

VOLUME
XXX

JAN. & JUNE
1901

THE BUILDER

THIS : ILLUSTRATED : WEEKLY
MAGAZINE : FOR : THE
ARCHITECT : ENGINEER : ARCHÆ-
OLOGIST : CONSTRUCTOR : SANI-
TARY-REFORMER : & : ART-LOVER.

CONDUCTED BY

H. H. STATHAM,

FELLOW OF THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

"EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kind of private principedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned." * * * * *

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON. * * * *

"OUR English word To BUILD is the Anglo-Saxon Bylisan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"ALWAYS be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE. * * * * *

OFFICE: 76, CATHERINE-ST. COVENT-GARDEN LONDON W.1

AT THE PORTAL.

What can we bring, who at the portal stand
 Of this new century, and far behind
 See the long highway of the Ages lined
 With structures reared by Man's symbolic hand—
 Egypt's dim Temples shadow the hot sand,
 Mystic as Fate; the Greek's æsthetic mind
 Expressed in clear columnar grace we find,
 And Faith's tall spires point to a heavenly land:
 What can we bring, who, fallen on empty days,
 Unsettled aims, and hard mechanic hours,
 Have chased a dying art through devious ways?
 Love, Work, and Hope—these three may still be ours;
 Through these the fallen fane we yet may raise,
 Where the great city of the future towers.

Retrospect and Prospect.

ALTHOUGH our larger divisions of time are arbitrary, or at all events only governed by considerations of arithmetical convenience in reckoning, there must nevertheless be a feeling of a certain solemnity and importance in the entrance upon a new cycle of a hundred years. For one thing, it is, unless in some few very exceptional cases of longevity, a unique event in the life of every one. When we wish each other "a happy new year," we make a mental forecast of the whole year and its possible events. But we can wish no one, in the same sense, "a happy new century." No one old enough to read these words will ever see another dawn of a century; whatever reflections we have to make on the situation must be made once and for all.

Since the lapse of one hundred years is a time long enough for great changes to take place in the intellectual, moral, and social conditions of life—changes sufficiently important to be appreciated in our retrospective view of history, we have been accustomed, by way of grouping our historic ideas, to think of each century as having special characteristics of its own, as representing certain tendencies in thought, in art, in social polity, not exactly contemporaneous with the century, but so far contained within its limits as to be appropriately associated with it. Thus, when we speak of eighteenth-century literature, we mean something more than a mere date; we think of certain marked characteristics which belong to the literature of that period. And in architecture these century characteristics are perhaps even more marked. We all have a perfectly clear definition before our minds when we speak of the architecture of the thirteenth, fourteenth, or fifteenth century. But how shall we characterise the architecture of the nineteenth century? And what are we to expect will be its development in the twentieth?

The future historian of English architecture will probably, we think, characterise the nineteenth century more especially as the century of the Gothic revival. Although it has run its course some time ago, and gone the way of all revivals, no other movement in architecture, during the epoch in question, has lasted so long, has been the object of such general and widespread enthusiasm, and has left such a large visible impress on the architecture of this country. It belongs to the century, in fact, more fully than would appear from the mere dates of the earliest churches erected under its influence; for it was in the air, so to speak, before it took visible shape in any important buildings. Rickman's celebrated publication, the first methodical attempt to classify the styles of mediæval architecture, dates from 1819, and was the result of an already existing feeling that our national mediæval architecture had been unduly neglected. Nor have we cause to be ashamed of the Gothic revival as the principal development of the outgoing century. We can see now that it was a mistake—an illu-

sion; but it was a noble error after all, the product of a genuine enthusiasm, and it had an important and lasting effect in awakening a new interest in architecture, and removing it from the category of a respectable profession to that of an art to be passionately loved and pursued for its own sake and not for mere lucre. And let it not be forgotten that it has left us as a legacy the finest, most picturesque, and most original public building of modern times.

The nineteenth century may also be remembered in a less satisfactory way, architecturally, as the century of restoration. This was a movement linked with the Gothic revival, and it must be admitted a much more questionable one. The practice of restoration has obliterated, since the beginning of the century, the genuine value, as examples of ancient architecture, of many of our churches and some of our cathedrals; and, unhappily, the mischief is absolutely irretrievable. We must not judge the architects of the last generation, however, too hardly in this matter. They did not, at all events, disfigure the ancient cathedrals, as some of their predecessors in the pre-revival generation did; they brought learning and care to their work; and in the rearranging and decorating of the often dilapidated and untidy interiors of cathedrals and churches they, and those who commissioned them, carried out a work which was really desirable and even necessary; and if some of those who now rail against every kind of restoration could be suddenly transported back into one of our cathedral interiors as it was in its unkempt and dingy condition before the restoration era, they would perhaps unexpectedly realise that there are two sides to the question, and that the buildings are now in a far more decent and seemly condition for public worship than they were at the commencement of the century. The misfortune is that, with the best intentions, the restorers, acting at the time with the approval of every one, carried out an immense amount of refacing of ancient architecture, under the idea of restoring its pristine beauty, before it was realised that this was an impossible effort, that the imitation was of no value as a substitute for the original. By the time this was realised, the mischief was done, and could not be undone; and this experience ought at all events to be a lesson as to too much meddling with old buildings in the future. It is fair to ourselves, too, to remember that the English are not the only or the worst sinners in this respect. The French have carried out restoration in a systematic and drastic manner beyond what the most enthusiastic of our restorers have ventured upon; they consider the promotion of such work part of the business of the Government, and they are still carrying it on, and still unrepentant and unconverted.

If we turn from the æsthetic to the practical side of civil architecture, there can be no doubt that in that connexion the century just closed will be remembered especially as the century of sanitation. At the commencement of the century we knew and apparently cared nothing about sanitation beyond a general notion that houses should be drained somehow or other. At the close of the century we seem to know all about it—about drainage and sanitary construction at all events; little remains except, in the words of the old hymn, to "always

practise what we know." In the more vague science of ventilation, if it can as yet be called a science, we seem to be still in a partially experimental stage; though as long as mechanical power is made use of we have now the means of securing perfect ventilation of a large building; it has been done with marked success in some instances, and might be done in all cases in which there is a *dignus vindicæ nodus* for keeping up a mechanical driving power. The fact is there is really no science of ventilation apart from mechanical power or special application of heat; without those aids we can only provide facilities for ventilation, without ensuring certainty. The contrary idea has only been fostered by the makers and exploiters of various ventilating nostrums—"extractors" which do not extract, and which, with the new century, let us hope, will go the way of other vain inventions.

The architectural problems which are in process of consideration, and are handed over to the new century for solution, appear to be three—viz., architectural education; the combination of the decorative arts with architecture; and the housing of the working classes. The latter subject, which has been much discussed during the last few years, may be thought to be as much a social and financial as a building problem; but the question of the best planning, the best situation, and the best construction for such a class of buildings, so as to combine economy with sanitary conditions and with as much attractiveness as possible, is an important part of the problem, and one about which we are still far from any final decision, though the present tendency seems to be towards the idea of suburban dwellings and cheap communication. Probably some experiments will have to be made, even at a loss, and some experience gained, before we arrive at a final settlement of the question.

Architectural education has never been so much discussed and considered in this country as at present, though we are still in a transition stage in regard to it. What is evident, however, is that there is an increasing desire to substitute a separate and systematised education for the mere office routine which formerly constituted the mainspring of architectural training in this country. With some, the predominant idea is a training in the craftsmanship of building, leaving the element of architectural design to evolve itself from this basis. With others the ideal is an intellectual training in the art of architectural design, analogous to that given by the *Ecole des Beaux-Arts* in France. The latter seems likely to prove the true solution of the problem. Architecture in modern times is an intellectual conception, to which mere building craft is subordinate. It is to the development of this power of intellectual conception that the future of architectural education must tend.

The general prospect for Art in 1900 is far more promising than it was in 1800. There is enthusiasm where there was then indifference; knowledge where there was then ignorance. We have every reason to hope that the Twentieth Century may prove a greater artistic era than the Nineteenth. We have been living through what has been admittedly an epoch of architectural imitations. Let us endeavour to render the coming century an epoch of new and original creation in architecture.

SIR CHARLES BARRY, R.A.

(From a Crayon Portrait in the possession of Sir J. Wolfe Barry.)

THE ARCHITECTURAL GENIUS OF SIR CHARLES BARRY.

BY THE EDITOR.

SO much is architectural taste at present under the influence of the fashion of liking for this or that character of detail, that we seem in danger of forgetting that architectural genius is really shown not so much in the details of a building as in its general conception as a whole idea, of which the plan is the basis, and the general grouping the development and expression. Refinement in detail is an indication of culture and scholarly feeling, and there are many great productions of architecture in which the detail will bear examination as much as the total effect; but it is, after all, the general conception which stamps a man as a great or a mediocre architect. We can recognise this in regard to Wren; for while we all admit the general grandeur and beauty of St. Paul's, and the extraordinary variety of invention displayed in Wren's smaller churches—while we count Wren as unquestionably one of our greatest architects, a man with in-born genius for the art of building—few people would in the present day deny that the details of his buildings are

too often poor and commonplace, as decorative work, abounding in mere repetitions of *rococo* ornament, the introduction of which can hardly come properly under the definition of design; and indeed it seems doubtful whether the detail of a great deal of Wren's work really owes anything to his hand at all, and is not merely the almost mechanical application, by artisans, of the style of carving and ornament which they were in the habit of carrying out indiscriminately on every building of the day.

Yet we recognise Wren as a great architect; his fame is established; he is taken for what he was; his works have now become ancient buildings, and are regarded without any reference to the artistic fashions of to-day. How is it that Sir Charles Barry, whose sense of refinement in detail was far superior to Wren's, and who in grasp of plan and architectural conception was at least his equal, is hardly thought or spoken of among the younger generation of architects of the present day? The reason (though a poor one) we take to be that, as an architect of the modern period, he is regarded as representing a phase of architectural taste which has been superseded. He belonged to a period

before the idea of the union of the arts and crafts had come into being; he designed buildings as "a professional architect" on the old lines; he was an "eclectic" in regard to style, which is now an unpardonable sin, but was in his days regarded almost as a virtue; he had a leaning towards symmetrical effect and careful detail which appears, no doubt, formal and antiquated in the eyes of a generation who are given up to the search of the picturesque, or even the eccentric, in architectural design. But it is a very narrow school of architectural criticism which considers a building only in reference to its agreement with the special likings and fancies of our own day and our own artistic circle.

The fact is, that in all the essential qualities which go to make that very *rara avis*, the in-born architect, Inigo Jones, Wren, and Barry are the three most remarkable figures in English architecture since the Renaissance; and if Inigo Jones, in virtue of a certain fiery quality of genius, may be considered to have stood above the other two, there can be no doubt that Barry was fully the equal of Wren, and the only English architect since his day who can be classed with him, and who has exhibited

something of the same kind of innate architectural insight, as it may be called, into the problems of architectural design. For what is it that especially marks the in-born architect? Not the power of making artistic drawings, nor yet of inventing picturesque and novel detail. It is the power of grasping the whole possibilities of a site and of a plan; of seeing intuitively what can be done with a building, and of understanding how to combine practical requirements with effective architectural treatment. And in these qualities, and in their exercise on a great scale, Barry is really the only person who can be rightly regarded as being a successor to Wren. Neither of them were sentimental architects; but then architecture is not all sentiment; it is a practical art, based on practical requirements; an important truth which neither Wren nor Barry ever lost sight of for a moment.

There was this difference between the two, however, that while Wren was, fortunately for us, drawn into the practice of architecture without being originally intended for it, and brought into it almost by the force of circumstances, Barry intended his career from the first, and went into regular training for it at the early age of fifteen, though in an office where it appears probable that he saw little except of surveying work and the business side of the profession generally. This business side, however, he studied accurately and industriously; "lists of prices, calculations of dimensions; methods of measuring and valuation, crowd his notebook, side by side with studies from 'Chambers's Architecture,' and sketches of such details and ornaments as struck his own fancy."*

It was probably owing to this familiarity with the dry business side of the profession in his pupilage days, that Barry acquired the practical view of architecture which he retained all his life. He was not one of the "art architects" who think specification and measuring beneath them; on the contrary, his biographer testifies that he rather had a contempt for architects who thought themselves above those practical subjects. Perhaps it was the best thing for him that he got his training in an office of that class; for his artistic tastes were innate and needed no external stimulus, and in the office routine he acquired what he might have neglected otherwise. Unlike Wren, he was a beautiful draughtsman; and, again unlike Wren, but like many successful modern architects, he precluded his career of architectural practice by an assiduous course of sketching. He was fortunate in getting some substantial assistance, just when he needed it, in carrying out his sketching tour further than he might otherwise have been able to do; for in 1818, just as he was feeling that considerations of economy must bring his tour to a close, a wealthy gentleman, Mr. David Baillie, whom he had met at Athens, offered to pay Barry at the rate of 200*l.* a year to accompany him and sketch for him on a tour in the East, the artist to be allowed to keep copies of the sketches. This tour was the occasion of the production of a large number of beautiful sketches, several portfolios of which have been secured again by his family from the inheritors of Mr. Baillie. Among these is the admirable,

* "Life and Works of Sir Charles Barry"; by the Rev. Canon Barry (now Bishop Barry).

and carefully executed drawing of Karnae, now in the possession of Sir J. Wolfe Barry, who has kindly lent it to us for reproduction in this issue (see lithograph). This is a masterly piece of architectural sketching, notable especially for its clearness and firmness of execution and for the care and evident truth with which the shadows are put in. Considering the number and the exceedingly careful and neat execution of the foreign sketches of this period (quite typically an *architect's* sketches), it is evident that Barry, even at this period and on this partially holiday expedition of sketching, must have been a most indefatigable worker.

Considering the class of buildings with which Barry's name is now chiefly connected—mansions, clubs, and the Houses of Parliament—it seems rather curious that his professional career commenced mainly with church-building. He gained the commission for St. Peter's, Brighton, in a competition in 1823, and regarded this as being, up to then, "the proudest day of his existence," and the entrance, as he promised his wife, "to a brilliant career." The brilliant career undoubtedly followed, but not in church-building; though this success in a competition which was rather strongly contested may, no doubt, have aided in bringing him into notice. It is not generally known, probably, that the melancholy regions of Islington and Holloway boast of three churches built from Barry's designs in 1826-7, viz., St. John's, Holloway (at the west side of Holloway-road), St. Paul's, Balls Pond (at the junction of Ball's Pond and Essex-roads), and Holy Trinity, Cloudeley-square, Islington. The first-named I have not seen; the other two are plain brick Gothic-revival churches in the rather late Gothic style then in vogue, with stone dressings and window tracery; unless one knew their authorship they would certainly not attract notice now; but there is a certain dignity and sense of proportion in the Cloudeley-square church (the larger of the two) which, when we know the work to be Barry's, we can recognise as characteristic of him. The three churches were built as a commission from the Rev. D. Wilson, then Rector of Islington, and whose name was afterwards widely known as Bishop of Calcutta.

Barry's general reputation as an architect was first attained in connexion with the Travellers' Club, his design for which was selected in 1823, in a limited competition. It is worth notice that in choosing a severe Italian style for this building, he depended for success entirely on the refined treatment of a very simple and unassuming design; and though he was conscious of the disadvantage which this simplicity of design might place him under in a competition—he himself doubted of his success because he thought the building would be considered "too plain"—yet this did not influence him in any way in departing from his architectural principles by endeavouring to produce something which might be more popularly attractive. This is typical of his whole career. Barry never for a moment allowed himself to be in any way sensational or eccentric in design; he was always for what was best, not for what might be popular; he always confined himself within the lines of dignity and simplicity in design and grouping, aided by a carefully-studied refinement

in detail. We see these qualities again exemplified in the Gothic design for the Birmingham Grammar School, made in 1833. This, as a modern Gothic building, shows a great advance on the rather thin and timid treatment of the Islington churches before referred to; there is a much greater breadth and massiveness about it; and though it shows an exceedingly simple adaptation of the elements of late Gothic architecture, it is still, in spite of the changes of taste in regard to revived Gothic, a building which will always give pleasure and satisfaction from its quality of dignity, repose, and harmonious proportions. The Travellers' Club shows just the same qualities in a totally different style of architecture. Compared with the more showy and restless character of much recent architecture, it is a building that might be passed over with little remark by many an observer who did not know its history; but it is one of which every detail will bear examination, and which fulfils the true ideal of an English gentleman's club, totally free from anything approaching to showiness or vulgarity. This quality is apparent again in the interior, in the unostentatious treatment of the main staircase, with its simple wooden balustrade; a marked contrast to some of the sumptuous staircases of more recent clubs, where the lavish use of costly marbles and gilding displays rather the taste of the *nouveau riches*. In the Pall Mall front of the club Barry regretted the necessity, owing to limitations of space, of planning the building so as to have the entrance at the end instead of in the centre of the façade; his desire for symmetry, and dignity would have led him to prefer a central entrance, but it would have divided up the plan too much. The garden façade to the south, which is less obvious and less noticed, is the more effective of the two; and it is noticeable how suitably a rather more playful treatment is given to this façade, by the grouping of the windows, while the street façade preserves the true Italian severity of equally spaced windows. In the interior of the house, which gives a much greater idea of spaciousness than the modest exterior would lead one to expect, there are various fine points in the treatment of the principal rooms; the dining-room, for instance, has the strongly marked cornice returned across the room at about ten feet from the fireplace end, while the latter portion is slightly separated from the rest of the room by a rather lower ceiling and this stoppage of the cornice, so as to give the impression of a separate alcove or ingle-nook without limiting the floor-space. In the library a charming effect is produced by the architectural pedestals and columns projected into the room near each end, leaving it as a large centre room with smaller ante-rooms at each end, which, besides adding to the architectural effect of the room, give the sense of seclusion suitable for quiet reading. We have to thank the committee of the club for their courtesy in allowing us to have a photograph taken of the interior of the library. The view does not show the full effect of the room as seen from one end, with the two sets of columns; but it was impossible to include the nearer ones in the foreground without too much distortion of the perspective.

Barry seems to have settled in his mind that this severe Italian style, with its large

Copy of Sir C. Barry's First Elevation Study for the Houses of Parliament Competition. (The same size as the original.)

Facsimile of an Original Pencil Sketch by Sir C. Barry.

of all to the grasp of Barry's architectural genius, and it was of them that I was mainly thinking in the opening remarks in this paper in regard to the superior importance of conception over mere detail in our estimate of an architect. People may say they do not like Barry's style of detail, or think his taste in this respect *passé*; but can any one question the architectural genius of a man who could conceive, and illustrate so thoroughly, such a grand scheme as this? That is where the hand of a great architect comes in; in the power to grasp a great idea for the architectural treatment of a whole group of buildings. The drawings explain themselves sufficiently; we may point out that the idea for the Government offices was to combine them all in one great building, with its south front facing the whole length of Great George-street, and the east front occupying the whole of Parliament-street and Whitehall up to the Horse Guards (the present Treasury buildings' front being incorporated in the new building); the building being divided up into court-yards each of which, with its surrounding buildings, was to be devoted to one of the Government departments, all of which would thus be in connexion with each other, and in contiguity to the Houses of Parliament. In looking at the sheet of sections and elevations showing the whole intended disposition of the buildings one is irresistibly reminded of Wren; it is such a scheme as one could imagine him laying out, though he would never have illustrated it so

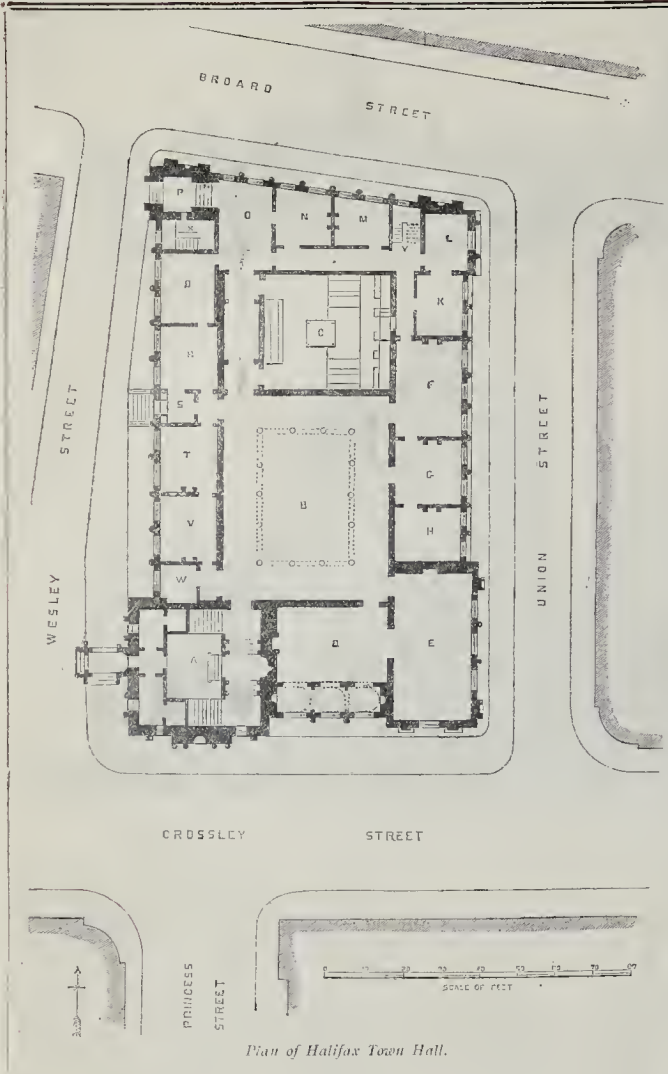

finely. It is melancholy to look at this design now, and to think that for want of adopting it when a great architect proposed it, we are now building Government buildings piecemeal on isolated and inadequate sites, and have lost irretrievably the whole architectural and administrative value of concentration. It may be mentioned, as characteristic of the man, that in the large elevation Barry, besides making the drawing, wrote out the whole of the long description in printed characters, between the two plans, with his own hand*; a kind of thing that most men leave to a clerk to do from their rough draft. But Barry's enthusiasm for work, in the interests of his beloved architecture, was untiring.

To Sir Charles Barry's country mansion-houses a separate article might well be devoted, and I have left myself no space here for more than a general reference to his masterly hand in remodelling an old house and adding to its dignity by new approaches, glorious flights of steps, fountain courts, and so on. It does not appear that Barry had any opportunity of carrying out a country mansion of the largest class as an entirely new work; but his alterations and remodelling of some great mansions, Trentham Hall especially, were so important as practically to make new buildings of them. And that typical faculty of a true architect, an eye for seeing how to take advantage of circumstances, was never better shown than in these extensions and

alterations. A series of his remodelled plans and elevations of large houses, together with the plan and elevation as previously existing, would form a most useful study, but it would probably be rather difficult to get the materials for it.

The last building carried out from Sir Charles Barry's design, the Town Hall of Halifax, I had long admired on paper, but only rather recently found opportunity, when in the neighbourhood of Halifax, to see the building itself. The effect of tower and spire, so Gothic in feeling though Classic in actual detail, was far more impressive than I had even expected. The plan (given on page 3) shows how characteristically careful Barry was, in placing the building on the site, to arrange that the centre line of the tower should be axial with the centre line of the street leading up to it. It is the aspect of this tower seen by itself as you come up Princess-street to it, which makes the real effect of the building; it is not, however, a very easy position to make a drawing from. Mr. Monk's view, taken from an angle position, gives the design accurately, but its finest effect is as seen from the centre of the street leading up to it. The building was actually carried out by Mr. E. M. Barry, after his father's death, and he altered it in one respect by raising the roof of the main building, so as to render it a portion of the design, Barry himself having intended to conceal the roof. But in other respects the exterior conforms mainly to Barry's original sketches, which are preserved in the Sur-

* I had this from the late Mr. Charles Barry.

veyor's department of the Halifax Corporation. As usual, Barry kept his main staircase in a separate position, so as to leave the centre court complete and unbroken; the staircase occupies the ground stage of the tower, and though on a small scale, is treated in a very dignified manner. A view of it is given, as this building has not been much illustrated.

The life of Sir Charles Barry is a highly instructive one in the example it affords of untiring pains in studying and perfecting his designs in every detail. Any reader can see, from the illustration given above, how inferior was the first conception of the Houses of Parliament compared with what it ultimately became when completed; and, as we have seen, this fine development of the original idea was not attained without persevering labour and the rejection of a number of successive designs as unsatisfactory. It was the same with the detail, the mouldings especially. It was told me many years ago, by one who remembered him, that it was Barry's habit, after profiling the mouldings for a building full size, to make very

careful reductions of their lines to scale, on an inch or half-inch scale elevation, to judge how they assorted with the general proportions of the elevation. In fact no labour was too much for him in perfecting his ideal of a building; and, as has been indicated, he did with his own hands what many would leave to an assistant draughtsman. In this as in his more important qualities—in his grasp of an architectural problem as a whole, and his intuitive perception of the relation between plan and design, he was a true and as one may say a born architect, of whom England may well be proud.

H. HEATHCOTE STATHAM.

NOTES.

As usual, we look in vain in the New Year's list of official honours for any recognition of architecture or any other art, unless we are to regard the conferring of a "C.B." on Colonel Plunkett, the Director of the Science and Art Department at Dublin, as an honour conferred on art. It appears that an admini-

strating official can be recognised in connexion with an Art Department, but not an artist. A well-known large contractor, Mr. John Aird, receives a baronetcy; but architects, apparently, are not worth any such recognition. It is a pity that those who arrange these lists cannot turn their eyes for a moment to France, and take example thence. They will find, if they take the trouble to inquire, that no distribution of official honours takes place in France, on any public occasion, without a considerable portion of these titular honours going to artists, and to architects, on the whole, more than to any other group of artists. But to the mind of the English Court official an architect is, as a "paramour" was to Bottom's colleagues, "a thing of nought."

A PRELIMINARY Report was issued in November by the Commission appointed by the President of the United States to determine "the most feasible and practicable route across the American Isthmus for a maritime canal between the Atlantic and Pacific Oceans, together with the cost of construction of the same and placing it under the control, management, and ownership of the United States." The Commission was divided amongst five committees, severally authorised to investigate the following subjects:—(1) The Nicaragua route, (2) the Panama route, (3) other possible routes, (4) the industrial, commercial, and military value of an interoceanic canal, (5) rights, privileges, and franchises. That the decision should be in favour of the Nicaragua route will probably perplex those who approach the matter from a purely engineering standpoint. The technical press of the United States has always recognised the undesirable character of the Nicaragua scheme, and early last year an influential engineering journal described it as "egregious folly." Even the report of the Commission does not anywhere recommend the Nicaragua route as superior to the Panama line. On the contrary, it makes clear the following disadvantages:—(1) That the Nicaragua scheme will cost 9,000,000*l.* more than the rival undertaking. (2) That the length of the Nicaragua Canal will be 186 miles, as compared with 43 miles in the case of the Panama Canal. (3) That the time occupied in traversing the former route will be thirty-three hours, as against twelve hours for the latter. As a sort of set-off, it is suggested that the cost of acquiring the rights of the Panama Canal might bring the total expenditure up to the amount involved in the Nicaragua scheme, but as no indication as to the purchase-money has been given by the French Company, it appears that this assumption of the Commission is purely theoretical. Until the full text of the final report is available, it would be premature to discuss the accuracy of the conclusions which have been formed, but it seems certain at the present stage that they have been influenced by political rather than by commercial and engineering considerations.

Two schemes have lately been discussed by the American Society of Civil Engineers—the first relating to a barge canal, and the second to a ship canal, from Buffalo to New York. It is not likely that a barge canal

The Staircase: Halifax Town Hall.

would provide the facilities now required. Since 1880 traffic on the Erie Canal has fallen 50 per cent, whilst railroad traffic has risen nearly 150 per cent, and the Canadian canals have entirely failed to divert commerce from the lake and railway lines. The only possible way in which a barge canal could successfully compete with other means of transport would be by the organisation of

companies for working fleets of lake steamers and canal barges in conjunction, so that through bills of lading might be issued from lake ports to the seaboard. Even then, the railway and shipping companies would not improbably combine to deprive the general public of any advantage in the way of reduced rates. On the other hand, a ship canal would form an unobstructed waterway connecting

harbours serving the most productive parts of the United States; the development of shipbuilding would be encouraged at lake ports; and individual shipowners would be able to compete on equal terms with large combinations. As recommended by the United States Commission, the ship canal would be 21 ft. deep by 215 to 250 ft. wide at the bottom, passing through the Niagara

River from Buffalo to Lasalle, thence by eight locks to Lewiston, through Lake Ontario to Oswego, thence to Lake Oneida and through the Mohawk Valley to the Hudson. The time now occupied by lake steamers between Chicago and Buffalo averages seventy-two hours, and for the same class of vessel between Buffalo and New York, by the proposed waterway, it is estimated at sixty-four hours.

The Ventilation
of Sewers.

To prepare a report on this important and difficult subject was one of the first duties which the new Borough Surveyor of Grimsby, Mr. H. Gilbert Whyatt, was called upon to undertake. Certainly some of the Grimsby sewers appear to be far from satisfactory, the pressure of sewer-air being at times so great as to lift the closed man-hole covers from their frames; in one instance, the cover and frame were blown a distance of 10 ft., the paving itself being torn up. Mr. Whyatt falls foul of the intercepting trap between the house-drain and sewer, and calls it a "fad," but, somewhat curiously, he does not recommend that it should be abandoned. He also says:—"In my opinion, the ventilation of sewers is not desirable, except on those occasions where workmen have to descend for certain purposes. . . . A current of air along a sewer is not a necessity." What he advocates is "a free vent for sewer-air," and this he proposes to obtain by means of shafts carried up the walls of buildings, and discharging at the highest possible levels. He also proposes to compel the owner of every new building to construct a vent-shaft from the sewer side of the drain-intercepting trap, and to carry it up the wall of the building, nominally for the purpose of ventilating the dead end of the drain, but really for the purpose of ventilating the sewer. In other words, he recommends the Corporation to compel private individuals to do the work, which, by law, the Corporation itself is bound to perform. We do not mean to say that a vent-shaft from such a point in the drain would not sometimes be useful, but we do say that the necessity for it would as a rule be of the slightest if the sewers themselves were properly constructed and adequately ventilated, as they ought to be, by the Sanitary Authority. Mr. Whyatt's report is an interesting contribution to the literature of the subject, but the wholesale multiplication of sewer-ventilating shafts on the walls of buildings, as recommended by him, cannot be regarded, either by architects or householders, as a really satisfactory solution of the problem.

Large Trusses. COMPLICATED constructional problems are frequently met with in steel-framed buildings, and their solution is rendered more difficult because details have to be considered with reference to the positions of internal walls and doorways, as well as to the purpose for which a building may be intended. A particularly marked illustration of this point is to be found in the arrangement of the trusses over the great ballroom of the Waldorf-Astoria Hotel, New York, as described in the "Proceedings of the American Society of Civil Engineers." The ballroom is 100 ft. long, 83 ft. wide, and three stories—probably 38 ft.—high. As there are no columns in this apartment,

two great trusses are concealed in the walls of the four stories immediately above, and their construction is so worked out that no indication whatever of their presence can be detected in the adjoining rooms. These trusses are each 85 ft. long by 56 ft. high, and stretching from side to side above the width of the ballroom they are practically equivalent to braced girders, carrying twelve stories of bedrooms weighing, with a reasonable addition for live load, about 20,000,000 lbs., nearly 8,930 tons. Some members of these trusses are of exceptional weight. The lower chords, for instance, are made of several 12-inch I-joists, carried on pins 12 in. in diameter. Although the form of support to which we refer may be regarded as a very simple affair by the bridge builder, or by any other structural engineer, it might not be attempted, and possibly would never be thought of on so extensive a scale by the average British architect. Yet it affords a perfectly safe alternative to the use of columns, which in some cases may be superfluous, and perhaps also objectionable, from an artistic point of view.

Changes in Leicester-square. THE site of No. 28, on the eastern side, is being cleared for the erection of a block of shops, offices, and chambers, after the plans and designs of Mr. J. P. Crosby. No. 28, extending some distance in the rear, was formerly occupied by John Hunter, who in 1783 bought the twenty-four years' lease of the house and of what was then No. 13, Castle-street, together with some ground abutting against Leicester-court, entered from Castle-street, between the two houses. Upon that plot of land Hunter built, at a cost of 3,000*l.*, a museum for his anatomical collections and lecture and dissection rooms. Amongst the papers and drawings deposited in the Royal College of Surgeons by Sir Richard Owen's executors, we have seen, by the Librarian's courtesy, a plan of the two houses, the museum, and the classrooms, drawn by Hunter's chief assistant and curator, William Cliff. The museum, which had since formed (until four years ago) the principal workshop of a firm of musical instrument makers, rose through two stories having a wide gallery midway and was lighted by three cupolas in the roof. In that house, formerly known as No. 12, Leicester-fields,* John Hunter held his Sunday-evening receptions, set up a printing-press and book-warehouse, and in 1785 established with Dr. Fordyce the Lyceum Medicum Londiniense. On the opposite side of the square No. 48 is about to be rebuilt, after the designs of Messrs. Treadwell & Martin, and the site has been cleared of Nos. 45-6, together with that of No. 62, Whitcomb-street in the rear. The new buildings for the Dental Hospital of London, at the square's south-eastern corner, have been erected by Messrs. George Trollope & Sons, contractors, from Messrs. Young & Hall's plans and designs, the Charity Commissioners having made, last March, an order for the sale for 18,000*l.* of the present hospital buildings, covering about 3,000 ft. superficial on the southern side of the square.

* In the auctioneer's catalogue (Stone Collection) of the sale of some of Hunter's household effects, including a set of painted hangings by Zucarello, on September 24, 1806, the house is described as "his residence, No. 28, on the east side of Leicester-square." Hunter died in 1793.

Carshalton Park. THE finely timbered grounds of Carshalton Park having lately been sold by the freeholder, Captain J. W. Blake Taylor, J.P., are being plotted and cut up for the erection of houses and villas. The property, with a mansion known as Mascall's, was purchased in 1696 of Sir Edmund Hoskins by Sir William Scawen, whose nephew and heir, Thomas Scawen, employed Leoni to design a new house upon a very extensive scale, which, however, was not erected. Leoni published his drawings for the house in his work upon the architecture of Leo Baptist Alberti. To Leoni are ascribed the stone piers, standing about 110 ft. apart, between which are the fine wrought-iron gates we lately mentioned, and which were unfortunately damaged by the fall of a tree in the avenue in the winter seven years ago. The piers carry, respectively, leaden statues of Actaeon and Diana. The park, surrounded by a wall now partly pulled down, about 2 miles in length, had been latterly the home of the Aitken family.

We have received from the London and Lancashire Fire Insurance Company a set of rules which they issue for the guidance of their clients when fitting up electrical installations for light, heat, and power. They have been carefully drawn up, and will prove useful to both consumers and electricians. Although principally, they are not exclusively concerned with fire risks—for example, the only rule which is printed in capital letters is the 93rd, which runs as follows: "Where conductors carrying alternating currents are enclosed in metal conduits, the positive and negative conductors must be run in the same tube." When this is not done the inductive action set up is so strong that the lamps burn dimly, but there is, of course, absolutely no danger of fire. The only rule to which we take objection is the one on testing (180). In the first place it is ambiguous, as it may mean that either of the two insulation resistances mentioned must be above a certain minimum, or that both must be above this minimum. Again, the rule is quite inadequate from the fire-risk point of view, as no mention is made of testing the insulation resistance between the mains when the switches are turned on and the lamps are taken out of their sockets. It is, however, a step in advance when a Fire Office recognises that there are two insulation resistances to be measured. When will practical men awake to the fact that there are three?

EXHIBITION OF MODERN ILLUSTRATION.—It has been found necessary to postpone the opening of the Exhibition of Modern Illustration in the Indian Section of the Victoria and Albert Museum from Monday, January 7, until Monday, January 14. The private view will consequently take place on Saturday, January 12, instead of January 5, as previously announced.

COLLAPSE OF A BUILDING NEAR FLEET-STREET.—The ground floor of premises known as Nos. 3, 4, and 5, Gunpowder-alley, Shoe-lane, suddenly gave way on the 31st ult., with the result that one man was killed and two injured. Messrs. Eyre & Spottiswoode have recently taken possession of the building. At the time of the accident a large quantity of paper and other material was stored on the ground floor. At the moment the floor fell a man was in the basement and was buried beneath a large heap of debris. The police hastily removed the material, but when the body was discovered life was pronounced to be extinct. Two men—one named Charles Bradley, aged twenty-two, and the other, Henry Miller, aged twenty-one, a brother of the man who was killed—were injured in the fall.

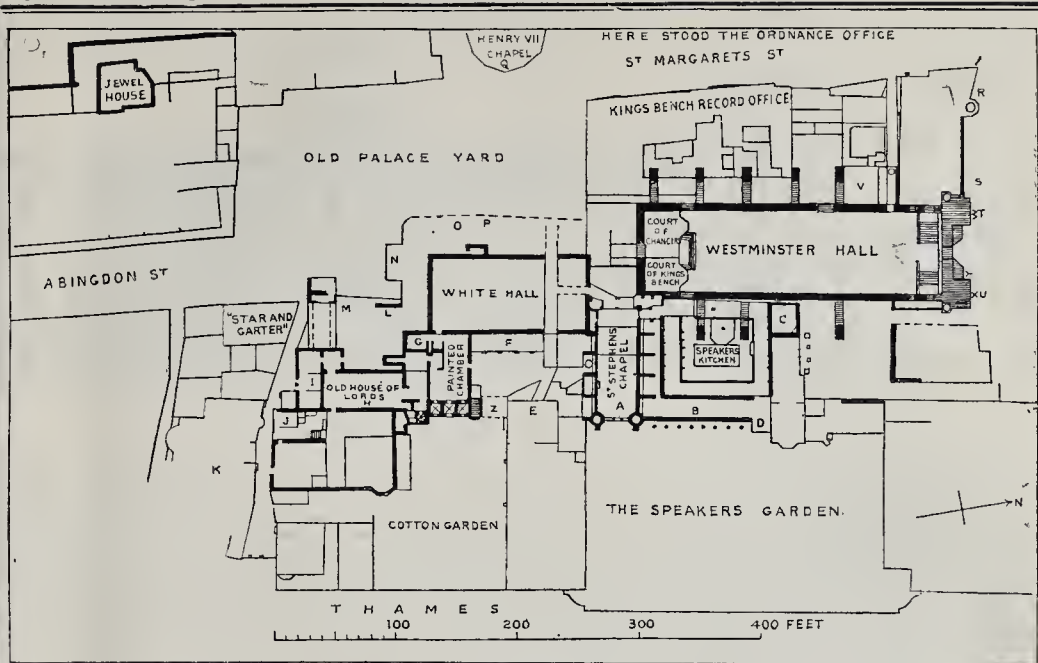

Fig. 1.—Old Houses of Parliament, Westminster Hall, &c. (From Smith's Plan.)

WESTMINSTER, OLD AND NEW:
1801-1900.

WESTMINSTER was accounted as a city during the ten years' tenure of the bishopric of Westminster by Thirlby, Bishop of Westminster, 1540-50, whose see comprised all of Middlesex, Fulham excepted. Letters patent passed under the Great Seal revive the old style by declaring that from November 1, 1900, being the date of the election of Borough Councillors, the Metropolitan Borough of Westminster, so constituted by an Order in Council of May 15 last, should be a city by name of the City of Westminster. We therefore may take the opportunity of recalling to mind some of the more important of the changes that during the last hundred years have quite altered the aspect of a quarter of the town which comprises the remaining portion of the ancient parish of St. Margaret, once co-terminous with the manor around the Benedictine monastery of St. Peter, and including the Royal palaces, with the seats of the Legislature and of the administration of justice.

The Abbey and Chapter-House.—Soon after James Wyatt (appointed surveyor to the Abbey on January 23, 1776) had begun, in 1803, the reparation of the exterior of Henry VII.'s Chapel a fire on July 9 in the roof and lantern of the Abbey church caused considerable damage, so that the necessary immediate expense of nearly 4,000*l.* prevented the Dean and Chapter from proceeding with the Chapel. In July, 1809, the work was resumed by Wyatt (*ob.* 1813), and completed by his son Benjamin in 1822, Thomas Gayferre the younger (*ob.* October 20, 1828) being the master mason. Gayferre bestowed infinite pains upon preparing the casts and drawings; the latter he and his foreman, Richard Lane, made at his house in Abingdon-street. The "Committee of Taste" chose Bath stone from Coombe Down, with Hopton Wood stone for the window-sills, and the Commons voted an aggregate grant exceeding 42,000*l.* In 1814, Gayferre, under Benjamin Dean Wyatt's directions, renewed the south transept marigold window, filled with stained glass by Thomas Ward and J. H. Nixon in 1847. Edward Blore (*ob.* 1879), architect to the Abbey, restored the north side of the nave in 1839, and designed choir stalls to replace the debased Gothic stalls erected by Dean Thomas. Sir George Gilbert Scott, appointed architect to the Dean and Chapter in 1849, Samuel Cundy being master mason, restored, 1865-73, the Chapter

House [February 10, 1872]* built in 1250-6 and wantonly converted, after the removal in 1547 of the Commons to St. Stephen's Chapel, into a depository of public records. He designed the marble and alabaster reredos, by Messrs. Poole, the Abbey masons, with the altar table, by Messrs. Farmer and Brindley [November 9, 1867], and the two transept wrought-iron screens and gates, by Potter [October 11, 1856]. Scott restored the south transept gable, and began the restoration of Solomon's Porch, north transept, completed (with the wall arcading and tracery in the gable) by his successor, J. L. Pearson, who also, in 1878-01, restored the east end of the choir and the south exterior of the nave and aisle, stone from the Chilmark and Wardour quarries being largely used. Bernasconi had restored the altar screen in artificial stone after Wyatt's drawings—the present frieze and sculptured groups are by Mr. H. H. Armistead, the mosaic of the "Last Supper" by Dr. Salviati, of Venice, after Messrs. Clayton and Bell's designs; the carrying through of the work being mainly due to the efforts of Sub-Dean Lord John Thynne (*ob.* 1881). Scott also planned and designed some residences for the Canons. This journal should not fail to cite the burial in the Abbey of Sir William Chambers (1796), James Wyatt (1813), Sir Charles Barry (1860), Sir G. G. Scott (1878), G. E. Street (1881), and J. L. Pearson (1897); also of Thomas Banks (1805), Telford (1834), and Robert Stephenson (1859); Samuel Arnold (1802), William Shield (1829), Muzio Clementi (1832); Sir William Sterndale Bennett (1875); Sir Charles Lyell; and William Spottiswoode.

Thus far the Royal Commissioners' scheme (1801) for a monumental Chapel as an annex to the Abbey has come to nought; meanwhile, the demolition in December, 1895, of Nos. 1-4, Old Palace-yard, land 1-3A, Poet's-corner, with the laying out of a garden on their site, afford a fine prospect of the Chapter House and the Abbey from the south-east. On February 16, 1884, and December 27, 1890, we illustrated James Fergusson's and J. L. Pearson's proposed additions to the Abbey.

St. Margaret's Church.—S. P. Cockerell, in 1798-9, restored the interior, and built a new roof, with galleries, &c. Scott carried out further improvements and refittings. The east porch (J. L. Pearson, 1894) was the gift of Lady Sherbrooke in memory of her husband, Robert (Lowe), first Lord Sher-

brooke, and contains his bust by Mr. Ezekiel, of Rome. In 1807, J. T. Groves, as surveyor to the Commissioners for improvements around the Church, raised the level of the graveyard; in 1881-2, about 4,000*l.* was expended, under J. L. Pearson's superintendence, in laying out the churchyard and the Abbey burial-ground, placing the railing that divided them close to the Abbey's north side, and sinking the grave-stones beneath the surface.

The Houses of Parliament.—Under Acts passed in 41-6 Geo. III. were acquired various buildings on the east side of Old Palace-yard, on the south side of New Palace-yard by the north front of the Westminster Hall, between Henry VII.'s Chapel and St. Margaret's Church, and along the west side of St. Margaret-street. The houses on the east side of Old Palace-yard gave place to James Wyatt's front to the House of Lords—the Court of Requests whither the Peers had migrated after the passing on July 2, 1800, of the Act of Union with Ireland. Comparing W. Capon's large-scale plan, 1793-1823, with Soane's, 1795, C. J. Richardson's (before the fire), 1835, and J. T. Smith's, 1807 (see fig. 1), we see that amongst the demolished buildings in Old Palace-yard stood, as reckoned from north to south, the Court of Wards and Liveries at the Hall's south end, Bellamy and Kew's, the Commons entrance, the "Ship" tavern, Casteel's (a very old house), and "Queen Elizabeth's Pear-tree" tavern, "Waghorn's" coffee-house, and the (old) Lords entrance facing south in the then north-east angle of the yard, the (old) Ordnance Office, and the (old) King's entrance and "Star and Garter" tavern at the two corners of Parliament-place that led to Parliament-stairs. The two last-named stood directly opposite No. 5, Old Palace-yard, now Mr. Labouchere's house, and Bellamy's opposite Poet's-corner. James Wyatt reconstructed for the Lords in 1800-1 the Court of Requests or White Hall in 1800-1 the Court of Requests or White Hall which is supposed to have been the great hall of the Confessor's palace; against its west wall stood the Groom Porter's. For the later King's entrance and Royal Gallery, Soane, appointed in 1791 clerk of the works at St. James's Palace and the Houses of Parliament, pulled down, in or about 1823, the Prince's Chamber, and the former House of Lords situated between Prince's Chamber (south) and the Painted Chamber (north), the west wall of the latter abutting against the east wall, at its south end, of the Court of Requests. (For illustrations of the old Houses of Parliament and the Painted Chamber, see lithograph in this week's issue.)

* Dates in square brackets relate to illustrations in the *Builder*. Mr. Henry Poole, master mason, 1856-92, died on February 25, 1892.

Fig. 2.—West Front of the Law Courts, Westminster. (Pulled down in 1883.)

Prince's Chamber was built *temp.* Henry III. over foundations of the Confessor's day; the Painted, or St. Edward's Chamber formed, reputedly, his bed-chamber and the scene of his death; the original House of Lords, or Parliament Chamber, rebuilt by Henry II., had beneath it the vaults, being the old palace kitchen, wherein Guy Fawkes laid his train. After the fire on October 16, 1834, Sir Robert Smirke re-roofed and refitted the Painted Chamber (pulled down in 1852) as a temporary House of Lords, the Commons being similarly provided for in the Court of Requests. The Lords first sat in their new House on April 15, 1847, the Commons in theirs on November 4, 1852.

On July 17, 1835, a Royal Commission was issued for choosing a site and obtaining designs. The acting Commissioners, Hanbury Tracy (Lord Sudeley), Sir Edward Cust, Thomas Liddell, and George Vivian—Lord Duncannon being First Commissioner of Woods and Forests—were instructed to select not less than three, and not more than five, designs. Of the ninety-seven sets they chose on February 29, 1836, that marked with a portcullis, and for the most part drawn by Barry's own hand. They awarded premiums of 500*l.* apiece also to—in the order named—Buckler, Hamilton, and William Railton (*ob.* 1877). The other competitors included Professor Cockerell (*ob.* 1863), Thomas Hopper (*ob.* 1850), Rickman and Hutcheson, James Savage (*ob.* 1852), Sir Robert Smirke (*ob.* 1867), Robert Wallace, J. Burgess Watson (*ob.* 1881), John White the younger, William Wilkins the younger (*ob.* 1839), and Lewis William Wyatt (*ob.* 1853). The coffee dam for the river front was begun in the autumn of 1837. In the autumn of the following year, Barry, with others, made a tour in Great Britain to choose a suitable stone. The terrace-wall, 920 ft. long, of Aberdeen granite was begun in the next spring. On April 27, 1840, Lady Barry laid the first stone of the superstructure at the angle of the plinth of the Speaker's house nearest to the bridge, and on December, 22, 1843 (her birthday), she and her husband laid the first stone of Victoria Tower. The exterior material is fine magnesian limestone from Anston, Yorkshire; the interior is mostly of Caen stone; the fabric rests upon a concrete bed 12 ft. thick; the inner brick walls carry floors upon cast-iron bearers, with brick arches turned from girder to girder; the wrought-iron roofs are covered with galvanised iron plates, and timber has been very sparingly employed; on the whole first floor there is no step. Barry gave the superintendence of the stone-carving to John Thomas, and that of the wood-carving to A. W. Pugin; he himself designed the canopy of the throne in the House of Peers. The Queen made her first State entry into the Victoria Tower on February 2, 1852, at the opening of the new House of Commons; on the 11th of that month she knighted Barry at Windsor. Charles Barry assisted his father during the progress of the works, and E. M. Barry (*ob.* 1880) after Sir Charles's death in 1860, completed the structure. His work includes the restoration of St. Stephen's crypt [July 9, 1864], the arcades and enclosure, New Palace-yard [January 11, 1868], and in 1860-6 the Queen's robing-room and staircase, and the decoration of the central octagonal hall. In the crypt the seven windows are by Hardman, the decorations by Crace and

Messrs. Clayton & Bell, the wrought-iron railing around New Palace-yard is by Hardman, Mr. H. H. Arnstead carved the statues of kings.

The Clock.—In 1851 the Government asked Lord Grimthorpe, together with Airy, Astronomer-Royal, to draw specifications for a clock for the Victoria Tower. Vulliamy and other leading clock-makers, invited to tender for the work, demurred to the stipulation that the clock was to be guaranteed to perform within a margin of one minute per week, that limit of error being, they averred, too small. So the work was entrusted to Mr. E. J. Dent (*obit.* 1853), who agreed to make a clock after Lord Grimthorpe's designs. For that clock Lord Grimthorpe invented the double three-legged gravity escapement, as well as a new maintaining power and a novel contrivance for letting off the hours in order to satisfy another one of the conditions, which required that the first blow of the hour should be made within one second of true time. He also devised for the clock a zinc and steel compensation pendulum, of which the principle was since adopted for the standard sidereal clock at Greenwich Observatory.

Sir Charles Barry's plan, extending over nearly eight acres, covers more ground on the south, north, and east sides than did the former Houses. J. T. Smith's plan (fig. 1) shows that at the time of the fire the House of Lords (Court of Requests) stood with its north and east walls closely against the angle of Old Palace-yard, the west wall being in alignment with the longer axis of Westminster Hall; between the Hall and the Court of Requests lay the House of Commons, now represented by St. Stephen's Hall above the chapel crypt or St. Mary-in-the-Vaults; on the Hall's east side are Star Chamber-court and the court of the later Cloisters with the Chapel or Oratory built *circa* 1530 by Dr. Chambers, last Dean of the College, and restored by Barry (October 25, 1851). Star Chamber-court marks the sites of the old stables and Exchequer. The Painted Chamber's site is that of the Peers' Lobby Corridor (west), to the north of which is the Judges' Court, where stood the (old) House of Lords, and next south of that lay the Prince's Chamber. The present Central Hall with its corridor and Peers' Lobby (south) and corridor and Commons' Lobby (north) are built over the Cotton and the Speaker's Gardens. On December 13, 1884, January 24, March 21, and July 11, 1885, we illustrated Charles Barry's modifications of his father's designs for the completion of Westminster Palace and treatment of Westminster Hall, by enclosing the Hall within a building to extend from Old Palace-yard to Bridge-street, and so forming a quadrangle around New Palace-yard, at an estimated cost of 500,000*l.*

Westminster Hall.—In 1810-22, under the superintendence of J. W. Hiorl, of the (old) Abbey of Works, Thomas Gafeyre, mason to the Abbey, restored the north and south ends of the Hall, together with the embattled towers at the sides of the north porch, attributed to William Wykeham; slate was substituted for the lead upon the roof, into which dormers were introduced; the interior roof, constructed of the *quercus densiflora*, was repaired with forty loads of oak timber brought from old

ships broken up in Portsmouth Dockyard. In 1844-6 Sir Robert Smirke recased the outside of the west wall and refaced the inside walls with Huddleston ashlar 6 in. thick, and laid the present pavement at the level of the old Purbeck stone pavement of *temp.* Richard II., which he found at a depth of 1 ft. 3½ in. below the Yorkshire flagstone floor laid at the latter end of the eighteenth century. At a depth of 2 ft. 9½ in. below the Purbeck pavement he found a hard surface of gravel and clay rammed level, beneath which lay 8½ in. of pure red sand, and beneath that a layer 7½ in. of masons' rubbish, Caen, Reigate, and rag stone, &c. Smirke erected the cast-iron louvre or lantern modelled after its late fourteenth century predecessor. The upper row of openings in the roof were made in 1843 for an exhibition of drawings. Sir Charles Barry added a bay to the Hall, removing the south window for his archway to St. Stephen's Porch, on the site of the Court of Woods and Liveries, and rebuilding it in the porch [February 18, 1843, September 3, 1853, and April 4, 1855]. The stained glass, of heraldical achievements of our sovereigns and the founders of their houses is by Hardman (1847-52), whose firm of John Hardman & Co. restored the nearly one hundred panels of leaded glass and the outer diamond glazing after the dynamite explosion on Saturday, January 24, 1885. Into the Hall's hitherto unbroken area have been obtunded (1886) two flights of steps that lead into the Journal, Private Bill, and other offices erected by J. L. Pearson on its west side. The Select Committee, of which Mr. G. Shaw-Lefevre was chairman, reported (April 27, 1885) in favour of Pearson's scheme, at an estimated cost of 5,000*l.*, for completing the corner of St. Stephen's Porch in harmony with Barry's work, 8,000*l.* for rebuilding and repairing the flying buttresses and repairing the west wall, and 13,500*l.* for the two-storied gallery and the building at right angles to the Hall. Having expressed *passim* our opinion upon that piece of sham "restoration," we will say here only that the building, based upon little more than conjecture, stands over the ground which Soane so skillfully used. In our lithograph will be found a sketch of the buttress uncovered when the Law Courts were removed, and since refaced in Pearson's "restoration."

The Law Courts.—The Court of Queen's Bench held its final sitting at Westminster Hall on December 21, 1882. On December 4, Lord Chancellor Selborne and the Judges had proceeded down the Hall in solemn state on their way to receive the Queen at the opening of the new Courts of Justice. Descending the steps from St. Stephen's Porch they passed between the places where, until eighty years ago, the Courts of Chancery and King's Bench had sat since their permanent establishment there in 1224. To Soane was given a confined space between the Hall and Kent's King's Bench Record Office. At the north end, facing New Palace-yard, stood the Court of Exchequer, formerly Queen Elizabeth's ballroom and breakfast-room, south of which were the Court of Common Pleas (Queen Elizabeth's

* See a letter from his son in the *Times* of January 2, 1895, and S. Smirke's communication to the Society of Antiquaries on February 4, 1846 (*"Archæologia,"* vol. 26).

Fig. 3.—Ashburnham House and Entrance to Dark Cloister; showing the late Dr. Turlie's House (over Cloister Entrance), pulled down in 1883.

bedroom), and Old Fish-yard. Soane constructed (1820-5) a corridor under, and inserted Judge's chambers between, the six or seven buttresses, and plotted the remaining area from north to south, for the King's Bench and Bail Courts, the Courts of Exchequer and Common Pleas, the Vice-Chancellor's (afterwards the Rolls Court), and the High Court of Chancery; for the Admiralty Court he provided in an upper-floor at the south. Soane's courts (see fig. 2) were justly extolled for the dignity, variety, and acoustical properties of their interiors, as well as for their lighting, ventilation, and means of access. The King's Bench Record Office was originally designed, after the Palladian mode, by Kent with, some say, Ripley's help, in or about 1738-9, for the records of Parliament, the estimate amounting to the large sum of 107,067*l.* The central block and south wing appear in plate IV. of Malton's "London and Westminster," 1792; James Wyatt probably added the north wing in 1813.

Barry pulled down most of the south wing and return front to Old Palace-yard in 1850, and in January, 1883, was begun the demolition of the west façade, the stones being taken to the Albert Palace, Battersea Park. Soane's courts speedily followed. Their removal exposed the buttresses and lower walling of *temp.* Richard II., which occasioned the controversy already referred to. The handsome marble chimney-piece in the judge's room behind Queen's Bench Court was removed to the Lord Chief Justice's private room at the Royal Courts. In the then Margaret-street, opposite Kent's Record Office, stood the Ordnance Office, 1784, by William Tyler (*obit.* 1801), which was pulled down in the Act passed on June 10, 1805. George Canning's statue marks its site.

Westminster Bridge, Canon-row, and New Scotland Yard.—An Act, 9 Geo. II., c. 29, passed in 1736, constituted a commission to choose the design and materials of a bridge, without houses upon it, and to raise 625,000*l.* by a lottery. Batty Langley made some designs, but in May, 1738, the Commissioners appointed Charles Labelle, a Swiss, whom it is said they invited to England, as "engineer" at a salary of 100*l.* a year with 10*s.* a day as subsistence money. The original proposal was to build the superstructure of wood, and Labelle's commission related to the construction of the stone piers only. The first pile was driven on Wednesday, September 13, 1738, after a method contrived by James Vauloué, a watchmaker, to whom the Royal Society voted their medal.

In the "Crowle" Pennant is an engraving by W. H. Toms, 1738, after H. Gravelot's drawing, of Vauloué's three-horse engine and one of W. Elbergher's machine for sawing off, under water, the piles used to support the centerings. Labelle built his piers upon caissons which he floated into position and then sank with loads of stone. In March, 1740, the preceding winter's frost and ice having destroyed the piers, a stone bridge was agreed upon; the last stone was laid on October 25th, 1740, yet the bridge was not opened throughout until November 18, 1750, as one pier and two arches were re-built. The bridge (see view in lithograph), 1,223 ft. long and 44 ft. wide at the arch-soffits, had fifteen

semi-circular arches with channelled voussoirs, and spans diminishing from 76 ft. (middle arch), to 25 ft. (two end arches); the bridge ends had at first a gradient rate of 1 in 15, since changed to 1 in 22-3. Thomas Gayfer the elder was chief mason, the builders being Andrews Jelfe and Samuel Tufnell. In the British Museum is a bound volume, *Addit. MSS. No. 27,587*, of Jelfe's cash accounts, and a mass of letters he wrote, October, 1740—June, 1744, mainly concerning the progress of the works and the supply of Portland, Kentish rag, Purbeck, and Cornish Moor stone. The cost is generally stated to have amounted to 218,200*l.*, with 170,700*l.* for the approaches, and Bridge-street on the site of the Long Staple, but an official return made in 1863 gives the total cost as 393,180*l.*, whereof 145,057*l.* was paid to the builders, and 248,132*l.* to other parties, with 109,054*l.* for the approaches.*

In 1823 Telford found that the substructure of the piers had sunk considerably; the subsequent removal of old London Bridge increased, as he foresaw, one of the causes of the settlement; two or three piers gave way, and in August, 1846, the bridge was closed to traffic. The fabric was relieved of it, is said, 30,000 tons weight by the substitution of a lower parapet, the removal of the high canopies from the alcoves, and the lowering of the roadway. Some of the alcoves have been re-erected in Victoria Park. Sir Charles Barry proposed, and we believe made designs for, an iron bridge of five arches, in the Gothic style. Thomas Page's bridge was begun in July, 1854, upon a tender for 201,000*l.*, and opened in its entirety on May 24, 1862. The total cost amounted to, we believe, 206,000*l.* The old bridge was first lighted with gas on December 31, 1813, from the Gas Light and Coke Company's works, originated by F. A. Winsor, and established on the site of the Bower teagardens, Horseferry-road, in 1812. In November last the London County Council resolved to re-build Lambeth Bridge (Messrs. Barlow), finished in 1862 at a total cost of 48,924*l.*

Near the north end of the bridge stands St. Stephen's Club, by John Whichcord the younger [April 11, 1874]. The building in Canon-row, distinguished by its Ionic portico at the top of a flight of steps, and its spacious circular hall, which William Pilkington (not William Atkinson, as is generally said) designed, 1810, for the Ordnance and Transport Office, served latterly for offices of the Civil Service Commission. It gave place last year to some offices and a police station, by Mr. J. Dixon Butler, official Architect and Surveyor to the Receiver for the Metropolitan Police District, as an addition to the adjacent headquarters, known as "New Scotland-yard," erected in 1888-90, on the site, 150 ft. by 200 ft., of the abortive Grand National Opera House. New Scotland-yard planned and designed by Mr. R. Norman Shaw, R.A., was built by Messrs. John Grover & Son, as a total cost of about 120,000*l.* Close by was the original home of the Royal Architectural Museum

* Mr. R. Bissell Prosser, s.v. "Labelle," Dictionary of National Biography, cites a model of the bridge at the Ecole des Ponts et Chaussées, and the original drawings, signed by J. Gayfer, preserved in the library of the Institute of Civil Engineers, where, too, is Francis Wisbaw's description (1833) of the edifice, for which he gained the Telford Medal. On February 27, 1751, an honorarium of 2,000*l.* was awarded to Labelle.

[January 3, 1851], founded by Sir G. Gilbert Scott and Beresford Hope, in 1851, and removed to No. 18, Tufton-street, formerly Bowling-alley (Ewan Christian and Joseph Clarke), in the summer of 1860.

Broad Sanctuary and Dean's Yard.—The former Guildhall or Sessions House was erected in 1804-5 after C. P. Cockerell's designs [May 14, 1802] on the site of the meat market (1751) which had been established there as early as 1568, and stood over part of the foundations of the Sanctuary Church, of (reputedly) Edward the Confessor's time, and of the bell tower built by Edward III. for the use, it seems, of the Minster. Cockerell's Guildhall, constructed of brick and quadrangular on plan with recesses at the angles, had its principal court in the centre lighted by round-headed windows between the angle oiers of an octangular tower, with a pointed roof carrying a lantern and vane. Above the cornice moulding of the piers that ran all round was a blocking course, surmounted with a light and lofty balustrade, having three panels in each face. The main front had a tetrastyle portico, of the Doric order, with a pediment. It was reconstructed (1803) by Messrs. Higgs & Hill, at a cost of nearly 20,000*l.* (with 3,000*l.* for furniture and fittings) for the Middlesex County Council after the designs of the County Surveyor, Mr. F. H. Pownall. On the second floor are an octagonal council chamber, 36 ft. by 36 ft., committee, ante, reading, smoking, and cloak rooms, with the County Surveyor's offices; on the ground floor are two courts, offices for the executive staff, private rooms, &c. After the burning of the Houses of Parliament (1834), Bellamy's stock of wines was removed into the vaults beneath the Sessions House, and thence to Parliament-street. The vaults had formed the cellars of the (later) "Quaker" tavern in Thieving-lane. The monument (Sir G. G. Scott—the St. George and Dragon is by J. Clayton) erected in memory of "old Westminsters" who fell in the Crimean and Indian Mutiny campaigns, stands next, south-east, to the site of the old Gate House, pulled down in 1760, and next, east, to that of the Cheyne Gate. Scott was architect of the block of houses, facing northwards, between the Jerusalem Chamber and the end of Victoria-street [March 4, 1854]. In fig. 3 is given a sketch of part of the east side of Dean's Yard as it appeared before 1883, when Dr. Turlie's house was pulled down and other alterations made. For the Westminster Hospital, founded in 1719 in James-street, competitive designs were made by Sir Charles Barry; it was built at a cost of 27,500*l.* in 1832-3; by W. Inwood, his son Charles Frederic Inwood (*obit.* 1840) assisting him in the work; two clinical laboratories were added last year. The Royal Aquarium, by Mr. A. Bedborough [May 1, 1875, and January 22, 1876] was opened on January 22, 1876. S. S. Teulon designed the memorial fountain to Sir Thomas Fowell Buxton, Bart., 1865 [January 27, 1866]. On June 24, 1891, was laid the first stone of the Church House, built by Messrs. John Thompson after the designs [January 2, 1897] of Sir Arthur Blomfield, who also designed the case for the organ, by Messrs. Lewis & Co.; the second block, for the House of Laymen, begun in the autumn of 1899, stands on the site of the old Westminster Library in Great Smith-street. The total estimate amounts to about 200,000*l.*

(To be concluded in our next.)

THE GRAND THEATRE, ISLINGTON.—This theatre, which was destroyed by fire in February last, has now been rebuilt. Formerly the exits were all on one side of the house, but now additional exits and staircases have been built on the other side, in compliance with the requirements of the County Council. New exits have also been provided from the stage and the dressing-rooms, and that part of the theatre which is behind the proscenium has been completely rebuilt and rearranged. An asbestos fireproof curtain now separates the stage from the auditorium. The latter has been reconstructed much on the old plan, but the upper part of the private boxes has been removed, to allow of additional accommodation in the amphitheatre; and the seats in the area have now been set out in curves instead of, as formerly, in straight lines, to give a better view of the stage from the sides. Hot-water pipes have been laid throughout the house, and the electric light has been installed both behind the scenes and in a part of the auditorium. The ceiling and the walls have been decorated with hand-painted panels after the designs of the architect, Mr. Frank Matcham.

Illustrations.

ILLUSTRATIONS OF SIR CHARLES BARRY'S WORKS.

THE first five plates given with this issue are illustrations of the work of Sir Charles Barry, and are all referred to in the article on him on another page.

They include an elevation of his design for concentrating the Government Offices in one building, with block-plans of the building and the district as proposed to be laid out, and a sheet of sections and elevations of the various buildings indicated in the plan; both these are from original drawings in the possession of Mr. C. A. Barry, the architect's grandson. The drawings of the Victoria Tower and the Halifax Town Hall were specially made for us by Mr. W. Monk. Sir C. Barry's view of the Ruins of Karnac is reproduced from a pencil drawing in the possession of Sir J. Wolfe Barry, to whose kindness we and our readers are indebted for enabling us to give this beautiful example of Barry's early work as an architectural sketcher.

MILTON ABBAS.*

BEFORE the victory of King Athelstan over the Danes at the Battle of Brunenburgh, he is said to have had his success foretold him in a vision on the hill which rises east of the Abbey Church of Milton, on the spot where the little Chapel of St. Catherine now stands, and to have founded a monastery here, in or about 937. The establishment seems to have been originally one of secular canons, but according to the Saxon Chronicle these were expelled by King Edgar in 964 and monks substituted. Like Sherborne, Milton was a house of Benedictines, and its church is a large and interesting, although incomplete, example of the fine buildings characteristic of the order.

The extent of the original building is unrecorded, but in 1309 the buildings were sufficiently destroyed by a fire, caused by lightning, to necessitate the rebuilding of the church. According to Nicholas Trivet, the church was burned on Tuesday, September 2, including "the bell tower and bells, the ornaments of the church, and the evidences of the monks."† In 15 Edward II. a patent was granted "pro constructione abbaticæ," and from the architectural evidence, building must have continued from time to time up to within a few years of the Dissolution in 1539, 31 Henry VIII. The site and buildings were then granted to John Tregonwell, in consideration of 1,000*l.* and the forfeiture of a pension of 40*l.*, and after, in later years, passing into the hands of the Damer family, it came to its present owners, the Hambros. The monastery was pulled down with the exception of the abbot's hall, and the house designed by Sir William Chambers about 1771 in debased Gothic of the period. The church underwent a "restoration" by Wyatt in 1789, and in 1865 the whole church was restored by Sir C. G. Scott.

The planning and extent of the church previous to the fire of 1309 is now lost, but on the south side of the presbytery—east of the sedilia and east of the stalls—are two openings in the wall, left probably at the time of Scott's restoration, in which are to be seen remains of enriched Norman arches. The curious arrangement of the presbytery with alternate bays closed by solid masonry, suggests the possibility of the earlier work having been encased where it was not considered worth while to remove it, and it is quite possible, owing to the great scale of the church as replanned, that the present incomplete buildings occupy the site of the entire length of the earlier church. There was a Lady Chapel (probably of three bays, as at Sherborne); a choir and presbytery of seven bays, with aisles and an eastern ambulatory; a large south transept; a "crossing"; and a north transept of one bay. On the "crossing" rises a central tower of similar character to that at Sherborne. The various parts were built in the order named, the work having commenced probably, as was usual, at the east end. The size of the north transept, although one of the latest parts of the building, was no doubt restricted by buildings already standing north of it. The

* With this Abbey our series of the Abbeys of Great Britain is concluded. A list of those abbeys which have appeared will be found on page xxvii.

† Hutchins' "History of Dorset," vol. iv.

nave of the church seems never to have been rebuilt. The aisle walls exist for a few feet westward of the crossing, and show the jamb of windows. At the time of the last restoration excavations were made with the idea of tracing the foundations, but nothing was discovered. At the Dissolution the Lady Chapel was pulled down, and in 1737 the chapel or sacristy (as it probably was) on the north side of the presbytery was destroyed. At the time of Wyatt's restoration (1789) the interior of the church seems to have been ruthlessly despoiled of its fittings, and the details of interest recorded by Rev. Thomas Warton, in 1781, quoted by Hutchins, were probably by then swept away. In the present century, when the church was again restored by the late Sir C. G. Scott, the stone screen walls at the back of the choir stalls, which were solid up to that time, were pierced with arcades, the screen wall on the north side of the altar, opposite the sedilia, being similarly treated. The encaustic paving tiles found in the floor of the presbytery were removed to St. Catherine's Chapel on the hill eastward, where they are now to be seen, and modern ones by Godwin put in their place.

Beginning at the east end, we have but the site of the Lady Chapel, although a few years ago the foundations were visible. Against the east wall of the presbytery are three arches and vaulting shafts of the ambulatory, and a portion of the outer walls, with the window jamb in the north wall, remains in continuation of the aisle walls. The details of caps and bases to the columns supporting the vaulting agree in date with that of the presbytery, and the features of the Lady Chapel can therefore be roughly determined. The choir and presbytery, remarkable for their length, remain in a very perfect state. The *Pulpitum* is placed under the eastern pair of "crossing" piers, and the choir stalls occupy the first two bays eastward of it. The third bay is a blank wall, showing in the recess on the south side the remains of Norman work already referred to. The fourth bay is open, forming the upper

entrance to the choir. The fifth bay is solid like the third, and the sixth has the sedilia and a piscina on the south, and a stone screen, similar to those behind the choir stalls, on the north. The seventh and last bay is like the third and fifth, and across its centre is the great altar screen wall, 2 ft. 6 in. in thickness, and allowing a space of nearly 4 ft. behind it. Midway between the west face of the screen and the piscina is another opening in the wall with the remains of an enriched Norman arch. The choir is one step above the "crossing," and six more steps lead up in the fifth and sixth bays to the altar. The vaulting is carried on long vaulting shafts mostly carried to the ground, but corbelled back at the western angles over the stalls and over the piscina near the altar. On the north side of the stone screen in the sixth bay was a chapel dedicated to St. John the Baptist. It is described by Hutchins:—"On the north side of the altar was a small chapel between two pillars. On the wooden work next the aisle, painted like marble, was this inscription in black letter:—'Benedic D'ne domum istam, que dedicata est in hon. . . . S'cti Johannis Baptiste, Venientium in loco isto exaudi glorie sue S.s.'" Behind the sedilia and facing the south aisle is a semi-octagonal bracket (see sketch), and in the wall of the next bay westward are the remains of a lofty canopied niche, over which is a stone about 18 in. square, bearing the rebus of Abbot Wm. Milton—the initial W and a pastoral staff, a mill on a tun, and the date 1514. The niche has been elaborately coloured. In the wall of the third bay (facing the aisle) is a small segmental-headed recess, also bearing traces of colour. In the fifth bay (facing the presbytery) are several rings and hooks still remaining *in situ*, which were connected with the Lenten veil. The stalls, thirteen in number on each side, with six more against the *pulpitum*, are for the most part modern, although a good deal of the old work was re-used. Hutchins mentions the removal of eighteen old stalls to make way for pewing erected by Sir Jacob Banks, and

jecting from the wall, and under it, all over the wall, was rich tracery work, now plastered up; and a fragment at one end remains of this piece of work, which was a chantry shrine, apparently about Henry VII.—perhaps the tomb of the great benefactor, William Middleton.*

In the south-west corner of the transept was a cross-legged effigy in armour, and a shield on the left arm, "on which was an obscure cross.†"

At the present time, the only remains of an altar are near the S.E. angle of the transept (see sketch). In the south wall is a piscina of Decorated date, and in the angle the doorway to the stair turret. About 3 ft. 4 in. from the south wall, and projecting about 3 ft. 6 in. from the east wall, are the remains of a wall 1 ft. in thickness, panelled on its north side with a piscina near its west end. It is of Perpendicular date, and is probably a part of the altars referred to above. The platform on which the altars were placed has been removed, and the transept floor covered with modern tiling. The panelled work now forming part of the pulpitum was probably removed from the south transept. The cross-legged effigy has disappeared. There are traces in the plinth of the vaulting shafts of a screen, which separated the transept from the rest of the church. The two western piers of the crossing, although similar in section, have different bases and plinth, and at a lower level than those of the eastern piers. The walls which block the western arch of the crossing, and the arches which would have led to the nave aisles are probably for the most part modern, although the nave never having been built, they may well stand on the site of temporary walls of pre-Reformation date. The present west porch is modern.

The north transept is entirely Perpendicular and only projects one bay beyond the aisles. There is a large eight-light transomed window at the north end, and long narrow three-light windows on the east and west sides. Against its north wall are the remains of a vaulted slype of four bays, and on the west side are the foundations of a large staircase turret which was evidently connected with the doorway, still visible in the north face of the western buttress. This buttress has been repaired in later times and on its west face are the names of churchwardens and the date 1683. The greater part of the adjacent buttress facing north is probably of the same date. The whole points to the probable existence of a staircase leading to the dormitory on the upper level over the slype, chapter-house, and other buildings, which must have existed here.

A great deal of work was apparently done to the church in the Perpendicular period—a large proportion of it doubtless being due to William Middleton, who was Abbot 1481-1525. The north transept with its parapet and those of the aisles of presbytery and choir, the parapet on the west side of the south transept, and the central tower, are all Perpendicular work, and the elaborate vaulting of the transepts and crossing includes, on the bosses, William Milton's initials and rebus. The flying buttresses of the choir and presbytery appear to have been added at the same period, and lastly, the great altar-screen which bears date 1492. On its west face is the inscription:—"Orate pro bono statu et animabus domini Willelmi Middleton hui' alui' monasterii abbatis ac etiam magistri Thomae Wilken hujus parochiae vicarii et decretorum cancellarii qui hoc altare ad dei laudem suis honorifice depinxerunt sumptibus anno incarnationis domini nostri Jhu' Xti millesimo quadringentesimo nonagesimo secundo." A good deal of the altar-screen is modern and probably of plaster, and the inscription is not the original, but copied from it. On the space behind the screen are several fragments, some Norman, others belonging to the altar screen, and preserving portions of the inscription.

The church must originally have been rich in shrines, relics, and monuments. Athelstan gave a piece of the cross, a great cross of gold and silver with precious stones, the arm and many bones of St. Sampson, the arm of St. Branwalader, and many others, and they were placed in the church in five gilt shrines.‡

Possibly most of these relics suffered at the time of the fire in 1309. The south transept would seem to have had a shrine in it (see ante) besides the cross-legged effigy, which

"chapel," or more probably a sacristy, 25 ft. in length, and probably about 12 ft. in breadth. This was pulled down in 1737, and the doorway and the wall ribs on the exterior are the only visible evidences of it. In the first bay (east of the north transept) is a third doorway, coeval with the rest of the eastern arm, which appears, from the appearance of the adjacent buttress, to have led into another building. The shortness of the north transept, with the remains of a vaulted passage or slype on its north side, are clear evidence that the monastic buildings—in this case the chapter house and its surroundings—always existed at this point, and the buttress projecting eastward from the transept is obviously an addition of late date. There is also a record of a passage between the church and the building west of the "oriel" of the abbots' hall. This passage was of later date than the doorway, and it is possible that there was another side-chapel here, similar to the Wykeham Chapel at Sherborne.

After the choir and presbytery, the next in order of date is the south transept. On the exterior the difference may be seen in the level of the string below the window-cills. The window tracery throughout is of later date. The transept projects two bays clear of the choir aisles, and is aisleless. The outer walls are of considerable thickness, and the buttresses are of great projection to resist the thrust of the vaulting. At the south-east angle is a staircase turret, finished with a pyramidal cap with crockets and finial. In the south wall is a large window of seven lights filled with reculいたed tracery. The glass is modern. The lower tier of side windows are of three lights, those in the upper tier being of four, except the window over the aisle, which is of two lights only. The design of the west face of the transept is the same as that of the east (shown in the view), with the exception of the parapets. This on the east and south is original, with ball flower ornament; on the west side, however, it is of pierced quatrefoils, the same in design as on the choir aisles, north transept, and central tower.

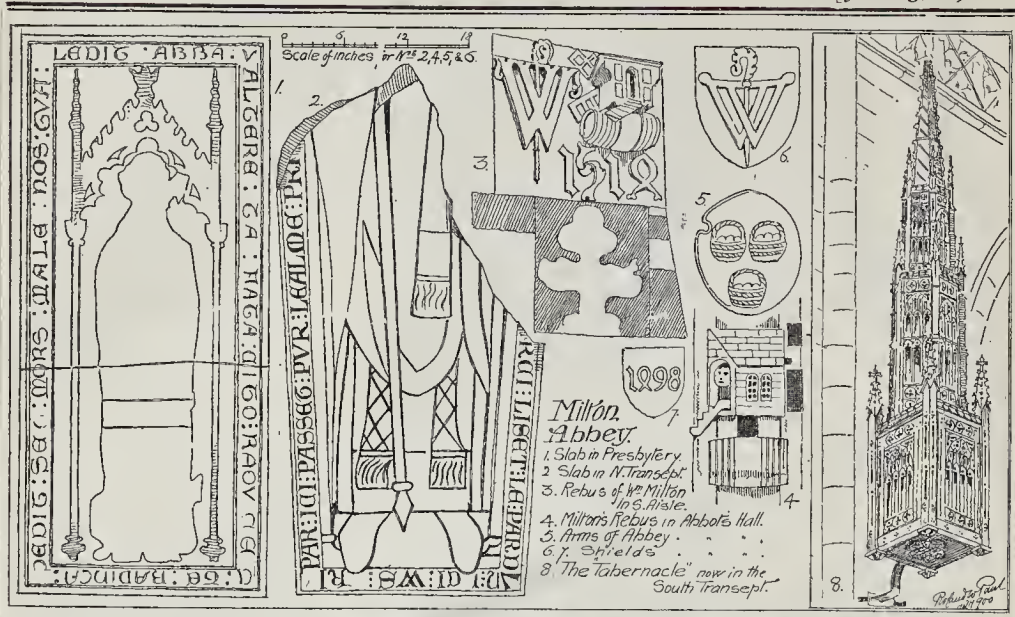

In this transept were formerly many points of interest. Against the east wall were the remains of two altars, or chantries, approached by "an ascent of three steps," "with two cornices of unequal height over them, which have been finely carved, gilt, and painted," and ornamented with remains of black letter inscriptions and armorial bearings. In the notes taken by Rev. Thomas Warton, D.D., in 1781, quoted by Hutchins, he says, "On the east side of the south transept is the ruin of a long, richly-wrought canopy, very high, pro-

See Builder, April 3, 1897.

* Hutchins, iv., 404. † Ibid., iv., 403. ‡ Ibid., iv., 403.

says that "the chancel, anciently part of the choir, was separated from the body by an old screen of wood, on which was I. H. S. and a neat piece of ironwork." At the backs of the stalls, which flank the entrance under the pulpitum, are two figures painted in oil on panel, that on the north representing the founder, King Athelstan, holding a church with three spires, a monk kneeling below, and an imperfect inscription above in black letter: Rex. Atelstan' hui' loci f[undator]. On the south side is the figure of a queen, holding what appears to be a parrot, but probably intended for a hawk, picking at the wing and claw of a bird. A white glove is held in the right hand. The panels measure 3 ft. 3 in. in length, and 1 ft. 8½ in. in breadth, and are probably late thirteenth century in date. There is another painted panel, now in the vestry at the east end of the south aisle, but of later date. The pulpitum, 6 ft. 6 in. in width, has a central entrance and two staircases leading to the loft over. There are two ogee-shaped openings on the stairs looking eastward, and on the north side of the entrance on its west face, is a small recess about 1 ft. in depth. The upper story projects about 6 in., and exhibits many evidences of having been built up with material from other parts now destroyed. The upper part of the western wall is largely composed of panelled and painted masonry, mutilated and for the most part inverted, and on the east side is a row of painted shields, which corresponds with the description of work formerly in the south transept and now destroyed. The side screen walls of the choir behind the stalls were, as already noted, pierced with arcading, during the restoration by Sir G. G. Scott in 1865. They are finished with a gabled coping somewhat similar to the side screens at Tintern Abbey. The sedilia on the south side of the altar are three in number. The pinnacles and upper parts generally have a good deal of modern work introduced. Their original condition is shown in a plate of details in Hutchins' "History of Dorset," vol. iv.

The aisles are a little over 13 ft. in breadth, and are lighted throughout by three light windows. The clearstory of the choir and presbytery has three light windows in the broad bays, and two light windows in the narrow bays, and high up in the east wall is a window of seven lights. At the east end of the north aisle are one or two interesting monuments, described later. In this aisle are three doorways. The one in the easternmost bay is probably post-Reformation, and there is a corresponding one on the south side (see view). In the fourth bay is a doorway opening outwards, which led into a

has now disappeared. The monuments existing consist principally of grave slabs. One in front of the altar steps has the matrix of an abbot's brass and a marginal inscription: ABBA : WALTERE : TK : FATA : CITO : RAPVERE : TE : RADINGA : DEDIT : SED : MORS : MALE : NOS : TVA : LEDIT. There was an abbot Walter de Corfe, 1273, and another Walter Archer, 1392-1417. The slab more probably commemorates the former.

Further west, in the middle of the second bay of the choir, is a large stone, now devoid of ornament, possibly having been reversed at the restoration. Two are mentioned by Hutchins in this position, "in the passage between the chancel and choir." In the eastern bay of the north aisle is a brass to a monk: "Hic jacet Johes Artur hui loci monachus cuius anime ppietur deus. Amen." Against the east wall is the monument of the Bancks family, and on the south side a canopied monument of Purbeck marble, with a brass of Sir John Tregonwell, to whom the abbey was given at the Dissolution. It bears this inscription: "Here lyeth buried Syr John Tregonwell knight doctor of the Cyvill Lawes and one of the maisters of the Chauncerie who dyed the xiii day of January in the yere of our Lorde 1505 of whouse soule God have mcy." Sir John is represented in a tabard kneeling at a prie Dieu, and at the sides and above the effigy are three shields of arms. In the north transept is an interesting example of an incised slab, with the lower half of the effigy of an abbot and a marginal inscription: (ME)RCI : LISET : LE : PARDVN : ICI : W.S. : RI : PAR : ICI : PASSET : PVR : LEALME : PRI. The initials W.S. are probably those of the abbot. There were two abbots, Wm. de Stokes, elected 1222, and Walter de Sudelynge, 1292, to either of whom this slab may belong. It was found at the time of the restoration at the west end of the south aisle. The Damer monument in the north transept is by Carlini, and the whole of the transept is raised one step, and the pavement composed of marble. In the south transept is a modern font, quite out of keeping with its surroundings, and the upper part of a figure of St. James said to have come from the parish church.

One of the most interesting possessions of the abbey church is the "tabernacle," a very beautiful piece of Perpendicular woodwork, now placed against the west wall of the south transept. Its original use is generally considered to have been for holding the pyx, although the interior bears evidence of its having once been used for bells. The general design is shown in the sketch. It is in three stages, the lowest square on plan, the two upper ones hexagonal, the whole surmounted by a spire. Two large irregular holes are still to be

seen in the centre of the front of the altar screen, which was its probable position. In 1781, according to the Rev. Thomas Warton, it appears to have been divided, part of it being in the transept, and part on the north side of the altar. It has been elaborately coloured, chiefly in red and green, with a powdering of roses in places.

There are a few fragments of old glass in the east window, and some old quarries in the westernmost window of the south aisle of the choir.

The present abbey house, built by Sir Wm. Chambers, incorporates the Old Abbot's Hall, apparently built by Abbot Middleton. On various parts of the room, on the cornice and screen chiefly, are shields of arms, the arms of the Abbey, and initials, rebus, and mitre of Abbot Milton. On another is the date 1498. A fireplace has been inserted on the south side, otherwise the room remains in good preservation.

The parish church of St. James stood a little distance south-east of the church, but the village and church were rebuilt outside the park about a mile distant, and the site alone remains.

A short distance east of the church, on the side of the hill, is the ancient chapel of St. Catherine. It consists of a nave and chancel, and the main walls are Norman. Later additions have been made to it, and the west front cruelly spoiled by being rebuilt in attempted

imitation of Norman. On the west jamb of the wall door, which is Norman, is a fragment of an inscription:—

INDULGENCIA : W : SCI : LOCL C : : X.DIES. :
In the floor of the chancel are a number of encaustic tiles, removed here from the abbey church. There are a large number of different patterns, some of the best being here illustrated. Among the armorial tiles are the arms of Clare, Bigod, three lions passant, a shield vair, another cheque, three swans, a cross between four lions rampant, within a bordure engazled, the arms of the See of Exeter (the crosskeys and sword), two tiles manufactured at Malvern, one with an inscription and date 1450, and the second a four-sided pattern with the arms of Clare. Besides these there are two knights on horseback (one with a spear, the other with a sword), a stag and hound, a dog in front of a tree, two birds, a star with six points, and several examples with conventional and foliage patterns. There are some border tiles with embossed patterns.

At Hilton church, north-west of Milton Abbas, are several panel paintings, with saints, removed from the abbey church, apparently at the time of Wyatt's restoration, and at Bingham's Melcombe church are several fragments of glass, said to have been brought from Milton.

The church was dedicated to St. Mary, St. Michael, St. Sampson, and St. Branwalader.

The arms of the Abbey were *sa*, three baskets with loaves of bread, *or*. The original number of monks is said to have been forty, but at the Dissolution the number had decreased to twelve.

The materials used in the abbey church vary, and this variation is largely a guide as to date. The whole of the eastern area (choir and presbytery) is chiefly of Portland stone, with an admixture of flint in the aisle walls. The south transept is the same, but with a good deal of Ham stone introduced. The later portions of the building are almost entirely of Ham stone—the transept, crossing (w. piers), and tower; and also the additions and alterations—such as parapets and pinnacles—made to the choir and presbytery. The interior is very striking in this respect, the eastern piers of the central tower being of Portland, while the western piers are of Ham stone. Ham stone occurs certainly in the jambs of the clear-story and aisle windows, but it may possibly have been later work inserted.

NEWGATE PRISON.

As this remarkable building will shortly, and of necessity, disappear—for it could be used for no purpose but a prison, in which respect its interior arrangements are out of date—we have thought a good record of its appearance would be of permanent value. Mr. Curtis Green has produced a fine drawing of it, which we are sure our readers will be glad to have.

We gave measured drawings of the building, by Mr. G. J. Lacy, and some account of its history, in our issue of December 21, 1895. Mr. Green wishes us to add that he has been most assisted by Mr. Lacy's drawings in making the present perspective view.

VIEWS OF OLD WESTMINSTER.

THESE views are given in connexion with the article on "Old and New Westminster," published in this issue, and are nearly all referred to there.

The view of "Rural Millbank," as it appeared at the beginning of last century, is from a pretty water-colour drawing in the Crace collection. That of Millbank Penitentiary is from an engraving made probably shortly after the Penitentiary was built. The sketch of the buttress of Westminster Hall, as it appeared when Soane's Law Courts were cleared away, was made at the time by Mr. W. E. Drummond - Milliken. The other illustrations are all from lithographs or engravings in the Crace collection. They show New Palace Yard as it existed early in the century, with the coach of the period also; Labeley's old Westminster Bridge, removed in 1861; the doorway of Old Bridewell, as it stood as a relic in the middle of a garden, subsequent to the demolition of the prison; the exterior of the "Painted Chamber" where once the House of Lords met; the Houses of Lords and Commons as they appeared before the fortunate fire which cleared the way for the present noble structure; and the cloister court east of Westminster Hall, as it appeared after the fire. On the right is seen the buttress which Barry cut away in carrying out the Houses of Parliament.

THE PORTAL OF THE NEW CENTURY.

It occurred to me that the entry on the new century might be architecturally symbolised by the idea of a vast hall of Cyclopean dimensions, beyond which the bridge into the future stretches towards the sunrise.

The sub-title, "An Extempore Fantasy," is a mere expression of fact, inasmuch as it was built up extempore on the paper without even a preliminary sketch—an "essay in the intervals of business," and must be taken as such.

H. H. S.

THE SMALLER ART PALACE ON THE CHAMPS ELYSEES, PARIS.

We give two illustrations, from photographs specially taken for the *Builder*, of M. Girault's beautiful building on the Champs Elysees, known as the "Petit Palais," so called in contrast with the still larger palace opposite, though in reality it is anything but a "small" building.

The one view shows the principal façade facing the Avenue to the bridge; the other shows the interior of the semicircular court,

The Smaller Art Palace on the Champs-Elysees, Paris. Plan.

perhaps the most charming portion of the architecture. The plan appended illustrates the arrangement which is the basis of the whole conception; the semicircular internal court with the double suite of galleries on a semi-hexagon plan outside it, the sides of which form tangents to the circle.

The building was described at length, in regard to its ornamental details and sculpture, in an article on "The Two Art Palaces of the Paris Exhibition," in our issue of June 16, 1900.

THE HEART OF ROUEN.

THIS drawing, which was sketched upon the spot a few months back, is taken from a window of a house upon the quay. It represents the most ancient part of that remarkably interesting city as it is at present (factory chimneys, iron spire, and all). The foreground shows the various old streets which form a kind of network of ancient houses and buildings between the Halles and the Rue Grand-pont. The houses are interesting examples of timber construction coated all over with slate very ornamentally treated. Viollet le Duc, in his "Dictionnaire," gives examples, under the heading "Ardoise," of this form of slate-casing, so common in this part of Rouen. It is somewhat curious that, although these houses have highly-ornamental gables, towers, and richly-carved corbels, no decoration of any kind is to be found on the chimneys, which are perfectly plain. The streets, &c., shown in this view are the Rue du Bac, the Rue des Halles, Rue de la Savonnerie, Rue de l'Épicerie, and the Rue Potard. Part of the buildings of the Halles are shown to the extreme left, but the curious Renaissance building called "Haute Vieille Tour" is not visible from this point of view.

Andrea Cook, in his charming "Story of Rouen," points out a great peculiarity of this part of the city. The streets all run *up* to the quay and not down to it, and as the Cathedral is on a hill, the whole district forms a valley, and it seems as if it must formerly have been covered with water and the river banked up at some time; or was there a *second* island between the original shore and the Ile Lacroix? This sinking of the land is distinctly visible in our view, and throws into prominence the Cathedral and St. Maclou whereas St. Ouen, which is the loftiest church of the three, being below the brow of the hill and on the opposite bank of the Robec, is less conspicuous. That eccentric little river almost turns a right angle under the Rue d'Amiens, and flows at the back of the Rue Damiette, after which it disappears. All this part of the city, when seen from a height, looks a bewildering maze of lanes and houses, which, together with the three magnificent churches, form a picturesque group such as is scarcely to be equalled anywhere else in Europe. Not only is the general view so fine, but when we examine it in detail we shall find such streets and houses as

delighted Prout and Coney. The Rue de l'Épicerie, the Rue du Bac, the Rue de la Savonnerie, the Rue Damiette, and "Eau de Robec" are specially rich in old carved and slate-fronted houses. The tall slate-covered towers are very singular features in the Rouen houses. One does not notice them so much in passing along the streets, because they are generally in the courts at the back of the houses.

Alas! what is to become of all this maze of picturesque but dangerous and insanitary dwellings—this "dream for the artist," but nightmare to the unfortunate Town Council of Rouen? The great danger is fire, the less "demolition!"

When, however, that demolition takes place we do trust that it will not be carried out with that total disregard of everything ancient which characterised the construction of the Rue de la République and some other new thoroughfares in Rouen; and one is glad to notice that in the rebuilding of the Hotel of the Crescent, "Cour des Comptes" (an eighteenth-century structure), the old sixteenth-century doorway and beautiful Early Renaissance cloister have been saved, which gives one a hope of better things for the future.

The last of the old timber houses touching the Cathedral buildings is coming down; it is in St. Romain-street, and is interesting. We cannot, however, blame the Town Council for removing these houses attached to the churches, as the danger from fire and the insanitary conditions created by such buildings are too serious to be neglected, even for the cause of picturesqueness.

H. W. BREWER.

ARCHITECTURAL SOCIETIES.

THE ARCHITECTURAL ASSOCIATION OF IRELAND. — On Tuesday, the 18th ult., Mr. Charles J. MacCarthy, City Architect of Dublin, delivered a lecture entitled, "Some Intentional Irregularities of Italian Mediæval Architecture." The lecture dealt in detail with a number of instances of structural irregularities in Italian mediæval churches. These irregularities were apparently first noted in modern times by Mr. Goodyear, an American architect, who attached so much importance to his inquiry that, assisted by a surveyor and a photographer, he entered on a regular course of inquiry, the results of which he duly published. These came under the notice of Mr. MacCarthy, who took the opportunity of inquiring personally into the matter by a couple of visits to Italy, with the result that he has become convinced of the correctness of Mr. Goodyear's conclusions—namely, that these so-called irregularities are absolutely the result of deliberate intention, and not due to constructive unskillfulness. The irregularities to which Mr. MacCarthy called attention take such forms as the narrowing of the nave

towards the east—the inclination diagonally of the central axis of the church—in some instances to so great an extent as 8 ft. by actual measurement; and in other instances a perspective reduction of the lines of the nave arcade by a continuous narrowing of the spans of the several bays, and curious to note such reduction is seldom regular, but on the contrary extremely unsystematic to all appearance. For instance, we get three or four bays regularly diminishing in span, and then a wide bay—wider than any other, perhaps. This is often held to prove that the irregularities were not the result of deliberate forethought, but rather of accident. Mr. MacCarthy strove to show this to be further proof of artistic feeling, which disdained a purely mechanical reduction. The lecture was illustrated by a large number of diagrams.

DIARIES, &c., FOR 1901.

MESSRS. HUDSON & KEARNS (83, Southwork-street, S.E.) have sent us specimens of their architects' and builders' diaries, and their special diary blotting-pads, all of which we can recommend for usefulness and neatness. The architect's diary is issued in two sizes, numbers 12 and 13, the only difference apparently being that No. 12 has, in the diary proper, one page to a day, while No. 13 has two. They contain, in addition to information usually to be found in a diary, some cases of interest to the profession decided in the Courts of Justice during the past legal year; a list of Metropolitan District Surveyors and districts, with official and private addresses; regulations and rules as to applications to the London County Council under the London Building Act; a list of some architectural, surveying, and engineering institutions, with their presidents and officers, &c. The builder's diary, No. 11, has two days to a page, and contains a series of useful tables for builders, including a wages table, a form of ready reckoner for carrying out estimates, checking invoices, &c., and tables for the valuation of property, leases, life interests, insurances, &c. Messrs. Hudson & Kearns' diaries need no recommendation to those of our readers who have used them; they are admirably arranged and printed, full of useful information, and leave little or nothing to be desired. As to the blotting pads, No. 8A and the banker's pad are specially good specimens.

"Sprague's Pocket-Book and Architects' and Surveyors' Memorandum" for 1901 is the thirty-second annual edition, by Messrs. Sprague & Co., Limited, 4 and 5, East Harding-street, Fetter-lane, E.C., of a useful and well-arranged little diary. The information for architects, surveyors, and others is put in a very concise way.

"The Architects' and Surveyors' Diary for 1901," published by Messrs. Waterlow Brothers & Layton, Limited (24, Birch-lane, E.C.), contains much information useful to architects, surveyors, and others. Besides the usual features of a diary, the work contains lists of members of the R.I.B.A., the Surveyors' Institution, Institution of Civil Engineers, and other bodies, a digest of the principal acts relating to buildings, &c.; conditions and contract on taking building land; general conditions for building contracts; professional practice and charges of architects, &c. The work is neatly bound and got up.

The first year's issue of "Knowledge, Diary and Scientific Handbook" (High Holborn) comes appropriately at the commencement of the new century, and gives promises of many future issues. The scope of the work is mainly astronomical, but its usefulness is not confined entirely to science, as some of its features will be useful for workers in other branches of work. The diary includes:—An Historic Summary of the Advance of Science in the Nineteenth Century; Astronomical Notes and Tables; Twelve Star Maps showing the Night Sky for every Month in the Year; Tables of Tides and Tidal Constants; Original Descriptive Articles on the Tides and Terrestrial Magnetism; A Calendar of Notable Events; Photograph and Detailed Description of the Gigantic Telescope exhibited at the Paris Exhibition; an essay on the Uses of Knowledge; The Constituents of the Sun; The Hundred Brightest Stars, with a Table of Principal Observatories of the World; List of Principal Refractors of the World; and Monthly Astronomical Ephemeris. The diary portion gives a page to a day. The work

is very neatly got up, and will certainly prove a useful book of reference as well as a well-arranged diary.

"The City Diary for 1901" (W. H. & L. Collingridge, 148, Aldersgate-street) is the thirty-eighth year of issue of a most useful work of reference to everyone interested in the local government of the City. A complete list of members of the Corporation, with addresses, is given, and particulars of the City Companies are set out, and other information useful to City people and others is given. The diary portion is well arranged, and is interleaved with blotting-paper.

"The Railway Diary and Officials' Directory for 1901" (McCorquodale & Co., Limited, Cardington-street, Euston-square) and a copy of the "Railway Almanac" have been sent us—both useful issues. The diary is full of information and statistics relating to railways.

"The Mechanical World Pocket Diary and Year Book for 1901" (Emmott & Co., Limited, New Bridge-street, Manchester) is the fourteenth year of publication of a cheap, neat, and handy little diary. The diary portion is somewhat limited, the greater part of the work being taken up with useful engineering notes, rules, tables, and data.

"The Gloucester Diary and Directors' Calculator for 1901" is the sixth year of issue of a work published by the Gloucester Railway Carriage and Wagon Company, Limited. It contains a list of stations and junctions attended by the company's wagon repairers, with names and addresses of the repairers.

Messrs. Benrose & Sons, Limited, 23, Old Bailey, E.C., have sent us several of their daily calendars—Shakespearean and Proverbial—which are excellently got up and suitable for use in the office or home. The same firm also send us their monthly diary—the diary consisting of twelve parts, suitable for carrying in the waistcoat-pocket.

Messrs. Jonas Smith & Co., timber merchants, Belvedere-road, Lambeth, S.E., also send us their daily calendar, the date on which is very clearly printed in red.

TECHNICAL EDUCATION ON THE CONTINENT.

MR. JAMES BAKER, F.R.G.S., has prepared for the information of the Board of Education a record of the impressions which he formed in the course of a journey that he undertook through East Prussia, part of Poland, Galicia, Silesia, and Bohemia, with the special object of observing, from the point of view of one generally interested in the development of British industry and commerce, the progress of technical and commercial education in those countries. Describing first the Berlin Royal Technical College, Mr. Baker observes that the very building induces respect for industry and mechanics. It has a great and stately facade, and a hold flight of steps leading to its principal entrance, the great building stretching away 125 yards on either side of this entrance, the entire structure being 250 yards long and just 100 yards deep. There are working in this building over 3,400 students and Hospitanten, 140 professors, and 260 assistants. The subjects taught here are architecture and building engineering—that is divided into Tief and Hoch Bau, the Tiefbau dealing with what one may term ground engineering (railways, bridges, drainage, &c.), and the Hochbau dealing with above-ground building such as houses, towers, &c.—machine engineering (including electro-technical work), shipbuilding and marine engineering, chemistry, metallurgy, and general science (including natural philosophy and mathematics). The fees are arranged according to the lectures attended and practical work undertaken, students paying for lectures 4 marks (*1 s.*), and for an hour's practical work 3 marks, whilst the free-lance students called Hospitanten pay 5 marks for lectures and 4 marks for practice. The classes from which the students are drawn are very varied; the poor lad who has gained a scholarship, or stipendium, as it is called, may be working by the side of an admiral who agrees with the statement that one is never too old to learn. Of these scholarships for the assistance of poor or clever students the school possesses a very large number, nearly a hundred in all; and many Prussian scholars who are poor but able are freed from paying the school fees, and a goodly number of the scholarships also carry with them this remission of the fees. It was interesting, Mr. Baker remarks in passing, amidst the orderly maze of class and lecture room, workshop and laboratory, and, above all, through the model or museum rooms, to note the extreme order that prevailed in all departments. In the great hall the frescoes are illustrative of the building and engineering arts, the two at either end being powerful and realistic studies by Ernst Hilkmant; one a painting of the Greek builders work on the Acropolis, the other the scene of the building of a modern iron bridge;

the other frescoes are of Rome, Philæ, &c. The next largest hall is devoted to the reading-room, and this adjoins the great library, wherein are 75,000 volumes, from the sets of folios with plates dated upon artistic or scientific subjects to the Transactions of American scientific societies of to-day. In the reading-room are foreign papers in all tongues, and thus the student is in contact with the art and science of the world. There are twenty different museums in the school. In the Building Museum are examples of the sets of folios with plates of the quarries from whence they are obtained, and of all possible building material; and in the Architectural Museum are models of all parts of buildings and of the famous buildings of the world. In PRUSSIAN POLAND Mr. Baker visited the, originally, Royal Polish City of Posen, and made a close study of the new technical schools which he found pleasantly situated on the outskirts of the interesting town. The pupils enter at sixteen; there are four classes, and each class lasts for half a year with twenty lessons, but as the pupil is on practical work during half the year he is twenty when he has finished the course. The fees are 80 marks (4*l.*) for the half-year and 20 marks (1*1*l.) for materials, pupils proving themselves with German, French, English, and water-colours. Lodgings are arranged for the pupils at a fixed rate for board and lodging of 40 to 60 marks a month. A certain number of poor students are excused a part, or even all the fees; but a proof of need, of intense diligence and capacity from former schools, such as the Volksschulen, must accompany any application for such exemption. At the end of each half-year the pupil receives a certificate of the result of his work, and on his passing out of the first or highest class an examination is held, and those who pass receive a diploma from the Royal Examination Committee, which is accepted by the master builders and architects as a proof of the knowledge their code demands; it also suffices for securing Government situations in the building department and in the Tiefbau department, *i.e.*, positions on the canals, railways, roads, &c. The programme of work is, shortly, as follows:—For the fourth, or lowest class, German language two hours a week, especial attention being given to building and business work and the important points in connexion with post, telegraph, telephone, and railways. Arithmetic and algebra have respectively two and four hours per week; mensuration of plane figures, four hours; natural philosophy, two hours; practical geometry, four hours; building construction, introducing every type of separate portions of buildings, and their construction in stone and wood, sixteen hours per week; to the elements of form, proportion, &c., four hours; to freehand drawing, four hours. The third-class gives three hours to algebra, four to trigonometry and stereometry, two to natural philosophy, three to the study of building material, four to practical geometry, four to statics, and twelve to building construction in stone and wood. These latter twelve hours are sub-divided thus:—Form: Joints and braces in stone, wood, and iron, and study of the columns of the Renaissance, simple facades, four hours; freehand drawing, simple ornament, parts of buildings from models, and practice in sketching—four hours; building knowledge or architecture, planning simple buildings and studying the principal laws affecting buildings—four hours. In the second-class two hours per week are given to natural philosophy, especially the uses of magnetism and electricity in connexion with the building art, and four hours to practical geometry. Then comes Festigkeitslehre, or the strength of form and materials, to which five hours are given; whilst to practical work—building construction that now advances to stairways, foundations and their difficulties (such as piling dams, &c.), pillars, joints, and the interior work (such as the carpentry and Locksmith's work, doors, windows, and wall decorations)—to this, as always, the most time is given, *viz.*, twelve hours. Then come architectural plans and designs for simple town houses and the essentials of farm building—five hours. In this second class also appears for the first time the Entwurfen, or designing, of which so much is made in all these schools at all grades. At the start plans are to be drawn of simple buildings; houses for artisans, or for the minor officials, small houses detached or connected with others, village schoolhouses, or the dwellings of a village pastor, the principal stress being laid on the details in working out the construction, and upon the most suitable forms taken in connexion with the class of material used. The pupil also has to sketch out working plans of the details of the sketch. Eight hours a week are given to this, and two hours to valuations, quantities, costs, &c. Then come studies in form, sketches, and designs of balconies, oriels, &c., gables in various materials—four hours; measuring and levelling—two hours; whilst modelling is introduced according to the discretion of the director. In this class is likewise introduced the ambulation or first-aid instruction, and twelve hours during the half year are given to this very helpful knowledge. In the first or highest class some time is given to a repetition of the foregoing work, the work being carried forward to more elaborate examples. Most time, *i.e.*, fourteen hours a week is given to designs and plans of all types of building save the highest, such as churches—these do not come within the

NEWGATE PRISON SHORTLY TO BE DEMOLISHED. BUILDING FROM A DRAWING BY

RY 5, 1901.

PHOTO-LITHO SPRAGUE & CO. LTH 4 & 5 EAST HARDING STREET, FETTER LANE E.C.

FROM THE DESIGNS OF GEORGE DANCE, R.A., ARCHITECT.
BY W. CURTIS GREEN.

scheme of this grade of school. Cost and measurement and quantities are exactly dealt with, and two hours a week are given to the laws and police regulations touching building, and one hour a week to special book-keeping suitable to a builder's work. The course for the Tiefbau—or, as one may term it, the ground-building course—for the first two (fourth and third) classes is the same as for the Hochbau course, and then it develops into the special subjects required by the pupils for their special work. Special time is given in the second class to durability and resistance power of the various materials and various forms of structure, also such subjects as subterranean buildings, roads, wear and tear, water-dams, bridges, railways, general drainage and irrigation works. Likewise in the first class hydraulics are taught with special attention to the pressure of water in drains, canals, and rivers; and eight hours are given to what is termed Wasserbau (waterworks) dealing with canals, sluices, dams, the supply of water to farms, drainage of the same, &c. The thoroughness of this plan, Mr. Baker suggests, will be at once seen, the only doubt that will occur to the mind being: Can all this be really learnt in the four half-years? but on going over the work actually in progress or accomplished in the school, he concluded that the work was being thoroughly learnt and understood. In the first class, for instance, were men of from eighteen to twenty years of age working upon roof construction, with details of wind and snow pressure and weight bearings. Others had a plan given them of a certain type of house, and then the pupil has to work out all details and create a design. The ground plan, floors, rooms, facade, doors, and windows, all have to be worked out to scale, and an effective design given for the whole building. In each class, according to the grade, Mr. Baker found this thorough type of work was going on—sometimes drawing from models, at others creating designs.

TRADE CATALOGUES.

MR. H. BURMAN sends us his No. 5 catalogue of wooden moulding sections, including also turned balusters and newels. We do not care for the newels, except No. 21, which is the best (well-designed newels are among the greatest rarities); but some of the balusters are very good and rather new in form. The sections of mouldings, which are numerous and well varied, are given full size.

We have received from the Welsbach Incandescent Gas Light Company a catalogue of burners and fittings for the illumination of streets and public places by incandescent gas light. The catalogue is profusely illustrated, and the so-called "shadowless" form of lantern and column is a marked improvement on some of the older forms of lantern. The great reductions which have been made in the prices of the commonest forms of burners and mantles must tend to increase greatly the popularity of the Welsbach system of lighting if the reduction in prices has not been effected by a reduction in the quality of the materials supplied.

Messrs. Lockerbie & Wilkinson (Birmingham) send us an illustrated pamphlet of their "autolite" portable acetylene industrial lamp. This lamp ought to prove useful for many industrial applications. It gives a brilliant light of 50 c.p. for eight hours with a charge of one pound of carbide. It can be extinguished and relit when required, and contains no mechanism that could get out of order. The makers claim that it is cheaper, simpler, safer, and cleaner than any oil lamp.

Messrs. Redpath, Brown, & Co. (Edinburgh), send us their new section book of steel girders, stanchions, and columns, calculated and arranged by Mr. Alexander Drew, M.I.Mech.E., Part I., referring to girders of different kinds, contains an introduction wherein the physical properties of the material are stated, together with formulas, by the aid of which safe loads may be calculated. In the tables of safe distributed loads for various types of girders, clear indication is given of the loads which are likely to produce greater deflection than is permissible in ordinary buildings. Some practical notes and sketch suggestions form the conclusion of the first section. Part II. treats of columns in a generally similar manner, and taken as a whole the book may justly be regarded as a most useful addition to mercantile literature.

We have received from Messrs. Merryweather & Sons their catalogue of the "Hatfield" pump, with illustrations showing its application to different requirements. The pump has three barrels arranged radially round a direct-driven shaft, and in principle resembles an inversion of the well-known "Brotherhood" engine.

Messrs. John Blake (Accrington), send us a

catalogue of Blake's self-acting hydraulic rams, in which are wood cuts illustrating some of the many uses to which these rams are applicable.

We have received several illustrated circulars from the Consolidated Telpheage Company of New York describing rapid and economical methods of transporting materials by means of what is practically a miniature overhead electric railway. They prove that in many cases great economies can be effected by this means, and it seems particularly adapted for conveying agricultural produce from farms to the nearest markets at cheap rates. For work in quarries, mines, blast-furnaces, factories, &c., it might also be useful, and those interested in the transportation of materials would do well to consider the telpheage system.

The "Warrington" Bond-iron Syndicate send an illustration and description of their wall-ties, which are formed from a length of iron wire shaped into a double loop and the ends twisted together in the centre; for cavity ties there is a long twist bridging the cavity, the loops going into the brickwork. In the case of cavity-walls this tie has the advantage that it presents only the smallest possible surface in the cavity. The makers state that it obviates the necessity of cutting or clipping the bricks, as "it can be bent to fit into the courses," but that somewhat injures its quality as a tie. It has, however, a great deal to recommend it. The ties are coated with a protective against oxidation.

Messrs. Chubb & Son send us a pamphlet describing the almost sensational test of one of their safe-doors by the firing of a 100 lb. "armour-piercing" steel shell at it at a range of 50 yards. The door was practically uninjured (as shown by a photograph), and the shell smashed up. The material of the door was the latest form of hardened "Harveyed" steel. There is also an illustration of the treasury-door made from this artillery-tested plate. We take the following from the pamphlet:—

"The door has no handles, screw holes, key, nor spindle holes; nothing can be taken off or removed from it, for there is nothing on it to remove; and as there are no holes nor the beginnings of any, nitroglycerine or dynamite cannot be introduced. In this respect, viz., being absolutely solid, it is believed to be unique as a door. It presents a plain front to the worst and best of burglars, giving them no point for attack. Steel that has withstood the impact of a heavy steel projectile from a 6-in. gun at point blank range cannot be touched by punches, drills, or chisels."

The first step towards opening the door is to find a tiny keyhole in the side of the frame surrounding the door. Into this is introduced a very small key, so small that it can be mounted in a finger-ring. This opens a little cupboard in which is discovered the dial of a keyless combination lock and the squared end of a rod or spindle upon which a loose crank handle can be fitted. By turning this rod it is possible eventually to undo the main bolts of the door, but at first the rod goes round and round without doing anything, turning with equal freedom in both directions: it is, in fact, out of gear, and it can only be put into gear—thus establishing its connection with the main bolts of the door—after the keyless combination lock has been worked. This lock is set to open upon predetermined numbers selected between 0 and 100 by the owner, and known only to him. Even if the knowledge of the correct numbers by which to open the lock leaks out, it would be of no practical value to a burglar, as the safety of the door does not rest upon this one little lock. When the spindle connexion to the bolts has been established by means of the internal clutch which the keyless lock controls, the spindle is free no longer: it is geared up to the boltwork.

The fastening of the door depends primarily upon twenty massive bolts, and these in turn are governed by a quadruple timelock. When this 'timer' is on guard the bolts cannot be moved inwards—that is to say, the door cannot be opened. But when at the predetermined hour the 'timer' has gone off guard, then, by means of the crank handle on the spindle end, the bolts can be withdrawn from the bolt-holes.

There is no handle by which to pull the door open, but in the floor outside will be seen the top of a small crank with a socket or hole into which a lever is put and pulled over. A simple but secure arrangement of links and levers from the crank brings pressure to bear in an outward direction upon the bottom of the door, and thus it is pushed open from the inside."

This door certainly seems to have attained the perfection of security as a safe-door.

Mr. T. Potterton (Balham) sends us illustrations of his patent zig-zag range boiler for warming houses in connexion with domestic supply. This is made in two E sections, which tooth into each other, leaving sufficient space for fire-way between. It is obvious that such a

boiler is very economical of fuel in proportion to the work done. The same sheet shows an illustration of Potterton's indicating safety valve for boilers. The spindles of the valve are made of strong brass tube instead of a solid rod, so arranged that water can be drawn through it from the seating of the valve. If this can be done it proves that the valve is free from incrustation, otherwise the hole at the bottom of the spindle would be stopped and no water could be drawn. Both spring and dead-weight valves are shown; but the latter are far preferable; a spring alters with use, a weight does not.

Messrs. Shanks & Co. (Barrhead) send an illustration of a bath with Pirie's patent swivel tap for drawing-off water. This is a convenient arrangement by which the tap nearest the outside of the bath is made with a turning bib or nozzle, so as to discharge either into the bath or into a pail or other vessel placed outside the bath. The arrangement is patented by an architect, Mr. Pirie, of Aberdeen.

Messrs. Waygood & Co., Limited, send us their newly-arranged catalogue of lifts and hoisting machinery. A noteworthy feature of this book is that exact dimensions and other useful figures are given relative to the appliances described.

ROOFS OF FARM BUILDINGS.

SIR,—With reference to Mr. Walmisley's paper read at the Surveyors' Institution, and also to Mr. Mann's communication in your issue of December 15, we are constrained to admit, although we are large manufacturers of corrugated iron, that as a roof covering it cannot compare in appearance with thatch or with tiling.

Its durability, however, in the pure atmosphere of the country, is undoubted; and while farmers and landowners are bound to study the utmost economy, we suppose corrugated iron will still form a not unimportant feature as a covering material.

We did, however, some time ago, having in view its plain appearance with the ordinary corrugations, introduce a section which we named our "Canadian" pattern. It is quite as rigid as the ordinary corrugations and as easily fixed, is no more costly, and many of our friends have preferred this pattern to the common section. We enclose you a sketch of it.

FREDK. BRADBURY & CO., LTD.
*The roofing which our correspondents describe is made in this section

and would have somewhat the appearance of a lead roof with rolls. We quite agree that it is preferable in appearance to the ordinary corrugated iron.—ED.

THE BELFAST PRESBYTERIAN ASSEMBLY HALL COMPETITION.

In reference to this competition, which has been the occasion of a great deal of discussion, the Council of the Royal Institute of British Architects has addressed the following communication to the Committee of the Presbyterian Assembly at Belfast:—

"9, Conduit-street, London, W., December 20, 1900.

Presbyterian Assembly Hall, Belfast.

DEAR SIR,—The Council of the Royal Institute have had their attention directed to the competition for the proposed new Presbyterian Assembly Hall, Belfast, and have carefully considered the whole question. In view of the unsatisfactory termination of this competition, and especially in view of the appointment as architect for this building of the firm responsible for the original objectionable conditions, the Council are of opinion that the only proper course to have been adopted was either to have appointed Mr. Rupert Savage as architect in conjunction with a consulting archi-

fect, as suggested by himself, or to have inaugurated a new competition with conditions drawn up by an experienced assessor.

My Council hope that the Assembly's Committee may yet see their way to adopt one of these courses.—Yours faithfully,
W. J. LOCKE, Secretary.

The Student's Column.

SANITARY FITTINGS AND PLUMBING. I.—INTRODUCTORY.

SO many books have been written on the sanitation of buildings, that the student may be inclined to think that there is no necessity for a series of articles on sanitary fittings and plumbing. This view might, perhaps, be correct if sanitation were an unprogressive science, but this is not the case. During the last quarter of a century sanitary science has progressed by leaps and bounds, and it is still progressing. The books of twenty years ago are now practically useless, and probably twenty years hence the books of to-day will also have been relegated to the limbo of forgotten lore, or will have been edited and revised till they are scarcely recognisable. Every year our knowledge becomes more exact and more complete, and every year new fittings are invented and old fittings improved, so that all architects must be students so long as they remain in practice, or must be content to be dubbed "old fogeys" and to be pointed at as being behind the times.

The wonderful increase in our knowledge of the causation of many diseases is one of the most marked features of recent years, and although very much indeed has yet to be learnt, sufficient is known to admit of practical application with beneficial results. The germ theory of disease is no longer regarded merely as a plausible hypothesis, but is accepted as a fact which is becoming every day more significant. "Find the microbe" is the key to as many enigmas as "*Cherchez la femme*."

The important effect which in this one fact must have on practical sanitation has scarcely yet been sufficiently recognised. The aim of sanitary science must be to remove from buildings and their appurtenances all conditions which can contribute to the growth and distribution of pathogenic organisms, and, as far as possible, to provide those conditions under which such organisms cannot exist. This is a difficult problem, and cannot be solved until the life-history of every disease-producing organism has been thoroughly studied. Something in this direction has already been accomplished, but the knowledge which has been gained shows clearly that the solution of the problem will not be easy. Dr. Sidney Martin's experiments with the typhoid bacillus show that this soon dies in "virgin" soils, whether these are sandy or peaty, but that it rapidly multiplies in moist sterilised samples of soils from gardens and other cultivated places, and retains its viability and vegetative properties for months and perhaps years. Moist sterilised soil which had been impregnated with the typhoid bacillus was found to contain the bacillus at the end of 450 days. The soil was then naturally dried for forty-nine days till it "could be readily powdered into a fine dust;" the bacillus was still there. Other experiments showed that the bacillus spread through the soil in different directions.

Experiments with sterilised soils are, however, of little practical use. It is more important to know how long the typhoid bacillus can survive in soils containing other bacteria. No definite statement on this point can yet be made, but there is reason to believe that, while in many cases the typhoid bacillus may be overcome by the other bacteria in the general struggle for existence, in some cases it will live and retain its dangerous properties for months. In a recent report on "Enteric Fever in the City of Chichester," Dr. Theodore Thomson and Col. J. T. Marsh, R.E., came to the conclusion that the most probable cause of the repeated recurrence of enteric (typhoid) fever in this city is the foul condition of the soil, due to the "leaky cesspools and cesspits," which, until some three years ago,* formed the sole methods of disposal of all its excrementitious matters.

The lessons to be learnt from these and other investigations are that some pathogenic organisms are not by any means so short-lived as is

* This was written in 1899.

commonly supposed, that they may spread rapidly under suitable conditions, and that they may exist for a considerable time even in dust so dry as to be blown about by the wind. The degree of temperature at which most rapid growth occurs differs, but most bacteria develop at the temperatures which are ordinarily maintained in inhabited buildings, while some (among which the typhoid bacillus is unfortunately found) can, in the words of Dr. Newman, "withstand freezing for weeks."

Moisture almost invariably favours the growth of bacteria, but some species can exist for a lengthened period in a dry medium. Sunlight, on the other hand, retards the growth of bacteria, and is often positively fatal to them, particularly in the presence of oxygen.

The practical application of the knowledge gained by medical experts is the problem which confronts the sanitarian, whether he be architect or engineer, and in attempting to solve this problem, the importance of sunlight and fresh air must not for a moment be forgotten. These are the natural germicidal agents which he must endeavour to utilise to the best advantage. It is also essential that rooms containing sanitary fittings should be so constructed and arranged that they can be kept scrupulously clean with the least possible trouble. Accumulations of dirt or dust in dark, unventilated rooms generally constitute suitable soils for the growth of bacteria.

But however satisfactory the rooms containing sanitary fittings may be, greater danger will exist if the fittings themselves are not of a suitable character, and if the plumber's work in connexion with them is not properly executed. Untold harm has resulted from the fixing of water-closets and other fittings of faulty design by unskilled workmen under more or less ignorant supervisors. The harm has not always been confined to the occupants of the houses containing the fittings, but has often spread throughout the community. Many towns to-day are paying the penalty for previous misdeeds.

Even some of our health resorts have shown an almost criminal disregard of sanitary requirements. Two examples will suffice for our purpose. In his report (dated January 30, 1900) on "Epidemic Enteric Fever in the Borough of Falmouth" Dr. G. S. Buchanan writes:—"Excrement disposal is almost everywhere effected by water-closets. Most of these closets are provided with flushing-boxes or flush-tanks, but some 200 are without flushing apparatus. The latter 'hand-flushed' closets are apt to become exceedingly foul. . . . At the date of my visit the occupants of a few of the larger private dwellings in Falmouth were having their house-drains exposed for examination. In each instance where I had an opportunity of seeing these house-drains they were seriously defective; thus, joints of pipe-drains were leaky. . . . soil-pipes were inside the house and unventilated, sink waste-pipes led directly to the house-drains. . . ." In a later paragraph he says:—"Soil-pipes are habitually unventilated." . . . Much of the recent plumber's work which I saw also seemed unsatisfactory."

In March, 1899, Dr. Buchanan, after a serious outbreak of diphtheria at Tunbridge Wells, wrote:—"House-drains are rarely trapped from the sewer, and frequently they are ventilated only by means of rain-water pipes which open just below the eaves. Often, I was informed, waste-pipes opening within the dwelling are connected directly with the house-drain. . . . Within the smaller dwellings commonly the only drain is a sink-pipe, which discharges its contents outside the building over a bell-trap. These bell-traps are usually defective. . . . In houses of better class are occasionally found water-closets provided with objectionable D-traps, and soil-pipes of water-closets often are unventilated. As a rule in smaller house property each dwelling has belonging to it a water-closet placed outside the building. A majority of these water-closets are without apparatus for flushing; being of the 'hopper' type, and getting merely an occasional 'flush' from a water-can, they often become filthy. In one row of houses I found closets of this sort built in the basement of the house, opening into the kitchen."

These instances serve also to show that, however much knowledge of sanitary fittings

* In the next paragraph Dr. Buchanan modifies this statement by saying that "new soil-pipes have in most instances been provided with ventilating shafts." The italics are ours.

and plumbing there may be in the country, the practical application of this knowledge has been, and still is, far from adequate. Every architect, who has to carry out alterations of houses, meets many instances of glaring defects even in buildings which have been erected in recent years. These defects are often due to ignorance or carelessness, but in many cases the blame must rest on the owner of the houses, for having demanded cheapness (however nasty) instead of efficiency. The architect unfortunately has to deal with many clients of this nature, and is often thwarted in his endeavours to do good work, even though he points out that cheapness in first cost almost inevitably entails excessive expenditure in repairs and alterations, and perhaps in doctors' bills.

Statistics as to the incidence of disease in houses provided with water-closets and in houses with pan-closets or privies are somewhat misleading, but it is not going too far to say that water-closets appear to be in many cases even more dangerous than the conservancy systems. Thus, at Gainsborough, according to the report of Dr. Darra Mair, twenty-five of the houses invaded by fever during twenty months of 1897-8 were provided with privies, five houses invaded were provided with pan-closets, and sixteen with water-closets. As there were 2,455 houses with privies (either separately or in common), 305 with pan-closets, and 1,500 with water-closets, the incidence of the disease was as follows:—

In houses with privies.....	1 in 98
" " pan-closets..	1 " 61
" " water-closets	1 " 81

It is not surprising to learn that "in some of the latter houses gross sanitary defects had been discovered in connexion with the water-closets or the drains."

The following words by Dr. Farr, the eminent statistician, are worth careful consideration:—"Almost coincidentally with the first appearance of epidemic cholera, and with the striking increase of diarrhoea in England, was the introduction into general use of the water-closet system, which had the advantage of carrying night-soil out of the houses, but the incidental and not necessary disadvantage of discharging it into the rivers from which the water-supply was drawn." In London the mortality per 1,000 from diarrhoea was '215 in 1838, '201 in 1839, and '238 in 1840 and 1841, an average of '223. In 1849 connexion of drains with sewers was compulsory, and the death-rate from diarrhoea became 1705 in 1849, '813 in 1850, '085 in 1851, and '983 in 1852, an average of 1,140, or five times the death-rate from 1838 to 1841. The average for the decade 1871-80 was, according to Dr. Ogle, '940 per 1,000, or very little better than the rate for 1849 to 1852, and more than four times the rate for 1838-41. The number of deaths from diarrhoea in London for the ten years from 1871 to 1880 was 33,168. If the death-rate of 1838-41 had been maintained during this period, the number of deaths would have been only 7,868. In other words, 25,300 lives appear to have been lost in London in 1871-80 from one class of disease alone, chiefly through mistaken "sanitation."

It follows from these premises that so-called sanitary fittings and plumbing are dangerous unless they are not only satisfactory in themselves, but are also connected with drains and sewers which are equally well designed and constructed. Everything must be so arranged that pollution of air, soil, and water-supply is reduced to the smallest possible amount. It is false economy to cut down the cost of sanitary work below a certain limit. Sanitary fittings ought always to be of good quality and properly fitted. If little money can be afforded, the number of the fittings must be reduced, as it is better to have one good water-closet than (say) two bad water-closets, or a bad water-closet and a bad slop-closet. Economy can also be effected by grouping the sanitary fittings together, and so reducing the length of the drains and the number of ventilating pipes, but this branch of the subject will be more fully discussed in the next article.

A MEMORIAL TO THE LATE SIR RICHARD TATE.—It is stated that Lady Tate, widow of the late Sir Richard Tate, Bart., has undertaken to defray the cost of erecting a new chancel at the Independent Church, Brighton, as a memorial to the donor of the National Gallery of British Art at Millbank. The church is being enlarged after the designs of Mr. P. Morley Horder.

OBITUARY.

DR. W. POLE, F.R.S.—On Sunday last Dr. William Pole, F.R.S., F.R.S.E., Hon.M.Inst.C.E., Mus. Doc., died at 9, Stanhope-place, Hyde Park, W., at the age of eighty-six. Although comparatively little known to the rising generation, the name of Dr. Pole is familiar to those who have left youth behind them as that of an accomplished and versatile genius, who was one of the ornaments of the century which has recently drawn to a close. Born on April 22, 1814, in Birmingham, he was articled to Mr. C. Clapper, an engineer in that city. On the expiration of his time he was concerned for three years in the construction of gasworks plant, and for four years in the warming and ventilation of buildings under the late Mr. Sylvester, who may be remembered as the inventor of the hot-air stove which bears his name. In the year 1836 he was elected an Associate of the Institution of Civil Engineers, for at that time the class of Associate Members did not exist, and four years later he received from the Hon. East India Company the appointment of Professor of Civil Engineering in Elphinstone College, Bombay. Returning to England in 1847, he was chiefly occupied in the mechanical branch of his profession, holding responsible positions as the Agent, Commissioner, and M. Simpson and Mr. Randall, and taking an active part in the provision of plant and stock for Indian Railway undertakings. On February 12, 1856, he was proposed by the late Mr. John S. Rastrick, and elected a member of the Institution of Civil Engineers; and in 1859 he became Professor of Civil Engineering at University College, London—a position he held until the year 1867. During the same period he also acted as Lecturer at the Royal Engineers Establishment. These appointments no doubt served as stepping stones to still more important scientific work on behalf of her Majesty's Government, for which Dr. Pole was eminently qualified both by his practical experience and by his intellectual attainments. From 1861 to 1864 he was a member of the Committee on Armour Plates; from 1863 to 1865 he served as one of the Committee on the comparative merits of Whitworth and Armstrong guns. He next acted as secretary to different Government Commissions; from 1865-1867 to the Royal Commission of Railways; from 1867-1869 to the Royal Commission on Water Supply; from 1882-1884 to the Royal Commission on the Pollution of the Thames; and in 1885 to a Committee on the South Kensington Museums. In connexion with the work following the recommendations of the Water Commission, he took an active part, especially with regard to the constant service system. In 1870 he was appointed by the Board of Trade one of the Gas Referees for the Metropolis, and in this position he held until the year 1890. At the request of the Institution of Civil Engineers, Dr. Pole undertook the work of arranging a mass of information gathered with relation to the systems of engineering education adopted by different countries. The result was an octavo volume, published in 1870, and bearing the title, "The Status of Civil Engineers in the United Kingdom and Foreign Countries." He was elected a member of the Council of the Institution in 1871, and in the same year his services were engaged by the Japanese Government, for which he acted as consulting engineer to the Imperial railway system, receiving on his retirement in 1883 the Imperial Order of the Rising Sun. He was elected honorary secretary to the Institution of Civil Engineers in 1885, as the successor to Mr. Charles Manby, F.G.S., and on giving up this office in 1896 he was proposed by Mr. (now Sir) John Wolfe Barry, and elected an honorary member of the Institution. Besides contributing various papers to the Institution of Civil Engineers, Dr. Pole was the author of many works on scientific subjects. Amongst others may be mentioned, "A Treatise on the Cornish Pumping Engine," 1844; "Iron as a Material of Construction," 1872; "The Life of Sir William Fairbairn," 1877; "The Life of Sir William Siemens," 1888. He was elected a Fellow of the Royal Society in June, 1891, and held office as Vice-President of the Institution in 1892. As may be supposed from his doctor's degree, he was a learned and accomplished musician and musical critic, though he did not produce much as a musical composer. Dr. Pole was also an authority on whist, of world-wide acceptance; indeed, we have met people who knew him only as a celebrated whist player, without being aware of his other and more serious accomplishments. Dr. Pole had also a special knowledge of precious stones, and contributed a learned article on the subject to a well-known review some time since. That one man should have been acquainted with so many different subjects, not superficially but thoroughly and scientifically, shows the possession of mental powers of a very unusual order.

Mr. H. C. BOYES.—We regret to announce the death on December 26, at Fir Cottage, Weybridge, in his fifty-fifth year, of Mr. Henry Cowell Boyes, of No. 6, Grocers' Hall-court, and Ormond House, Great Trinity-lane, Queen Victoria-street, E.C. Mr. Boyes was elected an Associate of the Royal Institute of British Architects in 1874, and a Fellow in 1882. He was a past-President of the Electrical Association, of which he had been elected a

member in 1865, and in 1888 was elected a Fellow of the Surveyors' Institution. He took a warm interest in all matters relating to the auxiliary forces of the Crown, and as Lieutenant-Colonel of the London Rifle Brigade was recipient of the Volunteer Decoration medal. Mr. Boyes was architect and surveyor to the Grocers' Company. In that capacity he superintended the reconstruction (by Messrs. Cubitt & Co.) and decoration of that company's hall, of which we published a view of the interior on July 15, 1893, together with new reception-rooms and some other apartments on the garden ground. The hall, which now measures 96 ft. by 42 ft., had been rebuilt in 1798-1802 by Thomas Leverton, and was altered in 1828 by Joseph Gwilt, who built the front towards Princes-street, and rebuilt the clerk's official residence. Mr. Boyes also carried out some extensive alterations and improvements of the buildings of the company's grammar school at Oundle, Northamptonshire, founded in 1556. Of other architectural works by him which have been illustrated in our columns we may mention the house, Ridgemoat, at Enfield Green, near Egham, for Mr. A. de M. Mocatta (April 10, 1886*); premises for Messrs. Secley & Co. in Essex-street, Strand, W.C. (May 10, 1885); and, in or about 1895, the rebuilding of No. 49, Chancery-lane, W.C. (December 30, 1895). Mr. Boyes also made the plans and drawings for a school erected in 1891-2, at a total cost of upwards of 25,000l., by Messrs. Cubitt & Co. upon the site of Dimsdale, Fowler, & Co.'s former premises, No. 50, Cornhill for the banking firm of Messrs. Prescott, Dimsdale, Tugwell, Cave, & Co., and, in 1892, the premises in Great Trinity-lane, E.C., for Mr. W. H. Gray. Mr. Boyes was known to many men outside the profession in connexion with a small debating society called the "Casual Club," of which he was for many years Hon. Secretary, and in which he took great interest. Mr. Boyes was, from his genial and open character and manners, a general favourite with all who knew him. He was emphatically a man with many friends, all of whom will regret his comparatively early death.

Mr. E. M. WIMPERIS.—The death of Mr. E. M. Wimperis, Vice-President of the Institute of Painters in Water-colours, which took place on Christmas-day at the age of sixty-five, is a serious loss to English art. Almost self-taught as a water-colour artist, he was one of the finest and most powerful modern painters of the school of David Cox—the grand old water-colour school of broad treatment in the method best suited to the finest capabilities of the art. His landscapes, always among the best things in any exhibition in which they were found, had a certain sameness in subject; a wide reach and a great expanse of sky were subjects he never tired of; and yet they could not be called repetitions, nor could he be accused of mannerism; each work had its own individuality. He subsequently carried the same style into larger landscapes in oil, in which he was equally successful and powerful, though the style perhaps rather suggested a copy of a water-colour in oil. He was a true artist, whose works will be much missed on the walls of future exhibitions. We hope the Institute of Water-colours will give a collective representation of them.

GENERAL BUILDING NEWS.

CATHOLIC CHURCH, EASTBOURNE.—The foundation-stone of the new Roman Catholic Church at Eastbourne was laid on the 11th ult. The building is being erected at the corner of Grange-road and the Meads-road opposite the Town Hall. The plan comprises a wide nave with narrow aisles, chancel, side chapels, and sacristies, with a tower and small spire at the corner of the junction of the two thoroughfares. The length of the completed church will be 102 ft. and the width 53 ft. 6 in. The walls externally will be faced with Sussex sandstone, with windows, doorways, and all dressings of Bath stone. The roofs will be covered with red tiles and the spirelet with copper. In the interior the columns and all stonework will be of Corsham stone. The main entrance will face Grange-road, and will have a boldly-moulded archway in the form of a projecting porch covering the doors, and above the archway a niche with canopy will rise to the apex of the porch gable. Above the porch will be a four-light tracery window. The side facing Meads-road will contain five windows and a side porch. Buttresses will divide the wall of the aisle into five bays. A feature of the church will be the absence of a clearstory to the nave, and consequently the aisles will be unusually lofty. A sanctus bell-cot in stone will rise over the chancel arch, and externally mark the separation of the nave and sanctuary. A small baptistry will project from the end of the nave aisle. The tower will rise square to almost the height of the apex of the nave roof, after which it will be carried up in an octagonal form, with brackets at the angles; the upper story or belfry will have two light tracery windows with louvres on four sides. Internally, the nave will be divided into five bays, and will be separated from the aisles by four arches of wide span, supported by clustered columns with

moulded caps and bases. A gallery over the main entrance will project into the church the space of the first bay, and form part of the structure, being supported by stone columns and arches. The Chapel of Our Lady will be parallel to two bays of the south aisle, and will be divided from it by open arches. The chancel will be separated from the nave by an arch rising to the full height of the ceiling, and will be divided into two bays, having a groined roof in wood, supported by clustered wood shafts. There will be a five-light tracery window high up over the altar, and four two-light tracery windows in the clearstory. On the south side a stone tracery screen will open into a small choir gallery over part of the sacristy. The sacristies will be on the south side of the chancel, and beneath the working Sacristy there will be the heating chamber, from which the church will be warmed with hot air. The organ will be blown by hydraulic power; and a chamber to accommodate the engine and also the bellows will be formed at the end of the nave. Accommodation will be provided for about six hundred persons, and the cost of the structure when completed will be about 11,000l. The architect is Mr. Frederick A. Walters, F.S.A., Westminster, and the contractor is Councillor Mark Martin, of Eastbourne.

INFECTIOUS DISEASES HOSPITAL, FORT WILLIAM, IVERNNESS STRZE.—A new hospital for infectious diseases is to be erected at Fort William on the site of the former hospital, which was recently destroyed by fire. Messrs. L. & J. Falconer have been appointed architects.

BUILDING IN ARBOATH.—Employment in the building trades has been steady during the past twelve months. Few big jobs were undertaken, but large additions have been made to house-property in almost all parts of the town.

THE BUILDING TRADES, BELFAST.—The trade is in a considerably less prosperous condition than it was a year ago. Several causes have contributed to this regrettable state of affairs; but undoubtedly the principle one is the carpenters' strike, which was begun about eight months since, and still continues. Some hopes, however, are entertained that a settlement will have been come to before the new year is far advanced, as the men seem anxious for the master builders to make fresh proposals, and if this happens the result may be looked forward to as encouraging. There have been no great changes in prices, but a slight reduction has taken place in regard to iron and steel girders, which are now used very largely in building operations. Few new works have been undertaken in the centre of the city since this time last year, and the most of those which were then in progress and not of a public character have been seriously delayed in completion by the carpenters' strike. The building of the new City Hall is being pushed forward as rapidly as the magnitude of the structure and all the details that have to be taken into account will permit. The walls of the edifice can now be seen above the hoardings. Satisfactory progress is also being made with the erection of the Belfast Cathedral, which occupies the site of the old Church of St. Anne's in Donegal-street. The Bank buildings, put in the hands of contractors at the close of 1899, have been greatly altered and improved. Additions have been made to several factories to cope with increasing trade, but none of the developments made in this direction could be classified as important. A new bonded warehouse of extensive dimensions is being erected in Academy-street for the Irish Distillery, Limited; a new warehouse for Messrs. McCrum, Watson, & Mercer in Linen-hall-street; and a new warehouse for Messrs. Murphy & Stevenson in the same street; while similar buildings are being constructed for Mr. John Thompson, Victoria factory, on the Dublin-road, and for Mr. J. Lepper in Donegal-street, in ecclesiastical architecture a good deal of business has been done. Several new churches have been established, especially in the outlying districts of the city, while many of the older edifices have undergone more or less extensive renovation. A hopeful start has been made with the building of the Royal Victoria Hospital, which, when completed, will cost close upon 100,000l. The position of the trade is certainly rather dull at present; but the outlook in prospect of an immediate settlement of the dispute between the masters and carpenters is more cheerful.—*Belfast News Letter.*

STONE AND BUILDING TRADES, BRADFORD.—The great activity which marked these local trades in the early part of the year 1900 seems to have declined gradually down to comparative quietness. Whether the extension of the city boundaries and the additional tramway facilities will bring about a partial revival remains to be seen. Some of the principal contracts let during the year and now in progress are those in connexion with the Cartwright Memorial Hall, the new Fire Brigade Station, the new Conditioning House, the extension of the Electricity Works, the large tramcar shed at Thornbury, the Green-lane Board Schools, the extension of the Bradford Provident Industrial Society's premises in Sunbridge-road, and alterations at the Old Brewery premises in Brewery-street. Of projected new public buildings may be named the new Corporation baths in Morley-street and Drummond-road, district police offices and fire stations, and the extension of the Rawson Place Market, while the extension of the

* Out of print.

Town Hall is receiving increased consideration. The Lancashire and Yorkshire Railway Company have let the contract for a large warehouse in Bridge-street, to cost about 60,000. House building has gone on at a rapid rate in many parts of the city, especially in the districts of Horton Grange-road, Lidget Green, Bradford Moor, and Eccleshill. There is a lull now, however, in this class of building. The local stone trade, though brisk during the first half of 1900, has fallen off considerably during the latter half, but the London trade has been fairly good during the year, and continues so. The following are about the prices which have ruled during the past twelve months, the figures vary somewhat according to quality:—Self-faced flags, 2 in. thick, 23.4d. to 25.6d. per superficial yard; 2½ in., 25. 10d. to 28. 2d.; and 3 in., 35. 6d. to 38. 10d. Tooled flags, 2 in. thick, 35. 6d. to 35. 9d. per superficial yard; 2½ in., 45. 6d. to 45. 9d.; and 3 in., 45. 8d. to 45. 10d. Ashlar, 15. 8d. to 25. 2d. per cubic foot. Outside wall stones, 44s. to 54s. per rod; inside ditto, 22s. to 24s.; and pitch faced, 44s. to 50s. Common bricks, 25s. to 30s. per thousand at works. There has been a steady demand during the year for timber, and prices have been well maintained.—*Bradford Observer*.

BUILDING IN BRISTOL.—A considerable amount of building work has been done in the year. Right in the middle of the St. Augustine's site, which had been recommended for municipal buildings, but which the members of the Council could not make up their minds to secure for that purpose, a fine block has been under construction since January for the Star Insurance Company. The Eagle Insurance Company has found a new home in Baldwin-street. At the corner of Clare-street and St. Stephen's-avenue workmen have been busy on a new office for the Prudential Company, and the purchase by the Sun Company, a few days ago, of the site of Mr. Thornley's business premises at the corner of Clare-street and the Broad Quay seems to suggest still another insurance office in that locality. The site in the last case cost the buyers 20,000. On a site between the Narrow Quay and Prince-street, the preliminaries have been practically completed for the erection of a large building by the Wholesale Co-operative Association. The amount to be spent on this structure has been spoken of as 40,000. Messrs. W. D. & H. O. Wills have opened, on the field which used to be in old days the Bedminster Cricket Ground, an immense factory to accommodate their industry, and Messrs. J. S. Fry & Sons have had in hand for many months past schemes for still further enlarging their works. Operations have been going on on two sites—one in Union-street and the other in the Fitzroy. The tramway power-house at Counterslip, their new depots, the Council House annex, the new public library in Cheltenham-road, Horfield Baptist Chapel, St. James's Parish Hall, All Hallows' Church, Easton, the extension of the Shaftesbury Hall, the new Y.M.C.A. at Totterdown, a new place of worship for the Bristol Society of the New Church, Cranbrook-road, the new church of St. Martin, Upper Knowle, the Franciscan Church at Bishopston, several new board schools, and the new wing of the Bristol University College are among the schemes which have occupied the builders, who have had also no small amount of business in converting private houses into shops and in the development of building estates. The fire which destroyed the former Colston Hall enabled fittings to be removed in the new design, and the existing accommodation to be greatly increased. The new hall seats about 4,000 persons. At Bath there has been the opening of the Art Gallery; at Weston, the building of a new Wesleyan church and of a museum and library.—*Western Press*.

BUILDING IN DUNDEE.—A survey of the building trade in Dundee reveals the fact that much activity has prevailed in every branch of the industry during the past two seasons of exceptional business. This state of matters is highly satisfactory, and together the past three years will rank as about the best business period experienced by the Dundee building trade for a very long time. The work performed last year has been especially marked in the direction of tenement and villa residence building, and the districts of the town have been for the most part the east and north ends of the city, although, consequent on the opening up to the fear of Blackness estate, operations in the west end have been greater than for several years back. It is a pleasing commentary, too, on the extension of the city's tramway system, that many of the new buildings have been erected, or are in the course of erection, along those routes tapped by the new lines or in the vicinity of their termini. This has been more pronounced in the Maryfield and Strathmartine suburbs, and by the time the cars are running to Ninevels a large addition to house property will have been made at this, the extreme West end of Dundee's boundaries. In 1899, and indeed for a considerable time previously, there was an outcry that the city was being overbuilt with tenement houses. This agitation seemed in no way to deter builders from continuing the campaign, but now matters appear to have reached high water level, and on all hands it is admitted that the putting down of new house property of the tenement class will practically have to be stopped for the best of all possible reasons—scarcity of

tenants. A very great deal of money was sunk last year in villa building, and the demand here is still sufficient to encourage further outlay on the part of those with cash to spare for investment. Amongst the building work of 1899 has to be included several large Corporation and private contracts carried out in the centre of the city, and some of these have been of an important character—notably the new municipal fire-station and the Parish Council offices. Church building has again formed a feature of the year's work.—*Dundee Advertiser*.

BUILDING IN LEITH, EDINBURGH.—A report issued by the Burgh Surveyor for Leith shows that during the year eighty-four applications for warrant to build were reported on at the Dean of Guild Court, compared with ninety-one the previous year. Several of the largest of the buildings which were for speculative purposes, including blocks of tenement houses, have, however, never been prosecuted further. On the whole, the year has been a quiet one compared with 1899, which was marked by exceptional activity. In the latter part of the year especially, the erection of new buildings apparently received a check, and the masons' strike, occurring as it did when a lull in the trade had taken place, most likely deterred many building operations until the spring of the next year. The erection of villas in the Trinity district has continued, but on a much more moderate scale; and in South Leith several large blocks of dwelling-houses have been constructed. Amongst the principal new buildings completed during the year were a church, an addition to the hospital, and a series of bonded stores. Work in the Dean of Guild Court during the last two or three months has diminished very much; and the absence of plans for any large buildings before the Court shows that there is a prospect of quietness in the building trade during the winter especially.—*Scotsman*.

BUILDING IN HALIFAX.—The building trade, in comparison with previous years, has been quiet. Several large contracts which have afforded ample employment for several years for masons and joiners have practically been completed, including the large Workhouse Hospital and the new Victoria Hall. A good many men are now unemployed, and those who are at work are mainly engaged on the erection of houses and cottages.

BUILDING IN HUDERSFIELD.—The building trades have been in a fairly flourishing condition throughout the year, but few works of much extent are at present in prospect for the coming year. The new Drill Hall is nearly finished, the new Temperance Hall is being roofed, and the new Church of St. Barnabas at Crosland Moor is well advanced, the generating station at Longroyd Bridge for the Corporation electric tramways is now nearly completed, and very soon the works of the Batterley reservoir of the Corporation Waterworks in the Wessenden Valley, Marsden, which have already cost 271,665l., will be finished. Up to November plans had been approved by the Corporation of 273 dwelling-houses (against 259 in the year preceding), 60 business premises, and 195 miscellaneous buildings. The chief work of the new year is the erection of the lunatic asylum at Storches Hall, near Kirkburton, and the extension by the Co-operative Society of their premises over the site of the present Victoria Temperance Hall in Buxton-road.

BUILDING IN HULL.—Building in the city has been exceptionally brisk during the past year. Many large buildings have been undertaken, and a great deal of house property erected, particularly on the outskirts of the city. This has been owing to the service of trams which has been in operation for the past eighteen months. A large area has been cleared of slum property, and blocks of artisans' dwellings are being put up by the Corporation. The year has been free from serious labour disputes affecting builders, consequently good progress was made in the erection of many buildings. Among these are the offices of the Yorkshire Provincial Bank in Saville-street, the National and Provincial Bank, Scale-lane-corner; the Ocean Accident Insurance Corporation, in Low-gate; the Telephone Exchange, in Mytongate; the Constitutional Club in Carr-lane, the extension of the Hull Savings Bank in George-street, the Pacific Club in High-street, and the Crematorium. Several new public schools have been erected, and the foundations of one large Board school have been laid. The outlook is said to be very bright.

THE BUILDING TRADE, INVERNESS.—For several years there has been a boom in the building trade in Inverness. Villa residences, business blocks, and dwelling blocks of all kinds were built with so much activity that the inevitable "slump" came, and for the last year or two there has been a feeling amongst monied people in the town that it is sufficiently built. The result now is that comparatively little building has been done during the past year, and that only what was necessary. Probably not in the memory of many contractors has there been such a lullness in trade. Fortunately there has been some stir in the country, and the workmen have been able to get employment elsewhere. Many of them have been working at the huge extensions to Skibo Castle, which are being carried out by Messrs. Ross & Macbeth, architects, Inverness. There have been a few big jobs going on in Inverness, although generally speaking trade was quiet. What will be

the largest block of buildings erected in Inverness for a quarter of a century is nearing completion in Queen's Gate. The masonry work is all but finished, and the street may now claim to be one of the finest in the town, from a building point of view. The block has a frontage of 231 ft. to Queen's Gate and 50 ft. to Church-street. The ground floor consists of eleven shops, while the first and second floors contain suites of offices, and on the top, dwelling-houses. The future of the block is a large hotel. The buildings will be up to date, lighted with electricity throughout, and the hotel will have hydraulic lifts, with a passenger and luggage service to all the floors. The erection of these buildings, it may be mentioned, was the cause of the demolition of one of the oldest houses in town. The total cost of the buildings is estimated at 25,000l. The work is being carried out under the direction of Mr. W. Caruthers, architect. Another building which has given some work, and which is in course of erection, is the Crown United Free Church. With spire, it will cost about 6,000l. The architect is Mr. J. R. Rhind.—*Aberdeen Journal*.

THE BUILDING TRADE IN LEEDS.—On the whole those in Leeds who are associated with the building trade are entitled to look back upon the year with more satisfaction than was the case last December. They have been, for the first time for some years, free from trade disputes, and that has been by no means an unimportant factor. It is true the Tyneside dispute has brought a disturbing element at the close of the year. There, the bricklayers struck work in May last for an advance of wages from 20d. to 11d. per hour, and that has done more to disturb the Masters' Federation, to which the Yorkshire masters are affiliated, have taken the matter up, would seem to be no strong disposition locally to push matters to an extreme by locking out the Leeds bricklayers in sympathy. Trade, therefore, has been very brisk during the year. In the last month or so there has been a hesitancy to let new contracts, the architects preferring to await a fall in prices. This fall, so far as certain classes of material are concerned, has already begun, but timber retains its abnormal price, and it is said that no substantial reduction will be made until the re-opening of the Baltic ports. Speculative builders have for some time past been kept from launching out on this account. Since March 25, 1900, which marks the beginning of the official year, 2,342 new houses have been erected and completed in Leeds. The approximate number of miscellaneous buildings erected and certified during the same period is 2,021, and it includes schools in Thornville-road, Woodside-road, and Broad-lane (Bramley), a woollen department and a refectory at the Yorkshire College, Emmanuel Institute (Woodhouse-lane), Constitutional Club (Roundly-road), infantic ward at the Beckett-street Workhouse, a mission church, three factories, one foundry, and one engineering works. Then there are several large buildings nearing completion. The improvement of Briggate continues, and with the completion of the fine line of new buildings at the top of the hill and of the new arcade, probably the finest in the north, the character of the street will be further changed. Lower down, the rebuilding of the Bull and Moutb estate is proceeding apace, and the new street from Duncan-street to Kirkgate, cutting through a "rookery," will be especially welcome. The Masonic Hall and the Leeds Pupil Teachers' Centre are also well forward. Looking ahead, there are such important schemes to be executed as the demolition of the Dispensary buildings, in order to complete the improvement of North-street, and the provision of a new home for the institution on Hartley Hill, and the pulling down of St. Ann's Cathedral for the improvement of Cookridge-street. This will cost the Corporation 40,000l., and another site for the Cathedral, and it is expected that the latter will be found in Great George-street. Several large contracts will shortly be let, and these will include a Market Hall, the Infectious Diseases Hospital at Manston, some churches and chapels, and several industrial establishments.—*Yorkshire Post*.

BUILDING IN MANCHESTER.—Builders and contractors in the Manchester district have experienced an unvarying briskness in trade throughout the year, but they have one important cause for regret. Many of them had large contracts in hand at the beginning of the year, and during the twelve months the prices of materials in all branches of the trade rose so rapidly that contractors in many instances sustained serious losses. Though this was very important, there are such important schemes to be executed, and no other reason to complain. Wages have maintained a high standard, and the workmen have enjoyed uninterrupted prosperity. Many large contracts have been in hand by Manchester and Salford firms, including the erection of the new station for the Lancashire and Yorkshire Railway Company at Bolton, which is to cost 300,000l.; the building of an additional 3,000,000l. worth of contracts, being also about 300,000l.; large undertakings for the London and North-Western Railway Company, the Great Northern Railway Company, and various large works in the neighbourhood of the Ship Canal. The prospects for the coming year are said to be satisfactory.

THE BUILDING TRADE, PERTH.—There is no distinguishing feature in last year's building operations. The end of 1899 saw a number of impor-

tant buildings in course of erection. Of these some are still in progress. Among those are the General Accident Assurance Company's office at the corner of High-street and Tay-street; the Royal Bank buildings at the corner of High-street and Kinross-street, which now almost complete the new street; the stable at Feus Wynd; and the Hospital for Consumptives at Barnhill. The principal buildings of last year include a coopers and store in Gray-street; the new Central District School in Meal Vennel; and laundry and gymnasium accommodation for the Caledonian-road School. A block of shops and dwelling-houses at the corner of South Methven-street and South-street will in the future improve that part of the town. A new mission hall for the United Free St. Stephen's Church and a new church for the United Free St. Paul's congregation are also being erected. A factory at Feus Wynd is on hand, and additions to dyeworks. Besides these, the Corporation are working at a scheme of working-class houses. Two blocks at Old High-street have been completed, and are now occupied, and two additions to these are in course of erection. This scheme is the realisation of a long-spoken-of and much-needed improvement—the widening of Old High-street. Seven large blocks of tenements have been in course of erection, chiefly in the northern district. During the year fourteen double villas have passed the Court, a large proportion of these being in the Craigie district. Many alterations and additions have been made to property in the town, and a large addition is to be made to Messrs. Pullar's dyeworks. Whatever the prospects for this year may be—and from the look of things in other towns it cannot be so good as recent years—this year has on the whole been marked with a fair amount of activity, but with master and workman working hand in hand, and in view of a reduction in the price of material, the prospect for the future may not be discouraging.—*Dundee Advertiser.*

HOME FOR CHILDREN, TUDHOE, DURHAM.—A home for children has just been opened at Tudhoe. The architects were Messrs. Dunn, Hanson, & Fenwick, of Newcastle, and Messrs. Johnson & Hanby, of Stockton-on-Tees, were the contractors.

BUILDING IN PETERHEAD.—The local building trade shows signs of great activity. Several new buildings have been completed in the course of the year, including the new Parish Home in King-street, a block of tenement houses in Kirk-street, a block of buildings at the corner of Windmill-street, &c. The building trades altogether have had a busy time, and the prospects are good for next year.

BUILDING IN ST. ANDREWS.—The building trades in the city have been busy throughout the year, and the prospects for the current year are fairly good. New ground has been opened up at the west end of the town within the area of the recently extended burgh boundary, and a number of smaller-sized villas are being erected. Properties are also expected to be built in other parts of the city in the course of the year.

BUILDING IN SHEFFIELD.—The operations of the builder are rapidly obliterating many of the beauties which the city once possessed. The city which was, a year or two ago, encircled with picturesque wooded hills, is now surrounded with a girle of brick-built cottages, the fiery colour of which is much too striking a complement to the soft green of the hills to be artistic. One can hardly look on the unpaved roads of many of the new streets and imagine that only a year or two ago nothing but meadows and trees existed there. In some places the smoke of the town has not yet had time completely to disappear from the green fields, and consequently there is a strange mixture of pastoral landscape and harshly-outlined streets. In another year or two, if the demand for cottage houses is maintained, the summits of the hills around the city will be reached by the builder, and the chief beauties of Sheffield's immediate surroundings will have been destroyed. The abnormal increase in building operations recorded in 1899 has been strongly maintained during the last twelve months. There has been a slight decrease in the number of houses erected during the year, but the falling off is more than accounted for by the special circumstances which existed in 1899. The approximate number of houses certified for occupation during the past year was 2,797, as against 2,616 the year before, i.e., an increase of houses certified of 181. During the year 1365 plans for all classes of buildings have been deposited, as against 1474 in 1899, a decrease of 109. In regard to street and sewage works thirty-two plans have been approved. These plans have involved or will entail the making of 5,051 yards of streets with sewers. There have also been sent in eighteen plans for sewers alone, and these will necessitate the making of 564 yards of sewers. The total extent of streets with sewers and sewers alone approved during the year thus amount to 5,615 yards, or over three miles. Coming to minor buildings, we find that ninety-two plans for such erections as cow-houses and stables have been approved during the year, as against ninety-nine last year. Plans for warehouses, workshops, &c., have numbered 654, as against 477 in 1899. The summary of statistics shows that the number of plans deposited for houses has fallen off by 1,200, and plans for other buildings have increased by something like 180; 070 of the plans which have

been deposited have been approved.—*Sheffield Independent.*

BUILDING IN YORK.—The erection of new buildings has been very brisk. Most of the houses have been erected on the new estates in Bishopthorpe-road, South Bank, Huntington-road, Leeman-road, Burton-lane, and Acomb-road. Two hundred and thirty-six plans have been submitted during the year, of which 170 have been passed, comprising 656 houses, 114 warehouses, out-buildings, &c., fifty-nine alterations and additions to premises, twelve new streets and back roads, and eleven public buildings, as follows: A church in Burton-lane, a Primitive Methodist chapel in Albany-street, a bicycle track and club-house Hull-road, two public-houses, three mission-rooms, and an arcade in High Ousegate.

THE PRINCE'S THEATRE, PRESTON.—This place of amusement, which has been in the hands of the builders for some fifteen weeks, has just been reopened. One of the most noticeable changes in the auditorium is the removal of the roof timbers and the wooden uprights which supported them, so that the occupants in all parts of the balconies are now enabled to have an uninterrupted view of the stage. Improvements have been effected in the ventilation, and appliances being provided by Messrs. James Slott & Co., engineers, of Manchester. The old boarded floor of the pit has been removed and replaced with Duff's patent wood block flooring laid on cement concrete by the Acme Wood Flooring Company, Limited, London. Additional emergency exits from the pit have been formed on each side of the stage. The staircases to the centre circle and balconies are of stone, enclosed with brick walls, and both the mezzanine floor and ceiling above it are of fireproof construction. The seating accommodation of this part of the house has been rearranged and improved, and the two approaches from the mezzanine floor to the circle are placed in direct communication with the staircases. The proscenium opening, 28 ft. wide and 23 ft. high, is fitted with an iron and asbestos fireproof curtain, supplied by Messrs. Merryweather & Sons, of London. The proscenium opening has been decorated in fibrous plaster by Messrs. Goodall & Co., of Liverpool, who also executed the balcony front. The stage has been improved by the provision of fly floors 33 ft. apart, scene artist's painting bridge, and a large grid, 50 ft. above the stage. The stage is also considerably enlarged, being 63 ft. wide and 40 ft. deep, giving an area of 2,520 square feet. Eight additional dressing-rooms, with necessary conveniences, have been provided at the back of the stage, from which they are cut off by iron doors as a corridor, the private entrances for the artistes being in Fochle-street and Tithenham-street. The contract for the whole of the work was let to Messrs. Whiteside, builders, of Preston, and the sub-contractors were Messrs. T. Croft & Sons, brickwork and masonry; Mr. W. Dryden, ironfounder's work; Mr. Thomas Nickson, slating; Messrs. Foster & Son, Padiham, plasterer's work; Mr. Edge, gas-fitting and stage lighting; and Messrs. Park & Son, plumber and painter's work. The alterations have been carried out under the superintendence of, and according to plans prepared by, Mr. W. Munford, architect, of Preston.

EUSTON THEATRE OF VARIETIES.—On the 19th ult. the Euston, which is situated just opposite the Midland terminus in Euston-road, was opened. There is accommodation for about 3,000 people. The house has been built from the designs of Messrs. Wyson & Long.

VICTORIA THEATRE, BROUGHTON, MANCHESTER.—This theatre, which has been erected near the junction of Fochle-street and Lower Broughton-road, has just been opened. The front of the building is of terra-cotta. On the ground floor are three shops, the main entrance, and the pit entrance. The front is divided by pilasters into bays, the centre one being surrounded by a carved pediment, above which is an attic story with a copper dome and iron cresting. From the main entrance the vestibule is entered; this is 24 ft. long by 16 ft. wide, with mosaic flooring and marble dado. To the left is the p-box to all parts of the house, and to the right a stair to the balcony. Facing the entrance from the street the vestibule opens direct into the grand foyer, 34 ft. by 18 ft., with mosaic flooring, walls panelled in fibrous plaster, and painted ceiling. From the foyer runs a corridor leading direct to the stalls, dress circle, and grand saloon. The auditorium is planned upon the composite two-tier principle, having orchestra stalls, pit stalls, and pit on the ground tier, dress circle and balcony above. Higher up the gallery, and on each side of the stage front, are two boxes. Seats are provided for 2,000 persons, but the holding capacity of the theatre is estimated at 2,500. The grand saloon for the dress circle and balcony is 42 ft. long and 25 ft. wide, and the orchestra stalls have their own saloon on the same floor. The lighting of the theatre is at present by gas, but electric light fittings have been installed in view of future requirements. The stage is 40 ft. from the curtain line to the back wall, 75 ft. in width, and nearly 60 ft. from the stage to the grid. The proscenium opening is 32 ft. in width. Abutting the stage are eighteen dressing-rooms as well as property-rooms. Mr. Bertie Crewe, of London, was the architect, Messrs. William Brown & Sons, of Salford, having

been the principal contractors. The cost has been nearly 25,000.

PUBLIC BATHS, LEYTONSTONE.—The foundation stone was laid recently of the public baths which are in course of erection in Cathall-road, Leytonstone. There will be a first-class swimming bath 100 ft. long by 30 ft. wide, the depth varying from 6 ft. 6 in. to 3 ft. 6 in., a second-class bath, 80 ft. by 30 ft., and a number of slipper baths. Mr. W. H. Duffield is the architect, and Mr. F. J. Coxhead, the builder.

THE CAMDEN THEATRE, CAMDEN TOWN.—The latest addition to the list of district playhouses is the Camden Theatre, situated at the southern end of High-street, Camden-town. The architect is Mr. W. G. R. Sprague, while Messrs. Waring have carried out the decorations. The theatre is built of stone, and over the main entrance there has been constructed a promenade and winter garden. The interior is partly on the cantilever system. The building, which gives accommodation to an audience of over three thousand, has cost 50,000. The stage is 40 ft. deep by 75 ft. wide, with a height of 60 ft. to the grid, and electric light is the only illuminating agent. The ceiling is supported by a cove.

NEW ASYLUM NEAR ABERDEEN.—The offer of Mr. Edgar Gauld, builder, Aberdeen, to execute the mason work of new asylum at Newmachar has been accepted by Aberdeen City Parish Council. The operations will be kept on until about 30,000. The operations will be commenced at once. Mr. A. Marshall Mackenzie, A.R.S.A., Aberdeen, is architect. The other works will be contracted for by-and-by; but the mason work is to be commenced at once.

THE PRESERVATION OF ROCHESTER CASTLE.—The repairs to the keep of Rochester Castle, arranged to be executed during the year 1900, are now completed. The work has been carried out under the supervision of Mr. George Payne, architect. Half as far down as the floor level of the state chamber, has been restored, and certain areas which were structurally unsafe have been made good. A gallery along the same side was in a very ruinous state, especially where the great crack occurred after the rebuilding of the south-east angle in the thirteenth century. In his report to the Rochester Corporation, Mr. Payne states that a large amount of the damage everywhere present in this gallery was due, as in all accessible parts of the keep, to the wanton destruction of arches and jambs in past times for the sake of the squared stones they contained. As these supports had been removed, it was deemed necessary for the stability of the fabric to replace them with Kentish rag. One outcome of the repair of the eastern wall of the keep has been to bring several interesting architectural features to light, and these are now permanently exposed to view. The beautiful arcade dividing the state chamber has been successfully treated. Traces were discovered, whilst the central wall was being repaired, that the keep had at some period suffered from fire. The cleaning out of the well of the keep proved to be a laborious work. The total depth from the top of the central wall of the keep to the bottom of the well was found to be 136 ft., and the diameter of the well-shaft from 2 ft. 9 in. to 4 ft. At low tide the water in the well has a depth of 18 in., but at high tide it reaches 9 ft.

SANITARY AND ENGINEERING NEWS.

WATER SUPPLY, LIVERPOOL.—The ceremony of cutting the first sod of a new reservoir at Prescott, in connexion with the water supply of Liverpool, took place on the 22nd ult. Mr. J. PARRY is the water engineer to the Liverpool Corporation. The work will be carried out by Messrs. Holme & King.

WATER SUPPLY, SCONE, PERTHSHIRE.—The water supply for the village of Scone was turned on on the 26th ult. Mr. W. R. Copland was the engineer.

FOREIGN.

FRANCE.—The Committee of the Société des Artistes Français (Old Salon), as the result of a somewhat heated discussion, has resigned its body, and a new committee is to be elected.—The Académie des Beaux-Arts has elected M. Camille Saint-Saëns President, and M. J. P. Laurens Vice-President.—The Conseil-Général of the Seine has petitioned the Government for the formation of a School of Arts and Industries in the Department.—The new buildings of the Bibliothèque Nationale, fronting on Rue Colbert and Rue Vivienne, are nearly completed.

The new buildings for the Académie de Médecine, in the Rue Buonaparte, will be opened next month.—An International Exhibition is to be held at Brest, to open in the middle of June.—The Municipality of Paris has acquired the mural paintings which decorated the staircase of the old Hôtel de Luynes, now in course of demolition. These works, executed in 1748 by Brunetti, show a number of personages in Watteau costumes seated on a balustrade intercepted by Corinthian columns; a garden scene forms the background. The three frescos, which are in very good preservation, will be seen from the wall and reflected most probably, in the Petit Palais.—M. Camille Lefèvre,

the sculptor, is completing for the Mairie of Issy-les-Moulineux a fine relief representing the Republics of 1792, 1830, and 1848 offering palms to M. Paul Lenard, sculptor, and a statue of the Duke of Orleans erected in the Allée de la Liberté at Cannes. He died at Cannes, at a villa which he shared with M. Gérôme.

CANADA.—Owing to the number of accidents which have occurred, a committee of the City Council of Toronto have under consideration the subject of the inspection of elevators by the municipality. The estimated number of elevators in that city is placed at 1,000.—The authorities of Queen's University, Kingston, have issued an invitation to architects to submit plans and designs for new buildings, to cost about 150,000 dols. A professional assessor not having been appointed to adjudicate on the plans, the Ontario Association of Architects has approached the authorities in reference to this omission.—Official statistics relating to the yield of minerals in the Province of Quebec in 1899 show that during the year the following building materials were raised or made:—Bricks, valued at 600,000 dols.; building stone, 250,000 dols.; lime, 110,000 dols.; cement, 31,130 dols.; granite, 14,780 dols.; flagstones, 3,500 dols.; and slate, 30,110 dols.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.

—Mr. Edward Chesterton, a member of the firm of Chesterton & Sons, auctioneers, for upwards of thirty-five years, has retired as from December 31. The business will be continued, under the style of Chesterton & Sons, by the remaining partners, Mr. Sidney R. Chesterton, Mr. C. F. Slater, and Mr. W. H. Wells, who have taken into partnership Mr. Frank S. Chesterton.—Messrs. Hayward Bros. & Eckstein, engineers and ironfounders, of Union-street, Borough, have opened a branch office and showrooms at 63, Mosley-street, Manchester.—Mr. Leopold Farmer, auctioneer and surveyor, of 46, Gresham-street, has taken into partnership his two sons, Mr. Harold L. Farmer and Mr. Herbert L. Farmer; and the firm will in future be known as "Leopold Farmer & Sons."

EDINBURGH AND LEITH MASTER BUILDERS' ASSOCIATION.—The annual dinner in connection with this organisation was held on the 20th ult. in the Royal British Hotel. Mr. James Millar, the President, was in the chair, and the croupiers were Messrs. Purves and Messrs. Drysdale and Lownie. Included in a company of about 130 were representatives of the Town Councils of the city and Leith, the Architectural Association, the Architectural Society, and the Society of Ordained Surveyors, the Glasgow Master Masons' Association and Master Builders' Association, the Dundee and District Master Builders' Association, the Perth and District Federation, the Dumfries Builders' Association, the Aberdeen Federation, and the local House Factors' Association. The Chairman gave "The Queen and Royal Family," and Mr. Ormiston "The Navy, Army, and Reserve Forces," for which ex-Battle M.L.E.S.H., Perth, responded. In submitting the toast, "The Lord Provost, Magistrates, and Town Councils of Edinburgh and Leith," the Chairman gave it as his opinion that if the housing of the poor was to be thoroughly gone into it would not be successfully accomplished by private speculation. At present the building trades were suffering from a slight depression, but he did not expect they would suffer much or very long. Battle Murray and Baillie Craig replied.

Mr. T. A. Williamson, a member of the Council of the Edinburgh Architectural Association, proposed the toast of the evening—"The Association." In doing so, he said that they all regretted the signs of a slightly falling trade, but hoped it might prove but temporary. The record of the city's growth was somewhat phenomenal. Since the passing of the Valuation Act in 1855 there had been a steady increase in the rental of the city, and of late years the ratio of increase had been very marked. Therefore, they all trusted that things would take a turn, and speedily revert to the older and more satisfactory conditions, in which the trades represented there were so deeply interested. For the sake of the workers they all desired an active and healthy state of trade, and personally he did not think the outlook was so serious as was sometimes suggested. In conclusion, Mr. Williamson congratulated the Association on the fact that a distinguished representative of the building trade had been selected for the highest place in the municipality.—Mr. Bruce, in responding, spoke of the importance of the building industry, and said that without it amongst the citizens would not be so comfortable as they were to-day. The Association existed for good—for the prosperity of the different branches of the trade. No doubt they had their difficulties at times. Reference had been made to the masons' strike, throughout which prolonged period the unity of the organisation was maintained. But for that the organisation would have failed. With it unity the employers would have failed. But for that they succeeded, and they succeeded because of the stupidity, he was sorry to say, of the operatives. They condemned themselves by the proposition they submitted to the employers. What was wanted was that employers and employed should work

together in harmony, because what was for the interest of the one class was for the interest of the other. In connection with the strike, he did not think the leaders of the men were in doing the activities they did. The present arrangements, he thought, were neither sound nor correct. There ought to be a minimum rate of wages, but no maximum, and the period during which any agreement should last should be reduced from a year to six months; while there ought to be legislative enactment whereby strikes should be illegal, and there should be a Council of Arbitration established in the country for the settlement of disputes. Treasurer Graham Yooll gave "The Scottish Building Trades Federation," and among the other toasts were "The Architects and Surveyors," "Our Merchants and Contractors," "The Chairman and Croupiers."

GLASGOW ARCHAEOLOGICAL SOCIETY.—The monthly meeting of the Glasgow Archaeological Society was held on the 20th ult. Mr. C. White-law said, in view of the discussion which had taken place about the placing of monuments in Westminster Abbey, that the members of the Glasgow Archaeological Society ought to pay attention to their own cathedral, where several large, costly, and very conspicuous monuments had been placed in the nave. Several of them were established in a manner which it was impossible for the hand of Time to tone to a colour suitable to their surroundings—most of them were made of white marble. The persons to whom they had been raised were at present important, but whether they would be important to another generation was an open question. He thought it necessary for the preservation of the appearance of the cathedral that no more monuments should be erected there, especially as they were being placed to perpetuate the memory of men who were not celebrated, but were merely known at the time for having had larger purses than their fellow-citizens. Men whose memory was celebrated by a monument in the cathedral should be of great outstanding merit, men renowned in the affairs of the nation and also of the city. The Society ought to consider the matter now, before any serious harm was done. Many of the monuments were in questionable taste, and if no more were erected it would be an advantage to the cathedral.—Mr. John Edwards thought the matter was one which ought to be very carefully considered before any more monuments of modern type were erected. Mr. J. D. Duncan said that when he was recently in the cathedral he was struck by the inappropriateness of many of the monuments in the nave. He thought it would be desirable to ask the Board of Works to see that great caution was used in the granting of facilities or permissions to erect monuments in the cathedral. The matter was remitted to the Council, to which Mr. White-law was added for the occasion. Mr. George Neilson, Vice-President, read a paper on "The Work and Place of Huchown."

NEW ELECTRICITY STATION, ABERDEEN.—The Gas and Electric Lighting Committee recommend that a portion of the new electric station at Dee Village be gone on with, including offices, half of boiler-house, half of engine and dynamo house, and a number of minor works, at a total cost of about 25,000. The machinery will cost, say, 20,000. additional. The plans are by Mr. Bell, Electrical Engineer to the Corporation, and Mr. Smith, Corporation Gas Manager.

BRITISH FIRE PREVENTION COMMITTEE.—Pending the opening of its new testing station, the British Fire Prevention Committee will conduct tests undertaken in the past year with the Mural and Decorations Company's floor, the "Cunhawn-Wright" partition, the Williams' firebrind, with two iron doors, and two pairs of wood doors. Summaries regarding tests undertaken at the North Bank Testing Station are also in preparation. Regarding the Committee's new testing station at Westbourne Park, a sub-committee of the executive will have charge of the arrangements, Mr. Ellis Marsland presiding.

ELECTRIC LIGHTING WORKS, STOCKTON.—For public lighting purposes at Stockton, the electric current was turned on on the 18th ult. at the Corporation's new electricity works. The system of supply is the "three-wire continuous current" system, with 460 volts being the output of the dynamos, the standard pressure of supply to the consumers being 260 volts. The generating machinery now installed consists of three "Universal" engines coupled to the Brush Company's standard type of continuous current generators. The dynamos are controlled by automatic switches and also by fuses, which will prevent damage being done by an excessive current. Up to the present the cables are laid in Thompson-street, High-street, Norton-road, Bishop-ton-lane, Dovecot-street, Yarm-lane, Wellington-street, and Silver-street. Contracts have also been let for extending the cables to Yarm-road, Oxbridge-lane, Richmond-road, and Church-row. Altogether there are three miles of distributor and one and a quarter miles of feeder cables. Street lighting is at present confined to the High-street, Bishop-ton-lane, and part of Norton-road, and consists of thirty Crompton arc lamps. The price of supply is fixed on the Wright system, at 6d. per unit for the first hour's use per day and 2½d. per unit afterwards, the prices for power being 5d. and 1d. respectively. The estimated cost of the scheme is 26,500. Mr.

C. S. Vesey Brown, the electrical expert and adviser, gave a technical explanation of the scheme.

ELECTRIC LIGHT WORKS, DARTINGTON.—On the 17th ult. a large number of members of the Corporation of Dartington, and officials, assembled at the new electric lighting works in Haughton-road to witness the inauguration of the new system of lighting which has been undertaken by the Corporation at a cost of 20,000. The system as at present arranged is a three-wire continuous current of 460 volts. Messrs. Scott & Mountain, of Newcastle, have supplied the engines and dynamos; Messrs. Cox-Walker have provided the switch arrangements; Mr. J. R. P. Lunn was the engineer under Professor Kennedy. The mains have been constructed by Messrs. Calderer, of London. The building containing the engines, dynamos, &c., is from the plan of the Borough Engineer, Mr. Smith. The works are capable of supplying about 7,000 8-candle lamps.

INCORPORATED CHURCH BUILDING SOCIETY.—The Incorporated Society for promoting the enlargement, building and repairing of churches and chapels, held its usual monthly meeting on Thursday, December 20, at the Society's house, 7, Dean's-yard, Westminster Abbey, S.W., the Rev. Canon C. E. Norman in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Bristol, All Hallows, 150l. in lieu of a former grant of 110l.; Chichester, St. George, 315l. in lieu of a former grant of 300l.; Darwen, St. George, Lancs., 143l.; Exeter, Emmanuel, 370l. in lieu of a former grant of 350l.; Lower Sydenham, Christ Church, Kent, 255l.; Wilbury, St. Chad, near Gravesend, from an old mission building fund towards building St. Helen's Mission Church, Stapleford, near Nottingham, 15l. The following grants were also paid for works completed:—Waltham Cross, St. George, Middlesex, 500l. on account of a grant of 1,000l.; Aberayron, Holy Trinity, Cardigan, 40l.; Nettleton, St. Mary, near Chippenham, Wilts, 100l.; Cobert, St. Hubert, near Grampound-road, Cornwall, 10l.; Kensal Rise, St. Martin, Middlesex, 100l.; Castle Bytham, St. James, near Grantham, Lincs., 25l.; Little Ilford, St. Barnabas, Essex, 75l.; Cobridge, Christ Church, near Stoke-on-Trent, 20l.; Llandysilio, St. Tysilio, Pembro, 20l.; Streatham, St. Margaret, Surrey, 200l.; Boderin, St. Mervin, near Pwllheli, 40l.; Wandsworth Common, St. Mary Magdalene, Surrey, 70l.; Ruckford, All Saints, near Wilberdine, Devon, 15l.; Calford, St. Andrew, Kent, 30l.; Boscaste, St. James, Cornwall, 20l.; and Portmadoc, Carnarvon, 15l. In addition to this, the sum of 158l. was paid towards the repairs of eleven churches. The grants made at this meeting have nearly exhausted the funds at the disposal of the Committee. They plead earnestly to the friends of the church at large for liberal contributions to enable them to vote substantial grants and to continue the work which this Society has so successfully carried on during the past eighty-three years. During the present year 9,710l. have been voted in grants from the general fund, and 355l. from the Mission Buildings fund.

BRADFORD CITY COUNCIL.—The Bradford City Council has recently had under consideration a number of applications for the post of City Architect. There were originally seventy candidates, and of these six were selected to appear before the Finance Sub-Committee empowered to deal with the matter, on Monday last. The appointment was ultimately conferred upon Mr. F. E. P. Edwards, A.R.I.B.A., for some time chief assistant in the Architectural Department of the Liverpool City Surveyor (Mr. Thomas Sheldermine) and joint Hon. Secretary of the Liverpool Architectural Society.

THE SLATE TRADE.—The past year will, we believe, show a falling-off in the make of slates, both in Carnarvonshire and Merionethshire. Trade in the former has been brisk the while year, but in the latter there was a slight falling-off in the spring, owing to foreign competition. The quarry-owners, however, by an adjustment of prices, recovered the bulk of their trade. The past century has seen an immense increase in the slate trade. Some of the quarries were worked by the Romans, but in 1800 the number working, and output, were very small, the method of working, needless to say, being primitive. The tonnage went on increasing up to 1898, when the value reached 1,875,671l. Since then it has slightly decreased, owing to a falling-off at some of the older quarries, and as the area of the Bangor and Festiniog veins is comparatively small, nearly all being worked, it is not likely to increase. The tendency of late years has been to close unproductive quarries and concentrate the management of others, so we may look forward to their again coming into favour for investment, the trade being or which, with proper management, shows very good returns; but owing to the best paying quarries being in the hands of private individuals, or companies whose shares are not quoted, little is heard of the large profits made. The new century will no doubt see large savings

effected by the use of electric power. Electric power has already been adopted in some quarries and is certain to be more extensively used.

RESTORATION OF INVERNESS MARKET CROSS.—The old Inverness Market Cross, which has just been restored, was unveiled on the 24th ult. The cross has been placed in front of the Town Hall. The carving was executed by Mr. Andrew Davidson at Rome from designs by Mr. J. W. Gall, of Inverness.

SEDGWICK MEMORIAL BUST, BRIGHTON.—On the 26th ult. Sir Henry Irving unveiled a bust of the late Miss Amy Sedgwick, which has been placed in the Royal Pavilion, Brighton. The bust is the work of Signor Bozzano, who was employed by the Statuary Company, of London.

LEGAL.

TEMPORARY STRUCTURES UNLAWFULLY ERECTED.

At Marlborough-street Police-court, on Thursday, December 20 last, before Mr. Plowden, several builders were summoned at the instance of the London County Council for having, on or about the 27th of October, erected certain temporary stands to enable persons to view the march of the C.I.V.'s, some outside and some inside of various premises within the district of St. George, Hanover-square North, without having first obtained from the Council the necessary licence under Section 84 of the London Building Act. The offence was distinctly proved in each case, and the defendants were all fined in various amounts, with costs.

