c.) to render them roughened or pitted to make a key with the cement. The enamel becomes fixed as the sawdust is consumed, when the tile or slab is fired. In the case of tiles, &c., of glass or earthenware the sawdust may be pressed into the soft material during the process of moulding. Coarse canvas, with or without an enamel filling, may be adopted instead of sawdust.

3,626.—A METHOD OF FIXING HANDLES IN TOOLS: F. H. Sohn and F. Thiel.—A wedge having shoulders and sharp edges is devised for fixing the handle of a hammer, an axe, or similar tool. Nails are driven into two holes cut in opposite directions in the wedge; the wedge and nails are forced further together, so that the nail points shall be turned up so as to prevent them from dropping out.

3,632.—A TOOL FOR USE WITH RED LEAD: W. Johnson.—The invention relates to the use of red lead in making water-tight and other joints. In the cylinder that holds the red lead is a piston which is loosely connected to a screw passed through a screwed cap, and having a handle. A cock controls the flow of the red lead through a nozzle which, being threaded, can be screwed into a tapped hole in a plate that has been riveted in its proper position, whilst a screwed plug closes the hole when the red lead has been forced behind the plate.

3,669.—A VENEER-CUTTING MACHINE: F. Kraus.—Guides for the knife-bar are affixed to standards, and a link joins the knife to the top of the framing so that it shall make a drawing cut as it travels sideways when the cranks move it downwards; a contact-bar, which may be shifted for regulating the thickness of the board, has its carrier pivoted on to the knife-carrier, and remains parallel to the knife. Levers, to be adjusted with screws and pivoted on to eyes upon the knife-carrier, adjust the place of the contact-bar, and if a knot, &c., comes against the bar the levers will give way by means of springs that are placed between the sliding portions of the machine.

3,671.—A PRESS FOR THIN VENEERS: F. Gröning.—Each of the stamps in the press has a foot in its middle which a spring will force outwards, which means the pressure can be freely employed at the centre so as to press out blisters, ridges, and other inequalities. Springs carry the table, and there are guiding bars for the stamps, which are worked with screws.

3,685.—A LIFTING-SLING: M. Enright.—A frame has recesses into which are slipped the eyes at the ends of the rope; when the load has been laid upon the sling the height is passed underneath the hooks, and then the lifting-hook is brought into engagement; the contrivance can be used with a chain.

3,717.—AN APPLIANCE FOR DRAIN PIPES AND TRAPS: W. P. Little.—By way of interposing an obstacle against the return of the soil, the passage of rats, and so on, the inventor fits a loosely-hinged flap which bangs within a cross-cut of the trap or pipe and makes it fast with a cover.

3,739.—A FLUSHING APPARATUS: H. Samsy.—For starting the main flush a bell is lifted or depressed in the customary manner. A siphon forms a communication between a well at the base of the bell and the pipe, and a pipe from the crown of the siphon is turned into a small vessel or container within the tank that holds water which will serve for an after-flush.

3,749.—ARTICLES OF ARTIFICIAL STONE: A. C. F. P. Thaarup and S. F. A. Dohlmann.—The inventors provide for the making of plaques, tiles, and similar goods of artificial stone without employing pressure or heat. They form an admixture of magnesium-chloride solution, magnesite, gravel or sand, water, and a colouring matter which is first exposed to become set in moulded shapes and is then air-dried. For objects having smooth surfaces they use glass or glass-lined moulds. Designs, pictures, and so on that have been made upon the surface of the glass and dried will, the inventors claim, become transferred on to the surface of the next cast article, the picture being made with a mixture of the above-named ingredients, the sand excepted.

3,765.—A GUARD FOR CIRCULAR SAWS: W. T. Ford & J. Pickford (Ford & Pickford).—To the usual radial arm is pivoted a hood, made of perforated iron or open wirework, that can be folded backwards so as to point upwards. A vertical pillar carries the radial arm, which can be turned round about it, or in another form the arm may be lifted or lowered upon the pillar.

3,797.—SWIVELS FOR CRANE-CHAINS, &c.: T. P. Hovell.—A link, a guide-washer, an eye-bolt, and a spring combined constitute the swivel. A band may be taken over a widening of the end of the link, and a hook-bolt may replace the eye.

