Mr. C. D. Collins, builder, Clapham, stated that at the request of the plaintiff's solicitors he had inspected certain skips used on the defendant's works. Some of the skips were in fair condition; one was in a very bad state, and another showed signs of being recently repaired. The side had been hammered out, and one of the corners had five or six new rivets.

Mr. Samuel Walsh Owen, M.R.C.S., &c., spoke as to the plaintiff's injuries. He considered that the man's injuries were permanent.

Mr. W. F. Sherard, M.R.C.S., &c., agreed generally with the evidence of the last witness.

For the defence Thomas Wright—known as "Ring"—said that he was foreman on the job in question. When the first man ("Ginger") met with his accident witness went to the plaintiff and said, "Dodge, what sort of a banksman are you?" By a banksman he meant a man to tip skips. The plaintiff replied that he could do the work, and witness then said, "Go up and empty the skips." Some of the skips on the job were in a very bad condition through being bent in at the sides. He did not, however, consider that the skips were dangerous, and there was no necessity for a man to put his hand between the side of the skip and the handle in order to release the catch.

Mr. Fredk. J. Smith, F.R.C.S., &c., totally disagreed with the medical evidence given on behalf of the plaintiff. He did not consider the man's injuries to be permanent; but, on the contrary, he found the hand almost restored to its normal condition.

William Weston, the defendant's general foreman, said that it was the constant lifting of the skips which bent in their sides. When skips were so bent they would be "usable," but the catch would, so to speak, be shortened. He did not consider the skip in question to have been in a dangerous condition.

The jury found in the plaintiff's favour, on the ground that the skip was defective, and that the foreman was negligent in not giving the plaintiff full instructions as to how he should do the work. They assessed the damages at 864.

His Honour gave judgment accordingly, and allowed full costs.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

23,820.—A SIPHONICAL DISCHARGE FOR WATER-CLOSETS: *H. L. Denton*.—A communication is made between the crown of the siphon and the upper end of the pipe that conveys in not giving the plaintiff full instructions as to how he should do the work. They assessed the damages at 864.

His Honour gave judgment accordingly, and allowed full costs.

23,845.—THE SAVING OF STONE, GRANITE, &c.: *F. Froehlich*.—An order that granules of cast-iron or steel may be employed for abrading purposes with circular saws, either the saws or the granules are magnetised. The adherence of the abrading material is effected with a coil, which is disposed at the side of the saw, the current being conveyed through brushes.

23,868.—SPIGOT AND SOCKET PIPE JOINTS: *J. Erick, J. W. White, W. Ferguson, E. Herron, W. Bales, W. Dodd, and W. A. Fairbairn*.—A shoulder is fashioned on one pipe that it may help to keep the other pipe steady during the time that the space between the two is being filled in with material. The joint is described as being adapted for use with pipes of clay, stoneware, brass, or cast-iron.

23,906.—AN APPLIANCE FOR USE WITH CRANES, LOAD-TRANSPORTERS, &c.: *J. Temperley and J. R. Temperley*.—The inventor's object is to prevent hauling or hoisting ropes from falling below the tops of the pulleys upon the rope-carriers before they become closed after the passing of the traveller. They provide hangers or loops upon the traveller, which will hold up the ropes, and deliver them on to the pulleys, the pulleys being mounted upon pivoted carriers after the kind specified in No. 14,162, of 1897.

23,956.—AN ATTACHMENT FOR DOOR-KNOBS: *G. H. Burrows*.—Notches cut in a hole in the door-knob are engaged by teeth that project from the neck, which is fashioned also with a collar, against which the knob is fastened by a bending-outwards of the teeth. The knob is made in two portions, whereof one fits within the other, and the two portions are fastened together by spinning the edge of one down over the shoulder of the other.

23,947.—AN APPLIANCE FOR USE WITH EXTINGUISHERS: *J. C. Mather and C. J. W. Yakenan*.—For purposes of opening it the acid-bottle is caused to slide inside a cage, and when the extinguisher is inverted a cutter cuts a thin membrane with which the bottle is closed. By a variant method a cam, which is turned with an outside handle, is so arranged as to be pressed against the membrane, and a frame at the top of the extinguisher retains the acid-bottle; or mixing-blades are attached to the axis which turns the cam.

23,948.—KILNS FOR DRYING EARTHENWARE GOODS: *C. Damsari*.—At the side and along the length of the drying-chamber is a conduit for hot air, the air entering from a passage having apertures that are provided with dampers. Upon the other side of the drying-chamber waste or discharge passages are placed. The partitions may be either permanent or removable, and for waste with air indirectly heated the conduit and flue may be joined with iron tubes. If the flue is made in two portions, one of them will receive the watery vapour and the other the gases of combustion, whilst chimney-shafts connected to the upper part of the flue will prevent the outlet apertures from becoming cool.

23,963.—MEANS OF CLEANING BASINS, BATHS, &c.: *Peck Bros. & Co.*—For removing dirt, &c., which has collected around the base of the top of a bath, washing-basin, &c., the inventor fashions a ribbed tube-shaped extension upon the base of the tub, and upon the extension he puts a shell of porcelain or similar material. The shell has inside grooves, and is so arranged that it will slide vertically upon ribs, whereby one can easily dislodge dirt from the base of the tub.

23,966.—THE MOULDING OF CLAY, ARTIFICIAL STONE, &c.: *C. Caerney and C. Schlimp*.—The feed-box is made whole with, or is firmly secured to, a die-block that moves beneath a fixed head, and propels the moulded brick slab or block on to the table; a cam and lever lift the moulding-box when

it is filled for engagement with the die, so that it motion upwards of the lower die (under the action of a hydraulic plunger) will compress the completely enclosed clay or artificial stone. In the first instance the material within the mould is subjected to the preliminary pressure of water which has been admitted into the cylinder under a pressure of relatively low amount, then water at an increased pressure is allowed to enter. When the block has been extruded from the mould on to the table through the entry of water at a low pressure in the cylinder the water is allowed to escape from the cylinder and a shaft with lever and rod mechanism are the cams that work the supply and exhaust valves of the cylinder. The dislodgment of the mould-box during the reciprocation of the feed-box is obviated by means of the cheeks or flanges upon the sides of the upper die.

23,987.—AN INSTRUMENT FOR USE IN BUILDING WALLS: *J. Goffe*.—The contrivance is devised for use in the building of walls at a given angle to one another, and to furnish means of obtaining the true horizontal and plumb lines; two blades, which can be set at the angle desired, are joined at their bases with an angle-plate, when some courses of bricks are being pushed in between two of the courses, the true plumb being determined by two levels mounted upon the blades; as the building continues the contrivance is sustained with movable hooks that are inserted into the joints between the bricks, and the line is to be held by holders mounted upon double-tailed slides, which are adjusted on scales marked upon the blades and are fastened with set-screws.

24,062.—WORKING IN WOOD: *R. Boughton & J. E. Smith*.—For cutting a groove in a block of wood and preserving (in the shape of a stick) the removed material at the same time the cutter is shaped as a semi-cylindrical sheet. The depth of the cut is controlled with an adjustable piece, and the cutter, which may be enclosed within a case, may have a row of teeth, can be driven by hand power. A lug serves to turn the tool gradually in making the cut, and for the groove the right and left halves should be cut separately, with a reversal of the tool for the second cut.

24,110.—A CRAMP FOR CONCRETE, STONE, &c. SIMILAR BLOCKS: *W. Shields*.—The contrivance intended for cramping blocks together in the construction of breakwaters and kindred works. It consists of two arms, on the nearer side of each of which is fashioned a flattened or rounded bearing-surface, whilst on their remoter sides are heels that will be against the surfaces of holes made in the blocks. In the heads of the clamping-arms are holes through which is passed a bolt that is tightened with a nut, or otherwise, so as to draw the blocks and the arms towards one another.

24,126.—ELECTRICAL CURRENT METERS: *Wright and Mutual Electric Trust*.—For purpose of a maximum demand indicator is made a vessel that holds liquid, and is fashioned in such a shape that the liquid is caused to flow from one portion of the vessel into the other without returning when the vessel is tilted (against the action of a spring) by a mechanism that comprises a sustaining-pulleys rope and a coil carrying the current. The quantity of fluid transferred is measured with a scale upon one part of the vessel. The normal position of the vessel is adjusted with a removable stop and provision is made—in one form with a constricted tube—for checking the too quick flow of the liquid into one portion of the vessel into the other.

24,181.—A PAINT-SCRAPER: *F. H. Crocker*.—Through the length of the handle is passed a bar of which one end is squared so as to take a slot in the scraper, and the other end is screw-threaded for a nut, by which means the handle is forced to hold the scraper securely. When the handle is turned a little the pressure becomes relaxed and the scraper is liberated.

24,185.—A REGULATING VALVE FOR PLUMB WATER SERVICE: *H. M. Williams*.—A cam attached to the axis of the balanced lever, when it is lifted impinges against a stem so as to open a spring-controlled valve, whereupon the flush ensues. As the flush-water traverses the valve, it communicates with the crown of the outlet siphon, the air becomes exhausted and basin discharge is started. The leaking of water into a receiver at the remoter end of the balanced lever effects an automatic closing of the valve, lever being in the end weighed down by the weight so that the spring is thereby released to pressure and shut the valve. A screw which regulates the current of water into the receiver controls the position of the flush.

24,187.—A CONTRIVANCE FOR BATH WATER SERVICE: *J. Simpson*.—The apparatus is designed for ensuring automatically the opening of discharge valves at the expiration of a fixed interval of time. A cord forms a connexion between the valve and a spring-drum, which under certain conditions is held by a pawl which a link joins an arm upon the axis of the drum; two oil valves communicate by means of a passage which is provided with a cock, and are attached to a cylinder. The filled cylinder is horizontal when the mechanism is set for action, but as oil flows slowly into the cylinder assumes a vertical position, whereupon stop upon the sleeve lifts the radial arm upon the axle of the drum, which then begins to

the cord, and so to lift up the discharge valve. In a modified form of the general principle involved a pawl in engagement with a rack attached to the discharge valve is substituted for the spring-drum.

24,227.—**FRIBS FOR DOORS, SPRINGS, PAVEMENTS, &c. F. W. HUBBERTS**—A beplate of some hard material, such as steel, is fashioned with slits and with tongues turned up at a right angle. Strips of some non-slipping material are fastened between the tongues and pressed through holes in the base-plate, or through holes in the tongues, so as to engage with projections upon the latter. By another method the leaden or other non-slipping material is laid across the entire face of the be-plate evenly with the upper edges of the tongues.

24,311.—**A GRIP FOR ROPES AND CHAINS: M. SCHIMPF**—The grip consists of two parts which are joined together; the wedge-shaped end of one part is set in adjustment with a lever which is passed through the notch, and of which the forked end closes the two parts. Upon the pin which belongs to the same part works a slotted bar, provided with a ring for its attachment to the load; the grip upon the rope or chain can be increased by turning the bar in the sense of a wedge.

24,349.—**CONTINUOUS STAIRWAYS: F. M. DODGE**—Over-lapping links, pivoted together and having cross-bars at intervals, constitute the chain, the inner-links being altered in their shape in order to allow allowance for flexure. Sprocket-wheels carry the chain-band. End rollers upon the cross-bars engage alternately with guide-grooves, so as to take tread and risers, and with another groove as to chain-band is returned.

24,375.—**A COMPOUND FOR CLEANING CHIMNEYS: L. HILSON**—For consuming or dispersing collected soot an admixture is made of nitrate of potash, lithum, and some non-hygroscopic material such as phosphate of soda, an iron or alkaline sulphate, irbionate of soda, or other finely-divided silica or urth.

MEETINGS.

SATURDAY, APRIL 6.
Edinburgh Architectural Association.—Visit to Uchie and Clackmannan Towers.

MONDAY, APRIL 8.
Bristol Society of Architects.—Annual General Meeting, Election of Officers and Council. 8 p.m.
Dundee Institute of Architecture.—Visit to Brechin Cathedral and Edzell Castle.

WEDNESDAY, APRIL 10.
Edinburgh Architectural Society.—Mr. Percy E. Abbs on "Impressions of a Tour in Italy."

THURSDAY, APRIL 11.
Sheffield Society of Architects and Surveyors.—Annual Meeting. Election of Officers, &c. 7 p.m.

FRIDAY, APRIL 12.
Institution of Junior Engineers (Westminster Palace West).—Paper on "Iron-lined Tunneling Construction," Mr. A. Woodroffe Stanton. 8 p.m.
London Association of Architects.—Mr. J. K. Ward on "Warm-air Heating Apparatus and the Aiding Preparations Necessary thereat." 8 p.m.

SATURDAY, APRIL 13.
Institution of Junior Engineers.—Visit to Great Northern and City Railway Works to inspect plant. 2 p.m.
British Institute of Certified Carpenters.—Mr. G. G. Smith on "How is the Future Workman to be Trained." 8 p.m.

PRICES CURRENT OF MATERIALS.

Our aim in this list is to give, as far as possible, the prices of materials, not necessarily the lowest, and quantity obviously affect prices—a fact which is remembered by those who make use of this list.

Table listing prices for BRICKS, &c. and STONE. Includes items like 'Bricks, 1 1/4 6 per 1,000 alongside, in river', 'Pit Sand', 'Blue Lias Lime', and 'Limo'.

Table listing prices for SLATES and TILES. Includes items like 'Slate, Bangor', 'Portland Cement', and 'Roofing Tiles'.

Table listing prices for WOOD. Includes items like 'Fir timber: Best middling Danzig or Memel', 'White Sea: First yellow deals', and 'Second yellow deals'.

Table listing prices for METALS. Includes items like 'Iron: Common Bars', 'Staffordshire Crown Bars', and 'Sheet Iron, galvanized'.

PRICES CURRENT (Continued).

Table listing prices for WOOD (continued). Includes items like 'Fir timber: Best middling Danzig or Memel', 'White Sea: First yellow deals', and 'Second yellow deals'.

Table listing prices for JOINERS' WOOD. Includes items like 'White Sea: First yellow deals', 'Battens, 2 1/2 in. and 3 in. by 7 in.', and 'Third yellow deals'.

Table listing prices for JOISTS, GIRDERS, &c. Includes items like 'Rolled Steel Joists, ordinary sections', 'Compound Girders', and 'Angles, Tees and Channels'.

Table listing prices for METALS (continued). Includes items like 'Iron: Common Bars', 'Staffordshire Crown Bars', and 'Sheet Iron, galvanized'.

Table listing prices for METALS (continued). Includes items like 'Iron: Common Bars', 'Staffordshire Crown Bars', and 'Sheet Iron, galvanized'.

Table listing prices for METALS (continued). Includes items like 'Iron: Common Bars', 'Staffordshire Crown Bars', and 'Sheet Iron, galvanized'.

Table listing prices for METALS (continued). Includes items like 'Iron: Common Bars', 'Staffordshire Crown Bars', and 'Sheet Iron, galvanized'.

Table listing prices for METALS (continued). Includes items like 'Iron: Common Bars', 'Staffordshire Crown Bars', and 'Sheet Iron, galvanized'.

Table listing prices for METALS (continued). Includes items like 'Iron: Common Bars', 'Staffordshire Crown Bars', and 'Sheet Iron, galvanized'.

PRICES CURRENT (Continued).

Table listing prices for METALS. Includes items like 'BRASS—Strong Sheet', 'Tin—English Ingots', and 'Solder—Plumbers'.

Table listing prices for ENGLISH SHEET GLASS IN CRATES. Includes items like '15 oz. thirds', '24 oz. thirds', and '30 oz. thirds'.

Table listing prices for OILS, &c. Includes items like 'Raw Lined Oil in pipes', 'Boiled Oil in pipes', and 'Turpentine in barrels'.

Table listing prices for VARNISHES, &c. Includes items like 'Fine Elastic Copal Varnish for outside work', 'Best Elastic Carriage Varnish for outside work', and 'Best Hard Oak Varnish for inside work'.

Table listing prices for TO CORRESPONDENTS. Includes text about the responsibility of signed articles and the publisher's policy on rejections.

Table listing prices for TENDERS. Includes text about communications for insertion under this heading and the publisher's policy on rejections.

HISTON.—For Baptist Schools, Histon, Cambridge. Messrs. Geo. Baines and Reginald Palmer Baines, architects, 5, Clement's-inn, Strand, W.C. 1.—

Table with columns for architects: T.G. Cowell, Oak Building Company, Ernest West, Coulson & Lofts, William Wade, Scales & Robins, H. Feast. Rows for estimates A through E, and a total estimate of £1,900.

LONDON.—For the erection of boundary wall, &c., at electricity works, Townmead-road, for the Fulham Borough Council. Mr. Charles Botterill, C.E., Town Hall, Waltham Green, S.W. 1.—

WEST HAM.—For the erection of dynamo-house, Dagenham, for the Town Council.—

NOTTINGHAM.—For the erection of motor-car works, Canal-street, for Mr. E. R. Bridson. Mr. W. Dymock Pratt, architect, Cauldon Chambers, Long-row, Nottingham. Quantities by architect:—

WREXHAM.—For additions to Vron Schools, Brymbo, for the School Board. Messrs. Davies & Moss, architects, 2, Temple-row, Wrexham. Quantities by architects:—

RUSHDEN.—For the erection of two houses and stables for Mr. Alex. Ladds, "Hayway, Rushden." Quantities by the architect, Mr. H. Knight:—

CORRECTION.—In our issue of the 9th ult. the name of Messrs. Chessum & Sons appears in the list of tenders for police station at Sidcup, instead of Messrs. J. T. Messom & Sons.

TERMS OF SUBSCRIPTION. "THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom, at the rate of 2s. per annum (13 numbers) PREPAID. To all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 2s. 6d. per annum. Remittances payable to DOUGLAS FOURDRIER should be addressed to the publisher of "THE BUILDER," Catherine-street, W.C.

ST. ALBANS.—For alterations and additions, Myrtle Cottage, London-road, for Mr. W. H. Moores. Mr. S. Doddimeade Edmunds, architect, St. Albans and London:—

W. H. Lascelles & Co., 121, BUNHILL ROW, LONDON, E.C. Telephone No. 1365, London Wall.

SALTASH.—For alterations and additions to No. 2, Port View Villas, for Mr. J. Bennett. Mr. Edgar M. Leest, architect, Saltash and Devonport:—

HIGH-CLASS JOINERY, LASCELLES' CONCRETE Architects' Designs are carried out with the greatest care.

SHENLY BARNET (Herts).—For a pair of cottages for Mr. Thos. Perry. Mr. S. Doddimeade Edmunds, architect, St. Albans and London:—

CONSERVATORIES, GREENHOUSES, WOODEN BUILDINGS, Bank, Office, & Shop Fittings. CHURCH BENCHES & PULPITS. ESTIMATES GIVEN ON APPLICATION.

The Proposed Queen Victoria Monument.

It appears that the announcement of the selection of five architects to engage in a limited competition for the proposed monument to Queen Victoria, which had found its way into some of the daily papers, was substantially correct. It is now officially announced at Mr. T. G. Jackson, R.A.; Mr. Aston Webb, A.R.A.; Mr. Ernest George, Sir Thomas Drew, and Dr. Rowand Anderson, have been invited to prepare designs for the treatment of the western end of the Mall, where the monument itself (in whatever form) is to be placed; and also to submit a general scheme to include an architectural entrance to the Spring Gardens end of the Mall, as well as "an architectural re-arrangement of the Mall with groups of sculpture at intervals, and a whole forming a processional road." The Committee having the matter under consideration consists of Lord Esher, Lord Lansdowne, Sir E. Poynter (President of the Royal Academy), Mr. W. Emerson (President of the Institute of Architects), Mr. Sidney Colvin, and Mr. A. B. Freeman Mitford. It has also been decided to invite Mr. Thomas Brock, R.A., to prepare a design for a group of sculpture, including a statue of the late Queen, to be placed opposite the entrance gates of Buckingham Palace. The Committee seems a good one, and the appointment of the President of the Royal Academy and the President of the Institute of Architects implies that it is intended that both sculpture and architecture should be properly considered in the scheme. It is also interesting to note that Mr. Mitford's claims to a place on the Committee are not apparent; but at the same time this is an improvement on the events of twenty years ago, when committees of taste on public works were usually made up of political grounds only, and artists were carefully excluded.

Beyond this, however, we fear that the inception of the scheme cannot be regarded as satisfactory, and will not give satisfaction to the public. No architects of any standing, of course, will grudge the five selected men their good fortune, in spite of the absurd idea of the *Times*, that the glaring piece of self-advertisement on the part of one person, which they allowed to appear in their columns, represents the general feeling of disappointed architects craving for a share in the job; a conclusion which is a sort of libel on all the most eminent and self-respecting architects of the day. But if the competition was to be limited, we may reasonably ask, why it was to be limited to five? Surely the Committee might have found a dozen architects in Great Britain worth including in the list, and have thus given a wider basis to so important a competition. But our own opinion is—without which, it is evident, public feeling coincides—is, that for a work of such national interest and such great importance there should at least have been a sketch competition open to all architects and sculptors of the United Kingdom. Such a competition would have been an event of the greatest interest in itself, and might have brought out some suggestion of genius which every one would have been glad to have. From such a sketch competition six, say, might have been selected to engage in a final competition. Some such system is undoubtedly what would have been adopted in France, where they understand better how to manage these matters.

And if we (and the public) complain of the limitation of the competition to five architects, we have still more right to complain of its limitation to one sculptor. Mr. Brock has a special reputation for portrait statues, but it can hardly be maintained that he is the leading genius in English sculpture; nor ought this to be a mere question of a portrait statue. On the contrary, it is a question whether a portrait statue is an advisable element at all in such a monument. For in all portrait sculpture there is the unavoidable discrepancy between the ideal

character of sculpture as an art, and the realistic character of modern costume. We may again appeal to the example set by the French, frequently at least, in such cases of personal memorials. Their favourite scheme is to produce a monument with symbolical sculptured figures representing abstract qualities or virtues, accompanying a bust or medallion portrait of the person commemorated, without any attempt at a realistic full-length presentation. Thus the whole monument is raised to the level of a poetic conception, and the incongruity of the prosaic detail of modern costume is avoided. In one case in England this has been admirably done on a small scale, in Mr. Gilbert's beautiful monument to Fawcett which is hidden away in a dark corner behind the west door of Westminster Abbey. And may we not take the Albert Memorial as a warning in this respect? In a general decorative sense the Albert Memorial, with some faults, is a remarkable work, in our opinion a good deal under-valued; but what is the absolute mistake (not to use a stronger word) in connexion with it? The portrait statue, unquestionably.

Let us turn now to the purely architectural part of the problem, and consider what can be done with this proposal to transform the Mall into "a processional road, with groups of sculpture at intervals." There are one or two points in connexion with such a scheme which do not seem to have occurred to any one, as far as published comments go at all events. In the first place, any transformation of the Mall into a really dignified and architecturally designed processional road must involve cutting down the existing trees in it, to begin with. If they were grand "immemorial" trees (to use Tennyson's expression) this might not be necessary; but they are poor and irregular growths, not likely either to come to anything more, and they would sadly interfere with any attempt to produce a monumental effect. Secondly, it certainly appears to us that if the ground immediately in front of Buckingham Palace is to become a monumental site sacred to

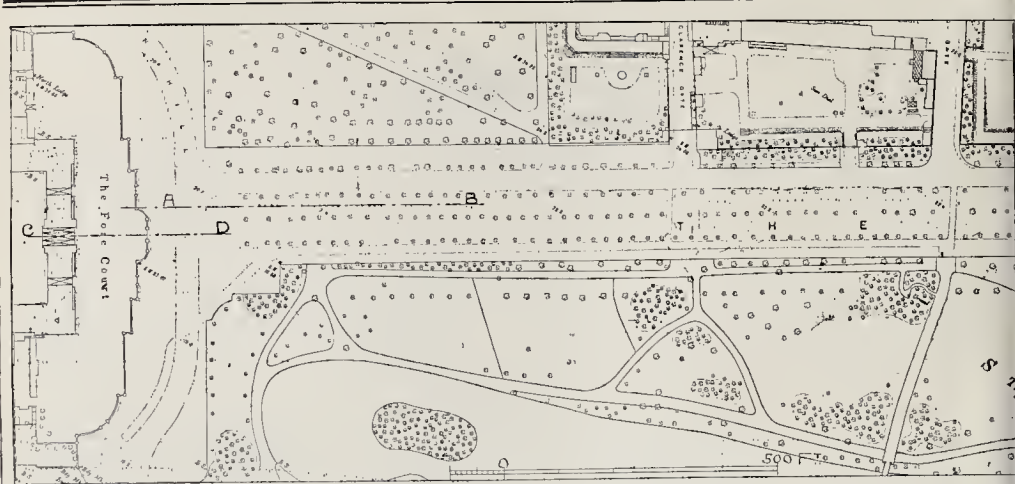

Fig. 1.—Buckingham Palace and the Mall as at Present.

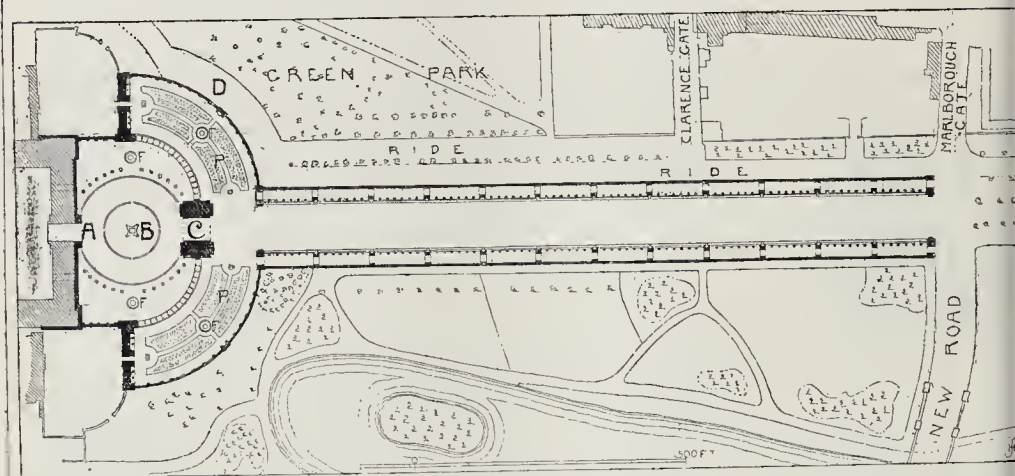

Fig. 2.—Plan for Colonnaded Approach and Triumphal Arch.

the memory of a great sovereign, the first thing to do is to put a stop to its use as the common cab thoroughfare to Victoria Station. It is we believe the fact (at all events we have seen it confidently stated in print), that the late Queen herself strongly objected to the existence of this exceedingly public road just outside the front railings of the Palace; and it may have been partly on that account that she used Buckingham Palace as little as possible. Certainly, a greater seclusion and dignity ought to belong to the approaches to the principal royal palace of the capital. Thirdly, as we have already observed, Buckingham Palace, though it contains internally a very fine *suite* of rooms, is externally a very poor affair in an architectural sense, quite unworthy of its position and function; and the erection in front of it of a new and, we may hope, impressive monument will render it, by contrast, even less imposing than at present. We again therefore, strongly urge that this occasion should be taken to reface the principal façade of the Palace, or rather the whole of the front block, including the returns at the ends, with a new and more dignified design carried out in a

fine stone; and that this should be considered as a portion of the memorial scheme, and form at the same time a worthy architectural background to the new monument.

Now, considering the two obstacles to a monumental processional road to which we have referred—the trees and the public cab-road, we would suggest that there is a method of making these two difficulties meet each other half-way, so to speak. But first let us reconnoitre the ground. Fig. 1, reduced from the Ordnance map, shows the site as now existing. From this it will be seen that though the avenue more especially called the Mall is central, or approximately so, with the axis of the Palace, the central axis of the total space, including the road and the avenue north of it, is some 50 ft. out of axis with the Palace. We will return to this point presently; let us for the present consider the Mall only, as axial with the palace. In order to divert the cab-traffic from the monumental site and from the vicinity of the Palace, we propose (fig. 2) to make a new road forming a continuation southwards of Marlborough Gate, crossing the lake in St. James's Park

by a new stone bridge a little eastward of the present footbridge (which would be moved), and joining Birdcage Walk,* along which the public traffic would then go. This new bridge might be so treated as to be an ornament to the park, and it would also serve an exceedingly useful purpose by affording (what is much wanted) a direct road to St. James's-street from the centre of Westminster, instead of the circuitous route round one end or another of St. James's Park. Having thus got rid of the cab-road to the Palace, we have also got a good excuse for treating the Mall in two sections, east and west of the crossing of this new road. The eastern portion would be left with trees, as it is at present, but with an architectural arch or other entrance from Whitehall. The portion west of Marlborough Gate would form a semi-private State avenue of approach to Buckingham Palace. The scheme indicated in fig. 2 shows a colonnaded loggia lining the road on the east side, with niches for sculpture at the pier and the back wall of the loggia could be decorated

* Only the commencement of this road is included in the plan, but its proposed course is easily understood.

Fig. 3.—Plan for Monument with Long Canal Facing it.

A. Front block of Buckingham Palace rebuilt and extended northwards. | B. Victoria monument. | F. Fountains.

with a series of frescoes representing English history. This road is up to a large triumphal arch, forming the entrance to the forecourt of the palace, the Marble Arch actually did in former times. The forecourt is enclosed by semicircular colonnades, through which could be seen the Victoria Monument erected in the centre of the court. Outside these circular colonnades a space is laid out with ornamental flower-beds. At the northern entrance to the road, by Marlborough Gate, would be great ornamental colonnades across the carriage-way. The idea is the public under ordinary circumstances should be admitted into the loggias and up the colonnades of the forecourt, but on occasions of levees and Drawing-rooms at the Palace they would be excluded, and the gates would then be open for the passage of carriages by this State route to the palace. The space now occupied by the carriage-way is turned into a Ride, which connects with Constitution Hill.

For carrying out such a scheme the trees in the Mall westward of Marlborough Gate would have to be removed, with the exception of the northernmost row, left standing in the Ride. If people exclaim at this as a needless proceeding, the answer is that a similar change was made in that way. For a decorative treatment of a site on a great scale, Nature must necessarily give way to

we may imagine a treatment on a somewhat more extensive scale, still retaining the expedient of the new road from Marlborough Gate to Birdcage Walk, and the entrance gates by Marlborough Gate, but occupying the whole width of the Mall, the present carriage-road included. In this case the axis of the new site would be nearly northward of that shown on fig. 2, and the front block of the Palace would be rebuilt and extended about 100 ft. northward, so as to bring its central axis in with that of the approach (see fig. 3). The entrance into the inner quadrangle of the Palace would necessarily be brought out in line with the quadrangle, and moved over to its north-east angle; but that is a matter of minor consequence compared

with the general visible effect externally. By taking a few feet off the St. James's Park ground on one side, and a similar amount off some private gardens and the Green Park on the other side, we get width enough for two roads up to the forecourt of the Palace, for going and returning, and a straight canal between them, lined at symmetrical distances with pedestals, either for groups of sculpture, or sphinxes, or some analogous symbolical sculptures; while at the west end of the canal would rise the Victoria Monument, a structure comparable in scale and richness to the Albert Memorial, forming the culmination to the vista, and reflected in the water of the canal. If people say this canal is an extravagance, and not worth the result, it may be asked why they admire, and why artists are continually painting, the effect of the Taj Mahal seen at the extremity of a long artificial canal; and why an effect which is thought beautiful in India is not to be supposed to be beautiful in England? It may be added that this effect of a long straight canal axial with the centre of the Palace was the actual treatment of the ground in front of old Buckingham House, before the present wriggling piece of water in St. James's Park was made. The forecourt of the Palace is shown laid out in a semicircle with radiating walks and parterres and a series of fountains round the margin of the semicircle; this also is a reminiscence of the former treatment of the forecourt of old Buckingham House. The margin of the canal, between the pedestals, is supposed to be lined with artificially clipped trees at equal distances; and as the canal is at a level considerably higher than that of the St. James's Park lake, the water from it, after flowing through it (for it should be kept at a gentle flow and not left stagnant), could be taken by a concealed sluice to form a waterfall discharging into the park lake, and thus add an attraction to the park.

As in the previous scheme, it is supposed that the roads on each side of the canal and up to the monument should be ordinarily open to the public as a kind of "pleasance," and only closed to them on days of State functions at the Palace. At the eastern end

of the canal the space between it and the Marlborough Gate entrance is laid out as an ornamental parterre, with a large fountain in the centre, which should be an artistic work of the highest class.

That anything on so grand a scale as this should be actually carried out we can indeed hardly hope, though there is absolutely nothing to prevent it except an objection to the cost. But whatever scheme is carried out should in our opinion include these three points—the architectural remodelling of the façade and the forecourt of Buckingham Palace; the diversion of public wheeled traffic from the immediate front of the Palace, and the provision of a more stately, dignified, and secluded approach to it; and the removal of the trees from the western portion of the Mall, in order to clear the ground for an artificial treatment of the site on a grand scale, with which these rather poor and irregularly growing trees must necessarily interfere.

We may conclude with repeating our opinion that there ought to be a sketch competition for the treatment of the site and the design of the monument, open to all British sculptors and architects, before any further steps are taken; and that public feeling will not be fully satisfied by anything short of this.

NOTES.

The Education of the Engineer. "It is plainly impossible, within the short space of three or four years and under academic conditions, to turn out an engineer, architect, or chemist fit for the full responsibilities of his profession." These words occur in the text of an address recently delivered by Principal Galbraith to the students and graduates of the Toronto School of Practical Science—an address which, although brief, is very much to the point. Technical education has been much talked about of late, and by some speakers it almost seems to be regarded as a sort of universal panacea for all ills that may afflict our commercial and professional pursuits. Mr. Galbraith is careful to emphasise the point that while a school can

furnish the student with such advantages in the race for success as will amply repay the time and money spent in acquiring them, yet faithful study for three or four years will not do more than enable him to grasp the main principles upon which his future profession is based. The practical knowledge and training of the engineer can be acquired only when engaged on professional work, as they are dependent far more largely on his own experience than on the experience of others. Until such practical experience has been in a measure obtained Mr. Galbraith wisely insists that "the young engineer should be placed in some subordinate position not entailing more responsibility than he is fit to bear." The commonest weakness of the young engineer, and we may add of the young architect, is insufficient knowledge of the trades. We do not mean to imply that manual skill is necessary, but practical knowledge is essential, so that the engineer or the architect may be able to decide when work is good and when it is bad, that he may know how it should be conducted, and that he should be familiar with the properties which affect the usefulness of any material specified by him. In the address to which we refer it is truly said "this practical knowledge cannot be obtained in the engineering school." A large proportion of civil engineers of the present day have followed the example of their predecessors, and have spent sufficient time in the "shops" to acquire a useful knowledge of practical work. It is quite the exception, however, for an architectural student to undergo a course of instruction in the workshops devoted to those crafts which it will be his ultimate duty to exemplify in professional work.

THE British Congress on Tuberculosis, which will be held in the Queen's Hall from July 22 to 26, will no doubt be chiefly medical in its discussions, but the question of the prevention or diminution of consumption has a certain direct relation with conditions of building, and this has been recognised by providing, in the museum which will be formed in connexion with the Congress, an architectural section in which plans and models of hospitals and sanatoria will be exhibited. Mr. T. W. Cutler is acting as Hon. Secretary of this section. The subjects to be discussed at the Congress include also that of "The Influence of Housing and Aggregation"; under which heading come the questions:—"How far are additional lighting and ventilation necessary to ensure a much higher standard of bacteriological cleanliness, and what additional legislation, if any, is required to render these advantages available?" and "How may cleanliness, with a sufficiency of light and pure air, be secured in factories and workshops, and in places of assembly generally, including steamships, railway carriages, and other means of transit?"

THE Ecclesiastical Commissioners, in pursuance of the Union of Benefices Acts, 1860 and 1898, have ratified a scheme for effecting a union of the two contiguous benefices (both being vicarages) of All Saints and Holy Trinity, Knightsbridge, the consent of the two vestries, the Dean and

Chapter of Westminster, and other parties interested having been obtained. The Commissioners ordain that the church of All Saints shall become the parish church of the united benefice, with the rectors of St. Margaret, in the City of Westminster, as patrons, that Holy Trinity Church shall be pulled down, and that the proceeds of the sale of its site and materials shall be applied towards the erection of a new church, with parsonage-house, upon a site in Prince Consort-road (St. Stephen's parish), South Kensington, which the Commissioners for the Exhibition of 1851 offer for sale. The scheme provides further for the removal from Holy Trinity Church to the new proposed church of all the carved work, fittings (organ by Jones), and furniture, together with such of its monuments, tablets, and antiquities as may not be otherwise lawfully claimed. Holy Trinity Church, Park-side, Knightsbridge, was built (1860-61) by Messrs. Dove Brothers, whose contract amounted to 3,250*l.*, after the designs of R. Brandon and H. M. Eytton (see the illustration in the *Builder* of April 21, 1860). It occupies the site of a district chapel, rebuilt in 1699, which had been the hospital chapel of a lazaret-house appertaining to the collegiate church of St. Peter, in Westminster, which Laud, when Bishop of London, converted into a chapel-of-ease to the parish of St. Martin-in-the-Fields, within the former limits of which it was then situated. The Dean and Chapter of Westminster are still, we gather, the ground landlords, and they are appointed patrons of the new church in Prince Consort-road. All Saints' Church was built fifty years ago, after Lewis Vulliamy's designs, in Ennismore-gardens, so named after Lord Ennismore, who was then living in Kingston House. The interior of the church was decorated by Owen Jones, and it has since been redecorated in sgraffito by, we believe Mr. Heywood Sumner. In August, 1891, the Consistory Court granted a faculty for an enlargement of the church, so as to afford further room for about 200 persons, at a cost of 4,000*l.*

WE were surprised that at the Board of Trade inquiry the subject of the dangerous pressures that exist in several cases between one main of a three-wire direct current system and adjacent water or gas pipes was not brought up by the opponents of the increased pressure. To us it appears the most serious drawback to the change. Engineers state truly enough that a shock of 200 volts is not a very serious matter, although they are careful to avoid them; but we regret to say that some of the London companies allow some of their mains to remain at a much higher pressure than 200 volts from the earth. In Glasgow one of the Corporation mains must always be above 250 volts from earth, and in Manchester and other towns, when testing the mains, the pressure between one of the mains and earth must be dangerous. The Board of Trade rightly prohibit the use of pressures greater than 250 volts between the mains in private houses, but this does not give complete protection from dangerous shocks unless they also prohibit pressures greater than 250 volts between any main and the gas or water fittings. The companies may object that the only way of preventing the pressure between any of the mains and

earth getting higher than 250 volts is increasing the stray currents to earth means of an artificial leak, and that these currents may do serious electrolytic damage to the gas and water mains. This is perfectly true, and shows that the electricians recommended the change over to the high pressure of supply did not take into account all the contingencies that might arise. Sooner or later those London companies who have failed to keep the pressure of the positive mains less than 250 volts from earth will have to adopt some desperate and expensive remedy or completely change their system. In a paper by Mr. Rus recently published in the "Journal" of the Institution of Electrical Engineers, various methods of regulating the pressures of the mains are described, but his conclusion is that those methods can only be applied when the insulation resistance of the work is high. They are, therefore, inapplicable to the older networks in London.

THIS estate, covering 5 acres, which was bought by Lord Churchill in 1897, has just been sold. Known as Wychwood, or Blandford, Park, and watered by a tributary of the Evenlode, it is situated near Charlbury and Woodstock, forming part of Wychwood Forest, a hunting-ground of Henry II., that once extended over 15 square miles. The property belonged to Elizabeth, to Robert Dudley, Earl of Leicester, and subsequently to the Danvers, advanced Earl of Danby; was then owned by the Hydes, Earl of Clarendon (who thence took their seat in the title of Viscount Cornbury), and afterwards by George, third Duke of Marlborough, whose son Francis was elevated to the rank of Viscount Cornbury in 1815. In his diary for October 17 and 18, 1664, Evelyn records visits to Cornbury in the company of Henry May and Viscount Cornbury to help in the planting of the park. Evelyn describes the present house as being

"lately built by the Earl of Denbigh [sic] in the middle of a sweet park, walled with a dry stone wall. The house is of excellent free-stone abundance of that part, a stone that is fine, but never sweats, and casts any damp. . . . We designed a handsome chapel that was yet wanting, as Mr. May has stables . . . having set out the walks in the park and gardens."

In Nicholas Stone the elder's MS. book of his own works are some entries (1664) which relate to his share in the building of the house. He writes:—

"Agreed with the Right Honbl. Lord Earl of Danby for to mak 3 ston gattes in to the park garden, Oxford, and to desine a new hows for at Corebury in Oxfordsheer and to deruch workmen and mak all thar. . . I was thar in 23 times and my covenant of acord with his lordship was 1,000*l.*"*

In or about 1630 Timothy Strong built the south front, with the cellars, great hall, and some adjoining rooms. Thirty years afterwards his son Thomas built, under Henry May's directions, the stables fronting Cornbury and the part of the house and terrace fronting Oxford. A drawing by Neale shows the house as having two floors and an attic story, with a tetrastyle portico and an apediment in the middle of the principal front.

* Lord Danby, *obit* 1644; Stone, *obit* 1647; Hyde was advanced Viscount Cornbury and Earl of Clarendon on April 22, 1661.

Front Elevation

ACCORDING to Dr. Fletcher's Report to the Local Government Board upon the sanitary circumstances of the Farnworth Registration Sub-district of the Bolton (Lancs.) Registration District, and upon the sanitary administration of the Farnworth and Kearsley Urban Districts, it seems that the Medical Officers of Health of these two sanitary areas have not been under the Board's order. Copies of the annual reports of the Medical Officer of Health for Farnworth have not been submitted to the Board, and those sent by the Medical Officer of Health for Kearsley have been deficient as regards the kind of information desired by the Board. In view of the above facts, the Board deemed it advisable that both districts should be inspected by one of their medical staff. Dr. Fletcher's Report gives much the same conditions for both districts. They are supplied with water from the mains belonging to the Corporation of Bolton; water derived principally from upland surface gathering grounds, the condition of which appears to permit certain opportunities of contamination of the supply. The almost universal method of excrement and refuse disposal is by means of privy-middens, all wrongly constructed. They are sunk beneath the ground level, most of them to a considerable depth; are very large, being capable in most instances of containing accumulations of refuse and nightsoil during a period of several months without becoming full. Excepting such nightsoil as is received by farmers, nightsoil and house-refuse are disposed of at one or other of the tips in the district. This is done by contract, and the method is to throw out into heaps on the surface of the ground the contents of several middens, and then to shovel the filth and refuse into carts. Thus in a back street may be seen several large heaps of stinking material at one and the same time, and the method involves not only grave nuisance during the process, but serious pollution of the ground surface and nightsoil. One is not surprised, after this, to read the following conclusions in the summary at the end of Dr. Fletcher's report. Mentioning some special causes of the prevalence of diarrhoea in the district, he continues:—

"But there are also other causes which exert a powerful influence on the prevalence of autumnal diarrhoea, and greatly encourage its local incidence and persistence. Chief among these are unwholesome circumstances, and especially such as are associated with pollution of the air and soil by decomposing animal and vegetable substances, and among such the foremost rank must be given to excremental material. These unwholesome conditions, moreover, are precisely those which encourage also the development, prevalence, and persistence of enteric fever. They have been shown to exist extensively throughout both the districts under consideration, and have undoubtedly had a large share in inducing diarrhoea, and in developing and maintaining infected material outbreaks of enteric fever, and in fostering the disease in an endemic form in the locality. If the district councils continue to permit the existing unwholesome conditions, the districts will probably suffer a penalty similar to those experienced in other places where like conditions have not been removed—The endemic disease may assume epidemic proportions with a correspondingly enhanced mortality."

This once pretty suburb has suffered many changes during the past few years. Amongst the buildings that have lately disappeared we may cite the old Greyhound Inn, established in

the former half of the eighteenth century, and twenty years ago was pulled down the Old Manor House wherein Edward Alleyn lived when engaged upon the founding of his College of God's Gift—completed in 1619, after designs attributed to Inigo Jones. Shortly afterwards the late Charles Barry, as architect to the College estates, laid out the Manor House property, extending over fifteen acres, for the building of villa residences. Alleyn first became a landowner in the parish of Camberwell in 1605. On March 5, 1885, was sold at Messrs. Puttick & Simpson's auction rooms the reputedly genuine agreement for the leasing of lands in the Manor of Dulwich to Edward Alleyn by Sir Francis Calton, signed by both parties, and dated October 3, 1605.* Another old landmark is doomed, being Rosendale Hall, erected, it is said, in 1658, and sometimes visited by Charles II. At Rosendale Hall was discovered a medicinal spring, which became so popular that the Green Man hostelry was opened for the reception of visitors; it was subsequently occupied by Lord Chancellor Thurlow.

It is to be feared that a large proportion of the contents of this exhibition can only be described as curiosities, mostly of a rather unattractive character. We pass by, one after another, half-finished sketches of landscape in grimy tones, and figure-subjects and portraits in which the object seems to be to get the ugliest persons possible as sitters, or to make them as ugly as possible. The latter must be the true explanation, for we doubt if there are any as ugly women to be found in real life, at least among those who live in drawing-rooms, as are shown here in more than one picture of "An Interior," or some analogous title. Occasionally we come across a rough sketch, like that of Mr. George Thomson's of "Penrice Castle," in which the artist, like Polygnotus, seems to have thrown his sponge at the paper with a happy accidental use of the right masses of colour for a bright landscape effect from which all detail is omitted. Mr. Clarkson in "The Bean Harvest" has got an effect of light in the sky, and Mr. Alfred Thornton's "Lombard Landscape" suggests the sentiment of poplars and clouds without any commonplace realism of effect. At last the eye catches sight of a picture—an actual picture! of "The Pool" with foliage reflections, and bearing the name of a real artist, Mr. Mark Fisher, and quite in his best way. But what does such a painter as he do in this gallery? We might put the same question to Mr. Furse, whose portrait of "Mr. Dodgson" is a reasonable picture; but in his larger work at the top of the room he seems unfortunately to have succumbed to the prevalent mania. Among the other pleasant exceptions are Mr. W. W. Russell's "Edge of the Forest," a landscape of some power, and the same artist's "A Holiday"; Mr. Fry's "St. George," a kind of archaeological whim, but amusing and clever in its way; Mr. Conrad's half-length "Portrait" of a young lady, pretty for once, and with a quiet repose of colour and treatment; and Mr. J. Henry's "The River Bar," a small coast

* In his "Dulwich College and Edward Alleyn" (1877), Mr. Blanch describes the deed as being the oldest document in the College respecting Alleyn's purchase of the manor. Mr. G. F. Warne's catalogue (1886) of the College MSS. says: "The original of this document has been lost."

landscape marked by clear and atmospheric effect. What is the aim in the majority of the landscapes hung, or what kind of pleasure we are expected to find in them, it is indeed not easy to understand.

MAGAZINES AND REVIEWS.

THE *Art Journal* contains an article by G. Montbard, illustrated by his own sketches, on "Fez, the capital of Morocco," which is to be continued. It gives us some glimpses of a little-known city. There follows an article by M. Day on "Cloth Bookbindings" and their susceptibility to artistic treatment. They can never have such a monumental appearance as stamped leather or vellum, but there is certainly no reason why artistic design should not be applied to them. Considering, however, that the material is much less lasting, the design should not attempt too much—it is not worth while. The simple design for the back of "Willow the King," gold on linen, with merely the plain but well-designed lettering and two or three bits of small spray ornament to fill up the outline of the lettering, ought to have an excellent effect (the illustration of course does not show the colour or the gold). Some of the illustrations remind one of the importance of having the feeling and style of the decoration in keeping with that of the book. The cover to "Gryll Grange," with a decorative peacock forming the prominent feature (Peacock being the author of the book), and that to "Pharos the Egyptian," with the Egyptian winged and snake-headed globe beneath, are suitable enough; but the cover for "Jacob Faithful," a conventional decorative treatment of an ancient gallery, is an absurd decoration for such a modern "old salt" story of sea life, and would have puzzled Marryat very much. The special number of the *Art Journal* is devoted to the life and work of Sir John Tenniel, the letterpress by Mr. Cosmo Monkhouse; the illustrations numerous and well chosen; the pathetic cartoon "Dropping the Pilot," perhaps the most memorable of all Sir John's *Punch* illustrations, forms the frontispiece. The Paris Exhibition supplement is still continued. It serves to remind most visitors, we fear, how much there was at that wonderful show which they missed seeing.

The most interesting article in the *Magazine of Art* is that on "Decorative Art in Belgium," by M. Octave Maus. From this article it would appear that there is quite a movement in Belgium for the decorative treatment of house fronts from designs by the architects, and also for furniture and the designs of entire rooms. By the decorative treatment of house fronts we mean the application of flat ornament on spaces defined by the architectural features. The two men named as most prominent in this movement are M. Paul Hankar and M. Victor Horta. English architects should read this sketch of the modern art-movement in Belgium. There is also an illustrated article on the decorative work in the new station of the Paris and Lyons Railway Company in Paris, to which reference has before been made in these columns. In introducing landscape as decoration—views of the places connected with the Paris-Lyons railway service, some at least of the artists have been very successful by a system of combining these landscape views with an architectural style of decorative design, which forms the framework through which they are seen, so that the landscape becomes only a filling up of spaces in a decorative design the main lines of which are completely architectural. This is a far better system than merely painting a landscape in flat style on a wall and calling it decorative.

The *Architectural Review* (Boston) contains among its illustrations some portions of Messrs. Cope & Stewardson's competition design for Washington University; very pretty drawings, looking almost exactly like sketches of some old Elizabethan building in England, an effect enhanced in one of the drawings by showing the wall half-covered with ivy; an appeal to sentiment which seems hardly fair. Messrs. McKim, Mead, & White's "Slate Savings Bank at Detroit" is a well studied one-story Classic design looking very like a bank, shown entirely in geometrical elevation and sections; the plan, however, is wanting. It is commendably honest to show in the elevation the hipped-leaded roof rising behind the balustrade, but nevertheless it spoils the look of the design, and in regard to this as well as many other

similar cases one is tempted to ask why, in these days of girders and concrete, a flat roof should not be made, and this interference with the main character of the design avoided. The balustrade is a feature which in itself suggests a flat roof, and, in fact, has little meaning apart from it. The editor takes exception to our remarks in the leading article of the New Century number of the *Builder* that the Gothic revival has run its course, and thinks that on the contrary its course has only just begun. If he lived in England he would know better. We are aware that Americans have not done with the Gothic revival; but it is certain that the English have. The principal article in the number is by an English architect, Mr. E. P. Warren, a long and interesting illustrated article on "Decorative Plaster-work."

The *Berliner Architekturwelt* contains illustrations of a considerable number of examples of recent German architecture, of which the most important is a *Kaufhaus* or mercantile warehouse by Herren Stiehl & Kampffmeyer, of Berlin; a building with a good deal of character and carefully treated in detail. The other examples are chiefly of villas and street architecture. There are also a good many designs for the interior decoration of rooms and for furniture which are of considerable interest and suggestiveness.

In *Fallden's Magazine* Mr. Twelvetrees brings to a conclusion his valuable scientific account of the construction of the Central London Railway. To the same issue Mr. W. H. Maxwell contributes an article on the important subject of "The Town Refuse Problem," and its relation to steam production. This gives valuable practical information, with sections, as to the structure and principle of various forms of refuse destructor. The article is to be continued in future issues. The main problem with which it deals is the extent to which refuse can be made commercially valuable as a heat producer.

The *Studio* (March 15) contains an article on the works of Mr. J. M. Swan, with a number of illustrations of his animal studies and paintings, and one on the curious subject of Japanese tobacco-boxes, with illustrations. An article by a lady "On Some Modern Cottages," with illustrations which are all of one school, and that the school of what we call the contrived picturesque. Articles on such subjects should be written by practical architects, not by lady amateurs, who look at the subject only from a sentimental point of view.

The *Artist* contains an article on "Book-binding," by Mr. Kineton Parkes, with some good illustrations, and one on John Martin and his works, by Mr. E. Wake Cook, who seems to have constituted himself the champion of this pinchbeck genius. Mr. Cook seems to think one reason that Martin does not take a place alongside Turner is that he has no fair representation: "Turner's works are everywhere in evidence; Martin's might be nonexistent." That is confusing cause with effect. Martin's works are nowhere because no one cares to have them.

In *Scribner* ("The Field of Art") Mr. W. H. Low gives an account of "the story of a painted ceiling" in an ordinary-sized private house, with a ceiling 13 ft. from the floor. The account of the gradual manner in which the treatment was arrived at, and the prejudices of the client softened down, is very well given, but the most interesting point in the article is the remark quoted from Pavis de Chavannes in regard to his decoration for the Hemicycle of the New Sorbonne. The story is told to illustrate the importance of being familiarised with your apartment before you set about a painting in it. What the great French decorative painter said was this:—

"When I was asked to do the Hemicycle of the Sorbonne I arranged to pass the better part of my days in the hall and before the space which my painting was to occupy. There I stayed, studying the lighting, the proportions of my panel, its distance from the spectator, until, little by little, the vision of my picture appeared to me, so very like what I ultimately placed there that you would be astonished could you see it as I did."

The *Century* contains a picturesque and at the same time practically interesting article by Mr. Wolden Fawcett on "The Transportation of Iron," the means by which the fresh-mined ore is within a week transported twelve hundred miles, by land and sea, to the furnaces in Pennsylvania and Ohio. The following quotation gives a good idea of the scope of the article:—

"It is a marvellous transit, this trip a third of the

way across the continent, and the journey itself is not more wonderful than the vehicles in which it is made. The flying trip is made by rail, then by boat, and finally by rail again; and it might be made even more quickly were it not necessary to lose a day and a half 'changing cars,' so to speak, although in reality, of course, the transfer is from cars to the monster freight-carrying vessels of the Great Lakes, and thence back again from the leviathans of the inland seas to the metal wagons of the steamroad. Of a part of the ore it may be said that from the time it leaves the hills of the northern wilderness until it is set down in the smoky valleys that lead up from the Mississippi, not a human hand touches it. Powerful mechanical shovels, doing the work of scores of men, place it aboard the cars at the mines; gravity carries it to these ungainly carts to the hold of the fresh-water ships; and, when the voyage is ended, ponderous arms of steel, impelled by steam, delve into the hold and draw out at a swoop sufficient of the fine-grained material to fill several of the largest farm-waggon's."

In the same number Mr. Birrell continues his amusing and characteristic article "Down the Rhine," in which we are asked to look at a good many things from a new point of view. He gets to Cologne in this article, and is greatly impressed with the cathedral, especially its scale. "The great door is 93 ft. high and 31 ft. wide. These figures are comforting and inviting." "The materials that go to compose the flying buttresses alone would build cottages for ten thousand men." Has Mr. Birrell worked this out, or is it only a local cicerone's tale? Scale, however, is not everything in architecture, and Mr. Birrell quits Cologne without a word for St. Gereon—a parlous omission. "Old Manor House Gardens," by Miss (or Mrs.) Nicholls, is a rhapsody on old gardens to accompany some illustrations.

The *Nineteenth Century* includes a short article by M. de Soissons on "Augustin Rodin," one of those rhapsodies in which it is now the fashion to indulge over the wrong-headed and fantastic works of a man of genius who has forsaken the paths of true art for those of sensationalism. Among other things which we are called on to bow down before is that confused and unintelligible plaster sketch called "The Gates of Hell," which was to be seen in the Rodin pavilion next the Paris Exhibition, and over which we are told the artist has been at work for ten years. Of course the preposterous so-called statue of Balzac comes in for the usual adulation. It would seem that sculptor and critics (?) have alike lost their reason.

The *Gentleman's Magazine* contains an article by Mr. Karl Blind on "Sir F. Barry's New Excavations of Brochs," those ancient and puzzling strongholds in Scotland to the remains of which special attention has recently been directed. Sir F. Barry has discovered eight in the neighbourhood of his own castle, "in places where no one had guessed their existence underground, so imperceptible did the marks on the grass-grown soil appear to the ordinary eye"; and the author, not without apparent reason, calls him "the Schliemann of Caithness." The same number contains a short article on the interesting subject of the old-fashioned "Semaphore Telegraphs," and one by Mr. J. Ellard Gore on "Recent Advances in Stellar Astronomy." He remarks on the great assistance given in recent times by the increasing number of amateur observers. One point touched upon at the close of the article is of special interest in connexion with the recently observed new star in Perseus, viz., the possible cause of these occasional outbreaks of flaming worlds. Mr. Gore supports Mr. Monck's theory, that these are dark or only faintly luminous bodies which acquire a shortlived brilliancy by rushing through some of the gaseous nebule which exist in space, as shooting stars take fire by rushing through our atmosphere. The comfortable reflection is added that if our own sun passed through such a mass, its heat and light would be vastly increased by the friction. In such a case there would be a literal fulfilment of the prophecy, "The earth also and the works that are therein shall be burned up."

The *Pall Mall Magazine* contains an exceedingly practical article by Sir William Richmond on London fog and smoky chimneys, the special point being to urge the unrelenting application of the power to fine proprietors of factories which are allowed to emit smoke from their chimneys, supplemented with the argument that the proprietors themselves would find more perfect combustion of their fuel a saving in the long run, and that the fines are really in their interests as well as in those of the public. He shows that in some cases the

authorities who have power require a great deal of external pressure put upon them to induce them to exercise their legal powers. It appears to us however, that to head the article "The Black City" is somewhat sensational—London can look bright enough in favourable weather; and the photographs which accompany the article appear to have been purposely taken under conditions of light such as to give the greatest possible dinginess of effect. The cause does not need these adventitious aids, which are rather apt to produce the opposite effect to what is intended. The same number contains a translation of posthumous article on Millet by the late Charles Yriarte; interesting, but not marked by any thoughtful criticism as to the position which Millet will permanently occupy in art. Ultimately it will probably be recognised that the value set on Millet's work at the close of his life and after his death, has been somewhat exaggerated. The same number contains an account of the making of the Uganda railway, which has been carried on not without practical opposition from natives, white ants (which attacked the telegraph poles), and lions. One of the latter animals was found one morning on the platform of one of the carriages, apparently waiting for the train to go. As he "refused to show his ticket," and was unfriendly in his demeanour, he was promptly shot. The difficulty with the white ants was got over by transplanting living trees for telegraph-poles, which the ants do not attack.

Knowledge, as may be expected, contains an article on the new star (so-called), in respect to which there is offered a variation on Monck's theory referred to by Mr. Ellard Gore (see above), to the effect that the blaze is due not to a body like the sun passing through a nebula, but to the passage of a dense swarm of meteorites through the sparser swarm composing a nebula; "the denser swarm, on this view, is responsible for the dark line spectrum and the sparser one for the bright lines." It is expected that there will be opportunity for much further study of the spectrum of the *nova*, which may afford further evidence for one or other theory.

Moring's Quarterly contains an article, with some illustrations, on "The Roman Camp at Birdswood," the largest camp on the line of the Roman wall.

The *Home Counties Magazine* (quarterly) contains several articles on subjects of archaeological interest in the neighbourhood of London, among which "A Walk by the Brent," by Mr. J. P. Elmslie, may be specially mentioned.

The *Quarry* contains an article on "Some Norwegian Building Stones" to which considerable additional interest is given by views of a number of buildings carried out in various varieties of Norwegian granite and stone; the material being specified beneath each illustration.

Climate, a small quarterly journal, gives an account of a rather interesting competition, initiated by the journal in question, for the best design (constructively) for a house suitable for European residents in tropical climates. They received four designs, of which what were considered the two best are published, with some particulars as to the methods and materials recommended, and the criticisms of the Committee of Selection. Those who are about to build houses in a tropical climate may find the report useful.

COMPETITIONS.

HEARTS OF OAK NEW OFFICES.—A two days' meeting of the delegates of the Hearts of Oak Benefit Society was concluded on the 9th inst. at the offices, Charlotte-street, Fitzroy-square. The Council submitted a report, which was adopted, stating that they had purchased for 30,000l. freeholds in Euston-road and Grafion-place as a site for new offices. They recommended that the leases of a third of the premises should be purchased for the erection forthwith of suitable offices. It was decided to offer premiums of 100l., 75l., and 50l. for the best designs of suitable buildings, the cost of which should not exceed 55,000l.

VOLUNTEER DRILL HALL, LEITH.—A drill hall and headquarters for the 5th V.B. Royal Scots, Leith, have been erected in Dalmeny-street, Leith. The hall is 160 ft. by 84 ft. The architect was Mr. F. G. Simon, of Messrs. Anderson, Simon & Crawford, of Edinburgh.

THE ORIENTATION OF GREEK TEMPLES.

The following is an abstract of a paper recently read by Mr. F. C. Penrose before the Royal Society:—

The paper contains notes on two examples from Greece and four from Sicily—of these, three are of the nature of amplification and correction, and three are fresh cases.