WORKMEN'S COMPENSATION ACT.

His Honour Judge Yates-Lee has entered the following judgment in a case heard at the Ashton County-court on the 13th inst., in which Joseph Hill, of 45, Peel-street, Dukinfield, claimed compensation for injuries alleged to have been sustained in the service of the plaintiffs, Messrs. Storrs & Co., builders, of Stalybridge. The claim was made under the Workmen's Compensation Act, 1897. His Honour, in the course of his statement, says:—The facts in this case are not in dispute. The applicant was employed at some premises where a building over 30 ft high was being constructed, and his leg was broken by an accident. The parties agree that he is entitled to compensation at 12s. 6d. per week. The applicant, in fact, was near the gate leading on to the premises, helping to load a cart, when he was injured. In the present case we have an uncompleted building on which machinery driven by steam has been used for the purpose of the construction, which machinery was in course of removal. I think that, on the principle enunciated in *Frid v. Fenton*, I must hold that this building was one on which machinery driven by steam was still "being used for the purpose of the construction" within the meaning of the section. The result is a little startling, but I think that it would be too thin a distinction to say that an accident in the one case gave a right to compensation, and not in the other. I think that it perhaps helps one a little to arrive at this conclusion to notice that the reference to the use of scaffolding and machinery is only meant to define a class of building to which the statute applies. I am sure, moreover, that it is most desirable, if possible, to avoid thin distinctions, which the workmen, to whom this statute is of the utmost importance, do not understand. In accordance with this view of the law I have signed an award for 12s. 6d. per week, the sum agreed upon, to continue during incapacity.—*Manchester Courier*.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

17,794.—**TREADS FOR FOOTWAYS, SUBWAYS, ROADS, &c.**: J. K. Kay.—In the footway, which may be formed of asphalt, concrete, or similar materials, are fashioned inclined channels which end abruptly in rises, and are protected from being worn away by means of strips of metal or wood; or the footway may be composed of wooden blocks or tiles of metal plates which are to be disposed in some such manner, the blocks being bevelled so as to form the requisite channel.

17,814.—**BAND AND ORCHESTRA STANDS**: H. H. Spital.—The inventor devises means for reflecting the waves of sound outwards. He forms the ceiling or soffit of the roof and the floor of the stand so that they shall present respectively a parabola in vertical section, and in horizontal section a circle or polygon, whereby the sound waves will be turned into directions parallel with the axes of the curves, through a focus about midway between the top of the base and the springing of the ceiling, the floor for the bandstand being raised above the base.

17,849.—**WATER-HEATING APPARATUS**: T. Pattison.—The external casing of the heater, which is after the "geyser" kind, constitutes a spiral water passage to which the supply pipe is joined; the water as it circulates is heated with a burner (gas or oil) which is put within the casing, and the water which rises to the top of the water passage, and so through sections which are made each of a plain disc and a spirally corrugated disc

fastened together, and so constituting another spiral water passage. In another shape of the contrivance the water is caused to circulate upwards making the sections dish-shaped.

17,853.—**CEMENT FOR DECORATIVE PURPOSES**: *Terranova Industrie, C. A. Kapferer and Schlemmer*.—For making a cement that will serve for purposes of decorative work, and for artificial stone and so on, a clay as free as possible from iron—such as pipe-clay or kaolin—is mixed with lime and with feldspar, also as free as possible from iron. To produce a cement similar to Roman cement the mixture should be burned to a temperature at which it will become clinker; for other cements that temperature should be exceeded. For the materials above-mentioned may be substituted kaolin, a siliceous anhydride, such as infusorial earth or waste silica, and carbonate of soda or some other alkali; or a substance that can be used as puzzolana may be obtained by mixing lime, quartz, sand or powder, and kaolin, to which alkali, feldspar, or fluorspar may be added, and grinding the admixture after it has been burned and used.

17,866.—**TILES FOR ROOFS**: N. Danbach.—Curved edges, stop-rips, recesses, and interlocking dove-tailed ribs are fashioned upon the tiles, whilst their top left-hand corners are cut away for the taking of keys of mortar to be inserted between the joints of mortar lengthwise and transversely. In the horizontal mortar joints strips of wire netting or of metal are inserted.

17,953.—**ELECTRICAL ARC-LAMPS**: J. Rathbone.—The lower carbon is carried by a split iron socket which is caused to slide within the lower portion of a vertical tube attached to the enclosed arc solenoid lamp, and the socket is sustained by a shunt coil placed around the tube's upper portion. Either mercury or a flexible wire or chain is used for an electrical connexion between the socket and the tube, the lower portion of the socket having a small tapered slot through which the mercury can pass, so as to check its movements. A casing encloses both the coil and the tube, the latter carrying a globe, upon whose upper end are mounted a collar and a screw plug that retain the upper carbon, and the joints are made air-tight.

17,994.—**FIRE-PROOF WALLS, PARTITIONS, &c.**: G. Fugman.—For building up fire-proof partitions or walls the inventor employs open-worked plates of metal which are coated on each side with plaster. In order to make the open-worked plates he cuts parallel slits in the metal sheets, and bends or corrugates the adjacent strips into opposed directions.

17,966.—**AN ARTIFICIAL GRANITE**: *Société Berthe & Cie.*—An artificial stone that will serve for use in making baths, bricks, tiles, columns, paving blocks, wall-linings, balustrades, statuary, &c., is formed by mixing in a cold condition certain parts of quartz, flint, glass sand, cork, grey or white cements, dust glass and flint, the articles being built up by the usual methods, and supported, if necessary, for a while with suitable frames. If glass is added to the compound, the goods are bathed in an acid. After the goods have become dry and set they can be polished, a good surface being ensured by the use of flint and glass having equal degrees of hardness.

18,011.—**A CONTRIVANCE FOR USE WITH PLANING-MACHINES**: H. E. Stone and S. Cheeld.—The inventors' object is to provide that the boards shall be planed to one uniform thickness. The contrivance to be attached to cutters, comprises machines that have rotating cutters, comprises springs which press the plan upwards against the flattened surface of an angle-plate before it is passed on to the cutters. A screw serves to adjust the height of the angle-plate which is carried between guides mounted upon a bracket.

18,012.—**CONSTRUCTION OF WALLS AND CEILING**: P. Taylor.—On to the surface of the wall or ceiling are glued narrow strips of cardboard in such a manner as to divide it into squares, rectangles, diamonds, or other regular geometrical shapes, and between the cardboard strips are fastened, with strips or beads screwed in their places, transparent panels or sheets (of glass or other materials) which have been backed with wall-paper or with some other decorative material. The wall-paper is sized, and over its back may be pasted sheets of paper or other material. For waterproofing purposes the backing should be varnished.

18,001.—**A FILTER BED FOR SEWAGE**: W. T. Scott-Moncrieff.—The invention relates to the bacteriological treatment of sewage. The filter bed has a series of discharge channels, which are set parallel to one another and are inverted, the sewage passing through perforations in the channels into a conduit, to which lead openings wherein are fitted some fans for drawing air through the filter bed.

18,133.—**VICES**: G. Hänsler.—The adjusting screw is protected from chips, dirt, &c., with a T-shaped or overhanging head, the jaws of the vice being carried upon a supporting rail with the head; the journals of the rail-ends are to be clamped in their bearings by means of screws, so that one can adjust the vice in any inclined position. One of the jaws engages with the adjusting screw, and the other jaw may be fixed in different desired positions upon the rail with a pin.

18,142.—**WINDOW SASHES**: E. I. Cooke and E. Cox.—Above the window-head is fixed a casing which takes the mounting of the pulley of one sash, the

cord being attached to the other sash without the use of nails and passed through holes in the window-head. The cord's knotted end is secured in a recess or hole cut in the sash-sill, wherein is cut a vertical groove, dove-tailed or otherwise.

18,146.—**AN APPARATUS FOR OPENING AND CLOSING WINDOWS**: J. H. Carland.—By one variation of the contrivance a cord that is passed over a pulley-run, turning upon a screw which carries a crank-pin, moves the window; the crank-pin is caused to slide within a slotted bracket affixed to the window. In another form the cord-pulley turns a worm which is geared with a toothed crank-rod, and in another form, adapted for a window that is hinged at its top, the pulley-run is mounted upon the window and the slotted bracket is fastened up to the frame. In the arrangement last described a tube that projects outwards from the window serves to protect the screw from the weather.

18,160.—**MOULDING OF BRICKS**: A. Swinney.—After the clay has been extruded from the pug-mill through the cutting-frame, it falls upon pallets disposed in sections so that they can be parted asunder by a set of cams upon a shaft which is rocked by a slotted link and a crank from another shaft. When the bricks thus separated have been propelled on to carrying-board, a crank upon the second-named shaft—which acts by means of a slotted link and rocking shaft—removes the board or table away from the pallets, whilst an increase of motion is imparted to the outer pallets by pins that project from under the pallet-boards and engage with grooves in the cams whose pitches vary in accordance with their distances from the centre.

18,164.—**FIREPROOF FLOORING**: J. C. Fender.—Skew-backs, in which are formed grooves for taking the plaster, carry the floor-blocks whose ends and sides are stepped; the blocks are fashioned with vertical side ribs, inclined side ribs, and central webs, and in the blocks are embedded plates or strips of wire gauze, perforated sheet metal, or expanded metal, similar strips or plates being also embedded in the skew-backs by which the girders' lower flanges are enclosed. For the ceiling, plaster recesses are formed in the blocks, which are made of calcined plaster. A non-conducting flake or skin of powder will form upon the blocks when they become exposed to the action of fire.

MEETINGS.

FRIDAY, JANUARY 4.

Architectural Association.—Professor Beresford Pite and Mr. R. Weir Schultz on "The Preparation of Studentship Drawings." 7.30 p.m.

Architectural Association of Ireland (Technical Demonstrations).—Mr. J. McLaughlin on "Ironwork" (at No. 47, Great Brunswick-street). 4.30 p.m.

SATURDAY, JANUARY 5.

British Institute of Certified Carpenters (Carpenters' Hall).—6 p.m.

MONDAY, JANUARY 7.

Royal Institute of British Architects.—Business meeting. Election of candidates for membership. At the conclusion of the foregoing business the chairman will move the adoption of the amendments and additions in the Paper of "Suggestions for the Conduct of Architectural Competitions." The Paper as revised was printed in our last issue. At the same meeting Mr. Lewis Solomon gave notice of his intention to move the following resolution:—"That the Institute is responsible for the inferior position of architects as compared with that of other professions, and that a committee be appointed to inquire into the causes of this inferiority of status and to suggest remedies." 8 p.m.

Leeds and Yorkshire Architectural Society.—Professor Baldwin Brown on "The Old English Village Church." 6.30 p.m.

Liverpool Architectural Society.—Mr. M. H. Baillie Scott on "The Planning of Small Country Houses." 6 p.m.

TUESDAY, JANUARY 8.

Institution of Civil Engineers.—Papers to be submitted for discussion:—1. "Glasgow Bridge," by Mr. B. Hall Blyth, M.A. 2. "Railway Bridge over the Fiteroy River, at Rockhampton, Queensland," by Mr. W. J. Doak, B.E. 3. "The Niagara Falls and Clifton Steel Arch Bridge," by Mr. L. Leffers Buck. 8 p.m.

WEDNESDAY, JANUARY 9.

Institute of Sanitary Engineers.—New Year's Presidential address.

Northern Architectural Association.—Mr. Allan Greenwell, F.R.S., on "Plumens: Its Application in Architecture and Engineering," with lantern illustrations. 7.30 p.m.

THURSDAY, JANUARY 10.

Institution of Electrical Engineers.—Mr. W. M. Mordey on "Capacity in Alternate Current Working," and, if time permit, Mr. J. B. C. Kershaw on "The Use of Aluminium as an Electrical Conductor, with New Observations upon the Durability of Aluminium and Other Metals Under Atmospheric Exposure." 8 p.m.

Sheffield Society of Architects and Surveyors.—Mr. H. J. Potter on "The Housing of the Working Classes." 7 p.m.

FRIDAY, JANUARY 11th.

Institution of Civil Engineers (Students' Meeting).—Address by Mr. Wilfrid Airey, B.A., on "Geodesy." 8 p.m.

Architectural Association of Ireland (Technical Demonstrations).—Mr. John McLaughlin on "Constructional Work" (at No. 47, Great Brunswick-street). 4.30 p.m.

Glasgow Architectural Craftsmen's Society.—Professor Gourlay, B.Sc., on "A Tour in Germany, Switzerland, and Italy," with light-slide illustrations. 8 p.m.

SATURDAY, JANUARY 12.

Dundee Institute of Architecture.—Mr. R. S. Douglas on "Architectural Decoration—(1) as Clothing; (2) as Structural." 8 p.m.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Nature of Work.	By whom Advertised.	Premiums.	Designs to be delivered
Public Offices.....	Hindley U.D.C.....	50l., 25l. and 10l.....	Jan. 18
Sewerage Scheme.....	Basford (Notls) R.D.C.....	Not stated.....	Mar. 25

CONTRACTS.

Nature of Work or Materials.	By whom Required.	Forms of Tender, &c., Supplied by	Tenders to be delivered
*Electric Light Station and Destructor.....	Whitby U.D.C.....	Clerk, Council Offices, Whitby, Yorks.....	Jan. 8
Shed Roofing, &c., Wilburn-street.....	Salford Corporation.....	L. C. Evans, Town Hall, Salford.....	do.
Road Works, Devon-road, &c.....	Croydon Town Council.....	Borough Road Surveyor, Town Hall, Croydon.....	do.
Electric Lighting Station.....	Nuneaton U.D.C.....	J. S. Pickering, Civil Engineer, Council Offices, Nuneaton.....	do.
Engins House, Chimney, &c.....	Pemberton (Lancs) U.D.C.....	G. Caldwell, Architect, Penzance.....	do.
Main Sewers, &c., Dunham Massey.....	Bucklow (Cheshire) R.D.C.....	J. McKenzie, Engineer, 7, Market-place, Altrincham.....	do.
Walls, Fencing, &c., Banchoy, Altrincham.....	Farnworth (Lancs) U.D.C.....	A. Clynne, Architect, Aberdeen.....	do.
Steel Tram Rails, &c.....	Knaresborough R.D.C.....	W. J. Lomax, Civil Engineer, 11, Fold-street, Bolton.....	do.
Water Supply, Burton Leonard.....	Mirfield (Yorks) U.D.C.....	T. J. Rushbrooke, Borough Surveyor, High Wycombe.....	Jan. 9
Stoneware Pipes, &c., High Wycombe.....	Stockport Corporation.....	F. H. Hare, Civil Engineer, Town Hall, Mirfield.....	do.
Road Works, &c., King-street.....	Maldon (Cornwall) School Board.....	J. Atkinson, Civil Engineer, St. Petersgate, Stockport.....	do.
Tramcar Shed, Workshops, &c., Wellington-road.....	Maldon Town Council.....	O. Caldwell, Architect, Penzance.....	do.
School, Hamoor.....	Fulham Borough Council.....	C. S. Hatton, Court House, Gravesend.....	do.
Well Sinking, Essex-road.....	Nelson (Lancs) Corporation.....	C. Botterill, Civil Engineer, Town Hall, Waltham Green, S.W.....	do.
Drainage Works.....	Minchhead (Somerset) U.D.C.....	D. Conroy, Architect, 2, Bishop-street, Londonderry.....	do.
Additions to Hotel, Portstewart.....	Mr. C. W. Bunting.....	B. Hall, Civil Engineer, Town Hall, Nelson.....	do.
Pipe Culvert, Hibson-road.....	Manchester Corporation.....	Miss Tom, Fair-street, St. Columb.....	Jan. 10
House, Watergate, Mawgan, Cornwall.....	Stretford U.D.C.....	S. Short, Surveyor, King-street, Hursl.....	do.
Sewerage Works, &c., Queen-street.....	Saddleworth U.D.C.....	K. Comerford, Union Offices, Kilkenny.....	do.
Timber, Bricks, and Slates.....	Birkenhead Corporation.....	W. Badler, Borough Surveyor, Town Hall, Fowkesbury.....	do.
Stoneware Pipes.....	Leeds Corporation.....	C. S. Ayles, Surveyor, County Offices, Throwbridge.....	do.
Police Station, Cricklade.....	Sutton Gas Company.....	W. Butler, 63, Market-street, Dalton-in-Furness.....	Jan. 11
Boundary Wall, &c., Nelson-street School.....	Rugby U.D.C.....	E. F. Hooley, Shire Hall, Nottingham.....	do.
Granite and Slag.....	Kendal Corporation.....	R. H. Lucas, Civil Engineer, Town Hall, Kendal.....	do.
Sewerage Works, Weston.....	Derby Corporation.....	H. Sheppard, 3, North-parade, Bath.....	do.
Reservoir and Cast Iron Pipes.....	Levensham Borough Council.....	W. J. Tamlyn, Architect, Minchhead.....	Jan. 12
Market, The Parade.....	Wolverhampton Corporation.....	P. M. Beaumont, Architect, Maldon.....	do.
Coach Houses and Stables, Maldon, Essex.....	City Surveyor, Town Hall, Manchester.....	do.	do.

SOME RECENT SALES OF PROPERTY :

Table listing estate exchange reports with columns for date, agent, and property details. Includes entries for Jenkin & Sons, Dew & Sons, and others.

PRICES CURRENT (Continued). TILES.

Table of tile prices including Best plain red roofing tiles, Best Broseley tiles, and various other tile types with their respective prices.

WOOD.

BUILDING WOOD.—YELLOW.

Table of building wood prices for yellow wood, listing deals, fir timber, and various wood types with prices per standard.

JOINERS' WOOD.

Table of joiners' wood prices including White Sea, Petersburg, and various wood types with prices per standard.

Table of yellow pine and kauri pine prices, listing planks, logs, and various wood types with prices per cube.

Table of dry mahogany prices, listing Honduras, Tabasco, and other types with prices per standard.

JOISTS, GIRDS, &c.

Table of joists and girds prices, listing rolled steel joists, compound girds, and other types with prices per standard.

METALS.

Table of metal prices including iron, common bars, Staffordshire Crown Bars, and other types with prices per ton.

PRICES CURRENT (Continued). METALS.

Table of metal prices including sheet iron, galvanized iron, lead, zinc, and other types with prices per ton.

ENGLISH SHEET GLASS IN CRATES.

Table of English sheet glass prices in crates, listing various sizes and types with prices per delivered.

OILS, &c.

Table of oil prices including raw linseed oil, boiled oil, turpentine, and other types with prices per gallon.

VARNISHES, &c.

Table of varnish prices including fine elastic copal, best elastic carriage, and other types with prices per gallon.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

BROMLEY (Kent).—For erection of house, Garden-road, for Mr. H. Weeks. Mr. James Pamphilon, architect, 21, Finsbury-pavement, E.C. Quantities by architect:—

[See also next page.]

PRICES CURRENT OF MATERIALS.

Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table of material prices including hard stocks, rough stocks, smooth brick, facing stocks, shippers, and various other materials with prices per 1000 or per yard.

Table of stone prices including Ancaster in blocks, Bath, Farleigh Down, and other types with prices per cube or per ton.

Table of slate prices including 10x10 best blue Bangor, 16x8 best, and other types with prices per 1000 or per 100 sq. ft.

Table of slate prices including 10x10 best blue Bangor, 16x8 best, and other types with prices per 1000 or per 100 sq. ft.

DEVONPORT.—For alterations to No. 23, Fore-street, for Mr. C. Burt. Mr. E. M. Leest, architect, Public Hall Chambers, Devonport.—
 Healy & Son £138 4/1 S. Perkins £119 14
 W. J. Oliver 133 10 Jenkin & Son 110 0
 Smith & Son 126 15 [All of Devonport.]

HENDON.—For portable shed for fire-escape, Hendon Station, for the Hendon Urban District Council. Mr. S. Slater Grimley, Engineer and Surveyor.—
 W. Pearce £148 0/0 Smith & Co. £106 12 9
 W. Cooper, Ltd. 125 0/0 Humphreys, Ltd. 87 0/0
 W. A. Fryer 115 0/0 Gardner & Hazell, 79 15 0
 Mitson & Co. 110 0/0 Smith & Co., Acze-
 Fredk. King 107 5 0 lane, Erixton*. 75 0/0

HENDON.—For 32 in. sewer, Mill Hill-road, for the Hendon Urban District Council. Mr. S. Slater Grimley, Engineer and Surveyor.—
 Bentham & Co. £745 R. Ballard, Ltd.,

FOPOSED IN THIS
CEMENTS OF THE

PLAN IT IS SUGGESTED THAT AS THE SITE IS LOW NO OTHER
ACCOMMODATION THAN THAT OF CELLARAGE SHOULD BE
PROVIDED IN THE BASEMENT THE GROUND FLOOR AND MEZZANINE
STORY ABOVE IT ARE PROPOSED TO CONSIST OF THE
CARRIAGE AND FOOT ENTRANCE WAITING HALLS AND
STAIRCASES OF EACH DEPARTMENT AND ALSO SUCH OF
THEIR OFFICES RESPECTIVELY AS ARE CONSTANTLY FREQUENTED
BY THE PUBLIC & THE PRINCIPAL FLOOR IS PROPOSED TO CONTAIN
THE ROOMS AND OFFICES OF THE CHIEFS, SUBCHIEFS, PRIVATE
SECRETARIES &c AND ALSO THE STATE ACCOMMODATION OF
THE BUILDING WHICH IS PROPOSED TO BE IN CONSTANT USE,
NOT ONLY BY THOSE FUNCTIONARIES BUT ALSO FOR
RECEPTIONS, POLITICAL CATHERINGS AND EVENING
RECEPTIONS. THIS PORTION OF THE BUILDING WOULD BE
APPROACHED FROM THE GATEWAYS FORMING THE MAIN
ENTRANCE OF THE OFFICE, BY MEANS OF SEPARATE
STAIRCASES FOR ENTRANCE & EXIT. THE STATE ACCOMMODATION
CONSISTS OF A GRAND ENTRANCE HALL [HAVING OVER IT A
DAPOT AND REGISTRY FOR ALL OFFICIAL RECORDS], AN
ENTRANCE GALLERY A SUITE OF RECEPTION ROOMS, TRAM AND
SUPPER ROOM, A STATE DINING ROOM CONNECTED WITH THE
FOREIGN SECRETARY'S RESIDENCE AND AN EXIT GALLERY &
ACCESS UPON ONE LEVEL TO THE WHOLE OF THE OFFICES IS
PROPOSED TO BE AFFORDED IN THIS STORY FOR THE CHIEFS
& OF EACH DEPARTMENT OF THE GOVERNMENT THE UPPER
STORIES OF THE BUILDING ARE PROPOSED TO CONTAIN THE
CLERKS OFFICES AND SERVANTS ACCOMMODATION OF EACH
DEPARTMENT. THE SEVERAL QUADRANGLES OF THE BUILDING
ARE PROPOSED TO BE COVERED OVER WITH GLASS, SO AS TO
AFFORD SHELTER TO CARRIAGES IN WAITING & AMONGST
THE LOCAL IMPROVEMENTS PROPOSED AS SHOWN BY THE
DISTRICT BLOCK PLAN THE MOST IMPORTANT ARE TWO

BRIDGES ACROSS THE THAMES ONE AT CHARING CROSS AND
THE OTHER AT LAMBETH AN EMBANKMENT OF THE RIVER THE
WIDENING OF WHITEHALL TO THE EXTENT OF 100 FEET THROUGH OUT
AND THE CONTINUATION OF IT OF THE SAME WIDTH TO THE PROPOSED
BRIDGE AT LAMBETH A FORMATION OF A NEW ROAD OF A SIMILAR
WIDTH THROUGH ST JAMES PARK FROM VICTORIA STREET TO THE
MARKET WHICH ROAD WOULD MATERIALLY RELIEVE THE NORTH
AND SOUTH TRAFFIC PASSING TO AND FROM THE EAST AND WEST SIDE
OF LONDON. LARGE OPEN SPACES PLANTED AND LAID OUT ORNAMENTALLY
ARE PROPOSED TO BE FORMED IN CONTIGUITY WITH THE GREAT PUBLIC
BUILDINGS OF THE LOCALITY BY WHICH THOSE BUILDINGS WOULD BE
SEEN TO GREAT ADVANTAGE IN THEIR GROWING WITH EACH OTHER &
THE PARADE IS PROPOSED TO BE ENLARGED LEVELLED AND ENCLOSED
BY A LOFTY AND HANDSOME RAILING TOWARDS THE PARK AND BEING
SURROUNDED ON THE THREE OTHER SIDES BY THE OFFICES FOR THE
MILITARY AND NAVAL SERVICES OF THE COUNTRY A STRIKING AND
APPROPRIATE ARCHITECTURAL FEATURE OF THE LOCALITY WOULD BE
CREATED & THE OTHER LESS IMPORTANT IMPROVEMENTS ARE INDICATED
UPON THE DISTRICT BLOCK PLAN & THESE LOCAL IMPROVEMENTS HOWEVER
DO NOT INVOLVE THE DESTRUCTION OF ANY OF THE EXISTING PUBLIC
BUILDINGS ALTHOUGH SOME OF THEM MIGHT HEREAFTER BE REMOVED
WITH ADVANTAGE. IT MAY BE WELL TO OBSERVE THAT THE TWO NEW
OFFICES MOST URGENTLY REQUIRED MIGHT BE IMMEDIATELY BUILT
IN ACCORDANCE WITH THIS DESIGN UPON UNOCCUPIED GROUNDS BELONGING
TO THE CROWN AND WITHOUT DISTURBING EXISTING ACCOMMODATION IN
DOWNING SQUARE. THE STATE PORTION OF THE BUILDING MIGHT BE
NEXT ERRECTED PARTLY UPON GROUNDS BELONGING TO THE CROWN
AND PARTLY UPON OTHER PROPERTY BUT WITHOUT EXCEEDING THE
LIMITS OF CHARLES STREET ALREADY AUTHORIZED TO BE PURCHASED
BY PARLIAMENT. IN SHORT THE PRINCIPLE OF THIS DESIGN
ADMITS OF AS LITTLE OR AS MUCH BEING CARRIED OUT FROM
YEAR TO YEAR AS PARLIAMENT MIGHT DEEM TO BE EXPEDIENT

Burlington House and the New Gallery.

Arranging an exhibition of the works of "British artists deceased since 1850," the Royal Academy have made one of the most interesting collections of pictures which could well have been got together.

Many of the principal works exhibited are so valuable enough to the present day to be still as fresh in the memory of many of us, and yet have not been publicly exhibited for so long that a sight of them again is welcome. Other really fine works there are owing to names of painters who never deserve that degree of impression on the public mind which their talents would have justified; painters whose style and whose subjects made little appeal to the popular taste, whose names are almost forgotten now except by a few persons, but whose re-exhibited works show how little they deserve to be forgotten. Among these Paul Falconer Poole, the painter of poetic landscapes in which more is meant than meets the eye; landscapes stimulating to the imagination, suggesting something beyond mere landscape-painting. He is represented here by two of his best pictures: one now called "The Seventh Day of Decameron," but which we first knew, many years ago, under the title "The Song Philomena on the Shores of the Beautiful Lake," is a kind of dream landscape, in which the figures are not Boccaccio's—they are not the costume or the manner of his day, but are idealised into harmony with the landscape. The other and more powerful work, "A Lion in the Path," hangs exactly where it was hung, we know not how many years ago, when it was first exhibited at the annual Academy; lurid and threatening landscape in the

foreground of which is a man pausing at the sight of a lion in the shadow of the trees before him; after Poole's manner, the landscape seems to express the terror of the incident. It is a pity that Poole's perhaps still finer work, "The Dragon's Cave," we believe the last which he exhibited at the Academy, was not added to the collection. Another half-forgotten name which is brought up again here is that of Sir William Boxall, most refined of portrait-painters of his day, so sensitive and so hard to please that he could hardly endure the sight of his own works after they were completed; yet even he, his own severest critic, might have been satisfied with the dignity and refinement of style realised in his portrait of the late Mr. Frederick Huth.

A few pictures there are which serve to recall reputations that are *passé*; it was kind to include them, perhaps, but their appeal to us is in vain now. We will not altogether class Sir John Gilbert among these; there is always a vigour of action and power of composition in his productions which make them effective in spite of their sameness of style and superficiality of conception; but surely ten of his pictures is a larger proportion than was required on an occasion of this kind. Perhaps they are more easy of acquirement than some others, and have not been lent so much. His large picture of Henry and Wolsey, "Ego et Rex Meus," belonging to the Corporation of London, is a fine work, but the head of the Cardinal does not give the idea of the dangerous and subtle character of the actual man. In some other cases we are surprised to find how much more finely and learnedly this or that man painted than we have been accustomed to think. C. R. Leslie, for instance, it has become the fashion to think of as a man over-rated in his day; perhaps he was in some respects; but look at the foreshortened head of the infant in his small picture called "Mother and Child" in Gallery I.; it is a masterpiece of delicate and conscientious execution; indeed, in the present day of "broad" effects it is rarely that we see a foreshortened head painted with such care as this; it is a bit of

work to which students should give their attention.

Where the earlier painters of the half-century most especially failed (and one or two of the later ones also) was in colour. Poor E. M. Ward, who was really a historical painter of much thought and dramatic power, and who was so harshly treated by the critics in his latter days that it drove him to suicide, was one of the prominent failures in this respect; MacIise was another; indeed in both cases it was not so much failure as a totally ignoring of the quality of colour. Ward's large work, "The Last Sleep of Argyll," however, is a really pathetic and expressive picture, and one we are glad to see again. Landseer, again, seems to have been almost without the sense of colour; in his large "Stag at Bay" the animal is magnificent in force and realism, but the tone of the whole picture is painfully cold and dreary; so also with his clever portrait of himself under the title "The Connoisseurs."

In landscape there are works in the collection which serve to remind us that there was in the earlier part of the half-century something like a great style in English landscape-painting; a quality which cannot be said to exist now. There was Turner of course—a school in himself; but we see the quality in some of the smaller works in this exhibition, such as David Cox's "Going to the Plough," and Linnell's "Landscape," both in Gallery II. Turner's "Venice," one of his later works, is exceedingly like a fulfilment in painting of Shelley's description or poetic paraphrase of Venice in his "Lines written among the Euganean Hills"; the whole thing a kind of uncertain vision of light and colour, in which we cannot tell very well where the water and reflections end and the buildings begin. It is curious, though, as an example of Turner's certainty of touch, how the apparently formless loading of white pigment on domes and other features in strong light, results in conveying the impression of architectural solidity and of the glitter of architectural detail; curious, too, to compare with such a picture Holland's solid and powerfully-

built but comparatively matter-of-fact pictures of Venetian architecture, of which there are two or three in the collection.

If we have lost for the present the sense of great style in landscape painting, however, we may be consoled by thinking of what we have gained in sea-painting. It is almost amusing (or pathetic) to look at Cooke's "Goodwin Sands" in Gallery III., and to think that the author of this was once one of our leading sea-painters. We have got beyond that, at all events. It must be confessed, too, that Turner's sea, in "The Minotaur" is just as bad, so far as any resemblance to sea goes; it is only less commonplace because it does not attempt a stage realism, but is an idealised sea, evolved from Turner's inner consciousness; whereas Cooke's is really a kind of stage imitation of sea. And yet Cooke, we believe, lived much on the sea and professed to paint what he saw! Was it that people really saw differently in those days, or was it that the power of representing sea was not developed?

Mason is largely represented; indeed, most of his best works are here—the "Harvest Moon," the "Evening Hymn," the "Pastoral Symphony," &c. It is interesting to see in the first room the "Harvest Moon" hung opposite to Walker's "Bathers"; two very opposite treatments of rustic life, which may be called the real and the ideal, though in fact Walker's centre-group is somewhat idealised; he could hardly have found two such Greek-like figures among lower-class youths in a riverside bathing party, any more than he would have found among real rustics such a *spiritual* figure as that which leans over the plough-tail, in the grand picture of "Ploughing" (which is also here), or such a figure of a labourer as that in front of "The Old Gate." Walker intended his figures to be typical of the best qualities of a class, or his instinct led him to paint them so (for he never theorised about his art); but Mason's "Harvest Moon" personages are mere creatures of a rural romance, and on the whole less interesting, on that account, than Walker's more human though somewhat idealised types.

Turner's "Conway Castle" reminds us of another change in landscape-painting, and that if we have lost the great style we have gained immensely in what is called "local colour," a matter in which Turner will often hardly bear criticism from the modern point of view; see the colour of his shore and foreground generally in this picture. Possibly it is in part through too much attention to local colour that modern English landscape-painters have lost that breadth of style which characterised Turner, Constable, Muller, Crome, and others of past days. Among the most beautiful landscapes in the exhibition are Alfred Hunt's "A Mountain Joyous with Leaves and Streams," and his exquisite "Time and Tide," a view of sea and sunset, one of the most perfect of modern landscapes in conveying the feeling of a scene. We have Millais' fine landscape-painting, too "Winter Fuel," not poetical certainly, but masterly in its way. Millais is not largely represented in proportion to his importance, because it was desired not to repeat pictures which had been already recently seen in the collective exhibition of his works. The most striking picture by him is one which we do not remember, a three-quarter length of a

brunette little girl in a yellow dress, under the title "Pensive"; a beautiful piece of colour. Among other works of special interest is Albert Moore's "The Quartet," originally called "A painter's tribute to the Art of Music," and one of the most perfect works he ever painted; much superior in colour and vigour of style to the larger and more elaborate but sentimental "Summer Night." Mrs. H. T. Wells is represented by several works, the only one of which that is at all striking is the sad little idyll, "No Joy the Blowing Season Gives," which is fine and pathetic. Owners of pictures by George Lewis have lent them liberally, and those who delight in fine painting of architectural detail and decorative accessories could find nothing better of the kind than in "The Commentator on the Koran."

But why, may we ask, in giving a representative exhibition of works by British artists who have died within the half-century, were the sculptors entirely omitted? Was it that sculpture is not popular, or have the Academicians a lurking feeling that British sculpture, till within the last twenty years, was better left without illustration? At all events in that case the title of the exhibition should have been "British Painters," not "British Artists." But it seems to be an *idée fixe* [with the Royal Academy that "art" means "painting."

The New Gallery shows a collective exhibition of the works of Sir William Richmond, who certainly has a claim to this dangerous honour, a modern ordeal from which Millais alone, to our thinking, came out leaving in the minds of the spectators an even higher opinion of his powers than they had gained from the study of his works in a more isolated manner. Sir W. Richmond, however, may be glad of an opportunity to show how varied his work has been—more varied than is perhaps generally realised; for we have here classic and legendary paintings, portraits, decorative work, and a number of small but very interesting landscape sketches and studies. Some of the classical pictures no doubt owe something of their inspiration both to Leighton and to Burne-Jones. Sir W. Richmond's own special treatment of classic legend is probably best illustrated in such works as "The Bath of Venus" in the West Gallery and the "Birth of Venus" in the North Gallery; pictures with a special scheme of colour, and in which the nude figure is treated in an abstract, severe, and half-decorative manner. "Hermes" and "Icarus" are however, admirable conceptions, though they make us think of Leighton, and would hardly have been painted but for the pre-existence of that artist. Among the numerous portraits are some which are admirable just as characteristic likenesses—those of Browning and Mr. Andrew Lang, for instance; others which have a remarkable character of sumptuous magnificence, such as that of Lady Bell, seated with one arm out in a grand attitude recalling Reynolds's Mrs. Siddons; and that of the Earl of Pembroke, a typical portrait for a nobleman with a long line of ancestry. The large cartoons for the mosaic at St. Paul's cannot be very fairly estimated in these comparatively limited spaces; they are too near the eye for their intended effect at the proper distance to be realised. The small studies and sketches in the Balcony, for St. Paul's decoration, and for

various pictures, are most interesting; and we would also specially mention the drawing for the treatment of one of the St. Paul's windows, in the South Gallery. Among the sketches of buildings and scenery are many architectural sketches of great interest, and giving admirably the character of the architecture. Everywhere there is to be seen complete command of draughtsmanship, whether in highly-finished portraits and groups or in slight sketches of figures and landscape. The whole collection is a remarkable testimony not only to the versatility but to the conscientious industry of the artist. Such a life's work goeth not forth but by labour and devotion.

THE HOLBORN TO STRAND IMPROVEMENT SCHEME.

By Mr. J. S. GIBSON, A.R.I.B.A.

It may be possible to influence the London County Council to take a worthy view of the greatest architectural scheme that is likely to come before it during our lifetime, I would briefly review the action taken by the Council, and that of the architects invited to submit designs for the southern end of the new street.

It is generally admitted that the lines of the new street, its width and gradients, are satisfactory, and the members of the Royal Institute of British Architects may be congratulated on their suggestion for the southern crescent end having been adopted, and this manifest improvement on the lines laid down by the County Council is the first fruit of expert advice.

The next step towards obtaining a street which in architectural design would be a credit to the town, was undoubtedly to obtain designs, but here the County Council failed most completely to rise to the occasion, and that for two reasons. The first was that there was no decision on their part as to the nature of the buildings desired for the land, beyond the re-housing of a newspaper, two theatres and a restaurant, which occupy a small proportion of the ground, all else was vague and unsatisfactory. It would have been a comparatively easy thing to lay down the general lines of the accommodation required for the business premises which it was manifest to all would ultimately occupy the land. The County Council have had for years the cost of this improvement before them; these estimates must be based on a return from property the nature of which is known to their valuer, and if these figures are not so based they are misleading. Having all this information before them, the Council acted exceedingly unwisely in not setting forth in general terms the actual conditions which will govern the design of the buildings likely to be erected to meet their financial estimates.

In reference to the suggested County Hall to be shown in the centre part of the "Island" site, I do not overstate the case when I say that the prohibitive costliness of the land for this purpose must have been evident to the Council for many months previous to the invitation to submit designs, and consequently its inclusion in the invitation was certain to render the designs for a large part of the land absolutely useless. That a responsible public body should wantonly waste the time of architects in this manner seems almost incredible.

The first reason of the County Council's failure may be summarised thus: that, having all the estimates of expenditure and return before them, they failed to acquaint the architects with the information or to decide on the class of property required, and so rendered the competition abortive.

The second reason for the Council's failure was their treatment of the architects selected to compete. The intention was to ask "eight leading architects" to submit designs for the frontages, and for these designs a sum of 150*l.* each (subsequently increased to 250*l.* each) was to be payment in full, and no guarantee would be given that any of the architects would be employed in the execution of his design.

It was intended that four architects should be nominated by the Royal Institute of British Architects and four by the County Council.

Before any nominations were made, a deputation from the Royal Institute waited on the County Council and pointed out the unsatisfactory nature of the conditions, and suggested others which would commend themselves to all architects, but with no appreciable result.

In consequence of the refusal of the County Council to amend their conditions, it was found that two out of the four architects nominated by the Royal Institute declined to take part in the competition, and a request from the County Council for further nominations was met with a refusal on the part of the Royal Institute owing to the unsatisfactory conditions. The result was that six architects were nominated by the County Council and took part in the competition, besides two of those nominated by the Royal Institute.

No doubt the gentlemen selected struggled with the unsatisfactory conditions governing the designs to the best of their abilities. The attitude of the County Council in refusing to give any guarantee that the architects would be employed in the execution of their designs was fatal to their chance of obtaining good designs, and is a typical instance of how architecture is regarded by the average man, cultured or otherwise. It shows the inability to distinguish between a design on paper and the actual embodiment of that design in the ordinary building materials. Now, however much architects be tempted to become designers on paper, it is nevertheless a fact that the erection of our designs is the sole justification of our existence as architects.

But it was apparently the idea of the County Council that they could get a number of sketch designs by leading architects, and that afterwards any person of average intelligence could carry these into execution. This would probably be paralleled by their asking Mr. G. F. Watts or Mr. J. S. Sargent for a sketch design for a fresco to a small scale, and then handing the sketch over to Mr. Cimabue Brown from which to paint the fresco itself. I could imagine a public body doing such a thing, but I should find it impossible to credit it with any business capacity or artistic appreciation. The business of architects is to produce buildings, and until all public bodies or private persons are aware of that fact there will not be proper relations established between the two parties.

Having pointed out the causes of the failure of the competition, I would also point

out that the obvious course for the Council to pursue, to enable them to obtain designs from which a street might be erected that would be a thing of beauty, is to institute a new competition, in which the conditions will be the reverse of those embodied in the former one. The objections to such a course are, that it is impossible to define conditions regulating the design of the buildings until the nature of the businesses to be housed is known. This contention is, however, fallacious, in view of the fact that the majority of these premises are for ordinary business shops and flats or offices, and that in very rare instances special requirements will necessitate special treatment. It has already been pointed out to the County Council how the architect for the street frontages could be employed by the lessees of the land without extra charge to them, and any other architect employed for the buildings behind the frontage if the lessees so desire.

In proof of my contention that these buildings in the majority of cases will not require special treatment, I may point to the cases of Shaftesbury-avenue and Charing Cross-road, where the vacant land as a rule was bought up by speculators, who had no intention to do other than make a profit out of it. If a purchaser or tenant did not come along within a moderate time, the speculator proceeded to erect the usual shops and flats over without any regard to any object other than his prospective profit. The result is such a deplorable exhibition of vulgarity as make those streets a travesty of architecture, and unless some strong line of action is determined in the case of the new street it is probable the results in the latter case will be worse than the former, owing to the greater scale of the street. I am firmly convinced that if the County Council insisted on the employment of the architect for the new street frontages whose design they may select, the economy to the direct lessees of the land would be considerable, and the architectural character of the buildings would assuredly be improved thereby. That something definite must be done very soon is evidenced by the fact that the houses are now being demolished, and the rehousing of the theatres and *Morning Post*, must be a matter of considerable expedition.

I have seen it stated in several newspapers that the Gaiety Theatre is to be rebuilt from the plans and designs of Messrs. Runtz & Co. If this means that this part of the "Island" site is to be built according to the design submitted by Mr. Ernest Runtz in the recent competition, it will interfere with the unity of the general scheme, and stand in the way of the opportunity to carry through a great architectural design for the new street. The question is of such moment to London that I hope the County Council will take the best architectural advice it can obtain before giving its sanction to the design of any buildings on this land, and until it is firmly convinced of a consistent line of action which will ensure an architectural treatment of the new street of which we may all be proud.

J. S. G.

NOTES.

It is sincerely to be hoped that the Royal Commission now engaged in a consideration of the various questions connected with

the Port of London may evolve some satisfactory scheme for ameliorating the conditions at present existing. We are glad to notice that the County Purposes Committee of the Corporation has lately put forward some suggestions for the future management of the port. The committee proposes that a public trust should be constituted, including representatives of the Admiralty, the Board of Trade, the Customs, the Trinity House, Lloyd's, the chief railway companies, the Corporation, and the London County Council. This very comprehensive body, it is suggested, should be armed with the fullest possible powers for making the port in every way attractive to the shipping industry. No doubt the Royal Commission will be prepared to show in what manner this desirable aim may be attained, and if the trust were instituted without loss of time after the report of the Commission has been presented, there would be reason for believing that the utterly inadequate accommodation and antiquated methods now prevailing might speedily give place to facilities more worthy of the metropolis, and of the century in which we live.

It is understood that the third wing of the Admiralty building, the one facing to the Horse Guards' Parade, is to be commenced almost immediately, and that it is to be more ornate than the other two, and to have sculptural decoration. It is to be hoped that it will at all events be architecturally more worthy of the site and of the purpose of the building than the portions already erected. We should have thought the best policy would have been to start again *de novo*, get a really fine design made and carried out for the new wing, and then pull down the two others and rebuild them as a continuation of the new design.

In a "Note" on August 4 last year we referred to the mishap, on June 28, 1900, to one of the lifts at the London Bridge Station of the City and South London Railway. A recently-issued Board of Trade Report confirms the details which we then stated. The primary cause of the accident was the failure of a shaft that was originally believed by the makers, and we presume by the Board of Trade also, to be of ample diameter. The condition of absolute intallibility with regard to purely structural matters is, of course, practically unattainable, but the public is entitled to demand reasonable safeguards against injury in the event of breakage, whether avoidable or unavoidable. In the present case, we find the lift gear included a safety apparatus, and buffers were fitted at the bottom of the lift well, but the safety gear had been disconnected while some adjustments were being effected. Under these circumstances it is simply astounding that the lift should have been used. But a further reason for astonishment is afforded by the fact that the workmen engaged in adjusting the balance of the apparatus had placed some heavy weights in an insecure position just above the fragile roof of the cage. When the shaft broke, the cage descended at an abnormal speed, and although the friction of the ropes prevented the attainment of a velocity likely to endanger the safety of the occupants, the sudden arrest of the cage at the bottom

The Port of London.

of the well was sufficient to shake the weights from their temporary resting place, and thus to injure the lift attendant and two out of three passengers present. There is one point in connexion with this particular case to which the attention of all lift makers should be specially directed, namely:—That even if the safety apparatus had been in gear, it would not have been sprung because the ropes neither broke nor slackened. As most of the safety gears used in this country cannot come into operation unless a rope breaks or slackens, it is imperative that some improvement should be introduced without delay. One plan suggested is to add a rope passing directly from the safety clutches over the pulley at the top to the counterweight. This will bring the clutches into operation as soon as any alteration takes place in the distance between the cage and the counterweight, measuring along the course of this auxiliary rope. In our opinion, a much safer device is that in which the release of the safety gear is directly controlled by the actual velocity of the cage. Under this system any abnormal rate of speed, whatever may be the originating cause, at once results in the application of the safety clutches.

Electric Railways and Electrolysis.

In a letter in Monday's *Times* Mr. Hunter points out the dangers likely to arise from electrolysis, owing to leakage of current from the rails of the electric tramways that are being constructed all over the country. He suggests that no injustice would be caused by making and enforcing proper regulations as to return mains, and that it would be advisable to appoint a Royal Commission to consider the subject. Now there are many indications that as tramway and electric lighting systems are getting larger and larger, the stray currents from them are increasing in proportion, and that the present Board of Trade rules about leakage will have to be made even more stringent in the immediate future. A striking instance of this was mentioned by Mr. Parshall at the recent Board of Trade conference to discuss methods of preventing the working of the electric tramway between Kew and Brentford from affecting the magnetograph records at the Observatory. He said that at the present time, although the tramways were not yet working, there was sometimes a difference of pressure between the ends of the tramway rails of 0·8 of a volt. As the resistance of the rails is probably less than the hundredth of an ohm per mile, it will be seen that at certain times of the day there are several amperes of current flowing along the rails. This current must be due to leakage from some of the neighbouring electric railways, or possibly from a direct current electric lighting network. This shows that already the currents flowing in some of the water and gas mains in London are appreciable, and a keen look out should be kept for any signs of electrolytic corrosion. The Board of Trade regulation for the difference of pressure between the two ends of a rail in an electric tramway is that it must not be greater than seven volts. Hence there is not much margin for preventing leakage by making this rule more stringent. Sooner or later a remedy will have to be found, as it is evident that the country

desires electric tramways. Several have been already suggested, such as keeping the pipes negative to the rail, &c., or using an insulated return. Making an insulated return compulsory in country districts would be a pity, however, as it would make the cost practically prohibitive.

Stoves in France.

A DEMOCRATIC people is sometimes the most arbitrary, and thus it happens that the French people patiently submit to official acts which would not be tolerated in England. Of late, in Paris, numerous accidents have occurred from persons being suffocated through stoves being imperfectly connected with the chimney, or it may be not being connected at all. An order has therefore been issued by which inspectors are appointed for the purpose of seeing that the stoves of Paris are properly fixed and their fumes carried away. They have full power to enter any house for this purpose. It may be desirable that there should be this form of inspection, but can any one imagine the letters which would be written to the daily paper were smoke inspectors appointed in England with similar powers? It is to this autocratic attitude of the French officials that many structural reforms are also due. It is to be observed in connexion with this order that it seems to show that stoves, however desirable as heating apparatus, require more careful attention than patentees and salesmen will often allow. That stoves are not sufficiently used in England—if it is desired to economise fuel—is certain; at the same time, they have drawbacks which do not belong to the agreeable, if often wasteful, open fireplace.

SOME tests on the corrosion of iron and steel have lately been considered by the "Engineers' Society of Western Pennsylvania," and they were undertaken with the object of ascertaining what influence the presence of copper might have in arresting corrosion. In the first set of tests the following percentages of loss from atmospheric corrosion were found:—Bessemer steel, 1·85; Bessemer steel, with 0·263 copper, 0·74. Other specimens in this series showed the percentage of loss to be inversely proportional to the amount of copper contained in the metal. In the second set of tests, the percentages of loss were:—Bessemer steel, 1·65; wrought iron (mean), 0·81; wrought iron, with 0·393 copper, 0·53. The presence of copper in the small proportions indicated above cannot be thought likely to exercise any prejudicial effect upon the physical properties of either iron or steel, and it might readily be introduced during smelting by the employment of ore containing copper. Retardation of corrosion also follows the addition of nickel, a result evidenced by investigations, of which an account was given at the Congress of the International Association for Testing Materials of Construction. In small proportions, nickel has the further property of increasing both the elastic limit and the tensile strength of steel.

Traffic Problems in New York.

ALTHOUGH American engineers have been allowed to do pretty much as they liked in the past, it is becoming more and more evident every year that their operations will ultimately have to be conformable with regulations

very much akin to those existing in our own country. The necessity for such rules is nowhere more apparent than in connexion with traffic facilities in great cities. City railroads and tramways have hitherto, in American cities, been carried in a cheerfully promiscuous manner along the public thoroughfares or erected on stilts, as it were, above them, the chief idea being to deal with a difficulty in the way that seemed for the moment to be the most practical and convenient. In spite of the freedom permitted to engineers, it is clear that means of rapid transit are still wanted in many American cities, and notably in New York. The view that public thoroughfares present a strictly inelastic area has prevailed for many years in London. It has successively extended to Glasgow, Paris, Boston, and New York. In the last-named city, an interesting example of an underground railway, known as the "Rapid Transit Tunnel," is now in course of construction. A large proportion of the subway is being made on the cut-and-cover method, and on sections of the line where this class of work is adopted little trouble in respect of actual excavation is anticipated, but somewhat complicated problems are likely to arise when material has to be removed from below various street railway tracks. Where tunnels are driven, they will generally lie at a considerable depth, particularly below the elevated district known as Washington Heights. For a distance of over two miles, between 150th-street and 195th-street, the average depth will be 120 ft., and two stations in this section will be 100 ft. and 120 ft. respectively below the street level. Like the Paris Metropolitan Railway, the new subway will contain both the up and the down lines, and electricity will, of course, constitute the motive power. Very satisfactory progress has been made with this undertaking, which is clearly a step in the right direction.

The Walls of Avignon.

THE credit which is due to France for the care which is given to questions concerning the erection of modern buildings can scarcely be extended to the buildings of historical interest. The French spirit is essentially logical, it is not one which values the past, hence it results that old structures are demolished not only without hesitation, but sometimes almost prematurely. There is no more striking relic of mediæval France than the wall which still surrounds Avignon, with its towers and its gateways. But the ancient gateway, which faced the modern suspension bridge and so formed a main entrance to the town, has been pulled down. It was said to be in a very weak state, but be that as it may, no attempt has been made to preserve it, and a great gap has been made in the wall. Restorations, or renovations after the antique, have to be carefully carried out, but we are inclined to think that if the old gateway could not longer have been preserved it might have been rebuilt, thus keeping up the continuity of the walls. These walls themselves are not too well looked after, and seem to be decaying in many places, and to need small repairs, and the shanties which are placed in various parts against their external sides should be pulled down. Boulevards may be built, but the walls of Avignon can never be replaced; and we wish we could think that those who are responsible for their preservation realise

to the full the trust which they hold, not for
 France only, but for the whole world.

In a "Note" of January 20,
 last year, we commented upon
 the scheme propounded by the
 Corporation of London for rebuilding upon
 their "John Carpenter" estate between
 Dover-street and Tottenham Court-road.
 The leases of nearly all of the property will
 expire on Lady Day next year. The City
 Lands Committee have now prepared plans,
 which the Corporation adopt, and which,
 as we apprehended at the time, will
 quite destroy the architectural character
 of the streets on that estate, as laid
 out by George Dance, R.A., for the Cor-
 poration in the interval 1790-1814. The
 approved plans provide for the demolition
 of the North and South crescents, at the two
 ends of Alfred-place; for the extension of
 Alfred-place towards the north as far as
 Alfred-mews, and towards the south across
 Bayley-street, and so behind Bedford-square
 to the lately widened thoroughfare from
 Caroline-street into Tottenham Court-road;
 and for the replacement of Alfred-mews
 with a new street, to be 50 ft. in width.
 In the report which accompanies the plans
 the City Lands Committee express their
 opinion that Dance's planning of the two
 crescents, with cross thoroughfares (Chenies
 and Store streets), at the open ends of the
 wide road upon the axis between their
 centres is quite out of date, and is to be
 deprecated for many reasons. We should
 like to know what these reasons are.

It is stated that the trustees
 have finally closed this school.
 in pursuance of an order to
 that intent made by the Charity Commis-
 sioners, and that the site will be disposed of,
 on behalf of the trust, for purposes of the
 proposed West London Polytechnic Insti-
 tute. The school endowment was estab-
 lished under an Act of Parliament passed
 for administering the estate of Sir William
 Godolphin, our Ambassador to Spain,
cap. Charles II., whose testamentary dis-
 positions were in that respect regulated by
 two schemes in Chancery in 1852 and 1859.
 The school, remodelled accordingly as a
 grammar school, was opened in August,
 1862, in the present buildings erected upon
 a site of nearly four acres, adjoining St.
 John's Church (Butterfield, 1860), in Dart-
 mouth-road, after C. H. Cooke's plans and
 designs, which are described and illustrated
 in our columns of August 10, 1861. The
 buildings comprise a schoolroom for 200
 boys, class-rooms, dining-hall, dormitories for
 forty boarders, and headmaster's residence.

On December 16 the final ser-
 vices were held in this chapel,
 and after a subsequent valedic-
 tory meeting of the congregation the
 chapel has been finally closed. The sites of
 the building and three adjoining houses have
 been taken for the local street improvements
 about to be carried out by the London
 County Council, who, we gather, will allot,
 in compensation, a fresh site on the line of
 the new road, High Holborn to the Strand,
 for headquarters with a church-house of the
 Baptist Union of Great Britain and Ireland.
 The chapel in Kingsgate-street was originally
 founded in 1735; the present building was

erected in 1855-6, after C. C. Searle's plans
 and designs.

This winter's exhibition of the
 Society of Oil Painters, at the
 Dudley Gallery, contains a good
 many interesting works, among them the last
 production of the late Mr. Wimperis, "Stan-
 pit Common" (112), a large work showing
 this artist's usual fine qualities as a water-
 colour artist of the old school. The new
 President, Mr. Frank Walton, is represented
 by a fine and carefully-finished landscape,
 "Holmbury Gorse" (276), not, it must be
 admitted, in the highest style of water-colour
 art, but a very charming work of its type;
 in regard to style, we prefer the smaller
 drawing, "Upfolds" (278). Among the pic-
 tures in which figures form a prominent
 element is Mr. Fulleylove's "Montpellier"
 (262), a kind of restoration of the terrace with
 eighteenth-century figures; possibly the young
 man in the foreground is meant for Rousseau,
 who tells us in his "Confessions" how he
 was warned against the fascinations of the
 Montpellier beauties. Mr. Dollman's "Fox
 and Pheasant" (256) is a clever picture of a
 hunting man and a shooting man, in approp-
 riately costumes, apparently discussing the
 merits of their respective sports. In a higher
 vein is Mr. Wardle's "The Flute of Pan"
 (209), where panthers and poppies combine
 to make a fine piece of imaginative colouring.
 Mr. F. D. Millet's "The Fireside"
 (165) is an interior with a figure painted
 in his best style. Otherwise the figure
 pictures are not generally the principal
 interest in the exhibition. Among land-
 scapes which may be singled out as of
 special interest are M. Fantin-Latour's
 "La Nuit" (169); Mr. Austen Brown's
 "Burning Weeds" (247); Mr. Julius Oisson's
 sea pictures, especially "Study of Rough
 Sea" (40); Mr. John White's "Evening at
 the Well" (70), a village street scene in a
 quiet evening light; Mr. R. W. Allan's
 "Honfleur Fishing-Boats" (150); Mr.
 Thorne Waite's "Evening Light" (308), and
 Mr. Alfred Hartley's "Water Nymphs" (468),
 which takes its name from some small
 figures of bathers, which add a little inci-
 dent to a beautifully composed landscape.

PROFESSOR AITCHISON'S Lec-
 tures on Architecture at the
 Royal Academy, which will
 commence on the 28th, deal entirely with
 the subject of St. Peter's. A set of lectures
 from Professor Aitchison on such a subject
 is sure to be of exceptional interest.

A CORRESPONDENT signing him-
 self "Engineer" makes an ex-
 cellent proposal in the *Times*
 for preserving the stones at Stonehenge
 from being any further overturned by storm.
 The object of course is to effect this without
 destroying the ancient appearance of the monu-
 ment. "Engineer" proposes to cut a trench
 of about a foot wide against one stone,
 excavated to the level of the bottom of the
 stone, and carrying it outwards to a length
 of 6 ft. or so at right angles with the side of
 the stone. Then fill this trench with con-
 crete, and make a similar one alongside the
 first, and so on until the foot of the stone is
 bedded in a mass of concrete; the turf
 to be then replaced over the concrete,
 so that no sign of the work would
 appear. We would suggest, however, that
 an improvement on "Engineer's" scheme

would be to have these trenches only at inter-
 vals, or two against each of the larger sides
 and one against each of the shorter sides of
 the stone; these would act as buttresses, as
 effectually as the complete mass of concrete,
 and would disturb the ground less and
 require less labour and material.

THE small and select exhibition
 of a few landscape-painters at
 the Dudley Gallery—Messrs.
 R. W. Allan, Aumonier, J. S. Hill, A. D.
 Peppercorn, Leslie Thomson, and E. A.
 Waterlow—again comes round as a pleasant
 event in the artistic world; an exhibition in
 which we can concentrate attention on a small
 number of thoughtful landscape-paintings,
 undistracted by the crowd of an ordinary mul-
 ti-farious exhibition. Mr. Waterlow, who comes
 first in the order of hanging, with a less distinc-
 tive individuality than one or two others of
 the group, is always complete and satisfying
 in his treatment of landscape, more espe-
 cially in the largest work exhibited here,
 "A Hill Farm, Provence," a landscape quite
 perfect in style. Of the others, "A Mill on
 the Ouse" (a mill we know well), and
 "Walberswick Church," are the most
 interesting. Mr. Allan shows his most
 typical qualities in "Cullen Harbour,"
 but surprises us by a grand and bold view of
 "A Gate of the Sea"; a sea-shore gorge
 between two vast cliffs, at the end of which
 the waves are just discerned breaking on the
 beach. The "Falls of Clyde" is rather
 heavy; "Portknockie" is a fine little harbour
 scene. Mr. Aumonier's largest picture, "A
 Cambridgeshire Farm," looks a little cold
 and ragged; the most taking of his pictures
 are "Evening" and "The Strayed Flock."
 Mr. Leslie Thomson's "Peaceful Summer"
 has a broad calm about it which quite answers
 to the title; his most powerful work is
 "After Thunder," where he has succeeded
 in conveying the effect of the glitter of white
 cliffs and other objects as the thunder-cloud
 clears off behind them. Mr. Peppercorn is
 not quite at his best; "A Sedgy Pool" has
 the materials of a fine picture, but the trees
 are too defiantly ragged in execution; the
 best of his set are "The Edge of the Moor"
 and the little bright sketch (on a Surrey
 road?) called "The Hay Cart." Mr. Hill's
 best things are really his flower-pieces—still
 life—hardly in place in a landscape exhi-
 bition; he experiments a little too much in
 landscape; his "Night" is fine, however,
 but (as usual in such pictures) not really
 dark enough for night.

THE PROPOSED NEW STREETS IN CENTRAL
 MANCHESTER.—A Bill to authorise the construction
 of new streets and other improvements in the
 neighbourhood of Market-street, Manchester, has
 just been deposited for next Session on behalf
 of certain persons named in the Bill, who seek to be
 incorporated under the name of the Manchester
 (Market-street Area) Improvements Company.
 The preamble sets out that great local and public
 advantage would follow the making of two new
 streets, the one to run from the corner of Market-
 street and Corporation-street to the corner of New
 Brown-street and Cannon-street, and the other to
 run from the corner of Market-street and New
 Brown-street to the corner of Corporation-street
 and Cannon-street, affording in the one case a more
 direct road from Shudehill Market to Victoria
 Station, and in the other a more direct road from
 the home-trade warehouses and Shudehill Market to
 the Manchester Exchange. The preamble further
 recites that the buildings on the lands adjoining the
 proposed new streets are for the most part very old,
 and their removal and the erection of new buildings
 thereon would be a public advantage. To effect
 these improvements it is proposed to establish a
 company with a share capital of 1,000,000l.,
 divided into 100,000 shares of 10l. each, and with
 the right to borrow on mortgage a further sum of
 500,000l. The new streets are to be completed
 within four years from the passing of the Act.

WESTMINSTER, OLD AND NEW: 1801-1900.

(Continued from page 13.)

VICTORIA-STREET. — Whilst the making of a new street from the Abbey to the Chelsea Waterworks basin at Pimlico was foreshadowed in Gwyn's "London and Westminster Improved," 1766, the formation of New Westminster may be said to practically begin with the appointment in 1845 of the Westminster Improvement Commission in terms of the Acts in that behalf of 1845-7. In 1845 various plans were submitted by Tarring, Donthorn, Lapidge, Lewer, S. Smirke, Bardwell, H. H. Russell, Abraham, and others, and "notices" were served on owners and tenants on September 27 of that year. The Commissioners laid out a slightly-curved thoroughfare 80 ft. wide, about 5 furlongs in length, and with frontages from 60 ft. to 70 ft. deep, from Broad Sanctuary to Shaftesbury-terrace, Pimlico, passing through the Almonry, Dean, Orchard, New and Old Pye-streets, to Strutton (Stourton) ground, through the burial ground at the New Chapel, and so across Brewer's-green, the artillery ground, and past the White Hart, or Elliott's, now Watney, Combe, Reid & Co.'s brewery, to a point opposite the later Victoria railway station. The street was opened on August 6, 1851. Building operations began at the south end. It is said that Mr. Elliott received 22,000l., at the rate of 4,000l. per acre, for the meadow fronting his brewery. In Broadway, on the line of route, is Christ Church (Ambrose Poynter, 1842-3, the glass by Willement) on the site of the New Chapel built in 1626 as a chapel-of-ease to St. Margaret's. Fig. 4, from Horwood's plan, gives the plan of the streets before Victoria-street was begun.

The new frontages were not acquired as quickly as was expected. Amongst the earliest buildings were Henry Clutton's Training Schools for the National Society, begun in 1852, and some blocks of flats at the southern end by Mackenzie [December 3, 1853] and by Ashton. E. Bassett Keeling (obit 1886) designed Prince's Mansions. On the site of the Black Coat School and Palmer's Almshouses with their chapel and school, founded in Tothill-side 1654, was built the "Army and Navy," renamed the "Windsor" Hotel (Thomas Pilkington, obit 1898), at a cost of 80,000l. Another conspicuous hotel is the "Westminster Palace," 1858-61 (Andrew and William Moseley), at the west end of whose Tothill-street front stood Caxton's reputed house (the "Reed Pale") in the Almonry (fig. 5), which fell down in November, 1845. Alexandra mansions, and Members'-buildings, 1878-9, are by Mr. Francis Butler. Beyond Palmer's-passageway, now Palmer-street, between the Peabody-buildings and the Windsor Hotel stood Nicholas Butler's Almshouses (1675). The Palmer and Butler Charities have been re-settled in Rochester-row. Abbey-mansions at the corner of Orchard-street were built by Mr. W. Rickard, contractor, at a cost of 95,000l., after Mr.

Fig. 5.—Caxton's House in the Almshouse at Westminster, which fell down in 1845.

in pitch (the dormers remain on the north side) and the dome of the great drawing-room flattened down, 1848, for the present top floor; alterations, including the "Scott" memorial library, 1883-5, by Mr. Bodley, for Westminster School; rebuilding, 1883, of the late Mr. Turle's house, *temp.* Henry VIII., on the site of the convent privy dorter or necessarium; "Rigaud's" boarding-house, rebuilt for Westminster School, 1897—Mr. T. G. Jackson. *Delahay-street*: No. 2, St. James's Lodge, on the site of Duke-street Chapel, which in 1769 was made out of the north wing of Judge Jeffreys' house; Nos. 7 and 9, being the front and south wings of the house built for Jeffreys, pulled down in October, 1832, and rebuilt after Messrs. Ernest George & Peto's designs; the State Paper Office, 1829-33, by Sir John Soane, pulled down, 1862, for Sir G. G. Scott's Foreign Office; Nos. 13 and 17—Messrs. Isaacs & Florence; No. 19—W. Butterfield. *Great George-street*: Houses at corner with Delahay-street—Henry Wyatt; No. 12, Surveyors Institution, 1807-8—Messrs. A. Waterhouse & Son [April 1, 1869]; No. 8, in 1884—W. Halsey Kearsley [October 10, 1898]; the Institution of Civil Engineers, on the sites of Nos. 24-5 (original Institution) and 26, in 1894-5—Charles Barry, *ob.* June 2, 1900, the portrait busts by Mr. H. C. Fehr, Messrs. Mowlem's contract for 41,000l. [June 22, 1895]. *Storey's-gate*: Institute of Mechanical Engineers, opened on February 9, 1899—Mr. Basil Slade [June 3, 1899]; block of flats, 1896-7—Mr. Basil Slade. *Dartmouth-street*: Universities Mission to Central Africa, with chapel—Mr. G. C. Horsley [September 10, 1896]; and House of the Society of St. John the Evangelist, the Cowley Fathers—Mr. Henry Watson. House in *Queen-square*, for Sir Charles Forster—T. H. Wyatt (1807-1880). *Totbill-street*: The "Cock," the traditional pay-table of workmen at the Abbey, *temp.* Henry III., demolished in 1845 (see Archer's "Vestiges of Old London"). *King-street*, and the west side of *Parliament-street*, pulled down, 1896-1900, for the new Government Offices—Mr. J. M. Brydon [March 25, 1899, and May 5, 1900]. *Parliament-street*: Nos. 52-3—Mr. H. Huntly Gordon [November 21, 1896, two]; No. 54, Grindlay & Co.'s bank, 1898—Mr. Alfred Williams [December 16, 1899]; No. 48, the "Red Lion," 1899—Messrs. Gardiner & Theobald. H.M.'s Stationery Office, *Princes-street*, 1853-4, by Sir James Pennethorne, on the site of the Guards' Store and Royal Westminster Mews—Decimus Burton, *ob.* 1881. *York-street*: Milton's, and afterwards Hazlett's house, No. 10, pulled down in 1877 for Mr. Harkney's mansions; M. D. Ry, Co.'s offices, St. James's Park Station, 1898—Mr. H. L. Florence, Messrs. Cubitt & Co.'s contract, 15,416l.; Wellington-chambers, 1899—Mr. G. Simpson. St. Ermin's mansions, *Caxton-street*—Mr. E. T. Hall [June 25, 1887]. *Vincent-square*: St. Mary's Church, 1837—E. Blore; Grosvenor Hospital for Women and Children, 1897-8—Messrs. Roumieu & Aitchison as honorary architects for the hospital and out-patients department.

Victoria-street: At the south-end, the Clock Tower, 1892—Messrs. Gillett & Johnson. St. Matthew's Mission House—E. Ayton-Lee (1846-90). St. Matthew's Church, *Great Peter-street*, begun in 1840—Sir G. G. Scott. *Great Smith-street*: Free Public Library—Mr. Francis J. Smith, Messrs. Stimpson & Son's tender, 7,350l., accepted in August, 1891; Baths and Washhouses—Mr. Francis J. Smith, Messrs. Stimpson & Son's tender, 18,800l., accepted in August, 1891; enlargement of Queen Anne's Bounty Office, 1899-1900—H. Currey and Mr. Percival Currey. Police-station, *Rochester-row*, 1900—Mr. J. Dixon Butler. *Greycoat-place*: Army and Navy Co-operative Society's buildings, 1899—Mr. R. T. Blomfield. Westminster Palace-gardens, *Artillery-row*, 1898-9—Mr. A. Blackford. Residential flats on west side of *Emery Hill-street*, and south-east side of *Francis-street*, 1900—Mr. E. J. Stubbs. Blocks of flats on the north-east side of *Carlisle-place*, and two blocks on the north side of *Francis-street*, between *Carlisle-place* and *Morpeth-terrace*, 1897-8—Mr. G. Baines. Army and Navy Mansions, corner of *Victoria-street* and *Francis-street* [May 7, 1898]—Mr. C. J. C. Pawley, built by Mr. W. Goodwin, 40,000l. *Horseferry-road*: Coroner's court, public mortuary, &c., 1893—Mr. G. R. Wheeler, Surveyor to the Vestry; workshops for Messrs. Broadwood, 1856—Francis Edwards, *ob.* 1857; Wesleyan Normal Training College Model School, 1849-50—James Wilson [December 21, 1850].

Chapter and Regency streets: Drill-hall and headquarters of the Electrical Engineers' Volunteer Corps, 1900—Mr. W. C. Waymouth.

Orchard-street: Offices and warehouse, 1898—Mr. G. H. Biphick. Rebuilding on the sites of Nos. 10-3, *Little College-street* and Nos. 6-8, *Cowley-street*, 1899-1900—Mr. F. A. Smith.

North of Victoria-street—Westminster enjoys a full share of eleemosynary and educational endowments. One of the more important was Emmanuel Hospital, in James-street (formerly Buckingham-row, and since renamed Buckingham-gate), founded by Anne, widow of George Fienes, tenth Lord Dacre of the South, who died *s.p.* September 25, 1501. The Baroness directed her executors to build near to her own home, Stourton House, in Tothill-fields, "a

J. C. Pawley's plans and designs [May 7, 1898], for Government offices. Our comments upon the disaster whereby seven men met with their death and others with serious injury through the collapse of the concrete roof, and a full report of Mr. Justice Grantham's summing up for the defendant in Regina v. Pawley will be found in the *Builder* of May 28 and July 2, 1898.

South of Victoria-street.—The old Bridewell, first built in 1618, along the northern side of Green Coat School and Hospital, on Tothill-side, stood until 1836, when its gateway, lock, and keys (see lithograph plate in last issue) were removed as relics to the new Tothill Fields Prison, erected in 1830-4 at a cost of 186,000l. upon about nine acres of land—between Ashley-place and Francis-street—purchased for 16,000l., and situated near the then Palmer's Village, after Robert Abraham's plans and designs, for 800 prisoners. The plan consisted of several wards, including forty-two day and 348 day-rooms, arranged around a central garden, the governor's house, with chapel above, being in the front. The entrance, on the south-east, in Francis-street, had a handsome elevation of granite, with a porticulis, and the whole structure, for which ten millions of bricks were used, was considered to form one of the finest examples of brick masonry in London. The outer wall, one-third of a mile in length, was 4 ft. thick at the base. The materials were sold by auction in February-March, 1884, and Ashley-gardens and Ambrosden-avenue now divide the site into two portions. The portal and inscribed stone of the original Bridewell were set up against the north wall of the Sessions House, since rebuilt, where they are still preserved. In 1850 Tothill Fields Prison was reserved for women convicted in Middlesex and youths under seventeen, and latterly formed the women's prison for all London. The site was acquired from the Crown by the Westminster Land Company, who in February, 1884, conveyed 4½ acres of the ground for a payment of, it is said, 55,000l. (since valued at about 300,000l.), with exchange of lands to the late Cardinal Manning, Monsignor Gilbert, and Canon Bamber for a new Metropolitan Cathedral in fulfilment of Cardinal Wiseman's project. In 1894 the design was committed to Mr.

John F. Bentley, who, after some months' study amongst the churches in Italy and consultation with Cardinal Vaughan, adopted the older Byzantine style in preference to that for a basilica as at first proposed. Of the new structure, described in our columns, July 6, 1895, February 25, 1899, and June 23 last, Cardinal Vaughan laid the foundation-stone on Monday, July 1, 1895. The contractors are Messrs. Shillitoe & Son, of Bury St. Edmund's. The works are being carried out "by schedule," up to December last the sums paid amounted to 134,600l. It is further proposed to build an archbishop's residence, together with a convent for thirty Benedictine monks and forty-five lay brothers. We gather that the exterior ornamentation of the cathedral will be mainly confined to the facade, the decorations being concentrated upon the interior. The church of St. James-the-Less, in Upper Garden-street, 1860-1, by G. E. Street [June 15, 1861, and March 15, 1862], was built at a cost of 9,000l., and endowed in memory of Dr. Monk, Bishop of Gloucester and Bristol, and formerly a Canon of Westminster, by his daughters. The fresco above the chancel arch is by Mr. G. F. Watts, R.A., the painting of the roof is by Messrs. Clayton & Bell, the carving by W. Pearce—all after Street's designs. St. Andrew's, in Ashley-place, 1851-5, is by Sir G. G. Scott; St. Stephen's, with parsonage-house and schools, in Rochester-row, 1846-7 (B. Ferrey, the glass by Wallis), were built at the cost (30,000l.) of Lady Burdett-Coutts as a memorial to her father, Sir Francis Burdett, Bart., who for a long period represented the borough in Westminster. The building in Francis-street for married men of the Guards regiments was designed, 1853, by H. A. Darbishire; Artillery Mansions are by Messrs. Waterhouse & Son, 1900; and the buildings on the site of Artillery Brewery, 1894, by Mr. John Calder, the contractors being Messrs. W. King & Son, 27,046l.

Notabilia.—For buildings, events, &c., not cited in the foregoing text:—

The Star Chamber, pulled down in 1836, some of the ornamental fittings of the Court Room removed to the dining-room at General Sir Edward Cust's country-seat, Leasowe Castle (see Capon's drawing, 1793, in the Walmisley Collection). *Little Dean's-yard*: Ashburnham House—the south wall raised, and the south part of the hipped attic roof altered

Fig. 6.—Milton's House in Petty France, Westminster.
(Now pulled down.)

meet and convenient house for twenty poor aged folk and twenty children," and appointed the Lord Mayor and Aldermen of London to succeed her last surviving executor as Governors of the trust. The hospital, as rebuilt, *temp. Anne*, was enlarged with a chapel in 1732, and in 1821 with a school-room and dormitory for the extended school that in 1873 the Charity Commissioners took into their scheme for the United Westminster Middle-class Schools—Palmer's (1653), Emery Hill's (1708), St. Margaret's (Greencoat, 1633), and Emmanuel—now in Palace-street. The buildings stood on three sides of a quadrangle, each of the two wings containing ten one-storied sets of rooms. The materials were sold on February 20-1, 1894, and in July of that year the late Lord Justice Chitty sanctioned a scheme for the apportionment of the eleemosynary endowment whose income had fallen to 2,600*l.* a year. St. James's-court (C. J. C. Pawley, 1896-7) has been built upon the site; the large gates, of forged and hammered iron, by Messrs. Starkie Gardner & Co., after Mr. Pawley's designs, were illustrated on December 12, 1897. Close by are the new Christchurch Schools, 1899-1900, by Messrs. Beazley & Burrows, who also enlarged the Bluecoat School [July 16, 1898] in Cuxton (formerly Little Chapel) street, removed thither from Duck-lane in 1799; the later schoolhouse, at Brewer's-green, which some attribute to Wren, was built by William Greene, owner of the still existing brewery. "Green's brew-house" is plotted in Evans's rare map-plan of London, 1799, as next, south, to the chapel—formerly Dr. Dodd's, now St. Peter's—in Charlotte (now Palace) street, Stafford-row, and was, it appears, the predecessor of Elliott & Watney's (see above), by the long-familiar sign of the White Hart. The Charity Commissioners framed a scheme in January, 1898, for the sale of the Bluecoat School at not less than 9,500*l.* to the Vestry of St. Margaret and St. John united parishes. Near the end of James-street are the headquarters of the 7th Middlesex "London Scottish" Volunteers—J. Macvicar Anderson (1885)—and Queen's Hall, the headquarters of the Queen's Westminster Volunteers. For the Town Hall in Caxton-street, opened on July 19, 1883, Messrs. Lee & Smith won the first premium [October 9, 1880]; it occupies the site of St. Etrian's Hill Workhouse, and, on the north, of Van Dun's Almshouses. The cost, about 42,000*l.* of the hall and site was quite met by the sale of the old workhouse in Marlowe-road to the Kensington Board of Guardians. Westminster Chapel, 1840 (John Tarring, *ob.* 1875), at the corner of James-street and Castle-lane, site of the old

venor, Bart. (*ob.* 1700), ancestor of the ducal house of Westminster. Pennant, whose account is somewhat confused, says the house "was rebuilt in its present form by the Grosvenor family"—it is plotted as "Belgrave House" in Horwood large-scale survey of May, 1799. It is commonly averred that the Penitentiary House was built upon the site of Peterborough House. We have been at the pains to ascertain by measurements on old and new maps and surveys that the south wall of the house—the river there runs nearly south and north—stood 108 yards distant from the middle line of Horseferry-road; that distance struck on the large scale Ordnance survey (1867) ends at about 11 yards short of the south end of Grosvenor-wharf, and at a point 146 yards distant from the nearest angle of the prison's outer wall, which angle was 99 yards from the river wall. The two Acts, 52 Geo. III., c. 49, and 56 Geo. III., c. 63, recite the purchase from James, seventh Earl and first Marquis of Salisbury, as sole vendor of a site for a Penitentiary House for London and Middlesex; the ground, some seventeen acres, between Peterborough House and the Halfpenny Hatch (south) was bought for, it is said, 12,000*l.* A sketch in the lithograph plate gives a view of rural Millbank as it existed at the opening of the nineteenth century.

Since some misconception prevails as to the authorship of the design for the prison we may here state that in 1813 the Government awarded premiums of 200*l.*, 100*l.*, and 50*l.* to J. Williams who had been teacher of military drawing at the Royal Military College, C. A. Bushy, and Hervey, respectively, for their proposed designs. On March 7, 1868, we printed a letter from a correspondent stating that the entire fabric (the gateway excepted, which was by Thomas Hardwick) was built from Williams's drawings, in the making of which our correspondent helped him. The plan of the radiating blocks has been claimed for Jeremy Bentham; also for his brother, Sir Samuel Bentham, by Sir Samuel's widow in letters addressed to and printed in this journal. In 1815-6 Sir Robert Smirke, R.A., made good, by laying down concrete, the failing foundations of the gateway and other portions, and in the end he rebuilt, in brick, the six radiating pentagonal blocks. Owing to the defective nature of the soil the structure cost a great sum of money, computed at nearly 500,000*l.*

The prison (see lithograph in last issue) was first used on June 27, 1816, for thirty-six female prisoners from Newgate, and was completed in 1821. In 1843 it became "Millbank Prison," with a capacity for 1,000 convicts. All the

Westminster Hospital (1719), was rebuilt in 1864 after Mr. W. F. Poulton's designs.

In the spring of 1652 Milton, being then Latin Secretary to Cromwell, removed from Scotland-yard to "a pretty garden-house" in Petty France, which at that time was entered, through its garden, from St. James's Park; he remained there until the Restoration, becoming totally blind in the interval. The house (fig. 6), since numbered 19, York-street, and rented in 1812-9 by William Hazlitt for the poet's sake, gave place in 1877 to Mr. Hankey's "Queen Anne's Mansions" (begun in 1875), where the lawn includes the ground of Milton's garden.

Millbank.—The grounds of Peterborough, known also as Belgrave, or Grosvenor, House (pulled down in 1869) extended northwards to Market-street, since Horseferry-road, and westwards to alignment with Marsham-street. The house, built by John Mordaunt, elevated Earl of Peterborough in 1628, was bought by Alexander Davies, of Ebury, whose only daughter and heir brought the estate in marriage to Sir Thomas Gros-

doors were of iron, the cells, galleries, kitchens, laundries, yards, &c., being paved with York or Portland stone. About nine acres of the site consisted of the burial-ground, exercise-yards, and gardens. Having ceased to be used as a convict prison, the building was finally closed on November 1, 1890. The materials were sold at auction at intervals in 1892-3. On October 24, 1893, the London County Council resolved to purchase about ten acres of the western portion of the site at 2,500*l.* per acre for the erection, at an estimated cost of 245,981*l.*, of dwellings for 3,700 (since increased to about 4,500) persons of the working classes. In February, 1897, they instructed their then architect, Mr. Blashill, to prepare plans for about 1,200 persons. In a limited competition for a "specimen block" of further buildings Mr. W. D. Caröe, as assessor, awarded, in March, 1899, the first premium of 150*l.* to Messrs. Spalding & Cross, the second of 75*l.* to Messrs. Joseph, Son, & Smithem, out of sixteen competitors. Of the seven completed blocks, the first five were completed in the course of last year; they are named Turner, Hogarth, Millais, Leighton, and Romney buildings. In the south-eastern corner of the prison site has been erected by Messrs. Higgs & Hill, after Mr. Sidney R. J. Smith's plans and designs [January 2, 1897], the National Gallery of British Art, the gift to the nation of Sir Henry Tate, Bart. (*ob.* December 5, 1899), and opened by the Prince of Wales on July 21, 1897. Mr. Sidney Smith's design was completed by the building of ten more rooms for pictures and sculpture, in 1899, by Messrs. Higgs & Hill.

THE ARCHITECTURAL ASSOCIATION: HINTS ON THE PREPARATION OF STUDENTSHIP DRAWINGS.

AN ordinary fortnightly meeting of this Association was held in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W., on Friday evening last week, Mr. W. H. Seth-Smith in the chair.

The minutes of the last meeting having been confirmed, the following gentlemen were elected Members of the Association, viz. Messrs. H. W. Clapson, C. L. Gill, H. J. Rippon, and K. D. S. Robinson.

Mr. R. S. Balfour, Hon. Secretary, announced the following classes commencing, viz. the Elementary Water-Colour class on January 11, and the Elementary Construction class on January 14.

The Chairman said he very much regretted to announce the death of a past-President of the Association, Mr. H. C. Boyes, and he desired to move that a vote of condolence be forwarded to the relatives of the deceased gentleman.

Mr. R. Weir Schultz then read the following paper entitled "The Preparation of Studentship Drawings":—

"Most of our studentships of the present time are rightly or wrongly awarded on a system by which, under certain conditions, drawings are submitted in competition for the various awards. It is a matter of grave question whether this is the best method of choosing the student who is most worthy to participate in the benefits to be derived from the opportunities for study opening up by the bestowal of the prize. I fancy, however, that it would be going outside the limits of our subject were we to discuss this point; we must, therefore, accept it for the moment as a fact, and try to consider how far the conditions can be acted up to with most benefit to the student and with the prospect of obtaining the best results. During the past thirty years or so architectural students have been encouraged to worship at the shrine of the fetish of mere draughtsmanship, and they have got into the way of dividing themselves into two camps—(1) that of the draughtsman *par excellence*, and (2) that of the so-called practical man. The former have been accustomed to go about with their heads rather high in the air, and a general tone of superiority in their bearing, and to be obtrusively patronising to the latter, who have been looked upon as mere 'hewers of wood and drawers of water.' It was considered a much greater merit to be able to make a pretty perspective than to be capable of working out an honest, straightforward piece of construction; and this is hardly to be wondered at, when we find that the bulk of the prizes were usually awarded, consciously or otherwise, to the

most taking sets of drawings, looked upon as drawings. Many things were responsible for this, and amongst them I think we may place the following:—1. In the case of the Royal Academy, the fact that the architectural prizes were judged by a committee or council in which painters largely bulked, the majority of whom had little or no knowledge of architecture. We can all remember instances where thorough and careful studies were obviously passed over in favour of others which had been made purposely attractive to the body of selection, often at the expense of ignoring or depressing the essential points of the subject set for study when judged from an architectural standpoint; and, indeed, students got to expect this, and, consequently, drawings were prepared purposely with a certain superficial attraction. I well remember a hue and cry which was raised by students a few years ago when by strange chance a really strong and original, if somewhat unprepossessing design, showing true genius in composition and construction, was given the first place over others better drawn perhaps and worked out on more correct archaeological lines, but which did not show anything like the same sturdy grasp and powerful, strong handling of the subject. 2. I think I may also say that Mr. Norman Shaw's beautiful drawings had a potent influence on the younger generation, who seemed to lose sight of his power of composition and daring of construction in the charm of his draughtsmanship. 3. The attraction of the walls of the architectural room at the Academy also carried weight. Men knew that a pretty drawing was more likely to be placed than a clear straightforward architectural diagram. 4. The growth of architectural competition generally, likewise created a certain demand for showy drawings, and men knew that they could command a higher price for their services if they cultivated the knack of mere draughtsmanship, and so were apt to ignore the more essential qualities which go to make a good architect.

I tried to ascertain from your Hon. Secretary the motive which influenced your Committee in selecting the subject for our evening's entertainment, but the answer I received left me more in the dark than before. I assume, however, that we are expected to give you some hints that will be useful to you. There are at least two ways in which such hints can be of service to you; but they may lead in diametrically opposite directions. The first is, hints that will enable you to go in for a studentship with a chance of winning it; the second, hints that may help you to prepare your work in such a manner that you will reap the greatest benefit to yourself from the study of the subject which has been set before you. On the first I cannot venture to help you, and will leave this to my friend Professor Pite, who, in his day, was fortunate in obtaining some of the most sought-after prizes, and who is now, I believe, a member of one of those mysterious bodies or councils who carry your fate in their hands. On the second, I can, perhaps, give you some advice which may be of use to you if only in the way of starting what I hope will be an instructive discussion afterwards.

I assume that studentships are looked upon as purely educational, that is to say, affording the young architect an opportunity which would not otherwise be open to him for perfecting himself in the study of his art. To enable him to obtain one of these studentships, certain conditions are laid down, some of which, I am sorry to say, have a considerable savour of red tape about them, and tend to hamper the student rather than to encourage him. I refer more particularly to the condition regarding size and number of sheets, scale of drawings, &c., which are in many cases needlessly arbitrary. Broadly speaking, the type of subject is of two kinds. The student may have to prepare a design for a building or a portion of a building, or he may have to submit a series of drawings, showing evidences of study of old buildings, or their accessories.

The first we may look upon as an essay in design and composition, and it will surely bear on its face the impress of the training through which its author has passed, or show evidences of the course of thought which has influenced him, but whether it will show a grasp of the sense of proportion, a constructive capacity, or an idea of fitness for a suggested purpose is very doubtful. The second will indicate that the author has visited and drawn examples of old work, or perhaps made careful and exact measured drawings to scale of an

old building—church, palace, or mansion; but how far he has peered behind the surface and tried to analyse the motives which influenced the old men, or to grasp the difficulties they had to contend with and see how they overcame them, is quite a matter of small moment as things are at present—probably the idea never occurred to him.

In the first case, we have a set of taking drawings, a plan more or less apparently workable, the elevations designed in some phase of a past architecture, and all nicely linked in with a good deal of go, carving and figure work perhaps suggestively indicated, but no cohesion, no definite note of character. You look at the perspective view; the building might be suitable for half-a-dozen purposes, it lacks expression.

In the second case you have a series of very pretty drawings with plenty of flick and dash—sketches of church towers, say, or old mansion houses, a piece of panelling or a ceiling to scale, or a church screen or font; and there may be also some sheets of coloured decoration more or less approximately suggesting the present state of the original, with all the blemishes shown to the life; but how seldom anything more! How rare to see the subjects really studied, the materials analysed, the detail and construction investigated!

Now in the preparation of studentship drawings it seems to me that draughtsmanship as such should occupy a secondary place. It is not the first essential by any means. The quality of the paper used, the tone of the ink, the breadth of the line, the way in which carving should be indicated, how mouldings should be tinted in; none of these things is of prime importance; undue attention to them will not make you a better architect. What you want to be able to do is to show as clearly as you can that you have made a thorough study of your subject. If it is a design for a new building, get your plan simple and straightforward; if an awkward site is purposely given, fit in your building skilfully and directly. Do not sacrifice everything to a hobby or a piece of empty cleverness. Get a sense of proportion and of dignity, or homeliness as the case may be, or both combined, into your composition. Ignore striving after effect as such. Make it apparent that you have considered the most suitable materials to be employed and the most judicious use of them. Do not neglect your construction. Do not overlard your design with ornament everywhere; if you want sumptuousness, you can get it by concentration more effectively than by diffusion. If it is a building for a town site, do not neglect such practical points as lighting. Do not put heavy cornices or other projections in positions where they will obstruct light and air, or where they will not be visible. Do not place your sculpture where it could only be seen at an angle of 60 deg. or not seen at all. Avoid unnecessary projections that would in reality only catch and hold dust and dirt, to be blown into the windows whenever occasion offers. Do not propose a scheme of colouring that will probably be obliterated after the first six months. Be reticent, appropriate, dignified. Give your attention to these and other such points, and do not be afraid. There will be plenty of scope left for a building with character, expression, and individuality; and see that your drawings express the building and its nature, just as the building itself should express its uses. Let them be clear, straightforward, and simple. If a perspective is required, let it not be set out from an impossible point of view. Apply the same rules generally to whatever the subject may be. Leave the books alone. There are far too many books to refer to nowadays. Sit down and let your mind have free play, and think the subject out from the beginning. By doing so you are training yourself for the real work of the future, and for tackling the real buildings you all hope to erect. There will be much harder and more complex problems to face then, but you will be able to deal with them far better by overcoming the ones of the present, and whether you win your studentship or not, you should come out of the ordeal feeling stronger and more capable by having manfully faced the real issue, by having trod the narrow path and not the broad road.

If, on the other hand, you are asked to submit studies of old work, go and examine the old buildings thoroughly; try to put yourself in the place of the old men who built them; raise, if you can, the conditions under which they laboured; look how they

made the most of the materials to their hand, and see how they overcame their difficulties, and how sometimes they did not, and had to remedy things afterwards; take warning from their weaknesses; admire their general skill and foresight; and learn what is good to be learnt from their experience; but do not think that you are going to imitate them, because you cannot if you try. Conditions are entirely different, and what was straightforward and right in the thirteenth century would be more often than not an affectation now; but come away, if you can, imbued with a desire to emulate them by trying in your day and generation to tackle your conditions as they did theirs, and show by the results of your study that you have grasped this. You may not win your prize, but you will have learned more than if you had done nothing but brought back pretty water-colour drawings and notes of useful, cribbable detail.

I do not wish to say much more now, although there is no doubt a great deal more that might be said. Do not forget that you are young, and being young, you have enthusiasm, which should carry you far and overcome many difficulties. Do not bury it in the slough of past styles—of Italian Renaissance, of Francis I., of Thirteenth Century, of Roman or Byzantine or Periclean Greek. Do not let yourselves be mere draughtsmen, but be men, and acquit yourselves like men, modern men, men of the new century which has just dawned. Yours will be the task to grapple with its complexities and its new problems. Try to make the complexities less complex and the problems more simple. Prepare to tackle them with a stout heart and with determination, foresight, and common sense. Do not mistake the shadow for the substance. Do not be slaves to a past which you probably do not understand. Do not study old buildings exclusively, but look at the works of great modern architects, men like Butterfield or Mr. Philip Webb, who have learnt the useful lessons that the past can teach better than most men, but who can never be classed with the copyists, and whose work can never be labelled with the tag of a dead style. They have worked in the period nearest to you, and have understood and tackled its difficulties. Where they have succeeded there is room for at least a hope that you will not fail."

Professor Beresford Pite then delivered an address on the same subject. He had not, he said, prepared a paper in the ordinary sense of the word, and all he proposed to do was to give a few hints on the subject. Mr. Schultz had put before them the evils of competitions and of draughtsmanship. It was certain that those evils would prevent a student from getting a studentship if he were really convinced of the evils of competitions and draughtsmanship, for in that case he would not compete. Another aspect of the matter which was equally tantalising was that, from Mr. Schultz's point of view, a competing student was always working for an impossible end—giving his attention to real building which would never be built, and working out construction which would never be constructed. A student from that point of view had better not go in for a competition. For his (the speaker's) part he would very much like to go in for a studentship competition now with all its evils.

In the first place, he desired to give them a few hints on materials. He thought that Mr. Street's advice on the subject was good advice, viz., to use only the best materials. Bad paper had an astonishing influence on a drawing. A good hard paper should be got and cheap paper should be avoided. There were many kinds of Whatman which could be used, and a very good paper, on which the Ordnance maps were printed and which stood a good deal of scraping, was that known as unbleached Arnold. The O.W. papers were good, especially an extra strong one with a very smooth surface, and there were good papers known as Joynson's. Drawing paper must bear scraping or the drawing would suffer. The best pencils should be used—the sixpenny kind he meant; for after all, in pencil drawing fine line was necessary, especially for the student, who should get a good point on his instrument. In ruling lines, a junction should always be effected where two lines meet; never stop accurately at the point where they meet, but draw them boldly across and put the point of the compass on the junction. They should never draw with the H, the HH, or the HHH, for as architects

they should draw beautifully, and the use of a hard point was about the worst habit possible for the fingers and tended to harden the student's methods. An HB would be soft enough for small scale, but for details a softer pencil could be used. They should draw mouldings with a free and running line, and the best instrument for the purpose was a brush, which afforded plenty of freedom. India-rubber was a very important adjunct. Any artist or architect who was such an accomplished worker that he had no need of india-rubber must be a very bad designer. He judged a man's artistic morality by his india-rubber. An architect must have an elastic conscience, as far as that went, made of india-rubber. Rubbing out was the test of perseverance, the test of revision. The late Professor Reginald Stewart Poole, of the British Museum, once said, and said truly, that the governing principle of Greek design was elimination; they eliminated and eliminated down to that point of refinement where the work would stand no further elimination; in other words, they rubbed out. Their friend, Mr. Devey of the profession, once sung the praises of india-rubber in some clever and amusing verses which were published in *Architectural Association Notes*. As to pens, they should avoid those abominable crow-quill mapping pens, which were as vicious as hard pencils and quite calculated to spoil a drawing; at the same time, for fine work a fine pen was needed, and those known as Edinburgh Fine Points were to be recommended. Decent quill nibs were difficult to get in these days, but students should not be put off with bad ones, for bold and free sketching. It was good practice to learn to draw with a pointed stick, for by that means they got breadth of line. As to bottle ink v. stick ink, the bottle ink was convenient, but to his mind it was a doubtful blessing. It was perfectly black, it was true, but under india-rubber it lost its brilliancy. With bottle ink, too, they were always sure to draw with that same dead black, and his advice, in short, was to flee the bottle and use the stick. They needed an ink which they could erase, and he thought that stick ink erased better than bottle ink. For erasing ink they should use the hardest and best ink eraser. Attempts to wash out ink lines or to scratch them out were, as a general rule, likely to fail. As to mounting drawings, mistakes were fatal. It was undesirable for a student to experiment when mounting his drawing, and he very strongly advised them, if they had a set of drawings on which they had spent much time and thought, to put them in the hands of the picture-frame maker, especially if they had got to the last week or day before sending in. They should use cheap strainers, and should have them stout enough; if they did not, the strainers might depart from the office nice and flat, and when they were seen on the walls the corners would be buckled up owing to the drying of the paste. They should have an eye to marginal lines. Very nice paper was to be had, but often drawings were spoiled by a horrible blue or a too dark brown. There was nothing safer for a black-and-white drawing than a white margin. As to the size of the strainers, he did not think we had them large enough, though that was chiefly on account of want of room. In the Alpine Club the Institute of Architects were now hanging 160 strainers more than last year, and of course there was not room to show them. Architects ought to, and perhaps one day would, have a suitable room for the exhibition of such works. As to the writing on the drawings, architectural printing revealed character as much as handwriting—perhaps a little more accurately. A pompous fellow, full of eccentricities, would be almost sure to show it in his architectural printing. Writing on drawings should be well and plainly done, though they should not imitate printers' type. Then there was the fine fun of selecting mottoes, which afforded the only chance a student had of being a little patronising to the adjudicators, and it was interesting to notice how character came out in the selection of mottoes. Their friend, Mr. William Scott, who had since turned his attention to etching, went in several times for the Institute Soane Medallion, and the motto on the drawings that finally won him the prize had the splendid motto: "Choose well; your choice is brief yet endless."

As to the methods of finish, if the Association were in the habit of passing resolutions, he thought that a resolution addressed to pro-

motors of studentship competitions, to the effect that drawings need not necessarily be finished in black and white, would be a healthy one. Black covered a multitude of sins; it was inimical to effects, and led to carelessness in drawings. Windows, for instance, were made black instead of inlets for light. He did not know why black had grown to be a necessity in such competitions, but he supposed the promoters were afraid of being bamboozled by colour. There really was a fine scope for the careful use of colour in the getting-up of an architect's set of drawings, and the whole paper technique of an architect ought to be artistic and satisfactory. In default of colour he would sooner have a whole set of drawings in outline, which would lead to the cultivation of boldness and quality of line. There was nothing more deceptive than to draw a set of drawings and then to black them in, for the black destroyed a fine line altogether. Window black was especially mischievous; vertical lining was better. They should avoid free etching on a geometrical drawing, and he thought the shadow etching which was sometimes seen in deficient elevations was a mistake, for it took the attention away from the elevation and its proportions.

In students' designs sketchiness was not possible or permissible, for as in painting and other forms of drawing, the line of demarcation between sketching and finished work was very definite indeed. The Royal Academy did not, they would say, exhibit sketches. Every picture must have a finished background, and there was just the same distinction of line in architectural drawings. A sketch had a charm and freshness which, though attractive, was manifestly different from the finished study. Complete perfection of the accomplished geometrical drawing should be aimed at, but the two elements of students' drawings should not be mixed up. Students should not raggedly sketch in tiles, &c., on to a carefully outlined drawing. He did not see why shadows should not be scientifically put in, and any student able to do that successfully would have a good pull over those who had not acquired the art.

In spite of its sinfulness, he must say there was a charm and a pleasure in accurate draughtsmanship—in sitting down and trying to excel in it; in trying to draw the dentils and brackets of a cornice, for instance, in such a way as to watch the growing effect; and gradually bringing in detail and letting the building gradually grow up. In inking in elevations they should give attention to the effect of lines; but, unfortunately, this was seldom done. In treating ornament, they should give attention to the concentration and grouping of those lines which made the drawing effective. They could not be too much concerned with the actual lines which told in an actual building, but they should always bear in mind the very important truth that a building never looked as it was seen in elevation on paper. When they were dealing with elevations they were dealing with diagram. There was a definite, logical difference between the elevation, viz., what the building was and what the building appeared to be; there was no real relation between the two apparent to the eye. As to the indication of surface and material, a great deal of interest could be given to a drawing if this were studied carefully. They would realise that drawing horizontal lines 3 in. apart all over the building made it look like brickwork; drawing them a foot apart, like stone; and omitting them altogether, like stucco. He had seen beautiful drawings in ink with the brick-course lines put in in pencil and the stone joints in their order, not to confuse the construction lines. But these methods should be used only so far as they gave a conventional effect akin with the materials of the surface.

Plans could be made impressive by the simple art of dotting, and a crooked plan could be made to look quite important by the aid of dots. Pavements and ceilings, fully shown, often made a drawing very interesting, and students must take advantage of these points, especially as they were not asked to show drains and gullies. The interior of a building should be shown in section; it was an opportunity for display which was all studentship drawings were for, and students should make the most of their opportunities. He would advise students to take full advantage of the size of strainer, and make the size of the strainer the ultimate size of the building.

In the detailed drawings, which were usually

wanted, a rare opportunity was afforded. The promoters of the competition knew pretty well the sort of thing they wanted in the elevations, but their minds were blanks as to the detail, and they directed that some part of the elevation must be drawn to a larger scale. That was the student's opportunity for display. He should show his freeland and indulge his humour in sculpture, and generally show what sort of a man he was. They should draw boldly, and he should make up their mind that their detail should not be overcome by a neighbouring perspective, or by the plan in black above or below. In detail there was an opportunity for using with plenty of freedom the pointed stick. Mr. Schultz had advised them to take the perspective from a possible point of view. He (the speaker) said, do not, and for this reason: the building would never be built, and students should be absolutely unfettered. They should be as original in the matter as they could, and if there were any choice, be imaginative—taking an imaginary standpoint rather than an actual one. They should say to themselves: "This is to be a picture, not a perspective; this is the end of my design; this is all I have been working for; I have come to the point when I can enjoy myself in laying out the richness of my imagination, spreading it large upon the strainer." The building would never get nearer actuality than that; therefore they should make the most of their opportunity. Of course, the perspective would fail badly if it had no relation to the design, and they must work the thing out so as to give it its value. In that connexion the best thing he could do was to give them an idea of what he meant. Take the perspective drawings of Piranesi, the great perspective artist; look how he revelled in the idea of vastness! Take the drawings of William Burges, when he was purely imbued with the Gothic flavour; he drew St. Simons Stylites simply for the sake of drawing, and for nothing else—a most delightful drawing which would for generations do students good to look at.

As to coloured perspectives, they had got into disrepute owing to the weakness of competition assessors. One of the most distinguished R.A.s of the day—an accomplished water-colour artist—issued competition directions with the almost invariable rule: that the perspective was not to be in colour, but was to be in outline. There was no monopoly of this art, and it was open to all who would like to venture. He would suggest that wherever they had the opportunity they should master the art of colouring architectural perspective drawings. That was a large order, but still there were plenty of opportunities for the proper study of the subject. They should go to the picture galleries and look at the works of that wonderful old architectural draughtsman, Mackenzie; say nothing of Prout and Roberts and Holland. Turner's extraordinary accuracy of architectural drawing should be studied, although in the ordinary sense of the word Turner was not an architectural artist. There was Mr. Ernest George, too, who had founded his delightful method on a sympathetic study and mastery of the art of Prout and others. It was a Fine Art which was being lost owing to our prejudices and the decrease of the art of chromo-lithography.

As to pen-and-ink work, the greatest duffer with the brush, or the most nervous architectural artist, was safe in an outlined diagram, and this was possible to those who were nothing more than geometrical draughtsmen, and could be made quite interesting and beautiful. Of course, if they liked to go farther, and shade it in pen-and-ink, they would be going outside the bounds of diagram-drawing into a new world altogether, where they would need someone to guide them. For the study of pen-and-ink work, he would advise them to study etching, or the works of etchers. The tendency in all pen-and-ink work was to get black spots and darkness without composition or line effect. An accomplished artist like Mr. Axel Haig never failed in this respect; his old black-and-white drawings showed that they were equally true in composition, weight, and value. There was that gradation of tone in Mr. Haig's work which was difficult to attain in pen-and-ink work. They should get a good type and follow it thoroughly; Mr. Norman Shaw, for instance, afforded a beautiful type, and had founded a school which was not difficult to follow, as the methods were clear. Foliage and foreground were subjects of diffi-

culty. Students could not go to some clever artist, as Mr. Shaw did, and get foliage put in; but rather than do it badly, students should omit it. They should study the work of the old men, and notice the way in which they filled up the foreground with architecture—with steps, terraces, pavements, and frustra. That method was open to architectural students who knew more about such things than they did about foliage. He had found useful the pen-and-ink sketches that accomplished artists used to put in the catalogue of the oil and water colour picture exhibitions. The wretched little photographs now put in were no good, but the pen-and-ink sketches which were their predecessors were exceedingly useful. If the student wanted to put in trees, he should take time in studying them, and obtain photographs and draw fully and carefully from them.

As to measured drawings, that was another class of work altogether, and must be dealt with rather more differently. If the drawings were to 4th scale, the plan should be done first; then the line of heights to the scale of the plan. Beginning at the top and working downwards the mouldings should be made full size and not touched afterwards. A few leading dimensions should be taken on the spot, and the building drawn to scale and the mouldings filled in at home from the full-sized drawings. The plot-scale sketches ought not to be touched again, for the redrawing of them robbed them of all their life, and studentships which were given for measured drawings not done on the spot were worthless, and, in his opinion, the prize for measured drawings should be for work done on the spot only. In this connexion the student should pay attention to the time of the year, so as to give the necessary days instead of hours to doing the work properly. In measured work, everything that Mr. Schultz had said about construction was essential. The student was not designing, but recording an accomplished fact, and unless he studied that accomplished fact thoroughly he would not do himself any good. They had to learn to think backwards—to begin with the finished building and go back to the elements out of which it was produced; consequently, they should measure the joints and show nothing which had not been measured. They should not, for instance, take the drawing home and proceed to tack on the stonework. If they wanted to show the rubble, they should measure it. That seemed a hard task, but they might measure, say, 3 ft. of it very carefully. This was an invaluable study and equally necessary for both beginners and advanced students, who ought to sketch and measure with thoroughness to the end of their studying days.

As to pretty pencil sketches, they could be done for their own sake—or for the ladies—and students could, and should, enjoy such work in doing so. Such sketches had their work to do, as had other pretty things in this world; but such work should not be confounded with the steady, businesslike drawings which were useful to an architect.

Mr. Schultz had given good advice as to colour decoration. It was very difficult to judge colour decoration from sketches or drawings, and he was inclined to think that drawings of colour decoration were of doubtful value. The colour deceived one, and it was difficult to translate on paper the actual colour of the building itself. One was liable to be greatly deceived, though of course it was necessary to take note of arrangements in the design. For the purpose of studying colour they should go to flowers, the old masters, and ceramics. One rarely got good colour out of old buildings, for the mediæval builders avoided harmony and indulged in positive contrast; whatever harmony in colour there was in old architectural works was the result of time—a refining fog, which made old buildings beautiful. Still, it must not be forgotten that the original colour was often crude, or extreme. Mr. Butterfield, who realised this, used colour as the mediæval architects did, and he was howled at for his pains.

As to design, happy indeed were students. They were happier than their employers, happier than practising architects. They had no clients to worry them, every opportunity to design, no fads but their own, and these they always enjoyed. There was no limit to cost, no light and air troubles, and above all, no hurry. Students had ample time for working out their designs. Oh, the joy of being able to design just for the sake of designing—to do it because it was nice, and not for the

sake of a living! That was the delight and pleasure of a student's life—he was free from caring care, and while he built castles in the air somebody paid for him to live. Then they could realise the truth that audacity always paid, for in students' competition they could be as audacious as they liked. His advice to them in matters of design was to begin early. The Institute, for instance, published their conditions of competition in March, and the designs had to go in by Christmas. Students could do no great work if they did nothing in the matter until the summer was over. They should begin at once to work up examples, and, as they did so, they should grow bold. They should say, "This is not good enough or large enough." They should not be content, but should think there was something better to be found ahead. But as they collected examples, they must design. They should not say, "When I have collected all the designs on this subject, I will begin to design myself." If they did they would find they had collected more than they wanted, and the material would not digest. Pegasus was a greedy and lazy beast, who must only have a certain amount of food. When the student had found his material he should work upon it. If he began in March the days would begin to get longer; whereas if he left his studies for cricket and croquet, and did not commence work until after summer, the days would grow shorter. If he commenced work in March, the fever would be on him in May, and by June he would be wanting to give up the delights of sports for something more exciting—something more enrapturing—something which would take him to the desk rather than the river. There was another reason for starting early—unlimited time was needed for revision. The whole history of good design was—revise, revise, revise; the wording might be altered into—refine, refine, refine. They should give themselves opportunities for going back upon themselves, and nine months were not too many for the preparation of a successful student's design. A student should sketch, rub out, and start again and again, keeping himself fresh, so that when the brilliant idea came which would certainly get him the prize, he would be able successfully to solve the problem. For they must not forget that every problem had its solution. They should not forget, moreover, that the architect who was easily pleased with himself—the man who could knock the thing off as he came up in the train in the morning—was a donkey. Nothing could be "knocked off." Unfortunately the "knocking off" process came easily to some architects who had been in the profession a year or two, and who prepared designs for little stucco villas in provincial towns. But that was not architecture, which could only be learnt by downright hard work, and this principle underlay all good design. True, there were moments of inspiration, but sometimes they were worth nothing at all, except to please the student, for they often put one on the wrong scent altogether. Inspirations were sadly needed, but they were a doubtful blessing when they came. One could not brew from nothing, and in architecture the only way to produce was to know. The student must feed his imagination and cultivate it, and fill his mind with information; he should take up a period or style, and work it until he got to the bottom for the sake of understanding it. It was open to them to design in the style chosen—not as the ignorant architect did, but as the Academy student was taught to do. Let him design, say, an immense mansion in the style of Cyrus the Persian, as a very accomplished architect once did, producing an extraordinary design, which was published in the Architectural Publication Society's proceedings. The student should cultivate his mind by the study of Bramante, Inigo Jones, or Sir William Chambers for instance—how they drew and thought, and what detail they loved. In doing that the student would begin to draw, think, and love as did those masters, and a new world would be opened to the student, *i.e.*, the world of antiquity. It was not open to the modern architect, but it was open to the student.

In addition to the names he had already mentioned there were Piranesi, Brunelleschi, William Burges, Alfred Stevens, and he would mention William Blake, and the architectural backgrounds of Holbein. The student should avoid the commonplace and the conventional, and be academic, grand, and graceful. He should remember that it was an unreal building

that he was engaged on and yet he must make it real with architectural life. There was design of liberty for ideas: if they had to design a national monument expressive of gratitude for victory without the employment of sculpture, how would they start? They ought to be able to deal with it, because the opposite proposition, a national monument expressive of grief and mourning appealed to the imagination at once. The study of decorative art was useful to the architect in this connexion, for the decorative artist, especially on the continent, had the knack of expressing such ideas—the love of country, or a prehistoric race, for instance.

Whatever the student did, he should not trouble himself in the least about the assessors. He should not trouble whether the men who were going to judge his work cared about this, that, or the other. That was the bane of the competition system in real life. In studentship work what was important was what the student liked and wished. The student, moreover, should remember that in the event of his design failing to move the assessors, he had the chance of publishing his own design and confounding their award: the publishing of designs was an effective way of influencing opinion, and putting on record accomplished work. Labour was not only its own reward, for if the student worked on a definite line of his own, fame would come, and perhaps some day an opportunity of carrying out his cultivated ideas, which had been growing in his mind from the moment they were conceived. But all successful students were not successful architects, though, of course, there were some who were. Mr. Norman Shaw took the Royal Academy gold medal with a commonplace academic design. Mr. Ernest George got the same prize shortly afterwards. The word "student" had a relation to its end which was study. They must bear in mind that they were not studying to gain the prize or the medal: they were artists studying art for the sake of art, and as such were willing, under these conditions, to compete with others. They were servants of the art, and would continue to be so whether they got the prize or not. Competing for the prize was an opportunity for opening up and revealing the resources of an art which wonderfully exhibited the nature and aspirations of man. The greatness of architecture would possibly never appear so vast as when they took up design, as students, for design's sake—for the sake of proving its delights and pleasures. They should work with eagerness, but actuality; with enthusiasm, but with completeness. They would be lifted above mere office routine, or baser designs, with minds delighting in the cultured vision of sweetness of proportion and form, and would prove, what he believed to be a fact, that if they cultivated the memory of architectural form at the same time as they cultivated design, they would find that design would operate in their memories upon the forms with which they had stored it. If, when they saw something beautiful, they stored the impression in their minds, some day it would influence them in their design, for the idea would mature in their brain. That was a process that was necessary to any lofty view of architectural art—to progress, really, in architectural art. His advice to them was to get the imagination to operate on the last step in architecture; to try and do something better than had been done before. There were grandeurs of expression of which this unspeakable art was capable, like music. They could not describe the impression produced on their mind by the Pyramids, the Pantheon, St. Peter's at Rome, or St. Paul's or Westminster Abbey at home, though that was their fault.

The Chairman said the interesting addresses they had heard appeared at first sight to contain conflicting advice, but he thought they could be reconciled in their teaching.

Mr. H. L. Florence, in proposing a hearty vote of thanks to the speakers, said that the first address was taken up principally with the word "don't," and the second with the word "do," and he thought there would be some difficulty in reconciling them from that point of view; but the spirit was practically the same in both. Professor Pite went very much more into detail than into the broad principles dealt with by Mr. Schultz. He thought that Mr. Schultz's address was more important to competition judges and committees than to the students. Unfortunately, the views of such committees were too often formed on some of the effects of a drawing, and were the result of

personal admiration. Consequently, he thought the principles contained in Mr. Schultz's address deserved considerable attention. At the same time, he had more sympathy with Professor Pite's remarks. In preparing drawings in competition for prizes, students should show in invention what imagination they possessed, and not merely the dry facts of construction or aesthetic principle. He was not disposed to quarrel with Professor Pite for expressing what at first sight appeared to be extravagant or impossible views. On the practical side it was necessary, before students' drawings could be proceeded with, that the student should be a draughtsman first, and he was always sorry to hear anything said which tended to undervalue the mere fact of draughtsmanship. It should always be remembered that the means by which an architect conveyed his ideas to others, and sometimes even to himself, was by paying attention to the way he could best represent them on paper. Draughtsmanship was necessary to the architect for his own knowledge and for the purpose of showing his intentions to others, especially if suggestively drawn and not merely with the hard and fast lines of pencil. As to the preparation of drawings, the brush gave a freedom and breadth of view which could not be obtained by pure line drawing, and this was particularly useful when the student came to design ornament on those graceful features which helped to make architecture a fine art. There was no doubt a great deal of truth about what Professor Pite said about india-rubber, but nothing had been said about the use of tracing paper. He had always found tracing paper as useful as india-rubber, over which it had this advantage, that it enabled one to preserve first and subsequent ideas. It was interesting in that connexion to note that often when a subject had been well considered, the first idea was often the one adopted, and if preserved on tracing paper it proved of great use to them. In reference to the use of the brush, it would be of great advantage to the student to take a plain piece of paper and shade it with the brush from black to white from top to bottom. It was a difficult thing to do, but when they learnt how to do it it was of much use to them later on in getting a disposition of light and colour.

Mr. W. J. N. Millard, in seconding the vote of thanks, said it was, as he expected, difficult for the lecturers to adhere to their title. Mr. Schultz, although he said something about drawing, told them principally how to set about making a design, and Professor Pite told them both how to make a design and how to draw it. He was very glad that this had been so, for it had enabled the lecturers to give some very interesting views, and especially in the way of self-revelation. In thinking about drawing, he was reminded of early days when there were two schools of drawing and two schools of architects. The battle of the styles was then not quite fought out, and the two schools of drawing—the schools of Street and Burges—practised respectively thin lines and thick lines, and it was his fate to go from the office of one to the office of the other. It was then that he began to doubt if it really mattered whether one drew in thick lines or thin, so far as the architecture was concerned, and he had been thinking that ever since. As to the use of india-rubber, there was a legend that Street never used india-rubber. He (the speaker) knew that Street did, because he had seen him use it, and he wished he had used it more. He never knew him revise details unless the whole work had to be cut down. He worked in that way in all his work and with the idea of not revising it. He (the speaker) did not think that an example for all to follow, and he, personally, agreed with Professor Pite when he said, "revise and refine." Architectural drawing was merely the production of diagrams. Unfortunately, a great deal of architectural drawing or draughtsmanship ought only to be called penmanship, for it was playing about with a pen on paper and the worship of dots and dashes. He would not call it draughtsmanship, and it was certainly not architecture. As to pretty sketches, if a sketch happened to be pretty he did not think it was necessarily any the worse for that; the point to consider was whether the sketched had put anything into his mind in doing his sketch, and if he had done so he did not think he need be blamed just for making his sketch pretty.

Mr. F. G. F. Hooper said he should like to urge students when they were looking at draw-

ings, either of executed or contemplated work, by men who had made their mark, to do so more with the desire to see what was good in them than with what was bad or weak. He thought there was a tendency with some students to do too much sketching—sketching of pleasing bits—to the neglect of measuring, and he was glad to notice that students were being encouraged in competition conditions and in other ways to do measured work. Men were apt to deceive themselves by making sketch elevations from the ground, though they no doubt got a certain degree of accuracy. It was essential to study effects and how they were obtained, and that was possible only by means of measuring. He had just been looking at a young fellow's design for a building on a rather important site in London; the cornice was put at such a level that the blocking course was completely hidden, as also were the dormers, a careful Mansard roof treatment, and an angle turret. In street architecture it was important for men to appreciate that their work would rarely be seen from a distance.

Mr. Arnold Mitchell said he thought that in one respect the advice of Professor Pite was hardly of the soundest, viz., that the student should regard his competition drawings as his ultimate object. Apparently, according to Professor Pite, a student might neglect entirely the real effect of the building so long as the competition drawing was pleasing and delighted the eye. That did not seem to be the soundest advice to put before students. It was surely necessary to think a building out in the solid—to think of it as it would really appear if put up; and a drawing prepared with that idea, and one which expressed that, would surely do the student most good, and would at least stand an equal chance of winning the competition. He thought that in doing such work they must assume that the building would be erected, and it was only by doing that that they could make the best of their work. As to the Institute competitions, a student who was competing should make up his mind that he would win, for in that belief he might feel an enthusiasm which would help him very much indeed. Students often spoke of their chances in a hopeless sort of way—"So-and-so is in for it, and I have no chance," for instance—and it was half the battle to make up one's mind that one was going to win, though, of course, no stone must be left unturned in order to attain that end. A student must use the best paper, &c., must use his india-rubber, and must draw with the greatest care, because there were others competing who would do all this. He was much interested in Professor Pite's remarks as to measured work. It seemed to him (the speaker) that the Measured Drawings competition was the first that the student should take part in. All would agree that the study of old work was essential, and he could think of no better preparation for future designing work than the careful study of some building. In doing measured work, in order to overcome the difficulty one often experienced in measuring old buildings, in regard to the varying levels of the ground—he had experienced great difficulty in getting accurate drawings of a building owing to varying levels of the ground—he made it his first work to take a short piece of straight board and to put a spirit level on it, and with a piece of chalk mark a level line round the building externally. Measurements up and down could be obtained from this line.

The Chairman said that the main point of Mr. Schultz's address was that students must prepare for practical work, and in his (the Chairman's) opinion that idea was running through Professor Pite's remarks also, and in that way, perhaps, they might be able to reconcile apparently conflicting opinions. It was desirable that the student should bear in mind Professor Pite's remark that he should not trouble in the least as to the views of the assessors; but he (the speaker) might say in that connexion that a judging committee valued thoroughly—he spoke as one of the Architectural Association Competition Committee—the power of imagination which some students displayed, and that power was made a great factor in the decision. At the same time, they looked at a design as a study by one who was preparing for practical architecture; they studied the plan, and noted what mastery a student had of building construction. Those two points of view were, in his opinion, essential. As to the bad influences which had led to the unsatisfactory state of architectural

training, referred to by Mr. Schultz, that indicated the great importance of keeping the teaching of the profession in the hands of the profession as far as possible. Architects who had had practical experience of designing were the only people who could properly control the education of the architectural pupil. Even architects were led away, with the result that there were many schools, but on the whole teaching by architects would produce the best results, and hence the great importance of the Association retaining its position as the principal teaching body for London. In reference to Professor Pite's interesting remarks as to scraping and rubbing, he (the Chairman) was looking the other day, at the Rembrandt etchings in the British Museum, and he would advise all those who had not done so to go and look at them. They there saw the growth of some of this great master's pictures, and in one—"Christ being Brought out Before the People—Alter the Judgment"—Rembrandt showed what he thought was a representative crowd looking on in a jeering way. The artist was apparently not satisfied with that, and in other proofs he treated the crowd differently, and finally left it out altogether, adopting a different treatment. It was an interesting example of how a great artist would rub out and alter again and again. An artist told him recently how much advantage he had derived from practising not allowing his fingers to rest on his paper or canvas—sketching architecture freehand. That was difficult to do, but it was a point worth striving after. He was not altogether in opposition to the making of pretty sketches, for as architects had to cultivate beauty in every line, it was very desirable to make a sketch of anything which was beautiful in order to cultivate the sense of beauty. Students should not make such sketches often, however, nor instead of a practical study of architectural subjects; but they should make such sketches occasionally so as to get into the artist's freedom of line apart from the architectural. Mr. Brydon, in his recent paper in the Institute Journal on the late William Young, the architect of Glasgow Municipal Buildings, mentioned the fact that Mr. Young came out last in the first competition for that building, and when he was asked if he would, in those circumstances, compete in the second competition, replied: "Yes, the first shall be last." That emphasised what Mr. Mitchell had said as to determination to succeed, and that was the spirit which would lead to success.

The vote of thanks having been put to the meeting and very heartily agreed to,

Mr. Schultz, in reply, said that in spite of what Professor Pite had said he was not converted; nor did he think there was any need for conversion, seeing that the Professor had asked them to ignore assessors, and do exactly what they pleased in their student designs and not to compete for the mere sake of winning the prize. Those were the ideas he (the speaker) had tried to give expression to. As to the idea that students should design in a style, he supposed that the students might do that in the same way that boys at school wrote Latin verse; it was easy to learn to design in a particular style, but somehow, if they did that, the tendency was for them not to get beyond it. If they once made their architectural compositions in an archaeological manner, the inclination was to go on doing so, whereas if they began at the root of architectural design and studied materials and proportion, they would do something which would be worth looking at. It would be modern, too, and not done simply because two or three hundred years ago the same sort of thing was done. As to the drawing materials a student should use, he did not think it mattered in the least whether they used dark ink or light, or thick lines or thin, whether the drawing was mounted on brown or white paper, or no paper at all; all that did not affect the result, and he did not think that the judges considered those points. When a student began the study of a subject, of course it was necessary to look up examples and find out how, for instance, such buildings as town halls or hospitals should be arranged; but even here it would be best to get such information from the practical side and not from books. After he had got all the necessary information, he should start afresh, begin at the beginning, and think the matter out. He thought that Burges's architectural drawings were about the finest examples that existed, and he would advise all students who

were going in for making measured drawings of old buildings to study Burges's book entitled "Architectural Drawings," and to note especially how carefully he had gone into minute details of construction and craftsmanship with evident enjoyment, and yet had not ignored the essential elements of draughtsmanship.

Professor Pite, who also replied, said he was for actuality and reality, and not for the sham and the fraud. It appeared that Mr. Schultz wanted the student to study materials, but he did not see that the materials were ink and paper, &c. If a man would be real, he had to work with such things and send in drawings only if he went in for studentship competitions.

The Chairman announced that the next

meeting would be held on the 18th inst., when Mr. Edwin T. Hall would read a paper on "Flats," illustrated by designs of flats in London, Paris, and Vienna.

The meeting then terminated.

Illustrations.

FONT COVER, GRANTHAM PARISH CHURCH.

 HIS font cover was placed to commemorate the Jubilee of the Queen. The font itself is a beautiful example of fifteenth-century work. It is octagonal

in plan, and each side of the bowl is carved in high relief, a winged figure standing at each angle. Beneath the bowl appear various emblems and devices, and on the shaft are figures placed under canopies; but in consequence of mutilation the only clearly identified image is that of St. Andrew. The Rev. D. Woodroffe, in his interesting booklet, "Half an Hour in Grantham Church," observes: "The occurrence of the Tudor roses and the emblem of the Corpus Christi point very emphatically to Richard Fox, Keeper of the Privy Seal to Henry VII. and VIII., and Bishop of Winchester, as the donor."

The font was placed some thirty years ago at the west end of the nave, standing only

[See next page.]

upon one low step, and much of its beauty was therefore lost. It now stands on three steps, with the result that the detail of the ancient carvings is well seen. They are of Ancaster stone, and have inscriptions and sunk panels containing shields bearing emblems of the Holy Spirit, the Church of Christ, Holy Baptism, and Purity. The cover, which rises some 26 ft., is in three stages, and mainly consists of elaborate tabernacle work, and canopied niches containing figures. The lower stage is provided with doors, which, being opened, reveal the interior, containing the figures of St. Hugh of Lincoln, St. Wulfstan, the Patron Saint of Grantham, and St. Edward the Confessor. At each angle of the various stages are carved paintings with niches containing angles. Canopied niches are introduced in the second and third stages, the former containing the figures of saints and the latter of angels. Rising from this is a large carved pinnacle terminating with a pedestal, on which stands an angel with wings outspread. The whole is of English oak, stained, the canopies and carved work being emphasised by the use of gold and colour. The cover was made by Messrs. Rattee & Kett, of Cambridge; Mr. Bridgeman and Lichfield, carved the figures; Mr. Powell, of Lincoln, executed the decorative painting. The steps were worked by Messrs. Rudd & Son, of Grantham.

W. J. TAPPER.

ST. MARK'S, PLUMSTEAD.

This church is designed by Mr. C. H. M. Mileham, to be built on a site on the north side of Plumstead Common; on which also a men's institute, parish hall, classrooms and parsonage are to be erected.

The church is to accommodate more than £200. It consists of a nave and aisles of five bays (part being screened off for a chancel and a chapel) and a low aisle or galilee at the south end, a vestry and sacristy, with heating-chamber under. The galilee is extended to form a porch at the south-east angle, and to the south of the galilee is a porch of two bays, covering the steps from the forecourt down into the church, from which the floor of the nave falls towards the chancel—for the site falls considerably towards the north, and the Tormount-road, on the east side, has a very steep gradient in the same direction, rendering a retaining wall necessary.

The architecture is of a very simple round-arched character; the walls to be of concrete with inner and outer skins of rough brick-work, and a very sparing use of stone, plastered inside and roughcast outside.

The whole building will be covered with concrete vaults; a plain barrel to the nave, and a Roman intersecting vaults to the aisles. The barrel vault of the nave will carry an outer roof of fir purlins and rafters, covered with pantiles. All the other vaults will be covered with asphalt.

The plan and view show the disposition of the various buildings, the view being taken from the Common. The institute, dwelling-house, &c., are intended to be of very plain and simple work suitable to their purposes, the walls being covered with roughcast and the roofs with tiles, as to the church.

The small rough sketch is a view of the church as it will appear before the other buildings are erected on the site.

THE WARWICK CHANTRY, TEWKESBURY ABBEY.

This fine example of Perpendicular work stands under the first arch on the north side of the presbytery east of the "crossing." It was erected by Countess Isabel Despencer in memory of her first husband Richard Beauchamp, Earl of Worcester, killed at Meaux in 1421, and is called the "Warwick" Chantry as the Countess afterwards married Richard Beauchamp, Fifth Earl of Warwick. She died in 1439, and was buried in the centre of the presbytery before the high altar.

The chantry is remarkable for the delicacy of its vaulting and other carving. The western half is divided into two stories, the lower supported by two slender columns. Its position, and the other elaborate monuments in this part of the church, are shown on the ground plan, published in the *Builder* December 1, 1894.

The drawings were made by Mr. Kotaro Sakurai, a Japanese architect, who was for some time resident in London, and who is an Associate member of the Institute, though he has now returned to his native country.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The fifth general meeting (business) of this Institute was held on Monday at No. 9, Conduit-street, Regent-street, Mr. William Emerson, President, in the chair.

The minutes of last meeting having been taken as read, the following gentlemen were elected as *Fellows*:—Mr. W. Aston, Manchester; Mr. F. O. Oertel, executive engineer, Indian Public Works Department, and Government architect; and Mr. T. B. Whitney, London. As *Associate*:—Mr. F. M. Harvey, Great Yarmouth.

The Chairman then moved the adoption of the amendments and additions in the paper of "Suggestions for the Conduct of Architectural Competitions." The revised paper, which was printed in our issue for December 29 last, was adopted after amendments to clauses 2, 4, and 8. Those clauses now read as follows:—

2. The duty of assessors should be—

(a) To draw up the particulars and conditions (as far as possible in accordance with the principles set forth in these suggestions) as instructions to competitors, and to advise upon the question of cost;

(b) To determine whether the designs conform to the instructions and to exclude any which do not;

(c) To advise the promoters on the relative merits of the designs admitted to the competition, and to make a selection in accordance with the conditions.

4. The number and scale of the required drawings should be distinctly set forth, and they should not be more in number or to a larger scale than necessary to clearly explain the design. Perspective drawings are not necessary, but if the assessor advises that they are desirable, it should be so stated; and such drawings should be uniform in size, number, mode of colouring, mounting, or framing (if any), &c.

8. Where a deposit is required for supplying the instructions, it should be returned either on the receipt of a *bona fide* design, or, if the applicant declines to compete and returns the said instructions, within a month after their receipt.

The Status of the Profession.

The same meeting resolved that a committee be appointed to inquire into the status of the architectural profession, and to suggest remedies if needed.

GLASGOW ROYAL INFIRMARY COMPETITION.

This competition has excited much public and professional interest.

Ten firms of architects were invited to compete, each receiving a premium of 100l. The committee sent along with the conditions plans for the reconstruction, drawn to a scale of 20ft. to the inch. These consist of alternative plans embodying the ideas of the Medical Staff as to classification, &c. The one which seems to have found most favour with the competitors is Scheme No. 5, which consists of five different blocks.

Block A is placed at the north end of the site and six stories in height; this to be used entirely for surgical wards and the necessary adjuncts. Block B, six stories in height, is placed on the south side of the site facing Cathedral-square, it being asked that the facade to the square should, by the character of its architecture, be commemorative of the Diamond Jubilee of the Queen; the ground floor of this block being used for administrative purposes, while the five upper floors are intended for medical wards.

Block C, also six stories in height, is placed in the centre between the medical and surgical wards, and on the east side of the site as far back as possible from Castle-street. The ground floor of this block to be used for administrative apartments, the top floor for kitchen and stores, and the four intermediate floors by wards for special diseases. Block D, one story in height, is placed on the west side of the site, on the building line of Castle-street, near medical ward, to be used as isolation wards. Block E, one story in height, is on the building line of Castle-street, near surgical ward, to be used as gatehouse containing emergency wards.

Scheme No. 3 shows a method of arrangement which has only been followed by one competitor: it consists of six blocks. Block A, on the north end of the site, runs east and west, is intended for medical wards; it is five stories high. Block B, to the south of A, is five stories in height, the three upper floors being for male surgical wards, the first floor for special diseases, and the ground

floor for administrative apartments. Block C is similar to B, except that a portion of the ground floor is occupied by the gatehouse. Block D is placed between B and C, running north and south, facing, but some distance back, from Castle-street; it is six stories in height, the top floor being used for kitchen and stores. The three floors immediately below contain all the female wards of the six surgical services, leaving the first floor for special diseases, and the ground floor for administrative apartments. Block E is behind block D, on the east boundary of the site, is two stories in height, and contains isolation wards—male on ground floor and female on upper floor. Block F, between D and E, contains engine and boilers.

In the design by Mr. James Millar, accepted by the committee, two designs showing alternative schemes have been sent in. The one understood to be the accepted one follows very closely on the lines of the committee's plan, Scheme No. 5, so far as the position and arrangement of the blocks are concerned, only details being changed and improved.

There is, however, one thing entirely left out in this plan, namely, fire escapes, and the matron's parlour, bedroom, &c., are on the fifth floor; those might have been placed in a more convenient position. The kitchen is on the top floor, the food being conveyed to the various blocks through covered passages on roof. The roofs are flat, and intended to be used as gardens where patients can sit in the open air.

The buildings are in the Baronial style of architecture, and flanked at the corners by round towers, which give a fine effect to the exterior, but the circular plan does not lend itself so well as a square turret to be divided up for water-closets and bathroom. In the centre of the Cathedral-square front there is a tower rising to a height of about 160 ft., and no ornamentation being indulged in, the whole of the effect is got by large masses.

This design is accompanied by three very powerful and artistic perspectives.

The design by Mr. H. E. Clifford was placed first by the assessor, and follows the lines of the plan issued by the committee, Scheme No. 5, except that the author has attempted to improve the courtyard to Castle-street in working the gatehouse into the ground floor of medical block. The isolation block is placed fronting Castle-street, and equidistant between the medical and surgical wards, which would certainly improve the air space. The operating theatre might with advantage have had more adjuncts, there being only a splint-room, a microscope-room, and a sterilising-room.

The elevations of this design have been very successfully treated, and in outline it follows the present building, making one feel that the author in the new design has graciously considered the beauty of massing, which characterises the existing front by Adam, and we again see the beauties of the old facade adorned and lighted to suit modern requirements.

In the design by Mr. A. Hessel Tillman, placed second by the assessor, the author, like most of the competitors, has had the courage of his opinions, and produced a plan quite different from either of the plans sent out by the committee. The arrangements show considerable originality and knowledge of hospital construction, and had the elevation been equal to the plans, this design might have been placed in an even higher position by the assessor. The front to Cathedral-square is treated in the form of a circular Jubilee Ward, some distance in front and joined to the main building by a circular colonnade. The staircases are placed at the intersections, and give convenient access to all parts. There is through communication throughout. There is an operating theatre on each floor, and the adjuncts are very complete, including students' staircase, and this is got at the minimum of expense, as each theatre is over the other and one stair serves for all. The theatre has a north light.*

There seems to have been a doubt in the mind of most of the competitors as to whether shading would be allowed on the perspective, and the perspective accompanying this design seems to lose very much by being in outline.

Messrs. Watson & Mitchell, who have been placed third by the assessor, sent in two designs, A and B. The blocks in this design are entirely separate, but connected by underground passages, by which the food is taken to the various wards in trolleys. The

* A feature of this plan is the dispensary. It is placed in front of the gate on entering and underground, lit from roof and accessible to both out and in-patients, it is circular in plan.

plan A has circular wards; medical on north side, special on south, and surgical in centre. The existing St. Mungo's college is retained on the present site and pathological buildings are provided within the grounds. The plan marked B assumes the removal of St. Mungo's College, and the placing of pathological buildings on some adjacent site where it could be connected by a subway under street.

The style of architecture adopted seems very suitable for a building of this kind, and the Cathedral square front satisfies the requirements.

Messrs. S. Mitchell & Wilson's design, placed fourth by the assessor, shows a plan with a corridor which runs north and south on the east side of the site; the wards are placed at stated distances on this corridor, on the west side towards Castle-street. The central block is used on ground floor for nurses' dining-room, entrance hall, doctor's and matron's dining-room, board-room, superintendent's and matron's offices; the first floor for diseases of women; the second floor for throat, nose, and ear; the third floor for skin diseases; while the kitchen and stores cover the whole of fourth floor.

Two very carefully drawn and shaded perspectives accompany this design. The elevations are fine in detail but lack breadth.

Mr. Hippolyte Blanc's design is illustrated by very carefully drawn plans and elevations. All the wards are joined by a corridor and the blocks are well separated, but the corridor rising as it does the full height of the buildings would prevent the air from passing through the buildings. The blocks come very near Castle-street, and patients might be disturbed by the noise from the street. The operating theatre faces north, and has all the necessary adjuncts, and the doctors' rooms are well placed in an isolated position. The walls are flanked by octagonal towers, between which there is a verandah. The main entrance is from Cathedral-square.

Mr. J. J. Burnet has arranged his design with a large square on the south, with buildings on three sides and open to Cathedral-square; the plan is of an elaborate nature, but would necessitate the whole of the buildings being taken down at the same time. Some parts of the plan have been very carefully worked out in detail, and the buildings would probably have looked better when executed than they do on the drawings.

Messrs. Stark and Rowntree have followed very closely on the lines of the committee's plan, Scheme No. 3, and considerable ability is shown in the designs.

Mr. Percy Adams has a design with a corridor going from north to south, with the wards running east and west, the corridor would prevent the free passage of air as it is continued to the top floor. The administration is placed in the centre, between medical and surgical wards.

Messrs. Douglas & Morrison's plans have been remodelled on the lines of the committee's plan, Scheme No. 5, and the elevations are of a plain character.

It is to be regretted that plans were sent to the competitors by the committee, since, as in every similar case, it has only served to stifle originality.

MAGAZINES AND REVIEWS.

The *Art Journal* contains an illustrated article on "Fez, the Capital of Morocco." The sketch of the entrance gate, by G. Montbard, the author of the article, is a fine piece of effect. The other sketches are mostly of types of the inhabitants. Mr. Lewis F. Day's article on "Mere Ornament" sets out with the position that ornament need not "mean" anything, so long as it is ornamental; in which we entirely agree. Mr. Day attacks in the course of the article some catchwords of art-criticism; one of these is "joyless." He points out that if it is true that ornament will not be interesting unless the designer enjoyed doing it, the converse does not hold good. It may have interested the designer and yet be interesting to no one else. Mr. Walter Crane contributes a short article on "Methods of Art-teaching," which is rather vague, but seems to aim at a condemnation of the system of teaching by drawing and modelling the figure, as the be-all and the end-all; "a stately method," he calls it, but destined to be superseded by the teaching of the crafts. This is the gospel of to-day,

and one hears it on all sides; but this side of the matter is just as much over-emphasised by its votaries as the other side is over-emphasised in the South Kensington educational programme. The *Art Journal* continues its special Paris Exhibition supplement, of which this number contains articles on the French centennial exhibition and on the stained glass exhibits and glassware generally, much of which was of great interest.

The *Magazine of Art* contains an article on the new Louvre, *i.e.*, the Louvre as recently altered and added to, with an illustration of the fine Rubens Gallery, in which the paintings are made to fit into an architectural decoration specially designed for them; the work has been referred to and described more than once in our columns. Mr. F. Hamilton Jackson contributes an article on "The New Art as seen at the Paris Exhibition." What is called the new art, in furniture and decorative objects, appears to us to be little more than an eccentricity, the main characteristic of which is the abolition of anything like clean and symmetrical line, and the torturing of tables and chairs, &c., into unexpected sinuous curves. It is merely a kind of craze, which will not last long.

The *Studio* contains an article in praise of "Open-air Museums," showing old buildings re-erected, and other archaeological curiosities which can be arranged in the open air; an idea which appears to have been really carried out in Norway and Sweden. It might be imitated in some one of the London parks. Mr. Prior's essay on "Garden-making" is continued, with illustrations, and there is an effective pencil sketch by Mr. Pennell, an "Evening Effect at the Paris Exhibition," and another of "Moonlight on the Thames," alongside of the Embankment and its lights, by Mr. O'Brien.

The *Artist* has an illustrated article of some length on Botticelli, by Miss Edith Harwood, written with special reference to the "Mars and Venus" picture in the National Gallery. The article, in both a critical and literary sense, is of considerable interest in regard to the motifs of some of Botticelli's works. The same number contains an article on the book-bindings of Otto Zahn.

In the *Berlin Architektur-Welt* is a striking sketch by Herr Schaudt of a "Helden-Grab" or tomb of honour, a purely architectural creation displaying a good deal of poetic imagination. The illustrations of the Golgatha-Kirche at Berlin, of which Herren Spiitta & Wilde are the architects, show a fine piece of modern Gothic in brickwork.

The *Antiquary* continues the articles on "England's Oldest Handicrafts" and the "Quarterly Notes on Roman Britain"; the craft dealt with in this number being that of the potter, which is treated at more length than usual, as indeed its importance and antiquity demand. The curious font of Lostwithiel Church is the subject of an illustrated article; and Mr. W. H. Burnet contributes a short article on the ruins of Gogarth Abbey on the Great Orme's Head.

The *Nineteenth Century* contains an interesting article by Mr. John Collier on "Varying Ideals of Human Beauty." It is an endeavour to inquire into the question—what type of human beauty was really the central and the admired one in different ages, and what was the relation of pictured types to the actual life around the artist. Do the Greek statues represent the Greek men and women as they did exist, or only as they would have wished to be? Mr. Collier's conclusion is that Nature was the model, though of course a selected model. He goes through the types of various schools of art, down to the present day when we have, as far as our art shows, no fixed ideal. We might have expected to find a word as to the very conventional ideals of Burne-Jones and Rossetti and their followers, but on this point the author is silent. In the same issue Mr. Henry Jephson makes a novel and eloquent appeal for a special celebration of the new century not by "a day of humiliation," as was the fashion of the old Evangelical party, but by "a day of purification," a day on which the whole nation should agree to be for once clean, and to get rid of all dirt in their persons and surroundings. His idea is that those who once entered into such a celebration might be led to continue in the same course. It is a fine idea, though we fear not likely to be acted on.

Macmillan contains an article by Mr. M. H. Witt, on "Two Great Pictures," one by Montagna, the other by Paolo Veronese,

existing in the church of the Madonna della Monte at Vicenza. "Montagna was a citizen of Vicenza, its one painter of great note and originality, and it is in the churches and picture gallery of his native place that he may still be seen to best advantage in fresco and altar-piece." The article includes also a kind of literary sketch of the city itself.

The *Century* contains an article by Mr. E. V. Smalley on "The American Patent Office," which is of considerable interest as showing how they manage these matters in the States; better than in England, apparently, for the Government undertakes to ascertain for each "inventor" whether or not his patent is really new, or is a repetition of an idea already patented, instead of leaving the onus of this discovery with the inventor himself. The article is accompanied by some piquant illustrations of typical inventors and their interviews with the officials of the Department. The United States Patent Office is a sumptuous specimen of Washington neo-Greek architecture.

In *Scribner* is an article on "Modern Athens," its ways and its society and surroundings, interesting though rather disenchanting to those to whom the name of Athens calls up only associations with a great and poetic past, Athens seems to have a vigorous and lively present life, far enough removed from classic ideals.

The *Fortnightly Review* contains a long article by Mr. Arthur Symons on "The Painters of Seville," of whom he seems to have made a special study.

In the *Gentleman's Magazine* is an article by Mr. Percy Fitzgerald on "An Old High Town and an Old Palace," the two places being Boulogne and Kew. In the former town, it will be news to many readers, is a house with a marble tablet recording that here died "the celebrated English poet Thomas Campbell," driven to Boulogne, unfortunately, by debts and drink. Some of the recollections in reference to Kew Palace are of considerable interest.

The *Genealogical Magazine* contains "Records of an English Manor for a Thousand Years"—Thornbury Castle, with illustrations; also an engraving of the arms of the Royal Borough of Inverness, which offer the singular and rather profane combination of a shield bearing a representation of the Crucifixion, supported by an elephant and a camel *rampant*. As to the allegorical or heraldic significance of this extraordinary combination no hint is given.

Man is the title of a small new periodical published by the Anthropological Institute. Among the contents of the first number is a note, with an illustration, on a fragment of Etruscan pottery which, according to Mr. H. Balfour, the curator of the Pitt-Rivers Museum, seems to present something like the genesis of the Roman guilloche ornament, the fragment being mostly covered with double concentric circles interrupting each other by overlapping, while in one place the circles are so interrupted as to produce the "over-and-under" effect of the guilloche. We must differ from Mr. Balfour; the guilloche ornament is, according to the illustration, separated by two parallel lines from the rest of the field, and is obviously designed intentionally for the situation. The deduction made from it is therefore one that cannot be sustained.

Knowledge contains an article on a point which has been the subject of much scientific disputation, *viz.*, the real size of ocean waves. The height is much less than is generally supposed, though we think all systems of measuring the height of waves must be subject to a large element of inaccuracy. The highest mentioned in this article is nearly 38 ft., and occurred in what the observers estimated to be the heaviest sea they had known. This agrees with Captain Scoresby's calculation, made many years ago, that the greatest height of waves from hollow to crest did not exceed 40 ft.

We have received also *Harper's Magazine* (containing this month nothing of special interest to our readers), the *Revue Générale*, *The Quarry*, and the *Architects' and Builders' Magazine* (New York).

THE NEW WAR OFFICE.—The building of the new War Office, which was commenced under the superintendence of Mr. William Young, will be continued under that of his son, Mr. Clyde Young. It is stated that Mr. Clyde Young will have closely associated with him the Board of Works consulting surveyor, Sir John Taylor.

SANITARY INSPECTORS' ASSOCIATION.

A MEETING of the Sanitary Inspectors' Association was held on Saturday evening at Carpenters' Hall, London Wall, chiefly for the purpose of hearing the President's annual address.

Mr. W. H. Grigg, the Chairman, said it had been their invariable custom to listen to an address from their President at the first meeting in each year, but on this occasion their rule would be broken, because the President, who was unwell, was now abroad.

Mr. W. W. West, Chief Sanitary Inspector of Wallthamstow, said the honour of giving the address at this first meeting of the year had been cast upon him, and his subject would be "Sanitary Politics in the New Century." It was unnecessary to recapitulate the work and the results of sanitary politics in the century just closed. During the latter half since the agitation upon the subject was started by the earnest band of workers, of whom their two former presidents, Sir E. Chadwick and Sir B. W. Richardson, and their late hon. member, Sir H. Rawlinson, were among the most eminent, giant strides had been taken, and the work of remedying the bulk of the bad conditions which they called attention to had, at any rate, been put well on the way. Half a century was not a great period in the history of a nation, and the difference between the conditions prevailing then and now was a subject of intense gratification. Food, drainage, construction of dwellings, water supply, infectious diseases, and the rest of the matters with which they had daily to deal, had been taken in hand, and the grosser evils at any rate removed. Granted that in most of these matters vast improvement had been made, what was the question which most pressed for settlement? Well, as the dying German philosopher was said to have cried for "light more light," so the anemic, enervated dwellers in our cities cried for "Air, more air." Overcrowding in cities and towns was the trouble. There had been an extensive reversal of our mode of life from the open air of the country side to the close, crowded, unwholesome air of the towns. The suggestions as to a solution of the difficulty could be divided into two categories—those that aimed at modifying or palliating the unwholesome conditions, and those which dealt with them in a more radical method by abolishing the conditions. Undoubtedly, in default of removal, we should all assist to ameliorate, but the suggestions in the first category had all been tried, but on the whole with small success. Take the enactments as to overcrowding in rooms—in the first place the minimum air space allowed was necessarily fixed so low as to leave the great bulk of the trouble untouched, and then, owing to a multiplicity of considerations, experience showed that even with the most energetic and determined enforcement of the law the amount of such overcrowding was not materially lessened, as the cases were only transferred from one place to another. Again, in the erection of model or artisans' dwellings on cleared spaces, the overcrowding on area was not generally lessened, for the designers of the various schemes prided themselves upon the fact that they made provision for as many or more inhabitants than previously occupied the area by lifting them nearer the clouds. Accepting the contention that these methods, while ameliorating, did not comply with the fundamental principle of modern sanitation, which was prevention, they must come to the conclusion in favour of those suggestions which had in view the principle of spreading out, such as the erection of model villages in the suburbs, the provision of rapid, cheap transit, and the removal of many manufacturing to rural districts. If they insisted strenuously in and out of season that the welfare of the people was the highest of all laws, there need be no doubt in their hope that the century now commencing would be as full of advantages, or more so, than the last. Considerable public interest had recently been aroused by the agitation in favour of fresh air cure for consumption, and statistics had been presented showing the great number of cases existing in our cities, due, in the majority of instances, to the unhealthy state of the atmosphere produced by overcrowding. Fresh air was the cure and fresh air the preventive. Well might H.R.H. the Prince of Wales ask at a gathering of sanitarians, "If preventible, why not prevented?" Because the principles suggested were not realised or acted upon. There

was no other law of sanitarians than the welfare of the people. They were told that these conditions were brought about by "economic laws." If so, the economy was a false one, and a new one should be put in its place. Men of all shades of political opinion admitted that the working of the existing land laws had a good deal to do with the propagation of the evils they were dealing with. Then the land laws should be amended in that direction. They would probably be told, as they suggested reforms which they saw to be necessary, that they were advocating rank socialism, but every one admitted that that was a generality, but those who were interested in maintaining the *status quo* objected to its special application. Eminent men of undoubted authority had repeatedly informed them that the cost of providing dwellings (in cities) in which the humblest of the people might live under conditions of decency was really in excess of the wages which they commanded. The subject of the erection of model dwellings in the suburbs had already been considered by the London County Council, and the admirable public spirit with which they had dealt with other questions justified them in hoping that the village they proposed to erect would be a model one—not a mere extension of the town. The roads would, of course, be of ample, even of generous, width; the dwellings roomy and substantial—a delight to the eye—let at a rental bearing a reasonable proportion to the earnings of the occupant, and such things as nuisances absolutely non-existent. They were often told of the immense amount of land which had gone out of cultivation in recent years owing to its being unprofitable to till. This being so, its value was small, and if utilised for small manufacturing towns, the lessened cost of land would compensate very largely for any increased cost of manufacture due to the distance from the metropolis or other centres of population and commerce, and certainly the *status quo* would be immensely advanced in every way by the more healthy condition of mind, body, and estate, which were inseparable from life in a small centre of population as compared with life in vast cities. This solution of the trouble had already been carried into effect by some wealthy and public-spirited employers of labour. In these directions they must look for the prevention of the evils of overcrowding, and the arrival of that time which as officials of the present they could certainly contemplate with serenity, while as sanitarians they should hope and strive for, as was described in the following quotation. When the early pioneers of sanitation first advocated the appointment of sanitary officers objection was raised as to the cost of such procedure. To this they urged "That whenever the proposed local conditions were effected and complete works laid down and put in action, public servants, by whom the work and consequent pecuniary savings and savings of life and health had been effected, will have comparatively little to do, and may change their sphere of action."

A vote of thanks was then passed to Mr. West, proposed by the Chairman and seconded by Mr. J. Young.

COMPETITIONS.

BATHS AND GYMNASIUM, DUNFERMLINE.—The committee invited competitive plans for the new Carnegie Baths and Gymnasium some time ago, and at a meeting on the 4th inst. Mr. William Reid, the secretary, intimated that the plans had been received from the following:—Messrs. H. J. Blanc, Edinburgh; David Beveridge, Crossgates; T. Hyslop Ure, Dunfermline; Williamson & Inglis, Kirkcaldy; Ross & Macbeth, Inverness; Jas. T. Scobie, Dunfermline; Andrew Muirhead, Dunfermline; D. Barclay, Glasgow; W. Swinton, Dunfermline.

GLASGOW ROYAL INFIRMARY RECONSTRUCTION.—The designs of the competing architects in this competition have been on view within the City Chambers during the past week. The following are the authors, also the approximate cost of carrying out the respective designs, as estimated by Mr. Robert Whitson, the committee's measurer:—(A) Sydney Mitchell & Wilson, Edinburgh, 303,000.; (B) Hippolyte J. Blanc, Edinburgh, 269,000.; (C) Malcolm Stark & Rowntree, London, 252,000.; (D) John James Burnet, Glasgow, 219,000.; (E) James Miller, Glasgow, 241,000.; (F) H. E. Clifford, Glasgow, 238,000.; (G) H. Percy Adams, London, 245,000.; (H)

A. Hessel Tiltman, London, 321,000.; (I) Campbell Douglas & Morrison, Glasgow, 225,000.; (J) T. L. Watson and H. Mitchell, Glasgow, 235,000. Plans marked (E) have, as already mentioned in our pages, been adopted by the committee as first in order of merit by 11 votes to 10 given for those marked (F). Dr. Rowland Anderson was the assessor.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the Building Act Committee of the London County Council, on December 17, being the day before the Council adjourned for the Christmas recess, the proceedings were governed by the clause in the order of reference which empowers the Committee at certain seasons to act on behalf of the Council in relation to matters included in the order of reference. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage.

Norwood.—A church on the south side of Thurlow Park-road, West Norwood, at the corner of Court-road (Mr. A. O. Breeds for the committee and managers of the West Norwood Presbyterian Church).—Consent.

Chelsea.—A one-story addition in front of the Swiss Cottage beer-house, No. 109, King's-road, Chelsea (Messrs. A. R. Barker & Son for Messrs. Michell & Aldous, Limited).—Refused.

Fulham.—A one-story shop on part of the forecourt of No. 10, Parsons-green, Fulham (Messrs. Hewison & Peacock).—Refused.

Kensington, North.—A one-story addition to No. 150, Holland Park-avenue, Kensington, to abut upon Norland-square (Messrs. E. & A. Swain for Mr. R. T. Swain).—Refused.

Projections.

St. George, Hanover-square.—That in accordance with the request of Messrs. Trollope & Sons for Mr. C. Czarnikow, the consent of the Council of November 20, 1900, to the erection of wood and glass inclosures to a portico at the entrance to No. 103, Eaton-square, St. George, Hanover-square, be modified by the insertion of the words "except the door and frame to inclose the front of the portico" after the words "that the whole of the exposed woodwork" in such consent.—Agreed.

Strand.—A balcony, at the first-floor level, in front of Nos. 5, 6, and 7, Chapel-place, Oxford-street, St. Marylebone (Mr. A. E. Hughes for Messrs. D. H. Evans & Co., Limited).—Consent.

Hammersmith.—A porch at the entrance to the Bush Hotel, No. 54, Shepherd's Bush Green, Hammersmith (Mr. W. M. Bruton for Mr. H. Buckley).—Consent.

Hampstead.—Wood and tile porches at the entrances to ten houses in course of erection on the north-east side of Fordwych-road, Hampstead (Mr. J. Phoenix for Messrs. Bridge & Neal).—Consent.

Woolwich.—Bay-windows to Nos. 1, 2, 3, and 7, Elderster-road, Eitham (Mr. G. F. Logsdail for Mr. A. Cameron Corbett, M.P.).—Consent.

Width of Way.

Bermondsey.—A one-story addition in the yard of the stables at the rear of the Swan public-house, Old Kent-road, Bermondsey, at less than the prescribed distance from the centre of Comus-place (Mr. J. G. Enzor for Messrs. Watney, Combe, Reid, & Co.).—Consent.

Width of Way, Lines of Frontage, and Projections.

Westminster.—An overhanging angle-turret at the first and second floor levels of Nos. 17 and 19, Regency-street, Westminster, at less than the prescribed distance from the centre of Page-street (Mr. E. Dru Drury for Mr. J. V. Webster).—Consent.

Woolwich.—Nine dwelling-houses, with one-story bay windows, on the west side of Red Lion-lane, Shooter's-hill-road, Plumstead, with the front court fences and bay windows at less than the prescribed distance from the centre of Red Lion-lane (Mr. A. E. Parnell for Mr. J. Sanford).—Consent.

Hammersmith.—Two blocks of buildings on the west side of Ravenscourt Park, Hammersmith, each abutting on Hamlet-gardens (Mr. T. Athey for Mr. W. H. Gibbs).—Refused.

Space at Rear.

Strand.—A modification of the provisions of Section 41 of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of two blocks of dwellings, adapted to be inhabited by persons of the working class, on a site on the west side of York-street, Drury-lane, Strand, abutting also on Drury-lane, and at the rear on a footway on the east side of the Theatre Royal, Drury-lane, such blocks of dwellings to be provided with an irregular space at the rear, and pro-

tions of such dwellings to extend above the diagonal line directed to be drawn by Section 41 of the Act (Mr. J. Briggs for the Housing of the Working Classes Committee of the Council).—Consent.

Line of Frontage and Construction of Buildings.

Finsbury, Central.—A wood and iron engine-shed at the Sadler's Wells Theatre, Rosebery-avenue (Mr. G. E. Belmont).—Refused.

Width of Way and Construction of Building.

Southwark, West.—A block of artisans' dwellings on the north side of Sumner-street, Southwark, to extend over Martagon-place, such dwellings to exceed in height the width of Sumner-street and also of Martagon-place, and the erection of a play-shed at the rear of such dwellings (Mr. F. Bailey for the City of London Electric Lighting Company, Limited).—Consent.

Width of Way, Lines of Frontage, and Construction of Buildings.

Woolwich.—A water-tower on the north side of Shooter's-hill, Plumstead, with the boundary fence at less than the prescribed distance from the centre of The Avenue (Mr. T. B. Whinney for the Kent Waterworks Company).—Consent.

Islington, West.—An iron roof on the north-west side of Warler's-road, Parkhurst-road, Holloway, at less than the prescribed distance from the centre of Warler's-road (St. Pancras Ironworks Company, Limited, for Messrs. Beale & Co., Limited).—Refused.

Formation of Streets.

Clapham.—That an order be issued to Mr. W. N. Dunn sanctioning the formation or laying out of two new streets for carriage traffic on the west side of Clapham Common, Battersea (for Mr. T. Ingram). That the names Manchuria-road and Clapham Common West-side (in continuation) be approved for the new streets.—Consent.

Greenwich.—That an order be issued to Mr. W. J. Kemp sanctioning the formation or laying out of a new street for carriage traffic to lead from Woolwich Lower-road, Greenwich, to Hilstow-road, and in connexion therewith the widening of a portion of Lower Woolwich-road (for Mr. H. Tarrant). That the name Chevening-road be approved for the new street.—Consent.

Lewisham.—That an order be issued to Mr. W. Barber, sanctioning the formation or laying out of a new street for carriage traffic, to lead from Bromley-road to Burnt Ash-lane, Lee, and in connexion therewith the widening of a portion of Bromley-road (for Mr. A. Durbin). That the name Heather-road be approved for the new street.—Consent.

Lewisham.—That an order be issued to Mr. J. W. Rhodes, sanctioning under the provisions of Section 10 of the London Building Act, 1894, the widening of a street, used for foot traffic only, known as Brockley Cottages, Malyn-road. Ladywell (for Mrs. M. E. Barnes).—Consent.

Cubical Extent.

Islington, West.—The raising of the roof of a building at the north-west angle of the Caledonian Saw-mills, No. 13, New Wharf-road, Caledonian-road, Islington, which building will exceed in extent 250,000, but not 450,000, cubic ft., and will be used only for the purposes of the trade or manufacture of sawing, planing, and moulding timber (Messrs. Haggis & Sons).—Consent.

Poplar.—An addition to the platers' shop at Messrs. Yarrow & Co.'s works, Manchester-road, Glengall-road, Poplar (Messrs. W. Whitford & Co. for Messrs. Yarrow & Co., Limited).—Consent.

Deptford.—The erection at the Hatcham Iron-works, Pomeroy-street, Hatcham, of an addition to a workshop (Mr. J. Donald for the General Engine and Boiler Company, Limited).—Refused.

Means of Escape from Top of High Buildings.

Strand.—Alteration in the means of escape in case of fire, proposed to be provided in pursuance of Section 65 of the Act, on the third, fourth, fifth, and sixth stories of an addition at the rear of the Grand Hotel, Northumberland-avenue, Strand, for the persons dwelling or employed therein (Mr. W. Woodward for the Gordon Hotels, Limited).—Consent.

Strand.—Means of escape in case of fire, proposed to be provided in pursuance of Section 65 of the Act, on the fifth, sixth, and seventh stories of an addition to the Hotel Cecil, on the site of Nos. 76 to 88, Strand, between Carting-lane and Ivy Bridge-lane, Strand (Mr. J. Sawyer for the Hotel Cecil, Limited).—Refused.

Buildings for the Supply of Electricity.

Hampstead.—A further variation (so far as relates to the water-softening house) from the plans, approved by the Council, for the construction of an extension to the electricity generating station and works, Lithos-road, Hampstead, abutting off a foot-path between West End-lane and Finch-ey-road (Mr. J. Hudson for the Metropolitan Borough Council or Hampstead).—Consent.

Lewisham.—The application of Mr. A. L. Phillips for the Crystal Palace District Electric Supply Company, Limited, for the rebuilding of a generating station and works at Springfield-road, Wells-road, Sydenham.—Agreed.

Wandsworth.—The application of Mr. C. S. Peach for the County of London and Brush Provincial Electric Light Company, Limited, for the construction of a temporary sub-station on the north side of Yikon-road, Balham High-road, at the corner of Lynn-street.—Agreed.

Dwelling-houses on Low-lying Land.

Woolwich.—That the solicitor do prepare a licence under Section 122 of the Act, to Mr. S. J. Driver, for the erection of sixteen buildings, to be used wholly or in part as dwelling-houses, on low-lying land situated on the south side of Abbey-grove, Abbey Wood, Plumstead, in accordance with the tracing submitted on his behalf by Mr. T. J. Young.—Agreed.

BOOKS RECEIVED.

THEORY OF ENGINEERING CONSTRUCTION. By Ernest H. Essex, A.M Inst.C.E. (The St. Bride's Press.)

LOCKWOOD'S BUILDER'S AND CONTRACTOR'S PRICE-BOOK, 1901. Edited by Francis T. W. Miller, A.R.I.B.A. (Crosby Lockwood & Son)

Correspondence.

To the Editor of THE BUILDER.

"CHURCHYARDS AND THEIR ACCESSORIES."

SIR,—All interested in "God's Acre" must be much indebted to Mr. Crawfurth Smith for his interesting paper, and to yourselves for publishing it in its entirety. But when discussing God's-Acre from the æsthetic point of view, one cannot but wish that Mr. Crawfurth Smith had raised his voice much more forcibly against the vulgarities which are erected in our churchyards.

What is wanted is a Cromwell in criticism, who would teach them to get rid of these baubles of bad taste. Only by forcibly speaking can this be done. The majority of our monumental masons can neither produce anything good, nor even appreciate it. In a suburban cemetery it was my good fortune to see a beautifully proportioned cross—simplicity in itself, without any moulding or chamfer on it, and upon which Mr. Crawfurth Smith had raised his voice much more forcibly against the vulgarities which are erected in our churchyards.

What I would venture to suggest is that a member of the Association should read a paper, illustrating it with examples of our monuments, good and bad, and that monumental masons should be invited to attend.

THOMAS G. GETHING.

COLLUSION AMONG CONTRACTORS.

SIR,—As a regular reader of your valuable paper, I should like to draw attention to a matter which I have not as yet seen touched upon in any journal devoted to the building trade.

I refer to the practice of some builders—made easier when only two or three are in for the work in question—of buying each other out, and arranging that one of them shall, for certain sums paid to his competitors, be allowed to get the work.

Naturally the successful one, knowing beforehand that his will be the lowest tender, makes his price right, as besides his own profit he has to pay to his (supposed) competitors the amounts agreed upon.

I do not think the practice is common, but I have come across it on a few occasions. It seems to me a serious matter and one worthy of attention.

A SUFFERER.

FOOTWAY MASONS' AND CARRIAGE-WAY PAVIERS' SOCIETY.

SIR,—In your issue of the 22nd ult. in your report of the London County Council you report us as asking for the hours of labour to be amended.

We beg that you will contradict the report. All we have asked for is that the Council will pay us our trade union rate of wage.

W. LEARY, Gen. Sec.

* * * We took the statement from the County Council's agenda paper.—ED.

HALIFAX TOWN HALL.—Mr. Joseph Parkinson, of Lancaster, writes to us in reference to the tower of Halifax Town Hall which was illustrated in our last issue, that the spire panneling was originally covered with encaustic tiles, but before 1870 (at which time he was serving his articles in Halifax) these tiles had begun to fall off, and it was considered advisable to remove them and replace them with stone facing.

The Student's Column.

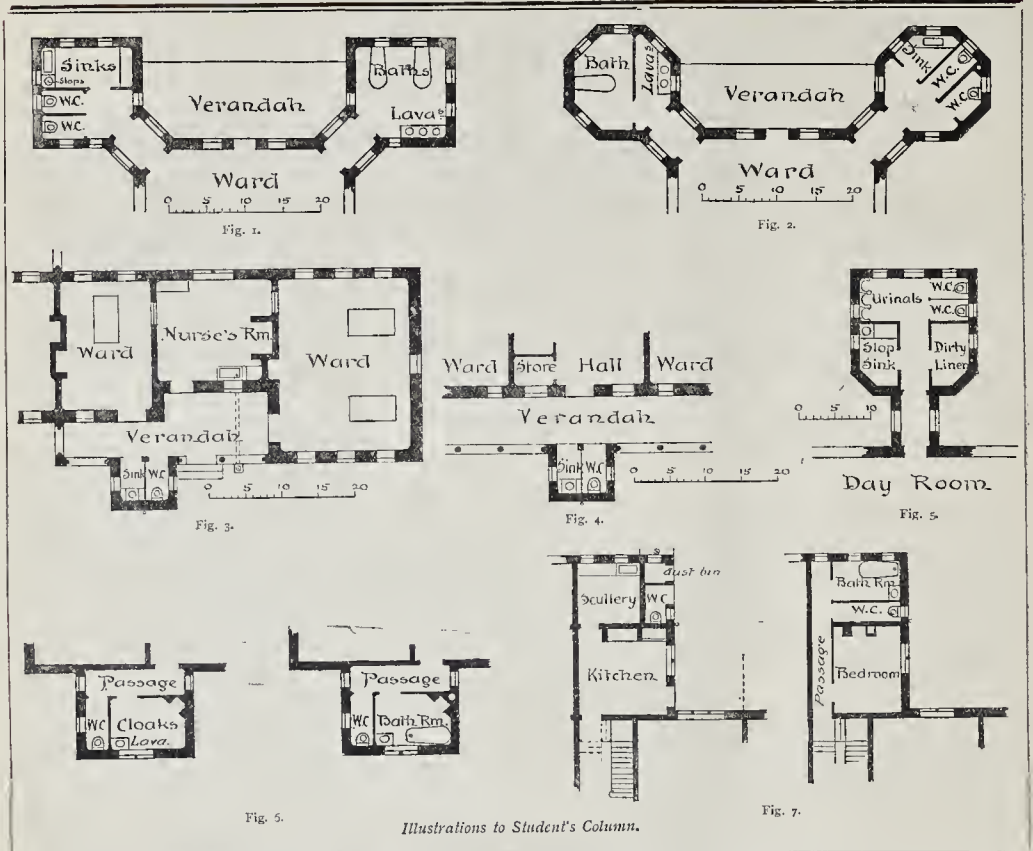

SANITARY FITTINGS AND PLUMBING.

2.—SANITARY-ROOMS.

THE diverse character of sanitary fittings necessitates considerable difference in the location and arrangement of the rooms in which they are placed, but certain general rules are applicable in every case. The most important points to be observed are plenty of light and, if possible, of direct sunlight, ample means of ventilation, impervious surfaces (at any rate, immediately around the fittings), convenience of position and plan, and (for certain fittings) privacy. If the rooms for the different fittings can be grouped together in one part of the building, although, perhaps, in two or more stories, it will be not only economical, but advantageous in other respects.

First, as to light. No sanitary fitting ought to be fixed in any room which is not properly lit by one or more windows or toplights. Borrowed lights ought not to be tolerated as the sole means of lighting sanitary rooms. The windows or toplights must be made to open, and must be of ample size. The common allowance of 1 square foot of window space to every 10 square feet of floor area is far too little for rooms containing sanitary fittings, even if the net area of the glass is taken as the basis of the calculation. For example, many water-closets measure only about 5 ft. 6 in. by 2 ft. 6 in., giving an area therefore of 13½ square feet; according to the rule, a window with a net area of about 1½ square feet ought to suffice. We need hardly point out that such a small window would be quite unsatisfactory; if placed near the ceiling it would not light the closet-basin or the floor, and if placed in the lower half of the room it would be of little use for ventilation. What is wanted is a window extending practically up to the ceiling, so that the air in the upper part of the room can be thoroughly changed by opening the window, and extending so low as to throw a direct light on the floor of the room and on the closet-basin, and seat. The width of the window ought to be such that the light is well distributed throughout the room. The area of the window in a small water-closet or housemaid's closet ought to be at least half the area of the floor. The proportion need not be so great for larger rooms, but much will depend upon the shape of the room and the position of the window or windows.

Ventilation is a most important point. The sanitary rooms of a house are those in which the foulest portions of the domestic and personal duties are performed, and yet less care is often taken concerning the ventilation of these rooms than of any other rooms in the house. In many towns the by-laws specify that an air-grate must be fixed in the external wall of every water-closet; sometimes two are demanded, one near the floor and the other near the ceiling, the assumption being that the latter will act as an outlet and the former as an inlet. Unfortunately, this assumption is often proved to be erroneous, as both grates frequently act as inlets. The value of these air-grates has been much over-rated. As a rule they serve as air inlets, and if, as is generally the case, the rooms have no extract shafts, the air, mixed perhaps with the foul air from the sanitary fittings, is drawn into the adjacent living-rooms or bedrooms, whence it escapes by means of the fireplace flues. In other words, the "fresh-air" supply of the house is to a large extent obtained through the bathroom and water-closet. The air-grates have also the disadvantage of reducing the temperature of the rooms in winter and of increasing the risk of frozen pipes. If proper extract-shafts were provided from these rooms there would be little danger of vitiated air being drawn into the rest of the building; the current of air would be in the opposite direction, i.e., from the main building to the sanitary room. In the scullery, bathroom, &c., the extract-shaft may take the form of an open fireplace or of a flue formed in the chimney breast by the side of the smoke-flue. These flues ought to be formed with fireclay tubes, thoroughly grouted around, so that the foul air cannot escape into the rooms above. In the water-closet, housemaid's closet, &c., it may be a flue of the kind just described, or a special sheet-metal shaft leading to an extracting cowl fixed on the roof.

Illustrations to Student's Column.

A clever contrivance for ventilating water-closets and other rooms in which flushing cisterns are placed has been designed by Messrs. Kerrill & Hunter. It consists of a fan actuated by the water as it flows into the cistern. Consequently, every time the cistern is used the fan is automatically started and continues to run until the cistern is full again. The fan is said to be capable of extracting 200 cubic ft. of air per minute with a 60-lb. pressure of water. This contrivance will be of service in many cases when extract-fines cannot well be provided; it has the disadvantage of being spasmodic in its action, but this disadvantage is not very serious if the sanitary fittings and plumbing are such as to exclude all drain air from the room.

In modern hospitals the water-closets, bath-rooms, and sink-rooms are generally planned with short passages or lobbies between them and the wards, these passages having windows and openings for air on both sides. Among the many positions in which these rooms can be placed, the most generally satisfactory is at the extreme angles of the wards, as shown in figs. 1 and 2. These should be planned so as not to obstruct the ward windows, and so that the currents of air through the lobbies are not in the direction of the windows either in the sides or ends of the wards. The conveniences and lobbies ought to be warmed and ventilated. If there is an upper story of wards, the same arrangement of conveniences is repeated, thus simplifying both the plumbing and drainage.

In small fever hospitals, the water-closets and sink-rooms are often placed at the side of a verandah, as shown in figs. 3 and 4. There is therefore a free current of air between them and the pavilions to which they are attached. In exposed situations, however, this arrangement is somewhat trying, as the verandah cannot, of course, be warmed; in the case of one hospital, built in this manner from the writer's design, the openings in the front and ends of the verandahs were a few years afterwards filled with wood and glass.

Similar or slightly modified arrangements may with advantage be adopted in other public buildings, such as workhouses (fig. 5), and also in hotels, houses, &c. A cloakroom with lavatory and water-closet on the ground floor of a house may have over it a bathroom, lavatory and water-closet, as shown in fig. 6. In small houses, where much money cannot be afforded, probably the utmost that can be done is to arrange that the approach to the bathroom and water-closet shall be properly lighted by means of a sash or casement window, and not, as is so often the case, a dark, unventilated passage.

The illustrations already given also serve as examples of the grouping of sanitary fittings. This is an important point for consideration, as the grouping of fittings reduces the length of water-pipes, wastepipes, soilpipes, and drains, and therefore reduces the cost and also the dangers arising from defective materials and workmanship. An isolated fitting often requires a long branch-drain, and the nature of the fitting may be such that its discharge is not sufficient to cleanse the drain; hence, unless some method of periodical flushing is devised, deposit occurs, and the drain becomes foul and is ultimately choked. With a little care in planning, the sanitary rooms of a house can be much better grouped than is usually the case. The bathroom and water-closet can be placed over the ground-floor lavatory and water-closet, or over the butler's or maid's pantry, or over the scullery. It is a great mistake to place such rooms over living-rooms or larders, particularly if the floors are constructed with ordinary joists and boards. Fig. 7 shows an arrangement for a small terrace-house. The house water-closet on the first floor is placed over the servant's water-closet on the ground-floor, so that one soilpipe serves for the two fittings, and the wastepipes from the sink, bath, and lavatory discharge over a single gully. Only two sewage drains, therefore, are required, and these lead to the intercepting-chamber, from which the main drain leads to the sewer in the back street.

The soilpipe serves as the ventilation shaft for the drain. The sink-gully is kept clear of grease by the flushes from the bath and lavatory.

Water-closets are often placed in most unsatisfactory positions. In a great many houses they are entered from the half-space landings of the stairs, or from other equally-exposed thoroughfares. Such arrangements are most objectionable. Privacy ought to be one of the guiding thoughts in the planning of these rooms, and this is best secured by arranging the lavatory and water-closet in close proximity to each other, and by approaching the two rooms by means of a short passage or lobby, as shown in fig. 6. It is a mistake to place the water-closet in the same room as the bath and lavatory, though this is too often done. It is also a mistake to place a water-closet in such a position that it is separated from an important room by nothing more than a lath-and-plaster partition. The noise made by the flushing of the apparatus will be heard on the other side of such a partition, and even of a $1\frac{1}{2}$ in. brick wall, and it is best, therefore, to build a 9-in. wall wherever possible. The arrangement shown in fig. 6 will effectually prevent all sounds passing to the rest of the house. It is even more essential that the housemaid's closet should be out of the way, and this can best be effected by placing it near the servants' stairs.

In this country lavatory basins are not now fixed in bedrooms as frequently as was formerly done, but if the lavatories themselves, and the plumbing and drains, are thoroughly satisfactory, there cannot be any very serious objection to the practice. A better position would, of course, be the dressing-room or small room adjoining the bedroom.

The general construction of rooms containing sanitary fittings ought to be of the best. The floors—of ground floor and upper rooms alike—ought to be concrete, the ingredients to be properly proportioned so that the material is practically impervious. In sculleries, lavatories, water-closets, housemaid's closets, &c., the floors may be finished with fine concrete.

NEW CHURCH OF ST. MARK, PLUMSTEAD WITH INSTITUTE.

which will be all the better if carefully laid and polished after the manner known as terrazzo. Tiles and mosaic also make satisfactory floor-surfaces. Such floors are, however, cold, and are not generally approved for bathrooms—at any rate, in houses—although a simple remedy can be found in cork mats or strips of cork carpet or other movable floor coverings. Wood blocks form a suitable surface for bathroom floors, especially if of hardwood wax-polished. The walls of all rooms containing sanitary fittings ought to be faced with impervious materials, which will not absorb organic matter and can be easily kept clean. Glazed bricks are often used for the purpose, with the mortar-joints painted with enamel paint. Glazed tiles are also suitable, or the walls may be finished with Parian or other cement, and afterwards painted. Ordinary lime plaster covered with wall-paper does not form a satisfactory wall-surface. The angles of the walls ought to be rounded; special glazed bricks and tiles are made for the purpose. In hospitals the angles formed by the floors and walls are also rounded off. This arrangement facilitates dusting and sweeping, and reduces the possibility of accumulations of dirt.

GENERAL BUILDING NEWS.

CHURCH, HIGH BROOMS, TUNBRIDGE WELLS.—A church is to be built at High Brooms from plans by Mr. Richard Hill, of London.

CHURCH, OYSTERMOUTH, GLAMORGANSHIRE.—A church is to be built at Oystermouth from plans by Mr. Bruce Vaughan, of Cardiff.

RESTORATION OF EAST CLANDON CHURCH, SURREY.—The old church at East Clandon was reopened recently after restoration. The transept has been restored to its original size, the tower has been strengthened by oak beams, new oak seating has been placed in the church, and an oak pulpit has been erected. Other portions of the work include an oak reredos, a new clock by Messrs. Gillett & Johnston, of Croydon, and an organ by Messrs. Bishop & Sons. The work was carried out by Messrs. Holden, of Cranleigh, under the personal supervision of the Diocesan Architect, Mr. T. G. Jackson, R.A.

REOPENING OF KINGSTON-ON-SOAR CHURCH, NOTTINGHAMSHIRE.—The parish church at Kingston-on-Soar was reopened on the 22nd ult., after undergoing partial rebuilding. Mr. Richard Creed, of London, was the architect, and Messrs. Walker & Slater, of Derby, were the contractors. The bells have been recast by Messrs. John Taylor & Co., of Loughborough.

BEECHROVE UNITED FREE CHURCH, ABERDEEN.—The United Free Church at Beechrove, Aberdeen, was dedicated on the 21st ult. Messrs. Brown & Watt were the architects.

CHAPEL, MAESTEG, GLAMORGANSHIRE.—Memorial stones have just been laid of a new chapel at Maesteg. Mr. T. J. Thomas, of Bridgend, is the architect, and Mr. Francis, Giffach Goch, the contractor.

CONGREGATIONAL CHAPEL, BRISLINGTON, SOMERSETSHIRE.—A Congregational chapel is to be erected at the corner of Wick-lane, Brislington. Mr. Frank Wills is the architect.

CHURCH RESTORATION IN LINCOLNSHIRE.—The parish Church of Kirkby-cum-Ashfordby, near Market Rasen, has been reopened by the Bishop of Lincoln, after complete restoration according to the plans of Mr. R. C. Clarke, architect, of Nottingham.

CONGREGATIONAL CHURCH, OLTON, WARWICKSHIRE.—On the 1st inst. the new Congregational church which has been built upon a site in the Kineton-road, Olton, was opened. The designs for the building were prepared by Mr. J. P. Osborne, the architect. The structure, which is of red brick with white stone facings, includes a tower on the left-hand side of the entrance. The church will accommodate 350 people. A chancel is provided, and there is the usual vestry accommodation. A covered way leads to the schoolroom at the back of the church, and here provision is made for 300 scholars. An underground kitchen, fitted with cooking apparatus, is for tea-parties, &c. The premises are heated by hot water. The church has been built with a view to extensions, and sufficient land has been acquired to enable the schoolroom to be enlarged if necessary. Mr. Turton is the builder. The church has cost 3,500l.

CONGREGATIONAL CHURCH, NOTTINGHAM.—The new Queen's Walk Congregational Church, Nottingham, has just been opened. In the construction of the building the old foundations have been utilised so that the main walls are identical with those of the old building. The organ chamber, however, is placed at the back of the church and is a new building. The front part of the building—the lobbies and space for the future staircase—has been brought forward and is outside the area of the old building. The church has been designed in the perpendicular style, the front to Queen's Walk and side of lobby being built of Dulwell stone rock with dressings of Hollington stone. The sides of the church are faced with pressed bricks, and the roof is covered with American sea-green

slates. Accommodation has been provided for 500 people, and the church has been so designed that an end gallery can be added in the future capable of seating 170 more. Internally the church itself has a length of 79 ft. and a breadth of over 43 ft. The roof, which is an open timber one stained and varnished, is 47 ft. up to the apex from the floor of the church. A feature of the interior is the seating, which is of Californian pitch pine. The rostrum is constructed of pitch pine and mahogany, and is approached by a flight of stairs on either side. Provision has been made for a church parlour, at the rear of the church, 25 ft. by 14 ft., and there are minister's and ladies' vestries, with lavatories attached. The building is heated by means of hot water, low pressure, and the ventilation is on Boyles system, fresh air being supplied by means of brackets fixed round the building. The whole of the buildings are lighted by electricity, this work having been carried out by Messrs. Pearson Bros. The church has been built by Messrs. Green & Sons, and the architect is Mr. Charles Nelson Holloway. The contract amounts to 3,000l.