3,808.—APPLIANCES FOR USE WITH WATER-WHEELS: F. Turina.—The wheel-shaft is set in blocks which slide in guides and are secured to the ends of a rope or chain carried over rolls; a weight heavier than the wheel, together with its bearings and shaft, hangs above from the chain; a similar chain or rope is attached to the blocks, and carries a weight which, when partly immersed in the water, will just counterbalance the parts so as to lift or lower automatically the wheel concurrently with a change in the water level. For lifting the wheel out of action the latter weight is taken away. Provision is made for the replacement of the weight by means of a roller-guided chain or cord, and also for altering the gearing at the remoter end of the wheel-shaft, to meet variations in the relative positions of the wheel.

3,812.—FITTING FOR KILNS FOR CALCINING CEMENT, &c.: C. Garman.—The discharge fittings, adapted for rotary furnaces or kilns, are intended to obviate the admission of air. A set of pockets having oppositely-hinged doors both above and below is disposed around the lower portion of the periphery of the inclined rotating cylinder, and as the cylinder is revolved the rollers of the doors will run upon their guides. Every door drops open as it reaches a gap, whilst the door at the top becomes closed before the door at the bottom is opened; so no air can enter, since the two doors are never open at the same time, and the material will fall into the pocket, whence it is discharged over the gap.

3,868.—A CONTRIVANCE FOR USE WITH TRAPS FOR CLOSETS AND DRAINS: J. Bruce.—A rectangular opening is made in the crown of the siphon-trap, three of the sides of the opening being undercut and the fourth being left opened so that it may be closed, when it is desired, with a plate which slides for that purpose.

3,882.—TIP-VAN AND WAGGONS: R. Knill and E. Knill.—From the middle of the bolt by which the body of the wagon is hinged to the under-carriage is suspended a curved rod which is joined to the back of the body with a spring-rod, and to the back of the front-carriage with a jointed rod; when a bar is liberated from its hooks the tipping action is set in motion with springs, whilst other springs act so as to restrain the fall of the body of the van or wagon.

3,992.—MEANS OF MEASURING ELECTRICITY: A. G. Electricitätswerke vorm. O. L. Kummer & Co.—The axle of a volt-meter is sustained between pivots and carries a pointer, together with an adjustable sleeve equipped with vanes that will move from between fixed metal plates towards curved metal rods. The plates, vanes, and rods are arranged at different angles in order that the evenness of graduation of the scale traversed by the pointer may be increased. The vanes and plates are connected to the terminals and the rods to the other terminal, and in order that the measuring parts may not be exposed to an excess of electrical pressure an adjustable discharger is set in connexion with the terminals.

3,994.—BUTT-AND-FLANGE JOINTS: J. A. Atton.

—For steel and wrought-metal flanged pipes a yielding or jointing strip of metal is electrolytically deposited upon the flanges. Around the curved flange is deposited copper or similar metal in the shape of a ring, and the pipes can be drawn to one another by means of loosely-fitting rings that encompass the flanges.

MEETINGS.

FRIDAY, JUNE 28.

Carpenters' Company.—Carpentry Examination, Practical Work, 155, Great Titchfield-street. All day.

SATURDAY, JUNE 29.

Architectural Association.—Visit to Colney Chape Convect, St. Albans.
Carpenters' Company.—Carpentry Examination, viva voce, Carpenters' Hall, 12 noon.

WEDNESDAY, JULY 3.

Royal Archeological Institute.—(1) Mr. F. G. Hilton Price on "Clay Tobacco Pipes of the Seventeenth Century"; (2) Mr. J. C. Stebbing on "Early Churches of Asturias"; (3) Professor B. Lewis, M.A., F.S.A., on "The Antiquities of Toulouse." 4 p.m.
Builders' Foremen and Clerks of Works' Institution.—Ordinary meeting of the members. 8 p.m.

SATURDAY, JULY 6.

Institution of Junior Engineers.—Visit to the Staines Reservoirs Works, under the guidance of the joint engineers, Messrs. Walter Hunter and K. E. Middleton, M.A. Inst. C.E. Train leaves Waterloo (South-Western Railway) at 1.25 p.m.
Northern Architectural Association.—Annual excursion, Edinburgh.

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

Table listing property sales with columns for location, details, and price. Includes entries like 'Hinton to—By MARK JEANS (at Swindon)', 'Clapham Park—Rodenhurst-rd., 74 plots of freehold building land (in lots)', 'Printed, Sussex—Two houses, cottage, home-stand, and 8a. 31. 27 p. c.', etc.