1. To the second head belongs a rude and archaic shrine in the Isle of Delos; not improbably the most ancient existing example of a religious structure on Greek soil. It exhibits the usual stellar connexion with its orientation and an approximate date conformable with its remote antiquity (1530 B.C.).

2. Some further observations on the Temple of Apollo, at Delphi, of which the recent complete clearance of the site admitted of measurement with greater exactness than before.

3. At Syracuse I found that the architecture of the temple, which has been erroneously attributed to Diana, was of a character much too archaic for the date assigned to it in that paper, which had been derived from the orientation of the axis; but that when taken from the northern limit of the eastern opening the date would be quite consistent both with architecture and the history of the town.

4. This led to a re-examination of the other Syracusan examples and an error was discovered, altering the orientation of the temple attributed to Minerva, and its derived date, from 815 to 550 B.C., to its great advantage in every respect.

5. The most interesting example, however, is from another Sicilian temple lately unearthed at Selinus. Of this temple I found the orientation of the eastern axis to be 30 deg. 22 min. north amplitude, which at once suggests a solar temple arranged for the summer solstice, which for a level site and for the date in ques-

tion, should be 30 deg. 35 min. But the temple's site is near the bottom of a valley; and the sun would have to gain an altitude of rather more than 2½ deg. before it could shine into the temple; and then the amplitude required would be 28 deg. 17 min. Thus apart from what may be derived from the plan of the temple itself, the orientation theory would seem to show to a disadvantage. At the same time the peculiarities of the plan of the temple would be difficult to explain without the orientation theory.

Presumably the angle upon which the lines of the temple were set out was taken from data obtained on some platform which had a level horizon, and the building was considerably advanced before the actual solstice came round and showed the error that had been made.

To meet the difficulty a *naos* was constructed within the flank walls, but hugging the northern one; so that the first beam of sunrise coming through the centre of the eastern aperture, at the local amplitude of + 28° 17' E., might shine in centrally upon the Statue of the Deity; and for this a pedestal was provided a little northwards of the centre of the niche which had been previously formed for it. We may notice also that the south-west angle of the Propylea is so placed as to keep exactly clear of the point of sunrise.

6. An argument is drawn from the orientation of the foundations of a small temple lately discovered, adjoining the famous theatre at Taormina, that the theatre itself was that of the city of Naxos, which occupied the sea-coast at about 800 ft. immediately below it; and not the work of the much later town of Taorminum, from which Taormina derives its name.

NEW WING, NURSES' HOME, KIRKDALE, LIVERPOOL.—On the 26th ult. a new wing, which has been built at the North Home of the Liverpool Queen Victoria District Nursing Association at Kirkdale was opened. The architects were Messrs. Rathbone & Beckett.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The members of this Association visited Sauchie and Clackmannan Towers on the afternoon of Saturday, April 6—the former through the courtesy of the Earl of Mansfield, and the latter by permission of the Marquis of Zetland. The leader at Clackmannan Tower was Mr. A. F. Balfour Paul, who gave a description of the old castle, and recalled its historical associations. The party then drove to Sauchie Tower, where Mr. John Watson acted as leader, and exhibited some measured drawings which he prepared many years ago before the topmost portion of the tower was demolished. The castle and the old cottages adjoining were then examined and described.

CARDIFF, SOUTH WALES, AND MONMOUTH-SHIRE ARCHITECTS' SOCIETY.—On the 3rd inst., at the Royal Hotel, Cardiff, this Society held a supper to mark the close of the session, Mr. George Thomas, the President, being in the chair. Since the end of October the members have heard the opening address of the President and papers by the following gentlemen:—Mr. W. H. Ashford ("The Orders of Architecture"), Mr. W. H. Dashwood Caple ("Sanitary Building Construction"), Mr. A. Gladding ("Wren's City Cathedrals"), Mr. C. B. Fowler ("Interesting Portions of Ancient Architecture in the Diocese of Llandaff"), Mr. H. Sesom Hiley ("Architectural Training and Education"), Mr. J. Coates Carter, and Mr. J. H. Phillips ("Holidays on the Continent"). Among the toasts given at the supper were "The Chairman," submitted by Mr. H. S. Hiley, and responded to by Mr. George Thomas, and "The Guests," proposed by Mr. H. C. Rimell and acknowledged by Mr. W. H. Dashwood Caple, who mentioned that last year thirty Associate members were elected, and urged the desirability of the younger members of the profession settling themselves to downright work if they meant successfully to meet outside competition. A smoking concert was held after the supper.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—The fifth lecture of the course on "Works Management" was delivered by Mr. A. H. Barker at the Westminster Palace Hotel on April 3, the Chairman of the Institution, Mr. Percival Marshall, presiding. The method of calculating piece-work prices was considered, figures relating to the product of lathes, shaping, and other machines being given, and diagrams were exhibited embodying results from actual practice. The necessity of exact records being kept relating to each process of a job was urged. Time-sheets and books were described, and the system of keeping them dealt with in detail. Reference was made to the advantages to be derived from a special rate-fixing department where devices could be submitted for executing standard jobs in the most expeditious manner in the works proper. The premium system was further alluded to, and the lecturer proceeded to the question of cost-keeping, the respective operations of the estimating and costs' office being traversed, including tabulating, book-keeping, indexing, &c. Considerations with respect to invoices in both directions were entered into, and systematic methods for the avoidance of errors, and of unbusinesslike occurrences in connexion therewith, were indicated.

PUBLIC IMPROVEMENTS, GREAT YARMOUTH.—On the 29th ult. at the Town Hall, Yarmouth, Lieut.-Colonel A. C. Smith, R.E., an inspector to the Local Government Board, held an inquiry into applications by the Corporation for permission to borrow 7,500l. for foreshore improvements at Gorleston, and 2,580l. for paving works. It was stated that the Corporation propose to acquire 2,394 ft. of cliff at Gorleston, and the slope of the cliff for the same length. The top of the cliff was to be levelled and laid out as a promenade, and the cliffs would be sloped off down to the beach, giving a gradual approach. The existing concrete sea-wall at the foot would be extended. The Corporation would have the right to erect shelters and lavatories, pavilions, and other structures below the level of the sky-line, but on the top of the cliff nothing must be erected that would obstruct the view from houses that might be erected on an estate on the cliff. Evidence was given by the Borough Surveyor. The paving works loan was for the formation of concrete paths in place of existing gravel paths.

* "Additional Notes on the Orientation of Greek Temples, being the Result of a Journey to Greece and Sicily in April and May, 1900." By F. C. Penrose, M.A. F.R.S. Received January 17.—Read February 14, 1901.

Formal Garden seen from Colonnaded Vestibule

THE ARCHITECT AND THE GARDEN.*

WHEN our late Hon. Sec. first asked me to read a paper before the Discussion Section I told him that it was not possible for me to rise to the high level required, but, like the impertunate widow, he refused to take "No" for an answer, and at last, weakly, I gave in.

If I thought it a difficult matter a year ago, much more have I found it so now, when so much has been said and written on the subject of gardens, and when there is at the present time a distinct and almost general revival of garden craft and design. I must, therefore, beg you not to expect anything new or original from me either in fact or theory. All I have endeavoured to do is to again call fresh attention to the intimate relation between the house and the garden, and, therefore, consequently between the house designer or architect and the garden.

That these important relations are almost entirely overlooked or unknown by the general public is, I think, a truism which we all realise, but it seems to me more than possible that this ignorance is, perhaps, due to the architect himself, who has in the past failed to make use of opportunities which must present themselves to him when he is called in to design a new home or, perhaps, to alter an old one. I mean architects generally as a body have failed to study garden craft and garden design, or to realise how great is the connexion between house and garden from both the practical and æsthetic point of view.

The vast number of amateur (so-called) garden books, the several excellent architectural ones written within the last few years, and the more or less ready sale which they command are sufficient evidence of the awakening interest which is being aroused, both in the public and professionally, in this, to me, most fascinating of all the allied branches of our art. It behoves us, therefore, to be on our guard, and to be fully prepared with reasons why the architect's jurisdiction should extend to the garden, and to see that our knowledge is founded upon sound principles. I do not propose, therefore, to go much into

* A paper by Mr. H. P. G. Mauls, read before the Discussion Section of the Architectural Association on the 13th ult.

the question of garden design, or what may be right or wrong in garden design. I would rather dare to paraphrase Kipling's ballad, "In the Neolithic Age," and say "There are nine and sixty ways of constructing garden lays, and every single one of them is right"—so long as we keep before us the spirit of the old English garden, and understand the principles which underlay its formation and development, and realise the reasons why an architect's education should include a study of garden craft. Perhaps here, at the outset, I had better say what I personally conceive those underlying principles to be.

First of all, then, I shall say *seclusion*. For if this was not the great aim of the old gardeners, it is an end which has certainly been attained: and it is at least interesting to find that the original meaning of the word garden in almost every language was "an enclosed space," and in the Greek word "kortos" a secondary meaning was a feeding-place. The brick wall with its green crusted coping, the close clipped hedge, defying the prying eyes of the curious, high trellis-work with its entwining creepers, all point to this end, and while serving the useful purpose of giving shelter to fruit and flower, wraps the whole garden with a tranquil air of seclusion, security, and mystery. This was well understood in the seventeenth century, and is, I think, clearly the reason why Georgian houses were so often placed close to the road in order to give more space and seclusion to the gardens lying behind them.

After seclusion comes *use*. Gardens were not made merely for pleasure, but to provide the home with necessities and delicacies elsewhere unattainable. Fruit growing was a fine art. The bakehouse, brewhouse, game larder, fishpond, dovecote, herb garden, walled fruit garden, orchard, quincunna, and stillroom were necessities, and not merely evolved out of playful fancy.

For instance, there is, I think, no doubt that the fishpond or tank owed its origin in mediæval Catholic England to the demand for fish, and hence the development and charming treatment of these ponds in later times. The ladies of the household were experts in all that pertained to garden produce, and the recipes of our great-great-grandmothers

would probably considerably astonish their twentieth century descendants. The old-fashioned herb garden must not be forgotten. The culture and curing of "simples" was formerly part of a lady's education, and gardens were oftentimes renowned for this feature alone. Evelyn says, "We walked into a large garden esteemed for its furniture, one of the fairest, especially for simples and exotics." Then also the necessity for good, dry paths and terraces, for it was in the garden that exercise was "largely taken." Roads were few and bad, and ladies no doubt disliked mud as much then as now.

The garden was therefore an integral part of the home—indeed, an absolute necessity—for modern conditions were unknown, and if the household was not self-supporting it could barely exist. Thus garden and house grew up and were designed together, for each was the complement of the other. Thus, I think that the keynote may be said to have been necessity, to which was doubtless added a real love of beauty for its own sake, prompting those quaint fancies which help to enhance the charm and discount the utilitarianism which really lay at the root of all. Necessity and pleasure thus walked hand in hand, the former, by its "directfulness," giving the cue to the sturdy formality and strength of purpose which so appeals to us now. The natural result was a happy blending of pleasure and use until, by the simple process of evolution, the original uses were no longer required, and therefore not understood and misapplied, and the way then stood open for the chaos and futility of Capability Brown and his evil school.

Some slight consideration of the original cause of the development of the garden leads us clearly to the fact that the garden was necessary for the home life; that fruit, flowers, walks, turf bowling-grounds, shelter and seclusion were the natural outcome of the household requirements, and so house and garden became wedded, as it were, into one, each dependent on the other, with logical purpose governing both. Each thus gaining from the close and living contact with the other, they finally became that perfect whole, which we can doubtless conjure up before our eyes. The grey stone or purple

A Trellis Pergola.

brick weather-beaten house, the trim well-kept walks, the velvet turf, the checkered play of light and shade on grass, yew, and gravel. The quaint old-world flowers, coming and going again and again, year after year, in their old familiar places beside the stained and lichened wall, with its kindly shelter from the northern winds. The sundial with its happy phrase, perhaps some little sunken garden, secluded and more sacred than the rest, with the flash of its cool fountain. Last, but by no means least, the generous fruit garden and orchard, delighting equally in sight and taste. But no words of mine can adequately describe the limitless possibilities which are to be found. The result we know, that happy blending of house and garden, which is the outcome, not merely of chance and time, but of steadfast purpose and well-trained organised design, born in the days when gardening was a loving craft worthy to be followed, loved, and understood by the noblest minds.

In effect, then, these three—seclusion, usefulness, and pleasure, are what I conceive to be the principles underlying the old tradition and examples.

The question we must next ask ourselves is this—Do these principles still hold good; are the same necessities still in existence; can we after making all due allowance for the lapse of centuries and rapid growth of modern requirements, still say that the same factors should form the basis of good garden design in this twentieth century, and, if so, how is the architect thereby affected? At first sight it may appear that as the old order changeth, giving place to new, so we must search for new essentials upon which to found the lines of a logically designed modern garden; but a little consideration will, I think, show that in reality almost all the old conditions should apply at the present time.

First, *seclusion*. I should say that in these days of publicity, of interviewers, photographers, cheap magazines, and general social scramble, never was the quiet calm of the garden more desirable. The greater number of houses, and the greater chances of being overlooked by near neighbours, serve to make strongly defined boundaries, which will act as screens, even more imperative than ever, and thus we have ample excuse for "high-walled gardens green and old," hedges thick and trim, and well designed trellis as bounding lines.

Of the usefulness and necessity of a garden the need is still the same, though perhaps at first sight not so apparent, and the reasons are more psychological than materialistic.

Different kinds of fruit and vegetables can probably be bought from the greengrocer as cheaply as they can be produced in most private gardens, certainly near London, but the demand for them is greater than ever. Jam and pickle factories have done away with the absolute necessity for home growing, but I think every one will agree that home-made jams are far superior. I am sure that few people realise how much can be done and how much pleasure obtained from even a limited number of well-cared-for fruit trees, and what is more beautiful than an apple or pear orchard either in early summer or autumn? Then, too, there are many trees such as mulberry, quince, medlar, cherry, plum, filbert, which are full of delight to the eye, and useful as well, which planted with discernment will give pleasure to generations. Although sociology hardly comes within the scope of this paper, and without going quite as far as Voltaire's "Candide" and saying "Let us cultivate our garden, for that comprises the whole duty of man," I am certain that if nowadays, gardening, not merely flower gardening but honest fruit and vegetable growing with the accompanying culinary knowledge, was better understood and followed, as our forefathers followed it, the modern cry of broken nerves and jaded energies would not be so much in evidence, both for men and women—and the everlasting cry for amusement and excitement might somewhat abate. There is no recreation more healthful than gardening, and health is the ground plan of all that is worth having in life.

There is one other point I must touch upon in connexion with the necessity of the garden, and that is its educational influence, especially upon children. In these days, when so many time-honoured fallacies have had to succumb to modern science, there is no better way of teaching scientific truths and imparting a true system of observation of nature than by means of the well-ordered garden—of the joy of the "pleasure garden" there can be no doubt. Bowling greens have given place to tennis and croquet lawns, but that is only in the course of the natural evolution of physical recreation, which has become more imperative and vigorous. The love and desire for sweet-smelling, beautiful flowers and dry walks—indeed, all the pleasing fancies of the old gardens are strong as ever, and, surely, we moderns of the twentieth century, with all our increased knowledge and vaunted cultivation, should be able to appreciate the pleasure part of the garden, and derive moral and physical good from it as much as our ancestors. Without wearying you further then, it is my

belief, that after making allowance for the gradual evolution of certain old forms, such as bowling greens, to modern ones, such as tennis lawns, speaking broadly, all the old essentials are still in existence. If some are in modified forms, and if some have dropped out, others have made their appearance, and, therefore, the same factors or their modified or more highly specialised descendants still govern garden design. The house and garden still require each other to make the home one perfect whole. Each must fit in with the other, and each must be in most cases subject to some special circumstance of site and locality.

Who, then, is so fitted to bring this about as the man who designs the house? He it is who must have a hand in the laying out of the garden, or, as I hope to show, points may be missed, and full advantage of the site may be lost, and so the chance of welding together house and garden through some happy accident of nature may be missed for ever. How, then, can we convince our clients that one mind should control the two? The end can only be achieved by taking our client (or more often his wife) with us. He probably has no conception that we look upon the garden as our province, and care must be exercised in approaching the subject. If he is a careful man, or anxious of expense, it may be well to approach the garden from the materialistic point of view. Point out the desirability of determining where surplus earth may be removed at one hauling, and thus save labour, and form your broad lines all in once. The making of paths from old material may be suggested, or the position of the carriage drive if the house is to have one. If by some such means the ice can be broken and the rude shock got over of finding that the architect wants to have some hand in the external surroundings of the house, then, perhaps, the rest may be plain sailing, and if the man or woman has any real love of the garden, out it will come, and the resulting garden should express not so much your individuality as in the house, but the owner's, directed by a trained mind, but still expressing, and that, too, decidedly, the owner's particular quips and cranks.

If, however, he is still untouched by the revival, and is a "wobbly-walk" man, then indeed our labours are hard, but it is well to remember that mostly these men are such from want of knowing better, and a little tact and an *apparently* unstudied introduction to "The Formal Garden in England," may work wonders, and all may be well in the end.

A Sundial.

Most people are open to argument, and the arguments in favour of formal lines and well-defined boundaries are so well known that no more than a passing reference is needed here. Moreover, the back of the old opposition is broken, and the architect will chiefly have to make good his claim to the right to settle the main lines of the garden scheme.

Before, however, he can scheme anything there are certain facts he must know. First of all comes the question of garden labour. He must ascertain exactly what amount of labour will be kept, for upon this hangs in reality the whole scheme. It is suicidal to design a garden which requires the time of four men to keep it in proper order if only two are to be kept, and the evil has two results. First, your garden will never look well, it will be untidy; and secondly, the owner will never feel satisfied, and will either be compelled to employ more labour than he can well afford, or else put up with the evil of an understated garden. In either case he will blame the designer, who assumed a responsibility without due knowledge.

The chief charm of a real garden is, I think, shown in the care which is taken of it. If the turf verges are shaggy and ill-kept the charm of line is gone, and the feeling of love and care which should be induced will be wanting. I know a garden, and I say garden advisedly, which is only some 16 ft. by 20 ft., and yet year in and year out it is the pride of a village, and that solely by reason of the love and care bestowed on it by its cottage owner. I know also gardens which are gardens in name only, because they are too ambitious for the staff, and therefore paths become weedy and turf gets dull for want of sufficient attention. These may sound great platitudes, and be well known, but it is so easy to draw on plans gravel walks, grass borders, and sunken lawns, forgetting all the while that walks want constant attention, and that grass borders and slopes especially require plenty of labour in summer if their true value is to be obtained. Grass particularly only looks its best when it is necessarily rolled and mown, and rolling and mowing, I know from practical experience, take time, even for a small quantity. Therefore, above all else, first find out how much

labour will be kept, and cut your garden accordingly. Some excellent practical advice on the subject of garden labour is given in Mr. Mawson's "Art and Craft of Garden Making," but the best way of arriving at a reasonable judgment is to carry in our minds some garden or gardens we know well and the number of men who are employed, comparing the results obtained with the size of the garden and using our knowledge when designing.

Having discussed preliminaries and discovered the trend of our client's garden mind—if, fortunately, he has one—the choice of the actual position and aspect of the house will largely depend upon the result arrived at, especially, perhaps, if the site is a hilly one. For instance, we might choose a level site for a lawn to avoid expense in moving earth, and the position thus chosen might affect the house considerably, for often it is far better to take old meadow turf in hand, to work, roll, and mow it, in fact, rather than to sow afresh, especially where time is an object and where a newly turfed or sown lawn would be a considerable drawback to the early enjoyment of the garden. For turving and sowing can only be done at certain seasons, viz., spring and autumn, and then the result depends largely upon weather, which is chance. Nothing so makes or mars the appearance of a garden as good or bad turf.

A fall in the ground or an old hedgerow may be utilised for a terrace, but it is not necessary to enumerate all the possibilities. Generally some characteristic of the country side or natural feature on the site which may lend itself to our gain can be seized upon, and which may influence or modify both house and garden, proving how essential it is that the architect should have the necessary knowledge to turn the accidental peculiarities of the site to the best advantage. If he merely settles the aspect and plants the house down upon the site without thought of the garden, it seems to me obvious that chances will again and again be missed of making some special point or feature which will stamp the future home with an individuality all its own.

Surely, then, each site must be treated on its own merits before the house is built, and it needs no imagination to see that to do this properly

house and garden must be considered together and at the same time.

It must not be forgotten that in almost all gardens there is a chance and opportunity—indeed, a necessity—for some architectural features which it is essential the architect should design or control. It is here that the modern garden designer and horticulturist necessarily fails. He has not had, in most cases, the requisite architectural training, and not having designed the house, he perforce loses that sympathetic link in detail which the architect would impart, and thereby still further blend in harmony house and garden. The old gardens were full of architecture, and such buildings as tool-houses, pottingsheds, root-houses, stone steps and balustrades, summer-houses, clovecoats, seats, and thoughtful trellis work—features in them—are required still, and if used with restraint will help to add human interest. But here again the necessity for them should be the keynote. Do not let us introduce them simply to make "features." If a seat is desired it will work its way into the design, and by its presence add to the garden's beauty. The sundial, though apparently no longer a necessity in these Grimthorpean days, is most fascinating, and if used rightly will set our thoughts working and lend just that touch of romance which is needful to both eye and memory. Above all, let us keep garden architecture simple both in form and feeling. It is not what we put in so much as what is left out that sets the seal on the perfect garden, and this is a point I particularly want to emphasise. The old formal garden had almost degenerated into grotesqueness by the eighteenth century from over-elaboration. Bacon's advice, "Be not too busy or full of worke," had been forgotten. Let us keep this and Sedding's maxim, "All is fine that is fit" well in mind, and see that we fall not into the like mistake.

Thus far I have dwelt only with the main principles upon which I conceive garden design was founded in the past, their application to modern conditions, and some reasons why the architect should be a garden designer. The architect's knowledge, however, must extend further than this. He must have a knowledge of garden craft. He must know and love the materials he has to design with—namely, the flowers, grass, trees, and herbs. He must have an eye to the fall and lie of land, and the differences of soil and aspect, and be fully alive to the fact that a garden is a living, growing thing, pulsating with life, and not the outcome of a geometric paper design made by a man who knows naught of his materials.

So much has been said lately about gardens from the practical point of view (and I would especially call to your attention a paper by

A Sundial: Designed by Mr. A. N. Prentice.

Mr. Mawson, read before the Birmingham Association, which appeared in the *Builder* for January 19 (this year) that I know I could only cover the same ground, and in a far less able manner; but some points may be mentioned as being typical and also as essential for us to know. I will mention them briefly, only saying that experience and constant inquiry whenever opportunities occur are the best means of gaining that practical knowledge which it is absolutely necessary for us to have if we are to cope successfully with garden design.

First, then, soils and drainage. Obviously the latter depends upon the former, and until considerable practice has given us knowledge I would suggest that we first of all ascertain what is the local custom as to treating the soil, and how much or how little drainage is required. Mr. Mawson says that "unprepared soil is the cause of almost all garden failures."

Secondly, we must discover what grows well in the neighbourhood, for it is no use designing and planting trees or boundaries which will not grow successfully in the locality, necessitating planting being done again after some years and at a time when some considerable show and growth should have been the result of our efforts.

Thirdly, botanical or horticultural knowledge. I do not think it at all necessary for us to go very deeply into this question, but what we must do is to know something of the times and seasons at which the flowers we propose to use will make their richest appearance. We need not know the best way to make them grow, but may presume that will be done for us. Observation and a garden notebook will teach us much.

Good, well-made, dry paths and walks are a practical necessity, for wheeling soon cures them up unless the foundations have been well prepared. Fruit and flower gardens must have sun and must have shelter, or plants will not grow, and early and late frosts will do a vast deal of unnecessary damage.

The house-drainage scheme must not be overlooked, and advantage should be taken of all manorial products.

In effect, then, the burden of my paper is this: House and garden must not be severed,

but must be treated together, and be the product of one mind—the architect's. He may scheme his garden as he pleases so long as it is subordinated to the house, and he always keeps before him its fundamental uses and objects—seclusion, usefulness, and pleasure.

Thus I have endeavoured to link architect and garden together, and the knowledge he will have to make his own will be the most satisfying and delightful of all his education. If in building materials we are brought in contact with Nature that is dead and gone, in the garden we are face to face with living Nature herself, and the more we know of her, the more we shall love her "myriad ways."

I have now but to ask you to "piece out the imperfections with your thoughts," and to make yours the ideal I have tried to keep before my own eyes—

"A garden bower'd close
With plaited alleys of the trailing rose,
Long alleys falling down to twilight grots,
Or opening upon level plots
Of crowned lilies, standing near
Purple-spiked lavender:
Whither in after life retired
From brawling storms,
From weary wind,
With youthful fancy re-inspired,
We may hold converse with all forms
Of the many-sided mind,
And those whom passion hath not blinded,
Subtle-thoughted, myriad-minded."

RE-OPENING OF TACKET-STREET CONGREGATIONAL CHAPEL, IPSWICH.—Tacket-street Congregational Chapel, Ipswich, was opened on the 21st ult. after undergoing extensive alterations and additions. The end galleries from the pulpits have been removed, with the vestries which were underneath them, the side galleries having been carried up to the end wall. The organ has been reconstructed and refixed on the ground floor. The east window has been raised and filled with stained glass. The additions consist of a church parlour, deacons' and ministers' vestries, lavatories, and a kitchen. The church parlour, which has been named the Langston Hall, is 35 ft. 6 in. by 23 ft. and has a recessed platform 14 ft. by 5 ft. The architects for the alterations were Messrs. Eade & Johns, Ipswich. Mr. Fred. Bennett was the contractor.

THE ARCHITECTURAL ASSOCIATION
SPRING VISITS.

ON Saturday, March 30, a visit was paid to the Prudential Assurance Company's new offices in Holborn. Last session the Association were much interested when this immense addition to the old building was in the earlier period of its construction, and this second visit was all the more instructive, as it is now possible to see the more fully-developed scheme, and in a measure to gauge the working of the new building with the old.

The whole of the block is to be used entirely by the company for their own offices, and in many respects the thought and consideration given to the employees is a remarkable evidence of what can be done by skilful planning.

The general character of the work has been previously dealt with in these columns. The excellence of the materials used and the quality of the workmanship leave nothing to be desired.

The central tower is the principal feature of the Holborn front, and will give an added effect to the now familiar lines of the present offices.

Mr. Paul Waterhouse, in conducting the visitors round, made some interesting remarks with regard to certain processes in connexion with the Falence work. It may be of interest to note that during the excavations some beautifully iridescent glass sack bottles and flacons were found, dating back to the fifteenth or sixteenth century.

Illustrations.

NORWICH UNION LIFE INSURANCE
NEW HEAD OFFICES.

THE directors of the Norwich Union Life Office recently invited a few architects in London, Norwich, and elsewhere to send in plans for new head office buildings which they proposed to build in Surrey-street, Norwich. The design which they selected, and which is to be carried out, was submitted by Messrs. Geo. J. Skipper and F. W. Skipper, architects, of Norwich.

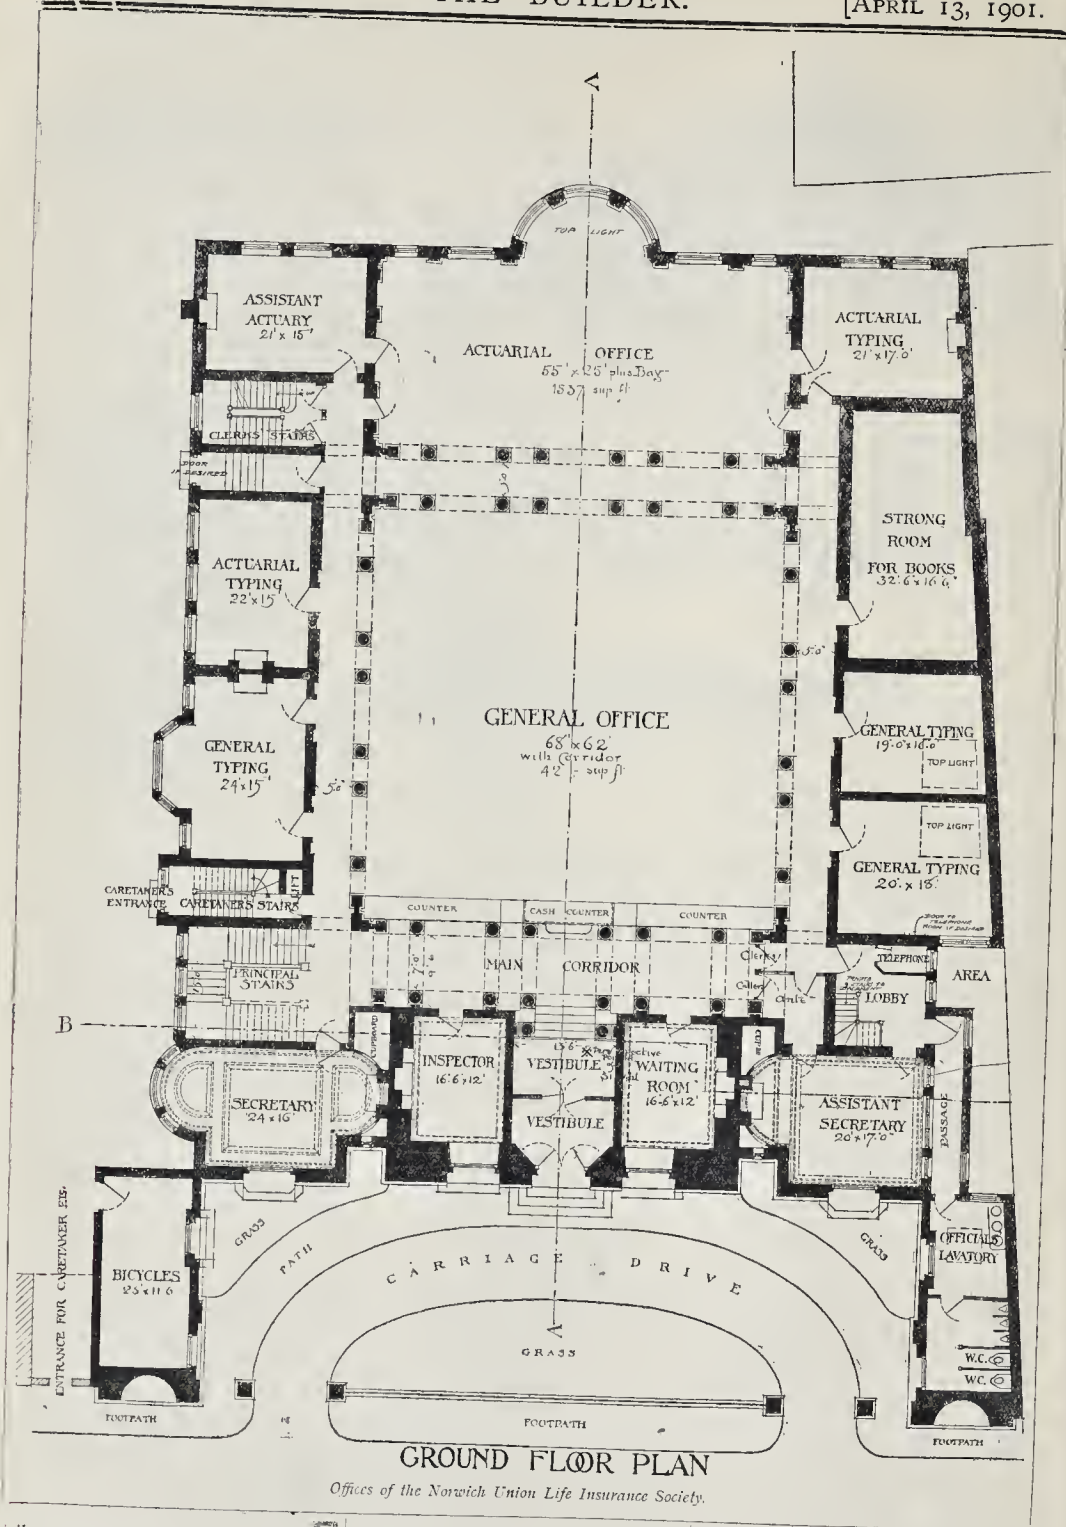

The instructions issued to the competing architects were clearly and concisely drawn up, and the conditions were framed in a very proper spirit; no limit to cost was imposed (though cost was to be a consideration), the building was to have but little carved enrichment, and all plans and drawings submitted were to be strictly uncoloured.

The requirements included a large general office or hall on the ground floor, as well as the other necessary smaller offices. In the design we illustrate this general office has been made the chief feature of interest inside the building, the other offices and rooms being placed round it. The plan explains how this idea has been expressed. The necessity for providing ready facility for getting from the central hall to the other rooms grouped round it suggested the open colonnade on the ground floor. On the upper floor many of the rooms are to be used by the directors, and consequently greater privacy was needed for the corridor surrounding the large hall; this was carefully considered in contriving this floor, and the corridor, although sufficiently retired, has yet been kept as an integral and visible part of the large hall. The solicitor's department occupies two sides of the upper plan, and the staircase arranged in the centre of this group of offices connects this department as closely as possible with the actuarial offices below, and at the same time provides direct and easy access for the clerks to their luncheon-room, which is situated immediately below in the basement.

The boardroom and committee-rooms on the first floor are set back from the street to avoid nuisance from street noises, dust, &c., and to the boardroom top lighting has been provided so that the room can be perfectly lighted even if the windows to the street are entirely closed or shaded.

The impossibility of placing windows on the boundary of the site on the right-hand side has necessitated top lighting in some cases, but this method has been used as sparingly as possible, and only to some of the lesser offices and where its use could be turned to architectural advantage.

The caretaker's kitchen (on the second floor)

is large enough to provide cold luncheons for the staff luncheon-room in the basement, with which it communicates directly by a lift next to the caretaker's stairs; the luncheons for the directors are otherwise provided for. The strong-rooms (with directors' examining-room adjoining) in the basement are entirely

separated from other parts of that floor, and have a special staircase leading to them from the ground floor.

The general character of the elevation was considered with a view to giving a dignified "head office," and one that would harmonise with its surroundings in Surrey-street. The

whole of the exterior shown in the view is proposed to be built in Portland stone.

The figures in the niches on either side of the main façade are designed to maintain the historic associations of the present Life Office, that to the left hand bearing the date 1706, when the Amicable Life Office, which is incor-

porated with the present office, was founded, and that on the right hand, in the dress of George III.'s time, bearing the date of the founding of the Norwich Union Office, 1808.

It is proposed to construct the building throughout, from basement to roof, of fireproof materials. The ventilation and warming will be arranged on modern principles.

THE GUILDHALL, EXETER.

The well-known ancient Guildhall of Exeter is situated in the High-street, a main thoroughfare of one of the three oldest and most historical cities in England. The High-street is very picturesque, containing many quaint timber fronts standing side by side with modern buildings, chiefly occupied as shops and offices. The most conspicuous building is the "Old Guildhall," with its Renaissance front, which is one of the most striking examples of a Town Hall that exist in this country. The hall itself is a very ancient building, with an open timber roof and a panelled wainscot dado about 9 ft. high, and was formerly a chapel dedicated to St. George and St. John the Baptist, and rebuilt in 1466. On its walls are numerous coats of arms of mayors, recorders, and benefactors, and numerous portraits, including one of George II., by Hudson; also the Princess Henrietta Maria and General Monk, by Sir Peter Lely. The cap of maintenance and the State sword, which was presented to the Corporation by Henry VII., and another sword presented by Edward IV., are among the civic treasures kept at the Guildhall.

In 1588 the present Beer stone front was added, consisting of an arcade of three arches carried on massive granite columns with caps and bases all in one piece. Above the arches is a frieze of raised panels and a cornice, then another series of panels. On the return elevations the city crest occurs, which at one time was picked out in red, yellow, and blue. Between the first-floor windows, standing on massive corbels, are pairs of Corinthian columns, with rudely-carved caps, supporting an entablature with a modern wooden balustrade above.

Until about forty years ago the front was periodically cleaned down and coloured cream colour, the frieze, flutes to columns, and sinkings being picked out in red, the columns being gilded, as traces of gold were visible before the recent restorations were made.

Not until the ancient building had been thoroughly opened out by the removal of the flooring and panelling around the walls of the Council Chamber and the flooring of the room above was it fully realised how dangerous the whole structure had become; indeed, it was then a matter for general surprise that the building could stand in such a serious condition, for the once massive beams of oak upon which the main part of the projecting portico was originally built had become so decayed that only dust remained. Fortunately this part of the edifice had been externally supported with centering and strutting in a very careful manner, under the direction of Mr. William Weir, the supervising architect representing the S.P.A.B.

In place of these beams lintels of tile set in cement were inserted, built slightly on the camber, and the internal masonry above carefully drawn out in sections and rebuilt. To brace the building iron tie rods have been placed both straight and diagonally at the floor level. The 18-in. square oak beams of the floor of the upper room were found, through decay, to have lost their bearing on the front wall, and they were, therefore, without any support except at their other ends, some 30 ft. northwards. To pick these up a truss was formed of teak to fill the entire gables of the front with a bearing on the main east and west walls. The beams beneath the main flat were also decayed, and have been replaced with many tons of English oak and securely tied back to the main building. Teak stanchions have been introduced from floor to floor in order to stay further movement of the front, gun-metal straps being placed around the piers of masonry between the windows and bolted back to them. The two main roofs, the bell turret and its roof, have all been reconstructed, the principals strengthened and left where found sufficiently sound, the remainder renewed in English oak.

The rotten slating to roofs, held together with tar and sand, has been replaced with rough thick slates from the Delabole quarries. All

the old lead has been recast in sheets of 8 lb. to the foot, and relaid on main flat, gutters, ridges, and flashings, and the flats protected with snowboards. The chimney is rebuilt in Thorverton stone, and the fronts of trussed gables and bell turret are covered with rough cast. A new oak floor of double thickness has been laid in the Council Chamber (now used as the Mayor's parlour), and the walls panelled in oak. The ancient fireplace in this room was exposed when the modern mantel was removed, the massive jambs of Thorverton stone being found in a good state of preservation; the lintels and hearth were renewed in the same stone. The interesting bit of fresco which adorned the wall around the fireplace has been carefully preserved. The old glass of the five-front transomed windows has been re-leaded and refixed. The preservation of the exterior stonework of the Beer stone front has been effected in a very conservative manner, and only where structurally necessary has new stone from the Portland quarry been inserted. All the loose jointing throughout has been thoroughly grouted, and loose portions of stonework rebuilt. The top beds of the projecting string courses have also been protected with lead flashings, the whole surface being finally treated with a preservative.

The basement beneath the pavement level was also taken in hand; the beams and joints supporting the stone flagging were in a very decayed condition, and have been replaced with brick arches and the flagging relaid. The whole of the work has been carried out by Mr. Herbert Read, of Exeter.

JAMES H. SHEARER.

VARIOUS EXAMPLES OF APPLIED DESIGN.

These examples of design applied to objects of practical use were all photographed from the collection of work in Mr. Montague Fordham's showroom in Maddox-street.

Fig. 1 shows a silver tea-pot, hot-water and cream jugs, designed by Mr. Arthur S. Dixon, and executed at the Birmingham Guild of Handicraft. These pieces of silver are hammered work, and the hammer marks not being polished off, a surface full of character remains.

Fig. 2 is a jewel-case, in gesso, designed by Mr. J. Paul Cooper. The raised figures, which are white, symbolise these various jewels; the rest of the outside of the box is a rich blue. The gold key is a fine piece of work.

Fig. 3 is a fire screen, in ironwork, designed by Mr. Percy S. Worthington, architect, and executed under his direction. The framework, of hammered iron, is finished half black. The lattice is made with threefold iron wire.

Fig. 4 is a kettle, of the same set as the three pieces of silver (fig. 1).

Fig. 5 is a brass electrolier, from the workshops of the Birmingham Guild of Handicraft.

Fig. 6 shows some china vases and candlesticks, by the Misses Lucas. This china is made under the direction of the Misses Lucas, and hand-painted by them.

INTERNATIONAL BUILDING TRADES' EXHIBITION.

The following is a list of fixtures to be held during the time the Exhibition remains open, from April 17 to 27:—

Friday, April 19.—Visit of Institute of Builders.

Saturday.—Visit of Architectural Association.

Wednesday, 24th.—Visit of Institute of Sanitary Engineers.

Thursday, 25th.—Annual meeting and dinner of Institute of Clayworkers.

Friday, 26th, 4 o'clock.—Conference on standardising of bricks.

In respect to the standardising of bricks, this Conference has been arranged jointly by the Royal Institute of British Architects, the Institution of Civil Engineers, and the Institute of Clayworkers. The chair will be taken by Mr. Thos. Blashill, F.R.I.B.A. Any one desirous of attending this meeting may obtain admission to the Hall upon application to 43, Essex-street, W.C. A party of Germans, numbering fifty, engaged in the building industries, will pay a ten days visit to England for the purpose of seeing the Exhibition. They will be entertained at a banquet in the hall by the Institute of Clayworkers, on the evening of Thursday, the 25th inst.

THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, April 2, Mr. James Mansergh, President, in the chair, the paper read was "The Burrator Works for the Water Supply of Plymouth," by Mr. Edward Sandeman, M.Inst.C.E.

He said the waterworks of Plymouth dated from 1590, in which year Sir Francis Drake, under powers conferred by an Act of Parliament of 1585, had commenced to build a weir to the river Mew or Meavy, and to excavate an open watercourse or leat from the weir to Plymouth, a distance of 10½ miles in a direct line, but 18½ miles along the route taken. The drainage area above the weir was 4,885 acres. The work had been completed, and water had been brought into the town in April, 1591. Water taken from the river by this means had supplied the town for 300 years. The open watercourse, however, was liable to be blocked in times of snow and frost, and for this reason, and also because the increased population demanded a larger and more certain supply, various schemes had been promulgated for the storage of flood-waters and the protection of the leat. In 1891 the author had been appointed Water Engineer, and a few months later he had presented a report, which had been adopted, advocating the building of a storage-reservoir and the substitution of a line of pipes for the open leat. An Act of Parliament had been obtained in 1893 for the construction of the necessary works, which had been commenced in August of that year, Mr. James Mansergh, President Inst.C.E., acting as consulting engineer.

By the new scheme the drainage area had been increased from 4,885 acres to 5,360 acres. Nearly the whole watershed lay on the granite formation, a small portion on the west side being on the Upper Devonian. The rainfall was about 58 in. or 60 in. annually, and an interesting feature of this gathering ground was the unusually high dry-weather flow from it. The Burrator reservoir was formed by two dams, one of masonry across the narrow gorge through which the river Meavy flowed, the other of earthwork lying between two hills, Sheepstor and Burrator. The greatest depth of water was 77 ft., and the area covered by water was 117 acres, the quantity of water impounded being 657,000,000 gallons. The masonry dam (called the Burrator dam) was built of large rough blocks of granite in cement in the interior, and faced with irregularly coursed granite on both sides. From the bottom of the foundation to the coping of parapet wall the height was 145 ft. 6 in. A roadway, 18 ft. wide, was carried over this dam on five segmental arches of 25 ft. span. The earthen dam was remarkable for the fact that its construction had involved the cutting of a very deep trench for the foundations, although the dam had to withstand but a small head of water. The trench had been cut through decomposed granite to a depth of 105 ft. in the centre, although the depth of water against the dam was only 17 ft. This trench was interesting on account of the peculiar geological features met with. The watertight core of the dam was of concrete (5 ft. in thickness) up to within a few feet of ground level, and of clay from that point upwards.

Water was drawn from the reservoir through two pipes, 36 in. and 25 in. in diameter respectively, laid in a 10-ft. culvert built in the masonry dam. There was no valve-tower. There was a specially designed valve to close the mouth of each outlet-pipe, worked by gun-metal rods and chains from a chamber at the top of the dam, in addition to sluice-valves in duplicate in a valve-chamber on the lower side of the dam. The water drawn for consumption was passed through screen-chambers before entering the pipe leading to the service-reservoirs. The flood-water running to waste was measured over a weir 50 ft. wide, the height of the water over the weir being recorded on a drum turned by clockwork. The compensation water was measured by an orifice gauge placed immediately below the weir. The water supplied to the town was measured over a gauge-weir 12 ft. wide, after which it passed through a 25-in. Venturi meter, which automatically recorded the flow on a diagram.

The pipe-line, which had been laid in lieu of the old leat, was 4½ miles long. The pipes were 25 in. in diameter, and were capable of delivering between 8 million and 11 million gallons per day. The pipe-line had been com-

pleted in May, 1894, and the reservoir and other works in June, 1899, at a total cost of 178,000*l.*

ARCHÆOLOGICAL SOCIETIES.

ROYAL ARCHÆOLOGICAL INSTITUTE.—A general meeting of this Institute was held on the 3rd inst., Judge Baylis, K.C., in the chair. Mr. O. M. Dalton read a paper on the "Foudri d'Oro, or Gilded Glasses of the Catacombs." He gave a brief summary of the present state of our knowledge on the subject, classifying existing specimens according to their subjects and presumable dates. It was probable that these glasses first became common in the third century, and that they continued to be made until an advanced period of the fifth, or even later. The process by which they were produced had an important influence in suggesting the use of glass mosaic, the cubes of which were made in a similar manner with a protecting layer or film of glass over their surfaces. The idea of glass vessels ornamented with etched designs in gold leaf between two layers, probably originated in Egypt, but at what date was not certain. An allusion of Athenæus to *ἀδάνα διάχροσα* belonging to Ptolemy Philadelphus seemed to refer to something of the kind, but the first certain evidence was supplied by specimens dating from about the beginning of the Roman Empire found in Egypt, Cyprus, and Canosa (Athenium). The process was said to have been continued in the Eastern Empire, and in the West was alluded to by the early mediæval writers Heraclius and Theophilus. Panels for caskets and triptychs of the same workmanship were executed by Cennius Cennini of Padua at the close of the fourteenth century. After the revival of interest in the Catacombs in the sixteenth century, various efforts were made to reproduce the ancient processes, and these continued with varying degrees of success down to our own time when Salviali had produced examples in something approaching the old style. By the kind permission of the director of the Victoria and Albert Museum several pieces of Italian work of the fourteenth century were shown, and a fine modern Venetian reproduction was kindly lent for exhibition by Mr. C. H. Read, F.S.A.—Mr. W. H. St. John Hope read a paper on the Gilbertine Priory of Watton, in the East Riding of Yorkshire, exhibiting a coloured and dated plan of all the remains of buildings as yet found on the site. The Gilbertine Order is one of special interest for two reasons: that it was the only monastic order of English origin, and that its houses were normally dual, having both nuns and canons. In some of the twenty-six houses of the order, the dual principle seems to have lapsed; but at any rate it remained in force in nine houses at the suppression. Watton was one of these, and the largest of the order. The site of the Priory is free from buildings, and the excavations have, therefore, resulted in the discovery of almost the entire plan of the house, with the exception of the infirmaries, of which nothing is as yet known. The nuns were the more important element in the Gilbertine house, and accordingly the buildings devoted to their use at Watton are the more extensive. They consist of the church, cloister, parlour, chapter-house, warming-house with dorter over, frater, kitchen, and a western range, including a guest-house. The church was a building 206 ft. long, with presbytery, central tower, north transept, with chapels and nave for the use of the nuns, and a large south aisle with south transept and chapels cut off from the rest of the church by a solid wall, which belonged to the canons. In the dividing wall was a turn through which the nuns might receive the communion and the pax, so arranged that a view of either portion of the church from the other was impossible. The canons' buildings are to the east of the nuns' court, and are joined to it by a long corridor in which was probably the window-house, where the nuns communicated with the officers who managed the affairs of the house. This second group of buildings consists of a cloister with the usual offices, and a church on the south side. Remains of a very fine fourteenth-century lavatory exists in the north walk of the cloister. The fifteenth-century prior's house, west of the church, remains for the most part complete, and is still inhabited. The buildings date from 1170—the larger church being of this date, with fragments of a somewhat earlier building destroyed in the

fire of 1167—down to 1500, the canons' buildings being chiefly of about 1320, and the nuns' eastern and northern range of the thirteenth century. Chalk was largely used in the construction, and consequently the ruins have been much destroyed by lime-burners. There are many traces about the site of the moats and earthworks prescribed by the Gilbertine statutes for the better seclusion of the members of the house.—Miss Rose Graham contributed some remarks on the history of Watton Priory from documentary evidence collected by herself. In 1330 the house was heavily in debt, the prior owing 70*l.* to the Archbishop of York. This debt was probably for the building of the canons' cloister. *Conversi* seemed to have ceased at an early date, all outside work being done by paid servants at the end of the thirteenth century. The house suffered considerably in the early fourteenth century from robberies, partly by the de Moleys, who seem to have had a quarrel with the prior, and partly through the royal purveyors of Edward II. on his expedition to Scotland. But in spite of this the general state was prosperous, and in 1326 no less than fifty-three nuns took the veil. The statute as to the kitchen, providing that all should be served from one kitchen only, was certainly evaded in the fourteenth century, if not earlier, despite Papal bulls to the contrary effect. In the very last years of its existence the Priory was drawn, much against its will, into assisting the rebels of the Pilgrimage of Grace, through the efforts of Holgate, who held the house *in commendam*, and seems to have stolen and squandered their resources shamelessly. Mr. Emanuel Green also took part in the discussion.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—An ordinary meeting of this Association was held on the 3rd inst., Dr. Winstone in the chair. Mrs. Collier exhibited an ancient religious picture of Byzantine art, painted on panel and enclosed in an ornamental silver frame about 6 in. square, with a curious filling of silver embroidery concealing the picture excepting the heads and hands of the figures. It was an "icon" and was brought from Moscow. She also exhibited a small "shrine" of bronze, inlaid with mother-of-pearl, presenting the singular feature of one foot of the Crucified being much larger than the other foot. This also came from Moscow. Mr. Patrick, Hon. Secretary, read a lengthy paper by Miss Russell upon "The Structure and Probable History of Some Rude Stone Forts in Scotland," the forts more particularly dealt with being those of Craig Phadric, near Inverness, and Castle Finlay, between Inverness and Nairn. Craig Phadric is a fort of loose stones bearing no visible traces of vitrification, although it is probable that a real vitrified wall exists beneath the stones, forming a backbone, or core, to keep the larger rampart of loose stones in place. Castle Finlay is a much smaller fort standing on a bridge-path through the woods, which is locally said to be the old road to Perth. It is quite small, with, in proportion, a large, loose stone rampart all round, in which the natives seem to find burnt stones. There is strong probability that Craig Phadric is really the castle on Loch Ness where St. Columba visited the king of the Picts.

TRANSACTIONS OF THE EAST RIDING ANTIQUARIAN SOCIETY for the year ending September, 1900. Vol. viii. (A. Brown & Sons, Limited, The Savile Press, Hull.)

LONDON COUNTY COUNCIL SURVEY OF MEMORIALS OF GREATER LONDON—BROMLEY-BY-BOW. VOLUME I. OF THE REGISTER OF THE COMMITTEE FOR THE SURVEY. (P. S. King & Son.)

BAPTIST ASSOCIATION CHURCH AND SCHOOLS, MUSWELL HILL.—The seating accommodation of this church is about 900 persons. The ceiling is vaulted in woodwork. A hold tower terminated with a spirelet forms a prominent feature in front; the buildings are faced with red brick, with Bath stone and Costessey dressings, and the style is Late Decorated Gothic. Messrs. Mattock Brothers' (Wood Green, N.) tender of 6,498*l.* 16*s.* has been accepted for the work; the architect's estimate was 6,780*l.* The design for the building was selected in a recent competition limited to six architects, the alternative designs by the same authors, "Greek Cross" and "Twentieth Century," being placed respectively first and second. The architects of the selected design, "Greek Cross," are Messrs. George Baines and Reginald Baines, of London.

Correspondence.

To the Editor of THE BUILDER.

THE PRESENT CONDITION OF THE BUILDING INDUSTRY.

SIR.—With reference to the prolonged discussion at the Surveyors' Institution on this subject, a few words of extenuation for the much maligned workman may yet be permitted. That the standard of efficiency of the artisan has degenerated is, unfortunately, true, and while, as one speaker suggested, the reduction of manual labour resulting from the use of machinery might have been expected to result in increased mental efficiency and knowledge, this is the very cause of a general deficiency arising from the human tendency to make no greater effort than that called forth by the necessities of the time. While there are individual exceptions, I think this applies very generally to the whole *genus* man. Suppose it were possible to introduce a machine which, by the manipulation of certain stops and the turning of a handle, designs for a building for any particular purpose and in any desired style could be reeled out. Is it likely that the efficiency of the architectural profession would be maintained? Again, if such designs could be placed in another machine, and a mathematically accurate bill of quantities could be produced by revolving the handle, I venture to think that "taking off" would soon become a lost art. There might be a few architects whose love of art, exceeding their love of money, prompted them to adhere to the present method of producing designs, but my opinion, whatever it is worth, is that few surveyors' offices would be without a machine as soon as their efficiency was proved (or possibly architects would invest in "quantity machines" as well, and have other quantities "ground out" by the young lady who operates the typewriter). In any case your architects and surveyors would become mere operators of machines and "piecers together" of the productions of the machines.

And this is exactly what has happened in the building trade; the work which the old time joiner did on the bench by manual labour is now prepared for him by machinery, and he is nothing more than a putter together and fader. And this applies in a less degree to all trades. The artisan has no opportunity of acquiring the skill possessed by former generations, and if he did acquire it, he would have little opportunity of exercising it. That this relaxation of manual labour has not produced a corresponding advance in technical knowledge arises mainly through the conditions brought about by the levelling-down process of trades-unionism, by which there is absence of proper encouragement to a workman to excel above his fellows.

The only remedy for this appears to me to be the establishment of grades. I do not suggest how it is to be done—that requires lengthy consideration; but so long as the veriest muddler and spoiler of material can go and get—I will not say earn—as much as the best skilled mechanic, there is little incentive to advance.

The great question of time, or want of it, generally bears very hardly upon the surveyor, who is accustomed to receive a roll of drawings, with an urgent request for dispatch from the architect, "as I promised the tenders should be in last week." This cannot always be avoided, but the surveyor has a real grievance when an architect supplies him with—in drawings for a new building with a specification of a former job to follow, and then, when the work is all taken off, sends him a set of details and new specification entirely in contravention of the old specification, necessitating a revision of the entire dimensions and descriptions.

HARRY G. ASSITER.

KRAUSS v. MAYOR AND CORPORATION OF BRISTOL.

SIR.—My attention has been called to your report of the proceedings in the Court of Appeal upon the Corporation of Bristol applying to stay an action which I had commenced against them for damages caused by their delay of works comprised in my contract with them for the erection of additions to the Bristol Lunatic Asylum.

Your report may create an impression that I had entered into a contract without any provision for an independent arbitration, but this is not the fact. On the contrary, the contract contained a clause entitling me to demand a hearing before an independent arbitrator in the event of my being dissatisfied with the decision or certificate of the architect upon questions relating to the quality of the materials supplied, or the character of the work done by me, or the price to be paid for any extra work.

The claim made in my action against the Corporation related to matters not contemplated by either party—that is, the damages caused by the delays of the Corporation; and I certainly did not expect that this would be regarded as a matter within the jurisdiction of the architect.

A. KRAUSS.

THE LATE MR. F. BOREHAM.

SIR,—In reference to the obituary notice of my father, the late Mr. F. Boreham, architect, which appeared in the *Builder* of March 30 last, seeing that mention was there made in detail as to some of his minor works, I think it is only just to his memory, therefore, to record some of the more important buildings erected by him during his thirty years' practice.

Perhaps he was best known as the architect of many Nonconformist churches in London and the provinces; but other works included the Aged Pilgrims' Asylum, Hornsey Rise, and Old Park, Dover, and, more recently, Temple House, Temple Avenue, the publishing offices of Messrs. Horace Marshall & Son. He was also responsible for several warehouses and business premises in the City, as well as various private residences.

On the list of successful competitions (out of the total entries two-thirds of his designs were premiated) may be mentioned the University College of Wales, Aberystwyth, and the Whitland Tabernacle, London. H. YOLKLAND BOREHAM.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.
13.—WATER-CLOSETS.

MECHANICAL CLOSETS.—For many years after the introduction of water-closets the appliances were of such an insanitary character, and the drains into which they discharged were so badly constructed and ventilated, that they deservedly received a bad name. They were undoubtedly the cause of a vast amount of sickness and a great number of deaths. The one point in their favour was their convenience, and this was so great that in spite of the danger the public insisted on having them. Sanitarians bowed to the public demand and turned their attention to devising improvements in the apparatus and in the soil-pipes and drains connected therewith. Their efforts have been so successful that to-day the principal objection against water-closets is not that they are dangerous to health, but that they involve an enormous loss of valuable manure. Notwithstanding the jeremiad of Sir William Crookes, the public will probably go on running the all-important nitrogen to waste.

It was in 1778 that Joseph Bramah patented his water-closet. This was of the valve type, but as it has long been discarded, no description of it need be given. It was followed by the "pan-closet," which, notwithstanding its terrible defects, has continued in use to our own day. Fortunately it is prohibited by many sanitary authorities, but large numbers are still in existence, and some makers of so-called "sanitary" fittings still continue to supply parts for repairing the apparatus, even if they do not manufacture complete closets. The

pan-closet has three principal parts—(1) the basin, which is usually of porcelain and of hopper form, sometimes with a flushing rim and sometimes with nothing but a fan-spreader for the inlet of the water; (2) the pan, which is a pan-shaped vessel (usually of copper), hinged at one point of the rim, and attached to a lever in such a manner that, when the handle of the lever is raised, the pan swings downwards and discharges its contents into the closed container below, and when the handle is released, the pan returns to its horizontal position, surrounding the lower part of the basin, and receives and retains the last portion of the flushing water; and (3) the container, which is a cast-iron chamber, large enough to admit of the free movement of the pan; as a rule, a lead D-trap was fixed under the container. Not a single important part of the apparatus is without one or more serious defects. The basin is of bad shape, easily fouled, insufficiently flushed, and with too small an area of standing water. The pan is quickly corroded, and therefore ceases to hold water. The container exposes a large area to the action of the "soil," and is soon coated with filth, as it cannot possibly be cleaned by the small amount of water used in flushing. And the D-trap also retains filth, and is in consequence more easily corroded, particularly in the parts of the trap above the water-level. To complete the black list, the flushing water is generally supplied through a very small pipe brought directly from the cistern used for storing drinking water. This description, which by the way, is not half black enough, ought to have been entirely unnecessary in the twentieth century, but as long as manufacturers and merchants continue to advertise the dangerous apparatus, so long must warning words be uttered. It would be a blessing if every pan-closet now in existence were at once declared a nuisance and removed. No one could reasonably complain that adequate warning had not been given, for as long ago as 1852 the apparatus was condemned by the now-defunct "General Board of Health" of this country.

Bramah's water-closet was followed by many others on similar lines. The improvements which were gradually made included the better flushing of the basin, the improvement of the valve so as to fit closely against the seating, the reduction of the size of the valve-box and the improvement of its shape, the introduction of a self-cleansing trap under the valve-box, the trapping of the overflow, and the ventilation of the valve-box. Fig. 1 shows such a closet, with the trap and part of the mechanism omitted. A is the basin of white-ware with flushing-rim, B the valve, C the lead valve-box with brass cover, D the ventilating socket of the valve-box, E the overflow from the basin trapped before its connexion with

the valve-box, and so designed that it receives a certain amount of water every time the closet is flushed, and thus the trap is kept charged, F the supply-pipe, and G the supply-valve with regulating thumb-screw. The valve-box is sometimes made of cast-iron enamelled inside, and occasionally of pottery. The ventilation of the valve-box is an important point, as it prevents the siphonage of the overflow-trap and affords an escape for foul gases generated in the closet-trap and valve-box. The ventilation-pipe may be carried through the external wall, and finished with crossed wires. In some closets the trap of the overflow discharges into the ventilation-pipe, and not directly into the valve-box. The object is to prevent the lower portion of the overflow-pipe or trap being blocked with paper or soil. More commonly, however, the valve is placed so as to cover the end of the overflow when the valve is open; this is the arrangement shown in fig. 2. The overflow-arm shown in the illustration is not of the best design, as it cannot possibly be cleaned.

It will be observed that the basin retains a large quantity of water, and an arrangement must be adopted whereby this quantity will be supplied automatically after the handle of the flushing apparatus has been released. One of the best-known devices for this purpose is the bellows-regulator shown in fig. 2. When the handle A of the flushing apparatus is raised it lifts the lever B, which actuates the valve of the closet, and also raises the lever C, which is pivoted at D and attached to the supply-valve at E. The lever C raises the spindle of the supply-valve and admits water to the basin, and at the same time raises the spindle and valve of the regulator into the outer compartment, from which the air can only escape through the small cock. When the handle of the closet is released the valve-lever B at once drops back into position and closes the closet-valve. The lever C, however, can only descend as the air is expelled through the cock of the regulator; consequently the supply-valve E does not close for some seconds after the handle has been released. The quantity of the after-flush can be regulated by adjusting the air-cock on the bellows-regulator. The device shown at G in fig. 1 is another arrangement for regulating the after-flush.