WESLEYAN CHURCH, WEYBRIDGE.—It is proposed to erect at Weybridge a church, with spire, a manse for the minister, and a lecture hall or Sunday school, with classrooms, and all the necessary adjuncts. The buildings so far erected consist of the lecture hall—which for the present is to be used as a church—with church parlour, stewards' vestry, two classrooms, infants' school-room, cloakroom, kitchen, lavatories, and other offices, and the expenditure incurred is 3,742l. 2s. 6d. The site is half an acre of land in Heath-road, and the present church is of red brick and Bath stone, in the Gothic style, capable of seating 300 people. The architects have been Messrs. Gordon & Gunton, of London, and the builder Mr. W. Greenfield, of Weybridge.

BUILDING IN NOTTINGHAM.—The number of plans deposited from December, 1899, to December, 1900, was 806, and 812 new houses have been certified during the same period. Probably the most important work carried out has been the completion of the Great Central Railway station, which was opened in June. The demolition of the old gaol in St. John's-street has taken place, and the erection of the Corporation electric power station begun on the same site. In connexion with the new electric tramway system the power station at Sherwood has been finished. Very little alteration has been made to buildings in the vicinity of the Great Market-place. Part of the old Moot Hall—an ancient wine and spirit establishment—situated at the corner of Wheeler-gate and Friar-lane, has been pulled down and the work of rebuilding commenced. A considerable amount of property has been reconstructed in and at the back of Wheeler-gate. The jubilee wing—a circular structure has been added to the General Hospital, and extensive alterations have been made in Standard Hill. On the west side of St. James's Church a number of old dwelling-houses have been pulled down and part of King Charles-street taken up—that portion between the church and the hospital—by a new laundry. A rare old landmark, the Tradesmen's Mart, in Lower Parliament-street, has disappeared, and on the site have been erected a cold storage depot and wholesale fruit stores. In St. Mary's Gate Messrs. H. Mallett & Co. are rebuilding part of their warehouse, and in Bridge-street Gate Messrs. Morris & Place, auctioneers, are rebuilding their premises. Alterations are in progress between the Midland Railway Station and Wilford-road Bridge. In addition to new locomotive sheds the Midland Railway Company are erecting a new electric lighting station and for the purpose of erecting a new passenger station have demolished a great amount of household property situated between the present station and Queen's-road. In Meadow-lane, on the east side of the Midland Railway, the foundations have been got in for the new works of the Railway and General Engineering Company, Limited. Quite a number of houses have been built on the old waterworks field near Trent Bridge, and in Rupert-street and Middle Furlong-street, off Wilford-road, additional dwellings have been erected. A building, commenced and practically finished during the year, is the Queen's Walk Congregational Church, which is shortly to be opened. A few other improvements have been carried out in the Meadows district, yet building operations continue steadily. At Lenton building operations have not been as brisk as in many other parts of the city. A number of villas have, however, been built in a commanding situation and at the west side of the Park. The greatest activity has been in evidence at Sneinton, several new streets having been named and houses built off Colwick-road.—*Nottingham Express.*

EXTENSION OF MUSEUM AND ART GALLERY, BRISTOL.—The plans for the extension of the Museum and for the Art Gallery, which Sir William Henry Wills, Bart., is giving to the city, have been prepared by Mr. Frank Wills, in conjunction with Messrs. Houston, of London. The front of the building is designed in the Renaissance style. The museum will contain a central hall, 47 ft. 6 in. by 50 ft. 6 in., and 40 ft. high. On the ground floor will also be two rooms, 62 ft. by 35 ft. and 62 ft. by 33 ft. 3 in. respectively; and two others, each 43 ft. by 29 ft. 6 in. Galleries may conveniently be added if required hereafter. A gallery in the hall leads to rooms which may be used for offices, refreshments,

&c. The Art Gallery will be on the top floor, and will include two rooms, each 64 ft. by 30 ft., two 43 ft. by 30 ft., and another 47 ft. 6 in. by 30 ft. In the basement will be workshops and store-rooms; and lifts are to be constructed to run from the basement to the top of the building.

NEW SCHOOLS, SUBURY.—The opening ceremony in connexion with a new infant school erected by the trustees of the North-street Church Schools, Sudbury, took place recently. The Diocesan Surveyor, Mr. W. M. Fawcett, M.A., of Cambridge, prepared the plans for the new buildings, the contractors being Messrs. George Grimwood & Sons, Sudbury. The new schools are calculated to accommodate 270 scholars. The main infant schoolroom is about 50 ft. by 20 ft. by 13 ft., while there is a large double classroom 20 ft. by 40 ft., divided by a sliding partition. In addition, there are two large classrooms and a lobby. The whole of the walls have a dado, 4 ft. high, with a chocolate-coloured border of salt glazed bricks.

TOWN HALL, TAUNTON.—Revised plans of the proposed Town Hall for Taunton have been submitted to the joint committee of the Market Trustees and Town Council. The architects, Messrs. Samson & Cottam, have been instructed to prepare an estimate of the cost.

ECCLESBOURNE - ROAD SCHOOLS, THORNTON HEATH.—These schools have just been completed for the Croydon School Board. The present accommodation is for 1,200 children—400 boys, 400 girls, and 400 infants, with room for future extension. The infants' school is a one-story building and comprises a central hall 60 ft. by 25 ft., seven classrooms, two caprooms and entrances, with a teachers'-room, which will be available as a committee-room. The boys' and girls' school is a two-story building, the boys on the ground floor and girls above. Each department comprises a central hall 70 ft. by 30 ft., with a class for fifty at each end, and five classrooms for sixty each, two caprooms, a teachers'-room, store, and two staircases, and the upper floor is approached by two staircases, so that there is always an alternative exit in case of emergency. There is a lock-up store with sink and hot and cold water for the use of the caretaker in each school; also a store for bicycles. The upper floor is constructed of steel girders and concrete, thus being fire and sound resisting, and permits of solid wood floors, formed with 1½ in. pitch pine blocks, being used throughout all the schools. The external walls are built hollow, 16 in. thick, faced externally with red Leicestershire bricks and Derbyshire stone dressings; the roofs being covered with red Staffordshire tiles. Instead of the usual type of lavatory basin in the cap-rooms, a marble lavatory trough of special design is provided, which is cleaner and more economical. Incandescent gas lighting is provided by a special form of burner introduced by Messrs. Wm. Sugg & Co., of Westminster. The heating is by low pressure steam, working at about 2 lbs. pressure, and is generated from two boilers in a basement under the large school. Messrs. Korting Bros., of London, are responsible for this work and guarantee, under a contract, that the temperature can be raised 40 deg. Fahr. above the outside temperature. There is a coil of gilled pipes in each room with a valve to regulate the amount of heat, and at the back of each coil a fresh-air inlet is provided with regulating shutter. On the opposite wall to the coil a foul air extraction flue is provided with a valved grating fixed at the floor level, thus ensuring an equable temperature throughout the room. The builders' contract amounts to 15,534l., which works out at barely 13s. per head, and is within the amount specially allowed by the Board of Education for the erection of those premises and works in connexion therewith. Messrs. Wm. Smith & Son of Croydon, are the builders, and Mr. T. W. Tester has acted as clerk of works. Under a separate contract, amounting to 732l., the Bennett Furnishing Company, of London, have supplied all the furniture, which is executed in a Canadian hard wood called orham. The architect is Mr. A. Carter Pegg, of Thornton Heath.

MASONIC TEMPLE, EDINBURGH.—No. 75, Queen-street, Edinburgh, has been converted into a masonic temple. Mr. P. L. Henderson was the architect.

TOWN HALL, ENNISKILLEN, CO. FERMANAGH.—The new Town Hall at Enniskillen has just been completed. Messrs. A. Scott & Son, of Drogheda, were the architects.

CONSERVATIVE CLUB, BRINHAM, DEVONSHIRE.—The new Conservative Club building at Brixham was opened on the 26th ult. The building is on a site adjoining the Market Hall, and was erected by Messrs. Hazelwood, of Brixham, from plans by Mr. E. Richards, of Torquay.

SCHOOL, EDINBURGH.—The site of the new Board school, the plans of which were approved at a recent meeting of Edinburgh School Board, faces Ashley-terrace, North Merchiston, and contains one and a quarter acre of ground. The main feature of the plan is a central hall both on the ground and on the first floor, with classrooms grouped round them on each floor, the ground floor being devoted to the infant department, and the first and second floors to the juvenile department. The second floor contains, besides the ordinary classrooms, a combined workshop and cookery classroom and gymnasium. The classrooms contain an

average number of sixty pupils, and there being twenty-seven classrooms in all, accommodation is provided for 1,580 pupils. The school has been designed in a simple treatment of English Renaissance, the windows lighting the juvenile hall on the first floor being marked by semi-circular heads. An ornamental belfry surmounts the central tower. The building will be heated by means of hot-water pipes on the low-pressure system. Ventilation is obtained by means of electrical fans extracting the vitiated air from all the rooms. Mr. Robert Wilson is the architect.

FRINGLES MEMORIAL UNITED FREE CHURCH, FOCHABERS, N.B.—This new edifice has just been opened. It has been erected from designs by Messrs. D. & J. R. McMillan, architects, Aberdeen. The tower and spire at the corner is about 105 ft. in height, supported by heavy buttresses carried up at the angles from the base, and finished off at the four corners with turrets. In the main gable there is a large tracery window. The main entrance doorway is situated in the tower. The church will accommodate 450 persons, but by extending an end gallery at a future date, the accommodation may be considerably increased. At the rear of the church is a hall to accommodate 150 persons, with a session-house adjoining, which can on special occasions be thrown into the hall by the opening of folding doors. Behind the pulpit is an apse where an organ may be erected. The roof is circular in form, lined with wood. The pews and inside finishings are of pitch pine. There is also the usual vestry accommodation and a tea kitchen. The cost of the completed structure is expected to be about £3000.

RE-OPENING OF PARISH CHURCH, SEATON, DEVONSHIRE.—The parish church of St. Gregory, Seaton, was re-opened recently after renovation, &c. The work has included the substitution of an open timbered roof for the old lath and plaster ceiling, and the erection of a new pulpit of carved oak, the work of Messrs. Harry Hems & Sons. A new font, with a bowl of Beer stone, is being made by Messrs. Hems. The work was carried out under the supervision of Mr. Strawbridge, of Taunton, by Mr. H. Abbot, of Seaton.

SANITARY AND ENGINEERING NEWS.

CHESTERTON RURAL DISTRICT SEWERAGE.—Colonel Marsh, R.E., an Inspector of the Local Government Board, held an inquiry recently at Cherry Hinton, Cambridge, concerning the application of the Chesterton Rural District Council for sanction to a proposed loan for works of sewerage and sewage disposal. The engineers' estimate of the cost of the works was £1,650. The District Council were represented by Mr. Bartley Dennis, barrister, London.

Mr. H. Bertram Nichols, consulting engineer, of the firm of Messrs. Beesley, Son, & Nichols, of Westminster, gave evidence for the District Council, also Mr. Frank Waters, of the firm of Messrs. Waters & Worrall, of Cambridge, engineers for the scheme. The scheme was opposed by the Town Council of Cambridge, also the Cambridge Waterworks Company. Mr. Strachan, engineer, of Westminster, gave evidence on behalf of the Water Company.

SEWER VENTILATION, BIRKENHEAD.—A monthly meeting of Birkenhead Town Council was held on the 2nd inst. in the Birkenhead Town Hall when Alderman Singleton, in moving the minutes of a special joint meeting of the Health and the Road and Improvement Committees, in reference to the ventilation of sewers, said the committee had come to the conclusion that ventilation should be provided by upcast ventilation instead of surface gratings immediately in case of streets 30 ft. in width or under, and as occasion arose with wider thoroughfares. The committee were unanimously of opinion that surface gratings should be closed at once in such narrow streets, as it was there, if anywhere, that danger arose from sewer-gas, whereas in wide areas there was little, if any, danger. It was not meant, of course, that the gas should be extracted from the sewers, but merely to provide a vent which would permit the escape of gas whenever pressure occurred, and thus prevent its finding its way into the houses. The proceedings were adopted.

STAINED GLASS AND DECORATION.

WINDOW, ST. CHAD'S, HEADINGLEY.—A stained-glass window has just been erected in St. Chad's Church, Far Headingley, Leeds, by Mr. John Kirk, of Headingley, in memory of his wife. The window, consisting of two lights, illustrates the coming to the tomb of the three Maries on the morning of the Resurrection, and is a copy of the altar-piece in Molde Church, Norway. The work is from the studio of Messrs. Powell Brothers, of Leeds.

MEMORIAL WINDOW, TRINITY CHURCH, NOTTINGHAM.—A stained glass memorial window, the work of Messrs. Henton, Butler, & Bayne, of London, has been placed in the south-east wall of the church of Trinity Church, Nottingham.

MEMORIAL WINDOWS, ASHILL CHURCH, NORFOLK.—Two memorial windows have been placed in St. George's Church, Ashill. The east window is in memory of the Rev. E. Edwards, at one time a rector of the parish. The other window is in memory of the late rector the Rev. C. W. N.

Custance, and is in the south side of the chancel. The new stonework in the windows was designed by Mr. A. H. Rowe and executed by Messrs. Corfield & Gaymer, of North Walsham. The glass was by Messrs. Lavers & Westlake, of London.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The firm hitherto known as that of Messrs. E. & H. Lumley, last agents and auctioneers of 27, St. James's-street, has been registered as a limited company under the style of "Lumleys, Limited." The constitution of the firm remains unchanged; Mr. Henry Lumley will be Governing Director and will give the same attention to the business as formerly.

—Messrs. Hayward Bros. & Eckstein, of Union Iron Works, Borough, have purchased the goodwill, patterns, plant, &c. of the Alliance Ventilating Company, late of 17, Bethnal Green-road. The firm of Ewart & Son (346 to 350, Euston-road, N.W.), sheet metal workers and copper roofing contractors, have converted their business into a limited liability company, and in future will be known as "Ewart & Son, Limited."

DISTRICT SURVEYOR.—BERMONDSEY.—Mr. T. Barnes Williams has resigned his appointment as District Surveyor for the district of Bermondsey, St. Mary Magdalen and St. John; St. Olave, and St. Thomas, Southwark.

ST. PAULS, COVENT GARDEN.—The Communion plate and the registers of this church were saved from the fire of 1785, but the latter have never again been entered. We are informed that this has now been done as far as the marriages are concerned, and those of the baptisms and burials will be completed shortly. The work is being prepared by Mr. H. Farrar, assisted by Messrs. T. C. Black and Harold and Percy Werwick, who have presented cases as covers for the slips. The registers of burial include some celebrated names, among those of Grinling Gibbons, Thomas Arne, and Macklin.

STREET REFUSE IN THE CITY.—The Corporation have for some time past been considering the question of dealing with dust and refuse from the City, and, among other things, the practicability of generating electricity from steam raised by burning the refuse. Mr. D. Ross, the City Engineer, reporting to them on the subject, states that last year 74,621 loads of refuse were removed from the City to Lett's Wharf, Lambeth, near Blackfriars Bridge, the lease of which expires in 1909. About 60 per cent. of the house and trade refuse is cremated, but the street sweepings, slop, and market refuse are shot into barges and removed daily. The Corporation, having permitted two electric lighting companies to obtain powers to supply electricity for lighting and other purposes, could only generate electricity for their own purposes or for street lighting. They were in a totally different position to other local authorities who are supplying electricity in their various districts and who are cremating their refuse and utilizing the power generated therefrom in connection with their electricity works. It was extremely doubtful whether the house and trade refuse could be profitably dealt with by cremation, as it consisted principally of paper, straw, and packing materials of very little calorific value, exceedingly bulky and difficult to manipulate. Although from a sanitary point of view cremation was preferable to any other method of dealing with the refuse, mature consideration leads Mr. Ross to believe that, having regard to the difficulties of obtaining a suitable site in the City and the expense thereby entailed, and to the difficulties that would arise in working any apparatus that might be erected without being stopped by legal proceedings, the objections to this course were almost insuperable, and in his opinion it would be better to barge the refuse direct into the country from the City than deal with it there. Mr. A. A. Voysey, the Electrical Engineer of the City, has also made a report to the Corporation on the subject. The Streets Committee, on these reports, have advised the Corporation to barge the dust and refuse into the country and to obtain some suitable site for the purpose. The question will be decided on the re-assembling of the Corporation after the vacation.

PAVING MATERIALS IN ABERDEEN.—The quantity of granite sets used for paving purposes in the city during the past twelve months is the smallest for several years, and shows a great falling-off compared with 1899, when the quantity of paving blocks laid in Aberdeen amounted to 1,070 tons. Of this quantity 817 tons were required for the paving of Great Northern-road, and that accounts for the exceptionally large quantity used in 1899. Last year the total quantity reached only 1,181 tons, which is certainly a very small tonnage for a city like Aberdeen. There is also a considerable decrease in the quantity of rubble used for street purposes, which amounted only to 4,600 tons, and shows a falling-off to the extent of 3,021 tons, or nearly one-half, but the quantity was greater than that of 1897. Of road metal 20,754 tons were used, which is nearly the same as 1899. In granite kerbing there has been a decrease of more than one-half, the quantity being 3,422 lineal yards as against 7,467 lineal yards, a decrease of 4,045 lineal yards; but in granite pavement an increase of 21 square yards falls to be recorded, the quantity being

890 square yards, compared with 643 square yards in 1899. Concrete pavement shows a decrease of 10 square yards, the figures being 6,081 square yards and 6,074 square yards respectively. One of the most interesting features in connection with the paving of the city is the large increase in the use of adamant pavement. In 1899 the quantity laid amounted to 1,682 square yards, while this year it has risen to 11,425 square yards. In the course of last year 10,737 square yards of tar macadam were laid, while in 1899 the amount was 9,026 square yards, showing an increase of 6,811 square yards. While this large quantity of tar macadam has been laid down, a very large quantity has been scraped up. In some of the thoroughfares where tar macadam has been used, tons upon tons of stuff have been swept, scraped, and washed away in the shape of black mud and gravel.—*Aberdeen Journal.*

THE ENGINEERING TRADES IN 1900.—According to Messrs. Matheson & Grant's half-yearly report the year 1900 has not been quite so profitable to manufacturers as 1899, when the maximum prices were obtainable without that increase in the cost of fuel, material, and labour, which has since taken place. It is to the economies obtained by the full employment of the iron works, as much as to high prices, that manufacturing engineers have owed their profit, and it will be to a lessened demand that a reaction will be due. In some branches this time has already arrived, for though contracts in hand keep most of the works busy, new orders are not so abundant as in the spring. There is no longer difficulty in obtaining prompt delivery of material, iron and steel, which in the previous year was selling at 65s. per ton, alike in Scotland and Middlesborough, had risen to 70s. and 75s. respectively in April, the north country iron being thus dearer than Scotch instead of being cheaper as in normal times. Cargoes from America arrived in this country during the spring and summer at lower prices than those which had a continuance of such imports was threatened; and as, meanwhile, the price of coke had risen to an unprecedented level, the owners of blast furnaces in this country found difficulty in selling their product on remunerative terms. The famine in coke was ended; the price fell during the summer and autumn as the demand for pig iron slackened, and at present the prospects of the iron masters are rather gloomy. Finished iron has followed much the same course. Ordinary bars which were saleable at 101. to 111. per ton in April, now, by a succession of reductions, stand at only at 81. "Marked bars," bearing well-known brands, have been least affected, and "Best Yorkshire" iron remains at the same high price to which it was raised a year ago. The heavy steel trade has had to meet Continental and American competition. Owing to the great demand during the summer and to the concert among manufacturers the prices of English rails reached 77. 10s. per ton for heavy sections, and in consequence several large purchases for the Colonies and India, which in ordinary course would have been supplied here, were bought from America. The present price of heavy rails is about 61. per ton, and there has been a corresponding fall in the values of the structural steel used by ship and bridge builders.

BUILDING INSPECTORSHIP.—Mr. Alfred T. Mills, Associate Sanitary Institute, Sanitary Inspector of the Borough of Bethnal Green, has been appointed Building Inspector to the Hornsey District Council.

THE TIMBER MARKET IN 1900.—In Messrs. Foy, Morgan, & Co.'s annual wood report for 1900, it is stated that the volume of the import last year was very great, being largely in excess of both 1898 and 1899, and practically the same as in 1897, while in value, owing to the exceptional rise in prices during the last two years, the past year surpasses even that of 1897 by several millions of pounds sterling. But while this is true of the totals, the facts that have most importance for the soft wood trade are only to be discovered from an examination of the details, and it would then appear—after setting aside the statistics of hewn wood (which include, beside timber and balks, such items as pit-props, round wood for pulp, &c.), and thus confining attention to the main importation of deals, battens, boards, and floorings—that there has been no difference of any practical importance between the quantities imported during the last three years either from Russia or Sweden or Norway or Canada. The quantity imported during 1897 from the same countries appears to have been in the case of Russia and Scandinavia 4 per cent. to 5 per cent. and in the case of Canada 15 per cent. larger than in any of the last three years. The only exporting country, and that by far the least important among our sources of supply, which has increased its shipments here is the United States, and inasmuch as its chiefest product, sawn pine timber, is used as a substitute for the hewn fir for the most part shipped from Germany the increase in such supplies would appear to be nominal only, and largely explainable as a simple transfer in our Customs' return from one category to the other. That portion of the import, then, which concerns the building, joinery, packing case, and allied trades has by no means tended to increase, but, on the other hand, has shown a marked diminution. In 1897 the face, however, of the great visible increase in stocks now held in such places as London, Hull, Hartlepool, Newcastle, Sunderland,

Cardiff, Swansea, Dublin, and Belfast, the statistics seem opposed to obvious facts, but the explanation doubtless lies in the conditions regulating the supply of tonnage. The establishment of liners, the gradual disappearance of sailing vessels and small steamers, besides the preference given particularly when freight is high to large ports, especially when also coal ports, where good despatch and low expenses can, as a rule, be relied upon—all serve to concentrate importation into the larger centres, which thus are made to serve a more extended area to the detriment of the smaller ports, handicapped as these are by want of tonnage facilities. The consumption during the past year has not continued on its previous satisfactory level. A twelvemonth ago some tendency of slackening was observed, and this has increased during the year, under the screen of high prices, so as to show a total decline of about 10 per cent. Whether continued or not, the consuming power of the market is even now brought down to within 5 per cent. of what it was in 1897, so that, comparing prices ruling then with those current to-day, it becomes a critical problem whether the present conditions of supply and demand are such as to support the scale of prices now in vogue.

NEW SURVEYING INSTRUMENTS.—Amongst the more recent surveying instruments introduced by Messrs. W. F. Stanley & Co., Limited, of Great Turnstile, W.C., some improved levels and theodolites are worthy of notice. The "New Model" level is an excellent instrument with a very rigid stand and a tribrach stage permitting the level to be used on a wall without the legs. An improved "Quick Setting-up" level has a head which combines the advantages of the Hoffman levelling joint and the tribrach system. This method of construction allows a considerable range of adjustment, so that the instrument can be used on very uneven ground. It can be rapidly set up, and may be employed without the legs if necessary. Each of these levels is supplied either with or without a prismatic compass, which, in the opinion of some surveyors, is an unnecessary addition, for the reasons that levelling and traversing cannot profitably be conducted simultaneously and that the level does not afford a particularly suitable mount for such an adjunct. Stanley's theodolite is a most serviceable combination of level and clinometer, for employment when the ordinary type of level would be at serious disadvantage, as, for instance, on sloping ground. The new model railway theodolite, as its name implies, is designed specially for railway engineers; it is a compact and steady instrument, levelled on the tribrach system, and is fitted with a patent locking-plate, making the instrument available for use on masonry or ironwork, as well as upon the stand. Stanley's new transit theodolite is particularly noticeable for solidity of construction, and it includes other improvements as to details, which should be conducive to additional accuracy of the work performed.

CARPENTERS' COMPANY.—We may draw the attention of workers in wood to the important exhibition of the Carpenters' Company to be held in June this year, of which an advertisement was found in the present issue. We gave a general sketch of the scheme of the exhibition in a "Note" in our issue of July 7 last year, when the circular regarding the exhibition was first sent to us.

A NOTABLE CHIMNEY-SHAFT.—Although surpassed in height by several chimneys in this country, the new shaft of the Metropolitan Street Railway power station, New York, is of greater diameter and power than any similar structure in the world. Its height is 255 ft., and the internal diameter 22 ft. from bottom to top. The chimney is designed to serve a battery of eighty-seven steam boilers, each of 800 h.-p. maximum, equal to a total of nearly 70,000 h.-p. Preliminary borings on the site indicated that the first 15 ft. in depth consisted of heterogeneous material, and that below this there were beds of sand gradually becoming coarser and more like hardpan until the depth of 75 ft. was reached. Below this level blue clay extends to an unascertained depth. After the necessary excavations had been made, piles 45 ft. long were driven into the coarse sand, to afford a sufficient bearing for the concrete foundation, the piles being spaced about 30 in. apart, centre to centre. The concrete bed is 20 ft. thick, and covers an area of 88 ft. square. Ordinary brick was used for the greater part of the chimney, which has two shells. The inner one is only strong enough to support its own weight, including that of the fire-brick lining; the other is designed to carry its own weight and the horizontal wind load, taken in this instance at 50 lbs. per ft., or 5 lbs. less than the load usually assumed by British engineers. For the purpose of increasing stability and stiffness, counterforts, or ribs, were built into the inner surface of the outer shell. These extend to within about 2 in. from the inner shell, and thus form guides for its movement during expansion or contraction. Flues from the boilers enter from opposite sides on each of the three floors on which the boilers are carried, and there is a baffle-wall in the middle of the shaft reaching a little way above the uppermost inlet flue, so that the products of combustion may be directed upwards, and be prevented from interfering with the discharge from the flues on the opposite side of the chimney. An internal lining of fire-brick extends to about 50 ft.

above the highest flue opening. The structure is finished with a cast-iron cap, made in sections and bolted together when in position.

OPEN SPACES.—The Executive Committee of the Commons and Footpaths Preservation Society have instructed their solicitor to draw up a report upon the private Bill (not yet thirty in number) which are prepared for next Session of Parliament, and which would encroach upon open spaces, village greens, and commons to the extent of taking an aggregate of 1,200 acres of common land for new waterworks and 350 acres for tramways and railways.—The Metropolitan Public Gardens Association have under consideration the making of schemes for the acquisition and the laying-out of Hoxton-square, Leyton-square, S.E., and certain vacant lands at Hackney, Bethnal Green, Hampstead, and elsewhere in London. During the eleven months January–November, 1900, the Association's income was less by about 700*l.* than during the corresponding period in 1899.—The London County Council have agreed, in consideration of a sum of 5,600*l.*, as estimated by their Finance Committee, to transfer to their Parks Committee the charge of the portion of the Falcon-court, Southwark, area, recently cleared in pursuance of the Housing of the Working Class Act, 1890, for the purpose of an open space, and to lay out and maintain the ground. The Council have further resolved to expend 7,000*l.* in buying the garden ground of Albert-square, Commercial-road, E.; and to contribute one-half of the cost of the acquisition by the Lewisham District Board of about 8 acres, known as the Home Park estate at Lower Sydenham, subject to a maximum contribution by the Council of 2,800*l.* and to an agreement by the District Board to retain the ground for the public benefit and for recreational enjoyment in perpetuity. The Council anticipate that the laying-out of the Archbishop's Park at Lambeth will be completed in the course of five or six months; there will be a new entrance from Carlisle-place. The total cost of the works is computed at nearly 5,000*l.*—The Enfield District Council propose to purchase for 7,000*l.* a portion, being rather more than 13 acres, of the Chase Side House estate, towards which Mr. Bevan and Mr. J. W. Ford contribute 500*l.* apiece. At Leeds, the City Property Committee have agreed to recommend the acquisition for 35,000*l.* of the Harehills Park estate, about 32 acres, and for 14,000*l.* of another site in Harehills-lane.

THE LABOUR MARKET IN THE COLONIES.—The January Circular of the Emigrants' Information Office states that in New South Wales the break-up of the drought last year has much improved the prospects of all kinds of labour; but there were throughout the year large numbers of unemployed in Sydney, many of whom were provided with work by the Government Labour Bureau at quarrying, railway construction, &c., the ordinary wage being 7*s.* a day. The demand for mechanics is not large, but competent men can generally get work without much delay; they should have some money with them on landing. The building trade in Sydney has been unusually busy. At Newcastle also there has been a demand for good turners, blacksmiths, fitters, ironmoulders, carpenters, &c. in Victoria there is no demand for mechanics or labourers, unless they are specially skilled, and bring a little money with them. In South Australia there is practically no demand for more mechanics in the towns, but a skilled hand can generally find employment after looking about for a little. With regard to Western Australia, it should be remembered that the population of the colony, though it has rapidly increased, is still small, and that therefore the demand for all kinds of labour is necessarily limited. Official returns for the quarter ending September 30 last show that the supply of mechanics is sufficient everywhere except at Katanning and Yilgarn, and for good men in the building trades at Perth. In Tasmania mechanics at Zeehan, Queenstown, and Gormanston, on the west coast, and in the surrounding districts, are well employed; good fitters can generally get work, but otherwise the labour market there is on the whole well supplied with men. The last reports from New Zealand show that there was plenty of work there except in the meat-freezing works. Good boiler-makers have been in demand at Christchurch. There has been a great demand at Dunedin for a limited number of good stone-masons, and several openings for a few first-class fitters and turners. At Invercargill, carpenters, bricklayers, and stone-masons have been especially busy, and men have been hard to get, even at an advanced rate of wages. Persons are warned against going to South Africa at present in search of professional or manual work, unless they have ample private means to meet the very high cost of living. They will not as a rule be allowed to proceed up country. There are already large numbers of persons in South Africa at the present time who are out of employment.

GLASGOW ENGINEERING CONGRESS, 1901.—This congress is to be held in Glasgow in the first week of September, 1901, and will meet in the University Buildings. Papers will be read on two or three days and excursions to works of engineering interest and social gatherings will be arranged. Lord Kelvin has consented to act as Honorary President, and the President and Council of the Institution of Civil Engineers have consented to the nomination of the

President of that Institution as President of the Congress. Among the subjects proposed to be treated are—Sewage and Sewage Disposal; Streets (including questions of paving and cleansing, the removal of snowfall from streets, traffic regulation, &c.); Light Railways and Tramways; Street Lighting; Removal of House Refuse; Utilisation of Dust Destruction for Power Generating; Smoke Abatement; Housing of the Working Classes; and Superannuation.

THE SHANNON MONUMENT, WALTON.—We learn that Mr. F. J. Williamson, of Esher, has been commissioned to carry out a restoration of the monument, designed and sculptured by Roubilliac, erected in Walton Church, Surrey, in memory of Richard Boyle, second and last Viscount Shannon, who died in December 20, 1740.

LEGAL.

EMPLOYERS' LIABILITY ACT.

QUESTION AS TO WHO WAS THE EMPLOYER.

AT Brompton County Court recently, before Judge Stomton, Mr. John Gilbeart, builder, 11 and 12, Chester-street, Belgrave-square, S.W., was sued, under the Employers' Liability Act, by John Spanner, jun., Battersea, the claim being in respect of personal injuries sustained by the plaintiff owing—it was said—to negligence for which the defendant was responsible. John Spanner, sen., father of the plaintiff, brought a similar action against the same defendant.

Mr. G. Aplin Nichols, solicitor, appeared for the two plaintiffs; and Mr. J. Jones, counsel, defended the case of the son who was taken first.

The plaintiff stated that on May 4 last he was helping his father to fix linacrusta to a ceiling at 50, Eaton-place. In order to reach the ceiling the defendant provided them with trestles upon which scaffold boards were placed. While standing on one of these boards and pressing the linacrusta up to the ceiling, a tread of one of the trestles suddenly gave way, and both he and his father fell a distance of some 5 ft. to the ground. He was taken to St. George's Hospital, and was unable to do any work for five weeks. He found that one of the trestles of the tread that gave way had been sawn too deeply, and he thought that this defect might have been discovered by putting a weight upon it, or placing the blade of a knife in the joint.

Cross-examined: Neither he nor his father examined the trestles before they went on them.

John Spanner, sen., the father, said that he did not put in a price for the work in question, but reckoned up the number of hours, and charged what he considered reasonable.

Arthur Dyer, another employee, maintained that the trestles were defective in the making, owing to the saw running too deeply when the tenon was cut. Trestle-makers generally tested their goods before sending them out for use.

Mr. Jones submitted that the plaintiff was not in the employ of the defendant at the time of the accident, and so could not recover under the Act. There was no evidence to show that Mr. Gilbeart exercised any control whatever over the two men. They came to work when they liked, and charged practically what they liked.

The Judge: But was there a contract?

Mr. Jones: There was a contract, of course, to do the job. The learned counsel went on to refer to the case *Hunt v. Moullin*.

Mr. Nichols submitted that the elder plaintiff was in the employ of the defendant, because he had entered into a contract to work for him.

Mr. Jones replied that it was the son's case that they were then dealing with, and that the young fellow could not be held to be in the employ of the defendant, for he admitted being engaged in assisting his father.

The Judge: With regard to the son, I shall non-suit.

Mr. Jones offered to forego all costs if the case brought by the senior plaintiff were struck out.

Mr. Nichols consulted with his client, and afterwards agreed to the case being struck out as suggested by the defendant's counsel.

MEETINGS.

FRIDAY, JANUARY 11.

Institution of Civil Engineers (Students' Meeting).—Address by Mr. Williford Airy, B.A., on "Geodesy." 8 p.m.

Architectural Association of Ireland (Technical Demonstrations).—Mr. John McGloughlin on "Constructional Work" (at No. 47, Great Brunswick-street). 4.30 p.m.

Glasgow Architectural Craftsmen's Society.—Professor Gourlay, B.Sc., on "A Tour in Germany, Switzerland, and Italy," with lime-light illustrations. 8 p.m.

SATURDAY, JANUARY 12.

Dundee Institute of Architecture.—Mr. R. S. Douglas on "Architectural Decoration—(1) as Clothing; (2) as Structural." 8 p.m.

MONDAY, JANUARY 14.

Surveyors' Institution.—Adjourned discussion on Mr. R. E. Middleton's paper on "The Future of the London Water Supply." 8 p.m.

Institution of Mechanical Engineers (Graduates' Meeting).—Professor J. A. Ewing on "The Structure of Metals," illustrated by lantern slides. 8 p.m.

Society of Arts (Cantor Lectures).—Mr. J. Liberty Tadd on "Elementary Art Education." 8 p.m.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

CONTRACTS.

Nature of Work or Materials.	By whom Required.	Forms of Tender, &c., Supplied by	Tenders to be delivered
Bridge, Balgig Burn	Dunoon (N.B.) Commissioners	Mr. Mackintosh, Civil Engineer, Dunoon	Jan. 15
Filter Beds, &c., Acomb Landing	York Waterworks Company	W. H. Humphreys, Waterworks Offices, Leulahl, York	do.
Hotel, Barrow-in-Furness	Wolverhampton Corporation	Harrison & Co., Architects, 36, Abbot-road, Morecambe	do.
Tranways (4 1/2 miles)	Cuckfield R.D.C.	J. W. Bradley, Borough Engineer, Town Hall, Wolverhampton	do.
Hospital, Burgess Hill	Caerphilly U.D.C.	G. T. Bille, Architect, 35, Parliament-street, S.W.	do.
Workshops and Five Houses, Boothtown, Halifax	Kawarasan U.D.C.	R. Berry, Architect, Halifax	do.
Streets Works, Commercial-street, &c.	Lewisham Borough Council	A. O. Harper, Surveyor, Council Offices, Caerphilly	do.
Cast-iron Sewage Main	Peplar Borough Council	W. J. Petch, Council Offices, Kawmarsh	do.
Sewerage Works	Burley Corporation	Surveyor's Department, Town Hall, Catford, S.E.	do.
*Kerbing and Tarpaving	Leeds Corporation	Boro Elec. Engr., Electricity Works, Glaucus-st., Bromley-by-Bow	Jan. 16
Electric Crane	Leeds Corporation	J. F. Leather, Gas Engineer, Gas Works, Burley	do.
Furriers, Roof, &c., at Gasworks	Leeds Corporation	City Engineer, Municipal Buildings, Leeds	do.
Wrought Iron Fencing, &c., Jowett's Park	Leeds Corporation	St. M. Grove, Civil Engineer, Town Hall	do.
Boundary Wall, Grove Hall	Aberdeen District Committee	Jenkins & Marr, Civil Engineers, Aberdeen	do.
Water Mains, &c., Culls	Ebbw Vale (Mon.) U.D.C.	J. Berry, Architect, 9, Queen-street, Huddersfield	do.
Shop, &c., Thornton-road, Huddersfield	Preston (Lancs) Corporation	Carter & Co., Market-hill, Cambridge	do.
Cast-iron Pipes, &c.	Leeds Corporation	T. Hughes, Council Offices, Ebbw Vale	do.
Bandstand, &c., North-street	Leeds Corporation	City Engineer, Municipal Buildings	Jan. 17
Paving Works, Ashton	Leeds Corporation	Borough Surveyor, Town Hall, Preston	Jan. 18
Additions to shops, Salford	Leeds Corporation	E. C. Evans, Town Hall, Salford	do.
Two Villas, Northland-road, Epsom	Leeds Corporation	R. V. Doye, Architect, strand, Londonderry	do.
Council Chamber, Offices, &c., Newport	Leeds Corporation	W. Tanner, Surveyor, Newport, Mon	do.
Granite Setts, &c.	Leeds Corporation	A. Durbie, Civil Engineer, Council Chambers, Gourock	do.
Thirty-two Houses, South Bank, York	Leeds Corporation	G. O. Beadle, Redcar-road, South Bank	Jan. 19
Additions to St. Saviour's Church, Weston-super-Mare	Leeds Corporation	White & Fry, Architects, Weston-super-Mare	do.
Hartshill Stone	Banbury Town Council	N. B. Dawson, Civil Engineer, Town Hall, Banbury	do.
Church, near Todmorden	Banbury Town Council	Borcham & Murton, Surveyors, 24, John-street, Sunderland	do.
*Fencing	London County Council	Parks Department, 11, Regent-street, S.W.	Jan. 21
Cast-iron Socket Pipes	London County Council	Borough Surveyor, Council Hall, Rotherham	do.
Street Works	London County Council	W. J. Newton, Civil Engineer, Town Hall, Accrington	do.
Retorts, Fire-clay, &c.	Bury (Lancs) Corporation	H. Simmonds, Engineer, Gasworks, Bury	do.
Villa, Glasgow-road, Perth	Mr. Boyd	J. Fraser, Civil Engineer, Liveness	do.
Bridge Works, Stronway, N.B.	Lewis District Committee	J. Wood, Engineer, Bridge-street, Todmorden	do.
Weaving Shed, Walden	Pioneer Mill Co., Ltd.	Chief Surveyor, Council Offices, Chelmsford	do.
Road-making Plant, Iford	Essex County Council	E. A. Whitaker, Architect, 1, Great-st.-buildings, Basinghall-st.	do.
*Laying-out, &c., of Cemetery at Uplminster	Essex County Council	Borough Engineer, Plymouth	do.
*Rails, Fish Plates, &c.	Essex County Council	Council House, East Hill, Wandsworth	do.
*Making-up Roads	Essex County Council	S. J. Newman, Architect, 3, Tunusoy-buildings, Branksome	Jan. 22
Additions to Council Buildings	Essex County Council	E. M. Whitaker, Architect, 1, Great-st.-buildings, Basinghall-st.	do.
Road Metal	Essex County Council	Engineer, 712, High-road, Tottenham	do.
Sewers	Essex County Council	S. Mather, Civil Engineer, Ewell-road, Surbiton	Jan. 23
Public Mortuary, Road Works, &c.	Essex County Council	G. T. Wilson, Architect, 121, Durham-rd., Blackhill, Co. Durham	do.
Additions to Hospital, Langley Park	Essex County Council	A. Allan, Engineer, Gasworks, Nelson	Jan. 24
Gas Purifying Plant, Brierfield	Essex County Council	H. Edwards, Civil Engineer, Town Hall, Remington-greys, S.E.	do.
Jarrah Timber	Lambeth Borough Council	Thomson & Sandilands, Architects, Glasgow	Jan. 25
Hospital, Stobhill, Springburn	Lambeth Borough Council	County Surveyor, County Hall, Lewes	do.
*Sessions Court, &c.	Lambeth Borough Council	See Advertisement	do.
*Coast Guard Buildings at Dunensis, near Falmouth	Lambeth Borough Council	do.	do.
*Coast Guard Buildings at St. Mawes, near Falmouth	Lambeth Borough Council	do.	do.
Waterworks, near Arundel, Sussex	Lambeth Borough Council	H. Howard, Engineer, Town Offices, Littlehampton	Jan. 26
Schools, Hall, &c., St. David's, Pembroke	Lambeth Borough Council	D. E. Thomas, Architect, Haverfordwest	do.
Gas Engines and Pumps	Lambeth Borough Council	Deputy Borough Engineer, Town Hall, Croydon	Jan. 29
Fire Station and Cottage	Lambeth Borough Council	W. Harston, Surveyor, High-street, Dartford	do.
*Additions to Schools	Lambeth Borough Council	See Advertisement	do.
Schools	Lambeth Borough Council	T. W. Latham, Architect, Kingsbridge	Jan. 30
*Isolation Hospital near Burgess Hill, Sussex	Lambeth Borough Council	G. T. Hinge, Architect, 35, Parliament-street, Westminster, S.W.	Jan. 31
Gasworks Plant, Prantton	Lambeth Borough Council	W. R. Herring, Engineer, Gasworks, New-street, Edinburgh	Feb. 1
*Lecture Room	Lambeth Borough Council	C. P. Aynes, Architect, Burvaile, Watford	No date
Church and School, Beeston-hill, Leeds	Lambeth Borough Council	W. G. Smithson, Architect, 13, Bon-a-street, Leeds	do.

PUBLIC APPOINTMENTS.

Nature of Appointment.	By whom Advertised.	Salary.	Application to be in
Clerk of Works	Dorking R.D.C.	Sl. 3s. per week	Jan. 16
*Clerk of Works	Bodmin Corporation	Jan. 19
Assistant Surveyor	Taunton R.D.C.	170l. per annum	do.
*Engineering Assistant	Croydon County Council	Jan. 23
*Sanitary Inspector	Woolwich Borough Council	104l. per annum	Jan. 28

Those marked with an asterisk (*) are advertised in this Number. Competitions, p. vi. Contracts, pp. iv. vi. viii. x. & xxi. Public Appointments, pp. xviii. xix. & xxi.

Clerks of Works Association (Carpenters' Hall) - Paper by Mr. Lewen Sharp, 7.30 p.m.
 Bristol Society of Architects - Mr. Frank Cowlin on "Building Contracts from a Contractor's Standpoint," 8 p.m.
TUESDAY, JANUARY 15.
 Society of Arts (Applied Art Section) - Mr. Cyril Davenport, F.S.A., on "Comes," 8 p.m.
 Royal Institution - Prof. J. A. Ewing, M.A., on "Practical Mechanics (experimentally treated): First Principles and Modern Illustrations," 8 p.m.
 Institution of Civil Engineers - Papers to be further discussed: - (1) "Glasgow Bridge," by Mr. B. H. Blyth, M.A. (2) "Railway Bridge over the Fitzroy River, at Rockhampton, Queensland," by Mr. W. J. Deak, B.E. (3) "The Niagara Falls and Clifton Steel Arch Bridge," by Mr. Lefferi Lefferi Buck. Paper to be submitted for discussion: - "The Present Condition and Prospects of the Panama Canal Works," by Mr. J. T. Ford, 8 p.m.
WEDNESDAY, JANUARY 16.
 Society of Arts - Mr. H. Snowden Ward on "Photo-

graphy of Natural Colours by the McDonough-Joly Process," 8 p.m.
 St. Paul's Ecclesiastical Society - Paper by Mr. F. Herbert Mansford, entitled "Notes on City Churches," 7.30 p.m.
 Builders' Foremen and Clerks of Works Institution - Annual meeting, 8 p.m.
 British Archaeological Association - Dr. Fryer, M.A., on "Forts in Cornwall," 8 p.m.
 Institution of Civil Engineers - Students visit to the Ventilation, Warming, Drainage, and Lighting arrangements at the Houses of Parliament. Assemblage at the Chancellor's Gate, Abingdon-street, Westminster, 2.30 p.m.
 Edinburgh Architectural Association - Professor G. Baldwin Brown on "Colour in Architecture," 8 p.m.
THURSDAY, JANUARY 17.
 Society of Arts (Indian Section) - Dr. John W. Evans, D.Sc., on "Metalliferous Mining in India," 4.30 p.m.
 London Institution - Mr. E. Stuart Bruce, M.A., on "Modern Aeronautics," illustrated, 6 p.m.

FRIDAY, JANUARY 18.
 Architectural Association - Mr. Edwin T. Hall on "Flats," 7.30 p.m.
 Royal Institution - Professor Dewar, M.A., on "Gases at the Beginning and End of the Century," 9 p.m.
 Institution of Mechanical Engineers - Fifty-fourth annual general meeting. Election of President and members of council. The first presentation by the Institution of the Williams Premium will be made to Captain H. Rial Sankey; and the prizes awarded by the council for the best two papers in the Graduates' Section will be presented to Mr. W. B. Cleverly and Mr. Bress van Homan. The adjourned discussion will be resumed upon the following paper, by Mr. H. A. Humphrey, on "Powergas and Large Gas-engines for Central Stations," read at the December meeting, 8 p.m.
 Architectural Association of Ireland (Technical Demonstrations) - Mr. Malcolm on "Limes, Lathing, Plastering, Cement," &c. (at Messrs. G. Rome & Co.'s, 22, Moss-street), 4.30 p.m.

PRICES CURRENT OF MATERIALS.

*. Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

BRICKS, &c.

Table listing prices for various types of bricks and building materials, including Hard Stocks, Rough Stocks, and Glazed Bricks.

NOTES

The cement and lime is exclusive of the ordinary charge for sacks. Grey Stone Lime... 13s. 6d. per yard, delivered.

STONE.

Table listing prices for various types of stone, including Ancaster in blocks, Bath, and Farleigh Down Bath.

SLATES.

Table listing prices for various types of slates, including best blue Bangor and best second.

TILES.

Table listing prices for various types of tiles, including Best plain red roofing tiles and Hip and valley tiles.

WOOD.

Table listing prices for various types of wood, including Deals, Battens, and Planks.

PRICES CURRENT (Continued).

WOOD.

Table listing prices for Fir timber, including Best middling Danzig or Memel.

JOINERS' WOOD.

Table listing prices for various types of joiners' wood, including White Sea, Petersburg, and Yellow Pine.

Table listing prices for various types of wood, including Yellow Pine, Kauri Pine, and Dry Mahogany.

JOISTS, GIRDERS, &c.

Table listing prices for various types of joists and girders, including Rolled Steel Joists and Compound Girders.

METALS.

Table listing prices for various types of metals, including Iron, Steel, Lead, Zinc, and Copper.

PRICES CURRENT (Continued).

METALS.

Table listing prices for various types of metals, including Brass, Tin, and Solders.

ENGLISH SHEET GLASS IN CRATES.

Table listing prices for various types of English sheet glass in crates, including 15 oz. thirds and 32 oz. thirds.

OILS, &c.

Table listing prices for various types of oils, including Raw Linsed Oil and Turpentine.

VARNISHES, &c.

Table listing prices for various types of varnishes, including Fine Elastic Copal Varnish and Best Hard Copal Varnish.

TO CORRESPONDENTS.

B. H. & Co.—H. C.—W. S. (Amounts should have been stated.) NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

BURY (Lancs).—For the execution of private street works for the Corporation. Mr. A. W. Bradley, C.E., Town Hall, Bury; Peter Booth, Breightmet, near Bolton; Samuel Fletcher, Heywood; Salisbury & Williamson, Blackpool; H. A. Sampson, Rochdale; Ratcliffe & Woodhead, Bury.

CHESTER.—For the construction of sewers, Little Sutton, for the Wirral Rural District Council. Messrs. Beloe & Priest, MM. Inst. C. E., 13, Harrington-street, Liverpool:—
 J. E. Gabbitt £10,700 7 10
 Charles Burt 9,923 0 0
 W. Jowett 6,259 6 7
 Marr & Sons 8,634 0 0
 F. Philp & Eaton 8,110 13 4
 J. MacCabe 8,100 0 0
 J. Taylor £7,450 0 0
 Simon John-son, Ilam-son, Herghts, Manchester* 6,657 0 0

DUDLEY.—For sewerage Netherton and Woodside districts for the Corporation. Mr. John Gammage, Borough Engineer, Town Hall, Dudley. Quantities by surveyor:—
 Barnes & Co. £24,707 0 0
 S. Saunders 24,176 0 0
 W. Westwood 23,025 13 11
 J. Owens... 22,105 0 0
 J. Mackay... 21,945 2 4
 McCarty & Co. £21,927 0 0
 Hughes & Son 20,461 17 1
 Nowell & Sons 19,073 1 10
 G. Law, Kid-derminster* 17,897 0 0

HIGH WYCOMBE.—For the construction of the Queen Victoria-road, for Earl Carrington. Messrs. J. Carter, Jonas & Sons, surveyors to Lord Carrington:—
 S. Saunders... £2,660 0 0
 J. C. Trueman 2,650 0 0
 H. Flint... 2,446 1 9
 F. Talbot... 2,444 17 4
 J. Macklin... 2,304 8 1
 Lee & Son... 2,237 3 7
 T. Adams... 2,243 0 0
 Lawrence & Thacker... 2,213 10 9
 R. H. Park-inson £2,213 0 0
 Sidons & Free man, Oundle* .. 2,123 0 0
 H. Williams; 2,123 3 7
 W. Wilson* ... 2,471 12 4
 * Withdraw.

HULL.—For the erection of school buildings, Mersey-street, for the Kingston-upon-Hull School Board. Messrs. Gelder & Kitchen, architects, Lowgate, Hull. Quantities by the architects:—
 John Hootton, South-street, Hull* £15,798

LEEDS.—For additions and alterations to Lynwood, Roundhay. Mr. A. E. Dixon, architect, 5, Park-lane, Leeds:—
 Masonry and Bricklaying.—G. Nettleton & Sons, Roundhay* £210
 Joinery.—Banks Mawson, Monroes, Leeds* 189
 Plumbing.—F. L. Armitage, 89, North-st., Leeds* 41
 Slating.—Pickles Bros, Park-lane, Leeds* .. 26
 Plastering.—Thos. Moore, North-st., Leeds* 35
 Heating Apparatus.—Vincent Roberts, Skinner-lane, Leeds* 22

LYNTON (Devon).—For the erection of market house, &c., for the Urban District Council. Mr. W. H. Chowins, surveyor, Town Hall, Lynton:—
 Jones Bros. £549
 Woolaway & Barnstaple* £590

NEWMARKET.—For the erection of stabling at rear of Ye Cottage, Newmarket, for Mr. W. M. G. Singer. Messrs. Henton & Gibb, architects, Newmarket. Quantities by Messrs. W. H. Barber & Sons, 22, Buckingham-street, Adelphi, W.C.:—
 Pamphilon & Sons £700 0
 A. J. Bateman ... 642 0
 H. Holland ... 640 0
 Scates & Robins ... 634 10
 F. J. Linzell 609 0
 D. Walkeley £590 0
 J. G. Cowell, Sobam, Cambs* 590 0
 Robert Hunt* 525 0
 * Withdrawn.

Students' Designs at the Institute.

HERE has been an unusually large competition this year for most of the prizes offered by the Institute to architectural students. For the Soane medallion there are twenty-two competitors; for the Tite prize twenty-six; for the Grissell medal, not usually a popular prize, and generally not drawing more than half a dozen competitors, there are eighteen; and even the Essay prize, for which a single competitor has not infrequently had a walk over, has this year induced three gentlemen to express their opinions at length on the interesting question of "The Comparative Desirability of Formal or Irregular Treatment of Street Architecture in Large Cities." We do not know whether there is any special cause for it, but there certainly seems to have been a kind of awakening among the student ranks this year. This is gratifying in itself; and what is more gratifying is that the great increase is in the competitions in design (the Soane, the Tite, and Grissell prizes), in contradistinction to those which are for mere drawing; and this seems to indicate that our young architects are beginning to recognise that architecture really means design and not drawing, however charming and improving a pursuit is architectural sketching in itself.

When we turn from the question of quantity to that of quality, the result is not so satisfactory, more especially in regard to the Soane medallion. This we regard as the most important and valuable of all the Institute prizes, since it is the only one which is concerned with the complete design and planning of an important building, as it might be carried out in actual practice. The Tite prize might be given for a similar class of work, but the subject set for this prize has generally been (as it is this year) rather more of the character of ornamental architecture, and rightly so, as the special object of the prize was the study of Italian architecture, or of a type of architecture coming within that definition, as a matter of style. But the Soane medallion is for

architecture in the fuller and complete sense of the word—the working out of a building in the practical as well as the artistic sense; if indeed plan ought not to be considered as an essential part of the artistic design. And in this sense we fear it cannot be said that the results of the competition rise to the occasion. So far as the exterior treatment is concerned there are not many which can really be called good designs, and the most satisfactory in this sense are in almost every case marred by serious defects of planning. On the other hand there are some good plans which are accompanied by bad exterior designs. There is no single *ouoi* which rises to the height of the occasion, or which equals some of the productions which conferred honour on competitors of bygone days.

The subject is "A Club-House in a Large City"; a very good subject, attractive (obviously) and not too difficult in respect of technical requirements. It may be useful if we take the competition as the occasion for a few words in regard to the architectural requirements and treatment of a club-house. As far as architectural character is concerned, it should be borne in mind that a club is to a certain extent a domestic building, a building for daily life, and one which should therefore have both the appearance and the reality of comfort; but it expresses daily life deprived of its character of *intimité* and individuality; the home not of one family but of a number of individuals unconnected together by any family tie. It therefore naturally assumes a larger and more stately air than should belong to any private house except what is admittedly a mansion of State. Bridgewater House, which is a private mansion, has in fact all the characteristics of club architecture externally, but this is a residence of exceptional size and stateliness. As a club on a large scale is an appanage of the wealthier class, it may rightly express this in the sumptuous character of its architectural treatment, but at the same time it should avoid assuming anything of the appearance proper to a public building, or which may lead to its being mistaken for one. Such features therefore as a large dome, or a tower of any kind, are out of place and give a false impression of the object of the building; unless perhaps

in the case of a yachting club at the seaside, when a small tower may be appropriate as a place for a lookout to seaward. Nor, though there may be dignity, should there be anything like display or self-assertion; that is at variance with its character as a gentleman's house. The Reform Club, though it may be thought to err on the side of quietness and simplicity (externally), has much more of the proper club character than the Carlton, with its display of polished granite columns and pilasters. Generally speaking, the employment of a large "order" on the façade of a club is out of place, apart from general grounds of architectural criticism (which might condemn such a treatment in any building), as at variance with the semi-domestic character of a club; the Junior Naval and Military Club, in Piccadilly, for instance, looks a good deal too much like a Bank. A good many of the well-known Pall Mall clubs, although the architecture of some of them may not be worth very much considered in detail, represent the general ideal of club architecture exceedingly well. The United Service, the Athenæum, the Travellers', the Reform, the Army and Navy, and the Oxford and Cambridge, all have the proper club expression of dignity without showiness, and preserving something of the "house" character; perhaps the sculptured panels in the last-named give a little too much the suggestion of an Athenæum or public library. The New University Club, in St. James's-street, is also, in another style, a building with the semi-domestic character of a club, while the front of the Royal Societies Club in the same street, with its large plate-glass windows in the ground story, suggests the idea of an "emporium" with a showroom on the ground floor. Some large recent clubs, such as the National Liberal and National Constitutional, produce too much the impression of hotels; it is not very easy to say why, but they certainly have that *genre* about them. In regard to detail, a club building cannot be too refined and carefully considered; it should express the acme of refinement and good taste. We may add that the American architects seem to understand club architecture exceedingly well; a good many designs for buildings of this class which have been illustrated from time to time in the American professional journals are

perfectly admirable examples of what club architecture should be.

In the interior a club requires a pretty large hall and staircase, both for reasons of dignity and because there must be plenty of space for a large number of members to move about without being in each other's way. As far as architectural character is concerned there is no necessity for a great central staircase hall lighted from above; it may even be argued that there is a little too much of the public building character in this; but on the other hand it is the easiest way of securing light to the hall; the difficulty of adequate lighting otherwise is only too well exemplified in a good many of the Soane competition designs. Generally speaking a club is a tolerably easy kind of building to plan, as there is usually plenty of space, and the principal apartments are a few large rooms which present no difficulty in arrangement. Among the small mistakes of the Soane competitors, however, are that of providing only one door at the corner for entering a room 100 ft. long, and that of one competitor, "Thistle," in lighting one of the main front rooms with windows on opposite sides, an arrangement destructive both of comfort and (in a room next the street) of privacy, as passers-by can look right through it. The two little difficulties in the planning of the principal rooms occur in connexion with the billiard-room and with the strangers' department. For convenience of access, the billiard-room should be near the dining-room; for convenience of playing, in the daytime (and club billiard-rooms are often much used in the daytime), it should be lighted from the ceiling, which can often only be managed by putting it on the upper floor. In an American club this would not matter, as there would certainly be a lift; but in English clubs lifts are not favoured, being tacitly supposed to be out of place in a club. Billiards can, however, be satisfactorily played with a side-light, but it must be an ample and a suitable light; points on which some of the Soane competitors seem to be quite at sea. "City" shows his billiard-rooms on the ground floor with a south light, which in summer is out of the question; a player opposite the windows would have the sun in his eyes, and pulling down the blinds would not leave enough light; the aspect must be north or east. Another competitor shows a basement billiard-room with one small window in the corner, which is of course absurd except on the supposition that artificial light is used all day—a possible but most undesirable expedient. The best resource is to place the billiard-room in a portion of the principal floor which need not be carried up, and give it a ceiling light. The Strangers' department offers another problem. Your clubman is rather jealous of strangers, and does not wish them to penetrate beyond their allotted precincts, or to be too much in evidence in any way. It is therefore certainly a mistake for "Rime" to have made his strangers' dining-room only accessible through the club dining-room, and for he and others to have placed the strangers' smoking-room at almost the greatest possible distance from their dining-room; and it is equally a mistake on the part of "Hiawatha" to have given the strangers' smoking-room and cardroom the central and architecturally emphasised entrance from the first-floor hall. The promi-

nent and central entrances should be for members. "Grex" has had a good idea in placing the strangers' rooms *en suite* on the ground floor, the similar rooms for members forming a suite on the first floor over them. The only objection is that the door of the strangers' dining-room is the central one in the entrance-hall facing the entrance; but it may be replied that upstairs is the principal floor, and that the position of the strangers' rooms on the ground floor prevents their penetrating into the members' territory—"Thus far shalt thou go and no farther."

The most original of the more meritorious designs (there are some that are original without being meritorious) is that signed "Ars," who has treated the front in a slightly concave line on plan, with a circular vestibule and cupola projecting in the centre of it; the arrangement is rather odd, but would be susceptible of effective treatment. The plan of the main hall and the coffee-room to which it leads up is the only thing in the whole set of designs which rises to the level of a really fine architectural conception. He has found the upstairs lobbies difficult to manage, and the small bracketed-out gallery forming the only communication across the stairs is a very weak point. Both the library and the private dining-room would be deficient in light, the library especially; a library requires a good light all through, and a window at each end of this long room would leave the centre portion without light enough to see the books properly. This, however, is a very meritorious plan, and the conception of the design is good, but it is spoiled in the perspective by weak or ragged handling. "Hiawatha," which we have already referred to, is one of the best efforts; the Classic front with an order is shown in rather a scraggy line drawing, but would work out well with good detail, and the plan has much merit. This and "Ars" are the two best taken all round.

We may add a few brief remarks on some of the others. "City" shows a sensible quiet elevation, which looks like a club, but the built-out corbels under the balcony are clumsy in appearance; the plan has some good points. "Fordinbridge" has a darkly-tinted perspective showing a rather good façade, though the centre and wings hardly seem to harmonise; the rooms are too small and there are other faults in plan. "Post Fanum Vacunæ" shows a centre garden-court lighting the corridors, and the arrangement of the south range of rooms is very good; but the secretary's room and committee-room would practically have no light at all. "Rime" shows a very simple elevation in good taste, but much too naive for a club. "Ionic" has gone in for winning the competition by dint of drawing; his perspective is much the finest drawing in the room, but there is little in the architectural idea apart from the drawing, and the plan is hopeless, as the main hall and nearly all the corridors are totally devoid of proper lighting; no one could live in such a building. "Elsa" shows a very pretty little perspective view of an Italian façade, unfortunately associated with a plan which is quite puerile. "Ace of Clubs" has one of the best plans in a practical sense, the rooms mostly well arranged and considerable care taken about lighting the corridors; the defect is that it is a merely practical plan, with no sense of interior effect, and the

façade is clumsy in detail, especially the treatment of the porch. We have already referred to a good point in the plan of "Grex," and may add that the elevation is graceful and pleasing.

The Tite competition, for "An Entrance Gateway to a Public Park," shows a better general average than the Soane; of course it is an easier subject, as there are no difficulties of planning to consider. It should be remembered that it was founded for the promotion of the study of "Italian architecture," and that in Tite's day and in his intention this meant Italian Renaissance. Such a design as "Le Nord," therefore, does not come under the definition, and should not have been accepted; and in any case it is bad as a conception, for it is, one may say, an absolute essential that a park entrance gate and screen should be symmetrical on each side of the roadway; it is an absurdity otherwise. Of course, in regarding the competition as restricted to Italian Renaissance, we are not denying that there may be attempts to develop that style in a greater or less degree in regard to treatment of detail. This has been recognised by the author of "St. George," undoubtedly the best design submitted, though shown in slighter and less finished drawings than many others. He treats the gateway simply as a gateway—a block with three archways, the centre raised a little, and sculpture decoration well introduced as a finish. The gate is led up to by Ionic colonnades, on each side in a concave line, and terminating in outpost blocks which harmonise with and partly repeat the design of the gateway block. The ironwork of the gates and the grilles in the colonnade are charmingly designed; original and new in treatment, and yet quite in harmony with the masonry design. The one weak point is that the entablature of the colonnades returns on itself to stop against the sides of the flanking blocks, thus showing a weak angle at the end; it ought to have stopped *against* them at the back. But as a whole this design shows the feeling of an artist. The next best to this, perhaps, is one in rather the same manner but making larger use of sculpture—that signed "Lion"; a very good composition, except that the rather heavy block with sculpture accessories seems wrongly placed over the columned opening in the wing-walls.

There are some other good designs; the prevalent mistake is in trying to do too much. A game composition of this kind should be simple and restrained as a whole, however richly ornamented. Thus, in "Nocturne," the perspective view of which is pretty, the lower erections forming entrances to the terrace are out of scale with the rest and detract from the effect; it may be added that the octagonal turrets to the centre block, rising from behind the colonnades, do not seem to harmonise with the rest of the composition. In "San Gallo" the dome comes much too abruptly on the top of that large arch, and it may be questioned whether a dome is in place at all. A gate is a gate, not a building. "Marble Arch" has merits, though the cupolas at the sides, graceful in themselves, do not seem quite to belong to the main composition. "The Bard" is a design of some power, with a mass of rustication on the centre block, obelisk finials, and

blanked by a large concave double arcade. It may be a question whether the cupola on the top should be rusticated, above the plain attic. "Englishman," a tawdry affair, is we trust wrongly named. "Pencil" is a rather weak design as a whole; it is too flat and thin, but the author shows a very good detail drawing. So does "Fiori," whose design is however much too complicated, and the general perspective drawn in a detestable style.

The Grissell medal is properly given for construction, and should be so regarded; in the present instance the subject, "A Wooden Bridge," has tempted several competitors into bedizening their construction with gimcrack ornament which ought to be enough to disqualify any competitor. Fortunately the best constructed, "Kopper-nob" and "Draughtsman," are also the least pretensions in this sense. "Trabs" treats his bridge railing well with a certain amount of simple character.

The Pugin drawings contain a great many good sketches and drawings, but we should be inclined to say that the set which are most germane to the objects of the studentship are the comparatively small but numerous and excellently handled pencil sketches by Mr. H. W. Cotman. The Owen Jones drawings are also a good collection, among which those of Mr. McLachlan seem to combine the most varied quality of work, including both geometrical drawing and good water-colour views of buildings.

We have seen some finer sets of measured drawings than any of the six sets submitted this year for the Silver Medal; but they make a good show, and include some interesting buildings—St. John's, Westminster; Burghley House; St. Magnus; the Exeter Guildhall, &c. The drawings of the latter, signed "Semper Fidelis," are the neatest in finish, but do not contain so much work as some of the others. St. John's, Westminster ("Archer"), is a large and complete set of drawings; the perspective is weak, but as this is a prize for measured drawings the perspective is merely an extra which need not be considered.

In each of the three sets of drawings,—the Pugin, Owen Jones, and Silver Medal, the adjudicators will have had some difficulty in deciding on the award. We cannot but regret that architectural design, especially as regards plan, does not seem to make more progress.

NOTES ON THE RIVIERA.

AMONG the features of the new century must certainly be numbered the growth of the towns of the French and Italian Riviera. To many English people the places which stud the northern shores of the Mediterranean are as familiar as, and often more so than, the cities of their own country. And for one reason this is not surprising; for whether we take the towns of the French Riviera—Cannes, Nice, Monte Carlo, and Mentone, or those of the Italian Riviera—Bordighera, San Remo, and others almost to Genoa, nothing is more noticeable in their development than the study which is given to physical comfort. If we compare the ordinary English hotel with those of the Riviera it will be seen that in England we have been standing still. Long ago sanitary arrangements were superior in England to those in any other part of the world; now

it is pretty certain that many foreign hotels are, taking them one with another, better equipped in this respect than those of England, except where the charges of the latter are very costly. Nowhere has the necessity of good sanitation been more carefully kept in sight than on the Riviera. One result is that the sanitary state of all European hotels is thereby improved, since hotel proprietors, who are amazingly cosmopolitan, recognise that the English visitors demand good sanitation, well-ventilated and well-warmed rooms. The odd part of this is that English men and women put up in their own country with accommodation which they would not for a moment endure on the Riviera. A review, indeed, of the hotels at the towns already named would show in the last decade an extraordinary development in the art of public entertainment for profit. We say "art," because there exists something in the nature of an art in building and equipping houses for the stay of strangers.

On the Riviera the main object of architects is to make the most of the sun and to avoid the wind. Aspect is everything, and a house placed in a right aspect must be constructed so as to take all possible advantage of the sun, even though in January it shines day by day as we sometimes find it in England in ideal midsummer weather. It may be doubted whether, in a sunless country such as England, architects study the question of utilising the sun as much as they should do. It may be that we are so accustomed to be without it that we defiantly determine to build without regard to it. But certainly it is interesting and important to observe how those who have had to advise on the construction of the more modern hotels on the Riviera have designed the buildings to capture the sun. Thus the dining-room of the Riviera Palace at Mentone has at the southern end an enormous bow, the breadth of the room, almost wholly glass; by this nearly the whole room is flooded with sunshine. Again, the hall is constructed so as to form a place for sitting, reading, or writing, the entire length having a window looking due south. The arrangements are simple, but this same simplicity is the more effective, for it successfully achieves an important purpose. The more modern hotels are also beginning to be planned with balconies, one of the most important points for obtaining sun and air to the full. The still incomplete building at Monte Carlo adjoining the Balmoral Palace Hotel, and facing to the west and so towards Monaco and its warm and quaint palace, is the best example on the Riviera of the appreciation not only of the utility but the picturesqueness of the balcony. This building may be a little too ornate, but it harmonises thoroughly with the glow and colour of the Mediterranean shore. Of the private villas on the Riviera as much has not yet been made as is possible; but the richness and beauty of the vegetation with which they are surrounded—the palms and the delicate mimosa, the formal but brilliant orange-trees—almost render simple white buildings the most effective.

We have dwelt upon some of the architectural features which distinguish what may be called the northern colonisation of the Riviera. But the astonishing growth of these towns in the last quarter of the century which has just ended must be regarded as a

noticeable social phenomenon. Opposite that singular collection of buildings which forms the town and Palace of Monaco has arisen a group of buildings of the most luxurious and complete description, ornate in character and full of comfort. The contrast of the small mediæval Italian principality with the modern city is remarkable—the past and the present stand side by side. Still more so, though in different forms, is this contrast noticeable at Mentone. Under the shelter of the rock on which the old cemetery stands are the clustered red-roofed houses of the ancient town of Mentone, half port, half fishing village, for two centuries under the rule of the Grimaldis, Princes of Monaco, and then for sixteen years, from 1848, a free town under the protection of the kingdom of Sardinia. On either hand villas and hotels and modern dwelling-houses have sprung up, from the Pont St. Louis on the east to Cap Martin on the west. But there in their midst is the quaint, crowded, ill-smelling relic of mediævalism, once a free town, reminding us how historically inaccurate it is to speak of this stretch of Mediterranean coast as the French Riviera. Still greater is the contrast between Mentone and Castellare, perched on its heights, surrounded by the silver olive-groves which cover the precipitous sides of the valleys of Mentone and Carrei. From the little "Place," to which alleys called streets lead, can be seen glimpses of the modern buildings of the Mentone of to-day, while in the squalid village, wanting indeed its walls, is visible—little changed—the fortified town of the Lascaris, Counts of Ventimiglia.

The contrast also between Nature and what perhaps for convenience may be called civilisation is more marked on the Riviera than almost anywhere else in the world. On a rocky point washed by the waves there suddenly, as it were, appears a great house of bright white stone, not wanting often in an opulent beauty. These intermediate hotels are springing up all along the Riviera. At the end of the rocky pine-clad gorge of La Turbie stands, for example, the Hotel Eden; on the sunny but sometimes wind-swept point of Cap Martin, among the brushwood and firs, there is an equally striking structure. The little promontory is utilised in a manner which is only to be found in the Riviera, since it is not mere ordinary comfort and four common walls which are placed on what was once a desolate rock, but a building such as one associates with the Boulevards of Paris. And the size and ornamentation of these white stone buildings is not disagreeable; on the contrary, they seem to harmonise with the expanse of light, the colouring of sea and mountain in which they stand. Whether from the commercial point of view this building of expensive structures may not be going on too fast one may perhaps doubt, but the energy and taste which are shown in these buildings can nowhere be surpassed.

As has already been pointed out, this remarkable change has occurred during the last quarter of the century. It is not a change caused by the development of the native population, by the growth of native industries as in the United States, but by an invasion, so to say, of Northern multitudes; for when we survey the coastline from Toulon to Genoa, and bear in

mind that along the whole of it there are hundreds of strangers during the winter collected like swallows from all parts of Europe and of America, we must recognise that we are in the presence of a phenomenon that should be noted. Technically this development of villa and hotel is of much interest to those connected in any way with buildings, but it should be regarded also from a broader standpoint, and as enabling us to contrast the mediæval town and village with the buildings of to-day. It is a development produced, as has been pointed out, wholly by external means, and as communication between North and South becomes more easy and convenient, this modern tendency to seek the sun must become stronger and more popular. Nor can it fail to have influences on English buildings and English habits. The climate of much of the south coast of England, though it never can be as dry and sunny as that of France and Italy, yet can give a sufficiency of sunshine for many. Yet how little is done to utilise its precious warmth, or to make, as on the Riviera, houses equable in temperature whether the sun be shining or not! It is not only continuous and brilliant sunshine, but the higher average of comfort and warmth which makes so many seek the shores of the Mediterranean, which in the future must unquestionably witness a far greater development of structures of every kind for the use of the stranger from the North.

NOTES.

The London County Council Water Bill. SOME controversy has recently been taking place in regard to the promotion in the approaching session of Parliament of the London County Council Fifth Water Bill. It has been said that it is wasting the ratepayers' money when it is obvious that this measure will not be supported—indeed, will be opposed—by Government. The Council is, however, acting in what may be called a constitutional, and also in a businesslike manner. It is the representative of the ratepayers; and the majority of the ratepayers of London, as shown by the character of the Council, are in favour of the purchase of the undertakings of the water companies. Therefore the Council must fulfil its mandate, and endeavour to carry it to a practical conclusion. Apart, however, from that view of the subject, it is obvious that unless the Council presses this matter on the attention of Parliament the Government will make no serious attempt to grapple with it. The last effort, two sessions ago, was a lamentable failure, and it needs pressure from London to obtain any measure whatever. The singular thing is that the Government should interfere in this matter at all. Birmingham, Liverpool, all the large provincial towns, are allowed to carry out their own municipal policy. One reason why London ratepayers are so apathetic is because the Metropolis is watched, and in a sense directed, by the Government of the day, instead of being allowed to work out its own salvation in strictly municipal matters.

Architectural Discoveries at Thermen. THERMON, in Ætolia, is little more than a day's journey from Athens, and yet until the recent excavations it was practically as unknown as though it were in another

hemisphere. In the days of Polybius it was the religious and political centre of the Ætolian confederation. The excavations have laid bare not a town but, as in the analogous case of Olympia, a sacred enclosure, an Altis. The greater part of the remains discovered, both architectural and epigraphical, are of the third and second century B.C., but one building, the ancient temple of Apollo Thermon, is of a date long anterior. This temple is of the Doric order; it is peripheral, with a colonnade of five by fifteen columns; it has an opisthodomos, but apparently no pronaos. It was destroyed about 218 B.C. by fire; and, of course, the new structure was in stone, but the bases extant show to the eye of the expert that they once supported columns in wood; they closely resemble the bases of the palace at Tiryns. In fact, the temple was of the primitive order of structure, *i.e.*, a compound of wood and terra-cotta. Great interest attaches to the remarkable terra-cotta remains, which have been found in large quantities. They consist of:—1. Antifixæ of the frontal roof tiles (*ἡγρόνιες κεραμίδες*). 2. Painted metopes. The antifixæ are heads of men, women, and Sileni—archaic for the most part, a few of the early fifth century B.C. They are brilliantly coloured. The metopes are decorated with mythological subjects, some inscribed. So far it has been possible to restore an archaic Gorgon, a Perseus taking flight, holding the head of Medusa, three seated divinities, and a huntsman with his prey. The temple presumably belongs to the fifth century B.C.

Views of London in the Eighteenth Century. A NOTABLE collection of paintings was dispersed at Christie's auction-rooms on Saturday in last week. The pictures, twenty-one in number, of large size, and well preserved, comprised paintings ascribed to Canaletto, Samuel Scott, E. Dayes, T. Malton, J. Boydell, J. B. Chatelaine, and J. Farington. Some of them are finely executed, and many illustrate views that have been but rarely represented. Amongst the latter kind are the seven by (or after) J. Boydell, showing the Tower as seen from the Thames, with trees—30 in. by 30 in.; Smithfield market-place, with St. Bartholomew's Hospital in the background; Skinner-street and Holborn Hill—a very uncommon subject; and old Chelsea, or rather Battersea, wooden Bridge, with the mill and the church on the river's right bank. The design of the bridge, somewhat similar to that of old Putney Bridge (illustrated in our columns of January 7, 1888), has been attributed to Cheselden, surgeon of the Royal Military Hospital, who, however, died in 1752. The bridge was erected in place of Chelsea ferry, for John Earl of Spencer, lord of the manor, and fourteen other proprietors, who subscribed 1,500*l.* apiece, in 1771-2, after the designs of Henry Holland (*obit* 1806), at a cost of about 23,000*l.*, by Phillips, George III.'s carpenter, whose father had also built Putney Bridge. Battersea Bridge was pulled down in the winter 1835-6; of Putney Bridge the collection included a view by E. Dayes. The design of Putney Bridge (1729-1836) has been attributed to Cheselden, to whom the proprietors passed a resolution of thanks on July 2, 1730; and also to Ripley. According to Chasemore's account, 1875, it is due to Sir Jacob Ackworth. The

fabric cost 23,075*l.* Another remarkable painting (Canaletto), which it is believed has not been engraved, depicts the Monument and St. Magnus Church, as seen by one looking down Gracechurch-street and Fish-street-hill. A pair, 30 in. by 50 in. (S. Scott), show old London Bridge with St. Magnus and St. Michael Churches, and the river-side between York Water-gate and Blackfriars Bridge. In the view (E. Dayes) of Leicester-fields, we see Saville House, in respect of which we have found in the St. Anne, Soho, rate-books that the Earl of Ailesbury was rated at 3*l.* 12*s.* in 1693, and Leicester House for which the Earl of Leicester was rated at 7*l.* 10*s.* in 1711—and which stood where the Empire Theatre and the adjoining hotel now stand. Bloomsbury-square (E. Dayes) shows the house of Lord Mansfield, at the north end of the east side, which the "No. Popery" rioters sacked and burned in June, 1780, with Southampton House (on the north side) built in 1664-5 for Thomas Wriothesley, Earl of Southampton, and demolished in 1800. We may mention, too, the rare view (T. Malton) of Fleet-street with the Church of St. Dunstan to the spectator's right-hand; the garden, as seen from the river, of Denmark House (Canaletto) with the water-stairs, and St. Paul's in the distance; Old Westminster Bridge (J. Farington); and St. James's Palace (Canaletto) with the Gate-house in the foreground, and Pall Mall leading towards the Haymarket and the King's Mews, which Kent rebuilt, beyond. The sale realised nearly 2,300*l.*, the prices ranging from 240 guineas for the last-named picture to 40 guineas for the view of the Tower.

The Sydenham Boiler Explosion. THE Board of Trade Report on the boiler explosion which occurred in July last at the works of the Crystal Palace Electric Supply Company has now been issued, and it discloses incompetence and neglect which, we hope and believe, are very unusual. The boiler was of the locomotive type, working at a pressure of 140 lbs. per square inch; it was nearly nine years old, and owing to weakness of the fire-box crown, that part was violently blown out, leaving a hole measuring about 6 ft. by 3 ft. 6 in., the explosion killing two, and injuring five, persons. It is stated in the Report that the boiler itself was of faulty construction, but this was not the real or immediate cause of the explosion, which is directly attributed to "the failure to make proper examinations." Several persons are blamed for this neglect. The company did not engage a competent person to examine their boilers in June, 1898, and thereafter; the boiler was not periodically examined by their fitter, who, moreover, was not competent to perform such work; the electrical engineer to the company knew there was deflection in the fire-box, and having been advised by a competent authority that he should test the boiler by hydraulic pressure to 280 lbs. per square inch, he failed to do so. An inspector who examined the boiler on behalf of an insurance company did not perform his work thoroughly, and did not even notice the deflection in the fire-box. In the opinion of the Commissioners the explosion was caused by the neglect of the electrical engineer, and it was contributed to by the neglect of the insurance inspector. We also believe that the boiler was on the point of being replaced.

by a new one when the explosion occurred. It seems probable that the directors trusted in the providential preservation of the old boiler until such time as the new one could be installed, and that their cheerful optimism was confirmed by the absence of any strong protest from the electrical engineer. One of the directors stated that "the company had insured only for the sake of being indemnified from loss caused by an explosion," and another director suggested that "insurance was effected for the additional purpose of obtaining regular inspections." The Commissioners state the opinion that the latter reason "was not very present to the minds of the directors." A most culpable condition of negligence certainly appears to have afflicted all those concerned in this disastrous accident.

Another Gas Geyser Fatality.
 IN our issue of the 22nd ult. we recorded the death of a lad at Hammersmith caused by the use of a gas geyser in a small bathroom. Another death which is also attributed to the employment of a gas geyser in a bathroom is now reported from Newton-le-Willows. The victim this time is Mr. D. H. Jeyd, the Gas and Water Engineer to the Newton-le-Willows District Council, a gentleman of about thirty-five years of age. He was found dead in the bath early on Sunday morning, the 6th inst. The depth of water in the bath was about 8 in. The geyser employed for heating the bath water was found to be red-hot, and the woodwork in the neighbourhood was on fire. The gas had become ignited at the air inlet, and consequently the gas was burning with a luminous flame inside the mixing tube, and products of incomplete combustion were formed. It appears improbable that the gas became ignited at the air inlet before the geyser became insensible, for any gas engineer would at once detect the odour evolved when gas is burned under these conditions. The evidence showed that the bath was due partly to syncope and partly to asphyxia, and the jury returned a verdict "accidental death." Once again we have to recommend the fitting of geysers outside, instead of inside, bathrooms; and where this is impossible, the provision of a flue for carrying away the combustion products and ventilating the room, without regard to any statement from the gasfitter or the vendor of the geyser concerning the needlessness of such a flue. If, moreover, the bather would take the precaution to turn off the gas before entering the bath, fatal accidents arising from the use of gas geysers would less frequently occur.

Aluminium.
 MR. KERSHAW read a valuable paper on the electrical uses of aluminium to the Institution of Electrical Engineers last week. The high price to which copper has been forced by a combination of natural and artificial causes has made electricians take the greatest interest in aluminium as a substitute for copper. In America many thousands of tons of aluminium wire are already in use, but exhaustive tests have not yet been made on its durability. Mr. Kershaw stretched some aluminium wires on the roofs of buildings at St. Helens, Lancashire, and so on at a town on the outskirts of Liverpool, and left them in the open air for six months. At the end of the time the wires were taken down, and after being

thoroughly scrubbed were weighed. It was found that most of them had gained in weight. This was due to the corrosion of the rods and wires, and to the settling of soot and dirt in the crevices. The conductivity for electric current of the wires suspended at St. Helens had diminished about 30 per cent, by the exposure, and the tensile strength had also diminished by about the same amount. This proves that the aluminium wire at present sold corrodes in outdoor work in our climate, and in manufacturing towns where sulphurous acid gas exists as an impurity in the atmosphere it corrodes rapidly. In the discussion Mr. Gavey, the electrician to the Post Office, stated that experimental trials of this metal for long-distance telephonic communication were being made, but that the results were far from satisfactory. The large coefficient of expansion for heat of aluminium has led to frequent breaks and consequent interruption of the service. Mr. Swinburne suggested that more thorough chemical tests should be made on commercial aluminium, as he found that very minute traces of impurity sometimes made it very rotten and friable. Professor Perry mentioned that Dr. Glazebrook, the Principal of the National Standardising Laboratory which is to be erected in Bushey Park, intended carrying out an exhaustive series of tests on this metal.

Widening of Hampstead-road.
 WE are informed that a meeting of influential traders and ratepayers of St. Pancras has been held to consider the question of widening the Hampstead-road at its junction with the Euston-road, and a committee, including representatives from all the large business houses in Tottenham Court, Euston, and Hampstead roads, was formed with a view to bringing the matter before the London County Council as a Metropolitan improvement. It was urged that the congestion of traffic at this corner is now so great that it is of the utmost importance that something should be done to relieve it. We quite agree as to the desirability of the improvement; we need only point out that the widening ought to be made at the east side of Hampstead-road, so as to bring it into line with Tottenham Court-road on that side.

Water-colour Art of the Nineteenth Century.
 THE rooms of the Fine Art Society are entirely devoted at present to an exhibition representing "The Water-colour Art of the Nineteenth Century"; the middle room containing early works, the west room works of deceased artists later in the century, and the south room works of living artists. Among the early brown drawings executed with the limited water-colour palette of that day, is Girtin's well-known grand view of Durham belonging to Mr. Roget, who formerly lent it to a Girtin exhibition at the Burlington Club. There are some works by less-known men of great interest; for instance, Powell's delicate little landscape (4) exhibited at the Royal Academy in the early part of the century. Shepherd's "St. Albans" (29) is a beautiful drawing, also Barrett's "Thames from Richmond Hill" (32), not equal, however, to John Varley's rendering of the same view (50). Among the later collection is to be seen Alfred Hunt's wonderful picture, "The Rainbow" (136), in which he almost succeeded in the apparently impossible task

of painting light. There are two or three splendid examples of William Hunt's still-life painting; some interesting early works by F. Walker; one drawing by Boyce (132) which hardly represents his finest work; David Cox's "Welsh Funeral"; a beautiful "Chrysanthemums" subject by Mrs. Angell (110), and a fine example (116) of George Frigg's broad and unpretentious style of landscape-painting. The collection of the works of living artists is hardly so representative as it might have been; it gives the idea of representing what could be got rather than what might be desired. There is a fine example of Mr. Phillip's Highland landscape painting, familiar to us at the Society of Water Colours; Mr. Fulleylove's view of the "Temple of Wingless Victory"; Mr. Sutton Palmer's "The Joy of Spring" (194); these are among the best works in a collection which, however, can hardly be said to represent the later school of English water-colour art in any adequate manner.

SMALL GARDENS.*

ONE of the most pleasing signs in the architectural profession is the recognition of the fact that cottage architecture to be truly successful cannot be confined to the planning and designing of the house and elevations, but must have some say in the interior decoration (or what is oftentimes better the avoidance of decoration) and in the design and arrangement of the furniture, the control of the approach to the house and also the garden, or at any rate that portion of the garden which immediately surrounds the house. I am afraid that in many cases the bare recognition or assent to the principle suffices, and that whilst we see here and there sparsely distributed signs of the approaching architectural millennium, we are not quite there yet, and I fear that some of you, when I suggest the addition to the already long list of subjects through which you have to conduct your studies, a technical knowledge of garden making, will almost hope that I do not succeed in proving my case, and yet I can promise that if I succeed I shall introduce you to a subject which shall yield you greater delights than any you have yet tasted in the field of design; and I may add, to the younger members of the profession, that you will soon realise that to a very large extent it is a vein which has not yet been fully worked or explored, and where you can within certain limits express the completeness of your own ideas, and determine what character of design shall rule in the making of a garden. I agree there are greater drawbacks and discouragements to encounter in the garden than in the house, and its interior arrangements or fittings, as so much more depends upon the aptitude and intelligence of the gardener who is to put your ideas into practical shape (a very worthy man in himself, according to his light and his training, but whose ambition is often measured by the local flower show exhibits) than upon either the builder, decorator, or furniture maker, whom you can restrict and restrain and guide by plans, details, designs, or sections. To make myself quite clear I may say that the cottage residence which I have in my mind would range from the small 400 semi-detached with its plot showing a frontage of 60 ft. and a depth of 100 ft., to the small house, with three entertaining rooms and six to eight bedrooms, stabling for two horses, and two acres of ground. Before I proceed to give you a few hints, which I hope you may find of a practical character, I wish to show, first, that you cannot really successfully plan a cottage residence without deciding the principal features comprising the garden scheme. The designer of the cottage ought in any case either to design the complete garden in a scheme or otherwise agree to allow of an exchange of opinion between himself and whoever may have to plan and carry out the garden. Even supposing the landscape gardener to be an artist with insight into, and in full sympathy with, true architectural dignity and expression, the architect

* A paper read before a recent meeting of the Birmingham Architectural Association by Mr. T. H. Mason.

has much the best opportunity of making a successful and complete plan. I also wish to show that if the architect does not undertake the designing the landscape gardener in all probability would not be asked to do it, and as a consequence the garden setting to the house, over which so much time and thought had been spent, would eventually be the joint production of the local jobbing gardener and the client. Respecting the first of these three statements, with whatever feelings or sentiments you may be inclined to approach gardens, I am perfectly convinced that in refusing to design the house as well as gardens I have lost some fine opportunities of gaining that wider outlook which it is so necessary the designer should achieve; and I am free to confess that any grasp which I may have of this principle of unity and completeness which should rule not alone in gardens and houses, but should underlie the character of the whole street, nay, of the whole city. I say, then, that this habit of viewing scenes in their broader aspect has largely resulted from the fact that I have been brought into connexion with a considerable number of clients who, having purchased their sites years before they were prepared to build, or even consult an architect, have nevertheless wished to do the necessary planting, and in some cases to lay out the outer fringe of the gardens. I have thus been compelled to consider the place as a whole, and to plan the houses in a way which I thought would best suit the site and my clients' probable requirements. In this way I must have prepared scores of plans for houses of all sizes, and I can assure you it has been a fine study. My reason for venturing this personal experience is because I feel that I am quite right in saying that it is just as necessary for the architect to realise the proper connexion between house and garden as for the garden designer to obtain a grasp of the character of the design and the planning of a house. I need only emphasise this by pointing out that the approach to a house, whether in the form of a drive, avenue, a simple court, or merely a walk, is the first impression a visitor gains, and generally the most important detail in the garden scheme, and is at the same time the introduction to the house itself. In passing, I would like to mention another great factor which, combined with others, has tended to broaden the vision and educate me to look beyond merely limited prospects; it is the laying out of building estates where the desired aim and object was to accomplish a worthy complement to pure air and pleasant surroundings without desecration and disfigurement, yielding pleasure to the beholder and profit to the proprietor. Architects who wish to lay out gardens would do well to cultivate this faculty of studying nature with a view to the attaining of aggregate effects, a grand antidote against mere sleight-of-hand draughtsman proficiency and commonplace invention, and against a too pedantic academical education. I am well aware of the ever increasing number of subjects that a modern architect has to keep pace with, but this faculty is, in a great measure, intuitive, although the foundation of it may be laid in the student's mind, and incentives and encouragements offered to continue; and when once acquired it has the tendency to soothe rather than irritate the tired brain and jaded spirits. This is a point which, I am pleased to be able to say, is being emphasised and reiterated by all sound reliable guides in architecture, although not, perhaps, entirely in the exact special direction now suggested; notably in Mr. W. H. Seth Smith's presidential address to the Architectural Association.

An architect is really the fittest man to design the garden, and I think it will be generally conceded, even by landscape gardeners, whatever gifts he may possess, that a circumscribed garden is seldom a success unless a formal treatment (why so termed I do not know) is applied. Mr. Kemp, who wrote that excellent practical work, "How to Lay Out a Garden," realised this. The advantage of this method is that the garden design is brought into direct relation with that of the house; that, in fact, a garden becomes a necessary outdoor extension of the family requirements, and of the entertaining arrangements—one set of apartments under cover, the other open to the interchange of shine and shower, and of each season's respective display. The relation of this series of garden apartments to the house would be more ably grasped by the person

who had planned the house and knew the relative use of each room to the other. The ingenuity necessary for the planning of the house would assuredly find larger liberty and unfettered scope in controlling the whole. An architect occupies a much better position than either the landscape gardener or any one else to realise a successful garden, for if he had to be responsible for the whole he would take care that the only place in which a *Marchal Niel* rose would grow is not occupied by the basement area; and that the steps to the beer cellar do not cut into the only piece of ground suitable for a flower garden; and that the coal-shoot is more than 3 ft. from the door of the principal entrance; also that the garden front was as far removed as circumstances would allow from the entrance front, and that the kitchen offices and stables, whilst helping the general effect, were so placed as to allow of their being screened from the private parts of the gardens. But perhaps the greatest advantage which the architect possesses lies in the fact that he has the control of the entire sum which his client is prepared to spend. I thus happen to know from experience what this means, for time and again have I, when called in to advise after the house was partly completed, found that the balance available for laying out the garden was totally inadequate for the purpose, with the consequent result that the garden was in a large measure a failure. When interests are divided one is prepared for this kind of thing; but if one realises that half of the money spent on, say, the barge boards, finials, and bristling insincere ornamentation would have given you some chance in the garden, one cannot help regretting the absence of some controlling master mind who, with perfect unanimity of purpose and comprehensive grasp, had had the spreading of the money over the larger area to the ultimate satisfaction of both architect and client. Now, do not misunderstand these remarks, for I quite sympathise with the architect, who must have realised that in the incapable hands of the jobbing gardener, who in no wise conceives the house and garden as one composition, the less money allowed for the garden the better, and that it was much better to make the barge board a counter attraction to the monkey-puzzle so carefully planted in the little circle in the centre of the carriage turn. The last consideration under this heading is that if you do not undertake the work it will fall into incompetent hands, or if a competent designer is engaged by the client direct, it is in the majority of cases because he has a reputation for a set form of garden design, or speciality, which, however advisable under the most favourable conditions, may be totally out of place here, but which the proprietor is persuaded, as mankind are by the fables of fashion, is the only correct form under all circumstances, and which, unless the architect can prevent, he is determined to have. There is more than one garden designer in this country who has realised the inconvenience of a prevalent fashion brought about by the dictatorship of some temporarily popular, bumptious, capability Brown, and the expressed disappointment of his client when he proposes to treat the ground in a manner characteristic of the surroundings. Architects, it is understood, in dealing with the ground which are expected to conform to a set of ideas which are well known to be foreign to their profession.

Having given you my reasons why you should undertake the designing of small gardens, I now wish to state a few necessities and qualifications. In the first place, a proper survey with accurate levels is needed, and I can assure you that you will need to lay out a very large number of gardens before you can dispense with this necessary operation, even to the extent of making a preliminary sketch, for to be in any way successful the plan must be arranged to fit the ground and give expression to its contour. You must also be able to judge when ground requires draining; and having decided upon this necessity, be able to arrange it in an efficient and economical way. Judging from many schemes which I have seen for dealing with surface water, I am inclined to think that you could easily spend on land drainage a sum large enough to lay out in a satisfactory manner the whole of the ground. You must know a little about soils; this is a question which troubles would-be garden designers greatly. Now, for the horticulturist pure and simple this is a most important branch of study and research, but for the garden designer there are a few sound rules

which will meet his requirements whether the soil is wet or dry, light or heavy, clay or gravel subsoil; whether the soil lies on limestone or in chalk. If the soil is wet, good drainage should remedy it; if clay, good drainage and the admixture of burnt clay, tannin refuse. Good trenching will usually be beneficial if light and sandy with an admixture of clay or cow manure; as a rule, however, you may say that a dry subsoil is best for a garden.

The first great desideratum is unity and cohesiveness. What is required here is some great controlling power to marshal and organise the petty clevernesses and talents and gifts, and make for and lead up to one ultimate end. The lack of this quality is what makes ninety-nine out of every hundred cities so disappointing when viewed from an eminence, such a motley jumble of points, angles, and pinnacles, style and no style. Almost all our national and municipal, parochial energies and aims lack this Socialistic quality; there is abundant individual cleverness.

But of all matters, says some one, do not interfere with the liberty of the subject in his garden. That certainly is not my motive; but I would, by all the powers of persuasion, try and induce the subject to use his liberty not merely to the gratification of his individual preferences, but to a certain extent to sacrifice these to obtain an aggregate effect; for instance, a fortunate possessor of a house in a city or suburb where vegetation was none too abundant and brick and stone largely predominate, with a fine, walled-in, geometrical garden, faultlessly laid out with neat box-edged beds, vases, and all that goes to make such a garden a success. But in taking a summary view of his surroundings, his eye longs for some counterbalancing mass of green, and to remedy this he sacrifices a part of his garden and plants a mass of hollies or limes or beech to tower above the boundary wall to the gain of the outside beholder, the public, and at a loss to himself. That man is a benefactor to the town and neighbourhood.

In the few architects' gardens I have seen I notice that they usually plant shrubs, both formal and others, in the grass, evidently expecting them to thrive as they do in properly-prepared and tilled borders. This is a mistake, and for several years at the least, until the shrubs are thoroughly established, all grass and weeds should be kept clear of their roots. I know how much better grass looks when it sweeps up to the stems and trunks of the trees or the leaves and boughs fall over in a fringe upon the sward. How difficult it is to convince clients of the dignity of mown grass, and how often do we see the majestic trunks of a fine group of cedars or timber trees muddled up with the inevitable fussy rhododendrons.

It is in the direction of flowering plants rather than shrubs that variety is to be sought after, and for these you must, I fear, rely upon the nurseryman's knowledge of things, simply controlling the shape of the beds and borders in which they are to be planted, and, perhaps, the massing of the few varieties which are essential to the architect's garden, a few of which I will enumerate later.

Now, respecting the planting of hedges, screens, &c., before you attempt to do anything satisfy yourself that what you plant will grow. You may wish for a yew hedge, but it may grow so indifferently in the neighbourhood that you would get more effect out of common privet. Having made up your mind as to the character of the shrub or tree you wish to plant, you will find it comparatively easy to discover whether or not it will grow in the neighbourhood, and if not, what would form the best substitute.

But before we discuss any more technical difficulties we had better consider broad principles, which it is necessary to grasp before arranging your garden plan. I have already stated that the controversy which has been waged between garden designers and architects does not apply to small gardens, for all are agreed on the general principle of formality, although not agreed as to the detail by which this formality should be expressed. The aim and purpose of a small garden, being totally different from gardens of large extent—the former expresses the sympathies, pursuits, and refinements of the home life; the latter, in addition to this, is first and foremost a mark of rank and opulence; the managing head gardener in the one case is the master or mistress of the house; presiding over the other is the skilled horticulturist, whose permission you

lady must ask before she may cut a flower. The small garden is probably the only form of rural pursuit open to its owner, and yields in relaxation and reflection a delightful change to the *sturm and drang* of his everyday existence.

Have you ever noticed in passing to and fro the difference between two gardens, apparently the same soil, and the same aspect? The one seems to have a blight upon it; everything, grass, flowers, shrubs, trees, seem to grow so tardily and sparsely, the shrubs stunted and starved, trees lanky and bare, the flowers shrivelled, scentless and blasted—a reproach to its neighbours; and in the adjoining garden everything is luxuriant and profuse. "Like fruitful trees by a well, whose branches hang over the wall." The flowers seem joyous and radiant; the shrubs healthy, strong, and clothed to the roots with foliage, or bent over with the added weight of foliage or berries; the trees healthy, ever ready to flash out the sunshine after the darkening storm and emerge greener and purer; the ivy, clematis, honeysuckle, jasmine, and roses peep in at the windows and flower in picturesque masses; the grass does not cake or languish, and burn in drought, but yields to the eye that refreshing, restful, compact aspect so desirable. But what is the reason for this contrast—the difference? You would be able to tell me almost at once if there were two adjoining houses in a correspondingly opposite condition, both apparently built with the same hand and with a corresponding amount of care—the one looking singularly happy, "Suitably received into the bosom of things," as some one has said; the other, in spite of suitable window adornments and owner's care, looks decrepit and unhappy. Your trained eye would at once glance at the unlevel joints, the slightly irregular ridge, finials, and chimneys, and other lines slightly out of the perpendicular—points scarcely discernible to any one else—and pronounce the verdict, "Bad foundations!" The foundation failure: unprepared soil is the cause of almost all garden failures. You may procure the choicest shrubs and flowers, manure the borders, roll the grass, but if the soil is not of sufficient depth, and is not properly prepared it will be of no avail. A grass lawn, a flower border, the root space for trees or for shrubs, all need their proper depth of soil and their own especial preparation, nor is it safe to trust the horticulturalist to do what is right in these matters. I have repeatedly seen gardeners laying turf where it was desirable to have a good tennis lawn with only 3 in. of soil, excusing themselves by saying that the grass would grow finer. I need not, however, enlarge upon this, as you will be doubtless familiar with the excuses for scripping put forward by the builder. By all means save and store all turf and soil from the diggings and the foundations. For a flower border (and in the limited area devoted to flowers in most suburban gardens the expense would not be great) it is a good plan to lay, at a depth of about 2 ft., a layer of broken brick or some absorbent material, provided that the soil water drainage level is deeper; then to overlay this with a covering of ashes, and then to overlay this to a depth of about 21 in. with soil of desirable lightness; if too heavy should be mixed with sand, and should have abundant vegetable matter and fibre in it, such as the decayed turf from close green pastures yield. For trees and shrubs a depth of from 1 ft. 6 in. to 2 ft., with a plentiful admixture of the fibrous turf loam, though it need not be so richly manured as the flower border. Grass also requires a depth of soil not less than 3 in., with a well-drained bottom, properly prepared. Of course, as before stated, different soils, heavy or light, clayey or sandy, require different treatment, but although the first outlay may be greater, it is cheapest in the end to lay a sound foundation. "Prevention is better than cure."

Of course it is necessary to know what to plant, and herein is the most difficult problem with which you have to deal, and I venture to think that very few of you will ever master thoroughly the technicalities, nor is it desirable to understand all the hybrids and the eccentricities of the nurseryman's catalogue. At the same time, I think you would soon realise how few varieties of trees and shrubs are required for making a small garden beautiful. The present day tendency seems to be to cram in as many un-English varieties of trees and shrubs as possible, notably rhododendrons and common laurels, and aucubas, &c., their big

polished leaves entirely out of scale with our sober harmonious box, holly, and yew of our predominating northern grey skies. It is the preponderance of such things that make town suburbs, town cemeteries, and town parks so disappointing. I oftentimes think that the quiet spacious dignity of the Harrogate stray would be preferable to many of the tortured, hillocky, unnaturally planted, parks nowadays so common.

In a large garden there are many things great and small which are considered necessities: some beautiful in themselves, others difficult to classify and adorn and harmonise with an all-pervading sense of true garden effect. There are the tennis lawn and summer house; the rose border where, too often, size of flowers seems to be the chief attainment, lanky bare sticks through more than half the year, the roots covered with untidy manure, from which the eye instinctively turns to find delight in the rich green of the despised herb border of parsley and sage. The greenhouse, where can be grown geraniums and decorative house plants in winter and also in spring, and also grow tomatoes in the summer and show chrysanthemums in the autumn; the little garden frame which ensures a supply of sweet violets throughout the winter months; a potting shed, also, and garden house, and a paved shed with a big block for chopping firewood when from stress of weather the proprietor has nothing else to do; in fact, so many interests are to be catered for in this class of garden, and such a host of details on which you can exercise your ingenuity for garden effects that, to the man of sense and refinement, make-believes become grossly irritating. What he wants is a purpose-like garden.

There are two considerations I would like especially to impress upon you. First, the desirability of disabusing your mind of your preconceived notions of the art which is said to conceal art; and, on the other hand, the value of plain surfaces and of definite unhesitating lines. In ignoring the latter it is quite true that you may be able to cover your lawn with trees and shrubs from every part of the temperate zone, just as you may fill your drawing-room with all sorts of bric-a-brac; in both cases you may, instead of securing a sense of restfulness, succeed in giving them an aspect of fustiness. In laying out definite lines you may not get quite so many of those little surprises so much sought after in gardens, and you may not even be able, by the exercise of a little trick, to make your neighbour's garden look as if it belonged to you, but you will be saved the humiliating knowledge that your garden is a fraud, and that your visitors are sure to find it out.

So much depends upon locality, materials available, and the importance of the house, and the amount of money at your disposal, that the question of fences cannot be profitably discussed in this paper; but I would like to say that split oak, which lends itself to such a variety of treatment, is at once one of the simplest and at the same time one of the cheapest forms of fencing, and I would suggest that if we could in this country use, in conjunction with this fence, the trained lines of limes and laburnum as they are used in Holland and France, we could obtain some delightful effects. Holly is, of course, an admirable hedge shrub, so is beech and thorn, but in each case the wished-for effect is slow. Privet makes a hedge very quickly, but it must be out of the reach of horses and cattle, which are very fond of it. The fence which is least permanent, and least desirable, is the strained wire or iron hurdle.

We may now consider more fully the placing of the house on the ground so as to make the most of the ground. Where the extent of ground is strictly limited, as is invariably the case when you are building a small house, the greatest mistake you can make is to cut up the ground too much with drives, &c. This point cannot, in my opinion, be too strongly insisted upon. If your site is well chosen, the public highway will be along the west, north, or eastern boundaries, preferably the north, and just as you would, for the sake of aspect, arrange your living rooms from east to west, so you should see to it that you have as much land as possible on these sides. Now I hold an opinion, which I must admit is at the present time, even amongst architects, very unpopular, viz., when the plot does not exceed, say, two acres, drives are seldom needed, and that every real requirement can be met by a simple carriage-court connecting directly with the high

road. This court you could probably enclose and pave for a less sum than you would otherwise spend on the drive. If the stable could be arranged to the west side of this court and the small kitchen garden, kitchen offices also arranged to this side, you would then have all the more ground at your disposal on the sunny side of your house. Plan No. 2 will give you some idea of the effect which can be obtained by a simple square court such as I have advised. Where the plot of ground is under half an acre it will be seldom that even a carriage-court can be arranged with advantage, but in Plan No. 1 I give you an example in which the court arrangement will be the making of the place; on the other hand, there is no court or drive to the house shown on Plan No. 3, two garden photos of which I propose to show on the screen directly. Where a drive is really necessary, make it as direct as possible. If the ground is fairly level and the junction with main road is convenient, a straight road, treated as an avenue, would give the best effect; but if the ground is rising and of irregular contour, then perhaps a curved drive would be the only one possible. There is something very pleasing in following the sweeping lines of a drive or walk encircling the base of a natural knoll or mound, and this has probably led one branch of the modern landscapists into manufacturing hillocks and mounds in order to multiply his curves and wriggles.

Above all things, do not make your gardens too large. Remember that perfect keeping is the soul of a small garden. I can assure you that you will have considerable difficulties with your clients on this score. Find out if you can what labour your client intends to employ. If a man only two days a week, a quarter of an acre would be sufficient; if he can employ a man and a boy, the garden might be as much as one and a half acres, or, if no glass, as much as two acres. You ask what I shall do with the remaining portion. If you have sufficient for a paddock for the pony you could not put it to a better use, and in any case you can never go very far wrong in planting an orchard; in fact, I always look upon an orchard—with its grass from late winter to spring broken up with colonies of snowdrops, crocuses, and daffodils; the trees in spring covered with masses of bloom; and, later, the boughs bending under its rich loads of fruit—the most delightful part of the garden. You also invariably require to plant for screen and shelter, and this alone would reduce the amount of ground to be kept under cultivation. There is also the arrangement of the wilderness, or wild garden. A piece of ground planted thickly with silver birches, beech, oaks and Scotch firs, hazel, dogwood and the spindle-tree and the savin, with spaces left for daffodils, wood hyacinths, foxgloves, and Solomon's Seal, having a meandering path running through it, or, which I think still better, a broad grass path with heather, vacciniums, mahonia, gaultherias, and other suitable flowering shrubs forming a border on either side, or, if very much shaded, with masses of fern and bracken on either side.

If your site has been well chosen, the ground will slope away from the house; if it does so in a southerly direction, you will have a very sunny garden. This fall of ground suggests terracing, an operation which in a suburban district requires much more careful arrangement and adjustment than would be the case in open country, where, as a foreground to charming distances, the balustrade serves as a frame or setting. In the case under consideration the eye should be induced to rest on the garden. Now there are roughly three ways of terracing—by walls, by grass slopes, and by planted slopes. Of the three, walls are the most satisfactory. A balustrade and expensive stone dressings are seldom appropriate to a small garden, except the house be severely classic. Terrace walls—maintenance considered—are probably the least expensive, and, to my mind, should never be built as if they were to remain naked. I can never think of a wall as so many yards super of Ruabon or Accrington bricks, but as a wall of the most delightful greenery. If you are in a brick country, any good hard brick the colour of which approximates to that of the house would answer; if in a stone country, rough rubble; and if possible the pointing omitted, so that toadflax, houseleeks, &c., could grow in the crannies; the coping, if dressed, to have very simple mouldings. The view of houses belonging to my brother and myself will give you

a better idea of what I mean by rough walling. The wall will cost under 5s. per yard super, and I think looks just as well as if we had spent three times the money. Grass slopes are practically impossible if the batter be less than 1 to 2, allowing step of 12 in. by 6 in.; but whatever batter you adopt for one bank should apply to the whole of the slopes in that part of the garden.

Planted slopes such as the one at Rydal Mount are very charming, but the great drawback is that you have to wait many years for the result. You can, however, obtain a very effective planted slope with mahonia, which, if fairly successful, will completely clothe the bank in two years, and also by planting *Cotoneaster microphylla*, which would clothe the ground in the same time. The one point to bear in mind when laying out batters is to avoid diminishing lines, as, for instance, when you make a sloping walk at the end from the upper to the lower terrace. In deciding the width of your higher terrace, you will need to bear in mind what I have said about cutting off the view of your ground below. Do not shorten your ground. Nothing gives more character to a garden than the form, arrangement, and quality of its grass lawns; and nothing is more refreshing than to look out of your room window on to a lawn perfectly formed and kept. To secure this perfect form is, I admit, a difficult task. I have often felt thankful that a tennis or croquet lawn was considered a necessary part of the scheme, and wherever possible I place this in front of the most important windows; or, if this is not possible, to so place it that a pleasing vista may be obtained across it. The terrace next to the house should be treated simply, but with a certain amount of colour from flowers, and certainly have a border next to the house in which to grow climbers. I am fond of broad paved walks on terrace next to the house, with a few quaint shrubs either planted permanently in beds or set out in tubs. Avoid the usual pattern of broad-brimmed vases filled with lobelia, echeveria, and calceolarias; green or oak tubs or big flower-pots are far better, and if filled with free-flowering green-leaved scarlet geraniums, hydrangeas, or *Fuchsia gracilis*; but do not have too many even of these.

If a garden is very small, I would advise the flower-borders being long and continuous, as in this way you get a much better display of bloom, especially when the borders run outwards from the house; and if the borders are arranged on either side of a walk, as in the summer-house walk which forms one of the series of photos for the screen. If this walk can be arched at intervals with honeysuckle, clematis, or roses, and the end finished with a seat or other suitable object, with yew or other suitable snug background, I know of very few garden effects which can surpass the one which might thus be produced.

Small panel gardens, such as you would wish to look upon from your entertaining room windows, invariably produce the best effect when in beds of the simplest design and at a lower level than the house. Such gardens, as a rule, should be perfectly level, and have some kind of boundary fence round them; this may be simply a low box edge, 2 ft. high, or a low trellis. In some cases it might with advantage be designed as a sunk garden, with grass slopes and steps at the corners or at each side; if on the same level as the rest of the ground, the flatness might be broken up by having a sundial or lead figure in the centre. For breaking up the remainder, you might plant golden or common Irish yews, golden mop-headed yews, standard Waterer's hollies, or even standard snowball trees.

According to the measure of the exact symmetrical balance secured in the house (though, as a garden designer, I do not desire to see any of those square box-like early Georgian erections so difficult to garden (or) so ought the disposition of the features on the terrace so to be: grove to balance grove, and tree to balance tree, though not, I hope, carried to the point of having a greenhouse on each side of the garden, necessitating two heating operations and two objectionable chimneys, as shown in a recently-published design; such attempts end in the ridiculous. If perfect balance you must have, and if you wish to emphasise this balance by some erection, choose a pair of garden houses, one for use as a tool-house and the other as a summer-house; but if balance is secured by the freer and more picturesque methods adopted by the majority of modern architects of coupling and grouping of gables,

chimneys, porticos, oriels, and the like. Balance ought to be secured in the gardens by similarly free measures. You would, whilst securing balance, obtain much greater variety.

One of the most awkward and expensive pieces of ground with which you will at any time have to deal is that in which the house does not follow the natural contour of the ground, but falls slantwise across the garden front of the house, thus giving you a bank of earth on one side which is many feet below the floor level, and on the other side banks of earth standing high above it. I am afraid that in the small plot you have little chance of compromising, but on the larger site I think if you had the garden to lay out, you would at times be able to devise some means by which a happier result could be obtained. Where you have a subsoil which is easily removed, such as soft sand, an alteration to the natural features may be more easily carried out than a modification of the plan of the house.

Although I have a great preference for walls when the ground slopes from the house, I prefer grass slopes when on the south side the ground falls towards the house. In this event an effective garden is very difficult of attainment, and unless very carefully managed you will succeed in giving a very damp, tank-like appearance to the place; the more your ground slopes away from the house, the more will you feel the necessity for plantations; but the reverse holds good when the ground falls from north and south towards the house. Bright colours from flowers, and occasionally trimly-trimmed trees to mark distances, if you like, but no general scheme of plantations. If the ground is treated formally, you should start with a piece of level ground as wide as you can make it, and instead of doing the entire break in level in one lift, divide into two or three levels as the case may require, allowing a sufficient width to allow of a few flower beds on each.

I have earlier suggested a portion for the kitchen garden; but apart from actual convenience for working I really cannot see much objection to its being placed in any position, provided it can be treated as a part of the scheme. I maintain that some of the most charming gardens I have ever seen have been kitchen-gardens. In Scotland more particularly you will often find a beautiful old kitchen-garden which sometimes excels the pleasure-garden, and I would not even mind if the living-room window looked right down the central walk.

You will notice that I have hitherto said nothing about the effects which can be obtained by the arrangement of water. My reason for the omission is because there are so few gardens in which, owing to the cost of water supply, this luxury is available. I would point out, however, that a small wall fountain with its one falling spray judiciously placed at the end of a walk, or a small circular basin with a central jet, are often most charming. Even where this is not possible, it is often possible to have a small pond in which to grow water lilies and water hawthorn.

The last detail to which I wish to refer is the planting of the flower borders, in connexion with which, I may add, I rely almost entirely upon hardy perennials and those of the hardiest varieties. To go in for what is popularly known as bedding-out is to adopt one of the most expensive kinds of gardening; there are, however, a number of annuals and biennials, which are most useful for filling-up blank spaces. Amongst these I need only refer to stocks, candytuft, sweet alyssum, mignonette, wallflowers, snapdragons, Canterbury bells, sweet rocket, forget-me-not, and penstemon. I would also allow bunches of scarlet geraniums, heliotrope, and verbenas. Amongst the perennials, hollyhocks (single or double), phloxes, dolphiniums, campanulas, lychnis, pinks (especially the common white) carnations, tufted pansies, and Michaelmas daisies should be planted in groups, the greatest care being exercised to secure effective groupings and continuous show of flowers throughout the greater part of the year; excepting on the outer edge of a border, where a continuous line of one thing, such as pinks, may look very effective. Avoid planting in lines, but rather try to secure a little irregular colony of each plant. If you intend to successfully cope with this most important branch of garden making, I would advise you to make the acquaintance of a nurseryman who has a good collection of hardy plants, and to visit his borders once a fortnight, making careful notes

of the plants in flower at the time, their colour habit, and height.

After all the advice I have given you I can imagine some of you will yet decide that the subject is too big, or that the advice has come too late. If so, as one who loves a garden, let me suggest that when commissioned to design a house, in connexion with which there is to be a garden, that you should seek to co-operate with the garden designer from the time you prepare your first sixteenth-scale plan, and to agree on some mode of treatment of those parts of the scheme where there is an overlapping of interests, and on the successful treatment of which depends in no small measure the success of the whole scheme.

In one of the most recent reviews of my book I am told that I lack fire and poetry. Now, I have fortunately realised, and I think it was probably due to Mr. Sedding's delightful book, "Garden Craft," more than anything else, that a man engaged in the design of gardens was in danger of holding a position analogous to that of the lover in being more sentimental than practical. I have therefore endeavoured to avoid rhapsodical sentences on the one hand, and, on the other, of giving you a series of cut-dried garden designs. I have tried to give you a series of hints which would help you to do the designing.

THE SURVEYORS' INSTITUTION: FUTURE OF THE LONDON WATER SUPPLY.

A MEETING of the members of the Surveyors' Institution was held at 12, Great George-street, Westminster, on Monday evening, Mr. John Shaw (President) being in the chair. The sole business of the evening was to resume the discussion on the paper by Mr. R. E. Middleton, M.Inst.C.E., on the London water supply, read at the preceding meeting, and printed in our issues for December 15 and 22.

The secretary (Mr. Julian C. Rogers) announced the receipt of a communication from Mr. Shaw, of Boston, Lincolnshire, bearing on the subject. In this Mr. Shaw pointed out that the population of London, and the amount of water per head to be supplied, had increased by leaps and bounds during the last quarter of a century, and while believing that with the supply at 30 gallons per head there was at least 10 per cent. of preventable waste, the water engineer of to-day might easily push back the rate of consumption per head to what it was twenty-five years ago. The quality of London water, both in the raw and the finished material, had enormously improved. The sanitary improvements in the towns and the villages above the intakes, the beneficial results of the supervision of the inspectors appointed by the Thames and Lea Conservancy Boards, had improved the raw material out of all proportion to the slight deterioration which the increase in population in such districts had tended, and the improvement in the work and the filters had provided a very high-class water. The writer agreed with the author in regarding the River Thames as the sheet anchor of the London water supply for many years to come.

Professor Robinson addressed himself to the utilisation of the Thames for the future water supply of London in a different way to that advocated by Mr. Middleton. He was of opinion that the right way to deal with the matter was by the construction of impounding reservoirs in natural valley tributaries of the Thames. Both Lord Balfour and Lord Llandaff's Commission agreed that 300,000,000 gallons a day from the Thames, leaving 200,000,000 as a minimum to go over Teddington weir, should be the basis. It was many years ago that he came to the conclusion that the solution of the question was in impounding reservoirs. He laid his views before the Balfour Commission, and since that report was issued he had continued his investigations and had come to the conclusion that an impounding reservoir for 15,000,000,000 gallons could be constructed at a cost of 850,000, and a storage reservoir for 55,000,000,000, at a cost of 1,610,000. By the construction of a reservoir of that magnitude the flow in the Thames could be maintained at 600,000,000 gallons. He also went beyond that and ascertained that a reservoir could be constructed at the cost of 2,400,000, which would give a flow of 700,000,000 gallons per day in the Thames. These figures had been arrived at within the last few years—since, in fact, Lord Balfour's Commission sat, and they could be taken with a full sense of responsibility and as capable of

being proved at the right time and in the right place. Discussing the conclusions arrived at by Lord Balfour's Commission, Professor Robinson said he was not convinced by Sir Archibald Geikie's evidence as to the difficulties on geological grounds, nor of those attributed to the "flow-off" and the flood water. In the ten years that had elapsed very much had been learnt on the latter point. To sum up his ideas, what would be the effect of the impounding reservoirs? It would preserve a uniform flow in the Thames, it would enable the pumps to work advantageously, the Conservancy would obviously favour it, because it would be better for navigation and hygienic purposes, the water delivered to the intakes would be in a better condition, the filtering beds would be less taxed, and the interests of both the consumers and the water companies would be better served. So far as the water companies were concerned it was desirable that this scheme should not be ignored, for when it came to the question of purchase after the Water Boards had been formed, it would be found very much to the interest of the water companies if they could point out that by the expenditure of 2,000,000l. the public could be served equally as well as by the outlay of five times the capital. He had no hesitation in saying that the more the impounding system was investigated in the spirit of pure research the more would his views be confirmed.

Mr. H. H. Statham said he was anxious to say a few words about what he considered the totally inadequate ideas prevailing as to the quantity of water per head required by the Metropolis. Until there was a sounder idea upon that point the seriousness of the problem would not be properly appreciated. The fact that at this time of day we had a necessary of life served out by private companies, whose interests were the shareholders' and not the public's, was an anomaly so monstrous that he was surprised that public opinion had not arisen ere this against the system. He was not going into that subject; but one effect of that system was that water engineers had got into the habit of thinking of water as a substance to be dribbled out in the smallest quantities, and with them, the problem was not how much to give per head, but how much consumers could be screwed down to. The most preposterous example of that was a letter to the *Times* by a venerable engineer, who laid it down that with proper care the supply could be reduced to 25 gallons per head. This was calculated to carry their minds back to the "antediluvian period," when people took a bath on Saturday nights only. Of the bearing of baths upon public health there could be no doubt. When he first came to London, an eminent physician gave him two pieces of advice—one of which was to get *into* water every morning. He was emphatic upon that; that total immersion was what was really required in a bath; and to regard that as "waste of water" was simply foolish. On measuring the quantity the other day, he found that in the ordinary bath the amount of water for total immersion meant between 60 and 70 gallons, and if this was such a desirable thing in point of health, what became of Mr. Middleton's 35 gallons per head? But even if they left alone the total immersion and gauged the amount used in the upper-class houses, they would find it amounted to far more than 35 gallons. For himself, he considered 50 gallons the very least that should be thought of. The answer might be given that there were a large number who used hardly any water at all for ablution, and the surplus could go to those who wanted it. That he called a most immoral argument. It meant that because the lower classes were dirty they need not give them water. His contention was that they were bound to give them a chance to have a bath. But the fact was that, as education progressed, the more people learned about the conditions of health, and the more they came to understand that a copious use of water was desirable, the more they would require. Then, as to waste, it had been said that if the water supply was in the hands of a Governmental or Public Authority we should be far more controlled than we are under the water companies. On the contrary, he thought no system of administration would have the same interest in stopping so-called waste of water as the companies had. In Birmingham the municipality supplied both gas and water, and he may recently described their policy as endeavouring to run the former at a profit,

but not the latter, because it was a necessary of life, and should be supplied as copiously as possible. But they would always be liable, as long as waste was checked by house-to-house visits, to be subjected to widespread irritation amongst consumers, and this system was open to this objection—that they did not get justice, because the officials employed on the visitation were always in a hurry, yet were anxious to justify their existence by reporting everything that was wrong—and more. He spoke thus from experience. When he came home one day a notice awaited him notifying half-a-dozen defects. He wrote to say who he was and challenging the statement, and their superior officials were sent who made a more careful inspection. Eventually the company admitted that four out of the six requirements were unnecessary. What was the remedy, then, for useless waste? He replied, supply by meter: that was a common-sense logical conclusion to his mind. With the supply checked by meter they made the householder interested in the amount consumed, and he would naturally see that the taps did not leak. They would, moreover, avoid that irritating visitation from house to house. Every one would pay for what he used, and the poor man who did not use very much would not pay for what the rich man used. The only valid objection he knew of was that the lower classes might be seized with a desire to economise and avoid washing altogether. That difficulty might be met by putting houses at a very low rental on a rating basis. Unquestionably, however, service by meter was one of the most effective systems for checking unnecessary waste—the meant real waste and not the copious use of water. But what he wished to urge was that water supply should be copious, not meagre and restricted. It was even more important in a great crowded city like London than in those American towns which supplied from 100 to 140 gallons per head. Those places, instead of being extravagant, were in advance of us in their notions of sanitation and civilisation, and instead of scoffing at them we should follow their example as nearly as we could.

Mr. Hassard, who remarked that he was the designer of the Welsh scheme now under consideration by the London County Council, said he desired to discuss probabilities as to the population and the amount of water received by the metropolis fifty years hence. The population of the metropolis at that time had been variously estimated by Royal Commissions and experts at from 15,000,000 to 30,000,000. He, however, regarded these figures as entirely illusory. He did not think the population in 1951 could possibly exceed 12,000,000, if, indeed, it reached that. Allowing 35 gallons per head per day, they would thus require 420,000,000 gallons daily—a supply which the Welsh scheme was fully capable of meeting, at a cost of about 38,000,000l., or about 3l. 4s. 6d. per head of the population. As regards the quality of the water, that now supplied to London he believed was of 18 deg. of hardness. This, however, was not such as should be supplied to the metropolis of the world. The Welsh water was very soft—something about two degrees of hardness—but he did not advocate the use of water of such soft quality. A higher degree of hardness was more pleasant to drink and was equally suitable for all purposes of trade and manufacture. In his scheme the difficulty was met by the incorporation of 30,000,000 gallons of the most beautiful water from the oolite beds of the Cotswold Hills, and which could be carried by gravitation into London. If the 38,000,000l. he had referred to were borrowed for fifty years the whole capital would cease at that period, and on a 3 per cent. basis this great supply would have been brought to London at a cost of 2½d. per thousand gallons, or, upon a 2½ per cent. basis, at 2½d. per thousand gallons. The idea that the Welsh scheme would involve ruinous taxation was quite unwarranted.

Mr. Vernon Harcourt (Oxford) said he feared that Mr. Middleton had scarcely treated the question in the spirit of free inquiry. His paper was mostly an argument in favour of the Thames as against any other source of supply, and even when speaking about that spirit of free inquiry, he declared that it could be proved conclusively that the bringing of water from Wales would mean a supply no better in quality than that drawn from the neighbourhood of London and would be very much more costly. Whatever demerits there might

be in the Welsh scheme, he (the speaker) did not think anybody would care to say that the water from the Principality would not be preferable to that from the Thames. Professor Robinson mentioned that there were some valleys in the Thames basin which could be used as impounding reservoirs. He (the speaker) did not know which valleys were referred to, but he had occasion years ago to survey most of the tributaries of the Thames, in fact, all above Oxford, and there were very few of those, irrespective of geological formation, which would have been satisfactory as impounding reservoirs on account of the small fall of the rivers. There was, perhaps, one exception—the river Chalon, which flowed in at Oxford. He agreed with all that had been said about preventible waste—not waste which arises from having baths—but the waste in which taps were allowed to run continuously. The population question was a difficult one. Mr. Hassard was right in saying that all conclusions arrived at were based merely on assumptions. What seemed to him to be a cogent fact was that the birth-rate in London was not increasing, yet it was impossible to gauge what would be the possibilities of the influx into the metropolitan district by 1961. The author of the paper seemed to think that if the supply was sufficient to meet the wants to 1961, London might then be allowed to look after itself. There were two points to be considered in this connexion. One was—How far could they have a large population on the river and in the valleys from which the water supply was drawn, with their inevitable sewage farms and effluent always flowing into the river above the intake, without incurring some risks? Another point to bear in mind was this—Although they might tap the Welsh watershed now they might not be able to do so in 1961, when the necessity for it would be more urgent. By that time, possibly, some other town might have appropriated that source. What would London do then? Mr. Baggallay, O.C., feared that the discussion was digressing from the main point at issue. The question was rather, What was the necessary quantity of water required to supply the population adequately, and not the discouragement of waste. Nor was the question of the supply of water by meter to the point, though he was bound to point out, now that it had been mentioned, that the system had been tried at Norwich, and was found to be a premium upon dirt and nothing else. Those who had the control of small classes of property were induced to reduce the supply of water to their tenants to an irreducible minimum. There was also a Bill brought in and backed by Mr. Causton among others, but it was withdrawn as impracticable. The main point raised by the paper was, as he took it, this:—Is it, or is it not, right that London should use the two rivers which nature had caused to flow through her before she went elsewhere? Two things controlled that question—one was the cost of the utilisation of what was at her doors, and the other was that of the sufficiency and the quality of what water was there. With the run over Teddington Weir, in one week's rainfall an adequate supply could be obtained for London for a whole year. It was purely a question of the cost of storage, and he held that reservoirs could be constructed wherever wanted without the enormous cost of going to Wales. Waste had been the curse of London for many years, and he hoped a serious endeavour would be made to restrict it.

Mr. Lucas thought it idle to suggest that such an aggregation of human beings could crowd the metropolis as had been suggested. There was a limit to all things, and in an able paper read some years ago before the Statistical Society by Mr. Pryce Williams, he showed that when the population of London reached 8,000,000 the breaking point would be reached. For himself, he regarded that part of Mr. Middleton's paper dealing with the population as a dream. In the discussion the question of the purity of the water seemed to have been ignored. He had found that when the Thames was at its lowest London was taking half the flow. When the population was doubled it would, as a consequence, take the whole, and if any pumping was to be done from the Thames there would be only mud to pump. Moreover, the time would come when the population on the banks of the Thames would be so great that the purity of the water must suffer. He was convinced that the time must come when

London would have to go to Wales. They had gone for many years to the Thames, and the river had served them well, but there could be no denying the urgency of a new source.

Mr. Ashton Hill (Birmingham) said the subject of the metropolitan water supply was one of the keenest interest to country water engineers, and they were watching closely to see whether London would seek an augmented supply at home or from Wales. Mr. Middleton had proved an able advocate of the home scheme, but, excellent as the paper was, he was not convinced. His argument was—Why should we go away when we have a good supply close at hand? But Mr. Middleton acknowledged that London would have to go to some distant source in, say, half a century. If this be true now, they could not begin too soon for the construction of necessary works would certainly occupy fifteen years, added to which would be another five years for preliminaries in getting powers, &c. That meant that by 1911 it would be necessary to go in for this distant scheme even if London got from the Thames valley all the water that Mr. Middleton said he could get. Having had long experience of deep-well water supply, he doubted if they could get so much as was indicated by Mr. Middleton from that source. He proposed to raise 381,000,000 gallons per day from wells alone. He (Mr. Hill) thought he must be a sanguine engineer to believe in such an enormous quantity from such a source. His pumping scheme seemed to him unworkable, and not justified by the experience of the past. On the other hand, the Welsh scheme involved no uncertainties, and by carrying out such a scheme, London would have entirely independent strings to its bow, and there was no doubt about the ability of engineers to bring it to the metropolis. If Liverpool, Glasgow, Manchester, and Birmingham could afford to carry out a scheme of gravitation, surely London would not be deterred from having the best scheme possible merely on the score of cost.

Mr. Cowper Coles, as an agent from the Welsh watershed, said he was afraid the question of compensation had not been sufficiently considered by the engineers. The Wye area was already burdened with a Birmingham scheme, and if London came to the same river for its supply, the remainder of the western area would be drained. This would have a serious effect upon the salmon fishing of the Wye, which was the largest net-salmon river in Wales, England, or Scotland. Estates were sold on the increased value attaching to this privilege. The speaker also pointed out that Welsh water had a peaty taste—to verify which they had, he said, only to ask a Liverpool man what he thought of it.

Mr. Morris remarked that, as so much depended on the future population of London, it would be well to take up the several schemes in blocks, so that there should not be a waste of public money.

On the suggestion of the Chairman, the discussion was, at 9.45, adjourned for a fortnight.

SCHOOLS, SNEYD GREEN, BURSLEM, STAFFORDSHIRE.—The new schools which the Burslem School Board have just erected at Sneyd Green have been built on a site containing 5,000 square yards with a frontage to the main road at Sneyd Green of 88 yards. There are two blocks of buildings, the main block being for the accommodation of the boys and girls, and the second being for the infants. The larger block comprises a central hall 51 ft. by 36 ft., which is lighted from one side and from the roof, and six classrooms, each 25 ft. square, in each of which sixty children may be seated. All the rooms are finished with concrete and wood block floors, glazed tile dadoes, picture rails, plastered walls and ceilings, and wrought iron gas fittings, and in the classrooms are galleries of three tiers. Warmth is supplied by means of hot-water, and ventilation is effected through Tobin tube inlets and roof extractors. The windows are large and in every room additional left-hand light is secured. Similar in construction is the infants' department. In this case, however, the central hall is smaller, being 45 ft. by 28 ft., and there are four classrooms measuring 25 ft. by 22 ft., giving a total accommodation for 300. Adjoining the schools is a caretaker's house, and there are extensive playgrounds which are asphalted, and covered play sheds. The general contractor is Mr. J. J. Longden, of Burslem, and the sub-contractors are Messrs. T. W. Eardley (plumbing and glazing), H. Barber (stone work), Truswell & Sons (heating), W. Durose (ironwork), and Bennett & Sons (furniture). The cost of the building and its equipment will be about 8,200l. The site has cost 1,100l. The whole of the work has been executed from the designs and under the direction of the Board's architects, Messrs. Wood & Hutchings, of Tunstall.

COMPETITIONS.

PORTSMOUTH TECHNICAL INSTITUTE.—The Portsmouth Libraries and Museum Committee have selected the plans for the new Technical Institute, which is to be erected at the back of the Town Hall. Three premiums had been offered, 100l., 75l., and 50l., and Mr. Cross, of London, was appointed the assessor. There were six competitors, and their own estimate of the cost of the work ranged from 43,000l. to 55,000l. The assessor's lowest estimate was 49,408l. He awarded the first premium to Mr. C. E. Smith, of Victoria-road North, Southsea, whose estimated cost of the building was 43,086l. The assessor's second award fell to Messrs. Rake & Cogswell, Prudential Buildings, Landport, their estimate being 44,600l., and the third to Mr. W. C. Bevis, Elm-grove, Southsea, who estimated the work at 43,000l., though the assessor's estimate on the same basis was 48,610l. The other competitors were Messrs. A. E. Guy, of Albert-road, Southsea; C. Ball, Kent-road, Southsea; and J. W. Walmsley, of King's-terrace.

PRINCE'S PARADE, BRIDLINGTON.—In the recent competition for extension of 1, Royal Prince's Parade, Bridlington, the first premium, of 35 guineas, has been awarded to Messrs. Mangnall & Littlewood, 42, Spring-gardens, Manchester. The second premiated design was by Mr. J. Freebairn Stow, Corn Exchange, Exbridge. The other competitors (as given by a local journal) were Messrs. Wood & Frenching, London; Messrs. Beal & Shepherdson; Mr. S. Dyer, Bridlington; Messrs. Shepherdson & Beal; and Mr. Matthews. The plans selected provide for an iron pier and promenade with a pavilion to accommodate 3,000 persons. The estimated cost is about 28,000l.

BRIDGE, SYDNEY.—The premium of 1,000l. offered to the engineers of the world for the best design for a bridge to connect Sydney with the North Shore has been awarded to Mr. E. Crutwell, engineer, of Westminster. The tender sent in with the plans by Sir William Arrol, the builder of the Forth Bridge, was for the amount of 2,927,230l. There were twenty-four tenders sent in from all parts of the world, the lowest being for 991,870l. The Board of Examiners, it is stated, considers the whole of the plans disappointing, and not one is recommended for adoption.

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS.—A lecture on "The Housing of the Working Classes" was given before the members of the Sheffield Society of Architects and Surveyors by Mr. H. Potter, at the School of Art, on the 10th inst. Mr. J. Smith presided. In introducing the subject, the lecturer said he did not intend to discuss the social or political side of the question, but to touch on the difficulties that architects had to contend with in recognising the natural requirements made by owners as well as tenants, and to see how they could best serve the interests of both, the latter quite as much as the former, by giving the owner a good security for his outlay, and the tenant the best accommodation possible for the rent he has to pay. In providing dwellings for the working classes, one of two methods was generally adopted, either to build blocks of four or five storied tenement buildings in the centre of a town, or to erect cottages in suburban districts, to accommodate one family only, or, at any rate, not more than two. He proposed to limit his paper to the consideration of the latter class, viz., small houses to be built either semi-detached, in blocks of four, six, or eight, or even in larger terraces. In a locality with a large working-class population earning good wages, there must be a steady demand for this class of residence, and owing to the existence of an excellent service of electric trams and cheap fares, Sheffield possessed one of the best aids for solving its own housing problem, for by this means there was easy access to the suburbs, enabling a working man to live where he and his family could enjoy a house and a reasonable space of ground to themselves, pure air, and be within easy reach of the country, instead of in a suite of rooms in a lofty tenement building, situated in the centre of the city. But there were probably here, as in most towns, a certain number of men who, owing to the nature of their calling, must live in the heart of the business centre, and for these an excellent scheme was now being carried out by the Corporation in the Crofts area. There were many

difficulties to be contended with by architects in designing these houses, which were all due to the important consideration of cost or the rent the occupiers can afford to pay, this being influenced by (1) the frequently high price of land; (2) the increased cost of labour and materials; (3) the adoption of more stringent building regulations by all sanitary authorities. In reference to the last, no objection could be raised to by-laws that tended to check unsound and unsanitary buildings, but architects did feel at times that they added unnecessarily to the cost. In this respect Sheffield enjoyed privileges in two important instances, viz., it was permitted to have two stories and rooms in the roof with a 9-in. external and party wall, and it was not necessary to carry the party walls through the roof for a height of 15 in. After giving some instances, the lecturer briefly referred to some points that arose in laying out estates. He suggested that, instead of large owners and public bodies cutting up the land at the rear of the houses into small strips for so-called gardens, each house might have a small yard, and the remaining land be kept as one large open space for the benefit of all the adjoining houses. With sites 70 or 80 ft. deep, a space 40 to 60 ft. wide could be obtained extending the entire length of the houses, which would form an excellent playground for the children, would facilitate the drainage, give good access to the rear of the premises for the delivery of fuel and collection of refuse, and save the loss of frontage caused by providing for this in the ordinary way. After making a few remarks about roads and the length of time these were sometimes allowed to remain in an unfinished state, the lecturer discussed the planning of these small houses in detail. He referred to a series of plans shown in the room illustrating houses occupying frontages of from 12 ft. to 18 ft., beginning with four-roomed cottages for one family, and gradually increasing in size up to six and seven rooms. Then followed plans for double tenements, representing a class of house for which there is an increasing demand in industrial centres. They consist of ground and first floors arranged in "flats," each having a separate front entrance, and being self-contained in every respect. They meet the requirements of a large class of people who are unable to pay the rent required for single tenement houses, and avoid all the inconveniences that arise if two families share a house that was originally intended to be occupied by one. In conclusion, the lecturer referred to the external treatment of these houses, and in making a plea for a more careful consideration of this part of the subject, showed drawings illustrating the use of different materials in a simple, but effective manner. The lecture was illustrated by drawings. A discussion followed, and, on the motion of Mr. E. M. Gibbs, seconded by Messrs. T. W. C. Fenton, and supported by Messrs. T. Shaw and the chairman, a vote of thanks was accorded to the lecturer. A ballot was taken, and the following gentlemen were duly elected—Mr. H. I. Potter, associate; Messrs. W. A. Forsdike and J. A. Whitehead, students.

ARCHITECTURAL ASSOCIATION OF IRELAND.—An ordinary meeting of this Association was held in the Grosvenor Hotel on the 8th inst. In the absence of the President the chair was occupied by Mr. Walter Doolin, M.A. Mr. M. J. Tighe, in the affirmative, opened a debate, "That the present system of apprenticeship is best suited for the training of an architect." Mr. F. G. Hicks replied in the negative, and a discussion ensued, in which Messrs. Hudman, Lynes, R. M. Butler, Scott, Allberry, and the chairman took part. Ultimately the following resolution was carried—"That, in the opinion of this meeting, the present system of pupillage, concurrent with a compulsory collegiate training and qualifying examination, affords the best promise for the architect of the future."

LIVERPOOL ARCHITECTURAL SOCIETY.—At a recent meeting of this Society at the Law Library, Castle-street, Professor Simpson, of University College, presided, and said that they united in wishing the Society a prosperous new century. They formed the oldest architectural society in the provinces, and claimed also to be the strongest. Their warmest congratulations were extended to Mr. Pearce Edwards upon his appointment to the position of City Architect at Bradford. Mr. Woolfall seconded a vote of congratulation proposed by the Chairman, and it was recorded on the minutes. A paper by Mr. M. H. Baillie Scott, of Douglas,

who was not able to be present, was then read by the Chairman. Its subject was "The Planning of Small Country Houses."

MANCHESTER SOCIETY OF ARCHITECTS.—On the 10th inst., at a meeting of the Manchester Society of Architects, held under the presidency of Mr. E. Hewitt, at Standard Chambers, King-street, Mr. Hugh Stannus, of the Manchester Municipal School of Art, read a paper on the subject of the training of an architect. Mr. Stannus mentioned that since he had undertaken to read a paper on this subject, the authorities of Owens College had made a move forward in their direction, and what he had to say was somewhat influenced by their intentions in the arrangement of his plan into years and sections. He acknowledged some indebtedness to Mr. Arthur Cates, the former Chairman of the Board of Examiners of the Royal Institute of British Architects, who had, he observed, great experience of the necessity and value of the higher education in architecture. It might be asked whether such education was necessary, but in Manchester that question was already answered in the arrangement by principals for their pupils to attend the School of Art for an afternoon in each week. Speaking generally, it might be said that beyond what was termed professional practice, which could be learned nowhere else, there was not much opportunity for the higher education in most modern offices. The principal was too much engaged to afford time to be a schoolmaster, and the senior draughtsman had rather to get work out of the pupils than to pump education into them. No system could be exhaustive, and the end of all the education they could give was to enable the student to educate himself. Should the system be academic or individual? If they could afford one separate teacher to each student then the system might be individual, but in such a case the student lost the advantage of seeing the various solutions of different problems by other minds and the further great advantage of emulation. So far as his experience extended, no student who had any originality in him ever lost it by judicious, systematic training. Hence he thought it better to teach according to a well-considered system during the earlier period of pupillage, and to leave the development of individuality to come in the later stage. In other words, he would generalise in the earlier and specialise in the later period. It had been objected that the academic teaching reduced all students to one dull level of monotony, and that as a result of this a street in Paris was the same from one end to the other, and was not so interesting as a street in London, where every shopkeeper did what appeared right in his own eyes, seeking only to shout louder than his neighbours. He contested the objections, and contended that the street in Paris was not the same from one end to another. Within the limits which had been fixed for the common good, there was a greater variety of artistic detail than in London, for the Parisian architect, having his mind set free from the lower considerations, could devote himself more fully to what, after all, gave the measure of the artist—the arrangement of the features and the details. Further, the academic method of study would bring to the student's mind the strength and the weakness, the applicability and the inapplicability, of the typical treatments that were used in each of the great styles to the different problems of modern building, and when a man had learned what to do without then he was on the direct road to make his own style by the omission of useless details. And as minds varied so would the architecture of our streets. Discussing in detail a chart of studies which he had drawn up, Mr. Stannus said he assumed the length of the course as three years, not because it was long enough, but because it was generally all a man could give. The method of study in the old times at Paris used to be to learn (1) all about construction, (2) all about plan, (3) all about elevations, and (4) mix the three. He would prefer to run these concurrently, to emphasise the fact that architecture was one. In the course of further comment he urged that students should look upon planning as a fine art. He assumed in the chart he drew up that a student would be able to attend on the instruction referred to for five hours a day for five days in the week for forty weeks in the year. The collegiate recognition of architecture was a desirable object in view of the special circumstances of architectural education. He considered, however, that two points demanded atten-

tion—namely, the requirement of attendance at lectures as a condition of granting degrees, and the examinations. With regard to the attendance at lectures, which was possible in the collegiate life and discipline of the older universities, he reminded them that the modern stressful life of Manchester, with its belt of subsidiary cities, killed the monastic ideal and left no place for monastic manners. Still, if attendance was required, he would plead that this should not be enforced for a period of three years from the inception of the system. Further, any student who desired to proceed to a degree during this transition period should be admitted to the examination on proper recommendations. A certificate might be granted to any student who had attended the lectures of one particular section and satisfied the examiner on it, without his being compelled to take the whole course. Thus the system would be made elastic until sufficient experience had been gained. He regarded examinations as necessary at the end of every course, whether long or short. The aim should be to make the education systematic rather than sporadic. While they did not desire to manufacture Admirable Crichtons, they ought to strive to deepen and broaden the education of the architect of the future, so that in his intercourse with his client and the contractor he should hold aloft the ideal of a cultured, practical, and trusted adviser. In replying to a vote of thanks and remarks which had been made by members present, Mr. Stannus said that he thought they would have to reconsider the question of pupillage. Students would go first for academic instruction for three years, or whatever might be the period, and then architects would find their pupils worth more to them. They might be able to take a pupil without any premium at all. The academic system, in his view, should come first, and then the student could go into an office to learn professional work. He thought they ought to welcome the institution by any college of a course which would tend towards the raising of the professional tone, which they all had at heart.—*Manchester Guardian.*

RATES OF WAGES IN THE BUILDING TRADES.

MANY interesting facts, based on statistics officially supplied by various representative organisations, are set forth concerning the above subject in a Report made by Mr. H. Llewellyn Smith to the Comptroller-General of the Commercial, Labour, and Statistical Departments of the Board of Trade, and presented by command of her Majesty to both Houses of Parliament. The Report deals with the standard rates of wages and hours of labour in force in the United Kingdom at the beginning of 1900, and represents the changes which have taken place since a similar Report was issued in 1894. It thus forms a fresh starting-point in the investigation of these important subjects, which it is intended to continue, and of which the results will in like manner be published periodically. Mr. Llewellyn Smith gives interesting explanations as to the meanings attached to the terms "time-wage" and "piece-wage," and he estimates that, taking into account all classes of workpeople, male and female, including those employed in agriculture and domestic service, no fewer than 74 per cent. of the workpeople employed in the United Kingdom appear to be engaged in industries in which time-wage is the most prevalent system. By the "standard rates of time-wage" is meant those rates which are recognised as applicable (usually as minimum rates of pay) to the remuneration of a considerable number of workpeople engaged in a given industry at a given place. "It will be understood," remarks Mr. Smith, "that, while competent workpeople, whose remuneration is governed by a standard rate of wages, are not expected to work—and would not consent to work—for a lower rate, individual workmen, whether on the ground of the possession of special skill or the difficult or dangerous character of the work, may and do receive more than the standard rate of wages ruling for their trade in the locality. On the other hand, workmen who have not yet mastered their craft (improvers, &c.) will not demand or receive the standard wage; and in some trades the arrangements between employers and employed permit of workmen admittedly too old to do a fair day's work accepting wages lower than those recognised as the minimum for the general body of workmen." In certain trades (Mr. Smith goes on to remark), more especially in the different branches of the building trade, the weekly wages of the workpeople fluctuate according to the season. The rates of wages and hours of labour upon which his (Mr. Smith's) returns are based are, therefore, those which obtain in the summer months. The conditions of employment prevailing throughout the winter months are not uniform, distinct

arrangements being made with respect to different parts of the winter season, during all of which, however, the standard hours of labour are shorter than in summer, and in some cases slightly higher rates of time-wages are paid. As between different branches of the building trades the amount of seasonal fluctuation in hours and wages varies considerably, some classes of workpeople (e.g., carpenters and joiners) being employed under cover, and being, therefore, in many cases employed for the same number of hours per week in winter as in summer. With regard to local variations in rates of wages, it is mentioned that in the building trades, while bricklayers, for example, receive 10d. in London and in a large number of other towns, their wages fall to 6½d. in several districts (Stroud, Wisbech, and Bridgewater), and to 6d. an hour, or even less in others, as in Tiverton and Barnstaple. The wages of carpenters and joiners vary from 10d. an hour to 5d. per hour in different districts, and similar variations are shown by the wages of many other classes of operatives. The causes of local variations in wage-rates are at once numerous and complex. As a rule, wages in the same trade are higher in London and other large towns than in the smaller centres of industry. In part, this fact is attributable to the higher cost of living incurred by the workmen, especially in regard to house rent; in part, no doubt, to the fact that on the average a somewhat higher standard of skill is expected in large centres, and that a higher rate of pay once established has a tendency to perpetuate itself by attracting the more highly-skilled workmen. Moreover, in some cases the wider labour market and the greater mobility of the inhabitants of a large town may place them in a better position to demand high pay than those workmen who live in a small town or village, and would have to migrate to a considerable distance in order to obtain work elsewhere. In an appendix particulars are given of the standard rates of wages and usual summer hours of labour (exclusive of overtime) recognised in the year 1900 for the principal classes of building trade operatives in the different towns of the United Kingdom. From this table we extract the figures applicable to a few typical places. Rate per hour for bricklayers:—London district, 10d.; Carlisle, 8½d.; Bradford, 8½d.; Liverpool, 9½d.; Manchester, 10d.; Bristol, 8½d.; Hereford, 7½d.; Potteries District, 8½d.; Shrewsbury, 8d.; Colchester, 7d.; Oxford, 8d.; Norwich, 7½d.; Bournemouth, 7½d.; Brighton, 8d.; Cowes, 6½d.; Portsmouth, 8½d.; Barnstaple, 5½d.; Bideford, 5½d. For masons:—London district, 10d.; London, 10d.; Carlisle, 8½d.; Liverpool, 9½d.; Carlisle, 8½d.; Bradford, 8½d.; Hereford, 7½d.; Manchester, 9½d.; Potteries 8½d.; Shrewsbury 8d.; Colchester, 9d.; Norwich, 7½d.; Bournemouth, 7½d.; Brighton, 8d.; Portsmouth, 8½d.; Barnstaple, 5½d. For carpenters and joiners:—London district, 10d.; Carlisle, 8d.; Bradford, 8½d.; Liverpool, 9½d.; Bristol, 8½d.; Hereford, 7d.; Potteries, 8½d.; Shrewsbury 8d.; Colchester, 9d.; Norwich, 7½d.; Oxford, 8½d.; Bournemouth, 8d.; Brighton, 9d.; Portsmouth, 8½d.; Barnstaple, 5½d. For plasterers and joiners:—London district, 10d.; Carlisle, 8d.; Bradford, 8½d.; Liverpool, 9½d.; Manchester, 9½d.; Bristol, 8½d.; Hereford, 7d.; Potteries, 8½d.; Shrewsbury, 7½d.; Colchester, 8d.; Oxford, 8½d.; Brighton, 8d.; Barnstaple, 5d. For plasterers:—London district, 10d.; Carlisle, 8d.; Bradford, 9½d.; Liverpool, 9½d.; Manchester, 9½d.; Bristol, 9d.; Hereford, 7½d.; Potteries, 8½d.; Shrewsbury, 8½d.; Bournemouth, 7½d.; Brighton, 8½d.; Portsmouth, 8½d.; Manchester, 8½d.; Bristol, 8d.; Hereford, 6d.; Potteries, 7½d.; Shrewsbury, 6½d.; Colchester, 7d.; Norwich, 6d.; Oxford, 6½d.; Bournemouth, 5½d.; Brighton, 7d.; Cowes, 6½d.; Portsmouth, 6½d.; Barnstaple, 5½d. For labourers:—London district, 7d.; Carlisle, 5d.-5½d.; Bradford, 6d.; Liverpool, 5d.-6d.; Manchester, 5½d.-7d.; Bristol, 5½d.; Hereford, 4d.; Potteries, 5½d.-6½d.; Shrewsbury, 5½d.-5½d.; Colchester, 4d.-4½d.; Norwich, 5d.; Oxford, 5½d.; Bournemouth, 5d.-5½d.; Brighton, 5d.-5½d.; Cowes, 4½d.-4½d.; Portsmouth, 6d.; Barnstaple, 3½d.-4½d. Hours of labour:—London district.—For bricklayers, masons, carpenters and joiners, plasterers, painters, and labourers, 50 hours; for plumbers, 47. Carlisle.—For bricklayers, masons, carpenters and joiners, 50; labourers, 50-54. Bradford.—For masons, carpenters and joiners, plasterers, and painters, 49½; painters, 52; plumbers, 49½. Liverpool.—For all operatives, 49½. Manchester.—For bricklayers, 54½; for masons, carpenters and joiners, and plumbers, 49½; for plasterers and painters, 52; labourers, 49½ to 54½. Bristol.—For all operatives, 54. Hereford.—For all operatives, 50½. Potteries.—For carpenters and joiners, 50½; for all others, 54½. Shrewsbury.—For all operatives, 51½. Colchester.—For all operatives, 50½. Norwich.—For all operatives, 50. Oxford.—For masons, 54; for all others, 53½. Bournemouth.—For masons, 50½; others, 55½. Brighton.—For bricklayers, carpenters and joiners, plumbers, and labourers, 50½; for plasterers, 50; for masons, 55½. Cowes.—For all operatives, 50½. Portsmouth.—For painters, 55; for all others, 55½. Barnstaple.—For all operatives, 50.

HOUSES, 38 AND 39, CHEYNE-WALK, CHELSEA.

THE main lines of the elevation of these houses were fixed by the adjoining "Magpie and Stump House," No. 37, Cheyne-walk, and the elevation is designed with reference to it.

No. 38 is a combined studio and residence, and has also a studio in the rear.

No. 39 is a dwelling-house only. There are several details of interest in it; the hall has a panelled dado of American whitewood, with

a decorative frieze by Mr. F. C. Varley, showing all objects of interest along Cheyne-walk in 1900, from No. 1 to the World's End. There are also in various rooms some interesting carved wood fireplaces of early 18th century date, together with some panelling from the old houses formerly on this site.

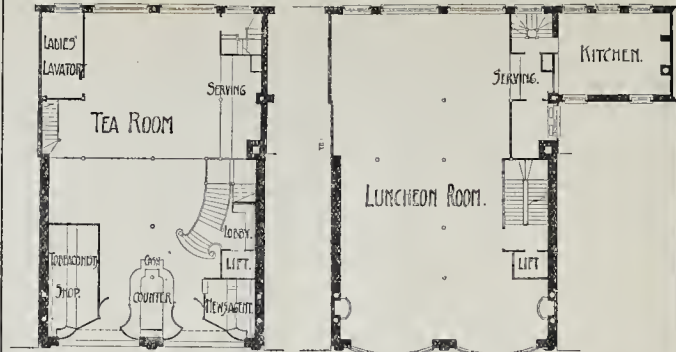

C. R. ASHDEE.

PROPOSED SEASIDE RESIDENCE, HUNSTANTON.

This is a design for a small seaside house at Hunstanton, with the sitting-room apparently intended to face inland, and not towards the sea, probably for consideration of shelter from cold winds. The pantry and scullery is cleverly placed between the dining-room and kitchen, and a servants' stair is ingeniously got in where it might have been thought there was hardly room for it. It would have been better if the servants' water-closet had been a little more separated from the scullery department; it would have been preferable, in fact, with an entrance from the outer air.

The architect is Mr. C. F. Skipper, of London.

The words "elevations 8 ft. scale," &c., of course refer to the size of the original drawing, but could not be erased from the lithograph without spoiling its appearance. As we have often remarked, it is always better to draw out the scale on a drawing, instead of merely noting it in writing.

DESIGN FOR THE END OF A SCHOOL HALL.

THIS design by Mr. F. Winton Newman was one made in the Royal Academy Schools, and included in the last exhibition of students' work at the Royal Academy.

The conditions were that the hall was to be 50 ft. wide and 70 ft. from floor to ridge, and to be entered through a vestibule with a large window over to light the hall. There was to be a clock turret on the ridge close to the gable end.

S. FRANÇOIS DE SALES, S. TROND, BELGIUM.

THE town of S. Trond contains about 14,000 inhabitants, and is situated about twenty-one kilos. from a junction called Triemont. The town contains some good churches, amongst them being St. Peter's, a small Romanesque church, and also the ruins of the church of the Seminary, formerly the Abbey of St. Trudo, which was destroyed during one of the rebellions. The Church of S. François de Sales is the church of the monastery, and is entirely served by the Franciscan monks. It is situated in a small street leading off the Grande Place. There are seven bays in nave, each 19 ft. between the large buttresses; the chancel diminishes in width by two sides of an octagon, and this inside is utilised for two altars against them. The choir is of three bays terminating at the east by an octagonal end. There is a very large and lofty altar at this end. The church is under one span, and pilasters with deep sub-bases go up to a considerable height, whence the vaulting springs. The western façade is built of stone, with red bricks between the pilasters. The church was built in the seventeenth-eighteenth century. By the side of the church is the monastery. There is also a Town Hall in the Grande Place with a sixteenth-century tower, which is very picturesque; it contains many small bells. This place is quite out of the way of the general run of travellers, but is well worth a visit.

T. MARTIN BROOKS.

NEW PREMISES FOR THE DUBLIN BREAD COMPANY.

THIS building has recently been erected in Sackville-street, Dublin. It was found necessary to build the front in the form of two distinct houses, in order to preserve the lines of separate takings, and an attempt has been made to reconcile the consequently dual effect with the uniform purpose for which the building was to be used.

It was also a motive in the design that it should be suitable in character to its purpose, and this principle dictated the emphasising of the first, or luncheon-room, floor as the principal one by the carrying out of large bow windows, over which a large balcony has been provided, accessible from the smoking-room.

The lower portion of the front, the bay windows, and all dressings throughout are of Portland stone, and the rest of the facing of Thompson & Co.'s pressed bricks.

The general contractor was Mr. Jas. Beckett, Messrs. McCulloch & Navin are responsible for the painting and decoration; Messrs. Henry Hope & Son, of Birmingham, for metal casements; and Messrs. A. Smith & Stevens, of London, for electric lift.

GEORGE F. BECKETT.

LONDON BUILDING ACT, 1894 :

TRIBUNAL OF APPEAL CASE.

THE Tribunal of Appeal under the London Building Act, 1894, sat at the Surveyors' Institution, Westminster, on Tuesday, to hear an appeal by Messrs. Saltwell, Tryon, & Saltwell, on behalf of Mr. James Fryer, against the certificate of the Superintending Architect of the London County Council, dated October 21, under Sections 22 and 23 of the Act defining the general line of building on the north side of Fawley-road, Hampstead, between West End-lane and Honeybourne-road.

The members of the Tribunal sitting were Messrs. Arthur Cates (chairman), A. A. Hudson, and J. A. Penfold.

Mr. G. N. Freeman, Q.C., and Mr. T. Willis Chitty appeared for the appellants, and Mr. George Wallace, barrister, for the London County Council.

The case for the appellant, as outlined by Mr. Freeman, was to the effect that appellant was under a contract to purchase the freehold of a plot of land bounded on the west by West End-lane and on the south by Fawley-road. The appellant had erected a row of shops abutting on West End-lane, of which the building in question formed part. On April 8 he prepared plans for a building at the corner of West End-lane and Fawley-road, but abandoned the work after erecting a wall. On May 11 appellant gave notice to the District Surveyor of his intention to resume the erection of this building at the corner, but on July 30 the Superintending Architect called appellant's attention to Section 22 of the London Building Act, 1894, and on August 7 he received notice from the solicitors of the London County Council requiring him to desist from building further. Since that date the appellant had not continued the erection of the building or made any alteration in it except that he had demolished a very small portion. The appellant, who then proceeded with the erection of other shops in West End-lane, received notice of an application to the Superintending Architect to define the line of building, and the appellant, by his solicitor, was heard before the Superintending Architect, but the latter refused to regard the reasons submitted to adjourn his decision and gave his certificate defining the general line of buildings. The grounds of the appeal were these—First, that there was only one row of houses in Fawley-road between Honeybourne-road and West End-lane, and that in order that the general building line of such row of houses should govern the buildings, such buildings would have to be actually situated in such row; secondly, that the contemplated building was not actually situated in that row, but, on the contrary, in a row abutting on West End-lane; thirdly, that consequently the general building line of the row in Fawley-road ought not to govern the building

in question; fourthly, that the Superintending Architect must have issued his certificate on the erroneous assumption that the corner houses are in law situated in two streets, that the houses have not a general building line in both streets, he not having had any plans of the proposed building before him; fifthly, that, having regard to the arrangement with the owner of the land on the south side of Fawley-road and the building already erected on the south-west corner of West End-lane and Fawley-road, it was desirable for the purpose of uniformity that the shop appellant desired to erect should be erected, and so maintain the usual building plan as regards the neighbouring streets out of West End-lane. Mr. Freeman contended that the corner building referred to was situated in West End-lane; that as it was part of a continuous row of houses for commercial purposes, it was entirely different in character to Fawley-road, which was residential property. He also contended that the Superintending Architect had before him insufficient data upon which to make his certificate. He cited the case of *Barlow v. the Kensington Vestry* in support of his case.

Evidence having been given by Mr. C. W. Stevens, architect, and Mr. John Tryon, Mr. Wallace, for the respondent, contended that, by Section 20 of the Act, the Superintending Architect had the sole power to fix the building line of any street, and the premises of the appellant were really in the Fawley-road. He relied upon the decision in *Wendon v. L.C.C.*, where it was held that the mere fact of a wall being erected did not give the appellant the right to carry on the building at any time. It was the duty of the Superintending Architect to get the general line, and the appellant had been subjected to no hardships. Moreover, it would be very inconvenient to have two lines of frontage within a short distance of each other. The Chairman stated that the Tribunal would consider their decision and announce it at a future date.

SAXON CHURCHES.

SIR,—The volume of the *Anastatic Drawing Society* for 1878, edited by Mr. Llewellyn Jewitt, F.S.A., contains a sketch by the Rev. W. F. Francis, of the Priory Barn, Isleham, Suffolk.

The description accompanying the sketch says:—“The ancient building, now called the Priory Barn, was once a church. It consists of a nave, with chancel in the form of an apse. The walls are of Roman brick built herring-bone fashion with clunch and flints. All the windows are very early Norman and extremely narrow. There is a large Norman doorway leading into the nave and a partly squar-headed one into the chancel. Perhaps the most remarkable features are inside the edifice, these consist of two stilted or horseshoe arches, the larger one separating the nave from the chancel. It is built of Barnack stone, and very massive. The building is now a repository for straw and waggons and every conceivable kind of agricultural implement.”

The sketch does not tally with the description; the nave only shows the Roman bricks, the chancel and its apse shows stone, and there are two courses of stone under the eaves of the nave, as though put there for repair. South door to nave very tall and plain semicircular arched opening. South door to chancel has a shouldered lintel, or (as sometimes called) “Carnarvon arch,” or a spring or water-table runs from the doorway under the sill of the one south window. The apse appears to be a semicircular (on plan), and has buttresses in three stages. There is a plinth to the apse, about half-way between the water-table of the chancel and the ground.

The drawing gives one the idea of a Saxon nave, a Norman chancel with early English doorway asserted, and an early English apse; but perhaps the buttresses are a later addition. Will you allow me to ask for information from any architect near Isleham?
J. M. GETHING.

CHURCHYARDS AND THEIR ACCESSORIES.

SIR,—I read Mr. Crawford Smith's paper in your issue of December 20 with much interest; but while I appreciate every effort that is made to improve monumental work, I cannot refrain from

writing a few lines in defence of the much-abused monumental mason.

In the first place has Mr. Smith (or Mr. Gething in his letter in your issue for the 12th inst.) hit upon the right man for such severe criticism? As a monumental mason I reply, “No.” I am willing to admit that there are good and bad monumental masons, but the majority of those now trading as such, or, as they more frequently style themselves, “monumental sculptors,” are not undertakers. Who has made these undertakers and marble merchants? I reply, our stone and their legitimate business of selling raw material to the skilled mason to the importing of ready-made monuments from Italy. I am far from saying that the merchants were the first offenders; others entered the field who knew nothing of material or workmanship and were also supplied from Italy, with the result that the market is full of cheap monuments utterly devoid of taste or beauty. Our cemeteries are full of such outrages, and our churchyards are now being attacked. Fortunately the vicars of many places are alive to the danger and prohibit the erection of these ugly things. A vicar recently remarked to me, “They shall not bring them here; I will not have them. If the public has no taste I have, and I will do my very best to educate the public.” Herein lies the gist of the whole matter—educate the public. This is a large order indeed. I have been endeavouring to accomplish this in matters monumental for many years. The fact of the matter is the public are ready to buy from any one who will sell the largest, the most flowery monstrosity (and it must be marble) that can be found, providing only it is cheap.

Now for the remedy. Mr. Gething says “if you cannot design what is beautiful, steal it, but don't produce bad work.” Alas, many of the monumental sculptors already referred to need no such advice, for this very “stealing” is one of the greatest curses under which the skilled monumental mason struggles. I have designed memorials which most architects and the educated public do appreciate, the undertaker “steals,” attempts to reproduce, and the result is most deplorable. Copy they cannot; I would that they could. Photographs of my original work and of bad copies of the same, taken by travelling photographers and supplied to the undertaker, have been brought to my office with a request that I should furnish an estimate. I produce my original design and estimate; the price is too high. The photograph is sent to Italy and another abortion is produced.

Many will doubtless be glad to attend any meeting of the Institute of British Architects to hear and discuss this matter and to devise some scheme which will give the legitimate monumental mason the place he deserves and protect his designs from this pilfering and mutilation, and thereby encourage those who wish to labour for art's sake and the beautifying of our burial places.

A MONUMENTAL DESIGNER AND MASON.

‘COLLUSION AMONG CONTRACTORS.’

SIR,—I have read the letter signed by “A Sufferer” in your issue of last week, and as a London builder of some experience I have no doubt that if the writer will publish his identity and come out in the open, there are many others besides myself who will be pleased to take up this discussion. If “Sufferer” cannot give his name, the matter is not worth the trouble of disproving.

F. G. MINTER.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

3.—GENERAL NOTES ON SANITARY FITTINGS.

THE term “sanitary fittings” is generally taken to include all fittings intended for the reception of the foul liquids and water-carried solids which are produced in and about our buildings, exclusive of trade processes. The term, therefore, excludes such fittings as dyers' and sizers' vats and other tanks employed in factories and workshops, and is confined to sinks, wash-tubs, baths, lavatories, water-closets, slop-hoppers and sinks, and urinals. Of each class of fitting there are many varieties, which are adapted for different purposes and for different kinds of buildings. The principal varieties will be considered in subsequent chapters. At present it is our purpose to state a few general rules which ought to be applied in the selection of sanitary fittings of all kinds. These rules may be summed up in five words—efficiency, cleanliness, durability, simplicity, and (within limits) economy. That a sanitary fitting should adequately

serve the purpose for which it is intended is obvious, but thousands of fittings are still fixed every year which cannot by any stretch of imagination be regarded as efficient. There are lavatories with waste-holes so small that they cannot be rapidly emptied, with overflows badly arranged, with drains from soap-dishes made only to be choked, and with the “clean” water arranged to enter through the more or less foul waste or overflow openings. Baths exhibit almost the same defects.

There are “water-closets” without water, or so insufficiently flushed that the thorough removal of the solids is impossible. Others are so constructed that they hold very little water, or none at all, for the reception and deodorisation of deposits. And there are unflushed urinals and slop-hoppers. All these perhaps serve in a manner the purpose for which they were designed, but they do not serve it efficiently, and every fitting of this sort is therefore imperfect.

One of the principal marks of efficiency in a sanitary fitting is that it shall form an effective barrier against the entrance of foul air from the drains and waste-pipes. In some fittings—as, for example, lavatories and sinks—this barrier is a plumber's trap which does not form an integral part of the fitting itself, but in many water-closets, slop-hoppers, and baths the trap is part of the fitting, and its efficiency must be carefully considered. Water-closets are often defective in this respect; the water-seal of the trap is, perhaps, too small, and is therefore in danger of being removed by siphonage or evaporation. Or the trap may have no provision for ventilation, a defect which will render it unsuitable for fixing in series.

Cleanliness is a question both of design and material. One of the best materials for sanitary fittings is undoubtedly some kind of porcelain, either solid or applied in the form of an enamel. It has its disadvantages of course,—if applied as an enamel it may chip off and expose the rougher porous foundation to the action of the foul water, and if solid it may (as in a lavatory basin) be cracked by a blow or by sudden contact with hot water,—but it has the great advantage of cleanliness. It is impervious, and consequently can always be kept clean, if the fitting is so designed that every part is accessible. Foul matters will, however, adhere to porcelain as to every other substance, and these must be periodically removed if the fitting is to remain satisfactory. Careful design is therefore necessary. All internal angles ought to be well rounded, and as far as possible every part of the fitting ought to be accessible to the brush or cloth. The overflows of sinks and lavatories have, until recently, been very defective in this respect; no provision whatever was made for cleansing them, and the consequence was that they often became extremely dirty, and were sometimes quite choked with soapy and greasy matter.

Many water-closets still in use are of such a form that they cannot possibly be kept clean by ordinary flushing. The containers of pan-closets are almost invariably coated with filth, and some closets of more recent design are very little better. The traps of wash-out closets are generally more or less foul, and many wash-down closets have such a small area of standing water that the basin is soiled every time the closet is used.

The nature of the flush is often accountable for the uncleanness of water-closets, urinals, and slop-sinks. The water may be insufficient in quantity, or may be delivered in such a small volume, and at such a low rate of velocity, as to be almost useless for cleansing the basins and traps. In many old closets the water is delivered through a fan-spreader, which cannot possibly distribute it over the whole surface of the basin.

The enclosure of sanitary fittings with wooden casings is fortunately now almost a thing of the past, but it is well to repeat that such casings are, as a rule, most objectionable. It is true that in some recent hospitals cupboards have been formed under the sinks for the storage of hed-pans, but in such cases the windows have been continued down to the floor, so that the cupboards are properly lighted, and air-grates have been fixed in the external walls or windows for ventilation. The panels of the doors of such cupboards ought to be fitted with sheets of clear glass, so that any uncleanness can be easily detected. Where these precautions are taken the objections to enclosed fittings are considerably

reduced, but it is certainly best to leave the fittings exposed wherever possible, as in nearly every case enclosures are difficult to keep clean and sweet. Certainly the ordinary casings of baths and water-closets are most objectionable, as they conceal the plumber's work, and add considerably to the difficulty of inspection and the cost of repairs. When removing the casing of a water-closet it will often be found that the floor within the casing has been covered with sawdust, and that this is sodden with water and filth; the plumber had evidently thought it a wise precaution to provide some material to absorb the leakage from the defective joints which he had made, and so prevent or delay the detection of his carelessness or incapacity. It is a golden rule to insist on all sanitary fittings, and the plumber's work connected with them, being exposed to view, so that everything can be kept thoroughly clean; exposure also ensures sounder and neater work, renders the detection of leaks more easy, and reduces the cost and dirt of repairs.

As woodwork in connexion with sanitary fittings is not conducive to cleanliness, the tendency of modern sanitation is to reduce the woodwork to the least possible quantity; hence we have cast-iron roll-top baths without enclosures, iron brackets for supporting lavatories, &c., steel seats for water-closets, porcelain-enamelled drainers for sinks, and other contrivances.

It is a mistake to cover sanitary fittings with elaborate ornamentation, either raised or printed or painted. Certainly the parts which are in contact with foul water—such as the internal surfaces of sinks, water-closets, lavatories, and baths—ought to have the surfaces perfectly white or cream-coloured, so that the slightest deposit of foul matter can be easily seen.

Durability is the third quality which sanitary fittings ought to possess. Baths are now generally of cast-iron, and experience has proved that it is a satisfactory material for the purpose. Some of the methods of finishing the surface leave, however, something to be desired. Copper and zinc are also used for baths, the former being the more durable. Salt-glazed or enamelled freelay is largely used for other sanitary fittings, and is an excellent material if it is thick enough to resist ordinary blows, and if the enamel is thoroughly adherent to the freelay body; in cheap fittings the enamel is often defective in this respect, and will chip or flake with the slightest rough usage. Indeed, the enamel is often cracked during the process of burning, and all enamelled freelay fittings ought to be carefully examined for such defects.

The best fittings of moderate size are made of some kind of pottery or whiteware suitably glazed. As the material is more or less brittle, it ought not to be too thin. Many lavatory and water-closet basins are defective in this respect, and are therefore easily cracked. For the tops of lavatories polished marble is a satisfactory and durable material.

Some materials are sufficiently durable, but are unsatisfactory in other respects. Stone, for example, has been much used for sinks, but, on account of its perviousness, it is difficult to keep clean. Even slate, dense though it is, is far from perfect; it has been largely specified for urinals, but the valid objections to the plain polished surface have led to the adoption of various kinds of enamel, none of which, however, is permanently satisfactory—at any rate, for urinals. There is less objection to its use for the tops of lavatories, but even for these fittings some kind of porcelain or enamelled freelay is better.

Of two sanitary fittings—other things being equal—the simpler ought to be preferred. Elaborate mechanism is out of place in such fittings. The tendency of recent sanitation towards simplicity is nowhere so marked as in the case of water-closets. The pan-closet is universally condemned, and the valve-closet, although its life has been preserved beyond its natural limit by the exertions of one clever writer, is hastening towards oblivion. Simpler fittings have taken their place. The same process can be observed at work in the case of the overflow and waste arrangements of baths and lavatories since the first attempts were made to do away with the old plug and chain and the uncleanable overflow. Complicated arrangements are likely to get out of order and increase the difficulty of keeping the apparatus clean, besides being costly to repair.

Of the last point to be considered—namely, economy—little need be said. In many cases it is one of the most important considerations, but in general fittings of good quality can now be obtained, and it is the architect's duty to see that his client obtains the best fitting possible for his money. Beyond a certain limit, however, economy cannot be safely practised, and the owner of the building ought either to be content to do without the fitting altogether, or to pay for one which is likely to prove reasonably satisfactory.

GENERAL BUILDING NEWS.

NEW CHURCH, BIRMINGHAM.—The foundation-stone of the new parish Church of St. Peter was laid recently by the Right Hon. Viscount Cobham. The site is in George-street West, near its junction with Spring Hill. Plans prepared by Mr. Frank Barlow Osborn provide for a building in the Early Perpendicular style, of red brick inside and out, with Hollington stone arcades, windows, and dressings, and a tiled roof. The west end faces George-street West, with a baptistry projecting from the end of the nave, from which it is approached by an archway. On each side of the baptistry are porches leading into the nave, and at the west end of the south aisle is the tower, which will be 81 ft. high to the top of the parapet. The length of the nave is 95 ft. 6 in., the chancel 38 ft. 6 in., and with the baptistry the total internal length of the church is 145 ft. The width of the nave and aisles will be 54 ft. In addition, there are two shallow transepts, increasing the width to 68 ft. In this portion of the church, each having separate entrance, is a chancel aisle on the south side; and choir and clergy vestries, with organ chamber over, on the north side. The seating accommodation will be for over 750 persons on the ground floor level. The church will be lighted by traceried windows, including large ones at the east and west ends. The roof will be open, showing the timbers. Oak will form the seating on the floor. The font from Old St. Peter's will be utilised and placed in the baptistry. The cost of the church, including the heating apparatus, but exclusive of the organ, will be 12,900*l.*, and it is expected it will be completed within two years. The contractors are Messrs. W. Sapcote & Sons.

WESLEYAN CHURCH, PENARTH.—Trinity Wesleyan Chapel, Stanwell-road, Penarth, has just been opened. The new building replaces an iron church. The style of the church is Decorated Gothic, the facings being of Newbridge stone with Bath stone dressings. The main dimensions of the building are 101 ft. in length, 78 ft. in width, 34 ft. to the top of the nave roof, and the spire when completed will be 107 ft. high. The principal entrance is at the west end. The porch has a mosaic floor, paneled wood ceiling, and painted glass windows. The interior arrangements of the building include a nave, with side aisles, north and south transepts, and chancel, with the organ chamber adjacent, minister's vestry, and a vestry for the choir, from which access is also obtained to the schools adjoining. The roof is of barrel vault construction. All the windows have traceried heads, and throughout are fitted with stained glass. The pulpit is of oak, and is placed in the nave on the south side of the chancel. The choir stalls are of oak, having traceried panels and poppy head terminations. The space behind the communion rail is floored with marble and mosaic, the other floors throughout being of teak and pine blocks. The means of lighting adopted is the electric light generated on the site; gas also is laid on in case of emergency. The seating is of oak, the floor of the church being formed on a gentle slope. The accommodation of the building is for about 650. The architects are Messrs. S. W. Richards and Henry Budgen, and the contractors Messrs. Jones Bros., of Cardiff. The whole of the coloured windows have been designed and executed by Mr. H. J. Salisbury, of London and St. Albans.

CHURCH, WORMIT, FORFARSHIRE.—A United Free Church has been erected at Wormit to accommodate 400. By the rearrangement of floor space and the insertion of a gallery the building will seat 150 more. It is built of stone, and the entrance is by a flight of steps and a stone porch. The windows are filled with cathedral glass, the lighting is by means of ten brass lamps, and the heating is by hot water pipes. The estimated cost of the building is 3,500*l.* The architects are Messrs. James MacLaren & Sons, and the contractors are as follows:—Builder, Robert Tait, Newport; joiner, W. Buist, Woodhaven; internal brickwork of walls, Luke Linder, Dundee; plasterer, Alexander M'Ritchie, slater, James Laburn & Sons; glazier, Lindsay & Scott; plumber and heating apparatus, James S. Jack, Newport; painter, D. Mackellar; lamps and tiling for porch, Kirk & Coutts, Dundee; ironwork, William Young Newport.

GOODALL-STREET CHAPEL, WALSALL.—This chapel was reopened recently after undergoing alteration and restoration. Messrs. Hickton & Farmer were the architects, and Messrs. Brockhast & Wood the contractors. A memorial window, the

work of Mr. Swaine Bourne, of Birmingham, has been placed in the chapel.

RESTORATION OF MACCLESFIELD PARISH CHURCH.—The work of restoration of this church is practically complete, and the opening will take place on Wednesday, April 23. The work was carried out from plans by the late Sir Arthur Blomfield, A.R.A., and has cost over 20,000*l.*

CATHOLIC CHURCH, OMAGH LUNATIC ASYLUM, CAPPAUGH, CO. WATERFORD.—A church has been erected for the Catholic inmates of Omagh Asylum. The building is 80 ft. long and 30 ft. wide, and will seat 500 persons. Mr. C. B. O'Connell, of Dublin, is the architect. The contractor was Mr. J. Colbourn.

CONGREGATIONAL CHURCH, SUTTON.—The Congregational church at Sutton has recently undergone redecoration, &c., and additional buildings have been added. The work has been carried out by Mr. Shoppard, builder, of Sutton, Tom plans by, and under the supervision of, Mr. Wm. Theobalds, architect, London.

BOARD SCHOOLS, WREXHAM.—The Victoria Board Schools at Wrexham were opened on the 1st inst. The architect was Mr. W. Moss, of Wrexham, his plans having been selected in competition. Mr. W. E. Samuel, of Wrexham, was the contractor; and Mr. W. L. Walker, the clerk of works. The schools accommodate 1,000 children and have cost nearly 15,000*l.*

BOARD SCHOOL, BINGLEY, YORKSHIRE.—A new infant school has been erected by the Bingley School Board in Belgrave-road, Bingley. The building, which is of stone, will accommodate 250 children, and is divided into an assembly-hall with classrooms, arranged in pairs. The main room is 47 ft. 6 in. by 60 ft., and two of the classrooms 47 ft. 6 in. by 22 ft. 6 in., and the third 21 ft. 3 in. by 20 ft., and the remaining one 20 ft. by 23 ft. The heating is by hot-water on the low pressure system, and there is also a fireplace in each room. The ventilation is effected by Tobin's inlet tubes and ridge extractors. The woodwork is of pitch pine. The playground is provided with a covered shed. The cost of the school, exclusive of land, has been 1,600*l.* The work has been carried out by the following contractors, under the superintendence of Mr. W. R. Nunn, the architect:—Masonry, Mr. R. Wood; joinery, Mr. J. Greenwood, Crosshills; slating, Mr. W. Thornton; plumbing, Mr. M. Brown; plastering, Messrs. H. Spurr & Son; painting, Mr. J. W. Anderson; heating apparatus, Mr. T. Meats, Bradford.

NEW BOARD SCHOOLS, SOUTHAMPTON.—The Central District Board Schools at Southampton were formally reopened last week. The schools have undergone extensive alterations and additions. The original school for boys and girls was a two-story building accommodating 598 children, and the infants' school was a one-story building accommodating 300, or a total of 898. In order to avoid buying a site for another school, to cope with the increased accommodation required, a daring and somewhat novel proposition was agreed to: the roofs have been raised and the necessary accommodation provided in that way. The boys' and girls' school has had an additional story put on, making it a three-story building, and the infants' school has had an additional two stories put on, and the two buildings have been coupled together, making one high building, the infants being on the ground floor, the girls on the first floor, and the boys on the top floor. The roofs were lifted bodily and the work carried up to them. The area of the boys' and girls' school roof was 3,900 ft.², and the infants' school, 2,500 ft.². The increased accommodation given is for 1,550 children, or a total, now the building is complete, of 1,657. The total cost of the additions, including furniture and contingencies, is 11,350*l.* The work was carried out without the slightest mishap to the roofs. The architect was Mr. John H. Billard (Messrs. Lemon and Billard), and the clerk of works, Mr. S. Jurd. The builders were Messrs. H. Stevens & Co. of Southampton.