Table listing property listings with columns for location (e.g., Camden Town, Kentish Town), area, and price. Includes entries like 'Camden Town—26, High-st., & 9, Little King-st., u.t. 271 yrs., g.r. 547, r. 904.' and 'Kentish Town—1 to 5, Hamrod-grove, u.t. 181 yrs., g.r. 271, r. 904.'

Table listing property listings with columns for location (e.g., Hammersmith, Kensington, City of London), area, and price. Includes entries like 'Hammersmith—16 to 24 (even), 25, 27, 29, 33 to 39 (odd), Stenfordale-rd., u.t. 76 yrs., g.r. 964, r. 454.' and 'Kensington—23, Bolingbroke-rd., u.t. 92 yrs., g.r. 87, r. 432.'

Table listing property listings with columns for location (e.g., Islington, Camden Town, Folkestone), area, and price. Includes entries like 'Islington—7, Noel-st., f. r. 504.' and 'Camden Town—18, Rochester-ter., u.t. 421 yrs., g.r. 61, r. 601.'

CONTRACTIONS USED IN THESE LISTS.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; e.r. for estimated rental; u.t. for unexpired term; p.a. for per annum; y.s. for years; s.t. for street; r.f. for road; sq. ft. for square ft. for place; ter. for terrace; cres. for crescent; yd. for yard.

PRICES CURRENT OF MATERIALS.

Table listing prices for various materials such as Hard Stocks, Lumber, and Bricks. Includes entries like 'Hard Stocks — 1 1/4 0 per 1,000 alongside, in river.' and 'Lumber — 2 11 0 per 1,000 alongside, in river.'

collection of prints and pictures as well as statistics. On the other hand are the Governmental insurance offices, such as those of Bavaria and Gotha, which show what they have done and are doing. Included in this section we may notice the contribution of the British Fire Prevention Committee, who show a model and plan of their testing-station, and photographs of some of the tests they have carried out.

ILLUSTRATIONS OF THE BIBLE.

THE attempt to illustrate scenes and personages in the Bible has been the occasion of the production of some of the greatest works in the art of painting. The mention of the subject at once recalls Michelangelo's sublime floating figure of the Creator on the ceiling of the Sistine Chapel, and his beautiful figure of Adam; Da Vinci's "Last Supper," and Raphael's cartoons and his picture of the Transfiguration. Painters of an earlier school, such as Orcagna and Signorelli, found a kind of fascination in the attempt to represent the solemnity and mystery of the Last Judgment, which also Michelangelo has represented in a manner more remarkable for vigour of execution than for solemnity or spirituality of conception. The subjects most often represented are perhaps the Nativity, the Crucifixion, and the Resurrection, and the second of these more especially, as embodying the central article of the Christian faith. Many other incidents both of Old and New Testament history have however, been made the subject of pictures by painters more or less eminent, and it would be possible to make a tolerably complete illustrated Bible from engravings or other reproductions of existing pictures. M. Tissot alone has produced a whole series illustrating the life of Christ, and a series of great and remarkable merit.

From time to time, however, there has been an endeavour to apply what may be called "book-illustration" to the Bible; illustrations made especially for publication in book form, bound up and interleaved with an edition of the Bible. There have been probably a great many more attempts of this kind than is generally known; illustrated Bibles which are long since out of print and become the treasures of collectors, and in which the naïveté of the illustrations would be too much for the reverential feelings even of children of the present day. There have been occasional attempts in modern times, however; of which the last one of importance, before the one which suggested these remarks, was that in which the illustration was confided to Gustave Doré, an artist of no sincerity or earnestness of aim or feeling, but who had ascertained that there was a large public in England for religious paintings, and made a fortune, or should have done, out of their credulity in taking him for a genius and a religious painter. To turn over the Doré Bible now is only to feel a kind of stupefaction over the fact that such commonplace and clap-trap illustrations as these should ever have been seriously accepted by accredited art-critics (as they certainly were) as an important contribution to the illustration of the Bible. The Doré Bible may still possibly find acceptance in the homes of the poorer and less educated classes, but for any others it is worthless.