The supply pipe and valve are usually only 1 in. in diameter, but this is often too small to give an adequate flush and after-flush. Where the cistern is less than 10 ft. above the closet the valve should be 1½ in.; where it is less than 6 ft. the valve should be 1 in.

Some plumbers do not connect the overflow-arm and the valve-box, but permit the overflow to discharge on to a lead safe under the closet, from which it escapes by a pipe to the open

air. This is a very faulty arrangement and often causes great annoyance, particularly if (as is often the case) the closet is used to receive slops. Unless the handle of the closet is held up during the whole time occupied in emptying the slops, these, mixed with the water contained in the basin, will overflow and foul the safe and give rise to unwholesome emanations. Even when the overflow and valve-box are connected the pouring of slops into the basin will foul the overflow-arm and trap, and as these are generally inadequately flushed, the surfaces will in time become very nasty.

The ordinary valve-closet has its trap below the level of the floor. This position is very unsatisfactory, as it renders inspection and repair of the trap more difficult. It is a better plan to raise the whole closet on a step, so that the trap is above the main floor. When (as is generally the case) the closet is enclosed with woodwork the step is not objectionable. Some sanitary authorities wisely insist on the joints at the outlets of closets being above the floor level, and the ordinary valve closet is rejected as it does not comply with this regulation. Special valve closets are made to meet the difficulty, an example being given in fig. 3. In this the valve-box, closet-trap, and overflow-trap are formed in one piece of stoneware. An inspection-opening, fitted with a ground cap, is formed in the top of the trap at A, and a ventilating socket is formed on one side of the valve-box. The closet cannot be recommended; the trap is of such a shape that deposits are almost certain to occur in it, and there are other defects which need not be particularised.

Valve-closets are also made in "pedestal" form—that is to say, for standing without wood enclosures; but some of these are far from pleasing in appearance. One of the best examples is given in fig. 4. In this the valve swings in the trap of the closet, the separate valve-box being entirely omitted. The valve is operated by a lever and two bevelled cog-wheels, and when open, fits into a recess at the side of the trap, so as not to interfere with the flow of the water. The overflow arm has a large opening at the top for the insertion of a brush, and is arranged to receive a small portion of every flush. The outlet of the trap is well above the floor. This closet is practically a wash-down closet with a valve inserted to raise the level of the standing water in the basin.

The great advantage claimed for valve-closets is that they retain a large quantity of water in the basin. This gives a large surface for the reception of the soil, and consequently prevents the fouling of the basin and other objectionable results; it also ensures a thorough removal of the contents of the basin when the valve is opened. The disadvantages are, that the closets are complicated, the mechanism is apt to get out of order, and the valve does not always fit tightly on its seat. Notwithstanding the high praise which the valve-closet has received, it is gradually being discarded. The invention of good forms of wash-down closet did much to lessen its popularity, and the siphonic closet, which gives an equal water-area in the basin, seems destined to complete the process. Some of the most noted manufacturers of sanitary fittings do not even trouble to show a single valve-closet in their catalogues, while others devote the smallest possible space to the subject.

The "Trapless" valve-closet was an attempt to simplify the mechanism of the ordinary type of valve-closet. The hinged valve was replaced by a plug attached directly to the handle by a vertical spindle, and working in a small compartment communicating with the basin by means of a large opening. When the plug was raised, the contents of the basin escaped through the opening under the plug to the soil-pipe below. The supply apparatus was regulated by a ball-cock or float in the plug chamber. The objections to this closet are that the plug is certain to be fouled by the soil, and that foul air is forced into the room whenever the plug is raised. The small ventilation-pipe sometimes inserted below the plug seating is of very little use as a preventative of the latter defect. The insertion of a trap below the plug seating is the obvious remedy, and this has been done in Jennings's improved plug-closet shown in fig. 5. The basin and trap are made in one piece of glazed earthenware; the plug is connected by a vertical spindle to the handle A, and fits on a seating at the tapered part B; the regulating supply-valve is

shown at C. The plug is hollow and forms the overflow, and is fitted with a ball trap. This closet is undoubtedly an improvement on the original form, but the plug is certain to get fouled, and may be prevented (by paper or soil) from fitting tightly against the seating. The absence of a flushing-rim, and the flange-joint at the floor level are also defects, but the closet is also made with an adjustable P-trap, the outlet of which is above the floor level. The closet has the advantage of retaining a large quantity of water, which deodorises the soil and prevents the fouling of the basin, and also ensures the soil being carried with considerable velocity into the trap, but it cannot be recommended for use at the present day.

GENERAL BUILDING NEWS.

CONGREGATIONAL CHURCH, CARDIFF.—On the 3rd inst. the foundation-stones were laid of the Central Congregational Church, Cardiff. The new church is erected from plans by Mr. W. Beddoe Rees, architect, Cardiff. It will be built of New-bridge stone, faced with Bath stone, and relieved with red Cumberland stone pilasters. Accommodation is provided for a lecture hall to seat 750, with vestries and classrooms, and the chapel proper to seat from 1,000 to 1,100. The total cost is estimated at 5,000.

WELSH CHURCH, PENTREBACH, MERTHYR, GLAMORGANSHIRE.—The new St. James's Welsh church at Pentrebach, near Merthyr, was consecrated recently. Mr. Penry Williams was the architect, and Mr. John Griffiths the contractor.

METHODIST CHURCH, CHESHUNT.—A Methodist church in the High-road, Cheshunt, was opened on the 19th ult. Mr. John Willis, of Derby, was the architect.

CONGREGATIONAL CHAPEL, CARDIFF.—A new Congregational chapel has just been opened in Clare-road, Cardiff. The building was erected, at a cost of 1,200*l.*, by Messrs. Lattey & Co. Messrs. James & Morgan were the architects.

INFANT SCHOOL, RUGBY.—The new infant school recently erected at the rear of St. Matthew's school premises in Pennington-street was opened on the 21st ult. The new building, of which Mr. J. T. Franklin was the architect, was erected by Mr. A. Harris. It consists of one large apartment, which, when occasion requires, will be divided into two by means of a folding screen with glass panels. The space on one side of the screen is 24 ft. by 22 ft. 6 in., and on the other 19 ft. by 22 ft. 6 in. The walls are of red bricks, with a dado of glazed bricks in three colours; the floor is of wood blocks, and the ceiling is of pitch pine.

SCHOOLS, DONCASTER.—On the 2nd inst. the Mayor of Doncaster opened the new girls' school in Carr House-road, Hyde Park, built by the Corporation. It was decided to build a new girls' school, giving the boys the existing girls' places. The total accommodation provided by the Corporation schools now is:—Boys, 420; girls, 320; infants, 272; total, 1,012. This new girls' school is so arranged that two additional classrooms, accommodating 120 additional scholars, can be added any time when required. The central hall, cloakrooms, and lavatories are already provided to accommodate 120 extra children, whenever thought necessary. Owing to the site being a sloping one, it has necessitated deep foundations, and practically another story being built, which has been utilised at the back for caretaker's storeroom and separate covered playground for the girls. The school floors are carried on steel girders above the playground below. Access to the central hall from the playground below is obtained by means of a flight of steps. The inside of the schools throughout is similar in character to the schools previously built, and has wood-block floors, glazed brick dados, patent folding pitch-pine divisions, and oak furniture. The Corporation decided to improve the heating arrangements at the old schools, as well as provide for the new, and by the enlargement of the boiler-house and coal-cellar, and the substitution of a much larger boiler and chimney, the caretaker will be able to heat the whole range of school buildings, comprising twenty classrooms, &c., from the one boiler. The roadway has been widened and improved, and a new fence wall with iron palisading has been erected in front of the schools. Over the main entrance a clock-tower has been erected, with a striking clock and four illuminated dials. The work has been carried out from designs and under the superintendence of the Borough Surveyor, Mr. Crabtree.

SCHOOL, CRAIGLOCKHART, EDINBURGH.—The plans of the new school which is about to be erected by the Edinburgh School Board at Craiglockhart have now been prepared. Situated at Ashley-terrace, the school and playgrounds will occupy about an acre and a quarter of ground. The building will accommodate nearly 1,600 children. Two halls on the ground and first floors form a prominent feature of the internal arrangements. That on the ground floor, some 70 ft. by 30 ft. in extent, is designed for the use of the infant department, and the hall on the first floor for the use of other juveniles. On each floor eight

classrooms will enter off the halls. Rooms for the headmaster and the lady teachers, cloakrooms, and lavatories will also be provided on the ground floor, and on the first floor, in addition to the eight classrooms above mentioned, will be two smaller classrooms and rooms for the teaching staff. On the second floor nine classrooms will be provided, a gymnasium, a combined cookery classroom, and a workshop. In a corner of one of the playgrounds the janitor's house will be erected. Mr. R. Wilson

BAPTIST SCHOOLS, HISTON, CAMBS.—The foundation-stone of these schools was laid on Easter Monday. The school is divided off into a number of classrooms by means of swivel partitions, which, when thrown back, make one large hall. Two other large senior classrooms are provided, also infants' room, kitchen, classrooms for boys and girls, and the usual offices. The building has nave and aisles arrangement (the aisles dividing off into classrooms) and has timber columns and arches of quaint design, carrying clerestory. The whole of the internal joinery is to be stained transparent olive green and varnished. The external facing is of red brick with Bath stone dressings, and roofs of green slates. The contract is let to Mr. H. Feast, builder, Haddenham, Cambridge, and amounts to 1,852*l.* (architect's estimate, 1,875*l.*) The architects of the scheme and also of the church, recently completed, are Messrs. G. Baines & R. Palmer Baines, of London.

A YEAR'S BUILDING IN LIVERPOOL.—The Corporation Building Surveyor (Mr. William Gostraw) in his annual report states that the number of houses built in the city during 1900 shows a decrease from the number of the previous year, which was abnormal, being 1,573, against 2,358 in 1899. In Westtree 481 houses were erected during last year, West Derby 373, Toxteth Park 312, Walton 300, Old City 107. During the last five years 9,318 new houses have been erected in the city, the greatest increase being in Wavertree, with 2,331 houses. It is a remarkable fact that in this respect the old city stands second, with 2,218 houses. During 1900 no houses under an annual rental of 12*l.* were erected, and four only in 1899; from 12*l.* to 25*l.* rental, 1,038, against 1,500 in 1899; from 25*l.* to 35*l.* rental, 402, against 607; from 35*l.* upwards 133, against 137. The total number of buildings of all kinds erected during 1900 was:—New houses, 1,573; workshops, stables, and minor buildings, 110; new public buildings, offices, and manufactories, 47; warehouses, 3. Buildings taken down:—Houses, 899 (of which 584 were demolished by the Housing Committee); workshops, &c., 37; public buildings, &c., 11; warehouses, 5. The buildings of all kinds taken down during 1900 were more in number than in any year since 1896, inclusive.

WORKHOUSE HOSPITAL, HALIFAX.—A building has been erected at Salterbebble by the Halifax Board of Guardians to meet the need for increased hospital accommodation. The hospital stands on a site of about twelve acres, about a mile from Halifax on the Huddersfield-road. Plans have been prepared by the architect, Mr. W. Clement Williams, of Halifax, for a comprehensive scheme which will provide accommodation for 642 patients, in addition to which there are beds for about 100 nurses and servants. The total estimated cost is about 130,000*l.* It has been thought, however, that to meet the immediate requirements the provision of 400 beds for the sick would be sufficient, together with the complete scheme of administration buildings, for by this arrangement it would only be necessary to add an additional 242 as the need may arise for more beds. The Nurses' Home is the first building seen on entering from the Huddersfield-road, and is placed astride the centre line of the hospital. It contains accommodation for nurses and probationers, including general and separate sitting-rooms, library, dining-room, and lecture-room. There are in this block over seventy bedrooms. Immediately behind the Nurses' Home, the first floors being connected by a three-arched bridge, is the administration block, the ground floor of which is devoted to porters' rooms and storerooms. The first floor is set apart for committee-rooms, doctors', matron's offices and sitting-rooms, dispensing and matron's stores, with electric lift from the basement. There are also a large kitchen and a scullery, with larder, &c. On the south side of this floor is an isolated receiving pavilion connected with the main building by a bridge. On the same story of the eastern block are the assistant medical officer's apartments. The chief medical officer will be provided with a separate residence. The other administrative buildings are the electric light and power station, placed below the ground level, the boiler-house and disinfecting station, and the laundry. The buildings already referred to occupy the centre line of the site, which runs from east to west, and the ten pavilions for patients (five for each sex) are placed on the south side of the north and one on the north side of this central block. Corridors connect the administrative buildings with the pavilions, all of which are connected by one-story corridors with service subways underneath them. The subways allow of any pavilion being served from the kitchen or store without the hospital corridors being used. Eight of the pavilions are oblong and two stores high, while

the remaining two are circular and three stories in height. Outside the general hospital scheme and entirely isolated are two small pavilions for maternity cases, each containing four beds. The mortuary will also be an isolated building. There are fire-escape staircases for all the wards. The Guardians have had to take over the mason's contract (with Mr. Richard Charnock as manager), and the electric lighting, &c. (under the superintendence of Mr. Savile Watney), while the other principal local contractors are—Messrs. Hanson & Son, joiners; Messrs. Rushworth & Firth, plasterers; Messrs. Moss Brothers, painters; and Mr. Boocock, plumber. In connexion with the water supply, the water is supplied through Walker's health pipes, supplied by Messrs. E. Walker & Co., of Heckmondwike.

NEW WARDS, BRISTOL EYE HOSPITAL.—On the 26th ult. the new wards and operating theatre of Bristol Eye Hospital were opened. The extension of the hospital has involved an expenditure of about 6,800l. The enlargement consists of the addition of another story and the erection of a new wing at the back of the present premises towards the garden. The new story provides sleeping accommodation for the nurses and servants, some small wards for patients, and an operating theatre, and the new wing contains a sitting-room for the nurses and increased ward space. The kitchen has also been enlarged and refitted, and the whole hospital is supplied with electric lighting. The architect was Mr. G. H. Oatley.

EXTENSION OF PRESBYTERIAN CHURCH, RATHGAR, DUBLIN.—Christ Church (Presbyterian), Rathgar, is being extended. The work will consist of the addition of a transept, the extension of the existing transept, the erection of a chancel, with provision for the choir and a new organ, and the enlargement of the lecture-hall with additional classrooms. The work is being carried out by Mr. William Crichton of Rathgar, Messrs. Musgrave & Co., of Belfast, having supplied the heating and ventilating apparatus. Mr. W. M. Mitchell, of Dublin, is the architect.

JEWISH SYNAGOGUE, GLASGOW.—On the 27th ult. the foundation-stone was laid of the new Jewish synagogue in South Portland-street, Glasgow. Mr. J. Chalmers is the architect.

FLATS, NOTTING HILL.—A block of self-contained residential flats, to be known as Crescent-nansions, has just been erected on the site of No. 122, Elgin-crescent, W., from plans and under the direction of Messrs. Palgrave & Co., architects, Victoria-street, S.W. The style adopted is a modified Queen Anne. The general contractors were Messrs. E. Collins & Co.

BUILDING NOTES, ABERDEEN.—The District Lunacy Board has accepted the tender of Messrs. Henry & Keith, Aberdeen, for the joiner work of the new asylum at Kingsent, Newmachar, Mr. A. M. Mackenzie, A.R.S.A., architect. The contract price is 116,526l.—The Committee of Aberdeen City Parish Council have agreed to provide accommodation for 660 inmates in the proposed new poorhouse at Oldmill, Messrs. Brown & Watt, Aberdeen, architects.—The various bodies concerned have approved of the plans (by Mr. A. Marshall Mackenzie) of new Greyfriars Church, corner of Queen-street and Broad-street, estimated to cost 10,000l. The entrance will be at the west end from Broad-street, where will be a tower 32 ft. square, rising to a height of 100 ft., and with steeple to 150 ft. The Queen-street elevation shows a series of seven three-light windows, and above them another series in the nave. The church will consist of a spacious nave with central passage along the entire length, and an apse at the end in which will be placed the stained glass windows from the old pre-Reformation church, a building which is to be removed in connexion with Marischal College extension. On the north side of the apse is the vestry. The organ chamber is opposite, and beside it the choir will be accommodated. To the south will be a side aisle separated from the nave by three stone arches supported on pillars. The height in the nave from floor to ceiling is 40 ft., and the arches of the aisle are 20 ft. high. At the west end will be a small gallery over the vestry. The whole will provide for 800 worshippers. In basement floor will be a hall seated for 300, session-house, guild-room, and heating chamber.—Aberdeen Town Council have accepted the tender of Mr. Leslie Smith, Aberdeen, for the mason work of the new Corporation Electric Station at Ferryhill amounting to 7,555l., and also that of Green's Economiser Company, Limited, for an economiser, 1,203l. The architects are the Corporation's Electrical Engineer and the Corporation's Gas Manager.—The Secretary for Scotland has consented to a further loan of 81,000l. for the electrical department, making the total borrowing power under the Electric Lighting Order, 1899, 185,000l.

CO-OPERATIVE PREMISES, BIRKENHEAD.—A new building in Catherine-street, Birkenhead, for the local co-operative society was opened on the 30th ult. The architect was Councillor Snape.

HOSPITAL EXTENSION, BRISTOL.—A meeting of the Bristol Health Committee was held on the 2nd inst., when the City Engineer presented plans and drawings for extensions at Ham Green. The erection of a new pavilion, the floors with provision for twenty-four patients on the ground floor and

twenty-eight patients on the first floor, with the necessary offices was estimated at 13,300l. The design was generally in accord with the pavilions already constructed, except that it would be longer and considerably higher. It was also considered necessary to have increased accommodation in the administration building, and, by the building of an additional wing at the back of the old house, provision was made for thirteen beds for servants on the ground floor and for thirteen nurses on the first floor. The estimated cost of the alterations and extensions was 3,100l. Designs for an additional isolation block, larger than the present one, were also presented. The plans showed a pavilion with accommodation for four one-bed wards and three two-bed wards, and the estimated cost was 3,260l. For extra cost of providing electric light, water, drainage, roads, fencing, &c., a sum of 1,400l. was put down. The design for the water-tower, submitted on the last occasion, was considered of too expensive a character, so he had reduced it to its absolute minimum. It would be simply a tank constructed on cast-iron pillars, and the cost was estimated at 1,750l., with 550l. for the cost of obtaining the loan and supervision. The plans and designs were referred to the Hospital Sub-committee to bring up a report on the same.

PROPOSED RECONSTRUCTION OF THE CATTLE MARKET, TRURO.—An inquiry was held at Truro on the 3rd inst. by Mr. W. O. E. Meade King, M.Inst.C.E., on behalf of the Local Government Board, respecting an application by the Corporation for sanction to borrow 5,400l. for the entire re-modelling of the cattle market. Details of the new market, which, by the addition of a new piece of land, will cover 6,588 square yards, were explained by Mr. Lea, the Surveyor and Engineer.

PROPOSED ISOLATION HOSPITAL FOR LONGTON, STAFFORDSHIRE.—At a recent meeting of the Longton Town Council the Sanitary Committee submitted a report from Mr. Hare, the architect appointed to prepare the plans of the proposed isolation hospital. The report was accompanied by drawings showing the arrangements suggested to meet the possibility of the settlement of the site owing to mining operations. The scheme includes administration and laundry blocks, two ward blocks containing eighteen and fourteen beds respectively, and isolation blocks containing eight beds. The total cost of the buildings as proposed would not exceed 8,000l. Mr. Hare had submitted the whole of the proposed construction to the Local Government Board, and had received an unofficial assurance that for the purposes of a loan they would regard the buildings of as permanent a nature as if built of brick. At an interview with the committee Mr. Hare explained that it was intended to construct underneath the whole of the site a concrete bed, with steel joists, at least 18 in. thick, and in his opinion there would then be very little risk of damage by mining subsidence. The committee recommended that the buildings be constructed of bricks and mortar, and that Mr. Hare be directed to proceed with the preparation of the plans and specifications immediately. The report was adopted.

SANITARY AND ENGINEERING NEWS.

WATER SUPPLY, GOOLE.—At the meeting of the Gas and Water Committee of the Goole Urban Council recently, the engineer for the new waterworks at Follington (Mr. J. C. Melliss) reported that the contractor had constructed the well 80 ft. deep and 10 ft. in diameter, lined with blue bricks in cement, and made the 20-in. borehole to a depth of 130 ft. from the bottom of the well, making a total depth of 210 ft. from the surface of the ground to the bottom of the borehole. He had also carried out the test pumping, and during twelve and a half days of continuous pumping some eight million gallons of water had been lifted from the well and borehole, and throughout there had been no diminution in the quantity which the well and borehole are yielding. Careful records have been kept, which show the yield of the well and borehole to approach nearly 700,000 gallons in the twenty-four hours, being ample for the present requirements of Goole and for a considerable time to come, and also for the supply to such adjacent villages as may require it.

WATER SUPPLY, LOOE, CORNWALL.—At a recent meeting of Looe Urban Council, Messrs. S. W. Jenkin & Son, of Liskeard, the engineers of the proposed water scheme, reported that they believed the conditions and requirements of riparian and other owners had been at length satisfactorily settled. The surveyor, acting on behalf of Mr. Somers Cocks, had visited the site, and the rights to be conveyed to the Council had been accurately defined to the mutual satisfaction of all interests. The map required by the Liskeard Highway Authority had been prepared, and would be forwarded with the required assurances to them, and the way was now quite clear to invite tenders and enter into contract for the construction of the works. After discussion, it was resolved that the Council themselves purchase the pipes and valves, and the clerk was instructed to obtain tenders from firms approved by the engineers, and that tenders for laying the mains and constructing the reservoir be invited as soon as possible.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Mr. George Wragge, craftsman in metal works, stained glass, &c., has removed his London premises from No. 22, Surrey-street, Strand, to No. 211, Shaftesbury-avenue, Oxford-street, W.—The Blackman Ventilating Company, Limited, have acquired from Mr. James Keith, C.E., his business as heating engineer (with departments in gas and hydraulic work), carried on at Farringdon-avenue, E.C., and at his foundries and engineering works in Arbroath. The company will be carried on under the new name of James Keith and Blackman Company, Limited.

PUBLIC IMPROVEMENTS, BRIGHTON.—On the 22nd ult. Mr. H. H. Law, M.Inst.C.E., Local Government Board Inspector, held an inquiry at the Town Hall, Brighton, with reference to the application of the Town Council for sanction to the borrowing of sums amounting to 10,600l. for purposes of electric lighting, and 8,400l. for works of sewerage. Mr. J. Christie, the Electrical Engineer, gave evidence. It was stated that the sewerage works consisted of the construction of a sewer in Lewes-road and the provision of flushing hydrants and sewer ventilators.

PROPOSED NEW STREET, DONCASTER.—On the 22nd ult. Mr. M. K. North, A.M.Inst.C.E., held a Local Government Board inquiry at Doncaster into an application by the Town Council to the Board for the approval of the purchase and exchange of certain land, the sale of consolidated stock, and the appropriation of the proceeds of such sale, or of the sale of Corporate land, towards the cost of the purchase of the aforesaid land, and of the formation of a new street from the corner of the Corporation Baths in French-gate to the commencement of High Fisher-gate, at its junction with Church-street. It was stated that the Borough Surveyor had made an estimate of the total cost of the work, which was 3,700l. The plans were explained by the Borough Surveyor, Mr. W. H. Crabtree.

SLUMP IN THE RED BRICK TRADE.—Building brick makers in the Oldbury, West Bromwich, and Tipton districts are now passing through the severest crisis experienced for many years. Twelve or eighteen months ago prices of common red bricks were raised to an unusual height by the rapid development of house building, not only in the immediate neighbourhood of the works, but also in London, Birmingham, and other large towns. Prices realised about 34s. per 1,000, compared with the normal rate of about 20s. On the strength of the "boom" old brickworks were extended and new works opened, causing the production of builders' bricks to reach enormous proportions. The extra demand for slack for the brickworks was an important factor in raising the price of that article from about 6s. to 10s. per ton. The usual result of over-production has followed in the slump now experienced, as most of the chief brickworks in the districts named have been working short time with no immediate prospect of improvement, while prices have been slowly declining for the last three months. Instead of 34s. per 1,000 the present selling price is, as one firm expressed it, anything between 25s. and 18s., and even a lower price is mentioned where large contracts have to be tendered for. Building operations in all the district towns seem to have been for a time suspended by common consent until the price of slack, and consequently that of bricks, is further reduced. More than half the present price of bricks is said to be absorbed in fuel, leaving little or nothing for labour and establishment charges. The practical result has been that brickmakers have recently incurred the heaviest losses known for thirty years.—*Birmingham Gazette.*

BRIGHTON MASTER BUILDERS.—The annual dinner of the Brighton Master Builders' Association and their friends was held at the Hotel Metropole on the 1st inst. The Chairman (Alderman W. Botting, J.P.) presided, and about sixty sat down to dinner. After the loyal toasts, Mr. G. S. Godfree proposed "The Imperial Forces," and Councillor Buckwell responded. Mr. J. K. Nye gave "The Corporation of Brighton." Councillor Cresswell, in a brief reply, said that although Brighton and Hove were practically one town, it did not follow that it would be better for both to be governed by one authority. The toast of the evening, "The Association of Master Builders," was next introduced by Mr. Gates, who said the Association was brought into existence about ten years ago by a strike. They accomplished the object they had in view, and the Association had prospered ever since. There had been no further trouble of the kind since. A Trade Defence Association was very desirable, especially in their trade. The number of members and subscriptions had been fully maintained, so much so that during the past year the subscriptions had been reduced 50 per cent. A peculiarly gratifying feature of the Association was the Insurance Company which was formed in view of the liability of employers under the Employers' Liability Act. Although only 4s. in the £ had been called up, there was a balance of something like 5,000l. to meet any liability, and the interest practically sufficed to pay the working expenses. He coupled with the toast the name of Alderman Botting, to whom the formation and success of

the Association was greatly due. In responding the Chairman said the object of the Association was to prevent strikes, and in that they had been successful. During the past year the only important thing that happened was the reception of a deputation from carpenters and joiners, who wanted more money and the fixing of certain rules, which would place them in a position to dictate who should do the work. That the Association would never submit to these rules had been tried in other parts of the country, and had they had worked, having had a great deal to do with causing strikes. He was glad to say the finances of the Association were in a healthy condition. The Builders' Association of the country had joined hands in providing a sum of over 21,000l. for the building of homes at Bisleigh for invalid soldiers from the war. That he looked upon as a splendid thing, and he hoped the remaining 9,000l. or 10,000l. needed to complete the scheme would speedily be obtained. The Insurance Company had been a great success, and by July they would have 5,300l. in hand to meet any liability. If they wound it up at once they were in a position to hand to every one who had paid 4s. a sum of 18s. Of course they paid all claims most cheerfully, and had a fund for the protection of their workmen. Other toasts followed.

BUILDING TRADES IN CHICAGO.—In a despatch to the Foreign Office, dated last month, Mr. Wyndham, the British Consul at Chicago, U.S.A., writes that building has been conducted during the past year under the greatest difficulties, and very few undertakings have been brought to a satisfactory ending. It is said that building contracts amounting to nearly 40,000,000l. are waiting to be signed as soon as it is certain that they can be carried through without interference. Many of the unions have signed contracts, with an arbitration clause, for three years, and with the cheap rate at which iron can now be purchased a prosperous future for the trades seems probable. Iron is more used in building every year, and enamelled terra-cotta is coming into favour as a substance which will not absorb the smoke and deteriorate. The year was disastrous for the brickmaking industry in Chicago, only 275,000,000 bricks, or 50,000,000 less than in 1899, being sold. Prices have not varied in the last three years, and are from 21s. 10d. to 25s. per 1,000 delivered. A great quantity of cement is used, but it cannot be ascertained that any of this is British. The local and German makers seem to have the trade, and, it is said, sell at much lower prices than the British makers.

PROPOSED PROMENADE, PENMAENMAWR.—On the 29th ult. a Local Government Board inquiry was conducted at Penmaenmawr by Mr. H. P. Boulnois respecting the promenade which it is intended to construct at that place at a cost of 17,000l. Mr. Ernest Worrall, Engineer to the Council, explained that treaties had been carried through for the acquisition of the freehold of the existing public beach, about thirteen acres in extent, and for certain facilities and better access across the line of railway. The works would extend nearly a mile along the front, from Dyffryn-road to Messrs. Brundritt's pier at the west end.

ELECTRIC LIGHTING AND DESTROYER SCHEME, CLECKHEATON, YORKSHIRE.—On the 29th ult. Colonel A. G. Durnford, R.E., an inspector to the Local Government Board, held an inquiry at Cleckheaton Town Hall in reference to an application by the District Council for sanction to borrow 25,000l. for the purpose of electric lighting and the provision of a refuse destructor. Evidence was given by Mr. C. Lund, Surveyor; Mr. A. H. Gibbins, Electrical Engineer; and Mr. Mortimore, representing Messrs. Meldrum Bros., Manchester, whose system of refuse destruction it is proposed to adopt.

BELFAST BUILDERS' ASSOCIATION.—A special meeting of the members of this Association was held on the 2nd inst. at the secretary's offices, 37, Ann-street, when the following resolution was unanimously adopted: "That the systematic watching, intimidating, and besetting of willing workmen now prevailing is intolerable, and employers are requested to inform the secretary of the Builders' Association of all cases of 'picketing' occurring at their works, so that immediate steps may be taken to prevent their recurrence, and, if necessary, prosecutions instituted under the Conspiracy and Protection of Property Act, 1875."

SCAFFOLDING ACCIDENT AT BIRMINGHAM.—Seven men who were engaged in the erection of a building in Eyre-street, Birmingham, were injured by the fall of the scaffolding on the 8th inst. The scaffolding was fixed upon girders near the roof. Two of the planks forming its basis suddenly snapped and the whole structure fell, carrying with it the seven men to the ground, 30 ft. below. The men were taken to the hospital, and four of them were detained suffering from serious injuries. One of them has since died, and another is not expected to recover.

CAPITAL AND LABOUR.

PENRYN QUARRIES.—As was anticipated in the district, the mass meeting of the quarrymen only strengthened them in their determination not to resume work until they receive some concessions.

ABERDEEN PLASTERERS' DISPUTE.—Through the good offices of Baillie Taggart and Courthill

Milne, a conference of representatives of the Aberdeen master plasterers and the operatives, who have been locked out since February 23, was held on the 2nd inst. in the Grand Hotel with the view, if possible, of arriving at a compromise. It may be recalled that the lockout was the result of the operatives refusing to accept a reduction of wages from 8d. to 7½d. per hour, given notice of by the masters. Baillie Taggart, in opening the proceedings strongly urged that the dispute should be settled by compromise. He suggested that in order to bring about this both parties might agree to recommend to their respective associations a wage of 8d. per hour. Neither side, however, indicated the slightest inclination to give way, and after some further discussion it was agreed that both parties should separate with the view of discussing the situation. The operatives' representatives accordingly retired, accompanied by Baillie Taggart, while Mr. Milne remained with the masters. When the joint conference resumed Baillie Taggart announced that the men's representatives considered 8d. per hour a fair compromise, and he asked the representatives of the employers if they were prepared to recommend such a compromise to the masters' association. After some discussion the masters' representatives expressed their readiness to recommend to their association 8d. per joint minute was drawn up, and signed by the Secretaries of both parties.—"The employers and employees present consider wages at the rate of 8d. per hour as a fair and reasonable settlement of the dispute. They also agree to recommend to their respective constituents that this compromise be accepted." This recommendation will come before the employers' and operatives' associations respectively for consideration, but it may also be explained that before any final settlement can be arrived at the recommendation must be approved by the Executive of the operatives' association in Glasgow.

SHEFFIELD PLUMBERS' STRIKE.—The strike of the Sheffield plumbers has ended, and the men, nearly 300 in number, have commenced work again. Since the strike negotiations have been carried on, and, finally, the men signified their willingness to observe as the masters' "new rules of working," which have been one of the main points of contention in the dispute, and they do this notwithstanding that their demand for an increased rate of wages has not yet been conceded. It is one of the conditions of the settlement, however, that the demand for 3d. an hour extra wages shall go to arbitration by the Board of Trade arbitrator. Another condition of the settlement is that the master plumbers shall all take back their former workmen.

THREATENED STRIKE AT GOSPORT.—The bricklayers and labourers of Gosport have notified the master builders of the town that unless the masters grant their demands of a halfpenny per hour increase all round, and a set of rules, they will come out on strike on May 6. The bricklayers at present receive 7½d. per hour and the labourers 5½d.

LEGAL.

DAMAGE TO ROADS BY TRACTION ENGINES.

At the Thirsk County Court on the 3rd inst. Judge Temple was occupied in hearing an action brought by the Thirsk Rural District Council against Thomas Harrison, contractor of Stamford-bridge, for the recovery of 136l. 10s. damages for injury to the Boroughbridge and Durham main road and to the Ripon and Carlton Miniott Township main road.

The case for the claimants was that the roads had been damaged to the amount named by a traction engine and waggon used by the defendant between June 20 and July 12 last, when he was leading gravel for Lord Leonfield from the Asenly gravel pit. Evidence as to the reasonableness of the sum claimed was given by Robert Wright, Assistant Surveyor for the plaintiffs; W. H. Dixon, Surveyor to the Stokesley Rural District Council; John Scott, Surveyor to the Bedale Council; John Robert Greenshaw, Surveyor to the Pocklington Rural Council; W. Southern, civil engineer, Hull and Beverley; and Peter Jesspill, Surveyor to the Hornsea Authority.

The defendant gave rebutting evidence as to the weight of gravel carried in the waggons drawn by his engine, and John Thompson, who drove the engine, deposed that no complaints were made to him at the time, and he made thirty-six journeys in fourteen days. He considered that the engine was improving the roads. Mr. Beverley, on behalf of the defendant, submitted that the claim was an extravagant one.

The Judge gave a verdict for the plaintiffs for the full amount claimed, with costs on the higher scale.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

24,426.—COMBINED LIFTING, WEIGHING, AND INDICATING APPARATUS: *W. Timmermann and H. Dörschlag*.—A weighing contrivance, for attachment to the hook of a crane or similar hoisting machine, comprises a spring above which is a plate

which carries the suspension-hook. The compression of the spring causes a stud upon the plate, that works within a spiral groove, to turn the stem of the stem being joined by means of bevel gearing to a shaft upon which the indicating mechanism is carried. The latter mechanism includes a pointer (upon the shaft) which, when it has traversed the dial once, is carried forward that it may register weights heavier than the 200 kilogrammes marked upon the dial. Ratchet gearing provides for the indication upon the dial in kilogrammes and upon a third dial in higher units of the aggregate of a series of weighings.

24,441.—A CONTRIVANCE FOR USE WITH ELECTRICAL ALARM BELLS: *L. Davoine*.—The circuit-closing device comes into operation at the melting of a fusible plug within the push, as the plug becomes heated its surrounding spring forces out a cap on to a spring so as to close the bell circuit. The fusible plugs may be also adapted for telephone circuits.

24,480.—DRAWING AND OTHER PINS: *F. H. Shaw*.—The pins are fashioned in various forms. The chief feature of the invention consists in fitting them with strips or pieces of leather, fabric, or other material, with which they may be readily drawn out of the board. In one shape the ends of a cord or strip are passed through holes in the head of the pin and a clamping disc is fastened to the under side of the head.

24,504.—A LOWERING APPARATUS FOR FIRE-ESCAPES: *W. Benson*.—The two cages are caused to ascend and descend alternately as their ropes are wound in opposite directions upon two pulleys mounted on one shaft, which at each of its ends abuts against movable plates held with springs. The springs serve to keep in check the revolutions of the shaft as well as its movement lengthwise, since one end of the shaft is screwed and works within a nut. When either cage is raised to the top it is sustained with spring arms which slide above and then drop over the beam, and can then be freed by hand.

24,511.—A METHOD OF HEATING WATER: *J. Winterfoot*.—The appliance, available for domestic and other purposes, combines a water-heater, a thermostatic gas-regulator, and a valve which controls the supply of water. The heater comprises the outer casing and inner casings of a central boiler or chamber. The thermostat is affixed through the outer casing of the heater beneath the boiler, and its valve-rod is worked with levers moved by a lever that is hinged on to the operating-rod, and a float upon the water in an upper vessel regulates the water-supply valve.

24,534.—A PAINT: *T. Möller*.—For making an air and water-tight paint, an admixture is compounded of milk of chalk (or else English red or ochre), rye meal, iron, vitriol, coal tar (or else wood or Finland tar), lime and water; if red or ochre and wood or Finland tar are used, the lime may be discarded.

24,552.—THE MOULDING OF BRICKS: *A. L. Maynard and J. Walls*.—Curved steel blades force the clay from a hopper through a die into the moulds, the blades being mounted upon a squared part of the shaft with U-shaped bolts which pass around them and through a clamp-plate; the moulds, open at both ends, are carried between guides upon a table or rollers, or else upon jointed bottoms, so as to form an endless chain. As the filled moulds are passed around a pulley they are taken away, and the empty moulds are put upon the bottoms as the latter are passed around another pulley.

24,567.—THE CONTROL OF CONTINUOUS CURRENT MOTORS FOR CRANES, LIFTS, HOISTS, &c.: *J. S. Stevens, C. G. Major, E. C. Stevens, and P. H. Stevens*.—The apparatus combines a multiple-contact switch with means of automatically cutting out resistances at starting and of putting them in at reversing or stopping. As a winding-drum revolves upon a shaft its wave-groove causes to oscillate an arm that is linked to a crank which has a pawl set in engagement with a ratchet-wheel, and the ratchet-wheel is set in frictional engagement with the arm of the switch. As soon as the motor has been started the switch-arm becomes automatically turned until it forms the lower end of its slide and the starting-resistance is cut out of the circuit, whereupon the ratchet-wheel slips and does not move the switch-arm, one end of another pivoted lever engages with a cam-groove in the stopping and reversing shaft, which, as it turns, moves the switch-arm back to its former place. The specification extends to various modifications of the apparatus.

24,568.—THE MOULDING OF BRICKS: *S. R. S. Bailey*.—A hand-lever upon a cross-shaft works the upper pressing-plunger, a crank or cam upon the shaft moves between rollers of the crosshead of the plunger, and at each end of the shaft is a weighted arm that balances the moving parts, one of the arms may constitute an extension of the hand-lever; rods that slide through a crossbar are attached to the lower plunger, the length of their slide being adjusted with nuts in accordance with the desired thickness of the bricks. The main working parts are arranged above the mould in order that they shall not become clogged with grit, &c., from the mould, and the machine—which is mounted upon wheels—is moved and steadied with its weighted side-handles.

24,585.—PAINT, DISTEMPER, AND WHITWASH BRUSHES. The inventor makes the brushes with bristles that on the outer side of the brush are longer than the bristles within, and he fills the top space with two segmental pieces of vulcanite or gutta-percha fitted with pegs; the segmental pieces are put into their position after the bristles have been bound with copper wire, the knot is dipped into cement, and then the blade of the handle is forced in.

24,602.—A RETAINING PIECE FOR PIPES: O. Egger. An appliance for holding or clamping pipes against walls or other brickwork consists of two parts, one of which is fashioned with an extended blade at its one end and the half of a ring at the other end, the portion between them being fashioned with openings and a channel that will take a wedge-shaped key; the corresponding part consists of a half ring and the other half of the portion into which the key is to be forced. When the two parts are wedged together with the key, the completed ring holds the pipe and the blade is secured in the masonry.

24,611.—THE MANUFACTURE OF TILES, BLOCKS, CONDUITS, PIPES, &c.: J. C. Sellars.—Some such binding material as glue water, together with lime, cement, sulphate, or other solution of alumina, protosulphate of iron, &c., are compounded with slag, clinker, or residue from a refuse destructor; when the moulded articles have been dried, they are placed in a solution of silicate of soda, silicate of potash, or other alkali under pressure. The goods may be rendered waterproof by dipping them into an acid, or a solution of alumina or a salt of iron, whilst pipes and conduits may be fired and glazed. For effecting a ready combination of the residue with the silicate solution, some silicious substance such as salt, sand, or spent lime should be mixed with the former material.

24,615.—TILES OR PLATES FOR BUILDING PURPOSES: F. Pagnon.—The facing tiles, made of earthenware, cement, glass, or other material are laid with their face downwards upon a table within a mould, and they are bonded together with a cement, which is poured into the mould, and forms a backing for the tiles. In the cement is embedded wire netting, which is laid so as to project beyond the edges of the tiles; the made-up slabs can be cemented on to the surface of the wall, and they can be separated from one another, or from the wall, by pulling the overlapping edges of the netting.

24,647.—PORTABLE COMPASSES: H. Cowley.—These are made in the form of a metallic cylinder, at whose upper end is a shoulder, which supports the container and its cover. The ringed groove of a disc, that stands upon the feet, carries the lower portion of the cylinder. At the top of the cylinder are fitted a seat and a hinged cover. The parts described can be easily detached from one another, and be packed in a box or case of suitable shape.

24,651.—A FLUSHING APPARATUS: J. Woodbury.—A spring serves to hold the pivoted working-lever in its normal and closed position. A tubular discharge valve is arranged at the base of the closed tank so as to operate within a cylinder, and is joined with a rod that is passed through a pipe and is attached to the end of the working lever above. The flush escapes through ports which are made around the lower edge of the cylinder which surrounds the discharge-valve, whilst the upper edge of the cylinder is made larger than it may take the packing and the compressing upon the valve. During the time that the valve is shut the packing remains seated upon the raised edges. The spring underneath the lever acts so as to keep the valve closed; the spring may be disposed in a horizontal position and be caused to bear upon a rod whereof one end is pivoted on to the inner end of the lever.

24,687.—A FLUSHING APPARATUS: J. Woodbury.—The filling of the closed tank from the supply-pipe (which is always open) causes air to escape until the water has attained a certain height and then a valve traps the air, the leakage from the valve and air being conveyed through a tube to the flushing-pipe. Within a cylinder that is closed at its top and has ports around its lower edge is a tubular discharge-valve, which starts the flush when raised by a crank-lever movement.

24,753.—A HOLDER FOR WINDOW-SASHES: A. Forin.—A wedge-shaped pawl, which is carried upon a bearing in a casing placed within a recess of the jamb, is to be turned with a handle-rod; on the sash is a rack whereof the notches are engaged by a spring that presses against the pawl. Of the two pawls for each sash, the lower one can be turned down for securing the lower sash.

24,788.—WATER SUPPLY (DOMESTIC): J. E. Kieching.—The pull-chain is secured to the end of a crank upon the axle which carries a tipping-vessel placed within the tank; in order that the float-lever may have play and that it may be sustained in the lifted position whilst the tipping-vessel is tilted, the axle is also cranked for a portion of its length between the sides of the vessel, which can be made to tilt automatically and be adapted for use with urinals.

24,812.—BRICKS, BLOCKS, SETTS, &c., FOR PAVING AND SIMILAR PURPOSES: E. Reese.—The articles are intended to be used as paving-stones and conduits, for channelling, and so on. They are made of granite, slate, or stone quarry refuse com-

pounded with pitch, tar, bitumen, alum, and sulphur, and are moulded under pressure.

24,824.—INCANDESCENT LAMPS: C. Howard.—The inventor provides that the long neck of the bulb may be divided and be fused together again when a new filament has been cemented to the leading-in wires; little cups of metal fit into two opposite recesses in the neck, and small holes in a cap upon the shoulder register with the cups, so that the melted solder shall pass through the holes and fill the cups; the device is intended to make the cap movable and to render the use of cement unnecessary for fastening the cap.

MEETINGS.

FRIDAY, APRIL 12.

Institution of Junior Engineers (Westminster Palace Hotel).—Paper on "Iron-lined Tunneling Construction," by Mr. A. Woodroffe Mantou, 8 p.m. Glasgow Architectural Craftsmen's Society.—Mr. J. K. Edwards on "Warm-air Heating Apparatus and the Building Preparations Necessary," 8 p.m.

SATURDAY, APRIL 13.

Institution of Junior Engineers.—Visit to Great Northern and City Railway Works to inspect plant. 3.30 p.m. British Institute of Certified Carpenters.—Mr. G. Ellis on "How is the Future Workman to be Trained," 6 p.m.

MONDAY, APRIL 15.

Royal Institute of British Architects.—Special general meeting (business) (1) to receive and consider a recommendation of the Council that Mr. Wm. Emerson, President, be requested to allow himself to be nominated as President for the ensuing year of office; and that, consequently, by-law 26 be suspended; (2) to sanction alterations in the Institute form of contract. 8 p.m. Surveyors' Institution.—Mr. Walter C. Ryde on "The Rating of Public Houses," 8 p.m. Literary and Architectural Society.—Mr. A. S. Flower, M.A., on "Old English Architecture: A Retrospect and a Suggestion," illustrated by limelight views. 6 p.m.

TUESDAY, APRIL 16.

Institution of Civil Engineers.—Mr. H. E. Jones on "Modern Practice in the Manufacture and Distribution of Gas," 8 p.m. Builders' Clerks' Benevolent Institution.—Twenty-third annual dinner, King's Hall, Holborn Restaurant. 6.30 p.m.

WEDNESDAY, APRIL 17.

British Archaeological Association.—(1) Mr. C. E. Keyser, M.A., F.S.A., on "Sculptured Tympana of English Norman Doorways," with limelight illustrations. (2) "Notes on interments at Blessea, North Lancashire," by Mr. T. Cann Hughes, M.A., F.S.A. 8 p.m. Sanitary Institute.—Messrs. Henry R. Kenwood, M.B., and W. Butler, M.B., on "Seawater Purification and Standards of Purity," 8 p.m. Builders' Foremen and Clerks of Works Institution.—Quarterly meeting of the members. 8 p.m. Edinburgh Architectural Association.—Sir John Sibbald on "Lunatic Asylum Design from a Medical Point of View," illustrated by limelight views. 8 p.m.

THURSDAY, APRIL 18.

Royal Institution.—Mr. Roger Fry on "Naturalism in Italian Painting," 8 p.m. Institution of Electrical Engineers (at the Institution of Civil Engineers).—(1) Replies of Mr. H. Ravenshaw and Mr. S. F. Walker to the discussion on their papers read at the last meeting. (2) "Test Room Methods of Alternate Current Measurements," by Mr. A. Campbell. (3) "Note on the Use of the Differential Galvanometer," by Mr. C. W. S. Crawley. (4) Announcement of the Council's nominations for the Council 1901-2. 8 p.m.

FRIDAY, APRIL 19.

Architectural Association.—Mr. M. A. Green on "The Eighteenth Century Architecture of Bath" (illustrated by lantern views). 7.30 p.m. Institution of Mechanical Engineers.—Ordinary General Meeting. Presidential Address by Mr. William H. Maw. 8 p.m. Royal Institution.—Professor J. J. Thomson, M.A., on "The Existence of Bodies Smaller than Atoms," 9 p.m. Institution of Civil Engineers.—Students' meeting. Mr. E. V. Clark, B.Sc., on "The Theory of Cast-Iron Beams," 8 p.m.

SATURDAY, APRIL 20.

Architectural Association.—Visit to the International Building Trades Exhibition, Agricultural Hall. 3 p.m. Edinburgh Architectural Association.—Visit to Dalrymple House and Church and Chapter House at Restalrig.

SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales including March 26, 27, and 28, Drivers, Jonas, & Co. (at Monmouth), Monmouth, Old Herford rd., &c., three freehold cottages and 1 a. 2 r. 24 p., &c., 1,300; Llantriheddi, an enclosure, 2 a. 3 r. 27 p., f., 1,300; Old Dixton rd., five enclosures, 19 a. 0 r. 24 p., f., 1,565; Osbaston rd., an enclosure, 1 a. 0 r. 26 p., f., 200; Monmouth Electric Lighting Works, f.g.r. 80d., reversion in 35 yrs., 2,100; Rockfield rd., four enclosures, 12 a. 3 r. 36 p., f., 790; Drybridge, Barber's Meadow, 4 a. 2 r. 7 p., f., 725; Dixton Hadcock, Mon.—Wyeasham House and 3 a. 0 r. 33 p., f., 7,950; A freehold cottage and 1 a. 2 r. 10 p., f., 165; Freehold building site, 2 a. 1 r. 27 p., f., 360; Hill House and 16 a. 2 r. 5 p., f., 5,100; Dixton Farm, 15 a. 0 r. 26 p., f., 3,800; Several building plots, 2 a. 3 r. 9 p., f., 437; Monmouth Gas and Water Works, f.g.r. 27d., reversion in 27 yrs., 2,100; Monmouth Sawmills, area 4 a. 1 r. 6 p., f., 2,750.

Table listing various property sales and transactions including Freehold building land, Butterby's Cottage and 3 a. 0 r. 9 p., f., 1,940; Four enclosures, area 3 a. 1 r. 14 p., f., 550; Mayhill Wharf, area 3 a. 3 r. 30 p., f., 550; Enclosure of building land, 11 a. 2 r. 1 p., f., 550; Enclosure of grass land, 0 a. 2 r. 32 p., f., 130; Wyeside Cottage and 0 a. 2 r. 4 p., f., 135; Two building sites, g.a. 0 r. 24 p., f., 500; A freehold nursery, 1 a. 0 r. 39 p., f., 160; A freehold building site, 5 a. 3 r. 26 p., f., 600; Monmouth.—The Garth Estate, 150 a. 3 r. 14 p., f., 4,600; Rockfield rd., an enclosure, 3 a. 0 r. 10 p., f., 165; Wonastow rd., two farms, 41 a. 0 r. 16 p., f., 1,950; Wonastow rd., two enclosures, 1 a. 3 r. 38 p., f., 310; Gibraltar Cottage, St. Dial's Wood, and 51 a. 3 r. 12 p., f., 2,800; Cinderhill-st., a cottage and 21 a. 2 r. 36 p., f., 1,875; 49, 51, and 53, Cinderhill-st., f., 135; Cinderhill-st., freehold business premises, 220; St. Mary-st., f.g.r. 12d., reversion in 41 yrs., 310; 5 and 7, St. Mary-st., f., 200; 1 and 3, Church-st., with whitesmith's shop, f., 147; 2 and 4, Agincourt-st., f., 430; 21, Minnow-st., f., 340; 11, 12, and 13, Agincourt-st., f., 2,600; Castle Hill, freehold house and warehouse, 490; Dixton Hadcock, Mon.—The Ymyn Summer House and 9 a. 1 r. 22 p., f., 125; Seven freehold cottages and 13 a. 3 r. 1 p., 247; Forest cottages and 4 a. 2 r. 36 p., f., 133; March 28.—By HENRY HENDRICKS (at Birmingham). TO CORRESPONDENTS.

J. F.—W. & G. N.—J. H. C. (Amounts should have been stated). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.] * Denotes accepted. † Denotes provisionally accepted. Some Cities of Modern Italy—Brescia.

BRESZIA is a small, clean, flourishing town. Its industries and activities are chiefly connected with the ironworks in the neighbouring valleys, but to all appearance it

seems the market town of a well-to-do agricultural district rather than the centre of smelting works and forges. The city possesses its old walls and fortifications, on which the Lion of St. Mark still stands sentinel—memorials of almost the farthest western possession of the Serene Republic of Venice. But outside these walls a considerable suburb of modern villas, with their gardens, has sprung up within the last few years, and the builders are busy now with many more new houses. This district has a pleasing, homely look; the houses are simple, substantial buildings, without the vulgar Parisian character of the modern districts of Milan, and yet at the same time of a very modern design. In Brescia the plastered front, with pseudo-Classical details, seems out of fashion; a kind of adaptation of round arch brick Romanesque prevails, and as there is considerable individuality of treatment, with simplicity and absence of uninteresting ornament, the result is satisfactory.

The chief architectural interest of Brescia lies in the projected and partly-executed re-instatements of some of the ancient monuments of the town. Here also the Ufficio Regionale is doing a great deal of work. The large Broletto, or medieval Palazzo della Giustizia, with its prison still in use, is undergoing careful treatment. Sketches of the old building of many years ago will be found in Street's book on the "Brick and Marble of North Italy." Street would probably have rejoiced to see the careful manner in which the old windows and other details are being relieved of the clumsy wallings-up and plaster coverings which have perhaps to some extent served

to protect them for modern use. The style of the building is Early Lombard of the twelfth or thirteenth centuries, with a chapel forming part of the block, which may be rather later. When the present work is finished, which will leave the building in its time-stained condition without any attempt to make it look new and fresh, the result will be most interesting and picturesque.

A still more important work at present being studied by the Ufficio Regionale is the re-instatement of the enormous chamber or "Salone" of the Municipio. This exceedingly beautiful building of the Early Renaissance is perhaps not quite so well known as it deserves to be. It is certainly one of the very finest examples of the style, and the refinement of detail, the sense of proportion, and the ingenious mode of construction are equalled in few buildings, ancient or modern. Unfortunately the upper portion, consisting of an enormous hall for the public meetings of the citizens, has been abandoned to neglect since the sixteenth century. The building was originally covered with one of the singular wooden roofs covered with lead, of a curved section, similar to those of Padua, Vicenza, and some other towns of the Venetian district. These very remarkable constructions are evidently an old Venetian speciality, and belong more to the mediæval than the Renaissance period. Such a mode of forming a roof is quite unknown elsewhere, and would certainly be condemned in modern times as both contrary to scientific principles and common sense. The great hall at Vicenza, on to which Palladio added his very ingenious arcades, is 21 mètres wide; the Sala della Ragione at Padua is wider, but this example at Brescia seems to be the widest of all, with no less than 24 mètres 70 cms. total span for the roof. In every case the inside appearance is that of a ship turned upside down, with the ribs exposed, and nothing in the shape of trusses or other internal framing to support them. The ribs are merely held in position by numerous horizontal iron ties at different levels in the height. The ribs are, of course, formed of lengths of timber bolted together in the usual way of forming a wooden curve,

but, instead of being trussed, these enormous curved beams appear to support themselves with the mere addition of a strongly tied-in foothold on the walls. Incredible as such a mode of construction appears, there are numerous examples of it all over the ancient Venetian provinces, and many of them date at least from the thirteenth century. In the case of Brescia, however, the enormous roof of this description which is said once to have existed over the "Salone" of the Municipio was destroyed by fire in 1575, after only twenty years' existence. The roof was never re-erected on the same lines. Architectural taste changed very considerably before the project of restoring it could be carried into effect, and then in place of the graceful lines of the curved lead roof crowning the Renaissance edifice, a very ugly barocco base to what was perhaps intended for a dome was substituted. But the dome also was never carried out, and the whole area was covered over with a common roof of tiles supported on rough wooden partitions which have formed a number of rooms in place of the "Salone." In this condition the edifice has remained for more than a century, practically a ruin, but structurally well preserved.

A desire has lately been manifested on the part of the public, as well as by the Government authorities, to recover this splendid monument from the neglected state into which it has fallen; but the question of re-constructing the roof is a serious one, both on account of expense and as a structural problem. The Ufficio Regionale appears to have no intention of adopting the original method of construction for the purpose, but instead suggests the use of iron in the ordinary way of the present day, but adhering closely to the original outline and proportions of the lead covering. The clumsy barocco additions on the top of the building must, of course, be removed. In this case a departure from the guiding rule of the Ufficio may, perhaps, be tolerated. The Ufficio has been formed for the purpose of preserving everything of whatever age it may be, but in the present case the perfectly beautiful Renaissance building is too

grossly disfigured by this clumsy, unfinished addition, which is not only useless, but impossible to retain if the original roof is reinstated. The architect (probably the same who built the "Duomo Nuovo" of Brescia in the seventeenth century) had very little idea of harmonising his work with that of his predecessors; on the contrary, his addition is totally out of scale and keeping with the substructure. Under the circumstances no reason can be urged for the retention of this portion on artistic or archaeological grounds. The restoration of the original roof with iron construction is, however, a somewhat different matter. The restoration of the roof is chiefly for the outside appearance of the building, and on the inside there must, of course, be a ceiling, otherwise the interior will present too much the appearance of a railway shed, and also be very subject to the effects of temperature. There are also other questions which arise in such a case: the weight on the walls of the iron construction will probably be far greater than the older system involved, and the permanence of modern iron roofs has not been tested in this way, or to the extent of the old buildings which have supported the lapse of six centuries. It is a pity the singular system of Venetian construction of the fourteenth century cannot be revived in the present case. It would be curious to see such a method, so contrary to modern ideas, employed in defiance of all modern principles of construction. But the Italians of the present day are not quite so venturesome as their forefathers, and so we must be content with a mere outside completion of the building, which will certainly be a great advantage to it and to the city.

The very beautiful little building called "La Madonna dei Miracoli" is in a perfect state of preservation and carefully guarded by the Ufficio Regionale. A view of the portico appeared in the *Builder* at the end of 1898, but it hardly represents the full beauties of this design, which consist not only in the exquisite detail, but also in the ensemble of the church. The portico represented in our view is surmounted by a most picturesque and original gable, equal in that respect to anything of the kind on a Belgian canal. The whole façade is a most interesting study of Venetian Renaissance, and reminds one very much of the little church with the same dedication at Venice.

THE BUILDING TRADES EXHIBITION.

THE exhibition at the Agricultural Hall appears to be one of the fullest and best that has been held there; and if the exhibits themselves were not quite all complete and in order on Wednesday, the opening day, they were much more nearly so than has generally been the case, and the catalogue at all events was ready—a great advance on some former occasions, when the catalogue could not be obtained till the exhibition was half over.

The bulk of the objects are arranged in the usual manner, in rows parallel with the length of the building; two extra departments being formed by architectural drawings, which are arranged in a room off one of the galleries, and by the Fire Prevention

Section, which has a place to itself in the small gallery in the corner of the building.

The architects' exhibits are less important than at the last exhibition, and need not detain us especially. They consist of a not very large collection of perspective views and elevations, many of them already familiar. Among the most prominent exhibitors are Messrs. Ernest George & Yeates; Messrs. Runtz & Co.; Messrs. Sugden & Son and Mr. Larner Sugden, nearly all of whose drawings show picturesque and original quality—a small view of a boat-house by Mr. Larner Sugden shows a very pleasing and original treatment; and Mr. Arnold Mitchell, one of whose exhibits, the sheet of "Small Country Houses," is illustrated in our present issue.

The exhibition got up by the British Fire Prevention Committee is the most important novelty, and may perhaps rightly claim our first attention. The most important exhibit is that of the Columbian Fireproofing Company, whose work came out so well at the Fire Prevention Committee's Testing-house. They exhibit a 15-ft. span construction, formed of two rolled iron girders embedded in concrete and seen in section, carrying a solid ceiling of concrete "armed" with steel laths embedded in it. The most interesting item of their exhibit, however, is the section, set on end on the floor, of a concrete floor and ceiling combined, on the same principal of "armed" concrete, with a ceiling finish of white glazed bricks with dovetail bond into the concrete. Regarded as a ceiling, this is a most solid and monumental piece of work, and looks as if it might last for ever; and we are more in favour of this solid and close construction than of the various forms of floors with air-spaces of which there are several in the room—one exhibited by this same firm. The supposed ventilation is of doubtful value in the case of materials which are not subject to dry-rot and other such ills, and we have always had an objection to the existence in buildings of empty spaces which are inaccessible; one never knows what may be going on there. Another article worth notice in this exhibit is the concrete floor made with bottle-glass broken small, which has the quality of being acid-proof, and has the appearance of being in other respects practically indestructible, while putting to good use an otherwise waste material. The company have got up their exhibit very effectively, and succeeded in giving it a more attractive appearance than is usual in the case of such very practical and undecorative processes.

An exhibit of some importance is that of the British Uralite Company, who have also another exhibit in the large hall. Uralite is a substance in the form of thin sheets composed of asbestos fibre and mineral substances, which is claimed to be absolutely fire-resisting; we saw a piece subjected to a severe test with the blow-pipe, under which it certainly did justice to its character. It is a fibrous sheet about $\frac{1}{8}$ in. thick. According to the patentees' statement:—

"Uralite can be cut with a knife or saw; it can be painted, grained, polished, and glued together like wood; it can be veneered to form panelling for walls or partitions for ships' cabins or for railway carriages; such panelling will not swell, crack, or blister. Uralite does not split when a nail is driven through it. It is not affected when exposed to moisture or very great changes of temperature,

and it can be impregnated throughout with any desired colour."

Its appearance and texture are in accordance with this description. In the exhibit it is shown nailed in slabs under joists to form a ceiling, and over joists to form a fireproof sheeting between them and the flooring boards. The exhibit in the main hall consists of a temporary hut covered with this substance in symmetrically shaped pieces held together by clips, in which shape it forms an exceedingly light and portable hut. The contents of the hut show how Uralite can be used for veneering, and can be painted, grained, and polished (we should prefer to dispense with the graining), in all cases forming a fireproof lining. It is certainly a material worth attention.