SCHOOLS, HASTINGS.—The new schools at St. Helen's, opposite the Hastings Borough Cemetery, have just been opened. Accommodation is provided for mixed and infants' departments. The building comprises two floors, with covered playgrounds, and a heating chamber under a part of the ground floor. The site is about an acre in extent. At present the ground floor accommodates 100 infants. On the first floor is the mixed school to hold 260 children. There are teachers' rooms in both the infants' and mixed schools. These rooms are in each case on a level with a dais, and by throwing back the folding doors this can be converted into a platform, to be used in connexion with the central halls when they are required for public meetings. The building is constructed of red brick, with moulded red brick facings on the front and sides, the back being perfectly plain, and the roof is covered with red tiles. The buildings were erected by Mr. T. T. Denny, of Walmer, Kent, and Mr. Arthur Wells was the architect. The heating arrangement and boiler were supplied by Messrs. Upfield & Sons, of Hastings. The amount of the contract for the erection of the buildings was 9,755*l.*

BOARD SCHOOLS, MORLEY.—The new schools which have been built by the Morley School Board in Victoria-road were opened recently. The build-

ing, which, with the site, has cost about 9,500l., provides accommodation for 500 children in the mixed department and 240 in the infants' department. The schools, which are in the classical style, have been erected on the central hall principle, and are in two portions, the classrooms (eight in number) being grouped round the central hall, the entrance to which is approached by corridors 9 ft. wide. Local stone has been employed, and the woodwork throughout is in varnished pitch pine. The architects were Messrs. T. A. Buttery and S. B. Birds, of Morley.

THE PLYMOUTH ATHENÆUM.—The new buildings which have been added to the Plymouth Institution have just been opened. They consist of a reading-room, library, and other rooms. The new buildings have been designed by Mr. A. S. Parker, architect, Plymouth, whose designs were selected in competition. The front is treated in the Grecian style of architecture, in continuation of the style of the original building, which was designed by Mr. Fulston, of Plymouth, in the early part of the past century. The entrance is adorned with fluted Doric columns on either side of a recessed portico. The entrance doors are wide, with bevelled-edge square plate panels. They lead into an entrance hall, 18 ft. square, the staircase hall and alcoves for the display of antiquities branching therefrom. The hall floor is on a level with the museum gallery, and there is a circular junction with the old buildings at the north-west corner. The reading-room is 30 ft. by 24 ft., and 18 ft. 6 in. high, fitted with electric lamps. The library, 32 ft. 6 in. long, by 24 ft. 6 in. wide, and 21 ft. high, has a stained open roof. A council-room leads from the hall and library. Opposite the entrances the main staircase leads to the ground floor of the museum, this forming the main connexion between the new and the original buildings. Ladies' and gentlemen's cloak rooms and a photographic dark-room complete the accommodation of the extension. The building and fittings have been carried out by Mr. G. P. Turpin, contractor, of Plymouth, and the heating apparatus, both for the old and the new buildings, has been fitted by Mr. W. T. Hocking, while the electric-lighting has been carried out by Mr. W. E. Heath.—*Western Mercury.*

IMPROVEMENT OF THE LEEDS TOWN HALL CRYPT.—An improvement in the access to the crypt of the Leeds Town Hall will be completed, from plans of the City Engineer, for the Lord Mayor's ball on the 24th inst. Instead of the narrow steps by which guests formerly reached the supper-room from the George-street corridor, a proper staircase leading from the ante-room forming the east entrance to the Victoria Hall is being provided. It will have a central main flight, and will divide half-way down into a right and left staircase. At the foot of these staircases there will be a crush-room, with large folding doors opening into the crypt. Besides the crypt, it was not only provided with an electric installation, but converted into quite a lofty hall by lowering the floor.—*Yorkshire Post.*

NEW BUILDINGS, EXPERIMENTAL FARM, GARFORTH, YORKSHIRE.—At the Manor Farm, Garforth, where, under the auspices of the County Councils of the West and East Ridings, educational work is being carried on as a department of the Yorkshire College, the new buildings are now almost ready for occupation. These are to be devoted to practical instruction in agriculture and kindred industries. There are two sections. One comprises the dairy, including rooms for separating, churning, making-up, packing, and delivery, and cold storage. The other has on the ground floor a lecture-room, the board and professor's room, male students' sitting-room, &c.; and on the first floor a laboratory, a classroom, a bacteriological-room, a female students' sitting-room, &c. In the basement are the heating apparatus and the boilers. The buildings, which cover an area of about 100 ft. by 30 ft. are lighted by electricity. The new buildings have been erected from designs by Messrs. Smith and Tweedale, architects, Leeds.

NEW HOTEL, STORNOWAY, SCOTLAND.—Estimates have been accepted for the erection of a new hotel in South Beach-street, Stornoway, and the site is now being cleared of existing buildings. The building will contain twenty letting bedrooms, large commercial-room, dining-room, drawing-room, smoke-room, &c.; and there will also be a restaurant on the ground floor. The stones for dressed work of the front elevation will be from Newton Quarry, Elgin; the other building material will be of local rubble, and the rear dressings of Granolith. The sanitary fittings will be by Mr. Leslie Hall, of Glasgow; the grates and tiles by Messrs. Bannochie, of Aberdeen; and the wood fittings by Messrs. Garvie, of Aberdeen. The building will be carried out from designs and under the superintendence of Mr. R. B. Pratt, Elgin, at a cost of 5,500l., by the following contractors:—Masonry, Messrs. Ross & McKenzie, Stornoway; carpentry, Messrs. Ross & McKenzie, Stornoway; plumbing, Messrs. Ross Brothers, Elgin; slating, Messrs. Fraser & Thompson, Elgin; plastering, Mr. S. Macrae, Inverness; painting, Messrs. McKenzie & Son, Stornoway.

PUBLIC HALL, GRANGE-OVER-SANDS.—The new public hall at Grange-over-Sands was opened on the 1st inst. The building has been erected at the rear of the new Council offices and bank premises in Main-street. The materials used were local

limestone and Prudham freestone dressings. Mr. John Hutton, of Kendal, was the architect, and the following were the contractors:—Masonry, Messrs. Jacob Denny; carpentry and joinery, Mr. Wm. Till; slating and plastering, Mr. John Chippendale, jun.; plumbing, Mr. Benjamin Ward; painting and glazing, Mr. J. W. Braithwaite; all of Grange. The heating and ventilating were carried out by Messrs. John King & Co., of Liverpool.

TOWN HALL, KEIGHLEY.—The members and the officials of the Keighley Town Council have entered into possession of the new offices—now called the Town Hall—which have been erected in Bow-street, in the centre of the town. The new structure is 133 ft. in length, with a width of 33 ft., and there are four floors from the ground level, the height to the eaves being 48 ft. The basement is divided into a number of storerooms and a room for the heating apparatus. On the ground floor, entering from the public door in Bow-street, the first room is given up to the Borough Treasurer's department, with a pay counter and pay windows. The clerks are accommodated behind the pay counter in a room 52 ft. by 23 ft. in extent. Next come a private room for the borough treasurer, two rooms for the town clerk, and other rooms for the sanitary officials, the medical officer, and the water superintendent. The mayor's rooms are on the first floor, and comprise a parlour with an oriel window, the room being 28 ft. by 18 ft. in size, a private room overlooking Bow-street, and an ante-room on the other side. The remainder of the floor is taken up with a range of rooms for the surveyor's department and two committee-rooms. The second floor is utilised for the council chamber and supplementary rooms. Occupying a corresponding position to the mayor's rooms are a retiring-room and a robing-room; then comes a dining-room, and at the north end is the new council chamber. This room is 35 ft. by 30 ft. The walls are panelled to a height of 12 ft. The arrangement of the rooms on the third floor is similar to that of the lower floors, but at present—with the exception of the kitchen—these rooms will not be used, though they will be available for extensions. The building is heated throughout with hot-water radiators on the low-pressure system. The lighting is by electricity, which, until the Corporation's works are ready, will be furnished by the Fleece Mills Company. The building, including furnishing and electric lighting, has cost about 10,000l. Mr. John Haggas, architect, is responsible for the external design, and the internal arrangements were planned by Messrs. J. E. Bailey & Son, architects, Scott-street, Keighley. The contractors have been as follows:—Masons' work, Mr. Thomas Moore, Keighley; joiners' work (including furnishing of treasurer's, health, and surveyor's departments), Mr. Ineson Taylor, Lees; slaters' work, Messrs. T. Nelson & Sons, Bradford and Keighley; plasterers' work, Messrs. Bradley, Krischke, & Co., Bradford; plumbers' work, Mr. J. Jackson, Keighley; iron work, Mr. Thomas Moore, Keighley; painters' work, Messrs. Tillotson & Harrison, Keighley; heating, Messrs. Bailey & Chapman, Keighley; electric lighting, Messrs. G. H. Woods & Co., Blackburn; and furnishing of the mayor's and retiring rooms and the council chamber, Messrs. Simpson & Sons, Limited, Halifax.

TOWN HALL, ENNISKILLEN.—The new Town Hall at Enniskillen was opened on Monday by the Countess of Erne. The building is situated on the Diamond, an elevated portion of the island on which the town is principally built, and the cost of its erection amounted to a sum of about 11,000l. The building is Renaissance in style, and the area which it covers is 9,070 square feet. Limestone from the local quarries has been used in the construction of the walls, together with brick, and the exterior is faced with punched stone, from the Carrickeragh quarries, which are situated on the shores of Lough Erne. Duganonn chiselled sandstone has been used in the mouldings, pilasters, columns, and cornices. The main entrance from Townhall-street is flanked by pilasters and columns, supporting an ornamental balcony, which is reached from the corridor on the first floor level, and surmounting the building is a tower containing four angled turrets terminating in a dome with finials, &c. On the basement floor there are caretaker's apartments, and advantage has been taken of an inclination in the site to arrange them principally overground. Provision has been made for cooking for public banquets, and there are also a storeroom and an engine-room containing all the fire-brigade appliances. On the ground floor there are two entrances, the main one being in Townhall-street and a side one in Water-street. The main entrance is flanked by the town clerk's office and the chairman's parlour on one side, and by a reading-room and a book store on the other. From the clerk's office on the left of the entrance there is a flight of stone stairs leading to the strong room in the basement of the tower, and there is communication through the chairman's parlour with the council chamber. A minor hall, 35 ft. by 31 ft., occupies a portion of the structure facing Water-street. It is fitted with a moveable platform, and will be for small meetings or entertainments. Off this hall there is a committee-room, divided by moveable partitions. Over the suite of municipal offices there is the assembly hall, which is reached from the ground floor by a staircase. This room is 29 ft.

high and is entered by four doors running along the corridor. Messrs. Anthony Scott & Sons, of Drogheda, were the architects, their plans having been selected in competition, and placed first by the assessor, Sir Thomas Drew. The general contractor was Mr. James Harvey, Enniskillen. Messrs. Musgrave & Co., Belfast, supplied the heating apparatus. The stone carving was executed by Mr. Hart, of Brookeborough.

WORKHOUSE INFIRMARY, SKIPTON, YORKSHIRE.—A new infirmary, adjoining the Skipton Union Workhouse, was opened on the 12th inst. Mr. Hartley is the architect.

TRINITY HOSPITAL, LEICESTER.—This old building is being demolished to make room for the new hospital. Some part of the building will be retained and incorporated in the new building. Mr. J. Goodacre is the architect.

SANITARY AND ENGINEERING NEWS

DOCK SCHEME, BRISTOL.—As the result of a citizens' poll, Bristol has decided to promote a Bill next Session for powers to construct a new ocean dock at Avonmouth, capable of accommodating the largest vessels afloat, at a cost of just under 2,000,000l. Fully 60,000 papers were issued, and 40,000 collected. Of these 13,000 were unsigned. There were 25,000 votes for the Bill and 9,000 against. Sir Wolfe Barry and Sir Benjamin Baker recommended the proposed dock, which will take five years to construct.

OSSETT SEWAGE. The scheme of extension at the Healey outfall is now approaching its last stage. It was sanctioned by the Local Government Board without any alteration or suggestions. Possession of the land has been got, and the Corporation have instructed Messrs. Malcolm Paterson and Sam Shaw, M.M.Inst.C.E., who are joint engineers, to prepare for letting the contracts. The works consist of three miles of intercepting sewers, new tanks, buildings, machinery, storm-water filter, and land filtration beds, and the engineers' estimate, inclusive of land, is about 10,000l. It is expected that the works will be let before the middle of March.

BURLEY-IN-WHAIRFEDALE WATERWORKS.—The arbitration in respect of the acquisition of Mrs. Crofton's two reservoirs and water rights on Burley Moor, near Ilkley, was concluded a few days ago. The case was peculiar in its complications, and the methods of valuation adopted by the two parties illustrated two totally different principles. The claimant's engineers assumed that their client was in the position of a vendor of water with power to sell in bulk to competing authorities, and assessed the claim, which included manorial rights, at 11,000l. On the other hand, the Council Engineers contended that there was no power to sell or even divert the water, but merely to impound it up to, and no further than, the present capacity of the reservoirs, which are encroachments on a common with rights gained by prescription only, and to turn such water into the stream bed. They therefore assessed the compensation for the reservoirs and water rights on the basis of the rental received and user at the claimant's mill, amounting to about 26l. or 28l. yearly, arriving at a total sum of 800l. or 900l. only. This, they maintained, was the true principle as laid down by the Lands Clauses Acts, namely, the value to the claimant at the time of transfer. They also denied the existence of competition, even if there were power to sell water. The umpire was Mr. T. T. Wainwright, of Liverpool, and the arbitrators Messrs. T. Fenwick and Geo. H. Crowther. The claimant's case was led by Mr. H. Johnson, C.E., and the Council's case by their Engineer, Mr. Malcolm Paterson, C.E.

STAINED GLASS AND DECORATION.

CAIRD MEMORIAL WINDOW, GLASGOW UNIVERSITY.—On the 12th inst., the window which has been erected in the Bute Hall of Glasgow University to the memory of the late Principal Caird, was unveiled. The window was designed by Mr. Dearle and executed by Messrs. Morris & Co.

FOREIGN.

FRANCE.—M. Mercier has completed the statue of Alfred de Musset for the Place du Théâtre Français in Paris, originally undertaken in collaboration with Falguère, but the delivery of the work is subject to the result of legal proceedings between M. Ogris, who commissioned the work, and M. Mercier, who now demands a higher price for the work than that originally agreed upon.—At the Gobelin's a large tapestry is to be taken in hand for the decoration of the Mairie of the XIIIth Arrondissement; it is to represent the apotheosis of Colbert, and is from the designs of M. Jean Paul Laurens.—M. Charles Meissonier has presented to the Bibliothèque Nationale six original copperplates engraved by his father.—It is proposed to suppress the beautiful Château Gaillon, which now occupies the beautiful site in the department of the Eure.—The death is announced, at Lyons, of Jean Baptiste Poucet, the

painter, who was a pupil of Hippolyte Flandrin. Among other works, he engraved, for the City of Paris, the fine paintings by his master which decorate the church of St. Germain des Prés.—The death is also announced, at the age of fifty-three, of the painter Georges Moreau de Tours, pupil of Cabanel. He leaves behind him some important military pictures painted with great power of conception and composition. He had obtained a silver medal in the Exhibition of 1889, and a gold medal in the recent Exhibition. He was a member of the Société des Artistes Français (old Salon), and most of his larger works had been purchased by the State—among them "La Drapeau," which is at the Elysée Palace, and the "Mort de Vaneau," which is at the Ecole Polytechnique; "La Famille," and the "Sacrifice à la Patrie," at the Mairie of the Second Arrondissement; the "Vive la France" (Dinan Museum), and the "Hypnoticists" (Reims Museum).—We have also to record the death, at the age of sixty, of M. Ernest Barden, architect to the department of Corrèze, and President of the Société Régionale des Architectes du Limousin, Périgord.

GERMANY.—Extensive canal construction is about to be made in Germany. At the opening of the Prussian Landtag on Tuesday the 8th inst., it was announced in the speech from the throne that what is known as the Canal Bill is to be brought in during the present session, and it seems to be no doubt of its passing into law as the schemes have, on the whole, been favourably received. The bill comprises not only the Rhine-Elbe canal scheme, but provides for the construction of a water-way for large ships between Berlin and Stettin, a better water-way between the Oder and the Vistula, the further regulation of the Warthe, an improved regulation of the tide on the Lower Oder and Lower Havel, and the amelioration of navigation on the river Spree.—The scarcity of dwelling-houses in many parts of Prussia is also engaging the serious attention of the authorities, and the construction of better roads is under consideration.

BULGARIA.—An important archaeological discovery has been made at Aboba. During the past year excavations have been carried out under the direction of M. Uspenski, chief curator of the Russian Archaeological Institute at Constantinople, on the site of what was believed to have been an ancient military camp. This has now been shown to be the remains, not of a camp, but of a town which was the residence of the earliest Bulgarian rulers, and was probably destroyed in the ninth century. In the centre of the remains, the ruins of a large castle and traces of a fine cathedral have been brought to light. The castle, together with the churches and buildings for the court officials, were surrounded by a double stone wall, and the whole town was protected by a trench.

CANADA.—Canadian architects have been intensely disgusted by a recent circular emanating from the authorities of the Toronto Industrial Exhibition. It appears that the authorities have invited architects to submit competitive designs for a new main building and several subsidiary buildings to be erected on the exhibition grounds to meet the requirements of the proposed Dominion Exhibition next year. The cost of the main building is estimated at 100,000 dols., and of the lesser buildings from 5,000 dols. to 15,000 dols. each. Indignation is felt on the ground that the author of the accepted design for the main building is to be awarded a prize of only 250 dols., and smaller buildings in proportion, seeing that plans, elevations, perspective, and a brief specification are to be provided, the premium is regarded as inadequate.

MISCELLANEOUS

PRIMITIVE METHODIST CHAPEL, BACKWORTH, NORTHUMBRIA.—A Primitive Methodist Chapel has just been opened at Backworth. It accommodates 300 persons, and was designed by Mr. J. R. Nicholson, and erected by Messrs. Bolam & Davison, of Birtley.

CALVARY, EAST BOURNEMOUTH CEMETERY.—A large Calvary has been erected in the Catholic portion of the new cemetery at East Bournemouth. The Calvary is of granite from Dartmoor, and consists of steps on a cairn of rough granite, upon which is a monolith over 12 ft. in height, the upper part of which is formed into a wheel-like cross. The work was designed by Sir Francis L. J. Barrow, Bart., and executed by Messrs. Harry Hems & Sons.

GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.—A meeting was held on the 14th inst., Mr. Alex. Davie, president, in the chair, when a lecture entitled "An Architectural Craftsman's Visit to Italy" was delivered by Professor Gourlay. The lecturer began by recommending all architectural craftsmen to make at least one visit to the Continent, though for a short time only, to enable them to realise their insular position, and, further, as an incentive to reading and study. Whether disappointed, satisfied, or exalted feelings pervade one when studying a building on the spot, the result of the study of worthy buildings either at home or abroad is to inspire the student to greater excellence in his future work than he has gained in the past. Beginning with Venetian architecture, a bird's-eye view of Venice was shown on the screen, and the many parts of the city and its buildings were

pointed out. Thereafter, views of buildings showing Byzantine, Gothic and Renaissance work in Venice, Ravenna, Verona, Milan, and Vicenza were shown. Passing to Tuscany, the Romanesque, Gothic and Renaissance architecture of Florence, Siena, Pisa, Pistoja, and Prato were reviewed. Finally, the ancient, early Christian and Renaissance architecture of Rome.

NEW ACQUISITIONS AT SOUTH KENSINGTON MUSEUM.—At the death of Mr. Henry Vaughan some valuable works of art passed by bequest into the South Kensington Museum collections. An Italian late fifteenth-century bas-relief in white marble of a female head and bust in profile is one of the most important items. The examples of carved woodwork include a walnut frame attributed to the Barili, uncle and nephew, who worked at Siena and Rome in the early years of the sixteenth century; two Italian carved-walnut mirror frames, and several panels of French workmanship dating from the brilliant period of François I. Two large studies in oil by J. Constable, R.A., for many years on loan at the Museum, were included in this bequest, as well as two drawings by Turner, placed, with the other water colours by the same artist, in the galleries, representative collection of lace, amounting to 114 pieces, has been recently given to the Museum by Mrs. Ambrose Rathborne. It fills three small cases, placed at the south-west corner of the loan court. Of Venetian raised or "rose-point" lace of the seventeenth century there are five borders, and there are also two pieces of same case is a fine needlepoint falling collar, of the middle of the seventeenth century, with raised flowers. There are also examples of somewhat later needlepoint laces of Alençon and Argentan. Several specimens of Flemish pillow-made lace of the seventeenth century, and borders from Brussels, Mechlin, and Valenciennes, of the eighteenth century, are also included in this collection, together with examples of fine white silk lace of Normandy, the "blonde de Caen" the production of which has now almost quite died away, giving place to machine-made imitations. There are one or two specimens of English and Irish laces of our own time.

ELECTRIC LIGHTING BOARD SYSTEM.—We spoke with approval, some little time since, of this system of electric lighting, known for brevity as the "E.L.B." system. It was then exhibited as a demonstration; but we learn that the system has been put into practical operation on a large scale in producing the effects in the Palace of Glass scene in the Drury Lane pantomime, and in the ballroom scene at the Hippodrome.

SOUTHWICK, DURHAM.—There being seven or eight places in the United Kingdom bearing the name of Southwick, as well as another recently created urban district of that name, the Southwick Urban District Council in the County of Durham, with the consent of the County Council, decided at a meeting on the 8th inst. to change the name from that date to "Southwick-on-Wear Urban District Council," and the name of the place to "Southwick-on-Wear." The object is to prevent a continuance of the miscarriage of, and delay in delivery of, letters, parcels, and goods.

MASTER BUILDERS' ASSOCIATION DINNER, HEREFORD.—The Hereford and District Master Builders' Association held their fourth annual dinner at the Mitre Hotel, Hereford, on the 10th inst., Mr. Lewis Hodges (President of the Association) presiding. After the loyal toast, which was given from the chair, Mr. Ramsden proposed the Town and Trade of Hereford, and Mr. Alderman Beddoe and Mr. Protheroe replied.—Mr. A. J. Corner gave the toast of "The National Association," coupled with the name of Mr. A. Krauss, of Bristol, who, he understood, would very soon occupy the highest post that the National Association could confer, and who had given time, brains, ability, and a great deal of money towards bringing the National Association to the position it now occupied.—Mr. Krauss, in response, congratulated the Hereford Association on its flourishing and peaceful condition. Speaking of the relations between engineers and contractors, he said his experience was that the more friendly terms they were on the better was the work done. He mentioned that the representatives of the four affiliated of the National Association had met at the Plasterers and closer relations with kindred associations. After a lengthy discussion, they arrived at four distinct points on which they would welcome kindred associations—(1) that we cannot recognise any members except they are affiliated to their local associations; (2) rule 3 to be admitted; (3) no one to be admitted if he is a member of a trades-union; (4) no monetary bond to be required. It came out that some plasterers and joiners belonged to some of the associations and also to the trade society. This could not and must not be, as a man could not serve two masters. There was to be a meeting to meet the kindred associations, and a good result was hoped for.—Mr. W. P. Lewis, sen., in giving the toast of "The Architects and Surveyors of Hereford," stated that they joined to be troubled very much about the contract forms, but since they had adopted the contract form approved by the Royal Institute of British Architects and the National Association of Master Builders, things had been much more satisfactory. Twenty of these

forms had been sold by their secretary during last year. In this form there was an arbitration clause, which was chiefly what they had been asking for, and also a strike clause. One little clause the builders got in the specifications generally, was as to the details that were to be provided thereafter. By the new contract form, if the builder considered these details to be excessive, and falling agreement about them with the architect, he could refer the matter to an arbitrator. He did not think there was a man who would not say such an arrangement was fair and just. The toast was coupled with the names of Mr. E. H. Lingen Barker, Mr. John Parker (City Surveyor), and Mr. E. G. Davies.—Mr. E. H. Lingen Barker replied, and said as to the form of contract he did not think architects were competent enough to decide all points, and apart from that he did not think they were the proper persons to do so, even if they were competent; and therefore a reference to a person entirely outside the work was most desirable. As to the relations between masters and men, the men were apt to tell the masters and accuse them most unjustly of taking all the benefit that arose from low wages, but this was not so. Builders put, and very properly put, an extra price on their contracts, if they had to pay their men more money, and the consequence was the building public hesitated to build. He had four works in various parts of the county at the present time absolutely waiting because the price of building was too high. These people would not go on with the building because they told him they could not find the money, seeing that building prices were raised 25 or 30 per cent. It had occurred to him what a desirable thing it would be if they could have some way or other of getting working-men, because many of them were exhibiting substantial and ordinary of the matter. If they knew that the fact of asking for higher wages would prevent builders carrying out their contracts, and so employing them, thinking working men would hesitate before they pressed these demands on the masters.—Mr. John Parker also replied, and said the authorities had been able to get the builders to rise to the proper point in exhibiting substantial and ordinary of the matter. Mr. E. G. Davies having also spoken, Mr. Gilbert Davies submitted the toast of "The Hereford and District Master Builders' Association," and said the society existed for the purpose of preventing these unfortunate disputes which had so long disgraced the country.—The President stated that as one looked back over the past one could not help feeling surprised that the master builders of Hereford had existed so long unassociated. They did not set themselves up to defy the men, but if they could not settle matters in a reasonable way they meant to stand their own ground, which they could not do before the Association was formed. Mr. J. Davies proposed "The Guests," and Messrs. H. C. Beddoe and A. J. Corner responded.—Mr. T. A. King proposed "The President and Officers," the toast being acknowledged by the President (Mr. Hodges), the Treasurer (Mr. William Bowers), and the Secretary (Mr. W. P. Lewis, junr.).—Mr. C. Cooke thanked the members for having elected him to the position of vice-president for the ensuing year.

INTERNATIONAL BUILDING TRADES EXHIBITION.—This exhibition opens on April 17, and will continue open until the 27th. It is stated that it promises to be larger and more varied than the previous one of 1899. A special feature will be a section devoted to fire prevention materials, which is being held under the direction of the British Fire Prevention Committee. It will include exhibits by firms manufacturing specialities in the way of non-combustible materials, and a number of exhibits will be on view that have been under the very rigid tests of the Committee. The Smoke Prevention Committee, under the chairmanship of Sir Wm. Richmond, R.A., will hold an exhibit of appliances. A further feature of interest will be an exhibition of drawings by architects.

COUNTY COUNCIL TECHNICAL INSTITUTE, SHOREDITCH.—A day school for boys who propose to enter some branch of the cabinet-making, joinery, or other woodworking trades will be opened in the London County Council Shoreditch Technical Institute on January 22. Among the subjects of study to be included are:—Arithmetic and mensuration (general); geometry and geometrical drawing; freehand and model drawing; modelling in clay; technology of woods and tools (notebook lessons); bench work (use of woodworking tools, &c. Second and third year courses will be provided, and in the third year a somewhat higher degree of specialisation will be permitted. The Institute is well equipped with classrooms, drawing offices, art studios, and shops for cabinet-making and manual training in woodwork, carving, upholstery, polishing and other branches of the furniture trades, while laboratories for physics and experimental mechanics and for practical chemistry are being provided, and will be completely equipped in the course of a few months. The school will at first be under the control of Mr. S. Hicks, who holds a certificate of the Board of Education as a trained teacher, and of an instructor who is an efficient foreman cabinet-maker, besides being a registered teacher of the City and Guilds of London Institute, with an Honours qualification. The services of additional teachers, especially in experimental science, will be secured

as required. The object of the school is to enable boys who intend to enter some branch of the furniture or other woodworking trades to continue their general education, and at the same time to acquire such a knowledge of the artistic principles of design, and of the scientific principles of construction, of the properties of materials, and of the use of tools, as will enable them at the end of a two or three years' course, to enter a workshop with a full appreciation of the points to which they are expected to direct their attention, and with an intelligence so trained as to make them immediately of substantial value to an employer.

CAPITAL AND LABOUR.

EMPLOYMENT IN THE BUILDING TRADES DURING DECEMBER.—The *Labour Gazette* for January reports that employment in the building trades declined in all branches during December. The percentage of unemployed union members among carpenters and joiners at the end of the month was 4.2, compared with 3.2 in November. The percentage for December, 1899, was 2.5. The London report is as follows:—The building trades are not so well employed, though but little change has taken place during the month. Returns from 188 branches of eight unions paying unemployed benefit, with a membership of 13,787, show that 522 (or 3.8 per cent.) were unemployed, compared with 37 per cent. in November, and 0.8 per cent. in December, 1899. The carpenters and joiners and stonecarvers describe employment as quiet, the bricklayers, tinsmiths, masons, and painters and decorators as dull, the plasterers and plumbers as bad. The single dispute which commenced during the month was at Blackpool and St. Annes, and affected 208 carpenters and joiners. It was in reference to a proposal of a reduction in wages of 1d. per hour. No settlement has been reported.

HALIFAX BUILDING TRADE DISPUTE.—On the 14th inst. the joiners in the employ of one of the Halifax building firms, who have been on strike 105 weeks, returned to work, a settlement having been effected through the medium of the Halifax Building Trades Federation. The agreement involves concessions on both sides. The employers concede 3d. per hour advance and an allowance for the grinding of workmen's tools, and the men consent to a modification in the employers' favour of rules 3 and 4. The terms of agreement are to extend to the whole of the operative joiners in the district. One of the items is that there shall be an annual October conference of masters and men, at which all trade questions shall be considered.—*Sheffield Telegraph.*

LEGAL.

DISPUTED LIABILITY FOR DRAINAGE WORK.

In the Westminster County Court recently, his honour Judge Lumley Smith, Q.C., tried the case of *Dombey v. Somerset*, in which the plaintiff, who is the landlord of premises known as 79, Upper Gloucester, Regent's Park, sued the defendant, his tenant, who held the premises under a lease, to recover the m. of 45l. in respect of drainage work which was carried out by the order of the Marylebone Vestry. Mr. Longstaffe (barrister) appeared for the plaintiff, and Mr. Spokes represented the tenant. In opening the facts of the case, the plaintiff's counsel said the question involved was one of considerable importance as between landlord and tenant, as to which of them were liable to pay for drainage work carried out to the order of the Vestry Authorities. The premises in question were to the defendant under a lease dated May 24, 1894, and there was a clause in it by which the tenant undertook to pay all rates, taxes, assessments, charges, and outgoings, and it was upon the latter that the present action was based. On May 4, 1900, a notice was left at the house by the Marylebone Vestry, requiring certain work to be done to the drains, but the defendant refused to have it carried out, and consequently the plaintiff, in his capacity of landlord, was bound to have it done, and now sought to recover the amount from his tenant.

The plaintiff was called and gave evidence in support of his counsel's statement. Mr. Gorlist, the Sanitary Inspector to the Vestry of Marylebone, was called, and said the work which was carried out was absolutely necessary as the drains were old fashioned and very imperfect, and constituted a nuisance within the meaning of the Act.

For the defence Mrs. Somerset was called, and said that during the whole time she had been in the house she had never noticed any bad smells, or suffered any inconvenience or injury to health, though she and her daughter slept in the basement. The learned Judge, after hearing a lengthy argument on both sides, and having consulted a number of authorities on the point, said he thought he was bound by the case of *Rawlins v. Briggs*, 3 C.P.D., and gave judgment for the defendant with costs, would, however, he said, grant a stay of

execution for fourteen days to give the plaintiff an opportunity of lodging notice of appeal.

ACTION BY A PAINTER'S WIDOW UNDER THE WORKMEN'S COMPENSATION ACT, 1897.

The case of *Dredge and Another v. Conway, Jones, & Co.*, came before the Court of Appeal, composed of the Master of the Rolls and Lords Justices Collins and Stirling, on the 11th inst., on the application of the plaintiffs for leave to appeal from the award of the County Court Judge of Gloucester in favour of the defendants, the masters, under the Workmen's Compensation Act, 1897. Mr. Ruegg, Q.C., and Mr. Morton Brown appeared in support of the application; and Mr. Arthur Powell opposed it.

Mr. Ruegg stated that the plaintiff was the widow of a painter, and the learned County Court Judge had given leave to appeal, and had assessed the damages the plaintiff would be entitled to if the Court of Appeal took the view that her husband came within the benefit of the Act at the time that he met with the accident. The judgment the plaintiff desired to appeal against was dated November 20 last, and the time for entering the appeal expired on December 11, or twenty-one days from the date of the judgment. The solicitor who represented the plaintiff had asked for a stay of execution in order to see what was best to be done in his client's interest, and the County Court Judge stayed execution for two months. The solicitor erroneously thought that the stay for two months enlarged the time for putting down the appeal, and it was not until December 19 that a consultation was arranged with counsel to advise whether the appeal should be proceeded with. He (Mr. Ruegg) had pointed out that the time for appealing had gone by, and, as he advised the appeal, this application to extend the time was made on the earliest opportunity. Their Lordships would remember that they had held that repainting a house from a ladder was neither work of "construction or repair," and in that case that the masters were not "undertakers" and liable to pay compensation to the workman's representatives. The House of Lords, however, reversed that decision, and had held that the words "construction, repair, or demolition of a building" covered every class of work which could be done to a building by a workman. The point no doubt would be taken, on behalf of the masters, the defendants, that as the House of Lords' decision was not given until December 10, the plaintiff only then decided to appeal, and had been led to make the present application only after seeing a report of the case in the Press. Mr. Ruegg assured the Court that the only reason of the delay was the mistaken belief of the solicitor that the County Court Judge had extended the time for appealing.

Mr. Powell in opposing the application said that but for the decision of the House of Lords the appeal in the present case would have been hopeless as the deceased man was "whitewashing" a ceiling at the time of the accident. His submission even now was that "whitewashing" was not "repairing" within the meaning of the Act. If it were then a man cleaning windows would come within the Section. He asked the Court to look with suspicion on the statement that the decision of the House of Lords over-ruling the view of the Act taken by the Court had really nothing to do with the delay in setting down the appeal. He asked the Court to dismiss the application.

The Master of the Rolls in giving judgment said that the County Court Judge had found, assuming the widow could show that her husband came within the benefit of the Act, that she would be entitled to some 250l. Having regard to the importance of the matter and that the solicitor had filed an affidavit taking upon himself the sole responsibility for the blunder, he thought that the leave asked for should be granted.

The Lords Justices concurred. Mr. Ruegg stated that the appeal would be set down that day.

ACTION AGAINST BUILDERS.

The case of *Hardman, Powell, & Co. v. Johnson & Co.* and *Another* came before Mr. Justice Bigham, sitting without a jury, in the Queen's Bench Division on the 11th inst. Mr. A. T. Lawrence, Q.C., and Mr. Rowlands appeared for the plaintiffs; and Mr. H. F. Dickens, Q.C., and Mr. Montague Lush for the defendants.

It appears from the statement of counsel that the action was brought by the plaintiffs to recover from the defendants the sum of 237l. 15s. in respect of art ironwork done in the new Palace Theatre, Plymouth. In January, 1897, a Mr. Pocock, one of the defendants, entered into a scheme to buy some land at Plymouth, and convert the then existing structure upon the land in Union-street into a theatre and hotel. Negotiations were commenced in January, 1897. The following month a syndicate called London & Devon, Limited, was formed with a nominal capital of 50,000l., and Mr.

Pocock was interested in it. Messrs. Johnson & Co. were the builders of the theatre and hotel, and in their contract provision was made for the fittings, which formed the basis of the present action. Mr. Pocock was financing the business, and advanced about 70,000l. for which he ultimately got 130,000l. in debentures and 10,000l. in shares in a company which was formed and called the County Theatre and Hotel Company, Limited. The sole point in issue was whether the London and Devon, Limited, were the persons for whom this work was done by the plaintiffs, or whether Mr. Pocock was the principal on whom rested the liability.

In the result, the action was settled on the terms that Mr. Pocock was to pay to the plaintiffs within six months debentures in the company for the sum of 450l. in settlement of the plaintiffs' claim. Mr. Pocock to have the option of buying back the debentures at the price of the claim within the six months, but if at the end of that period the debentures were not handed over to the plaintiffs, then there would be judgment for the plaintiffs for the amount of the claim without costs. The plaintiffs were ordered to pay the costs of Messrs. Johnson & Co. The record was accordingly withdrawn, and a second action in the list, *Verity's, Limited, v. the same defendants*, was settled on similar terms.

CLAIM BY A QUANTITY SURVEYOR AGAINST AN ARCHITECT.—IMPORTANT CASE.

The case of *Leach v. Arber* came before Mr. Justice Bigham, sitting without a jury, in the Queen's Bench Division, on the 14th and 15th inst. The facts sufficiently appear from the following judgment:—

Mr. Justice Bigham, in the course of his judgment, said the action was brought by the representatives of a gentleman named Robertson, a quantity surveyor, who had died, to recover from the defendant a reasonable sum for the preparation of some specifications required for the construction of a theatre and hotel at Plymouth. The question his lordship had to determine was whether in the whole of the circumstances he could find an implied promise on the part of the defendant to pay for the work. It was admitted by the plaintiff that there was no express promise on the part of the defendant to pay for the work. The work which was done consisted of the preparation of some specifications. A Mr. Earl in 1897 was employed by Mr. Robertson to assist him in the preparation of the bills of quantities for the theatre and hotel in question, and he was employed by Mr. Robertson on the terms that the remuneration that Mr. Robertson was to receive for the preparation of the bills of quantities should be divided equally between them. That was the contract existing between Robertson, the employer, and Mr. Earl, the servant, and the contract had been fully carried out. Mr. Earl assisted Mr. Robertson in the preparation of the bills of quantities, and received from Mr. Robertson in his lifetime the remuneration he was entitled to, and so there was an end of that. When the bills of quantities were about to be prepared, Mr. Robertson appeared to have discovered that Mr. Earl had in his possession the plans and specifications relating to a theatre in Edinburgh, and it seemed to have been thought that these plans and specifications might be of some assistance to the defendant, who was the architect for the buildings in question, and in the work which the defendant as architect had to do. On April 15, 1897, Mr. Robertson wrote to the defendant a letter stating that he sent the plans, but that the specifications for the moment had been mislaid, but that they would be searched for and sent on in due course. Mr. Earl said, in the witness-box, that the statement in the letter that the specifications had been mislaid was untrue, and that it was so stated to afford some sort of excuse for not showing the specifications to Mr. Arber. His lordship very much doubted whether he ought to accept Mr. Earl's evidence about that. He was rather disposed to think that the letter was perfectly honest, and that Mr. Robertson, when he wrote it, thought that the specifications had been mislaid. A great deal of discussion had taken place as to what happened at an interview between Mr. Arber and Mr. Earl. Mr. Earl's version of the interview was that he had a talk with Mr. Arber as to the preparation of the specifications for the theatre—there were two specifications, one for the foundation and the other for the superstructure. That Mr. Arber told him (Earl) that it would be a great assistance to him in the preparation of the plans if he could be furnished with a specification, and then asked Earl to prepare it. Earl said that if he did, he should require to be paid for the work by somebody; when Mr. Arber replied that he would take care to make the necessary arrangements with Mr. Robertson for the payment by Robertson for the work to be so done. Mr. Earl had admitted that it was a very unusual thing to prepare specifications before plans were prepared, but explained its being done in this case by saying that Mr. Arber was a tyro in connexion with such work as the preparation of plans for a theatre, and wanted these specifications in order to supply him (Arber) with the necessary information and guidance for the preparation of the plans which he had to prepare as architect. In these circumstances, Mr. Earl said I

* See the *Builder* for April 1, 1899, p. 332, and December 15 last, p. 531.

proceeded to draw out the specification for the theatre. Mr. Arber's version of what took place at that conversation was that he never said or did anything to convey to Mr. Earl the idea that he was intending to pay for the specifications at all, or that he was in any way requesting Earl to make them out for him. Mr. Arber had said, and his lordship believed him, that it was by no means an uncommon practice for quantity surveyors to prepare the specifications and to send them to the architect. Mr. Arber had pointed out that that course of business was very often advantageous to the quantity surveyor, because he was able to prepare his bills of quantities with greater ease and with greater exactness upon a specification which he had taken the trouble to prepare himself than he would upon a specification which was prepared for him by the architect. His lordship thought that it was the common practice to do the work in that way, and that in the present case the specification was not prepared by the architect, nor prepared at the architect's request, nor in such circumstances as to raise, in his lordship's opinion, an implied promise by the architect to pay the person who prepared it. His lordship accepted Mr. Arber's account of what took place at the interview between himself and Mr. Earl on April 15 and 16, and did not accept Mr. Earl's. He had said that after that interview Mr. Earl did draw out the specifications, and in this connection he (his lordship) might refer to the later specifications which were drawn out in October. In his opinion, in the same circumstances those specifications were drawn out for the benefit of Mr. Robertson. They were drawn out by Mr. Earl, and were used by Mr. Robertson in the preparation of the bills of quantities which were used by Mr. Arber in his capacity as architect. He thought the work which was done by Mr. Earl in connection with the specifications for the theatre was almost entirely desk work, and consisted of little more than a copy of the specifications which he had in his possession relating to the Edinburgh theatre. The specifications were altered to some considerable extent by Mr. Arber when he came to exercise his mind as architect upon them. He thought that the work done by Mr. Earl in connection with the preparation of the specifications was really very small. Mr. Arber had said that 25% would be ample payment for the work, and his lordship was not at all sure that Mr. Arber was not right. But he would say this—so that this part of the case might be once and for all disposed of—if it should in some other court turn out that he was wrong in holding that Mr. Robertson's executors were not entitled to recover in this action, he found as a fact that 20% would be sufficient payment for the preparation of these specifications. He considered that that would be ample payment for the work done. He was of opinion that Mr. Arber was not in any way liable to pay that sum, and if it were necessary he should say that Mr. Robertson's estate was not liable to pay it either to Mr. Earl. That, however, did not come within his lordship's province to decide. He held a strong opinion that what Mr. Earl did was nothing more than a service for which he got paid by Mr. Robertson in the latter's lifetime, and that he had no claim against anybody for payment in respect of these specifications. Now, what happened after April 16? On April 22 Mr. Earl said he made an agreement with Robertson that he was to get 1 1/2 per cent. for preparing these specifications. His lordship did not believe there was any such agreement at all. He saw nothing in the correspondence, or outside it, to lead him to suppose that any such agreement was made. The work of preparing the specifications was done by Earl under his retainer from Robertson. In other words, it was part of the work which Earl was expected to do for Robertson, and for which Robertson paid him in his lifetime by giving him one-half of the commission received by Robertson in respect of the preparation of the quantities. His lordship then dealt with the other letters which had passed between Mr. Earl, Mr. Robertson, and Mr. Arber, bearing on the case, and said that on March 13 Earl wrote a letter withdrawing his claim against Mr. Arber. On the strength of that withdrawal Mr. Robertson got payment for the bills of quantities and gave a receipt, which included a charge for lithographing the specifications. In his lordship's opinion that included all the claim which Mr. Robertson had against Mr. Arber in respect of those specifications. Never in his lifetime did Mr. Robertson make such a claim as his representatives were now seeking to enforce. Earl brought an action against Robertson, but failed, and, as his lordship thought, quite properly failed. Then for some reason Robertson's executors brought the present action against Mr. Arber. His lordship was sorry to find that the estate was being spent in litigation of that kind when it ought not to be used for any such purpose. He must enter judgment for the defendant with costs.

Mr. Nepean appeared as counsel for the plaintiff, and Mr. Willes-Chitty for the defendant.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

18,204.—**BURNERS FOR COOKING-STOVES, &c.**: F. Trendel.—For atmospheric acetylene burners the mixture of air and gas is provided for by the

insertion of a short mixing-pipe in the main mixing-tube, the gas nozzle being placed adjacent to the entrance to the mixing-tube. In order to prevent the mixed air and gas from being intercepted at the mixing-pipe's outlet, a space is made between that pipe and the mixing-tube; the latter arrangement will moreover maintain the velocity of inflow at an even rate.

18,250.—**METHOD OF REMOVING PROPS**: H. J. Taylor.—For the withdrawal of props from mines are devised a rope and chain, which are secured to the hook of a sliding tubular nut or sleeve, to be drawn inwards with a screw that is turned by a hand-lever and level wheels; a pin that is screwed through a casing into a key groove in the tube prevents the tube from rotating, whilst on the screw's end is a thrust-nut formed with grooves wherein anti-friction balls are placed.

18,257.—**FIREPROOF MATERIALS**: *Simmons & Bocks*.—Slabs, bricks, sheets, &c., are fashioned of an admixture of cement (seven parts), asbestos (about twenty parts), zinc oxide (from three to ten parts), and weak glue water, which is laid upon a backing of wire netting, jute, and so on. They are next pressed and impregnated with a solution of sulphate of alumina. For a covering of floors and walls the mixture is made of cement, asbestos, and water glass; and for roofing purposes the sheets or plates are rendered waterproof with a compound of alum (six parts), sugar of lead (two parts), and soda (one part).

18,265.—**A PAINT-SPRAYER**: C. L. Burdick.—An air-valve is mounted on the central part of the tool, which comprises a handle, a nozzle, and a reservoir. The supply of paint or pigment is regulated with a pin valve, to be closed with a spring and opened with a forked lever at the drawing back of the thumb-piece, to which is joined a link that acts upon the air-valve's spindle, whereby the supplies of air and of paint are separately regulated. In order that the spring shall not close the pin valve too tightly, the forked lever is held up by means of an annular cam's lug that projects through the casing. In a modified shape of the tool for doing coarse work, the pipes which are joined on to the reservoirs of air and paint constitute the handle. On the sleeve which carries the paint valve is a stud which is linked to the air valve, and has an adjustable stop which controls the opening. A separate reservoir, having a valve in its stem, may be affixed to the handle, just below the nozzle.

18,335.—**ARC LAMPS**: H. Bremer.—In order that the carbons shall present a large sectional area, they are fashioned as flat plates or groups of rods, and to produce long arcs that shift about quietly, the carbons contain at least 5 per cent. of calcium or magnesium fluoride or bromide; further, to obviate flickering, they are made up with certain portions of calcined salt of potassium, sodium, or boron, and after they have been rendered red-hot and immersed in a fused salt of boron they will assume a glass-like coating which will absorb their residual slag.

18,352.—**JOINTS FOR PIPES**: S. R. Dresser.—In the case of butt and expansion joints, a joint between the plain unthreaded ends of large pipes is effected by means of divided sleeves, which are bolted on to the pipe ends, and will at the same time provide for any slight movements arising from contraction or expansion, through the sleeves themselves; the sleeves are recessed for packing and over the pipe-ends is placed a coupling-sleeve of any gland; in another shape the divided sleeves are flanged with additional projections upon their sides that can be bolted together.

18,353.—**MANUFACTURE OF DRAIN AND OTHER PIPES**: C. J. Kitzberg.—The mould in which cement pipes may be cast has an internal core, and an external casing made in two parts, the latter is locked in position upon a wooden pallet. After the mould has been filled with cement a spiral flange turns the core and raises it through the cement. As the cement is lifted to the top the flange's horizontal part smooths away the pipe's upper end, when the cast pipe within the casing is carried upon the pallet to the drying-yard, it is left to become dry upon the pallet, the casing having been removed.

18,378.—**BENCH-CRAMPS**: E. Arnold.—A screw serves to adjustably fix to a stem's head the jaw of a piece which clamps the work on to the bench. In that piece is a groove into which the stem's head will fit, and there are holes in the bench that receive the stem which may be serrated, screwed, or plain, and is retained in its place whilst it is being used by its jamming against the hole's sides.

18,379.—**PLUG COCKS**: F. M. Ashley.—A valve projection, with a packing and a gland, which is fixed with a sleeve upon the spindle, is disposed within a central opening of a collar fastened with a nut on to the plug cock's casing; the valve is lifted or lowered when the sleeve is turned, and without changing the degree of compression of the packing; for clamping the gland to the valve's spindle lock-nuts can be employed, and the gland may be formed integrally with the sleeve, so that it can be screwed into the opening cut in the collar.

18,407.—**A HOLD-FAST FOR PIPES**: E. M. Edwards.—A projection which is either fastened or fashioned upon the pipe is so formed that it will engage with a slotted receiver upon the plate which

is to be affixed upon the wall; in the receiver or holder the hole through which is passed a pin that secures the pipe in position as keyed in the slot of the plate.

18,442.—**BRICK, TILE, AND BLOCK MOULDING**: R. Stanley.—Before the insertion of the rough material into the mould of the press, a coating of clay slip, oxide of iron, or oxide of manganese, to which a lubricating or other liquid may be added at option, is injected into the mould in order to allow of inferior clay being used for the body of the brick or tile, and to give it a surface having the desired vitrification, colour, and finish. By one form of the invention the slip is forced from its feed-chamber through a pipe and the pierced lining-plates of the mould by means of a current of air or steam, the supply of slip into the chamber being regulated with a cam, rod, lever, and springs. The lever opens a valve for the admission of compressed air or steam into the chamber when the valve has been shut, and before the valve has been again opened a spring acts so as to liberate the valve. The mechanism further provides for the supply to the mould of a half-dried and powdered material, as well as of coloured dust. The specification includes an arrangement whereby slips can be drawn from the sides and bottom of the mould, and the invention is described as being adapted for use with presses after various kinds, together with the press which is specified in No. 7,297 of 1898.

18,480.—**INCANDESCENT LAMPS**: *Siemens and Halske Aktiengesellschaft*.—For their connexion with metal wires, tubes, strips, &c., the ends of incandescence bodies that will conduct only when they become heated are coated with some suitable material, and are then reduced to a white heat until they become so plastic that the wires or strips can be pressed into them. For coating the ends they are heated and dipped into powdered boron, silicon, or refractory metals, such as manganese, molybdenum, titanium, chromium, nickel, and platinum metals and their alloys, for which however, may be substituted their oxides, phosphides, carbides, or nitrides, and the coating compounds may be applied in the shape of a paste mixed with hydrocarbons or water.

18,497.—**DRAWING-BOARDS, &c.**: F. Tray.—With the object of preventing the board from warping it is composed of sheets of veneer, which constitute both its back and front, the sheets of veneer being fastened to a set of slats placed between them, which interlock transversely and are inserted within a frame-sided frame.

18,512.—**GAS STOVES**: H. Lide, and Presta Gas-Cook and Components Company.—Upon the stove's hot-plate is mounted a hot closet divided into two stages and having two separate doors, the upper stage has removable shelves and the partition between the two stages is also removable, the metal closet may be lined with wood or some other non-conducting material and fitted with a grate, thus forming a cupboard for warming articles of food and for drying garments, &c.; it is to be heated by the burner and can be heated, further by waste gases from the stove.

18,517.—**AN APPLIANCE FOR WINDOWS**: A. Nesemann.—Cords that are passed over pulleys join together the two horizontal halves of the window so as to balance the one half with the other, and the cords are caused to slide within recesses, formed in the wall, as the window is being opened.

18,545.—**FIRE-GUARDS**: S. Muir and W. E. Speak.—The guard's front and wings are pivoted together upon a common axis, and are so arranged as to open out at the meeting edges of the wings are stopped by the edges of the front; an adjustable bracket, mounted upon a carrier, and consisting of a dove-tailed piece with a screw-pin, is secured to the guard's upright bars, or the bracket-carrier, having horizontal holes for the rods which constitute the bracket or carrier, may be made of a bar which connects two of the uprights, two screw-pins being used for fastening purposes.

18,550.—**A LINING FOR TUBES AND CONDUITS**: A. M. Louche.—An electrically-insulating lining is laid within the metal tube or pipe, and is then expanded so as to fit tightly against the tube with compressed air or live steam injected through a nozzle that fits into one end of the tube. For an insulating material the inventor prefers a compound of sulphur, a vegetable oil, zinc or lead oxides, &c., mixed with fibrous substance, waste rubber, with chalk, &c., for a filling, and some such adhesive material as tar, resin, gums, asphalt, and tana gum, or balata in place of rubber is prepared and spread upon one side of a sheet of light fabric, such as paper. After the sheet has been coated with a suitable adhesive cement it is cut up into strips and the backing is taken away along one edge, when the strip is bent round and inserted into the tube. When the lining has been expanded and fitted within the tube the paper backing is stripped away with a rod to which one end of the bare backing is secured, so that the insulating lining shall remain closely against the tube's inner surface.

18,570.—**SAFE AND SIMILAR LOCKS**: J. Lips.—The invention applies to the locks for use in safe-deposits, banks, and so on, which are turned with two keys; the bank's key locks on bolt, and the tenant's key is used for turning the other bolt

so as to lock the former bolt and to cover the banker's key-hole; pivotted levers which a double-bolted key throws into position secure the one bolt, whilst the other bolt has two sets of sliders whereof one set moves only vertically and the other set vertically and, with the other bolt, horizontally; a corresponding slider is engaged by each of the former set of sliders until the bolt has been shot forward, and as the engagement ceases the sliders fall downwards; when it is desired to unlock the safe the locking key is employed for lifting the former set of sliders into their proper positions, in order that the latter set may pass back into their engagement with them, when the bolt is unlocked a pin prevents the drawing out of the tenant's key, but before a new key can be used the pin must be taken away whilst the mechanism stands in the unlocked position.

18,623.—MANUFACTURE OF TUBES: E. T. Wainwright.—Tubes intended for gas, water, and other purposes are manufactured out of helically-coiled puddled iron bars in various ways. The coils, for instance, may be made plain, or so as to overlap at their edges; a coiled tube may envelope an ordinary tube; or the tube may be constructed out of two coiled tubes together. The diameter of the tube fashioned from the puddled bar and coiled upon a mandrel reduced during the process of rolling or working it, the helices being welded to one another.

18,667.—A SELF-CLOSING NON-JERKING STOP-COCK: S. G. Siveron.—Against the seating of a diaphragm which divides the outlet from the inlet, is placed a flexible diaphragm which is pressed by the running water in a container beneath, and has a seating which is pressed with a valve. When the push is forced downwards the flow of water from the container enables the flexible diaphragm to be depressed from above, and so to allow the water to flow directly to the outlet; but when the push is freed the water will flow into the container, whereupon the outlet becomes closed by the gradual pressure of the flexible diaphragm.

18,698.—LAVATORY AND SIMILAR FITTINGS: T. W. Rogers.—For waste fittings the inventor has devised a grating with outlets whose area is equal to or larger than the area of the discharge pipe. The grating fits into a recess in the mouth of a funnel-shaped attachment or receiver, which is secured with a nut on to the bottom of the basin, sink, &c.; instead of the customary plug a disc having its edge faced with india-rubber is used.

18,710.—CANS FOR INFLAMMABLE OILS, &c.: F. Henze, F. Cohn, & W. H. Schmitz.—In order that a flame may not enter the interior of a petroleum, benzine, or other can, the inner side of the filling hole (which has a cap) is safe-guarded with a placed box whose points press outwards against the sieve; a conical sieve is inserted also inside the spout at its base, a same kind of sieve is provided for the air-hole, and the cover which is fixed over it will return back into the can any oil that may be splashed out.

18,747.—FIREPROOF MATERIALS: A. Inschenetzky.—The invention affords a method of impregnating with silica the layers of material of which sheets of asbestos, cardboard, and other substances are formed for use in buildings and other purposes. The mechanism ensures that when the material is wound upon the large drum it shall have first passed in contact with a roller, by means of which a solution of sodium silicate is constantly applied, and shall then pass in contact with another roller which supplies some liquid—a solution of sodium bicarbonate, say—which will decompose the sodium silicate with deposit of colloidal silica. Together with the specification should be read Nos. 5,254 of 1895 and 4,628 of 1898.

18,750.—JUNCTION BOXES FOR ELECTRICAL MAINS: C. G. Fowler, and Reason Manufacturing Co.—Short lengths of cable arranged so as to extend outwards, that they may be connected with the mains, are attached to the junction-boxes of concentric and other electrical mains, whose inner ends are connected to plug sockets which project through an insulating cover-plug from the insulating base upon which they are mounted. Plug sockets that correspond with the cable sockets are fitted on to insulated spiders; over the box may be clamped or screwed a covering plate, the spaces that pass over insulating ridges may be provided for the plugs, which are disposed in pairs.

18,809.—AN ARTIFICIAL STONE: W. Schwarz.—Before the materials for making an artificial sandstone of lime and sand have been mixed together, the unknown amount of moisture which they contain is eliminated, and the compound is afterwards reduced into a plastic condition with water or steam; the component materials should be dried in vacuum-pans, which have revolving wings, that will mix the dried materials whilst they are yet an tano.

18,810.—GAS BURNERS FOR SOLDERING AND KINDRED OPERATIONS: P. Heinz and F. Heinz.—In the case of gas burners whose flame is automatically controlled with the pressure of air within the blow-pipe the air pressure is caused to act upon a little piston, which will operate the gas-supply valve either directly or by means of an electrical relay; the passing of dust into the interior of the burner is stopped by a cup-shaped

nozzle, having a pierced inner cup; flow of moisture is arrested by the turned-in nozzle, and a saliva-trap is added, together with an air-vent, for the space over the piston. When an electrical relay is used for the air piston's working of the gas supply valve, it is arranged that a valve shall be opened by means of the rising of the piston, so as to complete the circuit of an electro-magnet—the burner-cup being filled with fine copper wire—a pilot flame, that is fed with a by-pass, being attached to the burner in both instances.

18,835.—ROAD-BREAKING: H. Gebler.—The apparatus for breaking up a road is to be used as an attachment to a steam-roller or other motor, to which it can be fastened with a pivotted bolt held by a cottar; wheels at the back sustain the frame, and on the axle is mounted a tool-carrying frame, which is retained at the desired angle by means of adjustable stops; a front-bar supports the chisel, which is clamped in its place with screws.

18,851.—WATER-HEATING APPARATUS: J. T. Moxey.—In the case of slow-combustion stoves or water boilers, the hot-water pipes, which are convex-concave in shape, may be used with the channel uppermost or as economisers, &c. For heating greenhouses and for similar purposes the stove has two oval tapered shells, the one being placed within the other, which are joined to top and bottom plates, grooved and bolted together; water-tight joints are made with asbestos or other washers and red lead; the fire grate is made in two portions, that may be hooked on to the bottom plate, so that, upon the drawing out of a rod, the halves will hang down, or it may be made in one piece held at one end with bar buttons and hinged at the other.

18,856.—EXTINCTION OF FIRE: S. Fryer.—The principle of the invention lies in the substitution of a cylinder-shaped container having a hand-regulated valve, for the customary glass bottle, which holds the acid. The container is fixed upon a cap which is screwed upon the top of the machine. When a projecting end is forced downwards, the valve at the base of the container opens and sets the acid free, and the resultant mixed gas and alkaline solution is thereupon discharged through an outlet pipe, the valve having been again closed through the action of a spring; the receiver may be fitted with a piston, which will prevent the pressure of the gas from driving the acid back.

18,863.—CLUTCHES: J. Monkhouse.—Two arms upon the friction ring, which is split at two points, join it to a boss, which is keyed upon the shaft, and from a sliding sleeve spring arms, to the ends of which are pivotted toggles which fasten on to the pulley the drum whereon the ring is expanded; ledges, against which the toggles will bear, are fashioned upon the arms and upon abutments at the ring's free ends.

18,866.—PIPE COUPLINGS: New Haven Novelty Machine Company.—The coupling is devised for joining leaden pipes to one another, as also to wash-basins, baths, gas-meters, &c. A sleeve is put upon the pipe-end, and the screwed and tapered end of a ferrule or coupling-piece is screwed into the pipe; the ferrule is fitted with both the sleeve and the pipe; the flange of the ferrule's screwed collar is segmented that it may be slipped over the ferrule's screw-thread, which is correspondingly slotted. In another shape, applicable for joining two pipes to one another, sleeves are first fitted on to the pipe ends, into which a double-ended plug is then screwed.

18,874.—A CONTRIVANCE FOR USE WITH GAS AND OTHER PIPES: C. A. Weber-Marli.—The inventor's object is to furnish means of regulating the supply of gas, fluid or liquid, in pipes from a distance. Across the supply-pipe he places a piston-valve which is worked with air-pressure through another tube, the air gaining entrance behind the piston through a slot. A Bunsen-flame by-pass is joined beneath the valve and the piston.

18,879.—FACING-BLOCKS, TILES, AND BRICKS: H. F. Webb.—The bricks, blocks, and tiles, intended principally for use in mosaic work, are made with a porous backing of cement and a flux which is applied when in a plastic state and is affixed by fusion at a low temperature, whilst they are faced with layers of porcelain, glass, or some other vitrified substance; keys for taking the setting are fastened upon the rear face of the back of the block or brick.

18,903.—APPARATUS FOR EXTINGUISHING FIRE: A. E. Kennedy.—A system of automatic sprinklers is connected to a tank, constructed as an extincutor, and also to the water-supply in the street; a lever which is tied up with wire that will become fused by fire, holds up the valves of the sprinkler-heads that are carried by the horizontal portion of the outlet pipe, and the fusing of the wire will also allow of the escape of the compressed air which has been forced into the pipes with a hydraulically-worked pump; at the same time, a piston-rod is drawn back by the pressure upon a flexible diaphragm set within the casing, whereupon a tripper is liberated so as to let the acid bottle which is within the tank fall and empty itself into the soda solution, the chemical solution and the gas being then impelled through the pipe to the sprinkler. Collapse of the bellows for opening a valve which admits the supply of water from the street to the sprinklers is brought about by the falling of a non-

return valve, through which the pressure in a containing vessel communicates with the pressure in the tank when the latter pressure has fallen below a certain amount. The drawing back of the piston-rod serves to start an electrical alarm at a station either near or remote.

18,945.—TILED BUILDING-BOARDS: G. F. Gruendler.—Composite blocks for use in constructing ceilings, floors, panels, wainscoting, fire-places, and so on, are made by cementing facing-faces to wooden boards or blocks with an adhesive admixture of lime and fresh Dutch cheese, whereby the combination of the cheese's lactic acid with the lime results in the formation of a cement which contains calcic lactate.

18,950.—CLOSET VENTILATION AND SIMILAR PIPE TRAPS: M. W. Household and P. T. Ardley.—By way of improving the contrivance specified under No. 1,141 of 1895, the inventors devise a valve composed of two calottes, set one above the other upon a stem, which shall control the admission of air that prevents the siphonage of the traps; the lower calotte, bearing against its seating, will rise to allow the air to enter, but will close to stop any overflowing; or the valve seating may assume a vertical shape, the calotte being hung upon a book and pressed with an aluminium spring against its seating; the valve is also adapted for use with ventilating pipes.

MEETINGS.

FRIDAY, JANUARY 18.

Architectural Association.—Mr. Edwin T. Hall on "Flats." 7.30 p.m.

Royal Institution.—Professor Dewar, M.A., on "Gases at the Beginning and End of the Century." 9 p.m.

Institution of Mechanical Engineers.—Fifty-fourth annual general meeting. Election of President and members of council. The first presentation by the Institution of the Williams Premium will be made to Captain H. Kial Smith, and the prizes awarded by the council for the best two papers in the Graduates' Section will be presented to Mr. W. B. Cleverly and Mr. Brees van Homan. The adjourned discussion will be resumed upon the following paper, by Mr. H. A. Humphrey, on "Power-gas and Large Gas-engines for Central Stations," read at the December meeting. 8 p.m.

Architectural Association of Ireland (Technical Demonstrations).—Mr. Malcolm on "Limes, Lathing, Plastering, Cement," &c. (at Messrs. G. Rome & Co.'s, 26, Moles-street). 4.30 p.m.

MONDAY, JANUARY 21.

Royal Institute of British Architects.—Sixth general meeting (ordinary).—1. To read the deed of award of prizes and studentships for 1900-1901. 2. Mr. J. J. Stevenson, F.S.A., on "Difficulties and Hindrances in Producing Good Modern Architecture." 8 p.m.

Society of Arts (Cantor Lectures).—Mr. J. Liberty Tadd on "Elementary Art Education." II. 8 p.m.

Liverpool and Yorkshire Architectural Society.—Dinner.

Liverpool Architectural Society.—(Members' Meeting.) Mr. Ronald P. Jones, B.A., on "The Saranic Architecture of Cairo," illustrated by limelight views. 6 p.m.

TUESDAY, JANUARY 22.

Royal Institution.—Professor J. A. Ewing, M.A., on "Practical Mechanics (experimentally treated): First Principles and Modern Illustrations."—II. 3 p.m.

Institution of Civil Engineers.—Mr. J. T. Ford on "The Present Condition and Prospects of the Panama Canal Works." 8 p.m.

WEDNESDAY, JANUARY 23.

Society of Arts.—Mr. F. B. Behr on "The Proposed High-speed Electrical 'Monorail' between Liverpool and Manchester." 8 p.m.

Institution of Electrical Engineers (Birmingham Local Section).—Inaugural meeting of the section, at the University Buildings, when Dr. Oliver Lodge will deliver an address. 8 p.m.

Northern Architectural Association.—Mr. Jas. Bruce on "Recent Data Concerning Concrete Beams and Concrete Floors." 7.30 p.m.

THURSDAY, JANUARY 24.

Institution of Electrical Engineers (meeting at the Institution of Civil Engineers).—Adjourned discussion on Mr. W. M. Morley's paper on "Capacity in Alternate Current Working." 8 p.m.

FRIDAY, JANUARY 25.

Institution of Civil Engineers (Students' Meeting).—Mr. C. Johnston on "Sewage Treatment." 8 p.m.

Institution of Junior Engineers.—Mr. A. Ross on "Railway Construction," at the Westminster Palace Hotel. 8 p.m.

Architectural Association of Ireland (Technical Demonstrations).—Mr. T. Baird on "Drainage" (at 12, Lower Abbey-street). 4.30 p.m.

Glasgow Architectural Craftsmen's Society.—Mr. J. M. Arthur on "Legal Points relative to Building." 8 p.m.

SATURDAY, JANUARY 26.

Institute of Junior Engineers.—Anniversary Dinner, Westminster Palace Hotel. 7 p.m.

Dundee Institute of Architecture.—Visit to St. Luke's Church, &c., West Ferry.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

CONTRACTS.

Table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c., Supplied by, and Tenders to be delivered. Lists various construction projects across different regions like Plymouth, Leeds, and Manchester.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, and Application to be in. Lists positions such as Borough Engineer's Assistant and Draughtsman.

Those marked with an asterisk (*) are advertised in this Number. Competitions, p. —. Contracts, pp. iv, vi, viii, x. & xxii. Public Appointments, pp. xviii & xxiii.

SOME RECENT SALES OF PROPERTY :

Table listing estate exchange reports with columns for location, date, agent, and price. Includes entries for Ullswater, Staines, Brixton, Harlesden, and others.

Table listing property sales with columns for location, details, and price. Includes entries for Hammersmith, Sinclair-rd., and others.

Table titled 'PRICES CURRENT (Continued)' listing various building materials like bricks, tiles, and plaster with their respective prices.

Table titled 'PRICES CURRENT OF MATERIALS' listing materials like Hard Stocks, Rough Stocks, and Grizzlies with their prices.

PRICES CURRENT (Continued). BRICKS, &c.

Table listing prices for bricks and related materials, including 'Dipped Salt glazed Stretchers' and 'Portland Cement'.

Table listing prices for stone, including 'Master in blocks' and 'Leigh Down Bath'.

Table listing prices for slates, including 'Best blue Bangor' and 'Best blue Portina'.

Table listing prices for tiles, including 'Plain red roofing tiles' and 'Hip and valley tiles'.

Table listing prices for wood, including 'Building Wood - Yellow' and 'Timber'.

Table listing prices for joiners' wood, including 'Sea: First yellow deals' and 'Second yellow deals'.

PRICES CURRENT (Continued). WOOD.

Table listing prices for various types of wood, including 'White Sea and Petersburg' and 'Pitch pine'.

Table listing prices for joists and girders, including 'Rolled Steel Joists' and 'Compound Girders'.

Table listing prices for metals, including 'Iron' and 'Sheet Iron'.

Table listing prices for lead, zinc, and copper, including 'Lead-Sheet' and 'Zinc-Sheet'.

Table listing prices for English sheet glass in crates, including '15 oz. thirds' and '24 oz. thirds'.

Table listing prices for oils, including 'Raw Linseed Oil' and 'Blowpipe'.

Table listing prices for raw linseed oil in pipes and barrels, including 'Raw Linseed Oil in pipes'.

PRICES CURRENT (Continued). VARNISHES, &c.

Table listing prices for various types of varnishes, including 'Fine Elastic Copal Varnish' and 'Best Elastic Copal Varnish'.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

DOVER.—For additions to boiler-house, &c., drainage works, Strand-lane, for the Town Council. Mr. H. E. Stilgoe, C.E., Town Hall, Dover:— W. H. Stokes, £714 19 1; M. Warrington, £593 4 0; W. H. Grigg, £79 0 0; Austen & Lewis, £59 3 0; D. & G. Rider, £60 10 3; Geo. Munro, Brisley & Co., £64 1 3; Dover*, £59 0 0.

EXETER.—For the formation of cricket ground, including draining, road works, fencing, &c. Messrs. Ellis, Son, & Bowden, surveyors, Exeter. Quantities by surveyors:— A. N. Coles, £7,916 1; Grounds & Newton, £5,627; R. H. B. Neal, £6,999; Laphorn & Co., £5,549; Fomery, £6,788; G. Senter, £5,328; S. Saunders, £5,320; E. Judge, £4,923; W. Gibson, £5,760; E. Harris, Clysthidon, Wakeham Bros., £5,732; Exeter*, £4,600 1.

HARROGATE.—For private street improvements. Mr. F. Bagshaw, Borough Engineer:— Park-avenue. B. Oxley, Stonefall Farm, Starbeck, Harrogate, £1,404 4 0. Back Road off Union-street. R. W. Barker, Church-square, Harrogate, £64 8 10.

HARROGATE.—For stables and cottage on the Corporation Farm. Mr. F. Bagshaw, Borough Engineer:— Masonry, &c.—Barker Bros., Harrogate, £977 10 0. Joinery.—G. H. Carrick, Church-square, Harrogate, £350 0 0. Plastering.—J. Tyson, Tower-street, Harrogate, £54 10 0. Plumbing.—C. Allen, Harrogate, £95 0 0. Slating.—Baynes & Son, Harrogate, £147 13 0.

HARROGATE.—For widening Bower-road. Mr. F. Bagshaw, Borough Engineer:— James Frost, £798 8 5.

HARROW.—For the erection of a house at Kenton-road, for Mrs. Enderby. Messrs. Clarke & Charles, architects, Peterborough-road, Harrow:— F. T. Chinchett, £2,140 1; E. J. Bailey, £1,900; R. G. & Co., £1,100; Webster & Cannon, £1,500; J. S. Kimberley, £2,015; C. Simmons, Willesden, £1,987; Thomas Turner, Ltd., £1,987.

HARROW.—For the erection of a house at Lyon-road, for Mr. H. R. Matthews. Messrs. Clarke & Charles, architects, Peterborough-road, Harrow:— G. & J. Waterman, £3,884 1; J. S. Kimberley, £3,780; R. G. & Co., £3,805; T. Turner, Ltd., £3,570.

[See also next page.]

HORLEY (Surrey).—For alterations to the Chequers Hotel, Horley, for Mr. A. Brandt. Mr. E. Blundell, architect:— Thomas Wickens £1,530

HORNCHURCH (Essex).—For the erection of bungalow-residence, Parkstone-avenue, on the Emerson Park Estate, Hornchurch, Essex, for Mr. Laurence B. Wilson. Mr. D. Taylor, architect and surveyor, Station-avenue, Winchmore Hill, N.:— J. R. Jackson £750 Wm. Goddard, junr., New Southgate £775 [Surveyor's estimate, £717 11s.]

KINSON (Dorset).—For the erection of schools and additions, Kinson Heath, for the School Board. Mr. Walter Andrew, architect, Alton Office, Parkstone. Quantities by Messrs. Jennings & Goater, Bournemouth:— Jones & Leward £3,067 0 0 J. Challis £2,710 5 9 Jenkins & Son 4,983 0 0 Baker & Whitaker 2,938 0 0 Pearcey 2,670 7 9 A. & F. Wilson 2,913 2 2 T. C. Rigler 2,592 16 2 G. Crab 2,733 14 0 H. C. Smith 2,855 7 0 W. J. Cross 2,730 18 2 Bournemouth 2,278 10 0

LITHERLAND (Lancs).—For sewer and roadmaking, Field-lane, for the Urban District Council. Mr. W. B. Garton, C.E., 25, Sefton-road, Litherland:— W. F. Chadwick £3,559 11 1 Thomas Rowlands 3,114 4 0 Joseph Joyson, Walton, Liverpool 2,855 7 0 Peter Lyson 2,849 6 2

LLANDILO.—For building a church at Maestello (exclusive of foundations), for the Misses Mansels and the Building Committee. Mr. David Jenkins, architect:— Thomas Brothers £1,815

LONDON.—For artisans' dwellings, Phoenix-street, St. Pancras, N.W., for the directors of Hampden House, Limited. Messrs. Salter, Issett, & Salter, architects, Phoenix-street, N.W. Quantities by Mr. A. R. Henderson, surveyor, 47, Pall Mall, S.W.:— Marchant & Hirst £2,439 Patman & Fothergill £2,180 Vears & Co. 2,359 Ingham 2,138 W. Walls 2,375 T. E. Mitchell 2,138 W. S. Beaton 2,390 T. G. Sharpington 2,129 Wilkinson Bros. 2,215 Brown & Son, Wellington 2,100

LONDON.—For electric light wiring and fittings for the Fulham Parish Receiving School, 9, Parsons-green, S.W., for the Guardians of Fulham Parish. Mr. A. Saxton Snell, architect. Quantities by Messrs. Dolby & Williamson, consulting engineers:—

Table with columns: In Simplex Tubing, In Wood Casing. Lists various contractors and their costs for electrical work.

C. B. N. SNEWIN MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and TIMBER MERCHANT, Nos. 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, & 17, BACK HILL, HATTON GARDEN, and 29, RAY STREET, FARRINGDON ROAD, E.C.

ORSETT (Essex).—For the reconstruction of drainage at Orsett Union, for the Guardians of the Poor. Mr. Christopher M. Shiner, architect, 3, Bond-court, E.C.:— Cooke £105 2 9

WALTHAMSTOW.—For the erection of a villa residence at Walthamstow for Mr. W. Bach. Mr. F. T. Hill, architect, Walthamstow:— Barton £1,241 Carter £1,100 Goodhall 1,198 Reed, Walthamstow 1,095 Rawlins 1,190

WALTON-ON-NAZE.—For main sewerage and sewage disposal work for the Walton Urban District Council. Messrs. Beesley, Sott, & Nichols, engineers, 11, Victoria-street, Westminster:— G. Double £14,763 5 0 Cooke & Co. 10,329 0 0 J. W. Ransome 12,980 0 0 Burgoyne 10,130 0 0 Johnson & Sons 9,614 8 6 Co. 12,700 0 0 Mackenzie & Sons 9,410 0 0 Bros. 12,200 0 0 E. West 9,300 0 0 C. J. Ford 11,931 0 0 Parry & Co. 9,270 0 0 G. Bell 11,090 0 0 J. Moran & J. Jackson 10,770 0 0 Son, Harwich 8,950 0 0 Wilkinsons Bros. 10,720 0 0

WOOLSTON (Southampton).—For new Liberal Club, Victoria-road, Woolston. Mr. John H. Bilzard, architect (Lemon & Bilzard):— Bagslaw & Son £15,587 Hinton Bros., F. Chalk 15,540 Woolston £12,250 C. Daysh 14,339

TERMS OF SUBSCRIPTION. "THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 10s. per annum (25 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 10s. per annum. Remittances (payable to DOUGLAS FOLDRINGER) should be addressed to the publisher of "THE BUILDER," Catherine-street, W.C.

In Loyal Memory.

THE death of a sovereign who has reigned so long, and been so justly beloved and honoured as our late Queen, is one of those events before which men of all professions must feel bound for the moment to forget the limits of professional interest, in view of those wider interests which unite us all as Englishmen and as fellow-subjects of the English monarchy. Architect, engineer, artist, archaeologist, and artisan—the classes of readers for whom we especially write, must all feel this week the sense of a common regret which appeals to our common humanity. For it is no ordinary reign which has this week been brought to a close. It has been a reign remarkable for its length; for the general prosperity which the country has enjoyed; for many great and important reforms in polity and advances in science and in social well-being which it has witnessed; and more especially for the high character of the sovereign who has occupied the throne for so many years. Even to that great majority of English men and women who have never had any direct acquaintance with the Queen, her loss must be felt almost as a personal one. To all but the oldest among us her name has been a life-long association; "The Queen" has been a word and of living symbol of the nation;

her name the universally honoured toast on all occasions of festive gathering; the unfamiliar title "The King," which for the last two or three days we have read in the newspapers and on posters, and around which in time the same loyal associations will cluster, seems for the moment almost startling, and as if it belonged to some other country than our own. And throughout this long reign the Queen has merited and obtained the unfeigned and unflinching respect of all her subjects; she has maintained a high standard of social life in her Court; and it must be a melancholy gratification to all English people to notice how universal is the note of respect and admiration for her in foreign countries, even in those which apparently have no very kindly feeling towards us as a nation.

We have no authority for supposing that the Queen took any special interest in art, but it is probable that few sovereigns who ever reigned have taken a deeper and truer interest in the welfare of their country generally; we believe that Ministers who had to see her constantly on political subjects could say much more on this head than is commonly imagined. An idea which some of her perfectly loyal subjects have had, that the Queen, though an excellent lady, was not intellectually gifted, is, we believe, quite a misapprehension. Her two books, it is true, though pleasantly written and interesting, can hardly be said to have evinced literary genius; but that is, after all, only one kind of talent; and we have heard of eminent men of letters, whose position brought them from time to time into the

Queen's society, and who had conversed with her a good deal, speak with high appreciation of her talent in conversation, the extent and variety of her information, and the keen and enlightened interest she took in all that was passing in the world.

But it is in a moral and political aspect that the Queen's memory will remain most especially honoured by posterity. Called by hereditary succession to the highest office in the realm, she took her place in it with an even greater sense of the responsibilities than of the honours of the position; and throughout a reign—fortunately for the country—of very unusual length, she has left no memory behind her of any act or any influence, political or social, which the nation could regret or which history can call in question. She was an ideal Constitutional sovereign, never attempting to interfere with the government of the country in any manner beyond the scope which the English Constitution allows to the sovereign, but always maintaining an influence on public affairs, felt and acknowledged, we believe, by all statesmen who served under her. And her interest in the social well-being of her people could never be doubted, and has been evidenced over and over again by her public expressions of sympathy and sorrow in any case of misfortune or calamity. In her great position she has maintained a uniformly high standard of public duty and private character; and in this respect all the subjects who mourn her loss, from the highest to the lowest, may endeavour to emulate her example.

THE LAW OF LIGHT.

THE Joint Committee of the Royal Institute of British Architects and of the Surveyors' Institution is to be congratulated on having so speedily come to a decision. Its Report will be found in another column, and, constituted as the Committee was, this document must necessarily command respect and attention. Yet we fear it will be read with some disappointment. As we pointed out in our article* on the subject, after the appointment of the Committee, it is impossible to abolish altogether—as many would wish—the right to light. So clear is this that the Committee do not even discuss the possibility or desirability of such a legal change. It was probably regarded as too academic, but seeing how strong a feeling there is on the part of many competent professional men on the point, it would have been more satisfactory to have received from the Committee a definite pronouncement upon it.

The Report starts by a recommendation on a singularly minor point—namely, the right to an extraordinary amount of light, or, as it would be more properly expressed, the right to light necessary for a special or extraordinary purpose. As many of our readers are aware, this very point has lately been much before the Courts, and the tendency of recent judgments has been towards its limitation. That legislation in this direction is desirable there can be no doubt, but it would cover but a very small part of the subject.

It is certain, as all architects and surveyors know, that the law of light gives rise to not a little abuse; this has been summed up in the word "blackmail." We look, then, with no little interest to see how the Report proposes to keep the law from being used for unrighteous purposes. We must confess to considerable disappointment.

The owner of the dominant tenement who considers that his ancient light is likely to be interfered with is to have the right to inspect the drawings of the servient tenement, or if none exist to be informed of the intentions of his opponent. If his apprehension is justified he is to serve a notice on the owner of the servient tenement. For the several steps we refer our readers more particularly to the fifth and succeeding paragraphs of the Report. But it seems clear that it is not intended by the proposed Act to prevent the owner of the dominant tenement from proceeding in a court of law if he so desires. If this is so then all the old abuses will be left. In the article to which reference has already been made, we stated it to be our opinion that the remedy by injunction should be abolished—"Abolish the remedy by injunction and the blackmail disappears." If the owner of the dominant tenement can oblige the owner of the servient tenement to demolish his building, so long will blackmail continue. Limit the remedy to damages, and a just recompense for any loss of light will be obtained. Why, as we have already said, is the owner of a right to light to be placed in such unusually favourable conditions? If a railway company takes half the garden of the finest mansion in England, and mars it as a place of residence, damages only can be recovered.

Thus, when the Report comes to be considered, it will be found to do little more as regards existing rights than suggest an alternative remedy, which, we must confess, looks as though it would be remarkably costly, and will certainly lead the public to think that the suggested legislation will tend largely to bring grist to the mill of architects and surveyors, for it introduces the surveyor at every turn either as adviser or arbitrator. And there is this to be said—a reasonable owner can now put the matter in the hands of his surveyor to adjust the differences in a friendly and businesslike manner. Is it likely the unreasonable owner will go to the tribunal which is proposed?

Leaving this point, we come to two others: One is that the owner of the servient tenement may prevent the growth of the right to light by serving a notice—we presume to the effect that no right is to be gained—on the owner of the dominant tenement (see paragraph 2 of the Report). This is certainly better than the barbarous practice of erecting boardings or other obstructions; on the other hand, as the right to light comes from the enjoyment of it, it may seem to the public that the only practical way to prevent it is by stopping its actual enjoyment. In working any fresh regulation considerable care will be required. According to the Report, the notice shall be served on the owner, but there are others than owners interested in these matters. The main point to bear in mind is that any such notice must, if possible, be one which comes, or is capable without difficulty of coming, to the knowledge of any person having an interest in the dominant tenement. There then comes the recommendation that a building erected after January 1, 1905, shall not acquire fresh rights to light when it abuts on a street or highway. It is not easy to see the reasoning which prompts this suggestion, because these rights to light are such as relate to the properties dominant and servient of private persons. The question of the light in public thoroughfares is a matter to be regulated by the Building Acts. Why is the owner of a dominant tenement not to acquire a right to light for apertures which look on to an alley, and yet to obtain it in respect of those which open on to a back yard or garden? This recommendation we regard as impracticable—at any rate in its present form. Moreover, the right in this case seems to be for the public interest, and to diminish it would tend to darken streets and highways. We should have been glad had the Committee based their recommendation on reasons stated in the Report, which would have been stronger had it given the public the preliminary reasoning which we are accustomed to find in Government reports. It would also have been of interest to have known the materials in the shape of evidence and recommendations on which the Report is based. In other words, is it the opinion only of those who form the Committee, or is it the result of the statement of the opinion of competent persons, either architects, surveyors, or lawyers? If it is only the former, the Report will have merely a kind of individual authority; if, on the other hand, it is based on a consensus of general professional opinion, legislation will be much easier and more probable.

The first two recommendations, if en-

trusted to a competent draughtsman, and pressed on the attention of the Government, may become law, but we are not sanguine, and something must necessarily depend on the manner in which the Report is received by the profession. After stating that "the law and practice of ancient lights is exceedingly unsatisfactory," one would have expected that the Committee would have given the public a Report of a somewhat more seasoned and more far-reaching nature.

THE NEW RAID OF THE WATER COMPANIES.

THAT the inhabitants of the greatest city in the world should at this time of day be dependent for an absolute necessary of life on the health upon private companies who are working and selling water in the interest of their shareholders only, is something monstrous that it is astonishing that there has not, long ago, been a public appeal to the Government to put an end to it. And connected with this central anomaly is the minor but most vexatious annoyance arising from the petty tyranny which the water company has power to inflict upon householders, especially those of the poorer class by domiciliary visitations and by arbitrary requirements to renew this and that fitting, often with no reason except that it does not tally with a doctrinaire notion of the company's in favour of some special form of fitting; with the option of having the water cut off unless the order is obeyed. That any Government should ever have given such a power as this to private companies is something which with our present lights, seems almost incredible. For just imagine what cutting off water from a household really means; depriving people of a necessary element of ordinary sanitary living, a state of things the ill effects of which may extend beyond the household immediately concerned, by setting up an insanitary centre; and consider that this is to be done because a household declines to comply with a possibly perfectly arbitrary and unnecessary demand of the company.

The water companies, however, are apparently not even satisfied with their existing powers of household interference and tyranny; and while they are at present probably, the most unpopular bodies in existence, and while their suppression is, we trust, not many years to be delayed, they are demanding new and more extended powers of interference to enable them further to trample on the unfortunate consumer who is compelled to be their client, because they have acquired a monopoly in a necessary of life. As a piece of policy, it seems, it must be owned, singularly ill-timed even in the interests of the water companies, that while every sensible person is crying out for an end to be put to their rule, they are deliberately taking steps to make themselves still more obnoxious, and to impose still heavier burdens on the unfortunate consumer.

These new demands are to be discussed at a Conference of the representatives of the City Corporation, the City of Westminster and the Councils of the Metropolitan Boroughs, called for Friday afternoon this week. It is to be hoped that a strong line will be taken by the meeting in regard

* See *Builder*, June 2, 1900.

DER ROMAHOFF, VIENNA (PROFESSOR JULIUS DEHN)

INK PHOTO SPRAGUE & CO. LITH. 4 & 5, EAST HARDING STREET, FETTER LANE, E.C.

APARTMENT HOUSES

CORNER HOUSE, STEFANSPLATZ, VIENNA (MESSRS. FELLNER & HELMER).

to these new demands, and that resolutions will be passed such as will at least tend to prevent their ultimate adoption.

The new clauses have been printed, in view of the intended meeting, with an opposite column of criticisms or suggestions which have been already made by various Borough Councils, or by the "Conference of Borough Councils South of the Thames" (indicated by the letters B.C.S.T.). The first objectionable clause we come to is in the second paragraph, under the heading "Definition of Communication Pipe." By the alteration of one word, the substitution of "ball" for "stop," the ground is cleared for a new raid into the consumer's house. The communication pipe was formerly defined as "the pipe which extends from the district pipe, or other supply pipe of the company, up to the stop-valve;" *i.e.*, the stop-cock which is to be placed on the main near where it enters the building. It is now to read "up to the ball-valve," so that all the length of pipe within the house up to the ball-valve of the cistern is placed under the company's surveillance. The Hammersmith, Paddington, and Chelsea Councils all enter objections to this. The full object, however, of this insidious alteration is not perceived till we come to the fifth clause, which reads:—

"Defective communication pipe."

5. Any existing 'communication pipe' which is not as prescribed by these regulations, shall, when it becomes defective, or requires repair, be replaced by a lead pipe of the prescribed weight."

So that by this regulation the companies seek to have the power, on the notice of anything which they consider a defect in the rising main, to compel the tenant to re-nestate the whole length of it with new lead piping. This is strongly opposed by the Councils of Woolwich, Hammersmith, and Paddington.

The companies seek, further, to impose a pattern of their own for every fitting in the tenement. The connexion with the companies' mains is henceforth to be made not only "by a ferrule or stop-cock of a pattern approved by the company," but a long schedule is given of the required weights and dimensions of every portion of the work for four different sizes of waterway. Wandsworth Council and the B.C.S.T. comment bluntly—"delete this regulation," and with reason. But this is surpassed by the following, numbered 18, and which is entirely new:—

"Weights and dimensions of stop-valves, draw-taps, and bath apparatus."

18. Every screw-down stop-valve, draw-tap, and bath apparatus shall be fitted with loose valves (such valves shall be lifted by the spindle, and shall not be dependent upon the pressure of the water for opening), and shall be fitted for cold water with washers of oil-dressed leather, and for hot water with washers of vegetable fibre of the best quality, or other material approved by the company. The word 'inlet' shall be distinctly marked on the inlet side of the stop-valve, and such stop-valves for attachment to lead pipe shall be made with screwed ends and unions. The spindles shall in all cases be of gun metal, but all other parts may be of brass of good suitable quality. Every stop-valve, draw-tap, and bath apparatus shall be of not less than the following weights and dimensions:—

And there follows a tremendous schedule laying down the dimensions of every portion of every possible valve and tap. It is something perfectly unheard-of. Imagine the power for oppressing the consumer which would thus be put in the hands of the

officials of the companies; officials who, as many persons can testify, are even now only too ready to manufacture complaints about fittings, and to report things as defective which are not so. And is it even certain that the fittings approved by the company will be better than those they displace? We know of one instance where a householder, at the requirement of the company, sacrificed two existing ball-taps which were working well but which they declared to be of a bad pattern, and substituted two stamped with the company's seal, with the result that one of these is constantly sticking down and letting the water through. A final touch is given to these astounding demands by the provision (paragraph 15) that the company may make a charge for testing fittings; *i.e.*, fittings are to be renewed at the pleasure of the company and at the cost of the householder, and the householder is to pay the company for testing them, such test being made solely in the interests of the company and its shareholders! The force of impudence could not go further.

A further trap is prepared for the consumer in paragraph 42, relating to "existing fittings," which states that "when any such fittings become defective and cannot be sufficiently repaired, they shall be replaced with fittings prescribed by these regulations." Those who have had any experience of the ways of water companies' officials will have no doubt how readily all their existing fittings will be "found to be defective."

There are two more points of perhaps more importance than any others, to be considered in connexion with these proposed regulations. One is that relating to cisterns, which is entirely new, and runs as follows:—

"Cold-water storage cisterns."

19. Every house (or in case of flats each suite of rooms) supplied by the company shall, except with the consent of the company in writing, under the hand of their secretary, be provided with a cold water storage cistern or cisterns of sufficient capacity to contain in the aggregate at least twenty-five gallons of water for each room. Each outlet-pipe from such cistern or cisterns shall be carried up inside one inch above the bottom of the cistern, and such outlet-pipe shall be commanded by an efficient screw-down stop-valve, placed in a readily accessible position, within one foot of such cistern, and a draw-off tap from same shall be provided. In no case may there be any connexion between the draw-off pipe from the cistern and the supply or communication-pipe."

This demand for large storage cisterns is directly contrary to all sanitary opinion of recent years. It is exactly because large cisterns are a sanitary evil that constant service has been recommended and has been to some extent enforced on the water companies. Now they come forward and demand the very thing which constant service was to render unnecessary. And what is the object of this demand for large storage systems? Obviously it is to enable the companies to break or withdraw constant service whenever it is convenient to them, without the consumers finding it out. We are glad to see that this proposal has met with specially strong opposition from several of the District Councils, especially those of Woolwich, Hammersmith, and Shoreditch.

Another point in the proposals gives an opportunity, which we hope will be taken advantage of, to re-open the question as to the amount of flush to water-closets. Paragraph 34 of the proposed regulations repeats

the existing regulation, with some modification in the wording, which forbids a larger flush than two gallons. How the companies ever obtained the permission to adopt this regulation, in face of the unanimous opinion of all the sanitary expert witnesses that it was not sufficient—what authority was "got at" on the occasion—is one of those mysteries which we shall probably never know the solution of. But we observe, in connexion with this point, that the Councils of Wandsworth, Woolwich, Chelsea, Hammersmith, and Paddington, as well as the "B.C.S.T.," all concur in expressing the opinion that a two-gallon flush is insufficient. It is to be hoped that they will have the courage of their opinions, and will take this opportunity to get this insanitary regulation quashed. In that case some good will have been done by these "proposals," and we shall have the additional satisfaction of seeing "the (water) engineer hoist with his own petard."

In conclusion, we may say that all householders and consumers in the London water district ought to combine to resist the adoption of these proposed regulations, which will put in the hands of the water companies a power of oppressing the consumers, and causing irritation and unnecessary expense to them, far beyond even that which they possess already. It really seems as if in putting forth such proposals, the water companies had been anxious, out of sheer bravado, to show themselves in the worst light, and intensify the feeling of dissatisfaction—or something much stronger—which already exists against them.

NOTES.

We have received one or two letters from Soane Medallion competitors complaining of what they consider the harsh proceeding of the Council of the Institute in withholding the prize this year, when there were so many competitors. But we consider the Institute were perfectly justified in their action. It is not quantity but quality that counts in such a competition; and there was no design sent in which came up to the standard which might be attained, and which has been attained in Soane competition designs in former years. The best way to raise the competition to its former high standard is to show that the medal is not to be easily won, and to withhold it when no design comes up to the desired standard. In awarding a money prize to those who were considered the three best competitors, the Council were probably influenced by the desire not only to give the competitors something for their trouble, but also to afford a practical proof that the withholding of the prize was not influenced by any economical considerations. At the same time we do not think the selection of the three designs by "Ars," "Hiawatha," and "Ionic" *ex æquo* was quite justified. The two first were rewarded for merits of plan and design, the last for fine drawing; for apart from the drawing "Ionic's" design presented only rather commonplace features, while the plan was exceedingly defective. Drawing counts for something, but it should not be put on a level with plan and design. In the award of the Tite Prize we think a mistake has been made; the first and

The Institute Prizes.

second prizes should have been reversed. The design to which the second prize has been awarded, while quite within the lines of Tite's bequest, shows real originality, while the other does not.

THE case of *Roe v. the Aërated Bread Company, Limited*, which was recently decided by Judge Edge, and is reported in the *Land Agents Record* of January 19, is a useful decision. It has not, of course, any value as a precedent, except in so far as other judges may regard it as stating the law with accuracy. The question was a very simple one. A party-wall had in it an old crack, but for the purposes of a party-wall under existing circumstances it was a good wall. The company, however, required to enlarge their premises, and when this was done the wall would require to be rebuilt, and it was contended by them that the appellant should pay a part of the cost of rebuilding the wall because it was "defective or out of repair" within the meaning of Section 95, Sub-Section 2, of the Building Act, 1894. The judge held, however, that this contention was wrong, and that the Legislature did not intend that there should be a joint bearing of expense except when a party-wall must be rebuilt in order to enable it to perform its existing functions. This is obviously common sense; otherwise one owner might have to pay a large sum of money not for an operation which was for the joint benefit of himself and the other owner, but solely for the benefit of a man who wished to enlarge his premises.

It is certainly very surprising to find the India Office, at a time when on all hands it is admitted that one great need of the country is technical education, take a step which seems to be adverse to it. Cooper's Hill College is admittedly a successful engineering school, and it is self-supporting. To the ordinary man it would seem to be desirable not only to leave things as they are there, but if possible to enlarge the operations. But the Government, as many of our readers are probably aware, has given notice to several of the professors to leave at Easter, and is bent on limiting rather than enlarging the scope of the College. So far as it is possible to judge from the materials before the public, there is absolutely no ground whatever for this action on the part of the Secretary of State for India. Unless this action can be justified, it will be the duty of Parliament to prevent this blow to technical education. If it does not, it will be obvious that it is useless to hope that this country will not fall behind its rivals in many forms of science and technical knowledge. In Cooper's Hill there exists an institution which may become the nucleus for a much larger scheme of technical education.

THE paper read to the Institution of Electrical Engineers last week by Mr. Mordey described some of the difficulties which will have to be overcome by electrical engineers before they can distribute power economically over wide areas. One of them is the charging current which the concentric mains take even at no load. The inner and outer concentric conductors act like the two coatings of a Leyden jar to one another, and since

with alternating currents the pressures are always altering in magnitude and sign at a rate proportional to the frequency of the alternating current, we get a large current flowing in and out of the mains due to this action. Now, it has hitherto been considered that this condenser current requires little power to drive it, but Mr. Mordey found that a cable five miles long required about two horse-power to keep it charged at 2,000 volts. At 20,000 volts, the pressure at which it is proposed to work some of the new large central power stations, the loss would be one hundred times as great—that is, 200 horse-power. Now this loss would always be going on, night and day, and so would be a very serious item in the year's expenditure. In the discussion Professor Ayrton questioned the accuracy of the meter with which Mr. Mordey made his measurements. In our opinion, however, the meter read correctly, but the cables experimented on were not the most suitable that could have been got. In alternating current work it is essential not only to use a material between the two conductors which is a good insulator, but it must also have a small dielectric constant. Mr. Mordey's paper is a most timely one, as it is for the good of the industry that the difficulties which electricians will experience in distributing energy from the new central power stations be thoroughly discussed beforehand. It is to be hoped that there will be no repetition of the rash and expensive experimenting which marked the opening of the Deptford station.

THE War Office authorities have arranged to take over the prison buildings in the Castle, which are no longer needed for civil purposes, and to convert them for purposes of a military prison for the North-Eastern and North-Western Districts, with room for 155 prisoners in lieu of the civil prison buildings at Kendal which they have lately returned to the Prison Commissioners. Within the present and enlarged area of the Castle precincts, covering four acres and surrounded in 1836 with a wall 35 ft. high, stands the male debtors' prison erected in 1701-8; opposite the County Assize Courts, built in 1765-77 upon the site of the old Assize Hall (1673), stands the female debtors' prison, 1780—the two buildings having been planned and designed by John Carr, and enlarged in 1803 by T. Atkinson the elder. At the north-east angle are the Governor's house, 1833, and the county prison for felons, consisting of the four blocks and the massive towered gateway, erected in 1826-30 after P. F. Robinson's plans and designs. The alterations cost, in all, a sum of about 225,000*l.* York Castle stands in the south portion of the city, just within the confluence of the rivers Ouse and Foss, at the east end of Castle Gate. There are portions of, it may be, early twelfth-century work in the wall of the lower ward, overlooking the Foss, but the round towers are of a time not earlier than that of Henry III. On a high artificial mound within the later enceinte is Clifford's Tower, built early in the thirteenth century on a plan of four engaged drums whose walls are from 9 ft. to 10 ft. thick; the court within, in which is the well, has longer and shorter diameters of 64 ft. and 45 ft. respectively. The drums meet one another in the shape of a quatre-foil; they rise to a height of

40 ft. Above the first floor are hanging turrets or closets that project at three of the angles of intersection. At the fourth angle is a projecting rectangular bay, of which the lower stage forms the entrance and the upper stage a small bed-chamber or chapel, which is arcaded and ornamented with dog-tooth moulding. Two rounded staircases give access to the top. (Confer also Edward King's account, with drawings and plans, in "Archæologia," Vol. vi., 1782.) The Castle and tower were at one time strongly defended with a deep moat crossed by drawbridges, and being vested in the Crown, served during a long period as the High Sheriff's official residence and stronghold. Clifford's Tower, after its damage by a fire in 1684, and some other buildings were taken for the county gaol. In 1836 was built the wall, about 3,300 ft. in circuit, that included the later buildings within the Castle precincts, and at the demolition of the city gaol in 1878 the Castle became the city and county prison.

THERE has been some discussion recently as to a proposal to restore Haddington parish church, and Lord Wemyss contributed to the *Times* last week a letter on the subject which is certainly rather amusing, without being intended to be so. It appears that the minister of Haddington, in appealing for funds for the restoration, referred to the example set by Lord Wemyss, who had restored the stone tracery of one of the windows of the ruined transept. But Lord Wemyss is indignant at being thus accused of restoration. He says—"It was not with a view to the restoration of the ruined portion of our abbey church that I did this, but to embellish and perfect the ruin." This is certainly one of the most original distinctions we ever heard of. Most restorations of ruined buildings are made with the intent "to embellish and perfect the ruin;" that is just where the mistake lies. Ruins that are "embellished and perfected" cease to be ruins. Lord Wemyss seems to have imagined that the ruined part of the church would be improved by the addition of modern imitation Gothic tracery; but when other persons, not unnaturally, quote his example and wish to carry the same principle further, he is shocked, and rebukes them.

MR. E. WAKE COOK, writing in the *Times*, blames the Royal Academy for omitting, in their show of paintings by artists deceased during the last fifty years, to give any example of the works of John Martin. It is perfectly true, as Mr. Cook says, that Martin had a great power of representing vast architectural perspectives, and had he confined himself to such architectural compositions he would have had a *locus standi* as an eminent artist in that class of work. But these architectural compositions were merely the scenic setting for Apocalyptic scenes which were puerile in conception, violent in colour, and full of badly-drawn figures. If his "Last Judgment" with its millinery angels blowing trumpets, or the "Plains of Heaven," with the figures fluttering in gauze drapery and the gilded barges on the celestial lake, were brought out again now, they would only excite ridicule. Martin appealed to the artistically

Lord Wemyss on Restoration.

Alternating Electric Currents.

Martin's Pictures.

educated section of the religious public, and had his reward in his day. His reputation is out of date now.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

DIFFICULTIES AND HINDRANCES IN PRODUCING GOOD MODERN ARCHITECTURE.

An ordinary general meeting of this Institute was held at No. 9, Conduit-street, Regent-street, W., on Monday evening, the President, Mr. William Emerson, occupying the chair.

Mr. Alexander Graham, hon. sec., announced with regret the death of Mr. J. J. Burnet, of Glasgow, who was elected a Fellow in 1876. Mr. Burnet, who had reached the advanced age of 87 years, took, by his work, a very high rank amongst the architects in Scotland. It would be the wish of the meeting that a letter of condolence be sent to the relatives of their deceased colleague.

This having been agreed to, The Secretary, Mr. W. J. Locke, read the Deed of Award of prizes and studentships for 1900-1901, made by the Council in accordance with by-law 60. The Deed of Award is as follows:—

Prizes and Studentships.

THE ROYAL INSTITUTE SILVER MEDALS.—

(i) The Essay Medal and Twenty-five Guineas.

Three essays on the Comparative Desirability of the Formal or Irregular Treatment of Street Architecture in Large Cities were received for the Silver Medal under the following mottoes:— "For Truth and Dignity," 2. "Modus in Rebus," 3. "Per Ardua." The Council have awarded the Silver Medal and Twenty-five Guineas to the author of the essay bearing the motto "Modus in Rebus," Mr. A. M. Watson (London), and a Certificate of Honourable Mention to the author of the essay bearing the motto "Per Ardua," Mr. William Curtis Green (London).

(ii) The Measured Drawings Medal and 10l. 10s.—Eight sets of drawings were sent in, if the several buildings enumerated, and under motto, as follows:—1. Archer (St. John's Church, Westminster). 2. Cannon (device) Burghley House, near Stamford). 3. Cross Keys (Walpole St. Peter's, Norfolk). 4. Petrel (Holy Trinity Church, Hull). 5. Roda (Church of St. Magnus, Fish-street Hill). 6. Semper Idelis (Gulldhall, Exeter). 7. Stafford Knot (Kirby Hall, Northants). 8. Tressilian (Stoke Newington Church). The Council have awarded the Silver Medal and Ten Guineas to the delineator of Kirby Hall, submitted under the motto of "Stafford Knot" (Mr. Lawrence L. Wright, Nottingham) and Medals of Merit and five Guineas each to the delineators of St. John's Church, Westminster, and Burghley House, submitted under the motto of "Archer" (Mr. Wyatt Papworth, Maida Hill, W.) and device of a "Cannon," (Mr. Henry Francis Graylen, Stamford) respectively.

THE TRAVELLING STUDENTSHIPS.—(i.)

The Soane Medallion and 100l.—Twenty-two designs for a club house in a large city were submitted. The Council regret that they are unable to award the Soane Medallion, but they have voted sums of thirty guineas each to the authors of the designs submitted under the mottoes of "Ars," Mr. M. J. Dawson, Bayswater, W.; "Hiawatha," Mr. H. Munro (London), Westfield, Ipswich; and "Ionic," Mr. J. B. Fulton, London, respectively.

(ii) The Owen Jones Studentship and 100l.—

Six applications were received for the Owen Jones Studentship from the following gentlemen:—1. E. Bennett. 2. D. T. Fyfe. 3. James McLachlan. 4. Percy E. Nobbs. 5. Hervey Rutherford. 6. Ramsay Traquair. The Council have awarded the Certificate and subject to the conditions, among others, that the said candidate devote a tour of not less than six months' duration to the improvement and cultivation of his knowledge of the application of colour as a means of architectural expression, and furnish the Council with an original design in coloured decoration of a prescribed subject) the sum of One Hundred pounds to Mr. J. Hervey Rutherford, Edinburgh, Medals of Merit to Mr. Percy E. Nobbs, I.A.A., Edinburgh, and Mr. Ramsay Traquair, Edinburgh, and a Certificate of Honourable Mention to Mr. Edward H. Bennett, Paris.

(iii) The Pugin Studentship and 100l.—

Nine applications were received for the Pugin Studentship from the following gentlemen:—1. H. Comyn. 2. James C. Cook. 3. Henry

Wm. Cotman. 4. Shirley Harrison. 5. Frederic J. Horth. 6. C. B. Pearson. 7. Harry Phipps. 8. A. J. Pitcher. 9. J. Forbes-Smith. The Council have awarded the Medal and (subject to the condition, among others, that the said candidate devote a tour of not less than eight weeks' duration in some part of the United Kingdom to the study of mediæval architecture) a sum of 40l. to Mr. Henry Wm. Cotman, Streatham Hill; a Medal of Merit to Mr. J. Forbes-Smith, Edinburgh; and a Certificate of Honourable Mention to Mr. A. J. Pitcher, Worcester.

(iv) The Godwin Medal and 100l.—One application was received for the Godwin Bursary from the following gentleman:—Mr. S. C. Stephens, Birmingham. The Council have decided not to award the Bursary this year.

(v) The Tite Certificate and 30l.—Twenty-six designs for an entrance gateway to a public park were submitted. The Council have awarded the Certificate and (subject to the condition, among others, that the said competitor, after an absence of not less than four weeks, shall submit satisfactory evidence of his studies in Italy) a sum of 30l. to the author of the design bearing the motto "Corona" (Mr. William Fairbairn, Edinburgh), a prize of 10l. 10s. to the author of the design bearing the motto "St. George" (Mr. Ralph Knott, Chelsea), and a Certificate of Honourable Mention to the author of the design bearing the motto "Marble Arch" (Mr. W. Arthur Mellon, Ashwell, Herts).

PRIZE FOR DESIGN AND CONSTRUCTION.—

The Grissell Medal and 10l. 10s.—Eighteen designs for a timber footbridge across a stream were submitted. The Council have awarded the medal and ten guineas to the author of the design bearing the motto "Pons Asinorum" (Mr. Edwin Forbes, London).

THE ASPHYTEL PRIZE, 1900.—The Council have, on the recommendation of the Board of Examiners (Architecture), awarded the Asphytel Prize (which is a prize of books value ten pounds sterling, awarded to the candidate who has most highly distinguished himself among the candidates in the final examinations of the year) to Mr. Shirley Harrison, of Leicester. The Council have further awarded extra prizes of five guineas each to Mr. C. H. F. Comyn and Mr. C. E. Varnell, who passed the final examination in June, 1900.

THE TRAVELLING STUDENTS' WORK.—Owen Jones Studentship, 1899.—The Council have approved the drawings and design executed by Mr. John Stewart, who was awarded the Owen Jones Studentship for 1899, and who travelled in Italy, Greece, and Spain.

Pugin Studentship, 1900.—The Council have approved the work of Mr. James McLachlan, who was awarded the Pugin Studentship for 1900, and who travelled in Norfolk, Lincolnshire, Northamptonshire, and Warwickshire.

Tite Prize 1900.—The Council have approved the work of Mr. Percy Erskine Nobbs, who was awarded the Tite Prize for 1900, and who travelled in Italy.

Mr. J. J. Stevenson, F.S.A., then read a paper entitled "Difficulties and Hindrances in Producing Good Modern Architecture," of which the following is an abstract:—

Mr. Stevenson said that the difficulties besetting modern architects were due to the conditions of modern life as compared with those of former times. The hindrances were the laws and regulations which restrict practice and the natural development of building. Traditional architecture did not cease with the new life of the Renaissance, and though the mediæval styles lived on, the new architecture soon became a custom and tradition which every workman knew and could carry out without drawings from an architect. It is only in the last two or three generations that architecture has emancipated itself from tradition; that builders and architects, instead of conforming to established custom, have followed their own fancies and have done what was right in their own eyes, every man being a law to himself. Instead of the few whose force of genius broke through tradition and made an advance in the style, each architect and builder now thinks he must be original, and as original genius is scarce, so are good buildings. The best hope for new architecture is a thorough knowledge with the old, not a superficial acquaintance with many different styles. The style must be assimilated so that the architect can think in it and use it as he does his native tongue.

It might be thought that competitions, with an architect of standing as assessor or as judge, would secure good architecture by criticism

and selection of the best designs. But the result has not justified the hope, and there is now a tendency to abandon the system. In a competition the architect works in the dark; he has to guess what is wanted, and no information the assessor can give in his instructions to competitors can adequately supply it. Architects whose local standing might have entitled them to be appointed for the work, who possibly know more of the conditions and requirements than the assessor, hesitate to be judged by their drawings alone in competition with some young unknown architect from a distance who, if he is successful, has no character to maintain in the district. Sometimes the assessor is one whom architects may fairly decline to be judged by. They may know that he does not understand their art, and his instructions may show that he is ignorant of the requirements. In these he takes a power of decision more absolute than judges in law cases ever claim; they decide only after hearing both sides of the case, and they give reasons for their judgment. But the assessor hears no pleadings and gives no reasons for his judgment. Might not his proceedings be in some degree assimilated to those customary in law cases? The competitors, having studied for months the problems involved, would be able to point out to him how far their plans had solved them, and where their opponents had failed. It is possible that, however fair and able, the assessor may have missed them. They should not be condemned unheard. As to the objection that the assessor would thus know who the competitors were, and might be influenced to give the award to a favourite or a friend, such a suspicion amounts to a libel on the assessor's character. It would be more dignified for the assessor to declare himself incapable of such action by making the decision, knowing who the authors were. It might prevent his overlooking merits in the plans of architects whose character and reputation and the work they had done are a guarantee that they could be trusted to carry out the work. By refusing to know the competitors, the assessor neglects what is a far more important consideration in the selection of an architect than making competition drawings. The faculty of winning competitions is often not a gift of the best architects. The selection of the assessor is the most important factor for the fairness of a competition. Why should not the competitors appoint him by their votes? It would give a better guarantee that they could trust him to understand and appreciate their designs, and if the majority appointed one whom they thought unlikely to do so, they would be able to withdraw before wasting their time and risking their reputation. There would be a better chance of just decision if there was more than one judge, as in important cases in the Law Courts. Opinions vary as to what constitutes good architecture; different views of what designs are best may honestly be held. A judge may see fit to alter his opinion on the representations of his colleagues. As regards the labour and money risked by competitors, there should be a stipulation that architects invited to compete should each be paid a sum towards their outlay. Competitions, wisely conducted, might advance the art and produce good buildings. They should be made such that other architects than those who usually gain them would not hesitate to engage in them; that work done as well as the accidents of competition drawings should be an element in decision; that the judges should have the confidence of the competitors for their appreciation of art in architecture in the various developments now prevalent.

In considering the hindrances in producing good architecture the author referred to the modern rules and regulations by which the designs of buildings are hampered and restricted. These have generally been devised by doctors and sanitary experts for excellent and necessary objects. But instead of availing themselves of the knowledge and experience of architects they devise crude and often tyrannical rules without adequate knowledge of building construction, and without thought as to the architectural appearance or the cost of their requirements. The London Building Act would have been a far more effective measure had the County Council arranged with a body of architects, such as the Institute, the provisions for ensuring the necessary requirements, and the 20,000l.

Parliamentary expenses would have been saved. The Local Government Board's Model By-laws ignored local modes of building, and reduced houses all over the country to a uniform level of dullness. The recent Police Act for Scotland, to ensure ventilation, decreed that ground-floor ceilings should be 9 ft. 6 in. high, and bedrooms 9 ft. But this did not ensure ventilation; it rather provided space for vitiated air to accumulate. Such regulations spoiled cottage architecture, made buildings needlessly costly—indeed, prevented cottages being built. Equally foolish and costly is the regulation that every sleeping-room over 100 ft. area should have a fireplace and flue, though it would probably never have a fire in it and would most likely be stopped up with a smoke-board. Why forbid half-timber construction? It is a most charming development of old English architecture, and houses so built have lasted for hundreds of years. It gives beauty to landscape, and the risk of fire is insignificant in isolated cottages. The precautions against fire are needlessly oppressive for low or isolated houses. Carrying the party-walls above the roofs in ranges of low houses spoils their appearance, and is unnecessary if the slates are bedded on the walls.

In some rural by-laws the needlessly tyrannical provision that all woodwork should be kept back 4½ in. from the face of the wall has been revived after it had been removed from the new London Act. Another needless regulation, showing ignorance of building construction, is that compelling footings to be put to walls besides concrete foundations, which are perfectly stable without them. In conclusion, the author urged the Institute to press upon the authorities the acceptance of by-laws, ensuring sanitation, ventilation, fire prevention, and stability, but drawn with common sense and knowledge of building, and which would not hamper and ruin architecture and cause needless cost.

After some remarks by Mr. W. Woodward, Mr. Lacy W. Ridge, in proposing a vote of thanks, said he especially desired to thank Mr. Stevenson for calling attention, in his excellent paper, to those regulations which were so unnecessarily thrust upon architects in country districts. There was some justification for such regulations in London and other big towns, but it was different in country districts, where, however, by-laws, severe and unnecessary, were enacted. The Institute went last year to the Local Government Board and endeavoured to get something done, with the result that they were promised by the Under-Secretary of that day that attention should be given to the matter. There were now new Parliamentary officials at the Board, and it was time the Institute again moved in the matter. The by-laws which had been thrust upon the country districts were totally unnecessary, and a serious evil which not only architects, but many people in country districts were suffering from. The time had arrived when something like a public demonstration should be made on the subject, and influence brought to bear on the new officials at the Board. The permanent officials would not do much unless pressure were brought to bear upon them. Mr. Stevenson's remarks on competitions, also, were very interesting and well worth attention. Much that was so unsatisfactory in our architecture was the result of the system of competition to which the Institute had committed itself—much more than it should have done.

Mr. John Slater, in seconding the vote of thanks, said the paper had been an exceedingly suggestive one. The chief point of the paper was rightly directed to the hindrances which exist at the present time, and which prevented really good architecture being put up in our cities. With regard to the remarks about competitions, the whole gist of those remarks went to show that competitions on the whole are undesirable and ineffective, and it would be a very good thing if they could be done away with. That was impossible, but he ventured to suggest that one improvement on the principle of competitions, which were now so universally acted upon, would be this: instead of public bodies issuing general instructions to competitors, without limit, to send in designs, they should appoint an assessor who should select for the various bodies who wanted designs a certain number of architects to compete; that those selected architects should send in designs, and that the assessor should then decide which was the best.

He agreed with Mr. Stevenson that there was no harm whatever in a man who had a position which would justify his selection as an assessor knowing the names of the competitors, and that it would be an insult to the assessor to suggest that the fact that he knew the names would have the slightest influence on his selection or on the selection of the best design. If an assessor were to select the competitors, he would, as a rule, select them not only from among the more experienced men, but from among those younger men whose work he might have seen at the Institute or elsewhere, and whose abilities would give him reason to believe that they would produce designs worthy of consideration. With regard to the hindrances of which Mr. Stevenson had spoken, he (the speaker) perfectly agreed with what had been said by Mr. Ridge, who had confined his remarks more particularly to the laws and regulations of the Local Government Board in regard to country places; but here in London architects were hampered in a most regrettable way by the regulations of the Building Act. It was about ten years ago that he had read a paper before the Institute of building legislation, and he then pointed out, before the Building Act of 1894 had been compiled and passed, the great objections there were to laying down hard and fast rules when dealing with an area which had been covered by buildings for many years. With regard to the 1894 Act he did not think there was a single regulation of that Act to which he would have the slightest possible objection in dealing with new areas which were going to be covered by buildings. When they dealt with existing areas under the Act they were met by hindrances and obstructions in every way, and that prevented good building and perpetuated what was bad, in consequence of the great difficulty there was in getting up new buildings. There was one regulation of the Act which came within his purview very often. Mr. Stevenson had alluded to straight streets, and most of the streets of London were straight, but the Building Act made it very difficult to produce any little variations in the outline as to prohibited projections. He had never been able to understand, and he had never met a District Surveyor who understood, the reason for the restrictions as to bay windows. If you start from the bottom of a basement, you can only carry up a bay window three stories, and "story" was not defined in height. If you put an oriel you can go up as many stories as you please, and he could not understand that. Moreover, they could project a bay window 3 ft., but if, in reconstructing an existing building, they wanted to put up a porch, objections were raised by the District Surveyor, and if they went to the County Council, the chances were they would be refused. He had heard only that day of a most ridiculous objection to bringing out a small bay only one story in height. Such hindrances were real hindrances; they made the streets of London heavy and flat and unarchitectural. He believed there was some talk of the London County Council going to Parliament for various improvements and amendments of the London Building Act, and he was quite certain that if architects could show clearly that some restrictions of the Act were inimical to, and the cause of inharmonious architecture, it would be possible to get some desirable alterations made when other alterations were being asked for.

Mr. Lewis Solomon said that when a well-known architect such as Mr. Stevenson came before them to speak of difficulties and restrictions they must be very real. The Institute, as he had proposed at a previous meeting, should do something to get these difficulties removed, and, as the members now knew, a committee had been appointed to inquire into the matter.

Mr. W. D. Caröe said he had on many occasions spoken strongly as to the importance of the judge in a competition being entirely independent of the committee. At the same time he agreed with Mr. Stevenson that two assessors would be very much better than one, and he should like to see two appointed, with the possibility of appointing an umpire in large competitions. If the assessor were to be sole judge of the designs submitted, it might, he agreed, be an insult to the assessor to suppose that he would alter his judgment if he knew the competitors' names. But there was another point of view: a great many committees refused to let an assessor be sole judge; they reserved to themselves the final judgment; and it was a matter

of great importance that committees of public bodies should not be acquainted with the names of the competitors. But committees would not allow the assessor to know the names of competitors where they did not know them themselves. He agreed with what had been said about rural by-laws and the London Building Act, and he agreed with Mr. Slater that architects ought to take the first opportunity of endeavouring to get certain absurd regulations amended, so as to bring London into line with some of the Northern cities. The matter was of serious importance in rural districts, and since the District Councils came into existence things had gone from bad to worse.

Mr. Maurice B. Adams said they must all feel indebted to Mr. Stevenson for the practical manner in which he had shown that good architecture did not always consist in numberless features. Much of our street architecture was ruined by the numberless features which were introduced by some architects, and if only the architects of some of the buildings in Charing Cross-road and Shaftesbury-avenue had omitted some of the features of those buildings, those streets would have been much more satisfactory. Mr. Stevenson's buildings had often struck him as being distinguished by that breadth and simplicity which was so desirable. With regard to modern buildings in towns, one thing which was detrimental to good architectural effect, and which could not very well be helped, was the use of so much iron. A site in the City might be vacant, and a building was put up for some syndicate or other, the chief concern being that the interior should be as much of a skeleton as possible, so that it might be partitioned out with narrow partitions. That seemed to be one of the hindrances with which architects were faced. The only way to deal with iron construction satisfactorily was to recognise it frankly.

Mr. E. W. Hudson said that one difficulty he should like to refer to was, that in London and large towns it was difficult to secure an adequate site on which architecture could really be seen when produced. The way in which buildings were shut in must be present to the minds of all, and it was often impossible to see such buildings owing to an inadequate site. One of the most notable examples of that was the new Law Courts. In the commercial parts of London, that, he supposed, could not be avoided, but with public buildings the country's advisors must be at fault when they crowded a number of offices on to an inadequate site.

Mr. Aston Webb said that all architects suffered from the difficulties which had been referred to. Interesting and thoughtful as was Mr. Stevenson's paper, it was a little pessimistic about modern architecture. It was a great pleasure to him (the speaker) to hear a short time ago one of our greatest architects say, when asked what he considered the finest building in the world, that it was an English building, built within his own lifetime, viz., St. George's Hall. If one of the finest buildings in the world could be produced in our generation, and if in the previous generation the Houses of Parliament (which many competent people would consider to be one of the finest buildings in the world) could be built, there was no need to be so despondent. And it must not be forgotten that both those buildings were the result of competitions, which so many people considered such degrading things, though he would express no opinion on the matter. One of the remedies which Mr. Stevenson had suggested was the study of old work, and most people would agree that the study of old work was essential to the production of new. And yet he would have liked to have heard some other remedy as well held out to the rising generation. Many of them had studied old work for long, and had lived in the memories of some of those fine buildings which had been put up in the last century, and he fancied that the younger men would have to look forward, and, notwithstanding what had been done before, would have to develop some new line. The difficulties and hindrances in architecture were, after all, like other matters in life, one's greatest good. It was the restrictions, the limitations, the difficulties, and hindrances that perhaps brought out one's best energies and best work. When they remembered that the author of the paper read that evening was the architect of the Red House in Bayswater-road they would see that restrictions did not interfere with the production of such an excellent piece of archi-

lecture as that. That there must be hindrances he was quite sure; their work, however pleasurable, must be produced through trouble and pain.

The Chairman said he thought Mr. Webb was quite correct in saying that the paper had been a little pessimistic about the architecture of the present time. He supposed that even Mr. Stevenson could hardly expect that every man of their great profession could be the highest-class artist, but there was a sufficient sprinkling of very clever architects amongst the number, as was shown by the students' work, and the architecture of the present century might not be very far behind the architecture of last century. Mr. Stevenson apparently did not like to be restrained by anything, and that produced an artistic wail against the restrictions of County Councils and local bodies, though with much that Mr. Stevenson had said most of them would agree. With regard to competitions, there was a great deal to be said on both sides of the question. Certainly, in many instances much of the unsatisfactory results of competitions were due to the action of members of the profession themselves, more than to the promoters. If architects would rush into competitions on the most unfair terms they could only thank themselves if promoters did not take the trouble to make fairer conditions or appoint a competent assessor. The Institute did all it could in the matter, and only the other day had written a letter to a committee who had published unfair conditions. An insulting reply was returned to the effect that the Institute's interference was unwarrantable, but the council were able to reply that they wrote in the interests of the profession. He was glad to say the Institute's representations had been successful in a good many cases. In regard to rural by-laws the subject had been before the council that very afternoon, and it had been decided to approach the Local Government Board again.

The vote of thanks having been heartily agreed to,

Mr. Stevenson, in reply, referred to Mr. Aston Webb's remark that it was the difficulties that often made an architect. It was indeed the case that difficulties such as these were to the architect his opportunities, and that all the most interesting things in architecture had been attained by the architect getting over his difficulty. He sympathised with Mr. Adam's remark when he instanced the Shaftesbury-avenue. In the first draft of his paper he had cited Shaftesbury-avenue as an instance of what a modern street should not be from its extreme restlessness. But he cut it out, as he had cut out a good many other things, lest his paper might be too long. Mr. Hudson had referred to the inadequacy of old photographs which hung on the walls for them to see to show what good buildings they could get, and what splendid effects could be produced, on what a modern man would call perfectly inadequate sites. They were, he thought, quite wrong in thinking that it made a town healthier and finer to have great wide spaces. The Strand was a much finer street than, say, Oxford and Cambridge terraces, and there was something in a point with regard to the ventilation, which he had mentioned in his paper, but had not had time to elucidate. Better movements of air were secured where there was a wide open space and narrow streets opening into it. The ventilation and esthetic effects were far greater than where they had, as in Manchester, all the streets of the same width, never one more nor one less. Of course there were difficulties in the matter for the officials concerned; but if it was possible to allow some freedom and variety in that matter, he was certain that was one of the things that would tend to improvement. With regard to the assessor, one speaker suggested that he should be given even more power, not only to decide the competition, but to select the architects to compete. His point was that the assessor had too much power already. It was said as an objection to naming the competitors themselves, that although the assessor might be above suspicion of favouritism, members of the Committee might not be. In that case, again, the precaution seemed to him futile, because, if a member of the Committee wished to favour any one, the person he wished to favour might easily let him know which was his design, and his friend on the Committee could bestow the favour without incurring any discredit for doing so. What was wanted was perfect

openness—let everything be above-board; let the competitors put their names on the drawings; let the assessor, whether a judge or an assessor, give his decision and let it be known to the competitors; and he should also strongly advise—try at least what would come of the competitors, when they were appointed and paid, electing the assessor.

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of this Association was held in the rooms of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, W., on Friday last week, Mr. W. H. Seth-Smith, President, in the chair.

The minutes and some nominations having been read, Messrs. H. Cayley, S. A. Hall, and A. S. Tanner were elected members.

Mr. E. T. Hall then read the following paper on

Flats.

Mr. President and Gentlemen,—When your committee invited me to write a paper to read before the Association on "Flats," I accepted without reflecting on the difficulty of the subject given to me. The title was so short and seemed so simple, but the seeming simplicity of the subject is a delusion.

A house of one story we call a bungalow, but "flat" is the name we give to a self-contained residence on one floor of a many storied house. It is not euphonious, and it is not descriptive. The name betokens a lack of imagination, and it seems to me inept to adopt such a word to describe the abode of a large and increasing number of people. We do not often use the word for workmen's dwellings, but generally only for those of the richer class. We might as appropriately call an ordinary town house a "vertical." However, such as it is, the term is now accepted in England, or at all events in the south. In Paris *appartement* appears to be the accepted designation of such a residence as distinct from *piece d'un appartement*, which designates a room in a set of apartments. In Germany there appears to be no word to distinguish a "flat" from a house proper, *Wohnung* or *Wohnhaus* are applied to both.

I suppose it is not more than forty years ago when flats on any large scale were introduced into London. Among the first, I think, were those stuccoed buildings in Victoria-street, and I can remember how some of them remained for years unfinished, so little or so slowly did the idea take on. This is surprising, because they had long been established in—for example—Paris and Edinburgh, two cities which have had many things in common since, and even before, the days of the Stuarts. In England, however, habits are very conservative, and it took even the relatively travelled people of London a long time before they would accept a flat as a permanent residence. In the provinces to this day there are many cities and towns where no flat is known, as, for example, in go-ahead places like Leeds, Liverpool, Manchester, and Cardiff, to cite places wide apart where there is plenty of energy and activity; and in two or three of these there are not any many storied buildings for the working classes. As illustrating the feeling that prevailed until the decade 1880-90, hardly any insurance company would invest in ground rents secured on flats or lend money on mortgage of such buildings.

From about 1880, however, flats began to move—as the phrase goes—and the projects for their erection steadily increased year by year until we have now a very large number of such buildings in all parts of London and in many of the suburbs. Many people of the well-to-do classes who formerly only hired a house for the season now take a flat by the year in lieu of a town house, to which they can come when they please. With a town house absence means at least caretakers and structural maintenance, whereas a flat may be locked up and the keys left with the porter, on the assurance that all will be safe during the tenant's absence.

It may be interesting for a moment to make a slight digression by noting that the period which has seen the birth, growth, and acceptance of the flat as a residential unit has coincided with the immense development of hotel life in London. I can just remember the completion of the Langham Hotel. I heard people say that it was a mistake to build

an hotel of that size, that it would never pay. &c. That was the pioneer of the modern hotels. It was followed by Charing Cross and Cannon-street, Holborn Viaduct, the Grand, the Metropolitan, the Midland, the Victoria, the Fifth Avenue, the Grand Central, the Russell, and others further afield. The restaurant, too, was of the same period. It is within my time that outside a club or a chophouse there was hardly a place where one could get a decent meal, and certainly no place where one could take a lady except it were to an hotel. There were one or two Italian cafés, but if I remember aright the Holborn Restaurant was the first of any size to astonish the Londoner with its comparative luxury, cleanliness, and good cooking. This was soon followed, and now there are as many restaurants in London probably as in Paris, although not quite on the same lines. However, we must return to our subject.

Accepting, then, the fact that flats as a distinct class of property have taken firm hold of London and consequently afford an extensive field of operations for the architect, let us consider what are the problems to be solved when one has to design a building of this class. First, locality will have something to say. If the site be in a main West End thoroughfare where shops are the essentially lucrative part of the property and have to form the ground-floor or possibly two floors, it will not, as a rule, be found to be remunerative to put family residences above, but bachelor suites generally with one sitting-room, one bedroom, and a bathroom will be found to meet a considerable demand. In the side streets of clubland similar suites, sometimes with a manservant's room attached, will realise high rents. In Bayswater, Kensington, Chelsea, Westminster, &c., flats over shops will as a rule only be taken by the lower middle class, but in blocks which are exclusively residential and of good style there will be a considerable demand from well-to-do people of all sorts who do not wish for the trouble of a large house, the expense of a garden, &c., and who periodically shut up their flat and go away. In Hampstead probably as high rents can be obtained as in Kensington, but in Battersea Park, and still more in places like Brixton and such suburbs the style and the rents must be simpler and cheaper respectively. The locality, therefore, and consequently the class of tenant, will exercise an influence on the whole design.

I have noted that as a rule family residences for well-to-do people will not be readily taken if over shops in a main street in London. It is strange that this objection does not hold in Vienna and Paris, where family suites in the heart of the cities are the rule, and are sometimes sumptuous. I suppose the difference lies in the temperament of the peoples. In England the mistress of the house and the family generally like to have the opportunity of being quiet; "a quiet evening at home" one constantly hears as a phrase. In France and Vienna the genius of the people is for bustle, vivacity, stir, and movement. To some natures quiet is appalling and abhorrent. I have before me a book of new buildings in Paris—apartment houses—and of a total of fifty depicted, thirty-four are in main streets and have shops on the ground floor.

Another difference to be noted is that in Paris the rule is to make a service staircase in addition to the principal staircase; in Vienna and London this is not usual, although of course there are many instances to the contrary. In a building with only one principal staircase the service staircase is a great protection in the event of fire, and where the floors are extensive I think should be made compulsory, but it should be at a distance from the other, and should be next an external wall with windows in it to enable the smoke to escape. In some modern and handsome Parisian buildings there are stately principal staircases which are lighted by glazed partitions, or, as we call them, "borrowed lights," from the service staircase which itself has windows. This is bad. If a fire occurred, and the flames went up one staircase, the other would be rendered useless for escape by the breaking of the glass partitions between. When there are two or more principal staircases this fire exit can be made by carrying both or all up to the roof, forming there a fire-resisting passage from one to the other. In St. Ermin's Hotel and Mansions at Westminster, designed by me, where the buildings cover a site of about an acre, and there are some 650 rooms, I have six staircases with such intercommunication. It is

strange that in Vienna very large blocks have sometimes only one staircase with a comparatively narrow passage leading to it from the street through the main block. There is one such on the screen where there are six stories and four suites on a floor.

In London the reason for excluding service staircases is generally the desire to keep tradesmen's boys out of the house, and to avoid the uncontrollable "back door." Very frequently goods are transmitted from the ground floor by small hand-service lifts passing outside the kitchen window or service hatch, and very useful and speedy lifts can be made by using bicycle wheels at top and bottom with ball bearings, wire ropes, and two balanced covered cages or buckets. Apparently in Vienna in many buildings all goods come up the one staircase to the front door.

A further point to observe is the very small kitchens and offices of the Paris and Viennese flats; 13 ft. by 10 ft. appears to be considered ample, and many are much less. There is no scullery, but sometimes a small pantry with sink is attached. This, however, is by no means general, and a larder is still more rare. I am told that small as the kitchens not unfrequently are in Vienna, it is by no means unusual to find them very handsomely fitted, the walls tiled and decorated with handsome ware. My informant says perhaps 300l. is spent in such a way, and the mistress takes her friends to see the kitchen.

Yet another point of dissimilarity from our practice is the fact that in Paris frequently there is apparently no bedroom for the servants within the suite. In some cases the servants' bedrooms for the whole building are on the top floor, although there are many separate suites in the building. I should think a good deal of inter-family gossip is thus exchanged. In Vienna generally one small bedroom for a servant is provided, sometimes opening only from the kitchen. There is on one of the drawings displayed one handsome suite of rooms, with such a bedroom about 45 ft. in area, in another 70 ft. in area. These are not healthy. Certainly 100 square ft. should be a minimum. Of course, I do not know that other rooms may not sometimes be allocated to servants, but having regard to the few bedrooms and the size of the sitting-rooms this does not appear to be probable. In London it is usual to house the servants within the flat, but here, as well as in Vienna, the vice of making a bedroom open out of the kitchen is still practised, and when one reflects that slops have to be carried through the kitchen in times of sickness and of health, it will be seen how insanitary such an arrangement is.

Our friends abroad are not always so particular as we are in other sanitary matters, and you will note on the screens some bath-rooms with no light and not against external walls, larders similarly situated, even behind water-closets, and the evil practice which obtained in England, even within the last half century, is still maintained abroad, of lighting and ventilating water-closets from staircases and passages. Here that is no longer possible, thanks to our sanitary laws, and I feel sure that our friends abroad now realise the evil of such arrangements, and will not be offended at my mentioning the defects should any of them honour me by reading my paper.

I have yet another little sanitary point to mention, and that is the danger of taking soil pipes of flats down inside the building against external and even internal walls in chases. Such chases afford channels for carrying infectious diseases from one suite to another. They are passages for vermin and for sound, to say nothing of the danger if the pipe leaks. Our laws have practically banished this evil from London, although I well remember to have seen it practised in some of our pioneer flats.

Internal staircases, however handsome they may be, with only top light and ventilation, are also to be deprecated in confined areas where there are many stories of flats. Such staircases, in the event of fire, become furnace shafts, and at least get full of smoke, choking those trying to escape. The odours of the lower part of the house ascend to the top, and again illness is conveyed by them from one part to the other. While many will realise the last mentioned evil, it is not all who pay attention to the point I am about to mention, and that is the necessity for a current of air through small internal areas or courts extending from

the ground to the sky. These small courts are frequently and not inaptly called "well holes." Now every one knows that the air at the bottom of a well is often so bad that a candle will not burn in it. A "well hole" area without through ventilation is in a lesser degree bad in the same way; and when, as is generally the case, there are gullies at the bottom giving off foul gases from fermenting deposits, it can be realised that windows opening into such areas are merely inlets for poison. All such areas should be ventilated by means of an inlet of large capacity at the bottom from some road or considerable open space where there is always movement of air going on.

Fourteen or fifteen years ago I realised the evil and practised the remedy, and we obtained its insertion in the London Building Act of 1894. I was much pleased to see the necessity for this bottom inlet to small areas urged in a recent letter from M. Poupinel, of Paris, when he was kindly forwarding some of the drawings now exhibited, and it will be seen that he has inlets to his small courts in the houses Nos. 8 and 10 Rue Descamps. M. Poupinel has also taken fresh air flues from the exterior to every fireplace in his building, and he has outlet ventilators in his kitchens. We, in London, are accustomed to outlet ventilators from not only kitchens, but reception rooms and bedrooms, but they are uncommon abroad, and the atmosphere of a stove-heated and un-ventilated room on the continent is something to be remembered by those accustomed to fresh air.

There is only one further point to mention before leaving this hygienic branch of my subject, and that is the desirability in our cities of having large windows in our rooms and keeping the tops of them reasonably near to the ceiling.

A subject that may profitably engage our attention for a minute or two is the construction of the floors. In all high buildings for many families the floor should be of fire-resisting material. Some years ago Mr. Evans patented a floor which was composed of ordinary wooden joists laid close together and well spiked thus making a solid wood floor. I do not know what has become of the system, but its tests showed it to be practically impervious to fire, and from its fibrous character it was claimed to be sound-proof. Another mode of constructing a floor is to fix rolled steel joists and build 1½ in. thick brick arches between. This used to be the most common method of construction in London, and it is still much used in Vienna. We see it shown on one of the exhibited designs. Above the brickwork were wood joists and an ordinary floor. The most common because cheapest method used in England is, however, to place rolled steel joists at regular intervals, generally 2 ft. apart, and to fill the space solid with concrete made of cement and coke breeze, bringing the soffit of the concrete an inch or two below the joists to protect the steel from the direct action of the fire. Frequently small fillets of wood were, and sometimes still are, laid on the concrete, and the boards nailed to the fillets; without ventilation, however, if the floor is covered with linoleum, such fillets and the boards over them may decay from dry rot, and the same remark applies to linoleum laid on boards nailed direct to concrete. One objection to the solid concrete floor is that it is not impervious to sound. The only way to remedy the evil is to get an air cushion beneath the floor itself, and to suspend the ceiling. There are several ways of doing this. To get over the difficulty regarding wood floors where these are intended to be covered, I have in many recent buildings dispensed with boards, trowelled the floor with cement, and covered this with linoleum, either plain or ornamental. At once a furnished appearance is given to the floor, and rugs or carpets look well on it. The material is pleasant to the tread, it is not so resonant as wood, and there are no joints in which vermin may harbour.

I much fear that so much detail is wearisome, and yet it is valuable, and for the most part essential to an architect to know it all before he can start to make a good design with the hope of getting a successful result.

Turning now to the æsthetic side of the subject, let us consider the block plan. First of all, do not crowd too much building on your land. Doubtless a site that is crowded will show a large rent-roll on paper, but the building will not in the end be so popular as an open and more airy and consequently more healthy block, and the

rents of the former will have to be reduced. Of course the shape and extent of the site will largely determine the block plan, but for our purpose we will assume a considerable area to be at our disposal. It may be laid out with a large carriage quadrangle in the centre, as in the examples on the screen of (1) No. 87, Boulevard St. Michel, or (2) No. 32, Rue la Boétie, both belonging to Le Nord Assurance Company, the architect being M. M. J. Nerrot. In these the entrances are from the courtyards. In Mr. C. J. Pawley's, St. James' Court, Westminster, we get one large courtyard with a narrow roadway on each side leading to it behind and through the front block.

Another type is where the main entrances are from the roadways, as, for example, Der Habighof, Vienna, Herr H. Adams, architect. Here we have as characteristics two blocks parallel to the Hauptstrasse and one facing the side street. The internal courtyards are used merely for light and air. There is a third method, as at St. Ermin's, Westminster, where the buildings are U-shaped, the large central quadrangle being open to the south or main front. This open quad may, however, be at the back if the aspect is more suitable at that side. This third method is shown in Mr. Paul Hoffmann's recent buildings, 171-5, Queen's-gate. The enclosed quadrangles permit of more land being covered than where the fourth side is left open, but the latter scheme has many other advantages. Even, however, on a comparatively small site a very pretty effect may be obtained by having a central circular carriage court, partially glass roofed, over the ground floor, the area above being open for lighting and ventilating the staircase and rooms. An example of this may be seen on the walls.

Coming to a consideration of the internal planning of the buildings I think a good public entrance hall on the ground floor is a *sine qua non*. The porch and vestibule should be simple, and may be plain. The hall should be spacious; not a mere passage, but a good room, well lighted, the walls panelled in wood to a considerable height, having a large, hospitable fire, and a panelled ceiling. Personally I do not like the "gorgonzola" and other marble wall effects which are so frequently seen in modern blocks. They are not, I think, in harmony with essentially domestic buildings, and I prefer the more cosy effect of a good hall in a country house. Of course columns may enter into the composition with great advantage, and any scheme of colour.

The position of the staircase must of course be governed by the shape of the site, but if it can be made a part of the hall scheme so much the better, as it produces an effect of spaciousness which is valuable. I would draw attention to the very general feature abroad of staircases planned as semi-circles, ellipses, or on other curved lines. The result is very pleasing, and contrasts favourably with the straight flights of stairs in a rectangular space so frequently seen. I do not like curved flights of stairs to extend without any intermediate landing, from floor to floor. These appear to me rather monotonous, as well as tiring and dangerous. They are, however, common in Paris.

I think the best planning, internally, is where on each floor there is but one flat off a main staircase. Such a flat is more private, and gives an idea of not being limited by its neighbour. There may, of course, even with this arrangement be several staircases within the building itself, and several flats on a floor. Of course "the one staircase one flat" idea would only be practicable when the flats were of considerable size. When there are family suites, each of but five or six rooms, one staircase may reasonably serve two suites on each floor. This gives a certain elasticity to the place, as two small suites may then be combined and let as one large one. In high buildings I think it is not desirable to have a greater number of flats on a floor to one staircase. Mr. Hoffmann, at Queen's-gate, has his centre block with one flat to a staircase, and the wings with two flats to a staircase. The plan is an excellent example of how to lay out a large site. In the Avenue Ledru Rollin, No. 68, M. Montalto gives another good U-shaped plan, with the quadrangle at the rear and two flats to a floor. The site is out of square, but the planning is admirable, and all parts are well lighted. There is one main staircase, and there are two service staircases adjoining the kitchens.

The planning of a flat itself is an interesting

problem, one requiring great thought. First, there should be a good and well-lighted hall, or antechamber. The reception-rooms should be readily accessible from this, the bedrooms more retired, and the offices out of sight, but handy for service to the principal rooms and to trade access. Efforts should be made to get away from a mere narrow passage hall, and to adopt some more compact plan. An octagon or a circle, a hexagon or an ellipse will form pleasing forms, and all admit of decorative treatments. A good example of an octagon treatment may be seen in M. Nerrot's building in the Rue la Boétie, and there is another at No. 42, Avenue Henri Martin. The rooms, too, even in rectangular sites, need not all be square or rectangular. M. Poupinel, in his No. 10, Rue Descamps, gives an excellent plan of a flat, interesting as a composition, the rooms of different geometrical shapes, passages well lighted, the whole convenient and well arranged, although, perhaps, the hall might have had a better window in the angle without injury to the other rooms. In this building we note on the ground floor an up-to-date cycle stable in a convenient position, an elliptical staircase with lift, one suite on each floor consisting of three reception and five bedrooms, bathroom, two water-closets, a little kitchen (about 11 ft. 6 in. by 9 ft. 9 in.), with an "office" or pantry fitted with cupboards, between it and the service staircase. There is a meat safe in the kitchen window, but no separate larder. I have already referred to the servants' bedrooms on the top floor, to the ventilated courts, &c. I venture to suggest that it would have been better if the service staircase had an exit on the ground floor distinct from that through the main entrances.

As to height of rooms, it appears to be very general to adopt about 10 to 11 ft. in clear in all three capitals. I think this ample for moderate sized rooms; a greater height makes them appear smaller in area. Windows should be ample, especially in a city, and I would draw your attention to the large size of doorways in the Parisian examples. Passages should be light, and the more direct the better. Do not forget to provide ample cupboards. Baths, sinks, water-closets, &c., should not be all over the place, but, within reason, grouped near together.

On the subject of planning, I would sum up shortly by saying, make your plans interesting, bright, and above all study to make them simple, the simpler the better. You may be sure if you see an intricate plan it is ill-digested, inconvenient, and generally not so well lighted or ventilated as it should be.

We have hitherto considered only large sites, but there are a greater number of small sites which have to be treated, and I would refer you to Baron Max Ferstel's design of a house in the Stammgasse, Vienna. It is six stories in height, the top floor containing studios. The other floors contain each a flat with five rooms, in addition to a kitchen with servant's bedroom attached and a larder. Here the two nurseries are placed at the rear, with separate service from the kitchen. There is also an access from the living-room to these children's rooms, so that the mother has a ready control. The bathroom and water-closet are ventilated into a small area, but the bathroom is only apparently accessible from the living-room, which appears to me to be an undesirable feature.

The planning also of the suites over the Café Secession, in the Rothenthurnstrasse, by Professor Julius Deininger, is worthy of study. Herren Fillner and Helmer, in No. 21, Schottenring, have a pleasing and clever little plan, with a good courtyard. The suites have a hall, three rooms, bath, and water-closet.

Among the Parisian drawings there is an excellent treatment of an acute-angled small site at the corner of the Rue Montmartre and the Rue Réaumur by M. Gautrin. The angle itself is occupied by a circular salon, the other six rooms all face the two streets; the staircase is circular, lighted from an internal court, and the passage is also well lighted. M. L. Carrier, at the corner of the Rue du Faubourg Saint Honoré, has also a most convenient and pretty treatment of a good site. Another good plan is that at the angle of the Faubourg St. Martin and the Rue du Château d'Eau by M. Rives. In London, Mr. John Slater's corner of Mortimer-street is convenient and well lighted. In Palace-chambers, Buckingham Gate, Messrs. Martin & Purchase have an angle site which appears to have required considerable thought to evolve a plan to give good light to all the

Palace Chambers, Buckingham Gate. (Messrs. Martin & Purchase, Architects.)

The Mansions, Sloane Gardens. (Mr. E. T. Hall, Architect.)

apartments. Perhaps it may be permissible to mention one of my own buildings with a rather awkward site. It is a quadrant on plan at the corner of Sloane Gardens, and is shown on the screen. Among the plans of bachelor suites we have one of Mr. John Slater's for a very shallow site in Well-street. He puts two suites to a floor off each staircase, and also, in addition to a parlour or sitting-room, two bedrooms, and a bathroom with water-closet in it, gives a small kitchen. The whole forms a very small self-contained residence, to be let at a low rent. Mr. Paul Hoffman, in Harewood-place and Hanover-square, has one staircase, a corridor common to several suites, each containing an entrance-lobby, a sitting-room, bedroom, bathroom, and water-closet, but the two end suites can be combined to make a family suite.

I would draw your attention to two sets of plans of large buildings in Vienna the sites of which are acute-angled triangles, both by Professor Carl König. One at the corner of two streets is the palais for Herr Josef R. von Herberstein. It has a carriage entrance in the centre of the principal front, a small glass-covered courtyard in the centre, and a way through to

the side street. You will note that there is a stable within the main building entered from the courtyard. The second and third floors are divided into two complete suites of flats. Two principal staircases are carried to the mezzanine and first floor. One of these only goes up higher, and a service staircase is carried from bottom to top. A difficult site is well utilised, and all parts of the building are well lighted. The other building, with a site of almost identical shape but larger, is surrounded by roads, the Augustiner Strasse, the Tegethoff Strasse, and the Fühlich Strasse, and the approaches are arranged in the same way. No elevations have been sent. There are others of Professor König's designs which will repay study. In the Palais Leon-Wernberg, by Herr Burath von Neumann, we have an example of another large building with a good central area. One staircase above the first floor serves a large number of rooms, forming two suites per floor. From the landing an outer gallery gives access to the suites and borrowed light to two or three rooms. On the first floor I would note the careful planning of the acute-angled excrescence on the right hand. The

same architect sends us drawings of two other large buildings erected from his design. It may also be of interest to compare the design by Herr Victor Siedek in Vienna with that by M. Michel Rabier in Paris for sites of nearly the same shape.

It would not appear to be desirable to carry the limits of my paper to a further detailed description of planning, and I will conclude by some observations on external design. Manifestly, the accessibility of material will have an important influence on design if the architect intends to display his building material. In Paris stone is practically always used. In London red brick, with or without stone, is generally used. In Vienna the construction is very largely of brick, but the facing is of stucco or cement, and so are most of the columns and architectural detail, even in some of the largest buildings.

Owing to the commercial requirement that every floor of flats must be equally well lighted and to the structural desirability in high buildings of getting voids over voids, which together very generally result in windows being made of the same width on each floor, a Classic treatment is nearly out of the question.

Gothic, except in its latest English style, has not been attended with great success, and practically everywhere some branch or phase of Renaissance has become more or less the accepted basis of design. I have used the word Renaissance in a wide sense because, while some have introduced the normal Italian features, others have broken quite away from them. We know how, more in sorrow than in anger, one of our own Classic masters laments the depravity of a truant architrave or frieze in an entablature, and I can quite imagine the similar sensations of some of his Austrian colleagues at what is, I understand, there called the Secession style.

A very interesting example of this style is shown in Professor Julius Deininger's "Romahof." Note the original treatment of the exterior, the sculptured figures on the angles of the bays, the panelled pilasters with masks and long pendent ribbons, the coved floral cornice without architraves or necking, the carved or rather modelled surface treatment of growing trees. Another example is a house in Wenzels Platz at Prague by Professor Jan Kotěra, pleasing and refined in treatment; or, again, Professor Otto Wagner's house in the Magdalenenstrasse, Vienna, of which two views are given, one showing the circular angle of the building, with its pavilion on the top story flanked by pilasters, on which an effect of plain and rusticated courses is produced by a decorative treatment of growing foliage; the other illustrating the elaborate surface decoration of the principal elevation. There is also a design by Herr Oscar Marmorek, Der Nestroyhof at Vienna, illustrating that architect's views on modern architecture. Herren Fellner & Helmer's design for the building on the Franz-Josef Quai in Vienna is quite different in character, and is a refined treatment of Renaissance. Their St. Annahof is an example of design in a mediæval style, quiet and picturesque, the surface unbroken by strings and capped by a small cornice. The lower part is enriched with broad bands of nearly life-sized figure subjects modelled in bas-relief.

In Paris the architecture of the apartment house has generally its characteristically native treatment, shows great refinement, and, in my view, adapts itself admirably to the purpose of the buildings. If I may single out one or two illustrations as indicative of this adaptability, mention might be made of the exhibited design in the Rues Réamur, Ledru-Rollin, and Château d'Eau among many others.

In London the most conspicuous block is on the Embankment—Whitehall Court, by Messrs. Archer & Green—a stone building, as to design based on French Renaissance. Most of the other flats in London are of red brick and stone combined. They are well known and accessible to all of you. Doubtless in some, and may be in all, there are features which, whether admirable or not, are suggestive, and from which you may derive an inspiration of great value.

Well, sir, I am now coming to an end. My endeavour has been to recite first the practical and hygienic considerations regarding safety from fire, exits, ventilation, and sanitation, which form the very bed-rock on which to base a design; then on this basis to consider the æsthetic side, to suggest principles governing the laying-out of various sites, the internal planning and lighting of the buildings and their

Apartment House, Prague. (Professor Kotěra, Architect.)

exterior treatment. I have sought to interest the meeting by illustrations from the works of many architects at home and abroad. If I have succeeded in offering any food for reflection, then my labour will not have been in vain. In conclusion, I have to offer on my own behalf, and I am sure on yours also, our cordial thanks to our colleagues at home and abroad who have so kindly lent their drawings to-night. Their names are given in the body of the paper.

Mr. Locke, the esteemed secretary of the Royal Institute of British Architects, very kindly responded to my request to assist me in getting foreign drawings, and wrote to Baron Max Ferstel, of Vienna, and to M. Poupinel, of Paris. To both those gentlemen we owe an especial acknowledgment for their great courtesy in sending us so many drawings. Baron Ferstel especially must have taken infinite trouble to collect from so many architects the very large and interesting series of representations of their works which we have been privileged to examine. You will, I know, desire me to send through both the gentlemen I have named your greetings to them and their colleagues, with our expression of a hope that the new century may strengthen the bonds of amity between our respective countries.

Mr. J. J. Stevenson, in proposing a vote of thanks to the lecturer, said that one thing which most strongly affect the planning of flats in England, as compared with France, was the system in France, especially in Paris, of putting the bedrooms of the servants, male and female, on the top floor of the building. The system—an old one in Paris, where flats, or apartments, had been in existence a long time—was one which we should not tolerate in England, for it was neither good for the servants or the masters, and it would always be one of the great difficulties in the designing of flats in England. In large London houses the basement floor occupied a great deal more space than any other floor, and it was extremely difficult, on the space available for the flat, to plan the servants' quarters—the kitchen, &c., and their bedrooms especially—as servants could not now be crowded three and four in a room as they used to be. It had occurred to him that, instead of flats all on one floor, it might be possible to make a flat of, so to speak, two floors with a sort of two-storied house—a collection of two-storied houses one above the other. He thought there might be some economy of space in such an arrangement. In flats there was a good deal of dreariness due to a lack of open air space about them, and in order to see the sun straight above his head an occupant of a flat had to go down so many floors. That was a point which might receive the attention of designers of such buildings. He had seen some flats where it would have been far better that a part of the available space should have been left outside the walls, with the free winds of Heaven blowing round, and, following the examples of some of the old palaces in Italy, it was wonderful what an idea of garden and greenery could be got in such buildings by the skillful planning and adjustment of small spaces. If he had to live in a flat, that want of open air would cause him to prefer living at the top, and it had occurred to him that the roofs of such buildings might be treated as gardens for the use of the occupants below, so as to give them an opportunity of getting fresh air—though there was one drawback to that, viz., that such places would be exposed to smuts from chimneys. It was a matter for congratulation that so many architects at home and abroad had sent drawings and diagrams to illustrate the paper, and thanks were especially due to Mr. Hall for the trouble he had taken in the matter.

Mr. Paul Hoffmann said, as to the remarks of the last speaker in regard to two or more flats, one above the other, he knew of one or two examples where that had been done. One was the well-known block of flats, designed by Mr. Norman Shaw, adjoining the Albert Hall. Mr. Shaw had adopted the plan of having the drawing-rooms—in fact, all the residence-rooms—of considerable height, viz., about 18 or 20 ft., and on to these he had put two stories of bedrooms and kitchens, connected in the rear by a private staircase. It was a rather economical arrangement, and fireproof floors were not necessary to the floors dividing two flats. Another way of doing it, and one which was often adopted, was to combine a

flat below the topmost story with a flat in the roof. In regard to gardens, these could be taken into consideration where the site was affected by ancient lights, and in planning flats the question of ancient lights was an important matter. On the Continent this was not so, and all that an architect had to do was to keep his building about 10 ft. from the window which would be considered to have an ancient light. In this country, however, there was no law, only a suggested angle of 45 deg., and where such an angle was required, it would be possible to set the houses back and form ledges or terraces which could be used for gardens. He did not think that, generally speaking, flats in England compared unfavourably with those on the Continent, considering all the difficulties architects had to contend with here, especially that of having to submit designs to so many interested parties. He might add that such a thing as the leasehold system was not known on the Continent, and that considerably facilitated matters for the Continental architect.

Dr. J. F. Sykes said he spoke entirely from the point of view of a sanitarian, and not from the point of view of an architect. London, apparently, was going to be rebuilt in flats, and that was a most important matter for the architectural world, especially in regard to the lines on which such buildings should be laid down. Abroad, everything was cut and dried, and such questions as light and air had all been settled; but in London it was not so, and there were a great many difficulties in regard to the construction of such buildings as flats. On the Continent it had been the custom for years past to construct houses round a central courtyard, but that had not hitherto been the custom in England, where houses had been constructed as open houses round a street block. Those who had been abroad had noticed how common were the central courtyards, but that was a feature to be avoided, if possible, especially in the extreme way in which it was carried out, particularly in French towns. It was extremely desirable to get air into flats, and for that reason it was important to avoid the central courtyard. In the ordinary house there was the well-staircase, with windows opening on to it, as well as all the rooms of the house, so that each room got ventilated independently of every other room. A flat was, practically, one large room divided into apartments as a rule, but in the ordinary house the staircase-well acted as a ventilating well; but not so in the flat, because it did not exist, and some means of ventilation must be adopted to replace it. Some flats had ventilated corridors, with all the rooms opening on to the corridor; others had corridors running from back to front, and sometimes there was only a vestibule. Mr. Hall spoke of having a vestibule in the centre, but he (the speaker) greatly objected to closed vestibules in flats, because an occupant could tell what he was going to eat long before meal time, and the odour of one room would pervade the other rooms owing to the difficulty of ventilating the vestibule. [Mr. Hall: My point was that the vestibule should be ventilated.] The difficulty was to get that done, and many such vestibules had no ventilation whatever. There were things to be avoided in the construction of flats, which were very difficult to avoid. He would give them a practical illustration. In some parts of London where the well-to-do once lived, and in other cities, there were houses—generally the old type of self-contained house of ten or twelve rooms, which had been subtle, with the result that, each room being occupied as a separate dwelling, the chimneys of the building always smoked. That was invariably the case, and it was due to the enormous draught in the chimneys created by so many fires extracting the air and causing each chimney to pull against the other. If one fire was lighted the air was pulled down from another chimney, and it would be an extremely well-planned and well-ventilated house where that was not so. In flats that were occupied by a number of people at the same time, and where a number of chimneys were being used, the air of one chimney tended to draw against the other, with the result that in flats the chimneys did not draw so well as they did in ordinary houses. Moreover, another result of chimneys of flats not drawing well was that the air in the rooms was kept in a stuffy condition. The point he wished to dwell most upon was that the air of a flat was the main point to be considered, and it was a point which the archi-

tect would find it extremely difficult to deal with.

Mr. F. G. F. Hooper, in seconding the vote of thanks to Mr. Hall, said they had been very much interested in seeing the illustrations of flats by foreign architects. A most valuable education in the planning and arrangement of such buildings was obtained by living in one of them. It was extraordinary what a number of little points could be found out in that way. As to the treatment of stairs in such buildings—whether there should be one or two staircases—he had lived in a flat in Westminster where there were two staircases, and one of them, the servants' staircase, had a well. The occupants of each flat heard all the conversation and noise which took place on the servants' staircase, and from that time he had always advocated a solid newel where a servants' staircase was planned, and he was rather surprised that so few plans made such a provision. Scarcely any of the continental architects provided a solid brick newel, but for all that it was a good method for keeping a building quiet. Mr. Hall had alluded only to what were really self-contained flats, but there were many flats which were worked, in a measure, on the co-operative principle, the rooms were shut off and each tenant could have his private rooms, though the service was in common, and the kitchens and servants' department were worked from a central position. The convenience of that was obvious in many respects, especially when an occupant wished to go out of town for a few days. It was all very well to suggest that the occupant of a self-contained flat could shut up his rooms when he wished to go out of town; but what could he do with the servants? True, he could leave them in possession, but where would they be when he returned? He (the speaker) would do almost anything rather than be a servant in some of the flats he had examined, for many servants never saw the sky unless they went outside. As to air shafts, it was possible to plan them in such a way as to provide a tunnel—or a wide opening forming a corridor, or simply a ventilating duct at the bottom—so that there should be air passing from outside the building through the air-shaft; and if that were provided the architect would ease his conscience in regard to the circulation of air, as it was almost certain that a shaft with an inlet at the bottom would produce an upcurrent, and it was not the fault of the architect if the first manager of the place suggested a screen to go across the entrance—and this was often what an architect had to contend against. The architects' plans in that respect were often defeated by one man who insisted on stopping a draught that was annoying to him, though in so doing he made the other occupants suffer. A rather important point in regard to flats was as to the vertical division of them. An architect might plan his building with the utmost care, and with the object of suiting the requirements of the average mortal, only to find how varying were the requirements of the average mortal. One man wanted a large, and another a small, room; or one wanted four and another six rooms. In these circumstances it was convenient to construct the building in such a way as to make it easy to remove the partitions so as to make one large room, or to put partitions in so as to make small rooms. As to two-storied flats, he was glad that Mr. Hoffmann had referred to the interesting buildings by Mr. Norman Shaw. A simple arrangement by which the occupant of a flat could get into the open air was by means of balconies, not widely extending balconies, but those which extended far enough to enable a chair to be placed outside the French casement. It added greatly to the interest of such a place to be able to look down a street from such a position.

Mr. C. J. C. Pawley said he agreed that the best way to find out how to plan and arrange a flat was to live in one. In his opinion there would be a great development of the flat in London. In fact, already there was a great demand for such buildings, and architects should devote their attention to the subject. The first obstacle an architect of flats had to contend against was that of ancient lights, while another drawback had been the difficulty in getting financial people to find the money for the erection, though that difficulty was to an extent overcome in London owing to the great life and fire offices regarding such property as good investment and advancing sums of money on it. As to the ventilation of flats he had found it a good plan to have the

entrance doorways to rooms carried up to ceilings, and to have a fanlight with an opening gear worked from the lower part of the sash, and with a cord for the purpose of regulating the ventilation. He thought that Mr. Halls' observations with regard to large doors and windows were useful, especially in regard to the design of such buildings in London, where one could not have too much light. As to the doors, in many places the opening was so small that when furniture was moved about, both it and the doors were damaged. As to the aspect of flats, if Mr. Hooper visited some flats that he (the speaker) was acquainted with he would see from the buildings plenty of sky and sunshine and greenery. He did not think that any room in an ordinary flat should be less than 10 ft. from floor to ceiling. He thought it very important in such buildings to have roofs for promenade, and at St. James's Court there was a winter garden for the eight blocks and also provision for any tenant to go on to the roof for a walk. As to smoke, he thought they should do all they could to do away with the smoke in London, and in his opinion much could be done by advocating the use of gas fires which, in his opinion, would be the fires of the future for flats, especially in dwelling rooms. They knew the disadvantage of gas fires, but great improvements had been made recently. He regretted that there were no illustrations of American flats and that the American buildings had not been referred to. People in this country could not go quite as far as Americans, but we might with advantage adopt some of their improvements. As to removable partitions, he had used quite a new material for the purpose, viz., pumice stone made in blocks and imported from Germany, and he thought the material had a future before it. Of course, the material could only be used where there was no weight to be carried, but the blocks had this advantage—they were exceedingly light, plaster adhered to them, and they could be very easily cut, and for these reasons they were suitable as partitions in flats. He believed in the use of balconies in such buildings.

Mr. G. B. Carvill referred to the paragraph in Mr. Hall's paper relating to the solid wood fireproof floor patented by Mr. Evans. He (the speaker) had often wondered why the floor had not been a success, for it seemed to him to be a very good thing, and he had seen it used in two or three buildings, but not for the last five or six years. Perhaps one drawback to its use was that the timber had to be very dry when it was first put in, and unless the roof was on there was always the chance of rain coming in. Moreover, the expansion of very dry timber in such circumstances would exert a thrust on the walls.

Mr. A. T. Bolton said he did not think there would be the rapid development in the erection of flats that had been predicted, and for the following reasons. Although it was true that much of the centre of London would be rebuilt as flats, still the tendency of the day, aided by rapid means of locomotion, was for people to reside in the country. This was true not only of London, but of all great towns, and he had been very much struck by the fact in Dublin, and also in Leeds and Birmingham; therefore, although there might be great activity in the building of flats in places like Mayfair and Westminster, it did not follow that the introduction of flats was going to change the habits of a people. He thought there was no comparison in the advantage to a nation as between a people that dwell in houses and one that lived in flats. Consequently, there was a great deal more in the question than the purely architectural point of flats affording opportunities of larger, more expensive, and therefore, in a way, more important buildings. It would be a bad day for the country when an Englishman's house ceased to be a castle and became a flat. He had been over a good many flats, and he thought, observing the dark corridors and miserable outlooks, that the inhabitants of these highly-priced flats could have done incomparably better, with much more comfort, for the same or less money. It seriously affected family life also, for great as might be the attractions of such buildings to newly-married people, they would discover that their company would later on become undesirable to residents who were not fond of children. This question he had seen discussed in connexion with the Peabody Buildings, and in his opinion there was a tendency for people after some trial to remove from flats and to take a house. He

sympathised strongly with Dr. Sykes in some of his remarks, and he thought that in the case of infectious diseases the desire of a doctor who cared about his patient would be to remove at the earliest possible moment the patient from such buildings. Not only in the ordinary infectious cases, but also in subtle cases like influenza and in the many cases where quiet was required, flats were exceedingly detrimental. As to lifts, it was no doubt more pleasant to be at the top of these buildings, but the possibility of living there depended to a large extent on the accessibility of the apartments; there were certain hours when the lifts would not be available. He had seen something of the flat question in France, where the commonest complaint against life in such buildings was the automatic and arbitrary rule of the *concierge*. The *conciergerie* was described as a centre of gossip, and the tyranny of the *concierge* was a by-word in France; and it might be asked in that respect, whether the liveried porters in England were a source of trouble. A man certainly was not so much his own master in a block of flats as he was when he occupied a house of his own; and the idea that it was at any moment possible to lock up for a time one's apartments in a flat and send the servants off was a delusion. Servants could not be given holidays at any moment, and the real way to enjoy life in a flat was to do without servants. The non-self-contained flat, or the residential hotel, had been alluded to, and had been spoken of as presenting many advantages over the ordinary flat. For instance, people who love company were attracted to this mode of life, and many of these residential hotels provided splendid dining and other rooms where company could be found at all times. That class of flat was quite as likely as the ordinary self-contained flat to be the flat of the future. Mr. Hall had referred to the question of elliptical and circular staircases, and had said he preferred to have a landing. A landing was ruinous to the effect of a circular or elliptical staircase, the whole beauty of which consisted in an unbroken wreath, and if a landing were introduced the effect was spoiled. In that respect the French showed great taste, for when they indulged in that class of staircase they kept it unbroken from one floor to another. As, however, a block of flats was, in a sense, a public building, it was a question whether winding steps could or ought to be introduced. They would all feel indebted to the suggestion as to putting down linoleum on concrete without intervening boards, and he had heard of the same thing being done with cork carpet—the carpet being glued down; but he was not sure how far that excluded the noise. As to suspended ceilings, the difficulty was that there was a tendency to cut floors fine in depth in order to save in the total height, and it would be difficult to save space with a suspended ceiling. A solid 9-in. concrete floor with a suspended ceiling underneath meant a 12-in. floor. He did not quite agree with Mr. Hall that 7 ft. by 10 ft. was too small for a bedroom in the case of a house. It all depended upon what arrangements were made for ventilation. Many people would rather have five small rooms than four slightly larger in size; and provided that windows could be opened and that there were fireplaces provided, there was a great deal to be said for the small room. The best side of the flat system was that it taught a lesson of economy of space, and house planning would be improved in detail as a consequence.

The Chairman, in putting the vote of thanks to the meeting, said they were indebted to Mr. Hall for the great amount of trouble he had taken in the preparation of his paper. As to the development of the flat system, there seemed every probability of its further development in London, and he was of opinion that that was due in part to the enormous increase of visitors to London and not so much because of a demand by English people for that style of dwelling. Visitors came from the provinces and from abroad just for a season, and it was convenient to be able to take a flat for three months. He was much struck with Mr. Hall's remark that there were practically no flats in our great provincial cities. There was a very interesting article in one of the magazines suggesting that Englishmen were becoming a nation of entertainers, and the writer illustrated his remarks by reference to the enormous expansion of the hotel and flat system in London. As to the objection to flat life in consequence of the noise

of adjoining occupants, there was no difficulty in preventing it vertically, but horizontally it seemed almost impossible to stop it where there were families of inconsiderate people who thought of no one but themselves. He suggested that in constructing flats a small strip of felt nailed on the top of the joist carrying the wood floor would deaden sound. The question of the disposal of dust had not been referred to, but he might say that he did not think that the dust shoots which had been introduced into some of these buildings, were at all satisfactory. As to the great open court in the middle of these buildings it was not popular in England. The Latin plan had not taken root here for several reasons. He did not know whether a main ventilating duct had been tried and an air-shaft with electric fans. Perhaps that arrangement would establish sufficient up-current, though the expense and the draught might tell against it. It would be interesting to know whether electric fires had been tried. He very much doubted whether gas fires would take the place of coal as had been suggested, but he thought that some system of electric warming could be adopted with advantage. With the vote of thanks he wished to couple the names of their foreign and English colleagues who had supplied them with so many interesting illustrations.

The vote of thanks having been put to the meeting and heartily agreed to,

Mr. Hall, in reply, said they would all agree with Dr. Sykes as to the importance of making flats sanitary. If they were not sanitary they would not last, and it went without saying that architects intended to pay attention to sanitary points. As to smoky chimneys, his impression was that it was almost impossible to get a domestic flue 60 or 70 ft. long that would not smoke. The fires on one or two floors would be all right, but that was not the case with those on the lower floors, for a column of air which left the ground floor warm ceased to be warm as it ascended, and then did not rise, and the heavier air forced it down again. Rooms and corridors, of course, must be ventilated, and it was not difficult to do that. He introduced inlet and outlet ventilators as well as windows in all rooms, but what was really more important, residents should be encouraged to use them. He quite agreed with Mr. Hooper's objections to servants' staircases. It was not desirable to introduce the servants' staircase unless it were put close to the principal one, and there were objections to that on other grounds. As to removable partitions, it was his practice to build only the main walls, and to let partitions in flats or similar structures be carried on the floor itself, so as to make it easy to take them down if desired. Balconies were pleasing additions, but there was the danger, unless they were rather high, of people falling over them; and when this danger had been provided against, people could not see over them. He did not suppose that the private house would be given up in the future, or that an increasing number of people would not go to live in the suburbs; but out of a population of four millions a considerable and increasing number would prefer to live in towns, and flats were taken because ground for houses of equal area could not be obtained at an equal rent. He thought it wrong and selfish for people who had children to live in flats—wrong for the children, he meant. Children should not be brought up where there were no facilities for running and playing about, and consequently life in flats was deleterious to the health of children. He joined issue with Mr. Bolton when that gentleman said that flats were unhealthy. Quite the contrary was the fact, as Peabody statistics showed. [Mr. Bolton: A selected class.] They were not superior, so far as their habits were concerned, and therefore, not class under discussion, and he felt certain that the health of persons living in flats, assuming those flats to be built with some degree of sanitary fitness, would be superior to that of people living in the same district in ordinary houses of like accommodation. [Mr. Bolton: In all the Peabody buildings there is a large amount of supervision.] But supervision did not prevent a man dying. He had never heard of a private flat not being kept as clean as a private house (and he could not imagine things being different), nor of people altering their habits because they lived in flats. As to the prevention of noise, he thought that the suggestion as to felt was a good one, but he feared the felt might rot. Boards, when covered with linoleum, rotted

unless they were ventilated, and that was why he had given up using wooden floors. He had a case (it was not one of his own designs) in connexion with a twelve-year-old building where the 3 in. by 2 in. joists laid on concrete had been covered with linoleum, and about every three years a new floor had to be put in. The floor was unventilated, and the rotting was probably due to moisture which had got in at the time the building was erected. As to the size of rooms, no room for sleeping purposes should have less than 1,000 cubic ft. of space. It was all very well to say one could economise space, but a person needed a sufficiency of cubic space to breathe in. One could live tolerably comfortably in a cabin on board ship, because the port holes admitted plenty of pure air. In London, where the air was frequently stagnant, something had to be done to make the air move, and this was done by ventilation. The first thing a doctor did for a patient was to insist on his sleeping in a room with not less than 1,500 ft. of cubic air, and if a considerable cubic space was necessary for a sick person, it must be desirable for a person in health. People must have an adequate breathing space. As to dust-shoots, he hoped that no one would use such things as vertical dust-shoots in a flat, for they were abominable things. What were required were sanitary receptacles like galvanised iron pails with lids, and these should be collected every day. He would have much pleasure in conveying the vote of thanks to those gentlemen who had kindly lent them drawings for the occasion.

The Chairman announced that the next meeting would be held on February 1, when Mr. D. T. Fyfe would read a paper on "Architecture in Crete and Turkey."

The meeting then terminated.

ARCHITECTURAL SOCIETIES.

PROPOSED FORMATION AT BELFAST OF A BRANCH OF THE ROYAL INSTITUTE OF THE ARCHITECTS OF IRELAND.—A meeting of the architects of the city was held at Belfast Town Hall on the 15th inst., for the purpose of considering the advisability of forming a branch of the Royal Institute of Architects, Ireland. On the motion of Mr. Close, seconded by Mr. J. C. Lepper, Sir Thomas Drew was moved to the chair. The chairman said it gave him great pleasure to see such a large number of the members of the profession present. When the desire was expressed that a movement of that kind should be set on foot, it was thought that he, as President of the Royal Institute of the Architects of Ireland, should summon the members to meet him in Belfast. As the local representative of the Royal Institute of British Architects in London, he thought he could go further, and summon the members of that Institute. Other members of the profession had also been invited by the secretary to be present.—It was agreed that Mr. Fitzsimons be appointed secretary of the meeting.—The Chairman, in giving a statement of the objects of that meeting, said that as a native of Belfast he was pretty well aware of the difficulties to be met in the formation of a co-operative society. His forty years' experience in Dublin had also taught him the enormous advantages and good fellowship which was engendered by cohesion amongst the members of the profession. He had heard it said that it would be impossible to form a cohesive society in Belfast. He was perfectly well aware of the difficulties, but he thought those difficulties were not insuperable. One of the great difficulties in bringing about unanimity of practice in the city was the question of fees. He knew the position in Belfast was very different from that in many other towns, and differed in toto in respect to the class of buildings to be erected. There were buildings here of the warehouse class, and rows of houses in a growing town, and it was unjust and unreasonable to lay down a hard-and-fast scale of fees. Sir Thomas then went on to speak of the unsatisfactory condition of affairs amongst the architects when he first went to Dublin. There was little cohesion, and the members had very old-fashioned and evil notions, but since that time a better state of things had been brought about. Instead of the proper percentage being paid to architects, half, and sometimes less, was paid, but since that time the old system had died out, and now the architects were working together on terms of the most perfect harmony and understanding.

There was no architect who was in any difficulty but the other members of his profession came around him and supported him. He was quite sure that that society would strengthen all its members by co-operation, but he did not think at present there should be any very stringent rules laid down as to professional conduct in the way of declaration. It was quite premature to ask intending members to be members of the Institute in Dublin, but in many ways it was desirable that the local society should be affiliated to that Institute. It should be open to their members to become members of that Institute or not, just as they chose, just as their society would join with the British Architects' Institute. Their society would be simply to watch over the interests of all architects.—Mr. W. J. Fennell moved the following resolution:—

"That, having regard to the lack of organisation of the architectural profession in Ulster, it is desirable that an association be formed, having for its objects the promotion of union and professional integrity amongst its members, the establishment, as far as possible, of uniformity of practice, and the general advancement of architecture; to consist of Fellows and Associates of the Royal Institute of British Architects, and members of the Royal Institute of Architects, Ireland, together with such other competent members of the profession as may desire admission, and be elected subsequently under a constitution and by-laws, which shall be framed by a council elected for that purpose and approved of by a majority of the members; that the constitution and by-laws be subject to the approval of the Royal Institute of Architects, Ireland, and the association so formed be affiliated thereto and have official representation on its council."

After expressing his pleasure in being asked to fulfil that duty, he said there was no organisation at all in Belfast, and he thought it was a step in the right direction to form one. The objects were, first, the promotion of union, and in regard to that he thought there was exceedingly little union among architects in Belfast. At any rate, he had seen very little of it in his twenty-five years' experience. The last paragraph was a most important one, and it was to the effect that their branch must be affiliated to the Royal Institute of Ireland, and have representation on the council. That he considered most important. Such action would lead to a better and higher standard of practice, and it would be of great benefit to the members of the profession in Belfast and to the general public.—Mr. J. Gilliland seconded the motion, and said the necessity was great, because London was very far away, and Dublin not very near. It was impossible for the members to keep in touch with those centres, and as those centres had no local knowledge, it was necessary to deal with local questions and to discuss matters among themselves. Union in Belfast had been conspicuous by its absence, and disunion would be the more proper term to apply to it.—Mr. W. Kaye-Parry said it was a great honour to be permitted to support the resolution, and to be associated with the movement inaugurated that day. The resolution was then adopted.—Mr. S. P. Close then moved:—

"That a provisional committee be elected to prepare a scheme and report to a general meeting, correspond with the Royal Institute of Architects, Ireland, and take such other steps as it may consider desirable to promote the interests of the proposed association; that the following be the provisional committee:—Vincent Craig, F.R.I.B.A.; J. J. McDonnell, J.P., M.R.I.A.I.; Frederick H. Tulloch, A.R.I.B.A.; William J. Gilliland, M.R.I.A.I.; John C. Dewhurst, M.R.I.A.I.; Nicholas Fitzsimons, A.R.I.B.A., secretary and convener."

Mr. G. W. Crowe seconded. This motion was also carried unanimously. Mr. Jas. St. J. Phillips moved:—

"That this meeting hereby expresses its cordial approval of the resolution passed by the council of the Royal Institute of Architects, Ireland, at its meeting of the 7th inst., as follows:—The council of the Royal Institute of Architects of Ireland, having had the result of the Presbyterian Assembly Hall competition, Belfast, brought before them, are of opinion that the conduct of the Competition Committee in not following the usual and proper course of publishing the report of their assessor (which they understand was an open document), and in appointing as architects to the new building the firm who drew up the original very unsatisfactory conditions, is deserving of their condemnation as being absolutely opposed to the methods which should govern all fair and impartially conducted competitions. The council considered the proper course for the committee to have adopted was either to have given the work to the gentleman placed first by the assessor, in conjunction with a

consulting architect of experience, or else to have invited a fresh competition with more satisfactory conditions than the previous one."

Mr. Nicholas Fitzsimons seconded the motion. The Chairman, in putting the resolution to the meeting, said he could not do so as the assessor of the competition referred to without making some observation. The model in question was impossible, unsatisfactory, and distasteful, as were so many of the competitions in Belfast.—The resolution upon being put to the meeting was adopted. Mr. Vincent Craig proposed a vote of thanks to Sir Thomas Drew, President, and Mr. W. Kaye-Parry, secretary, of the Royal Institute of Architects, Ireland, for their action in calling the members together, the cordial interest and sympathy they had shown in local professional interests, and for their attendance that day. Mr. F. H. Tulloch seconded the motion, which was carried unanimously, and the chairman replied.

ARCHAEOLOGICAL SOCIETIES.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—At the meeting on Wednesday, January 16, Dr. W. de Gray Birch in the chair, the Rev. H. J. D. Astley, hon. editorial secretary, read some notes contributed by Mr. L. D. Jones, of Bangor, upon "Yr Eglwys Wen" (The White Church), as the remains of rubble walling, blocks of quartz, and slabs of rough stone are locally called. These remains are situated between seven and eight miles from Bala, and form a rectangular level space, 45 ft. by 15 ft. Mr. Jones submitted carefully drawn plans and maps of the locality to illustrate his notes, and also sent some fragments of pottery, charcoal, and contents of an earthen vessel, which were discovered in the centre of the area, about 12 in. beneath the surface. It is proposed to undertake a thoroughly systematic exploration of the site later on, in order to determine, if possible, the nature of buildings which seemingly originally existed on this spot. Dr. Winstone exhibited, on behalf of Mr. Fry, a seal found in an excavation at Dover, 6 ft. below the surface. The seal is finely cut and exhibits a portrait of a young man resembling Sir Walter Raleigh, and may be a conventional portrait of that worthy, but it was considered of later date than his time. An interesting paper was also read by Mr. Patrick, contributed by Dr. Fryer, upon "Norman Fonts in North-East Cornwall." These fonts form a group of nine in the parishes of Altarnon, Callington, Jacobstow, Landrake, Lancoast, Launceston, Lezant, Lawhitton, and Warbstow. They are all of the transitional Norman period, and very much resemble one another, both in design and workmanship, and are particularly interesting as affording further evidence of the existence of a band or a school, or perhaps a guild of carvers and masons. In the discussion following the paper Mr. Gould drew attention to the ordinance directing the locking of fonts, which was enacted in Stephen's reign, and asked for information. This was not in force, he thought, for many years, but was seemingly re-enacted at a later period, as he knew of some instances in which the locking was apparently continued to the fourteenth century. The hon. secretary announced that, upon the invitation of the Mayor and Corporation, the Congress this year will be held at Newcastle-on-Tyne.