Nevertheless, bad as these illustrations are, we are inclined to think that the system was the right one, of putting the illustrations to a whole edition of the Bible into the hands of one artist, provided that the right man were found. For it is only on this system that we can have a publication which is consistent and homogeneous in character, as an illustrated book. That success is possible in this way is proved by such a work as Flaxman's illustrations to the "Iliad" and the "Odyssey," and in a lesser sense by those to the "Divina Commedia," which are only inferior in so far as Flaxman's genius was more in sympathy with classic than with mediæval subjects. If it is difficult to find a single artist adequate to the task of illustrating the whole Bible and willing to undertake it, the next best thing would be to classify the subjects, giving a particular section to each artist—one undertaking to illustrate the Pentateuch, another the Prophets, another the Gospels and Acts of the Apostles, and so on. There would then at least be a unity of treatment in regard to each of the main sections of the Bible.

It is the want of any such scheme as this which is the weak point of the new illustrated *édition de luxe* of the Bible, the original drawings for which are on view at the Holland Fine Art Gallery in Grafton-street. Not only has there been no attempt at securing consistency of treatment, but the promoters of the work appear to have purposely aimed at a kind of popular *tour de force* in securing the assistance of leading artists of all countries and all (modern) styles, who seem to have been engaged simply for their names, without the slightest consideration of their inherent fitness for the treatment of sacred subjects. The result is the most extraordinary medley of drawings in all kinds of different styles and different methods of execution; and what is a more serious discrepancy, there is no common ground among them as to the spirit in which the scenes are to be treated. Some are realistic and modernising, and what may be called "anecdotal" in conception; others are more or less conventional, religious, or symbolical. What kind of common ground in illustration can be occupied, for instance, by Mr. Walter Crane, Herr Von Uhde, and M. Rochegrosse? The very collocation of the names sounds absurd. Mr. J. M. Swan is no doubt useful when it comes to illustrating Daniel in the lion's den, otherwise it is difficult to understand how he came to be thought of as a Bible illustrator, any more than M. Rochegrosse, whose reputation has been made in a class of work about as little associated with religion or spirituality as can be. Herr Von Uhde is a thoughtful painter who has seriously given himself to the study of the life of Christ and the endeavour to realise it in art; we do not always agree with his views, but he is at all events an earnest student of the subject. But he is evidently selected not on that account, but merely to represent one more school and nationality in the list. The promoters have not in fact been aiming at an adequately and seriously illustrated Bible, but at the production of a volume which shall show as great a variety of artists as possible for the money. That is not the spirit in which to do it.

Among the drawings exhibited those of M. Gérôme take the first place. They are all well-conceived and seriously-treated compositions, combining dignity of style

with a great deal of dramatic force and character; and he has not made the mistake of aiming at too piquant a realism, or treating Bible-scenes in an ultra-modern style. Signor Michetti's "Saul on the way to Damascus" after seeing the heavenly vision, is an example of what we mean; Saul is represented grovelling on the ground with his mouth wide open in a paroxysm of terror. This may be realism, but it is a realism degrading to the subject. This treatment of the Bible in a *genre* spirit seems the besetting sin of the Italian contributors; Signor Morelli's "Prodigal Son" is another example; it reduces the beautiful incident of the reception of the prodigal by his father to sheer commonplace; and the "Song of Solomon" is illustrated by a scene in a suburban garden. Herr Max Liebermann is pathetic in his picture of Job and his friends, but how far inferior to the spiritualised pathos of Blake's illustration of the same scene. Mr. Abbey's angels, and his Deborah singing her song of triumph, are wholly deficient in dignity; the only case in which he rises to the height of his subject is in the figure of "Christ Standing at the Door," which is really fine; and he has given a forcible conception of Jael after killing Sisera, representing her as what she must have been, a vigorous but coarse personality, with none of the tenderness of woman about her. M. Benjamin-Constant is somewhat theatrical in his effects, but not without dignity, and his "Christ Raising Lazarus" is a fine composition. M. J. P. Laurens's "Jephthah's Daughter" and "Ruth and Boaz" are finely composed pictures; Herr Kampf, in his picture of "Christ Riding into Jerusalem," has given one of the most disagreeable conceptions of Christ that we have ever seen; he suggests a personage in one of Mr. Gissing's novels rather than the Saviour of the world. Other German contributors have appreciated their subjects better: Herr Von Uhde, to whose work one naturally looks with interest—his scene where Abraham embraces Isaac in a rapture of paternal affection on receiving the command to spare him, is truly fine and pathetic; and Herr Vriendt, in "Jesus blessing little children," has combined realism with tenderness. In "The Angel appearing to the Shepherds" Herr Edelfelt has given us the only angel figure in the collection which is expressive of the beauty and love which one might imagine to characterise an angel ministering to human beings. Most of the angels in the pictures are commonplace; some are positively ugly. One of the finest and most poetic of all the illustrations is furnished by Mr. Briton Riviere; about the last person, from our general knowledge of his pictures, to whom one would have attributed this fine conception of the subject, "The Spirit of God moved upon the face of the waters." It is a shoreless expanse of water with a half suggestion of a bright presence in the distance, whose light is partially reflected in the water. This is a conception quite in the spirit of Milton.