The Mural and Decorations Syndicate exhibit their system of wire network in which the meshes are covered with fire-clay put on moist and the whole baked, forming a terra-cotta mesh, the special object of which is that, being used as the first covering to an iron column or other such object, the external plastering forms a much closer key with it than with bare wire, and is less liable to be thrown off or loosened by the action of heat. It is used also as the core for a 2-in. partition of great firmness and strength. In going through the exhibition generally one cannot but be struck with the immense variety of means now available for making partitions of but little thickness and yet of solid, fireproof, and fairly sound-proof character; much more sound-proof at all events than the old 4-in. or 5-in. partition of quartering, lathing, and plaster, besides being infinitely more sanitary. There seems really little left to be done now in the way of improving the construction of partitions. Another compact construction for floors or partitions is exhibited in the "Mack" slabs and blocks by Messrs. J. A. King & Co.; the slabs have hollow reeds embedded in a specially-prepared plaster; these form "sealed air chambers," the usefulness of which we somewhat doubt; but the material is a very solid and sound one, and easily handled, being made in slabs 12 in. wide and 6 ft. long, built up in courses with breaking joint; and a $2\frac{1}{2}$ partition of this material is stated to have stood a fire test of an hour and a quarter. The statements made in this portion of the catalogue may, we presume, all be relied on, as they are made under the direction of the Fire Prevention Committee. Messrs. King & Co. have a separate exhibit in the main hall.

Mr. L. G. Mouchel exhibits drawings and photographs showing the application of the Hennebique system of piling, where the piles, called "ferro-concrete," are formed of concrete with steel arming embedded in them, and shod with steel spikes in the usual manner. It seems extraordinary that long piles (of the same or even thinner proportion than timber piles) formed of concrete should, even with the assistance of the steel arming, be able to sustain the heavy blows necessary in driving them; but a sectional drawing is shown of a large building which has been erected on very long piles of this material. One special advantage in their use is that they are not, of course, liable to be attacked by worms. For sheet piling they are said to be formed with a dovetailed section to stop out water, though we should feel rather sceptical as to their efficiency for that purpose.

Among the other exhibits connected with the construction of floors and partitions the Asbestos and Asbestic Company show examples of the application of asbestic plaster to walls, on ordinary wooden lath. The Banks Fireproof Syndicate show a large sectional drawing of their ventilated concrete floor with iron girders over which pass stirrups supporting steel laths to which the ceiling, of armed cement, is suspended. This is called their "patent ventilated floor," but, as before stated, we fail to see the use of the ventilating spaces, and would much prefer a compact floor like that of the Columbian Company mentioned above. The Banks Syndicate have also an exhibit in the main hall, in which is shown the use of their helical metal lathing as a foundation for the protection of stanchions, &c.; an excellent lathing, light, and affording a very good key. Mr. Arthur E. Brown, the agent for Eredi Frazzi of Cremona, exhibits various sections of their floors constructed with light hollow bricks, arched from terra-cotta skewbacks; the various forms of hollow brick are very good samples of material, and have a good appearance also. The Fire-proof Partition Syndicate exhibit a small hut made with their iron sheeting worked into a dovetail section corrugation and plastered or otherwise covered; they also show an exceedingly simple and apparently cheap floor formed of sheets of the same corrugated iron bearing on the lower flange of a rolled iron joist, and filled in with concrete above; the iron ought also to be covered below; this is not shown, but owing to the good key formed by the dovetail corrugations it would, of course, lend itself perfectly well to this. The sheets can be used up to 3 ft. bearing between joists, and are 4 ft. 6 in. long. The firm have an exhibit of a larger cottage in the main hall, and draw attention to the saving in space by the thin proportions of their partitions, but the "net gain of four inches on each partition" must refer to comparison with the old lath and plaster partition, and it is hardly worth while to make that comparison nowadays. Messrs. A. W. Green & Co. exhibit a concrete floor with a serrated tile ceiling screwed to the under side of it; the joints of the tile or terra-cotta slabs come under the lower flange of the iron joists—a weak point.

The New Expanded Metal Company exhibit their flooring made of rolled steel joists, arched steel channels and expanded metal partially concreted, and various specimens of expanded metal and concrete floors and partitions. They have also an exhibit in the main hall. The Pease's Tubular Construction Syndicate exhibit a curious floor of metal tubes filled in with some composition and concreted between; it has not much to recommend it. Messrs. Potter & Co.'s concrete floor slightly arched on the under side between iron joists, with a plaster ceiling suspended by rods from the centre of the concrete arch, is a simple and inexpensive floor.

Among exhibits of other classes the Non-Flammable Wood Company show a number of specimens of wood treated by their process, which in no way affects the appearance of the wood; its practical efficiency has been well tested, as our readers are aware. Messrs. G. A. Williams & Sons' fire-blind, of asbestos cloth, is an outside window-blind which can be lowered from within the room,

the bottom rail of the blind fixing itself automatically in a catch on the window sill; a simple and useful protection against fire in a neighbouring building. With this may be mentioned Mr. R. Buggé's "firesail," for covering the front of a house for a similar purpose; it is of asbestos cloth, and made with horizontal rows of pockets at intervals, which catch and detain the water from the hose and serve to keep the cloth wet by percolation from these pockets.

Messrs. Hobbs, Hart, & Co. have an interesting exhibit. They show among other things, ventilating and fire-resisting lintels for safe doors, made of steel pierced with openings and containing within a fireproof brick filling, with interstices through which air can percolate. They show also ventilating tubular adjusting shelving for strong-rooms, which can be raised or lowered as required, the strong-room being built around them. Their keyed and rebated party-wall doors, sliding on wheels, are so constructed that top, bottom, and both sides work into a rebate, and the door is provided with an automatic clutch bolt; an ideal door for the purpose. The same form of clutch bolt is a feature in their safe doors, holding the whole construction together against expansion from heat. The Crittall Manufacturing Company have an excellent exhibit of somewhat similar class. It includes a sliding wrought-iron door on rollers geared so as to reduce friction, and some admirably constructed iron window frames for factories, geared so that a number of the sashes can be opened on centres, as much or as little as is required for ventilation, by a single rod; the make of these is excellent.

Applications of slag wool are shown by Messrs. Anderson & Son, Messrs. F. Jones & Co., and Messrs. MacNeill & Co. Messrs. Pilkington Bros. exhibit their wired rolled glass, which stood severe tests for fire-resisting quality; and the Luxfer Prism Syndicate have an exhibit of various special glazings of $\frac{1}{4}$ -in. glass, which are not only a resistance to fire but have the additional merit of being decorative in appearance; the 4-in. squares of polished plate glass, with their thin metal frames, form as agreeable a way of filling up a window as could be desired. Their prism exhibit is in the main hall.

The British Fire Prevention Committee has its own exhibit, including plans of the new testing station at Westbourne Park, models of the testing plant, and a number of photographs of the results of tests. In the same department Mr. Charles E. Goad exhibits a large map of London showing the sites and areas of notable fires, with the dates.

Altogether, the Fire Prevention exhibit has been exceedingly well got up, and contains a great deal of matter of practical interest.

Into the immense collection of exhibits of all kinds in the main hall we cannot go in detail in this issue, but we may mention some exhibits which are specially interesting. Among these is that of the Moreau Marble Company. We have a great dislike generally to imitation marbles; but the patentees of this material maintain, with some show of reason, that it is not an imitation, but that they are actually making marble by the same process by which Nature makes it, only in a few weeks instead of a few thousand years. They take a rather soft

and permeable limestone (what they are at present using is from the south of France), and chemically permeate it with various colouring matters which sink into the stone, and are not a mere surface colouring, as in scagliola. The completed material takes a fine polish, and many of the specimens are of beautiful colour and marking. Used as a veneer, it is about one-third the price of Nature's marble, and it certainly is worth more attention than most of the ordinary methods of imitation of valuable materials. Mr. White, of Bedford, has some very well-designed woodwork in the shape of mantelpieces, seats, &c., all of them simple in general form but unimpeachable in taste. The London Fireproof Plate Wall Company (which also has an exhibit in the Fire Prevention room) show fireproof partitions consisting of slabs containing vertical chambers. These are made in slabs about 2 ft. square and 3 in. thick, are said to be soundproof, and, as partitions, require no plastering. The catalogue states, "By this system of construction there is no weight on the floor, and a wall can be papered, painted, or distempered within a week from erection." The latter part of the statement we can readily believe, but the "no weight on the floor" we fail to understand. The slabs are very heavy in themselves. Is it supposed that they are put together so as to be self-supporting? If so, the means of doing this are not made obvious. The Wood Carving Company, of Windsor Works, Birmingham, have brought machinery to the assistance of wood-carving in a manner to which there is at any rate far less objection than in the case of the so-called machine carving of which we hear too much nowadays. Machinery is used to rough-out the work, which is then finished by hand. The general flow of the design must of course be limited by the capabilities of machinery, but at all events the finish is not mechanical. There are some pleasing specimens on view.

Among other exhibits connected with decorative objects is that of the Newellite Glass Tile Company, who produce an opal glass tile for which, though very thin, they claim an entire immunity from surface cracking or crazing. The substance of the glass is left as it comes from the furnace. The backing is a rough surface which forms a good key, but the special point claimed for it is that it has an elasticity which gives to any shock or vibration; "there is between the glass tile and the cement which holds it an elastic film which allows either substance to contract or expand independently of the other." This seems ingenious, though we are not much in favour of so very thin a substance as a wall-covering; the cost of Newellite facing to a wall of ordinary stock bricks is said to be 25 per cent. less than that of glazed bricks, and no doubt that will be a consideration in some cases; but on the whole we prefer the glazed bricks. Ripolin paint, which can be used with either a glossy or a flatted surface, is well represented at the stand of "Ripolin, Limited"; it shows some beautiful surfaces of colour and white, and for this also it is claimed that the enamel-looking surface will not crack with any moving or twisting of the material on which the panel is laid. At the stall of "Veronese, Limited," are shown specimens of decorative work in "gypsite," a thin and light material made in pretty large sheets, on which ornament can be embossed

and raised with great sharpness and finish. It is one of the numerous substitutes, in fact, for plaster-work modelled *in situ*, and can be used either for ceilings or walls. In the same compartment is exhibited a very pretty and new form of decoration by the Cloisonné Glass Company. This consists of wire cloissons formed in the usual way, but on a clear sheet of glass as a ground; the spaces are filled in with powdered coloured glass, as the enamel is filled in in ordinary cloisonné, and a second thin sheet of clear glass put over it; it thus forms a coloured glass design protected between two sheets of white glass. It is a new method of treating glass decoratively which seems quite legitimate, and has a good effect.

NOTES.

THE suggestion made by Mr. The Memorial to G. F. Bodley, in a letter to the Queen Victoria.

Times a few days ago, that the proposed monument to the late Queen should be erected in the St. James's Park lake, rising out of the water, and connected with the banks by two bridges, is worth consideration, and shows the feeling for the picturesque in the combination of architecture with water which might be expected from an artist like Mr. Bodley. But he passes over one point which we should have thought would inevitably have occurred to an architect. The St. James's Park lake is an irregularly-shaped piece of water, belonging to the "wriggling" school of ornamental gardening of the earlier part of last century. No satisfactory effect could be got with an architectural monument arising out of such a lake; the lake itself, or the portion contiguous to the monument, would have to be "architecturalised" into a formal and symmetrical shape, say a square or a circle, in order to form a proper architectural combination with the monument. That portion of the lake should be turned into an artificial basin, with stone steps round the edges, and pedestals for urns or sculpture as decorative objects in subordination to the monument. We do not know that we are disposed formally to recommend the adoption of the site in preference to that already suggested; we are only pointing out what should be a necessary condition for its success. If any idea of this kind were entertained, it would perhaps be still better carried out in the centre of the basin near Kensington Palace, which is already formal in shape, and which is on higher and more conspicuous ground.

Condition of Stonehenge.

SIR EDMUND ANTROBUS met at Stonehenge, on the 12th, the representatives of several archaeological societies, to consider the best means of preserving the remains from further injury. Nothing in the way of restoration is to be attempted, but it is proposed in the first instance to raise the large stone which at present leans over what is called the "altar stone," and which is in a rather precarious position. It is also proposed to examine the large stones numbered 6 and 7 on Professor Petrie's plan, with the view of putting them in a better position to support the lintel. Sir E. Antrobus also wishes to obtain permission to divert the roadway which at present passes near the stones, in order to put a wire fence round the monument at a sufficient distance not to interlere with

its effect. We hope he will obtain this permission, as it is of great importance that the stones should be fenced in some manner against the possible depredations of the thoughtless class of visitors. Sir E. Antrobus has engaged Mr. Detmar Blow, the architect who has done so much towards repairing ancient buildings in a conservative manner, as his professional adviser; and under Mr. Blow's superintendence we may feel sure that not a stone will be touched except for necessary repair or security. All who are interested in the conservation of this ancient and mysterious monument, which is a matter of national importance, ought to feel much indebted to Sir E. Antrobus for the wise and public spirit in which he is acting with reference to it.

GOOD fortune has attended New Discoveries Professor Furtwängler in his at Ægina.

expedition to Ægina, where he went to explore the ruins of the Temple of Athene. He has long cherished the hope that more fragments of the famous "Ægina pediments" might be brought to light by a systematic search *in situ*. He left Athens on March 30, and the very first day of digging yielded not only several interesting fragments, but two heads; they were found lying in front of the east pediment, but Professor Furtwängler conjectures that they belong to the west: the conjecture is based, of course, on considerations of style. It is now nearly a century since the "Ægina pediments" were discovered and brought away by Mr. Cockerell. England lost her chance of buying them, and they were secured by the Crown Prince of Bavaria for 20,000 scudi, and ever since have been lodged in the Glyptothek of Munich. Every one will rejoice that to the Munich professor who has done so much for their interpretation should fall the satisfaction of adding to the treasure.

The Royal Courts of Justice.

IN their annual report the General Council of the Bar express regret that no steps have yet been taken to carry into effect the scheme approved some time since by the Office of Works for the improvement of the access from the central hall to the Court corridor. We trust that some member of the Bar will, at the annual meeting next Tuesday, when the report is discussed, suggest that some more vigorous steps be taken to effect this needed improvement than mere expressions of regret. Unless pressure is brought to bear on the Office of Works, improvement will not be undertaken at the Law Courts. A deputation should wait on Mr. Akers-Douglas and attention should be called to the matter in Parliament. There are other points at the Law Courts in regard to which the Council of the Bar should take some action—the intolerable stench and want of air in the court corridors, the absence of artificial heat in the passages out of which the offices open, and the bad lighting throughout the building. We fear the Council of the Bar are inclined to deal too tenderly with the authorities.

Sanitary Warranties.

THE case of De Lasalle v. Guildford, which was decided by the Court of Appeal at the end of last sittings, is likely to become a leading decision. In the first place, it decides

that a statement that the drains of a house are in good order is a warranty, for it is a statement of a fact of which the buyer or lessee is ignorant, and on which the latter is likely to exercise his judgment. The court further decided that such a warranty is collateral to a lease in which no special terms are inserted as to the condition of the drainage of a house, and that it can therefore be put in evidence, and that if it is proved that it is broken, the lessor or vendor is liable for any damages which can be proved to result from this breach. The decision was in many respects one full of legal technicalities, for in the first place, the difference between a warranty and a representation is not very clear to the lay mind. Of course, in every case it has to be ascertained whether a statement is a representation or a warranty. If it is a warranty, its mere breach will carry damages; if it is a representation, it must be shown to be fraudulent. The importance of the decision lies in this, that there is now a considered judgment of the Court of Appeal which is distinctly in favour of the buyer or lessee—in other words, a vendor or lessor is liable if he states that the sanitary state of a house is good and it proves to be bad.

Corrosion of Pipes in Brooklyn.

A PAPER in the "Journal" of the American Institution of Electrical Engineers by Mr. S. Sheldon, on "Electrolytic Corrosion in Brooklyn," gives many data which illustrate the extent of the damage done by leakage currents in the vicinity of electric tramways. Brooklyn spreads over sixty square miles, and is covered with a network of electric tramways, some of which have been in operation since 1892. At certain times of the day 1,100 cars are running, and they require a current of 47,000 amperes. This current returns to the seven central stations mainly by the rails and return "feeders," but in addition the East River and the iron structure of the elevated railway of the Brooklyn Rapid Transit Company are intentionally employed. There are, of course, large stray currents flowing in the water and gas mains. The wrought-iron service pipes of the gas mains have suffered severely. In one block of buildings thirty-eight service pipes were completely destroyed in three years. The Gas Company also complain of an abnormal increase in the leakage of gas, which is now about 14 per cent. of the total output. The lead sheathing of the Telephone Company's cables is pitted and perforated in many places, and the armouring of the mains of the Edison Electric Lighting Company has suffered very severely from electrolytic corrosion. Mr. Sheldon expresses surprise that the cast-iron water mains have been very little affected, and suggests that their exemption is due to the non-conducting silicious compound formed on the surface of the mains in the sand mould in which they were cast. The various companies keep inspectors to measure the difference of electric pressure between the rails and the nearest gas mains. When the leakage current flows from the rails to the mains little harm is done, but when the current is in the reverse direction then trouble ensues. Mr. Sheldon states incidentally that at certain times of the day the difference of pressure between the two ends of Brooklyn Bridge is twenty volts. This paper shows that electrolytic corrosion is very insidious, and many years may elapse before its effects become manifest.

SOME extensive alterations are being made at Boxley Abbey House under the superintendence of, we understand, Mr. H. Bensted, of Maidstone. The house was built, *temp.* Henry VIII., by Sir Thomas Wyatt, the poet, of the neighbouring Allington Castle, after the dissolution of the abbey, of which the yearly revenues were then valued at 219*l.* It stands on the east portion, and opposite the brick-faced piers of the outer stone gateway, of the enclosure, about fifteen acres—which is encompassed with ruins of the wall of the once famous Boxley Abbey whose abbots were summoned to Parliament. To the west, within the wall, is the large granary of the monks, and beyond on the by-road outside the wall are Abbey-gate and the remains of St. Andrew's Chapel. At an investigation of the site of the Abbey church made a few years ago it was found that the high terrace in front of the house embodies portions, with the tracery of two windows *in situ*, of what is believed to be the south aisle. Boxley, the Boseleu of the Domesday survey, three miles distant northwards from Maidstone, stands in the beautiful valley of Mid-Kent, and lies just below the range of chalk hills along whose southern slopes winds the ancient British track—the later "Pilgrims' Way"—marked with its trees of holly, yew, box, and thorn that once formed the principal road from the south-west of England to Sandwich Haven, crossing the Medway at Aylesford. The manor formed one of the 184 manors which Odo, Bishop of Bayeux, held in Kent, and was granted by Richard I. to the band of Cistercian monks whom William d' Ypres, Earl of Kent, had brought thither in 1146 from Clairvaux, in Burgundy. The White monks of St. Mary's Abbey tilled the fruitful soil of the gault and Henry III. gave them a market at Farthings, near the Abbey gate. Whilst resting at Boxley Abbey, in 1321, on his way to Leeds Castle, Edward II. granted the charter to the citizens of London, giving them free choice in their election of Mayor, and it was there that Cardinal Campeggio met Archbishop Warham to discuss the matter of the King's divorce. St. Andrew's Chapel now forms a way-side cottage in the walls of which are preserved some remains of a three-light window, the west and priest's doors, and the stone-work of two squints.

This property, comprising the Castle and 750 acres of land, which was withdrawn after a bid of 40,000*l.* at the Mart a few months ago, has recently been sold. The castle was restored for Captain Kenneth B. Balfour, after the fire of January 26, 1896, from the plans and designs of Mr. R. S. Balfour (see the illustration in our number of May 20, 1899). Branksea, or rather Brownsea, Island was the seat of the late Right Hon. G. A. F. Cavendish Bentinck, who restored the Castle in 1888; after his death Captain Balfour purchased the property (1892). The island, famed for its beds of white clay, lies in the bay between Poole and the Isle of Purbeck; at its east end was built of brick, in 1545, a massive rectangular tower which was shortly afterwards fortified and strengthened with defensive outworks by the Corporation of Poole. In 1576 Queen Elizabeth appointed Sir Christopher Hatton to be castellan. The castle was dismantled in 1722. Some fifty years

afterwards the remains were rehabilitated by Humphrey Sturt, who brought much of the surrounding waste of sand, furze, and heath into cultivation. Fifty years ago, Colonel Waugh, of Campden House, Kensington, bought the island and made extensive additions, including a Tudor front in Portland stone, to the Castle.

Manchester Fire Station Competition.

WE are glad to find that the Corporation have amended the two conditions in this competition to which we took special objection, and which in fact would have prevented any architect of standing from competing. They have substituted the usual architect's commission of 5 per cent. for the 3 per cent. originally offered, and have agreed to appoint a professional assessor. They have not, however, yet done all that a competition committee ought to do in such a case. They retain the objectionable though usual condition that the competition premium should be considered as part of the architect's commission. We have over and over again pointed out the unfairness of this, since the preparation of the competition design is always a work extra to the preparation of the working drawings. The conditions also include the following sentence:—

"No other commission or payment will or shall be made to the architect for or in respect of any extra works or for any extra service out-of-pocket expenses or otherwise whether rendered done or performed before or subsequent to the date of these presents."

This, as far as the meaning of the words goes, appears to include a refusal to pay the architect's travelling expenses (if any), which is mean in itself, and contrary to the requirements of the Institute of Architects. Probably no Corporation would treat a lawyer in that manner; and in fact the legal profession would not submit to it. Again, why is the architect to have no remuneration for his services in connexion with extra work? The extras cannot, by the conditions, be ordered without a resolution of the Committee confirming them; and if they authorise the architect to carry out extra work, they ought to pay him for it. The percentage system of commission may be a bad one, but as long as it exists and is accepted, the architect has the same right to his commission on extra work as on the original contract sum.

CONSTRUCTIONAL STEELWORK AS APPLIED TO BUILDING.*

THE application of constructional steelwork is an extensive subject, divisible under many heads, each of which is ample in itself to form a complete and separate paper, especially as regards the problematic or mathematical considerations, and therefore I purpose avoiding the latter to a considerable extent, with the view of making my remarks somewhat historical, and the deductions therefrom as practical as time will permit.

I will ask you to go back to this time about fifty years ago, back in the nineteenth century, when the whole of the civilised world, I might say, was on the tip-toe of eager expectancy, for on May 1, 1851, the Great Exhibition was to be opened in London by her late most gracious Majesty the Queen and the Prince Consort. It proved a glorious sunny May day when the great festival of labour was inaugurated with immense enthusiasm in the presence of a vast concourse of people, and the first iron and glass building became an accomplished fact, notwithstanding the many pro-

* A paper read by Mr. Archibald D. Dawson, A.M.I.C.E., before the Bristol Society of Architects, March 18.

phetic pessimist spirits, eminent engineers amongst their number, who were quite sure—because they knew—that the first gale of wind, or the first crowd of visitors in the galleries, would assuredly lay the structure in ruins, and thus for ever wreck the ambition of the two great minds which conceived and worked out the idea. Even if it proved capable of standing, and a success, therefore, structurally, it would precipitate our national ruin, as the foreigner would be able to learn all about our machinery, our details of construction, and business methods, and by making use of the information would ultimately cripple and destroy our industries by absolutely driving us out of the world's market.

Events have, however, shown that these destructive prognostications were absolutely fallacious, for the greatest iron and glass structure the world ever saw more than satisfied its constructors. It now stands, as you are aware, re-erected, somewhat modified, at Sydenham, proving beyond doubt that a building of the kind is not only stable and safe, with enormous crowds perambulating the place, but practically indestructible. The Great Exhibition became the pride and glory of the nation as a whole, and especially of every architect and engineer who had an opportunity of seeing and studying its then called extraordinary construction, at once original in conception and in every detail. The late eminent engineer, Robert Stephenson, was so struck with the beauty of the designs when submitted to him by Mr. Paxton that he exclaimed, "Wonderful! worthy of the magnificence of Chatsworth, they are a thousand times better than anything that has been brought before the Commission." Some one of the visitors—probably an architect, for he had an eye to the beautiful—said, on viewing the Exhibition from one of its best aspects, "The eyes tire not, for there is beauty everywhere; the limbs grow not weary, for the mind is occupied; the mind, before enlarged, enlarges; and the heart, if rightly attuned, lifts itself from art and Nature up to Nature's God."

It is not desired, except in the merest outline, nor is it my intention to do so, that I should describe the construction of the Exhibition, although it would be exceedingly interesting and instructive, even nowadays, and you may therefore ask why I allude to it at all—well, if you consider the constructional iron point of view you will readily come to the conclusion that all our present iron and steel framed buildings may be said to have sprung from the Exhibition. Prior to it there were few buildings above the size of a greenhouse constructed wholly or in part of metal, excepting the solitary instance of the house erected by Mr. Paxton in 1848 at Chatsworth for the new plant called the "Victoria Regia," which found its home with the Duke of Devonshire, and even this building could only boast of an iron and glass roof on the ridge and furrow system, which the then King of Saxony, who was visiting Chatsworth at the time, called "a tropical scene with a glass sky."

In 1841 and 1845 there were some iron buildings of from 2,400 ft. to 5,200 ft. super sent out to Mauritius, constructed with cast-iron sills, stanchions, and curbs, with wrought plate sides, and cast-iron roofs, the latter being formed with cast-iron plates between tee irons. The only woodwork used was in the mahogany sashes and doors.

I think we shall be justified in dating the rise of iron and, as a subsequent result, steel framed buildings and American sky-scrappers, which are a more recent development, from the year 1851, for immediately after the Exhibition was found to be a success structurally, iron and glass buildings of almost every kind were designed by architects and engineers, to say nothing of successive Exhibitions which have been put up in various parts of the world. The Great Exhibition was constructed with cast-iron columns, in lengths superimposed, and cast lattice girders, throughout, with little or no wrought-iron below the roof level, and I venture to think that therein lies the secret of the durability of the metal walls. It has, after a century's experience, become a well-established fact that, out of water, no building metals with which architects have to deal resist rust like cast-iron. Other proofs of this feature in cast-iron may be found in the Coalbrookdale Bridge of 100 ft. span, built about 1777, and Wearmouth Bridge, of 230 ft. span, built in 1790, and many other similar structures erected to within the last twenty years.

Since then iron or steel has become more generally used. Brick, or even stone, piers and pilasters seem to occupy too much space in these days, when land is valued at sovereigns laid over its surface. Consequently, for supports generally, and as superseding the old-fashioned oak story posts and corbels, nothing is so easily adaptable as cast iron, as it can be moulded into any and every shape it is possible for an architect to require; and therefore even now, with all our modern steel applications, I think we ought not to give up our cast work altogether, as we are in a fair way of doing.

Perhaps the usual method of erecting tiers of columns for several stories by means of simply bolting their flanges together is not altogether satisfactory, as the stability entirely depends upon the resistance of the bolts to shear, and the abutment afforded by the several floors; moreover, in the case of a big fire, water gets through the core holes and joints, and frequently causes greater destruction to the columns than the action of the flames. To prevent this possibility nothing surpasses the use of spigot and socket turned and bored joints, through which neither air nor water can get into the inside of the barrel or shaft. In all my important work I adopt this method of jointing. The girders can be carried, as usual, upon gusseted brackets, and each upper floor can be erected and completed independently of the lower, which is not always the case when flanges are used. I am at present engaged on a building where the architect prefers bolted flanges, and places the floor girders upon the flange of the upper column, so that two tiers of columns must be erected before a floor of girders can be fixed. I certainly fail to see any constructive advantage in adopting such a system, but a considerable amount of inconvenience and delay. Of course cast stanchions cannot be dealt with in the manner I have described for columns, they can only be flange jointed on each or alternate floors, according as they are one or more stories in height.

As wood beams have gone out of use the intermediate box or hollow block connecting the upper and lower columns or box ends to the columns themselves have to some extent been given up, but not altogether, for not withstanding the introduction of steel or iron girders, which are of much less bulk than wood beams, these boxes are frequently still used, and I am often surprised at the inefficiency of the flange cheeks and gussets, as generally cast; they often fracture, and bring the weight upon the girder, and so remain sometimes for years undiscovered, creating a risk, the result of which might be terribly disastrous. This is not supposition merely; I have met with numerous cases, and I have also one at present under my notice, where all the floors and roof have had to be shored up five stories, so that the broken bases may be taken out and new ones of a more modern construction put in. The better plan is to bolt all girders through their flanges upon good gusseted brackets, and to web cleats or brackets, leaving the columns to stand as one unbroken tier from top to bottom.

Nowadays, when the fire question is such a serious one, it is often desirable to case the cast supports to render them, perhaps not fire-proof, but fire-resisting, and I think there is no better protection than a good coat of fine concrete, not coke breeze. Some long columns and stanchions which were so cased ten to fifteen years ago are still absolutely sound from top to bottom. But, of course, if casing is adopted, it is absolutely necessary to cast the columns or stanchions with bevelled grooves or fillets to hold the casing materials, something like the two examples on the table. I cannot help thinking that much of the composition lagging and casing with which supports are often covered will prove delusive in a great fire, as many of them which have been tested within my knowledge gave strong evidence that the casing was quite free of the casting inside, and therefore liable to come off under the action of fire and water.

As the oak post was displaced by the cast support, so is the cast support now rapidly being superseded by the steel column or stanchion, which, constructively, may be termed quite a modern invention, which has worked in a very short period an enormous revolution in building construction all over the world, and perhaps more especially in America.

I think the whole secret lies in the fact that by means of rivetted work, so easy a thing

now with steel joists rolled almost any length—60 ft. not being a limit—it is possible to make up stanchions in very great lengths in one piece, which would be impossible in cast iron, so that when erected two, three, or four girders in height, the girders can be put in place and several floors become ready for flooring, so that a considerable time may be saved to the builder. I have recently constructed a number of steel stanchions, 80 ft. and 82 ft. long, in one length, having brackets and gussets rivetted on at the several levels for sills, cornices, floor girders, and roof ties, so that it was possible to roof the place in before the building had reached the second floor; this was actually done in one instance.

The calculations for and the construction of steel stanchions require much greater care and consideration than for cast columns, because, in the ordinary way, the architect would have his column or stanchion table at hand, but in the case of steel stanchions each has to be treated on its own merit, and the variety of sections available for stanchions being so considerable, it would be almost impossible to compile a complete table. Buildings are not put up to suit the stanchions, but the stanchions must be made to suit the buildings. Hence, in constructing stanchions it is first necessary to determine what length each segment shall be and what strutting is available, especially in the direction of the narrowest width, and so on, for the total length and number of floors; for instance, if there is a five-story building requiring stanchions, with 10 tons of roof, 20 tons on each of the two floors, then 25 tons and 30 tons on the two remaining, giving a total of 105 tons on the bottom length, it would be well to make the bottom length of stanchion for three floors, starting with a 50-ton top load, having an additional 25 tons probably 12 ft. lower down, and 30 tons 15 ft. still lower down (illustration No. 2), the section would necessarily vary in each height, according to the load, the proportion of width to depth, and the value of the strutting.

Whenever possible, it is an excellent plan to use one section of joist from top to bottom, and get additional strength by means of plating; it facilitates construction and ensures a greater uniformity than if each floor had its independent jointed-up stanchion. The economical ratio for an unstrutted stanchion should range between 30 and 40, which gives 12 in. for the least width of a 40-ft. length, and 16 in. for a 50-ft.

The form of a stanchion is stronger as it approaches equality in width and depth; hence it is a great mistake to insist upon very narrow stanchions, although deep. Of course, the same rule applied to cast stanchions, but a great deal of stiffness was got out of an abundance of metal, which it was easy to obtain, while in steel the amount of metal is limited to thickness, and should be reduced to the proper minimum by exact calculation.

Generally, the following well-known formula will apply to single-loaded stanchions with carefully-bedded ends:—

- b. Breaking weight per inch of section.
 - r. Ratio of length to least diameter.
 - C. Constant for the material and section used.
 - c. Approximate crushing unit-strength of material.
- $$b = \frac{C}{r \times C^2} \text{ for a rolled joist stanchion 20 ft. long}$$
- $$12 \text{ in. by } 6 \text{ in.}$$

$$b = \frac{28}{40 \times 40} = \frac{28}{1600} = \frac{28}{1600} = \frac{28}{1045} = 10.94$$

breaking weight per inch of area.

Then s safe working load.

$$a \text{ area of section, which for a } 12 \text{ in. by } 6 \text{ in.} = 14.4 \text{ in.}^2$$

$$f \text{ factor of safety.}$$

This factor is obtained from tests upon various sections, and is usually expressed $\frac{r}{4} \times \frac{a}{20}$; as the ratio for a 12 in. by 6 in. beam is

$$40, \text{ then } f \text{ is } 4 \times \frac{10}{20} = 6 \therefore s = \frac{b \times a}{f} = \frac{10.94 \times 14.4}{6} = 26.2 \text{ T safe load, which agrees}$$

exactly with some of the tables.

In dealing with rivetted work due allowance must be made in the area for all holes which exist in the same plane or sectional line. I do not say that the mere rivetting on of a bracket with two or three rivets is a very material matter, but in the case of a box section it is quite possible to lose as much as $\frac{1}{4}$ in. of the area, depending upon the number of plates employed and the section adopted.

It should be remembered that the value of b in the formula above depends entirely upon the sectional form of the stanchion. The Phoenix form gives the greatest value and the box form the next. The variation is in the constant C , which runs between 900 and 2,480. The bedding of stanchions is a very important matter, and should be most carefully carried out, otherwise all the value of scientifically worked-out stanchions will be entirely nullified.

Depending on the value of steel, a 10 in. by $\frac{1}{4}$ in. joist on 20 ft. would carry 9½ tons, but a 10 in. by 5 in. would carry 13 tons, and a 10 in. by 6 in. 2½ tons; the increase is not derived so much from the additional metal as from the widening flanges, there being only 2½ lbs. per foot in the 10 in. by 5 in. over the 10 in. by $\frac{1}{4}$ in., and 12 lbs. in the 10 in. by 6 in. over the 10 in. by 5 in., the areas being 7.64, 8.58, and 11.01 respectively, and which indicates a safe working load of 1.24 tons per square inch of area for the 10 in. by $\frac{1}{4}$ in., 1.55 for the 10 in. by 5 in., and 2.06 for the 10 in. by 6 in., which appears very little indeed until you consider that the proportion of height to least width is 53:48 and 40. The effect of reducing this proportion will be readily seen by taking a length of, say, 10 ft., a more workable one for such sections, then the 10 in. by $\frac{1}{4}$ in. will carry 26.7 tons, the 10 in. by 5 in., 30.4 tons, and the 10 in. by 6 in., 48 tons, indicating a working load per square inch of 3.5, 3.62, and 4.03; the factor of safety in all cases is taken at one-fourth to one-sixth of the ultimate.

Practically there is no limit to the sections, which may be compounded out of joists and channels, plates, and angles. A sufficient variety exists to meet every possible requirement of the architect, besides which there are special sections, notably what are called Phoenix sections, consisting of segmental pieces, four or six to form the circle, and rivetted together as illustration No. 3; these sections give considerable result under actual test. A column 28 ft. long, having a ratio of 42 in length to diameter, gave a breaking weight of 16 tons per square inch, but at a ratio of 10 to the breaking weight was increased 18 tons per square inch. These sections are used to a great extent in America for diagonal and vertical bracing, and also in some forms of bridge work, but these and similar sections are only obtainable if a quantity is required, as they are not stocked. These sections are, however, from their shape very awkward to deal with if there are side girders to connect, and superimposed or continuous lengths.

Wherever long lengths of stanchions are used great care is necessary to ensure proper strutting by the girders, especially if the load is not calculated upon the total length, as the stanchion will depend upon strutting for effectiveness and rigidity. Angular bracing also is desirable wherever possible, so as to prevent any tendency to rack, but where bracing is not convenient, long single or double six-holed cleats and bolting should be allowed for all joints between girders and stanchions. Another method of ensuring good strutting and connexions, and at the same time shorter stanchions, is by running the girders of each alternate floor in between the stanchions and bolting up and down to each. In this case, of course, care must be taken to give sufficient strength in the girder ends to transmit the load through (illustrations were shown from work which was recently carried out). Where girders run all round a building of stanchions they should be properly mitred or jogged at the four angles, bolted together, and fishplated end to end, so as to form a complete platform upon which to start the upper walls and next tier of stanchions. Where it is impossible or inconvenient to deal with very long lengths of continuous stanchions, and side girder bearings are not objectionable, the continuity can be effected in a very satisfactory manner by adopting the fishplated joints, having all abutting ends machined and rivetted up *in situ*, as illustrations Nos. 3 and 4. This method avoids all cap and base joints, but, as I have before said, the strutting and bracing must not be lost sight of, not on account of any inherent weakness, but to maintain in equilibrium what may be perfectly correct both in calculation and construction and against contingencies, say, for instance, a settlement or other unforeseen circumstances.

In this country we have not gone to the same extent as the Americans in erecting lofty buildings, and I sincerely trust we never shall, but

HOUSE AT CROWBOROUGH, SUSSEX: THE

INK-PHOTO. SPRAGUE & CO. LTD. 4 & 5, EAST HARDING STREET, FETTER LANE, E.C.

DINING-ROOM.—MR. M. H. BAILLIE SCOTT, ARCHITECT.

we may do well to follow them to some extent in constructing steel "cages," so that the weight is not carried by the walling at all, but entirely by the steel work, which should be substantially cased all round and built up between, as, judging from recent disasters in America, I think that the risk of a veneered building in case of a great fire is very considerable indeed, and that there will be many more instances of total destruction and serious loss of life in time to come. A mere veneering of marble, stone, or brickwork is wholly insufficient to protect the steel work from fire.

During the last three or four years solid rolled steel columns have been introduced, and they are doubtless in some instances of considerable value if not treated as continuous, because the connexions for change of diameter, and which at the same time have to carry the floor girders, are very unsatisfactory. I have tried them with several forms of bearing joints, and, not considering them sufficiently rigid in fires, have abandoned them in that formation. For single columns to carry isolated weights they are useful, as occupying very little room.

Before leaving stanchions I might mention the present approximate costs of carrying, say, 100 tons on a 14 ft. high support:—

Best stock brickwork in cement 3 ft. 4 1/2 in. by 3 ft. 4 1/2 in. and template	£15 17 6
Blue-black brickwork in cement 2 ft. 7 1/2 in. by 2 ft. 7 1/2 in. and template ...	12 14 0
Cast column, 10 in. dia. by 1 1/2 in. metal ...	0 15 0
Steel column, 7 in. dia. by 1 1/2 in. metal ...	17 15 0
Steel stanchion 8 1/2 in. by 9 in.	7 18 0

It is assumed that the footings would be practically the same in each case. From this table it will be seen that a steel column occupies the least floor space, but that the steel stanchion is the cheaper construction.

One drawback to the stanchion, if cased circular, as a column, is that it would scarcely finish under 14 in. in diameter. Except in fire-resisting buildings or for decorative purposes, it is very seldom that steel stanchions need to be cased, and where for appearance or convenience in certain businesses a circular form is preferred to the rectangular, with its edges and angles, and where casing is undesirable, the cast column still stands of undoubted service.

The modern use of iron and steel for constructional purposes has entirely revolutionised the art of building, and perhaps in no department so much as that in which girders play so important a part. In the early days experimental researches and calculations for cast girders were carried to a very considerable extent of minuteness by Tredgold, Hodgkinson, Fairbairn, and others. I think the study of Tredgold's practical essay most interesting, as well as instructive, and eminently useful. But prior to their day cast-iron beams, as they were usually termed, were first used in cotton-mills near Manchester about 1801. Messrs. Boulton & Watts were the architects. Watts was the celebrated man of that name, and, so far as I can discover, must have been the inventor of cast beams. These served their purpose and day admirably, but now they are looked upon as being needlessly heavy, frequently a source of great delay, and expensive in production, carriage, and fixing, when compared with rolled steel joists, or in some instances riveted plate girders. Moreover, cast beams are a somewhat uncertain article, subject to all kinds of chance misfortunes in moulding and cooling, and from destruction by sudden impact, owing to undiscoversable defects. Many serious accidents have, as you are doubtless aware, occurred through their failure. The only remedy against disaster is by testing every individual beam, and not to rest content with testing one or two of a set. I always test those I use by hydraulic press and gauge, and have occasionally found a beam to fail from some inherent defect in the casting, while the metal itself proved to be fully up to specification. Nevertheless, no kind of girder is so suited for damp basements and similar situations, or as proof against atmospheric changes, as the cast iron, for it has by this time been satisfactorily proved that neither wrought iron nor steel, whether in the form of rolled joists or built girders, will resist rust arising from atmospheric changes, acid, smoke, or steam. It is only needful to look at the state of the girders and columns on some of the London railways to discover what havoc is being made with the steel and wrought iron work, while cast girders and bridges put up 100 years ago are scarcely pitted in the skin or outer surface.

The Liverpool Overhead Railway is another instance of the difficulty in preventing, or rather avoiding, the possibilities of rust in the outdoor steel work. The engineer states that there are 80 acres of steel surface to be protected, out of which 60 acres are black varnished, and the remaining 20 acres are painted with an oxide preparation. The painting has to be regularly carried out every two years. I have quite recently used cast girders in deep sub-basement strong-rooms in preference to wrought or steel, and as a further precaution they were cased all round and over the projecting flanges with concrete. Most of the spans were 24 ft. and 27 ft., and the ordinary fish-bellied form was adopted as the most economical, made of a metal to stand 9 tons per square inch tensile, and to safely take 6 to 7 tons per square inch in compression.

It should be understood that I am only referring to cast girders for certain purposes in buildings, and not for bridges or other structures subject to heavy moving or rolling loads, as of late years many of the railways have taken down their cast bridges, replacing them with steel, not on account of rust, but their inability to stand the present heavy traffic.

Rolled iron joists were first made in 1849 by the Providence Works in Belgium; the invention, which was patented by them, was wholly theirs. The same works introduced the manufacture into France in 1850. No section of the kind has been made in England, and the first rolled joists used in this country were produced by the works just named, but I believe that soon after the invention was seen to be of so great a value, the Butterley Works, near Derby, laid down a plant and commenced rolling to a limited extent. In 1851 Fox and Barrett began to give up the use of cast-iron girders for their fireproof floors, and introduced rolled iron joists in their place, but it was not until 1865 and 1866 that the architectural profession took up rolled joists in a general way.

I may say in passing that the *Builder* had been about that time, and for several previous years, a strong advocate for the extended production of "rolled beams"; the late Mr. Godwin readily grasped the fact that there was a great future for their use.

On September 21, 1865, Mr. Zerah Colborn tested five rolled iron joists, and wrote such a favourable report upon the extraordinary and most unexpected resisting power of the beams, that architects thenceforward felt perfectly safe in adopting the working tables that were shortly after published, and based upon actual tests. Thus another invention gave a further and enormous impetus to the use of metal by architects in their buildings, because, not only are rolled joists pre-eminently suited for girders called "compound girders," to distinguish them from rivetted plate girders, but their use for lintels, floor beams, and even for roof rafters and stanchions is almost unlimited.

Without advertising any particular manufacturers, I may say that so far as my experience of some thirty-two years goes, there is no difficulty in obtaining good joists to a given specification either from the Continent or America. It is often asserted that any English joist is good because it is English; well, that is rather far from the fact. I have no preference for foreign manufactures; for my own work I use both English and foreign, as either best suits my requirements as to strength, section, expedition, and my client's or employer's pockets. Architects have been frequently misled by grossly exaggerated and inaccurate reports as to the foreign joists being so very inferior to English as to be untrustworthy. Of course, it must be admitted that large quantities of low-test steel joists, or what some people misname "builders' joists," are produced, which answer their purpose very well for ordinary domestic work, but for important buildings good medium test joists are equally obtainable.

One fact is sometimes overlooked when comparing the ordinary with the good joist, that from a point of strength they are equal practically, because the low test joist has so much more area of metal with which to do the work than the high test joist; the same reasoning would apply in determining the area of any girder, for instance—presuming you have a flange stress of 100 tons to provide for, and are content with a steel of 25 tons tensile value at one-fourth of the ultimate, you would require 16 in. of area, but if a steel at 30 tons was desirable you would only require 13.3 in. at the same factor of safety; then it becomes a

question of facility in obtaining the material and the cost.

There are three ranges of tests submitted by steel joist makers, viz.,—25 to 29 tons per square inch, 26 to 30, and 28 to 32 tons per square inch. After some experience in the use of all three, I have come to the conclusion that for important architectural works an average of 28 tons per square inch is quite high enough. If a test is exacted above this there is great risk of uncertainty and shortness, besides which the joist is frequently unworkable. The following tables give the result of some tests which have been made upon English steel joists rolled in January, and from which I have specified. The sizes range from 6 in. by 3 in. to 15 in. by 6 in. There were thirteen samples, all basic Bessemer.

The highest result was 31.04 tons.

" average " 29.73 tons.

" lowest " 28.9 tons.

" elongation 25.5 tons, but some of the

pieces were 10 in. by 6 1/2 in. long.

Ten of these joists were afterwards tested in lengths, and gave the following results:—

Section.	Span.	Load centre.	Deflection.	Permanence under test.
16 in. X 6 in. X 61 lb.	26 ft.	12 1/2	7 1/2	nil.
do.	do.	12 1/2	7 1/2	nil.
14 in. X 6 in. X 55 lb.	12 ft. 9 in.	6 1/2	23 1/2	nil.
do.	do.	6 1/2	23 1/2	nil.
do.	do.	20 0	37 1/2	nil.
do.	do.	20 0	37 1/2	nil.
12 in. X 6 in. X 32 lb.	20 ft.	11 1/2	22 1/2	nil.
do.	do.	11 1/2	22 1/2	nil.
12 in. X 5 in. X 36 lb.	20 ft.	11 1/2	18 1/2	nil.
do.	do.	11 1/2	18 1/2	16 in. bare

The loads marked with an asterisk denote the central safe loads indicated in the makers' book.

Another series of tests for specified joists, flats, tees, angles, and channels, produced by the Siemens' basic open-hearth process, gave the following results:—

20 tests on channels	highest	30.3
	average	28.6
	lowest	27.0
23 " rolled joists	highest	30.8
	average	28.9
	lowest	27.3
21 " angles	highest	31.0
	average	28.8
	lowest	27.5
23 " girder flats	highest	30.6
	average	29.3
	lowest	27.9
19 " tees	highest	31.2
	average	29.1
	lowest	27.6

The elongation on 8 in. averaged 29 per cent. and on the 10 in. " 25 per cent.

In consequence of a joist proving defective during working up I had it tested, with the following results:—

Ultimate breaking 32.56, an extremely high point; the length of test piece was 8 in., the elongation 25 per cent., and the contraction 48.9. The fracture was silky.

This being somewhat surprising I determined to have some drillings taken from the joist, and subjected to a chemical analysis, and which gave:—

Carbon	23
Phosphorous	69
Manganese	77
Sulphur	648

which is fairly satisfactory. The cold shortness arises possibly from a little excess of phosphorous, which should not exceed .06, and a rather high carbon, which always tends to invite atmospheric disturbance.

In one other doubtful case a foreign joist gave 30.3 ultimate with an elongation of 26.8, and contraction of 51.4, so that it seems there are instances when failure does arise although tests are up to specification.

Recent tests I have had on foreign steel joists and channels came out as follows:—

14 channels, highest	30.16
" average	28.95
" lowest	27.74
" elongation	27.1
" contraction	50.35
8 joists, highest	30.54
" average	28.99
" elongation	27.7
" contraction	50.93

If these results are compared with the first English table quoted just now it will be found

that the difference is scarcely expressible. The English is:—

Highest.....	0.65	above.
Average.....	0.74	"
Lowest.....	0.64	"

In the second table the foreign compares even more favourably.

In selecting joists the first thing to determine is whether one-third or one-fourth of the ultimate is to be adopted, then adopt about one-twenty-fourth of the span for depth of narrow flange joists, so that on 15 ft. the depth should be 8 in. For wide flange joists it is safe to work on one-twentieth to one-thirtieth of the span, hence a 12 in. by 6 in. or 12 in. by 6½ in. joist would carry its table load on 30 ft. At the same time it is impossible to have any rigid sort of rule; there are a hundred necessities of construction which drive an architect away from all hard and fast lines. A good proportioned joist is said to have its flange half its depth, and this works out very well up to the 12 in. or 14 in. sections, then the proportion goes altogether, because above 14 in. and up to 20 in. section the greatest width is only 7½ in. Another suggested proportion is of flange width to span, say one-twentieth to one-fortieth, which when taken with the previous depth proportion works out very badly, thus for a joist 35 ft. span at one-fortieth a flange would be needed 10½ in. wide, and the depth at one-twentieth would be 21 in. deep, a joist 20 in. by 10½ in. So much for some of the theory. In practice it is found that any of the deep section from 14 in. to 20 in. will carry their table load on 35 ft. without lateral movement. Seeing the impossibility of architects designing their own joists, they must necessarily use some approved standard make, but when rivetted girders, either compound or plate and angle, are needed, then the architect has some chance of designing as he chooses.

So far as construction goes, there is little in connexion with joists to remark upon, except, perhaps, as regards connections. The notched joggle is only suitable for light work. The forged set-up joggle is the most approved method for good work. The size of connecting cleats and number of bolts, of course, depend on the sections connecting; up to 12 in. deep two bolts high are usually sufficient, then three or four up to the 20 in. depth. The question of single or double cleating depends upon whether the loading is ordinary or heavy, and subject to movement. The greatest difficulty, I think, architects experience is in the want of a uniform "standard" for steel joists; especially in the case of competition is this useful, otherwise a competition becomes one only in name, and depends more or less upon the opinions and ideas as to what is "near enough" by the respective makers, entirely apart from recognised professional intelligence.

Just now I mentioned compound girders. These originated from the rolled joist. The pioneers of this invention were not long in finding out that joists would combine with plates and make very excellent girders at a less cost than rivetted plate and angle, and be equally effective. In 1866 Mr. Kirkaldy carried out, before a large assembly of architects, at which I was also present, a series of experiments upon some compound girders. These experiments determined the constants of the calculated tables which were published for this form of girder in the same way in which Mr. Fairbairn's values of 60, 70, and 80 for rivetted plate girders have become constants for his particular sections. Two examples will suffice to illustrate the results. The first was an 8 in. by 2½ in. iron joist—a very poor section—having a 6 in. by ½ in. top flange rivetted on; the weight of the section was 22 lbs. per foot, the span 20 ft.; with four tons on the centre there was no perceptible set; a load of five tons gave a deflection of ⅜ in.; at seven tons set increased to 4 in., but there was no fracture. Taking the area of the last flange at 1 in. we have:—

$$C = \frac{WL}{ad} = \frac{7 \times 240}{1 \times 8} = \frac{1860}{8} = 210$$

which latter figures become the constant in the formula:—

$$W = \frac{adC}{L}$$

The other girder consisted of two 8 in. by 2½ in. joists with a top flange 8 in. by ½ in.; 40 lbs. per foot, and 20 ft. long; 10 tons applied to the centre gave the slightest set; at 16 tons the register indicated ½ in.; and at 20 tons

signs of fracture appeared under the top flange.

The constant from the formula $C = \frac{WL}{SD}$ came out at 300, thus:—

$$\frac{20 \times 240}{1 \times 26} = \frac{4800}{26} = 300$$

So here we have a constant of 210 against 60 for single web rivetted plate girders, and 300 against 76 for a box girder. Of course, no abstruse calculation can possibly upset these results, astonishing as they may appear. As Mr. Kirkaldy says, "Facts, not opinions." The *Builder* of March 3, 1866, has an interesting report on the subject, and most of the leading papers of that week highly commended the new girder. Since Fairbairn's renowned girder no such important invention applicable to constructive arts has been brought out.

As compounds of multitudinous forms were originally composed of iron, so now are they of steel, giving a corresponding greater strength. I do not suppose any of us present at those experiments ever thought that such an enormous and world-wide use of compound girders, as we now find them to have obtained, was possible, side by side with rivetted plate sections. During my practice I have used this form of girder very successfully up to loads of 210 tons on 37 ft. As a rule, they are cheaper to make than plate and angle sections, and undoubtedly stiffer, having fewer parts and involving less rivetting. A double plate-box compound girder has four parts, whereas a plate and angle girder has eight parts; a 20-ft. section of the former needs 240 holes to rivet it together, and the latter 960 holes, involving 120 and 480 rivets respectively. The rivets in such a compound girder are usually of 8 in. pitch, whereas a plate and angle girder requires them to be not more than 4 in. pitch. I seldom adopt a 6-in. pitch for compounds unless they have more than three plates, as from a considerable number of tests I have made it is very evident that up to three plates an 8-in. pitch is ample.

Although next to cast iron in invention, I have reserved my remarks upon rivetted plate girders—which have been incidentally mentioned—so as to follow "compounds." An iron rivetted single web plate and angle girder was patented by Fielder & Baker in 1847 (illustration shown). It was proved to 150 tons on the centre and gave an inch deflection. In the same year it appears that Mr. Fairbairn also patented "hollow-box girders," a section which he formulated in 1846, but I cannot find any reliable information as to its exact form, nor of any lists on such a beam being carried out, although the section was undoubtedly the origin of the Britannia Bridge. These forms of girders have become perhaps the most important item in building and engineering works where timber is incapable of carrying the heavy loads which confront an architect in these days, when people will have big spans and few supports. The two most noted girder structures erected during the past fifty years are the Britannia Bridge over the Menai Straits, wholly of iron (it was opened in 1850), the greatest span of which is 460 ft., each girder weighing 1,600 tons; and the reconstructed Tay Bridge, which is wholly of steel, containing 51,000 tons and 6½ millions of rivets.

The single and double web rivetted plate and angle girders—I wish there was a short name for them—are the forms we are most familiar with. The only new feature in connexion with them arises from the use of steel having almost entirely replaced iron, thus bringing into use a new value per square inch. The four or five tons of the good old days for a working safe load, with iron of 16 tons to 20 tons tensile strain, or even Low-moor of 22 tons, are probably gone for ever, seeing that steel may be so readily obtained for the best girder work, equal to a safe load of 7 tons and more per square inch at one-fourth of the ultimate. Rivetted plate girders require the greatest care to skilfully design. Although theory is not always convenient to carry out with exactitude, yet all the parts of a girder should be theoretically calculated by graphics or mathematics, and (unless there are large quantities of sections required, warranting special rolling to sixteenths of thickness) the nearest size usually to be obtained, not less than the theoretical, should be adopted in execution; this condition greatly affects both cost and time for delivery. There should be no excess of metal in one part over another; there must be a perfect balance

of resistance to all the strains imposed by the load to ensure an economical girder. Depth is always a trouble to the architect, who is greatly hampered in this respect when designing girders; he wants all the head room possible. While a deep girder is cheaper, it may be considerably in the way, and it will cost a little more to case. On the other hand, a shallow girder is more costly, but there is less casing involved, and so oftentimes the extra cost is cheerfully endured.

Take a not very imaginary case of an internal cross wall carrying, say, the half of all the floors up and the roof: load, 80 tons; span, 30 ft. Engineers generally say that a twelfth to a sixteenth of the span is a proper proportion; this is a wide range, and there seems no absolute reason for it, except that a girder may be theoretically strong enough, while not in itself able to stand; on the other hand, it may be so shallow that it would defect of its own weight, although theoretically strong enough.

When not tied to depth I have generally for heavy loads adopted such a section as that the tons stress in the flange equals the load to be carried; this involves a deep girder, but usually a sufficiently stiff one, and at the same time it is economical. First, taking the above figures and applying Fairbairn's formula $\frac{WL}{SD}$ we get depth at one-twelfth of the span = 2½ ft. $\frac{40 \times 30}{4 \times 25} = \frac{1200}{10} = 120$ tons stress in the flange. If 28 ton steel is used at a quarter of the ultimate, $\frac{120}{7} = 174$ square inches will be required in the flanges, plus the loss for holes.

At one-sixteenth of the span = 186 ft. depth $\frac{10 \times 30}{1 \times 186} = \frac{300}{186} = 161$ tons stress

then $\frac{161}{7} = 23$ square inches, an excess of nearly 6 in. over the one-twelfth result.

Now by adopting the equality method the flange becomes considerably less, thus:—

Depth 3½ ft., or about one-ninth of the span, then $\frac{10 \times 30}{1 \times 35} = \frac{300}{35} = 80$ tons, which agrees

with the load, and the area required is $\frac{80}{7} =$

1143 square inches. The least depth, just determined at one-sixteenth of the span, is 186, say 1 ft. 10 in. on 30 ft., but I constantly meet with strenuous objections to such a depth, and am frequently obliged to reduce it to 1 ft. 6 in., which, with an 11 in. joist foot, would give a 9 in. projection below the ceiling. The result at this reduced depth is as follows:—

$\frac{10 \times 30}{1 \times 15} = \frac{300}{15} = 200$

then $\frac{200}{7} = 2857$ square inches. The present

approximate cost of a 30 ft. span girder would be:—

	£	s.	d.
For ⅓ of the span ...	31	7	8
For ¼ of the span ...	37	19	2
For the equality method ...	28	18	2
And for the 18 in. deep section	39	11	5

These examples prove the axiom that a deep girder is the most economical, but I think it is not possible practically, except under very unusual spans and loads, to adopt a deeper section than that arising from the equality method; as for small loads the girder, while theoretically strong, would not even be self-supporting. To illustrate this, suppose a 6 ft. depth was taken for the girder under consideration, the area required would only be 714 in., thus:—

$$\frac{10 \times 5}{1 \times 1} = \frac{50}{1} = 714$$

for which, after providing for rivet holes, two 3 in. by 3 in. by ½ in. angles and one 12 in. by ½ in. plate would be sufficient; but, by reason of its stiffness, it would scarcely maintain lateral stiffness; hence such girders are only suitable for use in strutted pairs, say for a footbridge or bridge-way. This depth of 6 ft., or one-fifth of the span, is not at all unusual or unreasonable, more particularly if the practice of American engineers may be cited; it is not uncommon for them to adopt one-sixth or one-seventh of the span as economical working. It may be considered that 7 is a rather high stress for safety for steel, seeing that the Board of Trade some years ago fixed 6½ tons per

square inch as the maximum for railway work; but, as I have previously shown by test results, with a uniform steel at 28 tons a quarter, or 7 tons per square inch is quite safe. Of course, if the steel is less than 28 the factor of safety must come down in proportion.

There is no difficulty in dealing with any evenly distributed load, but when there are concentrated loads and loads at various points—for instance, a division wall coming in at the centre of a main front girder, and loads also brought thereon by stout mullions or small piers—each load should be worked out separately to obtain an accurate result. It is most unwise to be content with a "rule of thumb" method, and especially so when heavy loads at various points have to be dealt with.

It would be impossible in a single paper to quote formulæ even for the more usual cases which arise, but with regard to central loads I may remind you that every ton so placed is equivalent to two tons distributed, and practically a dead centre load is bad for a girder. Where the flanges require more than one plate it is economy to shorten the remaining number to suit the varying flange stress, although, perhaps, in the case of two plates only it may cost nearly as much to bed up the thickness as the extra length of plate is worth; it is, therefore, entirely a matter within the architect's discretion, and apart from the necessities of construction.

The use of steel has considerably reduced the number of thicknesses of plates required in girded work, and so to some extent the cost of manufacture, transit, and fixing; for instance, a girder requiring a flange area of 50 in. in iron, involving the use of six 14 in. by ½ in. plates and two 4½ in. by ½ in. angles, would only require in steel four 14 in. by ½ in. and two 4½ in. angles. In light iron girders ½ in. thick webs were generally sufficient for ordinary girders when properly stiffened, but it is hardly economical or good practice to adopt less than a ½ in. web because of using steel, as the additional stiffening required would bring up the cost to more than if the ½ in. webs were adopted. The sectional area of the web required at 10 ft. from the centre is thus:—

$$a = \frac{w \cdot x \cdot y}{t} = 66 \text{ tons per foot of loading.}$$

$$\begin{aligned} 3 &= 10 \text{ ft. from centre.} \\ 5 &= \text{Safe load per square inch.} \\ \frac{66 \times 10}{7} &= 38 \text{ per square inch.} \\ \frac{38}{14} &= 27 \end{aligned}$$

14 is the height of the web in inches between the flanges, 27, or say ¼ in., is the theoretical thickness. But on looking at the section it will be manifest that so thin a web for such a height will require considerable stiffening (notwithstanding the angles) by means either of packed stiffeners, as shown by red lines, or with bracket stiffeners, as shown by blue lines, Nos. 8 and 9.