COMPETITIONS.

SEWAGE SYSTEM, FALMOUTH.—In a competition for a new sewage system at Falmouth, the scheme of Messrs. Richardson & Le Maître, East Parade-chambers, Leeds, has been selected. The scheme placed second was by Messrs. Pollard & Tingle, 31, Old Queen-street, Westminster, S.W.; and the third was by Messrs. Richardson & Le Maître, East Parade-chambers, Leeds.

EXTENSION OF ABERDEEN FISH MARKET.—The extension of this market has now been finished. The new buildings are 50 ft. wide and run along South Market-street for a distance of 430 ft., the wall along the street being constructed of red Ruabon brick, the inside being laid with brown glazed Ruabon brick so as to permit thorough flushing. At the junction of the old and new markets a new block containing telegraph and officials' office, restaurant, &c., and measuring 93 ft. by 50 ft., has been erected. The total cost is about 5,000l., and Mr. R. G. Wilson, Aberdeen, was architect.

Illustrations.

VIEWS AND PLANS OF APARTMENT HOUSES.

OUR illustrations this week are all selected from those which accompanied Mr. E. T. Hall's valuable paper on "Flats" at the Architectural Association, printed on another page. We have devoted our plates entirely to this subject, not only in order to illustrate Mr. Hall's paper as fully as our space allows, but also because Mr. Hall has obtained for this occasion many drawings and photographs of foreign buildings of this class, which are not always easily to be had.

The illustrations of exterior architectural treatment are all from Vienna, a city in which a great deal of careful and sometimes rather novel design is expended on the architecture of apartment houses. Professor Deininger's "Romahof" building, as will be recognised, contains a good deal of original and effective treatment of decorative detail. The house on the Stefansplatz, by Messrs. Fellner & Helmer, is of more ordinary type of detail, and unfortunately stands on glass, but apart from this it is a fine and effective street building.

The second sheet shows examples of some of the surface decorations introduced on the front of Viennese houses, partly in tiles, partly in modelled stucco. We may think it a little overdone and wanting in reticence, but at all events it has, to English eyes, the interest of novelty.

The third sheet contains three German plans; the large triangular plan is traced from an original working drawing of the architect (Herr König), which was so covered with figures as to be barely intelligible in its original form. Unfortunately the names of the rooms were not given on the plan, so that they can only be guessed at; but we may say that it is a building of which a portion, commencing from the first floor, forms a private mansion; the outer portions of the ground floor are evidently intended to be let as shops; and the remainder of the building is an apartment house. In the smaller-scale plan of the Leon-Wernburg palace on the same sheet, we may point out the ingenious and effective plan of the rooms in the right-hand angle, whereby the difficulty of an irregular site has been made the occasion for giving a new interest to the plan. All these three plans are, we think, very suggestive in regard to the treatment of buildings of this class on irregularly shaped sites; it is for that reason that we have grouped them together.

The plans on the fourth sheet are chiefly Parisian, with one English example, and they mostly deal with more regular sites and more symmetrical planning. M. Nerrot's building in the Boulevard St. Michel is a fine example of a Paris house of this kind on a great scale, with its garden courts. M. Rives' small house in the Rue du Château d'Eau is an example of the manner in which the French succeed in packing the required rooms into a limited space, with a small internal area for light. The position of the water-closet, facing the end of the passage and with no window, will seem almost scandalous to English architects; it is possible that the absence of any window may be a mistake in the engraving from which the plan was taken, but this does not by any means follow; French architects are still quite capable of this kind of insanitary arrangement, and their clients, moreover, are quite satisfied with it.

BUILDING CONTRACTS FROM A BUILDER'S POINT OF VIEW.*

In the olden days it was, as you know, the custom for the architect personally to superintend the erection of his own work, and so now, if perfect work is to be produced, it is essential that the architect and builder should be in sympathy one with the other, so that the true spirit of the design may be carried out. To ensure absolute perfection in workmanship, only approximate prices should be given, and the work executed upon a percentage upon cost basis, or at daywork prices. Either of these courses from a builder's standpoint may be considered ideal, and as such would not commend itself to the ordinary commercial proprietor, who, on the average, has far more consideration for his pocket than for architect-

ural effect. There can, however, I think be no doubt that in the majority of cases bad workmanship is the result of low prices and strained relations between architect and builder, and when this fact is fully realised, and architects make up their minds to minimise competition to fair and reasonable proportions, and also make the conditions under which the builder has to work as easy and comfortable as possible, then, I think, they will find very little cause to complain either as to the quality of the workmanship or the manner in which it is executed.

To a builder the two most important factors in connexion with building contracts are the conditions or form of contract, and the bill of quantities. If the former is fair and reasonable and the latter correct and explicit, he may (should he know his business), with ordinary luck, rely upon getting through his work without losing any money, and if the conditions under which the contract is taken happen to be favourable and the competition not too keen, he may make a profit. Losses on contracts outside those occasioned by sheer misfortune, can, in nearly all instances, be traced to certain causes, and in the majority of cases these are (1) misconception of the conditions of contract, whereby you contract to carry out considerably more than you bargained for; or (2) inexplicitness on the part of the quantity surveyor. Speaking in this connexion, cases have come to my own knowledge where surveyors have been instructed in certain instances to make their quantities as inexplicit as possible, with a view to deceiving the competitors, and so keeping down the amount of the tender. I am pleased, however, to say, in the instances referred to, that the surveyors did not follow their instructions. With regard to the form of contract, for my own part I much prefer a sheet of notepaper saying that I am prepared to do certain work for a certain sum, to an architect's satisfaction, and specifying the terms of payment. It is obvious, however, that in a large number of cases, and with most people, this course would be unwise, and that a properly drawn form of contract is preferable, setting forth in precise terms what is agreed upon. Originally these contracts were drawn on behalf of the building owner by his solicitor, paid, I presume, so much per folio; the innocent builder of the days of our youth, confiding as a child, would not employ a solicitor to look after his interests, and being anxious to get the work would sign anything he was asked. As a consequence we have handed down to us forms of contract, which, I think I am safe in saying, many of us have signed without reading, and even if read, not understood, and which, if we had been legally held to them, would have resulted in our seeking fresh woods and pastures new. In recent years, however, this is changed, and although we are continually being asked to sign many different forms of contract, there is rarely much trouble in getting architects to see that there are two sides to every question, and that the builder is every bit as much in need of protection as the building owner. It is extremely rare for any contract now to be put before a builder which does not contain an arbitration clause, and yet fifteen or twenty years ago any man that asked for such a thing was regarded as a dangerous individual. It is strange that builders should have for such a long time existed without such a clause, and this may well be regarded as an example of their easy and tractable nature. All other contracts between business men invariably contain it, and, to my mind, in the building trade, with its many complications, it is all the more necessary, and as much from the employer's point of view as the builder's. The general impression seems to have been that unless the builder was entirely in the power of the architect, disputes would constantly be arising. Time, however, has proved differently, and as the insertion of the clause protects builders from unprincipled architects or so-called architects, it has also the effect of causing the exercise of more care on the part of employers and architects in the conduct of their works.

There are many different forms of contract, but those in most general use are that agreed upon by the Royal Institute of British Architects and the National Association of Master Builders, and also that issued by the Royal Institute of British Architects. Both of these are a most distinct improvement on those in use before they were issued, and are very similar to the one to the other. The former one has

since been objected to by the Royal Institute of British Architects, and has resulted in the issue, by them, of the latter. The difficulty arose over, I believe, the arbitration clause. In the original contract, in the event of any dispute arising, either party might immediately proceed to arbitration whilst the works were in progress. This was objected to, and in the form issued by the Royal Institute of British Architects, the following clause is inserted:—"Such reference, except on the question of certificate, shall not be opened until after the completion, or alleged completion, of the works, unless with the written consent of the employer or architect and the contractor." From my point of view, the clause in the original contract is much preferable; to a builder upon a large contract, dealing with men with whom he is practically unacquainted, it appears to me to be most vital. In the event of a dispute occurring in connexion with extra depths or other works to foundations, involving the expenditure by the builder of some thousands of pounds, if he is unable to get the matter settled as he proceeds, he may have it hanging over his head for three or four years, until all the circumstances are forgotten, and during which time he is also being kept out of his money. On the other hand, the argument may be raised that a contentious builder might start arbitrating at the commencement of a contract and go on arbitrating until the finish. This is a case which I do not think would ever occur, and in this my opinion is confirmed from my experience of the working of the arbitration clause. With this exception I would be prepared to agree to either form, both of which can only have been compiled after much careful thought and expenditure of time.

Much difficulty is, as a rule, experienced in dealing with Urban and Municipal Councils in connexion with forms of contract, they often requiring conditions much more drastic and arbitrary than any other body. They, however, are gradually learning wisdom, and when they find, as they often do, that respectable firms will not agree to their conditions, they are prepared to modify them. Doubtless the course they adopt is taken in self-defence, and if such a course is really necessary, and is founded on experience, they have my sincerest sympathy.

The forms of contract issued by the War Department, Admiralty, and Board of Works, are also fair and reasonable, and in many cases their terms of payment are more favourable.

Many architects adopt forms of their own. These, experience has taught me to be careful of, and always, if possible, avoid signing. With two such forms as those already referred to there is no necessity to go any further.

Speaking of forms of contract generally, the principal points the builder has to consider are (1) time clause; (2) terms of payment; (3) inability of proprietor to pay; (4) liability for acts of other persons or things; (5) maintenance clause; (6) arbitration clause.

As to the time clause. In the majority of cases this is more honoured in the breach than the observance, and for the reason that the time is named without thought, and in most instances is altogether inadequate. Considerable dissatisfaction is caused to the proprietor who cannot understand reasons for delay, and is therefore most anxious to get from the contractor damages to which he is not entitled. It is most decidedly to a contractor's interest to get his work done as quickly as possible; and for the benefit of all concerned a reasonable time should be appointed in which the work can fairly be executed, and to this both the contractor and the architect should be held, delays in many instances arising as much from dilatoriness on the part of the architect as on the part of the contractor.

In reference to the terms of payment. From time immemorial it has been usual to pay eighty per cent. on the value of the work executed and fixed in its place. Since this arrangement was instituted the times have considerably altered, and it is impossible for a builder now to obtain the same terms from merchants and manufacturers that he got eight or ten years ago. Then, it was usual to be allowed on most goods four or six months' credit, and on timber six months, whilst in several cases twelve months' accounts were allowed. Now all timber, iron, stone, bricks, and, in fact, by far the largest portion of the materials used in a building, have to be paid for in a month following delivery, whilst in a few favoured

* A paper read by Mr. Frank Cowlin before the Bristol Society of Architects on the 14th inst.

DECORATIVE TREATMENT OF APARTMENT HOUSES

THE BUILDER, JANUARY 26, 1901

HOUSE AT VIENNA. FRONT AND ANGLE (PROFESSOR WAGNER).

INK PHOTO SPRAGUE & CO. L^Y 4 & S. EAST HANING STREET, PETER LANE, E.C.

DECORATIVE TREATMENT OF APARTMENT HOUSES

cases a three months' account is allowed. This, you see, means practically a cash business, so that it is impossible to carry on anything like a large establishment on the old conditions. According to the terms of all contracts, all materials delivered on the ground become the property of the proprietor, and therefore they should be taken into consideration when the certificate is granted, and payment should be made on account of them. This you may say is liable to abuse in the case of a shabby builder, but by the exercise of some care and tact on the part of the clerk of works and architect in the granting of certificates, I fail to see how any difficulty can arise, and in any case the proprietor is protected as he has the goods, and also the margin of the reserve. With regard to the percentage to be paid, this should, I think, be increased to 90 per cent. If 80 per cent. was the standard twenty years ago, the manifest change in the conditions of trade since and the increase in competition and decrease in profits, fully justifies one in asking for the 90 per cent. Wages have to be paid weekly, and form, roughly speaking, 50 per cent. of a builder's turnover, and this, with the shortened terms of credit, make it most difficult to finance a builder's business; so much so, that no matter how profitable a business you may be transacting, you find it impossible to get on without borrowing from your bankers, for which luxury you have to pay pretty dearly.

As to the amount of the reserve. This, of course, varies with the amount of the contract, but for contracts up to 10,000l., 10 per cent. is, I think, now a generally accepted amount. Beyond that sum, it is a matter of arrangement. Personally I fail to see the necessity of a large reserve or the need of retaining it for any length of time. Much, of course, depends upon the character of the builder, but in ordinary cases I think it is fair to pay half the reserve at the completion and the remainder at the settlement of the accounts, retaining some nominal sum for a further period of three months, sufficient to make good any defects that might occur in that time. Such an arrangement as this would be an incentive to builders to get their accounts squared up quickly, and much inconvenience and trouble to architects would be saved.

The next clause of importance is one which should make the proprietor liable to pay within a reasonable time after the deposit of the certificate. This is a point which is a very sore one with builders. They are expected to perform their part of the contract, but it is not at all unusual to find that after having obtained (may be, after considerable trouble) a certificate for a payment on account, it takes a further four or five weeks to obtain payment. A clause to protect builders in such cases should be introduced in all contracts, as I am glad to say it is in the forms issued by the builders and the Royal Institute of British Architects. Much trouble and annoyance would be saved also if a clause were inserted whereby payments are to be made at stated intervals, no matter how small or great, then the proprietor would be prepared to meet the certificates as they are presented. The next clause I wish to touch upon is one making the contractor liable for any loss or damage whatsoever to the premises from whatever cause arising and until the expiration of the term of maintenance, and is often introduced into contracts other than those I have mentioned. The contractors' liability should cease, as far as loss or damage is concerned, when the buildings are completed and handed over. The maintenance clause I have already touched upon. It is one in which a great deal is left to an architect to decide, and when he happens to be weak and the proprietor is strong the position of the builder is uncomfortable.

There are two clauses in a form of contract drawn up and used by an eminent firm of architects which are I think worthy of your consideration. The first is the reference clause, which is as follows:—

"The architects shall, during the progress of the works, have the powers above described, and shall be the sole judges in all matters relating thereto as to the interpretation of the drawings and specification as to the execution, condition, and extent of the work from time to time actually executed, as to the quality of the materials used, or to be used in and about the several works, and as to the degree of despatch with which the works should be conducted and carried on, and in all matters of account connected therewith, and as to any question which may arise as to the progress and conduct of the works or deviation from the specification and drawing, and in respect thereof, their decision shall be final. But

in case after the building shall be completed any dispute or difference shall arise between the employer or the architects on his behalf, and the contractor in respect of the contract or of anything connected therewith or relating thereto or to any additional works or variations thereon or as to what addition, if any, ought in fairness to be made to the amount payable to the contractor by reason of the works having been delayed through no default of the contractor or by reason or on account of any directions or requisitions of the architects, involving increased cost to the contractor beyond the cost properly attending the works according to the true intent and meaning of the signed drawings and specification or as to the construction of these presents, such difference shall be referred to the arbitration of —"

The point I particularly wish to refer to is that portion which says, "or as to what addition, if any, ought in fairness to be made to the amount payable to the contractor by reason of the works having been delayed through no default of the contractor or by reason or on account of any directions or requisitions of the architects involving increased cost to the contractor beyond the cost properly attending the works executed according to the true intent of the signed drawings and specification."

Contractors are continually being put to considerable expense by the causes enumerated above, and although it must be patent to both architect and clerk of works that they are fairly entitled to it, I have only once in my own experience heard of an architect granting such a sum, except under pressure. It should be distinctly understood in such cases that a builder is to be paid what is fair and reasonable, and this should be left to the architect, and failing him, arbitration.

The second clause in the private form of contract referred to is as follows:—

"Notwithstanding anything hereinbefore contained the contractor shall not be responsible for the act, default, or omission of any other contractor employed by the employer in or about the execution of any of the works comprised on the specification or in or about the execution of any other works upon the site."

This speaks for itself, and I, speaking from very bitter experience, can testify to its importance.

This, gentleman, in brief, is all I have to say as to the conditions of contract, and I now come to what is just as important from a builder's point of view, and that is the question of quantities. In this connexion it is very pleasing to note that during the last few years there has been a most distinct improvement in the quality of the quantities supplied, and that the custom of allowing the surveyor to measure up for and settle all accounts is becoming more general. The advantages of this, from both sides of view, must, I think, be obvious; and whilst perhaps it may be more advantageous to a certain class of builder to settle accounts with an architect, who is not so well up in prices and variations as a fully qualified surveyor, it is to the benefit of the trade generally to leave the accounts in the hands of the latter; any profits made have then to be made on the basis of the prices quoted, and not on the basis of one's powers as a debater, to put it as mildly as possible.

A most important point in connexion with bills of quantities, and one upon which in this district there are many diversities of opinion, is the question as to whether they shall be the basis of the contract or not. Many builders I have spoken to upon the subject prefer that they should not, and that the custom generally prevailing here, of checking the quantities and then taking them as correct, is preferable. Personally, I cannot agree with them. It is not part of a builder's business to check quantities; and in a large contract it means a very great cost. In my opinion, it is not fair that a man should be paid for work he does not do, and in this system this is most invariably occurs.

It is usual for a builder in checking quantities to discover only items that are short or entirely omitted, and to get these allowed, whilst nothing is said about items that are full; and if a builder is of a particularly suave and persuasive nature, he is enabled to get more allowed him than he is fairly entitled to. A surveyor, if he knows his business, should be able, and is able, to take off quantities that are correct, and upon these the contract should be based. This is the system that obtains generally in London and the North of England, and is found to work satisfactorily. In many instances, notably in Government work, the quantities are guaranteed. This is practically

the same thing as making them the basis of the contract, and it speaks volumes for the character of their work that surveyors are prepared to do this even when the contract amounts run into several hundreds of thousands of pounds.

The main results of this system are:—1. A vast improvement in the quality of the quantities, a surveyor's reputation entirely depending upon their exactitude, whilst under the old system any mistakes might easily be covered up. 2. It has shown builders that a complete knowledge of the cost of their work is absolutely necessary, and this must tend to improve prices and the status of the trade generally. If a builder is only paid for exactly the amount of work carried out, it follows that his prices must be correct if he is to make a profit. He cannot assume, as one does at present, that the quantities will be full with one man and short with another. It reduces the speculative character of the business, and enables a firm to more fully trade upon their merits. It is the custom in Scotland to remeasure the work on completion, and pay at the original schedule rates. This, assuming the original schedule to be correct, is practically the same as making the quantities the basis of the contract, and this system is found to work satisfactorily, and is the outcome of previous experience.

The only argument, as far as I can see, that can be used against it is, that possibly, in the event of the quantities being incorrect, the building owner cannot tell exactly what he will have to pay for his work when he starts. This argument speaks little for the ability of the surveyors, and the contingency named is, I think, one which would very rarely occur.

The next question I would like to touch upon refers to prime cost sums and provisional amounts. Different surveyors have different ways of considering the term prime cost. It is usual to mention that it means net cost, and then the question naturally arises, what is net cost? Does it mean net cost to the contractor or net cost to the ordinary consumer, and this opens up the question of trade discounts, and then the trouble begins. It would, I think, be well if trade discounts could be altogether abolished. In tendering, you are told to add your profit, and this I usually make a point of doing. If there are a large number of prime cost amounts I usually lose the contract, which is obtained, perhaps, by a contractor of a more speculative nature, who does not add any profit at all, but who, in the settlement of accounts, does not divulge the net cost of the articles in question, and perhaps by pre-arrangement with the merchants supplying the goods, or by argument, or, to use a slang expression, "bluff," is enabled to obtain the trade discount, and in all probability obtains a larger percentage of profit than I should have added, and at the cost of the proprietor.

Many firms, especially when they quote the architect direct, refuse to allow any discount, or, if they do allow it, it is distinctly stated in their quotation, so that no misconception can arise.

It is fair to assume that a builder must make a profit on these amounts, and if it could be generally understood that all architects and surveyors would allow 10 or 15 per cent., or any stated percentage, upon the actual net cost to the builder, of the goods in question, and this sum were added by the surveyor in preparing the quantities, much discussion, misconception, and bad feeling would be done away with. We have lately tendered for a contract under Messrs. —, whose surveyors are Messrs. —, and in their conditions in reference to the prime cost amounts they have the following clause:—"The whole of the provisional sums and prices throughout are understood to bear a 10 per cent. discount to the contractor, and he is, it is understood, entitled to no further profit on these provisional amounts." This, to my mind, is a very good way of dealing with the difficulty, and as they also have a condition that the receipts for the various goods are to be produced if necessary, they are well protected against any unscrupulous contractor.

In one contract we are carrying out, the question of prime cost sums is dealt with as follows in the specification by special note:—

"Wherever the word 'provide' or 'prime cost' is used, the amounts thus mentioned are to be expended at the direction of the architects, and the architects may require the amounts thus mentioned to be paid by the contractor net to any tradesman

selected by them on their certificate, or such amounts may be certified on the proprietor direct and deducted at the settlement of the accounts."

In the quantities there is a special bill for provisional sums and works in connexion with them. As each sum is mentioned, so the discount upon it, if any, is given. At the end of the bill a clause is inserted which summarises the amounts in the following terms:—

"The total sum of the above provisional amounts is say, 4,000., of which part will be expended at contract rates or deducted at the settlement of accounts, and part is subject to discounts, as stated; but, as regards the sum of, say, 3,500., allow for all builder's profit and establishment charges," &c.

This, perhaps, in a large contract which contains a large number of provisional sums, is the best way of dealing with them. There can be no misconception, and if the contractor does not add his profit he does not get it.

A very general fault I find in quantities in this district is that there are not enough provisional sums included. Oftentimes, more particularly in alteration works, one has to price items, the cost of which it is impossible accurately to estimate until the work is being done. In all such cases a provisional sum should be inserted at the discretion of the surveyor, and the matter adjusted at schedule rates.

Again, with regard to some items the descriptions are often most inadequate. From a builder's standpoint, all items should be described so as to render it unnecessary for him to be continually referring to the drawings when preparing his estimate. It is not at all unusual to find the thickness of walls omitted in items for drawing openings for doors and windows, and the sizes of the same are also left to the imagination of the builder. On inquiry you are of course referred to the drawings.

The preparation of estimates is a most serious thing in a builder's business. Unless he is in a very large way he has to do most of the pricing himself, and when one considers the time this occupies and the number of estimates he has to send in for every one he is fortunate enough to get, the necessity for the quantities to be as explanatory and explicit as possible is apparent. In quantities, as with everything else, it is the best that is the cheapest, and I am confident, from my own experience, that the interests of the proprietor and also the builder are best safeguarded if a first-class surveyor prepares the quantities and adjusts the accounts. Much more might be written upon this interesting subject of quantities, but time does not permit.

Another important factor in considering building contracts is the clerk of works, so important a factor that I am of opinion that he deserves a paper to himself. Too much consideration cannot be given by an architect in selecting his clerk of works. One man, if he is not thoroughly conversant with his work both practically and theoretically, may make the work cost 5 or 10 per cent. more than another man, whilst both attain the same result. In many instances they have absolutely no conception as to the duties of their position, but imagine that all they have to do is to see that proper materials are used. My own idea is that the clerk of works should be the architect's representative upon the works, and as such he should be prepared to obtain and give all information necessary to the proper carrying out of the contract; he should be responsible, with the builder's foreman, for the proper setting out of the various parts of the building, and should also, in a measure, be responsible for the time taken to complete the contract. It would be a very good thing if they could be engaged at so much per contract. I think architects would then find their works executed with much more promptitude and despatch.

There are many excellent clerks of works I have had to do with, and I have to acknowledge many kindnesses at their hands, but I really do not think that architects generally appreciate the harm and annoyance which an incompetent or unprincipled man causes a contractor, who in the majority of cases is powerless to complain, for reasons which must be obvious.

In conclusion, there are three points in building contracts that I would strongly impress upon architects:—1. The necessity of keeping up all approximate quotations. Nine-tenths of the troubles between architect and builder, and also the proprietor, arise

from the fact that in the majority of cases the cost is considerably more than was expected. 2. To remember that it is essential for the good of the community that the builder makes a profit. If he is not allowed to do it fairly, he is, I fear in many cases, apt to do it unfairly.

3. Always be prepared to grant certificates if the money is due. The financial question is a most important one with builders, and whilst there is no difficulty in obtaining the first payment, one has often to write two or three times, without getting a reply, in one's efforts to get further certificates.

Speaking as a contractor who has sufficient capital for the amount of business done, I can honestly state that more worry and anxiety is caused the builder over this question than by any other detail in his business.

ENGINEERING SOCIETIES.

INSTITUTION OF MECHANICAL ENGINEERS.—From the annual report of this Institution we learn that the number of members was, at the close of the past year, 3,165. Thirty-three members have died during the year, among them Lord Armstrong, who was a past-president. With a view to the formation of a historical museum, relating to mechanical engineering progress, several gifts of value have been promised, and members are invited to help with suitable contributions of drawings and models. The summer meeting, extending over three days in June, was held in London, when the members of the American Society of Mechanical Engineers accepted the invitation of the Institution, and attended the business meetings and the excursions in considerable numbers. The numerous letters which have since been received from the United States evince a thorough appreciation of the reception accorded to the visitors by the Institution. The Council were requested by the Executive of the Glasgow International Engineering Congress to take an active interest in its success, and after full deliberation and consultation with the officers of other institutions, the Council have consented to take charge of the mechanical section of the Congress, the meetings of which will be held during the first week of September, 1901. They have also decided that these arrangements should not interfere with the ordinary summer meeting of the Institution, which will be held during the last week in July at Barrow-in-Furness.

ANCIENT LIGHTS.

The following Report has been adopted by the Council of the Royal Institute of British Architects, and intimation of such adoption has been conveyed to the Council of the Surveyors' Institution:—

Whereas by a resolution of the Royal Institute of British Architects passed at the general meeting of April 9, 1900, it was decided:—

"That this meeting considers an alteration in the law of Ancient Lights to be urgently needed, and requests the Council to put itself into communication with the Council of the Surveyors' Institution without delay, with a view to the co-operation of that body in taking such steps as may be necessary to secure an amendment";

And whereas the Surveyors' Institution, having been invited so to do, agreed to act in conjunction with the Royal Institute and to appoint a Committee to deal with such matters;

And whereas a Joint Committee, consisting of the undersigned, have held meetings and have carefully considered the subject of the above reference;

And whereas such Joint Committee are of opinion that the law and practice of Ancient Lights is exceedingly unsatisfactory in several respects and requires amendment in the manner herein suggested;

Therefore the Joint Committee recommend that the law and practice in respect of Ancient Lights be amended as follows, viz.:

1. The right to ancient lights shall, in all cases where such rights have not been already acquired, be limited to a right to receive light sufficient for all ordinary purposes, but shall not include a right to light of extraordinary amount for special purposes.

2. After the passing of the Act the owner of any tenement not at any time servient to some neighbouring tenement, but over which such neighbouring tenement would in course of time acquire dominant rights, may serve upon the owner of such neighbouring tenement a formal notice, in form and manner prescribed by the Act, and may advertise the same in the daily papers, and register the same at the Land Registry, where one exists, of the district, or, where no such Land Registry exists, at the offices of the County or Municipal Council of

the locality. Such notice shall have the same effect as though an interruption had been submitted to for one year, and such notice shall run with the land.

3. The owner of a building which is about to be taken down may cause plans, sections, and elevations to be prepared, and such drawings, if they are attested by the District Surveyor, in London, or the County or Borough Surveyor elsewhere, shall be accepted as legal evidence. Such drawings shall, on demand, be certified and registered by the officers above-named, who shall be paid fees on a scale appended to the Act.

4. No building erected after the 1st January, 1905, shall acquire any fresh rights of light or air where it abuts on any street, highway, road, court, or alley used by the public, or as an access to various tenements either held in the same ownership or in various ownerships.

5. The owner, lessee, or occupier of any tenement, who considers that his ancient lights will be or have been interfered with by the erection or proposed erection of new premises or alterations to old ones, shall have the right to inspect (or have inspected on his behalf) the drawings which shall be prepared by the building owner of the premises are in existence, to be informed of the intentions of the building owner, and to take or have taken such particulars from the drawings or information or from the building itself, if erected, as may enable him to ascertain where there is ground for complaint.

6. If such neighbouring owner, lessee, or occupier considers that the lights of his premises will be interfered with, he shall, within seven days from obtaining such information as aforesaid, give notice in writing by registered post of his objection to the building owner together with the name and address of a surveyor, who shall have power to act, on his behalf.

7. Within seven days of the receipt of such notice the building owner shall acknowledge the said notice, by registered letter, and inform the person from whom he received notice of objection of the name and address of his surveyor, who shall also have power to act on his (the building owner's) behalf.

8. Such two surveyors so appointed shall, within ten days of the date of the appointment of the last of them, select and appoint an umpire under their hands in writing, such umpire being a member of the Royal Institute of British Architects or of the Surveyors' Institution. The first-named two surveyors shall within the like period meet and discuss the points raised by the owner, lessee, or occupier, with a view of settling the same, and failing coming to a settlement they shall refer the matter to the umpire appointed as aforesaid. The said umpire shall view the site and buildings of both plaintiff and defendant, and shall have power to take such evidence upon oath as he may think necessary, and he shall, within twenty-one days from the date of the matter being placed before him, or within such extended time as may be from time to time determined, issue his award, in which he shall determine either in favour of all of the following points:—(a) the right of the building owner to carry out his intended works, the alteration (if any necessary) to be made in carrying out the proposed new buildings or alterations to prevent or lessen the obstructions complained of, and the amount (if any) of compensation of every description to be made to the owner, lessee, or occupier, the alterations or improvements to the adjoining premises by light-reflecting surfaces, enlargements of lights, heightening of premises, or other means, the amount of costs to be paid by each or either party, and generally all matters required to arrive at a settlement.

9. In the event of either party neglecting to appoint a surveyor within the time prescribed, or of the unwillingness of the umpire appointed to act, and no other umpire being agreed upon within a further period of ten days, either party shall apply to the President for the time being of the Royal Institute of British Architects, or the President of the Surveyors' Institution, who shall appoint an umpire forthwith, with all the powers as before described.

10. If either party shall be dissatisfied with the decision of the umpire, he may appeal to an Appeal Committee to be formed of nine persons, appointed annually, viz., three architects to be appointed by the Royal Institute of British Architects, three surveyors to be appointed by the Surveyors' Institution, and three barristers to be appointed by the Home Office. Three members of whom one shall be an architect, one a surveyor, and one a barrister, shall form a quorum. The decision of this committee, save as hereafter mentioned, shall be final, and they shall have full discretion as to costs. Before giving the decision the members of the plaintiff and defendant, and shall have power to decide whether, and, if so, to what extent, the proposed new buildings shall be amended, or the dominant premises altered.

11. In the event of either party refusing to accept the decision of the committee in all cases in which a larger sum than 500l. is awarded, either in money, damages, or works, or in which the interference with the proposed works exceeds 500l.

in value, he shall have power within one month from the publication of the said decision to bring the matter before the High Court of Justice by a summary process. The Court shall have the full powers set out in clause 8 aforesaid.

12. In any action to restrain building on the ground of its interference with the rights of light, and whether an interim injunction has been obtained or not, either party may apply to the judge by summons, either to hear the same with an assessor or assessors, or to refer the same to arbitration in accordance with clauses 8 and 10. If at the hearing of such application or motion for injunction it appears to the judge that the claim may be satisfied by damages, he may himself refer the case to such arbitration, and if he considers that the action for an injunction has been commenced unreasonably or unnecessarily, may order the party bringing such action to pay the defendant's expenses and costs on such scale as he may deem fit.

And the Joint Committee further recommend that they be empowered to expend the necessary funds in drafting a Public Bill to carry out the above provisions.

The Joint Committee also beg leave to submit to the Councils of the Royal Institute of British Architects and the Surveyors' Institution, for their consideration, copies of correspondence that has taken place between the Committee and the Council of the Incorporated Law Society.

 December, 1900. W. J. Locke, Secretary.

The following is the correspondence referred to in the concluding paragraph of the report:—

30th October 1900.
 The Secretary, Incorporated Law Society.

DEAR SIR,—
 With reference to the resolution carried at the Annual Provincial Meeting of the Incorporated Law Society recently held at Weymouth, which is reported in the newspapers as follows:—
 "That the Council take steps with a view to getting the Law of Ancient Lights considered by the Legislature, and if they thought fit to co-operate with the Royal Institute of British Architects and the Surveyors' Institution," I have the honour to inform you that a Joint Committee of the Royal Institute of British Architects and the Surveyors' Institution, which includes two Queen's Counsel, hon. members respectively of the Royal Institute and the Surveyors' Institution, is at present sitting, with a mandate from these two bodies to take such steps as may be necessary to secure an amendment of the Law of Ancient Lights.

Should such a procedure be acceptable to the Council of the Incorporated Law Society, the Joint Committee would be very happy, before taking any public action, to communicate to them the result of their deliberations, with a view to co-operating with the Incorporated Law Society in promoting a Bill in Parliament to secure an amendment of the existing law.

I should be glad to lay the reply of your Council before the Joint Committee at an early date.—I am, dear sir, yours faithfully,

T. ROGER SMITH,
 Chairman of the Joint Committee.
 Law Institution, Chancery-lane, W.C.
 November 10, 1900.

T. Roger Smith, Esq., F.R.I.B.A.
 DEAR SIR,—I am directed by the Council of the Incorporated Law Society to thank you for your letter of October 30, and to say that the Council will be obliged if you will let them see the draft of the proposed Bill when framed, and that they will give it their careful consideration.—I am, dear sir, yours faithfully,
 E. W. WILLIAMSON,
 Secretary Incorporated Law Society.

BOOKS RECEIVED.

CROYDON: NEW AND OLD (HOMELAND HAND-BOOKS). By E. A. Martin, F.G.S. (The St. Bride's Press, 3d).

JOURNAL OF THE SANITARY INSTITUTE.—Vol. xxi.; part 4. (E. Stanfard.)

THE STUDENT'S COLUMN.—Our Student's Column article ("Sanitary Fittings and Plumbing") is unavoidably held over until next week.

MEETINGS POSTPONED.—The ordinary meeting of the Institution of Civil Engineers on Tuesday, January 22, was adjourned, without the transaction of business, to Tuesday, January 30. The Students' Meeting appointed to be held on Friday, January 25, is adjourned to Friday, February 1.—The Anniversary Dinner of the Institution of Junior Engineers, which was to have taken place on the 26th inst., has been postponed.

THE LONDON COUNTY COUNCIL.

The first meeting of the London County Council after the Christmas recess was held on Tuesday in the County Hall, Spring Gardens, Mr. Torrance (Vice-chairman) presiding in the absence of Alderman W. H. Dickinson.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Paddington Borough Council 9,400l. for the purchase of land and reconstruction of bridge; the Deptford Borough Council 9,700l. for brick sewer works; Lewisham Borough Council 1,150l. for paving and drainage works, and 5,600l. for purchase of an open space; Battersea Borough Council 2,460l. for erection of sawmill, &c.; Hampstead Borough Council 4,386 for additional cells to dust-destroyer; Kensington Borough Council 1,100l. for street improvement; Lambeth Borough Council 2,650l. for underground convenience; St. Pancras Borough Council 50,000l. for the erection of baths; Woolwich Borough Council 7,600l. for a public library, and 8,070l. for various purposes; and Mile End Old Town Guardians 2,980l. for the erection of cottage homes.

List of Rates of Wages and Hours of Labour.—The same committee reported as follows, the recommendation being agreed to:—

"We have received a notification from the London Master Builders' Association that by agreement between masters and men an advance of 3d. per hour has been made, as from January 1, 1901, in the rates of wages paid to bricklayers. We therefore recommend that that rates of wages inserted in the Council's list of rates of wages and hours of labour as payable to bricklayers be amended, and that the rate be increased as from January 1, 1901, by 3d. per hour."

Bridges.—The General Purposes Committee reported as follows, the recommendations being agreed to:—

"We have received a joint memorandum from the Bridges and Improvements Committees stating they have had under consideration a suggestion to the effect that in future all bridges should be constructed by the Bridges Committee, except in cases where a bridge improvement is subsidiary to a street improvement, and that after consultation the two Committees have agreed to a form of amendment of the orders of reference to them, which, they believe, will assist the work of the Council. We concur in the proposals of the Bridges and Improvements Committees, and accordingly submit them for adoption. We recommend:—

(a) That the following addition be made to the orders of reference to the Bridges Committee:—

"In all cases in which the formation or widening of a bridge over a road, railway, or canal is the object of the improvement, the Bridges Committee shall take all initial proceedings in connexion with the work of construction of such bridge, and subject to the sanction of the Council, shall carry out the scheme. In all cases in which the formation or widening of bridges over roads, railways, or canals forms part of a street improvement, the Improvements Committee shall consult the Bridges Committee as to the design for the structure; after all necessary arrangements shall have been made by the Improvements Committee, the Bridges Committee shall undertake the work of construction of such bridge, and upon completion thereof shall hand it over to the Improvements Committee in connexion with the remaining portions of the improvement undertaken by the Improvements Committee."

(b) That the following words be omitted from the fourth paragraph on page 249 of the present order of reference to the Improvements Committee, viz., "including the formation or widening of viaducts or bridges over roads, railways or canals where such works form an integral part of a street improvement," and that the following words be substituted:—"In all cases in which the formation or widening of bridges over roads, railways, or canals forms part of a street improvement, the Improvements Committee shall consult the Bridges Committee as to the design for the structure; after all necessary arrangements shall have been made by the Improvements Committee, the Bridges Committee shall undertake the work of construction of such bridge, and upon completion thereof shall hand it over to the Improvements Committee in connexion with the remaining portions of the improvement undertaken by the Improvements Committee."

Fire Exhibition in Berlin.—It was recommended by the General Purposes Committee that no part be taken in the International Fire Exhibition to be held at Berlin in 1901.

Mr. Campbell expressed the hope that the Council would see its way to be represented at the Exhibition. He thought it would be a gross mistake not to send some appliances, and moved that the recommendation be referred back.

Mr. Lawson seconded the amendment, which was carried.

Horton Estate: Working Colony for Epileptics.

—The Asylums Committee recommended: "That, subject to the approval of the necessary plans by the Secretary of State, the estimate of 89,000l. submitted by the Finance Committee for the erection of buildings, &c., for an epileptic colony on the Horton Estate, for the accommodation of 300 insane male epileptic patients and staff, be approved."

"The area decided for the purpose of the colony is triangular in shape, and about 127 acres in extent. The site is bounded by main roads on two of its three sides, and is well divided by hedges in which there are a number of trees. A public footpath runs across the land, dividing it into two sections, the larger of which, 80 acres in extent, is the site of the proposed colony buildings. The buildings will consist of eight villas of two separate types, each designed to accommodate thirty-six patients and two attendants. In each villa a food and clothes store and a sanitary annexe will be included, and each will contain two single rooms. The villas will be single-story buildings, it being considered undesirable to house epileptics in two-story buildings, and, in addition, the one-story building is cheaper. There will be a house for the bailiff or other sub-officer, a residence for the medical superintendent, a block of administrative buildings which will include committee rooms, offices for the general staff, quarters for assistant medical officer and inspector, and a block for those attendants not accommodated in the villas, these four latter buildings being the only two-floored buildings in the colony. Attached to the administrative buildings will be (inter alia) the infirmary, which will accommodate twelve patients and include six single rooms, two being also added, and a common dining-hall which will seat 320 persons, and will also be used for religious and recreative purposes, the patients taking their other meals in their own villas. The houses of the medical superintendent and bailiff will be of stock brickwork up to the first floor level, and above that finished in rough cast. The administrative centre and steward's store will be in red brickwork, the corridors in stock work and red brick. The external walls of the recreation hall will be finished in rough cast, with red brick buttresses. Four of the villas will be wholly in red brickwork, the remaining four in rough cast, and the whole of the roofs will be tiled. The boiler-house, tower, and chimney will be stock work, with red gauged arches, and the internal walls will be plastered in all buildings except the tower and boiler-house. The total number of patients for whom accommodation will be found in the villas is 288, accommodation being provided in the infirmary for twelve patients, making a total of 300. There will be twenty-two single rooms in all, but these are not included in the number of beds available nor in the computation of the cost per bed. The total resident staff provided for is a medical superintendent, an assistant medical officer, an inspector, and thirty-three attendants, being approximately one attendant to 9.1 patients. The villas will be heated by double fireplace hot-air stoves. The single rooms in the infirmary will, in addition, be heated by steam pipe, and low pressure steam heating will be employed for the steward's stores, dining-hall, corridors, &c. A simple system of telephones, fire alarms, &c., will be provided, each villa being in communication with the administrative centre. The lighting will be by electricity, to be supplied from the central station already approved by the Council, and the water supply will be obtained from the well now being sunk on the estate. The laundry at the Manor Asylum and the Horton Asylum, when completed, will be available for the colony buildings. It is proposed to include the construction of the main roads in the building contract, but not the minor roads, which we anticipate will be made by patients. The drainage arrangements are designed to deliver the sewage on to the Epsom sewage farm direct, which is adjoining, if an outfall is provided by the Epsom Urban District Council, but in the event of the negotiations with Epsom for this purpose proving unsuccessful, it will be necessary to re-arrange the system, which it is estimated would entail an extra expenditure of 1,100l. above the estimate submitted. The asylum's engineer's estimate of the total cost of the scheme amounts to 89,000l., or 296l. 13s. 4d. per bed for 300 patients. To this sum, however, should be added the grant of 3,000l. made by the Council in January, 1899, of which sum about 1,600l. has been expended. With this addition the total cost would be 306l. 13s. 4d. per bed."

Mr. Beachcroft said that something like a year ago the Council authorised the Asylums Committee to undertake a new system for the housing of epileptics, and the preliminary estimate was then 60,000l. for the building, and the cost per head would be 220l. Now they were told that the cost of the building would be 89,000l., and the cost per head 306l. It was because they were told that the cost per head would be lower than that at the Horton Asylum that the Council decided to go in for the experiment. As a matter of fact, the cost

would be greater than the cost at Horton. He asked whether, even although they had spent 1,000*l.* on investigation, it would not be better to pause before going in for such a very expensive scheme.

Dr. Cooper complained that directly the Committee tried to make a new departure in the treatment of lunacy there was an attempt to deter them. The colony would be in advance of any German or American scheme, and was a scheme, if carried out, which the Council would have cause to be proud of.

Mr. Hubbard explained that the cost of building material and wages had largely increased, and that they had to meet the demands of the Lunacy Commissioners, which led them into further expenditure.

The recommendation was carried.

High-street, Kensington, Improvement.—The Improvements Committee recommended, and it was agreed,

"That the supplemental estimate of 96,500*l.* submitted by the Finance Committee in respect of the Kensington High-street improvement be approved, and that the Improvements Committee be authorised to incur further expenditure on capital account up to that amount for the purpose of the improvement in question."

Fire Station, East Greenwich.—The Fire Brigade Committee recommended, and it was agreed,

"(a) That the Council do sanction an expenditure of 13,100*l.* for the work of erecting the East Greenwich fire-station; that the work be executed by the Council without the intervention of a contractor, and that the drawings, quantities, specification and estimate be referred to the manager of works for that purpose.

"(b) That the Council do authorise an expenditure of 750*l.* in connexion with the electric light installation at the East Greenwich station and for incidental expenses arising out of the erection of the station."

By-laws as to the Drainage of Buildings.—The Public Health Committee reported as follows:—

"On December 18 last the Council on our recommendation resolved to inform the Local Government Board that it did not think it desirable to delay the confirmation of its Drainage By-laws in order that they might be considered by the Councils of the Metropolitan Boroughs, seeing that the Vestries and District Boards were given the opportunity of making suggestions on the draft, and that their observations were carefully considered.

The Board now state that they have informed the Borough Councils who asked for an opportunity of discussing the By-laws that the Board will consider any further representations they desire to make, but that these representations should be confined to matters not already dealt with, and should be submitted as early as possible."

Tenders.—The Fire Brigade Committee recommended and it was agreed, that the tender of Messrs. Johnson & Co. to execute for 204*l.* 9*s.* 5*d.* the repairs and painting required at the Waterloo-road station be accepted.

The Main Drainage Committee recommended and it was agreed, that the offer of Messrs. L. J. & C. Seager to supply for 290*l.* 3*s.* 4*d.* certain new parts required for the circulating pumps of the four beam-engines at the Crossness outfall be accepted, and that the work of fixing the parts be carried out by men employed by and under the supervision of the superintendent.

St. Clement Danes and St. Mary-le-Straud Churchyards.—The Improvements Committee recommended and it was agreed, "That the action of the Improvements Committee in arranging with the London Necropolis Company to undertake, at an estimated cost of 650*l.*, the work of laying the foundations of the dwarf wall and railings to be erected around the portions of the churchyards of St. Mary-le-Straud and St. Clement Danes churches not required for the purposes of the Holborn to the Strand improvement be approved."

Middle Level Sewer. Proposed New Sewer Scrubs-lane, Hammersmith.—It was agreed that an advertisement be issued inviting tenders for the extension of the middle-level sewer to Mitre Bridge, and for the construction of a sewer along Scrubs-lane from the county boundary to Waldo-road, and a length of sewer under the existing ditch forming the overflow from the Counter's Creek sewer, in accordance with the plans and specification prepared by the engineer.

Precipitation Operations during 1900.—The

Main Drainage Committee reported as follows:—

"We submit for the information of the Council the following table showing the quantities of sewage treated, chemicals used, and sludge sent to sea, as well as the quantity of refuse intercepted at the gratings at each of the outfall works at Barking and Crossness during the year ended December 31, 1900:—

	Barking.	Crossness.	Total.
Sewage treated	48,508,000,000	36,101,000,000	84,609,000,000 galls.
Maximum daily flow	293,392,000	179,995,062	—
Minimum daily flow	72,810,000	64,023,290	—
Line used	12,009	7,455	20,454 tons.
Proto-sulphate of iron used	2,918	2,011	4,929 "
Sludge sent to sea	1,574,000	798,000	2,372,000 "
Average per week	30,270	15,346	45,616 "
Refuse from gratings	4,176	813	4,989 "

Comparing the above figures with the returns for the preceding year, we find that the increase in the quantity of sewage treated is 6,920,186,000 gallons, and in the quantity of sludge sent to sea 82,000 tons."

The Council adjourned shortly before 7 o'clock, immediately the death of the Queen was announced.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage.

Lewisham.—Houses on the north and east sides of Southend-lane, Lower Sydenham (Mr. F. J. Smith).—Consent.

Deptford.—One-story shops on part of the forecourt of Nos. 122 and 124, New Cross-road, Deptford (Mr. R. Whaley for Mr. J. Murray and Miss A. Johnson).—Consent.

Kensington, South.—That the application of Mr. P. E. Pilditch for an extension of the period within which the erection of a building on the forecourt of Messrs. Barker's furniture depository on the south side of Pembroke-road, Kensington, was required to be commenced, be granted.—Agreed.

Paddington, South.—A conservatory in front of No. 19, Porchester-terrace, Paddington (Mr. M. Garbutt for the Metropolitan Railway Company and Mr. G. P. Ness).—Consent.

Mile End.—No order with respect to the application of Mr. F. A. Walters on behalf of the Rev. W. Donlevy, for consent to the rebuilding of the Church of the Guardian Angels on the north side of Mile End-road, Mile End, between Nos. 373 and 377.—Agreed.

Bow and Brouley.—A one-story addition upon part of the forecourt of No. 86, Bow-road, Bow (Messrs. Holman & Goodham for the Royal London Friendly Society).—Refused.

Kensington, South.—An iron and glass shelter at the entrance to No. 19, Bolton-gardens, Kensington (Messrs. W. T. Allen & Co. for Mr. L. Samuel).—Refused.

Dulwich.—The erection on three sites on the south side of East Dulwich-road, Camberwell, one of the sites abutting also upon Oakhurst-grove, of dwelling-houses (Mr. W. E. Deane for Mr. A. J. Walke).—Refused.

Finsbury, East.—The rebuilding of Nos. 228 and 230, Old-street, Finsbury, to an advanced line of frontage on the upper floors (Messrs. Crickmay & Zimmerman for Mr. A. Lefever).—Refused.

Greenwich.—An hotel, with stables, on the south-east side of Beaconsfield-road, Westcombe-park, Greenwich, at the corner of Mycenæ-road (Mr. M. L. Saunders for Mr. F. Bell).—Refused.

Hackney, Central.—A house and warehouse at the rear of No. 41, Mortimer-road, Kingsland, to abut upon Downham-road (Mr. J. B. Watts).—Refused.

Lewisham.—A house, with a shop on the ground floor, and three dwelling-houses with bay-windows, on the west side of Bronley-road, Lee, at the corner of Ronver-road (Mr. A. Eke).—Refused.

Projections.

City of London.—An iron and glass shelter at the entrance to the Holborn Viaduct Hotel, Holborn Viaduct, City (Mr. H. Godbold for Messrs. Spiers & Pond, Limited).—Consent.

Kensington, South.—A four-story bay-window in front of No. 3, Victoria-road, Kensington (Messrs. C. Saunders & Son for Mr. J. G. Broomfield).—Consent.

Marylebone, East.—A balcony at the second floor level in front of Nos. 14 and 14A, Princes-street.

Cavendish-square (Mr. A. E. Hughes for Mr. E. G. Betts).—Consent.

Newington, West.—Five projecting arc-lamps on the parapet wall in front of the Princess of Wales' Theatre, Kennington Park-road, Kennington (Messrs. H. Greene & Sons, Limited, for Mr. R. Arthur).—Consent.

Strand.—An iron and glass shelter at the entrance to the new grill-room at the eastern end of the Princess' Restaurant, Piccadilly (Messrs. J. T.

Wimperis & Arber for the Princess' Hall Restaurant, Limited).—Consent.

Strand.—An iron and glass shelter over the entrances in Rupert-street to Mr. Lowenfeld's theatre, adjoining the Lyric Theatre, Shaftesbury-avenue, St. James's (Mr. L. Sharp for Mr. H. Lowenfeld).—Consent.

Marylebone, East.—A projecting clock in front of No. 126, Oxford-street, St. Marylebone (Messrs. Maple & Co., Limited, for Mrs. Crossley).—Refused.

Marylebone, West.—Re-erection of the balcony at the first-floor level in front of No. 42, Montagu-square, St. Marylebone (Mr. F. W. Hunt for the Honourable Miss Powys).—Refused.

Width of Way.

Finsbury, East.—An addition to the King's Arms tavern, No. 18, Moreland-street, City-road, St. Luke's, at less than the prescribed distance from the centre of Cross-street (Messrs. Eedle & Meyers for Mr. W. E. Eaton).—Consent.

Rotherhithe.—A Congregational church on the north side of Queen Elizabeth-street, Bermondsey, with the forecourt fence and a portion of the church at less than the prescribed distance from the centre of Horselydown-lane (Mr. J. Willis for Mr. F. F. Ashley).—Consent.

City of London.—Addition to Nos. 28 to 31, Bishopsgate-street, Within, City, at less than the prescribed distance from the centre of a carriage-way leading from Bishopsgate-street Within to Crosby-square (Mr. T. H. Smith for Messrs. Lewis & Marks).—Consent.

St. Pancras, East.—A cart-house and stable, with rooms over, on the east side of Rochester-place, Kentish Town, at less than the prescribed distance from the centre of the street (Mr. J. A. Smith for Mr. F. J. Moulde).—Consent.

Clapham.—A two-story cottage on the south side of Upper Orchard-street, Brixton, between Nos. 29 and 31, with both the cottage and the forecourt fence at less than the prescribed distance from the centre of the street (Mr. M. Marsland for Mr. J. T. Grant).—Refused.

Space at Rear.

Wandsworth.—A one-story addition in a yard at the rear of No. 2, Charlwood-road, Putney, without the premises being provided at the rear with such an open space as is required by Part V. of the Act (Mr. E. H. Dance for Mr. G. Wootton).—Consent.

Battersea.—A modification of the provisions of Section 41 of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of a two-story addition over a one-story plumber's shop at No. 1, Stammer-street, Colestone-street, Battersea, with an irregular space at the rear (Mr. G. Hayter for Mr. J. Derrett).—Refused.

Deviation from Certified Plans.

Dulwich.—Certain deviations from the plan certified by the District Surveyor, under Section 43 of the Act, so far as relates to the proposed erection of five houses partly on the site of eight houses known as Grove-cottages, in a way leading out of Camberwell-grove, Camberwell (Mr. E. W. Mitchell).—Consent.

Projections, and Deviations from Certified Plans.

Kensington, South.—Certain deviations from the plans certified by the District Surveyor, under Sections 22, 43, 73 of the Act, so far as relates to the proposed erection of a block of residential flats on the site of Nos. 15 and 17, Gledower-place, Kensington (Mr. G. H. Fox for the Kensington Freehold Land Trust, Limited).—Refused.

Width of Way and Lines of Frontage.

Peckham.—One-story relief station at the rear of No. 87, Nunhead-lane, Peckham, to abut upon Albert-road and Scylla-road (Mr. A. E. Mullins for the Guardians of St. Giles, Camberwell).—Consent.

Brixton.—A one-story addition on the forecourt

of a workshop next No. 1, Station-road, Brixton (Mr. F. Harmer)—Refused.

Width of Way and Projection.

City of London.—An iron landing at the fourth floor level in front of No. 26, Paper-street, City, to overhang the public way (Mr. P. E. Tubbs for Messrs. Tubbs & Hiscocks)—Consent.

Lines of Frontage and Construction of Buildings, &c.

Poplar.—An overhead wood-transporter, to be constructed of steel and wood, across East Ferry-road, Poplar, near its junction with Glengall-road (the Millwall Dock Company)—Consent.

Hackney, North.—An iron and glass roof in front of a coach-house at No. 29A, Woodberry-grove, Green-lanes, Stoke Newington (Mr. R. Midworth for Mr. E. Barnett)—Consent.

Wandsworth.—That Messrs. R. Reid & Co. be informed that the Council is not prepared to accede to their request for permission to retain a wooden coal-order office on the north-west side of Mitcham-road, Tooting, at its junction with Longley-road.—Agreed.

Width of Way and Construction of Buildings, &c.

Deptford.—A temporary wood and iron office-building at the Kent Waterworks Company's premises, to abut upon Mill-lane, Deptford (Mr. W. Morris for the Kent Waterworks Company)—Refused.

Norwood.—A temporary wood and iron school-room and offices on the south side of Horsford-road, at the rear of Corpus Christi Church, Brixton Hill, to adjoin the clergy-house (Messrs. Humphreys, Limited, for the Corpus Christi School Committee)—Refused.

Space at Rear and Construction of Lift Shaft.

St. George, Hanover-square.—A lift-shaft for an electric elevator on a portion of the open space at the rear of No. 8, Stratton-street, Piccadilly (Messrs. Meynell & Penton for the Hon. R. J. G. Dicconson)—Consent.

Width of Way, Lines of Frontage, and Space at Rear.

Chelsea.—A block of residential flats on the south-west side of Park-walk, Chelsea, at the corner of Chapel-street (Mr. C. W. Stephens for the Metropolitan Industrial Dwellings Company)—Consent.

Greenwich.—The rebuilding of No. 220, Trafalgar-road, East Greenwich, to abut also upon Colombus-street (Mr. R. Whaley for Mr. W. C. Rose)—Consent.

Formation of Streets.

Hackney, Central.—That an order be issued to Mr. E. O. Sachs, sanctioning the widening and adaptation for carriage traffic of a portion of Tyssen-passage, Dalston-lane, Hackney (for The Shannon, Limited). That the name Tyssen-passage be approved for the new street.—Agreed.

Levensham.—A further deviation from the plan and particulars sanctioned by the Council on January 25, 1898, as modified by the plan sanctioned on October 4, 1898, for the formation or laying-out of a new street named Undercliffe-road on the Hollyfields Park Estate, so far as relates to a proposed alteration in the southern end of that road (Mr. W. H. Collier)—Consent.

Woolwich.—That an order be issued to Messrs. Church, Quick, and Whincox sanctioning the formation of laying-out of a new street for carriage traffic to lead from Eglington-road to Plum-lane, Plumstead (for Mr. T. Nash, Mr. R. J. Dallin, and Miss E. M. Dallin). That the name Dallin-road be approved for the new street.—Agreed.

Levensham.—That an order be issued to Mr. J. W. Webb, refusing to sanction the formation or laying out for carriage traffic of new streets on the Crofton Park Estate, Brockley.—Agreed.

Hampstead.—Fences across the ends of a new street to be named Grenville-street, Hampstead (Mr. C. J. Bentley)—Refused.

Height of Building.

Islington, West.—That the application of Mr. F. Matcham for an extension of the periods within which the erection of a theatre building on the south side of Holloway-road, Islington, to exceed in height the width of a new street to lead from Holloway-road to Waiters-road, was required to be commenced and completed, be granted.—Agreed.

The recommendations marked † are contrary to the views of the Local Authorities.

SANATORIUM ON DEESIDE, NEAR ABERDEEN.

The new Scots Nordrach Sanatorium (for tuberculous) at Nordrach-on-Dee, Banchory, has now been completed. There are forty bedrooms, and the cost per bed is upwards of £600. Mr. George Coult, Aberdeen, was architect, and the contractors were as follows:—Mason work, Edgar Gauld; carpenter, D. MacAndrew & Co.; plumbing, sanitary arrangements, and electric lighting, Jno. F. Anderson; painting, Jas. Garvie & Sons; plaster work and tiling, Jas. Scott & Son; engineer work, B. H. Gibson & Co. (all of Aberdeen); and Mr. James Smith, Aberdeen, was consulting engineer. The buildings are in Hill of Fare granite.

Correspondence.

To the Editor of THE BUILDER.

THE ANALYSIS OF MORTAR.

SIR.—In an article on the above, published in the Builder of December 22, 1900, reference was made to my method of determining soluble silica in the analysis of mortar, in the following words:—"Mr. Hughes and other workers appear to have overlooked the fact that silicate of alumina, the main constituent of clay, is more or less soluble in hot caustic soda solution, and that therefore before regarding the whole of the silicious matter found by Mr. Hughes's test as soluble silica, the soda filtrate must be examined for alumina."

This suggestion is quite in order, and should be attended to in the analysis of inferior or jerry mortar of the present day, but in reference to the mortar used in the construction of our old castles and abbeys the precaution above suggested is quite unnecessary, for the simple reason that clay or mud was not employed, but only sand and slaked lime. Any alumina present in the lime would naturally be dissolved out in the original exhaustion of the mortar with hot hydrochloric acid and the subsequent evaporation to complete dryness in a water bath.

For greater satisfaction, however, the specimen of mortar from the old Roman ruins at Silchester, reported on in the Builder of December 1, has been re-examined, but no trace of alumina could be detected in the soda filtrate, so that the original figures, 1.270 per cent, may be taken correctly to represent the amount of soluble silica present in the Silchester mortar.

Passing on to the general question of mortar analysis, there can be no doubt that an efficient method of determining the actual amount of active lime present in a specimen of recently-put mortar is much required. The actual figures for the total amount of lime present cannot be relied upon as a safe indication of the quality of such mortar.

This was pointed out by the writer on the occasion of the reading of the paper of Messrs. Dibdin and Grimwood before the Society of Public Analysts, June 5, 1896, and the mortar from Rochester Castle (of which only the keep remains), containing as much as 28.67 per cent. of lime, was quoted as an illustration of an inferior mortar; while that from Tintern Abbey, containing only 18.84 of lime, was quoted as an illustration of particularly good mortar, which was practically proved by the fact that the four gable-ends of this beautiful ruin still retain their original upright form intact, notwithstanding their comparatively light structure. Further, the employment of old bricks, which, according to Mr. Dibdin, may contain as much as 7.77 per cent. of lime in themselves, naturally introduces a certain amount of non-effective lime, though the proportion of such lime would usually be indicated by its association with carbonic acid.

Certainly, if analyses of mortar are resorted to as one means of determining the quality, they should be made as full and complete as possible.

The introduction of general terms such as "earthy matter" should be strongly objected to, inasmuch as such general expressions do not, and cannot, convey to magistrates any definite information whether a mortar has been compounded of well-burned lime and sharp sand in suitable proportions, or whether it has been made from badly-prepared lime and unsuitable substitutes for sand.

JOHN HUGHES, F.I.C.,

District Agricultural Analyst for Herefordshire.

SOANE MEDALLION COMPETITION.

SIR.—I wish to point out that in your able criticism of my drawings for the Soane Medallion you overlooked the fact that the library is lighted in the centre bay, as shown in Section C D.

MATHEW DAWSON.

** We see Mr. Dawson is right; the section was hung close to the floor and out of the way of the other drawings, so that it escaped our notice. We may observe, however, that it is well, in the case of a dome-lighted compartment, to show the plan of the light in dotted lines, so as to call attention to its existence.—ED.

COOMBER V SOMERSET.

SIR.—May we draw your attention to your report of the case of Coomber v. Somerset, which appears in your issue of the 10th inst.?

The clause in the lease is wrongly quoted. The tenant did not undertake to pay "all rates, taxes, assessments, charges, and outgoings," the word "impositions" being substituted for the words "charges and outgoings," and it was upon the word "impositions" that the action was based. Had the words "charges and outgoings" or either of them, been in the lease there could have been no defence. In Rawlins v. Briggs, and also in Tidwell v. Whitworth, it had been decided that the words, "taxes, rates, assessments, and impositions," did not enable the landlord to recover from the tenant, hence the judge's decision. We mention this because

possibly some one might be misled by the report as it now stands, which is our excuse for noticing it. ILMERMAUR CLARK & PARKER, Solicitors for the Defendant.

GENERAL BUILDING NEWS.

CONGREGATIONAL CHURCH, EAST HAM.—A Congregational church, which has been erected in Wakefield-street, East Ham, was opened on the 10th inst. The church will seat between 700 and 800 persons, and has attached class-rooms for Sunday schools, &c. The cost, including site and partial furnishing, has been £4,800. The architects were Messrs. Gould & Paritt, and Messrs. Battley, Son, & Holness were the contractors.

WESLEYAN CHURCH, THE PLECK, WALSALL.—A new Wesleyan church has just been erected at the junction of Wednesbury and Darlston-roads, from the plans of Mr. C. W. D. Joynton, of Wednesbury, by Mr. W. T. Lees. The pulpit and stalls have been executed by Messrs. Jones & Willis, of Birmingham, and the organ is at present being built by Messrs. Nicholson & Lord, and the electrical fittings by Mr. P. U. Fellows. The electric light fittings were designed and manufactured by Mr. Walter J. Chesterton. The fittings in the nave and transepts are of wrought iron and polished copper, and those of the choir and chancel are polished brass, with copper leaves and flowers. The stained glass, with which the church is lighted, is the work of Mr. B. Jones, of Walsall. The church is cruciform, with a nave of 42 ft. span with transepts of 22 ft. span, and a gallery at the western end. At the eastern end of the church are the chancel, with seats for the choir, communion table at the rear of the chancel, with apsidal end, organ chamber, minister's vestry, with lavatory, &c., and choir vestry. Seating accommodation is provided for about 710 worshippers. At the north-west corner of the building is a square tower, in which is formed a staircase leading to the gallery, and at the south-west corner there is a staircase, likewise leading to the gallery. Provision is made for ventilating and lighting the building, and a hot-water apparatus on the low pressure system is also provided for heating purposes. The style is Gothic, and the tracery, windows, and dressings are executed in warm buff terra-cotta. The boundaries next the roads are fenced with dwarf walls and malleable iron palisades and gates. The pews and other fittings are executed in light oak. The total cost of the building has been about 7,000l, including the organ.

BOARD SCHOOLS, HANWELL.—New Board schools are to be erected at Hanwell from a design by Mr. W. Pywell, of Hanwell. The scheme provides for a total accommodation of 1,250 children—780 boys and girls in the mixed department, and 450 in the infants' school.

LABOURERS' COTTAGES, MIDLETON, CO. CORK.—A Local Government Board inquiry, conducted by Mr. Richard O'Brien Smyth, has just been held at Middleton into an application by the Rural Council for sanction to a loan of 32,600l. for the erection of 101 cottages under the Labourers' Act in the five dispensary districts of the Union—Aghada, Castle-martyr, Cloyne, Middleton, and Walshtownmore. Evidence was given by Mr. Richard Evans, C.E.

HOTEL, OXFORD.—A new hotel and restaurant has been built on the site of the old White Hart in Cornmarket-street, Oxford. Mr. Stephen Salters was the architect, and Messrs. Kingler & Son were the builders. The building will be lit by electricity, the installation being by Messrs. Hill, Upton, & Co.

ALMSHOUSES, TOTLEY BOTTOM, SHEFFIELD.—At Totley Bottom, on the 17th inst., the new almshouses were formally opened. The houses are three in number, and are to be occupied by old people selected by the trustees. The houses stand on the right-hand side of the road, about a mile from Dore and Totley Station, and are built of Dunford Bridge rocky stone, with Stoke Hall ashlars dressings, the roofs being covered with Broseley red tiles. They are in the English Domestic style, with bay windows in front. There is only one floor, and each house consists of two rooms and a combined pantry and scullery. To the south and east the houses are bordered by ornamental shrubberies, and behind there is a large stretch of garden. The area of the land used is about 2,000 square yards, freehold. Messrs. Hall & Fenton, of Sheffield, were the architects, and the contractor was Mr. Edmund Fox, of Bradway.

SKIPTON WORKHOUSE INFIRMARY.—The new infirmary at the Skipton Union Workhouse was opened recently. The building is of stone with inside brick lining. There are two stories, the block is between the four sick wards. A verandah faces the south and immediately in front of the administrative portion. There are four wards, two each on the ground and first floors, the dimensions being 36 ft. by 24 ft. each. Each ward will accommodate twelve beds, the total provision being for forty-eight beds. The administrative block is between the four sick wards, with which it is connected by 6-ft. corridors. There are the usual nurses' quarters, bathrooms and dayrooms, and general conveniences. The floors are of marble boards on cement concrete, supported on steel beams and joists. The plastering has been done with adamant plaster; the baths, lavatories, and

sanitary arrangements are by Messrs. Doulton & Co., Limited, Lambeth; the heating is effected by means of hot-water apparatus through radiators and coils of pipes. There are two boilers—one for heating purposes and the other for the supplying of baths, sinks, &c. Shorland's grates have been fixed, while extract ventilators on the roof are connected to each room by means of air flues and tubing. The amount of the accepted estimates was 3,850*l.*, but certain alterations and additions will bring the total cost to something like 4,500*l.* The contractors were:—Masonry, Mr. B. Kirk, Skipton; joiner's work, Mr. James Greenwood, Crosshills; iron and steel work, Mr. W. Fawcett, Skipton; plumbing, Messrs. H. Walker & Son, Bingley; plastering, Mr. T. Bailey, Skipton; slating, Messrs. R. Thornton & Sons, Skipton; hot-water fitting, Mr. T. Mears, Bradford; ventilating and stoves, Messrs. E. H. Shorland & Bro., Manchester. The clerk of works has been Mr. Sam Whitlam, Crosshills. The architect was Mr. James Hartley, of Skipton.

CHILDREN'S HOME, MOORTOWN, NEAR LEEDS.—The foundation stone of a children's home in Street-lane, Moortown, was laid on the 18th inst. Mr. Percy Robinson is the architect. Mr. J. T. Wright is the contractor.

SANITARY AND ENGINEERING NEWS.

SOUTH DARLEY WATER SUPPLY.—The South Darley Urban District Council have approved and accepted a scheme of water supply prepared by Mr. Harry W. Taylor, of Newcastle-on-Tyne and Birmingham. The supply will be from the springs issuing from the millstone grit measures, from whence it will gravitate to the whole of the district. The estimated cost is about 3,500*l.* Application to the Local Government Board for borrowing powers will be made at once.

FOREIGN.

FRANCE.—MM. Pascal, Loviot, Normand, Vaudremer, Courtois-Suffit, Scellier de Gisors, Adrien Chancel, Boeswilwald, Formigé, and Raulin, who had resigned membership of the Committee of the Société des Artistes Français (Old Salon) have all been re-elected by a large majority.—At the Ecole des Beaux-Arts the jury on the Laharre competition have awarded the prize to M. Coutan, pupil of M. Pascal. The subject was "A People's Palace."—The collection of church plate left by Baron Adolphe de Rothschild is to be arranged in a special room devoted to it in the Louvre, and to be called the Rothschild Gallery. The monument to Victor Hugo by M. Barrias is to be inaugurated on the Place Victor Hugo next month.—M. Alfred Newham, architect, of Lille, has been elected President of the Société Régionale de la North of France.—There is talk of restoring and setting in order the Château de Compiègne as a summer residence for the President of the Republic.—At Marseilles a large building is to be erected for the offices and stores of the Colonial Service.—The Chamber of Deputies has voted a sum of 100,000 francs in which the national archives are kept.—The Municipal Council of Paris has before it a scheme, presented by four eminent painters, MM. Gérôme, Detaille, Robert-Fleury, and François Flameng, to erect, on the site of the former Cirque de Champs Elysees, a building for the periodical organisation of private exhibitions and concerts. The design of the building will be entrusted to M. Grault, the architect of the Petit Palais. The occasion would be taken to remove from the Champs Elysees the Théâtre Marigny and the Palais de Glace, which occupy a great deal of space with no corresponding advantage.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Miller's Karti and Jarrah Forests, Limited, have recently opened a depot and saw-mills at Purfleet Wharf for landing and storage of building materials of all kinds.

THE SANITARY INSTITUTE.—The thirty-first course of lectures and demonstrations for sanitary officers is announced to be given at the Parkes' Museum during February, March, and April, commencing February 1. It includes four lectures on elementary physics and on chemistry, and twenty-one on public health law, duties of a sanitary inspector, municipal hygiene, building construction in its sanitary relations, &c.

TEES-SIDE MASTER BUILDERS.—The annual meeting of the Tees-side and District Master Builders' Association was held at the Masonic Hall, Stockton, on the 15th inst. Mr. T. Wilkinson, of Middlesbrough, was elected president, and Councillor T. E. Atterby (Stockton), Councillor Proud (West Hartlepool), and Mr. W. Bastiman (Middlesbrough) were appointed vice-presidents. Mr. W. C. Creason (Stockton) was re-elected secretary and treasurer. Mr. W. C. Creason, in his annual report, said, as a result of an advance in wages granted to the joiners in 1899 by the Stockton

Association, several conferences were held with the view of arranging one set of rules to apply to the whole district, the wages being 6*d.* per hour all round. This was successfully accomplished, and was regarded as one of the best pieces of work done by the Association, inasmuch as when any demands were made by the joiners they must be made to all towns alike and at one time, and must be dealt with by the Tees-side Executive Committee. The members' attention was also directed to the fact that practically the whole of the employees in the building trade in the district were combined in one federation. In May last the employees asked that non-union men should not be employed. The employers offered to assent to that if the men would agree to work only with associated masters. The men would not agree to that, and the negotiations fell through. The past few months had shown that the federation was not a federation in name only. The bricklayers in Newcastle having demanded an increase of wages, and that having been refused, they went out on strike. The Newcastle builders bore the burden for some time before appealing to the federation for assistance. Ultimately they appealed to the Northern Counties Federation, which ordered a lock-out of all bricklayers, and that had been carried out. The dispute had also been before the Yorkshire, Lancashire, and Cheshire Federation, and they had decided, failing a settlement, to lock out their men on February 2. It must, therefore, he generally conceded that the federation was endeavouring to justify its existence, and possibly now that it had shown that the workmen would see that the employers meant to be masters of their own business. As a result of the present lock-out the Executive Committee had had under consideration the advisability of endeavouring to induce the foremen to leave the men's union, and to substitute something equally beneficial. The foremen were in a delicate position, and it was hoped that a scheme would shortly be formulated for dealing with the matter. In conclusion, the report stated that it was perhaps too much to expect that the great prosperity in trade would continue very much longer, but it was generally felt that if the workmen could be brought to see that their interests were identical with those of the masters, and would give a fair day's work for a fair day's wage, there were every likelihood that both employers and workmen would have good prospects for some little time to come. Afterwards a meeting was held for all persons interested in the building trade, at which various subjects were considered. The annual dinner of the Association was held in the evening at the Masonic Hall, Mr. T. Wilkinson, Middlesbrough, presiding. Mr. A. Harrison proposed the toast of "The Tees-side and District Master Builders' Association." Mr. T. Wilkinson, the President, said they were engaged in a struggle the magnitude and extent of which they could not at present comprehend. They had hoped that a settlement might take place, and that reason and cool judgment would take the place of strife. They offered arbitration, and they were prepared to stand by that. So far as the Tees-side district was concerned, he believed all the members of the federation had stood staunchly together. Mr. T. Dickinson also responded. Mr. W. G. Roberts (Middlesbrough) gave the toast of "The Northern Counties Federation of Building Trade Employers." Alderman Rankin, of Sunderland (President of the Association), in responding, said the members of the federation were determined that builders should have something like justice and right. With regard to the present lock-out, they were exceedingly sorry that anything of the kind should take place. What could they do under the circumstances? The Newcastle employers were refusing to give way to an unreasonable demand of the men. The men would have followed their usual custom of attacking one town at a time, and as soon as they had conquered that they would have proceeded to another. There was no other course for the employers to adopt but to amalgamate in order to resist such tactics. Mr. W. H. White (President of the Sunderland Association), who also replied, said it was a fact that imperfect organisation, coupled with the fact that the other side was so well organised and led by such capable leaders, had forced upon them the necessity of federating themselves. It had brought home to them the knowledge that the small local organisations were utterly incapable of resisting unjust demands made by the men, and it was only by combined action in extended areas that they could cope with the men. Mr. B. Dickinson proposed the toast of "The Architects and Surveyors," and Messrs. E. Whipham and A. Newsome responded. Other toasts followed.

GLASGOW HIGH SCHOOL CONSTRUCTION CLASSES.—On Saturday afternoon, the 13th inst., the students of the High School Building Construction Classes, under Mr. D. Bennet-Dobson, visited the buildings of the Glasgow International Exhibition. The party, which numbered about seventy, were conducted through the various buildings by Mr. White, clerk of works. Commencing at the Industrial Hall, the Indian and Burmese sections were first visited. The company's attention was drawn to the delicate and intricate carrying of the stalls and the difference between the work of the Indian and Burmese carvers. The exit close by gave a fine demonstration of the automatic arrangement of the

revolving shutters. The main roof of the Industrial Hall has a span of 103 feet, and it is designed, as was pointed out, on the three-binged principle, so as to counteract any evil effects caused by expansion and contraction of the metal. The feet of the trusses are supported by steel pins, fixed to bed-plates, which are securely bolted to the concrete foundations, the other pin being at the centre of the truss near the ridge. The party then visited the dome, which is 80 feet in diameter and 100 feet high. Instead of being supported by the steel pins which were originally intended to carry it, steel being so difficult to obtain at the time, timber was adopted, and the construction of the four massive L-shaped piers proved an excellent object-lesson in timber construction. The company then passed down the Grand Avenue, which is 1,000 ft. long by 75 ft. broad, and curved on plan. The roof, rising to a height of 40 ft., is formed of semicircular laminated ribs, 15 ft. centre to centre. The central portion of the ribs is in three thicknesses of timber, while the ends are in five thicknesses. The bridge across the Dumbarton-road was next examined, and, as explained by Mr. White, is on the cantilever principle. The cantilevers are supported on cast-iron columns, and the necessary back weight obtained by large concrete blocks. The Machinery Hall, which was next visited, covers a large area, and is roofed by five roofs. A central span of 108 ft. is braced by elliptical-shaped trusses supported at intervals of 8 ft. by double columns, and the space between these again spanned by curved lattice girders. Two roofs of timber construction flank either side. After having been shown all the points of interest in the Machinery Hall and having been conducted round the various detached buildings, the party passed a vote of thanks to the architect, Mr. James Miller, Glasgow, for his kindness in granting permission to visit the building, and also to Mr. White for his interesting and instructive way in which he conducted the party.

FIRE PREVENTION AT THE BUILDING TRADES EXHIBITION.—In further reference to the special "Fire-Proofing" Section at the Building Trades' Exhibition which is being organised under the auspices of the British Fire Prevention Committee, the Executive of this body, at a meeting last week, decided to invite numerous representatives of the municipal, technical, insurance, and industrial interests concerned to visit this elaborate demonstration of means and ways for reducing the modern fire risk. Among those to whom invitations are being issued are the provincial Chairmen of Works Committees, Engineers of the large Dock and Railway Companies, principals and masters of the technical colleges and polytechnics, &c. Special arrangements are being made by which the visitors will have every facility for studying the subject, and the committee will, no doubt, also entertain at their new Testing Station at Westbourne Park. A sub-committee has been appointed to take charge of matters relating to the Section, comprising Mr. F. Hammond (chairman), Mr. Max Clarke, Mr. Frederic R. Farrow, Mr. Charles E. Goad, Mr. Ellis Marsland, and Mr. Edwin O. Sachs, with Mr. H. Montgomery as business manager. Particulars of the general arrangements are obtainable from the committee's offices at No. 1, Waterloo-place, Pall Mall, S.W.

YORKSHIRE MASTER BUILDERS AT DINNER.—The annual dinner of the Yorkshire Federation of Building Trade Employers was held on the 17th inst., at the Queen's Hotel, Leeds. A company of between 130 and 150 assembled, and Mr. James Longden, of Bradford, presided. After the loyal toasts had been honoured, Mr. S. Smethurst proposed "The Yorkshire Federation," observing that the great object of their organisation was not to promote industrial war. They ought to look upon strikes and lock-outs as being something in the nature of a calamity. Sometimes they might be inevitable, but his impression was that largely they were the consequence, not of any real difference so much as of misunderstanding, and he thought that in proportion as they built up a strong, solid, intelligent combination on their side, they would find that something similar existed on the other side, and by mutual discussion, and by mutually trying to understand each other, many points of difference would be removed, and what in other circumstances might have led to disastrous conflicts would be met by discussion and argument. Referring to the strike of bricklayers on Tyne-side, he reminded them that there was no town in England that paid more to the men, and the attempt to get an advance from 10*d.* to 1*1d.* per hour, was in his opinion to be made a pivot to raise the standard wage throughout the country to 1*1d.* He was glad that at this moment the better sense of the country had prevailed, and practically the claim at Newcastle was withdrawn. There were certain technicalities to be completed, but the principle was withdrawn, and unless something happened that they did not at this moment foresee, practically that struggle was brought to a close, and the stern measure that a week ago they should have been compelled to resort to had been averted.—The President, in reply, expressed the opinion that the workmen were beginning to find that they would have to go to work in a more genteel manner, and be more reasonable in their demands. Of course, the employers had to find the money and the brains, and of late the workmen had wanted to tell them how that money

was to be spent, and how far they would like to put their hands down into their pockets. They wanted to try and alter that, and it could only be done by the united action of every employer in the building trade, and by their doing everything they could to assist the Federation to resist the unfair attacks that were made upon the masters in many ways. They must expect the men to give a fair day's work for a fair day's wage. If they were to maintain their position, they must be united. In that event he had no doubt they would have better times, and make their business more successful and remunerative.—Mr. G. H. Walters (Hull) and Councillor Mansfield (York) also responded. Mr. Walters, in the course of his reply, alluded to the scheme to raise a special fund for special work. He said they paid fifty millions a year in wages in the building trade, and if they only paid 3d. per 100l. of wages in this special fund they would have an income of 7,500l.

This matter was to come before the National Federation, and he trusted it would have the hearty approval of every employer, and then they would have a respectable sum behind them to combat the tyranny of the men and to go in for organisation throughout Great Britain.—Mr. W. R. Thompson (Dewsbury) next gave "The Northern Counties." He pointed out that they had an instance in Tyneside where a strong association had been unable to deal with a serious labour trouble. If the Newcastle Federated Masters had been left to deal with the trouble by themselves they would probably have come off second best. They, however, brought the difficulty before the Northern Centre, who came to the conclusion that it was desirable to help them. The impending lock-out had, they hoped, been averted. Their thanks were due to the Northern Centre for the tact and ability with which they had managed the business.

—Mr. R. Hislop (Newcastle) and Mr. E. Goode (Hull) responded. "The City and Trades of Leeds" was given by Councillor Clegg (Sheffield), and acknowledged by Mr. W. H. Dewar (Sheffield) submitted the toast of "The Architects and Surveyors," which was acknowledged by Mr. W. S. Braithwaite and Mr. G. F. Bowman.

CROYDON HURST PRESERVATION.—The Croydon County Council has decided to purchase the whole of the wooded hill to the south of Croydon known as Croydon Hurst. Two years since successful negotiations resulted in the acquisition of thirty-five acres, and public attention was drawn to the fact that the most lovely portion of all the remaining forty-five acres, was threatened with spoliation by the builders. As a result of an open-air meeting on the top of the Hurst on January 22, 1899, an influential committee of seventy members was formed to request that the whole eighty acres might be devoted to the use of the public for ever. This object has now been achieved, inasmuch as the Council has decided to offer the sum of 15,000l. for the remaining forty-five acres.

THE INSTITUTION OF JUNIOR ENGINEERS.—On Saturday, the 12th inst., a large party of members of this Institution visited the works of Messrs. W. T. Henley's Telegraph Works Company at North Woolwich. The various processes in connexion with the manufacture were seen in operation, and fully explained by the members of the staff. The business was founded about fifty years ago by the late Mr. W. T. Henley, and up to the time of his death, which occurred in 1882, the works were devoted almost exclusively to the construction of submarine telegraph cables and underground telegraph lines. Since then the business widened into other channels, until at the present day the cables manufactured embrace every type used for telegraph, telephone, electric light, and electric power purposes. Many of the huge reels now turned out at the company's works contain a cable of a design which was unknown at the time of the founder's death. Telephone cables, which were originally made with gutta-percha insulation, are now insulated with vulcanised india-rubber, and hundreds of miles of wire, of the well-known dry-core cable with paper insulation, are produced weekly. Large quantities of india-rubber and gutta-percha are always in process of being cleaned and prepared for insulation purposes; each operation is carried on in a crude condition, being received from abroad in a crude condition. The new buildings which have been erected on the river front comprise large electrical testing-rooms, forming an important feature of the works, each order executed having to pass stringent electrical and mechanical tests. The greater part of the machinery is driven by electric power, and every new workshop opened from time to time is run by this means. The works themselves give employment to over 1,000 hands, and there is also a large staff engaged outside in connexion with the laying of cables, &c.

CAPITAL AND LABOUR.

BIRMINGHAM BUILDING TRADE DISPUTE.—The difficulty that had arisen respecting the working hours of builders' labourers in Birmingham has been amicably settled. On the morning the employers gave notice to the workmen's section that in future they would require the labourers to commence work at the same time as the workmen they were assisting—carpenters, masons, or plasterers. The men asked

for a rise of a halfpenny an hour, and the matter has just been considered by the wages board. The men connected with the National Association of Gas-Labourers and General Labourers and the Federated Employers' demand would be that builders' labourers, except those working for plasterers, would work half an hour less per day than at present, and they wanted this made up in higher wages. The employers replied that their only object was to alter the hours of the men assisting the plasterers. At present the labourers start half an hour later than the skilled workmen—a very inconvenient arrangement. Carpenters' and masons' assistants would in no way be affected by the proposed change. The men's representatives were satisfied with this explanation, and signed an undertaking that this class of men should start at the time required, and the notices on both sides were withdrawn.—*Birmingham Post.*

COVENTRY BUILDING TRADE.—The men engaged in the building trade in Coventry have received from the Master Builders' Association notice of a proposed reduction of wages, to come into force on April 1.

THE NORTHERN BRICKLAYERS' STRIKE.—There is every probability of the strike of bricklayers on Tyneside being settled at an early date. It will be recalled that in the spring of last year the men applied for an advance of wages from 10d. to 11d. per hour, but that it was refused. The employers, however, offered to refer the matter to arbitration. This was refused by the operatives, and the strike commenced in May, and has continued till now. Practically the whole of the men found work elsewhere, and their removal caused a cessation of work in the federated shops of Newcastle and district. The votes cast in the ballot just taken of the Northern bricklayers with reference to the two propositions of the employers for the termination of the lock-out, viz., arbitration, or a guarantee of the present wages for two years, were counted on Saturday last week at Newcastle. The result was despatched to the London office of the Bricklayers' Union without being communicated to the branches. It is believed that a majority will be shown for arbitration, though as a protest against the action of the Executive Committee many papers were returned blank.

LEGAL.

IMPORTANT POINT UNDER THE LONDON BUILDING ACT, 1894.

THE case of *Moses v. Marsland* came before a Divisional Court of Queen's Bench, composed of Justices Bruce and Phillimore, on the 17th inst., on an appeal, by way of special case stated, from the decision of a Metropolitan police magistrate ordering the appellant to comply with a notice served on him by the District Surveyor for Camberwell (the respondent) under the provisions of the London Building Act, 1894, requiring him to do certain things, or certain alterations, to the Managers of the Metropolitan Asylums District at a building in Elm-grove, Peckham.

The facts were these:—By an order of the Local Government Board, dated April 2, 1897, the care of children of weak intellect or physical infirmity incapable of being trained in association with children in ordinary schools was placed in the hands of the Managers of the Metropolitan Asylums District, who, to carry out the order, prepared a scheme for purchasing various dwelling-houses in different parts of London adjacent to schools specially provided and staffed by the London School Board for the education of these children. Under the scheme the children had to live, sleep, and board in such houses under the care of a matron, in numbers generally not exceeding fourteen in any one house, and to attend such special Board schools each day for the purpose of their education. The houses were intended as permanent homes for the children. The house in question, No. 16, Elm-grove, had been an ordinary detached dwelling-house of two floors, with one room and a basement below, and this had been purchased by the Managers under the scheme, who instructed the appellant under the supervision of the Board's Architect to alter or convert the dwelling-house to make it suitable for the accommodation of twelve to fourteen children and a matron, cook, and housemaid. The total cubical capacity of the dwelling-house was under 50,000 cubic feet, with sleeping accommodation as above. The appellant, before he commenced the work, served a notice on the respondent giving him notice that he was about to make alterations in the above dwelling-house and convert it into a public building, and thereupon the respondent served notices on the appellant making certain requirements with regard to the staircase and the height of the rooms, &c. The only question before the magistrate was whether the building in the above circumstances was a "public building" within the meaning of the London Building Act, 1894, Sections 5 (27), 68, and 70. The magistrate held that the building was, in the hands of the Managers of the Metropolitan Asylums District, used or constructed or adapted to be used for a public purpose, and made the order asked for by the respondent.

Mr. Mansergh, Q.C. (Mr. Herbert Smith with him), for the appellant, submitted that the building

in question did not come within the definition in Section 5 (27) of the Act. The test was whether the building was intended to be used for a public purpose similar to those enumerated in the section, and the section did not apply to a mere dwelling-house, though placed under the control of a public body.

Mr. R. C. Glen, for the respondent, contended that the magistrate's order was right, and that the building was a "hospital" within the meaning of the section.

Mr. Justice Bruce, in giving judgment, held that the building in question was not a public building within the meaning of the section of the Act of 1894. He did not think that the building could be considered as a hospital in that sense, nor was the building within the section on the ground that it was a building used for "any other public purpose." Again, the building did not come within the term "home," because it had not a cubical capacity of 250,000 cubic feet or sleeping accommodation for 100 persons. His Lordship therefore thought that the magistrate came to a wrong conclusion, and that the appeal must be allowed.

Mr. Justice Phillimore concurred, and the appeal was accordingly allowed with costs.

USE OF GUY-ROPE IN HOISTING ;

WHEN DOES ITS ABSENCE CONSTITUTE NEGLIGENCE ?

AT Brompton County Court on Monday, before Judge Stonor and a jury, Alfred Crow, a builder's labourer, 13, Riley-street, Chelsea, sought to recover damages from his former employer, Mr. Joseph Pratt, contractor, Lots-road, Chelsea, the claim being in respect of personal injuries said to have resulted from negligence on the part of the defendant. The action had been remitted from the High Courts, and the proceedings were taken under Common Law.

Mr. J. W. Moyes, counsel, appeared for the plaintiff, and Mr. Arthur Powell, counsel, defended.

Counsel for the plaintiff explained that on July 2 last his client was engaged by the defendant to assist in unloading a barge of deals at Chelsea Wharf, Lots-road, and to place them in railway trucks which were drawn up by the side of the barge. For the purpose of hoisting the timber a steam-crane was used. A number of deals were attached to the end of the wire rope by which they were drawn up from the barge, and then they were swung round until over the railway truck, into which they were guided by the plaintiff and another man. Some deals had just been hoisted, and, as the plaintiff was waiting to receive them in the truck, they swung round, striking the unfortunate fellow and causing him to fall to the ground. His injuries appeared to be of practically a permanent character. It was now maintained that the defendant was guilty of negligence in not providing a guide-rope, technically termed a guy-rope, by which to steady the timber and prevent it from swinging round.

Mr. William Robert Pether, consulting engineer, Basinghall-street, E.C., stated that he had had a considerable amount of experience in the work of hoisting timber. He contended that a wire rope would be likely to cause long lengths of timber to swing round more than if an ordinary chain were used on the crane. He also maintained that when hoisting deals or other long pieces of timber, a guy-rope should be used to prevent the timber from unduly swinging round; otherwise he considered that the work would be dangerous.

Cross-examined: It was the usual practice in the trade when hoisting timber by a crane, to use a guy-rope. He was not aware that any different method was adopted at Folkestone, Newhaven, or Harwich.

Mr. Christopher Richard Griffiths, architect and surveyor, said that he also had had experience in the work of hoisting timber by means of a crane, such as the one in question. He agreed that it was usual to use a guy-rope for the work.

Cross-examined: He did not think that a guy-rope would be likely to get in the way and to interfere with the work; on the contrary, he considered a guy-rope to be quite necessary for the work.

The plaintiff then gave evidence. He bore out his counsel's opening statement, and added that at the time of the accident he was receiving wages at the rate of 7s. 6d. a day. Owing to the accident, he had been unable to do any hard work since.

Mr. Felix Charles Kempster, M.R.C.S., &c., described the man's injuries, which were of a very serious nature. For the defence, Mr. Albert Penthall, M.R.C.S., &c., and Mr. J. Edlin, F.R.C.S., &c., gave evidence implying that plaintiff's injuries had been exaggerated.

The defendant was then called. He said that he had had some twenty-five years' experience in using cranes for hoisting timber, and he maintained that for such work it was not usual to provide a guy-rope. Sometimes a guy-rope was used on a hand crane, but only for the purpose of helping to draw the timber round to any place required. He had never seen a guy-rope used on a steam crane like the one in question.

Cross-examined: On another crane at the same wharf they used a guy-rope but this was for moving the jib round, and not for steadying the timber.

Re-examined: Cranes were now generally fitted

with wire rope instead of a chain for drawing the loads up, the wire taking the place of the chain because it was better for the purpose.

Mr. Joseph Henry Pratt, son of the defendant, said that he had never seen a guy-rope used in connexion with a steam crane.

The Judge: Do these wire ropes make the timber turn round more than the chains?—The Witness: No, sir?

Mr. William Thomas Andrews, engineer to the Regent's Canal Company, stated that he had never seen a guy rope used when hoisting deals by a crane, although one was sometimes provided when pulling up large baulks of timber, 30 ft. or 35 ft. long. On wooden cranes, particularly in Quebec, guy-ropes were used to pull the jib round, so as to get the timber at the spot required.

Henry Frye, the driver of the crane in question, said that he had been accustomed to working steam cranes for the past thirty years and had never seen a guy-rope used in connexion with them, except for large baulks of timber.

Cross-examined: He believed that the plaintiff, at the time of the accident, was not in his proper place.

George Butcher, another man working on the job, gave similar evidence.

Mr. Pether and Mr. Griffiths, re-called, both said that when the witnesses for the defence spoke of a rope used for pulling the "jib" of the crane round, they appeared to be referring, not to a guy-rope, but to a "trail-rope."

The jury found (1) that a guy-rope was frequently and generally used for steadying timber when it was being unloaded; (2) that the absence of a guy-rope in connexion with a steam crane, under circumstances like those in question, was dangerous; (3) that the absence of a guy-rope in the present instance caused the accident. This was a verdict in whose favour the jury assessed the damage at £31. 10s., being £31. 10s. for wages and sol. for pain and suffering.

His Honour gave judgment accordingly, and allowed costs.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

19,070.—A CIRCULAR SAW GUARD: S. Drew.—On a bracket fixed behind the saw-bench is clamped a plate made of steel or other metal which (its bevelled-off edge excepted) is thicker than the saw. The saw's front is protected with an extension piece that is bolted on to the plate, and has a roller that will run upon the wood.

19,089.—AN APPLIANCE FOR VENTILATION: H. W. Roberts.—The ventilator is adapted for use with a partly-opened window, and admits air from without through an opening whose areas are gradually enlarged. Side brackets support a blind of some textile material, stained glass, &c., and at the bottom is a curved plate fitted with a reflecting lip, a screen being carried by slats mounted upon hooks.

19,116.—GLASS FOR DECORATIVE PURPOSES: Soc. Anon. Belge pour La Fabrication des Encaux Artistiques.—For giving a roughened back to glass slabs, mirrors, &c., and rendering them specially applicable for wall decorations, plinths, panels, wainscoting, and so on. Fragments of glass and white sand are put into the moulds before the material is poured in, so that they shall partly melt, and adhere to the slabs or plates when the moulds are heated in a furnace to high temperature; when the moulds have become cool the slabs or plates will have acquired a roughened back surface.

19,134.—A DOOR HINGE: C. Porter and F. D. Bishop.—The inventor's object is to provide means for folding an opened door behind the jamb; at the end of a tongue, which projects from the door-plate, is a pin turned downwards into a socket in an angle-plate, which is secured at the corner of the jamb; a slot in the angle-plate gives room for the tongue's movement, and the pin can be raised out of its socket by means of another recess in the plate; in a variant form of the device the relative positions of the socket and pin are interchanged.

19,142.—AN APPLIANCE FOR USE WITH DRAWING BOARDS: H. W. Roberts.—With this contrivance a drawing-board can be turned or set at an angle about the table. To its underside is screwed a square piece on to which is secured a cross-piece which joins the two side pieces that constitute a rest for the board, the square piece being arranged so that it may turn freely around the screw which joins it to the cross-piece. For protecting the table, grooves are cut in the cross-piece and inlaid with india-rubber.

19,168.—CONTINUOUS KILNS: H. R. Vaughan.—The kilns for drying and burning bricks, terra-cotta, pipes, other clay goods, and cements and limes are after the kind specified in No. 20,540 of 1895. In order to more efficiently distribute amongst the freshly-charged chambers the hot gases after their withdrawal from the fired chambers and their circulation amongst the "green" goods, their free delivery over the floor surfaces is effected by means of branch flues leading from the middle hot-air flue to beneath the perforated floors of the chambers. Over the chambers and communicating with them are disposed other branch flues whose connexions with the central main flue and the

hot-air flue are regulated by dampers. The working of the dampers will draw steam from the "green" goods as they are being dried, through the branch flues and the main flue, which is joined to the chimney flue and the chimney, and will direct the hot gases from the burned goods through some of the branch flues into the hot-air flue, and thence into the chambers in which "green" goods are stored. The burning capacity of the kiln can be increased with portable fire-grates or furnaces inserted into openings made in its side walls. The goods may be dried before they have been reached by the sulphur-laden fumes issuing from the chambers that are being fired. The middle main flues and walls are built along the kiln's entire length, and provision is made for the flow of hot gases through passages in the end chambers in the shape of a connexion between the hot-air flue and the cross flues.

19,177.—MILLS FOR THE MANUFACTURE OF CEMENT: H. Bing.—For grinding and crushing clinker and other materials used in the manufacture of cement are devised reciprocating plates having corresponding ridges or corrugations (set transversely in respect of the direction of their motion) fashioned upon their working faces. The upper plate is attached to a frame that is moved with a rod and eccentrics or cranks; the lower plate is secured to a bed-plate, the frame being forced downwards with springs that press against a girder which forked links retain against the bed-plate. The machine may also be constructed with its reciprocating frame mounted upon rollers, and a hydraulic cylinder acting through a roller beneath which the frame travels backwards and forwards may be used for forcing the frame downwards. In the case of an extended plant for diversifying cement-clinker and for treatment at successive stages of the material a series of the mills described can be employed.

19,197.—TREATMENT OF SEWAGE, FOUL WATERS, &c.: J. Brightmore, T. Swann, and F. S. Goodwin.—The plant comprises an anaerobic tank and two aerobic tanks, whereof the former is fitted with a set of pierced trays which carry the filtering media, and has an air-tight cover with an outlet through which gas and air may escape; filtering materials, such as coal and limestone, or coke, are laid in alternate courses upon pierced partitions arranged inside the two other tanks, from which pipes pass to the former tank; whilst one aerobic tank of a set is at work the other similar tank remains at rest, and during the intervals of rest the ration of the filtering substances can be effected by means of valves at the bases of the aerobic tanks.

19,287.—MANUFACTURE OF BRICKS: J. P. Fiske.—The inventor furnishes means of carrying bricks in the course of their making, so as to avoid their being frequently handled, together with an improvement in kilns. After the moulded bricks have been stacked upon trucks (which are run on to other trucks and thence into a drying chamber), they are transported to slotted stands, from which a travelling crane, mounted upon rails, carries the larger stacks (made up of smaller stacks) to the burning-kilns; injury of the soft "green" bricks is obviated by piling the small stacks upon a bottom layer of burned bricks placed on the stand, whose slots are equal in size to the slots in the kiln's floor which take the cross beams which carry the beams to which the lifting-chain of the crane are hooked; the kilns forming a series below the ground level have pits or flues in their floors which take the cross-beams, the cross-beams being drawn away when the bricks have been laid down, and the kiln chambers are closed with loose covers of hollow tiles joined with tie-rods to one another; the withdrawal of the beams is facilitated by means of openings in the partition walls between the chambers, which are ranged in alignment with apertures through which the gases pass from chamber to chamber, and the openings are closed, under normal conditions, with stop-blocks made of terra-cotta.

19,295.—COUNTER-SEATS FOR USE IN SHOPS: C. P. Evans & J. H. Hawksworth.—To the partition of a counter is fixed with lugs a tube, within which is a spindle that carries a block joined with a rail to another block having projections on its sides. The two parts of the seat, which can be folded, are hinged on to rods which join the two blocks, so that it may swing upon the spindle sideways, and be retained by the fall of the wedged portion of the first-named block into one of two notches which are cut in the tube's top. When the two portions of the seat are horizontal they rest upon the projections of the latter block and abut against the other block.

19,318.—SCREW UNION OR JOINTING OF PIPES: J. Gisholm.—A screwed coupling for screwed steam, water, gas, or other pipes of metal consists of a sleeve or socket piece to be screwed on to the pipes, which is fashioned with a bevelled socket that takes the packing, which is pressed together with a bevelled and screwed gland. The gland may be turned square, as it is described in No. 23,992 of 1893, or its plain part may be formed separately from its nut portion. In the former case a loose bevelled washer should be placed between the packing and the end of the gland. The invention is stated to be applicable to taps, cocks, valves, and similar fittings.

19,328.—FLOORING CRAMPS: J. Woodhead.—The ram is guided by a saddle that rests upon the joist, and has legs to which are pivoted

two dogs, to the ram is affixed a crossbar on to which a forked operating-lever is pivoted, and the lever is also pivoted to links that join the arms of the dogs. When the lever is pulled about its pivot upon the crossbar it presses the dogs against the joist, then—as it turns about its pivot upon the links—it impels the ram so as to clamp the floorboard. The cramp is retained in its place by means of a hinged stay as the board is being nailed down.

19,358.—BLOCKS OR SHEETS FOR FLOORS, PATENTERS, &c.: C. J. R. Le Mesurier.—A pavement or flooring which is claimed to be noiseless and elastic is made of a compound of moss-litter and some bituminous substance—such as tar, asphalt, creosote residues, or india-rubber, or some other resinous material, to which may be added, at option, brickdust, sand, or some such substance. The compound is made under pressure.

19,361.—A FLUSH FOR PRIMING, PAINTING, AND VARNISHING PURPOSES: A. E. Lefebvre.—An admixture which is intended for use also as an anti-corrosive and for the prevention of rust, is made of liquid wood, refined resin, tar, yellow colophony, and carbon bisulphide.

19,458.—COFFER-DAMS: A. D. Garretson and W. W. Brown.—In the case of crib-work coffer-dams for abutments, breakwaters, and similar structures, the inventors join together vertical metal plates with angular rails that are riveted on to them, forming tongue-and-groove joints with one another; to the rails are riveted cross-bars which join together opposite plates, and diagonal braces strengthen the end plates; a filling of stone, concrete, earth, &c., is used, and a plank floor is laid over the plates and bars or stringers.

19,587.—SISSONIAN DISCHARGE: T. G. Rhodes and B. Grant.—At the top of the discharge pipe is mounted a cup that is joined, by means of its radial wings, to a conical and smaller cup into which the siphon's longer leg is fixed. Over the two cups and surrounding the leg is a valve. When that valve is lifted the flush is started by the entrance of water into the discharge pipe through the rounded space between the two cups.

19,628.—VALVES FOR DOMESTIC WATER-SERVICE PIPES: E. G. Watrous.—A controlling valve comprises a cylinder, which is supported by a piston-rod, the cylinder's lower end pressing against a valve-seat and also against the flange of the principal valve which rests against its seating. A flange is screwed upon the rod's lower end, and within that rod is a hollow tube that will move through a little distance, and is fitted at its upper end with a time screw and aperture, as well as with a nut which presses upon an upper valve-seat and a spring into the cylinder. A rocking-lever, which is worked by the hinged closet-seat, is linked to the tube's lower end; a depression of the seat turns the lever upwards, whereby the valve rises to allow a flow of water from the chamber which surrounds it, and the rod, together with its valves, will also rise; in the end, the flange around the rod's lower end shuts the outlet. When the lever returns downwards, the upper valve becomes shut, and the rod descends slowly with the admission of air or water into the chamber through the time passage at its upper end.

19,678.—LIGHTNING CONDUCTORS: K. W. Hedges.—For joining together the various portions of the conductor a trough is made around a tinned part of the conductor and its connecting portion, point, &c., Lower Abbey-street, 29 p.m.

19,678.—LIGHTNING CONDUCTORS: K. W. Hedges.—For joining together the various portions of the conductor a trough is made around a tinned part of the conductor and its connecting portion, point, &c., Lower Abbey-street, 29 p.m.

19,678.—LIGHTNING CONDUCTORS: K. W. Hedges.—For joining together the various portions of the conductor a trough is made around a tinned part of the conductor and its connecting portion, point, &c., Lower Abbey-street, 29 p.m.

19,678.—LIGHTNING CONDUCTORS: K. W. Hedges.—For joining together the various portions of the conductor a trough is made around a tinned part of the conductor and its connecting portion, point, &c., Lower Abbey-street, 29 p.m.

19,678.—LIGHTNING CONDUCTORS: K. W. Hedges.—For joining together the various portions of the conductor a trough is made around a tinned part of the conductor and its connecting portion, point, &c., Lower Abbey-street, 29 p.m.

19,678.—LIGHTNING CONDUCTORS: K. W. Hedges.—For joining together the various portions of the conductor a trough is made around a tinned part of the conductor and its connecting portion, point, &c., Lower Abbey-street, 29 p.m.

MEETINGS.

FRIDAY, JANUARY 25.

Architectural Association of Ireland (Technical Demonstrations).—Mr. T. Bain on "Drainage" (at 12, Lower Abbey-street, 29 p.m.).

Glasgow Architectural Craftsmen's Society.—Mr. J. M. Arbuthnot on "Legal Points relative to Building," 8 p.m.

SATURDAY, JANUARY 26.

St. Paul's Ecclesiastical Society.—Annual meeting, the Chapter House, St. Paul's, 2.30 p.m.

Builders' Foremen's Association (Memorial Hall, Farringdon-street, E.C.).—Monthly meeting, 8 p.m.

London Institute of Architecture.—Visit to St. Luke's Church, E.C., West Ferry.

MONDAY, JANUARY 28.

Royal Academy.—Professor Aitchison, R.A., on "St. Peter's," 4 p.m.

Surveyors' Institution.—Adjourned discussion on Mr. R. E. Middleton's paper on "The Future of the London Water Supply," 8 p.m.

TUESDAY, JANUARY 29.

Royal Institution.—Professor J. A. Ewing, M.A., F.R.S., on "Practical Mechanics (experimentally

treated): First Principles and Modern Illustrations.—III. 3 p.m. Society of Arts (Applied Art Section)—Mr. Hugh Stanbury on "Some Examples of Romanesque Architecture in North Italy." Mr. T. G. Jackson, R.A., will preside. 8 p.m.

WEDNESDAY, JANUARY 30.

British Archaeological Association.—Mr. R. H. Forster on "The Roman Wall." With limelight illustrations. 8 p.m. Society of Arts.—Mr. P. T. Macquoid on "Evolution of Form in English Silver Plate." 8 p.m. City of London College Science Society.—Mr. H. Williams, A.M.I.M.E., on "Refrigeration and Cold Storage." 7.30 p.m. Northern Architectural Association.—Mr. Allan Greenwell on "Bitumen: its Application in Architecture and Engineering." With lantern illustrations. 7.30 p.m.

THURSDAY, JANUARY 31.

Royal Academy.—Professor Aitchison, R.A., on "St. Peter's." 11. 4 p.m. Society for the Encouragement of the Fine Arts.—Mr. R. Phœnix Spier, F.S.A., on "Greek Architecture." Limelight illustrations. 8 p.m.

FRIDAY, FEBRUARY 1.

Architectural Association.—Mr. D. T. Fyfe on "Great Architecture." 7.30 p.m. Sanitary Institute (Lectures for Sanitary Officers)—Dr. E. J. Stegmann on "Mechanical Physics, Laws of Motion, Hydraulics, &c." 7 p.m. Royal Institution.—The Rt. Rev. Monsignor G. Molloy, D.D., on "Electric Waves." 9 p.m. Architectural Association of Ireland (Technical Demonstrations)—Mr. B. A. Phillipson on Electricity, &c. (at 10, Lower Baginot-street). 4.30 p.m.

SATURDAY, FEBRUARY 2.

Sanitary Inspectors' Association.—Eighteenth Annual Dinner, Holborn Restaurant. 6 p.m. British Institute of Certified Carpenters.—Monthly meeting, Carpenters' Hall. 6 p.m.

SOME RECENT SALES OF PROPERTY

ESTATE EXCHANGE REPORT.

January 15.—By BRADSHAW, BROWN, & CO. Stratford—31 to 45 (odd), Abbey-lane, ut. 65 yrs., g.r. 241. £1,060 By W. R. NICHOLAS & CO. Hornsey.—High-st., Eagle House, area 33,000 ft., l., r. 801. 2,000 By ALEX. PHILLIPS & CO. Kilburn.—51, Tennyson-rd., l., r. 381. 525 6, Mareton-av., ut. 66 yrs., g.r. 101, 104, g.r. 601. 550 Willesden.—33, Leopold-rd., ut. 94 yrs., g.r. 51, 1 to 9 (odd), Oldfield-rd., ut. 68 yrs., g.r. 111. 1,500 January 16.—By R. TINSLEY & SONS. Islington.—2, Oakley-rd., ut. 37 yrs., g.r. 5, 10s., g.r. 501. 560 By HOBSON, RICHARDS, & CO. Dalston.—37, 45, and 47, Malvern-rd., and 52, Shrubland-grove; also 124, 125, 126, 6d., ut. 401 yrs., g.r. 271, 58, l., 133. 1,300 Hackney.—2 and 7, London Fields; also 1 g.r.'s 124, ut. 41 yrs., g.r. 171, 173, 6d., r. 631. 670 January 18.—By TINSLEY & SONS. Oxford-street.—No. 538, ut. 314 yrs., g.r. 57, r. 2101. 2,050 Southwark.—46, Southwark-st., ut. 443 yrs., g.r. 1404, r. 4401. 4,700 By BLAKE & DANFORTH. Holloway.—32, Freggover-rd., ut. 66 yrs., g.r. 71, 108, r. 441. 530 By LEONARD FAIRER & SONS. St. John's Wood.—71, Carlton-hill, ut. 60 yrs., g.r. 111, 118, g.r. 801. 720 By A. J. SHEPHERD. Stepney.—Eastfield-st., No. 1, g.r. 154, reversion in 19 yrs. 360 Old Ford.—32 and 34, Roman-rd., ut. 44 yrs., g.r. 501, g.r. 3501. 1,330 Canning Town.—30 and 32, Nelson-st., f. 380 2, Emily-st., f. 105 Barking, Essex.—9 to 15, Grove-place, ut. 812 yrs., g.r. 281. 640 Contractions used in these lists.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; i.g.r. for improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; s.r. for estimated rental; u.t. for unexpired term; p.a. for per annum; yrs. for years; st. for street; rd. for road; sq. for square; pl. for place; ter. for terrace; cres. for crescent; yd. for yard.

PRICES CURRENT OF MATERIALS.

* Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table with 2 columns: Material Name and Price. Includes items like Hard Stocks, Rough Stocks, Bright, Facing Stocks, Shippers, Flettons, Red Wire Cuts, Best Farchem Red, Best Red pressed, Ruabon Facing, Best Blue Pressed, Staffordshire, Do., Bullnose, Best Stourbridge, Fire Bricks, GLAZED BRICKS, Best White, Ivory Glazed, Stretchers.

PRICES CURRENT (Continued).

Table with 2 columns: Material Name and Price. Includes items like BRICKS, &c., Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sides and one End, Splays, Chamfered, Squints, Glazed Stretchers and Headers, Quoins, Bullnose, and Flats, Double Stretchers, Double Headers, One Side and two Ends, Two Sided Salt, Best Dipped Salt, Splays, Chamfered, Squints, Second Quality, White and Dipped, Salt Glazed, Frames and Pit Sand, Thames Ballast, Best Portland Cement, Best Ground Blue Liais Lime, Grey Stone Lime, Stonbridge Fire-clay in sacks.

STONE.

Table with 2 columns: Material Name and Price. Includes items like Ancaster in blocks, Bath, Farleigh Down Bath, Beer in blocks, Gainshill, Brown Portland in blocks, Darley Dale in blocks, Red Corsehill, Red Mansfield, Hard York in blocks, Hard York 6 in. sawn both sides, landings, to sizes s.d. (under 40 ft. sup.), 6 in. Rubbed Ditto, 3 in. sawn both sides slabs (random sizes), 3 in. self-faced Ditto.

SLATES.

Table with 2 columns: Material Name and Price. Includes items like 20x10 best blue Bangor, best seconds, 16x8 best, 20x10 best blue Portmadoc, doc, 16x8 best blue Portmadoc, 20x10 best Eureka un-fading green, 16x8, 20x10 Permanent green, 16x8.

TILES.

Table with 2 columns: Material Name and Price. Includes items like Best plain red roofing tiles, Hip and valley tiles, Best Broseley tiles, Hip and valley tiles, Best Ruabon Red, brown or brindled Do. (Edwards), Do. ornamental Do., Hip tiles, Valley tiles, Best Red or Mottled Staff-fordshire Do. (Peakes), Hip tiles, Valley tiles.

WOOD.

BUILDING WOOD—YELLOW.

Table with 2 columns: Material Name and Price. Includes items like Deals: best 3 in. by 11 in. and 4 in. by 9 in. and 11 in., Deals: best 3 by 9, Battens: best 2 1/2 in. by 7 in. and 8 in. and 3 in. by 7 in. and 8 in., Deals: seconds, Battens: seconds, Fir timber: Best middling Danzig or Memel (average specification), Seconds, Small timber (8 in. to 10 in.), Swedish balks, Pitch pine timber (35 ft. average), JOINERS' WOOD, White Sea: First yellow deals, 3 in. by 11 in., 3 in. by 9 in., Battens, 2 1/2 in. by 7 in. and 3 in. by 9 in., Second yellow deals, 3 in. by 11 in., 3 in. by 9 in., Battens, 2 1/2 in. and 3 in. by 7 in., Third yellow deals, 3 in. by 11 in. and 9 in., Battens, 2 1/2 in. and 3 in. by 7 in., Petersburg: first yellow deals, 3 in. by 11 in., Do. 3 in. by 9 in., Battens.

PRICES CURRENT (Continued).

Table with 2 columns: Material Name and Price. Includes items like WOOD, Petersburg: Second yellow deals, 3 in. by 11 in., Do. 3 in. by 9 in., Battens, Third yellow deals, 3 in. by 11 in., Do. 3 in. by 9 in., Battens, White Sea and Petersburg: First white deals, 3 in. by 11 in., 3 in. by 9 in., Battens, Second white deals 3 in. by 11 in., 3 in. by 9 in., Battens, Pitch pine: deals, Under 2 in. thick extra, Yellow Pine: First, regular sizes, Broad (12 in. and up), Oddments, Seconds, regular sizes, Yellow Pine Oddments, Kauri Pine: Planks, per ft. cube, Danzig and Stettin Oak Logs: Large, per ft. cube, Small, Wainscot Oak Logs, per ft. cube, Dry Wainscot Oak, per ft. sup. as inch, 3 in. do., Dry Mahogany: Honduras, Tabasco, per ft. sup. as inch, Selected, figured, per ft. sup. as inch, Dry Walnut, American, per ft. sup. as inch, Teak, per load, American Whitewood Planks, Per ft. cube, JOISTS, GIRDERS, &c., In London, or delivered to Railway Vans, per ton, Rolled Steel Joists, ordinary sections, Compound Girders, Angles, Tees and Channels, ordinary sections, Flitch Plates, Cast Iron Columns and Stanchions, including ordinary patterns, METALS, Iron: Common Bars, Staffordshire Crown Bars, good merchant quality, Staffordshire "Marked Bars", Mild Steel Bars, Hoop Iron, basis price, galvanized, (* And upwards, according to size and gauge), Sheet Iron, Black: Ordinary sizes to 20 g., 20 g. and 24 g., 24 g. and 26 g., 26 g. and 28 g., 28 g. and 30 g., Sbeet Iron, Galvanised, flat, ordinary quality, Ordinary sizes, 6 ft. by 2 ft. to 3 ft. to 20 g., 20 g. and 24 g., 24 g. and 26 g., Galvanised Corrugated Sheets, Ordinary sizes, 6 ft. to 8 ft. 20 g., 8 ft. 20 g. and 24 g., 24 g. and 26 g., Best Soft Steel Sheets, 6 ft. by 2 ft. and thicker, Thin, Cut nails, 3 in. to 6 in. (Under 3 in. usual trade extras.), LEAD—Sheet, English, 3 lbs. & up, Pipe in coils, Soil Pipe, ZINC—Sheet: Vicille Montagne, Silesian, COPPER: Strong Sheet, Thin, Copper nails, BRASS: Strong Sheet, TIN—English Ingots, SOLDER—Plumbers', Biennet's, Biowipe, ENGLISH SHEET GLASS IN CRATES, 15 oz. thirds, 2 1/2 d. per ft. delivered, 21 oz. thirds, 2 1/2 d. per ft. delivered, 18 oz. thirds, 3d. per ft. delivered, 20 oz. thirds, 3d. per ft. delivered, 22 oz. thirds, 3d. per ft. delivered, 24 oz. thirds, 3d. per ft. delivered, 26 oz. thirds, 3d. per ft. delivered, 28 oz. thirds, 3d. per ft. delivered, 30 oz. thirds, 3d. per ft. delivered, 32 oz. thirds, 3d. per ft. delivered, 34 oz. thirds, 3d. per ft. delivered, 36 oz. thirds, 3d. per ft. delivered, 38 oz. thirds, 3d. per ft. delivered, 40 oz. thirds, 3d. per ft. delivered, Hartley's Rolled Plate, 3d. per ft. delivered, 3d. per ft. delivered, 3d. per ft. delivered, 3d. per ft. delivered.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

(For some Contracts, &c., still open, but not included in this List, see previous issues.)

COMPETITIONS.

Table with 4 columns: Nature of Work, By whom Advertised, Premiums, Designs to be delivered. Includes entry for Water supply and Sewerage, Donaghadee.

CONTRACTS.

Large table with 4 columns: Nature of Work or Materials, By whom Required, Forms of Tender, &c., supplied by, Tenders to be delivered. Lists numerous construction projects across various locations like Portsmouth, Halifax, and London.

[See also next page.

PUBLIC APPOINTMENTS.

Table with 4 columns: Nature of Appointment, By whom Advertised, Salary, Application to be in. Includes roles like Draughtsman, Clerk of Works, District Superintendent, etc.

Those marked with an asterisk (*) are advertised in this Number. Competitions, p.—. Contracts, pp. iv, vi, viii, x, & xix. Public Appointments, pp. xvi, xvii, & xix.

PRICES CURRENT (Continued).

Table of prices for Oils, Varnishes, and other materials. Columns include item name, unit, and price.

TO CORRESPONDENTS.

W. P.—T.A. C. (Below our limit.) M. & F. (Amounts should have been stated.) NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner, and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under 100, unless in some exceptional cases and for special reasons.]

ASHTON-UNDER-LYNE.—For the execution of street works, Queen-street, &c., for the Hurst Urban District Council. Mr. Samuel Sluit, Surveyor to Council, Council Offices, Kings-street, Hurst. Isaac Powell £4,778 0 0 | J. & J. Woodhead, Ashton-under-Lyne..... £4,521 10 8

BECKENHAM.—For repairs at the George Inn. Messrs. Chart, Son, & Reading, architects, Croydon.— Smith & Sons..... £162 | Goulder*..... £141

BRIGHTON.—For alterations and additions at No. 60, Queen's-road, for Mr. A. G. Sharman. Mr. W. C. F. Gillam, architect, Brighton.— Saunders Bros..... £697 | G. R. Lockyer..... £639 | Titcombe & Son..... 657 | Brown & Son..... 560 | S. H. Diplock..... 645 | H. J. Penfold*..... 547

BRIGHTON.—For alterations and additions at No. 3, 4, & 5, Bond-street, for Mr. A. G. Sharman. Mr. W. C. F. Gillam, architect, Brighton.— Brown & Son..... £796 0 0 | W. & T. Garrett £724 0 0 | H. I. Penfold..... 737 0 0 | G. R. Lockyer..... 692 0 0 | Titcombe & Son..... 735 0 0 | J. Barnes..... 677 0 0 | S. H. Diplock..... 729 0 0 | Saunders Bros.*..... 575 10 0

CARDIFF.—For the erection of an electric tram depot, Pendryis-street, for the Corporation. Mr. W. Harpur, C.E., Borough Engineer, Town Hall, Cardiff.— W. H. Ingleson £3,238 11 0 | Knox & Wells £7,220 0 0 | A. J. Howell..... 8,150 0 0 | Melhuish Bros. £7,179 0 0 | G. Couzens & Sons..... 7,693 8 10 | Sons..... 7,032 19 2 | G. Griffith..... 7,689 19 4 | C. D. Dunn..... 7,024 8 8 | J. H. Venning..... 7,671 8 0 | J. S. Chubb & Co..... 6,984 0 0 | Jas. Allen..... 7,661 16 11 | W. T. Morgan..... 6,930 0 0 | S. Shepton & Sons..... 7,484 17 0 | E. R. Evans & Bros..... 6,927 0 0 | F. Couzens..... 7,481 8 5 | Sons..... 6,927 0 0 | W. E. Willis..... 7,277 17 3 | Price Bros..... 6,870 0 0 | W. Symonds & D. Thomas..... 7,260 5 6 | J. Thomas..... 6,869 0 0 | D. Thomas..... 7,260 5 6 | D. W. Davies, Cardiff..... 6,774 0 0 | Son..... 7,222 0 0

CHEAM.—For supplying and fitting up boilers and heating apparatus to the wards and for fitting up the disinfecting station and two steam laundries at the Small-pox Hospital at North Cheam, for the Croydon and Wimbledon Joint Board. Messrs. Chart, Son, & Reading, architects, Croydon.— Fraser & Co. Commercial-road East..... £2,566 [Five others tendered.]

CROYDON.—For the erection of a shop at Boston-road. Messrs. Chart, Son, & Reading, architects, Croydon.— Goulder..... £6,020 0 0 | Smith & Sons..... £689 0 0 | Walker..... 719 0 0 | Bacon*..... 659 10 0 | Worsfold & Sons..... 716 0 0

CROYDON.—For alterations at the Croham Arms Inn. Messrs. Chart, Son, & Reading, architects, Croydon.— Smith & Sons..... £189 0 0 | Bacon..... £123 0 0 | Truett & Steel..... 160 0 0 | Tomkins..... 110 10 0 | Goulder..... 130 0 0

CROYDON.—For repairs at the Royal Oak inn. Messrs. Chart, Son, & Reading, architects, Croydon.— Truett & Steel..... £153 0 0 | Goulder..... £137 0 0 | Smith & Sons..... 145 0 0 | Bacon*..... 117 2 6

FARNBOROUGH.—For fitting up the bar of the Queen's Head Inn, Green-street Green. Messrs. Chart, Son, & Reading, architects, Croydon.— Cohen & Co..... £219 | Knight..... £212 | Vanders & Son..... 224 | Simpson & Son..... 149 | Matthews..... 214

GLOUCESTER.—For alterations and additions to Barton Hall and the erection of two new shops in connection therewith, for Mr. William Sandoe. Mr. Harry A. Dancy, architect, Gloucester.— Godwin & Brasington..... £497 10 0 | Gurney & Sons, M. Byard..... 492 17 6 | Gloucester*..... 473 13 10 | J. Simmonds..... 487 10 0

HANWELL.—For the erection of schools for 1,230 children, board's offices, and caretaker's house at Springfield-road, Hanwell. Mr. William Pywell, architect. PATENT WIRED TERRA COTTA LATHING.

What is Wired Terra Cotta Lathing?

It is an invention to render metal fireproof by incorporating wire with terra cotta by a patent process which also oxidizes the iron. Recent trials by the British Fire Prevention Committee proved that it was absolutely fire resisting. After exposure to a temperature of 2,000 Fahr. for 1 hour and 15 minutes a 2-inch partition, as well as a fireproof floor and ceiling, were found to be uninjured. Enoxious losses to Buildings have occurred by the action of cold water from the fire engine. This partition was not affected at the trial. Directions to fix are sent. Any labourer can fix it.

There is a great saving in space of 2 inches each side of a partition as easy to bend and cut. (compared with Brick Partitions. Reliable as a non-conductor of sound. Rigidity when plastered is its strong point. As a covering to girders and joists, and for lifts, staircase enclosures, and ventilating shafts it cannot be excelled.

Ceilings constructed of this are fireproof shields. Only the price of wood stud partitioning. The key for plaster is unique. Plastered as a Fireproof floor it has great strength. All plasterers like it.

Lathing in metal will expand and throw off its protection. Architects should specify "Wired Terra Cotta Lathing." The material is specified by the L.C.C. Metropolitan Asylums Board, and leading London Architects.

Hundreds of thousands of yards specified recently. Immense advantages over any other lathing. It is the cheapest material to use as a centering for concrete floors. No fire resisting building complete without give it a trial. You will use it again.

NOW READY. "The Builder" Student's Series. Books sent from the Office, POST FREE, on receipt of remittance.

- 7/6 LAND SURVEYING AND LEVELLING. By ARTHUR T. WALMSLEY, M.I.C.E., F.S.I., F.R.C.S.L. A useful book for a Student, containing not only the usual instruction given in a Text-book on this subject, but valuable additions from the author's own experience, and an exhaustive chapter upon Parliamentary surveying.
6/- FIELD WORK AND INSTRUMENTS. By ARTHUR T. WALMSLEY, M.I.C.E., F.S.I., F.R.C.S.L. Hon. Assoc. R.I.B.A. With 221 Illustrations. Gives the Student a practical knowledge of the construction and handling of surveying instruments, and how to deal with their application in the field for setting out work.
7/- STRUCTURAL IRON AND STEEL. By W. N. TWELVEHETRES, M.I.M.E. With 224 Illustrations. In this elementary Treatise, the author has endeavored to present in a regular sequence some of the more important details relative to iron and steel as applied to structural work.
5/- STRESSES AND STRAINS; THEIR CALCULATION AND THAT OF THEIR RESISTANCES, BY FORMULAE AND GRAPHIC METHODS. By FREDERICK RICHARD FARROW, F.R.I.B.A. Hon. Assoc. R.I.B.A. A Handbook for Students, particularly those preparing for the examinations of the I.R.B.A. and arranged and intended especially for those whose knowledge of mathematics is limited.
3/6 SPECIFICATIONS FOR BUILDING WORKS, AND HOW TO WRITE THEM. A Manual for Architectural Students. By FREDERICK RICHARD FARROW, F.R.I.B.A. Hon. Assoc. R.I.B.A. Shows the Student how he should write a specification, so that when he has learnt the method and general principles, he may apply them to the particular services of any building he may desire.
3/6 QUANTITIES AND QUANTITY TAKING. By W. R. DAVIS. A reliable Handbook for the Student pure and simple, its scope being limited to the method of procedure in the production of a good Bill of quantities. The examples given, whilst intentionally simple, will be found to cover almost every phase of the subject.
5/- CARPENTRY AND JOINERY: A Text-book for Architects, Engineers, Surveyors, and Craftsmen. By PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. With 454 Illustrations. 2nd Edition. Revised and corrected by the Authors. Intended for those entering for the examination of the City and Guilds Institute, the Carpenters' Company, and the Institute of Certified Carpenters, &c. Also for the examination in these subjects by the R.I.B.A. and the Surveyors' Institution, &c.
5/- ARCHITECTURAL HYGIENE; or SANITARY SCIENCE AS APPLIED TO BUILDINGS. By BANISTER PHLETCHER, A.R.I.B.A. and H. PHILLIPS FLETCHER, A.R.I.B.A., A.M.I.C.E. Hon. Assoc. R.I.B.A. A concise and complete Text-book, treating the subject in all its branches, and intended to be of use to those entering for any examination in Sanitary Science.

London; DOUGLAS FOURDRINER "Builder" Office, Catherine Street, W.C.

ARCHITECT.—Young London Architect. (What Enthusiasm for the DESIGN for, or ASSISTANT to, one!) Has thorough experience and knowledge of work, and is a designer and draughtsman of ability.—Box 149, Office of 'The Builder'.

A THOROUGHLY qualified ARCHITECT can bear of an immediate opening in a busy office. West End, as MANAGING ASSISTANT with a view to eventual partnership. Must be ready with 500, on security. Liberal salary.—Box 152, Office of 'The Builder'.

ARCHITECT'S ASSISTANTS, &c.— Advertiser wishes to hear from any gentleman desirous of adding to his income without interference with his present employment, willing to join him in working up precise as quantity estimating and financial surveys. Advertiser has promise of work and good chances. Preliminary expense nothing. Only those who can influence work and get their bills paid, in confidence, to SURVEYORS, Box 110, Office of 'The Builder'.

ARCHITECT and SURVEYOR.— An ARCHITECT and SURVEYOR of experience (married; aged 28), who has for some years held an official appointment in South America, which is thinking of resigning in the middle of this year and returning to England, desires to PURCHASE a SHARE either in town or country. The latter preferred and kept or hurried, as he believes he could increase business in those countries. Strict references given and required. The advertiser would prefer to communicate direct with principals in confidence, rather than through agents.—Address, B. N. K. The News, Belfast, near relative of the gentleman in question.

ENGINEER STUDENTS in the NAVY (184-10). FORTHCOMING EXAMINATION, FEBRUARY 16, 1901. N. B.—At this Examination there will be practical tests in physics and chemistry. The date specified is the latest at which applications can be received. They must be made on forms to be obtained, with particulars for new roads, street improvements, and other similar works. Preference will be given to candidates who have had experience in the preparation of estimates and apportionments for new road and paving works. Salary, 22 s. per week. The appointment will, in the first instance, be made on probation for three months, and at the expiry of the duties being satisfactorily discharged, will then be made permanent, subject to one month's notice on either side. Candidates will be bound to state age, qualifications, and present occupation, and be accompanied by three or four testimonials of recent date, must be stamped "Draughtsman," and be delivered to MR. NORMAN S. DUFFIE, C.E. Borough Engineer and Surveyor, Town Hall, Hackney, not later than FIVE p.m. on TUESDAY, the 29th JANUARY, 1901. By order, GEORGE CRODTH, Acting Town Clerk.

THE HACKNEY BOROUGH COUNCIL. BOROUGH ENGINEER AND SURVEYORS. The Council REQUIRE the SERVICES of a DRAUGHTSMAN who must be competent to take surveys and levels, and prepare accurate plans and sections for new roads, street improvements, and other similar works. Preference will be given to candidates who have had experience in the preparation of estimates and apportionments for new road and paving works. Salary, 22 s. per week. The appointment will, in the first instance, be made on probation for three months, and at the expiry of the duties being satisfactorily discharged, will then be made permanent, subject to one month's notice on either side. Candidates will be bound to state age, qualifications, and present occupation, and be accompanied by three or four testimonials of recent date, must be stamped "Draughtsman," and be delivered to MR. NORMAN S. DUFFIE, C.E. Borough Engineer and Surveyor, Town Hall, Hackney, not later than FIVE p.m. on TUESDAY, the 29th JANUARY, 1901. By order, GEORGE CRODTH, Acting Town Clerk.

HEXTON MANOR, near Hitchin, Herts. WANTED, a CLERK of WORKS, to act under the direction of the Engineer and Architect, on the above alterations, which include rebuilding of Lodges, Cottages, and Museum, Water Supply, and other matters. Engagement for about 12 months. Applications, in the form of a copy of your resume, with not more than three testimonials, stating age and salary required, to be addressed to me not later than WEDNESDAY, JANUARY, 30th, 1901. JOHN WATGROUSE, in order, Cambridge Chambers, Bradford, Yorks.

WANTED, an ASSISTANT in the Borough Surveyor's Office, Hove. Must be good draughtsman and acquainted with work of Borough Surveyor's Office. Salary, 50 s. per week. Applications, stating age and experience and accompanied by copies of not more than three testimonials, to be sent to JOHN R. SCOTT, Borough Surveyor, Town Hall, Hove.

Building Stones in the Natural History Museum, Vienna.

we exclude the magnificent collection of stones for building and decoration exhibited in the National Museum at Washington, there is no better public collection of these materials in the world than is to be found in the Naturhistorischen Hofmuseums, on one side of the Maria-Theresia-platz, in Vienna. The American collection has been well described by its curator, Mr. G. P. Merrill; but when we saw it, a few years ago, it was very indifferently housed, and the materials were regarded more from a geological than an architectural standpoint. The same cannot be said of the collection in Vienna; it is located, together with other collections, in a magnificent building erected a few years ago in the Italian Renaissance style, chiefly from designs by Semper; the use of various decorative stones is well exemplified in the interior, the walls of the vestibule, grand staircase, doorways, &c., being built or lined with them; whilst the systematic collection of stone samples is well displayed—and the finishing touches have recently been given to their arrangement and classification. Professor Felix Karrer has accomplished the chief part of the work, so far as the museum collection is concerned, and his aim has been to present the different materials in such a manner that the samples may prove useful to architects, engineers, and surveyors, rather than to the systematic lithologist or mineralogist. The interests of these latter are well cared for in the general petrological collection, kept apart from the building stone collections—and this is as it should be, for whilst the petrologist is mainly concerned with stones in their genetic relationships, and from a purely scientific standpoint, no matter whether

they are used for practical purposes or not, the architect, engineer, or surveyor is mainly interested in them as materials of construction.

This collection in Vienna should serve as a model for all others of a similar description. We should like to see the authorities at our Jermyn-street Museum—which purports to be a museum of practical geology—do something on the same lines. Professor Karrer has not been contented to merely label each specimen of stone with its scientific name and locality, but he has written a book on the collection in which are numerous reproductions of photographs of public buildings, together with some account of the building and decorative stones employed in their construction. The museum specimens are thus closely identified with their practical uses.

The collection is not confined to the stones used in Austria-Hungary, though they are, naturally, chiefly represented. The following is a general summary and the method of classification adopted. The whole of the materials are primarily divided geographically; Austria is subdivided for the purpose of the employment (not the origin) of the various materials into the following regions:—Lower Austria, including Vienna; Upper Austria, Linz; Salzburg and its environs; Tyrol, Innsbruck; Vorarlberg, Bregenz; Styria, Gratz; Carinthia, Klagenfurt and Villach; Carniola, Laibach; Görz and Gradisca, Görz; Trieste and neighbourhood; Istria, Parenzo and Rovigno; Dalmatia, Zara; Bohemia, Prague; Moravia, Brünn; Silesia, Troppau; Galicia, Lemberg and Cracow; and Bukowina, Czernowitz. Hungary is divided into three regions:—Hungary proper, including Buda-Pesth; Siebenbürgen, Hermannstadt and Klausenburg; and Croatia, Agram. Foreign localities are represented as follows:—Germany, Italy, France, Belgium, England, Norway, Russia, Switzerland, Spain and Portugal, Greece, United States, Asia, and Africa.

As far as possible, these various regions are further subdivided according to the material

Thus, the materials of construction used in Lower Austria are divided into:—(1) Road and street stones; (2) paving stones; (3) raw materials for bricks and tiles; (4) sands for mortar; (5) raw materials for lime; (6) cement; (7) building stones; (8) stones for decoration; (9) slates; (10) artificial stones, &c., including fire-stone, asphalt, and terracotta; and (11) various materials, such as gypsum, ochre, and talc-schist.

The foreign building stones are not as well represented in the collection as they might be; those from Great Britain are very few, and are not at all characteristic. The German collection is as good as any, but the antique Italian (Roman) marbles and cements are well represented. The curators had, of course, to be contented with what they could get, but they do not seem to have gone to work in such a painstaking manner as have the authorities of the National Museum at Washington in reference to the collection of foreign materials. Thus, the Viennese are invited to regard the alluvial sand of the Seine as a characteristic French mortar sand, that being the only specimen exhibited from France; again, the Eocene plastic clay of Vanvers (called "argille (*sic*) plastique") does duty for French clays suitable for making bricks and tiles. When we look at the fine collection of freestones and stones used for decoration in France, however, it is not difficult to see that much more attention has been bestowed on the collection of these. Russia is very badly represented in the collection, and what few decorative stones are exhibited are not at all characteristic. Instead of a number of the largely used granites from Finland (which can be very easily obtained), and such excellent stones as the Isaac Cathedral in St. Petersburg, and the church of the Saviour, Moscow are built of, we only find such insignificant minerals as rhodonite, amazon-stone, malachite, jasper, &c., which are only employed in the manufacture of jewellery, bric-a-brac, and the like. Moscow marble is represented, and there is a practically unknown granite from Siberia. These do not

give an idea of Russian building stones at all, and this section of the collection requires strengthening.

Professor Karrer has conceived the happy notion of indicating the uses of various principal building stones exhibited by a number of illustrations of public buildings, as already mentioned. The following are the edifices he has selected, not from their architectural interest necessarily, but as showing the capability of the different materials, and as giving an all-round idea of some of the most important European stones for building and decoration.

It is natural that Vienna claims most attention, and the buildings selected for illustration in that city are:—

1. *St. Stephen's Cathedral*.—The oldest part of the building, up to the fifteenth century, is erected of Miocene calcareous sandstone from Zogelsdorf and Eggenburg; since then the remainder of the edifice and various works of restoration have been completed of Miocene limestone from Breitenbrunn, Eisenstadt, and neighbourhood. The earliest portions of the present building were erected in 1258-1276 on the site of a church destroyed by fire.

2. *The Votive Church* in Maximilian's Platz, erected in the Gothic style from designs by Ferstel in 1856-79, is one of the finest churches in Vienna. It is mainly built of Miocene limestone from Wöllersdorf, Mühlendorf, and Brunn, and another kind of limestone from Grisignana. The columns, chancel, and balustrades in the interior are of onyx marble from Egypt.

3. *Houses of Parliament* (Reichsraths-Gebäude), an imposing edifice in the Greek style by Hansen. The lower portions of the building are of granite from Neuhaus and Grasstein; the stairs and balcony of limestone from Repentabor and St. Croce; and the upper portions chiefly limestone from St. Croce and Cava Romana.

4. *Town Hall*, built in 1873-83 by Schmidt, in the Gothic style, principally of Miocene limestone from Wöllersdorf, Margarethen, Mannersdorf, and other limestone from Austria, Trient, &c.

5. *The Natural History Museum* has already been alluded to, and we need only add that the lower part up to the first floor is of calcareous sandstone from Zogelsdorf, whilst the remainder of the exterior is of similar material from Mannersdorf, Mokritz, Vicica, &c., and other limestone from Medolina and Merlera.

6. *The Maria Theresia Monument*, opposite the Burgthor, designed by Zumbusch, the pedestal by Hasenauer, was erected in 1888. It is chiefly of bronze, but the steps are of granite from Mauthausen, the plinth of granite from Petersburg, in Bohemia, and the columns of serpentine from Wissen, near Steyng.

7. *The University*, situated on the Franzens-Ring, a large quadrangular structure in the early Tuscan Renaissance style, was built by Ferstel in 1873-84. The upper parts of the building are of Grisignana limestone, the plinth of Miocene limestone from Wöllersdorf, and the entrance and steps of crystalline limestone from Grasthal.

8. *The Hofburg Theatre*, opposite the Town Hall on the east side of the Ring Strasse, is in the later Renaissance style, built from designs by Semper & Hasenauer in 1876-89. Practically the whole is of limestone from Pomer, Marzano, and Merlera, in

Istria, but columns in connexion with the window decoration are of limestone breccia from Seravezza, near Carrara, in Italy.

9. *The Imperial Opera House*, a grand Renaissance building, was erected in 1861-69 from designs by Van der Nüll and Siccardi-burg. The higher portions of the façade and the plinth are of Miocene limestone from Wöllersdorf and Brunn; the columns and plinth of the lower parts of the building flanking the façade are chiefly of limestone from Aviano and Kelheimerstein, in Bavaria.

From the above it will be noticed that Vienna architects have considerable preference for limestones, at any rate for large buildings. These are principally light in tone, and many of them withstand the action of the weather remarkably well. Their general appearance, as used during the last half-century, is not unlike the *calcaire grossier* so largely employed in Paris. It will also be observed that many of these limestones are quarried considerable distances from Vienna, and that immense trouble has been taken to secure suitable materials, whereby the beauty of the Austrian capital has been greatly enhanced. The calcareous sandstone employed in recent years seems to be of better quality than that kind of stone generally is. Granite is but sparingly used for large buildings in Vienna. It was only natural, however, that it should find its way into such a massive Classical structure as the Houses of Parliament, where it blends perfectly well with the lighter limestones of which the upper portions of the edifice are chiefly constructed. We are unable to mention specifically the numerous stones used for decorating interiors, though Professor Karrer is careful to indicate most of the important ones and parts of prominent buildings where they may be seen, apart from the museum specimens. The foreign marbles chiefly employed are the same as we have seen in London, Berlin, Madrid, Paris, St. Petersburg, and Brussels; the native marbles have, naturally, claimed a great deal of attention, though we cannot say, looking at them as a whole, that they are conspicuous for their beauty.

Turning to the building stones used in Upper Austria, the following edifices are selected for illustration:—

10. The new *Cathedral, Linz*, commenced in 1862 from the designs of the late V. Statz, of Cologne. The freestone is Vienna sandstone from Mais, near Altlenzbach; the plinth and columns are Neuhaus granite.

11. The new *Museum, Linz* (known also as the Francisco-Carolinum Museum), was built in the late Renaissance style in 1895, from designs by Bruno Schmitz, of Düsseldorf. This is a brick building with stone dressings. Around the second floor, in front and on the east and west sides, runs a frieze 8 ft. in height, designed by the late Professor zur Strassen, of Leipsic, and executed by R. Cöllen, portraying the progress of culture in Upper Austria from the earliest times down to its occupation by the House of Hapsburg. The frieze is made of white Tertiary sandstone from Stotzing and Goys, and the steps of limestone from Santa Croce.

Buildings illustrating the use of stone in the Salzburg district are:—

12. *The Stigmundsthor, Salzburg*, hewn out of the Tertiary conglomerate of the Mönchsberg, which is a common building stone in that part of Austria.

13. *The Cathedral and Fountain, Salzburg*, situated in the Residenz Platz. The cathedral was erected in 1614-28 by Santino Solari in the late Renaissance style, principally of the Tertiary conglomerate of the neighbourhood and limestone from the Untersberg; whilst the fountain, also of the last-mentioned stone, was executed in 1664-80 by Antonio Dario.

The two buildings selected for the Tyrol are:—

14. *The Triumphal Arch, Innsbruck*, erected in 1765, of Quaternary breccia from Hötting.

15. *The Parish Church, Bozen*, a Gothic building of the fourteenth and fifteenth centuries, constructed of sandstone and porphyry.

An illustration from Carinthia is:—

16. *The Dragon Fountain of Klagenfurt*, placed in the principal square of the town in 1590. The dragon is hewn out of a monolith nearly $7\frac{1}{2}$ metres in length, and is of green phyllite from the Kreuzberg, about two miles from the town.

Southern Austria is exemplified by:—

17. The new *Offices of the Austrian Lloyd Steamship Company, Trieste*, a palatial building designed by Ferstel; chiefly made of Istrian limestone; the plinth is of stone from Orsera, the pillars, &c., of Santa Croce limestone.

18. *The Palace of Miramar, near Trieste* constructed of Istrian limestone.

19. *The Piazza dei Signori, Zara, Dalmatia*, of limestone from the neighbouring islands of Curzola and Brazza.

Other buildings in Austria illustrated are:—

20. *Teyn Church, Prague*, commenced in 1360, with additions 1460, is the old church of the Hussites. It is built of limestone from Weissen Berge, Strahou and vicinity, and sandstone and Silurian quartzite. The decorated parts are all of sandstone.

21. "*Powder Tower*" (*Pulverthurm*), Prague, a late Gothic gate tower, erected in 1475-84, and restored in 1883. The older parts are of sandstone from Nehviz, and the newer of the same kind of stone from Horitz.

22. *Town Theatre, Brünn*, the capital of Moravia, built in 1882 from designs by Fellner and Hellmer. The groups of figures are of Tertiary calcareous sandstone from Breitenbrunn; steps and staircases of limestone from Kaisersteinbruch; plinth, columns and attic of sandstone from Wildenschwert and Bräusau; steps in front of the building of sandstone from Skalitz; staircases to the boxes of Istrian limestone.

23. *St. Peter's Church, Cracow*, erected 1597-1619, is constructed chiefly of the Upper Jurassic limestone found in the vicinity of the city.

The building stones of Hungary are well represented in the collection. The constructions selected for illustration are:—

24. *The Suspension Bridge (Kettenbrücke), Budapest*, the masonry of which is chiefly of Tertiary limestone from Soskut, with granite from Mauthausen, in parts.

25. *Royal Academy of Science, Budapest*, is principally of limestone of freshwater origin from Tüttingen and Töck and another limestone from Soskut; the plinth is of granite from Mauthausen, in Upper Austria, and from Meissen, in Saxony.

26. *The Redoute Buildings, Budapest*, erected in 1862-65 in the Romanesque-Moorish style, from designs by Fessel, con-

taining some of the principal ball and concert rooms in the city, is built of Sarmatian limestone from Soskut and red Liassic limestone from Tardos and Piske.

27. The *Opera House, Budapest*, built in 1875-84 in the Italian Renaissance style by Ybl, is of freshwater limestone from Süttő and Uröm and the Soskut limestone.

28. The *Cathedral, Gran*, is a large edifice in the Italian Renaissance style, built of the same limestones as the Budapest Opera House, together with trachyte from the neighbourhood.

From the foregoing it will be observed that some of the most imposing edifices in Budapest are chiefly built of limestone from the neighbourhood of Soskut and Süttő, which are very durable materials of their kind, and are readily worked.

Stones for building and decoration as used in Germany are well represented in the collection, and the museum authorities illustrate them by the following buildings:—

29. *Cathedral, Cologne*, constructed mainly of Cretaceous and Jurassic limestone from Bavaria and France, sandstone from the Trias of Germany, Wealden sandstone from Bückeberg, and trachyte from the Siebengebirge.

30. *Cathedral, Regensburg*, of Jurassic limestone and green Cretaceous sandstone from Bavaria.

31. *Cathedral, Strassburg*, of red sandstone found in the vicinity.

32. Large *Fountain, Nuremberg*; the basin of Wealden sandstone from Oberkirchen, the pyramid of Triassic sandstone from Zeil, Wendelstein, &c.

33. The *Catholic Church, Dresden*, the lower portions of sandstone from Cotta, the upper of similar material from Posta, near Pirna.

34. *Pavilion, Dresden*, of sandstone from Elbthale.

35. *Royal Opera House, Dresden*, of stone from the same locality.

Other foreign buildings illustrated are:—

36. *St. Peter's, Rome*, façade, from the base up to the cupola, of travertine from Fiano in the Sabine mountains; columns of the portico and the statues in connexion, of travertine from San Clemente (*Lapis Tiburtinus*).

37. *Cathedral, Milan*, erected almost entirely of crystalline limestone from Gandoglia, near Mergozzo Lake, and other localities not far away on the Lago Maggiore.

38. *Notre Dame, Paris*, built almost entirely of Tertiary calcaire-grossier of the Paris basin.

39. *Grand Opera House, Paris*—A great part of the principal façade is of Jurassic limestone from Larys; whilst the parterre is of similar limestone from Anstrudes and Ravières. Other parts of the building are also of Jurassic limestone, and of Tertiary calcaire-grossier from several localities. The decorative stones employed come from well-known places in Italy, Sweden, France, &c.

40. *Palace of Justice, Brussels*; principally of massive, crystalline, blue, Carboniferous limestone from Namur, and white Jurassic limestone from France. In a lesser degree (some columns, &c.) of Carboniferous limestone from other localities.

41. *Hotel de Ville, Brussels*; the old portion of the building is of Eocene calcareous sandstone from the vicinity; later work,

restorations, &c., of Eocene limestone from Gobertang.

42. *Hotel de Ville, Schaerbeck*, near Brussels, is of brick and Carboniferous limestone from Namur.

The only adverse criticism we would offer to this list is that some of the buildings selected for illustration are close together, or in the same city, whereby we do not get quite such a good idea of the range of European building stones as might otherwise have been the case. There was no need to have given so many examples from Vienna and Budapest, for instance, if the number of illustrations were to be so limited—though Vienna museum officials might readily be pardoned for so doing. Dresden and Brussels, again, are given three illustrations each. We should have thought it better to have brought together a few examples from Spain, Russia, and England, in lieu of some of these duplicates. However, we will not complain, for, as we have previously stated, the Vienna collection of building stones itself is a remarkable one, and well worth careful study by architects.

NOTES.

A CIRCULAR has been issued by the Council of the Institute of Architects to the effect that the meeting for the presentation of prizes and studentships announced for Monday, February 4, is postponed till Monday, February 25, at eight p.m., "in consequence of the lamented death of her late Most Gracious Majesty Queen Victoria, Patron of the Royal Institute." The Institute will be closed on the day of the Royal Funeral, Saturday, February 2. At the meeting of February 25 an address of condolence to his Majesty will be moved from the chair at eight p.m.

Buildings under the Public Health Act. It is a matter of some regret that the official law report should continue to chronicle cases which do not really lay down any principle of law, but are cases depending on the view taken by the Bench of certain facts. Last week, the Queen's Bench Division (so called by statute) had to decide whether a weighing-machine shed at Southend-on-Sea was a building within the meaning of Section 157 of the Public Health Act, 1875, which empowers urban authorities to make by-laws "with respect . . . to new buildings. . . ." The structure in question appears to have borne a considerable resemblance to a bathing-machine, and the Justices held that it was not a "building." This decision was appealed against, but was upheld. In the course of the argument several cases were referred to as governing the one under discussion—not cases laying down a principle of law, but resembling the present one in their facts. But a very slight difference may be sufficient to cause a judge to consider one structure to be and another not to be a "building," and one result of reporting and preserving such cases is to mislead persons. Each of these cases must be considered on its merits; and, as we have said, a slight dissimilarity, such as movability or unmovability, may cause judicial decisions to vary.

SIR W. RICHMOND, as President of the "Coal Smoke Abatement Society," has addressed a letter to the Secretary of the

London School Board, which has been printed in the *Times*, calling on the School Board to use the influence which its position gives it, as the largest owner of public buildings within the metropolitan area, in promoting and recommending the use of grates which will ensure perfect combustion. Sir W. Richmond considers that the Society which he represents has been very successful in procuring the enforcement of the existing law in regard to the issue of smoke from trade and manufacturing buildings, but admits that it is a greater difficulty to reach the domestic fire. He says:—

"It is in the latter direction that the society ventures to beg your assistance. Many forms of grates and stoves are already in the market which are designed to materially reduce the evil of imperfect combustion, and the society would respectfully suggest that wherever occasion arises your Board would specify for some form of these apparatus being used in its buildings. Such an example set by so influential a body could not fail to have a most salutary effect, and be of the utmost assistance to the society in its work."

I should add that a similar suggestion has been made to her late Majesty's Government, and has been received by them with a promise to put it in operation without delay and whenever possible, and even to furnish facilities for trials in order to ascertain the best form of grate for the purpose."

It is no doubt in the direction of the use of grates calculated to ensure perfect combustion that the true remedy lies—short of abandoning coal fires altogether for gas fires, which we do not think is likely to be done. As we pointed out before, the recommendation of such remedies as the use of anthracite coal alone, which has been suggested, is futile, because there is not enough anthracite available for universal use, even for a time, without sending up its price to a practically prohibitive extent. Much may be done by grates better formed for consumption of fuel than many of those in ordinary use; but it must be remembered that some of these pre-suppose special arrangements for the admission of air, which cannot always be applied in houses already built.

MR. ARTHUR WHITELEGGE, Fencing Machinery. The Chief Inspector of Factories under the Home Office, has issued a special circular in regard to the important subject of the proper fencing of machinery in motion, especially with regard to new machines. He points out that while much progress has been made in applying guards to existing machinery, new machines in other respects improved, are still sent out by the makers without due regard to this essential point; and, moreover, that precautions which are taken as a matter of course in the case of those made for export are often omitted in the construction of similar machinery intended for use in the United Kingdom. "Hence many serious and fatal accidents arise, and at best the fencing which can be carried out later by the purchaser is usually less effective and more costly, even apart from the risks attending delay. And further, it is obviously more easy when designing a machine to provide proper places for guards than to have to fit guards on to a machine designed without any provision being made for them." Among special points in the extracts appended to the circular it is mentioned that the apparently small matter of having set-screws with projecting heads on drill and lathe chucks has produced many accidents, and that many workmen will use projecting set-

screws even after the chucks have been altered and recessed to allow the screw to go flush with the chuck. No doubt carelessness (or sometimes ignorance) on the part of workmen is the cause of many accidents that need not have happened; and in the Walsall district we learn that it is a practice to paint all machine guards a bright red, as a kind of signal that there is danger inside their lines. It is noticed that American machinery is generally sent out by makers much more efficiently guarded than that made by English firms. The subject ought to have the careful attention of all owners or managers of factories worked by machinery.

Girton College, Cambridge.

SUBSCRIPTIONS to the amount of 31,000*l.* are invited towards the extension scheme which is being carried out at Girton College, Cambridge. The entire scheme, which will cost about 55,000*l.*, comprises a new hall and servants' quarters (now ready), kitchens, lecture rooms, rooms for fifty students, a chapel, a swimming bath, and additional rooms for the resident staff, to be erected after the plans and designs of Messrs. Alfred Waterhouse & Son. The old hall will, we gather, be converted for purposes of the library. Mr. Waterhouse's former designs for the College were exhibited at the Royal Academy in 1887, and were noticed in our columns of May 7 of that year. They consist of blocks of houses in red brick with black and white gables, and a gate-tower.

Professor Aitchison's Lecture.

PROFESSOR AITCHISON commenced on Monday his course of lectures at the Royal Academy on the ever-interesting subject of St. Peter's: the lecture is printed on another page of this issue. All the Professor's friends will have been glad to see him apparently in much better health than at his last year's lectures. The lectures are illustrated by a number of drawings and photographs hung on the walls, both of St. Peter's as it exists and of various other preliminary schemes of Bramante and San Gallo, and also by a number of lantern slides. Two of the architectural members of the Academy, Mr. T. G. Jackson and Mr. Belcher, were among the audience.

THE QUEEN'S DEATH.—On account of the death of her Majesty the Queen the ordinary general meeting of the Architectural Association, advertised for February 1, has been postponed to February 8, at 7.30 p.m., when a paper will be read by Mr. D. T. Fyfe on "Cretan Architecture."—The annual dinner of the Sanitary Inspectors' Association, to have taken place on Saturday, February 2, is postponed until February 15, at the Venetian Chamber, Holborn Restaurant, when the Archdeacon of London will preside.—The annual dinner of the Builders' Foremen's Association has been postponed from February 2 to February 9.—It was agreed on the 25th ult., by the Council of the Northern Architectural Association, that the following resolution be sent to Sir Arthur Bigge, Osborne House, Isle of Wight:—

"Sir,—On behalf of this Association we beg that you will be the medium of conveying to his Majesty the King and the Royal Family the deep sympathy of this Association in their great sorrow, and at the same time to express their sincere loyalty to the Throne of these Realms.—We are, Sir, for the Northern Architectural Association, President, Wm. Glover; Hon. Secretary, A. B. Plummer."

The following is the resolution passed at the meeting of the Dublin Local Section of the Institution of Electrical Engineers on the 24th ult., proposed by Mr. Porte and seconded by Mr. Ruddle:—

"That we, the Dublin section of the Institution of Electrical Engineers, desire to record the deep grief with which we have received the news of the death of our late beloved Sovereign, Queen Victoria, and that this meeting do forthwith adjourn as a mark of our sorrow. Also that the Central Institution propose to present a vote of condolence with the Royal Family, it is the desire of this section to heartily endorse the same."

LETTER FROM PARIS.

THE restoration of the dome of the Panthéon has become a matter of urgent necessity. The columns and capitals supporting the dome, the work of Soufflot, commenced in 1764 under Louis XV., are fast falling to pieces and endangering the superstructure. It is estimated that the work of repair will occupy about four years, and an important vote of money for carrying out this work is being urgently asked for.

The celebrated "Machine de Marly," near Versailles, a series of water-wheels constructed by the engineer Sualen on one of the small arms of the Seine at the time of the completion of the Chateau de Versailles, for the purpose of pumping the river water to the reservoirs there and for the supply of the celebrated cascades, is about to undergo a complete transformation. This old and powerful machine had already been modified somewhat under the Restoration, but it was found that the constant rise and fall of the Seine interfered greatly with the proper working of the supply; besides that the increasing contamination of the river water could no longer permit it being employed for drinking purposes at Versailles. The machine has therefore, for some time past, been employed only as power necessary to pump to the higher ground fresh water from the neighbouring springs. It has now been decided to replace the old-fashioned water-wheels, which have for so many years formed an interesting attraction at Marly, by modern turbines; but as it is necessary to avoid stopping the supply of water to Versailles for any time, however short, three of the old wheels will continue to work during the replacing of the other three, which will then allow the replacing of the three still remaining.

The construction of the new church of Saint-Jean on the hill of Montmartre has been stopped for some time by the authorities, owing to doubts as to the solidity of the new building. This church, which is to replace the old church of Montmartre, in which all public service has been stopped, and which has been classed as a "historical monument," is being built from the designs of M. de Baudot, diocesan architect, an old pupil of Viollet-le-Duc, and one of the most fervent advocates of a rational architecture evolved from a complete and rational use of modern materials. The building is being constructed entirely according to the system of armed cement known as the system Cottancin, and is therefore a perfect innovation in church building. The matter of the stoppage and the condemnation of the structure was taken up very strongly by Abbé Sobaux, the vicar of the parish, with the result that it was decided to allow the building to be continued if the trials of solidity proved satisfactory. These trials have just taken place and were found very satisfactory; the floors of the building, of a thickness of not more than 2 in., were found to resist perfectly the trial weight of 125 lbs. per superficial foot. M. de Baudot, whose private house is an interesting example of this system of construction and decoration, had every reason to obtain satisfaction as regards the strength of his new work, as he is himself General Inspector of Diocesan Buildings and has to report on the solidity of the many buildings in his diocese.

The city of Paris has just voted an important sum for the preliminary work of restoring and rearranging the Hotel de Lauzun, a fine old residence of the time of Louis XV., situated on the Quai d'Anjou in the Ile Saint Louis at Paris. This interesting old building, which for some reason had been spared during the troubles of the Revolution, was bought by the town some short time ago from the heirs of the late Baron Pichon, one of the most learned of French book-lovers, with the view of making it the museum of Parisian art of the seventeenth century. The decoration of the interior, which still exists in a marvellous state of preservation, is most sumptuous in style. The museum, when completed, will certainly be one of the most interesting places to visit in Paris.

The buildings at the late Exhibition are now being rapidly demolished, but nothing has yet been absolutely decided as to what will be done with the spaces left vacant. The international buildings on the Rue des Nations along the river bank are disappearing one by one. In a few weeks no traces will be left of the Belgian and German buildings. The English Royal Pavilion has been dismantled

all fittings and contents, and in a few weeks will be a thing of the past. The French official buildings, however, form a matter of more difficulty, for the various demolishing contractors are by no means satisfied with the specifications set out by the administration. It is wonderful how small are the offers obtained from demolishing contractors at present for buildings and materials which cost immense sums for their construction. The Porte Monumentale, designed by M. Binet, has been sold for the sum of 408*l.*, and the contractor for this sum enters into possession of 210 tons of iron, 260 cubic yards of timber, nearly 1,000 cubic yards of building stone, and over 7,000 electric globes. The German Pavilion has, it is said, been sold for 1,000*l.*

The following architects have been elected as members of the Committee of the Société des Artistes Français:—MM. Pascal, Vaudremer, Loviot, Chancel, Rauffin, Normand, Scellier de Gisors, Courtois-Suffit, Formigé, and Boeswillwald, the number of votes obtained at the election being in the above order.

A great discussion is taking place between the town of Paris and the State concerning the demolition of the fortifications of Paris on the west and north of the town, from the Porte d'Autueil to the Porte de Pantin. The operation, which will in all probability soon be put into effect, will result in an immediate loss to the town of somewhat over four million sterling; there will be 500 acres of ground, now occupied by the fortifications, to be purchased from the State at a cost of eight million pounds, the saleable value of the freed ground being estimated at about four million sterling. This will, however, be a great opportunity for private speculation, and some fortunes will probably be made over the future operations.

It is proposed to add to the present National Manufactory des Gobelins, the large old building which was erected in the fifteenth century, and which once sheltered the working artists who gave the name of Gobelins to this style of work. The building, known under the name of Atelier de la Reine Blanche, stands in the middle of a large piece of ground near that of the present manufactory. The addition of the original building to the present manufactory would be most advantageous, as its enlargement is much required; it would also save from destruction a building of historical interest in the arts of France.

A new and interesting scheme for the utilisation of the ground occupied by the Cirque des Champs Elysées has been brought up by MM. Detaille, Gérôme, Flameng, and Robert Fleury. They propose to construct thereon an elegant pavilion, the design for which would be entrusted to M. Girault, the architect of the Petit Palais of the Champs Elysées, and utilise the new building for the annual Salons of the French artists. At other times this "Palais des Artistes" would be available for concerts and other entertainments.

The Société des Artistes Français (Old Salon), after its internal dissensions during the last few weeks of last year, has at last appointed its Council. In succession to M. Jean P. Laurens, who resigned, they have elected as President M. Bouguereau, who, as far as art is concerned, does not exactly represent modern progress. Of course, it is a question not only of artistic but of administrative capacity, and we do not yet know what may be M. Bouguereau's qualifications in the latter sense. He is the fifth President of the Société, which commenced its career under the able directorship of the venerable M. Bailly; to whom succeeded M. Bonnat, followed by M. Detaille and then by M. F. P. Laurens. A sculptor and an architect, M. Bartholde and M. Scellier de Gisors, have been elected Vice-Presidents. M. Albert Maignan will fill the office of Secrétaire Rapporteur, with the assistance of M. Vibert (painter), M. Georges Lemaire (engraver), M. Pascal (architect), and M. Mongin (etcher). M. Boisseau, the sculptor, will continue in office as treasurer. The architectural sub-committee is composed of M. Adrien Chancel and M. Formigé. In the various separate sections, M. Henner will be president for that of painting, M. Frémiet for sculpture, M. Morot for engraving, M. Alfred Normand for architecture, and M. Gardet for decorative art, for the ensuing Salon.

Whether the new appointments will put an end to differences and dissensions remains to be seen, but it is considered rather doubtful

Plan of St. Peter's (no scale).

Fra Giocondo's Plan for St. Peter's.

and the proposal for a new building for exhibitions on the site of the Cirque des Champs Elysees, already referred to, looks like a threat of a rival exhibition. The Municipal Council has pronounced no definite opinion as yet, but it is understood to be favourable to this scheme partly because it is expected that M. Girault, the proposed architect, will have an opportunity to produce another very beautiful building. There will also be the advantage of having a concert-room for Paris in a central position; an addition very much needed, for that at the Trocadéro is both inconvenient in position and very bad in an acoustic sense.

The Champs Elysees, which would gain a new attraction by the realisation of the above scheme, is in fact much in need of a new laying out, for it has suffered terribly from the exigencies of the great exhibition, for the sake of which many fine old trees have been sacrificed. As soon as the favourite promenade of the Parisians has been restored to its usual condition, the administration will select a site for the erection of the fountain in ceramic ware which the Sèvres manufactory had erected on the Esplanade des Invalides, and which, when surrounded by trees and flower borders, will have a charming effect. It is proposed also that the portico in ceramic ware erected by Sèvres on the Esplanade shall be rebuilt either in the square of St. Germain des Prés or in that of St. Laurent.

M. Guadet, the architect of the Théâtre Français, has placed under the arcades of the Palais Royal, at the entry of Rue Richelieu, four frames of white marble in which will be placed medallion portraits of Racine and Victor Hugo by M. Barrias, and similar portraits of Corneille and Molière by M. Denys Puech. On these four frames will be engraved inscriptions recording the vicissitudes which the Théâtre Français has passed through, having been built in 1782 from the designs of the architect Louis and afterwards four times restored—in 1798 by Moreau, in 1822 by Fontaine, in 1864 by Prosper Chabrol, and in 1890 by M. Guadet.

The "Société des Miniaturistes et Eclaircisseurs" has opened its sixth exhibition in the Georges Petit Gallery. Among the best works may be named those of Mmes. Debillmont, Chardon, Marguerite Delaroché, and Camille Isbert, and those of MM. Guinier, Callias, and Zier. The annual exhibition of the Cercle Volney has also opened its doors. We need say nothing of the amateur artists who, in their quality of members of the club, indulge unfortunately in the right to exhibit a great many bad pictures. But there is a fine portrait of a lady by M. Humbert, a head of a Patrician of the sixteenth century by M. Benjamin Constant, other good works by MM. Cayron, Zeviller, and Albert Laurens, sea-pieces by MM. Gustave Garaud and Gransire, a fine landscape by M. Adrien Demont; and in sculpture, a beautiful figure of Joan of Arc by M. Levasseur, and some fine busts by M. Puech.

The death is announced, at age of 47, of M. Joseph Armand Olive, member of the Société Centrale des Architects of the Caisse de Defense Mutuelle. He was the son of a talented architect, M. Joseph Olive, who died only two years ago at Antibes. After having studied at the Ecole Centrale des Arts et Manufactures, Armand Olive was attached to the Orléans Railway Company, at Rouen. He subsequently studied architecture under his father and under M. Bénard, and since 1880 took part in important works at Paris and in the provinces. He was also professor at the Ecole Professionnelle de la Papeterie and at the Association Philotechnique; and was the author of an able treatise on hydraulics.

PORTMAN CHAPEL, BAKER-STREET.—On January 24, this chapel, which is one of the oldest existing proprietary chapels in London, was consecrated by Bishop Barry, Rector of St. James's, Piccadilly, as St. Paul's Church, Portman-square. The church and its site have been bought for 8,000l. from Lord Portman, who contributes 3,000l. towards the endowment fund, and are now conveyed by the Trustees to the Ecclesiastical Commissioners, who have assigned to the church a district taken out of the parish of St. Mary-lebone

FIRST ROYAL ACADEMY LECTURE ON ST. PETER'S.*

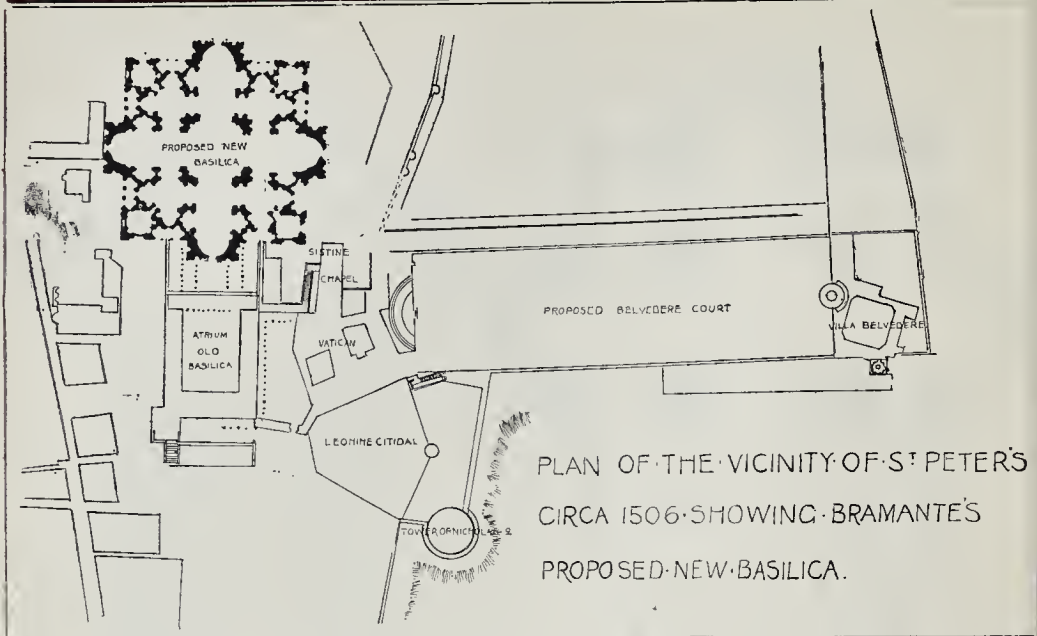

THE name of St. Peter's conjures up visions of the various impulses that were acting on mankind, when its first stone was laid by Julius II. in 1506, impulses that were dispelling the clouds of ignorance, breaking the fetters of habit and authority, and were again impelling mankind to dare to think, to reason, and to act on the results of that reasoning. Directly mankind began to turn their attention to Nature they found that it was only by observing phenomena and reasoning upon them, that discoveries could be made. This new attitude of men's minds was properly called the "Renaissance" or new birth of man's desire to use his intelligence how he liked. In the steamboat, the railway, the telegraph, the electric light and power, in chemistry and photography, we see some of the results.

Peace, comparative freedom and security had brought plenty, and must have had some effect on men's minds in Italy or in Tuscany at least, but the main reason of this new birth was the increased study of the Roman writers and the finding from them that all they knew was learnt from the Greeks, so that the Italians began to study the Greek language, till it was the mark of a neglected education not to be able to speak it—the study of the Roman and Greek literature and of Greek philosophy sometimes in a Roman dress, as the theories of Epicurus in the poem of Lucretius, "On the Nature of Things" ("De Rerum Natura").

So great was the effect of this new birth on men's minds and such hopes did it give them, that a tyrant like Sigismund Pandolfo Malatesta sent to the Morea for the bones of Gemistos Plethon, who had taught the Italians Greek, and after putting them and those of some other distinguished humanists into sarcophagi he enshrined them in his temple to Isotta at Rimini.

The Italians had learnt from their studies that the ancients were free to pursue any

* By Professor Aitchison, R.A.

CIRCA 1506 SHOWING BRAMANTE'S
PROPOSED NEW BASILICA.

studies that they chose without blame or hindrance, and to indulge in all earthly enjoyments. They saw that Alexander the Great had conquered much of the world known to the ancients, and that the Romans had a large part of the earth for their empire, and hoped that by rivalling the Romans in the fine arts they might restore to Italy the power and dominion it had under the Romans, and consequently they were on the tiptoe of expectation of enjoying the fancied elysium of the ancients. When I speak of the Italians, as a rule I mean the Florentines, and those from the cities of the Val d'Arno, who were the most brilliant and versatile of men. The only man I ever knew that can be compared with these men of the Italian Renaissance was our lamented President Lord Leighton.

I think that another of the causes of this sudden uprising of the human intellect was the long-continued discipline and austerity of the Middle Ages. There was at the Renaissance in Italy an ambitious craving to do something that would give each man an undying name in the career he had chosen, and the possession of this passion carried out to its realisation was called *virtù*, i.e., a clear view of what a man wanted and could do, carried out without regard to anything but success. It had nothing to do with "virtue," for Machiavelli constantly applies it to Cesar Borgia. This *virtù* was mostly found in Florence. We must, however, not forget that Luther was a German, Copernicus a Prussian, Descartes a Frenchman, Columbus a Genoese, the Cabots Venetians (though Sebastian Cabot was born at Bristol), Prince Henry the Navigator and Vasco di Gama were Portuguese, and we must see that the severe corporal and mental discipline, the restriction, and the austerities of the Middle Ages, though training mankind to suffer and to think, had begot a hatred of these austerities and restrictions that only wanted an example, which was got from Classic literature for all Europe to try and set itself free; and doubtless the Arab centres of learning and the speculations of the Arab philosophers had not a little aided this desire.

About the middle of the fifteenth century (1452-1498) Vasco di Gama found the way to India by doubling the Cape of Good Hope, and gave Camoens the subject for the "Lusiad," while the search for a new way to India led to the discovery by Columbus of the West Indies, in 1492, and he probably saw from his ships parts of North and South America. Amerigo Vespucci, the Florentine, had the good fortune to give his Christian name to the continent, but whether he or Sebastian Cabot saw it first is hardly settled now, though it is generally maintained that Cabot was the first—but this

was 1497. The revising of the old astronomy of Ptolemy (139 A.D.), known in the Middle Ages as the "Almagest," by Copernicus (1473-1542), Tycho-Brahe (1546-1601), Galileo (1564-1642), Kepler (1571-1630), and Descartes (1596-1650), ended in the discovery of the telescope and of the real solar system, so that the false theory of the sun and planets going round the earth, which had satisfied the world for 1,400 years, was exploded. Philosophy, too, began to flourish again in the hands of Servetus (1509-1555), Giordano Bruno (1550-1600), to whose memory Mr. Swinburne has dedicated so many of his fine stanzas, and Vanini (1585-1619), and the discovery of the law of gravity by Sir I. Newton, 1642-1727. The study of the Scriptures in their original tongues, the sale of indulgences, and the scandalous lives of some of the clergy at Rome, gave rise to the Reformation; while the new art of printing with movable metal type, and engraving on copper, made knowledge much more accessible.

The human imagery in the Romanesque and Gothic buildings had long before been improved by Nicola Pisano (1205-1277) in the thirteenth century, from the finding at Pisa of a finely-sculptured Roman sarcophagus, which he studied and imitated, whilst in the same century Margharitone (1212-1289), Cimabue (1240-1300), and Giotto (1276-1336) began to give vitality to the old Byzantine painting. The perfection of form in painting and sculpture was brought about by the great artists learning that the ancient masters produced classic perfection by the judicious selection from many models, but whether the Renaissance artists learned the secret from the numerous pieces of sculptured marble and bronze dug up, and from engraved gems found or brought from Constantinople, or from the statements of Aristotle, I know not. Our own art of architecture was made more simple, more refined and elegant, by the infusion of Roman methods by Brunellesco and his followers, though from that day architecture has but slightly advanced, and this advance has not been organic. In other pursuits the advance has been astonishing and marvellous, and continually progressing, while architecture is getting worse, for it was put in the same fetters from which all other efforts of the human mind were set free; before that time in the Middle Ages it had been one of the expressions of the human mind that was free, if not the only one, and we see what freedom then did for architecture in the sumptuous Romanesque monuments and in the marvellous Gothic creations.

I think it may be agreeable as well as useful to you if I give you a description of the

Renaissance basilica of St. Peter's at Rome, with some critical remarks upon it, for it has many claims to your attention. It was begun in the full tide of the Renaissance, at a time when the Papacy was at the height of its power, by Bernardo Rossellino, in the days of Pope Nicholas V., who died in 1455, and was again carried on by Bramante, under Pope Julius II. in 1506. Enormous sums of money were collected to defray the cost of the building from the several countries of Europe, possibly from North and South America, the Islands, and India as well. The most celebrated architects, artists, and amateurs of Italy were consulted about carrying out Bramante's design and several of the same men were engaged on the actual work. It is, I believe, the largest Christian cathedral in the world, is decorated with the most costly materials, while its dome has been looked upon as one of the wonders of the world:—

"But lo! the dome, the vast and wondrous dome.
To which Diana's marvel was a cell."
("Childe Harold," canto iv., stanza 153).

This dome of St. Peter's is visible from Tivoli to the naked eye. The cathedral, too, has the most grandiose approach of any building in Europe.

Every architectural monument must necessarily be interesting to man, for it is built by man for man, in the hope of raising those emotions which are proper to its destination; monuments that are colossal affect him unconsciously by their size, and when he reflects he must be impressed by the daring conception, and by the thought, skill, and labour expended on them; and when in addition to this, the monument has a vast dome rivalling a small mountain, it arouses in him still more wonder at the skill required to make such a mass of heavy material soar in the air. And yet, after having climbed those hundreds of steps that lead from the pavement of St. Peter's to its masonry roof, you feel as if you were walking on the solid ground, while the dome before you is the largest that has ever been raised to that height from the ground, and when you have climbed the steps that lead you to the lantern and look through the eye of the dome on to the pavement below, the worshippers look like ants, while on a clear day you can see from its brazen ball the blue Tyrrhenian sea, and the Campagna with its towns and villages spread out like a map.

Constantine the Great had the first basilica to Saint Peter built on the ruins of the circus of Caligula restored by Nero, and his architect used the place once occupied by the seats on one side as the foundation of the outer wall and the two adjacent aisles of the basilica. Bramante got two of the piers to support the

Elevation of Bramante's Design for St. Peter's, as restored by Baron de Geymüller.

dome on the same foundation, knowing that the Romans always put excellent foundations to their buildings.

In the days of Pope Nicholas V., who was elected Pope in 1447 and died in 1455, whose name was Tommaso Parentucelli, and who was born 1389 and died 1455, the old basilica was dilapidated, and he was of opinion that a more magnificent basilica should be raised in the centre of Christendom, partly for holding a greater crowd of worshippers and partly to show the great skill the Italians had attained in the fine arts. The Pope was acquainted with Bernardo Gamberelli, a celebrated Florentine sculptor and architect, who was known as Bernardo Rossellino (1499-1464). He worked with the great Leon Batista Alberti, and executed the beautiful tomb of Leonardo Bruni in Santa Croce, Florence, of which there is a cast in the South Kensington Museum.

Bernardo Rossellino designed a new St. Peter's for Nicholas V., but the foundation of the original apse only was executed, and that is all of Bernardo Rossellino's architectural work for St. Peter's that I have ever seen drawn, except the plan of it in Baron de Geymüller's book, "Les Projets Primitifs pour la Basilique de St. Pierre de Rome par Bramante," on which Bramante had worked, and, in fact, until his designs have been found we must consider Bramante's as the first design. According to the Baron H. de Geymüller, who believes himself to be the only writer of a life of Bramante who had seen all his works, it was Bramante's boast and not Michelangelo's that he would put the dome of the Pantheon on the vaults of the Basilica of Maxentius. The vaults of the Basilica of Maxentius were of the greatest span, and the Pantheon was the largest dome then known to the Italians, so you will find 83 ft. a span that the Tuscans tried to equal, and the dome of the Cathedral at Florence, a little less than the Pantheon, always aimed at in the revived Roman of the Early Renaissance.

Bramante's name was Donato Bramante of Urbino, and he was born 1444 and died 1514, aged seventy. He was a compatriot, some say a relation, of Raphael. As the first stone of the present basilica was laid by Pope Julius II. in 1506, Bramante had only eight years at the end of his life to complete his design and to see

it carried out, and in the latter part of his life he had palsy; but even that was only one of the misfortunes that happened to him. His plan was a Greek cross, which met with opposition in favour of the Latin cross, and no doubt there were other objections, both artistic and ritualistic, and most of the architects, artists, and amateurs, gave sketches or models of their own. We can but regret that Bramante did not have a complete set of drawings and a perfect model made to show his original design, as he was undoubtedly the greatest architect of the Renaissance. The Pope forced Michelangelo to have a perfect model made of his dome, and one is still in the model room at St. Peter's, showing the iron ties to the buttresses, but I cannot say if it is the original.

I was bound to try to give you some sketch of the state of men's minds when this great work was begun, and it would have been interesting to the architects to hear the complete history of this building, if only to show them that we are not the only men who have been harassed and thwarted, but that our forerunners and betters have even been worse treated; but to write a history of the designs and execution of St. Peter's would take at least ten years to read up, as the sources of information are contained in works not to be numbered, and often a whole book has to be read through to furnish a not very important passage on the subject. We ought, therefore, to be thankful to Baron de Geymüller for the immense pains he has taken to give us a complete life of Bramante, of his work on St. Peter's, and the influence he exercised on succeeding architects of the building and on Europe generally, and to Letarouilly for his "Vatican."

The present basilica is externally of travertine stone, its front consists of a Corinthian tetrastyle portico, with a pediment and two bays beyond on each side, finished by deeply projecting pilasters, and beyond an archway at each end flanked by a pilaster. Between the columns a wall is built up so as to leave only three-quarter columns with windows on the first floor, with balconies, from one of which the Pope's blessing is given, the whole front is crowned by an attic with windows. The front is by Carlo Maderno, and is said to be 379 ft. long and 148 ft. high. On the pedestals of the crowning balustrade our

Saviour and the Twelve Apostles stand, each statue being 18 ft. 6 in. high. The narthex is 468 ft. long, 50 ft. wide, and 66 ft. high. On the pavement of the nave of St. Peter's, its length and that of some of the principal cathedrals and churches of Europe are given:—St. Peter's, total length 613 ft. 6 in.; width of nave 87 ft. 6 in.; width of aisles 33 ft. 9 in.; St. Paul's London, length 520 ft. 6 in.; Milan Cathedral, length 443 ft.; St. Paul's, Rome, length 419 ft. 3 in.; St. Sophia, Constantinople, 366 ft. 6 in.; length of transept of St. Peter's 446 ft. 6 in.; the height of the nave of St. Peter's by the door 152 ft. 6 in.