The whole collection, in an artistic point of view, is exceedingly interesting, and well worth a visit; the variety of style and treatment increases its interest as a temporary exhibition. It is as a set of permanent illustrations for a single edition of the Bible that we think it defective, from want of any fixed or dominant aim in the whole, and (in many cases) a lack of dignity of conception and elevation of style in dealing with sacred subjects.

NOTES.

The New Government Offices. IN our last issue we recorded the reply of the First Commissioner of Works to a question asked in the House of Commons as to what course was to be taken in carrying out the War Office and the Government Offices in Great George-street, both the architects of which have unhappily died before their buildings were commenced. The War Office, as our readers are aware, is to be carried out by Mr. Young's son, in conjunction with Sir John Taylor, and the reply was given to that effect. The reply with regard to the building in Great George-street was less reassuring; it was to the effect that "the completed plans and drawings are in the hands of the Office of Works, and can be carried out either by the Department's architects or by an architect specially selected for the purpose." We hear, with consternation, that the Treasury (in the true spirit of the English Government in dealing with works of art) wish to save a special architect's fee by having the building carried out by the Office of Works. Such a proposal ought to be strenuously resisted. The detailing of a design is often the most important part of the architect's work in regard to its final effect in execution; and it would be especially so in the case of Mr. Brydon's design, which was not marked by any great or startling originality of general conception, and would depend for its effect very much upon the careful treatment of the detail, a matter to which Mr. Brydon always gave the greatest attention in carrying out his buildings. If the building is allowed to be carried out by the Office of Works Department, it will infallibly be spoiled. An architect of eminence, and experienced in classical detail, ought to be appointed to carry out the work, not only in justice to the late Mr. Brydon, but in justice to the public, whose money is being spent upon the building.

The Safety of St. Paul's. It has lately been suggested by Mr. W. Emerson, in a letter to the *Times*, that the vibration that may be expected to follow the working of the City and Piccadilly railway will possibly affect the future stability of St. Paul's Cathedral. Coming as it does from the President of the Royal Institute of British Architects, this proposition is not one to be dismissed lightly, and it will no doubt receive due consideration at the proper time. The author of the suggestion says "there would be in all probability a very real danger were this Bill passed," having apparently arrived at this conclusion in consequence of a statement by Wren relative to the injurious effects of incessant vibration. We all know Wren as an undoubted authority on St. Paul's, but his opportunities for studying the effects of long continued vibration could never have been equal to those open to architects and engineers of the present day. We should, therefore, much prefer to hear the views of living experts upon the very important point in question. Since the advent of ordinary railways and of heavy vehicular traffic in the midst of great cities thousands of buildings of every kind have been subjected to incessant vibration, probably of a more trying nature than that set up by low-level railways. Yet we have heard very little to confirm the evil prognostications of Wren. The possibility of damage to St.

Paul's must certainly be considered in the most searching manner, and from every point of view, in the light of latter-day knowledge and experience. If the slightest risk of injury to such a building should appear to be likely to result from the construction of the railway along the proposed route, then we heartily agree that "the voice of the public should be raised in conjunction with that of the Dean and Chapter in the most strenuous opposition to any such enterprise."