I seldom use a web less than ¼ in. thick except for very light work. A ¼ in. web requires less stiffening, and affords a greater chance of uniformity throughout; there are no changes of thickness. A sufficient metal is provided in the ends for shear without additional stiffeners. Moreover, now that it is possible to obtain flats up to 40 ft. long without much delay or serious expense, uniformity of web enables some of the longest girders to be constructed with one flat, which is a very great consideration, not only as regards workmanship, but effectiveness of the girders. Similarly, the angles and flats forming the flanges may be in one length, so that a girder of large dimensions may be constructed without a single cover plate or angle cover anywhere in its length. Girders thus made up will give a high result under actual test. I have had no opportunity myself of testing very large girders, but I have many ordinary ones, say up to 200 tons, and have found a considerable approach to the results already mentioned, as derived from the compound sections.

All steel beams have a perceptible deflection under their full load, unless, of course, they are clumsily and extravagantly designed. Some specifications stipulate that there shall be no deflection whatever; this is absurd, for, in addition to other tests, deflection should be specified at the usual limit of a good girder, not exceeding ¼ in. to each foot of span. A relatively shallow girder, even if strong enough, will always have a greater tendency

to deflect than a deeper one; hence depth is so important a factor in design. With regard to rivets in constructional plate and angle girder work, generally speaking a 4-in. pitch is the most efficient, but sometimes when there are an unusual number of plates or joints to be secured a 3-in. pitch is desirable. A great deal depends upon whether the holes are punched, broached, or wholly drilled. All rivets should be of mild steel, and specified to stand 24 tons to 28 tons per square inch, to double bend hot or cold without fracture, and to stand the head being hammered out when red hot to three times the diameter of the rod without splitting. Some rivets which I have had tested recently gave the following results (Tables 1 and 2):—

Rivets ¾-in. diameter, 3½-in. long (under head).

Original.		Ultimate Stress.		Fractured.			Stress per sq. inch of Fractured Area.		
Diameter.	Area.	Total.	Per sq. inch of original area.		Dia.	Area.		Difference.

Table 3.

As an instance of the vagaries of steel manufacture, I may mention that last month amongst some steel plates, all rolled at the same time and which were specified at about 30 tons tensile, we found one, a 14 in. by ¾ in., which worked very badly, and upon testing it the reason was apparent, as above (Table 3).

Instead of a contraction of 12.8 and an elongation of 11.6 there should have been about 45 and 22 respectively on 10 in.

In addition to tensile elongation and contraction tests it is as well, with very important work, to specify that a steel plate shall stand a number of holes being punched ¼ in. apart without breaking the metal between, as the samples on the table.

With regard to the thickness of plates, it is desirable not to exceed ¼ in. or ½ in. in a general way, because it is held that plates less than 1 in. thick give a better test than plates of more than 1 in. thick, and principally because the same work in rolling cannot be got upon thick plates as upon thin ones. I cannot do better than quote the words of Mr. Dicks (an eminent Scotch engineer) on the subject of carbon and thick plates:—

"In rolling metal down to a thin plate, say to ¼ in. or ½ in. thick, the molecules, if they have long dimensions, seem to have their long dimensions laid closer together; their centres of attraction are in the closest possible position, and therefore the plate has a higher tenacity for the same material. In a thick plate it is impossible to obtain this closeness, although I must say I have not been able to detect by careful experiments any difference in

the density between a thick and thin plate; still the appearance of the fracture is different.

A steel plate ¼ in. thick, to stand a tensile test of say 27 tons to the square inch, would require about 0.15 of carbon per cent. If that piece of steel were rolled into a plate of 1 ¼ in. thick it would probably break at about 25 tons per square inch. On the other hand, if a piece of steel 1 ¼ in. thick is wanted to stand 32 tons per square inch, in my opinion it must have carbon from 0.22 to 0.24 per cent. A plate with, say, 0.22 of carbon per cent. rolled down to a thickness of ¼ in. or ½ in. would break at something like the stress the fractured plate showed, somewhere in the region of 40 tons to the square inch.

Machine riveting is much in vogue, both pneumatic and hydraulic, to ensure good work,

as it is said, and a greater output; but, from experience, I find that the process requires quite as much looking after as hand riveting and the result is quite as uncertain, if there is any uncertainty at all. In any case there are numerous instances where machine riveting is not possible, so that hand riveting must still be in use. I shall no doubt be anathema if I say I have a strong leaning towards good sound hand riveting, though I candidly admit that, as regards numbers driven, speed, and cost, the machine work is not to be surpassed.

The warren, lattice, strut and brace, and kindred forms of steel girders, architects occasionally find of great service, but they are not girders altogether suitable for heavy loads in ordinary buildings, and their construction does not call for any special remarks, as the formulae adopted for iron equally applies to steel, the only variation being in the safe load per square inch, which I have before stated is 6 tons or 7 tons instead of 4 tons or 5 tons.

The use of steel for almost every form of roofing has also greatly increased, and is now supplanting the timber roof, except where such is required for appearance or to meet a prejudice; but I think there is no reason why roofing may not be still more generally adopted instead of wood; the forms available are so numerous that an architect's requirements can be readily complied with in ordinary sections. Steel enables the construction of very light trusses or principals, which up to 60 ft. or 70 ft. span can be easily lifted completely

framed the same as a wood principal, and when flush and level ceilings are necessary, a horizontal tie, formed with a \perp or two angles \perp will afford proper fixing for the ceiling joists, and there is no difficulty in giving the tie any other form to suit an elliptical, segmental, or coved ceiling. The pitch of a roof, however steep, is no impediment to constructing a sufficiently rigid steel principal, always providing that the calculations are correct. Illustrations Nos. 23 and 24, to a $\frac{1}{2}$ -in. scale, are two examples of what has been done in this direction. Steel joists, too, offer a most economical means of forming roofs without principals, and of constructing roof principals in such a way that the tie, being a joist, may carry the rafter ceiling joists, and also afford ample storing room above (illustration No. 4). The ordinary struts, as such, and braces, are wholly unnecessary, it only needs for the connections of the uprights and rafter joists to be ample and secure to ensure a perfectly rigid truss; so that, with principals of steel joists to 40 ft. span, and purlins of steel joists, even of 40 ft. span—which I have recently adopted—between brick or stone gables, interior party walls, or between principals, the use of wood may be almost entirely avoided. Such a construction should be most favourably viewed from a "fire-resisting" point, as the less there is to burn the less risk is there of a big fire. In the case of mansard roofs of two or more stories, steel joists afford very great facilities of construction, and are convenient when the slopes and sides have to be concreted. The floor joists form ties to the base of the sloping rafters, and the upper floor joists act as struts. The sloping rafters also become stanchions, and may usually be in one length (illustration shown).

Of course, I might expand this subject to an unlimited extent, especially in the region of steel roof construction. I feel that I have trespassed very much upon your time, and yet have only touched upon a few constructive questions with which you have to deal in your every-day routine. Steel is no doubt yet in its infancy, and there must be a great development awaiting it in the near future, especially with regard to its usefulness in building construction; and the adaption and application of constructional steelwork is one of the most important branches of his art that the architect of the near future will have to face.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL general meeting (business) of this Institute was held on Monday, Mr. E. A. Gruning, vice-president, in the chair.

Messrs. Butler Wilson (President of the Leeds and Yorkshire Architectural Society) and R. Stephen Ayling, attending for the first time since their election as Fellows, were formally admitted, and signed the register.

A recommendation of the Council, that Mr. Wm. Emerson, President, be requested to allow himself to be nominated as President for the ensuing year of office, was adopted, and consequently By-law 26 was suspended.

[By-law 26 states that—"No President who has filled the office for two successive years (Mr. Emerson has been President since June, 1899) shall be again eligible for the Presidency until the expiration of two years from the termination of his tenure of office." But the 33rd section of the Charter gives power to a general meeting to suspend a by-law by resolution of the Royal Institute confirmed at a subsequent general meeting, held not less than seven and not more than twenty-eight days after the former meeting.]

The alterations in the Institute form of contract proposed by the Council were sanctioned subject to slight verbal amendment.*

Mr. William Woodward gave notice that he would ask the Council to convene a special general meeting at the earliest possible date for the purpose of considering a resolution urging that "the proposed memorial to Queen Victoria should be open to the competition of all British (including Colonial) architects, sculptors, and artists."

The meeting then terminated.

The eleventh general meeting (ordinary) of the session will be held on Monday next, when a paper on "The Classifications of Romanesque and Gothic Architecture" will be read by Mr. Francis Bond, M.A.

THE SURVEYORS' INSTITUTION.

A MEETING of this Institution was held on Monday at No. 12, Great George-street, Sir J. Rolleston, M.P., presiding.

THE RATING OF PUBLIC-HOUSES.

The minutes having been read and confirmed, Mr. Walter C. Ryde, barrister-at-law, read a paper on "The Rating of Public Houses." After touching on the question of monopoly as influencing rent, Mr. Ryde admitted that trade, or the profits of trade, as such, could not be rated, but said that rateable value was the rent which might reasonably be expected, and the question was, would the existence of a trade, or the possibility of carrying on a profitable trade upon the premises, increase the rent which might reasonably be expected? If it would, the rateable value must be increased accordingly. In treating of the question of personal goodwill, Mr. Ryde said that if the outgoing tenant could take away all his customers, the new tenant would be starting a new business; if the outgoing tenant could take away none, the new-comer would have the benefit of all the existing trade. Whether the rent would be smaller or larger depended entirely upon the way in which this question of fact must be answered; and this was a question for surveyors and not for a lawyer to answer. In the case of a tied house, it was plain that if the tenant paid more for his liquors than a free tenant would the extra price must be regarded as forming part of the true rent. The rent, therefore, paid for a tied house did not assist the valuer, unless he knew what the tenant was paying to his landlord in the shape of extra prices for the liquor he bought.

A vote of thanks was passed to Mr. Ryde, on the motion of Mr. Marshall, K.C., seconded by Mr. W. Eve.

THE INCORPORATED INSTITUTE OF BRITISH DECORATORS.

ANNIVERSARY OF THE INCORPORATION.

A DINNER was held at the Trocadero Restaurant, Piccadilly Circus, on Monday evening to celebrate the second anniversary of the incorporation of this Institute. The chair was taken by Mr. J. D. Crace (President). Among those present were Mr. M. C. Cowtan (Vice-President of the Institute and Master of the Painters' and Stainers' Company), Mr. W. Rowe (Past-Master of the Painters' Company), Mr. R. J. Bennett (Glasgow), Mr. W. Pitman (Treasurer of the Institute), Mr. J. C. M. Vaughan, Mr. T. H. Pritchard (Clerk of the Painters' Company), Mr. F. W. Englefield (Secretary), Mr. Henry Gibson (Dublin), Colonel R. J. Bennett (Glasgow), Mr. Rowland Plumbé (Past-Master of the Painters' and Stainers' Company), Mr. W. G. Sutherland (Manchester), Secretary of the North of England Master Painters' Association.

After the loyal toasts, Mr. Pitman proposed "The Imperial Forces," for which Colonel Bennett responded.

The President gave the toast of the evening, "The Incorporated Institute of British Decorators." He thought the Institute had great possibilities. The first possibility it had was that of bringing into touch with one another those minds which were interested in the same subject, and that subject their beautiful craft. The craft of decoration admitted of almost illimitable extension and certainly refinement. Those who had recently made the journey, promoted by the Institute, to Italy had seen for themselves how art decoration might reach a high artistic ideal. But it was not only the advantage of rubbing shoulders at the social board that they had to look at, but the bringing together of men who were in every-day business competitors. It was possible for this Institute, through written and unwritten laws, to bring about a far more dignified and honourable relationship between man and man than could be otherwise attained. Then there were also many points in which the exchange of expert opinions one with another would have a wholesome effect. They were, he was afraid, apt to move in grooves. It was a most disappointing thing in their craft to see men satisfied with what already existed rather than aiming at something very much more studied and artistic in its result. There was no short road to success in art; it was rather by a constant endeavour to do better that the highest ideal was attained. He had reached that age when there was great reason for fancying that it was not necessary to go on

studying, but he confessed that he did not take that view, and it was with the greatest delight that he renewed his acquaintance recently with those splendid examples of the decorators' craft in Italy.

Mr. Sutherland gave "The Painters' and Stainers' Company." The guild, he said, held a charter dating back to the reign of Queen Elizabeth, and it had not only fulfilled its mission in the past, but had shown, by its more modern activities, that it was devoted to the task of lifting the craft to a higher level and inspiring it with loftier ideals. The success of the Incorporated Institute of British Decorators was due in a great measure to the stimulus given by the Painters' Company.

Mr. Cowtan acknowledged the toast, and gave the Institute the heartiest welcome on the occasion of holding its annual meeting at the Painters' Hall.

Mr. Sitwell proposed "The Health of the Chairman," remarking that their craft had been passing through a crisis from which it must emerge either in triumph or drop into insignificance. Personally, he regarded the Institute as having come upon the scene just at the right moment to achieve the triumph and to elevate their craft to the position of a profession. Hitherto their craft had been included among the despised and rejected occupations, but they need only inspect the great works at Florence to receive enlightenment as to what high ideals decorators could attain. The Institute was getting stronger from month to month, and would soon, he hoped, reach a stage of robust manhood.

The President's brief reply concluded the toast list.

THE ANNUAL MEETING.

The annual general meeting of the Institute was held at the Painters' Hall, E.C., on Monday afternoon, when the following officers were re-elected:—President, Mr. J. D. Crace; Vice-presidents, Messrs. M. C. Cowtan, J. C. M. Vaughan, R. J. Bennett, Hy. Gibson, and J. F. Barter. Five members were also elected to the General Council. The Treasurer (Mr. Pitman) and the Secretary (Mr. Englefield) were also re-elected. An account was given by the President of the year's work, reference being made to the instructive lectures given at Painters' Hall, particularly that by Dr. G. Williamson on fresco painting. It was also mentioned that some fifty decorators had been admitted as Fellows during the past twelve months, bringing the strength of the Institute, in all classes, up to 350, which included leading members of the craft of decorators in Great Britain and Ireland.

THE SANITARY INSPECTORS' ASSOCIATION.

At the meeting of the Sanitary Inspectors' Association, held at the Carpenters' Hall, E.C., on Saturday, Mr. T. C. Dee introduced for discussion the subject of "The present position of the sanitary inspector." Mr. W. West occupied the chair.

Mr. Dee said he was of opinion that the tenure of the sanitary inspector under the Public Health Act, 1896, was all that could be desired, and all the powers to deal with nuisances that they could possibly wish for were to be found in the same Act. If, therefore, the law was so satisfactory, why were inspectors anxious for better results in the work done for the advancement of the public health and more satisfactory position for themselves? Was the administration defective? He thought it must be accepted that certainly the tenure of office might be much improved if the Local Government Board could be induced to administer it in as liberal a spirit as had been done with respect to district medical officers of poor law unions. He regarded the present administration of the law as detrimental to the true interests of the public by leaving the sanitary inspector's position liable to be taken from him in consequence of a due fulfilment of his duties when it was against the personal interest of his direct employers. Again, the local sanitary authorities were at times very diffident in enforcing all the powers they possessed. He would only instance one form of this, that was the carrying into effect of the penal clauses of the by-laws of the London County Council with reference to water-closets and soil-pipes. The law was enormously strong and very clear—some might say too strong and too clear—yet they all knew that it was very frequently not fully administered.

* See our issue for April 6.

And what an unsatisfactory position for the sanitary inspector, who by the direct order of the Local Government Board reported such breaches, to find that he was unable to do anything, the strong law notwithstanding! Again, the taking from the sanitary inspector of the control of sanitary works in progress in his district prevented him from deriving full fruition of his work. For these and other reasons he submitted that the administration fell far short of what might be reasonably expected. Replying to a second query—"Is the present position due to the sanitary inspector himself?"—Mr. Dee pointed out that many of them were originally connected with the building trade, and with the widening of the opportunities of studying science opened up during the last quarter of a century their eyes were opened to the wisdom of acquiring something more than a rule-of-thumb knowledge of their handicraft; and by the knowledge they gained, coupled with the great opportunities they possessed of applying those scientific theories to the rising science of public health (hygiene), they were naturally led to prepare for a position such as they now hold. Again, many of them gained their first conception of the duties of their position in the office of a sanitary department, which was followed up by a practical application of the theoretical knowledge as a junior inspector in some provincial town, under the guidance of those who had passed many years in a similar position. They knew of a good many instances of successful inspectors who had attained better posts in consequence of their qualifications, and they were animated by a lively spirit of emulation to study hard, to work with intelligent interest, that they might likewise succeed. He urged that they must guard themselves in their dealings with their brother inspectors, holding at least that those inspectors were carrying out their duties as well as they were; and even if they could not fairly think this in every case, let them minimise their own personal light for the glory and welfare of their profession as a body. Professionally they were all brethren, and he urged them to leave the position of the workman and his foreman and rise to the professional dignity of colleagues. Having suggested a theoretical unity, he would point out a practical application of this merging of one's personality in the general welfare of the body that could easily be made—that was, they should be able to take up one or other of the undoubted hardships that sanitary inspectors met with; and, for instance, when a man lost his position, or was in danger of losing his position because he did or wished to do his duty, their Association, instead of being compelled to advise him to compromise with his authority until he had obtained another post, would be able to investigate the case, advise him how to act, and obtain wide publicity for his and his associates' actions. If, notwithstanding this, he lost his post, the honour of the whole body could be vindicated without loss to him, for they should support him (and thank him for the opportunity he had given them) until he was again acting for the good of them all and in the real interest of public health by a further fearless discharge of the duties of his honourable post as a worker for the advancement of health for his fellow-countrymen. He would urge them to aim high and say as a body, "We will do more than command success: we will demand it."

A discussion followed, and at the conclusion a vote of thanks was accorded to Mr. Dee.

COMPETITIONS.

HINDLEY DISTRICT COUNCIL OFFICES.—The first premium in the competition for these offices has been awarded to Messrs. Heaton, Ralph, & Heaton, architects, Wigan. The cost of the buildings will be about 7,000l. The competitors numbered between seventy and eighty.

DUNFERMLINE BATHS AND GYMNASIUM.—The sum originally offered by Mr. Carnegie to build and equip at Dunfermline the baths and gymnasium was 20,000l. Competitive plans were sent in and it was found that in every case the probable cost exceeded the sum at the committee's disposal. Mr. Carnegie has since agreed to increase the amount he had offered for the construction and equipment of the proposed buildings, so that the committee might be free to choose the design which they thought most suitable; but he relies on the

committee satisfying themselves that the accommodation to be provided, while ample, should not be in excess of the probable future requirements of the town, and that there should be no expenditure on needless display. Mr. William Reid, the secretary, was instructed to invite Mr. H. J. Blanc to meet the committee. The premiums offered to competing architects were awarded as follows:—First (50 guineas), Mr. Andrew Muirhead, Dunfermline; second (30 guineas), Mr. David Barclay, Glasgow; third (20 guineas), Mr. James T. Scobie, Dunfermline. The town is providing a site for the new buildings at a cost of 4,000l.

VILLAS AND COTTAGES, DUDLEY.—The result of a recent competition for villas and cottages, Dudley, is as follows:—10l. premium divided as follows:—Premium: Best design for villas—Mr. A. Ramsell, Dudley; best design for cottages—Mr. H. A. Reynolds, Birmingham. Highly commended designs—Mr. A. Gammage, Dudley; Mr. H. Phipps, Brierley Hill. Commended designs—Mr. Thos. Silver, Handsworth; Mr. Jordan Green, Handsworth; Messrs. Perry & Nightingale, Dudley; Mr. S. O. Pennington, Wolverhampton.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—At the meeting of this Institution, held at the Westminster Palace Hotel on April 12, the chairman, Mr. Percival Marshall, presiding, a paper on "Iron-lined Tunnelling Construction" was read by Mr. A. Woodroffe Manton. The author made reference to the visits which the members had paid to the works of the Central London Railway, and to the City and South London Railway Northern Extension Works, and also alluded to other shield-driven tunnels which had been constructed in England and on the Continent previously to those. The general details of the Greathed Shields were described, likewise modifications to increase the rate of progress of the work. Special types of tunnelling shields were dealt with, the most economical design of the shield chambers, both initial and terminal being discussed. In this connexion the ingenious hooded shield, invented by Mr. Dalrymple Hay and used on the Waterloo and City Railway, was introduced. Plant for air-compressing (for ventilating, grouting, and shield advance) winding, pumping, lighting, and traction was described, and particulars given of the speed of tunnelling which had been attained. Boring or excavating machines, as used in conjunction with a shield, were referred to and illustrated, the most successful being Thomson's Bucket-ladder machine, which had been employed in the construction of the Central London Railway. Proposed designs for rotary and chain-cutter boring machines were shown, and their relative advantages considered. Illustrations of special plant for the driving of iron-lined tunnels were exhibited, and the author indicated the conditions under which each design would probably give the best results. A discussion followed the reading of the paper, and a vote of thanks was accorded the author. On the following afternoon, April 13, the paper was supplemented by a visit to the Great Northern and City Railway Works, through the courtesy of the engineers, Sir Douglas Fox and partners, and of the contractors, Messrs. S. Pearson & Son. Mr. B. Everett and other gentlemen showed the members over. The surface machinery was first seen, and the system of removing the excavated material explained. Raised from the shaft at Poole-street, New North-road, it is taken away *via* the Regent's Canal and used for filling up an old East London Waterworks reservoir, situated in Victoria Park. The line runs from Moorgate-street to Finsbury Park and consists of five and a half miles of double tunnelling. The party walked to the working face, where they were shown the shield under actual driving conditions, a gang of workmen having been specially kept to go through all the various operations for the members' benefit. The outside diameter of the shield is 17 ft. 4½ in., and to drive it forward is fitted with sixteen hydraulic rams, each 7 in. diameter, the working pressure being two tons per square inch. It is expected that the tunnelling will be completed by September next.

THE EXHIBITION OF MODERN ILLUSTRATION.—This exhibition, now being held in the galleries of the Indian Section of the South Kensington Museum, in Imperial Institute-road, will close on May 4.

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS.—The annual meeting of the Sheffield Society of Architects and Surveyors was held on the 11th inst. in the School of Art. The chair was occupied by Mr. Joseph Smith. Mr. J. R. Wigfull and Mr. J. B. Mitchell-Withers having been elected as Fellows of the Society, an alteration of the rules was agreed to, with the view of strengthening the Council. Mr. W. C. Fenton presented the financial statement, which showed that the receipts for the year amounted to 210l. 10s. 7d., and that there was a balance in hand of 99l. 4s. 6d. Mr. Fenton read the fourteenth annual report of the Council, which stated that the membership was 112, as compared with 109 last year, and continued that as the library accommodation was very limited, the Council had appointed a sub-committee to go into the question of providing better accommodation. After a lengthy consideration of the subject, the committee had recommended that a room in connexion with the Literary and Philosophical Society's premises should be taken. The question of a proposed competition in connexion with the Norfolk Market Hall, and the Royal Institute of British Architects' suggestions with regard to competitions, were sent to the Chairman of the Finance Committee, who promised that due consideration should be given to them. The Council had to regret, however, that the draft conditions which were submitted to them were not satisfactory in several respects, and had intimated to the Finance Committee that in their opinion the competition was not at all necessary for this building, and that the architect from whose hands it had previously received attention should have been consulted on the matter. The Health Committee of the City Council had resolved "That the City Surveyor be instructed to prepare conditions and obtain competition plans for the erection of a building on the surplus land at the junction of Angel-street and King-street for the occupation by selected small householders in the upper portion, and salesshops on the ground floor and base-rooms underneath." The minutes of the Health Committee were not confirmed by the City Council, but on February 14 Alderman Styling succeeded in getting the appointment of a committee to prepare a scheme for the site. It was understood now that the idea of a competition had been abandoned. The City Council had decided to take over the School of Art from August 1 next, and it was hoped that this change would have the effect of procuring better facilities for the Society than had hitherto been the case. A resolution expressing the Society's satisfaction at the City Council's action had been passed. A letter had been sent to the Town Clerk in regard to the proposed action of the Plans Sub-Committee for the Highway Committee to restrict the construction of area lights in footpaths. The letter pointed out that up to the present the Society had no intimation that area lights were objected to by the Corporation, and they were unable to ascertain that any resolution had been passed by the Highway Committee of the City Council in regard to this matter. They considered that some formal intimation should have been given to the architects of Sheffield before the Corporation changed their policy. The proposed prohibition of area lights was a serious matter affecting the value of property, both to owners and ratepayers of the city. The prevention of area lights would depreciate the value of building sites already acquired on the supposition that such lights would be allowed as previously had been the case, and it would considerably reduce the ratable value of the property. Area lights of the maximum projection, if properly constructed, constituted no danger or inconvenience to the public, and most of the important towns did allow them to be constructed under proper regulations. This had been considered by the Highway Committee and referred to the Works Sub-Committee, upon whom a deputation from the Society had attended. The Sub-committee had delegated the Chairman, Vice-Chairman, and City Surveyor to meet the deputation at a future date, and discuss the matter in detail. The Chairman, in moving the adoption of the report, said although they had not proclaimed on the housetops the work they had done for the profession, yet a study of the report would show they had done their very best to serve the interests of the profession

and of the city.—Mr. P. Marshall seconded, and the report was adopted.—The Chairman referred to the limited character of the competition for the National Memorial to Queen Victoria, and called attention to the fact that there is a movement on foot to get the matter altered.—Mr. H. L. Paterson expressed the opinion that such a competition ought to be open to the whole of the British Empire, and he moved a resolution that that opinion be conveyed to the Royal Institute of British Architects.—Mr. C. M. Hadfield seconded, and the resolution was adopted.—On the motion of Mr. W. J. Hale, a hearty vote of thanks was passed to the officers and members of the Council for their services during the year, and in reply the President said it had been a pleasure to him to do his best to serve the interests of the profession.—The following officers were then elected by ballot: President, Mr. Peter Marshall; vice-president, Mr. Thomas Winder; treasurer, Mr. Frederick Fowler; secretary, Mr. W. C. Fenlon; members of the Council, Messrs. J. R. Wigfull, R. W. Fowler, C. Hadfield, J. B. Mitchell-Wibbers, E. M. Gibbs, H. L. Paterson (Fellows), C. B. Flockton, C. F. Innocent, and C. M. Hadfield (Associate members).—Mr. Gibbs expressed his intention of retiring, on the ground that new blood was required, and the next on the list, Mr. Edward Holmes, was put in his place. The President presented the Society's prizes to Messrs. H. W. Inolt and J. Miller, and it was then announced by Mr. Joseph Smith that in future the Society would have a home of its own, arrangements having been made to take a room in the building of the Literary and Philosophical Society.

BRISTOL SOCIETY OF ARCHITECTS.—The annual general meeting of this Society was held at the Fine Arts Academy, Queen's-road, Clifton, on Monday last, Mr. G. H. Oatley, Vice-President, in the chair. The scrutineers for the conduct of the election reported to the meeting that Mr. Frank Wills had been elected President, Messrs. W. L. Bernard and G. H. Oatley Vice-Presidents, and the Hon. Secretary, Mr. H. Dare Bryan, was unanimously re-elected. The following gentlemen were the members of the new Council:—Messrs. La Trobe, Nicholson, Silcock (Bath), Skinner, Joseph Wood, and J. Foster Wood; and Messrs. Green (Bath) and J. Cyril Thompson Associate Members of Council. The annual report and balance-sheet presented by the Council were, upon the motion of the Chairman, seconded by Mr. J. Cyril Thompson, taken as read and adopted. From the Report we learn that the Society now numbers twenty-three Fellows (the same number as last session), twenty-nine Associates (a gain of one over last session), and only nine students, as against twelve last session. In view of the small number of student members the Council again emphasise the point that appeared in last year's Report, that members of the Society should do all in their power to encourage their pupils and junior assistants to join the Society. Two new Fellows have joined the Society, three Associates, and one student member. Attention is drawn to the new clause of Honorary Associates eligible for election to the Society. The by-law runs that Honorary Associates "shall be persons not professionally engaged in practice as architects, who, by reason of their ability in art, science, literature or archaeology, or their experience in matters relating to architecture, surveying, engineering, or any of the arts or crafts connected with architecture or building, may appear to the Council to be able to render assistance in promoting the objects of the Society." The Council record with regret the death of Mr. William Bruce Gingell, in whom the architectural profession in Bristol has lost a much respected practitioner, and the members of the Society one of their oldest colleagues.

PRIMITIVE METHODIST CHURCH, SWINDON.—A new Primitive Methodist church has been recently opened in Rodbourne-road, providing accommodation for 400 persons, and new classrooms erected, the old chapel being utilised for schoolroom. The building, which is Gothic in style, has been built with red pressed bricks for face and Bath stone dressings, and covered with blue slates. There is a large oriel window in front gable. The interior is seated in pitch-pine, and the rostrum and roof principals are also of this material. The windows are filled with stained glass. Mr. R. J. Leighfield, of Swindon, was the builder, the contract being 1,151l. 10s., and the architects were Messrs. William Drew & Sons, of Swindon.

Illustrations.

SMALL COUNTRY HOUSES.

THESE houses have recently been built for various clients—in almost every case in accordance with some expressed wish as to plan or special treatment. They should, therefore, be taken not so much as examples of what small houses ought to be as illustrations of what an architect has to build in every-day practice. The cost varies, of course, with locality, and still more with the amount of internal finish. In two or three of the larger examples wainscot panelling and oak floors, elaborate door furniture, and enriched plaster will drive the cost up to as much as 2s. per foot, whereas the more modest examples average perhaps 10d., and in some cases the cost has come out at 8d.; but present-day prices hardly permit of this being a common occurrence. The cottages come out considerably less, only, however, because a much less high standard of finish was required. There seems, generally speaking, so little difference in cost between good and second-rate material that even in humble dwellings it is hardly worth while to specify the interior. Economies in labour and fittings go far further in reducing cost than savings on the structure or carcass. All the examples are brick and tile except the house "Manston," which is finished in rough cast and small, thick Westmorland green slates, and "Toy's Hill." This is built with the local stone, with Howley Park stone where the labours are elaborate. The drawing is exhibited at the Building Trades Exhibition.

ARNOLD MITCHELL.

HOUSE AT CROWBOROUGH: THE DINING-ROOM.

THIS drawing, which was exhibited at the Royal Academy of last year, shows one of Mr. Baillie Scott's now well-known and characteristic examples of decorative treatment of the interior of a room; keeping the lines of general structure and furniture very simple and severe, and depending on coloured decoration for decorative effect. Unfortunately we cannot reproduce the colour, but those who are familiar with Mr. Scott's coloured drawings will be able to picture the effect to themselves.

THE EASTER SEPULCHRE, HAWTON-BY-NEWARK.

HAWTON CHURCH is situated about two miles from Newark, and externally is not a very interesting church. On entering, one is surprised to find such a fine piece of work as the Easter sepulchre, here illustrated, which is built of a rich yellow sandstone. On the opposite side of the chancel are sedilia of similar character to the sepulchre.

At Heckington Church, in Lincolnshire, there is an Easter sepulchre resembling this one very much, but greatly inferior in design and workmanship.

J. H. R.

PROTECTION OF BUILDINGS FROM LIGHTNING.

A COMMITTEE, to be known as the Lightning Research Committee, has been organised by the Royal Institute of British Architects and the Surveyors' Institution, with the object of collecting and tabulating information from all parts of the country as to damage resulting to buildings from lightning-stroke. The Committee owes its inception to Mr. Killingworth Hedges, who, in his paper on "The Protection of Public Buildings from Lightning," read before the Institute of Architects last year, referred to the difficulty experienced by experts in getting accurate information as to injuries sustained by lightning-struck buildings, and urged the desirability of an inquiry by a recognised authoritative body as to how far buildings are rendered lightning-proof by modern systems of protection. The Lightning-Rod Conference, as the result of an exhaustive inquiry extending over three or four years, drew up and published with its report in 1882 a code of rules for the erection of lightning-conductors, which has served practically as a text-book on the subject up to the present time. Since the general adoption of these rules, however, no certain information has been collected on the effect of lightning-strokes on buildings

provided with conductors. The present inquiry, therefore, by the collection of precise data, may serve to test in some measure the results accruing from the rules laid down by the Lightning-Rod Conference nearly twenty years ago.

The Committee includes Mr. John Slater (chairman), Major-General E. R. Festing, C.B., F.R.S., Dr. Oliver Lodge, F.R.S., Messrs. J. Gavey, W. P. Goulding, W. N. Shaw, F.R.S., H. H. Statham, A. R. Stenning, Arthur Vernon, Killingworth Hedges, C.E. (Hon. Secretary).

In pursuance of their inquiry the Committee seek the co-operation of competent observers in all parts of the country, with a view to obtaining accurate details, noted on the spot, of the effect of lightning-strokes on buildings, whether fitted with conductors or not. A schedule of questions will be sent to persons willing to act as observers, who will be requested to investigate any disaster from lightning occurring to a building in their neighbourhood, and to furnish the Committee with the details suggested in the questions. Should additional particulars be desired, such as measurements, &c., the observers will be requested to make further investigations, and any reasonable expenses will be defrayed by the Committee.

Persons willing to assist by their observations are requested to communicate with the Secretary to the Committee at the offices of the Royal Institute of British Architects, 9, Conduit-street, London, W.

STANDARDISING SIZE OF BRICKS.

A CONFERENCE between representatives of the Institution of Civil Engineers, the Royal Institute of British Architects, and representatives of brickmakers will be held at 4 p.m. on Friday, the 26th inst., at the Building Trades' Exhibition at the Royal Agricultural Hall, Islington, to discuss the question of standardising the size of bricks. The following is the standard suggested by the two institutions:—

1. The length of the brick should be double the width plus the thickness of one vertical joint.
 2. Brickwork should measure four courses of bricks and four joints to a foot.
- Joints should be $\frac{1}{4}$ in. thick, and an extra $\frac{1}{16}$ in. making $\frac{3}{16}$ in. for the bed joints, to cover irregularities in the bricks; this gives a standard length of 9½ in. centre to centre of joints.

The bricks to be measured in the following manner:—

1. Eight stretchers laid square end and spay end in contact in a straight line to measure 7½ in.
2. Eight headers laid side by side, frog upwards, in a straight line to measure 35 in.

Eight bricks, laid the first brick frog downwards and then alternately frog to frog and back to back, to measure 21½ in.

This is to apply to all classes of walling bricks, both machine and hand made, and facing bricks.

The proposal to arrange a definite standard for the size of bricks is one which should meet with the approval and support of all who are interested in sound brickwork, it being impossible, with the varying sizes of bricks as at present made, to keep good sectional bond.

It is hoped that a resolution will be passed at this Conference which will establish a standard as suggested.

At the meeting statements will be made as to the standards observed in America and Germany. All who are interested in the subject of brickwork are invited to attend.

The Conference is initiated by the Science Committee of the Institute of Architects, of which Mr. H. D. Searles-Wood is the Hon. Secretary.

"THE ARCHITECT AND THE GARDEN."—Mr. Maule writes that it was incorrect to assign the design for the sundial on page 399 *ante* to Mr. A. N. Prentice, and that all the illustrations were designed and drawn by Mr. W. A. Forsyth for Mr. White's catalogue. Mr. Prentice's name, however, was certainly on the drawing lent to us; we presume it got there by some mistake.

CORRECTION.—In our report last week of the smoker, &c., of the Cardiff Architects' Society we stated that it was given by the members of the Cardiff, South Wales, and Monmouthshire Architects' Society. This, we are informed, is hardly correct, as the smoker, &c., and the whole of the work of the winter session, were organised entirely by the Associates.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE twenty-third annual dinner of the Builders' Clerks' Benevolent Institution was held on Tuesday evening at the King's Hall, Holborn Restaurant. There was a large gathering, the chair being taken by the President, Mr. G. Appleton (Messrs. Turtle & Appleton). Among those present were Mr. H. Holloway (Vice-president), Mr. J. Howard Colls (Trustee), Messrs. A. B. Colls, R. Holloway, S. Holloway, E. Holloway, Stephen Collins, — Carmichael, C. J. Wade, C. Smithen, — Campbell, Stirling, Bussell, Turtle, R. Barrett, and J. Austin (Secretary).

After the loyal toasts, the Chairman proposed "The Navy, Army, and Auxiliary Forces," which was responded to by Lieut. Stirling.

The President, in proposing "The Builders' Clerks' Institution," stated that it was founded in 1866 for the purpose of granting pensions of 30l. per annum to necessitous clerks, and of 24l. per annum to their widows, for the maintenance and education of their orphan children, and for making grants of temporary relief. There was only one survivor of the founders, and that was their esteemed treasurer, Mr. E. Brooks, who had done much to bring the Institution to its present position. The secretary, Mr. J. Austin, had also been most indefatigable. Every year 600l. had to be raised for the pensions and to meet the calls of temporary relief, and another 100l. to meet the general expenses. The Institution was doing most valuable work, and should be supported to a far greater extent by the builders' clerks themselves. Considering the advantages and privileges obtained by subscribers, every builder's clerk who was receiving a reasonable salary should subscribe half-a-guinea or a guinea per year. By this means the total funds received each year would be about 1,500l. instead of 700l., and accordingly much greater help could be given.

Mr. J. Howard Colls then proposed "The Architects and Surveyors." He mentioned that the Institution had his fullest sympathy because of its good work and the fact that his father had taken the keenest interest in it. With regard to the architectural profession, there was never a time when it was in a more satisfactory condition, but he thought it a great pity that the late Queen's memorial, which was one of the greatest opportunities which had been given to the architects of this country, should be limited to so few competitors. He considered that this was an occasion when young architects should have an opportunity of showing what they could do, and he hoped that the feeling which was so widely spread would result in some alteration being made, so that the scope of this competition could be widened.

Mr. Charles Smithen responded, and promised to become an annual subscriber to the Institution.

Mr. F. S. Oldham (Messrs. Perry & Co.) submitted "The Builders." He stated that they had always been strongly supported by the master builders—an assistance which they greatly appreciated. The builders and their clerks always got on well together, and one never heard of such a thing as a strike among builders' clerks.

Mr. Henry Holloway, in reply, said the builders had reason to congratulate themselves upon the very able assistance they received from their clerks. He, as ex-President, could testify to the usefulness of the Institution the whole affairs of which were most admirably administered.

The Secretary announced that 262l. 2s. 6d. had been contributed that evening towards the support of the Institution. The list included—Messrs. Turtle & Appleton, 21l.; Mr. G. Appleton, 10l.; Messrs. Kirk & Randall, 10l. 10s.; Messrs. Gabriel & Sons, 5l. 5s.; Mr. R. Barrett, 5l. 5s.; Messrs. Oliver & Sons, 5l. 5s.; Messrs. Holloway Bros., 5l. 5s.; Mr. A. Ritchie, 5l. 5s.; Mr. J. H. Colls, 5l.; Messrs. The Carron Company, 5l.; Mr. Colin Patrick, 3l. 3s.; Mr. C. J. Smithen, 3l. 3s.; Messrs. T. Dower & Sons, 3l. 3s.; Messrs. Farquharson Bros. & Co., 3l. 3s.; Messrs. Hobbs, Hart, & Co., 3l. 3s.; Messrs. Foster & Dickie, 3l. 3s.

The President next proposed "The Merchants," and expressed his thanks for the liberal support they had given.

Mr. C. J. Wade responded, and stated that he hoped the total of the subscriptions would be increased to 300l. In order to encourage this he would undertake to get a firm to give

5 per cent. subscription for every new annual subscriber within a fixed period.

Toasts to the President, Past-Presidents, and the visitors concluded the proceedings.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

AT the meeting of the Building Act Committee of the London County Council, held on 1st inst., being the day before the Council adjourned for the Easter recess, the proceedings were governed by the clause in the order of reference which empowers the Committee at certain seasons to act on behalf of the Council in relation to matters included in the order of reference. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage and Projections.

Chelsea.—A one-story addition in front of the Swiss Cottage beerhouse, No. 109, King's-road, Chelsea (Messrs. A. R. Barker & Son for Messrs. Michell & Aldous, Limited).—Consent.

Lewisham.—Three houses, with shops on the ground floor, on the north side of Perry Vale, Foot Hill, Lewisham, between Siddons-road and Woolstone-road (Mr. R. Willock for Mr. D. A. Scott).—Consent.

Lewisham.—An addition to No. 14, Kirkdale, Sydenham, at the corner of Peak Hill (Mr. J. P. Briggs for Mr. W. Cobb).—Consent.

Bermondsey.—One-story shops on the forecourts of Nos. 61 to 73 (odd numbers only, inclusive), Lower-road, Rotherhithe (Mr. T. W. Biggs for Mr. S. Single and Messrs. Stansfeld & Co., Limited).—Consent.

Penge.—A warehouse building on the south-east side of Green-lane, Penge, near Beckenham-road (Mr. E. Williams for Mr. A. Olby).—Consent.

Holborn.—A sign, to overhang the public way, in front of No. 211, Shaftesbury-avenue, Holborn (Mr. G. Wragge).—Consent.

Peckham.—Six houses on the north-east side of Forest Hill-road, Camberwell, at the corner of Honor Oak Rise (Mr. G. A. Lansdown for Mr. J. E. Lamerton).—Consent.

Dulwich.—An open shed at the rear of No. 10, Alleyn-terrace, Park-road, Dulwich, to abut upon South Crooked-road (Mr. W. Burrell for Mr. L. French).—Consent.

Clapham.—One-story shops upon part of the forecourts of Nos. 2 to 10 (inclusive) Penasbury-terrace, Wandsworth-road, Wandsworth (Mr. G. Sherrin for Mrs. C. E. Wigmore).—Refused.

Hammersmith.—A theatre building on the north side of Hammersmith-road, Hammersmith, at the corner of Rowan-road (Mr. W. G. R. Sprague for Mr. J. B. Mulholland).—Refused.

Holborn.—Two oriel windows, at the first, second and third floor levels, in front of Nos. 108 and 110, High Holborn (Mr. W. C. Waymouth for Messrs. Cardinal & Harford).—Refused.

Wandsworth.—Three one-story shops on part of the forecourt of "The Esterels," No. 223, Balham High-road, Balham (Mr. W. C. Poole for Mr. E. Coates).—Refused.

Width of Way.

Camberwell, North.—A three-story tenement house on the east side of Crown-street, Camberwell, at less than the prescribed distance from the centre of the street, and to exceed in height the width of the street (Mr. E. J. Stevens for Mr. R. Knight).—Consent.

Wandsworth.—That the application of Mr. S. J. May for Messrs. Carlo Gatti and Stevenson, for an extension of the period within which the erection of buildings and a boundary fence at Gothic Wharf, Brewhouse-lane, Putney, at less than the prescribed distance from the centre of the street, was required to be completed, be granted.—Agreed.

Hackney, South.—That Mr. J. Hamilton be informed, in reply to his letter on behalf of Messrs. W. J. Bush & Co., Limited, asking permission to retain the portion of the forecourt of Ash-grove works at less than the prescribed distance from the centre of Sheep-lane, Hackney, and to be allowed to erect a wall to enclose such forecourt, that the Council is not prepared to accede to his request.—Agreed.

Lines of Frontage and Width of Way.

Kensington, North.—A block of studios, with bay windows, oriel windows and a angle-turret, on the site of Nos. 89 and 91, Ladbroke-road, Kensington, to abut upon Ladbroke-road, Lansdowne-road, and Boye-terrace-mews (Mr. W. Flockhart for Mr. E. Davis).—Consent.

Kensington, South.—That the application of Mr. A. Blackford for Mr. A. R. Bulley, for an extension of the periods within which the erection of a block of residential flats, with bay-windows, on the site of Nos. 79, 81, 83, 85, and 87, Drayton-gardens, Kensington, was required to be commenced and completed, be granted.—Agreed.

Peckham.—One-story shops on the forecourts of Nos. 1, 3, 5, and 7, Blenheim-grove, Rye-lane, Peck-

ham, at less than the prescribed distance from the centre of the street (Mr. W. L. Dowton, for Mr. J. Shinkfield, Mr. G. T. Maloney, and Mr. W. Chapman).—Refused.

Formation of Streets.

Whitechapel.—Variations from the plan sanctioned by the Council for the formation or laying out of three new streets out of the east side of Middlesex-street (formerly Sandy-row), Spital-fields, so far as relates to an alteration in the position of a portion of the street to be named Short-street (Messrs. Cabitt-Nichols, Sons, & Chuter for Sir A. K. B. Osborn).—Consent.

Woolwich.—That an order be issued to Mr. J. O. Cook refusing to sanction the formation or laying out of new streets for carriage traffic on the south side of Tuam-road, Clay-lane, Plumstead (for Mr. W. G. Dawson and Mr. J. Harper).—Agreed.

Buildings for the Supply of Electricity.

Holton.—For a generating station and works on the west side of Bath-place, Haggerston, at the corner of Whiston-street (Messrs. Kincaid, Waller, & Manville for the Council of the Metropolitan Borough of Shoreditch).—Consent.

FIRE TESTS WITH DOORS (No. 60 of Reports of the British Fire Prevention Committee).

Correspondence.

To the Editor of THE BUILDER.

THE NATIONAL MEMORIAL TO QUEEN VICTORIA.

SIR,—Many old readers of the *Builder* must, like myself, feel grateful for the leading article last week, and especially for its concluding paragraph. For the memorial to Queen Victoria, the best of Queens, all sorts and conditions of men will be satisfied with nothing short of the best of monuments; and as subscribers in showing their desire to honour by it their late Sovereign, it should be a national and not a restricted affair in any sense, still less so in that of its authorship, nor should the function of judging the designs submitted be either hasty or weak. An open competition may perchance find yet another Alfred Stevens, and bring him to the fore, but a limited one never will.

The best monument, when reflected in a canal after the manner of the Taj Mahal, is indeed a happy inspiration and may lead to more; and, coupled with it, the overflow to a lower level to keep the water stirring and sweet, the diversion of noisy traffic, and, above even these, the suggested new front to the Palace itself—greater even than the flanks of the canal in value to the whole effort, forming, as it were, a worthy backing to the whole scheme, which as at present it is not and could never be so considered. Another strong point in favour of the canal scheme appears to lie in the fact that it is in the main a restoration of a former state of things there.

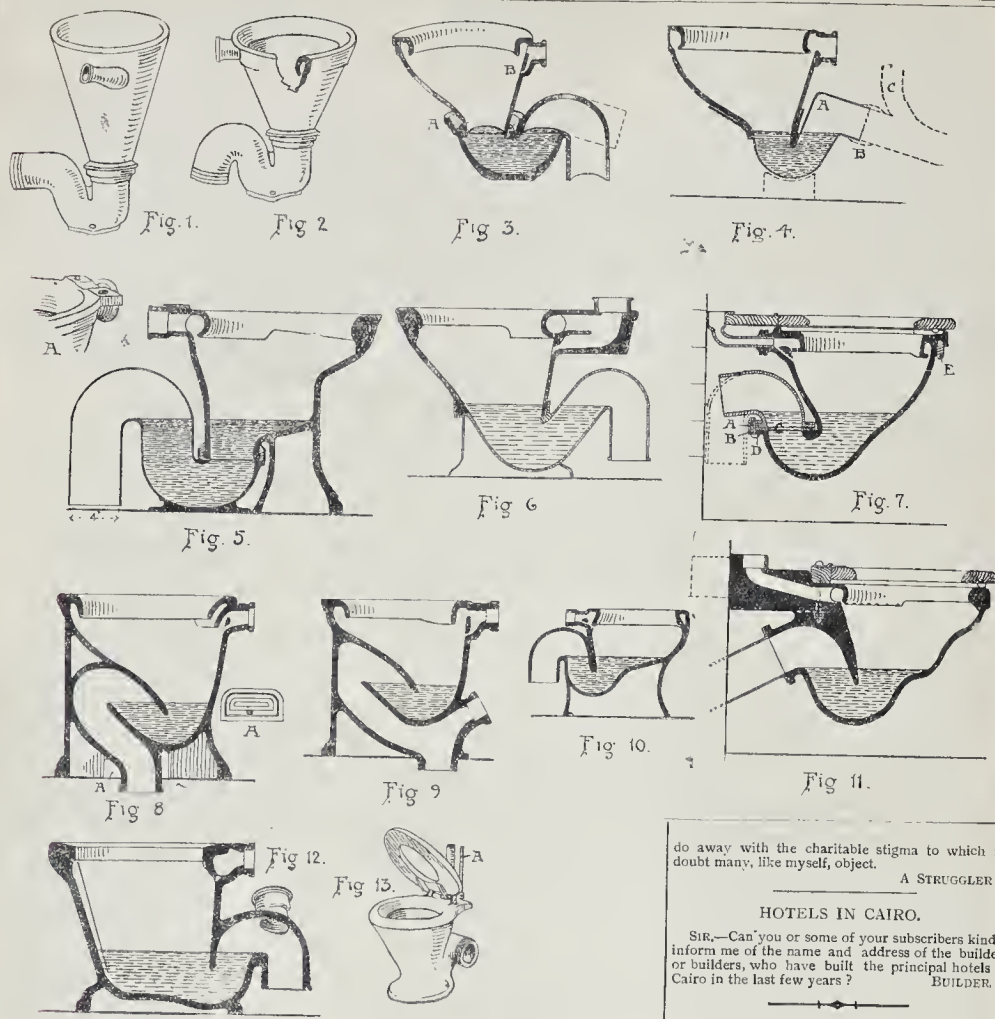

What appears to be a weak point in the plan is that the approach to the quadrangle of the Palace is, under the revised conditions, not central; but, as a matter of plan and elevation too, this could be easily obviated by creating a loggia forming a similar treatment to the gateway, uniform with it and equidistant from the south side of the quadrangle.

I am glad that you have some words of praise for the much-criticised "Albert Memorial," which is useful as a factor of warning, in that it shows how foolish we shall be if we repeat the mistake so conspicuous there—that of being central with nothing whatever. Opinions may differ as to the folly of concealing its static existence, of its unidealised figure, its white podium, sacrificing the idea of solidarity where most required; but scarcely any one could support the primary blunder (rarely, if ever, seen in foreign cities) of its unfortunate "placement," for which, I believe, its designer was not responsible.

E. S. II.

SIR,—The leading article in last week's *Builder* discusses this subject from many practical points, but neither therein nor in any reference to the subject that has come under my notice has allusion been made to a question of very considerable importance in connexion with portrait sculpture in the open.

I realise that the sketch-plans illustrating the article in the *Builder* are simply suggestions which probably would be widely departed from in any scheme which might be adopted. Nevertheless, as the site of the Mall has been selected, and the front of Buckingham Palace is at present the terminus feature thereto, the natural inference is that the position so far assigned to the statue of Queen

Illustrations to Student's Column.

Victoria is as thereby suggested, i.e., in front of the Palace facing down the Mall.

Unfortunately, neither of the plans given indicates the points of the compass, but reference to a map of London will show that the direction of the Mall towards the Palace is almost due south-west; consequently, the result of placing a statue facing down the Mall will be that during the greater portion of the day the sun will be towards the back of it, therefore it would rarely be seen to advantage.

The suggested canal scheme, admirable as it might be made with the aspect reversed, would, I submit, be a mistake, because, as the sun would generally be in front of the spectator, the reflection from the water would be so dazzling at times that the view of the monument and buildings in the distance would be obscured.

It is of interest to note that in the selection of a site for the Albert Memorial consideration must have been given to the important point of aspect; for there the figure rightly faces almost due south.

WILLIAM HENMAN, F.R.I.B.A.

. The aspect of the Albert Memorial statue was probably settled by the consideration that it was to be regarded in connexion with the Albert Hall, and the statue would therefore naturally face towards the Hall. The position of the monument to Queen Victoria has been suggested by the Committee as forming an object at the end of the Mall, treated as "a processional road." On that principle the monument must certainly face the "processional road"; it cannot turn its back on it. There is reason in Mr. Henman's point about the aspect in regard to lighting, but if the Committee retain their idea of grouping the monument with a processional road, the question of aspect would have to be considered as secondary. The only way, on this site,

to reconcile the two conditions would be to give up the processional road, and place the monument further from and facing the Palace, as the Albert Memorial faces the Albert Hall. It is a question, however, whether more would not be lost than gained by the change.—ED.

THE ARCHITECTS' BENEVOLENT SOCIETY.

SIR,—Referring to the report of the annual meeting of the Architects' Benevolent Society, I would like to suggest that, if the Society could be made more generally useful to architects, the benevolent funds available would probably be much higher; for instance, the Society, so far as I am aware, is not constituted to meet the following benefits conferred on its members by similar societies in other professions:—

1. Legal assistance in upholding the status of its members, and in defending cases of alleged negligence, &c.;
2. Granting loans at small interest, to struggling members;
3. Keeping a register of employers requiring assistance, and of assistants requiring employment;
4. Holding quarterly meetings to hear papers read and discussions on all matters affecting the status and general well-being of architects;
5. A system of mutual benefit insurance and savings bank.

If these benefits were conferred on members, it is probable that the majority of the architects and assistants in the United Kingdom would be found willing to pay a subscription of from 10s. to 15s. per annum, and instead of an income of 500l., it is possible that 5,000l. would be available, and thereby

do away with the charitable stigma to which no doubt many, like myself, object.

A STRUGGLER

HOTELS IN CAIRO.

SIR,—Can you or some of your subscribers kindly inform me of the name and address of the builder, or builders, who have built the principal hotels in Cairo in the last few years?

BUILDER.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

14.—WATER-CLOSETS (continued).

NON-MECHANICAL CLOSETS.—These may be divided into four classes—hopper, wash-down, wash-out, and siphonic. Trough-closets and latrines are also non-mechanical closets, but it will be most convenient to consider these separately. Waste-water closets form a class by themselves.

Hopper Closets.—In their simplest form these consist of a conical hopper (usually of glazed fireclay) with a trap of the same material below. There are thousands still in use in the outbuildings of cottages without any apparatus whatever for flushing. An occasional pailful of water is the only cleansing they receive. Such closets ought certainly to be condemned as nuisances, as they are not only foul in themselves, but cause deposits in the drains. Hoppers are generally known as long or short, according to their height. Fig. 1 shows a long hopper; it has a diameter of 14 in. at the top and 4 in. at the bottom, and a height of 15½ in., exclusive of the trap. The connexion for the flush is placed at the side in such a manner that the water circulates around the basin in a spiral form. The short hopper (fig. 2) is 11½ in. high, or (including the trap) 16 in.; the closet and trap can both be fixed above the level of the floor. This closet is shown with a flushing rim and the trap is a modified S-trap with shortened outlet, so that the joint is above the floor; it is sometimes known as a Q-trap. Fig. 1 shows a

P-trap. An ordinary S-trap, with or without ventilation socket, can, of course, be used with either the short or long hopper.

Sometimes the hoppers and traps are made of enamelled cast-iron, but, whatever the material, they are almost invariably enclosed with woodwork. The cheapness of hopper closets is the sole reason of their popularity; a short or long hopper, cane outside and white inside, can be obtained for 2s., and a trap for 1s., and it is no wonder, therefore, that they have been very frequently used in cottages and in the servants' closets of larger houses. An enamelled iron hopper with trap is more expensive, costing from 20s. to 25s. The great disadvantage of the hopper closet is that the water area is so small (only 4 in. in diameter, as a rule), and that it is consequently impossible to avoid fouling the basin; this defect is, of course, more pronounced in the long hopper. The flushing arrangements are often inadequate, and the wood enclosure is also objectionable. For these reasons the long hopper closet ought not to be used at all, and the short hopper closet ought not to be fixed inside houses, and even in outbuildings should only be used in connexion with a flushing cistern containing at least two gallons of water.

Wash-down Closets.—These are really identical in principle with the hopper closet, consisting simply of a basin and trap. Many so-called "wash-down" closets are nothing but short hopper closets with the shape of the basin modified to reduce the risk of fouling. It would be more satisfactory if the term "wash-down" were confined to closets with a water surface appreciably larger than that of the hopper closet. The basin in fig. 3 has a straight back, and the trap has a large socket A for receiving the basin, so that a good cement joint can be made between the closet and trap. The flushing nozzle is arranged so that the last portion of the flush drains slowly through the hole at B and recharges the trap.

Wash-down closets may be broadly divided into closets with loose traps and closets with the basin and trap in one piece. In each class there may be a further sub-division into closets for enclosure with woodwork, pedestal closets, and suspended or bracketed closets. The improvements to which inventors have chiefly turned their attention have been the improvement of the shape of the basin and the increase of the surface of the water standing in it (so as to reduce the risk of fouling), and the better design of the trap and flushing apparatus, so that the trap as well as the basin may be cleared at every flush. The ventilation of the trap and depth of seal, the method of connecting the trap to the branch of the soil pipe, and other points have also received careful attention.

As long ago as 1852 the General Board of Health of this country recommended two forms of pedestal wash-down closet with the basin and trap in one piece of glazed ware. In one the basin is of ordinary short hopper form and has only a small water surface, but that in the second has a recessed back and a fairly large area of water. The designs are historically interesting, but are not of any practical value at the present day.

The "Hygienic" closet (fig. 4) may be given as an example of a wash-down closet with separate trap. The latter may be of earthenware to match the basin or (as in the illustration) of lead. The lead trap allows a wiped soldered joint to be made at B between the trap and the lead branch of the soil pipe. The trap is of the well-known "Anti-D" shape, having a square angle at A to reduce the risk of siphonage. The ventilation pipe C may be connected with the branch of the soil pipe as shown at C. A wide flange of lead around the inlet of the trap forms a good seat for the basin, the joint being made tight with white lead or "elastic" cement. The objections to this basin are the small area of water and the large exposed surface of the basin.

The next example (fig. 5) shows a more recent closet of the same type, the "Compactum." In this the water area measures 8½ in. by 6½ in., and the depth of the trap-seal is increased to 3 in. The flushing rim is also of improved form, so as to discharge the bulk of the water towards the front of the basin, and the basin is made with an extension at the back (shown at A) to which the seat can be attached; this is better than fixing the seat to the wall, and a further advantage is that the extension is raised so as to keep the seat clear of the basin. The "Compactum" is

a pedestal closet, and is made with a drawn-lead trap of P or S form, or with a pottery trap in one piece with the basin. The lead trap can be turned in any direction at the rear of the basin within an angle of about 90 deg.—that is to say, 45 deg. on either side of the central line of the closet. This is a great convenience in many situations. Fig. 6 shows a "Citizen" closet, with glass-enamelled cast-iron trap and glazed fireclay basin; it is intended for use in industrial dwellings and other places where the apparatus may be subjected to rough usage. Pedestal closets are also made with half-traps, as in fig. 7, the advantage being that the joint between the pottery and metal is below the water-line, and that leaks can be discovered as soon as they occur.

The pedestal closet was a great improvement on the enclosed closet, as it allowed the floor and wall around the closet to be kept clean. But a further improvement was effected by supporting the closet on lugs or brackets, so as to be entirely clear of the floor. An example of this kind with drawn-lead half-trap is given in fig. 7. The basin is of white glazed earthenware with half-trap, having a flanged outlet D, to which the flange A of the lead half-trap is joined by means of a rubber washer C, and a loose brass collar B secured with hook-bolts. The trap may be of P or S form. The basin has a "slop-top" with raised rim, and is supported on an iron band E bedded in putty, this band being in turn supported by iron brackets. The surface of the water in the basin measures 7 in. by 5½ in., and the depth of trap-seal is 2 in.

Closets with basin and trap in one piece are almost invariably made as independent pedestal or bracket closets. The designs for pedestal wash-down closets are innumerable. The position of the trap outlet modifies the design to a very considerable extent. Fig. 8 shows a wash-down closet with central outlet intended to take the place of a valve or pan closet without altering the position of the branch of the soil-pipe. The joint at the outlet of the trap is not above the floor, and the closet therefore contravenes the regulations of the London County Council. The water area in such closets is necessarily small. In most closets of this kind it is impossible to make a thoroughly good joint at the outlet of the trap or to inspect it afterwards. In the example given, however, the side portions of the pedestal are made loose, as shown at A, so that the joint can be made and afterwards repaired. The trap itself is not ventilated. It is a great mistake to fix a new closet on old plumber's work—at any rate if this was formerly connected with a pan-closet—as the old plumbing is in all probability as insanitary as the old closet.

The closet with back outlet (fig. 9) is intended for fixing in the place of an old "wash-out" apparatus, without having to alter the branch of the soil-pipe. Like the previous example, it has only a small area of water. The trap has a ventilation-socket, although not in a very good position, and the outlet joint of the trap, although accessible from the back of the pedestal, is not above the floor.

The well-known "Simplicitas" closet, 1898 pattern, is one of the best modern wash-down apparatus. The water-area (fig. 10) is about 10½ in. by 6½ in., and the surface is brought well up towards the seat. The depth of the trap-seal is 2 in., and the outlet of the trap (which may be of P or S form) is well above the floor. The original "Simplicitas" closet had a water-area measuring only about 6 in. by 5 in., or less than half that of the new pattern.