The dome of St. Peter's is said to be 139 3/4 ft. inside diameter, height from pavement to base of lantern 405 ft., from pavement to top of cross 448 ft.

Although the present basilica of St. Peter's was begun in the time of Nicholas V. who died in 1455, nothing of what B. Rossellino designed except the foundation of the choir remains, and the present one of Bramante may be said to have been begun in 1506 by Julius II. when he laid the first stone. The basilica was consecrated November 18, 1626, by Urban VIII., being 120 years from the laying of the first stone by Pope Julius II.

During this time there were twenty Popes: Julius II., Leo X., Adrian VI., Clement VII., Paul III., Julius III., Marcellus II., Paul IV., Pius V., Gregory XIII., Sixtus V., Urban VII., Gregory XIV., Innocent IX., Clement VIII., Leo XI., Paul V., Gregory XV., Urban VIII.

St. Paul's, London, only took fifty-eight years and was under six sovereigns; and we may be thankful for one good action of James II.—he preserved us from Wren's original design. Although Wren was bitterly assailed by pamphleteers, he was enabled to carry out successfully his second design.

That pinchbeck Michelangelo, the Cavalier Giovanni Lorenzo Bernini, by the order of Pope Alexander VII., surrounded the square in front of St. Peter's with these porticos that form so grandiose an approach to it, of which I shall say something hereafter.

As Bramante died March 11, 1514, from at least that date all personal work must have ceased, and every intention of his must have been gathered from the drawings on the left, and any of his merely . . .

tions must have been learnt from his assistants, pupils, and friends. Raphael was both a pupil and a friend, and Bramante expressed his desire to Pope Leo X. that Raphael should be entrusted with carrying on the work on account of his mastery of construction. All we know of Raphael as an architect is the Pandolfini Palace at Florence, which he is supposed to have designed; and, if Baron de Geymüller is right, the Farnesina Palace at Rome, usually attributed to Peruzzi.

Baron de Geymüller has not only gone through all the drawings, sketches, and models of St. Peter's he could find in Europe, but has also looked over the sketches of the artists who visited Rome, and who have shown the works at St. Peter's in progress, and has given us as well a plan showing what each architect has done, and I presume when the architects were known and their work is not recorded by him on his plan, the work done did not materially alter Bramante's arrangement, for he only shows the work of the following:—

B. Rossellino.....	1450
D. Bramante.....	1506 to 1514
Antonio da Sangallo.....	1516 to 1546
Michelangelo.....	1547 to 1564
Carlo Maderno.....	1607 to 1622
and	
Giovanni Lorenzo Bernini.....	1626 to 1680

Fra Giocondo and Giuliano da Sangallo were appointed to assist Bramante during his illness—November 1, 1513, and January 1, 1514—and after his death on March 11, 1514. Raphael and Giuliano da Sangallo replaced him as architects at St. Peter's. Giuliano da Sangallo retired July 1, 1515, and Fra Giocondo died the same day. The four piers of the dome were built and vaulted over, and had at least a pendente up to half the circle in the pendente, as shown by Martin Heemskirk's sketches, dated by Baron Geymüller 1520 to 1536; and Raphael died April 6, 1520.

As illustrating the extraordinary versatility of the artists of the Renaissance, there is a story told about Giuliano da Sangallo, who was a carpenter by trade, which then involved the carving of wooden statues and the inlaying of wood with lighter or darker wood in ornamental patterns, which had just become the fashion, artistsmen as the best hand. The stalls were being put up in the cathedral of Florence, and Lorenzo the Magnificent used to look in at the work after his dinner, and talk to the craftsmen, who said it was a shame that Giuliano Giamberthi, the best inlayer, was not employed, and Lorenzo said, "Send him here," and he was employed, and Lorenzo was struck with his cleverness and resolution. One day Lorenzo said to him, "Giuliano, the Duke of Calabria has declared war against me, and is besieging one of my border castles, which I well know is much dilapidated, so pick up your tools, go there, and repair the castle; my gunners, too, are very bad, so when you have repaired the fortifications put my gunners in the right way." Giuliano did so, and when the Duke found the fortifications were repaired and the gunners aimed well he raised the siege. Lorenzo then set Giuliano to supply some town with water, and afterwards got him to design and carry out a monastery outside the Porta San Gallo. Giuliano found in the trenches a Classic Ionic capital of peculiar form, had it copied and used for the monastery, and after this time whenever Lorenzo saw him he called him "San Gallo." The Florentines were proud of their family names, so one day Giuliano said to Lorenzo, "Why do you always call me San Gallo? My name is Giamberthi, and I shall lose my family name." To which Lorenzo replied, "This is not losing your name, but gaining a more honourable one for yourself," and after that he and his brother, the old Antonio, called themselves "San Gallo," and their nephew, Antonio Piccone, called himself San Gallo as well.

I give you now some illustrations of St. Peter's, with plans and views of some of the Gothic cathedrals and churches, for you to see how small the Gothic points of support are to those at St. Peter's.

THE LATE MR. J. BURNET.—A correspondent in Glasgow points out that in the report of the Institute meeting in our last issue we gave the name of the deceased architect as "Mr. J. J. Burnet," whereas the name of the senior of the firm who is dead was Mr. John Burnet. We reported the announcement, however, as made by the hon. secretary, who gave the name as we printed it.

COLOUR IN ARCHITECTURE.*

THE present paper makes no pretence to be anything more than a starting point for discussion. There are certain features of architectural practice which are of interest, not to architects only, but to the members of the allied professions who co-operate with them in their work. The fulfilment of the task of the master builder involves many subsidiary operations on the part of the carver, the painter, and the decorative and industrial artist in general. Some of this subsidiary work is specially attractive, and is of a kind that appeals with greater force to the taste of the public than the more purely architectural qualities of the whole structure. There is accordingly some danger lest the essentially subordinate character of all this decorative work should be misunderstood, and the predominance of what is architectural in the architectural monument a little obscured. It will be remembered that the late John Ruskin in his "Lectures on Architecture and Painting," and also in the preface to the second edition of the "Seven Lamps," enunciated an extraordinary paradox to the effect that this decorative work just referred to as subsidiary is, in fact, the essential part of architecture. "Artistic and rational admiration" of a building, he stated, "attached itself wholly to the meaning of the sculpture and colour on the building. . . . The fact is," he says, "there are only two fine arts possible to the human race, sculpture and painting. What we call architecture is only the association of these in noble masses or the placing them in fit places." No one in the present day regards this famous utterance as anything more than an example of the aberration of genius. This summary condemnation of "what we call architecture" in the preface to one of the most interesting and suggestive books ever written about the art is not accepted even by pronounced Ruskinians; yet there must have been some reason for the assertion, some influence abroad in the artistic atmosphere of the times which suggested the paradox. This influence exists, and is perhaps still more potent in our own immediate day than it was half a century ago. It is the influence of painting.

Painting may mean two things. It may mean colour, or it may mean the life-like presentation of natural objects. It is in the latter aspect that we find it presented chiefly in the writings of Mr. Ruskin, who is possessed throughout with the spirit of naturalism, but in the present day, painting appeals to us not so much as an art of representation as in its more refined manifestations through pictorial effect and colour. In these aspects of it the art of painting is exercising to-day an overmastering influence, in which its only rival is music. It is as pre-eminent in public estimation as it was in the Italy of the fifteenth and sixteenth centuries, and it tends to affect the other arts with a desire to imitate its characteristics. The picture is so attractive in the eyes of the public, that those who serve the public in the other arts of form cannot help trying for pictorial qualities. The strength of the influence of painting on sculpture was very marked in the statuary of the recent Paris Exhibition, and the same influence is by no means inoperative in the case of architecture. Pictorial effect, or what architects call "picturesqueness," is one direction in which this influence is exercised, and another is colour. To aim at a pictorial use of colour in architecture is in accordance with modern tendencies. The fashion of the day tends to the exaltation of the picturesque in the arts generally, and there is of necessity a likelihood that the analogy of painting may be pressed too far, and the canons of pictorial art applied too crudely to the other arts, the principles of which are in many respects essentially different.

This being the case, it may be worth while asking the question, What after all, is the true place of colour in architecture? It is the aim of what follows to facilitate the discussion of this question by clearing it from some of the confusing side issues which tend to complication, and pointing to some considerations which must form the groundwork of any useful discussion. The main thesis of the paper may be stated for the sake of clearness at the outset. It is argued here that in colour we have an element of architectural effect of great artistic

possibilities that is at the same time not an essential element of architectural effect. In other words, colour is not necessary to architecture, though to certain forms of architecture it may add a considerable æsthetic charm. These forms of architecture to which colour is a useful auxiliary are not the highest forms. The nobler the architectural qualities of a monument, the less demand is there for any such adjunct. Architecture, it is maintained, is an art of form, not of colour. All that is really architectural in architecture is form; the only quality that may claim a place beside those of form is not the quality of colour, but that of texture, and texture, as we shall see, is much more inherent in a fabric than colour. The architect who is to lift his art in the present day to the level, say, of the art of Wren or of Bramante should stiffen himself even into asceticism in the resolve to make his work primarily architecture, not painting; that is to say, a great austere art of form, expressing itself in imperishable stone, not a lovely and attractive toy, however gaily dressed in the hues and shimmer of pigment or of gold. At the risk of seeming to burden the paper with too much theorising, we may devote a few moments to the fundamental question, What are the essential elements of architectural effect? What qualities must a structure possess before we can term it a work of architecture? Mass is, doubtless, the first element to notice, but this it is not always possible for the designer to secure. The grandeur gained by imposing size, the sort of grandeur which is the primary impression one receives from the exterior of Mr. Bentley's new cathedral at Westminster, is not always within the architect's power to compass; it depends on the nature of his task and the resources of his clients. The element next in order—proportion or composition, *i.e.*, the subdivision of the mass and the grouping of the parts according to an artistic scheme—is in the designer's own hands, and if he fails here nothing can really save him. It is the chief artistic function of the architect so to distribute the spaces of his building that its outward show may satisfy the eye with a fine æsthetic effect of proportion and grouping, and great success here, as in the case of Sir Christopher Wren, lifts the artist at once to the highest rank among his fellows. This is, however, not in itself enough. To subdivide a mass and group its parts and its openings in pleasing relations is not enough, if the parts are mere plain parallelepipeds and the openings are bare unframed holes cut in a wall. A certain apparatus of minor features is requisite for the purpose of lending accent and significance to the divisions, and doing all the artistic service to the structure which can be rendered by frame, or border, or plinth, or cresting. The most important of these features is the moulding. Mouldings explain the use and significance of a fabric by emphasising its parts and divisions, which all depend on the purpose it has to serve; they clear the construction by the accent they throw on points of junction, on base or crowning member; they minister to beauty through their aid to composition in linking or severing part and part, in framing the naked aperture, in enriching by repetition in bands of light and shade the pleasing or significant line. Without these features, of which the moulding is the chief, the structure cannot be artistically set off and clothed, and without the aid of these the æsthetic effect of architecture cannot be fully obtained.

It is maintained here that the qualities just indicated are all that are essential to the æsthetic effect of architecture, and that no further element, such as the element of ornament or of colour, is really needed. That a building without ornament or colour can give the full impression of architectural beauty is perhaps a hardsaying, and many would hesitate before surrendering as non-essential these attractive features. Wren's work, however, brings the matter to a practical test. There is no colour and very little ornament—and this all of a commonplace kind—on Wren's City churches; but do they on that account take a lower architectural rank than would otherwise be the case? Where is the decoration or colour on the High School at Edinburgh, or on the east front of the Old University? Robert Adam designed for the latter decorative sculpture in the form of colossal statues on the balcony above the columns of the portal, but they have never been added. Is the building architecturally any the worse for their absence?

* A paper read by Professor Baldwin Brown at a meeting of the Edinburgh Architectural Association on January 16.

The Greek temple at Paestum in Southern Italy exhibits now no ornament or polychrome decoration, yet it is one of the most perfectly satisfying structures to the architectural sense that the world has to show. Among mediæval buildings there is a very conspicuous test-case which gives us a definite issue. The two churches of S. Marco at Venice and St. Front at Périgueux in Western France are curiously, though only accidentally, alike in form, but no difference could be more striking than that between the artistic effects of the two interiors. In S. Marco, golden domes are upheld on jasper walls, and hang over a pavement fretted with the glowing tints of oriental marbles. The effect of colour is of a sumptuous richness elsewhere univalued. In contrast to this the interior of St. Front is one of puritanic plainness. There is absolutely no colour, and hardly a touch of ornament. All is pure form, and dependent for its æsthetic effect on the most austere architectonic beauty. Yet let us hear what is said about St. Front by the authors of the recent monumental history of ecclesiastical architecture in the West. It is one of the few buildings about which these writers kindle into something like enthusiasm. "In all the world," they exclaim, "there is no architectonic creation that in pure beauty is its equal. . . Here is architecture in the absolute, disdaining all collaboration of the decorative arts. One or two unpretending plaster-caps, only what is barely necessary in the way of mouldings to mark the line of springing of the arches—that is all the detail; it is probable that no provision was ever made for adornment in colour. The builder has given himself over entirely to his artistic sense of form, to a harmony of clearly defined proportions that carries its own sufficiency with it. One can linger long in this incomparable interior without ever becoming conscious of its entire bareness of decoration, and when we do feel this, it gives us no sense of poverty, but only of the inevitable. This austere artistic realism strikes us with all the more admiration in that it lifts itself to its lonely height out of an age that delighted above all things in decorative variety, in show and glitter, in childish pleasure of the eye. The unknown master of St. Front possesses in all the wide field of architecture only one compeer of equal mind, the great Bramante. To Bramante, also, the architectonic idea presented itself in such purity, that all ornament seemed to him a needless parade, and of artistic details only such were allowed as seemed necessary for the earthly clothing of the Ideal."

If there is any element of architectural effect after composition and details that may claim to be of the essence of the art, it would not be decoration nor colour, but surface-quality or texture. The surface of a building material should be so handled as to express the character of that material, and it derives from the intrinsic excellence of the material thus expressed a certain æsthetic value. This value is enhanced when the history of the fabric has been written there by the caressing fingers of time, and the surface has gained that expressive play of light and shade which makes a bit of Greek or mediæval walling in itself a thing of beauty. But building materials to have beauty of surface-texture need not be weathered. The Parthenon must have had this beauty when quite new, for the surface of the finely dressed but unpolished marble was an index to the quality of the material. Here in Edinburgh, look at the half columns on the two buildings on the east side of St. Andrew-square on either flank of the forecourt of the Royal Bank. They have been there for a hundred years but time has not corroded them. A mellowing influence it may have exercised, but the surface quality is still the outward expression of that molecular structure on which the excellence in a utilitarian sense of the building material depends. Or, to take a London as well as an Edinburgh instance, we may note the surface quality assumed by Portland stone in the atmosphere of the metropolis. The alteration of a greyish white and rich sooty black on the exposed and protected planes is singularly telling, and St. Paul's, St. Martin's-in-the-Fields, and other structures in this material owe not a little to this effective peculiarity. Why other building stones should in the London air degenerate to a lifeless mud-colour, and the Portland stone tell out to all time so bold and right, I do not know, but the phenomenon seems characteristic of the material, and as

such is its expression—an outcome of its inner constitution, in virtue of which it becomes the trusted vehicle of the architect's highest conceptions.

This texture is thus a noble and expressive æsthetic quality, very near to the essential character of architecture. It has been necessary to dwell upon it because it is often confounded with the quality of colour, with which, however, it has only an accidental connexion. It is true, of course, that most materials weather to colour as well as to beauty of surface. Owing to the fact that Pentelic marble contains minute particles of iron, the old Athenian buildings have assumed in time a rich golden hue, now known to be nothing more nor less than rust; and every one has admired the beautiful tints of old tiles and brickwork in our own domestic architecture. This is, of course, in the nature of a happy accident, not a piece of calculated effect. The case is different when certain materials have from the first inherent beauty of tint. To build with such, is necessarily to build with colour, and the element of colour comes here inevitably into view.

The general tint of a building stone, the hue of brick or fling, undoubtedly count for a good deal in architectural effect; and where two materials are equally good from the tectonic point of view, the one with a more pleasing colour is immeasurably to be preferred. The Redhall stone, so much used in the Edinburgh buildings of three generations back, has at times a beautiful golden hue, which certainly accounts for part of the architectural charm of the north side of Charlotte-square or the Register House. The cold grey of the same material from other beds, as seen in the High School, is in itself, perhaps, a little less pleasing. But would any practical architect be so far affected by this as to reject the grey Craigleith sandstone for an inferior substance of a warmer hue, like the reddish stone now so much employed? Surely the harder, more durable, and in every way finer material would on architectural grounds be preferred? In like manner would any London architect who could build in Portland stone reject it because of its coldness of hue, or in monumental work prefer brick to stone because of its warmth of colour? The gleaming white stone so much used in Paris, as in the effective exterior of the new Orleans railway station, is a beautiful material though entirely colourless. The inherent colour of a material is not, like texture, an index to its actual constitution. It is more of the nature of an accident than the outward expression of structure, and ranks lower in architectural importance than texture. A good building material will look well and weather well but need not be of any distinctive colour. Only when other things are equal should considerations of the colour of a material influence the choice of it. If, as is here contended, the architect who has a sense of the monumental will choose his stone or bricks primarily for their characteristics as building materials, and only in a secondary sense for their colour, then colour even in this most natural form of it is acknowledged to be a non-essential, though a valuable, quality.

We pass now from colour inherent in materials to colour deliberately applied either as incrustation or in the form of pigment.

There will rise up here before the mind's eye, like fairy pavilions at the wave of a genie's wand, a crowd of lovely structures, old and new and of every land, of which colour is the distinctive charm. Colour in paint or inlay or panel or film of gold glances and glows from them all. There are the pylons of Egypt gay with painted figures and picture script; the stuccoed walls of Babylonian palaces encrusted with enamelled tiles; the Mycenaean house that sparkled with metal appliques and inlaid pastes of oriental blue. The Greek temples were not pure white, but were pranked with coloured guilloche or fret and with golden stars on roofs of skye blue, and threw up their decorative sculpture from a background of full vermilion or ultramarine. The huge Alexandrian piles of brick and concrete were faced with veneers of oriental marbles of every hue, and the same materials, sawn out of every outland quarry, shone on the walls and pavements of Imperial Rome. The new Rome of Constantine rears above her varied marble walls domes all opulent within with golden mosaics, while the Early Christian artists of Ravenna with finer taste relieve against a background of blue their stately pictured forms

of Apostle and of Saint. While the Byzantine tradition of colour, mingling with old oriental elements, kindles the golden lights and fires the deeper gules and azure of the fretted Moorish roofs, and further east the glories of Babylon are revived in the tiles and inlays of Bagdad or Ispahan, in the mediæval churches of the north the interiors were aglow with paint and gilding in the carved woodwork, and with blood-reds in the hollow of the sculptured leafage and the mouldings, while the windows poured in a coloured light thrown back from the deeper hues of Saracenic hangings between the pillars of the nave arcades. The chapels and the halls of the Italy of the early Renaissance were habited within in every part with mural pictures, framed and extended by well-composed decorative motives. And, apart from these more ambitious structures, what a feast of colours, brilliant or subdued, is offered by the domestic buildings of wood and brick and tiling in all the lands of the North! Garish on Norwegian or Russian timber-houses, more mellow on the tiled cottage of Surrey or on Scottish harling, the tints of the homely fabrics seem to join with the splendours of church and palace to annunciate the universal rule of colour.

With the flag of colour flying so high upon the mast, how can a reader of a paper before an architectural audience venture to dethrone this element from among the essentials of architectural effect?

It must be said in explanation that there is no desire here to depreciate in any degree the æsthetic charm of colour. No admiration can be too great for the beauties of colour, sumptuous or delicate, which the various structures just glanced at afford to us. We have, however, an argument in hand and must consider the subject from every point of view. Plato often asks in his dialogues, Whither is the argument leading us? It is not what we secretly desire to prove that will necessarily come to light. We must follow the argument, and where it lands us we must rest. Now the argument here seems to lead us to a conception of architecture that rises in monumental dignity above the need of these artificial adjuncts, to an art that at its best is an art of form, and only an art of colour when its own best effects are denied to it.

A consideration of the sort of buildings noticed above does nothing to alter this conception. The majority of them are not of the most monumental materials, and the significance of this fact we shall presently see. The Egyptian temple, it is true, was of stone, but the forms of it copied in the crudest fashion far slighter structures that preceded it. The storied wall of the pylon is just a cunningly-woven curtain imitated in stone, just as the columns of the halls within, though of vast bulk, are simply overgrown papyrus reeds without real monumental character. The Greeks, when they petrified the timber and mud-brick forms of their temples, had the wit to stamp upon them an essentially lithic character, so that they not only were stone, but looked stone. They do not go so far, however, as to abandon the old practice of painting upon them ornaments. The use of pigment in this fashion on the finely grained Pentelic marble was a matter rather of tradition than of artistic choice. We cannot safely found any æsthetic theory as to the colouring of stonework on this feature in Hellenic practice, because the builders of the first monumental temples were in a way forced into this use of colour by its established vogue in the earlier and still common structures in wood and plaster. In the case of the mediæval churches in the lands north of the Alpine barrier, we have no knowledge as to the extent to which colour was actually applied to the exterior. Traces of polychromy on the sculptured figures outside the French cathedrals were observed in the last century, but I know of no other evidence. The details of the interior stonework were certainly often treated to a considerable extent with colour.

With the exceptions just noticed, all the notable instances of polychromy in the buildings instanced are of colour applied in veneers of a rich over a poorer material, or in the form of pigment on to wood or plaster. It is impossible to pretend that the marble veneer—invented, it seems, at Alexandria, spreading thence to Rome and Byzantium, and revived later in mediæval Italy—is a satisfactory architectural expedient. Mr. Ruskin, who was so severe on shams, might have found in the beloved Florence some very appropriate themes

* Dehio u. von Bezold, Kirchliche Baukunst des Abendlandes. I. 337.

for sarcastic comment. Is there any architect whose ambition would be satisfied by building a church with a western façade like that of the Duomo at Florence till they venerated it up a few years ago? Nor is the surface of stucco over rubble or brickwork a very noble form of artistic expression. Buildings of wood, though full of delightful æsthetic character, are not monumental.

The point which emerges here is of the essence of the argument of this paper. From the side of the æsthetics of architecture, and from the side of history also, the argument seems to lead us to the conclusion that monumental stone architecture, where the outward aspect of the fabric expresses the structure, and the surface-quality is an index to the nature of the material, not only does not demand but rather rejects the aid of colour, while, on the other hand, the less noble materials just indicated require, or, at any rate, open themselves to, an application of the kind. If a veneer is used, colour must almost necessarily be considered in its selection. Colour justifies the employment of such incrustation, whereas if used to give the impression of substance it would be a mere fraud, because the actual substance behind it is of quite a different and inferior character. When the material is used primarily for the sake of its fine colour the logic of the situation seems really to require its employment in thin slabs, and so to justify the veneering process. Such fine material is *ex hypothesi* rare, and economy demands that the most should be made of the available supply. Wood and iron or steel when exposed to the atmosphere absolutely need some coating or surface treatment to preserve them, and when this is provided by paint it would be absurd not to take full advantage of the great characteristic of paint, its colour-producing quality. Plaster does not perhaps need colour, but in an artistic sense it seems to thirst for it. In dealing with these materials we are at once transported, as it were, into the world of colour, and have nothing further for the moment to do with architecture in the purely monumental aspects with which we have been dealing. We may turn from this ideal of architecture as a pure art of form to consider the application of colour to materials which we can hardly imagine as existing without it. The subject of colour schemes, harmonies of colour and the like, cannot of course be entered on. The considerations with which we are here concerned are prior to all such special questions of artistic judgment.

On the treatment of woodwork a good deal might be said. Wood, like stone, when of fine substance, has its own surface-quality, and one admires it in the rudely-dressed oak beam of the old-fashioned cottage, as much as in the polished mahogany of a Chippendale chair back. Wood weathers delightfully on exteriors, but its surface has commonly been treated with a drench of some kind if not with pigment. Examples, in our own country and abroad, of the polychromatic treatment of woodwork are too well known to need mention here.

Among metals, bronze or copper and lead may be left to themselves to acquire by time their fine patina, but iron or steel are terribly sensitive to the damp in the atmosphere. Even under the favourable climatic conditions of the drawing-room fireplace, the housemaid has hard work to keep the steel grate up to her ideal of shininess. Exposed ironwork practically must be painted, and the buildings of the two last Paris exhibitions showed some notable examples of polychromy in the treatment of this material.

Of far greater importance is the question of the colour treatment of plaster. As a mere matter of acreage, the surface of plaster, at any rate in the interior of our buildings public and private, is far greater than that of all other materials put together, and its polychromy is one of the most practical of artistic questions.

It has just been said of plaster that in an artistic sense it seems to thirst for colour. What is meant by this will be seen if we cast our eyes backwards for a moment, and take a glance at the past.

In our treatment of plaster we have degenerated from earlier practice. In classical times, when plaster-work, at any rate in its technique, was better than it has ever been since, the application of colour was evidently held to be the normal finish of the plasterer's task. Vitruvius contains a passage on the subject that is of the highest importance and interest.

He gives a description of the methods of mixing and applying the successive coats of plaster to a wall—they are seven in number and the last is made with lime and marbledust, and finally polished till the surface of gleaming white would actually reflect the beholder's face as in a mirror. But the description does not stop here. Vitruvius goes on to represent the painter's work as following at once on the plasterer's, as if the same hand were to be engaged on both. As each successive coat of stucco had been laid on before the previous one was dry, so now the painter must be prepared with his pigments and brushes to apply his colour on the finely-smoothed but still wet surface of the finished intonaco. Granted that all this is deftly done—that the plaster is duly macerated, the coats laid on at the right moments and fairly smoothed, the colours carefully applied the instant the final layer is brought up to its exquisite surface—then will the work abide for ages, the stucco will not blister or crack nor the colours wash off or fade, and the whole will preserve its dainty brightness unroughened and undimmed.

The process Vitruvius refers to is, of course, that known as a *fresco*. It is the most simple as well as the most effective of all processes of painting, and for interiors, at any rate in the form of flat tints or simple decoration if not of the mural picture, there is no reason why it should not be employed to-day as it was of old. If it were an established principle that no plaster work was to be considered finished till it was tinted a *fresco*, what tasteful rooms and staircases we could have at a nominal cost!

There is no painted surface (save, of course, that of a fine oil picture by a great master) so artistic as *fresco* on well-finished plaster. It does not make a skin over the surface with a streaky texture of its own like the "one, two, or three coats of oil paint" we are so familiar with, nor roughen it up with the surface, pleasing enough but coarse, of distemper. *Fresco* has its own characteristic semi-lustrous face, but when laid in flat tints leaves to the ground its own proper surface. There is no mystery about colouring in *fresco*. Here are some bits of ordinary room-wall plaster painted over a long while ago with common earth-pigments, mixed with water alone. There is no binding material or varnish of any sort, yet the wet finger will not bring any of the colour away, and twenty years has brought no change or deterioration. Some old bits of Roman plaster coloured a *fresco* are shown for comparison.

In the Vitruvian plaster work the finely-finished surface of the final coat continued even when tinted to play its part in the artistic effect, for the ancients evidently considered that its polished whiteness would gleam through the transparent veil—it is not a coat or skin—of pigment. This use of the white ground to keep up the brilliance of the final effect is in accordance with those sound artistic traditions which prevailed in the past, so long as the arts and the crafts were one. To carry as much as possible of the value of one process on into the next is a maxim as sound from the point of view of economy as of art. If there are modern decorative painters to whom the plasterer is a servant rather than a fellow-worker, and who get their lights by loading with white upon a heavy bed of pigment they might take a lesson at the hands of the classical frescoist.

The polychrome treatment of plaster culminates in the mural picture, in *fresco* if possible, but, if not, in some one of the practical modern processes which permit the work to be done directly on the wall. The picture painted in the studio on canvas and then gilded in its place cannot but be regarded as a *pis-aller*, a modern confession of our degeneracy in the decorative art. There can be no attempt to discuss here the special æsthetics of mural painting, its conventions, the extent to which it may admit perspective and light-and-shade naturalism and action, or the relative places in a scheme of the storied panel and the more purely ornamental framing and filling. Only those features of it may be mentioned in which the architect of the building would feel a special concern.

It stands to reason that over all undertakings of the kind the presiding genius must be the architect. He need not concern himself much about the pictorial execution of the designs, but is bound to be greatly jealous in the matter of colour. Where he has gained by the use of his own materials a certain colour-effect

he is bound to exact from his decorative painters a due correspondence with it in their own scheme. He has, however, the primary and more essential task of setting out the spaces that the applied polychromatic decoration has to fill. He must assuredly make this part of his design. We have seen already that in the view of architecture taken in this paper, such polychromy is not an essential part of his effect, either on the exterior or interior view. If he chooses to finish interior and exterior alike with fine stonework, expressing in form and texture both the structure of the fabric and the character of the material, then the decorative painter and the inlayer and the glider have no business in the place. It must be for him to decide what he wants from them, or whether he needs their aid at all. An excellent example of what should always be done in this matter is to be found at the Catholic Apostolic Church in Edinburgh, built by Dr. Rowand Anderson, and now in course of decoration by Mrs. Traquair. Here is an exterior in monumental stonework, with pleasing colour in the material, but without polychromy. In the interior the spaces are mapped out for decorative painting by the use of plaster and the omission of dressed stonework. The painter comes and proceeds with confidence in assured accordance with the main design. Hence when the decoration is finished on wall and roof alike the result will be one of the most complete and interesting works of art that is anywhere to be seen.

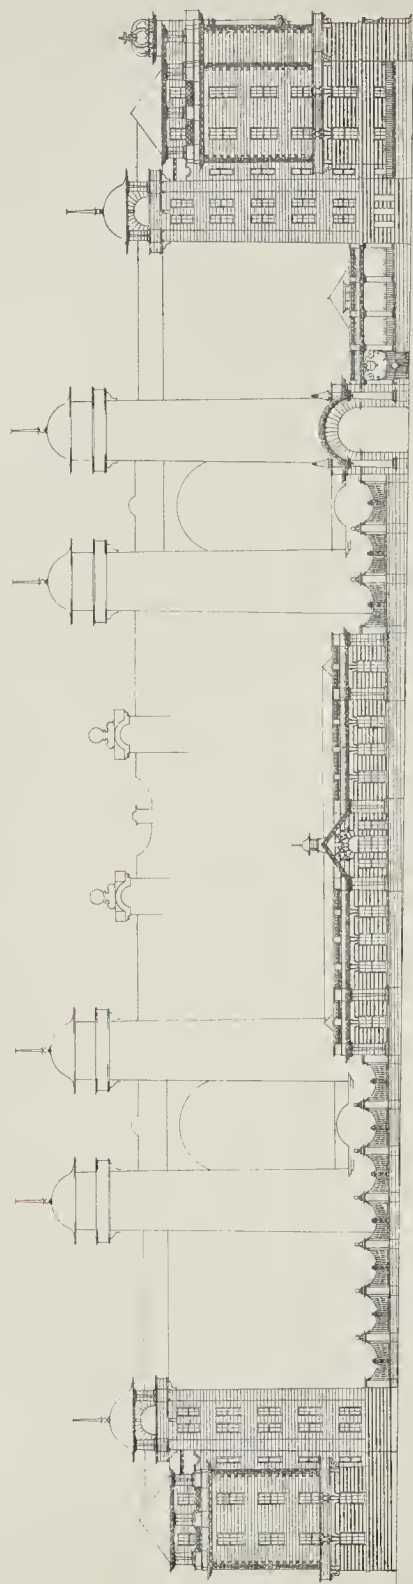

A conspicuous instance on the other side is the interior of St. Paul's in London. The difficulty which has been felt here all along, and which is still unsolved, is due to the fact to which it is no use shutting our eyes, that the designer of the building had no idea of a scheme of polychromatic decoration. He finished the whole of the interior, save the domes of the roof and their spandrels, in fine stonework, and left no hint in word or deed that he ever meant it to be coloured. The domes and spandrels are finished in plaster over brick, and there is distinct documentary evidence that he contemplated painting on the smaller ones, and on the great dome mosaic. Richly coloured Greek marbles we also know were ultimately to be used in the canopy over the altar. In view of the importance of the matter in question, it may be worth quoting the words of the *Parentalia*. On page 291 we read that (under the cupolas of the roof) "the arches and wreaths being of stone carved, the spandrels between" (and of course the domes themselves) "are of sound brick invested with stucco of cockle-shell lime, which becomes as hard as Portland stone, and which, having large planes between the stone ribs, are capable of further ornaments of painting if desired;" while in a note on page 292 we are told that "the judgment of the surveyor" (Sir C. Wren) "was originally, instead of painting in the manner it is now performed, to have beautified the inside of the cupola with the more durable ornament of mosaic." This is really all the encouragement in an affirmative sense that the decorators get from the architect himself, while the walls of the noble church are simply eloquent in their protest against the paint and gilding and marble veneers and stencilling and script, with which they have periodically been treated in the past, and are now actually attacked. With time, the stone has taken on itself "a most beautiful patina", and is far more lovely to-day in colour than any coating which is likely to be laid over it. It has everywhere, where left untouched, the surface-quality of a noble and efficient material, and it is positive vandalism to overlay this with heavy unrelieved gilding such as is now being applied. The words just quoted from the only authority which exists about Wren's intentions ought to be on this point conclusive. There is a distinction drawn between the carved wreaths which are of stone and the surfaces of plaster. The latter may be painted, but the inference is very strong that the stone wreaths were regarded as needing no such addition.

There are two plausible motives for the treatment now apparently adopted, but it is

* The Portland stone in the interior of St. Paul's has taken upon it a warm but light shade of golden brown, that is not like the usual patina of the material when used in exteriors. It is not a uniform flat tint, but is pleasantly varied. Whether this is due to time, to the effect of the London atmosphere, or to the varying treatment in different places in the past, does not concern us. As it is now, it satisfies the eye, and would not be improved by spots of gilding or inlay.

argued here that they have no such validity as to counterbalance the grave objections that exist to interfering with an architectural surface completed by the designer in fine material and never intended by him to be touched. One motive is the very natural ambition to have a rich and sumptuous interior effect. Such an effect is in itself desirable enough, and the builder of St. Paul's might, in his architecture, have secured or prepared for it. As a matter of fact, he aimed at an effect quite different and in its way fully as noble, though not so attractive to the multitude, and is this patent and vital truth to go for nothing? People visit St. Peter's and come back to find St. Paul's cold and bare, but they do not always reflect that the two interiors are treated in essentially different manners. St. Peter's is not finished within in fine stonework, but, in parts, with veneers of costly coloured marbles from antique buildings, and also to a great extent in plaster painted. This is one way of treating a monumental interior, and Wren's is another. The difference in principle between the two is surely one that the intelligent public will be willing to recognise. The subject of "Colour as Applied to Architecture" was discussed at a meeting of the Royal Institute of British Architects in 1857, in connexion with an interesting paper by Professor Aitchison. In that discussion the late Mr. Burges took part, and said, on this very general point, that "the western and its southern systems could not go together. If we wanted colouring in a building we must give up the mouldings, or vice versa. For his own part," he added, "he would always give up the mouldings." In this case it is not a matter of choice, for the decision was made by the architect two centuries ago, and it is simply flying in the face of principles, that in their own way are as valid as if they were theological, to try now and reverse it. There are other ways of gaining a rich and sumptuous effect in the interior of St. Paul's without hacking away or polychroming Wren's stonework.

The second plausible motive referred to above may seem to have more validity. It is based on the idea that if colour is introduced anywhere in an interior, say, on the roof, it must be carried out on the other parts. At St. Paul's large portions of the roof as well as the great dome were, as we have seen, intended for decoration in colour. This has been applied in the choir in the beautiful and monumental form approved by Wren himself of mosaic. This paper is not written with the intention of criticising adversely the work demanded here, which has been carried out with such conscientious pains by Sir William Richmond. One may feel that the want of previous experience in work of the kind on a similar scale has led to over-elaboration, and that a better effect might have been produced with half the detail, but the effect of the roof of the choir is rich and pleasing, and as the choir with its stalls and its reredos possesses in the lower parts a certain sumptuousness of fittings, the decorative effect was carried out easily through the whole. So soon, however, as the decoration crept out of the choir and fastened on to the upper spaces of the piers of the dome, where, in the open area of the crossing that expands in so monumental a fashion towards transepts and nave, it was seen under quite other conditions, the attempt was at once made to "carry out" the effect of the mosaics by gilding, stencilling, lettering, and what-not on the surface of the stonework. The result of these first essays every one knows, but it may be noted in passing that the obliteration of experiments is apt to spoil the beautiful colour and patina of the stonework, which is the most precious part of the decorative effect of the interior. The one thing that seems to be needful at the present juncture is to recognise that the idea of "carrying out" the roof decoration by gilding and stencilling on the stonework below is artistically impossible, and that in consequence the walls themselves should be allowed to set the key for the whole decoration. It would be quite possible to fill the domes and spandrels with mosaic so quietly treated as to accord with the colour and texture of the walls, which, as has been urged more than once in what has gone before, are in their present condition more beautiful than we can ever hope to make them. Richness of tints is always possible in fittings and in the glass of windows, for some of the Renaissance stained glass in France is nearly as fine as Gothic. The whole difficulty is due to the prepossession that colour is always

a welcome adjunct to every kind of architectural interior. We have seen, however, that the more dignified and monumental a building is, the less need it has for any auxiliary of the kind to its stately beauty; and it would be a good thing if architectural theory could be cleared from the notion that colour is an essential element in architectural effect.

A discussion followed, in the course of which Mrs. Traquair and Mr. Scott Morton offered some criticisms on the decoration of St. Paul's as at present carried out.

ARCHITECTURAL SOCIETIES.

GLASGOW INSTITUTE OF ARCHITECTS.—A special general meeting of this Institute was held on the 21st ult., in the rooms, Pitt-street.—Mr. Alex. Petrie, vice-president, in the chair. Sympathetic reference was made to the death of Mr. John Burnet, F.R.I.B.A., ex-president, and father of the present president, which took place on the 13th ult. Mr. Burnet had reached the venerable age of eighty-seven years, and was held in the highest esteem by all who knew him. He was one of the original members of this Institute, was long a member of council, and held the office of president from 1876-1878. Lately he was on the roll of honorary members. He became a Fellow of the Royal Institute of British Architects in 1876. During Mr. Burnet's long career as an architect he and his firm of John Burnet & Son designed many important buildings in Glasgow and the West of Scotland, among others the Western Infirmary, the Stock Exchange, the Merchants' House, the head offices of the Clydesdale Bank and of the Union Bank of Scotland, Woodlands-road United Presbyterian Church, the mansion houses of Auchendennan and Arden, and Rowardennan Lodge, Loch Lomond. Mr. Burnet's relations with the Institute and his professional brethren generally were of the most cordial character, and his genial presence and wise counsel will be greatly missed. It was unanimously agreed that the Secretary be instructed to send an excerpt from this minute to Mr. Burnet's widow. The meeting then took into consideration the unanimous report of the Council regarding the Royal Infirmary competition, and a letter addressed to the chairman and managers of the infirmary, which had been prepared by them, was approved of and adopted. The Secretary was instructed to forward the letter to the chairman and managers, and to send copies to the allied Societies and to the public Press.—*Glasgow Herald.*

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—A numerously attended meeting of this Institution was held at the Westminster Palace Hotel on Friday, January 25, the chairman, Mr. Percival Marshall, presiding. Before proceeding with the business of the evening, the chairman made a feeling allusion to the great loss which the nation has just sustained, and moved the following resolution, which was passed in silence, all upstanding:—"That the members of the Institution of Junior Engineers are deeply grieved to receive the intimation of the decease of her Gracious Majesty, the universally-beloved Queen Victoria. They humbly desire to tender to his Majesty the King, and to the other members of the Royal Family, their expressions of sincere and respectful sympathy on this sorrowful occasion." The names of thirty-two members, elected since the last meeting, having been announced, Mr. Alexander Ross, M.Inst.C.E., honorary member of the Institution, proceeded to read a paper on "Railway Construction." The author stated that on a new railway being promoted the services of an engineer would be required to make a preliminary survey, to report on the route he would recommend, and to estimate the probable cost; and on these proving satisfactory, his next duty would be to proceed with the surveys, and to take such levels as would enable him to prepare the Parliamentary plans and sections, prepared well in view the requirements of the several Acts of Parliament generally incorporated with the Special Act and particularly the Land Clauses Acts of 1845 and 1863, as well as the Standing Orders of both Houses of Parliament, and the regulations and requirements of the Board of Trade. It was pointed out how very important it is that every attention should be given to the centre line being fixed so as to avoid as far as possible

expensive property and buildings, at the same time avoiding such bad curves and gradients as would limit the working capacity of the line. Consideration was then given to curves and super-elevation of the outer rail, and the limiting effect curves had on the load to be hauled, but more particularly on the speed at which trains could be run with safety, the deduction being that for a first-class trunk line of railway no curve should be of less radius than one mile, if this could be reasonably secured. This was followed by a reference to gradients, data being given and a table submitted, indicating to what a serious extent bad gradients limit the hauling capacity of the engine, it being shown that when a gradient is so heavy as to require two engines to do the work of one, it might be economical to expend more capital in securing a better inclination, bearing in mind, however, that circumstances did arise when this did not apply, as, for instance, when coal or iron ore had to be hauled from the higher lands to a dock or depot lower down, the load then being with the gradient and the empty waggons only having to be hauled up the hill. The desirability of balancing the earthwork in cuttings and embankments was referred to, and also that in ranging out the line, level crossings should be avoided, and the number of bridges, viaducts, tunnels, retaining walls, and culverts should be kept down as much as possible with the smallest sizes adopted, consistent with efficiency. Cross sections of cuttings and embankments were illustrated, the author recommending for the cutting a width of 28 ft. at the formation level for two lines of way, earthenware pipes, with cesspits 100 ft. apart, being used at the sides in lieu of side ditches; the ballast carried right across, and in this manner supporting the slopes. Other precautions that should be taken for the prevention of slips in the slopes of cuttings and embankments were noticed. In describing railway bridges the author gave the preference to brick and stone arches when these could be used, both on account of first cost and after maintenance. When the superstructure must be of steel and when headway would admit, he favoured that type where the girders are placed directly under the rails, with parapet girders at a higher level and the whole connected with flooring plates. The paper next dealt with the advantages to be derived by using a type in which two centre girders are employed, and each line of rails is carried by an independent bridge, especially when a railway is overlying coal measures where subsidence is likely to occur, as one line of rails could be lifted while the traffic is conducted over the other line. The construction of tunnels was alluded to, and the several parts forming the permanent way were described in detail, as well as the various processes in use for the preservation of timber sleepers. Special mention was made of steel rails, the author referring to the Report of the Committee appointed by the Board of Trade in May, 1896, and regretting that while recommending the standardising of rails in connexion with (1) weight, (2) section, and (3) the chemical composition, no recommendation was made as to who should undertake this most desirable duty. The concluding part of the paper was devoted to signalling, it being stated that the lock and block system was working its way slowly to the front—and also that at the present time four methods of operating the interlocking, the signals, and the points by power are being considered, viz.: the hydraulic, the electric, the pneumatic, and the electro-pneumatic. As under existing conditions each of these necessitated the provision of special power, it was thought there was not much to be gained from the point of view of economy, but the author expressed the opinion that the ultimate development of the matter would probably resolve itself into every railway station being provided with a power station, looked after by skilled attendants, not only to supply power to work the signalling appliances, but also for electric lighting, for pumping water, for working hoists, for warming and ventilating the buildings, and to meet the numerous requirements of a railway station.

WILLING'S PRESS GUIDE.—"Willing's Press Guide for 1901" (James Willing, Ltd., 125, Strand, W.C.), is the twenty-eighth annual issue of a concise and well-arranged index to the Press of the United Kingdom. The guide also contains a list of the principal colonial and foreign journals and a variety of general information relating to the Press. It is one of the best and cheapest Press guides published.

THE GLASGOW INFIRMARY COMPETITION.

THE Glasgow Institute of Architects have addressed the following letter to the Infirmary Committee in regard to the recent competition:—

"115, St. Vincent-street, Glasgow,
January 21, 1901.
To the Chairman and Managers of the Glasgow Royal Infirmary.

GENTLEMEN,—Recognising it to be your earnest desire that the Infirmary, when reconstructed, should conform to the most modern standards of design in this class of building, and that the subscribers and the general public have a right to expect this, we, the Glasgow Institute of Architects, as a body of technical experts in such matters, feel it to be our duty to state that, in our opinion, this result will not be achieved if the reconstruction is proceeded with according to the plans selected by your Sub-Committee in the recent competition.

We attribute this failure not to any lack of zeal on the part of your Committee, or of ability on the part of the competing architects, but mainly to the manner in which the competition was initiated and carried through, and that in the following respects among others:—

I. That along with the printed conditions provided for the competition there were issued two sets of sketch plans as indicative of alternative arrangements which the Sub-Committee recommended, and which were stated in the accompanying report to be drawn by, or under the direction of, two members of the Sub-Committee respectively.

II. That a Jubilee Block, to be situated on a particular part of the site, was insisted upon as an integral part of the scheme.

The results of these elements in the conditions were:—

(a) That the competitors and the assessor were hampered in the exercise of their individual judgment as to the main points of importance in such a building, viz., the distribution of the various buildings with respect to each other for convenience of working, and of all for the freest access of sun and air.

(b) That the competitors were placed in the invidious position that, in the event of the schemes recommended by the Committee not proving themselves to be in accord with their judgment and experience, they were bound, in departing from them, to meet with disfavor from those influential members of the Committee who would enter upon the examination of all the plans with minds necessarily biased in favour of those which they themselves had put forward, while reserving their position as judges.

(c) That as the result the proposal that plan E be accepted, which became the finding of the meeting, was moved by the gentleman who was actually the author of the scheme which was adopted and worked out in detail by this competitor.

III. That neither of the sketch plans issued are in accord with the present day principles of hospital design, as might indeed be expected, seeing that their authors have not enjoyed the training which would qualify them as surgical, medical, or architectural experts; that, in fact, the plans are in many vital particulars inadequate and out-of-date, and that these faults are naturally displayed equally in the selected design, which is but an elaboration of one of them. A corroboration of this assertion with regard to the radical faultiness of the plans in question is furnished by the fact that six out of the ten competing architects found it necessary in spite of risk of possible consequences already alluded to, to entirely throw over the schemes furnished to them, and that among this number are found all the four architects from outside of Glasgow (two from London and two from Edinburgh), who were presumably invited specially on account of their knowledge of hospital design.

Such being the opinion of the Institute after a very mature and careful consideration of the whole subject, we would most earnestly urge the managers, before committing themselves and the public to the erection of any portion of the building, as designed, to have the plans submitted to one or more independent hospital authorities of recognised and outstanding position for consideration and report.

Apart from the all-important question of the erection with the public funds of an entirely adequate and modern hospital, we, the Institute of Architects, feel it necessary to lodge a protest against the setting aside by the Sub-Committee, without any reason given, of the award of the professional assessor, Dr. Rowand Anderson—the more so that a simple majority of one was considered sufficient to overturn his judgment—as liable to prejudice the success alike for promoters and architects, of future competitions in Glasgow. And we have further to state, that the erection of a Jubilee block, such as is proposed, seven stories high, and in the position selected, will, if proceeded with, dwarf and irretrievably injure for all time the external appearance of the cathedral. The foregoing statements represent the unanimous finding of the Glasgow Institute of Architects, as a meeting specially called to consider a report of the Council on the question, and as the matter is not only one of the greatest public importance, but of extreme

urgency, owing to the proposal of your Sub-Committee to proceed at once with the erection of the northern block, it has been communicated to the public Press at the same time as it is submitted, with our earnest prayer for its consideration, to yourselves.

In name and on behalf of the Glasgow Institute of Architects. C. J. MACLEAN, Secretary."

THE SURVEYORS' INSTITUTION.

A MEETING was held on Monday evening at the Surveyors' Institution, Gt. George-street, Westminster, for the purpose of continuing the discussion upon Mr. R. E. Middleton's paper on "The Future of the London Water Supply."

Mr. J. Shaw, the President, said that since they last met, which was only a fortnight ago, a very great calamity had happened to the country in the death of our beloved Sovereign, Queen Victoria. In consequence of that occurrence the council had resolved that it would be most desirable that they should show their respect by adjourning this meeting. It was thought that this course would commend itself also to the members present. In addition to this, the council proposed to send a resolution to the proper quarter, to the effect that the Institution desired to express their sense of the grievous loss sustained by the death of the late Queen, their sympathy with the Royal Family, and their loyalty to King Edward. It was impossible for them yet to realise what the loss really was, but in the midst of their sorrow they could be thankful that the late Queen died so peacefully, surrounded by her family. They should also be thankful for the great example which her late Majesty had left to them in every capacity, whether as wife, mother, or Queen—an example that never could be excelled, even if it could be equalled.

The meeting was then adjourned.

Students' Preliminary Examination.

Of the candidates who presented themselves at the Preliminary Examination of the Institution, held concurrently in London, Manchester, Dublin, and Glasgow on January 16 and 17, the following satisfied the examiners:—J. T. Abrahams, Maidstone; R. S. Andrews, Oxford; O. W. Allen, London; E. R. Appin, English; C. W. Archam; F. L. Baker, Bishop's Stortford; E. G. Bayly, Berkhamstead; H. C. Beaven, Enfield, N.; R. L. J. Bedford, Acton, W.; R. H. W. Bennett, Wimbledon Park; C. E. Benton, Grimsby; C. J. Berry, Wardsworth-common; B. F. Blois, Bournemouth; L. V. Bowler, Southend; T. H. Bowler, Canterbury; H. Brown, Chichester; W. E. Brown, Chester; A. H. Butelet, St. Austell; H. Burch, Hightgate; E. C. Burgess, West Hampstead; R. H. Barstow, Hailsham; C. R. Campbell, South Kensington; W. J. Carlisle, Gloucester; J. G. Chapple, Acton, W.; A. Chard, Horverton; A. H. Clarke, Walthamstow; W. C. Clemens, Plymouth*; C. S. Cobb, Strathfieldsaye; H. Cooper, Gravesend; H. J. Culpin, Walthamstow; H. Darby, Bridlington; W. G. Davies, Newbridge; A. C. Dorrington, Lancaster; W. M. Dugdale, Goswastry, S. Edwards, Exeter; C. Egan, Farnham; R. C. G. Ellen, Andover; R. A. Ellis, Wanstead; C. S. E. Evans, Havfordwest; G. W. Ferris, Maidstone; J. A. Flatt, Wanstead; J. H. Fenning, Bedford; G. F. Finch, Hornsey Rise; A. K. Foulis, Motherwell; E. L. Frost, Anerley; H. J. Gale, Wheatley; T. M. Glasson, Aspatria; T. K. Glog, London; P. W. Gregory, Haverstock Hill; O. Greenwood, Todmorden; J. C. Grierson, Liverpool; E. M. Haes, Surbiton; V. M. Hall, Hampstead; E. C. Harris, Upper Tooting; E. T. Haslehurst, London; E. R. Hawkins, Downham Market; J. Hayward, Bath; G. S. Henderson, Kilmarnock; H. A. Hinton, Highgate; S. Hooper, Upton Manor; R. L. Honey, Rochester; J. N. Horsfield, jun., Kingston-on-Thames; E. Howard, Snaresbrook; E. E. V. Ives, North Walsham; E. C. Jarvis, Upper Tooting; S. B. Kings, Abingdon; W. H. Lambie, London; J. C. Lucas, Lewes; A. J. Lyndon, Plymouth; M. L. Lyon, London; J. E. G. McSheehy, Wimbledon; J. Matley, Oldham; E. Meacher, Salisbury; C. McC. Myott, Cambridge; J. S. Naylor, Beckenham; A. O. Nonkes, Willesden Green; O. T. Nettleton, Kensington; H. B. Owen, Newcastle, Stairs; J. O. Payne, Bromley; C. F. Peile, North Finchley; G. L. Pepler, Croydon; A. P. Beckers-gill, Putney Hill, S.W.; E. T. F. Pope, Margate; P. H. Ross, Holloway; T. Rule, Aspatria; A. Salvey, Broxbourne; W. S. V. Sansom, Colchester; T. E. Scammell, Redland, Bristol; J. J. Shardlow, Leicester; A. J. Shield, Liverpool; F. M. Skelt, Leytonstone; S. W. Smith, Cheshunt; W. B. Smith, Hincley; C. T. Steward, London; N. D. Stewart, Dunston, Salisbury; T. Tyndale, Stoke Newington; C. W. Tansworth, Aldridge; A. A. Vigers, Walton-on-Thames; P. D. Voisey, Exeter; I. Wall, Huddersfield; S. J. Walter, New Wanstead, E.; J. A. H. Wells, Ashby-de-la-Zouch; A. V. White, Portsmouth; H. W. Whitton,

* Bracketed equal for head of List.

Caswell, near Towcester; W. O. Wightman, South-Croydon; H. W. Wilkinson, Winchmore Hill; E. Williams, Croydon; H. Wood, Grimsby; E. E. Woodbridge, Harrow-on-the-Hill; J. P. Woodhams, Hastings; B. Worral, Whalley Range, Manchester; H. O. Young, Rock Ferry, Cheshire.

THE LONDON COUNTY COUNCIL.

A SPECIAL meeting of this Council was held on Tuesday afternoon in the County Hall, Spring Gardens, Alderman Dickinson, Chairman, presiding, when it was agreed that an address of condolence in the affliction of the King, and of congratulation upon his accession to the throne, be presented to his Majesty the King.

The ordinary weekly meeting was then held.

Loans.—The Finance Committee recommended, and it was agreed, to lend Battersea Borough Council 4,795*l.* for building a coroner's court and mortuary; the Shoreditch Borough Council 2,430*l.* for a street improvement; the Woolwich Borough Council 6,500*l.* for stables and underground conveniences; and the St. Pancras Guardians 2,600*l.* for works at the infirmary.

New Statistical Officer.—On the recommendation of the General Purposes Committee, Mr. E. J. Harper, assistant valuer, was appointed statistical officer, in place of Mr. Gomme, promoted to be Clerk of the Council, in succession to Mr. Stewart.

Spitalfields Market.—In view of the Bill which the Council is promoting for the acquisition of Spitalfields Market, a provisional agreement with the freeholders, putting the price at 176,750*l.*, was approved.

The Port of London.—The Rivers Committee, in the course of a long report, recommended the Council to pass the following resolutions:—

"That the Council authorises the Rivers Committee to arrange for evidence to be given before the Royal Commission on the following lines:—

That the management of the Port of London and the docks of the London and India, the Millwall and Surrey Commercial Docks Companies should be consolidated in the hands of one public authority.

That the port should for all purposes be defined as extending from the tidal limit of the Thames at Teddington on the west to an imaginary line drawn from the Naze to the North Foreland, subject only to provisions similar to those in the Thames Conservancy Act, 1894 (Section 3) and the second schedule) with regard to charging shipping dues.

That the management and administration of the port and docks should be in the hands of a Statutory Authority, to be called the 'Port of London Committee,' subject to the Council retaining the control of capital expenditure.

That power should be conferred on the Council to purchase the property of the dock companies, and to raise the capital necessary for that purpose for deepening of the channel of the river, and the improvement of the port and docks.

That the Port of London Committee should be constituted on the general principle of one-third representation of the Council, one-third of ship-owners and merchants, and one-third of the City and official members.

That in view of the national interest in the Port of London the Government be invited to contribute towards the expense of improving the port.

That repayment of capital should be provided for by instalments spread over 100 years, on the annuity system."

These recommendations were agreed to, after discussion, practically unanimously.

Easton-road Fire Station.—The Fire Brigade Committee recommended, and it was agreed, that the estimate of 15,200*l.* to be submitted by the Finance Committee in respect of the erection of the proposed Easton-road station be approved, and that tenders be invited by public advertisement for the work.

Housing of Caledonian Asylum Site, Holloway.—The Housing of the Working Classes Committee recommended, and it was agreed, that the estimate of 16,500*l.* submitted by the Finance Committee be approved, and that the Council do acquire, under Part III. of the Housing of the Working Classes Act, 1890, the Caledonian Asylum and the site thereof, subject to the sanction of the Charity Commissioners, and subject to a provisional agreement embodying the conditions set out in the Committee's report.

Tower Bridge Southern Approach.—On the recommendation of the Improvements Committee, it was agreed—

(a) That the working-drawings, specification, and estimate of the cost (21,500*l.*) of the paving and other works in connexion with the portion of the

new Tower Bridge southern approach between Purbrook-street and Artillery-street be referred to the Manager of the Works Department, with a view to the work being carried out without the intervention of a contractor.

(b) That the Improvements Committee be authorised to engage, at the weekly wages of 3*l.* 13*s.* 6*d.*, a clerk of works in connexion with the portion of the new Tower Bridge southern approach between Purbrook-street and Artillery-street.

Westminster Improvement.—The Improvements Committee recommended, and it was agreed—

That the estimate of 1,315,000*l.* (in substitution for the capital vote of 51,443*l.* which was approved by the Council on November 6, 1900), submitted by the Finance Committee in respect of the Thames Embankment extension and Westminster improvements at Millbank be approved, and that as the Council of the City of Westminster had undertaken to make the necessary contribution of 100,000*l.*, the Improvements Committee be authorised to incur expenditure on capital account up to 1,315,000*l.* for the purpose of the improvements in question.

Theatres, &c.—The Theatres and Music-halls Committee recommended that the following applications be agreed to:—

Alterations to gallery, Euston Theatre of Varieties (Messrs. Wylson & Long).

Gallery steppings at the Grand Theatre, Islington (Mr. F. Matcham).

Quadrant Restaurant, London Exhibitions (Mr. A. O. Collard).

Deviations from plans of St. Pancras Public Baths (Mr. T. W. Aldwinckle).

The recommendations were agreed to, and the Council, having transacted other business, adjourned.

THE LONDON BUILDING ACT, 1894:
THE L.C.C. AND BUILDING LINES.
TRIBUNAL OF APPEAL CASE.

A SITTING of the Tribunal of Appeal under the London Building Act, 1894, was held on Friday last week at the Surveyors' Institution, Great George-street, Westminster, to hear the appeal made by Mr. James Ellis against the certificate of the Superintending Architect of the London County Council defining the general line of buildings on the south side of Woolwich-road, Greenwich, between the house known as No. 430 in that road and the street known as Ransom-road. The certificate referred to was issued under Sections 22 and 29 of the London Building Act, and the plan to which it referred—the one approved by the Superintending Architect—showed the building line to cut through a projecting house owned by Mr. Ellis. It was against this that Mr. Ellis appealed. The members of the Tribunal present were Mr. Arthur Cates (Chairman), Mr. Penfold, and Mr. Hudson. Mr. Ellis conducted his own case, and Mr. Dalbie, barrister (instructed by Mr. Andrew), represented the County Council.

At the outset of the hearing a question arose as to whether the Superintending Architect against whose certificate the appeal was made should be in attendance. Mr. Ellis maintained that as that gentleman was in the position of defendant, his attendance was necessary. In the certificate which he had issued he made certain statements which he ought to be there to substantiate, and he (Mr. Ellis) in turn was there to defend himself against the Superintending Architect.

After consultation, Mr. Hudson said the Tribunal had asked him to express their view of the position held by the Superintending Architect with regard to the present application. Their opinion was that that official was an independent officer. Before certain persons could do anything under the Building Act it was necessary that they should first of all obtain his certificate. If any dispute arose as the result of the provisions of the certificate, any of the parties concerned could, if they pleased, subpoena the Superintending Architect as a witness to be cross-examined by both sides, but they must take the risk of doing so.

The Chairman expressed the further opinion that the Tribunal was limited under Section 183 of the Act to require the production of documents or books, and to hear and receive evidence.

Mr. Dalbie pointed out that there was nothing in the Act, so far as he was aware, about the power of the Tribunal to call witnesses. Mr. Ellis asked if the more dignified course for the County Council to follow would not be to ask the attendance of their Superintending Architect. He was there in the interests of fairness, and he did not think his request an unreasonable one.

The Chairman: The case, then, must be left in this position, that you may request the attendance of the Superintending Architect.

Mr. Ellis: I do request it, but, unfortunately, he is not here. He has made an accusation and made a certain statement, and he is bound to be here to defend that statement.

The Chairman: The practice has been for the Superintending Architect not to be here.

Mr. Ellis: Perhaps not, in many cases, but in this case I wish to put him in the box as my witness.

I am going to prove that he has attached to the plan a line that was not attached on the day when he met the parties, and that he altered his plan after he left the parties. I am also going to show that once a decision has been arrived at by a public body it cannot be altered.

The Chairman: You have not given the Superintending Architect any notice asking him to be present.

Mr. Ellis: I have written the Solicitor of the County Council stating that the plan attached to the certificate is a false one. I have not made a formal request for him to be in attendance.

The Chairman: It is to him you must communicate your desire that he should attend. If he in response to that, declines to attend, it is for you to consider what steps you shall take to enforce his attendance.

Mr. Ellis: Unless he attends to-day the invalidity of his plan and certificate shall be established. It was for the counsel of the County Council honourably to call for the attendance of the Superintending Architect.

Mr. Hudson: They decline to do so, and leave you to prove your case.

Mr. Ellis: There being no defendant present, I have obviously no one to fight.

Mr. Hudson: Then that is to your advantage, but you must prove your case.

Mr. Ellis: Then I am prepared to proceed.

The case was then proceeded with, Mr. Ellis opening his appeal by handing in a copy of the correspondence that had passed between him and the Solicitors of the County Council, adding that copies had been sent to the Solicitor of the Council and also to members of the Tribunal. His objection to the plan annexed to the certificate was, he added, that the line of building therein marked by the Superintending Architect was not the one marked by him in the presence of the parties who attended the meeting held in December.

At this point the plan referred to was produced, and Mr. Ellis, after inspecting it, agreed that it was the one submitted to the parties with a certain pencilling made by the Superintending Architect deleted. The line which there appeared was not the one made by the Superintending Architect in the presence of the parties concerned. He had on two occasions subsequent to the meeting pointed out to that official the absurdity of making a building line which cut directly through a house that was more than a hundred years old. It was impossible, of course, for him to say whether the particular piece of linen submitted to the Tribunal was the one which was marked by the Superintending Architect in the presence of the parties.

Mr. Andrew (the Council's Solicitor) stated that an assistant in the County Council's office who was present at the meeting was in attendance, and he would prove the plan to be the identical one submitted on that occasion.

Mr. Ellis submitted that the plan, having been approved by the Council, could not be altered, and in proof of this contention quoted the case of *Slack v. the Mayor of Bradford* (8 *Law Times* (New Series), p. 401). In this case, he said, it was held that when a Town Council had approved a plan they had no right afterwards to alter the line of frontage.

The Chairman remarked that this was very good law, but he could not see that the approval by the Superintending Architect should be held as equivalent to approval by the County Council.

Mr. Ellis: Surely he is the representative of the County Council, and the Council is responsible for him?

The Chairman: No, he is not. He does not arrive at his certificate until he makes inquiries and decides as to what form his certificate will take. It is the final certificate, and that alone, we have to deal with. What transpired previously is quite beyond us.

Mr. Ellis: Passing over that, then, I have to submit that my application of October 4 was not made under Section 22. It was an intimation to the County Council that for the sake of peace I was willing to give up land, 48 ft. in length and 9 ft. in breadth, to widen the Woolwich-road, which is extremely narrow and dangerous at that point. I gave up that land voluntarily and without prejudice, and, as you will observe from the correspondence, I reserved my right to disregard the Council's pleasure or refusal. I wished to meet the Council for once by making the offer. I did. The Council did not accept; neither did they refuse it. Three weeks passed, and then I was asked to send in a fresh plan, as nothing had been done with my application—if application it can be called—and I did so. Subsequently the remark was made that the architect might be asked to define the line of building in Woolwich-road, and then I stated that this would not affect my line of building.

The Chairman asked if there was any plan lodged on October 4, as there was nothing referring to it in Mr. Ellis's letter to the Council of that date.

Mr. Ellis replied that there was.

Mr. Dalbie remarked that Mr. Ellis was entitled to assume that consent was given to his proposal. Under Section 27 there was the express provision that "the consent given by the Council shall not affect the building line." Assuming that he had the consent, I cannot see that it would help him, having regard to Section 27.

Mr. Ellis: You are misconstruing that Section.

If the Council gave consent to No. 498 to bring out his house, No. 496, next door, could not assume that he also had a right to do so. The reading of the Section is this, that providing the County Council do give consent for a particular person to bring out his property, it shall not bind them to assent to the people next door doing the same. Madame Tussaud's, in Marylebone-road, is a case in point. Continuing, Mr. Ellis said that his next points were that his application of November 15 was made at the request of the Council's Solicitor and Superintending Architect, and in no way barred his first application of October 4, and that his offer to give up a strip of land 9 ft. broad was gratuitous, he being only bound by Section 13 of the Act to keep 20 ft. distant from the centre of the road. He further maintained that as Ransom-road, which runs through Woolwich-road, broke the building line, as was proved by its absence from the plans of the Superintending Architect, owners of property beyond were not entitled to be heard in this case. His next point was that the Local Authority of the district had no *locus standi* as his building was not within the prescribed distance from the centre of the road, and that the works consisted of extensions only and consisted of one and the same building. The material point in this case was that Section 22 of the Act did not apply to his application, for that section only applied to where a building was erected within the prescribed distance, for if it was the County Council could take action.

Mr. Hudson remarked that his understanding was that the appeal was made under Section 25 of the Act, and it seemed to him as if Mr. Ellis was wandering about all sorts of sections. The appeal was against a certificate of the Superintending Architect defining the general line of buildings. He understood Mr. Ellis to have made a proposition without regard to Section 22, that the Council declined it, and that, as a consequence, it was abortive. Mr. Ellis replied that his offer to the Council came to an end. The Superintending Architect in fixing the building line, ran his head against a wall that was more than a hundred years old. Having failed to make a hole in it he attempted to cut through it, as was marked in the plan. Now, the Act contained provision respecting the prolongation of a building line, but whoever heard of the prolongation of a line being severed by 20 ft.?

Mr. Hudson pointed out that in his application of October 4, Mr. Ellis applied for leave to erect two domestic dwellings to be used as shops and dwellings. He asked the appellant to consider how these could be described as one building.

Mr. Ellis replied that he was putting iron doors to join the buildings. He said it was outside the power of the London County Council to restrain any one from building if he was 20 ft. from the centre of the road if there was no line at the point, and it was an extension of an existing building as was the case in his instance.

Mr. Ellis afterwards entered the witness-box and gave evidence, as did Mr. Harry Snywood, the appellant's foreman; Mr. Walter Spier, the District Surveyor; and Mr. W. T. Perkins, an assistant in the office of the Superintending Architect of the London County Council.

Mr. Dalbie, for the County Council, contended that they might have a general line of building even with one or even two buildings projecting over it, and this was the position of the building at 494, Woolwich-road. He submitted that this property should not be left out in the way suggested. If it were, it should not form a precedent for bringing out the two adjoining houses. As the matter stood at present the only obstacle to getting a proper building line for that part of Woolwich-road was No. 494, and if Mr. Ellis pulled that property down with the intention of rebuilding it, the Local Authority would have the opportunity of having it set back to the general building line by paying compensation.

Mr. Ellis repeated his contention that so long as he was kept out with the prescribed distance from the centre of the road he required no consent from the County Council or any one else to build. They had no power whatever to interfere with the property at 494, Woolwich-road, and he could carry it along to the point where he had offered to concede land to the County Council of the value of a thousand pounds. His offer stood open to the Council to accept because he had full sympathy with the community, and desired to see the road at that point widened.

The Chairman remarked that the Superintending Architect could not have intended to conceal anything, as he went to the spot and used his own judgment. Any attempt such as Mr. Ellis suggested would, therefore, have been vain and futile, and he could not put the intelligence of the Superintending Architect at such a low standard as to imagine that by putting forward any plan he could hope to deceive the Tribunal.

Mr. Ellis: I hold that I have a substantial grievance in the refusal of the Council to produce the Superintending Architect to-day.

The Chairman: You should have taken steps to ensure his attendance.

After some further observations the chairman intimated that the Tribunal would consider all the points raised, and issue their decision in due course.

Illustrations.

GLASGOW ROYAL INFIRMARY RECONSTRUCTION.

WE give this week full illustrations of the design for rebuilding the Glasgow Royal Infirmary, by Mr. H. E. Clifford, of Glasgow, to which the assessor, Dr. Rowand Anderson, awarded the first premium, and which, it would appear, ought to be the one to be carried out, though the committee, apparently, have chosen to throw it over.

The following extracts from the architect's descriptive memorandum, sent in with the design, will serve to explain the drawings:—

Block Plan.—In arranging the position of the various blocks on the site, scheme No. 5 has in a large measure been adhered to. It provides the greatest possible amount of free space between the infirmary buildings and the high tenements on the west side of Castle-street, while to the east of the infirmary buildings there is ample free space. The open roof quadrangle gives convenient access to each block.

It is proposed to erect the north part of block A (which stands clear of the present buildings), before taking down any of the present buildings. This is suggested with a view to maintaining the existing accommodation as far as possible throughout the entire reconstruction. The Pathological Institute remains in its present position, and will require at some future time to be rebuilt. Any attempt to alter the existing building is felt to be a mistake. The present laundry block, being considered sufficient, is not interfered with. Additional boilers are erected at the west end of laundry block to provide steam for the hot water supply to the infirmary buildings, and for warming fresh air in ducts to wards, &c. The chapel is placed at end of conservatory corridor, near west end of nurses' home. The nurses' home can be added to at east end.

Superintendent's House.—The house would be erected on ground at east end of site.

Basement Floor.—Owing to the levels of the site, this floor extends only under blocks A and C. Besides access by stairs from ground floor, there is an entrance from Vicar's-alley for stores, &c. A corridor is arranged from basement of block A to present mortuary and new boiler house. The accommodation on this floor is:—

1. General stores, with lift direct to kitchen on top floor.
 2. Linen and sewing-room.
 3. Mattress and mattress-work-room.
 4. Dorcas, dressmaking, and patients' clothes.
 5. Turkish bath.
 6. Electrical department.
 7. Gymnasium.
 8. Surgical services.
- One ward (spare), fifteen beds at 1,500 cubic feet per bed.
 One side ward (spare), four beds at 1,760 cubic feet per bed.
 One side room (spare), one bed at 1,838 cubic feet per bed.

Ground Floor.—Although an entrance is shown at front of Cathedral-square block, the working entrance to the infirmary is from Castle-street. A gatehouse with emergency wards is placed at west end of block B, and adjoining working entrance. The porter is also here. Accommodation on this floor is:—

- Block A.**—One complete surgical service.
 Three wards, forty-three beds at 1,550 cubic feet per bed.
 One side ward (female), four beds at 1,760 cubic feet per bed.
Block C.—Administrative.
Block B.—Administrative and emergency wards at Gatehouse.
 Two wards, eleven beds at 2,002 cubic feet per bed.
Block D.—Isolation.
 Five wards, twenty-seven beds at 1,550 cubic feet per bed.

The other stories follow much the same general arrangement, so that we need not continue the schedule further, except in regard to—

Sixth Floor (over Block C only).—Contains kitchen, &c., and storage accommodation supplied from general stores in basement. The kitchen is in centre of Block C, and a service passage is arranged on same level in roof over Blocks A and B, giving a direct service for food by trolleys to the hoists of Blocks A and B.

Abstract of Accommodation.			
	Male.	Female.	Spare.
Block A	179	120	20
" B	43	59	11
" C	137	109	—
" D	16	11	—
	375	299	31

Style of Architecture.—The English Renaissance has been considered the most suitable style from every point of view, and in order to emphasise the Diamond Jubilee, royal crowns have been introduced on the Cathedral-square façade, and the equestrian statues flanking the entrance could be those of the Queen and Prince Consort.

Materials and Construction.—The foundation would be concrete, and the outside walls of free-stone. The stone for external face to be from Lochbarriggs Quarry, Dumfries, all angle tested. The principal division walls would be brick, and the remainder of fireproof 'Fram' construction. The roofs would be slated with large-size pale green slates. The central dome and sanitary turrets covered with copper.

The floors would be fireproof, composed of steel girders, steel beams, and 'Fram' arch-blocks, finished on ceilings with 'Fram' boards coated with Adamantine polished plaster. The floors of wards, sanitary turrets, corridors, operating theatres, kitchen department, and all basement would be laid with 'Terrazzo' (see Paisley Infirmary and many Continental hospitals), and the floors of other apartments would be laid with pitch pine flooring, nailed direct on to 'Fram' blocks.

The interior of stone walls would have metal straps and expanded metal lathing, finished with Adamantine polished plaster. The lower part of wards and corridors, and all the kitchen walls to be covered with crystalline tiles of large size (the joints of these tiles are so close no lodgement is afforded for dust), and the operating theatres to have walls and ceilings entirely covered with these tiles, so that they may be thoroughly steamed.

All floors, walls, and ceilings to have corners rounded.

Heating and Ventilation.—It is proposed to adopt the 'Plenum' system as perfected by Mr. William Key, and so successfully carried out by him in Paisley Infirmary. It is impossible to give an adequate representation of his methods on plans, but his system is now so perfect that, with telephonic communication from every part of the building to the engineer, the temperature and volume can be regulated to a nicety at any point. The air of the wards is changed ten times an hour during winter, and up to fourteen times an hour during warm weather. Steam boilers for air warming are placed at end of laundry block.

Hot Water Supply.—The arrangements for this supply throughout the blocks are:—The utilising of steam from boilers of heating apparatus, supplying steam by pipes carried along in a duct outside of the buildings, and into copper water-heaters and hot water stock tank combined, placed in basement of each sanitary turret, from which an instant hot water supply is available at any point on the various floors.

The probable cost is estimated at 258,000l.

INTERIOR VIEW OF ST. PETER'S.

This view of the interior of St. Peter's is placed among our illustrations this week in connexion with Professor Aitchison's Royal Academy lecture. We have other illustrations to give with the succeeding lectures.

PROPOSED NEW WATER REGULATIONS.

The following remarks on the subject of water-closet flushing cisterns, included by Dr. Orme Dudfield, the Medical Officer of Health to the Borough of Kensington, in his last four-weekly Report, may be read with advantage at present. The italics in one or two passages are our own:—

Information on the subject, and some useful criticisms, will be found in a report by the Electric, Gas, and Water Committee of the Borough Council of Paddington, lately communicated to the other Metropolitan Borough Councils. One or two points not emphasised in that document seem to call for notice. And firstly, it would appear, by implication at any rate, that regulations 32 and 34 might have the effect of preventing, in future, the construction of pan and valve closets, as it is proposed that every water-closet shall be supplied through a flushing cistern or service box so constructed so as to 'prevent the discharge of more than two gallons of water at each flush, or a continuous flow of water,' i.e., by raising the lever or handle attached to pan and valve closets, which cannot be properly cleansed through a flushing cistern or service box. The object aimed at is economy in the use of water—a commendable object, if compatible with efficiency for cleansing the basin and trap of the closet. The proposed quantity of water—not more than two gallons at each flush, the quantity discharged often not exceeding one-and-half gallons—is inadequate for the purpose. Flushing cisterns are usually fed through a pipe of small dimensions and do not refill fast enough to enable the user of the closet to remain long enough to apply a second flush. Were it the custom to feed the flushing cistern with a large bore pipe, the question of capacity of the said cis-

tern would be of less moment; for then the person using the closet might follow the practice which, at the inquiry by the Local Government Board in 1895, the learned counsel for the Water Companies said he adopted, when necessary, viz., to use a second flush—thereby giving the case away; the obvious purpose of the regulation, limiting the quantity of water to two gallons at each flush, being to prevent the discharge of more than that amount at each use of the closet. The late vestry strongly advocated the adoption of the three-gallon cistern, and a very great many such cisterns have been fixed in this borough, the companies having raised no objection. The County Council, partly at the instance of the vestry, brought about the afore-mentioned inquiry, which resulted in the inspector appointed to hold the inquiry, deciding in favour of the continuance of the limitation to a two-gallon flush. Under the instructions of the vestry, the Council's surveyor and myself had a conference with the directors of the Chelsea Water Company in 1896, the Company's officers having in that year exhibited much activity in preventing the use of three-gallon tanks in their district. It was frankly admitted that the Company did not object to the use of such tanks on the score of local deficiency of supply, but only as an act of loyalty to the companies (acting with solidarity through a committee of the chairmen), and on account of the difficulties experienced at the time in connexion with the supply of large areas, especially in the eastern parts of London. The directors appeared to be surprised when told that a literal enforcement of the existing regulation, and the supply of closets through flushing cisterns only, would entail the abolition of valve closets, a statement confirmed by their own engineer present on the occasion.

COMPETITIONS.

SWANSEA HARBOUR OFFICES.—On the 24th ult. the report of the adjudicator on the Swansea Harbour Offices plan competition was submitted to the executive of the Swansea Harbour Trust. There were ninety-seven sets of plans sent in, and those of Mr. E. Seward, Cardiff, were adjudged to be the best, and he obtained the first premium of 100l. Messrs. Fairhurst & Thornley, Blackburn, secured the second premium of 50l. The adjudicator was Mr. W. M. Fawcett, of Cambridge.

NEW INFIRMARY, BRISTOL.—The competition for a new infirmary to accommodate 1,000 beds has now been settled. The committee of the Guardians dealing with the matter have considered the award of the assessor, and find that the three designs considered by him to be entitled to rank as the best and to be awarded the premiums are—1. Mr. H. Percy Adams, F.R.I.B.A., 28, Woburn-place, Russell-square, London; 2. Messrs. Giles, Gough, & Trollope, of 28, Craven-street, Charing Cross; 3. Mr. Arthur Marshall, A.R.I.B.A., of Nottingham.

EARTHWORKS AND CASTLES OF EARLY ENGLAND.

This was the title of an illustrated lecture given by Mr. Elliot Malden at the London Institution on Monday. In his opening remarks the lecturer said there were many different ways in which history had been approached in these later ages, but none had been more conspicuously successful than in the study of past times through their material remains. Such remains have a special advantage over written work, for, as the late Professor Freeman pointed out, the writers of original documents not only might sometimes be mistaken, but might sometimes be liars. Material remains, at all events, were genuine, though they might not always be read correctly by us. Among the remains which past ages had left in England, fortifications, fortified houses, military posts and camps of refuge, were very numerous and sometimes very remarkable. It was remarkable, too, that they had been so much overlooked or only casually studied. Ecclesiastical architecture was much more generally known to the man in the street than was military architecture. Most people could tell whether a church was Norman, Decorated, or Perpendicular, though they might not be able to go into detail; but an ordinary person had not the slightest notion whether the Tower of London or Arundel Castle or the Round Tower of Windsor was likely to be the older, and had not the slightest notion why the Round

Tower was round or the Tower of London square. There were two great uses for the military works of the past; they were either erected to shelter a considerable number of people and their flocks and herds, or they were erected for purely military reasons, for the command of the country. Posts on the top of a hill commanded distant views, but that did not give the command of the country, which could only be obtained by means of a garrison. The country could only be commanded by occupying the passes, fords, and bridges, and at such places camps were constructed. For sheltering non-combatants the top of a hill was a suitable place, and the primitive fortifications of our ancestors were on the tops of hills, by fords, passes, and rivers. The Roman camp was rectangular in form, while that of the ancient Briton was irregular in shape, following the contour of the ground on which it happened to lie. Ancient British camps were surrounded sometimes by two, sometimes by three, banks and ditches, and in rare cases by four; the Roman camps by one wall and ditch. The British camps were larger than the Roman, as they were meant to include a large number of people and cattle, and a British camp near Dorking covered an area of eleven acres. The camps were not permanent habitations, and no doubt the people had permanent villages near; nor were they constructed to stand long sieges, as nine out of ten had no water in them. The ancient British shelter camp, if untouched by subsequent occupants, was now a simple grass-covered hill, with banks and ditches covered by brush-wood, but the Roman stations had in many cases been turned into permanent fortresses with walls round them. It was marvellous what the ancient Britons did with their primitive implements! The remains of many different periods were found in these camps, and as flint implements and primitive stone implements, were found in considerable quantities, it was safe to conclude that primitive people occupied the camps for a considerable time and in considerable numbers. Old Sarum, Salisbury, was a striking instance of a primitive fortification held through subsequent ages until the time when the site of the city of Salisbury was transferred to where it now stands. After the Romans left, it was clear that the native inhabitants, having learnt something from the Roman engineers, were in the habit of making their camps rectangular in form, while keeping their primitive form of embankments to some extent. With the West Saxons came the building of burhs, places of shelter for a small community, which were common to Scandinavian and Low German nations. The burh consisted of a mound surrounded by an earth wall protected by wooden palisading, and with a house in the middle. Castles of masonry were much later erections. Prior to the time of William the Conqueror similar castles were erected in a few days or weeks, while, of course, castles of stone would have taken much longer to erect. But with the Normans came elaborate fortifications of stone, built more or less on primitive lines, the Normans enclosing the old British mound with a circular wall. There were several examples of this period, among them being Arundel Castle, Sussex, where a castle, in one form or another, existed from the time of King Alfred; Cardiff, Lewes, Rochester, and Rochester. With all their apparent skill in building, the Normans were not always skilful architects, and they built massively because they did not build well. The best known example of a Norman keep was at the Tower of London, though there was a great deal more than the keep, which had been badly dealt with by restorers. Inigo Jones put some big windows in it, for instance, which certainly did not belong to the original structure. Guildford Castle was a curious example of a Norman square tower erected on an artificial mound, and it was one of three such examples he knew of. The lecturer then referred to concentric fortifications—walls flanked by circular or semi-circular towers. While the Norman keep was a difficult place to capture, it was difficult to escape from it, and a very few soldiers could prevent the escape of the occupants; but a large force was required to blockade a concentric castle, and such a force always ran the risk of starving itself as well as the people blockaded. Concentric castles were, therefore, strong against active attack and strong against blockade. Residential castles were a very different type, and were erected

when fortified places were not much in demand and when it was considered fashionable to live in castles. One interesting point about castles was the way in which they were turned to account by different occupants at different periods. At Bramber Castle, Sussex, there were within the same area remains of the ancient British mound; there was enough to show that the Romans occupied the place; there was the Early English mound with its fortifications of earth and wooden palisading, and then there was the Norman stone keep. The Tower of London was also used for varying purposes at different times.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lambeth North.—That the Council do make an order as follows—Whereas Mr. E. Andrews, of the Engineer's office, Waterloo Station, London, on August 21, 1900, under the provisions of Sections 13, 41, and 42 of the London Building Act, 1894, delivered on behalf of the London and South-Western Railway Company, at the County Hall, plans of four blocks of intended dwelling-houses, to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a site between Boniface-street, and Lambeth Upper Marsh, Lambeth, and of a block of intended dwelling-houses, to be inhabited by persons of the working-class, proposed to be erected on the north side of Lambeth Upper Marsh, with an irregular open space at the rear, and the boundary fences of the site at less than the prescribed distance from the centres of Lambeth Upper Marsh and Boniface-street. . . . and whereas Mr. E. Andrews has since submitted an amended block plan (signed by the Chairman of the Building Act Committee) showing the boundary fence in Boniface-street set back the prescribed distance from the centre of that street . . . the Council does by this order sanction the said plans. . . .—Agreed.

Lines of Frontage.

Brixton.—Dwelling-houses on the eastern side of Coldharbour-lane, Brixton, at the corner of Vaughan-road, and the erection of houses on the eastern side of Vaughan-road (Messrs. Shoebridge & Kising for Mr. J. Pearman).—Consent.

St. George, Hanover-square.—A shop front, with projecting cornice and stall-front, to premises on the south side of Oxford-street at the north-east corner of New Bond-street (Mr. W. J. Almond for Mr. S. L. Stacey).—Consent.

Marylebone, West.—A wood, glass, and brick corridor in front of No. 33, Hamilton-terrace, St. John's-wood (Mr. T. B. Baldwin for Mrs. E. Wilkinson).—Refused.

Line of Frontage and Width of Way.

Lambeth, North.—An office building with projecting bay-windows at No. 45, Belvedere-road, Lambeth (Mr. R. G. Booth for Mr. C. Braby).—Consent.

Line of Frontage and Construction.

Hammersmith.—That Mr. T. Athey be informed that the Council is not prepared to accede to his request, on behalf of Mr. G. Tobutt, for permission to retain a wood and canvas fruit stall on the forecourt of No. 46, Uxbridge-road, Shepherd's Bush.—Agreed.

Width of Way and Construction.

Hampstead.—That Messrs. J. Sloper & Co. be informed that the Council is not prepared to accede to their request for permission to retain three wood and iron sheds adjoining the Tower Royal Works, Blackburne-road, Hampstead.—Agreed.

Mill End.—A temporary brick and iron church at the rear of No. 381, Mill End-road, Mill End, at less than the prescribed distance from the centre of Lawton-road (Mr. F. A. Walters for the Rev. W. Donlevy).—Refused.

Width of Way and Construction of Gangway.

Hammersmith.—An iron gangway, across the footpath known as Upper Mall, Chiswick, and with the fence in front of the northern buttress of the gangway at less than the prescribed distance from the centre of the footpath (Mr. M. W. Hervey for the West Middlesex Water Company).—Consent.

Formation of Streets.

Whitechapel and Bethnal-green, South-West.—That an order be issued to Messrs. W. Bradford & Sons, sanctioning, under the provisions of Section 10 of the London Building Act, 1894, the widening of Brady-street, Bath-street, and Foster-street, Bethnal-green, and the widening and adaptation for carriage traffic of Thomas-passage (for Messrs. Mann, Crossman & Paulin).—Consent.

Woolwich.—That an order be issued to Mr. W. Egerton, refusing to sanction the formation or laying out of a new street for carriage traffic out of Swingate-lane, Plumstead (for the Kent and Suburban Estates Company, Limited).—Agreed.

Working-class Dwellings.

Bow and Bromley.—Variations from the plans sanctioned by the Council on February 27, 1900, for the erection of a laundry and a block of three intended dwelling-houses, to be inhabited by persons of the working class, and proposed to be erected, not abutting upon a street, on a plot of land on the east side of Wellington-road, Bow-road, Bow, so far as relates to certain alterations and additions to such laundry (Mr. C. A. Brereton for the White-chapel and Bow Railway Company).—Consent.

Means of Escape from the Top of High Buildings.

Holborn.—Means of escape in case of fire, proposed to be provided in pursuance of Section 63 of the Act, on the seventh and eighth stories of a block of residential flats known as Russell Priory, on the east side of Southampton-row (the upper surfaces of the floors of which stories are above 60 ft. from the street level) for the persons dwelling or employed therein (Mr. G. D. Martin for Mr. T. H. Brookfield-Hitching).—Consent.

Buildings for the Supply of Electricity.

Holborn.—An electric sub-station, transformer-room and storage battery-room on the south-west side of Tower-street, Little Earl-street, Holborn (The Metropolitan Electric Supply Company, Limited).—Consent.

City of London.—A distributing station on a site at the rear of Nos. 82 to 84, Fenchurch-street, City, to abut upon Carlisle-avenue (Messrs. Clifton, Son, & Hope, for the Charing Cross and City Electric Company, Limited).—Consent.

Height of Buildings.

Hammersmith.—That the application of Mr. C. G. Miller for an extension of the period within which the re-erection of the Swan public-house, No. 40, Broadway, Hammersmith, with a portion of the new building to abut upon Beadon-road and to exceed in height the distance of the wall of such building from the opposite side of that road, was required to be commenced, be granted.—Agreed.

Construction of a Cabmen's Shelter on the Victoria Embankment.

Strand.—A cabmen's shelter on the Victoria Embankment, near Savoy-street, Strand (Mr. T. S. Stahlschmidt for the Committee of the Cabmen's Shelter Fund).—Consent.

TECHNICAL EDUCATION IN GALICIAN AUSTRIA.

MR. JAMES BAKER, F.R.G.S., whose reports to the Board of Education on technical education in Berlin and Fosen were noticed in the *Builder* of January 4, has also written a description of the technical and commercial schools in Galician Austria. He tells us that in Cracow, which is a town of 83,000 inhabitants, there are for technical education the Staats-gewerbe School, with 204 scholars; the Fortbildungsschule, with 140 pupils; a locomotive school, with forty-nine; an art school, and five town continuation schools, with 800 pupils; also a Handel, or commercial school, with 160 pupils. The cost of the building for the Gewerbeschule, which was built in 1898, was about 5,000. The apprentices of the town are compelled to go to the continuation or Fortbildung schools, and in the Gewerbe or trades schools poor scholars are assisted by thirteen State scholarships of 150 gulden (12l. each), and ten provincial and four private scholarships of the same amount; and, besides, there is a yearly sum of 350 gulden (28l.) for poor scholars. The principal trades of the town and the district, which latter is largely agricultural, are building, lithography, printing, and wood furniture, and iron-work for art iron production. These subjects are taught in the Gewerbe school, which is divided into three Fach, or trade divisions, i.e., building, technical mechanics, and technical chemistry.

The Fortbildung or continuation artisan school is held in the winter from October to May in the evening from seven to nine, and on Tuesdays from nine a.m. to noon. It is divided into four sections—the first being for building; the second for metals; the third for art cabinet work, art metal work, art goldsmith and bronze work, and carving; and the fourth for painting, engraving, and photography. A special course is held for locomotive machine work; and, in addition, a Werkmeister's school—that is, a school for master workmen who are no longer apprentices, is about to be established. In ascending the wide staircase of the building Mr. Baker noted some bold decoration in Sgraffito work on the walls, and a good cast of a sphinx at the foot of the stairs, and he was told all this was the work of the scholars. In one room the pupils were composing and designing decorations for walls; an example of a leaf was given and then they had to produce a design. Others were drawing working plans for cabinet work, and, even by the first-year pupils of

fourteen to seventeen years of age, some excellent work was being produced. In the builders' and architects' sections, plans and projections were being given, such as a corner house for such and such uses. Each pupil sketches out his own idea, and every detail is worked out, doors, balcony, &c., and the material varied of stone or brick, or the two combined.

It is noteworthy that in these Imperial Royal schools, in the obligatory studies enforced by the Government, the first subject is the Polish language, then comes the German, and in the first year's course the other subjects are geography, mathematics, and physical geography, and a study of the oro-hydrographical and climatic conditions of the earth, and lessons upon the principal trade and commercial districts, algebra and geometry and geometrical drawing, experimental physics, chemistry, and free-hand drawing. Thirty-six hours a week are given to these subjects in the first year's course. In the second year the same subjects are taken, an advance being made; and in the building section, building construction and freehand drawing of architectural models, and in the technical mechanical section, mechanics and freehand drawing, with special attention to sections, parts of machines, &c., are added; with every fortnight a practical course in the workshops. In the chemical technical section general and analytical chemistry and mechanics are added, with six hours weekly in the laboratory; and mineralogy, geognosy, and freehand drawing in the mechanical section. In the third year in the building section the architectural work is developed, and knowledge of architectural form is added, dealing with columns, gables, façades, &c. In the fourth year book-keeping is taught to all sections, and in the building section the subjects are carried on to the more elaborate studies—as Greek, Roman, and Eastern architecture—and in mechanics the study of the newest agricultural machines is introduced, and civil engineering in connexion with roads, bridges, water conducting, damming, &c., is studied; whilst in chemistry such subjects as artificial manures, fat and mineral oil industries are studied, and twenty-two hours a week are given to practical laboratory work; whilst to the chemistry of agriculture is allotted three hours a week. Each year the pupils are taken for a four days' excursion into the big factories of the province to study the work done there, and lesser excursions are made in and near Cracow to study especially, and make sketches of, the buildings. Students from this school are taking up good positions in various parts of Europe, and Mr. Baker significantly remarks that although "when first the schools were started both parents and pupils were reluctant to give the time for this education, now they are eager to obtain it." He adds that "the education is especially adapted to the requirements of the locality, and this localising and decentralising of education" is carried out most successfully throughout the Austrian Empire." Mr. Baker also visited Lemberg, the capital of Galicia. This is a town of but 130,000 inhabitants, yet, as the capital of the province and the seat of the Diet it has very numerous public buildings, and its schools would astonish the inhabitants of an English town of the same size. The Gewerbe or trade technical school is an important building, with wide corridors and spacious classrooms, giving instruction to 433 pupils, with a staff of thirty-three professors and workmen or teaching foremen. The original cost of the building was 24,000*l.*, and of the site 8,000*l.* The yearly cost of the professors is about 4,000*l.* The hours of tuition are, in the winter, from 8 a.m. till noon, and 2 p.m. till 7 p.m.; and in summer from 7 a.m. till noon, and from 2 p.m. till 7 p.m. To be admitted the students must have passed through six classes of a Volksschule if trained in a village, or seven classes if trained in town. Then they have to pay one gulden (1*s.* 8*d.*) entrance fee, and four gulden yearly; if they are poor but industrious these fees are remitted. The artisans are most eager to send their children to this school, but the trades people still strive to get their children into the Gymnasium. The aim of the Gewerbe, as set forth in its statutes, is to give a professional, theoretic, and practical training to industrial workers or apprentices, and to train tradesmen and artisans in the special trades for which lectures and practising workshops are established; likewise to offer to all the opportunity to study and perfect themselves in drawing and modelling, and to give apprentices the opportunity to gain such a full knowledge of their trade that they may assimilate this knowledge with their practice in the factory or workshop. The school comprises four divisions—(1) building trades; (2) art trades; (3) modelling; (4) continuation classes. Division 1, i.e., the building trades' school, is divided into:—Section A (1) for general minor building work; (2) for carpentry; (3) for stonemasonry; and Section B, which is a school for builders, carpenters, and locksmiths, divided into two parts, where theoretic and practical workshop work go on together for three years of two half-year courses each. In the art of building the three classes of artisans—builders, carpenters, and stonemasons—are most carefully instructed. Lectures and drawing are divided for the first half-year equally—four hours each; for the second half-year five hours are given to lectures and eight to drawing for the builders and carpenters, and for the stonemasons three to

lectures and six to drawing. In the third half-year the builders have five hours lectures and twelve hours drawing, the carpenters the same, and the stonemasons four hours lectures and eight hours drawing; whilst in the fourth half-year the hours are, for the builders, two hours of lectures only. The course of study is most complete, commencing in the first half-year for all with technical terms, materials, stone and wood, trussing, stability of walls, ground floors, and roofs; the use of iron, &c.; and the drawing works in with this, with drawings to scale, &c., until in the fourth half-year elaborate buildings, with all the outward decorations and internal fittings, are worked out and studied, free scope being always given for individual expression and originality.

Books.

Theory of Engineering Construction: A Reference-book for Civil Engineers and Students. By ERNEST H. ESSEX, Assoc.M.Inst.C.E. London: The St. Bride's Press, Limited.

NOTWITHSTANDING its somewhat comprehensive title, this volume is not, nor is it intended to be, a textbook on engineering construction. It is practically a series of five sample papers on the subjects in Part II. of the Examination applying to the election of Associate members of the Institution of Civil Engineers.

Forty-eight questions are selected by the author from amongst some already set by the examiners on the four essential subjects of theoretical and applied mechanics, the theory of structures, and the strength of materials; and three questions are taken on geodesy, which is one of eight optional subjects. Answers are written to these, and explanatory diagrams are included where necessary. Although the scope of the work is rather limited, the examples chosen refer to problems of general professional interest, and the solutions are well reasoned and lucidly expressed. As an adjunct to scientific textbooks, the volume ought to be useful, and it may also be serviceable as a guide to candidates for examination. It is less likely to be adopted as a reference-book, in spite of a carefully compiled index, because so many of the points receive only such mention as may be incidental to the elucidation of the various problems under consideration. Two unnumbered blank pages occur after each answer, so that the student may insert other examples on any subject engaging his attention. We believe that very few people avail themselves in this way of interleaved pages, which are apt to constitute an inconvenience to the majority of readers.

Field Work and Instruments. By A. T. WALMSLEY, M.Inst.C.E. London: D. Foulriner (Builder office), 1900.

Land Surveying and Levelling. (Same author and publisher.)

THESE are two more of the *Builder Students' Series*, the contents of both of which have appeared in the "Student's Column" of the *Builder*, and are issued in book form with revision by the author.

In the work on levelling and surveying the object has been to provide an elementary treatise which will be useful for those intending either to be architects, engineers, or surveyors. Mr. Walmsley remarks truly, in his preface, that "part of architecture consists in the consideration of a site with a view to placing a building on the land; and in the case of a mansion to be built on a new estate, an architect who surveys the estate himself will know much more about the ground than one who, without inspecting the site, has employed a surveyor to do the survey for him."

The subject of field work and instruments is a natural sequel—or shall we say a preface—to a work considering the subject of surveying generally. Many of the younger school of architects of the day are, we fear, little at home in the handling of the level and theodolite—instruments of great interest in themselves, as well as in their practical application for reducing the facts about a site to graphic form.

Mr. Walmsley's name is so well known as an authority on these subjects that no recommendation of him on our part is necessary.

We may mention that a good many new illustrations have been added in the books, besides those which originally appeared in our columns.

Mathematical Drawing Instruments. By WILLIAM FORD STANLEY. Seventh edition. London: E. & F. N. Spon, 1900.

WHEN the first edition of Mr. Stanley's useful work was written, about thirty-five years ago, it was the object of the author to place on record what he really knew, as a practical maker, on the subject of drawing instruments, hoping that his book might prove of practical value to professional readers. That this hope has been fully realised is known by all who are acquainted with the work, and is evidenced by the appearance of the present edition, in which about one hundred pages of new matter, with many illustrations, have been incorporated, with the object of describing the most modern types of instruments and appliances used in the drawing office. At the same time, we observe that references to various obsolete instruments have been omitted, so that the volume is now thoroughly up to date in every respect. Many of the appliances illustrated are only required for special classes of work; and as to ordinary instruments, it may be remarked that as the draughtsman adds year after year to his life, he not infrequently seems to grow less appreciative of those elaborate aids which appeared so desirable in his younger days. Mr. Stanley wisely advises persons with limited means to buy good instruments separately, "as they may be able to afford them;" perhaps he might have added with advantage the words, "and as they may find the need for them." The last four chapters contain hints of especial value to students on drawing materials, colouring, sun-printing, lettering, and similar subjects.

The Practical Engineer Electrical Pocket-Book for 1901. Manchester: The Technical Publishing Company.

SEVERAL additions have been made to this useful book. The section on the gearing of motors has been made thoroughly modern, and the tables given will simplify the calculations for the choice of suitable wheels for reduction gear. It would be better to omit the difficult methods given of measuring mutual and self inductance, as they require costly and elaborate apparatus.

Fifteen Studies in Book-keeping. By WALTER W. SNAILUM. London: C. J. Clay & Sons, 1900.

INTENDING students of book-keeping have already a rather large selection of works to choose from, and we find much that appears familiar in the pages before us; but in a work designed to instruct the novice, as well as to assist the more advanced student, and starting, consequently, with elementary principles, this is, of course, only to be expected. There is, however, an unusual variety in the selection of exercises and examples enabling the student to apply the principles to practice, which tends to render the work especially serviceable.

The "fifteen studies" are supplemented by a series of worked examination papers and test exercises, dealing with widely differing kinds of accounts—including, we notice, a month's transactions of a firm of contractors—and, while the same principles may govern the business records of a grocer and a builder, it is obviously a distinct advantage for the illustrations to comprise as many trades as possible.

In the papers given for solution, certain questions appear on matters of finance which are not dealt with in the text; and we assume that their inclusion is due to its being deemed desirable to set forth the papers in their entirety. The student will find both the "studies" and exercises of great assistance in preparing for examinations, and a fair equipment for ordinary commercial book-keeping. The other questions to which we have alluded will serve to show the necessity of enlarging his studies, in the event of his aspiring to the higher branches of book-keeping.

CLERKS OF WORKS AND BUILDERS.

SIR.—In the last issue of the *Builder* is a report of a paper read by a builder before the Bristol Society of Architects, in which some remarks about Clerks of Works occur.

I cannot remember ever seeing in print, except in reports of law cases, a builder's opinion of clerks of works, and for that reason and for the inferences to be drawn from them, they are unique.

On many occasions in these columns the duties and the responsibilities of clerks of works have been discussed by architects, and by surveyors, and even by clerks of works themselves, and now at last we are allowed to know what a builder thinks it right to say about us.

Some day we may be privileged to hear what our real employers, building owners, think about us, and then our cup of joy, or otherwise, will be filled!

Clerks of works have got quite accustomed to hear opinions expressed about them by builders, but hitherto those opinions have been conveyed, as the lawyers say, *in propria voce*, and the words used and the tone adopted are usually trenchant; but clerks of works are a thick-skinned race, and one of their chief qualifications is to be able to submit calmly to insult. Therefore, nothing in the report referred to will excite feelings of annoyance, but it may cause some surprise that a builder, presumably of experience, should say "My own idea is that the clerk of works should be the architect's representative." Now, whom does the clerk of works down Bristol way represent, if he does not represent the architect?

Really, the author of the paper must have come in contact with some queer specimens of the genus, if they are not "prepared to obtain and give all information necessary to the proper carrying out of the contract," so far as it appertains to their duties. But clerks of works should, in my opinion, confine themselves to their own duties as such, and not place their knowledge and experience at the disposal of builders who, taking advantage of good nature and courtesy, will frequently obtain from their assistance that ought to be supplied by their own foremen. I have heard builders say that a first-rate clerk of works is the best foreman on the job, and so he is, if by being willing and able to render assistance outside his own duties the builder escapes the necessity of paying for proper superintendence.

For every builder who suffers by a clerk of works there are, I think, two clerks of works who have their duties nearly doubled by incompetent builders.

The author goes on to say that "one man may make the work cost 5 to 10 per cent. more than another." That I utterly deny. It is impossible for any man to do that, because the wording of all specifications and contracts that I have seen distinctly and repeatedly says that everything is to be of the best and, presumably, the most expensive of its kind, and no man can make a builder do work of a lower quality than the best. If the best, if the author had said one man may let the work cost 5 to 10 per cent. less than another I would not have disputed it; but whether that type of man is of any use to architects and owners is another question.

I do not think it advisable to pay clerks of works so much per contract. It sounds plausible, but it would not work out very satisfactorily. Architects would not "find" their works executed with much more promptitude and despatch. A system of that kind would, in my opinion, lead to scamping and connivance. Clerks of works are not consulted by architects about the duration of time allowed, and, although a vigilant clerk of works may keep a sluggish builder up to concert pitch, nothing that he can do will cause a builder who knows his business to drag a job along. Unfortunately, dragging along is more frequent than pushing ahead, but the causes for that must be looked for elsewhere than in the conduct of a

CLERK OF WORKS.

NEW BATHS AND A BRANCH LIBRARY FOR LEEDS.—At a meeting of the Baths Committee of the Leeds Corporation recently, a rough estimate was submitted of the cost of erecting a building to serve for baths and library in York-road, and for new bath premises in Broad-lane, Bramley. Sites have been already purchased, and, exclusive of this outlay, the cost will be, in York-road, about 15,000*l.*, and at Bramley about 8,000*l.* If the City Council sanction these proposals, as the committee recommend, designs will be invited, with an offer of premiums of 50*l.*, 30*l.*, and 15*l.*, in the former case, and 30*l.*, 20*l.*, and 10*l.* in the latter. Mr. Braithwaite, architect to the Leeds School Board, whose advice had been sought, reported as to the best method of repairing the leakages at the Union-street and Kirkstall-road baths. Both these baths were opened in 1895. The committee will recommend that the work be taken in hand as early as possible. Tenders for painting the Kirkstall-road and Holbeck Baths were accepted from Messrs. Gaunt.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

4.—SANITARY POTTERY.

GLAZED ware of different kinds is now so much used for sanitary fittings, that a short description of the principal varieties cannot fail to be of service.

The material most commonly used for the cheaper kinds of fittings is salt-glazed fireclay. The glaze is produced by throwing common salt into the kiln during the last stage of firing. The salt is decomposed by the heat and fills the kiln with dense fumes of salt-vapour, which enter into chemical combination with the silica on the surface of the clay, producing a thin glaze of silicate of soda; the glaze is, therefore, a portion of the fireclay itself fused or vitrified under the influence of salt. A salt-glaze has the advantage of being thoroughly incorporated with the material to which it is applied. On the other hand, it is not very smooth, as roughnesses or inequalities in the plastic clay are still apparent in the finished production. Fireclay is a somewhat brittle material, and sharp corners may be chipped off by a blow, even though glazed. For this reason all external angles ought to be rounded. The colour of salt-glazed ware is generally some shade of reddish brown, with a mottled appearance.

Doulton-ware is a salt-glazed stoneware, which is claimed to be a denser material than ordinary fire-clay. The term "stoneware" ought really to be applied only to ware which is vitrified throughout, and not merely glazed on the surface.

The materials already described are largely used for the cheaper kinds of sinks, urinals, school lavatories, latrines, and water-closets, and also for heavy fittings for factories and other places where rough usage is likely to occur.

A better surface is obtained by means of porcelain enamel, which is a thin film of porcelain fired on to the fireclay or "earthenware" body. The piece of fireclay, modelled to the required shape, is burnt in the kiln in the usual manner without the addition of salt. It is then known as "bisque" or "biscuit" ware, from its porous appearance, and the enamel is applied by covering the surface (generally by dipping) with the liquid slips and glazes necessary to produce the porcelain enamel of the required kind and colour. The article is again fired in a kiln, in order to fuse the materials applied to the surface and convert them into a thin sheet of porcelain, which, if the process has been properly carried on, will be thoroughly adherent to the "biscuit" body. In many cases, however, the enamel is far from satisfactory. It may be cracked in firing, or may be so loosely adherent to the body as to be easily flaked off by a blow or by frost. Enamelled bricks are generally made in this manner, and the enamel of inferior qualities frequently fails by flaking off. In this, as in so many cases, cheapness in first cost is not always true economy. It is better to pay a fair price for a sanitary fitting made by a firm of good reputation than to buy a cheap fitting made no one knows where.

Enamelled ware of this kind is used for sanitary fittings of medium quality and also for very heavy fittings of the best class, such as urinal-stands, large sinks, and baths. In some cases the goods are sorted into two or more qualities, the inferior ware being defective either in shape or in the enamel.

With the exception of these heavy fittings, the best sanitary goods are made of some kind of white earthenware or pottery suitably glazed. Different manufacturers use slightly different mixtures of clays, flints, &c., and adopt distinctive names, among which may be mentioned "Queenware," "Titanite," "Vitrina" ware, and "Vitro-porcelain." For convenience they may all be classed together as whiteware or porcelain. It is practically the same material as that used for ordinary household crockery, and like this, varies in strength, correctness of form, firmness, and durability of glaze, and in other respects. The quality of the pottery must be considered in appraising the value of sanitary ware, exactly as in the case of plates and dishes.

The manufacture of a piece of sanitary pottery of this kind is not by any means a simple matter. Failures innumerable have occurred in arriving at the results which are

now possible, and the greatest skill and care have still to be exercised in order to produce a perfect piece of work. A brief description of the method of manufacture adopted at Twyford's Cliffe Vale Works, Hanley, will show what skill and care are required. The selection of the ingredients is the first step in the process. These consist of kaolin or china clay, blue or ball clay, flints, and Cornish stone. Kaolin is the finest kind of clay, and is prepared from decomposed granite or felspathic rocks; it contains a certain amount of potassium, and gives fineness of texture and plasticity to the final mixture. Blue or ball clay is a fairly pure hydrated silicate of alumina, and is therefore a true clay. It is of dark grey colour, but burns white, and is introduced to give strength to the mass. Flints are pure silica, and are added to give rigidity and to control contraction. Cornish stone is a partially-decomposed granite, and serves as a flux under the influence of fire.

Each of these ingredients has to be prepared separately. The flints must first be calcined, then crushed, and ground between bard stones in water. The Cornish stone is similarly treated, except that it does not require calcining. The clays are disintegrated and purified by agitation with water. In each case the material must be so finely triturated as to be held in suspension by the water. The four liquids are then mixed together in proper proportions, which vary according to the nature of the earthenware required and according to the amount of solid matter in suspension. To this mixture metallic oxides are added when it is desired to give colour to the body of the ware. Coarse particles are removed from the "slip" by passing it through wire and silk sieves; and fine particles of iron, which would render the earthenware speckled, are extracted by running the slip along a trough in which a number of magnets are placed. A large proportion of the water in the slip is then removed by means of filter-presses, from which the clay is taken to the pug-mill. This is a cylindrical apparatus with revolving steel knives, by which the clay is reduced to uniform consistency, and from which it is forced in a plastic state, ready for the potter.

Before the potter can use the clay, he must have full-size plaster models of the various parts of the articles to be made. It is impossible to mould a complicated piece of sanitary ware in one piece. The ware must be built up in pieces, each of which must be separately moulded. The clay is "pressed" firmly into the moulds, so that it will be absolutely homogeneous, and then the operation of "sticking-up" is performed, whereby the different pieces are joined together. If this operation is not well done, the joints crack during firing. The "Twyford" water-closet basin is composed of no fewer than thirty-two pieces, separately moulded and then "stuck" together. After partial drying the ware is "fettled" by "trimming the edges with a knife, sponging out all mould marks, and finally finishing with a piece of horn until the surface is perfectly smooth." The ware is then dried at a moderate temperature, and is afterwards dressed by rubbing gently with very fine sandpaper.

It is now ready for the kiln. Great care has to be exercised in placing the articles in the kiln. They are protected by enclosure in earthenware "soggers." The temperature of the kiln and the duration of the firing have also to be carefully regulated. But into this part of the process of manufacture we need not enter.

The ware leaves these kilns in the "bisque" or "biscuit" state, and is then stored in a warehouse and carefully examined. Damaged pieces are thrown out, and pieces containing slight cracks, which can be stopped, are marked and passed on to women who clean the pieces and repair the defects with liquid stopping.

The ware is now ready for printing or decorating, or (if it is to be left plain) for dipping into the liquid glaze. This is prepared from ground flints and other ingredients, and is of such a composition that, on firing at a high temperature, it forms a thin coat of glass on the surface of the pottery. The glaze generally contains a certain amount of lead, and this renders the process of dipping a dangerous one, unless careful precautions are taken and absolute cleanliness observed by the workpeople. After being dipped, the ware is

Illustrations to Student's Column.

touched up by means of a camel-hair pencil, and the glaze is sponged off those parts which are to be left unglazed. The ware is then dried, at a moderate temperature, and the process of manufacture is completed by burning it again in kilns to fuse and fix the glaze. This operation requires great care both in placing the ware in "seggars" and in regulating the temperature and duration of the firing.

This brief outline of the process of manufacture will serve to show that good sanitary ware is difficult to produce, and is necessarily costly. If a good piece of pottery is required, a good price must be paid for it.

The pottery which has just been described has a more or less porous body protected by a thin coating of glass, but within recent years attempts have been successfully made to produce ware which is practically vitrified throughout, and is therefore non-absorbent. This is a valuable improvement, as it sometimes happens that the glaze is not perfect throughout the hidden parts of a complicated piece of pottery, or that, if perfect when it leaves the kiln, it is subsequently damaged. In such cases a porous body is apt to become foul. Non-absorbent ware of this kind is now made by manufacturers of the best sanitary pottery, but under various names, such as "vitrina" and "vitre-porcelain." It is slightly more expensive than ordinary ware.

5.—SINKS.

SINKS are of various kinds. Among these may be mentioned (1) the sink-of-all-work, commonly known as a scullery or kitchen sink, which, being without a waste-plug, does not hold water; (2) the sink with waste-plug and overflow, often known as a butler's sink; (3) the nursemaid's sink, which is merely a variety of the butler's sink; (4) the vegetable sink; (5) the sink for washing pans and other hardware; (6) sinks for special purposes, such as laboratories, photographers' studios, operating rooms of hospitals, &c.; and (7) the housemaid's sink, which is generally fixed in connexion with the slop sink, and will be more conveniently described in the chapter on fittings of the latter kind.

The different materials used for sinks include stone, slate, glazed ware of various kinds, cast and wrought iron, tinned copper, wood, and wood lined with tinned copper or lead. There is not one of these materials which can be considered perfectly suitable for every kind of sink, but the most generally serviceable material is good glazed ware, which has the great advantage of cleanliness. The chief objection to such ware is its hardness, which results in damage being done to delicate crockery and glass. This danger can, however, be much reduced by the use of wood grids and drainers, as will be hereafter explained.

1. *Scullery Sinks.*—In small houses the sink is often the only sanitary fitting which can be

afforded. Such sinks are of the ordinary type without either plug or overflow. In former years they often consisted of a solid slab of stone with a portion dished out to a depth of 3 in. or 4 in., but this material, although durable in a sense, has the disadvantages of being pervious to moisture, and therefore difficult to keep clean, and of wearing away in places so that the water will not flow away to the waste outlet. Salt-glazed or enamelled fireclay is now generally preferred on account of its greater cleanliness. Sinks of this kind are commonly oblong, ranging in size from about 20 in. by 15 in. to 48 in. by 24 in., the outside depth being 5 in. to 6 in. The stock sizes of different manufacturers vary, so that it is now possible to obtain from stock a sink of almost any dimensions. Angular sinks of the shape shown in fig. 1 are also made.

The defects to be avoided in these and other pottery sinks are *sharp arrises*, as these are often damaged in transit or by contact with heavy pans, *sharp internal angles*, which render the cleaning of the sink more difficult, *warping*, which is often so serious as to prevent the water running to the waste-outlet unless the sink is purposely placed out of level, *cracks* in the body of the ware, and *flaws* in the enamel.

Kitchen sinks of this type are also made in cast iron, either finished black, or galvanized, or enamelled. The example given in fig. 2 cannot be recommended, as the trap is of the "bell" form. Such a trap is objectionable for several reasons:—The flow through it is so sluggish that the trap is not self-cleansing; the depth of seal is only $\frac{1}{2}$ in., and the seal is therefore easily lost by evaporation; and the bell grate is often removed (for the purposes of cleansing the trap and expediting the discharge of the water from the sink), thus admitting more or less impure air through the waste-pipe into the house.

Porcelain-enamelled iron sinks are easily damaged, as the enamel chips off under a comparatively light blow or if very hot water is suddenly poured on to it. Galvanized iron is better, unless the water is soft moorland water, when the coating of zinc is soon eaten away and the iron exposed to the corroding influences of moisture and air.

2. *Butler's Sinks.*—Sinks of the kind already illustrated are really nothing but fittings for the reception of the foul water poured from vessels of different kinds, and of water dripping from the taps or draining from articles which have been washed. They do not hold water, and "washing-up" must therefore be performed in a vessel of wood, papier-mache, or metal, placed in the sink. Such an arrangement is often inconvenient, and in large establishments is practically unworkable. The desired improvement is obtained by fitting a plug to the waste outlet, so that the sink will retain water, and this alteration necessitates an overflow, so that, if a tap is left running when the waste is closed, the water can escape

without overflowing the sides of the sink. A sink of this kind is shown in fig. 3; the overflow is of an old-fashioned type, consisting of a pottery bend (in one piece with the sink), to which a lead pipe can be attached to convey the water to the sink side of the trap, or (if the local regulations demand) the lead pipe can be taken straight through the wall to the open air. These sinks can be obtained from 15 to 27 in. long, 12 to 16 in. wide, and 7 to 10 in. deep, outside measurements.

Overflows of this kind cannot be kept clean, and a much better arrangement is shown in fig. 4, which is often known as the "Belfast" pattern. In this case, the overflow is formed in a projecting portion of the pottery, and is continued up to the top of the sink, so that a small wire brush can be inserted to cleanse the passage. A porcelain or metal cap to cover the top of the opening is provided in preventing the ingress of substances which might choke the overflow. These sinks are made from 24 to 48 in. long, 16 to 24 in. wide, and 7 to 12 in. deep. In fig. 5 the overflow is placed in a projection inside the sink, and the same projection affords space for the water-taps and the standing waste. This is made by Doulton & Co. in two sizes, 30 in. by 18 in., and 36 in. by 24 in., both 8 in. deep. The roll edge is much less likely to be chipped than a square arris.

Cast-iron sinks, with overflows similar to that shown in fig. 4, are now made in sizes from about 15 in. to 36 in. long, about 14 in. wide and 7 $\frac{1}{2}$ in. or 8 in. deep. Semicircular and quadrant sinks can also be obtained. The iron is finished by painting, galvanising, or enamelling with glass, porcelain, or coloured vitreous enamel. Some idea of the relative cost of these methods of finishing will be gathered from the following list prices of a sink 36 in. by 14 $\frac{1}{2}$ in. by 7 $\frac{1}{2}$ in.—painted, 10s.; glass enamelled, 18s.; vitreous enamelled, 25s.; white porcelain enamelled, 32s. 6d.

Sinks with high backs, such as that shown in fig. 6, have the advantage of preventing a certain amount of splashing, but the taps must not be fixed so low as to render the drawing of water into ordinary vessels an impossibility. Sinks with raised sides are also made as shown in the right-hand portion of the illustration. The sizes range from 24 in. by 14 in. by 10 in., to 48 in. by 24 in. by 12 in., the raised backs and sides being 5 in. higher.

Shank's new form of sink, illustrated in fig. 7, contains an improved overflow of large size readily accessible for cleansing, and a pull-up waste which can be removed with the greatest ease; to open the waste, the knob, carrying a crossbar which slides in metal grooves embedded in the pottery, is raised and moved backward so that the cross-bar rests on the horizontal portions of the grooves, and the removal of the waste is effected by raising the cross-bar through the upper vertical portions of the grooves. The sink is supplied either with or without the raised back, and measures

GLASGOW ROYAL INFIRMARY COMPETITION: DESIGN PLACED FIRST BY THE ASSESSOR—MR H. F. CHISHOLM, ARCHITECT

25 in. by 19½ in. by 9½ in. deep. It can be supported on a central pedestal, or on iron standards or wall-brackets.

OBITUARY.

MR. JOHN BURNET.—We regret to have to record the death, on January 15, in his eighty-eighth year, of Mr. John Burnet, of St. Kilda, Downhallow, Glasgow. Mr. Burnet was elected Fellow of the Royal Institute of British Architects in 1876. He was an original member of the Glasgow Institute of Architects, of which he was President in 1876-8, and a member of Council during many years. Mr. Burnet was father of Mr. John James Burnet, A.R.S.A., of Glasgow, and senior member of the firm of Messrs. John Burnet, Son, & Campbell. Of architectural works carried out by that firm the following have been illustrated in our columns: The Western Infirmary, the new Barony Church, and the Athenaeum (two views), Glasgow (July 9, 1898, "Glasgow," No. XVI. of our series of "The Architecture of our Large Provincial Towns"); and Athenaeum, Glasgow, with plans (October 21, 1893); competition designs, by the then firm of John Burnet & Son, for the Birmingham Law Courts (August 14, 1886), and Model Dwellings, Cathedral-court, Rotten-row, Glasgow (October 15, 1892). The firm were the architects also of the Art Gallery, Glasgow (J. Burnet & J. J. Burnet), a church at Stenhousemuir, Stirling, to commemorate Dr. McLaren's jubilee (John Burnet & Son); and in Glasgow, the Pathological Institute, the Subway Station near Glasgow Cross, Albany Chambers, and Cross-mansion, the Savings Bank in Ingram-street, the Clyde Trust Office, the Merchants' House, the Stock Exchange, the Union Bank, the Clydesdale Bank, and the Woodlands-road United Presbyterian Church. The Public Baths at Alloa, planned and designed by them, were completed in May, 1898. Mr. Burnet was, we believe, the author of the plans for the restoration of Arbroath Church that were approved in December, 1883; and he designed several mansion-houses in the neighbourhood of Glasgow and the West of Scotland.

GENERAL BUILDING NEWS.

RESTORATION OF GARVESTON CHURCH, NORFOLK.—The parish church of Garveston has been partially restored. The work has been executed by Messrs. Springall & Son, of Swanton Morley, from plans prepared by Mr. A. J. Lacey, of Norwich.

CATHOLIC CATHEDRAL FOR LEEDS.—We understand that the plans for the new Roman Catholic Cathedral in Leeds will be deposited with the city authorities for their approval in the course of a few days. The building, which is to take the place of St. Anne's Cathedral—scheduled in connexion with the Cookridge-street improvement—will occupy the site lying between the new Masonic Hall and Cookridge-street. It will be in the Early English style. Solidity and simplicity appear to have been aimed at in the designs. The presbytery, or clergy house, forms part of the church building. One remarkable feature will be the provision of double side aisles, an arrangement which has been made possible by the comparative breadth of the site in proportion to its length. The cathedral, both inside and out, will be built of stone, and the main entrance will be from Cookridge-street. It is anticipated that about two years will be required for the completion of the scheme. The schools, which were opened in the fortress by Daniel O'Connell, are also to be demolished, and new ones will be erected on a more convenient site in the parish. It is understood that the authorities of the cathedral will receive about 46,000l. from the Corporation in addition to building sites, and of this sum it is estimated that about 33,000l. will be spent on the cathedral and presbytery. The architect is Mr. J. H. Eastwood, of Kensington. *Yorkshire Post.*

BOARD SCHOOLS, WEST HARTLEPOOL.—The Lister-street Board schools at West Hartlepool were opened on the 20th ult. The schools give accommodation for 1,502 scholars, and have cost 18,997l. They are on the central hall system, and were designed by Mr. Percy Hinde, of Liverpool. Mr. Beetham, of West Hartlepool, was the principal contractor.

BOARD SCHOOL, BLACKPOOL.—The foundation-stone has just been laid of a Board school in Devonshire-road, Blackpool. Mr. R. B. Mather is the architect, and Messrs. Cardwell Bros. are the contractors.

NEW BANK AT ROCHESTER.—The Capital and Counties Bank Limited, have just opened a branch at 69, High-street, Rochester, opposite the post-office. Part of the building is of Elizabethan date, extensively altered and subsequently rebuilt in the eighteenth century and partly rebuilt in the nineteenth century and subsequently. In excavating to form the strongroom fragments of Roman pottery were found at a considerable depth below the present level. The house is well known on account of its then owner, Sir Richard Head, having given hospitality to James II, in December, 1688, and from it the fugitive king escaped to the river and so to France. The house and large garden will be occupied by the manager, while a portion of the

ground floor, until recently used as a shop, has been altered for the purposes of the bank. The shop front has been replaced by a front of Portland stone, simply treated with the arms of the bank carved over the entrance doorway. The walls inside were partly lined with eighteenth century large deal panels; these have been repaired and completed. The new doors, counter, and fittings are of oak. The counter affords accommodation for two cashiers, and is protected by a brass grille. The floor in front of the counter is paved with Rust's vitreous mosaic, the remainder with wood blocks. The window of the manager's-room has been filled with glass bearing upon it the arms of the present owners, the past owner, Sir R. Head, and his guest, James II, and others. A lavatory for the clerks has been built at the back, and a strongroom in the basement. The wood-block flooring is by Turpins Company, the beating by Jones & Sons, the brasswork by Vaughan & Brown, metal casements and glazing by R. E. Pearce & Co., and the strongroom door by the Ratner Safe Company. The builders are West Brothers, of Strood and Rochester, and the architect Mr. E. F. Cobb, of Rochester.

WATER COMPANY'S NEW OFFICES, SOUTH SHIELDS.—This proposed building is planned in two departments, communicating, one for office and public use, and the other for workshops. The building has elevations to Chapter-row and the Market-place, the latter being built on the ground floor with polished red and grey granite. The upper stories are finished in red brickwork, relieved with moulded and carved stone work. On the ground floor there will be a large general office approached through a tiled hall. Communicating with the general office is a manager's room, strong-room, telephone-room, &c. The remainder of the ground-floor is devoted to workshops, &c. The first-floor is approached by a stone staircase, and contains a board-room, of which the inspector's and other offices, and additional workshops. On the top floor a suite of dwelling-rooms has been provided, together with further offices and store-room. The work, which is expected to cost between 7,000l. and 8,000l., is being carried out by Mr. R. Allison, of Whitburn, from the designs and under the supervision of Mr. Henry Grievae, architect, of South Shields.

WORKMEN'S DWELLINGS, LIVERPOOL.—On the 22nd ult. at the Municipal Offices, Liverpool, Colonel A. J. Hepper held an inquiry on behalf of the Local Government Board into an application by the City Council of Liverpool for sanction to borrow 53,500l. for the erection of dwellings for persons of the labouring classes. It was stated that the present scheme of the Corporation was to provide for 3,056 dispossessed tenants. It comprised four houses in Arley-street, 114 in Kew-street and Newsham-street, ninety houses in Clive-street and Shelley-street. The houses would be of different sizes, the rents to range from 6s. 3d. per week for four-room dwellings, comprising a living-room, three bedrooms, and scullery, to 3s. 3d. a week for two-room dwellings.

MASONIC HALL, FROCKHEIM, FORFARSHIRE.—The new hall of the Bruce Lodge, No. 503, at Frockheim, was opened on the 19th ult. The building is in Gardyne-street, and was formerly a chapel. The necessary alterations were carried out under the supervision of Mr. W. G. Lamond, of Frockheim, by the following contractors:—Mr. Charles Esplin, masonry; Mr. John Macbeth, joinery; Mr. Dargie, Arbroath, painting; Mr. William Wishart, slating, &c.; heating apparatus, Messrs. A. L. Peacock & Co., Dundee.

PUBLIC LIBRARY, STIRLING.—A public library is to be erected at Stirling, from plans by Mr. H. R. Taylor, of Messrs. Lessells & Taylor, Edinburgh. The cost is estimated at 6,000l.

FISH MARKET, CARDIFF.—The new market for fish, poultry, fruit, &c., in Working-street, Cardiff, is constructed of brickwork with Bath stone dressings. The building is 158 ft. long by 63 ft. wide. The hall is paved with concrete, and the walls are lined with white glazed bricks to a height of 8 ft., and above that with buff bricks. The lighting will be by electricity. Mr. W. Harpur, the Borough Engineer, designed the building.

SANITARY AND ENGINEERING NEWS.

WATER SUPPLY, DANBURY, ESSEX.—Mr. M. K. Northan Inspector to the Local Government Board, conducted an inquiry, at Danbury, on the 23rd ult. into an application by the Chelmsford Rural District Council for sanction to borrow sums amounting to 4,430l. for water supply works for the parishes of Danbury, East Hammingfield, Little Baddow, Rettendon, Runwell, Sandon, and Woodham Ferris. Mr. J. Dewhurst, Surveyor, said that the new scheme was based on a report by Messrs. Taylor, Son, & Santo Crimp, of Westminster. That firm attributed the failure of the original scheme to an insufficient supply of water and to the faulty hydraulic gradients. The requirements of the district were estimated to be 47,700 gallons a day. He had found after two years' experience that the daily amount required was about 35,000 gallons. It was proposed to purchase thirty-three acres of land surrounding St. Thomas's spring. The daily supply from the two springs and collecting pipes to be laid from the springs across the common to the reservoir was estimated to be 58,880 gallons. They proposed to

erect a reservoir holding 60,000 gallons on Danbury Common. The scheme has met with considerable opposition.

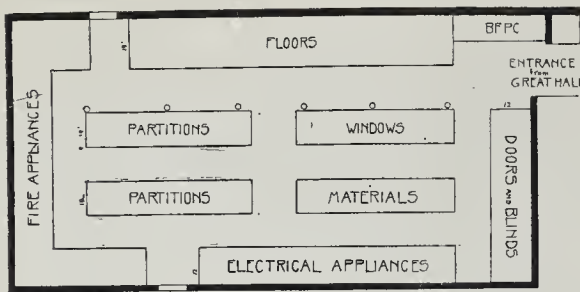

DOVER AND ITS WATER SUPPLY.—Some interest has been aroused lately by figures published with regard to the returns from the water supply works at Dover. As a matter of fact Dover seems to have made an excellent investment in securing its own water works. Year by year, although the water is supplied to householders at a much cheaper rate than in the great majority of towns in the kingdom, large profits are made from the municipal water supply and utilised for the reduction of the General District rate. At the Council meeting last week no less than 4,337l. profit on last year's water supply was transferred in this manner to the relief of the local rates. The surveyor on the same occasion reported the very satisfactory fact that increased meter supply and prevention of wastage in water had resulted in a saving of 579l. on the year. The returns made by the Borough Surveyor with regard to the water consumed at Dover are also interesting—especially to Margate, concerned as we are in regard to our own supply. It seems that at Dover during the year the quantity of water supplied for all purposes was 422½ million gallons, 99½ million gallons being supplied by meter and the remainder, 322½ million gallons, being for domestic supply, street watering, flushing, gardens, &c. He wished particularly to call attention to the great increase in the supply through meters. In 1804 the total supply was 321½ million gallons; by meter 31 million gallons, and supplied other than by meter 291 million gallons. In 1899 the total supply was 434 million gallons; by meter 88½ million gallons, and supplied other than by meter 345½ million gallons. In 1900 the total supply was 422½ million gallons; by meter 99½ million gallons, and supplied other than by meter 322½ million gallons. This showed the total supply per head in 1900 to have been 28½ gallons. For trade purposes 682 gallons per head was used, which left a supply for domestic purposes, street watering, &c., of 221 gallons per head. The income derived from the sale of water by meter was, in 1804, 775l.; in 1899, 2,211l.; in 1900, 2,480l. By a comparison of the total supplies in 1899 and 1900 it would be seen that 11½ million-gallons less were supplied in 1900, although the meters showed an increase of 11 million gallons over the previous year. So that, apart from the increased meterage, the supply was 22½ million-gallons lower than in 1899, although a larger population was supplied. This was mainly due to the recommendations adopted by the Water Committee. On the basis of the rate charged for water, 25l. per million gallons, the saving amounted to 579l. The Surveyor further informed his Council that in 1804 the total consumption per head was 2755 gallons.—*Thames Times.*

MISCELLANEOUS.

LONDON SCHOOL BOARD.—The usual weekly meetings of the London School Board were resumed on the 24th ult., after the Christmas recess. Lord Reay, Chairman, presided. *Rehousing*—The Home Department, in reply to a letter from the Board on the question of their liability for rehousing in the cases of some of the properties scheduled by the Board, stated that the Secretary of State had given the subject most careful consideration, and decided that the numbers for whom the Board might be called on to provide accommodation would be: St. Matthew, Bethnal Green, 483; St. Leonard, Shoreditch, 203; St. Giles, Camberwell, 281; Bermondsey, 263; Mile End and Ratcliff, 510; total, 1,830. The length of time which had in some instances lapsed since the acquisition of the houses taken by the Board, the shifting of population, and the accommodation of some of the persons displaced in vacant tenements in the neighbourhoods, were also matters which had a bearing on the question of the number of new dwellings to be erected, and in the present case the Secretary of State in the exercise of his discretion was willing to agree to allow the provision of accommodation for a total of not less than 1,200 persons to be deemed sufficient. He would also be willing, if the Board desired it, to agree to their contracting with a Public Authority, or with a responsible company, for the erection of the buildings. The Board's liability would, however, not be removed, and the scheme would be the Board's and would have to be approved by the Secretary of State. It was resolved to accept the provision of accommodation as satisfying the Board's liability.

REGISTRATION OF PLUMBERS.—On Wednesday the 23rd ult. a deputation of members of the Parliamentary Committee of the Irish Trades' Congress waited upon the Right Honourable George Wyndham, Chief Secretary for Ireland, in Dublin, to urge his support of the aims of the Congress, including the registration of plumbers under statutory powers. In the course of a sympathetic reply, Mr. Wyndham expressed his sense of the importance of plumbers' work, and his opinion that a number of deaths and a great deal of disease were attributable to defective sanitation and to bad work by incompetent plumbers.

BUILDING TRADES' EXHIBITION.—The Fire Prevention Section at the Building Trades' Exhibition is now taking shape, and the arrangement of the

Plan of the Fire Prevention exhibit for the Building Trades' Exhibition.

Hall has been definitely decided upon. The Hall will practically be divided into groups as shown on the accompanying plan. The Hall is being re-decorated, and should hence present a better appearance than is, unfortunately, generally the case with exhibitions of this description. If possible, arrangements will be made to bring the various exhibitors into line as to the displaying of their exhibits, and to place them in such a way that the different classes of materials are in close proximity to one another.

BRISTOL MASTER BUILDERS' ASSOCIATION.—The annual meeting of this Association was held on the 23rd ult. at the office in the Guildhall, under the presidency of Mr. E. Walters (vice-president of the Association). The Chairman moved the following resolution:—"That the members of the Bristol Master Builders' Association, at their annual meeting held at the Guildhall, Small-street, Bristol, on January 23, 1901, desire very humbly to convey their condolences to the members of her Majesty's august family in their great bereavement. Her Majesty has, during her long and successful reign, endeared herself to the nation, and the marked advances made in trade and commerce, both at home and in her Majesty's colonies and dependencies, will ever make Queen Victoria's reign stand out prominently in the annals of English history." Mr. G. Wilkins seconded the resolution, which was adopted, all the members rising. The Secretary (Mr. H. J. Spear) read the report, from which we extract the following:—An increase in wages of 3d. per hour has been granted all the way round, with the exception of the plasterers, to whom a rise had been granted in the previous year. A revision of the working rules has also taken place, and the rules have been signed by both parties. During the year the committee have devoted considerable attention to the revision of the schedule of daywork prices, and after several meetings a schedule was unanimously adopted, and the same has been circulated amongst the members of this Association, and also the architects, engineers, and surveyors of Bristol, and the School Board, Sanitary Authority, and other bodies. The question of depositing priced bills of quantities with tenders has upon several occasions been discussed, not only by the committee, but by the members of the Association generally, and it was definitely decided by the National Federation at their half-yearly meeting that no bill of quantities shall be deposited at the time of sending in the tender, and shall only be deposited when the contract has been signed, and then only under seal. The sub-committee of the Association has had under its consideration the question of an improved form of contract between the Corporation and the builders of the city generally. Numerous interviews have taken place between the Corporation officials, the solicitor of the Association, and others. It is hoped, during the course of the next few months, that a form will be agreed upon that will be mutually acceptable to all parties. The matter of apprentices is engaging attention, and it is hoped that at an early date a tabulated statement will be issued in respect thereto. The subject of the Workmen's Compensation Act is one which still remains very unsatisfactory. Prior to July, 1897, every workman laboured at his own risk, the master being liable to compensate only when the accident, broadly speaking, was due to the fault or negligence of himself or of someone in his service whom the workman had to obey. It seems, however, that this did not meet the case of the man who, without fault of his own, was injured at ordinary duties, and after much consideration by both political parties a Bill was produced, which, after Parliamentary discussion, became the Workmen's Compensation Act (1897). The original Bill was badly drafted, and a large number of amendments were made without full consideration of their secondary effects. In spite of all defects, however, the Act has been a great benefit to the men, and we do not believe that the masters would now repeal the measure if they could. The money cost of the liability has to be met by them in the first instance, but, like every other trade charge, it ultimately lands on the consumer. As a rule, the individual man is unable to maintain himself long

when disabled, and the average master, however willing, is unable to do it for him. Both of these difficulties are met by this Act, which serves to spread the burden; the slightly enhanced price of commodities being really a small indirect tax on the community for the relief of those who are killed or wounded in its industrial service.—The Chairman proposed the adoption of the report and balance-sheet. Mr. W. Church seconded the resolution, which was carried unanimously. The Chairman referred to the absence of their president (Mr. George Humphreys) through illness, and said that he had seen Mr. Humphreys lately, and he hoped soon to be recovered. Mr. G. Wilkins proposed that Mr. E. Walters be elected President for the ensuing year. Mr. W. Church seconded this, and it was carried. Mr. Walters acknowledged the compliment, and said he would endeavour to do all he could for the trade and the Association. On the motion of Mr. Krauss, seconded by Mr. F. N. Cowlin, and supported by Mr. Scull, Mr. George Wilkins was elected vice-president. Mr. Wilkins returned thanks for his election. Mr. W. Church proposed that the following be elected members of the committee:—Messrs. E. I. Neale, J. Lovell, F. N. Cowlin, F. A. R. Woodard, A. Dowling, J. Eastbrook, C. A. Hayes, and W. K. Thomas. Mr. Krauss seconded the resolution. On the motion of the Chairman, seconded by Mr. Dowling, Mr. G. Humphreys was voted of thanks to Mr. Neale for his services. This was carried; and subsequently, on the motion of the Chairman, seconded by Mr. Thomas, thanks were voted to the retiring president.

WHITE HART HOTEL, OXFORD.—The architects for this building, mentioned in our last, write to say that it is by Messrs. Davy & Salter, not Mr. Stephen Salter, as given in our paragraph.

DISCOVERY OF A ROMAN VILLA AT ROTHLEY, LEICESTERSHIRE.—While engaged in excavations close to the railway-cutting at Rothley Station for the purposes of road-making, the workmen have unearthed some remains of what promises to be a Roman villa. The discovery was made close to the spot where Roman remains were found when the water main at Rothley was being laid some time since. At that time some portions of a Roman pavement were dug up, together with other valuable finds, including a piece of red Samian ware, and also the beautiful fibule, which is now in the Leicester Museum. Several other valuable relics were discovered in the vicinity, and pieces of bone were taken up in one place where there were said to be several graves. These relics excited considerable interest at the time, and it was suggested that proper excavations should be made. This was not done, however, and nothing more occurred until the discovery a few days ago of the foundations of a villa revived interest in the matter. While working, one of the workmen struck his pick against some hard substance, which proved on further examination to be a concrete floor of great age. After this the greatest care was used, and continuing their efforts, a whole room was laid bare. The floor was surrounded by the remains of walls about 2 ft. in height from the base. These were constructed of rough granite, filled with concrete. The granite had evidently been covered with plaster. The part uncovered would appear to be the heating-room of an extensive villa, judging by the flues which were found close to the spot when the water main referred to was laid. Near here were discovered some roofing tiles, a few pieces of bone, and a piece of a mortar, apparently used for pounding food, perhaps grain, &c. The mortar was of pottery ware, the inside being lined with small flints pressed into the clay before baking. There appears to have been a very extensive villa at this place, but, unfortunately, the greater part of it seems to lie under the new road. As far as it has been uncovered, it can be seen that the foundations are in perfect condition. The concrete floor of the room is intact, and from this spring a number of small pillars, the bases of which remain. Among the things found there is a piece of red Samian ware, which appears to have been the spout of a Roman lamp. The discovery of this

portion of the villa is of the highest interest, as it shows the extent of the Roman occupation of Leicestershire. The work will be proceeded with, and it is hoped to unearth the whole of the villa.—*Leicester Post.*

THE SANITARY INSTITUTE.—At an examination in Practical Sanitary Science, held at Bristol, on January 25 and 26, three candidates presented themselves, and the following two candidates were awarded certificates:—W. S. Brabner and W. O. Torr.

FITZGEORGE AVENUE, HAMMERSMITH ROAD.—On January 16, the Lord Mayor, attended by some of his suite, opened a new thoroughfare which has been made from North End-road to a point near the south side of St. Paul's School. The street, which is 50 ft. wide and about 400 yards long, was built by Mr. Henry Lovatt, after Mr. Delissa Joseph's designs and plans. On each side of the road are blocks of residential flats, some of which are already taken or ready for occupation. The blocks differ from one another in respect of their planning and design, so as not to present a prolonged repetition of the same elevation.

EDINBURGH BUILDING TRADES EXCHANGE.—The second annual dinner of the Edinburgh Building Trades Exchange took place on the 17th ult. in the Royal British Hotel, Princes-street, Treasurer Graham Yoell (Leith) presiding over a company of about seventy gentlemen. After the usual loyal toasts had been honoured, Councillor Forrest proposed "Kindred Associations." In replying, Colonel Bennet said he had no doubt they were feeling with the Glasgow Exchange that the members did not take that interest in the Exchange they ought to do. The Exchange was made and thought of for the good of the trades they were connected with, from the very root of the tree to the very top. They wanted the Exchange, beginning with the architect, to take in the builder, the constructor, the finisher—every one connected with the trade. They desired that they should all be united in the Exchange. Colonel Bennet further counselled them to keep abreast of the times in their various lines of business. Other countries were making vast strides; they must make a point of seeing they were not left behind in the race. Mr. J. C. Hamilton proposed the "Imperial Forces." Captain Moscrop replied. Mr. A. P. Laurie gave the toast of the "Magistrates and Town Councils of Edinburgh and Leith." Councillor Pollard and Bailie Kinnaird replied. The former remarked that the relations of the Town Council of Edinburgh with the building trade and building interests were of a very satisfactory kind and the Council were only doing their duty if they were trying to make that satisfactory condition of things a matter of long continuance. Bailie Kinnaird, in replying, scouted the idea of amalgamation or union with Edinburgh. Leith, he said, had made greater strides in the direction of improvement than any other town in Scotland. He hoped they would soon have better tramway communication between Edinburgh and Leith. Mr. John Robertson having proposed "The Edinburgh Building Trades Exchange," the Chairman responded. It had taken a great number of years, he said, to make the Exchange what it was at present, although it had only been constituted for the last three years as the Building Trades Exchange. He earnestly pleaded for further support to the Exchange, which was endeavouring to extend its sphere of usefulness.

PETERHEAD MASTER BUILDERS' ASSOCIATION.—The annual supper of Peterhead Master Builders' Association was held on the 10th ult. in the Palace Hotel. Mr. Alexander Webster, builder, presided, and Mr. Alexander Milne, engineer, was crozier. The Chairman, having proposed the loyal and patriotic toasts, gave a resume of the work done by the Master Builders' Association since its inauguration, which he said was due to the efforts of Messrs. W. Hadden, builder, and J. Davidson, plumber. Treasurer Martin proposed the "Architectural Profession." Mr. William Stuart, architect, responded. Mr. A. Scott, builder, proposed "The Public Boards." Bailie Wilson, in acknowledging, said the only burning question before the Town Council at present was the erection of an hospital, which they would be compelled to build whether they wanted to or not. Mr. W. Kennedy, quarry manager, Cruden, proposed "The Town and Trade." Councillor Ritchie responded. Other toasts followed.

NOTTING HILL ELECTRIC LIGHTING SCHEME.—At a meeting of the Kensington Borough Council recently, the Notting Hill electric lighting scheme was discussed. Under this scheme one of the electric supply companies seeks powers to acquire sites in Napier-road and Holland-news, Kensington, for the erection of works for generating or distributing electricity. The Law and General Purposes Committee were of opinion, considering the residential character of the district in which the selected sites were situated, that the scheme should be opposed by the Borough Council, unless the promoters would agree to the insertion of clauses in the Bill whereby the sites in question would not be used for generating stations, but be restricted to the purpose of storage and transferring stations. The Council decided to address a letter to the promoters intimating that, unless they were prepared to consent to the insertion of clauses as above, the Bill would be opposed by the Council.

WOOD-CUTTING MACHINERY.—Messrs. Glover & Co., of Leeds, whose circular saw guard was described and illustrated in our issue of August 25, 1900, have patented a machine for cutting up old and waste wood which may be saleable or useful for various purposes at a profit which cannot be ensured by the slower and more expensive process of labour. Their machine, in fact, deals with the whole process of cutting up wood, from the original tree to the handle of the saw. They state also that as very large knots can be split by their machine, knotty waste wood can be turned into the finest fire-wood, which cannot be so utilised or dealt with by hand.

CAPITAL AND LABOUR.

NORTHERN BUILDING TRADE DISPUTE.—At Leeds, on the 23rd ult., a conference was held between the Executive of the Northern Centre of the Building Federation and representatives of the London Order of Bricklayers in reference to the dispute at Newcastle. It is stated that the principle of arbitration was accepted by the men, but the conference closed without any understanding as to the arbitrator and the basis of arbitration being arrived at. A general lock-out in Yorkshire, Lancashire, and Cheshire is threatened unless the men furnish a definite reply on the points mentioned.—A general meeting of the members of the Newcastle, Gateshead, and Tyne District Master Builders' Association was held at the Building Trades Exchange, Newcastle, on the 29th ult. As the reply to the terms of arbitration offered by the Northern Centre of the Builders' Association to the operative bricklayers was not considered satisfactory, no decision was come to by the meeting. It is stated that the lock-out will now extend to Lancashire, Yorkshire, Cheshire, and the Isle of Man on February 2.

LEGAL.

IMPORTANT POINTS UNDER THE PUBLIC HEALTH ACT, 1875.

THE cases of the Mayor, &c., of Southend-on-Sea, *v.* Archer; and the same *v.* Romanis, came before a Divisional Court of King's Bench, composed of Justices Bruce and Phillimore on the 23rd ult., on two appeals by the town clerk of Southend from the decision of the justices of Southend dismissing informations preferred by him against both respondents for alleged contraventions of the by-laws in force within the borough with respect to new streets and buildings.

In the first case Archer was charged with unlawfully erecting a new building, *viz.*, a weighing machine house, without causing such building to be enclosed with walls constructed of good bricks, stone or other hard and incombustible materials, in alleged contravention of No. 11 of the by-laws of the borough. With regard to this case the material facts were these:—The structure in question was a house or shelter of a weighing-machine on the western esplanade where the public passed and stopped for the purpose of using the machine. The erection was made in sections and could be easily moved and was only used in the summer. It measured 10ft. 4 in. by 7 ft. (exclusive of projecting steps, 1 ft. 8 in. wide), with a height of 10 ft. in front and 8 ft. 6 in. at the rear. It consisted of wood framing, closely boarded with match-boarding on all four sides. It had an opening 7 ft. wide in front, open during business hours, but closed at night with wooden shutters and bolted. There was also a door on the east side which was locked at night. It had a wooden floor closely boarded and placed on sleepers or joists, the roof being constructed of wood, covered with felt. Inside was the machine, a table, two chairs, and some hat-pegs. The structure was not fixed to the soil, the only foundation being the wooden floor joists resting in the ground. There were no sanitary arrangements, and no provision for artificial lighting or heating. The structure was always closed at night, and no person remained on the premises. The appellant contended that the object of making by-laws under the Public Health Act, 1875, was to prevent the erection of wooden buildings or buildings of combustible materials in unfit situations, and that the structure in question was not an "exempted" building, and that it was a new building within the meaning of the by-laws. The respondent Archer contended that the structure was not a building or new building within the by-laws at all, and the justices upheld his contention and dismissed the information. The question for the Court now was whether the justices were right.

In the second case the structure in question was erected by the respondent Romanis on land in the borough on the sea front for the purpose of being used in the summer months for the sale of light refreshments. It was erected at the beginning of the season and taken down at the end, it being unfit in sections for the purpose. It measured 11 ft. 3 in. by 6 ft. 11 in., with a height of 7 ft. 5 in. It consisted of wood framing closely boarded with 1-inch match-boarding on all four sides. The front was movable and was taken down during business hours and closed and locked at night. It had a wooden floor and a roof of canvas fixed on wooden

cross-pieces and fastened down all round. Inside there was shelving and a counter, and goods on the shelves. There were no sanitary or drainage arrangements and no provision for artificial lighting or heating except an utensil for making hot water. The structure rested on the ground by its weight without being fixed to the soil, and had no foundation or chimney. The place was used as a shop for the sale of mineral-waters, tea, and so on, during the summer months, a person being employed there to serve customers. At night it was locked up, but nobody remained on the premises. The justices also held that the erection was not a new building within the meaning of the by-laws, and dismissed the information. The question also for the Court now was whether they were right in so holding.

Mr. Macmoran, K.C., and Mr. Herbert Smith appeared in support of the appeal. The respondents were not represented.

At the conclusion of the arguments of counsel, their lordships came to the conclusion that neither of the erections was a building within the Public Health Act, 1875, and the by-laws made thereunder, and dismissed both appeals.

RESPONSIBILITY FOR DRAINAGE WORK.

At the Clerkenwell County Court a few days ago, before his Honour, Judge Edge, judgment in the case of H. L. Markham, clerk, Leigh-court, Muswell Avenue, Muswell Hill, N., *v.* Charles W. Rook, builder, Muswell Avenue, Muswell Hill, was delivered. Judgment had been reserved, the plaintiff claiming *sl.* 13s. 6d., moneys paid by him to the Vestry of St. James and St. John, Clerkenwell, in respect of sewers, which moneys were payable by the defendant. The latter entered a counter-claim for 12l. 13s. 2d. for fittings supplied and work done for the plaintiff.

Mr. Davis was counsel for the plaintiff, and Mr. Gervans for the defendant.

The judge now reviewed the facts of the action, and said, as a matter of equity, no doubt the plaintiff would have to pay the outgoings from the time that he obtained possession, and the defendant would have to pay them up to the time that he gave possession to the plaintiff. It turned out that the plaintiff purchased the house on the representation made by the defendant, and he probably would not have purchased had he known that the paving and sewerage were not paid for. His first impression was that the plaintiff could recover, and that it was a misrepresentation on which the contract was based. But upon the perusal of the cases which had been cited to him, he had come to the opposite conclusion. He was quite clear that there was no fraud on the part of the defendant. The sewer had been put in some two years before the contract of sale was made, and no demand whatever of any kind had been made upon the defendant in relation to it. The case in question broadly laid it down that, although there was a contract in writing and a representation of certain things existing at the date of the contract, and it turned out afterwards that they did not exist, if the purchase was completed before any action was taken there was no remedy. The verdict would, therefore, be for the defendant, with costs on the claim, and for 6l. 4s. 6d. on the counter-claim, without costs.

"TUBE TREMORS."

MR. J. W. PENFOLD, F.S.I., sat as arbitrator, on the 29th ult., at the Surveyors' Institution in respect to a claim against the Central London Railway Company for injury done to No. 2, Lancaster-gate. The claimants were Lord Herschell and Mr. A. W. M. Baillie, acting as executors under the will of the late Mrs. Mary Conliffe.

Mr. C. A. Cripps, K.C., who appeared for the claimants, said that in consequence, it was believed, of the construction of the Central London Railway serious cracks began to appear at 2, Lancaster-gate, and there were indications that a serious subsidence was taking place. Owing to these disturbances, the tenant, Mrs. Hawkins, left, and the house now remained unoccupied. The owners claimed damages to the amount of 1,600l.

Mr. E. R. Robson, F.R.I.B.A., said he had inspected the house on May 17, 1899, and found a number of cracks in the walls and ceilings. They seemed to him to be caused by a general disturbance of the foundations, due, he should think, to the construction of the railway.

Mr. J. Bott, house agent, described the damage as seen by him on several recent visits. The first house, No. 1, which was nearer the line of the railway, showed even greater damage, and steel girders had had to be introduced into the hall. The cracks he imagined to have been caused by the construction of the railway, and now that the trains were working, the damaged houses were less able to stand the vibration.

Mr. Mark Judge, A.R.I.B.A., stated that he had inspected the house in June last year, and was of opinion that the damage was caused by the railway.

Mr. Freeman, for the defence, said this was the first practical claim for damage brought against the company, and they were prepared to submit a large body of evidence to back up the defence. It

was impossible from an engineering point of view that the damage could have been caused by the construction of the railway, which was 64 ft. below the surface of the road. The house, which was forty years old, had been built on the remains of a water-brook, and there still remained a large deposit of mud, with an unstable substratum. Moreover, the bursting of a water-main in 1897 had undermined the foundations, and it was quite possible that this was the cause of the damage.

The hearing was adjourned provisionally until February 8.

THE CENTRAL LONDON RAILWAY.

At the London Sheriff's Court, on Wednesday, before Mr. Under Sheriff Burchell and a special jury, the case of Purvis *v.* the Central London Railway Company came on for the assessment of damages. The claim was for 4,200l.

The case for the plaintiff, Dr. W. Laidlaw Purvis, of 20, Stafford-place, Oxford-street, was that his house, of which he held a perpetual lease from the City Corporation, had been damaged by the construction of the Central London Railway, the ground having subsided, thereby causing cracks in the outer walls. Expert evidence was called to prove that it would cost 2,200l. to carry out repairs, including the underpinning of the house, while 3,000l. was claimed for the depreciated value of the house, and 470l. for loss by reason of the tenants of the top and bottom floors having to leave while the repairs were executed. Dr. Purvis also claimed 1,000l. for inconvenience, damages to his practice as a consulting physician, consequent on his having to take other premises for a time, and for other incidental expenses. Witnesses stated that the work would take nine months to do.

For the defendants, expert witnesses stated that the necessary work could be done for 574l., and that the time occupied would not be more than fourteen weeks. The defendant company were willing to pay 1,120l.

In the result the jury awarded the plaintiff 1,500l., and judgment for this amount was entered.

ACTION BY AN ARCHITECT.

THE case of Green *v.* John Mason & Sons came before Mr. Justice Channell and a common jury in the King's Bench Division on the 29th and 30th ults. Mr. Marshall Hall, K.C., and Mr. Foa appeared as counsel for the plaintiff; and Mr. Duke, K.C., and Mr. Moyses for the defendants.

Mr. Foa, in opening the case, said this was an action by an architect and surveyor (of 10, Warwick-court, W.C.), who claimed the sum of 185l. from the defendants, who, he alleged, employed him in two capacities, first as architect in drawing and supervising the plans for the erection of certain buildings, and also as agent acting for them in selecting the site necessary for the purpose of buildings which the defendants intended to have erected. The larger portion of the sum claimed, *viz.*, four-fifths of the whole sum due, the plaintiff claimed in his capacity as architect. The defendants were brushmakers at Clerkenwell. Like a great many other firms who carried on business in large premises, they found it convenient to go into the country—that was to say, into a place which was not so crowded a district as Clerkenwell, but not too far from London. The defendants throughout these transactions were represented by a firm of solicitors.

At the time the story opened the solicitor was a Mr. Cowley, and this gentleman played an important part in the case. He shared chambers in Gray's Inn with the plaintiff, and knowing that the defendants wished to erect a factory, he placed the matter before Mr. Green. In March, 1899, Mr. Cowley told the plaintiff what the business was, and two days later Mr. Cowley, Mr. Mason, and the plaintiff had an interview. Mr. Mason then gave the plaintiff definite instructions to do certain preliminary drawings. An arrangement was also made that the plaintiff should go to the defendants' factory in Clerkenwell in order to study the requirements of Messrs. Mason. On April 6 the plaintiff, one of the defendants, and Mr. Cowley went to Willesden. The plaintiff, when he was first approached by Mr. Cowley, informed him that he thought he knew of some land which would just about suit the requirements of Messrs. Mason. A few days afterwards the plaintiff, having obtained from the vendor the price of the site, received definite instructions from defendants, through Mr. Cowley, to negotiate with the vendor for the sale of the land. Mr. Green offered, under the instructions of Mr. Cowley, 650l. in the first instance. That offer was refused by the vendor, but after further negotiation Mr. Green, under the instructions of Mr. Mason, offered 750l., and this offer was accepted by the vendor. Unfortunately, the vendor's solicitors were unable to put the thing through. The chief difficulty was this. At the present time, before a building could be put up in the London district, it was necessary to get a licence from the London County Council. The London County Council refused this licence until a certain bridge which spanned a canal in that neighbourhood had been widened. The bridge did not belong to the vendors but to the canal company, and the company refused to have the bridge widened. This

difficultly was never got over. To put the matter very shortly, after the amended offer had been made and accepted Mr. Green and the defendants thought the thing would go through, and Mr. Green was asked by the defendants to go on with his plans. Those were the amended plans, because the first plans were abandoned. In the autumn of 1899 the defendants were getting a little tired and pressed the plaintiff to get them a site somewhere else. The plaintiff undertook several journeys in the neighbourhood of London—Harrow, Finchley, and other places—but at the same time the defendants did not like to give up this site at Willesden, which they thought the most convenient for their requirements. In December matters had so far progressed that the plaintiff received definite instructions from the defendants to prepare the specifications. This was a very lengthy document. At the beginning of January last year, the defendants, finding that the site they would have liked to have presented so many difficulties, were advised to take a site on the same land at the other side of the bridge. The price of this site was 1,000*l.*, and defendants bought the land for that sum, and amended plans were prepared by the plaintiff on the instructions of the defendants. At the end of January, 1900, these plans were submitted to the defendants by the plaintiff. On January 31 the plaintiff received instructions from Mr. Mason to complete the plans in accordance with the amendments made by the latter, and to get out an estimate of the cost. It turned out afterwards that the defendants were not able to acquire that site. In February, 1900, a dispute of a serious kind broke out between Mr. Hanna (Mr. Cowley's partner) and Mr. Green, but with reference to matters not germane to the transactions in question. Mr. Green was told that he must settle the matter within seven days or it must be considered to be at an end. Mr. Green at this time had done all the work he was employed to do. Mr. Green then sent in his account to Messrs. Mason for services rendered. Messrs. Cowley & Hanna, on behalf of the defendants, denied liability to pay the account as rendered, stating that it was a condition that in the event of the plaintiff failing to negotiate for the sale of the land to the defendants, he should only charge the defendants with out-of-pocket expenses and disbursements and a merely nominal charge for his services. The plaintiff would tell them that he never made any such arrangement as that. The defence set up by the defendants was this. They said that although it was true plaintiff had done work for them, and that they had employed him as their architect, his being paid for his work was subject to the condition that the land should be acquired by defendants, and that as the land was not acquired that was sufficient to disentitle the plaintiff to charge anything except out-of-pocket expenses. The plaintiff denied this, and, said the learned counsel, it was extremely improbable that any architect would agree to any such thing. In conclusion, he stated that the plaintiff was suing on a *quantum meruit*. The plaintiff had to make out that his charges were fair and reasonable. Those charges were according to the scale as recognised by the Royal Institute of British Architects. The plans which the plaintiff had prepared were made under the direction of the defendants. Evidence would be called to prove that with slight adaptation the plans could be used on any site.

The plaintiff was then called, and gave evidence generally bearing out counsel's statement.

Cross-examined by Mr. Duke. He was a land agent, surveyor, and architect. He had ascertained particulars of the land at Willesden before he came into communication with the defendants. He made an agreement with Messrs. Roebottom, the agents for the vendors, that if he was able to dispose of the land he should share half of their 5 per cent. commission. He did not seek at any time to obtain anything in the nature of a double commission. He was an architect and surveyor.

Are you an architect? Yes.—I was articled for three years to a Mr. Richardson, and afterwards to a Mr. Allen, who was a Fellow of the Royal Institute of British Architects.

Did you make the plans in this case?—Not the actual plans submitted to Mason's. I assisted in making them. I did not actually prepare them. The witness in further cross-examination said, he did not draw all the specification but about one-half of it. Mr. Goss prepared the plans and the specification, but under the witness' supervision. Goss was paid 15*l.* for the plans and 3*l.* 5*s.* for preparing the specification. It was true that he asked the defendants to pay 160*l.* for the plans and specifications, but this sum included survey fees, interviews and correspondence, which was very voluminous.

Mr. Mason, when he saw the drawing which the witness had prepared, had not said witness was going to unnecessary expense and that if they (defendants) did not get the land they would not want the drawings. His instructions were to prepare plans of certain departments at certain dimensions. On June 8, 1899, there was a risk whether they would get the site at all. The matter was out of his hands so far as the contract was concerned. He could not say whether that was about the date when he put the matter into the hands of Goss to prepare plans for which he afterwards paid Goss 15*l.* 15*s.* He had known of architects preparing

plans of buildings without taking the levels of the site, or the correct measurement of the sites. He had never personally erected a factory, but he had been concerned during his articles in the erection of a number of warehouses.

Is it not a matter of common-sense that before you prepare plans for the erection of buildings you must find out what your levels will be?—It depends entirely upon the land. I took upon myself as the architect the full responsibility for the erection of the factory. The witness further stated that negotiations between Messrs. Mason and himself came absolutely to an end at the end of April. On April 28, witness told Goss to get on with the specification in order that the witness could complete his own specification. He subsequently received the specification from Goss. That work formed part of the work for which he claimed payment from the defendants.

Mr. F. R. Farrow, examined by Mr. Fox, said he was an architect and an F.R.I.B.A. If an architect prepared plans and specifications, it was in accordance with custom that he should be entitled to a certain fee on the estimated cost of the building. If the proposed building was not proceeded with the architect would be entitled to charge for the preparation of the plans and specification 2½ per cent. on the estimated cost of the building. This was in accordance with the rules of the Institute of British Architects. He had seen the specification and drawing in the present case. From these he considered that to erect a building as proposed would cost at least 6,000*l.*; 2½ per cent. on that would work out at 160*l.* It was not unusual for architects to employ another architect to prepare plans and specification, the latter being paid a fixed sum for doing the work.

Cross-examined. It was very usual for busy architects to do this, but not for young architects just commencing business. He had never heard of Mr. Allen or Mr. Richardson, to whom Mr. Green said he had been articled. He knew a Mr. Richardson, an auctioneer and surveyor, who lived at Finchley.

Other evidence having been given,

Mr. Duke, in opening the defendants' case, said that the plaintiff was told when defendants commenced negotiating with him, that all they could afford to spend on the erection of a factory to include the price of the land, was 5,000*l.* No doubt Masons would have allowed Mr. Green to draw the plans when the matter was ripe for that to be done, but their case was that that never happened. The defendants told Mr. Green that he must understand they did not intend to incur expense in the matter, and that they would not lay out more than 5,000*l.*, and that it was no good his going to expense until they were certain they were going to get the site. In answer to Mr. Mason, the plaintiff had said, "Oh, that is all right; these are only rough drawings, and if the site is not got it will not be any cost to you worth speaking about."

Mr. Arthur Mason, a member of the defendant firm, examined by Mr. Duke, said he had asked Mr. Green for a rough idea of the cost of the building, so that they might adapt it to their requirements. He told him they could not possibly exceed 5,000*l.* for the whole amount, including the land. Plaintiff said he could easily keep it down to that sum. In April plaintiff showed him a rough drawing by a Mr. Smith. Witness told him that it was different from what he wanted, and to run to no expense. Green replied that they were merely rough drawings in order to get at the cost of the building, but that they would cost nothing for professional services. Witness was subsequently shown plans drawn by Goss. Witness then said they were more like what they required, but inasmuch as the question of acquiring the site was hanging fire, he hoped he would incur no expense. Green assured him that no expense would be incurred until the site was acquired. There was no truth in the suggestion that the matter was withdrawn from the plaintiff because of his quarrel with Mr. Hanna.

Cross-examined by Mr. Fox. They had not paid the plaintiff anything. Witness had received Mr. Green's amended plans and kept them and studied them—at least the ground plan. He did not believe that his solicitor had instructed Mr. Green to get out specifications.

His lordship said it was plain from the correspondence that that was only intended to be done when the land was got.

Cross-examination continued. He agreed generally that the price of the land should not exceed 1,000*l.*

Mr. Hanna, examined by Mr. Duke, said he was a solicitor, one of the firm of the defendant's solicitors. He never told Mr. Green anything about getting out the specification. The thing never came to such a stage that a specification became necessary. Mr. Green was distinctly told that it was not necessary until the land was obtained.

Cross-examined by Mr. Fox. He had heard that a fresh site had been selected and the offer of 750*l.* increased to 1,000*l.* He had nothing to do with that personally.

Mr. Cowley, a member of the firm of solicitors representing the defendants, examined, said the plaintiff was told that the building, including cost of land, should not exceed 5,000*l.*—Plaintiff said it could easily be kept down to that. Witness told

Green repeatedly that it was no good going on with the plans until they had secured the land. He had never given Green specific instructions to prepare plans and specifications.

Mr. P. D. Smith, an architect, late student of the Royal Academy, Silver Medalist of the Royal Institute of British Architects, and Travelling Student of the Architectural Association, examined, said he had known plaintiff twenty years, but did not consider him an architect. He had prepared the plans mentioned, but had not yet been paid by Mr. Green anything for doing them.

Cross-examined. Did you had out Mr. Green's acquaintance in everything since that job?

Mr. Sidney George Goss, examined, said he was the gentleman who had prepared the plans produced. He was an A.R.I.B.A. Mr. Green was not an architect. Witness agreed to take a small fee because the plaintiff had told him that it was purely speculative work on his part. The plans were not sufficiently completed to enable a builder to build a factory from them. Witness could not complete them until the site was selected. The plans could not be carried out for less than 8,000*l.* or 9,000*l.*, and so he told Mr. Green when he took him the sketch plans.

Cross-examined by Mr. Fox: So long as Messrs. Masons obtained a site large enough, they could use the plans in question if they were amended. When an architect did such work as this for another architect, it was technically known in the profession as "taking in washing."

Other evidence having been given, the jury in the result returned a verdict for the plaintiff for 25*l.*, but inasmuch as the defendants had paid the amount into court in satisfaction of the plaintiff's claim, judgment was entered for the defendants with costs.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

19,720.—KEYS FOR LOCKS: I. Dugmore.—The tail, which is made separately from the bolt-head, is fastened within a recess cut in the head. In the bolt is a hole through which passes a stump that is also made upon separate piece, of which the tail is slotted so that it may ride upon the fixed stump.

19,722.—BLOCKS FOR USE IN THE CONSTRUCTION OF CONDUITS, ARCHES, WELLS, SEWERS, &c.: D. T. Clegg & H. N. Brooke.—The vitrified blocks are hollow, and are shaped with dovetailed or under-cut grooves in their sides and outer faces, which will take cement. The blocks are also fashioned with interlocking end spigots and sockets.

19,756.—A MACHINE FOR SURFACING AND POLISHING MARBLE, GLASS, PORCELAIN, &c.: D. Gilles.—The machine for surfacing and polishing glass, marble, metal, and other plates is fitted with discs placed horizontally and forming two sets, each of which comprises a grinding-stone, an emery or some similar disc, and a buffing disc; the composite discs are mounted above the rails upon which the work-table is moved. The two sides of the plates are ground by the two sets of discs respectively. The discs can be adjusted vertically by means of a screw gear that secures them to their spindles. The rails can be similarly adjusted, and grinding-blocks may be substituted for the discs. The contrivance is described as being applicable for use with the frames of other glass-grinding machines, and for the grinding of lenses beneath stones fixed to the necessary curvature, the lenses being held stationary, the wheel.

19,781.—ELECTRICAL SWITCHES: S. A. Hunter.—For tumbler-switches one of the two projecting pieces upon the base separates the contacts and carries a support upon which the tumbler lever is mounted, to the other projecting piece is pivoted the movable contact-lever which has an insulated cross-bar and a connecting cross-piece; the cross-bar is pressed by the lever, which is so shaped that the contact-lever shall move quickly at first but more slowly afterwards; a quickbreak is effected by means of a spring, and a loop gives a positive movement.

19,813-4.—RADIATORS FOR THE HEATING OF BUILDINGS: F. A. Witmot.—For hot-water or steam-heating apparatus a wrought-metal radiator consists of pipes that are fitted into "headers" formed of sheet metal fashioned into shape, flanged sleeves, having inner sleeves and being bolted together, join the sections, which may be several in number, to one another. From the end of the radiator section projects a second flanged sleeve in which the steam or hot-water supply pipe is screwed. (19,814.) The radiator-pipes are secured in "headers" cupped and drawn from wrought metal, the edges of the blank in each case being closed in and fastened upon the "header's" outer face, whilst openings with collars are fashioned in the inner face to which the pipes are secured—confer No. 6,824 of 1897. The collars may either extend downwards or extend upwards, and so take the pipes around or within them.

19,861.—CONTROLLING VALVES FOR DOMESTIC SERVICE-PIPES: L. R. Smith and E. A. Gilbert.—A partition in which is an aperture controlled with a valve divides a cylinder into two parts; a valve and stem are mounted in a piston attached to the lower end of a hollow sliding tube, on to which the

former valve is fixed; when the latter valve is removed from its seat with a spring push-rod, the piston is forced downwards by the excess of pressure upon its upper side, and the flush thereupon is admitted through the valve in the dividing partition, but the piston will be raised again as the excess of pressure becomes transferred to act from underneath it by the closing of the push-rod valve, which is effected by means of the impact of an extension at the end of the rod against the bottom of the lower division of the cylinder.

19,881.—ROUGHENING OF GLASS SURFACES: A. J. Davis.—For roughening the surface of a finished sheet of glass in order that it may be cemented to walls, &c. The glass sheet is blown into the shape of a cylinder, and then split lengthwise. After being re-heated and flattened out, the inside of the split cylinder is coated with a composition of minium, silica, and calcium phosphate mixed with water, varnish, or oil, applied with a brush, and roughened with a grainer's tool.

19,921.—FACING-SLABS FOR BUILDERS' USE: Y. Bassett, leading on Bassett's Plaster Company.—The invention applies to the making of slabs for facing walls, partitions, ceilings, and so on. They are composed of pierced strips of scrap or waste metal, to be obtained from chain-making and similar works, which are embedded in a mass of coarse adamant plaster poured into a mould. When they have been nailed on to the wall or ceiling they can be plastered, painted, and decorated.

19,955.—A TAP FOR MIXING HOT AND COLD WATER SUPPLY: H. F. Adams.—In a combined hot and cold-water supply tap a screw-down valve regulates the outlet from a chamber of the casing, which is divided accordingly, the cold water supply pipe being connected with that chamber. An extension downwards of the spindle of the screw-down valve operates a lever which is pivoted beneath it, and is set in engagement with the spindle of a self-closing valve, by means of which the hot-water supply is furnished and regulated. The arrangement prevents that hot water only shall flow from the tap when the screw-down valve has been depressed so that it bears against its lower seating and thereby cuts off the supply of cold water.

19,956.—WRENCHES: A. A. Pearl.—A cam which is placed so as to press against the stem of the wrench and is formed upon the end of a handle which is pivoted to the movable jaw, serves to retain that jaw in a fixed position upon the stem. For an increase of the grip both the cam and that portion of the stem against which it bears should be toothed.

19,975.—A COWL FOR CHIMNEYS: W. Whitehead, T. Harris, and H. C. Sacré.—Gimbals or a Hooke's joint within a cup containing oil carry a cone-shaped cowl above the uptake of the chimney. In the case of an ordinary chimney-pot a bridge upon a short pipe fitted into the pot is employed as a mounting for the oil cup, and the cowl may have radially-curved vanes for its turning by the wind, the cowl being placed above a spindle made of metal. In the case of an archimedean screw, a similar arrangement set within an archimedean screw that form an india-rubber buffer ring is placed around the pipe at a level lower than that of the oil cup, and a conical baffle-ring is placed around the uptake just below its mouth.

20,004.—FLEXIBLE METALLIC TUBING: C. Rudolph.—The ends of the tubing which is after the kind specified in No. 6478 of 1885, have protective and heat pieces to be brazed, soldered, or welded together, or they may be joined by means of rolled strips in such a manner that, whilst the thicker ends are left, the middle part becomes thinned; the tubing is composed of the ends of channelled metallic strips which are wound around in the manner of a helix.

20,028.—GAUGES: H. Brooker and A. J. Baxter.—A toothed disc which works within a casing is set in gear with the threads of a spindle, various gauge-scales of known kinds, with a decimal scale for plates and wires, are marked upon the disc, and there is provided a vernier-scale for very fine adjustments; the scales can be read through openings cut through the casing; in some instances the disc may be advantageously replaced with a travelling rack-bar.

20,038.—FEED-WATER APPARATUS: T. J. Whitney.—Upon the main boiler is mounted a supplementary boiler, wherein the supply of hot water is kept up by the admission of exhaust steam. Inside the auxiliary boiler is placed a feed-heating chamber, into which water enters through a five-way disc or plug-valve. The reversal of the valve arrests the flow of the feed-water, and the heater is thereupon brought into communication with the boiler, both above and below the water-level, by means of pipes, the water flowing through its own gravity into the boiler. A spindle and a cross-arm in engagement with notches work the spindle.

20,048.—MANUFACTURE OF ACETYLENE: H. J. Rogers.—A hanging pocket, having a cover, is fitted within an ordinary gas-holder bell, the carbide is laid upon trays disposed in the pocket, and the supply of water is regulated by a cock of which the handle can be moved over the face of a dial affixed outside the bell; the resultant gas flows through a cock so as to lift up the bell and at the same time to cut off the water supply. The cock can be turned from without the bell; the position of a ratchet wheel, which is engaged by a pawl upon the gas-holder, will indicate when the top tray of carbide has

been exhausted, then the two cocks are turned off and the trays can be re-charged whilst a supply of gas remains in the holder; a coil and pipe are provided for the flow of the gas into a purifier charged with oxide of iron or lime, or with lime and oxide of iron together.

MEETINGS.

FRIDAY, FEBRUARY 1.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. E. J. Steegmann on "Mechanical Physics, Laws of Motion, Hydraulics, &c." 7 p.m.
Royal Institution.—The Rt. Rev. Monsignor G. Molloy, D.S.C., on "Electric Waves." 9 p.m.
Architectural Association of Ireland (Technical Demonstrations).—Mr. E. A. Phillipson on Electricity, &c. (at 10, Lower Baggot-street). 4.20 p.m.

SATURDAY, FEBRUARY 2.

British Institute of Certified Carpenters.—Monthly meeting, Carpenters' Hall. 6 p.m.

MONDAY, FEBRUARY 4.

Royal Academy.—Professor Aitchison, R.A., on "St. Peter's." 111. 4 p.m.
Society of Arts (Cantor Lectures).—Mr. J. Liberty on "Elementary Art Education." IV. 8 p.m.
Institution of Engineers.—The President for the past year, Mr. Henry O'Connor, will present the premiums awarded for papers read during the year. 2. The President for the year 1901, Mr. Charles Mason, will deliver his inaugural address. 7.30 p.m.

Sanitary Institute (Lectures for Sanitary Officers).—Dr. E. J. Steegmann on "Natural Forces: Light, Heat, Electricity, and Chemistry." 8 p.m.
Leeds and Yorkshire Architectural Society.—Mr. F. Rowntree on "Domestic Work." 6.30 p.m.
Liverpool Architectural Society.—1. Election of members and the election of a joint honorary secretary in place of Mr. F. E. P. Edwards, resigned. The council nominate Mr. C. Hastwell Grayson, M.A., A.R.I.P.A. 2. To consider and approve a draft memorandum and articles of association in connexion with the proposed incorporation of the society, which has been prepared by the council in accordance with the resolution passed at the last annual general meeting. 6 p.m.

TUESDAY, FEBRUARY 5.

Royal Institution.—Professor J. A. Ewing, M.A., F.R.S., on "Practical Mechanics (experimentally treated). First Principles and Modern Illustrations." IV. 3 p.m.
Institution of Junior Engineers.—Mr. A. H. Barker, R.A., F.S.E., on "Works Management." I. 8 p.m. (at Westminster Palace Hotel, Victoria-st., S.W.).
Royal Photographic Society.—Mr. Ernest Marriage on "Romanesque Architecture." Illustrated by his own slides. 8 p.m.
City of London College Science Society.—Visit to the Colonial Consignment and Distributing Company's stock stores, Nelson Wharf, Commercial, Lambeth, S.E. 2.45 p.m.

WEDNESDAY, FEBRUARY 6.

Royal Archaeological Institute of Great Britain and Ireland.—Professor T. McHenry Hughes, M.A., F.R.S., on "The Natural Forms Which Have Suggested Some of the Commonest Implements of Stone, Bone, and Wood." Dr. S. Russell, F.R.S., on "Recent Excavations in the Forum at Rome." 4 p.m.
Society of Arts.—Mr. Joseph Pennell on "Some Experiences of Motor Bicycles." 8 p.m.

Design for an Entrance Gateway to a Public Park.....	138				

Some Cities of Modern Italy—Milan.

MILAN is the most important commercial city in Italy, and perhaps in that sense it may be looked upon as the veritable capital of the new kingdom. But with the large influx of foreign residents

during the last quarter of a century, a great deal of its national character is disappearing, and it is becoming a cosmopolitan and consequently uninteresting town. Its modern streets, lined with brass-plated doorways and plate-glass fronted shops, with an endless variety of foreign names inscribed, remind one of any other ordinary European capital. In Naples, Rome, or Florence the huge modern palaces are still constructed in the old manner, their ground-floors honey-combed with quaint little shops, amongst which the *portone*, or principal entrance of the palace, affords entrance into the invariable spacious courtyard. But in Milan the ground has become too valuable of recent years, and economical planning is practised as much as in London. Old local characteristics, which give so much interest to ordinary Italian towns, carried on as they often have been through the nineteenth century, are now quite abandoned in the modern buildings, and with this abandonment the architectural aspect of the city has fallen to a very low level. It is true that the Victor Emmanuel Gallery, a species of gigantic Burlington Arcade, with transepts, built by an Anglo-Italian company forty years ago, may be considered to have a unique and local modern character. It is on a grander scale than anything of the kind elsewhere, but its architecture is of the very poorest description, and it can hardly be considered to compensate for the disappearance of the long-drawn mediæval arcades and grand old palaces, which must have formerly occupied its site, and the centre of the

ancient city. This "Galleria" is, at the present time, in course of "restoration," after only forty years of existence. Illustrations of it will be found in a very long ago number of the *Builder* of contemporary date.

The development of the city since 1860 has been enormous, and to a great extent unprepared for. The *actovi* limit has recently been extended to embrace more than double the space of twenty-five years ago. The value of property has risen to such an extent that a benevolent society, instituted to provide dwellings for the poor turned out of their homes by the alterations of those days, and which built a considerable modern quarter of the town for that purpose, is now receiving 50 per cent. more income than the shareholders are permitted to accept in accordance with their rules. The unfortunate society is embarrassed with its riches, and a difficulty has arisen as to the disposal of the ever-increasing surplus.

Although not so early in the field of modern development as Florence, Milan was perhaps the first of the Italian cities to make a clean sweep of many filthy lanes and dilapidated houses which blocked up its centre before 1860. But, alas! in the progress of "sventramento" and "risanamento" almost every trace of mediæval architecture, excepting the little group of buildings surrounding the Piazza dei Mercanti, has disappeared. Hardly another city of Italy has suffered so severely. This drastic measure may have been necessary, but it has destroyed all artistic interest in a famous old European city, the theatre of great historical events.