The Right of Foreign Workmen for Personal Injuries. It is a constant source of surprise that so many legal points which one would suppose had long ago been settled keep arising again. One of these was decided last week in the King's Bench Division—namely, whether the representative of a deceased foreigner is entitled to bring an action in this country under Lord Campbell's Act. In these days, when a good many foreigners are to be found engaged in various operations—such, for example, as in laying down asphalt—this point has a good deal of practical importance. The two Judges decided that the Act was intended to give to foreigners the same remedies as to Englishmen, thus differing from the single decision of Mr. Justice Darling in a previous case. It would certainly be very inequitable for two workmen—one English and one a foreigner—to be fatally injured when working for one employer, and for the widow of the one to be entitled to compensation and not the widow of the other. Of course, as regards personal injuries which are not fatal, the point does not arise, since the remedy under these circumstances arises from the general law and not from a particular statute.

Railway Charges for Goods Traffic. SEVERAL of the principal railway companies are giving notice of a reform in procedure which has long been in contemplation, but which will, perhaps, be regarded as somewhat drastic. They will decline to accept a reference to the sender for carriage of goods not consigned "carriage paid," and will, presumably, withhold delivery of the goods pending settlement. Of course, the liability for carriage can, and should be, clearly understood and arranged between buyer and seller in any ordinary transaction, and when the carriage should be prepaid, the goods should always be so consigned. Where the trouble will arise will be in the case of returned goods and articles sent for repairs, for the carriage of which the receiver is not responsible, but which, nevertheless, are frequently tendered to him "carriage to pay." The railway companies always have many items of this nature in dispute, which neither party will pay if they can possibly help it, and these cases entail an immense amount of clerical labour before they are settled. Even in those cases where the sender, on being referred to, pays up without demur, a great deal of extra book-keeping and correspondence is involved. Various facilities have been withdrawn by the railway companies recently, a considerable amount of friction being thereby occasioned; but while a too rigid application of the new rule might prove a mistake, and would certainly cause more trouble, the proposal can hardly be regarded as unreasonable.

The Virginia Disaster. FROM the later accounts given of this lamentable occurrence, it is clear that the original despatch was not precisely accurate in attributing the disaster to the failure of the Pocohantas dam, although it is true that the violence of the flood was materially augmented by that untoward event. In the mountainous region on the borders of West Virginia and Virginia States a continuous rainfall of thirty hours is quite sufficient to account for widespread damage. Such a result might naturally be expected in a narrow defile like the Elkhorn Valley, varying from a quarter of a mile to one mile in width, and extending for many miles with mountains on either side, from which numerous streams bring down the waters that recently transformed the populous valley into a raging and destroying flood. The storm of rain culminated in a cloudburst, and the immense volume of water liberated appears to have entirely overcome the resistance offered by the Pocohantas dam, thus releasing a further quantity of water, which swept down in the middle of the night upon the towns and cities of the doomed valley. Details of the construction adopted in the case of this particular dam will no doubt be furnished in due course by the American technical press. Criticism of American dams has not been invariably favourable in this country, but at the present moment there is no definite reason for assuming deficient strength. The utmost ingenuity of man must sometimes be at fault, and there is no factor of safety capable of providing security against the illimitable forces of nature.

Standardisation of Steel Sections. OUR readers will doubtless learn with some interest that a committee has recently been appointed by the Institution of Civil Engineers, with the co-operation of the Institution of Mechanical Engineers, the Institution of Naval Architects, and the Iron and Steel Institute, to consider the advisability of standardising the various sections of iron and steel, and if found advisable, to consider and report as to the steps that should be taken to carry such a standardisation into practice. It seems an altogether superfluous task for a committee to sit down and solemnly to discuss the advisability of standardisation; but this part of the programme has possibly been inserted with the object of showing that the committee will approach the subject without any limitations on their discretion. Amongst the names of gentlemen appointed to serve we notice well-known representatives of bridge, harbour, railway, shipbuilding, and mechanical engineering, whilst metallurgy and experimental science are duly recognised. Work has already been commenced by the taking of evidence offered by engineers, manufacturers, and contractors upon the subject indicated. Standardisation is the order of the day in every branch of manufacture, but it is by no means so generally obeyed as it ought to be. Those who wish to see the additional prosperity of British engineering work, and the more universal adoption of British steel sections, will welcome the practical realisation of methods calculated to facilitate constructional work and the economical production of the material used therein. We hope the attention about to be directed to the subject will have the effect of bringing to a proper state of mind those

TO CORRESPONDENTS. NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond new news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses.

Any commission to a contributor to write an article is given subject to the approval of the editor, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications, regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS. [Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot or the building-owner; and we cannot publish announcements of any tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.] * Denotes accepted. † Denotes provisionally accepted.