Bracket wash-down closets, in one piece of fireclay, are made by different firms under licence from Mr. Hellyer, the original patentee, who, we believe, was indebted for the idea to Mr. Keith D. Young, F.R.I.B.A., although he had previously made specially-shallow wash-down closets and supported them on flat cast-iron brackets. They have the advantage of leaving the floor perfectly unobstructed, and have been adopted largely for hospitals and asylums. They are known by various names, such as Bracket, Corbel, Console, and Projector. The projection ought to be such that the joint between the outlet and the branch of the soil-pipe is within the room, and not in the thickness of the wall. Fig. 11, known as the "Projector," is satisfactory in this respect; the water-area is about 7 in. by 6 in. The bottom of the closet is 3 in. above the floor.

It is impossible in the space at our disposal

to discuss all the different forms of wash-down closet. Strong glazed fireclay or enamelled cast-iron closets are made for workshops and other places where they will be subjected to rough usage. For prisons the fireclay closet is sometimes encased in sheet-iron, the space between being filled with cement, while the flushing apparatus is actuated from an adjacent corridor. In some cases, prison closets are made to fit an angle of the cell. Some pedestal closets are made with a flat back to fit closely against the wall; this does away with a confined space which is difficult to keep clean, but the outlet joint must be formed in the thickness of the wall and cannot be inspected without removing the closet or providing an inspection opening on the outside of the building.

The wash-down closet shown in fig. 12 represents a new departure in some respects. It is known as the "Anti-fouling and Non-contagious Water-Closet," and was designed by an architect (Mr. Lanyon, of Belfast) for use in public places, and in barracks, workhouses, and other institutions. The plan of the basin is long and narrow, measuring at the water-line about 10½ in. by 4½ in.; the back is nearly vertical and is kept well in the rear of the opening at the top of the basin; in the front of the basin a shallow recess or groove is formed, which is continued forward through the rim and seat. The flushing-rim has the openings equal in area to the area of the flush-pipe, the openings being increased in size towards the front, so that the principal part of the flush is discharged in the front part of the basin. The rim is 3 in. wide, and slopes inwards, so that the closet can be conveniently used for slops or as a urinal. There is a good depth of water in the basin, so as to prevent fouling of the bottom. The seat also is specially designed. The outlet of the trap is above the floor, and is provided with a ventilation socket. A three-gallon flush is required to clear the basin and trap.

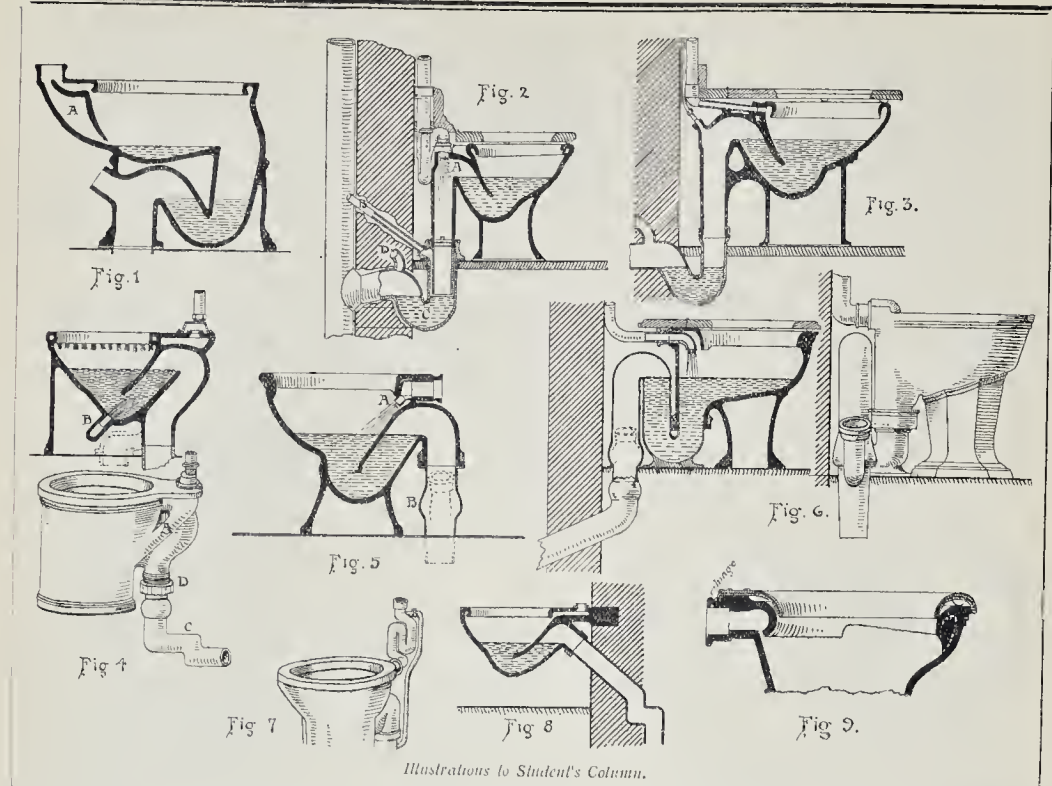

The closet shown in fig. 13 is one of Adams' and is peculiar in having the outlet of the trap turned to the side. This is convenient when the closet must be fixed with the back against a return wall at right angles to the external wall. The basin and trap may be in one piece of "Titanite" as shown, or a half-trap of lead may be used after the manner illustrated in fig. 7. The wood seat is supported on the lead extension at the back of the basin, and the cistern is operated automatically (by means of the spindle A) when the seat is released.

15.—WATER-CLOSETS (continued).

WASH-OUT CLOSETS.—These closets were very popular from fifteen to twenty years ago, but are now little used. The special feature is a shallow basin for the reception of the faeces. This basin holds water to the depth of about 1 or 1½ in., and has a weir on one side, over which the contents are driven by the flush of water from the cistern into the trap below. The force of the water is broken by the basin, so that the trap is seldom cleared with one 2-gallon flush. The lip of the weir and the sides of the vertical tube leading to the trap are quickly coated with filth, and the depth of water in the basin is too little to cover and deodorise the soil. The closets are made for enclosure in woodwork or as pedestals, the trap (which may be of S or P shape) being sometimes in one piece with the basin (as in fig. 1) and sometimes in a separate piece. An after-flush chamber A is provided on the inlet horn to recharge the basin.

Siphonic Closets.—We have seen that the washdown closet was evolved from the hopper closet. The siphonic closet is merely another step in the process of evolution. The basin is practically a washdown basin, but with a greater depth and area of water and a greater depth of trap-seal. The outlet-arm of the trap is also continued well below the bottom of the basin, in order that the greater portion of the contents of the basin may be removed by siphonage.

The essential difference between the wash-down and the siphonic closet is that in the former the contents of the basin are driven out by the flush, while in the latter they are drawn out by siphonic action, which is indeed started by the flush but, when once started, continues independently. The method of starting the siphonic action varies in different closets. Siphonic closets are almost invariably made in pedestal form, and may there-

Illustrations to Student's Column.

fore, when fixed in houses, be used as slop-receivers. In some closets the siphonic action will be started if a pailful of slops or water is poured into the basin, and the contents of the basin will be siphoned out without the flushing cistern being put into operation. The seal of the closet-trap may therefore be destroyed or very much reduced. Other closets, however, are so designed that the siphonic action can only be started by the water from the flushing cistern. Others, again, are so arranged that if from any cause the siphonic action of the basin is started, the flushing cistern is automatically set in action.

Many siphonic closets require a trap on the branch of the soil-pipe in addition to the trap in the closet itself. This forms a double safeguard against the entrance of drain air; but as the pipe between the two traps cannot be properly ventilated (otherwise the siphonic action could not take place), it may contain foul air, and some of the most recent closets substitute for the second trap one or more square bends in the branch pipe, which ensure siphonic action by checking to some extent the escape of the water.

Jennings & Morley's "Closet of the Century" (fig. 2) is one of those with two traps, although it can also be used with a weir bend, instead of the lower trap. Siphonic action is started by part of the flush-water passing through a nozzle, A, into the top of the long leg of the siphon, the air in this leg being at the same time expelled through the puff-pipe, B. The second trap, C, is of lead, and can be ventilated, if necessary, by the pipe D. Part of the flush is diverted to the flushing rim, in order to cleanse the basin. It is obviously a disadvantage, when only a small quantity of water is allowed by the water companies, that a great part of it should not pass through the basin, and various closets have been designed in which this objection has been overcome.

Doulton's siphonic closet (fig. 3) is on the same general lines as Jennings & Morley's, but with "the full discharge from cistern passing through and cleansing basin." The area of the water is 12 in. by 9 in., and the greatest depth 6½ in. The depth of the trap-seal in the basin is 3¼ in. The bore of the outlet leg of the closet is 2½ in., which is found to be sufficient for the passage of soil and

paper. The joint between this and the lower trap is above the floor. It is claimed that the basin cannot be siphoned out by pouring slops or water into it.

The "Twycliffe" siphonic closet (fig. 4) does not require a second trap. The siphonic action is started in an ingenious but simple manner by taking part of the flushing water down the arm A and discharging it at B in the direction of the outlet arm of the trap. The soil is therefore cleared out by the first part of the flush. The peculiar bends in the branch-pipe C are supplied with the closet, and are introduced to check the water until siphonic action is properly set up. These bends are in one piece of lead wiped to a brass socket at the top, so that the joint at the closet-outlet can be made with neat cement; or a brass screw-cone joint is made as shown at D; or a short lead tail-piece is united to the outlet by a porcelain metal wiped joint, to which tail piece the lead bend can be united by an ordinary wiped joint. The area of the water in the basin is about 12 in. by 10 in., the greatest depth 7½ in., and the depth of trap-seal 3½ in. A flush of two gallons is sufficient to clear and recharge the basin, but in this, as in other siphonic closets, a 3-gallon flush is safer. The flushing-rim has a series of holes, instead of the usual continuous opening. The closet is also made with a central outlet at the floor-level, as shown by the dotted lines, but this cannot be recommended. A close imitation of market. The "Twycliffe" siphonic closet is also on the trap being in front instead of in the rear; by this arrangement the pottery tube leading straighter, but the bend at the top of the trap is necessarily constricted; according to the published section, it measures at one point less than 1½ in.

The "Injecta" siphonic closet (fig. 5) has a basin of almost normal wash-down form, but containing more water and having a deeper seal. As in the "Twycliffe" closet, siphonic action is started by a jet of water, but in this case the nozzle is at the back of the flushing rim and is directed into the standing water in the basin. The tail-piece B is a patented part of the apparatus, and is united to the pottery outlet of the closet by a special soldered joint. On one side

of the tail-pipe a socket is found for the puff or ventilation pipe, which must be connected to the main ventilation pipe. The depth of seal is 3½ in., and the closet can be cleared and recharged with a 2-gallon flush.

The "Barrhead" siphonic closet (fig. 6) has a water area measuring 13½ in. by 11 in., and an 8-in. seal. The trap, which has a 3-in. bore, is of lead united to the basin by a special soldered joint. As in the last example, the siphonic action is started by a jet of water descending from the back of the flushing rim, and the long leg of the siphon has the bulbous portion with ventilation socket. This closet cannot be unsealed by slops, and can be cleared and recharged by a 2-gallon flush, although it is, of course, preferable to use a 3-gallon cistern where possible. In the section, the long leg of the siphon is shown behind the short leg, but in practice it is placed at the side in order to reduce the projection from the wall; this is correctly shown in the elevation. The long leg of the siphon is also made sloping, like the tail of a P-trap, so as to pass directly through the wall. The outlet is then connected into the side of the soil-pipe. All the joints, including those of the puff-pipe, are therefore outside the building, with the exception of the joint between the closet and trap, and this joint is under water.

In the case of closets in which siphonic action may be started by a pailful of slops or water, Dicksee's arrangement (fig. 7) is sometimes introduced. This is simply a small air-pipe connecting the long leg of the siphon and the flush-pipe, the flush-pipe being trapped below its connexion with the air-pipe. When the siphonic action of the closet is started air is drawn from the flush-pipe, and this starts the siphonic action of the flushing cistern.

Siphonic closets have recently been made in bracket form to stand clear of the floor. The "Console Siphon" water-closet (fig. 8) is an example. It is on the lines of the "Twycliffe"; the bent outlet leg of the siphon is of brass. The basin has a 3-in. trap-seal, and requires a flush of three gallons. The total depth of the basin is only 12 in., so that there is a space of about 5 in. between it and the floor.

It is unnecessary to give further examples. All siphonic closets have a large water area

and deep seal, and thus possess some of the chief advantages of valve closets without their objectionable mechanism. It is essential that a siphonic closet should be fixed only in connexion with the flushing apparatus which has been specially designed to suit it, as the satisfactory working of the closet depends to a very large extent on the nature of the flush. Siphonic closets have been made to work with 1½-in. regulating supply valves similar to those used for valve closets, but valves of this kind can only be adopted in places where the water is supplied by meter or without restriction as to quantity, as, for example, in the case of a private supply. The long legs of the siphons are as a rule only 2½ in. or 3 in. in diameter, and there is no reason why the soil-pipes for single closets should be any larger.

Combination Closets.—This name is often applied to closets in which the flushing cistern is placed immediately above the seat of the closet. Such closets were originally introduced for fixing in places where the water would not rise to the level of the ordinary flushing cistern, but have proved so satisfactory, that they are now being used with high-pressure water supplies. The principal advantage is that they are less noisy in action. This is partly due to the lower velocity of the water when the cistern is in operation, partly also to the fact that the cistern is always provided with a cover. The cistern may be of cast iron or pottery, but the writer prefers wood lined with lead or copper, as the wood also assists in deadening the sound. The cistern may be of the valve or siphon type, but must have a large outlet, as the lower velocity of the water necessitates a larger volume being discharged in a given time. A closet of this kind may where a window prevents the cistern being fixed in the ordinary position above the closet. If the cistern is fixed on one of the side walls, two additional bends must be made in the flush-pipe, and these not only add to the cost, but are unsightly and very considerably reduce the power of the flush, and, if the wall is a half-brick wall, the noise of the cistern will be transmitted to the adjacent room. Low-level cisterns of this kind are now applied to siphonic as well as to wash-down closets.

The name "combination closets" may also be applied to water-closets which are specially designed to serve another purpose besides that for which they are primarily intended. In small houses the water-closet usually serves also as slop-closet and urinal, and it is therefore desirable that the rim should be of a good width and made to slope inwards, as shown in fig. 12 of the preceding article. Sometimes the top of the basin is widened to form a "slop-top," which is provided with a raised rim, as shown in fig. 7 of the preceding article. In the "Hy-back" combined water-closet and urinal the basin has a vertical extension at the back and the seat is of horse-shoe shape, pivoted in the middle, the wings being weighted at the back, so that the seat, when not in use, remains in a vertical position. Such an arrangement cannot possibly be adopted in a private house, or anywhere else where decent people congregate.

A much more elaborate combination is that designed by Mr. J. J. Lish. It is water-closet, urinal, slop-sink and draw-off sink (for hot and cold water), and is supplied with loose fittings, so that it can also be used as a lavatory, bidet, and rising douche-bath. The urinal is a curved porcelain slab rising from the back of the basin, but covered by a glazed door when not in use. The whole of the apparatus above the closet seat is encased with woodwork and forms a ventilation shaft, in which a gas flame can be kept burning to induce an up-current, which will also be assisted by the hot-water pipe placed within the casing. A glazed door is hung in front of the gas flame, so that this serves to light the room. Elaborate combinations of this kind, like the wonderful pocket-knives, which we used fondly to believe (until we bought them) equal to a whole chest of tools, will never prove entirely satisfactory. They will be useful in the confined quarters of bachelors, or elsewhere on occasion, but are not likely to come into general use. The ventilation shaft rising from the basin of the closet is certainly a good idea. Of all the rooms in a building the water-closet is the one where extraction of air ought to be most carefully provided for.

Water-closet seats are commonly made of

wood, left plain, or painted, varnished, or polished. Polishing is the best finish. Where the closet may be used as a slop-sink or urinal, the seat must be hinged so that it can be readily raised, or swung on pivots and weighted behind the pivots so that it remains in an upright or inclined position when not in use. Hinged seats ought to have rubber buffers underneath to prevent injury to the basin, and it is a great convenience to have the basin formed with an extension at the back to which the back rail of the seat can be fixed. Sometimes the wood back rail is omitted, the seat being hung to brass supports rising from the pottery seat-extension; this allows the whole of the basin to be cleaned. Many seats are made of two thicknesses of wood, placed with the grain at right angles to each other to give additional strength and to prevent warping. Hinged lids or flaps are useful in deadening the sound of the water in the basin and in preventing splashing on to the floor, but the polish on the underside is soon destroyed by the moisture. Indurated wood-fibre seats have also been made. Sheet-metal seats have been tried, but unless covered in some way are too cold for comfort. A very good covered seat of this kind is shown in fig. 9. It is known as Shanks's "Metallo-Vulcanite" seat, and consists of a piece of stamped sheet-steel covered on both sides with a substantial coating of black, red or brown polished vulcanite. The seat is light, durable, and non-absorbent, and has been used in hospital work. The hinges are at the back of the seat extension, so that the whole of the basin can be thoroughly cleansed. Rubber buffers are provided under the seat.

In workshops and some public places the seat is occasionally omitted, but this leads to fouling of the pottery. A better plan is to fix wood pieces on the side portions only of the closet rim, leaving the pottery exposed along the front and back, or to use a hinged seat with the front portion cut entirely away. Such a seat is not, of course, very strong, but it has certain sanitary advantages.

OBITUARY.

MR. H. H. BULL.—The death took place at Southampton on the 15th inst. of Mr. Henry H. Bull, builder and contractor. The deceased was a member of the firm which had the contract for building the Parliament buildings at Capetown and the Law Courts in London. The last-named work, it will be remembered, was beset with many difficulties, not the least of which was the great strike of masons, to combat which a great number of men were imported from Germany.

GENERAL BUILDING NEWS.

WESLEYAN CHURCH, OSMASTON.—At Osmaaston-by-Derby, on the 8th inst., the foundation-stone of a new Wesleyan chapel was laid. The building is situated on the east side of the main road, and will supersede the present iron structure. The walls will be brick, with Derbyshire stone dressings. There will be seating accommodation for 560 persons. The architect is Mr. John Wills, of Derby.

WESLEYAN CHURCH, TONES.—On the 8th inst. foundation stones were laid of a new Wesleyan church, Tones, which is being built in front of the school. Designed by Messrs. Bridgman & Bridgman, architects, Torquay and Paignton, the church will be in the late Decorated style. It will be of local stone with a facade of dressed limestone, the mullions of the front window and other stone dressings being of Bath stone. At the north-east angle, facing Fore-street, will be a tower terminating in a turret. The front of the building will recede from the street, from which it will be separated by a court and steps. The main entrance will be through a tiled vestibule at the north end, and there will be a second entrance on the west side. On the west side of the choir stalls will be the vestry, and on the east the organ chamber. There will be two aisles, and the floor will be of wood blocks. Provision has been made for the erection of a gallery at the north end, but this is not included in the present contract. Exclusive of the gallery, seating accommodation will be provided for 328 persons, the pews being of pitch pine. A pulpit of stone will be placed facing the west aisle. Messrs. Reeves & Sons are the contractors. Including the site the cost is estimated at 3,000*l.*

CONGREGATIONAL CHURCH, AVONMOUTH, GLOUCESTERSHIRE.—On the 8th inst. foundation stones were laid of a Congregational Church at Avonmouth. The site is at the corner of Napier and Victoria Roads. The church will consist of a nave and aisles with open timber roof. At the opposite end to the pulpit there will be a gallery. The choir and organ will be situated at the same end as the pulpit, in the apse, there being an apsidal

termination. A dwarf tower will be at the corner, the upper part of which will be used as a classroom. The church parlour will adjoin the apse, and be hexagonal in shape. The building is to be constructed of local stone with Bath stone dressings, the walls lined inside with buff bricks, and with a tiled roof, in which there will be dormer windows. The low pressure water system of heating apparatus will be fitted by Messrs. Crispin & Son. The architect is Mr. G. H. Oatley, and the builder Mr. W. G. Bindon.

CHURCH, SOMERCOTES, ALFRETON.—Plans for a new church at Somercotes have been prepared by Mr. Percy H. Cursey, of Derby.

BAPTIST CHURCH, CARLTON, NOTTINGHAMSHIRE.—A Baptist church and Sunday school buildings have been erected at Carlton from plans by Mr. R. Whitbread, of that town. The builder was Mr. G. Tegidine.

POOR LAW SCHOOLS, SIDCUP.—The foundation stone of the new Poor Law schools which the Guardians of the Greenwich Union have found it necessary to build at Halfway-street, Sidcup, for the accommodation of the children chargeable to the Union, was laid recently. The buildings will comprise four homes, to accommodate fifty boys each upon two floors, eight or ten in a dormitory, with playing-rooms, dining-rooms, kitchens, &c., on the ground floors, and two cottages, each to accommodate twelve boys. There will be ten pairs of cottages, each to accommodate fifteen girls and infants. In each will be a single bedroom for the girl who is next to be sent out into the world. That makes a total of 524, and besides there will be probationary cottages—two for boys, accommodating ten each, and the same number for girls—where new-comers will be kept for three or four weeks. An isolation block will give accommodation for dealing with four kinds of infantile disease, each being kept from contact with the other. The architect is Mr. T. Norman Dinwiddie, and the contractor is Mr. T. Rowbotham. The estimated cost of the buildings is 108,500*l.*, and Mr. Rowbotham's tender was for 107,777*l.* The buildings will be constructed mainly of Tunbridge Wells bricks, with tiled roofs.

PRIMITIVE METHODIST CHURCH, HASLAND, DERBYSHIRE.—A Primitive Methodist church has been erected at Hasland from designs by Mr. W. Cecil Jackson, of Chesterfield. It is intended to erect a tower at some future time. The building will accommodate 400 persons.

BANK PREMISES, CUPAR.—New premises for the Cupar Fire Savings Bank are being erected in Crossgate, Cupar. Plans have been prepared by Mr. Birrell, architect, of Cupar.

CO-OPERATIVE PREMISES, DUNFERMLINE.—A furniture warehouse has been erected in High-street, Dunfermline, for the Dunfermline Co-operative Society, Limited. Provost Scobie, of Dunfermline, was the architect.

BUILDING IN HULL.—Plans for 229 new houses were passed by the Works Committee during March last. It is evident that the threatened slump in the building trade does not deter speculative builders from developing the new building estates off Prince's-avenue and in other parts of the city. The supply up to the present appears to have been only equal to the demand, for no sooner are houses built than they are occupied, even before the plaster on the walls is dry. The opening up of the Prince's-avenue district is perhaps one of the most notable transformations ever seen in the city. What only three years ago was open fields is now a forest of houses, with streets each half a mile long. The new street—Chanterlands-avenue—running from Walton-street behind the Western Cemetery and across the extreme end of Marlborough and the other avenues, is now open, and building operations are about to be commenced.—*Eastern Morning News.*

THEATRE ROYAL, SEAHAM HARBOUR.—The new Theatre Royal, Seaham Harbour, has been erected on the site of the old Theatre Royal, in Green-street. The building covers an area of 908 square yards and is of brick, the external walls being of red glazed bricks. The stage measures in width 46 ft., from back to front 30 ft., and has a clear proscenium opening of 26 ft. square and allowing in height for a fireproof screen, and ventilated and lit by a turret 10 ft. square. The body of the theatre measures in width 46 ft., from back to stage 50 ft., and is in height 40 ft. The theatre provides accommodation for nearly 2,000, and will be lighted throughout with both electric light and gas. The contractor for the work is Mr. Mark Howarth, the decorated plaster work and fireproof steps are by Messrs. Rule, the plumbing by Messrs. Altkin & Austin, and the painting by Messrs. Austin & Sons, all of Sunderland. The scenery is being executed on the premises by Mr. Geo. Collier and his son, Mr. Geo. Collier, jun. The work has been designed and is being carried out under the supervision of Messrs. Wm. & T. R. Milburn, architects, Sunderland. The electric lighting installation is being fitted by Messrs. T. Reid, Ferens, & Co., electrical engineers, Newcastle, under the supervision of Mr. A. Andrews.

WAREHOUSES, NEWCASTLE-ON-TYNE.—New warehouses for a firm of wholesale grocers have been erected in Stowell-street, Newcastle. Mr. Alexander Bruce was the general contractor. The building is fitted with electric lifts by Messrs. Waygood & Co. The lighting is by electricity, the

fittings having been supplied by Messrs. T. G. Usher & Co. Messrs. Henry Walker & Son carried out the steam-heating and hot-water supply arrangements. The architects were Messrs. Bädenoch & Bruce.

BANK PREMISES, TRALEE, CO. KERRY.—New premises for the Munster and Leinster Bank have just been opened at Tralee. Mr. J. B. Healy, of Tralee, was the builder, and Mr. L. A. McDonnell the architect.

BOARD SCHOOLS, HULL.—The foundation-stone of the new schools which the Hull School Board are building in Mersey-street, Holderness-road, was laid on the 3rd inst. The scheme comprises a two-story mixed school in two departments of "junior mixed" for 508 scholars, and "senior mixed" for 508 scholars; also a separate infants' school for 300 children—a total accommodation of 1,316. The two-story main buildings of the mixed school, in the centre of the site, have been designed at right angles to Mersey-street, with its end only facing the street. The building is well removed from the noise of the street by being set back about 40 ft. The juniors are provided for on the ground floor, and the senior department on the first floor. In each case there is a large central hall, surrounded by eight classrooms all entered from the hall. The entrances for boys and girls respectively are at the opposite ends of the building. There are no corridors for mixed children, and the sexes will not be mixed in any way except within the central halls or classrooms where under supervision. The senior mixed school on the first floor is similarly arranged to that of the junior school on the ground floor. The infants' school is arranged in the recessed portion of the site facing the side street, and comprises a central hall surrounded by five classrooms. Ample lavatory and cloakroom accommodation is separately provided for each department. The central halls are placed on the west. Teachers' rooms and book-stores are provided for each department. In addition to the above accommodation there is a special two-story building provided on the Mersey-street frontage as a laundry and cookery centre. The laundry has accommodation for forty-two students and the cookery centre on the first floor for fifty-four students. The buildings will be faced with ordinary hand-made kiln bricks and roofs slated. The floors of the central halls will be of wood blocks laid on concrete. The floors of entrances, corridors, cloakrooms, and lavatories will be of concrete, and staircases of Yorkshire stone. The classroom floors will be of ordinary joists and boarding. The inside walls of entrances, staircases, cloakrooms, and lavatories will be of white glazed bricks from floor to ceiling, and a dado of brown salt glazed bricks will be run round all inside walls of the central halls and classrooms. The seating throughout will be by dual desks. The buildings are being erected by Messrs. J. Houlton & Son, contractors, from the designs and under the supervision of Messrs. Gelder & Kitchen, architects. Mr. J. Tullis is acting as clerk of works. The amount of contract for these buildings is 10,650*l.* The heating and ventilating of the new buildings is being carried out by Messrs. Ashwell & Nesbit, of London. The heating will be by low-pressure steam.

STAINED GLASS AND DECORATION.

WINDOW, ST. MARY'S CHURCH, WOLVERHAMPTON.—A two-light window has been filled with stained glass in the aisle of this church to the memory of the late Queen. The subject of the window is the Passion of our Lord treated in four subjects, with canopies and bases of the Gothic period. On a ribbon on the base is the following inscription:—"To the glory of God and in revered memory of our late most beloved Sovereign Lady Queen Victoria, who fell asleep January 22, 1901. Erected by the St. Mary's Needlework Guild." The work has been carried out by Mr. H. A. Hymers, of Chelsea.

WINDOW, PARISH CHURCH, DONNINGTON WOOD.—A three-light window was lately placed in the east end of the parish church at Donnington Wood, near Newport, to the memory of the late vicar. The subject taken was the Crucifixion, with figures of St. Aidan, St. Matthew, and St. Chad in the base. The window was designed by Mr. T. W. Camm, of Smethwick, Birmingham, and executed at his studio.

FOREIGN.

FRANCE.—The Société Nationale des Architectes has chosen, as programme of its annual competition, the construction of a refuge for the victims of accidents met with in the course of daily work. The competition will be closed on September 5.—The Prefect of the Seine is about to enter into negotiations with the State with a view to the preservation of the platforms of the quays in connexion with the great Exhibition, in order to form a promenade along the river bank; also for the total demolition of the buildings on the Champ de Mars, and the sale of the land bordering Avenue Suffren and Avenue La Bourdonnais.—The Annual Congress of the Sociétés Artistiques de France will be held on Tuesday, May 28 (the twenty-fifth anniversary of the foundation of the Société), in the Hémicycle of the Ecole des Beaux-Arts.—The jury in the Chena-

yard competition has awarded the prize to M. Lefort, a pupil of M. Paulin, for his design for "The Interior Decoration of a Transatlantic Building."—The town of Flers (Orne) has opened a competition for the rebuilding of the church of St. Germain, at an estimated cost of 680,000 francs.—The family of M. Thiers have presented to the city of Marseilles the house in which the former President of the Republic was born, and which will be made use of as a museum.—The municipality of Lyons is about to erect a "Hôtel des Invalides du Travail," at an estimated cost of 814,000 francs.—The Société des Artistes Indépendants is about to organise an exhibition of painting and sculpture in the large conservatory on the Cours la Reine, now the property of the municipality of Paris.—M. Gaspard George has been elected President of the Société Académique d'Architecture de Lyons, for 1901, and M. Marcel Boille President of the Société des Architectes de Touraine.—The death is announced, at the age of fifty-eight, of M. Edouard Dupire-Rozan, architect, of Roubaix, and a former pupil of Questel and Vaudremier. He was the architect of a number of noteworthy town mansions and country châteaux in the northern district of France, especially in the neighbourhood of Roubaix and Turcoing. He received a medal in the Salon of 1881, and in 1893 the Société Centrale des Architectes awarded him their "Grande Médaille" for domestic architecture.

MISCELLANEOUS.

THE CITY SURVEYOR'S DEPARTMENT, MANCHESTER.—At a meeting of the Manchester City Council recently, the following memorandum and suggestions, prepared by Sir John Harwood, were included in the proceedings of the Town Hall Committee:—"That the architectural and building surveyor's work be removed out of the City Surveyor's office, and all such work be placed in a new department, and that we recommend the employment of a competent architectural and building surveyor, who would be capable of making plans for all plain buildings that might be required for the Corporation; that he should have the entire charge of this office, and should take out the quantities of all buildings, whether they were designed by him or some other architects in the city; that he should prepare and be responsible for all quantities for competitive builders for carrying out such work, and that when the works are finished he should measure up all extra work, and make all deductions which should form a basis of a final settlement for all contracts; to do this a gentleman would be required who has had some considerable training as this is a very important and would be to the Corporation very remunerative work, and save a great deal of friction and misunderstanding. The Committee passed a resolution proposing that the Corporation advertise for an architect and surveyor at a salary of 600*l.* per annum." Councillor Wilson moved, and Councillor Brocklehurst seconded, an amendment proposing that the matter be referred back for further consideration. After discussion, the Lord Mayor said the Committee would further consider the matter, and the proceedings were approved on this understanding.

BUILDING SCHEME, SHEFFIELD.—Some few months ago the City Council of Sheffield appointed a special committee to consider a scheme proposed by Alderman Styling for the utilisation of surplus land belonging to the Corporation in Angel-street, Sheffield. The committee recommend the erection of a block of buildings, to be used as shops and artisans' dwellings, at the corner of Angel-street and King-street, and the borrowing of 11,000*l.* to cover the cost of land and buildings, &c. At a recent meeting of the City Council the minutes of the committee containing this recommendation were confirmed. A report on the subject has been submitted to the committee by Messrs. Gibbs & Flockton, of Sheffield.

FALL OF A PILLAR IN WESTMINSTER ABBEY.—A few weeks ago there was a sudden fall of masonry in Westminster Abbey. Early in the morning a marble shaft, about 4 in. in diameter, fell from one of the windows, through the glazing of a window and a balf. The shaft was broken, and in its fall it shattered two of the hot-water pipes of the Abbey heating apparatus, and damaged to some extent the tomb of Lord Norreys.

DISTRICT SURVEYORSHIP OF WEST HAMSTEAD.—Mr. Rowland Plumbé, F.R.I.E.A., has resigned the office of District Surveyor, under the London Building Act, for the above district.

PROPOSED NEW TOWN HALL, HARROGATE.—The Mayor (Dr. J. A. Myrtle) presided at the monthly meeting of the Harrogate Town Council on the 15th inst., when the question of the provision of a New Council Chamber and Municipal Offices was discussed at some length. The Corporation originally decided to utilise the Promenade Room, which, with the adjuncts, had for many years been used as the Town Hall Theatre. Extensive alterations to the premises were deemed necessary to carry out the scheme, and on October 8 last the Corporation passed a resolution instructing the Town Clerk to make application to the Local Government Board to apply for their sanction to a loan of 8,000*l.* for the new Council Chamber

and office accommodation agreed to. The Corporation having abandoned this scheme, Alderman Chippendale moved that this resolution be rescinded. Councillor Milling seconded. The Mayor, in supporting, said the Corporation were tied to build Municipal Offices and a Town Hall, by act of purchase, on the Town Hall site in Victoria-avenue. The motion was carried unanimously. The Finance Committee reported that they had considered the question of new Municipal Offices, and recommended that Councillors Atkinson, Binns, Dickenson, Judge, and Mudd, be added to the Finance Sub-Committee, which was instructed to consider the requirements to be provided for, and report, and that afterwards competitive designs be invited for the erection of a Town Hall on the Victoria-avenue site.

THE CITY OF LONDON DIRECTORY, 1901.—The thirty-first annual edition of the City of London Directory (Messrs. W. H. & L. Collingridge, Alders gate-street) is accompanied, as usual, by a large and excellent coloured map of the City, which would be more useful if, like the map in the Post Office London Directory, it had been mounted on linen. The Directory, which is an exhaustive guide to the City, and which appears to have been brought well up to date, contains an Official Directory, giving details of the principal Government Offices; Corporation Directory, showing the Aldermen, Common Councillors, &c.; London Hospitals and Charities; City Schools; City Clubs and Institutions; City Churches; Public Buildings, comprising a description of many of the principal buildings in the City; Newspaper Directory; Conveyance Directory, giving the railways with their principal officials, and a complete list of the receiving offices in the City; a Biographical Directory; Livery Companies' Guide, comprising the names of the Masters, Wardens, and Members of the Courts of Assistants of the Livery Companies, with the history of their halls, charters, arms, charities, and schools; Streets Guide; Alphabetical or Commercial Directory; Trades Guide, classified under the various trades or professions, with as few cross references as possible; Public Companies' Directory, &c. The street improvements of the year are indicated in the map, and include the alterations in Lower Thames-street, Jeffreys-square, Threadneedle-street, and other streets of the City of London. The Central London Railway is shown as a line in use, and the Great Northern and City as a railway in course of construction.

CAPITAL AND LABOUR.

EDINBURGH JOINERS.—A meeting of joiners was held in the Music Hall, Edinburgh, on the 10th inst., to discuss certain alterations proposed by the local masters in the working of the by-laws. The proposed alterations include a reduction from 9d. to 8d. per hour, and a suggestion that the date of the expiry of the notice of any alteration in the by-laws be changed from April 15 to June 6. The meeting agreed to accept the masters' suggestion that the proposals be submitted to arbitration, on condition that the present rate of wages and the code of by-laws be adhered to pending the arbitrator's award.

ABERDEEN PLASTERERS.—It was mutually agreed locally by both parties to the dispute in this trade that the wages be reduced from 8*sd.* to 8*d.* per hour instead of 7*sd.* as originally proposed by the employers. The central executive in Glasgow of the Operatives' Union have, however, rejected this compromise, and ordered the men to stand out for 8*sd.* The strike will thus be continued.

END OF PERTH JOINERS' STRIKE.—On the 9th inst. a deputation from the Perth joiners who have been on strike for some time met the employers in the City Café, when the dispute as to the wages was settled. It was agreed that the wages remain at 8*sd.* per hour for the next three months, and afterwards at 8*d.* per hour until April 1, 1902.

BELFAST BUILDING TRADE.—The strike in the Belfast building trade has been settled by arbitration. The Rev. Father McMullen was the arbitrator.

LEGAL.

WOODEN STRUCTURES ERECTED WITHOUT LICENCES.

On Thursday, the 11th inst., at Marlborough-street Police-court, six builders were summoned at the instance of the London County Council for having erected wooden structures in various places for viewing the Royal funeral procession on February 2 last, without having obtained licences as required under Part VII. of the London Building Act, 1894. The offence was admitted in each case, and each defendant was fined 5*s.*, with 12*s.* 6*d.* costs. Some of the structures were erected within private grounds, Mr. Fenwick, the learned magistrate, remarking that that made no difference.

with connecting rods and cranks upon a shaft, the ends of the arms being supported with rollers, of which the bearings may be lifted off or lowered upon the work-table with bevel gearing moved with a hand-wheel. Other bevel gearing turns the table whilst the arms are being reciprocated.

24,879.—ARMoured CONDUCTORS (ELECTRICAL): *W. H. Isherwood*.—The conductor is laid upon insulating-rests within a metal tube, which is filled with an insulating material. For a plastic compound may be used an admixture of finely divided paper and shellac wetted with methylated spirit. A finely powdered low-melting glass may be filled in, or a melted compound of mica and shellac. For joining the sections together a sleeve is placed over the exposed ends of the conductors, or the ends may be faced. The sleeve should hold an amalgam of mercury and tin, or some such plastic composition, and a screw-sleeve will serve to draw the ends up to one another.

24,883.—PLUGS FOR WALLS: *J. Fridinger*.—A wooden wall-plug is fashioned with a circular or triangular section. It has a ring attached to its front end, and has a wedge-shaped recess. After the plug has been put into the hole in the wall it is split, and opened out at the back by the forcing in of a flattened bar of wood.

24,926.—A LIFT-VALVE: *F. C. T. Wilham*.—The tap-valve is provided with a facing of some hard fibre or a leaden ring, and is to be screwed on to or off from its inclined seating with a left-hand screw spindle, which is packed with a collar within the cover; a projection from the valve, which engages with a vertical groove cut in the casing, prevents the valve from being turned round.

24,937.—BOOKCASES AND CUPBOARDS: *I. E. Rockwell and J. D. Adams*.—The cases and cupboards are made in sections that may be fitted together by means of strips upon the top of one section that will fit into grooves in the bottom of another section; a hook is affixed to each end of the upper edge of the door, and is caused to slide between strips attached to the ends and spaced with washers, from the bottom of the rabbit at their upper ends. At the drawing out of the door the hooks impinge upon the washers and so form hinges upon which the door will turn.

24,948-50.—CELLINGS, ROOFS, AND TILES FOR ROOFS AND WALLS: *Basel Mission Tile Works*.—The ceilings are built up with ornamental slabs of earthenware (either hollow or solid) held up between the joints with mouldings of earthenware that extend below the ceiling to protect them from fire, and are either nailed beneath them or are rased over battens. For the construction of hollow roofs are devised ceiling or lining tiles fashioned with lower hanging nibs and upper ribs to be used together with weather-proof outer tiles which are hung upon the ribs of the inner tiles. Hollow roofing-tiles are fashioned with interlocking side-edges, hanging nibs, central ribs, and stepped edges (both above and below), which, as they overlap, will make air-spaces to reach from the ridge to the eaves, and to open into side passages of the ridge tiles—the latter tiles having radial flanged ribs and sockets at their ends which will interlock with one another as well as with the roofing-tiles. In the case of tiles for walls, nail-holes and ribs which extend nearly as far as their lower edges, are made in the tiles, which may be fashioned with overlapping edges or be secured, side by side, upon battens.

24,954.—A CONTRIVANCE FOR ROOFING PURPOSES: *C. Thomas*.—The inventor seeks to obviate leakage through the bolt-holes of sheet-metal roofs and similar constructions; between the sheets and the purlins he inserts saddle-pieces which have conical projections that stand up around the bolt-holes, and in order that the water arising from condensation may flow down beneath the sheets he sustains the latter at some interval from the purlins; he fastens the saddle-pieces on to the purlins with screws, or by means of hooked projections on to angle-iron or T-iron purlins, and between the sheets and nuts he inserts concave washers.

24,972.—AN APPLIANCE FOR CASEMENT WINDOWS AND SIMILAR OBJECTS: *J. Campdrill*.—For maintaining a casement window at a distance that can be varied at will, and for keeping or moving toothed gearing, brakes, &c., either in or out of action; a hook is formed with a shank which comprises a spiral part and a straight part that slides within the spiral part and engages with it by means of a loop near its end; the shank may be lengthened or shortened by turning its spiral portion upon the straight portion around its axis of rotation.

24,973.—AUTOMATIC WATER-SPRINKLERS: *G. W. Beldau and W. S. Cotes*.—For sustaining the sprinkler valve is employed a ball (having a spreader underneath it) of some combustible material, such as celluloid, which holds the valve against its seating, being pressed with a screw that passes through the base of the holding-bracket, which is enclosed within a case made of celluloid. The valve and its seating should be made of lignum-vite, and a fusible plug can be employed together with the ball of celluloid, whilst other shapes than that of a ball may be adopted.

24,993.—A FLUSHING CONTRIVANCE: *J. West*.—This contrivance is intended for use with a flushing apparatus wherein the operation of a piston within a cylinder that is attached to the shorter leg of the siphon serves to start the flush. The inventor

places the cylinder and the shorter leg of the siphon inside an elbow-piece provided with an inlet in the shape of a bell or an oblong, he fixes a plate for directing into the siphon the water that is forced out of the cylinder, so that the flush shall enter through the inlet of the elbow-piece.

24,997.—COCKS FOR WATER TAPS: *H. H. F. M. Parlow*.—A self-closing cock comprises the casing of a self-closing valve, against which a spring forces the valve, that can be opened by pushing down a knob. A row of strainers is fitted within the nozzle, and to obviate the effects of frost, a small current of water is caused to flow through a little auxiliary cock during the cold weather.

25,006.—A PLASTIC COMPOUND: *F. G. Kleinsteuber*.—A composition adapted for articles, especially electrical insulators, that are exposed to vibratory action, is made of asbestos or mica (as a filling substance) mixed with copal solution or some such resin in warmed turpentine, benzine, or other spirit, together with Chinese wood oil, and, it may be, dammar resin and rosemary oil in small quantities.

25,010.—AN INDICATOR FOR ELECTRICAL CUT-OUTS: *Siemens and Halske A. G.*—For showing when enclosed main fuses have become consumed, the inventors devise a small supplementary and visible fuse. In one form of the contrivance they completely enclose the main fuse in one of the two compartments, against which a spring force the fuse, which is provided with a sight-hole—the latter fuse will burn as soon as the main fuse has burned.

25,028.—LATHING OF METAL: *International Metal Lath Company*.—Alternating slits are cut in opposite directions in blank sheets, which have plain ribs or strips that will be strengthened by means of the engagement of the ends of the slits of one series with the ends of the slits of the next adjoining series when the sheets are opened out; the slits may be grooved and set, approximately, in the plane of the sheet, or they may be turned at nearly 90 deg.; so, similarly, the slits that project at 90 deg. from the ribs may be inclined to the plane of the sheet or be turned into or parallel to that plane; the sheets are intended for use in plastering and lathing work, for screens, gratings, and similar purposes.

25,089.—A METHOD OF DRYING BRICKS: *A. H. Beasley, I. W. Beasley, and A. H. Beasley*.—Tongues are formed in the back-covers, which consist of corrugated iron or steel sheets curved for wooden crossbars that are fastened with nails or screws and are laid upon the tops of the bricks as they are being dried. In another form metal crossbars are used and are fastened with rivets to the back-covers.

25,139.—THE CASTING OF SHEET-GLASS: *P. T. Siewert*.—For the process of rolling the molten glass the inventor substitutes means of shaking the plate or table, around which is fixed a ledge or rim for preventing the liquid glass from running over. The plate, which may be hollow, should be made of some non-conducting substance—such as asbestos, wood, or refractory clay—and apertures may be made in its upper surface for the supply of water to the layer of fibrous material over which the glass is poured.

25,140.—IRON RAILINGS: *E. M. Edwards*.—Cast-iron panels are fashioned with lugs or extension pieces that will engage with sockets in the standards or the intermediate panels, pins and wedges or wrought-iron bars being employed for fastening purposes.

25,145.—AN APPLIANCE FOR USE WITH WOODEN BLOCK PAVEMENTS AND FLOORS: *W. Shoosmith*.—The inventor's object is to afford allowance for contraction and expansion of the wooden blocks; he inserts metal springs or blocks of some elastic material between the rows of the blocks and fills the joints with a mixture of tar, pitch, sawdust, or sand; he also lays strips of rubber or some such elastic substance between the blocks recessed for the purpose in order that the strips, under pressure, may become expanded into the grooves or recesses.

25,179.—MEANS OF EXTINGUISHING FIRE: *F. Diesfeld and B. Baer*.—Liquid is kept under air pressure within a container of which the discharge-pipe is closed at its top with a screw-down valve which also serves to shut the outlet to the hose-pipe, a steeve-valve is arranged for shutting the inner end of the passage through which air is pumped into the receiver on to which a cap is screwed after the pump has been taken out.

25,200.—ELECTRICITY METERS: *W. H. Johnson*.—Series and shunt electro-magnets are employed to rotate, and a shunt electro-magnet retards, the conducting-body of an alternating-current induction meter for an active current that may be applied as an energy meter upon constant pressure mains; two laminated magnets, having four coils connected in series between terminals and the two supply mains, is passed at two diametrically-opposite parts a conducting disc which is driven by poles of the magnets and by two coils of copper strip disposed near the poles and connected between terminals in one main, whilst the opposite poles will retard it; a vertical spindle, geared to a counter, supports the disc, and clips upon plates screwed on to a back-plate support the two laminated magnets.

25,215.—A FLOOR COVERING FOR INSULATING PURPOSES: *G. E. Hey-Die*.—The floor covering, intended for use in accumulator-rooms, transformer-chambers, and so on, is composed of ordinary or

waterproofed paper sheets and sheets of india-rubber, which are vulcanised and calendered. For the india-rubber may be substituted any suitable material compounded with pitch, French chalk, oxide of zinc, cork, barytes, &c.

25,250.—BRICKS: *J. Holroyd and R. Bond*.—For glazed bricks to be used in building walls which shall present a glazed surface on each side, the inventors devise a header, which consists of two adjustable portions that can be joined together with overlapping tongues, the two parts having holes or recesses for the keys of mortar. The half bricks may be glazed upon only their outer surfaces.

25,320.—GULLY TRAPS: *H. Brauner*.—A removable attachment, in the shape of an inverted siphon, constitutes the outlet of the body of the trap, and immediately above the siphon rests a sludge-box, into which the water (from the drain above) flows through holes in the cover and out of which it flows through holes in the sides to beneath the shorter leg of the siphon below.

MEETINGS.

FRIDAY, APRIL 19.

Architectural Association.—Mr. M. A. Green on "The Eighteenth Century Architecture of Bath" (illustrated by lantern views). 7:30 p.m.

Institution of Mechanical Engineers.—Ordinary General Meeting. Presidential Address by Mr. William H. Mau. 8 p.m.

Royal Institution.—Professor J. J. Thomson, M.A., on "The Existence of Bodies Smaller than Atoms." 8 p.m.

Institution of Civil Engineers (Students' Meeting).—Mr. E. V. Clark, B.Sc., on "The Theory of Cast-Iron Beams." 8 p.m.

Building Trades' Exhibition.—Visit of the Institute of Builders.

SATURDAY, APRIL 20.

Architectural Association.—Visit to the International Building Trades Exhibition, Agricultural Hall. 3 p.m.

Edinburgh Architectural Association.—Visit to Duddinghouse and Church, and Chapter House at Restalrig.

British Institute of Certified Carpenters.—Visit to the Building Trades Exhibition. 3 p.m.

MONDAY, APRIL 21.

Royal Institute of British Architects.—Mr. Francis Bond, M.A., on "The Classifications of Romanesque and Gothic Architecture." Illustrations will be shown by lantern slides. 8 p.m.

Society of Arts (Cantor Lectures).—Sir William Chandler Roberts-Austen on "Alloys." I. 8 p.m.

TUESDAY, APRIL 23.

Institution of Civil Engineers.—Paper to be further discussed, "Modern Practice in the Manufacture and Distribution of Gas." By Mr. Harry E. Jones. 8 p.m.

WEDNESDAY, APRIL 24.

Society of Arts.—Mr. Alexander Siemens on "Patent Law Reform." 8 p.m.

Edinburgh Architectural Society.—Address by Hon. President (Mr. H. O. Tarbolton) and Award of Prizes in Competitions.

Building Trades' Exhibition.—Visit of the Institute of Sanitary Engineers.

Institution of Civil Engineers.—Students' visit to the shipbuilding department of the Thames Iron Works, Shipbuilding and Engineering Company, Limited. (Assemble at the works, Orchard Yard, Blackwall, E. Train from Fenchurch-street to Blackwall, 2.25 p.m.) 3 p.m.

THURSDAY, APRIL 25.

Institution of Civil Engineers (The Ninth "James Forrest" Lecture).—Professor F. Clowes, D.Sc., on "Chemistry in its Relations to Engineering." 8 p.m.

Royal Institution.—Mr. R. Fry on "Naturalism in Italian Painting." II. 3 p.m.

Society for the Encouragement of the Fine Arts.—Dr. Todhunter on "Some Pictures in the National Collection."

Institution of Junior Engineers (Westminster Palace Hotel).—Sixth and concluding lecture on "Works Management," by Mr. A. H. Barker, Wh.Sc., B.A., B.Sc. 8 p.m.

Building Trades' Exhibition.—Annual meeting and dinner of Institute of Clayworkers.

FRIDAY, APRIL 26.

Society of Arts (Howard Lectures).—Mr. Alfred C. Ehorah on "Polyphase Electric Working." I. 8 p.m.

Glasgow Architectural Craftsmen's Society. Business meeting. 8 p.m.

Building Trades' Exhibition.—Conference on standardising of bricks.

A New Dictionary of Architecture.

DICTIONARY of Architecture may take two or three different forms. It may be, as in the case of "Gwilt" (which indeed is called an "encyclopædia"), a didactic work professing to include

in one publication the outlines of all subjects of study which bear upon architecture and building. "Gwilt" is in fact a collection of artistic, scientific and historical treatises; and a wonderful volume it is in respect of the amount, variety, and generally reliable character of the information contained in it. But it wants the feature of alphabetical arrangement, which is one of the proper qualifications of an encyclopædia; and though this want is atoned for by a very good index, a book so arranged hardly comes into the category implied by its title. Then we may have, as in the "Dictionary of Architecture," a work alphabetically arranged, which aims at giving a short essay on each important subject named, but rather avoids smaller subjects and brief definitions. In this respect the "Dictionary of Architecture" bears more properly the character of an "encyclopædia," and should rather have been so entitled. It is a great piece of work, and remarkably accurate as a rule, but is of course out of date now in regard to a good many subjects connected with structure and material; and it is now out of print. It represents, however, such a large body of information, and affords such a fine basis for a new edition brought up to date, that one is surprised that no such attempt should have been proposed.

Mr. Russell Sturgis, the able editor of the new dictionary which comes to us from America,* recognises in his preface the existence of the "Dictionary of Architecture"

as the only such dictionary in the English language: "Apart from this there are only glossaries, and those avowedly partial and limited in character." He does not allude, however, to the fact of the "Dictionary" being out of print, and leaves the reader rather to suppose that he considers it insufficient. In a certain sense it is, but it might have claimed a word of recognition as a remarkable work of its class. Mr. Sturgis's dictionary is on different lines and is more distinctly a dictionary in the most general sense of the word, viz., a book in which explanations of terms in architecture can be readily found, and which is strictly alphabetical in its distribution. It includes essays at some length on the larger subjects which come within its scope; but the majority of the articles are short and aim merely at defining a term and, when necessary, amplifying and illustrating the definition. An important point in the work is the large use made of cross-references. Thus, under "Columnar architecture" there are cross-references to "Distyle," "Tetrastyle," "Hexastyle," "Octastyle," "Peristyle," "Peripteral," "Dipteral," and several others; and one value of this system is, as remarked in the preface, that it serves to recall to the reader a term in connexion with the main subject which he may have forgotten, and therefore would not know immediately where to look for in the "Dictionary"; the cross-reference under the main heading reminds him of the word he wants and also shows under what letter to find it.

In regard to all these matters of clearness of arrangement the dictionary appears to be most admirably and systematically carried out, and likely to be the most useful one for reference on short notice which has been produced. It has the merit also—never found in a French architectural dictionary and hardly to the same extent in an English one—of being essentially cosmopolitan in its scope. The illustrations are numerous and very well executed; the majority are in the shape of comparatively small cuts on the page; there appears to have been some difficulty in placing them always in immediate connexion with the articles they illustrate, owing to the number of the illustrations and the shortness of some of the articles; so that there is rather a confusion in some places between the text and the

illustrations; but the inconvenience is only occasional. Besides the text illustrations, the first volume contains thirty-six separate plates of important buildings; and as these include the Abbaye aux Hommes, the Certosa, Canterbury Cathedral, the Natural History Museum, London, and the Bourse, Paris, it will be seen that the selection is made in a wide spirit.

The contributors to the dictionary, besides the editor (who is a large contributor, and of course a most capable one) are mostly American architects, engineers, and other specialists; the list includes, however, four English contributors—Mr. Brewer, Mr. Alexander Graham, Mr. Lethaby, and Mr. R. Phené Spiers; two Frenchmen—M. A. Sandier, the Art-Director of Sèvres, and M. J. Schopfer of Paris; one Canadian—Mr. Taylor, of Montreal; and one contributor, Mr. Fiske, who resides at Alassio (Genoa), and may therefore be counted as an Italian contributor.

The present volume of the dictionary carries us as far as the end of letter E, and it is natural for us to look first to the treatment in it of any subjects that are especially English. The principal among these, of course, is "England—Architecture of," which is written by Mr. R. Clipstone Sturgis. This is on the whole a very fair view of English architecture. In speaking of English mediæval architecture the author recognises, as other visitors to England have done, the instinct which the English architects had for the picturesque placing of the cathedrals. While pointing out, however, the points in which English mediæval architecture was less bold and less complete in its system than French, he fails (like every foreign critic as far as we have observed), to note the superiority of English mouldings to French. The profiling of English mouldings in mediæval work, considering the difference of the material in which they were to be executed, is almost as refined and as worthy of study as that of Greek mouldings; a fact which neither French nor American writers on architecture seem ever to have recognised. The author does justice to the fine and important feature made by the central tower in English Gothic; an effect which was rendered impossible to the French architects by the height to which they carried the nave, which left no opportunity

* "A Dictionary of Architecture and Building—Biographical, Historical, and Descriptive." By Russell Sturgis, A.M., Ph.D., and many architects, painters, engineers, and other expert writers, American and foreign. In three volumes, Vol. I. A—E. New York: The Macmillan Company. London: Macmillan & Co. 1901

for a tower that would dominate the composition. In comparing the French and English Gothic, the author emphasises the fact that the French were more systematic and complete in their treatment of vaulted structure, sacrificing everything else to that, reducing their walls between the buttresses almost entirely to openings, and making immense masses of the buttresses; but though this system is more scientifically and logically complete, there is surely the question whether, in regard to architectural beauty, the French did not over-do this, and whether their cathedrals do not become too much like stone scaffolding—works of engineering rather than of architecture. Mr. Sturgis, indeed, seems to admit that there is a spirit of beauty in English Gothic which is hardly to be found to the same extent in French; though he makes the admission in rather a passing and left-handed manner.

Again, the following comparison is surely open to much question:—

"French builders recognised the three-fold plan, and terminated the nave with a wondrous portal and the aisles with vast towers. England almost invariably disregarded both plan and section, and built her west fronts as screens, which masked, rather than expressed, the building."

Now, in the first place, "almost invariably" is quite overstating the case. In fact, there are only three cathedrals in which the screen system is carried out in the sense implied in the above quotation—Peterborough, Salisbury, and Lincoln. The principle of the two towers marking the ends of the aisles, with the nave wall between them, is carried out at York, Durham, Westminster (where the towers were intended though not completed), Canterbury, Lichfield, Southwell, and Ripon; at Ely the triple plan is recognised, though in the inverse way, by a centre tower over the end of the nave and a partial screen with turrets at the end of the aisles; at Wells the triple plan is plainly indicated in the front, although the two towers are spread out beyond the line of the aisles. We do not know exactly what Norwich was when the first design of the west front was complete (if it ever was)—probably something like Tewkesbury. At Worcester, Winchester, Gloucester, and Rochester, the nave and aisles are frankly shown at the west end, with neither towers nor screen. To say that the screen system was "almost invariably" employed is therefore a serious exaggeration; and in any case, it is a question whether, in an architectural sense, the system is so bad as it is here called. The section of nave and sloping aisle roofs is a weak line for the end of a building; it is much better to have its lines masked by a screen than by nothing else. And an even more important consideration in favour of the English cathedrals as compared with the French is the remarkable variety of the west fronts. The French west front is always the same in general conception; the English are all different. The glory of the great French portals we fully admit; but even here Peterborough, as an example of the "screen," goes beyond them.

In regard to the Renaissance the author is perhaps right in saying that it brought no new life to English architecture; the English Renaissance was a kind of echo of the Italian afar off. Mr. Sturgis attributes this partly to the Reformation and the consequent break with Roman connexion.

England produced a beautiful manner in the Jacobean mansions, and one quite her own; though it had features derived from the Italian Renaissance, it was not Italian Renaissance architecture, but English architecture making use of some Renaissance features. The name of the Elizabethan style, that peculiarly English chapter in architecture, is not even mentioned, though some of the buildings which belong to the style are named. However, Mr. Sturgis leaves us with a blessing; he seems to think he has been too hard on us, and concludes:—

"Notwithstanding shortcomings and faults, no country contains in itself a more precious architectural heritage than England; for, if it teaches no great lessons of art, it is yet instinct with all those qualities that have made England great; and every stone tells the history of a people who for all time have stood for freedom and justice, for honesty and uprightness.

Their houses speak of that home life which has been the underlying strength of its people, their churches tell of the struggle for truth, their municipal buildings tell of the dignity and freedom of the people who have built their great cities, and made England strong and powerful for good. Such a record is worthy to stand side by side with the greatest."

The article "Builder," by Mr. R. W. Gibson, lets us into some of the views held across the water on the subject of the contractor, and we have the contrast between the American and English type of builder explained. According to the Dictionary, the English contractor is usually more of a practical builder, the American more of an administrator and financier; but if this is regarded as the type of the American builder, it may be said that in this as in some other things besides building our institutions are becoming Americanised. The writer of the article laments (and we sympathise with him) the extinction of the old "days' work" system of payment for building, which he says "still prevails to a small extent" (hardly we think in England); but observes that "the admitted fact that days' work is always expensive is explanatory of its decadence." But is that the right way to put it? Is it more expensive in regard to the quality of the work done? The fact probably is that days' work is nearly always better done than contract work, and therefore is worth its money. As the author himself says immediately afterwards—"the impulse in days work is to render the best work possible. In contract it is to do the least that will be accepted." And that fact is at the bottom of a great deal of the difference, constantly remarked upon, between the massive and solid work of older buildings, even since the great days of architecture—the work in eighteenth-century mansions for example, and the comparative smallness and meanness of proportions and thicknesses in modern work. The owner wants the lowest tender, and the putter out of the lowest tender has to scamp the work to make it pay. The contract system is at the bottom of a good deal of "the decay of modern architecture." We get some further light on American ideas on this subject in the same contributor's article on "Bill of Quantities"; a subject which, by the way, should perhaps rather have been placed under letter Q, as "Quantities." American contractors usually each prepare their own quantities according to their own system; and thus, in the case of competition tendering, the same work is done many times over. The defence for

it is partly that each contractor understands his own system best, but more especially that the large contractors consider that hereby they keep out the smaller ones from interfering with them; under the system of a single set of prepared quantities "the builder of small attainments would dare, and would be enabled, to tender proposals for works which, under the present system, he is unable to approach." Attempts to introduce the "quantities" system have met with no success in America, and the author rather scoffs at the English bill of quantities as "minute and analytic to the verge of triviality," and seeming to aim at "complete presentation of the work without the aid of the drawings," which is just the fact, and hence the contractor sometimes dispenses with seeing either the drawings or the building itself of which he is nominally the builder. This is one of the evils inseparable from the quantities system carried to its full extent: it divorces the builder from the building.