A few over-restored old churches, once suburban, now enveloped in districts of modern houses, are the only mediæval monuments left to recall its ancient history. The Sforza and Visconti have long ago faded into oblivion, as far as monuments are concerned; their few memorials are very hard to find; and such few buildings as survive, which can at all be associated with them, have been rebuilt and restored beyond recognition. Milan appears to have suffered

from a careless destruction of ancient monuments at the time of its great development in 1860. Before the "Unity of Italy," the city was an ordinary, old-fashioned provincial capital, where the local aristocratic families resided in their ancestral palaces, in old Italian patriarchal fashion. But the times and also the manner of living have changed since then. A flood of modern speculation and commercial activity has swept away the old social order and mode of existence, and the palaces, abandoned by their owners, who now live either on their country estates or in modern suburban villas, are tenanted as houses of business, or, still harder fate, have become commercial hotels. Most of these old palaces, situated in what were once suburbs, and which have consequently escaped the "sventramento," are of a very pronounced *barocco* style. One of the largest, the Palazzo Litta, on the west side of the city, covering acres of ground, and with a long front of poor seventeenth-century design, is now turned into the central railway administration, a kind of use for which such buildings serve very well. The gardens of the old palaces have in all cases, of course, been transformed into sites for the new tenement houses.

The new suburbs of Milan are in the highest degree depressing and uninviting. They consist, with only one exception, of factory districts, with their accompanying slums of workmen's dwellings, which even an Italian sun fails to redeem from the most sordid and miserable aspect. A fashionable quarter has sprung up within the last few years, surrounding the remains of the mediæval castle, to accommodate the *nouveau riche* class of speculators and bankers, which directs the modern life of the city. The houses in this district are the usual six-storied Parisian tenement-palaces, in which luxury, combined with economy of space, are ruling features. Planted boulevards, pretentious shops, and, in some places, the "maisonette" type of property, give the effect of a French or German town. The buildings are terribly commonplace in their

design, and utterly uninteresting, although built of very costly materials and loaded with ornament. In one or two cases "Mansard" roofs have been attempted—and in Italy!

Although there are absolutely no private buildings in Milan worthy of attention or of any architectural interest or value, there are several important rebuildings at present in progress, under the auspices of the "Ufficio Regionale" for the preservation of ancient monuments of the district, which are worthy of notice.

This Government Department or "Ufficio," now established in every provincial capital of Italy, which in its present form dates from about 1890, is an institution needing some explanation to English readers. Copied to some extent, presumably, from a similar Government Department in France, its scope embraces not only the necessary reparations and restorations of buildings actually in the service of Government officials, such as the clergy, schoolmasters, public offices, &c., but it also exercises a control and supervision over such private property as may be considered to possess artistic or historical associations. It is of course specially concerned with all work of an architectural character, comprising fresco paintings and sculptures, but in addition to what may be considered "fixtures," the department must also be consulted in any case of removal or translocation of mere furniture of an important description. The powers of the department in this latter direction appear to be exercised to a large extent, and up to the present without serious opposition. Such a Government institution would perhaps be hard to understand in England, where vested interests and personal rights in property, in such a sense, are more jealously regarded than in Italy. Our nearest approach to such an institution is perhaps the Society for the Protection of Ancient Buildings; which, however, has not of course the same official status.

As far as any one can at present judge, the influence of this department on the preservation of artistic and historical memorials in Italy is distinctly beneficial. The officials of the department seem animated with an intelligent desire to carry out the principles of modern conservatism and preservation, as opposed to the vulgar "restoration" of the past century. In the case of private property, the presumable "red tape" and officialism of a Government administration are probably the best means possible for delaying the ravages of the private "restorer." Public buildings rebuilt or restored by the department directly, run the danger of being overdone, as was the case with France in the days of Viollet-le-Duc; but in Italy the better taste of modern days, combined with greater economy of means at disposal, will prove a safeguard.

The rebuilding of the mediæval castle of Milan is the most imposing of the works at present being carried out by the "Ufficio" of Lombardy. A committee of the citizens is assisting the work with subscriptions, and when finished it will become the home of several learned, artistic, and educational societies, as well as of two or three museums. Although considered a "restoration," very little of the original fifteenth century building remained ten years ago to be "restored." Its walls, cut down to half their

original height, were encumbered with sheds and hovels both inside and out, and its appearance was entirely devoid of any character. Such architectural details as existed in the form of entrances into the enclosure used as a barrack were in the Napoleonic "Empire" style. The imposing towers and battlements which are now rising around the old courtyards are consequently due to the ingenious study of Signor Moretti, the architect in charge of the work. When finished, this "restored," or rather new, castle promises to be a very creditable and satisfactory effort. It represents a careful study of similar buildings in a style peculiar to the Lombard district, many examples of which, seen from the railways of North Italy, impress the traveller with their immense size and simple outlines. Unfortunately, the Castle of Milan, instead of being surrounded by open country, or even the usual concomitants of an old city in harmony with its character, is now constituted the centre of an enormous semi-circle of the most ordinary-looking modern houses, which, although individually very large, look singularly mean and small under the circumstances. Such a background for such a monument is singularly unfortunate; it is as if the central part of the Tower of London were set down in the middle of a Bayswater square.

By the courtesy of Signor Moretti, chief of the Lombard "Ufficio," we are enabled to give two of his photographs of the castle specially taken for the *Builder*, together with a view of the restored interior of the Archbishop's Palace—the "Arcivescovado"—which has just been completed under his supervision (see lithograph plate).

The Palace of the Archbishop of Milan has been so much rebuilt in successive ages, especially in the eighteenth century, that it is wonderful that so early and characteristic a Renaissance feature as this cortile should survive. The curious projecting balcony, carried on consoles over the columns, is a very unusual treatment. The building is of brick, with stone architectural details; the walls are covered with painted decorations.

The beautiful church of St. Maurizio, filled internally with the frescoes of Bernardino Luini, has recently been repaired in a truly conservative spirit; not a particle of stonework has been renewed, except where it was absolutely necessary for structural purposes, and no new carving or painting has been introduced anywhere.

Concerning the Cathedral of Milan, some years ago a Milanese gentleman died, leaving a considerable sum of money for the purpose of reconstructing the west front. An international competition, as our readers may remember, was held for the purpose, and a series of designs appeared, which were all about equal in merit, and neither better nor worse than the florid and rather weak Gothic exterior of the building they were intended to complete. The intention is now to carry out the design of the late architect Brentano, whose design received the first place in the competition; the "Ufficio Regionale" intervening in the interest of any archeological discovery which may be made during the progress of the work.

Another bequest for beautifying this cathedral was made a few years back, with the object of providing bronze doors for the future west front. For various reasons—the disinclination of the Milanese sculptors

to descend to mere decorative work, and some element of uncertainty about the scheme—the public competition was very poorly responded to, and the matter has for the present been shelved.

THE RUSKIN EXHIBITION.

THE exhibition of Ruskin's drawings at the Gallery of the Society of Water-colours is calculated to confirm the opinion we have

more than once expressed, that Ruskin would have been a greater man, and would have left a more incontestable reputation behind him, had he devoted his powers to producing art instead of writing so much about it. True, his genius as a master of literary expression is as undeniable as his mastery with pencil and brush, but he has expended this literary genius on a great deal of exceedingly questionable art-criticism, while of the results of his work as an artist, so far as it went, there can be no question whatever. The present exhibition is one of the most interesting and varied that has ever appeared in that gallery, although all the work of one man; and it ought to be specially interesting to architects, for it contains some of the most beautiful architectural drawing ever seen. In this class of subjects Ruskin's work is remarkable not only for its accuracy and clearness of line and perspective, but for the unerring manner in which he gives the true character of the subjects he handles. The most practised architectural sketcher, who has devoted himself entirely to this class of drawing, could hardly rival some of the work to be seen here. Notice especially for instance, in the "Fountain at Rome" (11), a pencil drawing on toned paper slightly tinted with the brush here and there, the beautiful clean drawing of the front of a classic building seen in sharp perspective on the left, and which, rather than the fountain, makes the real subject of the picture. Notice also, near this, the "Market-place at Abbeville—Study for Detail" (6), a view of an old city square in which every characteristic of the various buildings is faithfully followed out and drawn, down to the most insignificant detail. The wonderful water-colour study of a portion of St. Mark's (19) has been exhibited in this room before; a second examination can only confirm one's opinion of its surpassing truth and delicacy of handling; and an almost equally remarkable one is that of an angle of the Ducal Palace (29), with the row of shafts and capitals down the side of the building, in the sharpest perspective, all followed in their intricacies and conscientiously drawn. In the pencil sketches on toned paper, slightly shaded here and there with the brush, it is remarkable what amount of distance and aerial perspective he obtains, in a medium difficult to get such an effect with, by the judicious introduction of a bit of rather more strongly shaded masonry in the foreground, throwing all the rest into its place; perhaps the very best example of this is in the beautiful sketch on "The Avenine" (144); an ideal of what an architectural sketch should be. The more elaborate and finished drawing of Abbeville, again (234), in which more colour is used, is wonderful in its completeness of effect and the careful manner in which the more distant bits of the architectural scenery are worked out. In quite

another manner the sketch with a soft pencil of the "Chapel at Reu, near Abbeville" (175), labelled "six hours' work," is quite masterly in its rapid but complete indication of the architectural detail. Ruskin's determination to secure a study on a large scale, even when he had no large paper at hand, is amusingly illustrated in the at first puzzling water-colour drawings which seem to be divided up into parallelograms of slightly varying scale of colour, having been originally made, piece by piece, on the separate leaves of a small sketch-book, which were then pasted down in position on a larger sheet of paper or card, as in No. 191 and one or two others. Then there is an admirable colour study of the coloured marble front of San Miniato; a fine colour study of the pier in the porch of St. Martin's Lucca (38); details and colour of the apse in the Duomo at Verona, covered with written notes; the "Castelbaroc Tomb, Verona" (92), a coloured elevation admirable in its representation of the texture as well as the colour of the different materials; "Spandril—Pisa" (125), a small sketch in which again the texture of the marble is admirably conveyed. Among the pencil and tint sketches, besides those already mentioned, some especially good ones are "Castel Vecchio" (27); "Castel del Uovo, Naples" (155); "Street in Naples" (166); "Fountain at Verona" (176); "Naples" (251); "The Prentice's Pillar, Roslin" (266—pencil only); "Bologna" (270), showing strongly the influence of Prout; "The South Transept, Melrose" (276—pencil only); and "Porta Capuana, Naples" (290).

The landscape studies are not equal to the architectural ones, except in cases where buildings enter considerably into the scene. In purely landscape subjects, Ruskin, in accordance with his own principles expressed in one passage in "Modern Painters" (though he practically contradicted it on other pages), seems to have been aiming at recording accurately the geological or other facts of the scene rather than at giving its poetic impression, and the landscapes are accordingly more valuable as records than as impressions. Exceptions to this are "On the Lake of Geneva" (289), and "The Pass of Killiecrankie" (368), which are fine landscape studies of effect, the latter especially. There are many other various classes of drawings; colour-studies of birds; an admirable one of a crab, in which both the colour and texture of the carapace are remarkably given; bits of carved detail drawn with great delicacy, and an exquisite little study of a spray of leaves (12). But the highest value of the collection lies in the architectural studies, which form in themselves a practical evidence how genuine was Ruskin's love of architecture, whatever may be thought of some of his opinions about it. Hardly anything in the collection, it is true, is really finished; the drawings are all the work of one who drew solely for his own pleasure or practice, and left off when his own object was attained; and it may be argued (he would perhaps have argued himself) that this is an essentially amateur attitude in art, and that there is a great gulf between the best sketch or study and a finished picture. Yet this exhibition seems to give evidence enough that the author of these drawings could have gone further in practical artistic production

had he made up his mind to it. In architectural sketching, at all events, his works are a perfect model, and architectural students should not miss this opportunity of considering them carefully.

NOTES.

A COMMUNICATION appeared in the Press recently pointing out the advantages of the Post Office Express Delivery Services. Many people are unaware that they can telephone a message of thirty words to a post-office for delivery by a messenger at the ordinary express rate of 3d. per mile. These telephonic facilities were promised by the Post Office to the National Telephone Company when they took over the trunk lines of the latter. It is thus possible for many business firms in London to send a message of thirty words to clients residing within a mile of Metropolitan post-offices quicker and at half the price that twelve words would cost by telegraph. As the Post Office will soon be competing with the National Telephone Company, it is only right that the privileges of the latter company should be known. In the opinion of many it is time that the legal decision in the case of the Attorney-General v. The Edison Telephone Company, of London, should be revised. As Dr. Fleming says, the judgment virtually amounts to this, "that the Post Office possesses the sole right to transmit intelligence for profit," not only as the art was known in 1880, "but by any and every means which the wit of man might through endless ages devise." A fitting commentary on this is that the Post Office makes a loss on its own proper telegraph business, which it works itself, and takes over 100,000*l.* a year in royalties from the National Telephone Company, which it does not work. It is hardly fair to inventors that all methods of transmitting signals, sounds, or visual images, whether with or without wires, and all methods by which one human mind can affect another intelligently, must not be practised for profit in this country unless the Post Office obtains the lion's share of the profits and runs none of the risks. As the ether is supposed to fill infinite space, its monopoly by the British Post Office is rather ludicrous. If this monopoly were being administered in the best way no great harm would be done; but if it is used, as we are afraid that it sometimes has been used in the past, to drive electrical inventors out of the country, then it is time that the whole question should be reopened.

THE accidents that occurred in Liverpool on Monday night illustrate very forcibly the danger of having overhead trolley and telephone wires in the same streets. During a heavy fall of snow the telephone wires suddenly gave way and, making contact with the trolley wire, they became a source of the greatest danger to the people in the streets. Two men were killed outright, and many people were taken to the hospital suffering severely from electrical shock. There were many dreadful scenes of people in agony unable to free themselves from contact with the wires. Efforts were made to relieve them by cutting at the wires with a hatchet, and as promptly

as possible the current was cut off. As the accidents happened during the night in a blinding snowstorm they might easily have been much worse. Even a wireman with rubber shoes and gloves and insulated pliers would have taken some time to clear away the debris of some fifty telephone wires in the dark, and the operation would not have been free from danger. These accidents were very similar to one at Vienna, which we described two or three months ago, and the same conclusions are to be drawn. When an overhead trolley wire is used for electric traction, telephone, and telegraph wires should be placed underground. It has been proved over and over again that the so-called guard wires are very inefficient, and are in themselves a source of danger, as it is always possible that they might break. Accidents like this one at Liverpool will do harm to the cause of electric traction in this country, and those electricians who desire that the people should have the benefit of a cheap and rapid means of locomotion would do well to take precautions, so that similar accidents would be a physical impossibility.

THE Hampstead Heath Protection Society have issued their fourth annual report. The Committee have been in frequent communication with the London County Council in regard to various points which they consider require attention or alteration, but apparently not with very satisfactory results. Among other things they have called the Council's attention to the cast-iron drinking-fountains lately placed on the Heath, and have suggested that any fountains placed in future on the Heath should be of rough stone or some suitable material, and more in harmony with the character of the surroundings; a recommendation with which we entirely concur. They have also given attention to the question of the bare state of the banks of some of the ponds on the Heath, and have suggested to the London County Council, as a beginning, some practical steps which might be taken for restoring the natural aspect of the banks of the Leg-of-Mutton Pond; but what they mean by the "natural aspect" is not very clear. The Committee have also been in correspondence with the New River Company, who have acceded to their request that the banks of the newly enlarged reservoir on the summit of the Heath should be planted with suitable trees and shrubs. The Committee are watching with much anxiety the proceedings of the promoters of the proposed extension of the Charing Cross, Euston, and Hampstead Railway in the direction of Golder's Green and Hendon. They are in communication on this subject with the Commons Preservation Society, the Metropolitan Public Gardens Association, and the Hampstead Borough Council, with a view of co-operating in opposition to any features of the scheme which would be injurious to the Heath. They deprecate any tunnelling under the Heath, and the erection of any station which would in any way encroach or infringe upon it, and here also they are perfectly right. Unless a strong stand is taken the Heath might be practically ruined as far as its true beauty and its value to Londoners are concerned.

Post Office Monopolies.

Hampstead Heath Protection Society.

Trolley Wire Accidents.

The Rating of Montague House.

The difficulty of arriving at a satisfactory value, for rating purposes, of great mansions has been well exemplified by the appeal which came before the County of London Overseers in regard to the rating of the Duke of Buccleuch's well-known mansion, Montague House. The old rating was:—Gross value, 4,200*l.*; rateable value, 3,500*l.* These figures had now been raised to 5,500*l.* and 4,584*l.* respectively. Not only did the Duke say, on his appeal, that these figures were too high, he went so far as to ask that the figures of 1890 and 1895 should be lowered, on the ground that the residential value of property in Westminster had declined. The contention of the Local Authority was that the letting value of such a house was not the right criterion, and that the proper way to arrive at its true value was to take 4 per cent. interest on the actual cost of the structure and adding to that the ground-rent and land-tax. The court, judiciously, no doubt, gave no opinion on the basis to be adopted, but allowed the appeal by reducing the figures to 4,500*l.* and 3,750*l.* respectively. So far as we can judge, this means that the court did not accept the respondent's method of valuation, but, at the same time, believed that property in Westminster was more valuable than it was five years ago. As a matter of fact, such a building as Montague House could always have a high value for other purposes than those of a nobleman's residence. It is clear, however, that a rough-and-ready valuation, based to some extent on the rent obtainable and similar considerations, is not the only means of arriving at the rateable value of these great houses, for the county, aspect, locality, and many other circumstances would seem to have to be considered.

Sanitary State of Nuneaton.

DR. R. W. JOHNSTONE'S report to the Local Government Board upon the causes of epidemic enteric fever in Nuneaton and Chilvers Coton Urban District shows the old and oft-repeated story of contaminated soil coupled with water supply from shallow wells. It appears that house refuse and excrement are generally disposed of by means of midden privies, the receptacles of which are not always protected from the rain, and are often sunk several feet below the surrounding ground level. These middens, when full, are emptied by the Urban District Council, sometimes not more often than four times a year. Where they are not lined with impervious material, their contents soak into and pollute the surrounding soil. Water supply is largely from shallow wells, and old and leaky slop-water drains frequently pass close to the mouths of wells. Dr. Johnstone had a few wells opened, and a section was prepared by the surveyor showing their water levels as compared with the level of sewers in the infected area. As far as could be judged from the few wells represented in the section, it seemed that the water levels in the different wells of this area corresponded one with another, and hence it was not impossible that specific contamination of the ground water might influence the water of several wells. It only remains to add that all the wells examined were dry-streined with brick, and the tale seems complete.

SECOND ROYAL ACADEMY LECTURE ON ST. PETER'S.*

WE can hardly in thought put ourselves in the position of the men of the Renaissance, for to them it was a time of joy and ardent enthusiasm. This grand movement in the fine arts may be said to be of purely Italian origin; if not of Florentine, at least of the cities of the Val d'Arno. We know from Dante of the factions by which Florence and the neighbouring cities were torn and of the suffering of Milan at the hands of the Germans, but so great were the evils of the factions in Florence that Dante is always calling on the Emperor to come and rule this part of his empire. The Latin classics were much read in Dante's time by the advanced men, and shortly after his death Greek began to be closely and passionately studied. Boccaccio, from the advice of Petrarch, became one of the first notable Italian students of Greek. The Tuscans are supposed to have come from a Greek stock, and the air of Florence is both healthful and exhilarating, and the Tuscans were particularly keen witted and astute. Tuscany gave us Dante, Petrarch, Boccaccio, and Machiavelli. At the beginning of the thirteenth century Nicola Pisano had seen the superiority of Roman sculpture and copied and imitated it, and towards the end of the century Brunellesco and his friend Donatello, both sculptors, made their fatal journey to Rome and were both struck with the magnificence and elegance of the antique buildings and ruins there. Brunelleschi, who had sold a farm to go, and spent all the money he had started with, eked out a livelihood by his old trade of goldsmith and jeweller, which gave him the means of studying the Roman buildings and of investigating the Roman method of building domes, which after his return he put in practice in the doming of Santa Maria del Fiore (St. Mary of the Flowers).

Brunelleschi died in 1444 (the year that Bramante was born) after doing much work, doming the Cathedral, building the Pitti Palace, the church of St. Spirito at Florence, and much work elsewhere, as he thought in imitation of Roman work, but really infusing into his buildings the grace and simplicity of Classic work.

The novelty of the new architecture took the fancy of the Florentines and others, and the comparative simplicity, dignity, and elegance of Roman architecture not only satisfied the desires of the Italians, but by degrees took captive the whole of Christendom. Vasari, who was born in 1512 and died in 1574, and may well be taken as a judge of the opinions of his time, says of Brunellesco, "he was of so lofty an intellect that one may well say that he was sent by heaven to give a new form to architecture, already gone astray for hundreds of years, in which the men of those times had wrongly spent much treasure in making buildings without order, in an evil manner, of wretched design, with strange inventions, with ungraceful grace, and with worse ornament." Here you see the Renaissance opinion of Gothic.

Nothing can be said against the sculptor's and painter's taste; but a monument of architecture is not only a thing to look at—like a picture or piece of sculpture—for delight, but the architectural monument is intrinsically costly and for use as well as for delight; it is also a specimen of structural science which requires a profound knowledge of statics. This knowledge can only be acquired inexpensively by theory, or very expensively by practice; the medievals had to learn it by practice, and for nearly a century the elements were taught by the buildings put up falling down or going to ruin. But this is not all, for we may make trifling errors without failure, if we have ample means, by making those parts where the main strains occur twice, thrice, or four times as strong as is necessary. The medievals were so hampered from this, as those ages were very poor, so that unnecessary strength could not be afforded, and the medieval architects carried slightness to such a pitch that the loss of substance by weather-wear in a few hundred years has rendered many medieval buildings unsafe, and if the weakened parts had not been replaced with stronger parts in our own time the structure would have failed, if not have fallen down. This was primarily due to the weakening by weather-wear of the flying buttresses, so that

they could no longer resist the pressure of the vaults, while the fine open tracing of late Gothic has so perished that it looks like torn lace.

Skill in building is commonly reckoned by the ratio of the points of support to the whole area of the building, and Gwilt gives the proportion of the points of support to the whole area in the Pantheon at Rome as 0.232, which has stood since 13 A.D., or for 1,762 years.

The following is the ratio of points of support to total area in five other celebrated buildings—

St. Peter's at Rome	0.261
St. Sophia, Constantinople	0.217
The Cathedral at Florence	0.201
St. Paul's, London	0.170
St. Genevieve, Paris	0.154

I have only given the buildings with large domes, for in my opinion any other comparison is inapplicable, the small difference in the decimal does not strike one, but when you consider that the points of support in St. Peter's are 59,308 square feet, or nearly double the whole area of the Pantheon (which is 34,328 feet), you will judge how enormous it is, and you see by comparison that it is a larger proportion of the whole area than that of any other notable domed building. We suppose that Bramante had become an architect, and had at least some rough method of ascertaining whether his piers would sustain the weight of the dome, though we know that some of the piers showed signs of weakness before they were loaded. They were built up continuously day and night, probably without proper supervision. But Michelangelo never had the training of an architect, and all he could have learned about doming was from studying the cathedral at Florence. Ward says he was lucky in having Giacomo della Porta to do the doming and to put the requisite bands to restrain the thrusts in the dome and drum. As it is, the buttresses of the drum have cracked away from the other work and been cramped to it with iron ties.

The public should know that architecture is a structural science, and also that no important building should be undertaken without complete drawings and a model, while till Michelangelo had his model of the dome made, the whole design of St. Peter's was in a constant flux.

St. Peter's is said to have cost 46,800,000 scudi, nearly 10,000,000*l.* sterling, but looking at the purchasing power then, the 46,000,000 scudi may be looked on as pounds now.

It is to be regretted that Bramante did not have St. Peter's to build when he was in the fulness of his powers, instead of having only eight years at the end of his life; that he did not leave a complete set of drawings and a perfect model, for he was in my opinion the greatest architect of the Renaissance, and though he began as a painter, I think that we may believe that he made himself an architect there was a suave beauty about all his works that I know that is enchanting. Bramante's first scheme for St. Peter's seems to have been a square with sides 450 ft. long made on plan into a Greek cross by the crossing of the nave and transept* with the same length of arm, whose ends form square projections one in the middle of each side, roughly 130 ft. wide, and 43 ft. projection from each side of the square. The nave and transept are about 93 ft. across from wall to wall, ending in semicircular apses about 80 ft. diameter; the clear length of each internally is about 512 ft., there are two aisles to the nave and transept, the narrowest part of each of these aisles is about 40 ft. long and the aisles are about 370 ft. long and have semicircular apses at both ends about 30 ft. diameter, kept back about 30 ft. from the face of the building, making eight porticos. The four angles of the large square are sacristies about 60 ft. square internally, and were to be carried up as bell towers. In a later scheme of the same basis two columns are put between the narrow openings of the aisles which would have spoiled the vistas. These aisles and their chapels suggest top lighting. The blocking up of the vistas of the nave and transept aisle had been skillfully avoided by making the aisle clear of the piers of the dome. The dome seems to have been designed of the same diameter as the actual dome that was erected. There appears to be no elevation or section of Bramante's design that has come down to us beyond the one on the medal struck in commemoration of the first stone being laid in 1506 by Pope

* By Professor Aitchison, R.A.

* See plan in the last issue of the *Builder*, page 106.

Half Section of the Dome of St. Peter's (no scale).

ulus II., and what is shown in Serlio's book, so that we cannot know what lighting could be got from the clearstories. The view of Bramante's front of St. Peter's, taken from a medal 2 in. in diameter, does not strike one as being quite happy, but it was probably done in a hurry for the die-sinker; the bell-towers are ugly, but we may be quite sure that had the designs for their execution come from Bramante's hand, they would have had the grace and beauty that pervaded all his works. Of all the designs that Baron H. de Geymüller has given, the one from a drawing on which Antonio da Sangallo the younger has written on the back is, in my opinion, the most successful, only the bell-towers are rather too wide for the centre.

We must recollect that Bramante had such fertility of genius that he could sketch out at once his schemes, so we need not be surprised at the number of sketches that have come down to us; and as in the latter part of

Bramante's life he was afflicted with palsy, he was obliged to have some architect or draughtsman to put into form his descriptions and palsied scrawls, and this, in Baron de Geymüller's opinion, is why many of his designs have been attributed to B. Peruzzi.

One must not be surprised at the number of architects who submitted schemes or models, for in the conclave of cardinals there must have been many conflicting opinions and interests, and the very fact of Bramante's design being in plan a Greek cross must have had many opponents, and at last the plan was made into a Latin cross.

Before Bramante died Fra Giocondo and Giuliano da Sangallo were given him as aids during his illness. He died in March, 1514. Raphael and Giuliano da Sangallo replaced Bramante at St. Peter's, but on July 1, 1515, Giuliano da Sangallo retired and Fra Giocondo died the same day. What Raphael did besides making the plan for a new scheme

of basilica we know not, but he died in 1520, and a week before his death Antonio da Sangallo obtained the same remuneration that Raphael had, so we conclude he was made architect, for before he had only half the remuneration; and almost at the same date B. Peruzzi was made architect. I judge that the Italians always had two architects to their important buildings. In 1527 Rome was sacked by the followers of the Bourbon; after these had withdrawn Peruzzi returned to his office at St. Peter's in 1535, and remained in it till his death in 1536, and was buried in the Pantheon, and the place was then, I suppose, given to Antonio da Sangallo alone. According to Baron de Geymüller's plan, little else was done by Antonio than to strengthen the main piers under the dome, and a few other trifling additions and alterations, but beyond that he made several designs for a St. Peter's quite different from that of Bramante, and his wooden model is still in the model-room at St. Peter's.

Antonio da Sangallo was born in 1485 and died in 1546. On January 1, 1547, Paul III. conferred on Michelangelo the office of architect to St. Peter's for life, and Michelangelo then took in hand Bramante's modified design. Peruzzi before him had found Bramante's plan too expensive to be carried out and had suggested something smaller, but when Michelangelo became architect he always stated that any alteration from Bramante's plan would be a mistake; and we see from Baron Geymüller's plan that Michelangelo intended to leave the building as a square with a portico in front. Pirro Ligorio and Jacopo Barozzi da Vignola were made executors of Michelangelo's work, but P. Ligorio was dismissed for wanting to alter, and Vignola is said to have designed the small cupolas. Michelangelo died in 1564, having completed the drum of the dome, and Giacomo della Porta was appointed architect by Pope Sixtus V., with Domenico Fontana as his assistant about 1583; he is said to have finished the lantern in 1590. Fontana it was who raised the obelisk from the circus of Caligula and erected it in front of St. Peter's in 1586; and he died in 1607.

The finishing of St. Peter's, having been put up to a public architectural competition, was gained by Carlo Maderno, who was appointed architect November 5, 1607. The narthex was roofed in on December 12, 1614. By Maderno's converting of Bramante's design from a Greek into a Latin cross, the beauty of the dome is quite lost from a front view.

Giovanni Lorenzo Bernini, sculptor, painter, and architect, was born at the end of 1598, and at an early age showed remarkable talent for sculpture, so much so that Pope Paul V. is reported to have said to Cardinal Barberino, "Let us hope that this young fellow may become the Michelangelo of his age," and afterwards Anibal Caracci made a somewhat similar remark. When Cardinal Maffeo Barberino was made Pope Urban VIII., he had Bernini brought to him and said, "It is your good fortune, O Cavaliere, to see the Cardinal Maffeo Barberino Pope; but our fortune is much greater, that the Cavaliere Bernini should live in our pontificate." Shortly after his election he ordered Bernini to make the high altar and baldachino. A great deal of the bronze from which it was cast was from the bronze casing of the bressummers of the portico of the Pantheon. These bronze casings are shown in one of the sixteenth-century books, but which one I have forgotten. Bernini did some trifling work besides in St. Peter's, and, I think, put up the front bell-towers, now taken down, and built the celebrated staircase to the Vatican at the side of St. Peter's. I never saw any of Bernini's paintings, but his sculpture made quite an epoch in Europe. He executed one statue of Charles I. from the portraits by Vandyck which were sent out to him.

Most of the philosophers whose works I have read holdly take it for granted that mankind at all epochs have the same capacity, and it is difficult to prove that this is not the case, although we can be certain that in some cases the classes who once furnished the highest intelligences have deteriorated and can no longer furnish them, and there can be no doubt that the capacity shown in the Fine Arts is sometimes, or in some epochs, greatly superior to that of others. We know that the capacity of the Greeks just after their successful struggle against Persia was superior to that ever after evinced; and that in the Golden Epoch of the First Empire the Roman architectural monuments were superior to those of the Silver Age, if we except the Pantheon. At

the third great epoch, the Middle Ages, the Romanesque, though very impressive, was perhaps inferior in some respects to the finest specimens of Gothic when fully evolved; at any rate the Gothic was a complete system of a new art of vaulting and buttressing, and the piercing of all parts only wanted for stiffening; but it never attained the dignity and impressiveness of the Norman Romanesque; witness the nave and choir of Southwell.

At the Renaissance in Italy there was a delicacy and grace about its first development which gradually disappeared, and formalism prevailed and eventually gave place to conformation.

In 1414, thirty years before Brunelleschi died, the codex of Vitruvius was found at St. Gall by Poggio, and between 1480 and 1490 the "Editio Princeps" of Vitruvius was printed and published at Rome. The architects and artists, when they became conversant with Vitruvius, supposed that they had got a book which would enable them to rival the best works of the Romans, and a stricter adhesion to his rules was almost universally followed.

We know that Alfonso the Wise told Panormita (Beccadellii) that he would build the Castel Nuovo of Naples from Vitruvius alone, and that mighty genius Michelangelo seemed to favour the view that everything that Vitruvius said was perfect and applicable, and though Michelangelo's genius enabled him to produce sublime works, such as the tomb of the Medici, even this is full of glaring inconsistencies. But nothing that Michelangelo ever did had that grace and sweetness which so distinguished Bramante. As Michelangelo studied Bramante's designs he became more and more convinced that his scheme was the right one, and professed merely to carry out Bramante's design; but it was impossible for a man of his originality and power to carry out the work of another man of a genius entirely different, even if the size of it had not been too large for its cost to be defrayed when the resources of the Papacy were diminished after the Reformation. But the dome of St. Peter's, for which he left a model, is, I think, the most graceful dome I have seen. When I was in Rome as a student I frequently had to return on foot from San Lorenzo outside the walls. It was just as the sun was setting, and then before my eyes I had this graceful outline of the drum, dome, and lantern before me, fringed with the golden red of the setting sun; and whatever may be said about St. Peter's in regard to the indifferent taste displayed in details, the dome not only grows upon the visitor, but is looked upon by foreign artists who have lived for many years in Rome as one of the finest things in the world; and we must recollect that the size, the colossal proportions, and the solidity of the building must always impress mankind, even if it were a ruin. The ruins of the great baths at Rome, although stripped of their statues, precious marbles, columns, ornamental carving, and bronze, impress everybody that goes into them with a sense of their sublimity; and though we may wish that a purer and finer architectural sense might have been possessed by the architects and by the educated public when St. Peter's was completed, it is still one of the most impressive buildings of modern times.

A SENSATIONAL GAS SCHEME.

An attempt is to be made during the next session of Parliament to pass a Bill to sanction the formation of a company with power to supply gas to a number of Midland towns at a maximum charge of 4d. per 1,000 cubic feet, or in the case of a consumer using not less than 4,000,000 cubic feet per quarter, at a maximum price of 3d. per 1,000 cubic feet. This Bill is known as the Mond Gas Bill, and the gas which it is proposed to supply is Mond or similar low-grade gas, which may be sold for all purposes except for illumination. The district to be supplied is a large one, including Smethwick, Walsall, West Bromwich, Wolverhampton, and several other neighbouring towns, but the Company does not ask for a monopoly of the power to supply this area with fuel gas.

The apparently extraordinary propositions contained in this Bill have evoked some amusing comments in the popular Press, in which the proposed prices have been compared with the existing charges for illuminating gas, without regard to the fact that Mond gas is of only one-fourth the value of coal gas for heating or motive-power purposes, and

would require service pipes of four times the usual capacity if supplied at the same pressure.

Mond gas is a description of "producer-gas" produced with the aid of an unusually large quantity of steam, and a characteristic feature of the process is the manufacture of a large quantity of ammonium sulphate as a by-product, the sale of which is to cover the cost of the coal slack required for the production of the gas.

Roughly speaking, the illuminating gas supplied in London costs 1s. per 1,000 cubic ft. to manufacture, and another 1s. per 1,000 cubic ft. to distribute to the consumers. It is therefore difficult to conceive that fuel gas can be profitably distributed in comparatively small quantities at 4d. per 1,000 cubic ft. (The Company may refuse to supply any consumer requiring less than 1,000,000 cubic ft. per quarter.) The supply at 3d. per 1,000 cubic ft. to consumers taking not less than 16,000,000 cubic ft. per annum is perhaps more feasible, because the plant required for the production of the gas does not occupy a large area of ground, and it might be expedient to erect a special plant in close proximity to the premises undertaking to consume so large a volume of gas. Distribution charges might thus be reduced to a minimum. This, however, is not the method of distribution at present contemplated.

The distribution of cheap fuel gas has, we believe, been attempted in the United States, but has not proved a commercial success. The district which the present scheme proposes to supply undoubtedly comprises an excellent field for an enterprise of this description, but it is exceedingly doubtful whether a dividend could ever be earned with gas selling at the prices quoted; and the Bill will, of course, meet with great opposition from those who already supply these districts with illuminating gas, which is very largely used for fuel purposes. Difficulty would also probably be experienced in preventing consumers from using the gas for illuminating purposes. The attempt is, however, a step in the right direction, for gaseous fuel can be more economically consumed than solid hydrocarbon mixtures of varying composition, such as coal. Already fully half of the enormous output of illuminating gas from the London gasworks is used for purposes for which non-luminous gas of the same heating power would be equally serviceable; and as several processes are now known by which non-luminous water gas possessing half the heating value of 16-candle coal gas can be manufactured at considerably less than half the cost, the question is being asked in many directions as to whether the time has not arrived when the gas companies should be requested to supply a cheap non-luminous gas in the place of the expensive illuminating gas at present supplied.

In view of the extreme importance of the calorific power of the public gas supply to London consumers, who drive many thousands of engines with it and use it for cooking in most of the numerous restaurants and hotels, it is remarkable that the London County Council has not, so far as we are aware, given any attention to this matter. This is the more strange, since it is a matter of public knowledge that the composition of the gas supplied has, during the last five years, been undergoing a change owing to the ever-increasing proportion of carburetted water-gas added. Ceaseless watch, it is true, is maintained by the Council upon the illuminating power of the gas, but two gaseous mixtures of equal illuminating value may possess very different heating values. We do not know with what degree of success non-luminous producer gas can be used with the incandescent gaslight system or with the "albo-carbon" system, but any difficulties which may exist cannot be insuperable. High-grade water gas, such as that made by the Dellwik-Fleischer process, could, we believe, be used with either system as an illuminating agent.

It is unfortunate that any radical change in the character of the gas supplied necessitates a change in all the gas-burners employed. We have already drawn attention to the fact that the South Metropolitan Gas Company will reduce the quality of its gas from 16-candle power to 15-candle power after June 30 next, and subsequently to 14-candle power, and that one of the conditions upon which this reduction to 14-candles is to be permitted is that the company will exchange old burners for new burners better adapted to consume the poorer gas free of charge. Similarly, if non-luminous gas were substituted for illuminating gas, all

the present burners would have to be discarded; but if the change is to be made, it may be better to make it in one stage than in a number of gradations.

The great demand for gas for the generation of electricity, for driving engines employed for all kinds of industrial work, for cooking and heating, and for incandescent gas lighting, has to so large an extent changed the standard of quality from the consumer's point of view from one of illuminating power to one of heating power, that we anticipate a radical change during the next decade in the tend of gas legislation, accompanied by a remarkable increase in the volume of gas manufactured. An indication of the quantity of gas that will be required when gas becomes universally employed as a source of motive power is given in a paper recently communicated to the Institution of Mechanical Engineers by Mr. Humphrey.* He stated that at the works of Brunner, Mond, & Co., at Winnington, Cheshire, a million cubic feet of gas are consumed per hour. An arithmetician might find interesting employment in calculating from this figure the quantity of gas that would be required to drive all the dynamo and stationary engines in the country, and, adding to the sum thereby obtained, the volume of gas consumed by a few hundred thousand gas fires and cookers. The resulting figure would serve as a rough estimate of the volume of gas which would be required to meet the public demand if Mond gas could be supplied in all our large towns to all classes of consumers at a maximum charge of 4d. per thousand cubic feet. It has often been suggested that two qualities of gas should be supplied, one for lighting purposes and one for fuel; but in most towns this is impracticable, owing partly to lack of road space, and it is probable that the consumers would speedily find some way of utilising the fuel gas for illuminating purposes at a cheaper rate than they could use the illuminating gas, and the supply of the latter would become unprofitable.

The Mond scheme, if sanctioned by Parliament, might not, and probably would not, be a commercial success, for, among other incidents that would follow its adoption, there would probably occur a rapid rise in the price of slack and a fall in the value of sulphate of ammonia. But if it attracts renewed attention to the possibilities of obtaining motive power from a smokeless agent at a lower cost than it can be obtained from coal direct, the introduction of the Bill may prove of great benefit to the community in general.

COMPETITIONS.

CARDIFF BOROUGH ASYLUM.—The Cardiff Asylum Committee, at a meeting recently arranged to meet Mr. E. G. Hine, the assessor in the competition among architects for designing the Cardiff Asylum to be built at Whit church. From a large number of competitive designs Mr. Hine selected five to send in complete drawings, and from these five he will make his award. The architects are Messrs. H. H. Wills and J. Anderson, Swansea; G. H. Catter and W. S. Skinner, Bristol; Hooley & Sander, Nottingham; Law & Allen, Arundel street, W.C.; and Greenaway & Newberry, Queen Anne's Gate, S.W.—*South Wales Daily News.*

WESLEYAN CHURCH, WESTERHOPE, NEWCASTLE-ON-TYNE.—The trustees of the proposed Wesleyan Church at Westerhope have selected the designs, submitted in a limited competition, by Messrs. Marshall and Tweedy architects, Newcastle. Their scheme is for a church to seat 500, with school hall, and a smaller hall to accommodate 100, vestries, an caretaker's house. The buildings are to be of stone.

ADDITIONS TO WESLEYAN SCHOOLS, PRESTON; LANCASHIRE.—Extensive additions and alterations have been made at St. Mary's-street Wesleyan Schools, Preston. Four classrooms have been added on the east side and four other classrooms have been extended. The increased accommodation is for 150 scholars. The new work is in stone, in conformity with the original building. The cost of the extensions has been about 2,700l. The work was designed by Councillor E. J. Andrew, and was executed by the following contractors:—Mr. Luca, Preston, the masonry and joinery; Mr. Woolton, the plumbing and painting; and Mr. Nixon, the flagging and slating.

* See the *Builder*, December 22, 1900.

R I B.A. Tite Prize, 1901:
Second Prize of Ten Guineas

DESIGN FOR AN ENTRANCE GATEWAY

PHOTO-LITHO SPRAGUE & CO. L^{ts} 4 & 5 EAST HANING STREET, FETTER LANE E.C.

A PUBLIC PARK.—By Mr. RALPH KNOTT.

Bronze Memorial Tablet to be placed on the House, No. 27, Southampton-street, Strand, in which Garrick lived.

MEMORIAL TABLET TO DAVID GARRICK.

The bronze tablet of which we give an illustration is to be placed on the wall of the house, No. 27, Southampton-street, Strand, where Garrick lived for twenty-two years. The tablet is put up at the cost of the Duke of Bedford's estate. It is cast by Mr. Parlanti from a model prepared by Mr. H. C. Fehr, the sculptor, after a sketch by Mr. C. Fitzroy Doll, architect. The figures are supposed to be those of Melpomene and Thalia, the muses of Tragedy and Comedy. The portrait medallion was made after a study from an existing picture, and the dates on the tablet were obtained from the Parish Register of St. Paul's, Covent Garden. We may congratulate all concerned on having produced a memorial tablet of more artistic character and interest than most of those which have been affixed to historic houses in London.

ELECTRIC LIGHT, &C., HARROGATE.—Colonel A. G. Dumford, R.E., held an inquiry in the Council Chamber, Harrogate, on the 16th ult., respecting an application to borrow 10,000l. for electric light purposes and 1,000l. for sewerage purposes. As regards the electric light, the loan is required principally for generating plant. Mr. G. Wilkinson (Electrical Engineer) explained the scheme, and Mr. Bagshaw (Surveyor) the plans, &c. The loan of 10,000l. is to enable the Corporation to construct a sewer from the Grove Park Estate to take the sewage from that district to the sewage farm at Bilton.

WESLEYAN MISSION HALL, BILSTON, STAFFORDSHIRE.—A Wesleyan mission hall has been erected in Temple-street, Bilston, at a cost of 1,300l. Mr. H. Walker, of Wealdston, was the architect, and Messrs. Morrell Brothers, of Bilston, were the builders.

MAGAZINES AND REVIEWS.

THE *Art Journal* contains an article on "Decorative Flower Studies," with illustrations from drawings by Miss Foord, which we presume are intended not as decorative designs but as examples of the study of flower-forms with a view to their subsequent use in decoration. Drawings made with this object will probably be, and should be, different from those made with the view to a pictorial treatment of flowers. Miss Foord's studies are good examples of careful analysis of flower-forms with the pencil. Mr. Walter Armstrong contributes an article on "Early Italian Portraits," with illustrations from Ghirlandajo, Ambrogio de Predis, and Lorenzo di Credi. Mr. Maccoll contributes a short article to accompany an engraving of Rodin's "John the Baptist," which it is proposed to purchase by subscription for the nation. The article contains the extravagant praise of Rodin which is fashionable at present, but we do not see how a figure which is quite finished and has all its limbs complete can properly be accepted as a typical work of the Rodin of the present day. *Au reste*, it is a fine work, but we think a nude John the Baptist is a mistake; no one can ever think of John the Baptist without his "treatment of camel's hair." The frank nudity of the "Age d'Airain," Rodin's best work, was quite right; but a nude John the Baptist is out of keeping. Mr. Cosmo Monkhouse's article on the Charles I. statue at Charing Cross is really interesting, and among other things contains illustrations of two designs by Wren for the monument, which one may be thankful were not carried out.

The *Studio* (January 15) opens with an article on Manet, whose works appear much better

in black and white illustration than in their original often repellent, crude, and violent colour. The article is by M. Antonin Proust (translated we presume), and is marked by the usual indiscriminating adulation of Manet's friends and partisans; indeed, one may say there is hardly any such thing as "art-criticism" now, in the true sense of the word; what is so called consisting simply in picking out certain artists for worship, and praising indiscriminately all that they have done. M. Proust says that "it was reserved for Manet to revive the healthy national tradition—the love of the rare and unrecognised." That is precisely what we should call an unhealthy tradition. A remark of Manet's own at the close of his life is quoted—"you know, my work must be seen in its entirety. If I should vanish, I beg you not to let me go bit by bit into the public collections, for people would judge me ill." There is truth and perception in that. When Manet's works are seen collectively, one can at least see what he was aiming at. But he is an artist not at the centre of art. The number contains an attempt—hardly wise—to represent in chromolithograph Didier-Pouget's great picture "Gargillesse," at the last year's Salon; it would have been better to have given a reproduction in black and white, the attempt at an imitation in colour can never be successful except with a very conventional class of landscape-painting. The illustration (with some others) accompanies an article on Didier-Pouget's work, from which we are glad to learn that this fine landscape artist is still a comparatively young man. The number includes a short article by Mr. C. F. A. Voysey on "Domestic Entrance Halls," which, for houses of the better class, strike us as too domestic; it seems to be the new idea to make the interior of an ordinary-sized gentleman's

house as like a cottage as possible, a treatment at variance with the true fitness of things. Plans of two houses are given, but we observe that Mr. Voysey, like the architectural students at the Royal Academy, omits the compass point from his house plans.

The *Magazine of Art* contains an article on the work of Sir W. Richmond, and one by Mr. Spielmann on Louis Morin, who may be said to be a humorous artist dealing mainly with eighteenth-century subjects and figures. There is a rare talent in some of the designs illustrated.

The *Artist* has, under the title "A Minor Tuscan Town," an article on San Gimignano, with sketches of the celebrated towers, all that remain to us of the "flock of steeples" (in Browning's phrase) which used to be the characteristic of the Italian mediæval town.

The *Quarry* has a special article on "The Petrography of Building Stone," defining "petrography" as "the science which treats of the mineral composition and minute structure of rocks."

The *Gentleman's Magazine* is a good number, but none of the articles come within our province to notice.

The *Architectural Record* (New York) contains under the heading of "Leading French Architects" an article on the works of M. Bouvard, who was architect-in-chief for the 1900 Exhibition, and whose executed works give proof of a remarkable versatility, practical planning and temporary decorative art-palaces appearing to be equally within his grasp. Among the best of the permanent buildings illustrated is his façade for the building erected as the "Bourse de Travail," a scheme which, if we remember right, failed of its social and commercial objects. His central dome for the 1889 Exhibition is recalled by an illustration here, and is so harmonious in its general lines that one cannot but regret that it was not erected as a permanent building shorn of some of its gaudy accompaniments. The new capitol of St. Paul, Minnesota, is illustrated by a perspective from a drawing by the architect (Mr. Cass Gilbert); a rather weak building with a gracefully treated central dome. The plan is not given, but we have several of the sculptured figures (of Virtues, &c.), by Mr. Daniel C. French, which we must say remind us a good deal of Mr. Dodd's allegorical group, described in Stevenson's "The Wrecker," of which the Parisian sculptor under whom he had worked, being told it was for a kind of Prefecture, at first replied "Qu'est-ce que vous me chantez là?" but on learning it was for the States, added "Ah—en Amérique; ver' goot, ver' goot!" If the Americans have assimilated French architecture very successfully, they are certainly a long way as yet from French sculpture. Among the works of recent American architecture, illustrated from some photographs, is a stable in 78th Street, New York, which as an architectural treatment of that class of building is worth attention. An article on "American Artists and their Public," by Mr. Herbert Croley, is interesting as an appreciation of the position by an American, and the following passage is worth quoting:—

"While Americans are very much interested in works of art, they have little instinctive love either of the work or the art, and the writer—who, in this respect, and I hope in many others, is a good average American—can discern the plain and sufficient reason. What we want is art with associations and a background. The popularity of the recent decorations is not in the least a tribute to the intrinsic merit of the painting; it depends almost entirely on interesting accessories. The Congressional Library is thronged with visitors, because the place in which the decorations are situated impresses the patriotic imagination of the American people. They must be worth seeing, because they are in the Congressional Library; and everybody says they are worth seeing. Once the civic order has formally approved them, they have obtained an importance beyond the power of mere paint. So it is with the popular interest in art history. We make a great to-do about Phidias, Amiens, and Giotto. If we are a woman, we read essays on them to the members of our favourite club. We study them, we translate them into prose, we use them as educational influences, we find in them a source of spiritual illumination; but, I make bold to say, we very seldom genuinely enjoy them. We have not taken to them because of an actual and innocent love of beautiful things, but because the Garden of Art has been recommended to us as a serviceable training and tilting ground for our moral aspirations."

He adds, what we have no doubt is true, that the best American artists do not at all approve this attitude in regard to art, and find

in it one of their great stumbling-blocks both to progress and to appreciation.

The *Architectural Review* (Boston) gives among the illustrations to its latest issue a fine competition design for the new Union Club at New York, by Mr. Donn Barber; a design showing in its architectural treatment all the proper characteristics of club architecture. Mr. E. R. Smith's essay on architectural classics (books) is continued, and deals in this issue with French architectural writers, with a number of curious illustrations reduced from the pages of Du Cerceau, Le Pautre, and others.

The *Edinburgh Review* contains an article on "Landscape: Symbolic, Imaginative, and Actual," tracing the change from ideas of landscape with the ancients, with whom external nature was always the symbol of something in the mind or the destiny of man, to the modern view of landscape as a concrete fact or phenomenon. The article is concerned, naturally, with conceptions and descriptions of landscape in poetry as well as with its representation in art. The *Review* contains a well-written and judicious article on Velasquez—a review of several books of art history and art-criticism, pervaded, however, by some of that over-adulation of this great but seldom beautiful artist, which is the attitude of the modern art-critic.

The *Quarterly Review*, a very good number, contains, however, nothing that is within our province to comment on; one article is on the subject of "The Nicaraguan Canal," but it is purely political, and no question of engineering enters into it.

Scribner contains an interesting and picturesque article on "Carcassonne" and "Albi," with illustrations by the author, Mr. E. C. Peixotto. Under "The Field of Art" is an article by Mr. P. B. Wight on the question, which had been discussed at an architectural symposium at Chicago, "Can architecture again become a living art?" The direction suggested for the answer to the question may be best indicated by quoting the concluding paragraphs:—

"The modern independent designer spurns the thought of copying anything his neighbour has done, though he may be willing to use the same ancient model; and he indignantly protests if anything he does is copied. Evolution in architecture is impossible in such a case. It is only possible when every one copies the best work of his neighbour, and adds something to it of his own; and his neighbour thanks him for so doing, and goes and does likewise.

If we should take the models of Roman architecture for our starting-point, and recognise and structure that we now have, we would in time evolve a new architecture which would differ little from what we might get if we started with Byzantine or Gothic, provided all the architects adhered to the precept contained in the last sentence. So from whatever point of view we regard the question, "Can architecture again become a living art?" it will always be found that the first essential is that the architect shall stop his individuality. It is in this respect that the profession of the architect differs from that of the painter, the sculptor, or any other artist."

The conclusion is the same at which one or two able English architects have arrived; though others, again, are as strongly opposed to it. It seems to us that there is a great deal of truth in Mr. Wight's view.

The *Pall Mall Magazine* has secured a posthumous article by Charles Yriarte on "The Rise of the Romantic School in France," as represented by the works of such men as Gericault and Delacroix, followed by Diaz, Rousseau, Corot, Couture, Barye, &c., while Rude's fine relief on the Arc de l'Étoile is taken as representing the romantic movement in sculpture. The article, though short and concentrated, contains much interesting critical suggestion in regard to the period of French art treated of.

Harper contains a somewhat over-enthusiastic article by Mr. S. Whitman on the works of Franz von Lenbach, the German portrait-painter, with illustrations from his portraits of Bismarck, the present Pope, and Gladstone; all of them, we fully agree, highly characteristic portraits. Mr. Paul Meurice's article on "Victor Hugo as an Artist" is continued; but these semi-grotesque efforts of Hugo's are certainly not worth all the fuss here made about them.

The *Fortnightly Review* list of contents is headed by the rather surprising announcement of an article on "Railway Reform in Great Britain," by Mr. Rudyard Kipling. This however turns out not to be the usual style of

statistic article, but a most delightful and humorous treatment of the subject in a kind of Oriental parable, or parallel. Every one should read it, whether they care about railway reform or not. The general moral of it is that competition is the means to keep railways up to the mark, and that monopoly of a route or country tends to a sleepy and slack administration.

The *Berlin Architektur-Welt* gives an article with a number of illustrations on the competition designs for a new church at Zehlendorf, which illustrate both the wiry character of Gothic favoured in modern German church architecture, and the ingenuity and variety in planning which often accompanies it. The design by Herr Kieckhof, of Potsdam, for a brick church on a stone base, is the best and most interesting in architectural treatment. There are some interesting examples of modern villa residences by various architects.

The *Century* has a short article by Mr. R. H. Thurston, Director of Sibley College, Cornell, on "The Steel Industry of America." It is mainly statistical in regard to the present stage of this immense industry in America. Under "Open Letters" is an appreciation, or rather depreciation, of Landseer, which is rather too pessimistic, though it is quite true that Landseer's success was not a purely artistic one.

Knowledge has an interesting illustrated article on "Constellation Figures as Green-Coin Types."

The *Church Builder*, the quarterly record of the work of the Church Building Society, gives the statistics of work of the past quarter together with a historical sketch of the Rural Deanery of Woolwich, with sketches of the curious interior of Woolwich Parish Church, and of two of the new churches—St. Mark's, Plumstead, which we illustrated recently, and St. Paul's, Plumstead.

The editor of *Architectural Association Notes* has had the happy idea of asking all the former presidents who are living to write their New Century greetings to the Association; this has resulted in the collection of nineteen short letters expressing good wishes with suggestions for the best course for architecture at the present moment, which are of considerable interest.

WATER COMPANIES' REGULATIONS.

A CONFERENCE convened by the London County Council of the representatives of the City Corporation, the City of Westminster and the Councils of the Metropolitan Boroughs was held at the County Hall, Spring-gardens on Monday, to consider the proposed amended regulations of the Metropolitan Water Companies.

Alderman Dickinson, Chairman of the London County Council, presided, and in opening the proceedings said that the County Council would deal with the matter at their meeting the following day, and the following Monday the Local Government Board inquiry on the subject would be held. He welcomed the representatives, and he thought there could be no matter of more common concern to Londoners than the one they had before them that day. Even from the point of view of £ s. d. the proposed regulations, should they become law, would affect almost every household in London, and a great deal of expense would be forced upon inhabitants. The Council had tried to ascertain roughly what that expense would be. They had taken a house of the rateable value of 45*l.*, and it had been found that it would cost 53*l.* to the householder to carry out the regulations proposed. Another house of rateable value of 250*l.*, which was already provided with a cistern of the size and kind required, would require 85*l.* to be expended upon it, and, but for the cistern, 40*l.* more would be required. But perhaps the most striking instance of all related to a block of artisan dwellings now being erected. They had compared the cost of the water fittings of those dwellings under present regulations and under the proposed regulations, and they found that under the old regulations the cost of the fittings would be 60*l.*, while under the new regulations it would be 125*l.* If that sort of thing was to affect all the houses of London, as no doubt it would to a great extent, the situation was one of very great seriousness. There was no doubt that the proposed regulations had evoked the hostility of all the Borough Councils as well as the County Council. In 1872 an inquiry was held into

certain regulations of the companies in regard to fittings; that inquiry lasted a very considerable time, cost a large amount of public money, and was ultimately settled by a system of regulations under which the companies had carried on their business for the last thirty years. Those regulations had been to a very great extent perfectly satisfactory. The Royal Commission which sat last year pointed out that it had been stated to them that the system of examination of fittings of various houses was not satisfactory, and they had had brought to their notice the fact, which had been known for years, that there was an enormous amount of waste of water going on in London, though they did not sufficiently inquire into who was responsible for that waste. That waste did occur—that a large amount of water was unnecessarily used daily in London, was an undoubted fact, but whether it was the fault of the consumer or of the companies was a moot point, and for his part he thought, to a large extent, it rested with the companies, who had not properly carried out the powers they possessed. Taking the figures for last July he found that the Kent Company supplied at the rate of 36 gallons per head per day, whereas the Grand Junction Company could not do its business with less than 56 gallons per head per day; and between those extremes the other companies varied. But the conditions of London were not dissimilar, and if the Kent Company, and the New River Company, and the East London Company could give a satisfactory supply with about 36 gallons, it was evident that something must be wrong with the company which required 56 gallons per head per day. The amount of water which was lost by the differences between the companies was remarkable: the amount supplied last July was 247 million gallons daily, but if all the companies had carried out their undertakings as the Kent Company did, the amount would have been only 222 million gallons, or a saving of 25 million gallons per day. That was the question to which the water companies ought to apply themselves before they sought the extraordinary powers they were now asking for over the construction and management of the private houses of London. But even if a re-arrangement of the regulations of the companies was necessary, it was a grave question whether it was expedient at the present time, because the water question in London had assumed a very different complexion from that which it had in 1872. A Royal Commission had reported in favour of purchase by some public authority and there could be little doubt that the Government would take up the question of purchase before long. It was only under the heading in the report of the Royal Commission of what would be necessary if purchase did not take place that the proposals for increased and more efficient regulations came. There was no doubt that in a few years purchase would take place, and the only effect of proposed regulations would be to place the companies in a much better position before the arbitrator who would fix the price when the question of purchase arose. Some of the companies were very near the end of their resources, and if these regulations were agreed to their power would be extended and their position, from a financial point of view, greatly improved. But the position was serious. The companies had applied for those regulations to be made. He did not know that the Local Government Board had any power to refuse to consider the question. The matter would have to come up, and he could only rejoice at that day's demonstration, which showed that the representatives of Londoners, as a whole, would do their best to protect the interests of Londoners as a whole. The County Council would consider the matter the following day in the form of a joint report of the Water and Public Health Committees, and he would suggest that the conference should consider the recommendations of the joint committee on each of the proposed regulations of the companies. After some discussion as to procedure, the chairman's proposal was agreed to. Mr. T. McKinnon Wood, Chairman of the Water Committee of the Council, moved: That the Local Government Board be requested to adjourn the inquiry, seeing that the Government has intimated its intention of introducing a Bill in 1902 dealing with the water question. That, he thought, would strike at the root of the matter, besides leaving the Conference free to deal with the proposed regulations.

Mr. Shaw Lefevre seconded, remarking that it was monstrous that the regulations should be brought forward now, seeing that the Royal Commission had recommended purchase. An inquiry at the present time was a waste of public time and money. Mr. Morton said that in the City they had decided to go to the Local Government Board for permission to use automatic cisterns and three-gallon flush cisterns. The regulations, if agreed to would give the companies a great deal of power to interfere with property. Mr. Wood's motion was then agreed to. The first amended regulation proposed by the companies is as follows:—
1. *Place of communication-pipe*.—No "communication-pipe" for the conveyance of water from the waterworks of the company into any premises shall hereafter be laid [until after the point or place at which such "communication-pipe" is proposed to be] or brought into such premises [shall have had the approval of] *except at the place previously approved by the company.*
To this the Joint Committee of the Council recommended, and the Conference agreed, that Regulation No. 1 should be struck out, and the old regulation substituted. It was also agreed to add the following suggestion of a conference of Borough Councils south of the Thames and the Wandsworth Borough Council:—
Add "and in the event of the company not consenting to the position of a 'communication-pipe' as suggested by an applicant, there shall be an appeal to the Borough Council, whose decision shall be final."
The second of the proposed regulations of the companies is as follows:—
2. *Definition of "communication pipe"*.—In these regulations the term "communication pipe" shall mean the pipe which extends from the district pipe, or other supply pipe of the company, up to the "stop" ball valve, prescribed in the Regulation No. 24, and any pipe of the consumer subject to pressure from the company's main.
On this the Joint Committee recommended, and the Conference agreed, to oppose the proposed extension of the definition of "communication pipe."
The third proposal of the companies is as follows:—
3. *Not more than one communication pipe to each house*.—No house shall, unless with the permission of the company given in writing, under the hand of their secretary, be hereafter fitted with more than one "communication pipe."
The Joint Committee of the Council proposed "That a proviso should be added to Regulation 3 to the effect that branches from a communication pipe shall not be deemed to be separate communication pipes."
This gave rise to some discussion. It was agreed to strike out the words "under the hand of their secretary"; and it was also agreed to add to the recommendation of the Joint Committee of the Council words to the effect that there should be an appeal to the local sanitary authority in the event of the refusal of the water companies.
The following proposals, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, and 14 of the water companies, and the recommendations of the Joint Committee of the Council at the end of each, were then considered. The recommendations were agreed to by the Conference:—
4. *Every house, with certain exceptions, to have its own communication pipe*.—Every house supplied with water by the company (except in cases of stand pipes) shall have its own separate "communication pipe." Provided that, as far as is consistent with the special Acts of the company, in the case of a group or block of houses, the water rates of which are paid by one owner, the said owner may [at his option] with the consent of the company in writing under the hand of their secretary, have one sufficient "communication pipe" for such group or block of houses, but each house so supplied shall be communicated, independently of any other house, by a stop valve, placed in a readily accessible position.
[L.C.C. Committee and Conference:—] That regulation No. 4 should be struck out and the old regulation substituted.
5. *Defective communication pipe*.—Any existing "communication-pipe" which is not as prescribed by these Regulations shall, when it becomes defective, or requires repair, be replaced by a lead-pipe of the prescribed weight.
[L.C.C. Committee and Conference:—] That Regulation No. 5 should be amended so as to provide that any existing communication pipe which is not as prescribed by the regulations shall when it becomes so defective as not to be watertight, be repaired or replaced by a pipe of similar material to the exist-

ing pipe, but of the prescribed weight for a new communication pipe; provided that the regulation shall not require the whole of the existing communication pipe to be replaced but only so much of the pipe as is not watertight and cannot be made so.]*
6. *No house to have connexion with fittings of adjoining house*.—No house supplied with water by the company shall have any connexion with the pipes, cisterns, or other fittings of any other premises, except in the case of groups, or blocks of houses, referred to in the [preceding] Regulation No. 4.*
[The L.C.C. Committee and the Conference had no observations to make on this regulation.]
7. *Connexion to be by ferrule*.—The connexion of every "communication pipe" with any pipe of the company shall hereafter be made by means of a sound and suitable brass screwed ferrule or stop-cock with union, and such ferrule or stop-cock shall be of a pattern approved by the company and shall be so made as to have a clear area of water-way equal to that of a half-inch pipe. The connexion of every "communication pipe" with the pipes of the company shall be made by the company's workmen, and the company shall be paid in advance the reasonable costs and charges of, and incident to, the making of such connexion.*
[Joint Committee and Conference:—] (a) That the words in italics should be omitted.
(b) That regulation No. 7 should be amended so as to provide that the company shall provide, fix, and maintain at their own expense the fittings and piping necessary to supply the water up to the premises, including the stop-cock.†
8. *Weights and dimensions of ferrules*.—Every ferrule shall be of not less than the following dimensions:—[Here follows an elaborate table which we have not space to print.—Ed.]*
[The Committee and Conference had no recommendations to make.]
9. *Materials and joints of external pipes*.—Every "communication pipe" and every pipe external to the house and through the external walls thereof [hereafter] respectively laid or fixed, in connexion with the water of the company, shall be of lead; all such pipes shall be properly protected to the satisfaction of the company against frost, theft, or mischief, and every joint thereof shall be of the kind called a "plumbing" or "wiped" joint.*
[Joint Committee and Conference:—] (a) That the word "hereafter" should be retained in line 2 of regulation No. 9.
(b) That the words "external to the house" should be inserted after the word "pipes" in line 3 of regulation No. 9.
(c) That the words "to the satisfaction of the company" should be omitted, and that words should be added to regulation No. 9 to the effect that in case of dispute between the company and the owner or occupier as to whether the pipes are properly protected against frost, theft, or mischief, the matter shall be decided by the Borough Council.†
10. *Material, joints, and position of internal pipes*.—Every pipe hereafter laid or fixed [in the interior of any dwelling-house] for the conveyance of, or in connexion with, the water of the company [must, unless with the consent of the company] shall, if in contact with the ground, or under the flooring or not visible, be of lead, but may otherwise be of lead, copper, or wrought iron lap welded steam tube at the option of the consumer; and every joint on lead pipe shall be of the kind called a "plumbing" or "wiped" joint. All pipes inside any building shall be accessible, and not be embedded in the plaster, stone, or brickwork of any wall, or placed behind match lining.*
[Joint Committee and Conference:—] (a) That the words "or under the flooring, or not visible," should be omitted.
(b) That the words "to be hereafter erected" should be inserted after "all pipes inside any building."
(c) That the words "or placed behind match lining" should be omitted, and that a proviso should be added to the regulation to the effect that it shall not be deemed to prevent pipes from being placed in properly formed chases, or behind movable casings.†
11. *Weight of lead pipes*.—No lead pipe shall hereafter be laid or fixed in or about any premises for the conveyance of, or in connexion with, the water supplied by the company (except when, and as otherwise authorised by these regulations, or by the company), unless the same shall be sound of good metal, and of equal thickness throughout, and of at least the weight following, that is to say:—

Internal diameter of pipe in inches.	Weight of pipe in lbs. per lineal yard.
3/4-inch diameter.	5 lbs. per lineal yard
1 " "	6 " "
1 1/4 " "	7 1/2 " "
1 1/2 " "	9 " "
1 3/4 " "	12 1/2 lbs. "
2 " "	16 " "
2 1/4 " "	22 1/2 " "
(New) 2 1/2 " "	30 lbs. " "

* Words omitted from the old regulations are shown between brackets and the words added are in italics.
† The whole of this regulation is new.

* Words omitted from the old regulations are shown between brackets and the words added are in italics.
† The whole of this regulation is new.

[Joint Committee and Conference:—] That the increase in the weight of lead pipes proposed in Regulation No. 11 be opposed.*

12. *Depth of Pipes Underground.*—Every pipe hereafter laid for the conveyance of, or in connexion with, water supplied by the company, shall, when laid in open ground outside any building and underground, be laid at least 2 ft. 6 in. below the surface and shall in every exposed situation be properly protected to the satisfaction of the company against the effects of frost.*

[Joint Committee and Conference:—] (a) That the words "where the pipes of the company are of the same or greater depth" should be added after "surface."

(b) That the words "to the satisfaction of the company" should be omitted, and that words should be added to the regulation to the effect that, in case of dispute between the company and the owner or occupier as to whether the pipes are properly protected against the effects of frost, the matter shall be decided by the Borough Council.

13. *No Pipe to be Laid through Drains, &c.*—No pipe shall be used for the conveyance of, or in connexion with, water supplied by the company, which is laid or fixed through, in, or into any drain, asphalt, sink, or manure hole, or through, in, or into any place where the water conveyed through such pipe may be liable to become fouled, except where such drain, asphalt, sink, or manure hole, or other such place shall be in the unavoidable course of such pipe, and then in every such case such pipe shall be passed through an exterior water-tight cast-iron pipe or jacket of sufficient length and strength, and of such construction as to afford due protection to the water-pipe.*

[Joint Committee and Conference:—] That Regulation No. 13 should be so amended as to prohibit persons from laying water pipes through drains, asphalts, sinks, or manure holes.*

14. *No Connection with Rain-Water Receptacle.*—No pipe for the conveyance of, or in connexion with, water supplied by the company, shall communicate with any cistern, butt, or other receptacle used or intended to be used, for rain-water, or for any water not supplied by the company.*

[The Joint Committee and Conference had no recommendation to make.]

No. 15 of the companies proposed regulations is as follows:—

15. *Fittings to be Tested and Stamped.*—All water-fittings shall hereafter be made in accordance with the particulars, weights, and dimensions prescribed by these regulations, and, previously to being fitted or fixed upon any premises supplied with water by the company, shall be tested and bear the company's stamp of approval. All fittings which when in use will be subject to pressure shall be capable of resisting a force of 300 lbs. per square inch. Fittings submitted for the purpose of being tested and stamped shall in all cases be of a quality at least equal to samples approved by the company. The company may make a reasonable charge for testing any water-fittings submitted to them for such purpose.

[The Joint Committee of the Council recommended that the regulation be opposed with a view to its being struck out of the regulations.]

The Conference agreed to this recommendation, with the addition of the following words as alternatives:—

"But, in the event of the opposition not being successful, that the regulations defining the weight and patterns of fittings be placed in the hands of a public authority, such as the London County Council, and that any fitting or appliance stamped by such authority may be used in any premises supplied with water by the metropolitan water companies.

Further that, if the water companies are to have the power to stamp fittings, they should do so without charge, and that the stamping should be a guarantee that the fitting is as described."

The following is Regulation 16 as proposed by the companies:—

16. *Waterway of Fittings.*—Except with the written consent of the consumer, no cock, ferrule, joint, union, valve, or other fitting, in the course of any "communication pipe," shall have a waterway of less area than that of the "communication pipe," so that the waterway from the water in the district pipe or other supply pipe of the company up to and through the stop-valve prescribed by Regulation No. 17 shall not in any part be of less area than that of the "communication pipe" itself, which pipe shall not be of less than $\frac{1}{2}$ -in. bore in all its course.*

The Joint Committee proposed, and the Conference agreed,—

"That the words 'hereafter provided' should be inserted after 'fitting' in line 3 of Regulation No. 16, and that the words 'Except with the written consent of the consumer' should be omitted."

The companies' next proposal is as follows:—

17. *Stop Valves.*—Every "communication pipe" for the conveyance of water to be supplied by the

company into any premises shall have outside such premises at or near its point of entrance [into such premises, and if desired by the consumer within such premises] a sound and suitable stop-valve of the screw-down kind, with an area of waterway not less than that of $\frac{1}{2}$ -in. pipe, and not greater than that of the "communication pipe," the size of the valve within these limits being at the option of the consumer, who shall also fix a second stop-valve inside the house or building.

[Such] Every stop-valve [if] placed in the ground shall be protected by a proper cover and "guard box" approved by the company, secured upon brickwork or other suitable setting.*

The Joint Committee recommended as follows:—

(a) "That regulation No. 17 should be amended by the insertion, after the word 'kind' in line 7, of the words 'such stop valve to be provided and maintained by the company at their own expense'."

(b) That all the words after "communication pipe" in line 9 of regulation 17 should be omitted, and the following words substituted, "The owner may at his option provide and fix a second stop-valve inside the house or building."

(c) That the second paragraph of regulation No. 17 should be omitted as a consequence of the foregoing amendments.

The recommendations were agreed to by the Conference with the following addition:—

(d) "That the outside stop-valve should be as near as practicable abutting on the frontage of the premises, but where there is a forecourt it should in all cases be placed in such forecourt, and that in all cases of dispute as to its position, there shall be an appeal to the local sanitary authority, whose decision shall be final."

The following regulation as proposed by the companies is entirely new:—

18. *Weights and Dimensions of Stop-valves, Draw-taps and Bath Apparatus.*—Every screw-down stop-valve, draw-tap, and bath apparatus shall be fitted with loose valves (such valves shall be lifted by the spindle and shall not be dependent upon the pressure of the water for opening), and shall be fitted for cold water with washers of oil-dressed leather, and for hot water with washers of vegetable fibre of the best quality, or other material approved by the company. The word "inlet" shall be distinctly marked on the inlet side of the stop-valve, and such stop-valves for attachment to lead pipe shall be made with screwed ends and unions. The spindles shall in all cases be of gun metal, but all other parts may be of brass of good suitable quality. Every stop-valve, draw-tap, and bath apparatus shall be of not less than the following weights and dimensions:— [Here follows an elaborate table which we have no space to print.—Ed.]

The Joint Committee recommended:

(a) "That the words 'which may hereafter be provided' should be inserted after the words 'apparatus' (line 3), 'valve' (line 11), and 'apparatus' (line 16), and that the words 'equally suitable material' should be substituted for 'material approved by the company' in line 9 of regulation No. 18.

(b) That the words '(such valves shall be lifted by the spindle, and shall not be dependent upon the pressure of the water for opening)' should be omitted.

These recommendations were agreed to, with the following addition:—

(c) "That the words 'waste arrangements of bath pans shall always be submitted for approval,' should be omitted from the table of weights and dimensions.

A long discussion took place on the following proposal:—

19. *Cold Water Storage Cisterns.*—Every house (or in case of flats each suite of rooms) supplied by the company shall, except with the consent of the company in writing, under the hand of their secretary, be provided with a cold water storage cistern or cisterns of sufficient capacity to contain in the aggregate at least 25 gallons of water for each room. Each outlet pipe from such cistern or cisterns shall be carried up inside 1 in. above the bottom of the cistern, and such outlet-pipe shall be commanded by an efficient screw-down stop-valve, placed in a readily accessible position, within 1 ft. of such cistern, and a draw-off tap from same shall be provided. In no case may there be any connexion between the draw-off pipe from the cistern and the supply or communication pipe.

The Joint Committee recommended that the regulation be opposed, with a view to its being struck out of the regulations, but one or two of the representatives expressed the belief that the Committee is in error in objecting to the use of cisterns. The following recommendation was moved by Mr. Councillor J. T. Clark and seconded by Mr. Councillor E. Gates:—

(a) "That this Conference, while agreeing that

storage cisterns are necessary to ensure consumer against temporary stoppage of supply, and that such cisterns should be properly designed for storage of water, is of opinion that the character of such cisterns is a vital public health question upon which public opinion stands in much need of guidance, and suggests that the London County Council shall take such steps as it may deem expedient for holding a public competition of the improved cisterns now in the market, and to make suitable awards of merit thereon.

The motion was defeated, and the recommendation of the Committee was agreed to by a large majority.

On the following proposals of the companies no recommendations were made by Committee or Conference:—

20. *Buried cisterns prohibited.*—No cistern buried or excavated in the ground shall be used for the storage or reception of water supplied by the company, unless the use of such cistern shall be allowed in writing by the company under the hand of the secretary.

21. *Wooden receptacles prohibited.*—No wooden receptacle without a proper metallic lining shall [hereafter brought into use] used for the storage of any water supplied by the company.*

The following are the amended regulations proposed by the companies from 22 to 30 inclusive, with the recommendations of the Committee in brackets, which recommendations were agreed to by the Conference:—

22. *Character of Cisterns.*—Every cistern used in connexion with the water supplied by the company shall be made, and at all times maintained, water-tight, and be properly covered with a close-fitting lid, and placed in such a position that it may be readily inspected and cleaned.

[That the words in italics be omitted.]

23. *Protection of Cisterns.*—Every cistern hereafter fixed in connexion with water supplied by the company shall, except with the consent of the company, be placed within the house or building, and shall have a clear space of not less than two feet between its top, measured from the centre, and the ceiling, rafter, or roof, and any cistern hereafter fixed in an exposed position shall be bricked around or otherwise properly protected, to the satisfaction of the company, against frost, theft, or mischief.

[That the regulation be opposed, with a view to its being struck out of the regulations.]

24. *Ball Valves.*—Every [such existing] cistern shall be [if not already] provided, and kept provided with [an efficient "ball-tap," and every such future] cistern shall be provided with a sound and suitable "ball-tap" of the valve kind for the inlet of water, and suitable "ball-cocks" securely braced into the inlet pipe (which must be firmly fixed, and so that the ball will not become submerged or allowed to arise within two inches of the lower side of the warning pipe.*

[That the words "connected to" should be substituted for "branched into" in line 6 of regulation No. 24, and that all the words after "water" in line 9 should be omitted, and the following words added, viz., "to overflow by the warning pipe, provided that this regulation shall not require any such ball-tap to be altered or replaced, or replaced in cases where the ball-valve is or can be made to be in such working order as to prevent overflow of water as aforesaid."]

25. *Weight and dimensions of ball-valves.*—Every ball-valve shall be so constructed and fixed as to shut off when under a pressure of 100 lbs. per square inch, and shall be provided with a copper ball, with a brass stud to screw on to the lever, and a piston of the valve which comes in contact with seating shall be screwed, and fitted with a cap containing the rubber washer, which shall be made of 3-ply rubber of the best quality. The ball-valve and various parts shall be of not less than the following weights and dimensions. [Then follows a table which we have no space to print.—Ed.]

[That the words "which may hereafter be provided" should be inserted after "ball-valve" in line 6 of the regulation.]

26. *Waste pipes to be removed or converted into warning pipes.*—No overflow or waste pipe other than "warning pipe" shall be attached to any cistern supplied with water by the company, and every overflow or waste pipe existing at the time of these regulations come into operation shall be removed, or [at the option of the consumer shall be converted into an efficient "warning pipe," within two calendar months next after the company shall have given to the occupier of, or left at, the premises in which such cistern is situated, a notice in writing requiring such alteration to be made.]

[That the regulation be struck out and the regulation substituted.]

27. *Arrangement of Warning Pipes.*—The outlet of every "warning pipe" shall be placed in such a situation outside the house as will admit of the charge of the water [iron] for such "warning pipe" being readily [ascertained] seen by the officer of the company entering the house. And the pos-

of such "warning pipe" shall not be changed without the previous notice to and approval by the consent of the company. Every "warning pipe" shall be made to discharge not less than 2 ft. above any drain, sink, or gully, over which the same may be fixed.*

[That regulation No. 27 should be struck out, and the old regulation substituted.]

† 28. Weight of Lead Pipes having Open Ends.—Every lead "warning-pipe" and other lead pipes of which the end is open, so that such pipe cannot remain charged with water, may be of the following minimum weight, that is to say—

1/2 in. (internal diameter)	3 lbs. per yard.
3/4 "	5 "
1 "	7 "
1 1/4 "	9 "
1 1/2 "	12 "
1 3/4 "	16 "
2 "	18 "

} New*

[No recommendations were made by the Committee or Conference to this and the next proposal.]

† 29. Ordinary Draw-taps.—No draw-tap shall in future be fixed unless the same shall be sound and suitable, and of the "screw-down" kind.

[Regulations 30, 31, 32, and 33, as proposed by the companies, are as follows, the recommendations of the Committee, in brackets, being agreed to by the Conference.]

† 30. Direct Draw-taps.—A draw-tap of a proper screw-down pattern may be placed in connexion with the "communication pipe" in a suitable position in any house or building.

[That regulation No. 30 should be amended so as to read as follows:—"Draw-taps of proper screw-down patterns may be placed in connexion with the rising main, or branches from the rising main, in suitable positions in any house or building."]

† 31. Draw-taps in connexion with stand-pipes.—Every draw-tap in connexion with any "stand pipe" or other apparatus outside any dwelling house, in a court or other public place, to supply any group or number of such dwelling houses, shall be sound and suitable and of the "waste-preventer" kind, and be properly protected [as far as possible from injury by], to the satisfaction of the company, against frost, theft, or mischief.*

[That the words "to the satisfaction of the company" be omitted from the regulation.]

† 32. Boilers, Water-closets, and Urinals to have Separate Feed Cisterns.—There shall be no direct communication [from] between the pipes of the company [to] and any boiler [urinal or water-closet], water-closet, urinal, drain, trap, gully, flushing cistern, or service box. Every boiler [urinal and water-closet in which water supplied by the company is used (other than water-closets in which hand flushing is employed) shall, within three months after these regulations come into operation, be served only through a cistern or service box and without a stop-cock] shall be supplied through a separate covered feed cistern, and every water-closet and urinal through a covered flushing-cistern or covered service box, all such supplies being taken from a storage cistern. Stool cocks, or other apparatus by which water may be allowed to flow continuously into any water-closet pan or urinal are prohibited. [No pipe by which water is supplied by the company to any water-closet shall communicate with any part of such water-closet, or with any apparatus connected therewith, except the service cistern thereof.]†

[Joint Committee and Conference.—That the regulation be struck out and the old regulations (Nos. 20 and 24) substituted.]

† 33.—Definition of water-closet.—The word "water-closet" in these regulations shall include any slop-hopper.

[Joint Committee and Conference.—(a) That the words "sink used for receiving any solid or liquid excremental filth" should be substituted for "slop-hopper" in Regulation No. 33.

(b) That words should be added to Regulation No. 33 to provide that the regulation shall not be deemed to entitle a water company to make a charge for supplying water to a "slop-hopper" or "sink used for receiving any solid or liquid excremental filth," as if such "slop-hopper" or "sink" were a "water-closet."]

Regulation 34, as proposed, is as follows:—

† 34. Water-closet Apparatus.—Every water-closet flushing cistern, or [water-closet] service-box hereafter fitted or fixed in which water supplied by the company is to be used, shall have an efficient waste-preventing apparatus so constructed and maintained as [not to be capable of discharging] to prevent the discharge of more than two gallons of water at each flush or a continuous flow of water, and shall not be automatic.*

The Joint Committee recommended as follows:—

(a) That the Council do express at the inquiry its view that water-closet flushing cisterns should be capable of discharging three instead of two gallons, but that having regard to the recent decision on this

question no evidence be called in support of the Council's view.

(b) That Regulation No. 34 should be struck out and the old regulation substituted.

Recommendation (b) was agreed to, but the following was substituted for (a):—

(a) That in the opinion of this conference owners and occupiers of property should be allowed to use three-gallon flushing cisterns if they so desire.

The following is proposed by the companies:—

† 35. Closet and Urinal Service Boxes.—Services (sic) boxes for closets and urinals, if made of cast-iron, shall be of approved design, and if of wrought-iron be galvanised, and constructed of sheets of a thickness of not less than 18 B.W.G., securely riveted, the pitch of the rivets not exceeding 1 1/2 in.; and they shall be provided with a close-fitting cover properly secured. Connecting links, between the levers and the valves, shall be made with suitable slotted, or knuckle joints, shall be made of brass and not be less than 3/4 in. diameter, and a brass plate with a square hole [for wrought-iron service box], or some equally efficient approved arrangement (for cast-iron service box), to prevent the ball-valve from getting displaced from its proper position, shall be provided. Balance weights shall be properly secured with 1/16-in. diameter wire; cotters or split pins, when used, shall be of brass, and not less than 3/4 in. diameter, and washers on service box valves shall be of the best rubber, and not less than 1/4 in. in thickness. Where a syphon is used in a service box, the undernath part of the syphon shall be brought above the top of the service box, and there shall be no opening or valve on the down leg of any syphon. The nuts for securing the syphon in position shall not have less than four full threads, and the "top water line" shall be cast upon the inside of each syphon service box on the back and the front, such water line being 1/2 inch below overflow pipe. Outlets from closet service-boxes shall not be less than 1 1/4 in. internal diameter, and of the weights and dimensions given below. [Here follows a table.—Ed.]

The Joint Committee recommended as follows:—

(a) That the words "which may hereafter be provided" should be inserted after "boxes" in line 2 of Regulation No. 35, and in such other lines as may be necessary for the purpose of making the regulation not retrospective.

(b) That the word "suitable" should be substituted for "approved" in line 3 of Regulation No. 35.

(c) That the words "three-eighths of an inch measured across the outside diameter of the link" should be inserted after "than" in line 11 of Regulation No. 35, in lieu of the words "3/8 inch diameter."

(d) That the word "approved" should be omitted from line 14 of Regulation No. 35, and the words "or painted" inserted after "cast" in line 28.

(e) That words should be added to Regulation No. 35 to provide that the supply pipe to the flushing cistern shall be of not less than a prescribed diameter so as to ensure the rapid filling of the flushing cistern.

The following was agreed to by the Conference: [That Regulation 35 be opposed with a view to its being struck out of the regulations; but in the event of the opposition being unsuccessful, the amendments proposed in recommendations (a),(b),(c) and (d) be pressed, and that in any case the proposal in recommendation (e) be pressed, and that in (e), after the words "supply pipe," the words "and union" be inserted.]

No recommendation was made by either Committee or Conference on the following:—

† 36. Water-closet down pipes.—Every "down pipe" hereafter fixed for the discharge of water into the pan or basin of any water-closet shall, when the bottom of the service box is more than 4 ft. above the top of the closet pan, have an internal diameter of not less than 1 1/4 in., and the outlet of the service box and the down pipe shall have an internal diameter of 1 1/2 in., when the bottom of the service box is less than 4 ft. above the top of the closet pan. The down pipe, if of lead, shall weigh not less than 9 lbs. to every lineal yard, may be of the weight prescribed in No. 28 of these regulations.*

The companies propose the following as Regulation 37:—

† 37. Urinal Service Box Apparatus.—Every urinal [cistern] service box in which water supplied by the company is used, other than public urinal [cisterns, or cisterns having attached to them a self-closing apparatus] service boxes, shall have an efficient "waste-preventing" apparatus so constructed and maintained as [not to be capable of discharging] to prevent the discharge of more than one gallon of water at each flush or a continuous flow of water, and shall not be automatic.

Outlets from urinal service boxes shall be made in accordance with weights and dimensions given for urinals and lavings in No. 18 of these regulations.*

* Words omitted from the old regulations are shown between brackets and the words added are in italics. † The whole of this regulation is new. ‡

The Joint Committee recommended and the Conference agreed to the following:—

(a) That the words "which may hereafter be provided" should be inserted after "service box," and the words "for each urinal or urinal compartment" inserted after "flush."

(b) That the words "(except when the water is supplied by measure)" should be added after "flow of water," and the words "and shall not be automatic" omitted.*

The companies propose:—

† 38. Automatic Flushing Boxes Prohibited.—No apparatus capable of discharging automatically shall be fitted or fixed except by special agreement with the company in writing under the hand of their secretary.*

The Joint Committee recommended:—

"That the words 'when water is supplied by measure' should be inserted in place of all words after 'except.'"

The following, however, was the resolution of the Conference:—

"That the words 'when water is supplied by measure or' should be inserted after 'except.'"

That the words "under the hand of their secretary" should be omitted.

That words should be added to the regulation to provide that in the event of the company refusing to allow automatic flushing apparatus there shall be an appeal to the local sanitary authority, whose decision shall be final.

The companies propose the following as Regulation 39:—

† 39. Bath Apparatus.—In every bath hereafter fitted or fixed, the outlet shall be distinct from, and unconnected with, the inlet or inlets. The inlet or inlets must be placed so that the orifice or orifices shall be at least 3 inches above the [highest water level] warning pipe or top of the bath, and the outlet of every such bath shall be provided with a perfectly water-tight plug, valve, or cock.*

[The Joint Committee recommended and the Conference agreed that the regulation be struck out and the old regulation substituted.]

The companies propose the following as Regulation 40:—

† 40. Bath to be without Overflow Pipe.—No bath or fixed basin supplied with water by the company shall have any overflow waste-pipe, except it be so arranged as to act as a "warning-pipe."*

[The Committee and the Conference agreed that the regulation should be struck out.]

Regulation 41, as proposed, is as follows:—

† 41. Alteration of Fittings.—No alteration shall be made in any fittings in connexion with the supply of water by the company, without [two] three days' previous notice in writing to the company.*

[The Committee recommended that the following words should be inserted after the word "company" in line 3 of Regulation No. 41, viz.—"Except such repair or replacement or alteration as may be necessary to prevent leakage, waste, or damage by water."*]

The Conference agreed to this with the following addition:—"That 'two' be retained instead of 'three' in line 3 of the regulation."†

The next proposed regulation is:—

† 42. Existing Fittings.—All existing fittings, which shall be sound and efficient, and are not specifically required to be removed or altered under these regulations, shall be deemed to be prescribed fittings under the Metropolitan Water Act, 1871; but when any such fittings become defective and cannot be efficiently repaired, they shall be replaced with fittings as prescribed by these regulations.*

[The Committee recommended and the Conference agreed that the words "and are not specifically required to be removed or altered under these regulations," and all the words after "871" should be omitted, and that the definition of "fittings" given in Section 3 of the Metropolitan Water Act, 1871, should be added.]

On the following proposed regulations neither the Committee nor the Conference had any recommendations to make:—

† 43. Penalties.—Every person who shall wilfully violate, refuse, or neglect to comply with, or shall wilfully do or cause to be done any act, matter, or thing in contravention of these regulations, or any part thereof, shall, for every such offence, be liable to a penalty in a sum not exceeding 5l.

† 44. Authorised Officer may Act for Company.—Where under the foregoing regulations any act is required or authorised to be done by the company, or approval or consent given, the same may be done or given on behalf of the company by an authorised officer or servant of the company, and where under such regulations any notice is required to be given by the company, the same shall be sufficiently authenticated if it be signed by an authorised officer or servant of the company.*

* Words omitted from the old regulations are shown between brackets and the words added are in italics. † The whole of this regulation is new.

* Words omitted from the old regulations are shown between brackets and the words added are in italics. † The whole of this regulation is new. ‡ In the old regulation the word "all" was used instead of "every," and the consequential alterations made.

But the Conference passed the following general resolutions:—

* That a regulation be added that in case of frost the companies shall be required to erect stand-pipes in convenient places for all consumers.

That this Conference asks the London County Council to take all steps that may be necessary to obtain the amendments to the proposed regulations now determined by the Conference.

That this Conference supports the recommendation of the London County Council, that if these alterations are made the cost of making them should be borne by the companies."

The Conference then concluded.

Illustrations.

ST. PETER'S AND BERNINI'S COLONNADES.

HIS view of the great basilica and the converging colonnades of the approach, though familiar enough to most of our readers, may be of interest taken in connexion with Professor Aitchison's Royal Academy lecture reported in another column. We see here the work of three of the architects who were connected with St. Peter's. The dome is Michelangelo's, or at least from his design, though only carried up to the cornice of the drum in his lifetime; the façade is Carlo Maderno's; the flanking colonnades are Bernini's.

The view gives the opportunity of showing how much the exterior effect of the dome, as the dominant feature of the whole, suffers, even when seen from the further side of the square, by the lengthening out of the nave, though it may be admitted perhaps that the interior effect is added to by the vista. As the dome is perhaps the most beautiful of the large domes of the world, so the façade is one of the worst of any great cathedral in the world, being entirely destitute of coherence or power of design, and impressive solely from its immense scale.

COURTYARD AND CASTLE TOWER, MILAN.

THESE illustrations represent the courtyard of the Archbishop's Palace at Milan, and two views of one of the towers of the Castle, the latter a modern restoration carried out under Signor Moretti, the architect to the municipality. They are both referred to and described in the first article in the present issue.

DESIGN FOR AN ENTRANCE GATEWAY TO A PUBLIC PARK.

THIS design, by Mr. Ralph Knott, was submitted in competition for the Tite prize given by the Institute of Architects, and received the second prize of ten guineas. Without any disparagement to the design which received the first prize, which is also a good one and which we shall have the pleasure of publishing, we considered from the first (after a long and careful examination of the drawings) that this was the best design, and we therefore give it the first place in publication.

The object of the Tite prize should not be merely correctness in the application of Italian details, but the study of this type of architecture with a view to its further development, and this object seems to be attained in Mr. Knott's design, which, though entirely founded on Italian architecture, has nevertheless a certain degree of novelty, and agreeable novelty, especially in the treatment of the accessory ironwork. The centre block of the gateway, with its sculptural decorations, is also exceedingly harmonious and well balanced.

Mr. Knott writes, in explanation of his intention in the design—"The centre gateway is for Royal or otherwise important processions, the others, on either side, are to be 'In' and 'Out' respectively, the pedestrians' entrances being kept well away to avoid mud, splashes, &c. The curved plan has, I think, the advantage of allowing people full warning of approaching carriages. I have purposely omitted any lavatory accommodation or attendants' quarters, as I consider it would have been little the elevation; but there is ample room in the semicircular space in either pedestrians' entrance for a chair for the gate attendant in wet weather."

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—At the meeting of this Association on the 30th ult., Dr. W. de Gray Birch, F.S.A., in the chair, Mr. R. W. Forster gave a lecture upon the Roman Wall, illustrated by over fifty lantern slides, many of which were prepared specially for the purpose. After a short description of the situation and design of Hadrian's Wall, and a brief statement of the questions concerning the wall and the earthen vallum, the views were shown illustrating the chief portions which still remain. The series began with the most easterly fragment of the wall, near Heddon; and this was followed by three views near Downhill, in the neighbourhood of Corbridge, where the vallum makes a sudden bend and skirts the south side of the hill, while the wall keeps to the northern brow. At this point an ancient road has recently been discovered, cutting through the vallum; and it has been suggested that the road is Roman, and the vallum therefore of earlier date than the wall. Downhill, however, has been extensively worked for limestone at an early date, and it is hardly possible to assign a definite date to many old roads and tracks which lead to it. Even if the road in question be Roman, the lecturer considered that fact did not prove what is alleged; for the Roman occupation lasted for nearly three centuries, and probably the vallum was not kept in repair after the province south of the barrier had settled down. Several views were shown of the remains at Cilurnum (the Chesters), including the flagstone pavement recently exposed in the Forum, from which inscriptions may be possibly recovered, if the lower sides of the stones are examined: also the larger eastern gateway, with the wall coming up to its southern side, so that this gate, as well as the north and main west gates, opened on the northern side of the defences, possibly to enable cavalry to issue with greater speed from the fortress. Cilurnum was garrisoned by the second *ala* of Asturians. Views were shown of the large suburban building between Cilurnum and the North Tyne, which has been described as a bath or a temple, but was probably a villa. The largest chamber has a row of seven niches, which perhaps originally held statues representing the seven planets and the seven days of the week; in size and in appearance they resemble the niches of the reliefs discovered at Plumpton in 1813, which represent five of those deities (see "Lapidarium Septentrionale," p. 411, No. 805). Another view showed the alcove opening out of the long chamber, with the lower part of its window, below which many fragments of glass were found. At the back of the villa is a space bounded by three walls and open behind; it seems to have been roofed over, and in one corner is a hatch or small window, opening on the floor level of one of the rooms within, and below this hatch the hypocaust is brought outside the building, forming a kind of table. It was suggested that this space was the kitchen of the villa and that the hypocaust formed a kind of "hot plate" on which the dishes were placed before being passed through the hatch to the triclinium. A series of views of Borcovicum were next shown, beginning with the gate in the valley on the east of the fort, formerly supposed to be a means of access to the so-called amphitheatre on the north of the wall. This, however, has recently been proved to be merely an old quarry, and the purpose of the gate was evidently strategic. Views of the east, west, and north gates of the fortress were exhibited, as well as of the recently excavated prætorium and the fine water tank in the south-east corner. Views of the Housesteads Mile Castle, showing how the massive north gate was partially walled up during the latter part of the Roman occupation, and several views of the remains of the wall on the basal hills besides the Northumbrian lakes, were shown. Attention was directed to the manner in which, at the gaps in the line of hills, the wall is drawn back so as to command both flanks of an attacking party, and also to the sudden changes of thickness which occur at many points. Dr. Bruce's theory, that these show the places where the working parties joined up their sections, seems insufficient. As a rule the insets go in pairs forming a shallow recess in the south side of the wall, generally less than a foot deep, and from 20 to 200 ft. long; and in many cases the lowest course is

not set back at all. Just east of the Housesteads Mile Castle the breadth of the wall changes seven times in 130 ft. The series of views ended with that of the last fortress, of which the name can be identified. In view of the forthcoming Congress at Newcastle-on-Tyne the lecture was much appreciated.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—The first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, February 4, at the Royal United Service Institution, Whitehall. Mr. Henry O'Connor, the President for 1900, occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's Gold Medal to Mr. Henry C. H. Shenton for his paper on "Recent Practice in Sewage Disposal"; the Bessemer Premium to Mr. Richard F. Grantham for his paper on "The Closing of Breaches in Sea and River Embankments"; a Society's Premium to Mr. C. Rous-Marten for his paper on "English and French Compound Locomotives"; and a Society's Premium to Mr. Robert Henderson for his paper on "Paper-Making Machinery." Mr. O'Connor then introduced the President for the present year, Mr. Charles Mason, to the meeting, and retired from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year. Upon the motion of the President a resolution of sympathy and condolence with the King and Queen and the other members of the Royal Family upon the death of her Majesty Queen Victoria, and expressive of loyalty to the Throne, was unanimously passed. The President then proceeded to deliver his inaugural address, in the course of which, although not making a review of the engineering profession during the past 100 years the main subject of his address, he dwelt briefly upon the marvellous progress made, instancing works of the present day as compared with those designed for the same objects at the commencement of the century. The President then proceeded to review the progress of the Society, which was founded in 1854 with about 100 members, and which now numbered 500 members and associates. The financial position of the Society was also favourable, there being a substantial excess of income over expenditure, and an extremely satisfactory accumulated fund. The practice of a municipal engineer was then referred to, with special reference to work in large towns, and surprise was expressed that more headway had not been made with regard to the general adoption of a scheme of subways for drain-pipes, &c., in London, the few now existing being frequently too small for the purposes they were intended to serve. An ideal subway was described by which the entire width of the street should be occupied. The science of heating and ventilation was discussed with special reference to domestic heating, and to the small extent to which well known and efficient systems of heating had been adopted in private houses, old associations and cheap fuel being the prime causes for want of progress in the matter. The advantages and disadvantages of warming by steam hot water, and hot air were stated, the President pointing out that it was impossible to adopt the same principle for all buildings. Steam, he said, as a heating medium, was not adapted for warming private houses, churches, or institutions where skilled labour was not permanently employed. In such buildings low-pressure hot water formed a far better system, being more easily managed and not requiring such constant attention. The President concluded by briefly referring to ventilation as being closely allied to and dependent upon heating; the introduction of an ample supply of pure fresh air being the main consideration in arranging any system (whether natural or mechanical), without allowing such air to become overheated or to cause draughts on its admission into the apartment. Want of attention in the working of an apparatus after it had been installed was the chief cause of inefficient working. It was often the case that in a ventilating plant the air flues and inlets were seldom properly cleaned, and a thoroughly efficient heating apparatus might often be condemned through inattention to small details in management, such as regulating valves and cleaning flues, the engineer receiving the blame which should be bestowed on the caretaker.

THE BUILDER, FEBRUARY 9 1901.

INK PHOTO, SPRAGUE & CO., LTD., 4 & 5 EAST HARDING STREET, FETTER LANE, E.C.

THE COURTYARD OF THE ARCHBISHOP'S PALACE, MILAN; AND ONE OF THE TOWERS OF THE CASTLE.

AS RESTORED UNDER SIGNOR MORETTI, OFFICIAL ARCHITECT.

THE INSTITUTION OF JUNIOR ENGINEERS.—The first of the series of six lectures on "Works Management" was delivered at the Westminster Palace Hotel on Tuesday evening, February 5, by Mr. A. H. Barker. The appreciation of the arrangements made by the Institution for the delivery of these lectures was manifest from the very large number present. The Chairman, Mr. Percival Marshall, in opening the proceedings, referred to the opportunities which those attending would have in the discussion at the close of each lecture for obtaining special information bearing on their own particular work. The lecturer's introductory remarks dealt with the general state of organisation in this country, with special application to engineering firms. The causes of our present position in the market, questions of experience, and selling power of products were then treated. The best methods for dissection of orders and of providing continuous work for operatives engaged attention. An analysis of the number of employees in different shops and of machines used followed, with prices of equipment. Some valuable curves were exhibited showing the relative cost in each case of machine tools, fitters' tools, &c. The questions of buildings, driving power, electrical *versus* mechanical driving were considered; and the lecturer concluded with some figures relating to the determination of various particulars in connexion with the size of steam-engines and boilers. Mr. Barker supplemented the lecture by further information in reply to questions put to him at the close. The next lecture takes place on Wednesday, February 20.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of this Council was held on Tuesday in the County Hall, Spring Gardens, Alderman Dickinson, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend the Hackney Borough Council 9,750l. for street improvement and paving works; the St. Pancras Borough Council 850l. for electric lighting of public buildings; the Shore-ditch Borough Council 4,460l. for paving works; the Hampstead Borough Council 17,220l. for electric light installation; the Hammersmith Borough Council 2,220l. for underground convenience, and the School Board for London 200,000l. for schools, &c.

The Horniman Museum.—The Chairman read a letter which he had received from Mr. E. J. Horniman, who said he was empowered by his father, Mr. Frederick John Horniman, M.P., who is now travelling in the East, to offer as a free gift to the people of London some 15 acres of freehold land, together with the museum which had just been erected at the cost of about 40,000l. In it were placed the large art and natural history collections gathered by Mr. Horniman during the last twenty-five years. The property is situated close to Lordship-lane Station on the South-Eastern and Chatham Railway, and about three-quarters of a mile from Forest Hill Station on the London, Brighton, and South Coast Railway. It consists of a large house known as Surrey Mount and some 9½ acres of pleasure grounds on the summit and slope of a hill commanding extensive views over South-Eastern and South-Western London.

On the motion of Mr. Torrence, the Vice-Chairman, seconded by Mr. Fletcher, Deputy-Chairman, it was agreed that the offer be accepted, and that the thanks of the Council be communicated to Mr. Horniman.

Tramways.—The Highways Committee recommended, and it was agreed, that the Council do approve the estimate of 7,900l., submitted by the Finance Committee, in respect of the cost of construction of the new tramways in Crowndale-road, Agincourt-road, and Constantine-road, authorised by the London County Tramways Act, 1900; and that the Highways Committee be authorised to arrange for the carrying out of the work by the Council's tramway department and under the supervision of the tramways manager.

The Proposed New Water Regulations.—The Water and Public Health Committee brought up a joint report on the proposed amended regulations of the metropolitan water companies. The recommendations of the report were submitted on Monday to a conference of local representatives, and were endorsed with

a few emendations, as will be seen from our report of the conference on another page.

Mr. McKinnon Wood, Chairman of the Joint Committee, moved the reception of the report, and stated that the conference was unanimous in condemning these regulations, and especially that which required that every house, flat, and tenement should have a cistern. The Local Government Board were opening an inquiry into the regulations on Monday next, and it was highly important that the County Council should express its opinion upon them.

Mr. Beachcroft thought some of the proposed regulations might be useful.

Mr. Webb regarded them as an infamous attempt to put the householders of London to a great expense.

Mr. H. Clarke was in favour of opposing that attempt to the utmost.

Mr. Westcott regarded it as scandalous.

Mr. Benn said that the new regulations were part and parcel of the system of persecution which the London consumers had suffered at the hands of the water companies for many years.

Mr. Shaw-Lefevre doubted whether it was lawful to compel persons to again provide themselves with cisterns. The action of the water companies was a move in anticipation of purchase, for the direct purpose of increasing the value of their property.

Mr. Burns, M.P., rejoiced that the plucky crusade of the London County Council against the water companies for the past twelve years had been endorsed by a representative body of delegates from the City and the Local Authorities of London.

Mr. Harris said that some of the regulations were possibly of a useful character, but many of them were, to say the least of it, a rather large order. Moreover, in view of the present position of the London water question, this was a very inopportune moment to bring them forward. On those grounds, he was generally opposed to the regulations, and supported the request that the inquiry should be adjourned.

The Council proceeded to discuss the recommendations of the Joint Committee, *seriatim*. The most important related to the proposed regulation requiring the provision of cisterns, which the Joint Committee recommended should be opposed at the inquiry, with a view to its being struck out.

Mr. Beachcroft suggested that the Council should not oppose the regulation, except to prevent its being made retrospective. If an effort was to be made to introduce sanitary cisterns, the Council ought not to be the body to resist it.

Mr. Emden regarded the system of cisterns, especially in the smaller houses, as an absolute death-trap. No form of cistern had been invented which could be always kept from fouling.

Mr. McKinnon Wood hoped the Council would speak with no uncertain voice upon this matter, and would support the unanimous conclusion of the Conference of Borough Councils.

Mr. Jeffrey said the object of the companies in reviving that iniquitous system was to get out of their obligations with regard to high pressure.

Dr. Longstaff thought there was more public danger arising from a temporary deprivation of water by a breakdown of the supply than from the use of cisterns.

The Council divided, with the following result:—For the recommendation, 99; against, 4.

The remaining recommendations were agreed to, with the alterations made at the conference the previous day.

Theatres, &c.—The following recommendations in regard to theatres, &c., were agreed to:—

Private Pass Doorway, Great Queen-street Theatre (Mr. J. Murray).

Reconstruction of the Imperial Theatre, Westminster (Mr. F. T. Verity).

Temporary building at the London Exhibitions (Mr. A. O. Collard).

Heating Arrangements, Wandsworth Public Baths (Messrs. Spalding & Spalding).

Housing: Churchway scheme, St. Pancras.—The housing of the Working Classes Committee reported that under the Churchway, St. Pancras, scheme, now being carried out by the Council under Part I. of the Housing of the Working Classes Act, 1890, the Council is required to provide accommodation on the cleared area for 580 persons, out of a total number of 1,095

persons thus displaced. Provision will, however, be made for 832 persons in dwellings to be erected on both sides of Churchway. Two houses in the block of dwellings which is being erected on the west side of Churchway will shortly be completed, and ready for occupation. The dwellings will be known as Wellesley Buildings, and will provide accommodation for 300 persons in 60 two-room tenements and 20 three-room tenements.

Subways.—Mr. Parker moved: "That it be referred to the General Purposes Committee to consider the best manner of bringing before the Borough Councils the imperative necessity of making subways under, at least, all the leading thoroughfares of the metropolis to contain all the gas and water pipes and telephone and telegraph wires; and, if necessary, to summon a conference to formulate some comprehensive scheme for remedying the scandalous and ever-increasing inconvenience to pedestrian, omnibus, and mercantile traffic caused by the constant tearing up of the footways and roadways for the purpose of inserting or removing the pipes, wires, &c., above referred to.

Mr. Baker seconded the motion, and it was agreed to.

The Council soon after adjourned.

PANAMA CANAL WORKS.

At an ordinary meeting of the Institution of Civil Engineers on the 5th inst., the President, Mr. James Mansergh, before beginning the ordinary business, proceeded to make known the terms of an address which it was proposed should be transmitted to his Majesty the King on behalf of the whole body of members of the Institution, expressing their profound sympathy on the death of the late revered Queen, and their loyal congratulations on his Majesty's accession to the throne. The address was adopted, *unanimously*, and the whole audience standing.

The paper read was on "The Present Condition and Prospects of the Panama Canal Works," by Mr. J. T. Ford, M.Inst.C.E. The paper began with a few remarks as to the general importance of the subject, and expressed the hope that the facts put forward might tend to modify the somewhat unjust estimate that had been formed of the character of the distinguished originator of the Panama Canal works, owing to the unfortunate cessation of work at the Isthmus. A short historical sketch of the work was then given, from its inception at the International Congress in Paris in 1879 down to the liquidation of the old company and the formation of the New Panama Canal Company under the auspices of the officers appointed by the French courts. The labours of the new company were discussed and classified under three important heads. First, the maintenance and recovery of all the plant, material, and buildings on the Isthmus that could be considered valuable on a resumption of the work at a future date. Second, the formation of a Technical Commission of Engineers, to make surveys in detail, borings, and meteorological observations; to determine the feasibility of otherwise of the Canal under any plan of construction; and to submit to the company such plans as they would recommend for completion of the work, with full estimates, &c. Third, the prosecution of such excavation work on the Canal itself, principally on the great cuts of Culebra and Emperor, as would be not only substantial progress on the work itself under any plans that might finally be adopted, but might also serve to prove the perfect possibility of those great cuts which had been questioned, with the result that doubt had arisen as to the feasibility of the whole work. Further, to carry out the deepening of the channel in the Bay of Panama, and the construction of a large steel pier at that end of the Canal, so that vessels in the Pacific could come alongside, and in connexion with the Panama railway (principally owned by the Canal Company) an improved and more economical method of handling the traffic across the Isthmus could be established, to the benefit of the Canal enterprise itself during the continuance of the work of construction.

The subject of the present position of the Canal works and their future prospects was then dealt with under the following five headings, the conclusions therefrom being in the author's opinion generally favourable to the continuance of the work:—(1) The present

condition of the works, after their practical abandonment and neglect for upwards of eight years, in its bearing on the question of the stability or permanency of such work in that particular region, in the event of the Canal being completed; also, the present condition of encampments, and provision for the large number of labourers to be employed on different sections. (2) The fitness for service in the continuation of the work of the existing plant, machinery, and materials generally, judging from their condition to-day as to state of preservation, more or less obsolescence of pattern, &c., and the extent to which new material would be required. (3) The extent to which the investigations and published reports of the New Panama Canal Company inspired confidence in the solution of the physical and technical problems admittedly left doubtful by the old company, and the nature of the essential points that caused adverse criticism and differences of opinion among eminent engineering authorities as to the possibility or otherwise of constructing the Panama Canal at all. (4) A general description of the essential features of the plans finally adopted by the International Commission of Engineers, invited by the new company to decide upon various projects after making their own independent and detailed investigations, with dimensions of the several sections of the work, &c. (5) The author's estimate of the proportion of the total work already completed, the time required for completion, and the reasons for such conclusions.

It was stated that the works were in far better condition than was generally supposed, even the maritime or sea-level sections—those most exposed to tidal and flood damages—having suffered but little. Further, that while a considerable amount of new plant would be required, there remained much that was still serviceable, as had been shown by the work accomplished by the New Canal Company. With regard to the inherent difficulties to be encountered in the construction of any canal at Panama, whether at sea-level or with locks, the author expressed the opinion that a sea-level canal, although it would be extremely costly, would be in every sense feasible, and would certainly be the ideal solution of the problem. The three main difficulties of a canal at Panama were:—The question of water-supply for lockage purposes during the dry seasons; the control of the Chagres River during its flood seasons; and the nature of the material encountered at the great cuts of Culebra and Emperor.

These three important questions having been thoroughly and exhaustively examined with actual experimental work under practical conditions, a favourable solution to all of them had been given by three alternative plans submitted to the company, all equally feasible, for a lock-canal with the summit-level at 126 ft., 98 ft., and 62 ft. respectively above sea-level; one of these, the medium plan, with summit elevation at 98 ft., was recommended. The author strongly urged the superior advantages of the lower plan with summit-level at 62 ft. above sea-level in opposition to the plan recommended by the Commission. A full description was given of the route and engineering features of the plan adopted, the general lines of which were identical for all three projects, except in the important feature to which the author objected, viz., the auxiliary supply canal from the storage reservoir above the Alhajuela dam to the summit-level of the Canal. This feature would be eliminated with great advantage by the adoption of the 62-ft. level.

The author was of opinion that, assuming the Canal to be completed according to the plan proposed by the Commission (and taking into account the general work done, not only in excavation proper, but in the establishment of existing conditions on the Isthmus, opening up and improving sanitary conditions, settlement of a permanent population as a nucleus for the labour supply, &c., &c.), the effective work already accomplished on the Canal fairly represented a sum of money equal to the amount still to be expended, according to the estimate of the Technical Commission, for completion, and that the Canal could be completed in eight or ten years; hence one-half of the Panama Canal might be considered as already completed, in spite of the admitted extravagance and errors of the old company. The author's reasons for this conclusion were given at some length.

The paper concluded with some general remarks as to the existing sanitary conditions

of the Isthmus of Panama, showing great improvement in recent years, as a result of the Canal works; and without entering into any comparisons with other proposed routes for a canal across the Central American Isthmus, the author was of opinion that at no place other than Panama could a canal of equal capacity and general advantages as to stability, low cost of maintenance, facility of transit, and safety and sufficiency of harbour accommodation at both ends be completed for the same cost or within the same period of time. In an appendix to the paper a summary of quantities and items of expense included in the 20,816,000l. needed to complete the work was given, extracted from the published reports of the Technical Commission.

NATIONAL SOCIETY FOR CHECKING THE ABUSES OF PUBLIC ADVERTISING.

THE above-named society, known among its adherents briefly as "S. C. A. P. A.," has issued to its members (who now number about a thousand) the following circular, which may be very well worthy of attention beyond the limits of the Society:—

"1. Camp View, Wimbledon Common. The approach of an election for the County Council offers to our London members an opportunity of doing substantial service.

As a result of efforts made by those interested in diminishing the grosser forms of advertising disfigurement, the Council have—

1. Absolutely prohibited sign-s.
2. Refused to allow advertising in the tramcars on lines under their control.
3. Passed by-laws enabling the Council to forbid flash-lights and illuminated advertisements where they are dangerous to traffic.

You will see that the Council (except in the management of their own property) confines its assumption of power to cases where it is possible to suggest that there is danger to 'life or limb.' We believe that there has been a very strong feeling in the Council in favour of checking, on purely "aesthetic" grounds, the present tendency to destroy the architectural propriety and dignity of London. But to enable them to make suitable regulations, special legislation would probably be necessary, and owing to the claims of other far more contentious topics, our views, though theoretically commended, have been in practice neglected. This will not be the case in the Council which has to be elected in March next, if in the meanwhile our members and friends do their duty as electors or as residents. We believe that when the Council has distinct evidence of the strength of the feeling existing on the subject, they will be glad to take action for obtaining statutory powers.

Edinburgh set the example in 1899, when, in spite of the interested opposition of some trade associations, Parliament gave it adequate rights of control. Dover, Chesterfield, and (in a less degree) many other municipalities are applying this year for similar authority. London, we are convinced, has only to ask to obtain. But the first stage is to impress upon all candidates that the question is regarded as serious and urgent.

It is suggested by one of our many friends in the Council that at meetings held to promote the interests of candidates the following or some similar question should be handed in writing to the chairman, and that a definite answer should be obtained from the candidate or candidates:—

'Are you in favour of measures to check advertising disfigurement in the metropolis?'

We do not ask you to make your vote or your support dependent upon the view the candidate may take, but we may safely say that evidence of genuine interest in our aims ought to count as a virtue.

We are only too well aware that many quiet-loving citizens find it distasteful, and that others are too busy to attend to municipal affairs. But we would urge that it is only by using personal influence to secure the best order of representatives that the better standard can be made to prevail. The labours which have for many years been devoted to the development of a sound opinion on the disfigurement question can be rendered effective only by the co-operation of members within their several spheres of individual action.

ALFRED WATERHOUSE, R.A., President,
RICHARDSON EVANS, Hon. Secretary."

BAPTIST CHAPEL, HORFIELD, GLOUCESTERSHIRE.—A Baptist chapel, in Brynland-avenue and Gloucester-road, Horfield, was opened on the 16th ult. Messrs. Drake & Pizey were the architects, their plans having been selected in competition. A clock which has been presented to the chapel was designed by Mr. Drake. The case was made by Mr. Ridd, and the works by Messrs. W. W. Kemp & Co., of Stokes Croft.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

AT the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage.

Hackney, North.—Eight houses, with bay windows on the east side of Upper Clapton-road, Hackney, between No. 174 and Moresby-road (Mr. G. H. Paine for Mr. C. C. Paine).—Consent.

Brixton.—A children's hospital on the east side of Clapham-road, Kennington, at the corner of Primaroad (Mr. H. P. Adams for the Committee of the Belgrave Hospital for Children).—Consent.

Greenwich.—A dwelling house on the south side of Manor-way, Lee-road, Lee (Mr. L. V. Hunt for Messrs. L. Whitehead & Co., Limited).—Consent.

Peckham.—Four houses with bay windows on the south side of Reynold's-road, Peckham-rye, Camberwell (Mr. A. Wood).—Refused.

Finsbury, East.—An entrance porch to Cocker's Hotel, Charterhouse-square, Finsbury (Mr. E. Haslehurst for Messrs. Wheeler & Warren).—Refused.

Finsbury, East.—An iron and glass pent roof in front of the City and South London Railway Company's station on the south side of City-road at its Junction with Moreland-street (Mr. T. P. Figgis for the City and South London Railway Company).—Refused.

Hampstead.—A one-storey office building on the south-west side of Belzise Park-gardens, Hampstead (Mr. A. F. Faulkner for Mr. W. Willett).—Refused.

Islington, North.—A one-storey coal-office building on the south-east side of Lennox-road, Islington, at the corner of Stroud Green-road (Messrs. Stevens Brothers for Messrs. Meyers, Gilson, & Rose).—Refused.

Islington, North.—One-storey shop additions to the flank of No. 122, Dartmouth Park-hill, Islington, to abut upon Langdon-road (Mr. C. Tupman for Mr. F. Bryen).—Refused.

Poplar.—Latrines and a caretaker's cottage at the northern end of Portree-street, Abbott-road, Poplar (Mr. S. L. Walters for Messrs. W. W. Howard Brothers & Co.).—Refused.

Projections.

Greenwich.—An iron and glass shelter over the entrance to Morton's Theatre, London-street, Greenwich (Mr. A. Roberts for Mr. A. Carlton).—Consent.

Islington, North.—The retention of bay-windows in front of Nos. 2 to 20 (even numbers only) Heathville-road, Islington (Mr. R. Midworth for Messrs. Wootton & Green).—Refused.

Marylebone, East.—That Mr. A. J. Hopkins be informed that the Council is not prepared to accede to his request on behalf of the Columbia Photographic Company for permission to retain three illuminated signs at the second, third, and fourth floor levels respectively in front of No. 122, Oxford-street, St. Marylebone.—Agreed.

Marylebone, East.—An iron and glass shelter at the restaurant entrance on the west side of the Hotel Great Central, Marylebone-road, to overhang the public way in Harewood-avenue (Colonel R. W. Edis for the Frederick Hotels, Limited).—Refused.

Wandsworth.—The retention of a bay window in front of a house known as Arran, Rutford-road, Streatham (Mr. J. W. Coates).—Refused.

Woolwich.—Bay windows to eleven houses on the north side and seven houses on the south side of Gatling-road, Plumstead (Messrs. Church, Quick, & Whincoop for Mr. T. Brandon).—Refused.

Width of Way.

Walworth.—An office building and a boundary fence on the east side of Hemp-row, Darwin-street, Walworth, at less than the prescribed distance from the centre of Hemp-row (Mr. L. H. de Pothorier for Messrs. T. T. Burton & Co.).—Consent.

Lincoln.—Two one-storey buildings on the south side of Cinnamon-street, Wapping, at the corner of King Edward-street, at less than the prescribed distance from the centres of those streets (Messrs. Barnes-Williams, Ford, and Griffin for Messrs. A. Jacob & Co.).—Consent.

Bethnal Green, North-east.—Twelve houses on the south side of Prospect-terrace, Usk-street, Bethnal-green, at less than the prescribed distance from the centre of Prospect-terrace (Mr. A. P. Stokes for Mr. C. Lacey).—Refused.

Fulham.—That Mr. W. D. Thompson be informed that the Council is not prepared to accede to his request on behalf of Mr. W. Maynard for permission to retain a one-storey stable and cart shelter at the rear of No. 101A, Fulham Palace-road, Fulham, at less than the prescribed distance from the centre of Lurgan-avenue.—Agreed.

Holborn.—Warehouses on the north side of Castle-street, Holborn, at less than the prescribed distance from the centres of Castle-street, Onslow-street,

and Great Saffron Hill (Mr. E. J. May for Messrs. Falk, Stadelmann & Co., Limited).—Refused.
Kennington.—A three-story building at Cumberland Works, Wigton-place, Milverton-street, Kennington, at less than the prescribed distance from the centre of Wigton-place (Mr. A. Parnacott for Messrs. Judge & Co.).—Refused.

Wandsworth.—Buildings and a boundary fence at Gothic Wharf, Brewhouse-lane, Putney, at less than the prescribed distance from the centre of Brewhouse-lane (Mr. S. J. May for Messrs. Carlo Gatti & Stevenson, Limited).—Refused.

Width of Way and Construction.

Holborn.—That the application of Mr. T. J. Anderson for an extension of the period within which the erection of oriel windows at the first, second, and third floor levels of an addition at the rear of No. 28, John-street, Bedford-row, Holborn, to abut upon Little James-street, was required to be commenced, be granted.—Agreed.

Line of Frontage and Construction.

Dulwich.—An iron and glass shelter to adjoin a bakery at the rear of No. 10, Alseyn-terrace, Park-road, Dulwich, at the corner of South Crooked-road (Mr. F. R. Bodley for Mr. L. French).—Refused.

Width of Way and Construction.

Holborn.—A play-shed at the school in Rosebery-avenue, Holborn, at less than the prescribed distance from the centre of Poole's-buildings (Mr. T. J. Bailey for the School Board for London).—Consent.

Woolwich.—An open cart-shed on the north side of Brewery-road, Plumstead, at less than the prescribed distance from the centre of the street (Messrs. Inskip & Mackenzie for Mr. C. Beasley).—Consent.

St. George, Hanover-square.—Retention of a wooden ticket-office in the yard of Victoria railway station, at less than the prescribed distance from the centre of a roadway (Mr. R. T. Kingham for the London General Omnibus Company, Limited).—Refused.

Formation of Streets.

Brixton.—That an order be issued to Messrs. Shoebridge and Rising sanctioning the formation or laying-out of two new streets for carriage traffic to lead out of Coldharbour-lane and Vaughan-road, Brixton, respectively (Mr. J. Pearman). That the names Vaughan-road (in continuation) and North lands-street be approved for the new streets.—Agreed.

Fulham.—That an order be issued to Messrs. Cluttons sanctioning the formation or laying out of new streets for carriage traffic on the London Bishopric Estate, Fulham Palace-road, Fulham, and in connexion therewith the widening and adaptation of a street for carriage traffic of Crabtree-alley (for the Ecclesiastical Commissioners). That the names Woodlawn-road (in continuation), Ellerby-street, Finlay-street, Greswell-street, Harbord-street, Inglethorpe-street, Kenyon-street, Langthorne-street, and Stevenage-road be approved for the new streets.—Agreed.

Height of Building.

Whitechapel.—A warehouse building on the north-east side of Middlesex-street, Whitechapel, at the corner of Cobb-street, to exceed in height the width of Cobb-street (Messrs. D. Cubitt Nichols, Sons & Chuter for Mr. R. Biggs).—Consent.

Working-Class Dwellings.

Bow and Bromley.—A further variation from the plans sanctioned on February 27, 1901, as modified by the plans sanctioned on January 29, 1901, for the erection of a laundry and a block of three intended dwelling-houses, to be inhabited by persons of the working-class, and proposed to be erected, not abutting upon a street, on a plot of land on the east side of Wellington-road, Bow-road, Bow, so far as relates to the erection at the premises of a building, to be used as baths (Mr. C. A. Brereton for the Whitechapel and Bow Railway Company).—Consent.

The recommendations marked † are contrary to the views of the Local Authorities.

BOOKS RECEIVED.

LAXTON'S PRICE BOOK FOR ARCHITECTS, BUILDERS, ENGINEERS, AND CONTRACTORS, 1901. (Simpkin, Marshall, & Co.)
 SILICO-CALCAREOUS SANDSTONES. By Ernst Stöfler. (E. & F. N. Spon.)
 A PRACTICAL TREATISE UPON STEAM HEATING. By Frederick Dye. (E. & F. N. Spon.)

STEPNEY PARISH CHURCH.—We read that the cost of the renovation of the parish church of St. Dunstan amounts to 5,426l. 17s. 3d., and that the whole of the money has been subscribed. The repairs, which include re-flooring, re-seating, and the removal of the galleries, were executed under the directions and superintendence of Messrs. J. E. K. & J. P. Cutts.

Correspondence.

To the Editor of THE BUILDER.

"BUILDING CONTRACTS FROM A BUILDER'S POINT OF VIEW."

SIR,—When reading Mr. Frank Cowlin's paper, as read before the Bristol Society of Architects on the 14th ult., and reproduced in your issue of 26th ult., I was much disappointed at the shortness and tone of his remarks in reference to clerks of the works.

I can truly say the clerks of works in Bristol and district are the representatives of the architects, and that they furnish all the information required for the due performance of the contracts, as far as my experience goes; and I am pleased to say I have carried out works as the contractor's representative in that part of the country as well as in other provincial towns and in London.

As Mr. Cowlin thinks the clerk of works deserves a paper to himself, I only hope he will give one, and I shall then have an opportunity of criticising it, which will doubtless lead to many improved methods of working by the builders and their agents or foremen.

It seems to me that much friction between the clerk of works and foreman would be prevented if only the builder was more in touch with his foreman. He would find that, instead of a discussion between the clerk of works and the foreman so often taking place, and also ending in personalities, that the materials in question need not have required all this wasted talk had he made a proper agreement with his merchant as to the quality of materials to be delivered, and to be to the architect's satisfaction. Why should the builder not bind his merchant to supply what he himself has already contracted to supply?

Then as to the quality of the work. I find that in nine cases out of ten when having complained to the foreman, and he has objected to my complaint, that his objection was entirely removed when I have suggested that if we (the clerk of works and the foreman) could not agree, then the matter in dispute should be referred to our respective employers—the architect and the builder—to settle. No clerk of works could object to any dispute being thus settled, and the builder and his foreman have an undoubted right to this course; and if it was more often adopted, I feel confident that a deal of unpleasant duty which now devolves on the clerk of works would be better understood by the architect. Also an unqualified clerk of works would be most easily put right.

I have most generally found the cause of slow progress with buildings to be due to the materials being brought late on the works. It often happens that builders altogether underestimate the time required by manufacturers to get special materials ready. Labour is most often a secondary consideration, and if a builder is anxious and able to carry out a contract quickly, it is absolutely necessary that he should get his materials on the site in good time, before they are required, as his foreman cannot very well be expected to tell his master, or the office, that they are keeping the job behind because the materials are being slowly delivered.

Then as to the clerk of works being responsible for the setting out of the building with the foreman, it should be remembered that a competent foreman, with assistance if required, will not allow the clerk of works the chance of finding the setting out incorrect when he checks it, as the clerk of works has his duties to perform, and cannot see the materials being delivered or built into position on one part if setting out on another.

I firmly believe the architect and builder will be brought more in sympathy with each other if they use the necessary tact when dealing with their respective representatives, the clerk of works and the foreman; and that if better prices are needed, builders should tender them, and above all see that, if first-class men are to be obtained as clerk of works and foreman, the salaries as at present paid by many must be much increased.

A CLERK OF WORKS.

THE LOCAL GOVERNMENT ANNUAL.—The issue for 1901 of this useful annual has been sent to us. It is the tenth issue of the work, which is published at No. 2, Dorset-street, Fleet-street, E.C. The directory portion gives the names and addresses of the chief officials of all Corporations, London Borough Councils, County Councils, Boards of Guardians, Urban and Rural District Councils, County and Borough Asylums, &c., throughout the kingdom, as well as the public libraries, public parks, and City companies of London. There is also much useful information relating to the public libraries, baths and washhouses, and electric light undertakings in the boroughs of London, and an abstract of the Local Government legislation of 1900. The charges for water and gas in London are shown, the population of the various provincial Unions is given, and a complete list of all the parks and open spaces for the metropolis, with the Local Authorities controlling them.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

6.—SINKS (continued).

THE name "combined sinks" is often applied to sinks containing more than one compartment, or containing a draining slab in addition to the sink. A double sink is undoubtedly a great advantage, as one compartment can be used for the preliminary washing of the crockery, &c., and the other for the cleaner process of rinsing, and two persons can work at the same time. Such a sink is illustrated in fig. 1, the front of each compartment being fitted with Twyford's inserted wood rim, which prevents damage being done to the enamel by heavy articles, and also reduces the risk of breaking or chipping the crockery which is being washed. One compartment has "snugs" formed for the reception of a draining-board, so that the sink can be used either as a double sink or as a single sink with draining-board. It is made in two sizes, 36 in. by 21 in. by 9½ in., and 48 in. by 21 in. by 9½ in., with raised back as shown, or with a separate back 18 in. high. Combined sinks of very large size are now made, either in one piece, or in two or more pieces joined together.

The "Beresford" combined butler's sink (fig. 2) has two compartments, one of which has widely-rounded corners forming seats for the reception of a wood drainer. This compartment has a 2-in. rubber plug with brass washer and union. The other compartment has a "Neros" standing waste and overflow, and a shelf for brushes, &c., is formed along the back. A separate compartment is formed in one corner to receive a perforated copper vessel for holding garbage; this compartment is fitted with a brass grate, so that the water draining from the garbage can escape. The sink measures 5 ft. by 2 ft. by 1 ft. and is made with a raised back as shown, or with a loose back 18 in. high.

A more ordinary form of combined sink is illustrated in fig. 3. This consists of an enamelled fireclay sink (about 22 in. by 18 in. by 13½ in.) with rubber slate or marble front and skirting, slate or marble drainer dish to the sink, and teak grating. The sink is fitted with 1½ in. vulcanite plug with brass washer and chain. The number of joints and the square angles formed by the slabs of slate or marble are objectionable features of this kind of sink.

Combined lavatories and sinks are now made in one piece of enamelled fireclay, and are often a convenience in butlers' pantries and other places, but they do not call for detailed notice.

A common complaint with regard to pottery sinks is that they are so hard and slippery that it is practically impossible to avoid breaking or chipping delicate crockery and glass which are being washed up in them. The pottery draining slabs of combined sinks, even when fluted, are a frequent cause of such damage. For this reason the draining slab is now generally covered with a wood grid or fluted drainer, and to prevent damage being done to crockery in the sink itself, the bottom of the sink is fitted with a loose wood grid (fig. 4). These grids are not expensive, and reduce the risk of breakages very considerably; they, of course, become foul sooner or later, and must then be replaced with new ones. The sink with hinged draining-board (fig. 5) is one of Shank's new designs; the sink has a standing waste and overflow, and is supported on galvanised iron legs, and the draining-board is made of separate pieces of wood bolted together.

Undoubtedly the hard and slippery surface of pottery sinks has had much to do with the retention of the wooden sink, either naked or lined with lead or copper. An unlined wooden sink (fig. 6) is specially adapted for washing very fragile articles, such as delicate porcelain ornaments and glassware, which are not seriously fouled, but it cannot be recommended for general work. The best woods for the purpose are birch, sycamore, and teak, but soft woods are sometimes used. The wood should be about 2 in. thick, and framed together with tongue and groove joints made water-tight with red and white lead. The whole should be secured with galvanised iron bolts with nuts and washers. A rounded capping may be fixed on the edges of the sink, and a skirting along the

Illustrations to Student's Column.

back and ends, as shown in part of the illustration. Triangular fillers are sometimes fixed in the angles with brass screws, in order to do away with the sharp corners. They should be thoroughly bedded in red and white lead. The sink may be about 2 ft. 6 in. by 1 ft. 6 in., and from 8 in. to 12 in. or 13 in. deep inside.

Of the two materials generally used for lining wooden sinks, lead is usually preferred on account of its greater softness. The objections to the material are that the bottom piece is apt to form into ridges in consequence of the expansion due to hot water, or to crack in consequence of the subsequent contraction. These defects can be in a great measure obviated by making the bottom piece very stout; the sides may be of 6 or 8 lbs. sheet lead, but the bottom ought to be of 10 or 12 lbs. lead. A further precaution is to make the sides slope outwards and to fix a feather-edged fillet in the angle, as this gives the lead more freedom for expansion. Sometimes the bottom, sides, and ends are in one piece, so that only the vertical angles need to be soldered, but this method cannot be recommended. More frequently the bottom and two sides are in one piece, and a separate piece is used for each end. When the bottom is of stouter material than the other parts of the lining, the front and one end will be in one piece, and the back and the other end in another piece. The front edge of the sink should be protected by a hard wood weathered capping to prevent the lead being damaged by pails, and the wood bottom should be dished out around the waste-hole, as shown in fig. 7. The vertical angles must be well rounded off with solder, and an overflow grate and pipe must be provided.

Copper is not so much used as lead for lining sinks, although it is more durable. The bottom may weigh 4 lbs. per sq. ft., and the sides about 2½ lbs. The lining is made independently with welded seams, and is then tinned to protect the surface of the copper and at the same time make the seams watertight. It is afterwards fitted into the wooden case. Copper sinks are sometimes hammered out of one piece, but

these are of round or oval form, like the bowl of a lavatory; they ought always to be tinned.

3. *Nursesmaids' Sinks.*—These are best made of white porcelain-enamelled fireclay, fitted with waste and overflow, and need not differ in design from some of the butlers' sinks already illustrated.

4. *Vegetable Sinks.*—These sinks are often made of galvanised-iron, or of cast-iron finished in one of the ways mentioned in the last article. They should be about 15 in. or 18 in. deep, so that the dirt can sink below the floating vegetables. The waste may with advantage be placed in a small compartment separated from the body of the sink by a perforated metal strainer, so that grit and garbage will not be carried into the trap. Where soft moorland water is used, the coating of zinc on galvanised iron is soon destroyed, and some other material should be used, such as slate or enamelled fire-clay. The deep fire-clay "wash-tubs" are very suitable for the purpose. Two compartments are of service, the one for the preliminary washing and the other for rinsing.

5. *Sinks for Washing Pans, &c.*—Sinks for this purpose are best made of galvanised wrought-iron, or of cast-iron finished black or galvanised. The depth will vary according to the maximum size of the pans in use, and as sand is generally used for scouring the pans, the waste-outlet ought either to be in the side of the sink a little above the bottom, or in a small compartment separated from the body of the sink by a finely perforated metal strainer.

6. *Special Sinks.*—As an example of a special sink, the laboratory sink illustrated in fig. 8 may be given. It has a porcelain standing waste and overflow, so that no metal whatever is exposed to the action of the acids which may be used in the sink. Porcelain traps and waste-pipes are made for use with these and other sinks. Other special sinks are made for the operating rooms of hospitals and for other purposes, but these need not be specially described. Slate sinks are sometimes used for

pickling meat, but enamelled fireclay is a better material.

Sink Supports.—Sinks ought not, as a rule, to be enclosed, but the space beneath left open for inspection. Glazed-brick piers or enamelled fireclay pedestals are often used as supports for fireclay sinks, but these form a number of angles with the floor which are difficult to keep clean. It is better to support the sinks on iron or glazed-ware legs or on iron brackets fixed to the wall, so that the floor is not obstructed. Legs and brackets of the kinds mentioned are now supplied by all the leading makers of sanitary fittings. Wood sinks can, of course, be supported on iron or wood brackets or legs.

Wash-tubs.—Wash-tubs are now made in enamelled fireclay, ranging in size from about 24 in. by 20 in. by 15 in. upwards. The fronts generally slope outwards, and should have a roll edge. The backs are often raised. Steeping troughs for laundries can also be obtained in enamelled fireclay up to 7 ft. by 3 ft. 6 in. by 3 ft.

OBITUARY.

MR. J. M. ROBERTSON.—Mr. John Murray Robertson, architect, of Dundee, died on the 31st. ult. at Crossmount House, Perth. Born in Strathord, Mr. Robertson was the son of Mr. James Robertson. His early days were spent at Blair Atholl and Dunkeld, and at the latter place he first went to school. On the death of his father deceased removed with the family to Perth, and was educated at the Free West Church School under the late Mr. James Moir, and latterly at the Perth Academy. In his sixteenth year he entered the office of Mr. Andrew Heiton, the Perth architect, with whom he remained for about fifteen years. Acting in the capacity of assistant architect and Inspector of Works, he first became connected with Dundee district while superintending the erection of Castle Roy, Broughty Ferry, the residence of Mr. A. E. Gilroy, of which Mr. Heiton was the architect-in-chief. Under Mr. Heiton he likewise had to do with the plans of Kinbrae, Newport, the residence of Sir John Leng, M.P., and of Westwood, West Newport. After these and other houses which Mr. Heiton had in hand were well forward to completion, Mr. Robertson resolved to commence business in Dundee on his own account. He quickly succeeded in establishing a large private connexion. While his work was chiefly of the domestic order, he was an architect of wide scope. Some of his principal public and other buildings include the Royal Exchange Shelter, the Caledonian Insurance Company's Buildings, the Caird Maternity Hospital, Fyvie's Buildings in the Nethergate, Lochce Public Baths and Library, the Technical Institute, additions to the University College, the Royal Victoria Hospital, &c., while among numerous private houses of which he was the architect may be mentioned Seathwood, Glamis House; The Cottage, Lochce; and The Buchties, Broughty Ferry. Last year there was completed a large addition to Glenstal Castle, County Limerick, of which he was the designer, and there is at present building a large house for a gentleman in Dunblane, the plans of which he prepared. He was likewise architect of the Consump-

five Home at present in course of erection at Barnhill Perth. Nor was deceased's work confined to villas and large public buildings. Late in the eighties he submitted designs for model houses for working men in a competition in connection with the Dundee Industrial Exhibition and took the first premium. Mr. Robertson was a Fellow of the Royal Institute of British Architects. To his intimate friends he was known as one of the bappest and most genial of men. Happy always while engaged in the pursuit of his calling, even his holidays were employed in study, and for this purpose he travelled considerably on the Continent, and was familiar with the principal architectural features of many of the notable European cities. His death at the comparatively early age of about fifty-six years will be greatly regretted, not only by all his professional brethren in the city, but by many others to whom he was known, and there will be general sympathy with the widow, son, and daughter by whom he is survived.—*Dundee Advertiser.*

GENERAL BUILDING NEWS.

REOPENING OF CONGREGATIONAL CHAPEL, KELVEDON, ESSEX.—This chapel was reopened on the 23rd ult., after renovation, &c. The old-fashioned, straight-backed pews have been replaced by sloping-backed seats, a pulpit has been erected opposite the gallery, and the organ has been placed behind it. The ceiling has been paneled, and a new front has been made for the gallery. The new woodwork is of pine. The Sunday school at the rear of the chapel has also been renovated. The works were carried out by Messrs. J. Smith & Son, of Witham, under designs by Mr. Charles Pertwee, of Chelmsford. The organ was removed and repaired by Mr. A. Hurst, of Long Melford; and Mr. J. Polley, of Kelvedon, carried out the lighting arrangements.

CHURCH, CASTLEBAR, CO. MAYO.—The new church at Castlebar is nearing completion. The high altar, and the stained-glass window above, have been placed in position. Mr. Walter G. Doolin is the architect.

INFANTS' SCHOOL, NETTLEHAM, NEAR LINCOLN.—An infants' school has just been opened at Nettleham. It will accommodate ninety scholars. Mr. H. H. Dunn, of Lincoln, was the architect; and Messrs. Bailey & Kirk, of Nettleham, were the builders.

BOAR'S SCHOOL AT WELLINGBOROUGH.—The new Board school in the Westfield-road, Wellingborough, was opened recently. The school now opened is to take the place of the present boys' school in Rock-street. It has been built from the designs of Mr. J. E. Cutlan, architect, Wellingborough, and has been erected by Messrs. Hacksley Bros., of the same town. The schools are arranged on the central hall system, and are built of red brick with Broseley tile roofs, Sibley facings being used for the south and west fronts, relieved with brick moldings and Bath stone. Access to the main entrance is from the Westfield-road, and this entrance opens into a vestibule, shut off from the passage leading to the central hall by a glazed screen. Leading from this vestibule is a flight of stairs to the first floor, which contains, besides a landing, a head-master's room, assistant teachers' room, lavatory, and two storerooms, and from this same landing access is also gained to a small balcony overlooking the whole of the central hall and some of the classrooms. Descending to the vestibule and passing through the swing doors in the screen, the scholars will pass to the entrance to the central hall, leaving the cloakroom, &c., to the left. The hall is 30 ft. long, 31 ft. wide, and 27 ft. high. The room is only half its intended length, and indeed the whole building as it stands is only half of what it will ultimately be, it being so arranged that the remaining half will be a duplicate of the present structure. The classrooms on either side of the hall are four in number—two to accommodate sixty children each, and two to accommodate forty children each—and from the south-west end of the central hall entrance is gained to two classrooms accommodating fifty children each, these latter rooms being provided with a sliding glazed partition which enables the two to be thrown into one as occasion requires. The classrooms are treated, so far as the walls are concerned, in similar manner to those of the central hall. The floors of the central hall and classrooms are laid with wood blocks of pitch-pine, the classrooms having galleries of the same material and are furnished with dual desks. The central hall is furnished with two museum cupboards. The classrooms are shut off from the central hall by wooden partitions which are two-thirds glazed. The playground is laid with asphalt, and on the northern boundary area is a playground and a barn, between them being placed the usual out-buildings. At the north-west corner of the buildings there is a flight of steps leading to the basement, which contains the heating apparatus and coal cellars. The heating of the building is by means of hot air, Grundy's system. The classrooms, central hall, and head-master's room are all fitted with electric bells.—*Northampton Reporter.*

FORESTERS' HALL, LEICESTER.—The foundation-stone has just been laid of a Foresters' Dispensary and Institute, which is to be built at a cost of 4,000, at St. Nicholas-street, Leicester. The architect is

Mr. A. Wakerly, of Leicester, the contractors being the Leicester Builders, Limited.

ELECTRIC TRAMCAR WORKS, MANCHESTER.—About five acres of land have been purchased in Trafford Park, Manchester, adjacent to the Ship Canal and the Railway Systems, by the British Electric Car Company of St. Swythins-lane, London. The works, which are capable of turning out 120 tramway cars at a time, have been designed by Mr. Charles Heathcote, architect, Manchester, and have been commenced.

BANK PREMISES, CAMBERWELL-GREEN.—New premises for the Camberwell branch of the London and County Banking Company, Limited, have been erected on the site of the old police-station at the corner of Camberwell-green and Camberwell New-road. The building is of Ancaster stone, with bands of Belgian blue stone and red bricks. The entrance is at the junction of the Green and Camberwell New-road, and is surmounted by a small tower and dome. There is a suite of rooms for the manager on the upper floors. The whole building will be lighted by electricity. Mr. Alfred Williams was the architect, and Mr. William Shepherd, of Bermondsey, the builder.

PLYMOUTH ROYAL EYE INFIRMARY.—The new building for the Plymouth Royal Eye Infirmary was recently opened. The new infirmary is situated near Mutley Station. It stands on a triangular-shaped piece of land, 1½ acres in extent, and the building faces a new road running westward from Mutley Station. It is in the Later Renaissance style and is built of red bricks, with Doulton stone dressings, and the roofs are covered with Broseley tiles. With regard to the arrangement of the building, the main entrance and administrative block are placed in the centre of the south front. This portion contains a large entrance hall, board-room, office, and matron's room, whilst from the main corridor separate stone staircases ascend to the men's and women's wards on the first floor. The western wing contains the nurses' dining-room, grocery and linen stores, and kitchen department. The dispensary, out-patients' waiting-room, doctors' consulting-room, small operating and ophthalmoscopic rooms are situated in the eastern wing, together with the steward's room, lavatories, and entry and exit lobbies for the out-patients. On the first-floor is the operating-theatre, which is centrally placed and has a large bay-window to give the maximum amount of light without shadows. Two large wards are provided in both the eastern and western wings. These are capable of accommodating fifteen male and fifteen female patients. They are entered from a wide ambulatory corridor, which faces south, and extends the whole length of the building, and is divided by glazed screens. Lavatories, bathrooms, &c., are provided in special wings at the south-east and south-west corners of the building, and there are also linen and clothes cupboards, ward kitchen, and other conveniences. On the second floor is an isolation ward for infectious cases, and bedrooms for the staff and servants, with bathroom, lavatory, linen and store-rooms. Hot-water radiators are placed in the corridors, halls, waiting-rooms, and entrances. The wards are heated by stoves, and patent fireplaces are fixed in the various rooms. Fresh air passages are connected with the radiators, and fresh air is brought in tubes to each fire grate and stove. Extraction shafts are arranged in the roof from the ceilings of the rooms and wards, and continued to air flues in the main chimney stack. The heating apparatus is situated in the basement. The hot-water service for domestic purposes is supplied from a separate boiler in the basement, and is continued through the kitchen department, lavatories, and bathrooms. Fire hydrants are placed on each landing. The building has been wired for electric light, and at present is lighted by incandescent gas. Lifts are arranged for luggage and dinner service to each floor, and in the kitchen from the basement. Electric bells connect the administrative portion with all rooms, and there are telephones for inter-communication on each landing. As falls rapidly from south to north, it was necessary to carry up the foundation walls to a considerable height to bring the ground floor on a level with the new roadway. By the advice of the architects, the committee made the best of this necessary expenditure on the foundations by erecting well-lighted and ventilated cellars under the whole building. Messrs. King & Lester were the architects of the building, and it has been erected under their supervision by Messrs. Laphorn & Co. The cost, including furnishing, was 16,568l. The boundaries are enclosed by wrought iron railing on the south front and by oak fencing on the north-east and north-west fronts.—*Western Morning News.*

SANITARY AND ENGINEERING NEWS.

SEWERAGE SCHEME, DRIFHLINGTON, YORKSHIRE.—On the 20th ult. Mr. R. H. Bicknell held an inquiry at the offices of the Driflington District Council into an application by the Council to the Local Government Board for a provisional order empowering the Council to put in force, with reference to certain lands required by them for purposes of sewage disposal and situate in the parish of Tong, the powers of the Land Clauses Acts with

respect to the purchase and taking of lands otherwise than by agreement. An application by the Council for sanction to borrow 12,600l. for carrying out the scheme was also considered. Mr. G. B. Waugh, of Bradford, the engineer for the scheme, stated that he selected site for the sewage disposal works was nearly 6½ acres in area, and was on the north of the township boundary. It had been selected as there was not a suitable site within the Driflington district. The drainage would be by gravitation. The site had been recommended four years ago, but was abandoned because of the excessive price the owner of the land wanted for it. The scheme was opposed by Mr. Baird, a barrister-at-law, on behalf of Sir Robert Tempest, the owner of the land.

STAINED GLASS AND DECORATION.

WINDOW, ST. HILDA'S HOSPITAL, MIDDLESBROUGH.—The two-light window in this hospital has been filled with stained glass as a memorial window. The lower subject, through the two lights, is "Christ Healing the Sick." The upper subjects are, "King Oswy delivering his Daughter to St. Hilda" (A.D. 655), and "Cædman Reciting his Verses to St. Hilda" (A.D. 680). The window is from the studio of Mr. H. A. Hymers, of Chelsea.

WINDOW, ST. ANN'S CHURCH, WANDSWORTH.—A window in the Lady Chapel of this church has been filled with stained glass. The subject chosen is "The Madonna and Child," surmounted with a canopy. The work is from the studio of Mr. H. A. Hymers, Chelsea.

FOREIGN.

FRANCE.—A museum is to be formed in Paris, on the former site of the Ave Maria market, Rue St. Antoine, for the illustration of everything connected with hygiene, and the security of ateliers, shops, and manufactories.—The works for the enlargement of the Port of Dunkerque are to be commenced shortly. The operations will entail an outlay of more than two million francs.—M. Antonin Caries, the sculptor, is completing the model of the monument to Pasteur to be erected at Dôle (Jura). The design shows a woman embracing two children whose lives have been saved by Pasteur. At her side another female, symbolising Science, raises with an air of triumph, symbolising Science, towards Pasteur, whose figure, standing in a meditative attitude, forms the crown of the whole group.—A Committee has been formed, under the presidency of M. Bonnat, to erect a statue in memory of Antoine Vullon, the eminent painter.—M. Roty has completed a medal in commemoration of the centenary of the Bank of France. Another in honour of the rebuilding of the Théâtre Français has been completed by M. Chaplain.—M. Dalou has been modelled by M. Quiberon. On a pedestal cut in the rock the figure of the Republican General is shown standing, his hands crossed on the pommel of his sword.—M. Marceau has completed the statue of Daudet, to be inaugurated this year, and has been commissioned to execute a statue of Dumas fils. It represents, seated in a realistic costume, while the pedestal is surrounded by the figures of the heroines of his dramas. It is to be erected on the Place Malesherbe, opposite the statue of General Dumas which M. Moncel is modelling.—M. Henri Mayeux has been appointed architect to the National Factory of Sevres, in place of the late M. Paul Sédille.—M. Henri Nenot, the architect of the Sorbonne, has been promoted to the grade of "Commandeur" in the Legion of Honour. The cross of "Chevalier" has been bestowed on M. Louis Rousseau, architect, of Louis-le-Saunier.—M. Daveley, architect, has been commissioned by the Municipality of Algiers to prepare plans for a large Salle des Fêtes which is to be built in that city, at an estimated cost of a million francs.—It is proposed to entrust to M. Olivier Merson the decoration of the Salle des Caritatives at the Hôtel de Ville. It was to have been decorated by Cabanel, at whose death it was given to Emile Lévy, who also died without having commenced the work. Since then M. Deperthes and M. Formigé have been successively commissioned to study a decorative scheme for this apartment, where the Caritatives, the work of Cugnot, will probably be replaced by figures of a more decorative character.—The artistic club in the Rue Boissy d'Anglas, known under the double name of the "Union Artistique" or "L'Épave," always opens at this time of year. The present exhibition has a considerable number of portraits, of which the most striking is that of Cardinal Mathieu by Benjamin Constant, a splendid work. Among the other exhibits are portraits by MM. Humbert, Roybet, Bonnat, &c., as well as interesting works of other classes of subject, by MM. Gervey, Chartran, Bouchon, and René Billotte.

GERMANY.—Excavations in the cathedral at Speyer have now been completed, and a mixed commission appointed by the Bavarian Ministry has met to deliberate on the question as to what is to be done with the human remains discovered. It is noteworthy that the commission consists of leading

artists, architects, and scientific men. Specialists have declared that the remains are those of Conrad II. (who died about 800 years since) and of other Royal personages, and the principal point the commission has to decide is whether these remains shall be replaced, or whether a mausoleum should be erected for their reception. The matter is still under discussion.

INDIA.—The commerce of Calcutta has increased so enormously during the past few years, that considerable difficulty is experienced in dealing with most of it by the several railways, which approach the city but not enter it. *Indian Engineering* states that the problem admits of but one solution, namely, the establishment of unbroken railway communication, by the shortest practicable route, between the eastern and western termini, Calcutta, and the docks, with a central passenger station in the business heart of the city. The matter is engaging the attention of the authorities.—New buildings for the Rangoon College are expected to be completed within the present year; the high, middle, and primary departments will then be separated from the college.—It is estimated that the new military secretariat buildings now under construction in Calcutta will cost eight lakhs of rupees.—The Government of India has sanctioned the erection of a fort at Dargal, the terminus of the Nowshera-Dargal railway.—With the view of mitigating the effect of drought and famine, it is announced that the Viceroy is considering several plans of storing water. It is generally believed by Indian engineers that the proposed great works would be highly beneficial, and reference is made to the successful establishment of the water supply of the city of Nagpur in 1860 by Sir A. R. Binnie.—It is announced that the Lahore railway station has been completed; the cost of the additions and alterations to the Lahore yard is estimated at 78,515 rupees.—The city of Taunggyi, the headquarters station of the superintendent of the Southern Shan States, has been much improved. The drainage has been completed, and amongst its recently constructed public buildings is a school for the relations of the various Shan chiefs and a commodious brick-built bazaar. The houses generally are also of a more permanent character than any which previously existed.—The Government of India has, practically, decided to establish a first-class arsenal at Kirkee.

AUSTRALASIA.—Victorian architects are highly incensed at certain observations recently made by the judge and an engineer during some evidence given in connexion with the Inquiry Board in Melbourne. The gist of the observations was that 90 per cent. of the architects were not worthy of being called professional men. The Council of the Royal Victorian Institute of Architects have, consequently, called upon the Board to give an explanation. It is pointed out that the Institute's examination of the credentials of candidates for membership is very strict; that the Board's stigma cannot possibly refer to them. The remedy suggested is an Act for the registration of architects.—The new municipal buildings at Toowoomba, Queensland, are completed, and were duly opened towards the end of December last.—Plans for a School of Arts building, to be erected at Exeter, New South Wales, are being prepared by Messrs. Slatyer & Cosb, architects, Sydney.—A Roman Catholic church has recently been opened at North Richmond, Victoria; the architect is Mr. G. W. Vanheems, of Melbourne.

MISCELLANEOUS.

APPOINTMENT.—The Secretary of State for India has appointed Mr. William Henry James, B.Sc., Assoc.M.Inst.C.E., professor of civil engineering in the Madras College of Engineering. Mr. James is the present assistant lecturer and demonstrator in engineering at University College, Cardiff.

ELECTRIC LIGHT, MOTHERWELL, EDINBURGH.—On the 1st inst. the installation of electric light, which has been laid down during the past year, was turned on in the principal streets of Motherwell. The scheme carried out from designs prepared by Professor A. B. W. Kennedy, of London, will cost 30,000*l.*

A SAW-SHARPENING MACHINE.—Messrs. Glover & Co., of Leeds, send a description and illustration of their patent saw-sharpening machine, the advantages of which are thus represented by them:—"The most experienced 'hand-saw sharpener' is obviously only able to file the teeth of the saws quite straight, and certainly the frequent liability is for him to file them round, whereas, by means of the circular revolving emery-wheel in this machine, the teeth are compelled to be slightly hollow, like a skate blade. Thus they are rendered much sharper, and cut better, and remain sharp longer than if sharpened by hand. By very easily adjustable contrivances all the various angles and 'leads' required in the saw teeth may be secured, and by a 'stop motion' (the emery-wheel lowered to a given point for each tooth) the teeth are accurately sharpened to one height; thus each tooth must do an equal amount of work. In this improved machine 'Glover's Special Emery-Wheels' are used, and the temper of the saws is kept intact by a fine spray of cold water ejected exactly on the tooth being operated upon."

The "Kallio" Sink.

THE "KALLIO" SINK.—A new scullery sink in porcelain enamelled fire-clay, and called the "Kallio" sink, is brought under our notice by the Durran's Patents Syndicate. The sink appears to have some advantages. Half of the sink contains water in which vegetables or dishes are washed, the overflow passing over a "weir" into a channel where the bits and refuse are collected as the water runs away. Judging from the drawing, the plan is a good one, but it is sometimes difficult to induce the English servant to adopt new methods; still, we think this sink ought to lighten the labour of the thankless and uninteresting "washing-up" process.

GREEK ARCHITECTURE.—At the rooms of the Society for the Encouragement of the Fine Arts, 9, Conduit-street, on the 31st ult., Mr. R. Phené Spiers, F.S.A., delivered a lecture on "Greek Architecture." Dr. Phené, who presided, said the point had arisen whether or not they should postpone the lecture because of the national distress which had overwhelmed them. But he himself had advised that there should be no postponement. Amongst the many things that our late Sovereign took in hand, and mastered, was that of the ornament of architecture, especially as exhibited in the Albert Memorial and in the Mausoleum at Frogmore.—Mr. Spiers then proceeded with his lecture, which was, in the main, a description of an extremely interesting series of lantern views of the leading features of the architecture of Greece, together with some presenting specimens of Greek architecture discovered in the South of Italy. In referring to the Temple of Hera, at Olympia, Mr. Spiers discussed the question as to how it was that the famous statue of Hermes, by Praxiteles, remained undiscovered until about twenty years ago, when it was found buried in the clay of which the temple was built. He inclined to the belief that the walls of the temple, constructed of crude or unburned bricks, lost their roof or protective covering about the fourth century, and so crumbled away, with the result that the statue fell and was buried underneath the débris of the walls, thus escaping the notice of the Romans, who generally took everything, and that of the Christians, who generally destroyed everything.—*Standard.*

NEW CLOCK, BEVERLEY MINSTER.—A very large clock and chimes are being made for the Minster Towers. The clock and chimes will be in the north tower and the hour striking will be done in the south tower upon a bell between five and six tons weight. The work is being carried out by Messrs. Smith & Sons, of Derby, to the designs of Lord Grimthorpe.

COLLAPSE OF A BRIDGE.—On the 31st ult., Buckle Burn-bridge, N.B., which was christened by the Buckle Town Council a few days previously the "Queen Victoria Bridge" collapsed. All night, and, indeed, steadily for a week past, a fierce gale played upon the structure, which was just on the point of leaving the hands of the contractors, Messrs. Stuart & Sons, of Peterhead. The two central piers, built of masonry, hearted with concrete 6 ft. 6 in. broad at the base, tapering to 4 ft. 6 in., collapsed under the strain, there being, it is computed, fully 4,000 tons of superstructure resting on them. The three arches, two of 25 ft. and one of 34 ft., went bodily into the valley 40 ft. below, snapping off like a pipistem at the granite pilasters, and leaving a yawning gulf a hundred feet wide. The débris, consisting of bricks, scaffolding, granite blocks, concrete stones, and sand, completely choked up the valley and dammed back the Burn, which is in flood, forming a lake 20 ft. deep and extending far up the valley. The contractors began the bridge on August 4 last, and, favoured by the weather, were enabled to make rapid progress. A month ago the Town Council decided to add 3 ft. of extra height to the superstructure, after being approved by the consulting engineer, Mr. Barnett, C.E. of Aberdeen. This had just been done when the disaster happened. The roadway was 45 ft. wide. Each of the smaller arches was circled with three rings of brick, a coating of 6 in. of cement being laid over all, the central span having four rings. Peterhead granite figured largely in the erection.—*Morning Advertiser.*

STREET IMPROVEMENTS, YORK.—The Corporation of York having petitioned the Local Government Board for powers for compulsory purchase in regard to certain properties in Coppegate, Nessgate, and Spurriergate, which they propose to take for the purpose of effecting street improvements, Mr. R. H. Bicknell, M.Inst.C.E., one of the Inspectors of the Local Government Board, held an inquiry in the Guildhall on the 1st inst. The

Corporation were represented by the Town Clerk (Mr. W. H. Andrew), the City Surveyor (Mr. A. Greer), and the City Accountant (Mr. Davison). The Town Clerk read the petition, which dealt in detail with the proposed improvements. It was proposed to widen Coppegate, Nessgate, and Spurriergate. After discussion, the inquiry closed.

COCKSPUR-STREET.—The London County Council have recently purchased for, we understand, 100,000*l.*, the freehold interest in Nos. 26-7, Cockspur-street, Charing-cross, for the purpose of providing additional accommodation for their staff. At their meeting on November 6 last the Council also agreed, with that same object, to a recommendation made by their Establishment Committee to acquire for 16,250*l.* the interest of the superior lessee in the adjoining premises, No. 25, Nos. 26-7, Cockspur-street were erected for Mr. E. Stanford (who removed thither from No. 55, Charing-cross) in 1888-9, by Messrs. Higgs & Hill, contractors, after the designs of Mr. T. Barnes-Williams. They stand on the site of the "British Coffee House," designed in or about 1770 by Robert Adam, and, as we observed at the time, it is to be regretted that so good an example of the school of the brothers Adam was destroyed. Mr. E. Stanford has opened a new chief establishment in Long Acre, but the sale of the 1-in. and 6-in. Ordnance maps of England and Wales and other maps, together with that of cognate works and publications, will be continued in the front shop of the existing premises in Cockspur-street.

MODERN OPERA HOUSES AND THEATRES.—Mr. B. T. Batsford announces a second issue of Mr. Edwin O. Sachs' monumental work, "Modern Opera Houses and Theatres," which will be published in the spring. The new issue will contain a special preface, not dealing with the latest developments and improvements in theatre architecture, not only at home, but in foreign countries.

PRIZES FOR DESIGNS FOR FURNITURE.—The Council of the Society of Arts hold a sum of 400*l.*, the balance of the subscriptions to the Owen Jones Memorial Fund, presented to them by the Memorial Committee, on condition of their spending the interest thereof in prizes to "Students of the Schools of Art who, in annual competition, produce the best designs for household furniture, carpets, wall-papers, and hangings, damasks, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes will be awarded on the results of the annual competition of the Board of Education, South Kensington. Competing designs must be marked "In competition for the Owen Jones Prizes." No candidate who has gained one of the above prizes can again take part in the competition. The next award will be made in 1901, when six prizes are offered for competition, each prize to consist of a bound copy of Owen Jones' "Principles of Design," and the Society's bronze medal. Further particulars may be obtained from the Secretary of the Society of Arts, Sir Henry Trueman Wood, M.A., John-street, Adelphi, W.C.

REFRIGERATION AND COLD STORAGE.—At the City of London College on Wednesday, the 30th ult., Mr. Hal Williams read a paper on "Refrigeration and Cold Storage" before the City of London College Science Society. As the paper was combined with a visit to the cold stores of the Colonial Consignment and Distributing Company, Limited, Nelson's Wharf, Commercial-road, S.E., where modern refrigerating plant was seen at work, the author confined himself to a popular explanation of the principles of refrigeration and the refrigerating machine. Refrigeration means the reduction of a body to a temperature below its normal. The only way this can be done is by bringing the substance to be cooled into contact with a substance already colder than itself. The heat absorbed by the refrigerating substance is, as it were, pumped by the machine to a higher level of temperature, and there discharged into some substance, such as water, which will, while in its natural condition, receive heat from it. Heat cannot be raised from one level of temperature to another without the expenditure of energy in some form or other, so that the heat given up to the cooling water consists of the heat absorbed from the substance to be cooled, plus the heat representing the work done in raising it to a higher level of temperature. A refrigerating machine is the exact opposite of a heat engine, for in the latter the higher the high temperature and the lower the low temperature, the more efficient the engine, while with the former the lower the high temperature and the higher the low temperature, the more

efficient machine. The author went on to give a description of the cold-air machine and explained its principles. He then pointed out the qualities of the chief refrigerating agents and explained the characteristics which made their use as a refrigerating medium possible; and this he described in the absorption machine and the vapour-compression machine, and—quoting Professor Ewing—said that the absorption machine was from two and a half to three times as efficient as the cold-air machine, and the vapour-compression machine from five to six times as efficient as the cold-air machine, and from two and a half to three times as efficient as the absorption machine. Some remarks were made on the much mooted question of the critical temperature of CO₂, and of the behaviour of that gas under high temperatures; and the paper concluded with a description of the three chief methods of cooling cold stores—viz., by direct expansion of the refrigerating agent in pipes traversing the cold stores; by the circulating in pipes of brine previously cooled by the refrigerating agent; and by the air blast system, in which air is brought into contact with cold brine, is reduced in temperature, and is then circulated through the stores.

STONEHENGE.—The Society of Antiquaries, it is stated, has offered to co-operate with the owner of Stonehenge for its protection.

A NEW PARK FOR TOTTENHAM.—At the next meeting of the Tottenham District Council, it is stated, a contract will be signed for the purchase of a new public recreation ground. The site selected is a part of the estate known as "Downhills," and consists of a mansion, its grounds, and three large fields. The whole comprises nearly thirty acres, and although a good deal of neighbouring land has been sold for 1,000l. an acre, the price to be paid for the new park is but 800l. an acre.

WIDENING OF HAMPESTEAD-ROAD.—A meeting is to be held on Monday, at the Tolmers-square Institute, Drummond-street, at 8 p.m. to advocate the widening of Hampstead-road at its junction with Euston-road. Dr. Collins, of the London County Council, will take the chair. The improvement advocated is one which we consider is really called for.

BUILDING LAND AT WIMBLEDON.—In our advertisement columns will be found the announcement of an approaching sale of a considerable portion of the Wimbledon House Estate. The land included in the present sale is divided into about thirty-five lots of various sizes and positions, suitable for houses of various classes. It is to be hoped that the present sale will be the opportunity to establish a residential district well laid out and occupied by self-built and architectural houses.

CAPITAL AND LABOUR.

THE CARPENTERS' AND JOINERS' DISPUTE.—The annual meeting of the Builders' Association was held at 32, Ann-street, Belfast, on the 29th ult., the proceedings being conducted in private. Mr. J. A. McAuley, secretary, informed, in a business representative, however, that the employers were unanimous in declining to accede to the demands of the men for an increased wage, and are at present well supplied with non-union workmen. A circular has been drafted, and will reach the Carpenters' and Joiners' Union in a few days, giving notice of a material reduction in the rate of pay. In the face of the builders' decision the possibility of a settlement of the dispute, which has now been on for about nine months, appears very remote. A deputation was appointed by the Union to meet the Association and discuss the situation in the presence of Sir James Haslett, M.P., but matters have been left in abeyance owing to the death of the latter. The men refuse, after being out nine months, to resume their work at the same rate of wages and hours as previously, but it is stated that they would be willing to accept 3d. per hour advance in wages, or a promise of such advance, with the other concessions already promised by the Builders' Association. Failing that, they have the option of their governing body to remain on the job till an increase of wages is offered, as well as hearty support of the other trade societies in the district and throughout Ireland, England, and Scotland, who have from the beginning assisted financially on a liberal scale. A principal point of difficulty appears to be that the refusal of the builders to discuss Rule 1, which has reference to wages and hours. The men assert that they are willing to meet the masters in every possible way, and propose that the wages part of the dispute should be discussed and the hours omitted, or *versus*, as a reasonable compromise.—*Irish News.*

HEFFIELD PLUMBING TRADE DISPUTE.—This is the fifth week of the plumbers' strike in Sheffield, and as there are no prospects of a settlement, the employers have for the first time made a statement of their position. On June 30 last the operative plumbers gave six months' notice for an advance in wages of 4d. per hour, in order to bring themselves to the level of some of the building trades. On July 13 the employers, on their part, gave notice for the alteration of rules, in order to bring plumbers to the same conditions of working as other trades of the building trades, and also for a reduction of 4d. per hour in wages. When the rules of the trade were settled some years ago it was

agreed, in order to prevent strikes, that in case of any dispute or any request for an alteration of rules, a court of arbitration should be formed, consisting of six employers and six operatives, the decision of this court of arbitration to be final and binding on both sides. In case of disagreement, an umpire was provided for, and his award should be accepted by both sides. Acting on this rule, the masters asked the operatives to appoint six of their members, and a court was formed. Several conferences were held, but as there was no prospect of an agreement being arrived at, the employers asked for an umpire to be appointed. The operatives declined to agree to this course, stating that unless the demands they had made were agreed to they would strike. In the face of this the masters were unable to proceed further, and a strike commenced at the beginning of the present year. The employers resist the claim of the operatives for the following reasons: 1. Taking into consideration wages and conditions of labour, the Sheffield plumber is as well off, if not better off, than plumbers in any other part of the kingdom, and certainly better off than men engaged in other branches of the building trades in Sheffield. 2. In face of declining trade, and the general state of the labour market, the employers consider it would be unreasonable, not only in their own interests but also in the interest of the public, to give an advance of wages at this time. 3. When the last advance of wages was arranged by the Board of Arbitration, the employers' representatives gave way on the understanding that the operatives would give way on the question of rules as to men going direct to their work instead of to the shop. The operatives were very much dissatisfied with the carrying out of this agreement. Leeds and other towns are only paying their men 84d. per hour, and the workmen there have worse conditions than in Sheffield. Notwithstanding the great inconvenience that has been caused to the public by the strike, the employers have done their best to meet the most urgent demands made upon them, and they have succeeded in securing a goodly number of workmen from other towns to help them out of their difficulty. Of course, some of these "strangers" have returned home again, and it is alleged by the employers that this is the result of the action of the operatives' union. "It is a disgrace to the twentieth century," says one official, "that a man who is able and willing to work to provide for his wife and family should not be allowed to do so, and should have to submit to coercion and intimidation from those who decline to work."—*Sheffield Daily Telegraph.*

DUNDEE JOINERS' WAGES.—A meeting of Dundee Master Joiners' Association was held on the 1st inst. in the office of Mr. Joseph Wilkie, solicitor, the secretary, when the standing by-laws between employers and men were under consideration. Certain modifications were discussed, and ultimately the matter was remitted to the Conciliation Board. The decision of the men at their meeting the previous evening to resist any attempt on the part of the employers to reduce their wages was likewise discussed. The general feeling was that as the spring and summer months advanced a slight reduction in the rate of wages would be necessary, and that the men would be well advised to agree thereto. It was pointed out that in the meantime the rate was the same as that paid in Edinburgh, whereas Dundee was always formerly regarded as paying 4d. per hour less than the rate paid in the capital. No definite decision was come to, and this matter was also remitted to the Conciliation Board.

LEGAL.

SPECIFIC PERFORMANCE OF A BUILDING COVENANT.—IMPORTANT CASE.

THE case of the Mayor, &c., of Wolverhampton v. Emmens came before the Court of Appeal on the 1st inst., on the application of the defendant for judgment or a new trial on appeal from verdict and judgment at trial before Mr. Justice Wills and a special jury at the Birmingham Assizes. The action was brought for specific performance of a covenant to build, or in the alternative for damages for breach of that covenant.

It appeared that the plaintiffs, the Corporation of Wolverhampton, conveyed to the defendant, a solicitor, a piece of land in the borough of Wolverhampton, and in that conveyance the defendant covenanted with the plaintiffs that he would commence to erect upon the land within twelve calendar months from May 25, 1897, a new building or buildings of a minimum height of 35 ft. from the pavement to the eaves or parapet, and not more than the height regulated by the by-laws in force in the borough, and would complete the same ready for occupation within two years. The defendant proposed to build on the land eight houses, and submitted plans of the proposed buildings to the plaintiffs, and they were accepted. The defendant afterwards came to the conclusion that, in view of the overbuilt condition of the neighbourhood, it would be impossible for him to make any profit on his building scheme, and he failed to erect any buildings in accordance with his covenant. The plaintiffs then brought the present action against the defendant. The defendant pleaded that it was not a case in which the

Court would order specific performance, and paid 40s. into court, as being sufficient to satisfy the plaintiffs' claim for damages. Mr. Justice Wills, at the trial, held that the plaintiffs were entitled to a decree for specific performance, but in case the Court of Appeal should consider he was wrong on that point, he left it to the jury to say what damages they considered the plaintiffs were entitled to for the breach of the covenant, and they assessed the damages at 50l.

Mr. Jelf, K.C., and Mr. Disturnal appeared for the appellant, and Mr. A. T. Lawrence, K.C., and Mr. R. J. Lawrence for the respondents.

Mr. Jelf contended that it was not a case in which specific performance should have been ordered, as it was not the practice of the Court, except in very exceptional cases, to grant specific performance of a covenant to build. The covenant in question was exceedingly vague, being simply to erect a new building or buildings. Nothing was said as to the number, style, or as to the material to be used. It was not, he submitted, a contract which ought to be specifically enforced. The defendant was willing to pay the 50l. damages and the costs of the action and to give back to the Corporation the site he had purchased from them if they would hand him back the 1,000l. he had paid for it.

Mr. A. T. Lawrence, for the respondents, argued that it was a proper case for specific performance. If the covenant was indefinite, the contract between the parties had been made definite by the submission and acceptance of plans.

In the result their Lordships unanimously came to the conclusion that it was a case in which specific performance was the proper remedy, and that the judgment of Mr. Justice Wills was quite right.

The application accordingly was dismissed. Upon the application of Mr. Jelf, and the plaintiffs not objecting, the appellant was given until this time next year in which to carry out his contract.

THE BLUE LIAS LIME PROSECUTION.

THE hearing of the summons issued at the instance of Alfred Andrews, of the Blue Lias Lime-Burners' Association, Medway Wharf, Grosvenor-road, against the Cam Portland Cement Company, Limited, Weldreth, Royston, Cambridge, under the Merchandise Marks Act, was resumed before Mr. Horace Smith at the Westminster Police-court on Wednesday afternoon. The summons charges the defendants with "unlawfully and with intent to defraud applying or causing to be applied to certain goods, namely, four tons of ground hydraulic lime not being Blue Lias Lime, a false trade description as to the place in which the said goods were produced, the mode of producing the same, and the material of which the same were composed, whereby the said goods were falsely described as being Ground Blue Lias Hydraulic Lime, contrary to the provisions of the Merchandise Marks Act, 1887."

At the last hearing it was stated that four tons of lime described on the invoice and on the sacks as "blue lias lime," was obtained from the defendants, and upon examination and analysis it was found that it was not made from the blue and lias rock, a geological formation not known to Cambridgeshire.

Mr. Willis, barrister, again appeared for the prosecution, and Mr. Horace Avory, K.C., defended.

Mr. Bertram Blunt said he was a Fellow of the Chemical Society, a Fellow of the Institute of Chemists, and a member of the Society of Public Analysts, and a member of a firm of analysts having offices at the Broadway, Westminster. He had received a sample of material described as blue lias lime which he had analysed and examined. On being mechanically examined he found it did not present the characteristics of blue lias lime in the way in which it set. Blue lias contained a much greater proportion of actual lime than the material he examined, and correspondingly a smaller quantity of silica and oxide of iron. The specimen he examined contained 57.64 per cent. of lime and 20.98 per cent. of silica, whereas the ordinary amount of these constituents in lime made from blue lias rock were 70.00 per cent. of lime and 12.200 per cent. of silica.

Cross-examined: He was not a geologist, and therefore did not know that the lias formation consisted of five distinct strata which differed entirely from one another. Asked to explain a preponderance of silica in a sample of lime admitted to have been made from the blue lias rock, he stated that it was the result of the workmen not picking out the shale cleanly enough before sending the rock to be burned.

Mr. Avory: Do you say that blue lias lime means something into which no shale or extraneous matter has been introduced?—Yes.

And you do not care what builders and engineers say?—I don't care what builders say, but the opinion of engineers is most valuable.

Do you know that blue lias lime that comes from the district of the blue lias formation does, in fact, contain extraneous matter?—I do not know it.

Mr. George Frederick Deacon, a civil engineer of Westminster and a member of the Council of the Institution of Civil Engineers, said he had used blue lias lime very largely in the construction of reservoirs. Blue lias

me had a definite signification, and was well known to engineers and builders long before any other limes generally known by name, and before Portland cement was known at all. Blue lias lime meant hydraulic lime burnt from the blue lias formation—the lower beds of the lias formation. "Blue lias" as applied to lime was not used as a mere synonym for hydraulic.

Cross-examined: The lias formation included an immense number of hands of rock, none of which were precisely the same. They differed a little in proportion of the materials, but the general proportion of lime was 50 or 60 per cent. It varied from a strong hydraulic lime to a weak hydraulic lime. Mr. Avory: Is the fact that lime has come from the blue lias formation a guarantee of the hydraulic character of the lime? It is a guarantee of the behaviour of the lime—that is, in its slowly-setting qualities. All lime that comes from the lias formation sets slowly.

In reply to the magistrate, witness stated that he had seen an analysis of a hydraulic lime which set slowly, and it was exactly the same as artificial Portland cement.

Sir Douglas Fox, civil and mechanical engineer, and formerly President of the Institution of Civil Engineers, said the term "blue lias lime" was a definite one to engineers. He could not speak for the builders. He would not accept lime from Cambridgeshire when he had specified blue lias.

Cross-examined: The blue lias lime he had used had been of constant quality and always strongly hydraulic. Bad blue lias could be made, but he always approved of the makers when buying.

Mr. Wm. Gregory, surveyor and estimator to Messrs. Bywaters & Sons, builders, King-street, Regent-street, said the term "blue lias" was well known in the building trade, and had a uniform significance. It was lime burnt from the lower beds of the blue lias rock formation. The term was not properly applied when applied to lime made from chalk or marl.

Mr. Frederick Thos. Mullitt, a surveyor, of London and Cambridgeshire, said that there was no blue lias rock in Cambridgeshire. The blue lias formation was run out long before it reached Cambridgeshire. A hydraulic lime was made in Cambridgeshire, but it ought not to be called lime—it was only a sort of poor cement. He would not accept blue lias lime except it came from Warwickshire, Leicestershire, or Nottinghamshire.

Cross-examined: Blue lias lime was made in other places than had been mentioned. For the building trade, blue lias lime, if specified without any qualification or special name, implied blue lias lime from one or other of the three counties he had mentioned. Until that case he had never heard of lime that was lime being made in Cambridgeshire. It was not within his knowledge that blue lias lime had been made and sold in Cambridgeshire for the past ten or fifteen years.

Mr. Alfred William Redding, a member of the firm of Redding & Son, builders, Reading, said he was acquainted with the lime manufactured from materials found in Cambridgeshire. He had never heard the term "blue lias" applied to any lime made there, nor that it was made there from imported blue lias rock.

Cross-examined: He would not go to any place but Leicestershire or Warwickshire for blue lias lime.

Mr. Alfred Wm. Swan, a lime burner, of Cambridge, said he had never heard of blue lias lime being made in Cambridgeshire.

Mr. Avory: They have brought you all the way from Cambridge to say that?

Witness: I suppose so.
This concluded the evidence in support of the complainant's case, and the summons was again adjourned.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

20,056.—BALL AND FLOAT VALVES: *J. Levick*.—The novelty of the invention consists in the adoption of wrought metal instead of cast metal for the studs that join the float-arms and the floats; a stud which is made out of a metal blank is so fashioned that whilst one side of it will screw on to the float-arm the other side will fit on to the float.
20,058.—ATTACHMENTS OF DOOR-KNOBS, &c.: *E. V. Bally*.—Transverse holes are made in the spindle, a portion of whose length is split. After the pin has been screwed into its place the end of the spindle can be expanded within the neck of the knob. In another form it is arranged that the point of the screw shall enter into the opposite side of the neck of the knob, the point of the pin, instead of its head, being threaded accordingly. The contrivance is available for attaching cupboard turns and similar fastenings to their spindles.

20,061.—JOINTS FOR PIPES, DOORS, &c.: *D. A. Blair, F. B. Blair, & R. Baillie*.—The inventors' object is to provide means of jointing or bolting together the metal flanges or faces around pipes, doors, &c., so that fluid-pressure joints can be easily made or disconnected by the employment of T or other headed bolts and nuts, the nuts and bolts being strung together and pivotted upon a continuous wire or rod. In one modification the bolts are inserted sideways into the bolt-holes that are

open at the side outwards, and the rod or wire upon which they are pivotted is coupled or joined with a sliding link or with screw-threaded ends and nuts; the hinge joint is to be broken by turning the bolts downwards after the nuts have been loosened.

20,068.—RESISTANCE METERS (ELECTRICAL): *C. Bessie*.—With a source of constant current, a rheostat, and a resistance that may be either a 1,000-ohm standard or the higher resistance which is to be measured, is connected in series a graduated galvanometer which will measure a few milliamperes, by means of a suitable adjustment of the rheostat the galvanometer will be caused to give its maximum reading with the standard resistance in circuit; then is substituted the resistance which it is required to measure and the diminished deflection of the galvanometer will thereupon show, by means of its graduation marks, the amount of the resistance in question.

20,100.—A SUPPORT FOR ELECTRICAL LAMPS: *M. Raiting and F. H. Collings*.—The two halves of a ball fitting are screwed together, and connected electrically with spring plungers, which are mounted within recesses in an insulator bearing in halves upon a circular and a central block. If more than two connections are needed, the circular block should be divided into segments, and corresponding spring plungers should be supplied. An S-shaped lug projects between the plungers from the insulator, and the supply and lamp wires are secured with screws in the circular and central blocks and the carriers of the plungers.

20,124.—ELECTRICAL APPARATUS FOR GAS LIGHTS: *Soc. Anon. "L'As Nova"*.—The gas is lighted and extinguished with an apparatus that comprises separate electro-magnets and circuits. The valve and the sparking contrivance are worked at one and the same time; the spark ignites the main burner, and not an auxiliary burner or pilot jet. With the flow of the current through the electro-magnet of the lighting circuit an armature operates a lever so as to open the gas cock, whilst an insulated disc raises a rod which serves to break circuit at the sparking points; another armature turns the lever in the reversed direction so as to cut off the gas supply, after the current has been caused to pass through the other electro-magnet. An adjustable spring, that bears against the large end of the cock, obviates leakage of gas from the plug cock.