We should have been interested to see an article on American architecture, but the subject has been divided into North and South America, United States, &c., and hence is relegated to future volumes. Canada is the subject of a short special article, "Byzantine Architecture" is well treated by Mr. A. D. F. Hamlin, and "Egyptian Architecture" by the same contributor. The subject of "Design" is treated in two sections, the first by the editor, the second by Mr. Lethaby. The former is an exceedingly practical and common-sense article, basing architectural design almost entirely on considerations of plan and convenience, a view which is somewhat too exclusively maintained. The other side of the question was however perhaps purposely left to Mr. Lethaby, who discusses the subject from the ideal or æsthetic side. His short essay is full of pregnant suggestions. "All design," he says, "is dealing with certain problems in the light of a body of observation and experience." There is a general agreement that the first condition is utility, and the construction must be governed by considerations of stability. "Beyond this, there is no agreement as to elements and no recognised basis of criticism, other than that of archaeological correctness—judgment by authority." This is certainly too sweeping a statement, and seems to be partially contradicted in the next sentence—"All criticism of art which is not a mere expression of 'taste' comes to this—it is either a statement of 'authority' or it examines a work 'according to reason.'" According to this latter sentence, then, "reason" is a basis of criticism; and here we are entirely with the author. A real architectural criticism depends upon a very subtle application of reasoning, in relation to circumstances, intent, and material. This surely promises some ground beyond "authority." The difficulty of criticism according to reason is that it is often exceedingly difficult to express in definite words what is often almost a matter of intuitive perception. Those who are acquainted with Mr. Lethaby's other writings or lectures on architecture will hardly need to be told that he is much disposed to reduce everything to a consideration of the handling of material. There is a great deal of truth in this; but it may be pressed too far. It is surely possible to have an abstract design on

paper which has not been influenced by considerations of material. No doubt, as soon as it comes to executing it in the solid, material influences and probably modifies it; but we are still of opinion that there is such a thing as abstract design, difficult as it may be to define in what it consists or should consist. For built design, however, Mr. Lethaby's summary may be considered pretty near the truth:—

"All consideration of architectural results leads us back to material determining conditions, and there are infinite possibilities open for natural growth to that architecture which shall once again examine the groundwork. When a serious general interest is taken in building for noble uses, we shall find in these considerations of materials, need, tradition, and nature, all that is required to build up a positive style of architecture."

The biographical articles are short, and appear to be studiously confined to the mere statement of facts. That dealing with Barry, for instance, has not a word either in regard to his special merits or to the character of his great and world-renowned building; it is simply a short and dry catalogue of buildings and dates. If the theory be consistently adopted that the function of a dictionary is only to give information and not opinions, this is right; but in that case Mr. Lethaby's paper on "Design," and some others, are out of place. There seems rather a tendency to the multiplication of smaller headings. Is "Bedroom," for instance, properly to be regarded as a technical expression requiring explanation in an architectural dictionary? or "Committee Room," which is defined as "a room specially provided for the meetings of a committee or committees"? This reminds one of the famous definition of "Archdeacon" as "a person who performs archidiaconal functions." Under the general heading "Column" are a number of rather trivial sub-headings, some of them rather arbitrary: "Midwall column," for instance, for a column a good deal narrower than the wall, and standing under the centre of its thickness; this is surely not an integral technical term in architecture. "Unbending column" seems still more questionable; it is defined as "a column of which the diameter is in such proportion to its height that, under vertical pressure, it cannot be fractured transversely by any tendency to lateral bending." We certainly never heard of "unbending column" as a special technical variety; and at all events, when it is stated that "the proportion of safety varies according to the material used," it would seem that to make the article of any use there ought to have been some statement of the proportions to ensure unbending stability in different materials, otherwise it was not worth while to introduce the heading at all. We are indeed told that a column of stone or marble "finds its idea of stability in the proportions of the Greek orders." As the proportions of height to thickness are different in various orders, this is an exceedingly unscientific statement, and the paragraph is altogether rather a foolish one.

Under the heading "Bell Cage" or what would be called in England "Bell Frame," only the old-fashioned wooden frames are illustrated, the recent use of steel frames built into the walls not being alluded to, and the information on this subject is altogether rather meagre; but it is

perhaps rather an English than an American subject. Under the head of "Carillon" mention should certainly have been made of the modern system of having the hammers kept in a raised position and merely *dropped* on to each bell, instead of their having to be raised and dropped for every blow, an improvement (due to an English firm of makers) which gets rid of the curious stammering effect of the old carillons.

Taken as a whole, however, the American "Dictionary of Architecture" is a remarkable work, and great pains have been taken to make it complete; but in spite of it being in our common language and, as we have observed, much more cosmopolitan than any French or German dictionary, one may perhaps still think that an English editor and contributors are required to produce a dictionary of architecture which would completely satisfy English requirements.

THE NEW GALLERY.

THE fear the New Gallery must be judged to have fallen from its high estate. The death of Burne-Jones was a great loss to its annual exhibitions, where his works were the chief attractions; and not only is there no one to make up for him, but some of the best of the other usual contributors have either dropped off or have sent much less important works than formerly. In fact, this year the New Gallery can only rank as an exhibition of the secondary order.

Mr. Watts is faithful to the gallery, and though he hardly paints as he once did, his "Greed and Labour" (127) affords a fine contrast in physique and expression between the stalwart labourer in the foreground, carrying his tools as if he were proud of them, and the mean cunning figure of "Greed" behind; the picture is not without pictorial effect, though, like many others of Mr. Watts's later works, it is far too obviously painted for moral rather than artistic motifs. Mr. Watts, in his later years, has appeared to regard the art of painting more and more as a means of giving moral lessons. To moral lessons we have no objection—in their proper place and delivered through their proper medium; but they are not the business of art, and the idea that they are has led Mr. Watts already into pitfalls which he has more or less escaped in the present picture. Nevertheless, we look with more sympathy on his pretty little work, "Trifles Light as Air" (124), a kind of chain or garland of fluttering children, which in its spirit, though not in its texture, recalls Correggio. This is pure art, and a pretty and delicate fancy.

Beyond these, there are few figure pictures which are of much importance. Mr. Walter Crane's "Fountain of Youth" (67) and Mrs. de Morgan's "Attainment" (23) both represent the kind of revival of the moral picture of the early Renaissance which is an object with some artists at present; and neither interest us much, except in respect of the fact that the first named work, as well as some other smaller pictures in the Gallery, is painted in tempera. We have revivals of every method in art now; we had the revival of etching, and more recently the revival of lithography; and for the next few years probably

we shall see a number of pictures in tempera. It is a medium which has its own beauties; it keeps a dead surface, and it is especially suitable to that school of flat painting which is the proper walk of decorative art. But it can never have the richness and depth of oil painting. In painting this revival of tempera seems rather analogous with the revival in music of the harpsichord and clavier in opposition to the pianoforte; the latter is far the finer instrument, but we have got used to it, whereas the old instruments are for the time a novelty. It is the same with tempera—an inferior medium to oil, but for the present a novelty.

Among other pictures in which the figure dominates is Mr. Von Glehn's "L'Enchantment de la Forêt" (182), called "a design for an architectural feature." We presume this means for a decorative picture; it is a scene in a forest, with a number of nude nymphs not very carefully executed, but the whole has a decorative effect. Mr. George Henry's "Gold Fish" (176), a study of a woman seated nearly with her back to the spectator and looking at a globe of gold fish, is a work of real character; and Mr. Melton Fisher's "Dreams" (193), which may be taken to be practically a portrait, is one of real beauty. Mr. Boughton shows the same young woman who appeared last year at the Academy by "The Waters of Forgetfulness," this time as "A Diana of the Goose Pastures" (204), a pretty nude preparing to bathe in the brook; far superior in colour and artistic sentiment to Lady Stanley's well-drawn but hardly-painted "Bathers" (111). Mr. Austen Brown's "Sunshine and Shadow" (246) can only be called a sketch on a large scale; as a small sketch it would be an effective study, but for this large scale it is far too rough and crude; the mass of shadow over a great part of it seems like wasted canvas.

Among portraits there is an admirable bust of a man by M. Benjamin-Constant (102), fine both in character and colour, and a good straightforward likeness of Mr. Kipling (36) by Mr. John Collier. Mr. Greiffenhagen's portrait of a lady (16) is characteristic in colour and treatment, as might have been expected, but the face is perhaps the least satisfactory portion of the work.

The landscapes in the exhibition, though none of them are of the first importance, include several works which are interesting from their individuality of style and sentiment. Mr. Wetherbee's "Pool of Diana" (147) suggests the idea of a landscape by Leighton, with the figure of the huntress goddess at the margin of the pool added by another hand. Diana is a good deal in evidence in the gallery. Mr. Byam Shaw has also his conception of her (129) following her dogs and clearing a hedge with a most athletic bound—a picture which looks rather like a joke. Mr. Coutts Michie's "Autumn Clouds" (161) is a fine scene over a flat country with rolling masses of cloud above it; somewhat in the same spirit is Mr. Hetherington's picture of a rain-storm coming over a moor; a work the more effective from its reserve of treatment. It is somewhat disappointing to find Mr. Adrian Stokes only represented by a small city picture, "Twilight in Trafalgar Square" (177), very good in its way however. Mr. Frank Brangwyn, like some other painters,

seems to have a kind of spite against old Kew bridge; we have seen it in several landscapes lately, always badly and inadequately treated in regard to its architectural character—this example being perhaps the worst.

Among the miscellaneous articles in the Central Hall is a head of a woman in white metal, by Mr. Taubinan (460), finely modelled and full of character; a very pretty silver and enamel jewel casket by Mr. Alexander Fisher, and two charming silver cups by the Countess Gleichen, one of them (No 462) showing a marked originality of design. There are also two small cases of jewellery, by Mr. Nelson Dawson and Mr. and Mrs. Gaskin. There is no sculpture work of any importance.

NOTES.

PROFESSOR J. J. THOMSON, the Cavendish Professor of Experimental Physics at Cambridge, gave a most interesting lecture on "The Existence of Bodies Smaller than Atoms" at the Royal Institution last week. Many years ago it was noticed that if a coin or a sheet of printed matter was shut up close to a sheet of white paper a faint "ghost-like" image was sometimes produced on the paper. These images were proved by Becquerel, in a series of brilliant researches made a few years ago, to be formed by rays which he found were being given off continually by compounds of uranium, printing ink, and many other substances. Professor Thomson, in order to explain the observed phenomena, was forced to make the supposition that the Becquerel rays were not waves in the ether like light waves or the waves used in wireless telegraphy, but were actual streams of matter thrown off from the surface of the bodies which emit them. Unlike Newton, who made the hypothesis of the corpuscular theory of light and then tried to explain all the laws of optics by means of it, Professor Thomson expressed mathematically the laws of Becquerel and kathode rays, and then saw from his equations that the rays possess momentum, and, therefore, must have mass. When he first enunciated his theory to the scientific world three or four years ago it was received with incredulity, but it has now been adopted by many of the foremost scientists. He regards the chemical atom as made up of a large number of similar bodies which he calls corpuscles. The normal atom forms a system which is electrically neutral. The electrification of a gas consists in the breaking off from the atoms of a few corpuscles. The remainder of the atom is positively electrified, and the more corpuscles broken off the stronger is the attraction that bind the remainder to the atom. Professor Thomson has calculated from the results of experiments on very different substances that the mass of a negative corpuscle is about the five-hundredth part of the hydrogen atom. It seems to us highly improbable that his theory can have no solid foundation in fact, for if it had not we should be forced to explain his results as simply marvellous coincidences. Yet if it is true, the theory of chemistry will be revolutionised, and the old dream of transmuting the baser metals into gold may again absorb the attention of inventors.

MAY-DAY will witness the inauguration of a reform in railway procedure which has long been wanted. The haphazard way in which we are content to abandon our luggage when travelling has always been a source of amazement to foreigners, many of whom are accustomed to having their property protected by a system of baggage registration. Not only are they astonished at our heedlessness and recklessness, but they have succeeded in making it understood that they strongly object to being made the victims of our luggage system—or want of system. The Great Eastern Railway Company, who seem to have quite superseded the Midland as pioneers of railway reform, announce the introduction of the check system next month between their Liverpool-street terminus and seaside stations. It is to be hoped that this will prove the thin end of the wedge, and that it may result in a general adoption of some such system on all lines. The Great Eastern are not the only sufferers from the depredations of luggage thieves, and the nuisance is not only a general, but a growing one. The railway companies have constantly been pressed to move in the matter, and it is difficult to see what objection can be urged against an optional system of registration such as the Great Eastern Company are about to adopt.

The Tank Failure at West Ham.

It would be premature at the present moment to attempt to decide whether the regrettable disaster at the West Ham Workhouse resulted from want of attention, or from some defect practically impossible of detection. Yet the subject is worthy the consideration of architects, and especially of those engaged in the design of public institutions. In some instances it may be convenient to distribute storage tanks over the different blocks constituting a workhouse or hospital, and under such conditions galvanised steel tanks can be employed which, humanly speaking, provide an absolute safeguard for the occupants of structures beneath. But in most large buildings or groups of large buildings there are reasons why a central reservoir should be established. To construct a wrought-iron or steel tank of sufficient size would be very costly, and cast iron is naturally accepted as the most suitable material of construction. Owing to the nature of the material and the weight of the units employed, the completed tank cannot be regarded as a satisfactory structure, for it is little more than an assemblage of plates somewhat insecurely bolted and tied together. Any individual plate might collapse by reason of imperfection; the joints are made between flanges of more or less brittle metal, and their maximum strength is determined by the resistance to variable strain of bolts which are exposed to considerable corrosive influences. Unless aided by internal stays, the tank cannot be trusted to contain the weight of water required to be stored. As a general rule, internal stays take the form of long horizontal bolts, and it is no easy matter to adjust these so that equal strain may fall upon the joints of the different plates composing the tank. There are, therefore, several sources of weakness and as many sources of possible danger. The chief care of the architect or engineer should be to reduce lateral

pressure as much as possible by adopting a shallow rather than a deep form of tank, and to avoid the use of long horizontal tension ties, which may become direct sources of danger by permitting excessive strain upon one or more joints. His influence should be brought to bear upon proprietors so that large storage tanks may be erected in places where inmates can be in no danger in case of accident, and it is also desirable that he should urge the necessity of adopting such dimensions for water towers as will permit the design of cast iron tanks to be in accordance with recognised mechanical principles.

MR. F. C. COLEMAN, of Darlington, writes:—"During the course of the last few weeks

The First Railway Bridge. the first metal railway bridge, one crossing the River Gaundless, a tributary of the Wear, at St. Helens, about seven miles west of Darlington, has been replaced. This interesting structure was built in 1823 for the Stockton and Darlington Railway, and has been in position ever since at the western extremity of their original line. It was composed of cast-iron, and it is believed to be the only one of its kind.* A Mr. Storey is generally credited with its erection, presumably to the plans of George Stephenson, the then engineer of the Stockton and Darlington Railway. At this period civil engineering was scarcely recognised as a distinct profession, and the bridges erected prior to 1825 were the work of either architects or millwrights. The first railway bridge at Darlington was the work of a Durham architect—Bonomi" [This was the son of the celebrated Bonomi] "and it is said that the first railway 'skew' bridge—one crossing the River Tees at Croft Spa—was the work of a millwright. In consequence of the heavy locomotives now in vogue on the North-Eastern Railway, the bridge at St. Helens has been replaced by a more massive structure and removed to Darlington, where it has been suggested that it should occupy a position upon a pedestal alongside Stephenson's other relics, the No. 1 Engine and the Derwent."

JOHN KIP's fine large-scale print, entitled "Vue à Perspective de la Ville de Londres

Westminster et Parc St. Jacques" (1710, first edition), shows the prospect as seen by one looking westwards from a height in front of Buckingham—or, more correctly, Buckinghamshire—House. The foreground depicts upon an unusually extended scale the aspect, 200 years ago, of the site which has been chosen for the National Memorial to Queen Victoria. We there see the three avenues of which the middle one, bordered with a raised kerb or edging, was used for the game as well as by "the quality" for their fashionable morning's walk. A passage in a scarce pamphlet, "A Trip from St. James's to the Royal Exchange," 1744, indicates that separate walks were assigned to "valets de chambre" and to "ladies' women." To the south is the straight canal or "river," 17 yards wide, which extended about 600 yards between four lines, two on each side, of lime trees planted in 1660, as far as the Tilt-yard of Whitehall Palace—the present Parade—ending at a point opposite

* The only railway bridge, we presume the writer means.—Ed.

the Cockpit (Treasury Chambers). The long canal, together with its cuts and canals, constituted the Decoy, in Duck Island, which Le Nôtre and Dr. Morison laid out for Charles II., who appointed St. Evremont its governor. The ground had previously been diversified with many ponds fed by the Tyburn, of which the largest, Rosamund's pond, at the north-west corner, remained until 1770, and formed the scene of a painting by Hogarth. Henry VIII. built a wall around the pleasure of his Palace of St. James's; Aggas's map delineates a part of the original park, with its wall, and with stags in the enclosure. The Calendar of State Papers, *passim*, records an order of January 1, 1650, for the issue of a warrant "to the keeper of Marylebone Regent's Park to cause one hundred best deer to be transferred to St. James's Park—Colonel Pride to take care of this business." Deer and cattle in plenty appear in the views by Kip, Maurer, Canale, and others of the Mall and the Park. The "Milk Fair" has survived to our own day at the old Spring Garden, though in the autumn, 1885, peremptory steps were taken for the removal of the cow-stalls, only two being suffered to remain. The Park as we now know it was laid out and drained in 1828 by John Nash, whose Marble Arch was first erected in 1825-7 at the west end of the Mall. There is a good view by Higham showing the Mall, the Marble Arch, and Nash's original north-east front of Buckingham Palace before the alterations carried out by E. Blore in 1847, and the erection, after Sir James Pennethorne's designs, of the State ballroom, supper-room, and galleries. The bridge across the ornamental water was built in 1857.

THE items under this heading

in vol. v., p. 570, of the "New English Dictionary" should prove to be of interest to most of our readers. Dr. Murray states that the origin of the term is not ascertained; he declares, however, that the assertion made in a letter to the newspapers in January, 1884, that the words "jerry builder" and "jerry built" commemorate the name of a firm of builders and contractors, Jerry Brothers, of Liverpool, in the earlier years of the last century, has upon investigation not been confirmed. Jerry—which is really an adverb—is a vulgar variant or corruption of the proper name Jeremy or Jeremiah. In nearly all the compounded words in which it occurs it has a depreciatory signification. The earliest examples cited in the Dictionary of the use of "jerry" as an adverb qualifying "built" and "builders" consist of quotations from the Lonsdale "Glossary," 1869, "jerry-built, slightly or unsubstantially built;" Ruskin, "Fors Clavigera," v. 263 (1875), "rows of jerry built cottages are creeping up;" and Young's "Every Man His Own Mechanic," 1881, "jerry builders."

CHURCH, NORRIS BANK, NEAR STOCKPORT.—The new parish church of St. Martin, Norris Bank, near Stockport, was consecrated on the 18th inst. by the Lord Bishop of Manchester. The church consists at present of large chancel, chapel, organ chamber, vestries, and three bays of the nave, and aisle, leaving three bays to be erected at some future time. The present accommodation is for 420, but it is estimated that eventually there will be sittings for 700. The cost of the building, which is built of local bricks, with terra-cotta dressings, is put down at £1. a sitting. The pulpit is of carved oak. The architect was Mr. R. B. Preston. The roofs are open timbered and boarded.

THE ARCHITECTURAL ASSOCIATION.

An ordinary fortnightly meeting of the Architectural Association was held on Friday evening last week in the Meeting-room of the Royal Institute of British Architects, No. 9, Conduit-street, W., Mr. W. H. Seth-Smith, President, in the chair.

The minutes having been read and confirmed, a vote of thanks was accorded to the donors to the library of the following books, *i.e.*, "Principles of Planning" by Mr. P. L. Marks, and "Building Specifications," by Mr. John Leaning.

On the motion of Mr. G. B. Carvill, hon. secretary, a vote of thanks was passed to Mr. Andrew Oliver for a donation of some lantern slides of Hatfield House and Church.

Mr. H. le C. Browning having been elected a member, Mr. Carvill read the names of those gentlemen who have been nominated as officers for the ensuing session.*

The following gentlemen were then appointed to act as scrutineers in connexion with the election of officers, *viz.*, Messrs. W. A. Jekells, H. G. Collins, C. W. Beaumont, and A. A. Carder.

The Memorial to the late Queen.

The Chairman said that the Committee had had before them that evening the question whether any representation should be made to the Royal Institute of British Architects as to the selection of the five architects by the Executive Committee for the memorial to the late Queen Victoria, and they had come to the conclusion that the Council of the Institute was not in a position to say what course the President should take or had taken on that Committee. Mr. Emerson was only one of that Committee, and very likely he had used the utmost of his influence to widen the competition, and, at any rate, five architects had been selected as against one sculptor. The Committee felt it would be unwise to make any strong representations, therefore, especially as a general meeting of the Institute would be probably held to discuss the whole question; but they had decided to send a letter in general terms to the Institute Council expressing the desire of the Association that the competition should be a wider one. He (the Chairman) would like to know if the meeting approved of the action that had been taken.

By-Laws.

The members having indicated approval, the Chairman gave notice that a special general meeting would be held on May 10 at 7 p.m. to consider suggested new by-laws limiting the terms of office of hon. treasurer, hon. librarian, and hon. secretaries to five, two, and four years respectively, and authorising the appointment of four trustees in whose names the funds of the Association shall be invested.

The Eighteenth-Century Architecture of Bath.

Mr. M. A. Green then read the following paper on "The Eighteenth-Century Architecture of Bath" :—

In this paper we are mainly concerned with the period between the years 1727, when the elder Wood came to Bath, and 1781, the date of the death of his son. But it is necessary to review the work which preceded and which followed theirs, and therefore we will take a survey of the principal buildings erected from the very beginning of the eighteenth century to its close, including the names of those who were sometimes competitors with, sometimes followers of, these two men.

But to go back still farther in time for a few moments. In his "History of Bath" Wood shows a map which, he says, is "a copy of Dr. Jones's view of the city of Bath as it was published in the year 1572," really of a Dr. Johnson's. Here the city can be seen in delightful simplicity, surrounded by its walls, of which we have now few traces except in name, a piece in the Upper Borough Walls and the Eastgate, with a portion till lately adjoining, being the only relics above ground, unless there are remains built into any of the houses. The size of the city at this time was about 1,200 ft. from east to west and 1,150 ft. from north to south.

By 1590 the city was much enlarged, and by a charter granted by Queen Elizabeth extended from the bridge over the Avon at the bottom of Southgate-street along the middle of the river as far as the meadow called Kingsmead, and thence to the highway leading from Weston to

Walcot, and so to the Win Yards, or Vine Yards, thence by Walcot Churchyard, and so along the middle of the river back to the old bridge.

A word here as to the Bath waters. Wood says:—

"About the latter end of September in the year 1663, the King (*i.e.*, Charles II.) brought his Royal Consort, Queen Catherine, to Bath; Sir Alexander Frayser, as chief physician, attending them hither, who, upon finding the hot waters to be from the same minerals as those of Bourbon, and that they could be pumped up directly from the spring, began to advise the inward use of them, sending all such patients to the hot fountains of Bath as he had before ordered to those of Bourbon, whereby the fatigue and expense of a long journey from the Britannic Island to the heart of France, as well as the danger of crossing the sea, was avoided, to the private advantage of the subjects of Great Britain and to the public advantage of the kingdom.

"From this period the drinking of the hot waters of Bath may be very justly said to have been established, and from the same period the trade of the city began to turn from the woollen manufacture to that of entertaining the strangers that came to it for the use of the hot waters."

In 1702 and 1703 Queen Anne and her Royal Consort, the Prince of Denmark, came to Bath, and thereupon so many people of rank and fortune came also that the villages around were filled with them, and many had to pay a guinea a night for their beds. In the following year Dr. Oliver began to write on the Bath waters (he was by no means the first to do so), and in consequence the Corporation improved their surroundings somewhat, but they still fell short of the Doctor's wishes, and in 1707 he published a practical dissertation, at the same time recommending the making of a cold bath for the use of the public. Says Wood:—"Mr. Thomas Greenway, one of the Freestone Masons of the city, directly engaged upon the work and made a handsome bath in one of the rooms of a house built by him upon the beach at the foot of Beaching Cliff. The bath was supplied by a spring of water which issued out of the ground at a place where the rays of the sun could never reach fill after surmounting the equinox." Beaching Cliff is one of Wood's misnomers; it is really Beechen Cliff, from the beeches planted upon it.

About this time Parliament was applied to for power to amend the principal roads leading to Bath, to pave, cleanse, and light the streets, lanes, &c., of the town, and to regulate and license a sufficient number of chairmen, that nothing might be wanting for the public utility of the city.

"Twenty years," says Wood, "had now been spent in improving the private buildings of the city; in the course of which improvements, thatch'd coverings were exchanged to such as were tiled; low and obscure lights were turned into elegant sash windows, as soon as Mr. Taylor (who was by the way a Chairman) had set the example; the houses were raised to five and more stories in height; and everyone was lavish in Ornaments to adorn the outsides of them, even to profuseness." But with all this splendour little attention was paid to the wants of the company that assembled at Bath until Harrison's rooms were built in 1708. In spite of a reaction on the part of the citizens because of the increase in the numbers of the houses, Mr. George Trim, a member of the Corporation, and whose mother was a near relative of Inigo Jones, began in 1707 to build the street named after him at the north-west corner of the city. It was in a house in Trim-street that General Wolfe lived, who was in Bath when he received intimation that he was to command the expedition to Quebec. Note the group of warlike emblems in the tympanum over the door.

On the other side and farther down the street are some houses built in 1727 and restored in 1807.

Trim Bridge, or St. John's Gate, is the connecting through between the Upper Borough Walls and Quiet-street.

The houses about this period are characterised by the large windows with projecting wave mouldings round them. Of such is the Saracen's Head in Broad-street, with initials W. D. and date 1713 upon it. It was here that Dickens used to stay.

The oldest house in this street is No. 38, date 1709, and almost identical with it in elevation is one in Chapel-court. I think these are by far

* See our issue for April 6 for these nominations.

the best of the older houses in the city, and their dignity is probably due to the very large window spaces and the number of openings. Whatever may be the cause of it, there is undeniably good proportion shown in them. In the St. Catharine's valley there are entrance doors of the same type, with unusually wide and massive bolection mouldings.

In 1716, on the site of the new bowling green, a row of houses was begun, and was called Green-street. It is one of the most picturesque parts of Bath now remaining. The detail at times shows a free Classic treatment, and there seems to have been a distaste for bare wall space which has led to a full enrichment of these small facades. The sashes are also divided into small panes, with wide glazing bars.

There remains in Westgate-street an inn called the Bunch of Grapes, which has a fine plaster ceiling dating about 1680-1700, but the front facing the street was rebuilt, together with other houses in the neighbourhood, about twenty years later—i.e., just before Wood began his work. In the adjoining house the Orders are used—the Ionic and Corinthian remaining on the first and second floors, the Doric having been most likely used on the ground floor.

Meanwhile, another citizen had been building in the south-east corner of the city.

In a house in St. James-street South small panes of glass still remain in the lower windows; these make at once a feature in the design, whereas in the upper lights, where plate glass has been substituted, the windows seem to lose their identity with the building.

Hard by is Weymouth House, which was built in 1720 for a Dr. Bellinson, and was designed by William Killigrew. Weymouth House was the residence of the Thynne family, whose descendant, the Marquis of Bath, is still its owner.

An almost exact copy of Weymouth House is to be found in No. 3, St. James-street, but the consoles which support the pediment over the door are here carved into griffins, which were never executed in the former.

Nearly opposite to Weymouth House is a curiously rusticated building, which was once Crutwell's Bath Chronicle office. The Orders are used, as seen frequently, to make a central feature, but the treatment is not good. A writer in 1870 says—"This newspaper, which was always considered one of the most elegant printed provincial journals in the kingdom, Mr. Crutwell, in commemoration of her late Majesty's visit to Bath, had a new type cast expressly on purpose, and everything to correspond, so as to produce a *chef d'œuvre* in newspaper printing, and who had the honour of presenting it to her Majesty, who most graciously received the same, and expressed her approbation, not only upon this compliment offered to her on her visit to Bath, but of the great improvement made in this Department of literature."

Near here in Abbey Gate-street are two shell heads serving as pents for the doors.

The best rain-water head which I have seen in Bath came from the houses pulled down a few years since on the south side of Orange-grove, and has a date 1703 or 1709 scratched upon it faintly.

We must here notice old Widcombe Manor, built for Mr. Philip Bennett's son in 1727. The builder was likely to have been the Thomas Greenway who put up Beau Nash's house in St. John's-court, now the theatre. The great feature of this house is the treatment of the order which embraces two stories, and which appears rather large, seeing that it is almost impossible to view it from a distance. The canted bay on the south side, with the projecting balcony, was an addition in the middle of the nineteenth century. Note how the base moulding of the pilasters ramps down as it leaves the house and becomes the coping of the balustrade in the garden. The interior shows a hall with a flat arch thrown right across it, and a wide staircase with moulded and twisted balusters rising in groups of threes and set close together. At the top of the stairs all the pilasters and arches are carried out in wood. This gives a somewhat wiry appearance to what would otherwise be a good architectural feature.

The garden house here is a refined piece of work. The ground story facing the garden has three arches, which were originally open to the ground. Between the arches are engaged Doric columns, and the upper part has merely an Ionic column at each end of the

wall and is severely simple; nevertheless, the firmness of the mouldings more than atones for any want of ornament.

From a comparison of this building with the Palladian Bridge in Prior Park I am disposed to think they are both by the same hand, and that if the Palladian Bridge was designed by Wood, then this little house was also.

Inside there are three recesses for seats, and the whole except the ceiling is built in stone.

The dovecot, also entirely of stone, lies near the stables, and is a most interesting feature.

The building called the Garrick's Head, and now known as the Theatre, was at one time the residence of Richard Nash, M.C. of Bath. Nash had a chequered career. Born in Swansea in 1674, he went to Oxford at the age of sixteen, and, having tried the law and the army in turn, finally entered the Temple. In 1703, however, he came to Bath, and on the death of Captain Webster he was appointed M.C.

This house, situated in what was known then as St. John's-court, was built in 1720 by the Thomas Greenway above mentioned and after whom Greenway-lane is named. The treatment of the windows of the second floor in connection with the cornice is very unconventional. The dies at the angles are now the only parts remaining to show the existence of a former balustrade. On the right will be seen the doorway of Beau Nash's house.

After Nash's power had declined he removed to another house just north of the last, the chief feature of which is its elaborately ornamented doorway, and here he died in 1761, aged eighty-seven.

On the other side of the theatre are Beaufort Buildings, which Wood says are the piratical architecture of a Mr. John Strahan, a friend of Mr. Hobbs, a timber merchant, of Bristol, whom we mention below.

Londonderry House and Kingsmead-square were also built by John Strahan.

In 1723 another Act was obtained for Bath relative to lighting, cleansing, and other things, and to make the former Act more effectual; and "in 1724," says Wood, "a subscription was opened by Mr. John Hobbs, a deal merchant of Bristol, for carrying the navigation of the river into execution, so that when I found the work was likely to go on, I began to turn my thoughts towards the improvement of the city by building; and for this purpose I procured a plan of the town, which was sent me into Yorkshire in the summer of the year 1725, where I, at my leisure hours, formed one design for the ground at the north-west corner of the city, and another for the land on the north-east side of the town and river."

It is proper to mention here that little is known of John Wood's early life. He was born in 1704, and it is probable that he was introduced to Bath through the influence of Ralph Allen, who may have met him while in Yorkshire, for it is there, as we have seen, that a plan of the city was sent to him. He was thus at this time but one and twenty years of age.

"After my return to London," he continues, "I imparted my first design to Mr. Gay, an eminent surgeon, in Hatton-garden, and proprietor of the land; and our first conference was upon the last day of December, 1725. On March 31 following I communicated my second design to the Earl of Essex, to whom the land on which it was proposed to be executed then belonged; and in each design I proposed to make a grand place of assembly to be called the Royal Forum of Bath; another place, no less magnificent, for the exhibition of sports, to be called the Grand Circus; and a third place, of equal state with either of the former, for the practice of medicinal exercises, to be called the Imperial Gymnasium of the City." In May, 1726, during the consideration of the drawings, a great fire broke out in Horse (or South-gate) street, and the larger houses that took their place were the last built before 1727.

In November of 1726 Wood fixed his preliminary articles with Mr. Gay, who then empowered him to engage with anybody that he could bring into the scheme for the building of a street 1,025 ft. long north to south, by 50 ft. east to west, for a way to the grand part of the design. This was Berton-street, but at first it did not go forward, and Wood having two other schemes on hand, and finding it necessary to have good workmen, determined to become his own contractor. The first scheme was the building of a court of houses for his Grace James, Duke of Chandos, and the second

was a canal between Bath and Bristol. For the canal he obtained men that had been on the Chelsea Waterworks; and he says "that until that time the real use of the spade was unknown in and about the city." "I likewise," he says, "provided masons in Yorkshire, carpenters, joiners, and plasterers in London and other places, and from time to time sent such as were necessary down to Bath to carry on the building that I had undertaken; and it was then, and not till then, that the lever, the pulley, and the windlass were introduced among the artificers in the upper part of Somersetshire, before which time the masons made use of no other method to hoist up their heavy stones than that of dragging them up with small ropes against the sides of a ladder."

At that time he was asked to prepare plans for dwelling-houses, an assembly house, and a general hospital, and in 1727 he left London altogether, and followed his workmen to Bath.

In 1727 Chapel-court was begun. The house to the left is that in which Horace Walpole lived in 1765, and the wing to the right St. John's Hospital or the Blue Arms, designed by Wood in 1728.

In the former is a characteristic fireplace of the period, with fine castings on the grate.

The death of the King (George I.), however, causing Mr. Gay to fall from his bargain, and the Corporation making light of Wood's schemes, the latter dropped his agency, became absolutely his own master, and took ground from Mr. Gay for the building of Queen-square, so named in honour of Queen Caroline. John-street took the place of Barton-street, and Barton-street was what is now the east side of Queen-square and part of Gay-street, as well as the portion to the south.

At this time (1728) he was building an addition to the north side of R. Allen's town house in Lilliput-alley, putting also a new front to and raising the old building a story higher. There was thus a basement story and, as in Queen-square and later on by his son in the Crescent, an order rising through the two stories over with one crowning cornice, and he says that it was "a sample of the greatest magnificence that was ever proposed" by him for the city houses.

The house now presents only two sides, north and south, and even so the south wing has been entirely severed from the main building. Inside there appears to be nothing of note remaining. It was here that Allen kept his clerks, who were engaged in the business of the cross posts. After Allen's death, in 1764, the house was neglected, although retained for some twenty years afterwards for postal business.

In 1730 the houses of the Duke of Chandos, called Chandos-court, were being erected. They were to form three sides of a square with a garden in the middle. The strictly symmetrical elevation is a good feature in this design, which is crowned with a fine pillowed frieze and cornice.

Chandos House had been rebuilt in 1727 for the Duke.

The staircase leads to the large hall over. Queen-square was in reality Wood's chief delight. The first side built was that on the east, which was begun in 1728. The whole was finished in seven years' time, including the chapel and many houses adjacent. The ground was originally intended to be level from top to bottom, but to save expense was afterwards allowed to slope southwards. The centre was to have a low enclosing wall bearing a balustrade, inside this a border of flowers, and then a basin of 45 ft. diameter supplied with water from a spring close by, but which was soon intercepted by some one who "penetrated the ground for vaults in the very line of it." Espaliers of elm and lime trees enclosed the four quarters, and within were flowering shrubs. The diagonal walks were covered with turf and the other walks with gravel. The basin in the middle had an obelisk 70 ft. high rising out of it, and on a dark marble stone on the south side of the obelisk and level with a man's eye was the inscription, "In memory of Honours conferred, and in Gratitude of Benefits bestowed on this City by His Royal Highness, Frederick, Prince of Wales, and His Royal Consort, in the year 1738. This obelisk is erected by Richard Nash, Esq." Wood confesses that this square, when planted, somewhat obstructed the view from the opposite sides of the houses, but he adds that the intention of a square is for people to assemble together, and that it should be separated from the ground about it.

The width of the square from house to house is about 315 ft.

You may know his thought in making the grand façade, as we may call it on the north of the square, it was to be as if it were a palace, and the east and west sides the wings. The vases on the pediment have disappeared. The original intention is shown in the plate from his own book. The design as usual with him was a simple one—a rusticated basement with the Corinthian order over and a large crowning cornice just as in Ralph Allen's house and yet from its treatment so different in effect as was fitting to a widely extended façade such as this. The windows have alternately triangular and circular pediments, as in a similar story in the Farnese Palace at Rome, and it will be observed that the masonry of the lower story has a vigorous effect on account of the boldness of its rustication; at the same time there are refined and beautiful impost mouldings at the level of the door and window heads. A bronze tablet has been lately put up on the centre house to mark the residence of the elder Wood. It was here that he died on May 23, 1754, and here also his widow deceased some twelve years later.

The house on the extreme right has furnished me with two details, the first being that of a staircase where we may note that, as in Widcombe House, the balusters are arranged in rising groups of three to each step; and the other a ceiling on one of the upper floors in plaster. There was no shirking of finish in the case of John Wood's builders though the work was often of a speculative nature.

The east wing was completed with little alteration from the original design, but the west had to be altered in order to get the building taken up and it was divided into three main blocks, the centre one being treated with the Ionic order, and having a decidedly Greek feeling about it.

At the south-west angle of Queen-square stood the Chapel of St. Mary, of which the token here shown gives a good general idea, seen more in detail on an old photograph which was kindly lent me. Ionic capitals from the interior yet remain on the site of the chapel. Dr. Hunt had tried to get St. Michael's Church rebuilt instead of having another chapel, but as the parishioners of St. Michael's rejected all such proposals, Dr. Hunt gave up his point and promised to support Wood in his new design. Immediately the proposal was made to build this chapel, Wood had applications for ground for no less than seventeen houses. He approached Mr. Gay, the patron of the Rectory of Walcot, for the purpose of procuring a lease of the land required, and on March 25, 1732, at Mr. Gay's request, he laid the first stone and the work was pushed forward and completed at the end of 1734. The inside was of the Ionic order—67 ft. long, 48 ft. broad and 36 ft. high, the outside of the Doric order, and the whole structure, with its furniture, cost about 2,000l.

In 1729 Wood built a villa called Eagle House at Bathaston, where he lived for some time. The house has been much altered, but a fine original doorway now remains, which has been applied to the south side of the house. The head on the keystone is that of Queen Caroline, wife of George II. An eagle carved in stone surmounts the frontage to the road. The younger Wood died here in 1781.

While mentioning the works of Wood outside the city, it will be well to include two or three more houses which he built at various times.

The little house called Lilliput Castle was built, as the legend on the engraving says, by Mr. Jerry Pierce, in the year 1738, against the north end of Mons. Badonca, that is, Lansdown, and formed the nucleus of what is now known as Battlefields, standing about a quarter of a mile below the monument. From its form the wits of Bath called it T. Totum. The whole structure was but 120 ft. square. Much to the regret of our architect it suffered from two fires, and was afterwards altered.

At the south end of the Kingsdown at Bradford-on-Avon, stands Belcombe Brook Villa, built in 1734 for Mr. Francis Yerbury. The situation is extremely pleasant, the grounds sloping down to the river Avon, and it was here that Wood showed himself to be a master of landscape gardening. To the right of the courtyard is a stone-built dovecot and the paving in the courtyard is as originally laid. From each angle of the house a balustrade runs

diagonally into the garden, following the slope of the grounds.

The elevation is finished with a pediment supported by four Ionic pilasters, the lower windows being well treated with triangular pediments and close balconies, and the upper ones having moulded architraves only. It is 37 ft. wide and 24 ft. deep.

At Bathford, on an eminence of Kingsdown and looking north-west, is to be found one of the most finished of Wood's buildings. Titan-Barrow Loggia was erected some fourteen years after Belcombe Brook Villa, in 1748, for Mr. Southwell Piggott. In its central part it bears some resemblance to the general treatment of the latter, though the Corinthian order is here used and small wings are added, the whole front being 46 ft. wide. The drawing-room is of such a height as to include the half-story.

It appears to me that this building would have gained much in dignity if it had been raised on a substructure, though on the spot the want of it is to a great extent lessened by the fact of a terrace of grass in front of the house being carried down very abruptly, and it is from the ground at the foot of this terrace that the finest point of view must be obtained.

The mansion of Prior Park was the largest and best work of Wood, and was begun about 1735. Let him speak as to its origin: "The reflection cast upon the freestone of the hills of Bath brought him (Mr. Allen) to a resolution to exhibit it in a seat which he had determined to build for himself near his works, to much greater advantage and in much greater variety of uses than it had ever appeared in any other structure. Thus it was that Ralph Allen, whose little house in Lilliput-alley we have seen, came to build himself such a vast country mansion."

The scheme of the design was three-fold—a central mansion with east and west wings and a pavilion placed between these three more important buildings, the mansion occupying about 150 ft., and the whole line of building from end to end about 1,200 to 1,300 ft. in length. The south side of the mansion, facing up the hill towards Combe Down, and at a height of about 460 ft. above sea level, consists of a hexastyle Ionic front with attached columns, and this forms the entrance; the windows on either side are simple in the extreme, bearing a strong contrast to those on the north side and the two ends. Immediately below the cornice there were originally windows along the frieze, which gave light to the garrets; they are now nearly all blocked up. The basement story lies in an area and there are no balusters in the parapet.

The north side looking towards the city is a fine front and is full of detail. In the first place the natural slope of the ground allowed of the basement being entirely exposed as shown on the elevation which is the original design of Wood, who had never intended the flight of steps as now seen, although I cannot help thinking that this has added greatly to the dignity of the building. The fine projecting hexastyle portico was intended to be a rival, and something more, to the one which the architect, Colin Campbell, had erected at Wanstead House, in Essex, for whereas that one had columns of 3 ft. in diameter, these were 3 ft. 1½ in., and on the return side are two complete intervals between the columns instead of one and a small portion of another as at Wanstead.

On this front and the two ends there is an open balustrade, and the windows of the ground and first floors are dressed with moulded architraves and heads, those on the ground floor resembling the ones which are seen in the villa at Belcombe Brook. Originally the detail of these was intended to be richer still.

A word or two as to the building of this house, as Wood gives it: 800 tons or 16,000 cubic feet of freestone in large blocks are buried underground to make the foundation walls as strong as the nature of the ground seemed to require. After this the walls of the basement were built inside and out with freestone, the ceilings of the rooms and passages were arched or vaulted over in stone, and the floor was paved with a harder kind called ragstone. These rooms are 12 ft. high in the clear, and the passage, which runs through the length of the house, is 11 ft. lower in height and is divided into five parts, being the chief ornament of this portion of the house, while the architraves of the door cases were moulded upon their external faces. The ground floor was 16 ft.

high. The hall, which extends from front to back of the building, and has eight Corinthian columns to support the floor above, was originally covered over entirely, but has now been opened in the middle so that one sees from below the cove and ceiling of the upper story, the former with its rich ornamental plaster work. The pilasters and caps are of stone.

The walls of the ground floor are built entirely of freestone both outside and in, and the fixed ornamental parts of the hall and other parts were originally of stone also, though those of the dining and drawing rooms were afterwards cut off, and these rooms lined with wood. There is great refinement in the door-head of the dining-room, and the mouldings of the door panels are also enriched. It is curious to contrast this with the naturalesque treatment in the pilasters.

Of much the same general character is the drawing-room, but an elaborate mass of carving over the fireplace, wonderful as it may be, seems inconsistent with the dignity of the other parts. This carving is said to have come from Hound-street House. The type of fireplace is not uncommon in Bath.

In the west wing of the mansion, which was finished in 1737, and was the first part completed, is a fine piece of vaulting, which is one of the best bits of architecture in the whole building. The pendentives are crowned with a small flat dome. This was intended for stables and coachhouse and such-like buildings, and was simple in its first design; like other parts, it was lined with freestone.

The east wing was altered from Wood's design. It shows a good three-light window at the first floor, with a Doric entrance below.

Prior Park was finished in 1743. Two fine sweeps of stone steps with balustrades and vases form an architectural treatment of the gardens below the great portico. They were executed by Bishop Baines about 1830.

At the foot of the slope lies the Palladian Bridge, considered to be the work of Wood. Here are the old fishponds once belonging to the Priory of Bath, and from which Prior Park takes its name.

The interior of the bridge is well treated. Except the ceiling all is of stone, and the entablature has the swelling frieze, which Wood was so fond of. The balusters here are of a rather unusual type, being Venetian in character, and it must be admitted are not like those which he usually designed.

Before leaving Prior Park I should like to show you a view of the stone staircase of a later date in the west wing; and also a doorway in the present church which was brought from Hound-street House, near Shepton Mallet, on the destruction of that place about the year 1848. The work upon it is the most refined of any to be seen in this district, and, indeed, it may have been brought from Italy.

When Wood's scheme for building a grand parade on the south side of Queen-square was abandoned and Wood-street, which had been intended to be 100 ft. wide, was reduced to about half that amount, Wood turned his attention to the large space at the south-east side of the city, and began to lay out his ground and buildings on a large scale. This space was the old Abbey Orchard, and the plan will show his ideas, and how far they were carried out. At the top left hand corner is seen the east end of the Abbey, and to the right the Orange Grove; on the south is St. Peter's Gate, leading thence to the Terrace Walk, where on the east side are Harrison's Rooms and on the west Lindsay's Assembly House, which Wood completed in 1730. West of this lay Mr. Allen's garden and town house, abutting on to Lilliput-alley on one side, while his garden ran northwards as far as the Abbey Church. The triangular space between this part and the river was to be a spacious open area called St. James's Triangle, with the Grand Parade south of it, then some large blocks of houses and the Royal Forum beyond that again, facing to the south, now known as the South Parade, and still more buildings beyond.

The first stone of the first house of the Grand Parade (now North Parade) was laid on March 10, 1739-1740. It was intended to have adorned the middle block of buildings with Corinthian columns and pilasters, but through a scheme which came about among the tenants the ornament was cast aside and the whole executed in a plain manner, as we see it to-day.

The Royal Forum, or South Parade, was begun in January, 1742-43.

The opening under the house on the west of Pierpont-street was called St. James's Portico, and was erected by Wood, as well as the houses in the same street.

At the end of Lilliput-alley, now North Parade-passage, is a house which is interesting as showing one of the few shop fronts on the ground floor now remaining in Bath as originally designed.

A doorway also near here may be noticed as showing the original conception of the glazed door.

Another shop front may be seen at the north-east angle of the Abbey churchyard.

South of Ralph Allen's town house, and little known or appreciated, there lies a large court built by Wood, with good houses on either side, of about the date 1740, having doorways with the Corinthian order and often with panelled walls inside, good staircases, and much finish of detail. They are North Parade-buildings, formerly called Gallaway's-buildings. The best one is that on the west side at the bottom. The hall is vaulted in plaster, and with a boldly-carved arch springing from pilasters on either side; a step or two further and we see the whole staircase from top to bottom at one glance.

The landing on the second floor having to be set back, and fortunately there being no girders in those days, the superincumbent wall is supported on an ornamented wood beam sustained by two Ionic columns.

One room must suffice as the typical interior. The fireplace is of well-moulded stonework, the walls are panelled, and the cornice is full of detail, though, unfortunately, now filled in with whitewash. I am pleased to say that this house is particularly well kept up and rather suffers from too much paint than the want of it.

At the west side of Orange-grove stood until quite recently an edifice known as Nassau House. It was probably designed and first occupied by Richard Boyle, fourth Earl of Cork and Burlington, about 1730. He was a companion of Pope. After his death in 1753, the house became the Bath residence of the Earl of Howth about 1780, whose daughter Lady Francis St. Lawrence married in 1808 the Rector and Archdeacon of Bath, the Rev. J. Phillott.

The chief point of interest in the interior was the staircase.

The name "grove" is derived from the trees that were planted in it, and it was called "Orange" on account of the visit of the Prince of Orange, in commemoration of whom the obelisk in the centre of the Grove was erected in 1734 after the Prince's restoration to health through drinking the Bath waters. It was here that the chairman would bring those who were going to take the waters, and who afterwards returned to the Grove for conversation or a little constitutional.

It is probable that the same Earl whom we have just mentioned built the house in the Abbey Yard, known as Marshall Wade's, at a little later period than Nassau House. It was this Marshall Wade who was four times M.P. for Bath, and who greatly benefited this part of the city by making a passage between the houses on the north side of the Abbey, so that those who wished to walk from the Pump Room to the Orange Grove might do so without entering the church, the north aisle of which had previously served the same purpose. These houses still existed in 1829, as shown on an engraving of that date.

There seems to have been considerable difficulty in the commencement of the Mineral Water Hospital, called then the General Hospital.

The site at first proposed in 1727 was on the north corner of the Ambrey. In 1730 plans were made, but disputes occurring in the conveyance of the land, which involved a delay of many years, the trustees determined to seek a new site, and in 1737 accepted the offer of a piece of ground in the north part of the city. A new set of plans was made in 1738, the work of demolishing the old houses was commenced, and the first stone was laid on July 6 (as seen in the inscription on the east side of the building). Let Wood give his own description of it: "The Hospital as it was finally fixed upon the 25th of August, 1738, became a magnificent pile of buildings, of the Ionick Order, consisting of a Ground, Principal and Chamber Story, and extending 99 feet in front to the North, 84 feet on the West, and 97 feet on the East. The E. and W. sides are parallel, but they are not at right

angles with the N. front, which contains five windows on each side the door, and the central part of it makes a Teatrayste Frontispiece of almost whole columns, elevated upon a large Plinth and finished with a Pediment, whose tympanum was proposed to be adorned with a bas-relief, representing the good Samaritan." This piece of sculpture was omitted, but at a later time was executed by Mr. Elkington Gill in the tympanum of the additional building. The hospital was finished in 1742. The stone and other materials for this building were provided by Ralph Allen.

Although Wood prepared the designs for the Grammar School in Broad-street, it is not known that he executed the building. He says that the committee appointed by the Corporation, after proposing to lay out about 3,150l. in the purchase of ground and in erecting a building thereon, proceeded no farther than to employ him to make a proper design for it, which he completed on September 10, 1742. The architraves round the windows have been cut away to form splay. As shown by the maps of the period, the building seems to have been erected some time between 1750 and 1760.

The "History of Bath," published by John Wood the elder in 1749, though in part a chimerical work, is a valuable addition to the records of the state of the city during the first half of the eighteenth century.

Gay-street was designed by the elder Wood, but executed by his son, and it was in the house at the corner of Queen-square and Gay-street that the younger Wood lived.

The rooms of the circular bay here are planned as a rectangle with an apse at each end, that facing outwards forming the window, which on the ground floor is treated simply, with rusticated blocks between the architraves; but on the upper floor coupled Ionic columns between and on each side of the lights help to enrich the fine Venetian window. It is, I think, the only instance of Wood having used a circular bay.

The interior is treated with long panels and an enriched plaster cornice. There are Corinthian columns standing at the two angles of the apse, and Ionic pilasters with a pediment over mark the door in the centre of the same: all these are executed in wood and painted.

The panel on this house shows that John Wood the younger was born in 1727 and died in 1781.

The Circus, also designed by the elder Wood, was carried out by his son. It was in 1753, the year before his death, that John Wood the elder entered into an indenture with the Right Hon. William Pitt for the building of a house here; this was No. 7. The buildings were begun in 1754, and they took fifteen years in completion.

A writer at the beginning of the nineteenth century says there was a shrubbery in the middle of the enclosure and a gravel walk surrounding a reservoir, which supplied the houses with water. This was, of course, the Circus Waterworks; they are now closed over, but I do not know how long the plane trees that are there have existed. It was at No. 24 that Thomas Gainsborough painted some of his most famous portraits. I should like to point out here that the æsthetic sympathy of the younger Wood with his father is a remarkable feature in his buildings, and it seems to me not unlikely that as Gay-street and the Circus were the designs of the elder Wood, they may have conferred together as to the buildings west of them, and that the younger Wood may have been guided in their development by the advice left him by his deceased father; at any rate, in the Crescent exactly the same use of the order is seen as in Queen-square, though less elaborately worked out, and in the Assembly Rooms the broad treatment of spaces externally and internally is observable as in the work of the elder Wood.

It may not be amiss to make some little comparison between the Circus and the Crescent. Given the idea of a circular line of buildings, the design is largely modified by the space at disposal, and it is very evident that in elaborating the Circus with three distinct orders—Doric, Ionic, and Corinthian—all with coupled columns and with bands of ornament at the lower story in the frieze, and at the top story between the capitals, and a stone ornament crowning each coupled order, Wood intended to impress the spectator from a near point of view, knowing well that in such a form a distant view would be impossible. For this reason there is much interest in close examination of this work, and

the truth of the design is enhanced by the orders being confined to their respective stories.

But in point of dignity and bold conception it must yield to the Crescent, the very situation of which lends a great charm to its imposing effect. It appears to the spectator almost suddenly, with a broad sweep of lawn stretching in front of it from end to end. The scheme is simple; an entirely plain basement story supports a large Ionic order, which rises through two stories, and is crowned with a very deep entablature. The parapet is an open balustrade, but there are no ornaments over the dies; it needs none. The effect is obtained by the dominating order and the bold sweeping circular lines over, unbroken to the roof. Detail is not looked for; it would serve no purpose, but would destroy the dignified simplicity of the whole. At the same time it must be admitted that this effect is gained by a less legitimate use of the order than in the Circus. It should be noted that originally the roofs, as indeed the roofs throughout Bath, were covered with stone tiles, and a more artistic covering can hardly be conceived. The eye is thus carried up to the topmost part of the building, and sees it as one harmonious whole. The Crescent, which, as we have seen, was the work of the younger Wood, whose buildings we are now considering, was begun in 1767, but not finished till about eight years after.

The diameter of the circus from house to house is about 320 ft., and the major axis of the crescent (an eclipse on plan) 550 ft. In the interior treatment of the crescent the hall has usually an arch with enriched panels in the soffit.

The staircase walls are panelled out with plaster mouldings, and are sometimes enriched with festoons and paterae.

The walls of the principal rooms are also panelled, and the door heads enriched with carving.

But the ceilings are the chief means of decoration. The enrichment is nearly always in low relief, though occasionally small subjects such as birds are introduced in the centre in very high relief. The panelling is at times set out geometrically, concentric circles occupying the width of the room, with long panels at the two ends, and an enclosing band of ornament running round the four sides, or perhaps divided into still smaller panels with a variety of forms. The cornice is usually very rich.

A still finer treatment is that where there is a circle of ornament in the middle with ornaments radiating from the four corners of the room and a panel between, or where the ceiling becomes almost entirely naturalesque.

While noticing these instances from the Crescent, I should like to draw your attention to a beautiful ceiling which exists at Mr. Wood's shop in Old Bond-street (No. 12), and there is a well-known one also at Stuckey's Bank, in Milsom-street.

The beauty of the fireplaces lies in the simplicity of their design and the restraint in the ornament. The marbles used are chiefly white statuary and some coloured marble such as Siena. Ionic columns are usually employed with the entablature breaking round them.

Two porches of the same order as that in the Circus, and, in fact, belonging to it, stand at the east end of Brock-street. The metopes in the frieze display a great variety of devices, which are carried round the entire Circus.

A drawing of Bath taken about 1757 shows the Circus complete, but no indication of Brock-street or the Crescent. It appears to have been the intention of the Woods to build another street beyond the Crescent, and another Crescent beyond that again, but Marlborough Buildings effectually put at an end any such scheme.

Brock-street was the work of the younger Wood and connects the Circus and the Crescent. In it is Margaret's Chapel, which has a good Venetian window overlooking the street.

The first stone of the New Assembly Rooms in Alfred-street, on the east of the Circus, was laid by Wood in May, 1769, five years after the proposal to build a somewhat similar set of rooms at the north-west corner of Queen-square. The rooms were finished in 1771, at a cost of 20,000l., on ground covering over an acre and a half. They were formerly called the New, or Upper, Rooms. The planning is exceptionally good.

From the hall in the centre of the building

the entrance on the left leads to the large assembly, or ball, room, that in the middle into the octagon, a room 48 ft. in diameter, and that on the right into the smaller assembly or tea room. The entablature over the entrances is supported on Doric columns. The looking-glasses, with their ornaments, are of the same date as the building. In the octagon room is a portrait of Captain Wade, first M.C., painted by Gainsborough, and one of Mr. Tyson, "Arbiter Elegantiarum," 1806. Beyond the octagon lies the card-room, 60 ft. long and 30 ft. wide.

The ballroom, 105 ft. long, 42 ft. wide, and the same in height, is divided in its altitude into three parts. The substructure is plain, but relieved by good doorways; the middle portion has an attached range of Corinthian columns, with three windows at each end and nine on the side facing north. These windows are ingeniously provided with rising and falling shutters. The third portion of the room is occupied by an immense cove, and above is a flat panelled ceiling.

The most interesting portion of the tea-room is that at the back, where six Ionic columns stand forward some little distance and support a gallery on the first floor, which has an equal number of detached Corinthian columns, while an engaged colonnade of the same order runs all round the room. The ceiling over the gallery is flat and deeply recessed, but above the projecting order rises a great cove with very bold ornamented ribs to form the panelling. Between the columns in the gallery is some good ironwork of the period.

The detail of the doorway in this room will show you the general treatment of the parts throughout the building. Between the carved consoles are festoons carved in wood.

Alfred-street was also built by Wood. The doorway of the last house but one on the side opposite to the Assembly Rooms is one of the richest in Bath—that is to say, the richest, good taste being the standard. The house was called Alfred House from the bust of King Alfred over the doorway. The ironwork well represents the customs of those days in the torch-extinguishers placed on either side above the railings.

It was here that Catharine Macaulay lived for some time and wrote her History of England, dealing with the period of the seventeenth century, eight volumes of which were published by Richard Crutwell and the ninth in London.

It is probable that about 1776 Wood rebuilt the Leper's Bath, adjoining the Helting Pump-room. This is a piece of work which is little known.

Originally the balustrade was more visible from the street than at present.

About the same time he built Woolley Church, near Bath, the cupola of which is worthy of note.

Possibly a Classic stone font in the interior is by him also.

In 1779 he built Hardenhuish Church, near Chippenham, a cleverly-designed piece of work. The exterior shows a good steeple. On the side is a three-light Venetian window, and the internal treatment is such that the great thickness of the wall is fully set off by the interior Doric columns being set close to the inside of the wall with a broad arch thrown across corresponding with that on the outside.

John Wood, jun., died in 1781 at the house at Bathaston which his father had built, and the doorway of which we have seen.

Before leaving the history of the Woods I should mention that the Exchange in Bristol was by Wood senior, erected 1740-43; also Redland-court, in the same city, the latter with terraces in the Italian manner.

Shockerwick House, near Box, was built by him in 1750.

There still remain many interesting buildings in Bath which must not be passed over.

Milson-street was probably designed by Robert Lightholder about 1760. He at any rate designed the Octagon Chapel there, which was opened in 1767. The three best houses are on the east side, and together with those between form a fine group, the basement of all the five having been originally rusticated in the manner of the central one, as shown in Nattes' "Views of Bath," published 1806. He also shows a vase on the top of each of the two pediments. It must be confessed, however, that at times Nattes shows a calm indifference to truth in his details.

About this period the Corporation had to rebuild the old Town Hall, and one Thomas

Attwood, who about the year 1762 had built a family house for the Pulteneys in Grove-street on the farther, or Bathwick, side of the river, was instructed to proceed with the matter. This house afterwards became the gaol, and, considering that Attwood's trade was that of a plumber and painter, it shows no little talent. He died, however, from the effects of an accident while the old houses near the Town Hall were being cleared away, and shortly afterwards, in 1774, a plan for a Town Hall and markets was offered by Thomas Baldwin, who was then only twenty-four years of age, having been born in 1750. These were approved by the Corporation and carried out. Thus Baldwin became the chief follower of the Woods. In 1780 he was made City Surveyor, and four years later City Architect.

It will be observed that Baldwin's work has not the strength of that of the Woods, but depends more on surface decoration. However, the recessing of the windows here within a great enclosing arch is a good feature, and the rustication, known as vermiculated, with which the central portion of the lower story is treated, adds immensely to the strength of the whole design.

At this period, nevertheless, the ornamental treatment of interior surfaces was not less beautiful than any that had been before, and the Guildhall contains within its walls perhaps the finest of any.

The soffits of the staircase, as well as the walls and ceiling, were liberally adorned, and the manner of the whole is chaste in the extreme. Notice particularly the semicircular panel at the top of the stairs.

The banqueting-room is without any exception the finest thing of its kind in Bath. At each end is an arched recess with three similar recesses on the one side corresponding with two groups of three windows each and a fireplace on the other. Over the fireplace are the arms of Bath. The Corinthian order extends with its base to about half the height of the room and supports an entablature which is continued all round, broken only at the recesses, the middle one of which on the inside is set back still further to contain the orchestra; above are circular discs at the two ends and oval ones at the side, facing the oval windows. A second cornice runs unbroken round the room above this and here the cove rises up to a large flat ceiling, which is ornamented with three immense circles filled with enriched plaster work, between which are two smaller ones serving as grilles to the ventilators. The raised ornaments on the fireplaces and doors are of wood covered with a coat of fine plaster and this is the usual method adopted in this kind of work in Bath. The building was completed in 1777.