20,132.—AN APPLIANCE FOR SLOTTING HOLES IN DOORS, &c.: *F. Flocks*.—An appliance, to be driven by the hand, for slotting holes in doors and for kindred purposes, consists of a frame which is clamped on to the door, a worm upon the slotting auger gears with two worm-wheels, the wheels being carried by screws which communicate a side feed-motion to the auger.

20,139.—ARTIFICIAL STONE, TILES, BRICKS, &c.: *A. Catosinski & L. Weintraub*.—The material is composed of an admixture of hydraulic cement and coal waste or slack, and water—the ratio of the cement to the waste being as one to two—and is then ready for being moulded into the shapes desired.

20,166.—FLOORING CONTRIVANCES: *F. R. Gibbard*.—For joining wooden blocks and so on, together, and in order to prevent portions of the floor from rising or becoming otherwise displaced the inventor devises some sharp diamond-shaped or double-pointed metal fasteners which are to be driven into the sides and the ends of the blocks or pieces, or the blocks may be slotted to take the fasteners; the fastener should be made with one of its points longer than the other point. In laying the flooring the blunted points of the fasteners are first driven into the blocks.

20,221.—PAINTS AND PIGMENTS: *T. F. O'Sullivan*.—For the making of pigment, a mass of sawdust is saturated with a solution of some iron salt, the compound is then dried and burned. The strength of the iron solution will determine the colour of the resultant pigment.

20,263.—RACK PULLEYS FOR BLINDS: *E. Wareham*.—To the lower portion of the window frame is fixed a cup. Within a slot in the cup is pivoted an arm, at the end of which is a pulley, around which the endless cord of the blind is passed; tension upon the cord is obtained by means of spiral springs that bear against the arm lever and against lugs fixed upon the cup. The invention includes modified applications of the principle involved, and in one shape a spring-arm is substituted for the spiral springs.

20,271 and 20,275.—THE MOULDING OF SINKS, SAGGERS, &c.: *B. Robinson*.—In an extrusion machine used in the making of sinks and similar dish vessels a movable slide, which is fitted upon the mouthpiece, is to be pressed downwards on to the clay or other plastic substance by means of a screw which is turned with a hand-wheel and bevel gearing, the slide being lifted when enough of the material for making the trough of the sink has been pressed out. A wire then cuts off the sink closely against the mouth-piece; a distributing centre is formed upon the mouth-piece, and rollers, or latbs affixed to endless hands, serve to support the sink; the side-plates of the die are allowed to open out (being afterwards driven together) so as to prevent the back of the sink from bulging inwards just before it is cut off. For shaping the front of the sink a sliding rod, worked with a weight and cord, presses a facing-plate against the mouth-piece, a cranked shaft serving to retain the rod in

its position; the front of the sink is supported with plates, which also gauge and regulate its thickness (20,275). In the case of Saggings &c.: The extrusion or pipe-making machine is provided with an adjustable centre and a die-plate with a cutting-rim which trims the edges of the slabs. A lever lifts the table until the plate and the rim come into contact; the clay is pressed through the die that it may unite with a hat or slab of clay which has been laid upon a loose plate on the mill, whereupon the table is freed and is pressed downwards by the body of the sagger as it is being forced out; adjustable pipes and an aperture in the core admit air to the inside of the sagger. A slotted die-plate may replace the core and die-plate.

20,316.—CONDUITS FOR ELECTRICAL CONDUCTORS: *W. Sykes*.—The conduits consist of open troughs, made of stoneware, and in single and multiple shapes. The conductors are to be set in bitumen as high up as a rabbet which is fashioned inside the upper parts of the conduits, and will take a cover of cement and sand or bricks after the conductors have been set. The several lengths are fitted together with their spigot and socket joints and a filling of bitumen, and two adjoining lengths are retained in alignment by means of a shoulder or stud that is formed, partly around the socket of one of them.

20,347.—A COMPOSITE MATERIAL: *H. A. Fryor*.—A composite material for use as an artificial stone or marble is made by mixing silica of soda with milk of lime, and gradually adding Faturan or some similar cement to the liquid mixture; then are added mineral colours or other pigments, after which the whole mass is stirred about so as to give it a variegated or veined appearance. The moulded articles, after they have become dry and hard, are taken out of the moulds and rubbed with soft cloths steeped in linseed oil. By another method an admixture of milk of lime, of soda, glycerine, soft soap, and ground marble or small rock, together with hydraulic cement, gypsum, or some such substance ordinarily employed in the manufacture of artificial stone, is moulded, stirred, and strained through a sieve. The compound can be cast when it is in a liquid state or be moulded when in a plastic condition.

20,351.—ELEVATORS AND HOISTS: *A. C. H. Tiedemann*.—A tubular casing which is put together in sections carries the bucket-band. A frame, in which the motor is fixed, joins the pivots upon which the upper and driving sprocket-wheel rotates. On the motor-shaft is a worm which is set in gear with a worm-wheel upon the shaft and the sprocket-wheel is driven by pinions that are fixed upon the worm-wheel's shaft so as to engage with teeth around the inner side of the sprocket-wheel, the two sides of the bucket-band are drawn together with a guide-wheel.

20,377.—BRICKS: *E. W. Beech*.—By this invention, which is described as being quite independent of those set forth in No. 12,874 and No. 12,875, Nos. 5,352 of 1890, one side of the brick is fashioned with one dove-tailed groove, or it may be more, so as to ensure a holding or keying with the mortar or plaster; and in order that the bricks may not cut the bricklayer's hands the grooves are made with rounded edges.

20,387.—AN ADHESIVE CEMENT: *F. Scher*.—A cement which is described as being particularly useful instead of plaster of Paris in the making of electrical gas lamps, gas whips, and other ceramic glass, porcelain, and in some instances metal objects, is made from a paste composed of water-glass, feldspar, and finely pulverised waste fragments of half-burned porcelain and fully-burned hard porcelain.

20,416.—A GRATING FOR DRAINS: *W. R. Hindmarsh*.—The grating is made in a rounded shape, and the top of the side block upon which it rests has a recess which will take the curved grating so as to constitute a common surface with it.

20,423.—A CONTRIVANCE FOR INCANDESCENT GAS BURNERS: *A. Murinick*.—The inventor seeks to provide compensation for variations in the pressure of the gas supply; he arranges the cone-shaped nozzle so that its solid end shall partially close the opening around it. As the gas flows through vertical channels cut around the nozzle it assumes the form of cylindrical films within the chamber above, whence it rises into the mixing tube that is mounted upon springs so as to minimise shocks or vibrations communicated to the mantle. Side draughts are reduced with a pierced disc; and a split tube, to which a nut fastens the support of the mantle, carries the burner head, which is perforated.

20,428.—VALVE-FITTINGS FOR SYSTEMS OF HEATING: *G. Brook*.—The valve-fittings are contrived for circulation pipes, and radiators, and are intended to provide means of diverting and otherwise regulating the course and flow of the heating-fluid, whereby some of the radiators, &c., can be placed out of action without interference with the circulation. For that purpose, a tapered plug-valve, having a handle for its adjustment, is put at the junction of the inlet, outlet, and radiator branch pipes, or at the junction of those three pipes is regulated with mushroom valves, to which are fitted a screwed spindle and a hand-wheel or lever for their adjustment. In the case of a junction formed by the meeting of four pipes, the circulation is regulated with a suitable plug-cock.

MEETINGS.

FRIDAY, FEBRUARY 8.

Architectural Association.—Mr. D. T. Fyfe on "Architecture in Crete and Turkey." Illustrated by lantern views. 7.30 p.m.
Royal Institution.—Professor G. H. Bryan on "History and Progress of Aerial Locomotion." 9 p.m.
The Institution of Junior Engineers (Westminster Palace Hotel).—Mr. Louis F. Auld on "Electric Power Supply in the Metropolis." 8 p.m.
Institution of Mechanical Engineers.—Adjourned discussion of the preceding paper—"Power-gas and Large Gas-engines for Central Stations," by Mr. Herbert A. Humphrey. 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Mr. W. Marriott on "Meteorology." 8 p.m.
Institution of Civil Engineers (Students' Meetings).—Mr. H. E. Wimperis, B.A., on "Cycle Resistance." 8 p.m.
Glasgow Architectural Craftsmen's Society.—"Wall Coverings," Mr. C. Sinclair on "Limes," Mr. R. W. Horn on "Cements," and Mr. J. Arthur on "Patent Plasters." 8 p.m.
Architectural Association of Ireland (Technical Demonstrations).—Mr. B. A. Phillipson on Electric Lighting (10, Lower Baggot-street, Dublin). 4.30 p.m.

SATURDAY, FEBRUARY 9.

Builders' Firm's Association.—Annual Dinner, King's Hall, Holborn Restaurant.
Dundee Institute of Architecture.—Mr. J. D. Mills on "Warwick and Staffordshire Architecture." 7 p.m.
Edinburgh Architectural Association.—Visit to Royal High School, Canongate Parish Church, and Old Tolbooth.
Monday, February 11.
Royal Academy.—Professor Aitchison, R.A., on "St. Peter's." 4 p.m.
Surveyors' Institution.—Adjourned discussion on Mr. R. E. Middleton's paper on "The Future of the London Water Supply." 8 p.m.
Clerks of Works Association (Carpenters' Hall).—Paper by Mr. H. E. Neale. 8.30.
British Society of Architects.—Mr. C. H. Sanson on "Church Restoration." 8 p.m.

TUESDAY, FEBRUARY 12.

Royal Institution.—Professor J. A. Ewing on "Practical Mechanics (experimentally treated): First Principles and Modern Illustrations." 3 p.m.
Institution of Civil Engineers.—(1) Paper to be further discussed, "The Present Condition and Prospects of the Panama Canal Works," by Mr. J. J. Ford. (2) Time permitting, Mr. W. J. Weightman on "The Nilgiri Mountain Railway." 8 p.m.
Society of Arts (Applied Art Section).—Mr. W. Burton on "Recent Advances in Pottery Decoration." 8 p.m.
Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, M.D., on "Sanitary Law." 1. 7 p.m.
Edinburgh Architectural Association.—Evening visit to City Observatory.

WEDNESDAY, FEBRUARY 13.

Sanitary Institute.—Mr. Thomas Blashill on "The state of our Streets." The chair will be taken by Sir Alexander Binnie. 8 p.m.
Institution of Civil Engineers.—Students visit to the engineering Models at the Victoria and Albert Museum, South Kensington. 2.30 p.m.
Institution of Sanitary Engineers (Incorporated).—(1) Examination and Literary Committee at 3 p.m. (2) General Purposes and Finance Committee at 4 p.m. (3) Election Committee at 5.45 p.m. (4) Members' Sessional meeting at 7 p.m.
Sanitary Institute (Demonstrations for Sanitary Inspectors).—Inspection at Lambeth Disinfecting Station, Lambeth-road, Lambeth, London, S.E. 1.
Edinburgh Architectural Society.—Mr. J. A. Arnot on "A Holiday Tour in Belgium and Holland." Illustrated by lantern views.

THURSDAY, FEBRUARY 14.

Royal Academy.—Professor Aitchison, R.A., on "St. Peter's." 4 p.m.
London Institution.—Professor A. C. Haddon, F.R.S., on "The Decorative Art of Primitive Peoples." Illustrated. 6 p.m.
Society for the Encouragement of the Fine Arts.—Dr. J. Offord on "Some recently-discovered Relics of Ancient Art from Western Asia." Lantern illustrations.
Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, M.D., on "Sanitary Law." II. 1. 7 p.m.
Institution of Electrical Engineers.—Adjourned discussion on Mr. W. M. Mordey's paper on "Capacity in Domestic Current Working." 8 p.m.
British Society of Architects and Surveyors.—Mr. H. Stabton on "Our Cathedral Fronts: A Comparative Criticism." 7 p.m.

FRIDAY, FEBRUARY 15.

Architectural Association.—Mr. E. S. Prior on "Gothic architecture and the Basis of its Beauty." 7.30 p.m.
Royal Institution.—Professor J. J. Thomson, M.A., on "The Existence of Bodies Smaller than Atoms." 9 p.m.
Institution of Mechanical Engineers.—Mr. J. Ashford on "Light Lathes and Screw Machines." 8 p.m.
Sanitary Inspectors' Association.—Annual Dinner, Metropolitan Club, Holborn Restaurant.
Sanitary Institute (Lectures for Sanitary Officers).—Dr. J. Priestley, M.D., on "Sanitary Law." III. 7 p.m.
Architectural Association of Ireland (Technical Demonstrations).—Mr. J. Early on "Glass Manufacture." 4 p.m. (at 1, Upper Camden-street).

SATURDAY, FEBRUARY 16.

Architectural Association.—First spring visit to the man Catholic and Cardinal's House, Ashley Down, Victoria-street, Westminster, by permission of architect, Mr. J. F. Bentley.

RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

METALS. Table listing prices for various metals like oils, etc.

TO CORRESPONDENTS.

NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any communication to a contributor to write an article is given subject to the approval of the editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to 'The Editor,' and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.] * Denotes accepted. † Denotes provisionally accepted.

The History of the Housing Question in London.

THE approach of another election for the London County Council makes it opportune to give something in the nature of a sketch of the progress of the Housing Question in the Metropolitan. Both Progressives and Conservatives, as the so-called Moderates have now called themselves, admit that the Housing Question is the most important with which they have to deal. Not a little pessimism prevails regard to it, and we should be the last to take a sanguine view of this difficult problem, yet a review of the last half-century will show that great progress has taken place. No doubt, the subject has been growing in complexity and in difficulty, but at the same time both the Legislature and Local Authorities have taken many important steps deal with it.

The first part of this question is concerned with the progress of legislation, and in noticing it we shall follow the useful, and, indeed, indispensable, work on the subject which has lately been issued by the County Council.* So far as the Authorities of the Metropolitan are concerned, it is desirable to point out that from 1855 to 1889 London was governed by the Metropolitan Board of Works, and by Vestries and District Boards. In 1889 the County Council came into existence under the provisions of the Local Government Act, 1888, and in 1900 the new municipalities, of which we have heard recently so much, superseded the Vestries and District Boards. But we have to go back to the year 1851 to find the beginning of modern legislation on the housing question in London, so that, roughly speaking, both legislation and local action have arisen

during the lifetime of the existing generation of Londoners. If we bear this fact in mind it should encourage us in regard to future progress.

It was in 1851 that Lord Shaftesbury (then Lord Ashley) brought the housing question before the House of Commons, and his efforts resulted in the passing of two statutes, the Common Lodging Houses Act, 1851, and the Labouring Classes Lodging Houses Act. Not only is it to Lord Shaftesbury that the perpetual honour belongs of directing public attention for the first time to this question, but he had the unique privilege of piloting these measures through both Houses of Parliament, for he succeeded to the peerage while this legislation was in progress. The first Act was passed with the object of improving the quality of the houses, the authority for that purpose being the Commissioner of Police and the Secretary of State, and it was not until 1894 that the jurisdiction of the former official was transferred to the County Council. By the second Act, it was proposed to increase the quantity of dwellings by enabling Local Authorities to adopt the Act and purchase, lease, or build such dwellings as were needed. Here then we have the germ of the important legislation which ensued to the end of the century to provide more dwellings for working men.

To return, however, to the quality of the houses; passing over the Nuisances Removal and Sanitary Act of 1855 and 1866 we come to the year 1868, in which year was passed the first of the series of statutes known as "Torrens' Acts." The main principle of the measure was that "the responsibility of maintaining his house in proper condition falls upon the owner, and that if he fails in his duty, the law is justified in stepping in and compelling him to perform it." The manner in which the owner was obliged to fulfil this duty was, broadly speaking, by the appointment of medical officers of health to report to the Local Authority, who then had jurisdiction to oblige the owner to do such work as was necessary, or even to demolish insanitary houses.

In seven years time we reach a legislative period which may be regarded as the contemporary or modern one, since in 1875 we come to the Artisans' and Dwellings Improvement Act, the first of the series known as "Cross's Acts." This Act dealt with "whole areas, when the houses are so structurally defective as to be incapable of repair." The authorities to whom the duty of carrying it was given were the Metropolitan Board of Works and the City Commissioners of Sewers. The main point to bear in mind in regard to this statute is that it is the beginning of the work which has been going on for the last quarter of a century for the wholesale rehousing of the working classes. The machinery for carrying it out was soon seen to be cumbersome, and in 1879 it was amended. In 1882 we find an important measure, the Artisans' Dwellings Act, 1882, to amend both Torrens' and Cross's Act, which again is a simplifying Act. Then from that time follow in due order the Housing of the Working Classes Acts of 1885 and 1890 and 1894. This review will give some kind of idea of the amount of legislation which has taken place during the last half century. Space wholly prevents the consideration of the details of these voluminous statutes. It is desirable, however, to endeavour to form some kind of idea of the practical results of this legislation.

In the first place the action of the predecessors of the County Council, the Metropolitan Board of Works, must be reviewed, which covers the period extending from 1875 to 1882. The number of schemes undertaken during this space of time was sixteen, which extended over an area of forty-two acres, and provided for 27,780 persons, as against 22,868 persons displaced. The actual cost worked out as follows:—Of property, 1,570,160*l.*; of works, 99,836*l.*; as against receipts, 346,581*l.*; leaving a total net cost of 1,323,415*l.* Between the schemes of the Metropolitan Board of Works and those of the County Council come some of an intermediate kind, begun by the one body and completed by the other.

These are six in number, and provided

* "The Housing Question in London."—Prepared to the order of the London County Council, under the direction of C. J. Stewart, Clerk of the Council.

accommodation for 2,930 persons though 6,188 were displaced. This curious discrepancy is explained by the fact that in one case the site was by Act of Parliament devoted to the purpose of an open space, and that in other cases the number for whom accommodation had to be provided was reduced by modification orders. Be that as it may, there is in regard to these six schemes the unsatisfactory fact that, apparently, over 3,000 persons were displaced and scattered into other districts already too crowded. The total net cost of these works was 281,673*l*.

We now come to the work which has been done, or is being carried into effect, by the London County Council. The schemes seem to be twelve in number. They affect an area of 34½ acres. The total number of persons displaced by these schemes was 16,278, and the number actually rehoused 6,808, and to be rehoused 9,416. As regards expenses of the work, the total actual net cost to March 31, 1900, was 592,549*l*. In addition, schemes have been undertaken by Vestries and District Boards affecting a displacement of 4,042 persons. In addition the Council has undertaken various projects under Part III. of the Housing of the Working Classes Act, 1890, which is concerned—as many of our readers are aware—with what may be called lodging requirement. Under this head we find that there has been a supply of 2,132 tenements containing 5,012 rooms. It is impossible to enter into details of these schemes, but the entire work is apparently summarised in the table given with this article, taken from the appendix to the Report already referred to.

Considerable as is the work done, as pictured by these statistics, it is obvious, when the growth of London and its suburban districts is borne in mind, that it is comparatively little in comparison to the increase of population. We see that even with great expenditure of money and labour the requirements of the artisans of London can scarcely be coped with, and the conclusion to which one must apparently arrive is that while municipal effort should be increasing, as much encouragement as possible should be given to individual enterprise. It seems to be clear that the housing problem can only be adequately grappled with by the combined effort of public bodies and private companies, and therefore that municipalities should not crush out private enterprise. Those who are interested in this great social problem will

find much that is valuable in the Report upon which the foregoing remarks have been based, and by a perusal of it better appreciate at once its magnitude and its difficulty.

HINTS ON STABLES.

BY A HUNTING MAN.

WISH it to be clearly understood at the outset of this article that I am neither an architect, nor connected in any way with the building industry. I am writing without prejudice, and therefore trust that my remarks and suggestions will be construed in the same spirit in which they are written. My objects are to promote the welfare of the horse and to save the owners of horses unnecessary expense, which arises from inferior stable accommodation.

At the beginning of the century an ill-drained, ill-ventilated, ill-lighted barn was considered a good enough home for the average hunter. Even within the last twelve months I have seen many of these barns attached to old country houses, and I have inspected stables in London which are little better than cowsheds. In London and other large towns where economy of space is a primary consideration there may be some excuse for narrow gangways, narrow stalls, and narrow doors; but in the country there is no such excuse for placing valuable horses in erections which are the hot-beds of disease, owing to want of sanitation and space. Then how often are the situation and aspect of a stable misjudged. In the case of stables built at the beginning of the century we constantly find that they are situated in a valley on account of the warmth and shelter; but if the windows and doors fit properly and the ventilators act properly, so that there is no unhealthy draught, the question of shelter need not arise.

In regard to ventilation, there is a popular idea that ventilation merely means draught. A greater mistake cannot be made. The proper definition of ventilation is "the ingress of fresh air and the egress of foul air." Let us now consider what is the best method to ensure perfect ventilation in a stable. My own opinion is that there should be one or more according to the size of the stable, ventilating shafts in the roof, and one or more on each side of the walls. These should have "louvre" boards and cords to allow of them being opened or

closed, as the exigencies of the weather may demand.* Furthermore, there should be ventilating gratings a few inches from the wall on all the walls, furnished with closing bars. I have only heard one objection to this system of ventilation, namely, that in many private stables, if there were a hundred ventilators, the grooms would never dream of opening one of them, and the stables would still be found reeking with foul air laying the seeds for every imaginable form of lung disease. What does this objection amount to? It simply means that the owner of valuable horses does not employ servants upon whom he can rely to fulfil their duties. The groom who keeps his stable hot in order to make the coats of his horses shine is like the Chinaman who burnt his house so that he might roast his pigs.

The first thing which an architect has to consider is the aspect of a stable. The aspect should be south or south-west, so that the horses face north or north-east. The stable will thus gain the greatest possible amount of light with the least possible amount of glare to the horses. The situation of the stable should be on dry soil when possible, but never in a valley. It is not necessary to build a stable in a low valley in order to obtain the temperature at which it should be kept, namely, 60 deg.

The construction of the outside walls of a stable has been the cause of much difference of opinion. If possible, that is to say if the stable is near to a quarry, they should be of hard stone, since bricks absorb moisture and cause the stable to become damp.† I am an advocate of corrugated iron, lined with wood, providing that there is ample space between the iron and the wood, which could be filled

* "A Hunting Man," however, does not state whether he intends these for inlets or extracts, and possibly does not know. If intended as extracts, probably some of them will be found acting as inlets. And what is to induce them to act as extracts? To adopt his own phrase, "there seems to be a popular idea" that it is only necessary to have openings, and the fresh air will flow in through one and the foul air out at another, just as you wish, without anything more than wishing. If no mechanical force is employed, the best chance is to have only one ultimate extract at the highest point of the building; there may be ducts to it from different parts of the stable ceiling. In large stables—those containing as many as ten horses and upwards—it ought to be worth while to have a mechanically driven extract fan, but it must be used with moderation, so as not to draw in anything like a rapid current of air through the inlets.—E.D.

† This is, of course, far too sweeping a statement. It depends on the kind of stone and the kind of brick. Some bricks absorb much less moisture than many stones do.—E.D.

* No work of this character was done by the Metropolitan Board of Works. Such figures as are given relate to what has been done by other bodies upon land purchased by them from this Board.

† Of this number, accommodation for 240 was provided by the Provident Association. The total also includes persons provided for in lodging-houses.

‡ This does not include any figures in respect of the Russell-court site, nor in respect of any rehousing in connexion with the schemes of 1899.

with sawdust or some other non-conducting material.* This provision is important, since a careless builder neglects to use sufficient non-conducting material, the corrugated iron will in hot weather turn the stable into a furnace. Some architects recommend painted cement in preference to wood for the inside lining of the walls, since it is easier to keep clean and is more economical; but there is an unsportsmanlike look about the cement, and the appearance of wood is far superior to that of cement. Then horses do not care to live in a place resembling an Ebenezer Chapel, and in the construction of our stables the horse is the first interest to be considered.

In regard to the external construction of a stable, no subject has aroused such divergence of opinion amongst hunting men than that which concerns the roof. Many hunting men are in favour of a thatched roof, because it is warmer in winter and cooler in summer. But there are many objections to thatched roofs. In the first place, it is difficult to find a good thatcher outside Dorsetshire, and a badly thatched roof is useless. In the second place, they absorb more damp than any other kind of roof, as anybody who has had the misfortune to live in a thatched house can testify. Thirdly, they are expensive in regard to the initial cost, and constantly need repairing. Fourthly, they serve as breeding places for vermin. Fifthly, they are a source of danger from fire. The late Mr. Ruskin stated that they were a pleasing prospect in the landscape. I willingly admit that, to the artistic eye, a thatched roof is a pleasant appendage to a country parsonage, though the parson's fat cob may differ from me; but a thatched roof on a gentleman's stable always reminds me of a dilapidated farmhouse. If we discard thatched roofs, we must alternate between slates and tiles. My chief objection to slates is that they generate more heat than tiles, while the ugliness is so apparent to require any comment from my pen. Good tiles, well laid, form the best of which I have had experience.

"Let the gutters from each stall or box run direct into one common gutter, which traverses the stable from one end to the other, and the further the gutter is extended beyond the stable in its open form before it received into any underground drain the better. As far as stable drainage is concerned, nothing further is necessary." Such is the *dictum* of Major Fisher, as written in his admirable little book, entitled "Through the Stable and Saddle Room," and his words convey the necessary advice to those connected with the construction of a stable drainage. It is my duty to warn my readers against the modern systems of borate drainage. The more simple the system of drainage is, the more healthy it is for man and horse. Moreover, it requires a special education to understand the complicated sanitary arrangements which have been introduced into stables during the last decade. Simplicity and cleanliness should be the two most important features of a stable. We cannot expect a stable-lad to keep in order drainage, when he is ignorant of the structure of the drainage.

A Hunt secretary, who is also a farmer

This may no doubt make a warm and comfortable stable, but few owners of large country houses would like to see their stable court disfigured by so hideous a material as corrugated iron.—E.D.

We should really be interested to know in what sense the word "unsportsmanlike" is used.—E.D.

and a breeder of horses, once stated to me that he only required the services of a veterinary surgeon in order to test the eyesight of a horse. Now, the bad eyesight of horses is invariably due to the misplacement of the windows in the stable. The windows of a stable should be behind the horses, facing south or south-west, unless the aspect be north or north-east, when the windows must be placed in front of the horses, and as near the ceiling as possible, so as to prevent any glare in front of the horses' eyes. Lattice windows are preferable to those made of squares of glass; but in either case they should be made to open upon pivots, and have holland blinds to shield the glare of the sun. One window to three stalls or loose-boxes is sufficient, unless the aspect is closed in by trees or other buildings. Whether or not there should be trees or shrubs in the vicinity of a stable has long been a controversial subject amongst the owners of valuable horses. My own experience is that verdure attracts atmospheric moisture, and thereby prevents the moisture from reaching the stable.

In reference to the internal structure, in the first place, let us consider the position of the forage loft. Should it be between the ceiling and roof of stable? Such a situation is the most convenient, so far as the grooms are concerned, and, moreover, serves to keep the stable warm. But in any case the forage should be stored near to the stable, and, wherever possible, in the same building. I recently considered some designs for stables in which the architect had placed the forage loft fifty yards from the stable. I will not refer to the extra labour entailed to grooms by such an arrangement, but how about the forage on a wet night? I should not like to eat my food sodden with rain water, and I do not think that my horses would care to do so. In regard to stables the horse is the first object for consideration, and yet how often do we see valuable horses ruined on account of inadequate stable accommodation! The stiffest fence in Leicestershire is a bagatelle when compared with a narrow stable-door. The door of the stable should be at least six feet, or, if possible, seven feet in width, since in passing through a narrow doorway horses are apt to knock themselves against the side-posts, and to do themselves serious injury. The doors should be half-doors, cut horizontally in the centre, and there should be no projections of any sort or kind whatsoever in the door. Sunken bolts and ring handles obviate any necessity for such projections, which are more liable to injure a horse than barbed wire.

The flooring of a stable should be of the hard corrugated or grooved blue bricks, specially manufactured for stable purposes. These should be so carefully laid that the grooves fit into one another, and thereby form a miniature system of drainage. The gangway should be as wide as space permits, but not less than 8 ft. in width, and the surface should be level. The slope of the surface flooring of a stall or loose-box has for many years been a subject of disagreement amongst men of the greatest experience in all matters connected with the stable; but, with the exception of the late Duke of Beaufort, who favoured a flat surface, the majority of hunting men consider that the gradient of a stall or loose-box should be $\frac{1}{2}$ in. in 13 ft. I do not like to differ from such an authority as the late Duke of

Beaufort, though in most hunting and racing stables the gradient which I have described is adopted. The reason for the adoption is obvious. If a rider wants to stand still by covert-side or anywhere else, and leaves the position to his horse, the horse will choose to place his forelegs on an elevation on a proportionate gradient to his hindlegs to the one which I have described. Surely, therefore, this gradient must be the most comfortable and the most natural for the horse. I may also add for the benefit of hunting men who may read these words, that when the surface is flat, horses contract the pernicious habit of "standing over."

I do not think that there can be any difference of opinion between the relative merits of stalls and loose-boxes. Unfortunately, space often prevents the use of loose-boxes, but it is easy to improvise them by placing strong bars of oak from the stall posts across the gangway to the wall. This is a method which I have often seen adopted in old stables. The economical objection to loose-boxes, namely, that they take more straw to litter them than it takes to litter stalls has long been exploded, since it must be apparent to everybody connected with stable management that the greater the space to be littered, the less amount of straw will be soiled, trodden upon, and have to be removed. In regard to size, twelve feet by thirteen feet is a fair size for a loose-box, and thirteen feet in length by eight feet in width a proper size for a stall. These dimensions may seem extravagant to some of my readers but they must remember that there is nothing more dangerous than for a horse, excited by the idea of leaving the stable, to be obliged to turn round in a narrow stall.

In regard to interior fittings, my primary statement is that there should be nothing superfluous in a stable, and that all the fittings should be as simple as possible. *Simplex munditiis* should be the motto for a stable, as our old friend Horace, who was the cause of many bad hours to me in my Rugby days, said should be the motto of ladies. The more superfluity that there is in a stable, the more dirt and dust, and the more things to be kept clean. Briefly, the greater the simplicity, the greater will be the tidiness. The stall partitions should be made of oak or pitch-pine boards; for it is false economy to use deal, which is liable to splinter, and has accordingly to be constantly renewed. These partitions are now made so as to be movable. Thus by removing the partition and putting up the oak bars already referred to on the two adjacent partitions, a loose-box, sufficiently roomy for the most capricious animal, can be made in a few minutes, and every hunting man will agree with me that after a long day the horse will appreciate the luxury. Space does not always permit of the erection of loose-boxes, though it is seldom that an owner of hunters does not possess a spare stall, by which, by the use of the movable partition, he can get a loose-box when required. The mangers in any stable should be made of enamelled iron, for wooden mangers tend to make horses crib-biters. Moreover, wooden mangers are not so easy to keep clean as those made of enamelled iron. One modern improvement which I strongly urge my readers to use is an enamelled basin or water trough, which can be bought and fixed in a stall or loose-box at a trifling cost, so that the horse can drink when he feels

thirsty. The old habit of giving horses their water out of a bucket at stated intervals always reminds me of Fagin telling Oliver Twist to drink his gin-and-water because another gentleman required the glass. The stomach of a horse is not like the boiler of an engine, though many people fail to see the difference.

In conclusion let me state that there should be no cupboards in a stable, but only shelves upon which nothing but the grooming utensils should be placed. With the exception of a dung basket, the stable utensils should be kept in the saddle-room. But the architecture of the saddle-room would demand a separate article.

NOTES.

IN accordance with the new Tilers and Bricklayers' working rules, a Joint Conciliation Board meeting was held at the offices of the London Master Builders' Association on Monday, the 28th ult. There were present on the occasion five representatives of the London Master Builders' Association, three representatives of the Operative Bricklayers' Society, and three representatives of the Slaters' and Tilers' Union. The question to be considered was the claim put forth by the Operative Bricklayers' Society that its members should have the exclusive right to do roof tiling; and the questions submitted to the board were:—(a) Is roof tiling to be given exclusively to tilers? (b) Is roof tiling to be given exclusively to bricklayers? (c) Shall roof tiling be done by bricklayers or tilers, at the discretion of the employer? The result was that it was decided by the majority of the board "That it shall be left to the employer to elect whether he shall employ bricklayers or tilers to do roof tiling." This is the common-sense of the matter. It all depends on the character of the work to be done, and the necessity or otherwise of skilled labour; and of this the employer has the best right to judge.

IN our note on the Luton Hoo tapestry case when it was decided by Mr. Justice Byrne, it was pointed out that the reasoning by which it was held that the tapestry in the drawing-room was a fixture, and belonged to the freehold, was fallacious. The decision has now been reversed by the Court of Appeal. There appears, however, to be a tendency to attribute too wide an inference to the new decision, and to regard it as having extended the law by giving greater liberality to it in regard to the rights of tenants for years or for ever as against a freeholder. No doubt law always reflects, sooner or later, the general feeling of the community, and public opinion is distinctly in favour of limiting the rights of freeholders to property for which they have not paid. This is most noticeable in agricultural tenancies, but the same trend of public opinion is reflected in such a decision as that of the Court of Appeal on the Luton Hoo case, in which the Judge of First Evidence took a narrow and technical view. At the same time, where there is any possibility of disputes arising as to what is or is not a tenant's fixture, it would be desirable for tenants to obtain a written license from the freeholder to erect fixtures, with the condition that they do not belong to the freehold. It is obvious that as long as the law on this

subject remains in its present somewhat indefinite condition, there must always be a certain danger of disputes. No doubt some class legislation on the subject is desirable by which the rights of tenants would be clearly defined and safeguarded. But modern legislation is so confused and muddled—as witness the Workmen's Compensation and other Acts—that it is sometimes worse than the evil which it is intended to remedy.

THE proposal to restore Linlithgow Palace as a memorial of our late Queen seems to us a rather foolish one. There is no suitability in it as a memorial to Queen Victoria; the name of the place will always be connected historically with that of a feminine royalty of a very different type; and as a matter of archaeological interest it would be a great deal better to leave the building as it is instead of "restoring" it into a modern building. All that seems necessary is to provide against its further decay.

ALTHOUGH the casual visitor to Newcastle may find little temptation to cross the river in search of the beautiful, there is, and has been for years, urgent necessity for more adequate means of railway communication between the banks of the Tyne. Apart from the heavy toll payable by the railway company to the owners of the High-level Bridge, this structure notoriously offers insufficient accommodation for the heavy local and main line traffic of the present day. Moreover, its position with regard to the Central station renders necessary for through trains a change of engines, causing expense and delay to the railway company, and a reversal in the relative position of the carriages, causing discomfort to many passengers. A second railway bridge, with four sets of metals, is now to be built, crossing the Tyne from Gateshead near the Redheugh bridge, and entering the passenger station at the western end. The new structure is to be of the lattice girder type, having two spans resting on a central pier of granite. On the south side of the river the approach will afford communication with the main line a little below Gateshead Station, with which connexion will be made by means of a loop line, so that the utmost advantage may be derived from the addition of the new bridge. Each span of the bridge will be about 300 ft. long, the total length being 675 ft., and the height above high-water level to the lowest rail of the bridge is to be 85 ft. The structural details of the northern approach are not yet finally settled by the engineer.

A CORRESPONDENT writes:—"I presume that the leading architects of Wiltshire are working hard to obtain the tempting bait held out to them in the enclosed advertisement, cut from the *Wiltshire Times* of February 9 inst." The following is the advertisement referred to:—

"TO ARCHITECTS.—The Trustees of the proposed New Wesleyan Church and Schools at Chippenham invite Pencil Sketch of Buildings, including Elevation, Ground Plan, and Section. Terms: Ten guineas for design selected, the same to be the property of the Trustees, without prejudice to any future action."

The hon. secretary to the Committee is the

minister. We are inclined to think a clergyman of the Established Church would have known better than this, at all events.

WE understand that Mr. Allan Wyon, F.S.A., chief engraver of his Majesty's seals, has received instructions for the making of new Great Seal. Mr. Allan Wyon is the third son of Benjamin Wyon, who in 1831 succeeded his father, Thomas Wyon, as chief engraver of his Majesty's seals, and was succeeded in that appointment by his three sons in turn—Joseph Shepherd Wyon in 1858, Alfred Benjamin Wyon in 1865, and Mr. Allan Wyon in 1884. The Wyon family were originally of German extraction and reckon amongst their members the Court jeweller of King George I., Thomas Wyon the younger, chief engraver at the Mint, and his successors at the Mint, Leonard Wyon and William Wyon, R.A., F.S.A.

WITH the demolition, now in progress, of the massive gateway and the Governor's house at Mount Pleasant, Clerkenwell, will disappear the only remaining portions of the old prison that was closed in November 1885. The stone gateway, having a lion's head and rusticated voussours around the arch and inner piers in the archway, is the last of its kind in London. It has retained the original doors with their two big iron knockers, but the linked fetters on the outer piers and the inscription beneath the cornice—"1794 Middlesex House of Correction 1866"—have been removed. In pursuance of the Act 26 Geo. III., c. 55, the erection of the prison was begun upon a site of marshy ground, nine acres in extent, bounded along its west side by the Fleet, which the county magistrates bought for 4,350*l.* from Thomas Clarke Jervoise. Plans and designs for 232 cells were prepared by Sir Robert Taylor after whose death in 1788 the works were carried on by Sir William Chambers in 1788-91, and then after Chambers's death in 1796 by T. Rogers. The prison, first opened in 1793, was enlarged and remodelled in 1830 by Robert Sibley with five blocks radiating from a common centre, to the north of the older buildings, and on such a scale as to render it the finest and one of the best appointed goals in the kingdom, with a capacity latterly for 1,558 prisoners. On the east side, in a detached building, was the great treadwheel for grinding corn (since removed to Pentonville), with room for 350 at a time of the prisoners condemned to hard labour for periods known as "short sentences"—two years or shorter. Upon the removal of the prisoners to Pentonville protracted negotiations ensued between the Clerkenwell Vestry, the Home Office, the late Metropolitan Board of Works, and the London County Council in respect of a project to secure the ground, partly as an open space and partly for the building of artisans' dwellings. In the result the site was acquired under the Post-office Sites Act, 1889, at a valuation of 96,000*l.* and a payment of 10,000*l.* to the London County Council in lieu of the reservation of any portion of the land as a recreation ground, for the Parcels and Telegraph Engineering Works services of the Post Office. In June last year the Provincial Mails service migrated from St. Martin's-le-Grand to the premises erected there, at a

cost of about 113,000*l.*, by Messrs. Lorden of Upper Tooting, contractors.

ADVERTING to the obituary notice in our last issue, pp. 142-3 ante, of the late Mr. John Murray Robertson, of Dundee, we may mention that in our number of August 13, 1898, "Dundee," being No. XVII. of our series, "The Architecture of our Large Provincial Towns," we published illustrations of the Fyffe's Buildings in the Nethergate, the Lochiee Free Library and Baths, the Caledonian Insurance Company's offices, and the Technical Institute—all erected after his plans and designs.

The usual series of lectures at Carpenters' Hall will commence on Thursday evening the 21st inst., with a lecture by Mr. H. H. Statham on the architecture of the recent Paris Exhibition, illustrated by lantern views of a number of the buildings, permanent and temporary. The lecture is not intended to be merely descriptive, but for the critical consideration of some points suggested by the treatment of the Exhibition buildings. The succeeding lectures will be by Mr. H. C. Richards, on "Old London" (February 28); by Mr. John Slater, on "Celebrated Ancient Buildings" (March 7); by Mr. W. E. Riley, on "Dwellings for the Working Classes" (March 14); and by Professor T. Roger Smith, on "Westminster Abbey" (March 21). The lectures commence at eight o'clock.

The receiving days for works sent in for exhibition at the Royal Academy this year are:—
 Royal Academy Exhibition.
 water-colours, miniatures, black-and-white drawings, engravings, etchings, architectural drawings, and all other works under glass, Friday, March 29; for oil-paintings, Saturday, March 30, and Monday, April 1; or sculpture, Tuesday, April 2. We may remind our readers that architectural drawings must all be sent in gilt frames; any other frames are not admissible.

PORTSMOUTH TECHNICAL INSTITUTE AND LIBRARY.

The designs submitted in competition for the proposed Technical Institute and Free Library have been on view at Portsmouth Town Hall this week. The competition was limited to architects practising in the town, and involved an estimated expenditure of 43,000*l.* Six sets were received; we have already published the names, together with the award of the premiums (see "Competitions" in our issue of January 10).
 The circumstances of the contest are somewhat unusual, and considerably to the advantage of the architects, as the Corporation engaged the services of Mr. A. W. S. Cross to act as the assessor, and he prepared sketch plans, outlines which were furnished to the competitors. This was no doubt a wise course to adopt, as otherwise probably it might have been difficult to have locally obtained a satisfactory plan. The competitors were directed generally to follow the lines of the plans as laid down, it being open to them to make what minor modifications might commend themselves.

All six designs are therefore practically identical, no one competitor caring to launch out. This is somewhat remarkable in regard to one special feature—the entrance; no design attempts to make this an element in the plan, and coming at the angle of the site it is of considerable importance.
 The site is a fine one, situated west of the town Hall, and now occupied as an ornamental garden; it is bounded on one side by a railway embankment, and on the other by

Park-road, to which latter it has a frontage of 180 ft., and of 160 ft. to the Town Hall, forming an *^-* shape, with the entrance at the angle.

The general disposition of the plans is as follows:—Entering from Park-road at the corner, the building is bisected by a corridor both ways, the staircase being opposite. In the right wing is located the free library—reference library, store and engineering-room being in the basement. The first and second floors provide an examination-room, which is also available for banquets in connexion with the Town Hall, and an elementary art room. The left wing contains in the basement the building-construction and engine rooms, &c. The ground floor has a range of ten classrooms and other offices on either side of the corridor, which is lit from the end, and is about 150 ft. long by 8 ft. wide, with caretaker's-room in a wing at end. The first and second floors have in front the physical laboratories, lecture-rooms, &c., while the art rooms are situated at the back, which has a good north light. Two lecture theatres come over the entrance, while cart access is provided at the rear.

This is the plan which all of the competitors have adopted, with but slight modification, and no one has grappled with the dislocation of the sanitary adjuncts, which are all within the building, or the architectural treatment of plan of the entrance.

The problem, therefore, submitted was tempting, and comparatively easy of solution in having merely to modify the plan and clothe it architecturally, and that the result has not been more satisfactory is a matter for some surprise, as no design submitted shows any high and unquestionable merit.

The first premium has been awarded to Mr. G. E. Smith, who follows the sketch plans; but the details are not wholly free from defects, the supervision of the library being imperfect, and the entrance doors, which are at the head of a long flight of steps, are inadequate. On either side are two great bay-windows partially treated as sash frames, the upper half being lead lights; angle turrets abound, which are utilised as recesses. A tower encloses the staircase at the rear, but would not be seen, at all events, from the point of view indicated. In regard to details the scheme may be a good deal improved. The elevations are brick and stone banded, with many breaks, projections, and turrets, and the fronts to the streets suffer greatly from a profusion of irritating ornament. For economy's sake this has been omitted on the back elevations, very greatly to their advantage. The design is illustrated by an admirable perspective, which gives a pleasing interpretation of the design, but will not bear investigation.

Messrs. Rake & Cogswell are awarded the second premium; this is a more spirited, though evidently hurried, design. The entrance is by a circular porch. The wall above is carried up and finished with a curved pediment, the angle being filled with splayed piers, with cappings; these not running into the pediments having an inconclusive effect. A lofty turret is carried up on either side, projecting at the top and much overweighted. It is clear from the plan that these features are impracticable, as a 14-in. iron column is being carried up on either side to produce them over the lecture theatres. The fenestration is deficient, the windows being ranged in a diminishing scale, which makes the laboratories on the top floor very dark. The examination-room is more effectively treated than in the first design, in view of its municipal use. The spacing of the façades is well considered, and the stonework agreeably grouped, with a pediment at either end, with the intermediate spaces divided by pilasters, makes up the two fronts. Parts of the plan are dark, such as the lavatories and the students' locker-room. The arrangement of the library is, however, good. The design is effectively shown by a pen-and-ink perspective sketch.

Mr. W. C. Bevis, who is awarded the third premium, has some good points in his plan, and the arrangement of the library is certainly the best submitted—the book stores being kept at the rear, and all well lighted, with the news and magazine spaces in front, all under visual control. The entrance hall in the plan has received some slight recognition, two alcoves being formed, one of which affords convenient access to the basement. The treatment of the angles is the especially weak point in the design, an error which is apparent in all the designs to a certain extent excepting the first, in cutting the building into two. In this instance, a portico and two segments, surmount-

ed by a stone balcony and turret, attempt to fill the space of the angles, but do much to mark the distinction the more. The building is seen to better advantage in the scale drawings than in the view. The elevations in this have been extended in every instance but one, without any real gain. The theatres are well-planned, and careful attention has been given to the fenestration.

Mr. C. W. Ball has his design evidently illustrated by the same artist as in that placed first, and it is noticeable that the perspective and elevations do not correspond as they should. Judged by the former, it is generally one of the best designs. The frontage to Park-road is, not unreasonably, treated in a different phase, being divided by a pediment treatment at the far end, and the intervening space by two curved pediments, the resultant being a crowded effect. The Town Hall front is quiet and satisfactory, and with a feeling of repose which but few have sought after; but the contrast between the two calls for some elimination on the Park-road elevation. The entrance is treated on a plane, within a curved pediment and porch, the fenestration over is not happy, the whole completed by an octagon and dome; but it requires more connexion to be entirely satisfactory. The library seems to be divided by solid partitions, which would not be desirable, and the lighting generally would require re-consideration.

Mr. A. E. Guy's design is the most pretentious of any. The chief point about the plan seems to be the complete system of heating and ventilation. The lecture theatres are on the reverse plan to the others shown, the lecturer being placed back to the light. The elevations and perspective do not call for remark, being of a nondescript character.

Mr. J. Walmisley submits a carefully-prepared set, and a good line perspective. The building looks suitable for its purpose, and has gables with stone tops of a rather commonplace type now in vogue. The porch on the Town Hall side is brought up to the path, contravening the instructions. The Park-road front has been kept at a higher level, and the whole effect as one building is satisfactory, although the windows have a wiry look.

We have before called attention to the question of perspectives in competitions; there is something to be said for them at times. They do not, however, influence an assessor's choice; but this is one of those rare instances where architects of good local repute might have been asked to submit perspectives without elevations, for more often than not the one or the other is delusive.

COMPETITIONS.

CARDIFF NEW ASYLUM.—The award in the competition for designs for a new asylum which the Cardiff Corporation have decided to build on the Velindre Estate, near Whitchurch, was made on Thursday last week, when Mr. George T. Hine, the assessor, placed first the designs of Messrs. George H. Oatley and W. S. Skinner, of Edinburgh Chambers, Bristol. Fifty-four architects had submitted plans, and five had been selected for the final decision. They were Messrs. Oatley and Skinner, Bristol; Messrs. Law and Allen, Arundel-st., London; Messrs. Greenaway & Newbury, Queen Anne's-gate, London; Messrs. Hooley & Sander, Nottingham; and Messrs. Wills & Anderson, Swansea. Messrs. Oatley & Skinner were appointed the architects to carry out the work at a commission of 5 per cent. on the contract. Their estimate is that the work will cost 235,000*l.* Each of the remaining four competitors named will receive a premium of 100 guineas. The accommodation is for 1,250, but it is proposed to open wards for 800 patients only at first. Mr. Hine announced that all the five named competitors had complied with the conditions, and that the standard was high.

UNION HOSPITAL, PATRICKCROFT, LANCASHIRE.—On the 6th inst. the new union hospital at Patrickcroft, erected by the Barton Board of Guardians, and situate adjacent to the new workhouse, was opened. The buildings were erected as a memorial of the Queen's Jubilee. The plans were prepared by Messrs. Worthington & Sons, architects, Manchester, and provision is made in the male and female wards for 200 beds. The contract for carrying out the work was entrusted to Messrs. Gerrard & Sons, builders, Swinton, and the cost has been considerably under 20,000*l.*

THE ARCHITECTURAL ASSOCIATION.

AN Ordinary Fortnightly Meeting of this Association, deferred from the 8th instant on account of the Queen's death, was held on Friday evening last week in the Meeting room of the Royal Institute of British Architects, No. 9, Conduit-street, Regent-street, the President, Mr. W. H. Seth-Smith, occupying the chair.

The late Queen Victoria.

The minutes of the previous meeting having been read and confirmed, the President said: "I think it will be in accordance with the wishes of all of you that the Architectural Association, at its First General Meeting after the death of the late Queen Victoria, should pass a vote of condolence with the King and with the Royal Family (the members of the Association here all rose from their seats and remained standing until the President's motion was agreed to). The Architectural Association cannot boast of Royal Patronage. Your committee, therefore, felt it might savour of presumption to send a tribute to the Queen's memory in a form such as that which it became the Royal Institute of British Architects to offer. The members will, however, I am sure, feel that this occasion must not pass without a public record of the profound sense of loss we, as a public society, in common with every one of our fellow subjects, have sustained by the death of Queen Victoria. Every man must acknowledge himself the poorer and at the same time the richer. We have lost a Mother in the highest sense; but has she not bequeathed us a fortune and a great one for all who recognise that man does not live by bread alone? That life, early consecrated by resolute will to the service of its author and its fellow men, has realized the ideal of religion and of ethics, and of public, domestic, and social duty. The throne of the greatest Empire the world has yet seen is a point towards which the eyes of all men are naturally directed, and when that exalted position is occupied by a life lived on a plane altogether higher—intellectually, morally, and spiritually—than that which mankind is accustomed to witness, it must wield an incalculable influence for the progress of the race. It is this which makes Queen Victoria's life so rich

a gift to mankind, so great an inheritance to the British Empire. A gift, which if made good use of as an ideal of womanly character to our men and as a pattern to our womanhood, cannot fail to make us true to our vast responsibilities as the teachers and rulers of so large a proportion of mankind. The King has, we consider, during his many years of gracious and generous devotion to the interests of the public, shown a desire to encourage art by every means within his power, and we welcome in him one whom we may surely hope will help to give architecture the place in the public estimation which its greatness merits, and who will in particular use his royal influence to further the better training and organisation of the profession. I will, therefore, move that the following respectful address of condolence be forwarded to His Most Gracious Majesty the King—

"May it please Your Majesty,

We, the President, Committee, and Members of the London Architectural Association at our first General Meeting since the lamented death of Your August Mother beg leave very humbly to offer to Your Majesty and to the Members of Your Family our profound sympathy and sincere condolences on the irreparable loss which you and Your Empire have sustained by the death of Your August Mother, the late beloved Queen.

At the same time we would venture to hope that Your Majesty will be graciously pleased to accept a dutiful assurance of our devotion and affectionate loyalty, both to Your Majesty's throne and person and to the Members of Your Royal House."

The address was signed by Mr. W. Howard Seth-Smith, the President, and the Members of the Committee.

The motion having been agreed to, the Chairman said that owing to an engagement made before the date of that meeting had been changed from the 8th to the 15th inst., he would not be able to remain for the rest of the evening; and he would call on the senior Vice-President, Mr. W. A. Pite, to preside.

Mr. W. A. Pite then took the chair, and the following gentlemen were elected members of the Association, viz.—Messrs. A. F. Benjamin, W. J. Brough, B. A. Everitt, A. H. Fleuss, A. P. Lambert, and E. E. Temple. It was also announced that Mr. T. Davison has been reinstated a member.

A vote of thanks was accorded to Messrs. G. Bell & Sons, the publishers of Mr. J. Blomfield's book entitled "A Short History of Renaissance Architecture in England," for presenting a copy of the work to the library.

It was announced that the first spring visit will be made on the 16th inst. to the Roman Catholic Cathedral and Cardinal's House Ashley-gardens, Victoria-street, Westminster by permission of the architect, Mr. J. Bentley.

Architecture in Crete and Turkey.

The Chairman then called on Mr. D. T. Fyfe to read a paper on "Architecture in Crete and Turkey," remarking that Mr. Fyfe was well known to most of them as a former Architectural Association travelling student, who has since had the honour of being sent out to Crete to take part in the recent excavations there.

Mr. Fyfe then read the following paper—"Like all Greek lands, Crete belongs to the dawn of history, and is rich in remains of the Mycenaean civilisation, about which so little is known. This period, however, belongs more to the domain of archaeology than of architecture, as also, in the case of Crete, do the Greek and Roman periods; their remains being so scanty as to afford little architectural interest. After the decline of the Roman period the island was conquered by the Saracens in A.D. 820; then by the Byzantines in 961; but to Venice belongs the chief mediæval period which lasted from 1204 till the final conquest by the Turks in 1669. The island in its most representative aspects is Venetian. Under the Turks how rebellion followed rebellion in a matter of well-known history.

It is certain that Crete held an important place in the Early Ægean civilisation. Homer mentions it as a land of ninety cities, from which we can infer that it was highly populated. The sites of many of the Homeric cities have been identified, and are now partially disclosed, notably, Knossos, Gortyna, and Ghoulas. In their construction we notice the same characteristics which are displayed in the Palaces of Mycenæ and Mycena, in the mainland of Greece, excavated by Schliemann and Dr. Dörpfeld, &c. In all are the same mud (or rubble and mud) walls, mysteriously

Fig. 2.—Sketches at Candia.

appearing to be contemporary with Cyclopean masonry; the same circular stone column-bases and paved areas. Only Knossos has produced some entirely new forms of architectural plan and detail, and such a collection of painted stucco, both existing on the walls and in fragments, as to make it quite unique in the Levant. Looking at this stucco as a means of decoration, it is noticeable that two distinct scales seem to have been employed; one, comparatively easy to appreciate now, consisting of life-size representations of figures, bulls, gryphons, &c., or conventional representations of landscape; the other consisting of very small objects or figures produced in a more brilliant style, and found in such small fragments as to make it hard to understand how it could have been used. From this latter variety some very interesting architectural representations are apparent, which help to elucidate the subject of Mycenaean building. The art displayed at Knossos is the complete fruition of the genius of the time. Though some of the finds at Vaphio, in Greece, are quite as artistically mature, a comparison of Knossos with either Vaphio or Mycenaean is futile at present, as so much of the treasure of the latter comes from the tombs, which in the Cretan site have not as yet been discovered. But in the palace itself enough has already been found to show that in this reputed home of the art of Daedalus, a very keen, strong perception of natural forms existed, and a direct getting at nature behind an indefinable veil of conventionality, which gives the art of this epoch a distinct value of its own. In building, the outer walls, which may have been more or less fortifications, are based on ponderous squared blocks of gypsum, which weathers with water grooves, like the hard calcareous substance of a cave. The bases of many walls in limestone and gypsum have been found very accurately levelled and laid out, but it still remains a problem in many cases whether the superstructure was of the same substantial material or of mud to take stucco work. Nothing of direct evidence has been found to point to the existence of later Greek or Roman settlements over this primitive one of the palace at Knossos, though many Roman fragments exist in the vicinity. The site of Ghoulas is an Acropolis much more approaching the wild and inaccessible character of Mycenaean than the refined and civilised Knossos. Splendid polygonal masonry exists here, forming ramparts up a steep hillside which overlooks a truly Greek prospect of hill and plain. And here also are picturesque evidences of a later Roman settlement on the Acropolis itself. But Crete has no prominent Roman

architectural remains above ground that would bear comparison with those of Italy, Greece, and Asia Minor, and be of much help to the student in his search for the historic links which bind the Imperial Art to the Romanesque and Renaissance of later times.

Coming to more modern times we notice also that Crete has passed through so many vicissitudes, and fire and sword have wrought in it such havoc, that its present day can show but little of permanent architectural value above ground. Whatever it was in early times, both under the Venetians and the Turks, it formed but an outpost-station, very liable to attack; so it is not surprising if the engineering of walls, and the useful side of architecture generally, form a large part of what is to be seen in the island to-day. Owing to the fusion of periods of the dominant mediæval power and the later conquering Islam, Candia, the most important historical town and the capital of the island, presents in its picturesque aspect an Eastern town with white walls and minarets, combined with massive sea-walls and fortifications. One can sail close in round the harbour in a small boat, and see as a sign the lion of St. Mark high up in frowning walls, and afterwards, on landing and traversing the market, be bewildered by all the strangeness of an Eastern town. This is true, of course, all over the Levant. The conquering Turk was an interloper and a barbarian, who settled down amidst the cultured evidences of mediæval times; and so from Constantinople, downwards in the scale, one finds the same thing—the dome, minaret, and whitewash of the Turk side by side with the grey stonework of the conquered Christian races.

The more modern architectural remains of Crete include:—1. Churches and monasteries in a pseudo-Byzantine style, similar to those met with in the country districts of Greece. 2. Buildings of the early Venetian period, in which the pointed arch was employed. 3. Later Venetian buildings in a provincial Renaissance style. 4. Turkish buildings, which are mainly domestic, and in plain stucco. The town of Candia contains examples of all of these, except the first, though it has also been sadly deprived of much that was apparently interesting of the Venetian period. I shall give some description of Candia, and then indicate what I saw of other work. The great defence of Crete against the Turks in the seventeenth century was a matter of such interest to the Christian Powers of Europe, that we fortunately possess some literature on the subject, and contemporary plans of the fortifications of Candia, the siege of which lasted for more than two years, and became

one of the most memorable in history. I have here a plan of that time made by a French Admiral, the Marquis de Ville, who commanded a relief expedition. This plan will serve to show to the curious the nature and extent of the original fortifications (fig. 1). Many of these, especially on the north side, exist to the present day in a good state of preservation; and some of the photographs I have will indicate their character. It will be seen from the plans, that the nature of the harbour has been taken advantage of much in the same way as at Rhodes; and the fortifications of the two towns resemble one another, both being more irregular than those of Nicosia in Cyprus, a plan of which was published in the *Builder* recently. The Candia walls are good examples of their class, but they have no prominent towers and no decorative details of interest, except the occasional panels with the Lion of St. Mark before alluded to, and a few small carved coats of arms. So they are probably inferior in general interest to those at Famagusta, in Cyprus, and those at Rhodes. There are three principal gates in existence, all Renaissance of the Venetian period: the Canea Gate, the *Kainourio*, or 'New' Gate, and the Lazaretto Gate (see lithograph). This last is probably the most interesting of the three, and has a long vaulted passage from the ornamental inner gate to the outer entrance. This passage is barrel-vaulted in rubble and descends pretty rapidly towards the outside. It turns sharply to the left at the end, so that there is an intersection, over which is a dome lit with a single eye; thus when the outer gate was shut the passage would not be in darkness. The form of the inner gate, with its pediment, is quaint; but the details are coarse and in no way improved by much whitewashing. The part of the wall at this gate was perhaps the most impregnable, as it commanded a very deep moat, owing to the rapid slope of the ground towards the sea. The level square of the town inside the gate (shown in the lithograph) is raised artificially, and a few steps ascend to a platform which juts out beyond the main line of wall, being built upon a forework which originally protected the bastion here. The raised plateau is now the Public Garden, and commands a fine, though limited, view seawards and a good sight of the walls. To return to the other gates. The *Kainourio* is more commonplace than the Lazaretto, but is of naked stone, and has a good quiet cornice. It forms the entrance to the town from the interior of the island, and the present roadway really crosses what was the moat of mediæval times. It has also a

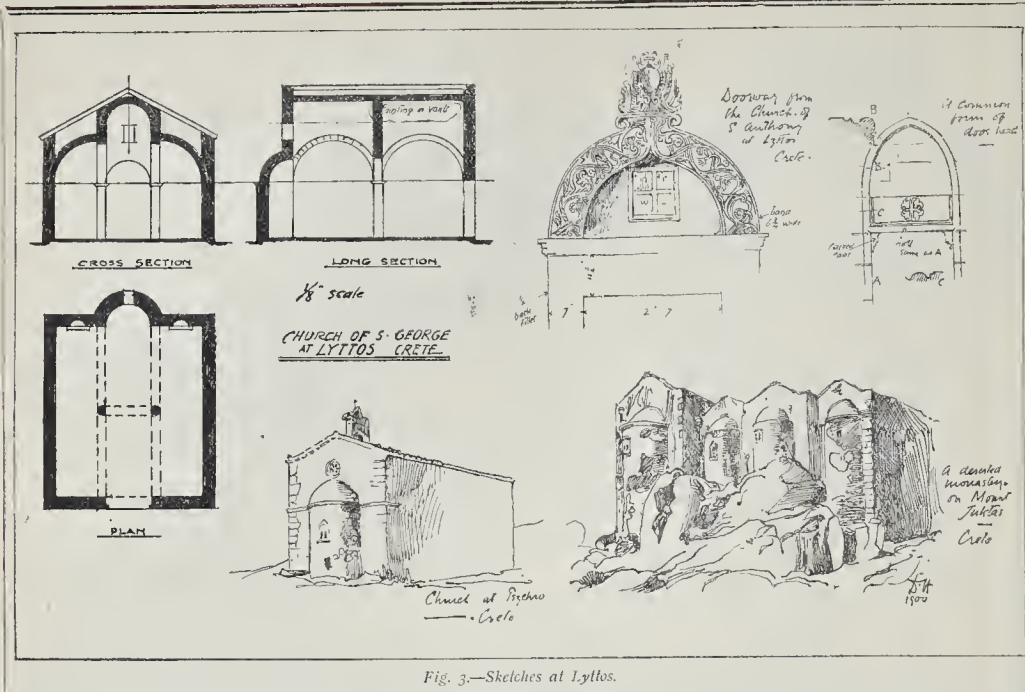

Fig. 3.—Sketches at Lyttos.

long vaulted passage from inner to outer gate, though not so remarkable as the other.

The Canea Gate has even less of architectural interest than the other two, and I do not possess any illustration of it. It has no vaulted passage, being merely in the thickness of the wall, and it leads to the high road that runs eastwards along the north shore of the island, towards Reimo and Canea.

Leaving the walls and gates now, and entering the town by the harbour, we see first the remains of the great arches of Venetian Gothic which formed the arsenals of the mediæval town. They are marked thus on the old plan, and were, no doubt, complete before the great siege. Now, in their ruined state they are used as boat-slips. The responds which exist on the back wall show that there must have been ribbed and groined vaults here, and the piers that exist are massive enough to show the large scale of the whole. Leaving the harbour, we pass up a sloping street to the centre of interest—the market square—at the highest part of the town. Streets radiate in all directions, but the interest here is diffused, and the square is only a quiet aside. The throng of the markets is at another meeting of streets a few yards from it, surrounded by low, squalid buildings, with here and there a crazy, whitewashed dome. The market square, however, has a fine old Venetian fountain in the centre, surrounded by a Turkish marble and wrought-iron grille (see lithograph); and from this point can be seen, partly hidden by a large plane tree, the only large building in the town of any character—the old Venetian Renaissance armoury (see lithograph), now proposed to be renovated and used as a museum of antiquities. This building is a very good example of its period, and exhibits, as do other little things in Candia, many of those quaint provincialisms which so often delight the careful eye in architectural by-paths. The proportions and details are alike good, and admirably in scale with the general air of the town. A crowning balustrade is rather wanting somehow, though its addition might take away from the Venetian character of the building. White stone is the material used, but the lower story has been whitewashed—a favourite trick of the Turk everywhere. The smallness of the rustication is noticeable. At the rear of the building, otherwise plainer than the front, are some quaint metopes in the Doric frieze, representations of weapons, &c., carved with great boldness. The other Renaissance work in the town is fragmentary, but the Turks largely adopted details of the late Venetian occupation, which causes some con-

fusion. The Gothic work in the town, or rather the 'pointed arch' work, is in some cases even more difficult to analyse, as the Turks are always at home with the pointed arch, so that the Venetian Gothic and the Turkish work are not always readily distinguishable. Both of them have probably a Saracenic origin. Venetian Gothic is certainly quite a unique flower in architecture, and perhaps belongs properly to the East, as the Turkish work undeniably does. There are one or two charming fragments of Venetian Gothic in the town, enough to show what might have been under a more fortunate dispensation. The doorway, of which I have a sketch, is a good example (fig. 2). The capitals at the impost show Byzantine and Classic influence, and are beautifully detailed. The sturdy stone fountain of lions in the market square (fig. 2) is quite a treasure, with large and generous treatment of basins and mouldings. The Turkish grille surrounding it, though it rather hides the older and better work, gives it additional dignity. The form of the grille is probably governed by the old carved marble panels of Roman or Byzantine time which are built in at the base. In the new upper part a light grey marble is used for the framework, sparingly decorated with gilding and green paint. Here should be mentioned the only Gothic church in the town which is still standing. It is now used as a mosque, but is evidently the building marked as St. Saviour's in De Ville's plan. It has no pretensions whatever, being merely a barn-like structure, with high, narrow, pointed windows, all perfectly plain. It has a stumpy Turkish minaret of pleasantly original design. This mosque is illustrated in Pashley's 'Travels in Crete.' I have, unfortunately, no illustration of the wall fountain in the little square beside this mosque, which is the only example I know in Candia of Roman work being built into a wall by later hands, and which is so commonly seen and often so charmingly effective in Rome and Constantinople. The Candia fountain has merely a quaintness caused by broken-nosed statues and battered columns, associated with some common-sense mouldings. Of Turkish work one of the best old fragments is the series of arches in the main street leading up from the harbour. It much resembles the boat-slips at the harbour, but has one or two tricks of Turkish detail (see lithograph). The Turkish fountains are mostly at the corners of the streets, and, generally speaking, are hardly worth taking note of; but in one or two cases the simplicity of the mouldings deserves attention. Turkish work, when it redoubles

on itself without other influences, has a tendency to over-elaboration, and most of the great show fountains of Constantinople are glorified grottoes in their total effect; so that it is refreshing to come across some things in this little provincial town which, either from poverty of workmanship or uncertainty of style, are simpler and broader in treatment. The little corner kiosk illustrates the better class of Turkish bijou in Candia, and though it is small, has some claims, if one can get behind the oceans of abuse and whitewash. The centre spot in the lower panels is a favourite form, and is met with all over Turkish work. In the narrow winding streets one sees Turkish wooden houses with latticed windows, usually with a good projecting cornice and pilasters, and the upper story projected two or three feet and supported on wood brackets. In the high walls giving access to the forecourts of the stone houses one sees here and there a Renaissance door and window, with occasionally a wall fountain, a trough surmounted by a round-arched niche and accessories being the usual motive. None of these call for any particular remark. The wood houses are pretty much the same as those in the streets of Stamboul, and remind one a little of English half-timbered work, gables of course being absent, and a thin, matchboard effect taking the place of the solid oak of the English. I have reserved the mention of the earliest work of all, the Byzantine, till the last; but there is really no definite building in that style that I am aware of existing in Candia. Pashley mentions nothing in his book, and the only thing which Spratt mentions which I have not identified is (I quote his own words) 'the ruined church of St. Titus, over the eastern part of the fortifications; for such a town, of cathedral proportions and architecture. A handsome entrance and circular window over, and part of an elegant baptistry attached to it, are still standing.' It may have been an oversight on my part, but I certainly know nothing of such a church, which may, of course, have been destroyed since Spratt's time (1865). The church also may not have been Byzantine. This takes us pretty well over the ground for Candia. In general impression it is a hopeless mixture of the odds and ends of various periods. There is not a recent building of any note whatever, except perhaps the Greek cathedral, and not a single mosque which is worth enlarging on. The best mosque in the town is the plain old building mentioned before as the only Gothic church existing; but here, beyond a picturesque, weather-beaten, brick-and-stucco wall, there is

nothing to be noted. The modern Greek cathedral (shown in the sketch in combination with the minaret of the new mosque) is best seen at a distance, and gives additional life to the sea-view of the town. One can pretty well take in the town after a walk through, and appreciate what it is—tawdry, neglected, mediæval Eastern—shortly to become more important, perhaps, through a museum which consists of valuable exhibits with no proper building to hold them; which is part of the fact that many people have ideas about reform in Crete, but as yet very little money or unanimity of opinion have been forthcoming to carry them out.

But, leaving Candia and the burden of Crete meanwhile, let us turn our attention to other parts of the island, and see what is to be found in the way of architecture. And if the result is disappointing, we can remember that archaeologically, at least, the ancient evidences are of immense value. The results of Knossos, Praesos, Gortyna, Ghoulas, &c., and the sundry caves of Zeus are giving Crete a research interest quite exceeding expectations. Architecturally, however, it has no town with a strong mediæval interest, like Rhodes, and no body of work such as is disclosed to us in M. Enlart's new book on Cyprus. The results for Crete are in comparison meagre and fragmentary; here and there a small Byzantine church or a picturesque monastery, and for the rest, merely the plain domestic work met with in the country districts of any Eastern land. It is true that there are two other towns of importance on the north coast—Canea and Retimo—Canea being really the modern capital of the island; and I have not examined these towns as I have Candia, but anything really important would naturally be found at the latter place. The growth of Canea is due to the adjacent harbour of Suda, by far the best in Crete, and its prestige is only on the modern side. It is the residential town of the High Commissioner, and, like Retimo, a commercial centre. It would be necessary, therefore, to thoroughly explore the country districts to arrive at a complete knowledge of all the smaller Cretan work. As the architectural bits are so fragmentary, and native evidence so little to be depended on, this would mean a tour of several months' duration. The Italians are said to be working up the architecture of Crete now, but I am not certain how thoroughly for the country districts. I was only able to make a tour of about 100 miles through fairly representative country, but was unable to appreciate pretty well what can be looked for from the island. I could not do better, I daresay, than illustrate by examples the Cretan house, church, and monastery.

The houses of the Turkish beys are the only ones left to us of any importance. They are usually farm-steadings in themselves, but the houses of retainers are sometimes grouped in their village near. I can briefly illustrate the latter class of house by the one I have most acquaintance with—the headquarters of the Cavation at Knossos—of which I have a sketch (see lithograph). The front entrance is like a private one, and leads to the little piazza served for the household. The real entrance is at the back, through a courtyard, and leading out of this yard round which are grouped e stables, is a smaller one descending to the kitchen apartments and entrance to the harem. The *scamliik* looks out to the front, as do the other principal rooms. All have stone wall-utains, which cool the air in summer, and a divan, or at least a platform, round three sides. Glass is a luxury, but hinged wood-utters opening outwards are indispensable. In the house I am describing, there are loopholes in the walls, presumably for defence, lined on to the house, besides the little piazza in front, is a large water tank, forming a reservoir for the irrigation of the garden. This tank is not conducive to health in summer. The house is all whitewashed externally, and is very sensibly plain, with a square parapet to the flat mud or cement roof, so that rain water is carried off by channels running down the wall, which in the front of the house are screened by plasters. The ceilings are of wood; stout exposed rafters trying boarding. In the back entrance-lobby an olive press in the wall for the use of the household. As for the villages, the small out-of-the-way ones have the merest shanties, with high stone whitewashed walls and flat mud roofs, huddled together in picturesque style. The hill-villages in summer are pleasant, as a half lives on the roof. The larger villages

have whitewashed houses, the more important ones with courtyards opening off the streets, and sometimes of two stories, as in Candia. Red tiled gabled roofs are also occasionally met with, though they are really modern features.

The next thing to consider is the Byzantine church. This is often in splendid isolation, sometimes on a hill-top, and occasionally even on mountain summits. But every village has its *εσθια*; at feasts, such as Easter, a very important place indeed. The universal plan is an oblong hall, without a narthex, and with but one feature—the tiny apsidal projection at the east end, finishing semi-dome fashion. In this apse is the only fancy window; in common cases, usually a queer little two-light, with the luxury of a hood-mould. The better class of church has a carved door, or painting in the plastered vault. Notes from the two churches beside the ancient site of Lyttos will illustrate. The rough plan and section of the church of St. George illustrates an average arrangement (fig. 3). There are traces of rude painting in the vault of this church. A very common type of door-head is shown. The wood doors of these churches are sometimes elaborately carved. The usual type is a two-leaved square door, with a rounded centre-post, on which most of the carving is lavished. Many of these wood carvings are so undoubtedly executed in the full tradition of good work, that it is astonishing to find they mostly belong to this century; in some cases being done within the last thirty years. So tradition is dying hard in Crete. It is quite possible that these churches at Lyttos, not specially celebrated in the island, may point to some fairly interesting bit-bits of Byzantine work, fairly, perhaps, one or two new developments of plan in other parts of the island. But there are no outstanding churches of any size, and I doubt if results would go beyond the student's notebook. I have the names of three or four other churches in the island which are said to be interesting.

Following naturally from this, of course, is the subject of the monasteries, as they always have chapels attached. The situation of monasteries here, as elsewhere in the Levant, is often very delightful. One rides up a ringing stony pathway to a sense of summit and retirement, and a clean spacious comfort which is a relief to the wayfarer after the squalid village. They are usually more subjects for the sketcher than the architect in his more practical moods, but the monastery at

Fig. 4.—Monastery at Arkadhi. (Traced from a Photograph by Mr. F. B. Welch.)

Arkadhi (fig. 4) shows a front of considerable interest, with that quaintness of combined Gothic-Classical influence so instructive often in unacknowledged forms. In this way it appears to be even more interesting than the armoury at Candia, though I regret that I have not been able to verify the detail from actual observation.

Unfortunately, I have reason to believe that this is one of the only things of its kind in Crete. The country is not rich in monastery work. Pashley mentions a monastery at Triadha, and gives rough sketch, which appears picturesque enough. The pen-sketch of a deserted monastery on Mount Iuktas shows how the average of these buildings tell by their grouping, but have no particular architectural qualities, strictly speaking.

The second part of this paper, dealing with some Turkish work at Broussa, follows somewhat naturally from the first; as after an examination of the mosques at Constantinople, one feels, as in Crete, the readiness of the Turk to adopt the indigenous architectural forms in the territories of his conquests. The work of the Osmanlis at Broussa, however, is earlier and more representative than any found at Constantinople, and holds an isolated position in Turkish art, somewhat similar to the *Cinque-Cento* in the history of the Italian Renaissance. The intricacy in the developments of Eastern work is manifold, but in the vast web of Saracenic styles the growth of what might be called the Renaissance of Turkish architecture is at least clear and distinct. The beginnings are to be found in Asia Minor, in those large and suggestive and often very beautiful remains of the Seljouk domination. It may be said that this pointed work of the Seljouks bear most affinity to Persian work, on which, as far as I know, it was directly founded. The work about which I wish to speak begins with the era of the Broussa Sultans, when Mourad, Bayezid, and Mohammed—all first of the name—built the chief mosques of Broussa. Founded, as it was, on what the Seljouks had done before, this work seems to have, in addition, some large and common-sense individualities. The typical two-dome plan, which Texier observes is not found at Constantinople at all, is best seen here in the Mosque of Mourad II., the Mosque of Bayezid I., and the Green Mosque, or Mosque of Mohammed I. It is of this last, and of its *Turbek* adjoining, that I wish specially to speak (see lithograph).

The two-dome plan, in its completeness, has an open porch, or loggia, of the whole width of the entrance front; and this feature can be seen in the Bayezid and Mourad Mosques. The Green Mosque, however, was left incomplete, and the porch was never added. It would be interesting to know whether the great canopy of the entrail doorway (see lithograph) belongs to the original period, or was added later. The mosque was built in 1420, and one hardly looks for such big, say *Michelangelesque*, detail in Anatolia at that time. In exterior disposition the mosque is, uniformly, of two stories, finished with a cope, over which is a low-pitched roof. At the entrance end are two minarets, originally covered with green *faience*, and evidently reconstructed since the earthquake of 1855. The exterior, generally, is all marble surface, and has exquisite carving at the doorway, windows, and niches. The doorway is a particularly fine piece of design, both in proportion and detail. The plan (fig. 5), in essentials, I can answer for as being reasonably correct, though there is no scale. As yet, I have seen no publication of the plan of this mosque. Recollect, in this connexion, the caution that is necessary in Turkey when taking notes on a casual visit, and do not judge hardly of these meagre sketches. The thought displayed in this building is its essential quality, and this one may realise without elaborate means. The adjoining *Turbek*, or tomb of the founder (see lithograph), is one of the most delicious creations imaginable. The lower part of the exterior is of white stone, with large panels of bright blue-green tiles. The upper part is painted light green, and it is finished with a domical lead roof. It is of large scale, as can be seen from the figures in the photo of the entrance. The sketches exhibited were from memory, and, as in the case of the mosque, have no scale. The following notes concerning both these buildings were taken on the spot. Beginning with the *Turbek* first, 'Outside, the mouldings are large and simple, and the size allows for great breadth of scale. There are ornamented tiles over some of the lower windows, and panels of same above these. The doorway is a fine piece of colour, painted, not tiled, and over the doorway is a good, simple, stone-moulded hood. The plan of the building is an octagon, with a range of large lower windows occupying six sides, the *mihrab* and door, opposite each other, being in the other two. There are two ranges of upper smaller windows, the highest being just below the springing of the dome, in that deep band of slightly projecting corbelling, triangled out, which occurs so often in Turkish domes. These top windows are stained glass, the others plain; but the light coming from the lower ones is subdued, as the wall is very thick, and the straight ingoings catch a lot of light. The interior defies description. A rich blue-green dado of hexagonal tiles, with a

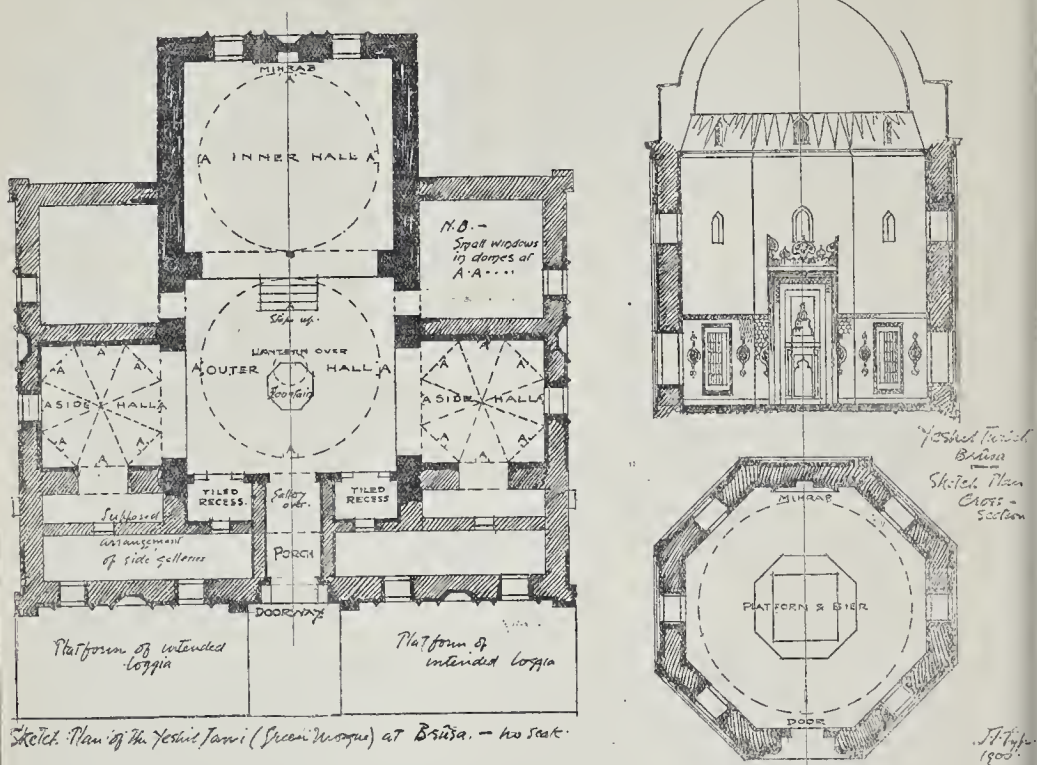

Fig. 5.—Plans and Section of Green Mosque and Turbeh, Broussa.

border at the floor and ditto at top, runs right round to a height of about 10 ft. It stops against the doorway and *milrab*, and the windows are set in it with independent borders. At the sides of each window, about midway up the dado, is an ornamental spot of tiling. At the broader *milrab* and door there is only room for half of this (see sketches). All is white plaster above the dado, except for a little centre flower painting in the dome, not of much account. The stone floor has an octagonal centrepiece, raised one step, and ornamented with tiles on the edge. Above this, again, is a square tiled platform, about 18 in. high, for the bier. This platform has a vertical design of tiles of great beauty and exceeding richness of colour—a perfect harmony of blues. The *milrab* has some exquisite work; in fact, it is full of the most delightful detail in form and colour. The small round pillars, covered with *faience*, and the centrepiece over the pointed niche-head, are specially noticeable. In the latter one notices the delicacy and beauty of the contrasts between the main ground colours: pale mauve competes with a light blue-green, helped by a judicious balance of white and green-yellow. There is an immense amount of study in the floral patterns. The lighting is perfect. Leaving the *Turbah*, we come to the mosque. 'Outside, certain windows have a thin blue strip of tiles, 2 or 3 in. wide, inside the architrave. This has a good effect in combination with the white marble. The interior, considering its size, for bigness and beauty and rest, impressed me more than almost any I know. It is on the two-dome system, and quite successful, owing to some simple expedients. (1) The entrance-domed hall has two side-spaces opening off it, roofed with hexagonal domes, and with floors raised above centre level, which gives the entrance a breathing room that is particularly valuable. (2) The floor of the inner domed hall is raised some 2 ft. 6 in. clear drop above the other, with a small centre stepway only. (3) There is

a flat marble arch between the domes, which is good, as it does not exclude too much light, or separate the domes too much. (4) There is a small octagonal fountain under the outer dome, which helps it to be more obviously an entrance to a higher shrine. (5) There is a circular top light over this dome, so that the inner dome, being darker, has more of an air of mystery. All the richness of tile decoration (and this part is quite as fine as the *Turbah*) is concentrated on the doorway, side recesses and upper gallery, so that the entrance end is bright and cheerful, yet with an air of quietness about the side niches of the door; the inner part is plain, sombre, and tomb-like. Yet with all the accessories the two are so perfectly joined together that there can be no question as to their being one building. Standing in front of the dais, looking back to the door, one notices the fine effect of the subdued light in the rich tile work there, all in a beautiful scheme of blue. There is a dado in this building as in the *Turbah*, but not so fine; the colour is a plain dark green. There is nothing particular about the *milrab* and *minber*.

The lighting arrangements of this mosque are most instructive for study: there are three small windows in each of the main domes, at the springing; and the side domes have each six similar windows. The other windows, shown on the plan, give a subdued light, as in the *Turbah*. The gallery on each side of and above the entrance is a most interesting feature. It is shown, to some extent, in the photo, but its plan is by no means clear to me. Undoubtedly it bears some resemblance to the similar feature in the Mosque of Mourad II., of which Texier has a plan.

Other most interesting mosques in Broussa, besides those already mentioned, are the *Ulu Fami*, or Great Mosque, the Mosque of *Emir Sultan*, and the Mosque of Mourad I. at *Tehekirgeh*. The former is a very large building, more like a bazaar than a mosque, and quite dominates the general view of the town.

It is of large simple-pointed work, with two tall minarets and a forest of domes. It is finished in stucco, like most of the Constantinople mosques, and this poverty of material contrasts rather unfavourably with the Green Mosque, which is finished with marble both outside and in. Some very good brickwork is also to be seen at Broussa—in the exterior of the Mosque of *Emir Sultan*, and in the various *Turbahs* at the Mosque of Mourad II. The type of entrance loggia which was so common here, and which was continued as a feature in the Constantinople mosques, may be well seen from the Mosque of Bayreid I.

In considering the conditions of the problems presented to us by these Turkish buildings, we can learn by seeing the use the builders of them made of their materials to hand in *tolerance*; that is to say, of conditions of climate and religion, as well as hard, matter-of-fact forces of everyday design; and following from this, by the good old lesson on the justification of apparent eccentricities, common in some form or other to every period of architecture. What strikes as boldness in a design, when we come to analyse its constructive meaning, may appear simplicity itself when the effect as it stands is only taken into account, and unworthy of any except admiring notice. For example, stripped of its effects and considered on plan, the corbelling out of the main domes of the Green Mosque on three sides only may appear freakish, but in reality it serves to make one interior of the two domes, especially as softened by the beautiful form of corbelling adopted by the Turks and all Saracen races. The fact, too, in the same building of a higher shrine inferior in cheerfulness to the lower entrance part seems peculiar on the face of it, apart even from any religious motive; but when we see that this effect is balanced by a stately gravity in the design of the entrance wall, and, moreover, is quite reasonable in itself from an æsthetic point of view, we realise something here which gives a sense of fresh perception, and, as such, is, of course, of the

highest value. The sense of strangeness in contemplating Eastern buildings at the first rush is inevitable to us, because the real East is far removed from the West in everything, including such a small thing as the treatment of an interior. The elements of the composition in a mosque interior are the fountain of cold water surrounded by cool and restful colours, and an exquisite diffused light. In the best mosques there is no attempt at strenuousness in anything. The mihrabs, though often marvels of detail, are set as a rich door in a plain wall would be, which means that they draw attention to themselves, but do not detract from the simplicity of the composition as a whole. Naturally, in Eastern countries the smallness of the entire window area necessary for lighting a building adequately, vastly affects the conditions of design. It is this partly, perhaps, that makes the domical construction of these countries so easy, as there is no need to be eternally fussing about this or that window which interferes with this or that construction. The total effect of lighting in two interiors (one Western and the other Eastern) may be the same; the former with its many windows, and the latter with its few. The advantage, however, for purposes of decoration is distinctly with the East; the wall-spaces are broader and simpler, and the absence of an appearance of lighting forcing itself on one gives greater restfulness to the decorative effects. Thus in a measure the entire question of Eastern decoration must be considered with reference to itself alone. The large use of tiles in decoration is the prevailing characteristic of Persian art and what emanated from it. This makes possible the large spaces of plain colour which are necessary when only borders and spots of pure ornament are used. Hexagonal tiles of an exquisite blue-green, relieved by gem-like touches of pure colour, such as we see in the Green *Turbah*, are, under the circumstances, perfectly satisfying. It is a question of surroundings and mental attitude to a large extent. Coming from the blinding sun and dusty glare of an Eastern summer into such a perfectly neutral half light, with its cool marbles and fountains, and its atmosphere of satisfying colour, one feels a sense of the fitness of things. Use and wont and perception of long ago have made the materials which best suit the situation. The practical conclusion of the whole matter is to try and find out how the Moslem has solved the ordinary problems of his building, for naturally he has a certain discount to start with, having Persian tiles, which belong to the world's chiefest treasures of art, at his command. But if there are evidences of thought in their setting—as I think, will easily be found in such buildings as the Green Mosque at Broussa—we can have scope, after the first burst of admiration, to contemplate wise solutions of problems which come very near to us after all. There is a strange freedom also in the treatment of much of the Turkish work which makes it easy to institute a comparison with modern work. For instance, Mr. Philip Webb's conception of stone detailing seems to me similar to the attitude of the Broussa builders in a like capacity. A strong feeling or material is evident, and a daring reserve in design which is nearly always justified in effect."

After the paper, Mr. Fyfe showed a number of lantern slides illustrating the newly-excavated palace at Knossos, Crete, and gave a brief description of numerous drawings of the same which were hanging on the walls, including architectural plans, details, and large photos, and a large selection of the original drawings of the painted stucco work which was found. The slides and drawings were kindly lent for the occasion by Mr. Arthur J. Evans, Keeper of the Ashmolean Museum at Oxford, who was present at the meeting, and who referred in detail to an architectural representation on a small scale which had been found in fragments of coloured stucco; but without the illustration of this it would be useless to report his remarks.

Mr. Phené Spiers said that the whole subject was absolutely new to all of them, and it was impossible for anyone who had not been over the ground of the discoveries in Crete to say much. He was struck by one remark which Mr. Fyfe made in the first part of his discourse, *i.e.*, where he noticed how strange it was that in those early towns the people built in materials of the most lasting

nature, and also carried out works built in the poorest material; but that which was strangest of all was that evidence should now be found of crude or unburnt brickwork. One would suppose that a wall built of crude brick which, here in England, a week's rain would destroy could not have stood through so many centuries; but in some of the photographs they had seen there was distinct evidence of some material, probably the crude brick he had referred to, above the walls of stone. Sometimes the walls were built of rubble masonry with clay mortar, and that was the description of a wall found by Schliemann at Troy. Of course, there were other instances of crude brick walls lasting through many centuries, but they were in countries where the intense dryness of the atmosphere made destruction almost an impossibility. Professor Petrie found at Denderah, in Egypt, an arched vault with three rings of voussoirs of unburnt brick, dating from 3,500 years B.C. It must be borne in mind that these ancient bricks were very different from those which people might think of. They were dried in the Egyptian sun, and their hardness was so great, that it was very difficult to scratch them with one's nail; they acquired a hardness of which people in this country had no conception. Vitruvius mentioned the very great care which had to be taken in preparing these crude bricks, remarking that they must be exposed for at least two years in the sun, and that care must be taken that at first they were not exposed too much to the heat of the sun, or otherwise they would crack and would not last. It was interesting, therefore, to notice in some of the illustrations they had seen the remains of crude brick on the top of the broad and well-built stone walls. The same construction was employed in the temple of Hera at Olympia—at least, that was Dr. Dörpfeld's conclusion. The paintings they had seen that evening were very interesting, because they were so natural. Work of a similar kind had been found in Egypt. A certain king gave up the religion of the country, and in changing it had adopted a system of decoration which, as in the case of the pavement of Tel-el-Amarna, one might think the work of the Japanese of the present century. We wanted to know a good deal more about the architecture of the Seljouks. He desired to propose a hearty vote of thanks to Mr. Fyfe for his lecture. They could congratulate themselves that Mr. Fyfe was going out again to Crete, and no doubt at some future time he would communicate to them something more on the subject.

Mr. A. C. Dickie, in seconding the vote of thanks, said that the paper was very interesting, especially that part relating to the plan of the palace at Knossos. That plan was rather confused, and it was almost impossible to come to a conclusion in regard to it unless one had been over the ground. The suggestion he had made in regard to it was suggested by a mosaic of the sixth century he had seen, where the columns were shown in exactly the same manner as in the illustration shown that evening—in the manner of primitive people who combined elevation and plan in their drawings. It seemed difficult to find anyone who could appreciate Turkish architecture unless it was seen on the spot. Seeing Saracenic architecture in drawings was not the way to judge it, and unless seen in its native soil it was difficult to appreciate its beauties. There was much in Turkish buildings that violated what were considered to be the canons of design, that one often forgot the frequent harmony of the whole.

Professor Beresford Pite said he was sure they would all wish to include Mr. Evans in the vote of thanks for the honour he had done them by attending the meeting, and by lending the photographs that had been shown that evening. As to the newly-discovered and now world-famous frescoes from Knossos, one could speak on the subject without much knowledge, but they suggested to him something which he had not fully realised before. If they reviewed the whole growth of Greek art as they knew it from the period indicated in the colour work in the Cretan palace to the period indicated by a Roman city like Pompeii, he did not think they could lose sight of the fact that Greek architecture which lay between these two extremes was coloured in the same key and with the same richness, and it was interesting and suggestive that the same-colour schemes had been found in earth-bound and ash-bound cities separated by such a long period of time. In some of

the fresco work which they saw that evening there was an extraordinary naturalistic expression. The figures were very life-like, and were distinct from the ordinary Egyptian form, to say nothing of the perfect freedom and beauty of drawing. He was glad Mr. Fyfe had not been to Egypt, because had he done so they would not have had his careful description of some commonplace but interesting Turkish buildings. That, of course, raised another question, *viz.*, had the Turks any art at all—any building materials which they did not borrow, and any forms which they did not degrade? In fact, was not the whole of Turkish art a degradation of what had preceded it?

Mr. Walter Crane supported the vote of thanks to Mr. Fyfe for his paper and to Mr. Evans for his help on the occasion. He had been attracted principally on account of the frescoes which, as seen from his position, reminded him of a sort of blend of Egyptian and Etruscan work. Closer examination revealed resemblances (in treatment of drapery and extremities) to the work of early Greek vase painters. He did not know about their being naturalistic (except the modelled and coloured bull's head, which had great vivacity), for that was a comparative term, and as they were treated on one plane they could scarcely be said to be naturalistic. He would like to know more about the colours—whether, for instance, they were the ordinary earth colours, or colours of which we did not know. As to the scheme, frequent use of turquoise blue and deep red reminded one of Pompeii and Egypt.

Mr. A. T. Bolton said it would be a misfortune if Mr. Fyfe, who seemed to be inclined to take up the study of Turkish architecture, were to be discouraged by the idea that Turkish architecture was merely a degradation of what had gone before. Some of the later Turkish buildings possessed a value of their own, for in them the ideas of the Arab builders were carried on. One did not get the detail, but as far as the forms were concerned, in the ideas of the builders of some of these comparatively late and rather unprepossessing buildings there was a distinct value. The very late mosque on the citadel at Cairo, for instance, was interesting, for in that building could be seen a dome supported by four half domes. Some of the Turkish mosques in Constantinople, judging from drawings, he thought might be of interest and value; while some were very extraordinary; for instance, there was one where the domes were supported by immense octagonal pillars. He thought that if Mr. Fyfe examined some of those mosques he would realise that they afforded valuable information in the way of development. Somewhere about the Renaissance times some of these Oriental buildings were worked out by Italian architects who had gone abroad. Nearly all Turkish architecture was the work of foreigners, and he did not believe that the Turks, as a people, ever did any building at all; it was all the work of Greeks, Arabs, Italians, Frenchmen and others. In short, the Turk did not appear to have any building instinct at all; but, however unprepossessing their work might be, he did not think it should be neglected, and anyone who took up the subject would do a work of much value.

Professor Elsey Smith said, in regard to the frescoes, it would be interesting to compare them with a very small fragment which existed in the museum at Athens, and which was found close to the Erechtheion in 1886. It was on a much smaller scale than the drawings they had seen that evening, but it represented the figure of a warrior with a shield, on which was a drawing of a satyr. In that case, also, the figure was in elevation, and the colour was perfectly flat; but the outline appeared to be drawn with a strong brown line with the colour filled in between. Was there any explanation of the great tank in the throne-room of the palace, or of the curious set of chambers running out of the long passage? It was a matter of great satisfaction that a member of the Association should have taken part in such work, which rivalled in interest anything since the days of Mycena. As to the other part of Mr. Fyfe's paper, it was an important contribution to the history of architecture in Crete. It was disappointing to find that the remains were so extremely slight of almost all periods.

The vote of thanks having been heartily agreed to, Mr. Arthur J. Evans said he could bear testimony to the very good work that Mr. Fyfe has done in connexion with the excavations which he (the speaker) undertook last year at Knossos. The results of the

excavations were very surprising. He had known the site for some years, and Schliemann had his eyes on it once. When he was especially studying the existence of early writing in Crete, it seemed very important to undertake the excavation of the site, where the remains of wall paintings, curious signs, &c., might refer to written characters. He secured a part of the site as early as 1895, but it was only last year that he obtained the remainder. Although he had great hopes of finding something during the excavation, he had been inclined to think that with such a site, occupying an elevated bit of ground in the immediate neighbourhood of a great city which had lasted through Greek and Roman times, and not far from another city—Candia, which was its immediate successor, and at one time a great fortress—it seemed quite hopeless that there should be much of interest left under the surface; but the result of a few weeks' digging was to reveal the astonishing fact that the site had practically never been touched since the days when the Mycenaean Palace was destroyed. He supposed that last season they excavated about two acres of the site, and over the whole extent there was hardly a bit of pottery later than the Mycenaean period. Another curious fact was that very often a foot or so below ground began the remains of intact walls, with frescoes on them, as intact as when left by the workmen. It was very astonishing to dig down a few inches below the surface and find these walls—to find a carved throne unharmed; beautiful alabaster vases laid on the floor just as they were left. In fact, if one took the arrangement of the throne-room—the benches, the throne itself, the pavement with the traces of painted cement, and the very beautiful stone tank, one might imagine oneself in the room of a Pompeian house, though the palace at Knossos was fourteen centuries older than Pompeii. As he had said, there was nothing later found than of the Mycenaean period, and what pottery had been found fitted in generally with that found in the tombs of Mycenae, and also with fragments found in Egypt under circumstances which enabled one to date them absolutely to the time of the Pharaohs of the eighteenth dynasty. There was a great deal of resemblance, too, between the fragments found and those found by Professor Petrie at Tel-el-amarna. In addition to that, there was evidently a very intimate contact with Egypt, as was seen in the Egyptian forms of griffins and sphinxes. Even in the procession there were certain Egyptian elements which curiously recalled some of the processions on the tombs of the times of Thothmes III. at the beginning of the fifteenth century B.C., in which the people called Kefts, the islanders of the sea (who evidently were the representatives of the Mycenaean civilisation), were depicted. People were bearing vases precisely similar to those found in the palace at Knossos. But the most important discovery of all was the establishment of the fact that these people possessed a highly elaborate system of writing. Some of the paintings went back to the period of fully developed Mycenaean art, viz., about the fourteenth century B.C., but beyond that there was evidence of a still earlier stage. As to the different dates of the walls, there could be no reasonable doubt that the walls to a certain extent represented certain dates, but on the whole there was a great deal of unity about the main walls of the palace. The walls went off at right angles; there was the great gallery running along the main access, but here and there were slight deflections from the original direction; and in many cases fragments of the early wall were built into the later. Some of the curious symbols, cut on gypsum blocks, were religious; the double axe, for instance, which appeared in conspicuous positions, and which occurred on nearly every block. There were also found on the floor level vases of a very beautiful ceramic style, and which showed them to be more or less continuous with the Mycenaean period. There was one bit of fresco which unquestionably represented the same stage of art as those earlier pre-Mycenaean vases. In addition to that, there was found a very interesting monument of a figure with an inscription on three sides, and about which Egyptologists seemed to be pretty well in accord, and the approximate date of which was 2,000 B.C., corresponding to the earlier period of the palace. As to the frescoes, there were one or two specimens of what might be called the minotaur style, representing ladies in extraordinary aspects—with narrow waists, and

with their hair most elaborately curled and frizzed. One thing was clear, and that was that Crete was the centre of a very high civilisation. Perhaps in the earlier time it had few foreign relations, but by the time of the great Mycenaean days, it was becoming more or less cosmopolitan; it took ideas from Egypt and Assyria, and in the main was independent. Some of the monuments were very naturalistic in style, and, so far as the animal representations were concerned or in the portrayal of nature, they were never rivalled in any period of classical Greece.

Mr. Fyfe also replied. As to the way the frescoes were treated, the red was very permanent and would stand scrubbing, but the blue was rather perishable and came off somewhat easily. As to Turkish architecture, he thought that later examples had a good deal of Renaissance influence in them. He agreed with Mr. Bolton in thinking that later Turkish work might be usefully studied now. Of course Cyprus was more interesting than Crete, and it could not be expected that Crete would produce anything like the beautiful mediæval work of Cyprus.

The meeting then terminated.

The next meeting will be held on Friday the 15th inst., when Mr. E. S. Prior will read a paper entitled "Gothic Architecture, and the basis of its Beauty."

Illustrations.

CHOIR STALLS, AND VIEW IN CHOIR, LINCOLN.

THESE drawings from Lincoln Cathedral, as well as that of the entrance to the Galilee Porch at Ely, form a portion of the excellent work done in connexion with the Pugin Studentship of the R.I.B.A. by Mr. Jas. McLachlan, of Edinburgh, who gained the Studentship last year.

The stalls form a fine example of Gothic woodwork of the Decorated period. Of so well-known an interior as the choir of Lincoln it is unnecessary to say anything here. Mr. McLachlan's charming sketch shows it from a point of view different from that most usually taken, looking back westward from the eastern portion of the choir. In the distance, between two of the piers, are seen the stalls shown in the larger drawing.

GALILEE PORCH, ELY.

THIS drawing shows the entrance to and interior of the Galilee Porch added to the Transitional front of Ely in the Early English period, obviously in the first instance for a structural reason, viz., to afford a western abutment to the arches of the tower, which had probably shown some signs of requiring such support. This piece of "engineering" was turned into an exquisite piece of architecture, more satisfactorily to be viewed in the interior than on the exterior, where it can be seen in connexion with the older work of the front, with which it does not harmonise; while the interior is complete in itself.

ANCIENT REMAINS IN CRETE.

THESE should more distinctly be defined as Venetian remains in Crete, with one exception, the view of the Turkish arches in Candia. They form a part of the illustrations to Mr. Fyfe's paper at the Architectural Association on "Architecture in Crete and Turkey." The two sketches at the top are by Mr. Fyfe; the other illustrations are from photographs taken by Mr. Welch.

TURKISH BUILDINGS AT BROUSSA.

THESE are also in illustration to Mr. Fyfe's paper above referred to, and represent three portions of the "Green Mosque" at Broussa, and the "Green Turbeh." They are described in Mr. Fyfe's paper on another page, in connexion with which will be found also a sketch plan and section.

NEW CHURCH, KIRKCALDY.—Dunnikier United Free Church, Kirkcaldy, was opened on the 31st ult. Designed by Mr. John B. Wilson, Glasgow, the church is fitted for electric light, but is in the meantime lighted temporarily with gas. It is seated for 740, and has a hall for 260 attached, with session-room, vestry, cloakroom, &c.

THE SURVEYORS' INSTITUTION: FUTURE OF THE LONDON WATER SUPPLY.

A MEETING of the Surveyors' Institution was held on Monday evening at No. 12, Great George-street, Westminster, Mr. J. Shaw, the President, in the chair.

The secretary, Mr. Julian C. Rogers, read the following address to be presented to His Majesty the King, which had been adopted by the Council:—

"We the president, council, and members of the Surveyors' Institution, in general meeting assembled, respectfully approach your Majesty with an expression of heartfelt grief at the great calamity which has befallen the whole Empire in the death of our beloved Sovereign, Queen Victoria, and our gratitude for the blessings which the nation has enjoyed for the many years of her long reign under the influence of her Majesty's exalted character and noble example. While thus expressing to your Majesty and the Royal Family our respectful sympathy, we desire to offer our sincere congratulations on your Majesty's accession to the Throne of the Empire and an assurance of our loyalty and devotion."

The President moved the adoption of the address by the meeting. The motion was carried, the members standing.

It was announced that the address would be inscribed upon vellum.

The meeting then resumed the discussion on Mr. R. E. Middleton's paper on "The Future of the London Water Supply," which has occupied the attention of the two previous meetings.

Mr. E. K. Darvall, in a letter which was read by the secretary, stated that at the beginning of 1892 the eight London companies supplied approximately about 31 gallons of water per head of the population. Constant supply was afforded as follows:—Chelsea, November, 1891, 23 per cent.; November, 1900, 100 per cent. East London, 98 per cent. in November, 1891, and 99 per cent. in November, 1900. Grand Junction, 75 per cent. in November, 1891, and 100 per cent. in November, 1900. Kent, 56 per cent. in November, 1891, and 93 per cent. in November, 1900. Lambeth, 53 per cent. in November, 1891, and 76 per cent. in November, 1900. New River, 44 per cent. in November, 1891, and 95 in November, 1900. Southwark and Vauxhall, 77 per cent. in November, 1891, and 93 in November, 1900; and West Middlesex, 43 per cent. in November, 1891, and 98 per cent. in November, 1900. The great increase in the percentage of constant supply was a point upon which the companies were to be congratulated. At the present moment the supply was afforded to about 6,200,000 persons at the rate of nearly thirty-three gallons per head per day. If the population in the said area had increased as was anticipated, according to Mr. Middleton's figures, the number would have been 6½ millions. It was therefore apparent that the population was not increasing at the rate that was anticipated. There could be no doubt but that a domestic supply of seventeen gallons and a trade and public supply of eight gallons was ample for London or any well-managed undertaking (unless the trade supply was abnormal), or a total of twenty-five gallons per head daily. It was apparent that a loss of over eight gallons per head daily was taking place, or approximately 50 million gallons a day, or a supply for an additional two million persons, or 30 per cent. more than the number at present supplied, as pointed out by himself and partner, Mr. Stevenson, in a pamphlet on the Metropolitan Water Supply published in 1892. These 50 million gallons daily led to an expenditure for collecting, pumping, and filtration of nearly 50,000l. annually, and the expense of nearly 10,000l. yearly in the additional quantity of sewerage which had to be dealt with by the London County Council at their pumping stations. In comparing the month of November, 1891, with the same month in 1900, it is found that only one company—the East London—had improved its position in the matter of checking waste. The other companies had all gone on the backward path, thus:—Chelsea, 1891, 33.87; 1900, 45.25; Grand Junction, 35.49, 45.29; Kent, 27.24, 39.21; Lambeth, 27.46, 33.29; New River, 29.85, 30.25; Southwark and Vauxhall, 29.97, 30.19; and West Middlesex, 29.08, 32.63. The notice recently published in the papers intimating that the Metropolitan Water Companies were intending to propose fresh

regulations under the powers of their Acts of 1852, 1871, and 1897, was apparently an earnest of their intentions to bring the regulations of the water companies in London into harmony, and it was to be hoped more in unison with those prevailing in well-managed undertakings in provincial towns such as Portsmouth, Nottingham, Norwich, Bury, Derby, &c. Unless regulations similar to these were adopted in lieu of the enunciated regulations usually finding favour with the Local Government Board, they would be of little more use than those existing at the present time.

Mr. Hunter stated that he was connected with Mr. Middleton in carrying out the new water-works at Staines, and he could congratulate him upon his paper; it was written in that scientific spirit which appealed to the judgment of them all. He agreed with him in his conclusions generally, and the deductions by which he had arrived at them. It appeared to him that Mr. Middleton had brought forward many cogent reasons with regard to wells, and it was quite possible that they could derive from wells a much larger supply than they at present availed themselves of. He proposed to confine his attention to the question of the development of the Thames and the means of storage. The matter divided itself into four divisions. First, what was likely to be the requirements of London in the future? Secondly, was the quality of the present supply good? Thirdly, was the available quantity sufficient for many years to come? And then, if Nos. 2 and 3 be answered in the affirmative, there remained this question—which was the cheaper method of supply, and therefore the more advantageous, to London? With regard to the future requirements of London it was very difficult to arrive at reliable figures so far as population was concerned. Generally, he agreed with Mr. Middleton, his figures being fairly in agreement with those accepted by the Balfour Commission, who considered the question up to 1931, by which time they anticipated that if London were to increase in the same proportion as between 1881 and 1891 it might reach a population of about 14½ millions. They took as the rate of supply about 35 gallons per head per day, and that seemed to him to be ample, because, for instance, in Norwich it was 17, Manchester about 32, Liverpool about 28, and Sheffield about 26. He was glad to find that they would have the support of Mr. Whittaker in their endeavours to check waste. The water companies had that day appeared before a tribunal appointed by the Local Government Board with the view of obtaining reasonable regulations which would assist them in guarding against waste. Waste was of no use to anybody, but was detrimental to the interests of the large body of consumers. He hoped that in this matter the companies would have the support of the Institution. The fact had been arrived at that in 1901 there would be required a supply of 717 million gallons, and that 400 million gallons would be taken from the Thames. He proposed on this occasion to confine his remarks to the consideration of the 400 million gallons which had been shown in the Balfour Commission might be required in forty years from the present time. With regard to the question of quality, several gentlemen—Mr. Lovegrove, for instance—had a doubt as to whether the Thames could be used, and Mr. Whittaker said that the river must be adequately safeguarded, it doubted whether that could be done. Mr. Vernon Harcourt had similar doubts, but they turned to the reports of the responsible bodies during the last few years they could see that the quality of the water was absolutely secured. Since the date of the Balfour Commission the Thames Conservators had obtained their Act of 1894, and they have used it with great effect. Anybody who had observed the river must have seen that it was in a very much better condition than at that date. Mr. Groves, of the Thames Conservancy, stated before Lord Landaff's commission that the water contained only one part of the impurities it did some eight or nine years ago, and Sir Edward Franklin, in a report dated January 31, 1898, bore testimony to the improvement of the quality of the water, if he had had more experience as analyst to the Local Government Board perhaps than any other man in the country. A great proof of the goodness of the London water was given in the vital statistics of the Metropolis. Apart from the reports of chemists, they could not over the importance of the death-rate.

There never could be such a low death-rate as 18 per thousand if there was an impure or imperfect water supply. He could state with the greatest possible confidence that the water as supplied by the companies of London was of excellent quality. Another point was the quantity obtainable. As they were aware, it was proved by Mr. Moore, the engineer to the Thames Conservancy, in his evidence before the Balfour Commission, that the average flow of the Thames was 1,350 millions daily. The minimum which the Thames Conservancy required was 200 million gallons, so that there was a balance of 1,150 million gallons available for water supply if only reservoirs of sufficient capacity be made to store water. Of course, in time the cost of storage became greater than the cost of obtaining a sufficient supply from an outside source. The supporters of the Welsh scheme at first proposed doing away with the supply from the Thames and the Lea, and anticipated obtaining 415 million gallons from Wales daily at a cost of 38,000,000. They then proposed the Welsh supply as a supplemental scheme, and he did not wonder at their change of front, because in time the Welsh supply would be exhausted, and it would be necessary to revert to the present source, which the supporters of the Welsh scheme now affected to despise. The true solution was to develop our present supply until the cost of that was greater than that of obtaining water from Wales or some other outside source. In estimating the cost of these schemes he used as analogy the cost of the works at Liverpool, Birmingham, and Staines. The Welsh scheme for 121 million gallons daily would cost for works 20,600,000, and the Thames scheme for the same quantity would cost 5,340,000. The interest during construction would be 3,190,000, on the Welsh and 943,000, on the Thames scheme; and the on the Welsh scheme and 2,773,000, on the Thames. So that for 121 million gallons daily supply the cost of the Welsh scheme would be 23,878,000, and for the Thames scheme 9,057,000. For a total quantity of 214 million gallons daily the total cost of the Welsh scheme would be 37,169,000, and for the Thames 17,486,000. Water companies were often attacked and called all sorts of names, but he ventured to think that no public bodies in the world had done more beneficent service for the health, comfort, and convenience of mankind.

Mr. Wheeler, K.C., stated that the discussion was of the highest moment. The whole of this agitation had been commenced, fermented, and brought about because at some unknown period of our future history the population of London might amount to no less than twenty millions. He, personally, did not follow such statistics to any great extent. He would like to point out the exaggeration with which this subject had been treated. Any one who knew the habits of the majority of Londoners was aware that a very small proportion had a morning bath.* He believed that in time this consumption of 35 gallons per head per day might be largely reduced. An enormous quantity of twice purified water was used for washing our streets, and an immense economy could be effected if the tidal water of the river was used. The whole matter was condensed into a few sentences of one of the speakers, who contended that there was nothing whatever to justify the burden and expense of going to Wales for water when it was close at hand. There was no evidence to prove that there was any immediate necessity of going to Wales. When the necessity arose, if it ever did, means would be found to deal with the matter.

Mr. Wilkins said the first difficulty they had to face was the prejudice which had been introduced. The question had become the sport of political party, and it was difficult to find a common basis for any branch of the subject. One would have thought that after the exhaustive inquiry which Lord Balfour of Burleigh made his report would have commanded the respect and adherence of most people; but they found that no sooner was it published than it was attacked, and it was assumed that it was unworthy of credence and that it contained a lot of improbable statements which ought not to be accepted. The same thing had occurred with regard to Lord Landaff's Commission, and he was sure—having attended almost every meeting—that a more

* Apparently this is supposed to be a desirable state of things, and one which ought to be encouraged and continued.—Ed.

patient attention could not have been given to the various interests. They, however, it seemed to him, had one starting ground, viz., that the present supply was adequate for the present requirements, and that the quality was satisfactory. The problem they had to solve was not the present but the future supply, and that depended entirely upon speculation as to how London would grow. In considering the question they must bring in the four tests laid down by Mr. Hunter. There was no doubt that the quality of the water had improved, in spite of the increased population on the banks of the Thames, the Conservators having used their increased powers with a certain amount of vigour, tempered by a great amount of discretion. He did not think it would be wise to supplement Thames water, which during some months was spring water, by very soft water, as the inhabitants of London had become accustomed to their water and a change might result in illness. The colour of Welsh water could not be compared with that of the Thames; and then, again, it would be brought to London through covered culverts which would prevent its being purified by sunlight and air. With regard to the proposed new regulations, the members of Lord Landaff's Commission were strong upon this point, having blamed the companies for not seeking further powers to prevent waste. It had been said that the water companies were bringing in these regulations in order to inflate their market value, but he would like to point out that the fittings were not the property of the company, but of the householders. There would, however, be a certain amount of saving to the companies. It seemed to him that Mr. Middleton had proved his case very well indeed—that the source nearest at hand should be utilised to the fullest extent before they embarked upon an unknown supply.

Mr. Basil Kilis said there was an idea in the minds of a great many people that if they only go to Wales for water there was practically an inexhaustible supply. Mr. Middleton had shown that this was not by any means the case, and he had also shown that the extension of the present system of supply was far cheaper than bringing water from Wales.

Mr. Wiseman referred to the possibilities of chalk.

Mr. Hennell said the storage of Thames water had been well considered from the water companies' point of view, and almost entirely from their point of view, and possibly not from that of the general public. He advocated the system of storage by gravitation, and contended that 300 million gallons, if not the whole 400 millions required, could be taken by this system at times when the flow of the river was considerably above the average. Storage by gravitation would be a great advantage over the present system and would be much cheaper. The Staines works would be very important as the first storage. The second should be at no great distance from Reading, and there should be another reservoir above Oxford. By whom was this work to be done? He could not help thinking that the proper authority was the body whose duty it was to look after the purification of the river. It seemed to him that the conservators who purified the water should store it and supply it to the companies, but what would be better would be that the future water body should also be made conservators of the Thames.

Mr. Hutchinson said the question was not who should be the authority, but whether we should turn away the water supply which was at our doors and go further afield. He was not at all disposed to admit that it was within the region of moral ethics to say we were entitled, because there was a large amount of water existing elsewhere, to take it away and bring it to another part of the country; and no one could predict what change might take place hydrologically in the district. It appeared to him outside the question from a chemical standpoint that because the water was drawn from the Thames, the source of which was looked upon many years ago with suspicion, that therefore you are to condemn it. It was better to trust, in some respects, to the water from an area that required to be looked after with a great degree of care to prevent pollution rather than to put the fullest trust in the idea that you are securing pure water from an area that was beyond the possibility of contamination, when a single shepherd might pollute the water and bring disease to five millions who inhabited London.

Mr. Middleton, in reply, said that in some

cases the speeches had been a little discursive, and had not held very strictly to the matter of his paper. Professor Robinson's remarks were almost entirely alien to the paper. He began by saying that he advocated a system of storage which was different from the system advocated by the author. He, Mr. Middleton, had looked very carefully through his paper and failed to see that he advocated any system whatever. He had, in fact, avoided going into any engineering system outside the question of the supply of water. With regard to the system of storing water by gravitation, he could see conditions in which it might be advisable to adopt it for the present system, but Mr. Hennell had pointed out one weak spot, inasmuch as the storage must be some distance from London. He was bound to disagree with some of the figures given by Professor Robinson. For instance, he said that the cost of storing a million gallons at Staines would be 378*l.*, whereas it would be 184*l.*, and it was possible to make reservoirs so that the cost per million gallons would be as low as 100*l.* Mr. Hennell had said that the water question had only been considered from the companies' point of view. He thought that was scarcely correct, but, at any rate, the companies were endeavouring to do the best for themselves and the best for their customers in giving an ample supply of water. With regard to the question of population, he did not think that it would increase so rapidly as was anticipated; but the Royal Commission, after careful consideration, had accepted a particular rated increase, and he had accepted that because it was authoritative. It was extremely improbable that the population would increase at such a rate, however, and that being so, his point was consequently stronger; if the anticipated population was never arrived at it would never be any necessity to go to Wales. Unlike Liverpool, Manchester, and Birmingham, there was no need for London to go a long distance for water, because there was plenty of it within reach, and there was no possible reason why we should repudiate water at our doors.

The meeting closed at a late hour, Mr. Middleton stating that he would write the remainder of his reply and forward it to the secretary.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of this Council was held on Tuesday in the County Hall, Spring Gardens, Alderman Dickinson, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend the Poplar Borough Council 11,360*l.* for pipe sewer and paving works, and 27,360*l.* for electric light installation; the Fulham Borough Council 24,145*l.* for dust destructor and street lighting; the Guardians of St. George's Union 17,500*l.* for the extension of infirmary; the Hackney Guardians 20,770*l.* for the erection of workshops and boundary wall and purchase of lands; and the Woolwich Guardians 10,475*l.* for the erection of a nurses' home.

Standing Orders—Dangerous and Neglected Structure Expenses.—The General Purposes Committee recommended, and it was agreed, that the following be substituted for paragraph 11 of Standing Order 249, relating to the recovery of dangerous structure expenses:—

"As soon as these accounts have passed the Finance Committee and been paid, the whole of the expenses incurred in relation to each dangerous structure shall be charged to the owner, and in cases where the expenses remain unpaid after demand has been made by the comptroller, the necessary proceedings for their recovery shall be taken by the solicitor."

Housing of Working Classes.—Mr. Samuel George Burgess, secretary and manager to the Middle Class Dwellings Company, Rowton Houses, Limited, and Wharnciffe Dwellings Company, Limited, was appointed manager of the new Housing Department at a salary of 800*l.*

Fire Stations.—The following recommendations of the Fire Brigade Committee were agreed to:—

"That the supplemental estimate of 25,000*l.* submitted by the Finance Committee in respect of the provision of additional fire brigade stations in London be approved, and that the estimate of 2,000*l.*, approved on February 1, 1898, in respect of the site for the Homerton sub-station, and the estimate of 2,000*l.*, approved on May 24, 1898, in respect of the station to be established at Highbury, be cancelled.

That the Council do sanction an expenditure of 11,375*l.* for the work of erecting the West Hampstead station; that the work be executed by the Council without the intervention of a contractor; and that the drawings, quantities, specification, and estimate be referred to the manager of works for that purpose. That the Council do authorise an expenditure of 860*l.* in connexion with the electric light installation at the West Hampstead station, and for incidental expenses arising out of the erection of the station.

That the estimate of 13,010*l.* submitted by the Finance Committee in respect of the proposed Perry Vale station be approved; that the Council do sanction an expenditure of 11,000*l.* for the cost of erecting the station; that the work be executed by the Council without the intervention of a contractor; and that the drawings and specification be referred to the manager of works for that purpose."

Applications under the London Building Act, 1894.—The Building Act Committee brought up the following recommendations, which were agreed to:—

Hackney, South (Width of Way).—Retention of a boundary fence wall in front of three buildings on the north side of Homerton-road, Hackney, adjoining Hackney-cut, such wall being at less than the prescribed distance from the centre of the street (the Lee Conservancy).—Consent.

Deptford (Cubical Extent and Construction of Buildings).—An addition to a workshop at the Hatchesham Iron Works, Pomeroy-street, Hatchesham, which workshop and addition will together exceed in extent 250,000, but not 450,000, cubic feet. (Mr. J. Donald for the General Engine and Boiler Company, Limited).—Consent.

Chimney Fire Penalties.—The following recommendations of the Fire Brigade Committee were agreed to:—

(a) That the following be the scale of payments to be demanded under Sect. 30 of the London County Council (General Powers) Act, 1900, in cases of chimney fire:—

Rateable value of premises.	Sum to be demanded	£	s.	d.
Not exceeding 20 <i>l.</i> a year	0	2	6	
Exceeding 20 <i>l.</i> , but not exceeding 30 <i>l.</i> a year	0	5	0	
" 30 <i>l.</i> , " 40 <i>l.</i> "	0	10	0	
" 40 <i>l.</i> , " 50 <i>l.</i> "	0	15	0	
" 50 <i>l.</i> a year	1	0	0	

(b) That the recovery of penalties in respect of chimney fires be left in the hands of the solicitor of the Council.

(c) That the following be the procedure in cases of chimney fires:—(1) that the chief officer of the Fire Brigade do report to the solicitor all cases of chimney fires other than those cases in which the poverty of the occupier of the premises is so apparent as to make it inexpedient for the Council to take action; (2) that the solicitor do then send to the occupier a demand note requiring payment within seven days of the sum mentioned in the scale, and if that amount be not paid within the time limited that the solicitor do take proceedings forthwith, unless there be special circumstances in the case which in his opinion render it advisable that the matter should be first reported to the Fire Brigade Committee.

(d) That a communication be addressed by the solicitor to the chief metropolitan stipendiary magistrate drawing attention to section 30 of the General Powers Act and mentioning the action which the Council has determined to take under that section.

Tenders.—The following tenders were accepted:—

Additional stabling, Kingsland Fire Station.—J. Jarvis & Sons, 293*l.* 19*s.* 6*d.*
Iron fencing, Archbishop's Park.—Hill & Smith, 455*l.*
Iron fencing, Battersea Park.—McVey, 191*l.*
Repair to Shakespeare fountain, Leicester-square-gardens.—R. Harding & Son, 299*l.* 10*s.*
Supply of shell at various parks, &c.—J. Weston & Sons.

Dangers of Electricity.—Replying to Mr. Baker, Mr. Parker said the attention of the Highways Committee had been called to the serious accidents which had happened in Liverpool and Sunderland, where they had the trolley system of electric tramways. No such danger would arise in London, because the Highways Committee had decided on the underground system.

Appointment of Electrical Engineer.—It was agreed to appoint Mr. John Rider Hele, the Chief Consulting and Resident Engineer for electric tramways and electric lighting under the Plymouth Corporation, Electrical Engineer to the Council at a salary of 1,000*l.* a year.

The Works Department.—The Housing of the Working Classes Committee brought up the following paragraph:—

Clare Market, Strand, Scheme—Sheridan, Beaumont, and Fletcher Buildings.—By the provisional order confirming the Clare Market, Strand,

improvement scheme, under the Housing of the Working Classes Act, 1890, as modified by the Council's Improvement Act, 1899, the Council is required to provide accommodation on sites adjoining the cleared area for 750 persons of the working classes to be displaced by the carrying out of the scheme. Working drawings, specification, quantities, and Duke's-court, one of the sites allocated for dwellings, are now completed. These dwellings, consisting of three blocks, will be known as Sheridan, Beaumont, and Fletcher Buildings, and will provide accommodation for 670 persons. In view of the completion of the plans and particulars of the work, it has become necessary for us to determine the steps to be taken for the erection of the buildings. It is essential that there should be no delay in putting the work in hand, as, until the new buildings are erected and ready for occupation, the Council is unable to remove the existing houses on the condemned area. We are urged by the Improvements Committee, who are dealing with the Clare Market properties in conjunction with the Holborn to Strand Improvement, to make provision as quickly as possible for the persons to be displaced, and we have therefore, in order to save time, advertised for tenders to be delivered to the Council on 26th inst. for the erection of the dwellings. We propose to submit to the Council the working drawings and estimate of cost on the same date, and the Finance Committee will, at the same time, report the estimated financial result of the erection of the buildings. We recommend that the course taken be approved.

Mr. Goulding, M.P., said the decision of the Committee was a justification of the policy of those who held that the erection of such dwellings could be done more cheaply and expeditiously by contractors than by the Department.

Mr. Edward White said the work could not only be done better but cheaper by contractors.

Mr. Purchase added that it was impossible for contractors to do work as good as that performed by the Department.

Mr. D. S. Waterlow said the decision of the Committee was because the dwellings were urgently needed; but the Committee's policy had not changed.

The matter then dropped.

Bills Opposed.—On the motion of Mr. Cornwall, Chairman of the Parliamentary Committee, it was decided to oppose the following Bills, which are to be introduced in Parliament this Session:—Gas Light and Coke Company's Bill, London and India Docks Company (Lighterage Rates) Bill, London and India Docks Company (New Works) Bill, and South Metropolitan Gas Company's Bill.

Gift of a Fountain.—The Parks Committee reported that a lady had offered to present a drinking fountain to be erected in Archbishop's Park, Lambeth.

The gift was accepted by the Council.

Russell-street, Drury-lane.—The Improvements Committee recommended and it was agreed:—

"That the estimate of 4,133*l.* 6*s.* 8*d.* submitted by the Finance Committee be approved, and that a contribution be made by the Council on the usual conditions of one-third of the net cost of widening Russell-street, between Catherine-street and Drury-lane, to 50 ft., proposed to be undertaken by the Council of the City of Westminster, such contribution not to exceed the sum of 4,133*l.* 6*s.* 8*d.*"

Proposed Enlargement, Brockwell Park.—It was agreed to contribute 2,250*l.* towards the cost of acquiring certain land for adding to Brockwell Park.

The Council adjourned soon after six o'clock.

BUILDERS' FOREMEN'S ASSOCIATION: ANNUAL DINNER.

The seventh annual dinner of this Association was held on Saturday last week at the King's Hall, Holborn Restaurant. Mr. Henry Hibberd presided, and amongst those present were Messrs. E. C. Ackermann (the President), J. Hibberd, G. Hibberd, Sydney Butler, G. H. Webster, and W. Cook (secretary).

After the toast of "The King and Royal Family,"

The Chairman proposed "The Builders' Foremen's Association." He said it was at such gatherings as this that they became intimately acquainted with one another, and that enabled them to assist each other in business and often in their private matters. There was a sort of mutual help association, for if a member were out of employment, all the others would be looking out for work for him. Mr. E. C. Ackermann, the President, in reply,

said that the Association had been established a little over eight years, and although it might still be termed a budding Association, it had come to stay. Lectures and smoking concerts had been held during the winter, and they had been very successful. They had lately formed a system of insurance in connexion with the Association, the fees of which were very small.

A toast in honour of Mr. W. Cook was proposed by Mr. Ackermann, who referred to Mr. Cook's services as secretary, and Mr. Cook, replying, expressed his thanks.

Mr. G. H. Webster submitted "The Building Trades," and said that master builders had been objecting very strongly to their foremen being members of a trade union. He quite agreed with them, and he did not see how a builder's foreman could do his duty as a foreman and at the same time be a member of the men's trade society. He might be ever so good a man and ever so good a foreman, but it was impossible for him to serve two masters. The master builders in the north of England were formulating a scheme for inducing foremen to withdraw from the trade society, and recompensing them in some way financially for any loss they might incur. He thought the London builders would take the matter up also.

Mr. McKenzie, in responding, said that one of the things which struck them in these days was that everybody bemoaned the fact that they were losing their ability and capacity for building great structures. It was considered that the early Greeks and Romans were the masters of the art, but he ventured to think that the builders of these days were quite equal to the occasion; they had shown by the great transformation that had and was taking place in London that the builders of to-day were worthy successors of the ancients who showed them how to build. So long as they joined together in such associations as this, where members could help one another, improve their skill, and receive culture in the arts and sciences, so long could they expect the men of London to do well.

A toast to the visitors, proposed by Mr. W. Read, and to the chairman, submitted by Mr. Sydney Butler, completed the list.

METROPOLITAN ASYLUMS BOARD.

The weekly meeting of this Board was held on Saturday at the Board's offices, Victoria Embankment, Sir E. Galsworthy presiding.

The tender of Messrs. Bradford & Co., of High Holborn, of 4,580l., was accepted for supplying and fixing the necessary laundry machinery at the North-Eastern Hospital. The other tenders were: Lees & Harrison, Leeds, 3,214l. 16s. 11d.; Lighting Corporation, London, 4,243l.; Matthews & Yates, Swinton, Lancashire, 4,233l.; Berry & Sons, Westminster, 4,057l.; Potter & Sons, 4,001l.; J. & F. May, London, 5,100l.; Morwood, Sons, & Co., Sheffield, 5,178l.; Wenham & Waters, Croydon, 5,280l.; Fraser & Co., London, 5,329l.; Douglas & Sons, Putney, 5,349l.; Thomas & Taylor, Finsbury Park, 5,362l.; Macintosh, Brocklehurst, & Co., London, 5,091l.; Cherry Tree Machine Company, Blackburn, 6,102l.; Manlove, Alliott, & Co., London, 6,405l.

The Finance Committee reported having considered the question of the mode of defraying excess cost of building works over amounts authorised by the Local Government Board's order. The Committee had hitherto authorised small amounts to be defrayed out of current rates without first obtaining the Board's formal approval thereto. They thought, however, that they should have a general authority vested in them to deal with such matters, and they recommended that excesses not exceeding 500l. be defrayed out of current rates. This was adopted.

The Hospitals Committee presented a copy of an account they had received from the accountant detailing the cost of executing the ward pavilions (8 to 18) and workshops at the South-Eastern Hospital. The total cost was 21,721l. The loan sanctioned by the Local Government Board was 21,350l., which left an additional order required for 371l. 18s. The Committee recommended that an application be made to the Local Government Board for an order sanctioning the further expense of 371l. 18s. This was adopted.

The same Committee presented a return showing that 11,515l. 7s. 7d. was spent during 1900 in painting works at the several hospitals.

The Works Committee reported upon the orders received for the erection of White Oak school.

They recommended [and the Board agreed to

accept the tender of Mr. Charles Wall, of Ashburnham Works, Chelsea, in the sum of 112,324l. The other tenders were:—Martin, Wells & Co., Vauxhall, S.E., 115,000l.; J. J. Wise, Deal, 116,035l.; W. H. London & Sons, Footing, 121,888l.; B. E. Nightingale, Albert Embankment, 133,227l.; Stephens, Bastow & Co., Bristol, 135,220l.; R. J. Tonge, Watford, 138,052l.; Foster and Dicksee, Rugby, 140,270l.; Leslie & Co., Kensington, 14,1450l.; Balaam Bros., Old Kent-road, 151,256l. The total cost of erecting, fitting up and furnishing this school is estimated at 137,041l.

ARCHITECTURAL SOCIETIES.

LIVERPOOL ARCHITECTURAL SOCIETY.—The fifth ordinary meeting of the fifty-third session in connexion with the Liverpool Architectural Society was held on the 4th inst., at the Law Library, Castle-street. Messrs. Segar Owen and James Strong were elected as Fellows to the Society, and Mr. A. C. Broadbent as Associate. Mr. G. Haswell Grayson was elected joint secretary, vice Mr. F. E. P. Edwards, who had resigned. The members afterwards considered a draft memorandum and articles of association in connexion with the proposed incorporation of the Society, which had been prepared by the council in accordance with the resolution passed at the last annual general meeting, and, after considerable discussion, the articles were left over for further consideration. The paper by Mr. A. S. Flower, M.A., entitled "Old English Architecture: a Retrospect and a Suggestion," has been postponed until April 15th.

ARCHITECTURAL ASSOCIATION OF IRELAND.—At the general meeting of this Association held at the Grosvenor Hotel, Dublin, on Tuesday, the 5th inst., the following resolution was proposed by Mr. R. M. Butler, and seconded by Mr. F. G. Hicks:—"That the Architectural Association of Ireland, in general meeting assembled, desire to record their sense of the great loss which the nation has sustained by the death of her Majesty Queen Victoria, and their sympathy with his Majesty King Edward VII. and the Royal Family in their bereavement." The resolution was adopted in silence, the members standing. Mr. P. J. O'Reilly then delivered a lecture dealing with the history of Mont St. Michel, in Normandy, and descriptive of its numerous features of architectural interest. The lecture was illustrated by upwards of 60 lantern slides.

ARCHAEOLOGICAL SOCIETIES.

ROYAL ARCHAEOLOGICAL INSTITUTE.—A general meeting of this Institute was held on the 6th inst., Judge Baylis, K.C., in the chair. Professor T. McKenny Hughes, M.A., F.R.S., F.S.A., read a paper on the forms of implements of war and other appliances in use among primitive races of past and present times, pointing out and illustrating by actual examples that many of them were suggested by natural forms. On this occasion he confined himself chiefly to bone objects, first calling attention to the suitability of the material and to its universal occurrence. He exhibited specimens of small bone graving tools from recent mediæval Saxon, Roman, and earlier deposits. He showed apple scoops and flayers made of the limb bones of ruminants, in which one end of the bone remained untouched. He produced some bones from the heads of common fish which almost exactly resembled the fish-hooks made from turtle bone, and used in the South Sea Islands. He was of opinion that the form of the Fijian battle-axe was suggested by the ribs of cetacea, and pointed out the variation in the shape of the proximal end as we approach the head of the animal, and thought that the different ribs may possibly account for the original manufacture of different forms which are observed in the axes, rather than that they were a modification of one original type of weapon. He criticised the statements of some authors respecting the widespread use of the boomerang, especially as to the catéa having been a boomerang. He thought that the early notices, which described that weapon as having been hurled with a thong (amentum), developed into the idea that it had a string attached to it; next, that it could be drawn back by the string; and lastly, dropping the mention of the string, that it was so thrown as to return to the thrower, and, therefore, must have been something like a boomerang.

Mr. R. E. Goolden, F.S.A., read a paper by Dr. Russell Forbes on "Recent Excavations in

the Forum at Rome." The report dealt especially with the remains of the Regia, the official residence of the Pontifex Maximus, which lies between the Via Sacra and the Temple of Vesta. Dr. Forbes gave many quotations to show what history relates about the palace at different periods, which the excavations have confirmed. He also reported on the more recent discovery of the Fountain of Juturna, with its adjoining altar and the inscription. Messrs. Hilton, Wilson, and Rice took part in the discussion.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—The sixth meeting of the Session was held at 32, Sackville-street, on February 6, Mr. C. H. Compton, Vice-President, in the chair. The paper of the evening was read by the Rev. C. H. Evelyn White, the subject being "Some Recently Discovered Earthworks: the Supposed Site of a Roman Encampment at Cottenham, Cambridgeshire." A large plan of the earthworks was exhibited on the easel, and in order that the paper might be more readily followed smaller copies of the plan were furnished to the members and visitors. These earthworks are of a very singular nature, extending over 20 acres of ground, and have hitherto been unnoticed, so far as the writer was aware. Immediately to the north of Cottenham Parish Church is the Cottenham Lode, and abutting upon this lode to the north-west is an unploughed field of about 8½ acres, in which field are situated the principal entrenchments. This field is bounded on the north-east by the Car Dyke; while the roadway known as the Setchell Drove, running nearly parallel with Cottenham Lode, encloses it on that side. There are visible large rectangular ramparts of chevron, or zig-zag formation, with a ditch on each side; the formation extends into the field beyond the Setchell Drove, which cuts through it, and there are remains of geometrically formed entrenchments in the surrounding fields. The trenches are well above the old water level of the Car Dyke, and vary in depth from 6 in. to 2 ft. Mr. White exhibited a large number of pieces of Roman and other pottery, which is found in abundance all over the site; Samian, Upchurch, and red ware, some bearing potters' marks and decoration. One fragment of the neck of a vase, or urn, bore an unusual type of ornament in the shape of a series of straight lines going up from the collar. The only article of personal adornment found was a portion of a bone pin having a series of notches for ornament, somewhat resembling one illustrated in Keller's "Lake Dwellings." The question to be decided by antiquaries was whether these remains indicate the site of a British settlement or of a military position, as the peculiar formation of the entrenchments would rather suggest. At all events, we had here ancient earthworks hitherto apparently unnoticed, Roman pottery in abundance on all sides, surrounded by lines of British and Roman communications, and near to an ancient waterway that afforded means of access to the larger rivers in very early times. In the discussion which followed the paper, Mr. Bull, a resident of Cottenham, who had been largely instrumental in bringing these remains to notice, gave his impressions of their nature.—Mr. I. C. Gould pointed out that the character of the pottery exhibited, which was of the fourth century, and probably late in that, showed that the place had been occupied at that date. He also said that the so-called Samian ware was not real, but British imitation of Samian, and was typical of a late period. The chevron, or zig-zag formation of rampart, was entirely new to him. The Rev. H. J. D. Astley remarked upon the seemingly unique character of the earthwork, contrasting it with the round or oval shape of the British fortifications and the Roman, which were rectangular. It is probable that further explorations will take place, when the rampart will very likely be cut through and sections obtained.

AN IMPROVEMENT IN WHITEHALL.—The Westminster Borough Council have commenced an improvement in Whitehall. The broad pavement along the Government Offices was very irregular; now it is being made rectilinear from end to end, and in some places it is necessary to extend the pavement into the roadway in order to accomplish that object. The surface was very uneven, not having been repaired for some years; now it will be relagged. The work is at present proceeding in front of the Horse Guards, the Paymaster-General's Office, and the Admiralty.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—At a meeting of the Institution of Junior Engineers, held at the Westminster Palace Hotel on Friday, February 8, the chairman, Mr. Percival Marshall, presiding, a paper was read by Mr. L. F. Awde on "Electric Power Supply in the Metropolis." After emphasizing the importance of the subject of a cheap and general supply of electricity for power purposes, as evidenced by the attention devoted to large power distribution schemes during the last Session of Parliament, the author referred to the comparatively small amount of electric power at present used in London, and dealt with the difficulties attending the supply of electricity for power purposes from the existing stations in the metropolis at a price that could really be considered as reasonable, and which would induce the manufacturing community generally to adopt this form of energy for machine driving, &c. The disadvantages attaching to the positions of most of the various stations and their results upon the working costs were dealt with at some length, and in this connection a curious fact was adduced, viz., that the average works costs for 1899 were exactly the same for both local authorities and companies, being 191d. per unit in both cases, the advantage resting with the local authority only in the matters of rates and management to the extent of 0.37d. per unit. After a reference to the attitude of the local authorities as to assessments of electric supply stations—when these were not their own property—the author protested against their proceedings with respect to the question of smoke nuisance, and spoke strongly upon the action of the colliery proprietors last year in cornering the coal market, the results of which were so severely felt by all the electrical undertakings, and hinted at some contracting remedy that it might be necessary to find, should their tactics be sustained or repeated. He expressed himself in favour of one large station down the river, generating for power purposes and street lighting only, and submitted detailed estimates for such a station of a plant capacity of some 33,000 h.p., the whole scheme involving a capital expenditure of over one million sterling distributed as follows, the station estimates providing for five triple-expansion sets of 3,500 k.w. each and two sets of 2,500 k.w. —

Lands	£
Generating station	30,000
Mains, &c.	625,000
Distributing centres	105,000
	288,000
	£1,068,000

The system proposed was a 3-phase generation, and distribution at extra high pressure to transforming centres, the low-pressure distribution to consumers' premises being at 500 volts from rotary converters and batteries. The costs of working were set out in detail, showing a total cost of under 4d. per unit, the maximum selling price being suggested at 14d. per unit, or 14d. per h.p. hour. In the case of factories in the immediate neighbourhood of the generating station, and with a view to encourage the erection of such factories, the special price for these was put at the low figure of 14d. per unit, equivalent to very little more than 4d. per h.p. hour. The author dwelt upon the fact that in this country, and especially so in London, electrical engineering was a long way behind the times, and had been far outstripped in the direction indicated by American and Continental practice; but if such a scheme as he had propounded could be inaugurated, some of the grounds for self-reproach would thereby be removed, and the position of the metropolis as a manufacturing centre substantially improved.—As a sequel to the paper, a visit has been arranged for Saturday, February 23, to the Willesden station of the Metropolitan Electric Supply Company.

BOOKS RECEIVED.

EXERCISES IN GRAPHIC STATICS: Part 2: Beams and Girders. By G. F. Charnock, Assoc. M. Inst. C. E. (J. Halden & Co., Manchester.)

PLYMOUTH EYE INFIRMARY.—We are asked to state that the stoves used in the wards of the above-named building, described in a former issue (page 143 ante), are by Messrs. Shorland & Brother, of Manchester.

CHARING CROSS, EUSTON, AND HAMPSTEAD RAILWAY EXTENSION BILL, 1901.

THE FOLLOWING HAS BEEN ADDRESSED BY THE Royal Academy to the London County Council on the subject of the above-named Bill:—

"We, the undersigned Members of the Royal Academy, do most earnestly petition the London County Council to oppose the above Bill, in so far as it affects Hampstead Heath.

We should deplore any tunnelling under the Heath, and the erection of any railway stations, and other railway buildings within the boundaries of the Heath, the wild aspect of which is of incalculable value to London, and to all lovers of natural beauty.

Hamo Thornycroft.
W. C. Orchardson.
February 4, 1901.

We need hardly say that we are entirely in sympathy with the above protest, and hope it will have the weight with the London County Council which it should have.

Correspondence.

To the Editor of THE BUILDER.

"BUILDING CONTRACTS FROM A BUILDER'S POINT OF VIEW."

SIR,—I have read with some interest "Clerk of Works" comments on the above, and with your permission, give him my ideas on the subject as a contractor's agent.

With regard to the fact that clerks of works do represent the architect there is no doubt, but whether they do so truly and in the way the architect would wish is an open question, or whether they at times place the architect in such a position that he must either side openly with the contractor against his clerk of works (which he would be very loath to do) or must cause the contractor unnecessary annoyance and expense; and as for the information supplied by the clerk of works, my own experience is that it is very limited, and then confined to verbal instructions. I have never known a clerk of works give a signed working detail drawing or definite written instructions.

With regard to "Clerk of Works" wish that Mr. F. Cowlin may write a paper on clerks of works so that he may criticise it, this is eminently characteristic of some clerks of works, who wait until the work is done and then criticise it. How much better would it be if instead of his waiting for anyone to read a paper on clerks of works, he would at an early date give your readers the benefit of his suggestions, so that these improved methods may be put into operation! I should also be glad if he will explain what he means by a builder being more in touch with his foreman.

As regards the builder making a proper agreement with the merchant in respect to the materials he supplies, "Clerk of Works" must know, or should know, that no manufacturer would agree to this. They would willingly agree to supply goods according to sample or as is generally recognised in the trade; but who would risk having their goods thrown on their hands at the discretion of an architect, more especially seeing that damage may be done to them in transit? Not only that, but architects at the present time often specify the manufacturers who shall supply the different materials, thus further tying the builder's hands.

Coming to the question of the quality of the work, he gives your readers his method of dealing with a dispute which is fair and reasonable, and which, I think, no foreman could object to; but at the same time, it may be of interest to the foreman to know of a method I usually adopt when unable to agree with a clerk of works. I tell him that as I consider the work is according to the contract, it is my duty to keep on with the work, and as he considers it is not, it is his duty to stop the works, and I ask him to give me a written order to stop them until further notice, so that my employer and the architect may settle the matter; and I have found that most clerks of works are rather shy of maintaining their opinions to this extent.

With regard to delays, the principal cause I have found is that the detail drawings are not supplied at the same time as the contract, and a builder has to be cautious or he may find the architect make a variation and the material will then be thrown on his hands.

Coming to "Clerk of Works" remarks as to a

foreman not telling his employer or the office that the materials are not being delivered fast enough, I consider it one of the most essential parts of his duties, and when he finds it necessary to write on that point, to do so in a way there is no mistaking.

With regard to the setting out, I fully agree with him; the clerk of works is welcome to check the works when set out. Help in the actual setting out, I am afraid, would more likely prove a hindrance.

My own opinion is that the great mistake clerks of works make is that they start with the idea that the builder or his foreman is going to try and "have them"; if a suggestion is made, they look upon it as a kind of trap for them to fall into, and so act accordingly, and this it is which so often leads to friction.

CONTRACTOR'S AGENT.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

7.—SINKS: WASTES AND OVERFLOWS.

ON the common sink-of-all-work, the waste-outlet generally takes the form of a simple brass grate, the stone or freelay having a rebated hole, as shown in fig. 1, to receive it. A cup of lead (a), with a flange or rim at the top, is bedded in red-lead cement, and the brass grate (b), with the edge previously tinned, is then soldered to the flange of the cup; sometimes the grate is secured by pouring molten lead around it instead of by soldering. The lower end of the cup is soldered to the inlet of the lead trap. At one time glazed freelay grates and shanks were often used, but they are not as durable or as satisfactory in other respects as brass grates. The area of the openings in the grate ought to be at least equal to the area of the cross section of the trap and waste-pipe, so that these will be effectively cleansed by the flush of water. It is a good plan to place in every sink a small perforated metal strainer for the reception of garbage, such as tea-leaves and scraps of food, so that these do not choke the grate or the trap.

Another method of fixing the grate is by means of a brass coupling with fly-nut (a), as shown in fig. 2. The brass tail-piece (b), after being tinned, can be soldered to the inlet of the lead trap by an ordinary wiped joint. Fig. 3 is an improved form with enlarged grate; the dimensions are as follows:—Diameter over flange 3½ in., diameter over screw 2½ in., bore of union tail 1½ in.

Similar arrangements to those shown in figs 1 and 2 are often adopted for butlers' sinks, but the grating is placed at a lower level, so as to leave a socket above it for the reception of the plug. Fig. 4 shows an improved form of plug and washer for large sinks or baths; the diameter of the plug and grating is 3 in., diameter over flange 4½ in., diameter over screw 3½ in., and the outlet tail is either 3 in. bore throughout or tapered to 2½ in., the latter being preferable. If a tail-piece shown in fig. 5 may be used. Fig. 7 in our last article shows the common form of waste-plug for lead-lined sinks. For wood sinks, the flange of the washer is sometimes square and fixed with four screws, one at each angle.

In freelay sinks with overflows formed in the body of the ware itself, after the manner illustrated in fig. 6, page 118 ante, it is necessary to have an opening in the side of the brass washer to receive the overflow. Fig. 6 in the present illustrations is a section of Twyford's "Ruchill" hospital sink, showing the overflow in detail. This sink is made to stand clear of the wall and is glazed on the back. A loose enamelled freelay plug or cover is provided for the top of the overflow. The form of washer for such an arrangement is shown in fig. 7, with union for lead pipe. In the modification known as the "safety plug" the plug can be raised, but cannot be withdrawn; with this plug a pull-up arrangement is required, which, by a quarter-turn, will hold the plug some distance above the washer, so that the water can escape.

The waste and overflow shown in fig. 7, page 118 ante, are extremely simple, and can be easily kept clean. Of course, the same overflow can be used with an ordinary chain and plug instead of the spindle and safety plug shown in the illustration.

Combined wastes and overflows are now made in almost endless variety, but they are,

Illustrations to Student's Column.

as a rule, merely modifications of the old standing waste and overflow, of which the simplest form is shown in fig. 8. The vertical tube is made to fit into the washer of the waste-outlet, and so take the place of the plug. When the tube is in position and water is turned into the sink, the water will rise to the level of the top of the standing waste, and will then overflow down the standing waste to the waste-pipe below. A simple improvement consists in attaching the standing waste to a hook and knob above, so arranged that, when the knob is raised and slightly turned, a projection on the spindle passes into a corresponding socket or over a bar, and holds the standing waste clear of the grated outlet; by a backward turn of the knob, the waste is released and drops back into the washer.

Sometimes these standing wastes are concealed in small chambers formed at the back of the sink, but this arrangement cannot be recommended, as neither the chambers nor the standing wastes can be kept clean. The grease and other objectionable matters present in the water of sinks will soon render concealed parts of the apparatus extremely foul, and it is, therefore, highly desirable that standing wastes should be exposed to view, and should be easily detached for cleaning. A very good form of waste (Shank's "Simplex") is illustrated in fig. 9, which is adapted either for lavatories or sinks. To empty the basin, the standing waste is raised and slightly turned; a further turn will permit the waste to be taken out. If desired, the waste is furnished with a set-screw, so that it cannot be removed from the side; this arrangement is suitable for gymnasiums, schools, &c. Standing wastes are generally made of copper, brass, or gun-metal, and often have a rubber seating around the lower end to form a watertight joint with the washer. Porcelain standing wastes have also been made, and xylonite has recently been pressed into service. Porcelain and xylonite, however, will not stand rough usage, suitable though they may be in other respects; for this reason porcelain cannot be recommended, and xylonite only for lavatories in private houses, where they will be carefully used. They are, however, suitable for sinks.

Waste-plugs are generally of brass, carefully turned to fit the washer, but the weight of a plug of this kind is so great as to damage the enamel of the sink if the plug is allowed to drop upon it from some height. A slight improvement is effected by covering the plug with indiarubber, as shown in fig. 10. Plugs of solid indiarubber are better in this respect, are apt to get out of shape, and vulcanite is frequently used with satisfactory results. Plugs have the advantage of not forming a projection above the bottom of the sink. The size of the waste-plug and grate will tend to some extent upon the capacity of the sink, but the larger they are the quicker the water escape, and the better will be the scour through the trap and waste-pipe. As to the waste-pipes of sinks should not be less than 1 1/2 in. in diameter, and need not be more than 2 in. It is a good plan to have the trap and washer at least 1/2 in. more in diameter than the trap and waste-pipe, as the trap is more easily kept clean. This can be done by means of the tapering washers and tails

illustrated in figs. 3 and 4, or by using a washer and tail of larger size than the trap, and belling out the inlet of the trap as required.

Several kinds of overflow have already been described and illustrated, from the old-fashioned pottery overflow in fig. 3, page 118 *ante*, to the more modern forms of pottery overflows and of combined metal waste and overflows. Two simple overflows for connection with lead pipes are shown in figs. 11 and 12. In the former the joint is made tight by bedding the metal in suitable cement and screwing the metal in to the bent tail-piece; in the latter the grating is fixed with two screws to the back plate. These overflows and the pipes connected with them cannot be easily cleaned, and are therefore not as satisfactory as some of the other kinds which have been described.

GENERAL BUILDING NEWS.

TOWER, ST. MICHAEL'S CHURCH, BOURNEMOUTH.—On the 5th inst. Bishop Sumner dedicated a new tower which has been erected in connexion with St. Michael's Church, Bournemouth, at a cost of 5,000l. The tower has been placed in a nearly central position on the south side of the church, and in style is a rather late variety of Early English. A figure of St. Michael stands above the gabled entrance. The architect is Mr. J. Oldrid Scott, of London.

LEICESTER BOROUGH ASYLUM.—On the 7th inst. the new buildings of the Borough Asylum, which, exclusive of land, have been erected and furnished at a cost of 94,743l., were opened. The extension, which is to the east of the old building, and comprises a complete asylum for males, provides accommodation for 235 patients. The total number of beds now provided in the old and the new buildings is 855. Plans were prepared by Mr. Hine, of London, and Messrs. Moss & Sons, Limited, of Loughborough, obtained the building contract, and began the work in the autumn of 1897. Good progress was made till 1899, when the strike in the building trade hindered the erection of the superstructure. From an exterior point of view the buildings present no strikingly attractive feature. On the contrary, they are severely plain, the red brick being relieved only by a dressing of stone. There is, however, a peculiarity about their formation, the wards having been arranged in blocks in echelon, but as a continuous building, with a main corridor in the rear, giving a separate approach to each ward. The formation of the site, which slopes considerably to the south, made this arrangement necessary. It is by no means a disadvantage, as the whole of the wards look out on the south, and receive much more sunshine than would otherwise be the case. Centrally placed between the new and old asylums are the new administrative buildings comprising, on the north side, facing Gipsy-lane, an official block with a new principal entrance, and rooms for committee and officers. The stores, with an inclined sunk roadway for delivery of heavy goods to the basement, are between the entrance block and the kitchen and offices, and to the extreme south is the recreation hall, 84 ft. long by 44 ft. wide. Adjoining the recreation-hall is a small detached block, containing rooms for the assistant medical officers. Flanking the administrative buildings on either side is a corridor leading from the principal entrance, kitchen, stores, &c., to the several wards, that on the west side for the female asylum, and on the east side for the male asylum. Adjoining the male corridor is a complete suite of rooms for the male attendants, comprising a sitting-room, mess-room, and billiard-room, with a number of bed-

rooms over. To the north of the attendants' rooms is a large bakery, with a two-decker oven, and machinery driven by electricity. On the north side of the main corridor are the engineering workshop, comprising a boiler-house, containing three Lancashire boilers, 28 ft. long by 7 ft. diameter, engine-house, containing two direct driven dynamos for lighting the whole of the new buildings with electricity, a battery-room, with storage cells sufficient for providing light through the night; also engineers' workshops, smithy, coal store, &c. To the east of the boiler-house is the workshops' yard, surrounded by shops for plumbers, painters, carpenters, upholsterers, tailors, and cobblers, a bricklayers' shed, and an office and store for the clerk of works. The day rooms, dormitories, and corridors are warmed by ventilating radiators, and the ventilation is effected by means of extraction flues built in the walls and gathered up in the roof as chimneys. The single rooms are treated in a special way to prevent the patients from injuring themselves against any heated metal. In a room sunk below the level of the boiler-house is fixed a receiver which collected the condensed water from the whole apparatus. The electric installation has been carried out under the supervision of Mr. Colson, and comprises a total of over 1,000 16-candle power lamps and two motors, at a cost of about 4,000l. —*Leicester Post*.

CO-OPERATIVE PREMISES, EDINBURGH.—Premises for a drapery branch of St. Cuthbert's Co-operative Association have just been completed in Nicolson-street, Edinburgh. Mr. T. P. Marwick, of Edinburgh, was the architect.

ARDROSSAN AND SALTCOATS JOINT HOSPITAL.—A new infectious hospital has just been opened for the reception of patients at Springvale. The site lies about equi-distant from the centres of the Burghs, and is situated on the higher ground behind Saltcoats. The buildings are four in number, and are designed to accommodate nominally fourteen patients with the necessary staff; in the event of an epidemic, however, this number may be doubled without unduly crowding the wards. The administrative block provides accommodation for a matron, four nurses, and two servants, and has kitchen offices of sufficient size to do the culinary work for the whole establishment. The ward block is divided into three sections, thus allowing for the treatment of three distinct infectious diseases. Each set of wards has its own nurses' duty-room, bath-room, &c., and is entirely disconnected. The wards are well ventilated and heated by hot-water radiators in addition to the most modern description. The sanitary fittings are of the latest type. The laundry, wash-house and laundry, with drying-room attached; boiler-house, mortuary and visitors' room; ambulance-house and disinfecting-rooms. Connected to this building are the rooms where the patients are discharged, being bathed and supplied with clean clothing before leaving the premises. The porter's lodge, which is situated at the gates, is a compact little cottage, and controls the access to the grounds. The sewage is treated before leaving the site by the Septic Tank system, the apparatus being designed and supplied by the patentees, Messrs. Cameron, Commins, & Martin, of Exeter. The roads and paths leading to the various blocks have been formed, and the avenue leading to the site has been re-made. Lamps have been erected, and hydrants provided to cope with any outbreak of fire. The whole work has been carried out from the designs and under the direction of Messrs. Fryers & Penman, architects, Largs. The contractors for the various works were:—Brick work, Messrs. Greig Bros., Kilwinning; joiner work, Mr. Thomas Miller, Saltcoats; slater work, Messrs. Hogarth & Co., Ardrossan; plumber work, Mr. T. B. Stevenson, Ardrossan; plaster work, Messrs. Murray & McCallum, Salt-

coats; painter work, Messrs John Gillilan & Son, Adrossa; heating, Messrs. Boyd & Son, Paisley; disinfecting apparatus, The Reck Heating Company, Copenhagen; railings, gates, and lamps, Messrs. Frazer Bros., Largs. The clerk of works was Mr. James Potter, Largs.

VICTORIA HALL.—HALIFAX.—The new Victoria Hall, which occupies a position at the juncture of Commercial-street and Fountain-street, Halifax, has been erected from the designs of the architect, Mr. W. Clement Williams. The site was a difficult one to deal with, but the wedge-shaped end has been utilised for the principal entrance, and allows of a semicircular lecture theatre. The large hall is placed on the westerly side of the site, adjoining Powell-street, and the shop-premises front into Commercial-street on the easterly side. The stage, which is at the northerly end, will give full accommodation for a large orchestra as well as for the organ presented to the town by Miss Porter. Under the stage dressing-rooms have been placed for both sexes. The hall itself, and especially the ceiling, is of a highly decorated character, consisting of enriched panels of ornamental outline, and the leading spaces have been filled with processional groups of figures representing the Fine Arts. The large cove, which connects the ceiling proper with the wall line, is divided into panels filled with ornamental fibrous plaster medallions. The ranges of fluted pilasters face round the hall in the clearstory down to the balcony level. The gallery fronts are enriched with varied scroll work, supporting Cupids bearing panels on which are inscribed the names of the chief musicians and poets of the century. The proscenium consists of a large archway, having deeply recessed panelled soffits. One feature of the scheme is the mode of support of the galleries. The cantilever principle has been put into use, with the result that the necessity for pillars is quite obviated, while at the same time safety is assured. The floor of the area is supported on spiral springs, which, by a block arrangement into a solid floor. From the broad corridors, passing round the whole of the hall proper, there are seven entrances into each section of the hall, and connected also with the four curves of each corridor is a panic staircase communicating with no other portion of the premises. All the doors are made to open outwards, and are fitted with automatic locks. The whole area is fitted with concrete and steel. From the principal entrance a broad staircase ascends to the grand circles, with communication on either side of the area. The northerly side of the staircase landing is divided into open arcade work, pilastered and corbelled. The lecture theatre is approached from the grand staircase by two separate entrances, and both the large and the small halls may be used at the same time without interfering one with the other. Accommodation has been provided for a lounge and refreshment-rooms, cloakrooms, and other offices. There are eight lock-up shops, and a semicircular restaurant in the basement. The style of the building externally is English Renaissance. The building externally is English Renaissance. The contractors are as follows:—Mason and joiner, J. Charneck & Sons; plasterer and slater, J. Bancroft & Sons; plumbing and ornamental modelling, Jonas Binns & Sons, who also are the painters and decorators; electric lighting, H. Wright, who has worked under the scheme of Shepherd & Watney, electrical engineers, of Leeds; stained-glass dome, William Pape, Leeds; other ornamental work, Reuben Bennett, Manchester; concrete and terrazzo flooring, G. Greenwood & Sons; ventilators, W. Crossley; structural steel work, A. Handyside, Derby; mosaic pavement, Maw & Co., Salop. The accommodation of the hall is exactly 2,436.—Balcony, 750; area, 856; grand circle, 500; orchestra, 350. The lecture theatre will hold an additional 300. Twenty-one inches per person is allowed in the best seats, and 18 in. in the cheap seats. The total cost is about 30,000.—*Halifax Guardian.*

SANITARY AND ENGINEERING NEWS.

CARDIFF WESTERN SEWER.—The Borough Engineer of Cardiff (Mr. Harpur) has prepared the estimates required by Parliament showing the cost of the works proposed to be executed by the Corporation under their Bill for powers to construct new intercepting and other sewers for the purpose of discharging sewage into the sea at or near Lavernock Point. The total estimated cost of these works is 181,000, made up as follows:—intercepting sewer, 21,100; outfall sewer from the termination of the intercepting sewer to Lavernock Point, 103,070; two connecting sewers forming connexions with the intercepting sewer, 12,570; storm overflow sewer, 1,670; pumping station, engines, pumps, and buildings, 33,000; and land easements, 9,500. To meet this expenditure, including the cost of passing the scheme through Parliament, provision is made in the Bill to enable the Corporation to borrow any sum not exceeding 186,000.

MANCHESTER SHIP CANAL.—From the half-yearly Report of the Engineer to the Manchester Ship Canal (Mr. Henry Hunter), we learn that the depth of water in the canal and docks has been maintained

throughout, notwithstanding that, as a consequence of the excessive rainfall experienced during the half-year, exceptionally large quantities of sludge and detritus have been carried down and deposited in the canal and docks. Above Eastham Locks two dolphins, which are required for the berthing of vessels while being ballasted, are in course of construction on the easterly side of the canal. At Barton Coal Basin additional lines of railway, together with two weighbridges, have been laid down and are in use. One set of the spare steel gates for the 65 ft. locks on the canal has been completed and delivered at Barton. The additional roads and railways at the timber storage ground at Weaste have been completed and are in use. In the Manchester Docks, the curve which forms the junction between Salford Quay and No. 8 Dock is being faced with timber work so as to provide additional berthing space for vessels in the dock. The erection of new offices (1) at Trafford-road and (2) at the end of No. 1 Dock, for the staff engaged in the working of the docks and railways is proceeding. Considerable additions have been made to the railway sidings at the docks; a portion of the new railways on the Trafford Park side of Trafford Wharf-road has also been completed. A commencement has been made with the operations required for the dock and railway extension and other works under the provisions of the Company's Act of 1900, and the main road on the northerly boundary of the property recently acquired by the company are in course of construction; the permanent fence is also being erected, and the levelling of the ground for quay and storage space is in hand. The embankments and slopes of the canal generally are in good condition, and the works throughout the canal have been efficiently maintained.

AYLESBURY RURAL DISTRICT SEWERAGE.—A Local Government Board inquiry was held on Thursday, the 7th inst., at the Public Hall, Waddesdon, by Mr. F. H. Tulloch, M.Inst. C.E., one of the Inspectors of the Local Government Board, into the subject-matter of a petition presented to that board by the Aylesbury Rural District Council, to put in force a provisional order to acquire certain lands required by them for purpose of sewage disposal for the township of Waddesdon, the powers of the Land Clause Act with respect to the purchase and taking of lands otherwise than by agreement. The land in question was about three acres of glebe adjoining Quainton-road, of which the Rev. Dr. Yule, as Rector, is the life owner. Mr. Guest Luckett, engineer of Aylesbury, was present, and explained the scheme to the Inspector. On the following day a similar inquiry was held at Haddenham by the same Inspector. Mr. G. Luckett on this occasion was also present as engineer of the scheme, and explained the plans to the Inspector as on the previous day.

BOILERS FOR THE BUFFALO EXHIBITION.—The boiler plant of the Pan-American Exhibition which is to be held at Buffalo, U.S.A., from May 1 to November 1 this year, will be stationed in a separate building across the canal to the west of the machinery and transportation buildings, the steam main being brought under the bridge to the boiler-house. The steam will be furnished by four "Climax" water-tube boilers, built by the Crownrock Steam Boiler Company, Brooklyn, New York. These boilers will be about 13 ft. external diameter, will stand over 31 ft. high to the base of a 48 in. chimney stack, and will have a minimum evaporative capacity of 5,000 lbs. of water per hour each. They will be fired with natural gas, but will have the regular coal grates covered with fire brick, so that in case of failure of the gas supply the covering can be removed and the boiler run with coal without serious interruption to the service. The "Climax" boiler is now being built in this country by Messrs. B. R. Rowland & Co., Limited, Climax Works, Reddish, near Manchester, who are the sole manufacturers outside the United States.

SEWAGE OF RHOSLANERCHRUGOG, DENBIGH.—Colonel A. J. Hepper, R.E., Local Government Board Inspector, held an inquiry on the 8th inst. at the Public Hall, Rhoslanerchrugog, with reference to an application made by the Wrexham Rural District Council for a loan of 25,000 required for purposes of enlarging the Rhos sewage outfall. Mr. Erice Evans, engineer to the Council, gave evidence in support of the scheme.

FOREIGN.

FRANCE.—There is continued talk of the formation of a new Académie des Beaux-Arts outside of the Institut. The promoters of the scheme are MM. Gérôme, Bonquereau, Bonnat, Benjamin Constant, Mercier, Fremiet, Vaudremer, Chaplain, Cormon, and Dagnan-Bouveret. It is to number one hundred members, and is to include women, after the example of the old Académie Royale, of which Mme. Vigée-Lebrun and Mme. Rosalba were members.—The graceful building in the Boulevard des Capucines, known as the "Favillon Hanovre," is to be demolished.—The commemorative medal of the great Exhibition, intended for presentation to exhibitors, and which is designed by M. Chaplain, presents on the principal face a figure of Fame bearing on her wings a figure of Labour, and sailing over a panorama of

the Exhibition. On the reverse is a profile head of the Republic, with a view of the city of Paris as a background.—A statue to the celebrated philanthropist, Victor Considérant, is to be erected at Salins (Jura).—The demolition of the fortifications of Abbeville and enlargement of the ancient cathedral of Nice has just been completed.—Parliament has decided on building new hotels for the French Ambassadors at Vienna and at Washington.—The statue of a Parisian lady, by M. Moreau-Vauthier, which surmounted the entrance to the great Exhibition from the Place de la Concord, has been bought by a contractor concerned in the demolition of the buildings, who proposes to set it up in the public square of a small town in Cantal called Puy-Mary.—The death is announced, at the age of seventy-seven, of M. Louis Fabre, a former pupil of Constant Dufeux, and who was since 1866 a member of the Société Centrale des Architectes. He had been an inspector of works under the Paris Municipality, and had carried out numerous works in the provinces and in Paris, including a number of private houses at Neuilly-sur-Seine.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The well-known business of Mr. George Jennings, sanitary engineer, has been converted into a limited company under the style of "George Jennings, Limited," the share capital being taken up by members of the family or friends.

GLASGOW ARCHITECTURAL CRAFTSMEN'S SOCIETY.—The usual meeting of this Society was held on the 8th inst., Mr. Alex. David presiding. The subject for the consideration of the members was "Wall Coverings," the lecturer, reading papers thereon, being Colin Sinclair, honorary secretary, discussed the subject of "Limes" and their application to wall surface, drawing special attention to the successful use of hydraulic lime plaster, as perfected by Mr. Alex. McAra, Glasgow, by his process in the preparation of Arden lime for this purpose. Mr. Robert W. Horn, A.R.I.B.A., confined his remarks to the use of "Gemeux" as plaster, and made clear in an interesting manner the various uses of "Bedford" in its numerous functions. A third branch of the subject, Mr. David Jackson, modeller, lectured on "Patent Plasters," speaking of such forms as Keene's, Robinson's, and Parisian cements, adamant, &c., and gave some useful information with regard to "Fibre" plaster and the casting of such, with special reference to its use in the Glasgow International Exhibition.

THE LONDON MANUAL.—The London Manual for 1901 (the fifth year of publication) contains much interesting and useful information concerning public bodies such as the London County Council, City Corporation, Boards of Guardians, Metropolitan Asylums Board, and the School Board. The work of the new Borough Councils is also described. The Manual, which is published by Edward Lloyd, Limited, Salisbury-square, appears to contain everything that is looked for in such a work. There are several small illustrations and maps in the issue.

ARBITRATION CASES.—At the Surveyors' Institution, Westminster, on the 6th inst., Mr. J. H. Clifton, arbitrator, concluded his inquiry as to their compensation to be paid by the London County Council for the property at Albert-square, on the south side of Commercial-road, E., which they had acquired as an open space under their General Powers Act of 1869. At the previous meeting evidence was taken from which it appeared that in 1869 the claimant, Mr. Morris Cohen, a mantle manufacturer, purchased the property at Albert-square, consisting of thirty-nine houses and the open square, for the sum of 22,000, or 1,000 more than was paid by the previous purchaser. Mr. Cohen, on obtaining possession of the property, proceeded to build workshops in the rear of the houses, and, as the demand for such premises was brisk at the East End, got an extra rental of 20l. per annum for each house. He was about to erect houses with workshops and shops on the square when the County Council obtained their compulsory powers. The claimant had been offered 37,500 for his property, but had declined the offer in view of its development. The value of the vacant land at Albert-square as a building estate was variously estimated by his witnesses—Mr. Haslock, architect, Mr. E. J. Housfield, surveyor, Mr. Douglas Young, surveyor, Mr. H. J. Dils, surveyor, and Mr. C. H. Moore, surveyor—at 10,500, to 17,187. The case of the County Council was opened by Mr. English Harrison, who contended that the valuations of the claimant's witnesses were greatly exaggerated. He called Mr. S. Walker, surveyor, whose estimate was 7,600; Mr. Farmer, surveyor (of Messrs. Debenham, Tevson, & Co.), whose estimate was 3,202; at the rate of 5s. per foot; Mr. Collins, surveyor, whose valuation was 7,920; and Mr. J. M. Knight, surveyor, who valued the open space at 7,497. The arbitrator, at the close of the proceedings, reserves his decision.—On the 31st ult., at the Surveyors' Institution, Mr. Ralph Clutton sat as arbitrator in the case of "Lord Guildford v. War Office," claim in respect of the compulsory acquisition of the War Department of 247 acres of frehold land

for military purposes. It was stated that the land in question formed part of Lord Guildford's estate, and was situated in the parishes of East Langdon, Guston, and St. Margaret-at-Cliffe, and within easy distance of Dover. Evidence on behalf of Lord Guildford was given by Mr. Alex. R. Stanning, F.R.I.B.A., Mr. George James Brown, F.S.I., and Mr. W. J. Jennings, F.S.I. For the War Office evidence was given by Sir William Crundall, Sir J. Whittaker Ellis, Bart., F.S.I., Mr. R. F. Granville, Mr. Cobb, F.S.I., and Mr. James Green, F.S.I. The owner's contention was that the land was of value as a possible building estate, an assertion which was denied by the War Office.

STREET IMPROVEMENTS, MAIDENHEAD.—Colonel W. Langton Coke recently held an inquiry on behalf of the Local Government Board in respect of the application of the Maidenhead Corporation for sanction for a loan of £9000 for street improvements. The Borough Surveyor (Mr. Percy Johns) gave evidence in support of the application. After several objections had been heard, the Inspector visited the various streets and localities proposed to be dealt with.

WIDENING OF HAMPESTEAD-ROAD.—A local committee held a public meeting, on the 11th inst., at Tolmer's-square Institute, Drummond-street, to consider the danger arising from the narrowness of Hampstead-road at the Euston-road. Dr. Collins, L.C.C., who presided, said the width of Hampstead-road at its southern outlet was only 33 ft. According to recent police returns, no fewer than 33,941 vehicles passed this spot between 8 a.m. and 12 midnight on a given date. The three lines and 12' width of the road was insufficient for the number of trams deposited thousands of passengers at that spot daily, and the danger was increased by the changing of horses. The question was affecting the welfare of London in general, and St. Pancras and North London in particular. The Mayor of St. Pancras moved a resolution declaring that the great and continuous increase of traffic rendered imperative the widening of the road at Hampstead-road. Of the 33 ft. of the thoroughfare, 18 ft. 6 in. were, he said, appropriated by trams, on either side of which omnibuses usually pulled up. The resolution, which was seconded by Mr. W. R. Cremer, M.P., and supported by Lord Elcho and Mr. Westacott, L.C.C., was adopted, with one dissentient. It was further resolved to bring the matter before the London County Council and the St. Pancras Borough Council, and to ascertain from London County Council candidates their views upon the subject.

THE PROPOSED RESTORATION OF LINLITHGOW PALACE.—Mr. Ross, of the firm of Messrs. H. Gibson Ross, architects, Edinburgh, who has had a life-long practical acquaintance with Linlithgow Palace, is of opinion that it could be restored in keeping with the other parts of the building at a cost of, say, about £40,000. He suggests that it should be converted into a great national institution, such as a museum or a library. "I have before now," he says, "urged the advisability of restoring Linlithgow Palace, and that for many reasons. First of all, that it is not in such a desperate state of ruin but that it could be easily restored to its original condition. Nothing else would preserve it but to place a roof upon it. As history records, in 1746 it was set fire to by Hawley's Dragoons, who were quartered in the Palace after the battle of Falkirk of that date. Up till then the Palace was in constant occupation. As the birthplace of Queen Mary, there is undoubtedly great appropriateness in the suggestion for its restoration as a memorial of a still greater Queen, and of a Queen about whose history there can be no cavil or dispute. Of course, the building, when restored, would not be suitable, owing to its situation, as a Royal residence, but still it could be used as an institution of the kind already suggested. Being situated mid-way between Edinburgh and Glasgow, there could be no rivalry between the two cities as to which city it belonged, and consequently, the rivalry being eliminated, it might become a very favourite Scottish institution. Some of the large apartments, especially the great hall, erroneously termed the Parliament Hall, would be one of the most magnificent rooms in Scotland. The Domestic Chapel is also a place of singular interest. It is by far and away the finest of the kind in Scotland. In fact, the Palace might be made a place to illustrate the medieval history of Scotland."—*Dundee Advertiser*.

BRITISH FIRE PREVENTION COMMITTEE.—At the monthly meeting of the executive of the British Fire Prevention Committee the death of her Majesty the late Queen was referred to in fitting terms, and it was proposed by Mr. Edwin O. Sachs (chairman of the executive) and seconded by Mr. F. R. Barron (chairman of the commercial section) and unanimously carried, that, "The executive of the British Fire Prevention Committee representing some 500 architects, engineers, municipal officers, and other professionally interested in fire prevention and research desire to offer their sincere condolences to his Majesty the King on the great sorrow sustained in the death of their late beloved sovereign, Queen Victoria. The executive further desire respectfully to assure his Majesty of their unwavering loyalty and devotion to the Throne."

MUNICIPAL HOUSE BUILDING IN SHEFFIELD.—The following item appears on the minutes of the Health Committee of the Sheffield Corporation:—"The City Surveyor reported that ten of the cottages

in Hands-lane were ready for occupation, and that five more would be ready in a few days. He also reported that the cost of cottages, including land, erection, street works, and incidental expenses, would be approximately as follows:—

	Estimate.	Approximate total cost.
	£ s. d.	£ s. d.
Land.....	714 12 0
Contract work.....	1,856 15 4	
Increased (through contractors having declined to carry out tenders).....	2,020 14 6	
Building wages, &c., done and lock-out of operative bricklayers.....	2,750 0 0	2,751 5 7
Printing, clerk of works' wages, street works, &c.,.....	306 18 2
		£5,793 10 3

Resolved, that the Tramways Committee be requested to lend to the Health Committee a sum of £800, the amount required, in addition to the £5000 already lent by them, for the cost of the erection of the Hands-lane cottages, on the same terms as to interest and period for repayment as the £5000.

THE SANITARY INSPECTORS' ASSOCIATION.—In consequence of further unavoidable circumstances, the annual dinner of this Association has been postponed to March 15. It will be held at the Venetian Chamber, Holborn Restaurant.

CAPITAL AND LABOUR.

THE NORTHERN BUILDING TRADE DISPUTE.—The Northern Centre of the National Federation of Building Trades Employers and the London Order of Operative Bricklayers have agreed to submit the matters in dispute at several of the centres of the industry to arbitration. An agreement to this effect has been made as follows:—"Memorandum of an agreement made between the Executive Council of the Northern Centre of the National Federation of Building Trades Employers of Great Britain and Ireland and the Executive Council of the London Order of Operative Bricklayers for the settlement of the strike and lock-out of operative bricklayers in Newcastle-on-Tyne, Gateshead, and district and the Northern Counties Federation district. It is hereby agreed that the dispute between the employers and operative bricklayers at Newcastle-on-Tyne, Gateshead, and district shall be submitted to the arbitration of two gentlemen, one each of which shall be appointed by the respective parties hereto, and in the event of the two gentlemen nominated being unable to come to an agreement they shall have power to appoint a referee, whose decision shall be final and binding on both parties; and it is hereby further agreed that in the event of the two arbitrators being unable to agree upon a referee the President of the Board of Trade shall be respectfully asked to nominate one at the request of both parties to this agreement. The arbitrators' award to be given within a fortnight of the date of signing this agreement, or at such subsequent early date as they the arbitrators may fix. It is further agreed that all the union operative bricklayers shall return to work in all the northern towns affected immediately the arbitrators' award is given, those in Newcastle-on-Tyne, Gateshead, and district on the terms of the award, and those in the other towns affected on the rules and rates of wages in force prior to the lock-out." Since the signing of the agreement by the chairman and secretary of the respective parties it has been practically arranged that one arbitrator shall be accepted, to be nominated by the President of the Board of Trade at the request of both parties.

SHEFFIELD CORPORATION AND THE PLUMBERS DISPUTE.—The Sheffield Corporation Water Department are going to pay the plumbers in their employ the 9½d. per hour asked for, on the condition that they accept the new proposals in regard to walking time and winter hours. Originally the men demanded 9½d. per hour—an increase of 3d.—without any conditions, but later the employers suggested certain new rates, the most important of which were that within a radius of 1½ miles of the parish church, or 2 miles of the workshop, no walking time should be allowed, and that the rule fixing 49½ hours as the working week throughout the year should be so varied that during the four winter months it should be 47 hours.—*Sheffield Telegraph*.

PERTH JOINERS' WAGES.—Perth operative joiners have received notice from the masters that on and after April 1 the wages will be reduced from 8½d. to 7½d. per hour.

THE DUNDEE BUILDING TRADE.—A conference took place on the 8th inst. in Dundee between the Master Builders' Association and the Operatives' Association regarding a proposed reduction of wages. The men's wages at present are 8½d. per hour, and both committees recommended a reduction of 3d. per hour, commencing on February 16, with no further change till the end of May, when a new agreement could be considered.

PENRYN QUARRIES.—Negotiations are being carried on between the managers and the men, but we do not think it probable that the latter will resume work.

LEGAL.

BUILDING DISPUTE AT SOUTH SHIELDS.

The case of the Mayor and Corporation of South Shields v. Wilson Brothers came before a Divisional Court of King's Bench, composed of Justices Wills and Channell, on the 7th inst., on appeal from a decision of the Justices of South Shields, who decided in favour of the defendants.

Mr. Ralph Bankes appeared for the appellants, the Mayor and Corporation of South Shields; the defendants were not represented.

The case came before the Court in the form of a special case stated, from which it appeared that a complaint had been brought before the Justices on behalf of the Mayor and Corporation of South Shields against Messrs. Wilson Brothers, that they had unlawfully erected a "new building" in Redhead-street in the borough without having first given fourteen days' notice in writing to the Corporation, and not having delivered to their surveyor plans thereof, contrary to the by-laws of the borough. Upon the hearing of the complaint the following facts were either proved or admitted by both parties: The defendants were the owners of a piece of ground of about an acre in extent in Redhead-street. It was boarded on every side, and occupied in part by a veterinary surgeon, who had an office, a stable, and some other wooden erections for his business. The defendants also occupied other parts of the ground as a builder's yard, and near the centre of the ground the defendants had an open shed. Against this shed the defendants put up the wooden erection complained of. It was of no great size, being under 20 ft. each way, and at the apex of the slanting roof only 12 ft. high. The public had no access to it, and it was to all intents and purposes in the enclosed private ground of the defendants, and was intended for a stable. On the part of the appellants it was contended that the wooden erection complained of required plans to have been delivered to the Corporation, which had to be approved of by the Corporation before the defendants commenced to build, and this the defendants had not done. The defendants' contention was that it had never been the custom of the Corporation to require any plans for wooden-built stables to be submitted to them; that the by-laws had not been insisted upon in such a case previously; and further that the by-laws did not apply to such a case as the present. The Justices, before deciding the case, surveyed the erection and its surroundings, when they held that the by-laws did not apply to a stable built of wood upon enclosed ground, as in the present case. In the opinion of the Justices, "a building to be a building within the meaning of the by-laws should answer to the description of an edifice having some approach to architectural design and structurally fit and intended for use and occupation by humanity in a civilised form." They therefore held that the structure in question was not a "building" within the meaning of the by-laws, and that no question of law arose in the case.

At the conclusion of the argument of counsel, their lordships held that the structure in question did come within the meaning of the by-laws, and remitted the case to the Justices, directing them to convict the defendants.

The appeal was accordingly allowed.

CENTRAL LONDON RAILWAY AND SUBSIDENCES.