Passing down Bridge-street we come to the Pulteney Bridge, which was built about 1776 from designs by Robert Adam for his patron, William Pulteney, Earl of Bath, that he might have the more ready access to his Bathwick estate.

Beyond this the domestic work of Baldwin is principally seen. In a shop in Argyle-street there remains a good fireplace, carved with pendants and festoons, with musical emblems in the centre. The form of the grate, as well as the technique of its casting, are both highly artistic.

In 1788 Laura-place was commenced.

Great Pulteney-street, which was begun about 1792, was his finest work. It certainly has a very imposing effect, from its great length and width; and the old Sydney Hotel, afterwards Sydney College, at the end, adds considerably to the beauty of it.

The old Pump Room had been finished in 1706. It was much enlarged in 1751. Previous to 1780 Reveley had been commissioned to prepare plans, and work was commenced and carried to a considerable height at the west end. On the appointment of Baldwin as City Surveyor in that year, however, the work was stopped, and he, in his official capacity, had to prepare plans. In 1788 a committee was formed to discuss them with him, together with the estimates, and work appears to have commenced, but difficulties arising between him and the Corporation, it was again suspended. In 1794 John Palmer gave new plans and elevations, and in 1799 the new Pump Room was finished under his direction. The two colonnades were certainly the work of Baldwin, and as the capital adjoining the basement of the Pump Room is worked out of the same stone as the rustication, it would appear that the whole of this front was at least de-

signed and commenced by the same hand, whoever might have carried out the upper part.

The interior of the room is very lofty, and is treated quite simply with a Corinthian order supporting an entablature and cove. In length it is 85 ft. including recesses, in width 46 ft., and in height 34 ft., or 8 ft. less than that of the large assembly room. A statue of Beau Nash is at the further end and underneath a fine clock presented by Mr. Tompion.

In about 1790 Reveley, the architect referred to above, had built Camden-crescent, remarkable for the manner in which the rise of the ground is overcome in the design. The old print in Nattes' coloured views (1806) shows the portion of the Crescent begun at the east end, and which was afterwards taken down because the houses between could not be completed on account of the landslip, those now in existence being built on the solid rock.

In 1789 an Act of Parliament had been obtained for the improvement of the older part of the city, and much was done within the next few years. A new street was built to connect Milson-street with Stall-street, as formerly the back part of the Bear Inn premises served for this purpose. This was Union-street; Cheap-street and Westgate-street were widened, and Bath-street was built, all under Baldwin.

The Ionic colonnade in the latter street forms a very interesting feature with the Cross Bath at the bottom, also erected from Baldwin's designs. This building has some good detail upon it, the Corinthian capitals particularly being very finely worked. At the north end is a portico supported on four columns.

At this period a very large house was commenced at Grosvenor, intended originally for an inn, but which for a long time lay unfinished. It is faced with seven composite columns, and the shafts were to be adorned with three tiers of festoons, though the lowest has not been finished. The cornice is broken at each column. There is a simple Doric portico on the ground floor.

The oval medallions were intended probably to represent Earth, Air, Fire, Water, Spring, and Summer. Of these, the eagle on the left represents Air, the lion Earth, and the whale on the right Water; the others are uncarved. The middle ones would have been for Spring and Summer. This building is now Grosvenor College.

There remains, at 24, High-street, in the old Market Place, a front illustrative of the manner of building at the very close of the century. No doubt the Doric order was once to be seen on the ground floor, but like many more it has been obliterated. The date—1800—is seen in the circular pediment at the top.

I cannot close my paper in a more fitting way than by exhibiting to you the excellent map prepared by Mr. T. Sturge Cotterell, called the Historic Map of Bath. It contains a great deal of interesting information as to the past, and shows the remarkable change which took place during the period which has been under our notice this evening.

The Chairman said they could have but one opinion in regard to the paper, and that was as to its exceptionally valuable character. Mr. Green had not only given them a great deal of most interesting matter in regard to Bath, but he had shown a large number of lantern views, each from photographs taken by himself. There was not much that could be added in the way of discussion, but one point that had struck him was the extraordinary opportunity which had been given to one man to develop the town in which he lived. The case appeared to be unique, and fortunately the opportunity was made the best use of. A local character had been given to the architecture of Bath by this influence of one master mind, and a certain amount of uniformity had been obtained which had, he believed, no parallel in our country. There were harmony, beauty, and dignity, enhanced by a fine local building material. He was afraid that a repetition of such conditions and results would not be likely to occur for a long time to come, even if they ever got public sentiment in favour of a certain uniformity of treatment. Another idea which had suggested itself to him was the value of the speculative architect. When a really qualified architect speculated where a number of buildings like the Bath ones were required for the community, the effect was much more happy than when a number of individuals were concerned in the erection of the buildings of any particular place.

Mr. Matt Garbutt, in proposing a vote of thanks, said although he had been to Bath he had had no idea that there was so much of interest there. The elder Wood appeared to have been responsible for nearly all the architecture of Bath of his period, and his work formed a most interesting study. There had been one or two parallels on a smaller scale in London, where one or two streets had been laid out by one man, but such a chance did not often occur.

Mr. A. T. Bolton, in seconding the vote of thanks, said he did not think a better example could be set before students than what Mr. Green had been doing at Bath. All over the country the old provincial towns were disappearing, and if Association students who came up to London to study would, on their return to their native towns, do what Mr. Green had done at Bath they would render a great service to architecture as well as to the towns. In thirty years' time there would not be a single example of old Birmingham, Leeds, and other towns left, and yet any Londoner going to Birmingham was struck with the old Quaker element of it, and the same with Leeds. It did not strike people on the spot so much, but they would wake up one day to what they had lost. At Brighton people seemed to take an interest in the old topographical aspect of buildings, for in the Pavilion there there is a collection of lithographs which enabled one to form an idea of what Brighton must have been at the time of its greatest glory. There was a great value in the preservation of the old setting. In the case of a novelist, for instance, who was taking the period of Nash and other celebrities at Bath, if a man who was worth his salt, he would want to form an idea of what the streets and walks and buildings were like in which the characters moved, and a book about Bath, such as that which Mr. Green was preparing, would supply a complete mental idea of the town. As to the Bath architecture, what struck an outsider most of all was the smallness of scale, and one had to remember that after all Bath was only a small watering-place, as it were. The scale of the architecture was no doubt really too small; for instance, the orders of the Circus were not much more than 12 ft. and 14 ft. in height, and the columns could hardly be 9 ft., and any one familiar with Italian architecture must feel that the scale of some of the Bath buildings was a great deal too small. In the Circus the orders looked much like umbrellas or walking-sticks; but in the Crescent one did not get that idea, for the orders went up two stories and there was something of the effect of the right classical scale. There was no getting away from the fact that the dignity of classical architecture required a certain indifference to size; and tied down as the elder Wood was in the means at his disposal, he was not able to carry out the Circus on the scale demanded, and in looking at it one had to regard it from the point of view of an architectural model; and if one realised that a certain meanness in regard to the architecture of Bath, which first struck one, was due to that, one would be better able to appreciate what was good in it. Mr. Green had shown some beautiful interior work—staircases, ceilings, &c., which were remarkable. He wished that some one would do the same for old Dublin architecture, for in some of the old houses there there was much that was reminiscent of what was in Bath.

The vote of thanks having been heartily agreed to,

Mr. Green, in reply, said that in the provincial towns there was a great deal hidden away that had to be searched for and brought to light. In Bath, living in the place, it had been an easy matter for him to do that, and people had been very kind in allowing him to go into their houses to take photographs. He was glad the matter of speculation had been noticed. It was the hard-working, speculative master builder Wood who had achieved so much. He seemed to combine the profession of the architect and the business of the builder, and hired men himself to carry out his work. Wood must have had a master mind, and made nothing of difficulties which would have stopped other men. As to the scale of the Circus, he had come to the conclusion that it would have been worse to have made the scale twice its present size. To have made it twice its height would have made the houses uninhabitable. Wood relied on the nearness of view in the Circus. It was entirely different with the Crescent, which could be seen to perfection a long way off. The difficulty was

bound to occur where three orders were used on a building; dignity was sacrificed to detail. As to the book he was about to publish, there was so much of interest in Bath that it seemed desirable to put it in book form as a permanent record of these eighteenth-century buildings, for some of them were bound to disappear.

The Chairman announced that the next meeting would be held on May 10, when a paper would be read by Mr. A. Hinds on "The Protection of Buildings from Lightning."

The meeting then terminated.

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—At a meeting of the Edinburgh Architectural Association on the 17th inst.—Mr. Henry F. Kerr presiding—Sir John Sibbald read a paper on the Plans of Asylums for the Insane Poor, looked at from the medical and administrative points of view. It was at least helpful if not absolutely necessary, he said, for a proper understanding of such questions to know something of the grounds or which persons familiar with the treatment of the insane had arrived at their present opinions, and this knowledge could be best obtained by taking a general survey of the changes that had occurred in the character of asylum buildings during what might be called the modern epoch. Sir John briefly referred to the kind of buildings in which the insane were lodged previous to the nineteenth century, and mentioned as illustrations the cells attached to the Charity Workhouse and the old Royal Infirmary. The duty of erecting asylums at the public expense was not seriously recognised in this country till the middle of last century, when the English Lunacy Act of 1845 and the Scottish Lunacy Act of 1857 laid this duty upon localities, and conferred on them powers for obtaining the necessary funds. To illustrate the growth of opinion in regard to asylums since that time, Sir John first referred to the plans of the Derby County Asylum, which was opened in 1851. He then drew attention to the plans of the London County Asylum at Bexley, which was opened in 1898, and referred to the improvements which showed themselves in the more recent plan. Among these it was noticed that the several wards into which the accommodation for patients is divided no longer consist, as they did at Derby, of rows of cells in prison-like galleries, identical in plan, but they are each specially designed for the patients they are to accommodate, according to the requirements of their different bodily and mental conditions—those requiring hospital treatment, for example, being placed in wards arranged like those of an hospital, and those in good bodily health, and whose mental condition does not require them to be housed differently from sane persons, being placed in wards of more home-like character. He pointed out that this type of asylum, which he called the aggregated pavilion type, differed from the next type to which he drew attention, chiefly by the several wards being connected to other wards either by being portions of the same building or by the existence of corridors of communication. The type in which the wards consist of separate and independent buildings he called the segregated pavilion or village type; and he illustrated it by reference to the plans of the Prussian asylum at Alt-Scherbitz and of other more recently erected asylums of the same type. He gave a number of reasons which, in his opinion, justified a preference for the segregated pavilion or village type. Among these he mentioned the importance of making the buildings and everything else about an asylum as likely as possible to have a beneficial influence on the minds of the patients; and he showed that it was difficult to prevent a huge building which was neither a palace nor a manufactory from being, both inside and out, gloomy and prison-like. He was also of opinion that where each ward was a completely independent building its arrangements could be made more efficient, both from the general points of view of cheerfulness and health and from the special point of view of the adaptation of each ward to its own purposes. He said that he thought the objections to the segregated buildings that had been raised from the administrative point of view were sufficiently met by the fact that they received no support from those who have had the actual administration of a village asylum. He

alluded to the fact that it was proposed to erect the new Edinburgh Asylum on the village type, but did not make special reference to the Bangour plans, as they had not yet been finally adopted by the District Lunacy Board or approved of by the General Lunacy Board. In the course of the paper Sir John drew attention to the difference in practice north and south of the Tweed in regard to the courts surrounded by high walls which were at one time attached to asylums as well as prisons, and which are generally known as airing courts. He said that in Scotland the use of these airing courts had fallen into disfavour as early as 1869, and in that year the walls were removed and the airing courts abolished in one asylum. Since then the walls had either been removed, or lowered so much as to cease to be restrictive, in nearly every Scottish asylum, and in no Scottish asylum erected since 1869 had any airing courts been provided. In English asylums, on the contrary, airing courts were still in general use, and he quoted from the English Commissioners' reports to show that in at least three of the London County Asylums from one-fourth to one-third of the inmates never took exercise beyond the airing courts. He strongly advocated the abolition of these airing courts. Another point to which he drew attention was a recent movement—to which he gave his support—for the diminution of the practice of locking up in single rooms during night-time the noisy, the excited, and others of the more troublesome patients, and he spoke strongly in favour of the great increase in recent years both in the amount and the efficiency of the night-nursing given to such patients, and he showed how such a change in the mode of treating them should affect the plans of future asylums.

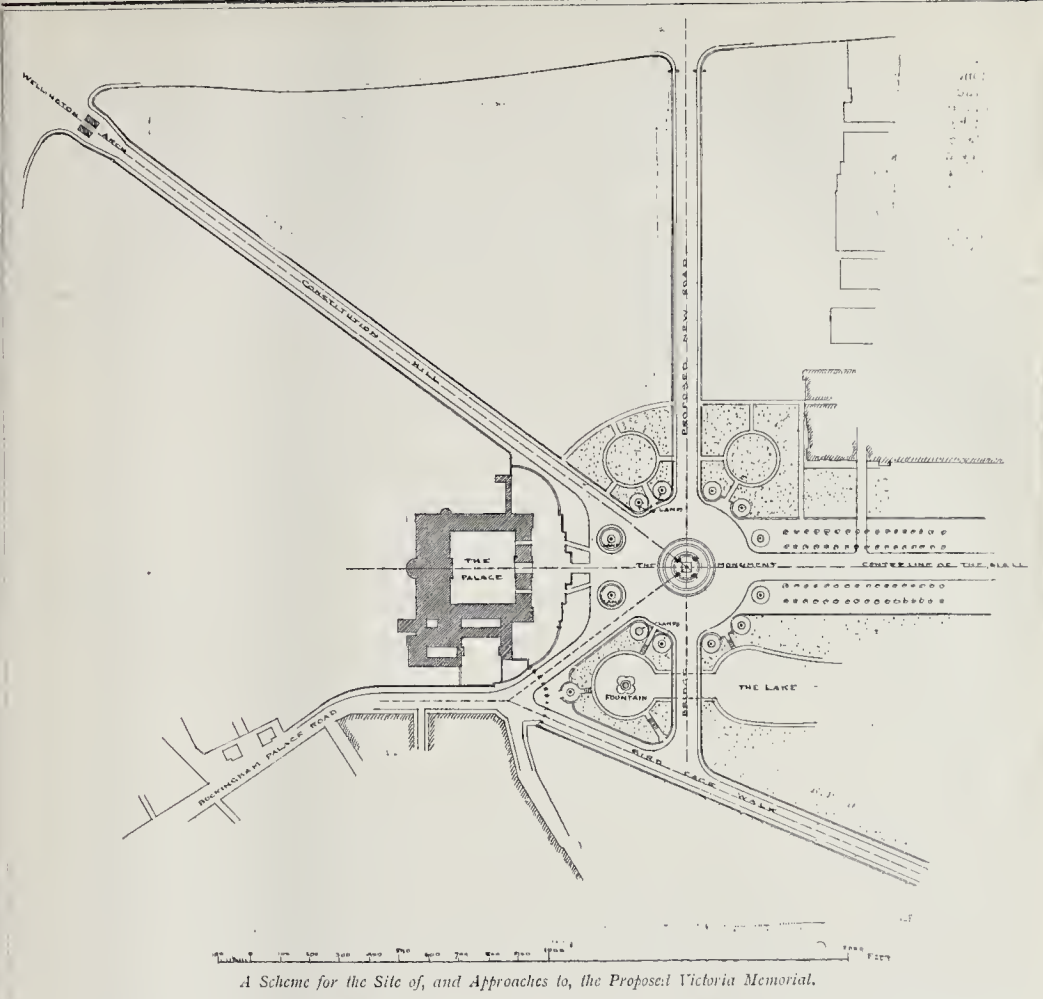

CARDIFF ARCHITECTS' SOCIETY.—The annual dinner of the Cardiff, South Wales, and Monmouthshire Architects' Society was held on the 20th inst. at the Royal Hotel, Mr. George Thomas, F.S.I., President, presiding. Mr. Downing, in responding to the toast of "The Society," said he could not speak in very congratulatory terms of the present state of architectural practice in the district. The building trade had not yet recovered from the effects of the recent coal strike. Alluding to public work, the speaker mentioned the new municipal buildings, and said he anticipated that they would be worthy of the reputation of Cardiff. The promotion of the study of architecture as an art and science, observed the speaker, was worthy of the consideration of the Welsh educational bodies. "The Master Builders" were toasted by Mr. H. V. Lancaster, and Mr. W. Thomas replied. The speakers to the other toasts included the President, Alderman D. Jones, Mr. Dashwood Capel, Rev. A. Henderson, Mr. John Sankey, Colonel Hopkins, Mr. Edwin Seward, Mr. Lewis Williams, Alderman Rainsdale, and Mr. D. Morgan.

COMPETITIONS.

BANK BUILDINGS, LEEDS.—In a recent competition for bank buildings at Leeds, the first premiated design was that sent in by Messrs. Oliver & Dodgshun, of Leeds; the second premiated design was by Messrs. Perkin & Bulmer, Leeds.

RESTORATION OF CHURCH, LONGRIDGE.—The church of St. Lawrence, Longridge, near Preston, which has been in course of restoration for a considerable period, has been reopened. The present restoration includes the reflooring, reseating, and reeroofing of the structure, the rebuilding and enlargement of the chancel and vestry, the erection of a new west entrance and baptistry, the reseating of the gallery, and other improvements, which have been effected from the designs and under the superintendence of Mr. J. A. Seward, architect, of Preston. The cost of the work was about 2,500l.

SCHOOLS FOR STEPNEY CHILDREN, STIFFORD.—Mr. J. Whyte Harper laid the foundation-stone on the 15th inst. of the new schools being built for the Stepney Guardians at Stifford, Essex. The cost of the site was 10,000l., and eighty acres of land had been purchased by the guardians. It was proposed to build two blocks, each accommodating sixty children, and four semi-detached cottages, each accommodating fifteen children, with the usual offices, swimming baths, laundry, &c. The children, it is hoped, will be educated at the Stifford Board schools, while the elder girls will look after the infants, and there will be a store at which the girls will purchase the articles required for the daily life of the homes, and thus fit themselves for their part in life when they leave the schools. The architect is Mr. Baggallay, and the builders are Messrs. Wall, of Chelsea.

THE QUEEN VICTORIA MEMORIAL.

SIR,—In the plan which has been published in a contemporary daily paper of the proposed "Place" to be formed in front of Buckingham Palace, the monument does not seem to be sufficiently emphasised. The Mall, and the Mall only, has a vista culminating in it.

In the plan, which I enclose herewith, the monument would be in a circular "Place" with five roads leading up to and concentrating attention on it. I beg to briefly explain.

At the bottom of Constitution Hill there is at present a bend; by slightly setting back the railing of the Palace forecourt the road is continued in a straight line from the Wellington Arch to the Mall and the monument placed at the intersection. The road from the Buckingham Palace-road is brought in so as to make the same angle with the Mall as Constitution Hill. A new road is proposed leading from the monument up through Green Park to Piccadilly, and this road is continued southwards to Birdcage-walk, being taken over the lake, the end of which is re-arranged by a bridge. The southern end would be useful for diverting the cab traffic away from the Palace on Drawing Room days, and the northern would make a fine approach from Piccadilly.

The monument is further from the Palace than in the published plan, and therefore would not clash so much with its inferior architecture.

PLAN THE BASIS OF DESIGN.

CONGREGATIONAL CHURCH AT WARING GREEN, BRIGHOUSE.—Two memorial-stones in connexion with the erection of a new Congregational church at Waring Green, Brighouse, were laid recently. Messrs. Sharp & Waller are the architects for the building.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute of British Architects was held at the Rooms, No. 9, Conduit-street, Regent-street, W., on Monday evening, Mr. E. A. Gruning (Vice-President) in the chair.

The minutes having been taken as read, The Chairman moved "That the resolution of the Royal Institute suspending By-law 26 for one year, passed at a special general meeting on April 15, now be confirmed."

Mr. Alex. Graham (Hon. Secretary) seconded the motion, and it was carried.

Mr. W. J. Locke (Secretary) reported that three candidates attended the examination for the office of Building Surveyor, and the successful one was Mr. James Edwin Webb, Nottingham. There were also three candidates for the examination for District Surveyor, the successful of whom were Mr. Sidney Joseph Halse, Fulham, S.W., and Mr. F. Sizer Capon, Streatham Common.

Classification of Romanesque Architecture.

Mr. Francis Bond, M.A., then read a paper on "The Classification of Romanesque Architecture," of which the following is an abstract:—

In introducing his subject the author alluded to some of the difficulties which beset the student on his first introduction to the great style which preceded Gothic and was based on Roman work. This subject of the classification of the Romanesque styles was a large one, and could only be dealt with shortly within the limits of his paper. Classifications already existed—those of De Caumont, Quicherat, Viollet-le-Duc, and particularly Anthonyme Saint-

Paul, were referred to—but they helped one but little forward. It remained to consider whether a wider basis of classification could not be found—one resting on the main facts of plan and structure.

First of all, what was the one thing that the old builders—whatever the schools they belonged to—were trying to do? With the exception of a certain number of them who were attempting to solve the church-building problem by following the type of St. Stefano Rotondo at Rome or of St. Vitale at Ravenna, and whose furthest outposts, with the exception of the churches of the Knights Templars and the Knights Hospitallers, are to be found in the churches of Aix-la-Chapelle, Ottmarshheim, and Gernigny-des-Prés, all the builders of Western Europe, from the ninth century, when Romanesque architecture commenced, to the twelfth century, when it was superseded by Gothic, were engrossed with one supreme problem—how to vault a basilica. This was the master-problem of the builders of the Middle Ages from the end of the ninth to the middle of the twelfth century. The amount of engineering skill, the ingenuity, and the variety of the solutions proposed were astonishing. They seemed never to have had their full due. Gothic architecture got nearly all the credit. As a matter of fact, every single one of the main difficulties inherent in the task had been effectually met—and met in more than one way—before the first Gothic architect ever handled a trowel. Early in the twelfth century, or before, at least five complete solutions had been arrived at, as may be seen at Le Puy, Tournus, Cluny, Speyer, and Durham.

The problem how to vault a basilica meant—(1) that there were to be aisles as well as a high nave; (2) that some form of vault construction was to be devised; (3) that since a vault of stone was heavy, piers must be substituted for graceful, but weak, classical columns; (4) that the thrusts of the high vault of the nave must be stopped in some way by abutment in or above the aisles; (5) that top-lighting by clearstory windows was to be retained; (6) that the outer surface of the vault must be protected from the weather.

I. In most cases one or more of these conditions were evaded. One school—the most ancient of all, which held the whole of the field till the ninth century—simplified the problem by omitting the vault and retaining the colonnade.

II. A second solution—also very incomplete—was to omit the aisles; to build a hall-church roofed with a tunnel vault. This simplified the question of supports, for it substituted solid walls for hollow arches, any amount of clearstory light could be introduced, and the walls could be thickened to any extent to provide continuous abutment to the thrust of the great tunnel vault. Everywhere it was the natural and proper solution where only a small church was required, but it was employed in Provence even in churches of cathedral rank.

III. A third method, represented by the school of Périgueux, also removes the difficulties of supports, abutment, and top-lighting by eliminating the aisles. It presents us with another variety of hall-church, roofed, not with a tunnel, but a row of domes, and it is to be noted that the corners of each square bay of the nave are filled in with pendentives to support the dome.

IV. The next method is found only in the church of Loches, near Tours. Originally there was a low tunnel-vaulted nave, without aisles, of the eleventh century. But about 1160 the eastern portions of the nave were pulled down, two square bays were formed, and on these bays two spires were erected.

V. In two churches of the first rank a row of domes was employed to roof an aisled nave. The nave was spanned by a series of strong arches. These were so placed as to divide the nave into square compartments. On each square an octagonal dome was poised, the corners of the square being filled up with corbelling or squinches to afford support all round to the base of the dome. The typical example of this is the wonderful cathedral of Le Puy, the nave of which is roofed by a row of six domes on squinches.

VI. The next method may be distinguished as the arch-and-lintel system. Strong transverse arches were built across the nave about 9 ft. apart; a wall was built on each arch rising up to the apex of the arch, and then lintels of basalt were laid longitudinally—i.e., from west to east. Count Vogüé has fully illustrated this curious phase of architectural history in *La Syrie centrale*.

VII. We next come to a whole series of attempts to solve the problem by covering an aisled nave with what is called a tunnel, wagon, barrel, or cradle-vault. Of these the most scientific is that of Tournus Abbey church. As in the churches of Syria, the nave was spanned by stout arches, each arch carrying a wall. But each pair of these walls, instead of carrying lintels, as in Syria, carries a short tunnel set *transversely*.

VIII. We now come to the vast number of churches in which the tunnel-vault of the nave was placed longitudinally—i.e., in the direction of the axis of the church. The naves vaulted with longitudinal tunnels may be divided into those (a) where the tunnel rests on a pier-arcade; (b) where the tunnel rests on the arches of an upper vaulted aisle; (c) where the tunnel rests on a wall pierced with clearstory windows.

IX. Such interiors as that of Notre-Dame de Poitiers were painfully low. It would have been dangerous, however, to raise the tunnel much by increasing the height of the piers. So, in Auvergne especially, the expedient was hit upon of building two aisles instead of one, both vaulted; then the tunnel could spring at a much higher level. Moreover, some of the gloom of the Poitevin type of nave could be dispelled by piercing the back wall of the new upper aisle with windows.

X. The first step to carry out the one unfulfilled condition in the problem—the provision of clearstory light—was taken by piercing the base of the tunnel itself with clearstory windows. The final step—a most important

change—was to insert the windows wholly in a clearstory wall. This latter seems to have been accomplished independently in the south, in Provence and Languedoc; in the north, in Burgundy. The clearstory was already in use in tunnel-vaulted churches in the eleventh century at Saint-Guilhem-du-Désert, in the Southern Cevennes; and in Burgundy on a small scale at Saint-Benoît-sur-Loire (commenced 1062), and on a gigantic scale at Cluny (commenced 1089).

XI. This solution, which was destined, within a generation or two, to culminate in the Gothic architecture of Saint-Denis (1140), consists in covering a nave with unribbed groined vaults.

XII. The final step was to substitute the ribbed for the groined vault; to dispose the vaulting compartments of the nave in oblongs, to facilitate the vaulting of these oblongs, by the application of the pointed arch, and to transmit the thrusts of the high vault by means of flying buttresses to the buttresses of the aisle walls. To this, Gothic architecture added three developments: (1) It weighted the buttresses with pinnacles; (2) to a large extent it replaced the masonry of the walls by glass; (3) in Durham nave, the Abbaye-aux-Dames, and elsewhere, abutment was sometimes provided by flying buttresses disposed beneath the aisle roof. In Gothic the flying buttresses are placed above the aisle roof.

XIII. This method, which consisted in omitting the vault, was no solution at all. The nave is not constructed in genuine basilical fashion, as in the first method, but is built as if a vault were intended. The home of this unworthy construction is Normandy.

Of the above solutions of the vaulting problem, the third, the employment of a dome resting on pendentives, is by itself a full and satisfactory criterion. It occurs nowhere except in a group of some thirty-five churches in the district of Périgueux, with such "outliers" as Fontevrault and Angoulême. No. 2, the hall-church, is most common in the southwest and south of France, from Poitou to Provence. It may be vaulted either with a longitudinal tunnel or with groined or ribbed vaults. No. 3, where a tunnel-vault rests directly on the pier arches, occupies much the same districts as No. 2. No. 9, where the tunnel rests on the arches of an upper aisle, extends from Clermont-Ferrand, in Auvergne, to the south-west as far as Conques and Toulouse. No. 10a, where the tunnel is combined with a triforium and clearstory, is the final development reached in Burgundy. No. 10b, where there is tunnel and clearstory, but no triforium, is the solution of Provence and of Piedmont. No. 12, the ribbed vault, occurs sporadically, except in Germany and Lombardy, where it is characteristic. No. 13, the unvaulted nave, was nearly universal in Normandy and England till the twelfth century was well advanced.

The author went on to consider how these eight divisions will stand other tests. A very important test is afforded by the planning of a church, especially of its eastern limb. It must suffice to trace four main types of choir-plan. The first is that with three parallel eastern apses, of which there is a variant with square-ended aisles, as at Cerisy-la-Forêt, and another with aisles square externally and semicircular internally, as at Romsey. This is pre-eminently the plan where the unvaulted nave prevails, viz., Normandy. It is frequent in Lombardy and in those Provençal churches that have aisles. A second plan is that of the ambulatory and "chevet." It is rare in Germany, Lombardy, and Provence, and non-existent in Normandy (excluding England).

The plans alone, apart from other considerations, would entitle Germany to rank as a distinct architectural province. In Provence the aisled churches generally have three parallel eastern apses.

The divisions may be tested again by the treatment of the central tower: (1) its vaulting; (2) its shape, whether square or octagonal.

The Romanesque builders had three forms of vault at their disposal in the eleventh century: the groined vault, the tunnel-vault, and the dome. The most difficult problem they had to cope with in vaulting was the question of putting a vault over the crossing, resting not on walls, but on four unbuttressed legs. They had hardly dared yet to put a groined vault over their naves, fearing its concentrated thrusts. Their favourite tunnel-vault could not be used at all at the crossing, for it needed

solid walls for its support. They had perforce to use the dome, in all cases, except in the Périgueux district, resting on squinches. Secondly, they had to stop the thrusts of this dome by carrying up a central tower to weight the arches or walling on which the dome rested. As regards the shape of this tower, they had two alternatives. The crossing was square, and so the tower over it might be square, as was the great central tower of Cluny and that of Tournus. But the squinches reduced the square of the crossing to an octagon, and as the tower rested directly on the octagon, and not on the square, it was more natural that the tower also should be octagonal. Hence that magnificent series of octagonal central towers in Burgundy and Southern France, Germany, and Lombardy, culminating at Mayence and Saint-Sernin, Toulouse. In Normandy and England, on the other hand, the builders hardly ever dared to vault their naves at that early date, and never the crossing. And there being no dome in an Anglo-Norman tower, it is square.

Another test is afforded by the grouping of the towers. (1) The glorification of the tower reaches its highest pitch in Germany. Six towers are found at Speyer, Worms, and Laach, seven at Limburg. (2) In Burgundy the magnificent tower-group of Cluny seems to have remained without a rival. Its daughter churches were satisfied with a triplet; an octagonal central tower and two square western towers was the favourite arrangement. The towers have several stages, similar in form. (3) In Normandy also the triplet was the favourite, but the central tower was square, and not domed internally. (4) In Poitou the characteristic is the conical spire, "en pomme de pin," which often surmounts the tower. (5) In the Périgordian region is seen the same conical spire, together with the characteristic cupolas. (6) In Provence "a simple square tower is common, with a very low spire." But some have central octagons. (7) In Auvergne a specially characteristic arrangement is that of a square western tower in the centre of the façade and a central octagon. (8) In Northern Italy the campanile type greatly predominates, and where the massive Romanesque tower is found, it is usually divided (in campanile fashion) into very numerous stages. Nowhere, except in the Como churches, does the campanile form part of the structure of the church; often it is quite detached.

Summary.—We may discriminate the following eight schools of Romanesque:—I, the Périgordian; II, the Poitevin; III, the Provençal; IV, the Auvergne; V, the Burgundian; VI, the Norman; VII, the German; VIII, the Lombardic.

As regards the above classification, one word of caution is necessary. In speaking, e.g., of the style or school of Auvergne, it is not meant that all the churches in Auvergne were built in this style, or that there were no such churches outside Auvergne, but merely that such churches were more common in Auvergne than elsewhere, and may therefore for convenience be described as belonging to the style or school of Auvergne. Also that those features described as characteristic were not invariably found; they were merely those which occurred most frequently.

One is tempted to try to work out the relations to one another of the different schools. Certain resemblances are patent. The superposed aisles link the style of Lombardy to that of Auvergne; German Romanesque is connected with Lombardic on the one hand, and with Norman on the other. But a much more exhaustive classification is necessary before any results of lasting value are likely to be obtained.

Still stronger is the temptation to inquire into the origins of all the Romanesque styles; whether they are derivatives, as some have held, from Provence, or, as others have held, from Lombardy. Such architectural pedigrees are not, as a rule, trustworthy. And there always remains an alternative hypothesis, which seems to have within it much of truth, viz., that the styles were none of them mainly derivative, but that the same problem was engaging all the different regions more or less simultaneously; that the builders of each region were solving it, with some little light, indeed, from their neighbours, but mainly independently, by empirical experiments of their own, aided by the survival here and there of traditions of Roman construction, and by the study of local Roman monuments.

Another caution requisite is that the classi-

fication does not cover the whole ground. This is necessarily so. Between each region and the next there was always a debatable ground, where two or more styles would be in simultaneous use. Indeed, a "pure" region would be the exception; the greater part of the area of any one country would employ mixtures of style. England is an instance.

It had always been customary, the author believed, to regard the Romanesque of England and Normandy as one. The Romanesque of Normandy, however, seemed to be a "pure" style, and that of England a "mixed" style. While by far the most important factor is the influence of such pre-Conquest churches as Bernay, Jumèges, and the Abbaye-aux-Hommes, we must also attribute some degree of importance, at any rate in the planning, to the highly developed Romanesque of Auvergne and Burgundy.

The lecture was illustrated by a numerous and interesting series of lantern slides, mainly from photographs taken by the author himself.

Colonel Prendergast, I.I.A., said he had the pleasure of proposing a vote of thanks to Mr. Bond for the very important paper they had heard read. The subject which had been treated so ably that night was so great that there was no time to give the historical part of it. It so happened that he had recently made some researches connected with the buildings they had had shown them that night, and he had tried to find by what process this form of architecture had been arrived at. It prevailed everywhere, and it had reached even to their own land. Any one who cared about archaeology would know that the Venerable Bede, when in the North wrote clearly about buildings that were being erected about the year 780, and which were being built after he made his visit to Rome, which he described as being made "more Roman." He for one was very anxious to trace where the old Roman methods ended and what followed had arisen, and he paid a visit to Le Puy, of which a picture had been given, because their much-regretted member of the Council, Mr. Fergusson, had mentioned to him that there, perhaps, the missing link could be found. He confessed, however, that he was unable to follow that clue. Later on the work which had already been alluded to that night—the most valuable book of M. de Voglie, in conjunction with the French Ambassador, M. Waddington—gave him a better clue. There, he thought, they might make out what the processes were, and he considered it worth their while to follow it up. One of the advantages of the paper having been kept to the one phase of the Romanesque was that they kept clear of the pitting of one school of architecture against another. He hoped that they would remember that the ignorance of the general public as to this particular phase of architecture was absolute and, in this country, complete. No one knew anything about it. The British public was bound down with detail, and the paper read that night would be Greek to a large number of the British public, who cared little about technical construction. This, however, should no longer be the case, for these Romanesque churches had their effect. He had never met any one who had been to Durham or any of the great English churches of this period who did not come away saying there was something about them which it was impossible to describe. Surely it was worth their while to take some little trouble to know how the style was formed, and he, for one, was extremely grateful to the distinguished member who had given them the paper that night, because it really was a revelation.

Mr. R. Phénix Spiers, in seconding the motion, said it would be impossible now to follow Mr. Bond into the arguments he had laid down and which must have taken an immense amount of time to elaborate. He happened to have visited nearly all of the places he had mentioned, and his only regret was that he had not had that excellent paper with him when he visited them. At the same time it did happen that on his visit he took interest in the method of arched vaults, and the photographs they had seen reminded him of the buildings he visited many years ago. On the present occasion he thought he would be doing a greater service to the Institute and Mr. Bond if he limited himself to one or two additional examples which it might be interesting for him to take up, because he did hope that the subject would be pursued. Mr. Bond had given them

what could only, in the time, be the skeleton of his theory, and it was one on which many volumes might be written. He hoped Mr. Bond would continue the subject, because he was quite certain that it was one of the greatest possible advantage to them. With that view he would mention one or two buildings somewhat earlier and somewhat later than those given by Mr. Bond. Mr. Bond had been rather timid sometimes with regard to the date of the church he had shown of Périgueux. As a matter of fact, there was an earlier church in the vicinity of Périgueux—St. Astier, the date of which was 1010—and that was the first church he knew of which was covered with a dome on pendentives. The pendentives of the dome were gone, but the piers which sustained them were still there. This was the same as at St. Etienne, Périgueux. It was rather singular in this church and in St. Astier—and it may be found in other examples—that, instead of beginning, as had always been the custom, with the choir, they seemed to have begun at the other end. They had another instance of that in the case of Angoulême for the earlier period, 1117 to 1120. The east dome was probably the first portion erected, and the others added afterwards; and, as regarded St. Etienne, it was certain that two domes were erected and a third may have been erected and pulled down. As regarded the Church of St. Front, probably the church was begun much later than 1120. It seemed an additional proof to him that, after the basilican church of St. Front was burned down, there was an attempt to copy St. Etienne, for in the middle of the nave they built four great piers to support a dome. He presumed that some one saw St. Mark's, and then they commenced the building they knew well before its restoration. The problem of St. Hilaire, Poitiers, which was one of the most wonderful interiors he knew of, might be solved in this way. There were portions of it earlier than the nave portion. Certainly the aisles were older and portions of the transept. They wanted to vault the nave, but it was 50 ft. wide, and that was more than they dared at that time, so what they did was to build within the existing nave, piers at certain intervals and construct domes in each bay. But that was a theory which might be worked out later on. It was one of great interest, and he thought its suggestiveness for the treatment of modern churches was wonderful. Although Mr. Fergusson was not a practising architect, it was astonishing how closely he arrived at results, and he (the speaker) thought his idea was a valuable one when he pointed out that the object of the pointed barrel vault was to have less filling in at the top because it was the custom to cover over this barrel with a roof. For that reason the pointed barrel vault actually existed before the circular barrel vault. As regarded the Church at Tornour, it was a wonderful building, and he did not know why it had not been copied. The light they got was splendid and he was astonished that the type had never been reproduced, as he thought it extremely fine. Mr. Bond had stated that the consecration took place in 1019. The church was begun in 1007, after the fire, and the consecration took place in 1010, but the choir was of the twelfth century. The crypt was of the old church of the tenth century, and still existed. Mr. Bond had instanced two cases in which transverse vaults were run across the aisles, and he might add St. Remi, Rheims, and the basilican church of St. Front. As regarded the Church of Grandson, in Switzerland, which was put down as being of the tenth or eleventh century, its appearance was deceptive, and Mr. Street considered it to be twelfth century, a date also quoted by Reber. With regard to the test of plan, St. Sulpice, a small church in Switzerland, was certainly very early—only three apses and the transept remained. At Vignory there had been some change as regarded the east end, and it had been vaulted. It was vaulted with barrel vaults originally, and was one of the earliest instances of vaults carried round on apse. The two bays now built into the base of the tower of St. Front were identically the same as at Vignory, and the two vaults may have been built by the same masons. Architects, no doubt, in those days went about and brought in views of their own country, and it was natural that there should be later changes brought into buildings. He thanked Mr. Bond for the enormous research he had shown on the subject and the admirable way in which he had illustrated it.

The motion having been heartily carried,

Mr. Bond said he was extremely obliged for the hearty vote of thanks.

The Victoria Monument.

The Chairman announced that a special general meeting had been summoned by the Council in compliance with a requisition by twelve subscribing members, to be held next Monday, to consider the various resolutions regarding the proposed national memorial to Queen Victoria.

The meeting then terminated.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—The eleventh meeting of the session was held on the 17th inst., Dr. W. de Gray Birch, Vice-President, in the chair. Mr. Charles E. Keyser gave a very interesting exhibition of photographic lantern-slides illustrating the Norman tympana of English church doorways. There were over 170 slides, besides a large number of bromide enlargements arranged in series on the walls of the room. Mr. Keyser explained that he did not intend to give a lecture or to read a paper, but simply to offer a few views in explanation of the subject of each view as it was shown, with the name of the church to which it belonged. The exhibition had been given before several other societies, and the collection of photographs—which is being continually added to—is certainly a magnificent one and, of its kind, unique. A paper was contributed by Mr. T. Cam Hughes upon some recent discoveries at Bleasdale, Lancashire. These discoveries consist of a group of pre-historic remains occupying a prominent position on a knoll of boulders in the midst of an amphitheatre of moorland hills due west of Fairsnape Farm. Mr. Shadrack Jackson, with the help of Mr. Kelsall, the occupier of the farm, made a series of excavations in what he suspected to be an early British burial-place. Two circles of timber were met with, the outer being 150 ft. in diameter, composed of round logs of oak placed closely side by side, five in a row, forming a kind of platform. The inner circle is much more complex and is 75 ft. in diameter. In the centre of the circle was found a rectangular hole which had been filled with wood ashes, and in the hole a group of three cinerary urns was discovered. Two of the urns contained calcined human bones. A small cup was also found in the mouth of one of the urns in an inverted position. The features of this remarkable discovery are all characteristic of the Bronze Age, and we shall await with the greatest interest a more full account, which, we understand, is to appear in due course.—Mr. Patrick, Hon. Secretary, announced that the Congress would be held at Newcastle-on-Tyne, from Thursday, July 18, to Wednesday, July 24, both days inclusive, under the presidency of Mr. Thomas Hodgkin, M.A., D.C.L., F.S.A., of Barmoor Castle, Beal, Northumberland.

THE WORKMEN'S COMPENSATION ACT, 1897: A PLEA FOR REVISION. By R. T. Thomson. (Eltingham Wilson.)

PROPOSED BATHS IN CHORLTON-ON-MEDLOCK.—The Baths Committee of the Manchester Corporation have adopted plans which have been prepared by the City Surveyor for the erection of new baths in High-street, Chorlton-on-Medlock, to be called the Victoria Baths. The building, which will include a variety of baths, in addition to plunge baths for both sexes, is estimated to cost 40,000.

DRILL HALL, GOSPORT.—A drill hall is to be erected at Gosport from the designs of Lieutenant H. A. F. Smith, of Gosport. The building will be situated in Walpole-road, and will be three stories in height. The hall itself will be 80 ft. by 45 ft. The contractors are Messrs. Lane Eros, their contract being for 2,925/.

DESIGN FOR NORWICH UNION LIFE INSURANCE OFFICES.

WE published a fortnight ago the selected design in the competition for these new offices at Norwich, which seems to have excited a good deal of interest, and called forth an amount of architectural ability unusual in the case of a competition for a private building.

We give this week the perspective view of the design submitted by Mr. Charles Heathcote, of Manchester, together with the plan for the ground floor.

PRIOR PARK, BATH.

THOUGH Prior Park has been the subject of a good many illustrations, these have been generally from pretty nearly one point of view, showing the garden front. A collection of four views gives a better all-round idea of a house which has acquired some celebrity both architecturally and otherwise, and the view in the garden shows that here also the element of staidness was not neglected.

Little did Colin Campbell, when he refused to use Bath stone in the erection of Greenwell Hospital, think of the results of his action; for Ralph Allen was the proprietor of large quarries, and if he could not induce them to use his stone, he would use it himself. He would build a mansion that should display not only the variety of uses of his stone but the grandeur of architecture. The site was one particularly calculated to set off any building that might be placed upon it. At the upper end of one of the many "combes" with which the neighbourhood abounded, with grassy slopes stretching away down to Old Widcombe House and church, was to lie the country house of Prior Park, the design of John Wood.

A word about the owner. Ralph Allen, whose name has come down to us associated with high principles of honour, loved to entertain at his home the cultured and learned men of the day. Although anxious to develop the natural resources of the neighbourhood, he was yet careful to show the greatest kindness to all whom he could befriend. Especially was this the case in regard to his workmen, for whom he erected dwellings on Combe Down. Among the great men who had tasted of his unsparring hospitality, were Pope, Fielding, Smollett, Warburton, and others. His natural abilities had brought him to this honoured position. Born in 1792, he had, after a good education, been a clerk in the Bath Post-office, and the story is often told of how he was fortunate enough to secure the attention of General Wade, who was then stationed in Bath, through the discovery of a plot for insurrection in the West of England. As a result he was made postmaster of Bath. In 1742 he was mayor, and in 1763, on his retirement from the Corporation, he gave the city 500*l.* towards the building of a new Guildhall.

It is not unlikely that in the first instance Wood had been found by Allen in Yorkshire and invited to come to Bath. In any case the two men were friendly for a period of some years, and no doubt Allen found that the advice which he received from Wood was such as tended to develop his schemes, while Wood, on the other hand, must have felt the advantage of working for such an influential patron.

Allen died in 1764, aged seventy-one years, and the estate descended to Bishop Warburton, who had married Allen's favourite niece, Miss Tucker. But he did not live much at the mansion, and the society fell away. After his death in 1779 the house came into the possession of Viscount Hawarden, whose wife was Mary, a daughter of Ralph Allen's brother. He died in 1803, and Thomas Ralph, second Viscount Hawarden, succeeded him. With the death of the latter, in 1807, the connexion of the Allen family with Prior Park ceased. In 1829 Bishop Baines bought the estate for 22,000*l.*, and it was for a time well cared for, although the interior of the house suffered considerably from a great fire which took place on May 30, 1836. After passing through other hands, it was in 1867 purchased by Bishop Clifford, and became a Roman Catholic college, which it has since remained. The real interest of the old work now lies in the central block and the building on the west of it.

M. A. G.

OLD ARCHITECTURE OF BATH.

THESF examples of the eighteenth-century architecture of Bath, taken from photographs, are given as illustrations to Mr. M. A. Green's paper on the subject read before the Architectural Association last week, and printed on another page.

SKETCHES AT WHITBY.

THE sketches which we reproduce were made at Whitby, a sketching-ground so well known, either by visit or reputation, that it is, perhaps, unnecessary to make any statement as to its suitability; but the town and neighbourhood abound with endless subjects for sketches of pictorial architecture and objects for study, in variety, perhaps, unequalled by any other town on the English coast. Until the year 1751 all the roads in the neighbourhood lay in a state of nature, rough, rugged, and uneven, and it was dangerous, especially in winter, for any one on horseback or by conveyance to come into the town. To this long-continued isolation may be attributed the primitive condition of the place and its inhabitants, a condition which, however, is in danger of disappearing owing to the increasing popularity of the town as a seaside resort.

The first object of interest on approaching the town is the well-known abbey crowning the East cliff, a ruin which, with the old church of St. Mary built on the same spur, dominates the surrounding country, and in conjunction with the old town and the river Esk flowing some 250 feet below, make a very striking composition. Of the old abbey all that now remains are the ruins of the church occupying the site of the old Saxon building, but exhibiting no traces of remains earlier than the twelfth century. The most ancient portion is the choir, which is Early English; the transept also is Early English, but of later date, and the nave is richly decorated. On the south side are foundations of cloisters and domestic buildings.

The town itself, with its quaint narrow streets and old-fashioned houses built in such picturesque confusion, also gives ample material for those fond of architectural sketching, and it is very interesting to wander in and out by the narrowest of passages and up and down by the steepest of stone stairs, the attention being constantly attracted by something worth sketching in the most out-of-the-way corners.

The river runs through the centre of the town, the two parts of which are connected by a bridge, apparently a combination of old and new work, its stone huttresses and wooden corbels giving it a very quaint appearance, somewhat spoll, however, by the iron draw-bridge in the central span. From this bridge some very effective sketches may be made, especially in the evening, when the town is bathed in the light of the setting sun, the outlines and colouring of the red-tiled cottages modified by the atmosphere, acquiring as the evening draws on that harmony and breadth of effect which is so restful and beautiful after a hot day. Leaving the bridge, and passing along the quay, where there are to be seen many objects of interest and "little bits" to be noted in the sketch-book, is the principal of the two piers which form the harbour entrance, a delightful spot for study or recreation. At the end of each pier is a lighthouse; the larger one, which has weathered to a beautiful colour, being exceptionally fine in proportion.

For change of scenery and study there are the moors and several picturesque villages within easy distance from the town, and Robin Hood's Bay is but seven miles by train, and although so frequently illustrated is none the less interesting and well worth a visit.

GEORGE W. COLLINS.

LOCAL AUTHORITIES' OFFICERS SUPERANNUATION BILL.—In reference to this Bill, a meeting of the surveyors to the Local Authorities in the Birmingham district was held on Thursday last week in Birmingham, when the question before them was the Bill now being promoted in Parliament, entitled the "Local Authorities' Officers Superannuation Bill." It was resolved: "That, this meeting of surveyors, being unanimously of opinion that the Local Authorities' Officers Superannuation Bill should be carried through Parliament this session, pledge themselves to do everything in their power to accomplish this end by interviewing the various Members of Parliament representing their several districts, and requesting their strong support thereto, and to also urge upon their Authorities to petition in favour of the Bill."

BUILDING TRADES EXHIBITION.

THE exhibits of bricks, tiles, terra-cotta, and similar clay goods are quite up to the standard of previous exhibitions. There is an increasing tendency to manufacture red terra-cotta, finials, ornamental bricks, and models of terrible-looking animals. Common bricks seem to have fallen into the background, and higher-class bricks, of the rubber and terra-cotta types, take their place at the exhibition to some extent. The increasing use of roofing tiles has brought forth several more or less original designs, whilst the perforated common tile is also present in great quantity. Chimney-pots, on the other hand, appear on the whole to be of a simpler character than usual, and many are executed in red terra-cotta. Rustic ware is well represented, and ornamental terra-cotta tablets with designs in high relief are conspicuous on some of the stands.

Messrs. S. & E. Collier, of Grovelands, Reading, have a large stand whereon are exhibited roofing and wall tiles, both machine and hand made; there are ornamental tiles in various patterns for vertical work, and small tiles for bays, porches, &c. There are many ornamental patterns of ridge tiles and finials. In regard to bricks, Messrs. Collier show smooth-faced air bricks, and common bricks both smooth and sand faced. These goods are for the most part made from clays, sands, and loams of the Reading period, and give a good idea of the wide range of utility of that formation.

Mr. Mark Gentry, of Sible Hedingham, Essex, also has a good exhibit of his "M.G." brand red facings, rubbers, arch bricks, and moulded and enriched bricks.

Messrs. Perrett Brothers, of Cheam, Surrey, have a well-furnished stand of red facing and moulded bricks, also rubbers, tiles, finials, chimney-pots, terra-cotta ware, vases, &c. The earthen employed in their manufacture are the clays and loams of the Reading series, which are well represented in the neighbourhood of Cheam; they take on a good red colour, of a uniform tint. This is a new venture, and we wish the undertaking success.

The Somerset Trading Company (late Messrs. Browne & Co.), of Bridgwater, have erected a small building which is covered with their patent interlocking tiles. It is claimed for them that they are easily laid, without nails, and as they are proof against rain and snow-drift, they are specially suitable for use in exposed positions. The same firm also exhibit interlocking double Roman tiles, square-shouldered to break the joint, Poole's tiles, Phillips' lockjaw tiles, triple and double Roman tiles, bricks, and terra-cotta.

Messrs. Candy & Co., Great Western Potteries and Brickworks, Heathfield, Newton Abbot, have a large stand exhibiting their bricks and stoneware of various kinds. The body of the ware is chiefly of a buff tint, but the goods are very largely glazed. The firm has published some interesting chemical analyses of the fireclay in the raw state and the brick made from the clay. The results are as follow:—

	Composition of the Fireclay.	Composition of the Fire Brick.
Silica	77.30 per cent.	82.90 per cent.
Alumina	16.60 "	14.11 "
Peroxide of iron....	1.90 "	2.39 "
Lime and magnesia	traces	traces
Potash (with some soda)	"	0.54 "
Loss	4.20 "	0.06 "
	100.00	100.00

The very small percentage of lime and the alkalis invests this material with special interest from a clay-working standpoint, for the raw clay is, practically, a pure silicate of alumina plus about two per cent. of iron. It is not surprising that bricks made from such clay should be capable of withstanding great compression. Six bricks tested for crushing strain, each about 3 in. by 9 in. by 4½ in., gave as a mean result 4452 tons per square foot; whilst tests as to porosity showed that some white glazed bricks absorbed from ¼ to ½ oz. of water during four hours. It would have been interesting had the precise method of experimenting been explained, as in absorption experiments that counts for much; and the effects of a more prolonged immersion than four hours might well be given. However, we are pleased to see that some attempt has been made to give the physical properties

of the bricks, for very few manufacturers go to the trouble and expense of doing so.

The Cattybrook Brick Company, of Bristol, have specimens of brickwork in different colours, red and buff terra-cotta and moulded bricks, with blue and brindle goods. The most conspicuous parts of the stand are in the buff terra-cotta, such as window-heads, mouldings, &c. The same firm also shows red facing bricks and vitreous blue bricks for stables. Experiments in regard to thrusting stress on six yellow pressed bricks, each about 2.65 in. by 8.75 in. by 4.20 in., show a mean stress per brick, cracked slightly at 286.6 tons per square foot cracked generally at 386.3 tons, and crushed at 393.7 tons per square foot. The results on six red bricks are—cracked slightly at 328.8 tons per square foot, cracked generally at 371.9 tons, and crushed at 381.2 tons per square foot. In all the experiments the bricks were bedded between pieces of pine 2 in. in thickness.

Messrs. H. J. & C. Major, of Bridgwater, have erected a hut whereon are displayed their patent roofing tiles, of Roman and other patterns; also Major's patent interlocking plain tiles of Brosley type, requiring neither nails nor mortar to make a good roof. There are also specimens of milklin and ornamental ridge tiles, bricks, &c., chiefly in red goods, but there are some good white perforated bricks.

Messrs. Stanley Bros., of Nuneaton, exhibit a variety of their goods, including white and coloured enamelled bricks, improved salt and grey granite bricks, red and buff chimney pots, ornamental red and buff terra-cotta, semi-ercaustic paving tiles, blue pressed bricks, garden tiles, red and buff terra-cotta and glazed vases, and Staffordshire quarries.

The Glenfield Premier Brick and Terra-Cotta Company, of Glenfield, near Leicester, show their best red, hand-pressed facing brick, tapped wire-cut for seconds facing, moulded and ornamental bricks, terra-cotta chimney-pots and ridge tiles and finials, all red goods.

Messrs. G. Tucker & Son, of Loughborough, exhibit their red and buff terra-cotta, red pressed facing bricks, red sand stocks, special sewer bricks, and roofing and paving tiles. The colour is good, and the different specimens seem to have been carefully burned.

Mr. Charles Watson, of Napton-on-the-Hill, Warwickshire, also shows some samples of bricks, roofing tiles, and quarries made from the well-known lias clays of the neighbourhood.

Messrs. Joseph Place & Sons, of Darwen, have a large exhibit of salt glazed bricks, enamelled bricks (white and coloured), chimney-tops, &c. An analysis of the fireclay employed gave the following results:—

Silica	47.20	per cent.
Alumina	35.70	"
Oxide of iron	2.07	"
Lime29	"
Magnesia36	"
Potash and soda98	"
Combined water and organic matter.....	13.15	"
	99.84	

The sample was dried at 212 deg. Fahr., and the analysis shows that the clay is an excellent material for the manufacture of fire bricks and lumps. The proportion of silica is somewhat lower, and of alumina higher than in most fire clays, which is in its favour as a refractory material. The fire bricks are made from the Lower Mountain Mine clay of Lancashire makers. Place's patent chequer bricks for kiln bottoms are also shown on the stand.

Mr. George Swift, of Liverpool, shows some plain and embossed enamelled tiles, mosaics and architectural faience for internal and external decorations, also some patent dovetailed security back tiles.

Messrs. Oates & Green, of Halifax, exhibit a number of salt glazed, white and coloured glazed bricks, as well as many examples of their sanitary goods. In the Smoke Abatement section the firm shows the application of certain of their bricks in connexion with the "Berceford" fire.

In the last-mentioned section the Flaming Fire Brick Company, of Mark-lane, have an exhibit. They claim that their process produces a smokeless fire by enabling coke, anthracite, or cinders to burn brightly in any open grate or closed range, with less trouble and less expense than ordinary coal or gas, yet without any structural alteration of the grate being necessary. These perforated bricks be-

come much more quickly and intensely heated than ordinary solid fire-bricks do. The use of anthracite must, of course, be beneficial from a smoke abatement point of view, and the bricks certainly appear to do what is claimed for them.

Stones are not well represented in the exhibition, and there are very few building stones. Mr. John Rooke, of Weldon, near Kettering, has a small stand of the cream-coloured oolitic limestone, known as Weldon stone. Messrs. Harwood & Young, of East Grinstead, exhibit some specimens of yellow sandstone from the Hackenden quarries. This stone comes from the Hastings division of the Wealden formation. Mr. S. T. Clothier, of Street, Somerset, has some blocks of blue Lias Keinton stone, including slabs and kerbs. The Crown Dale Stone Company exhibit their silicious limestone in the form of ashlar mouldings, carvings, &c. In the gallery there are a few good stone exhibits, principally illustrating the use of the material for surveyors' purposes. We noticed the stands of the Pwllheli Granite Co., whose specialities are granite setts, channels, kerbs, and macadam; the Hard York Nonslip Stone Co., Halifax, which firm has laid down a pavement to show the applications of the stone; Mr. James Runnalls, of Penlee, Penzance, exhibits specimens of Penlee stone; the Newry Granite Co., of Newry, Ireland, shows some setts and other uses of the stone; Messrs. John Wainwright & Co., of Shepton Mallet, have some basalt road metal, and samples of carboniferous limestone; the Mountsorrel Granite Company, of Loughborough, near Leicester, show the employment of their well-known stone for street purposes; Messrs. Field & Mackay exhibit Cleve Hill basalt road metal and kerbs from the Titterstone quarry; Messrs. Mackay & Davies, of Pontypridd, have some specimens of blue Pennant paving stone; Messrs. Darbishes exhibit their well-known Penmaenmawr stone, from North Wales; the Hopton Wood Stone Company, of Wirksworth, Derbyshire, have blocks of their carboniferous limestone for building, &c.; there is also a good display of Norwegian granites, opicalcites, and marbles.

Of artificial stones, the Patent Indurated Stone Company* have, in addition to their ordinary products, a red window bay, also a staircase made of broken Leicestershire granite mixed with Portland cement; Messrs. B. Ward & Co. have some samples of artificial stone dressings, stair-treads, and mosaic work; and in the gallery the Victoria Stone Company have a good exhibit of their ordinary materials.

Cements are hardly represented, but in the entrance-hall we observed an apparatus, known as the Patent Standard Flourimeter, invented by Mr. W. F. Goreham, of Belvedere, Kent, which by an ingenious adaptation of a specific gravity process separates the flour of the cement from the grosser particles; this instrument must prove of great value to large users of cement and others.

Messrs. John Knowles & Co., in addition to a goodly display of sanitary pipes and similar ware, have some blue quarries and firebricks, blue cornice bricks, white terra-cotta, brown salt-glazed ware, and the like. In connexion we also noticed Callender's bitumen damp-proof course, which has been largely utilised in recent years, especially in the construction of reservoirs, water-tanks, &c.

Messrs. Peter Wood, of West Bromwich, have an interesting stand whereon are exhibited a goodly assortment of their annealed blue bricks, including pressed facings, bull-noses, plinths, splays, stables, and pavings; also channels, platform, and wall-coping, of various kinds, kerbs, large step bricks, window-heads, &c. A chemical analysis of the clay employed is given as follows:—

Insoluble residue (quartz and felspar)	33.58	p.c.
Combined silica	27.33	"
Alumina	16.73	"
Ferric oxide	6.57	"
Ferrous oxide	3.38	"
Manganous oxide	0.34	"
Lime	0.39	"
Magnesia	0.86	"
Potash	0.75	"
Soda	1.06	"
Combined water, loss, &c.	9.21	"
	100.00	

This analysis shows that the clay is a very good one for clayworking purposes, and

* Where no locality is given, the exhibitors are London firms.

judging from the finished products on the stand, vitrification is easily arrived at. One of the types of bricks made by the firm is styled the "imperishable blue," which is said to be non-corrosive.

Mr. F. H. Brook has a composite exhibit made up of the produce of various firms. Messrs. John Carr & Sons, of North Shields, show some well-glazed bricks in different tints, as well as sanitary ware; the Lumley Brick Company, of Fence Houses, co. Durham, have some white and coloured glazed bricks; the Sussex Brick Company, of Warnham, near Horsham, exhibit machine-pressed common bricks, re-pressed red facing bricks, sewer bricks, and hand-made red bricks; Mr. William Moberley, of Woodseton, near Dudley, has some Stourbridge fire-bricks, lumps, and fire-tiles; and the Midland Stone Pipe Company have sent some buff terra-cotta chimney-pots, salt glazed bricks, and some sanitary ware. Altogether the combined exhibit is an effective one, if there is not much of novelty in it.

Messrs. Broad & Co. have a large exhibit of sanitary goods, as well as white and coloured glazed bricks, building bricks, glazed tiles, hearth tiles, and majolica tiles in various colours and patterns, for wall work.

Messrs. James Woodward, of Swadincote, near Burton-on-Trent, show various types of sanitary goods turned out by the firm, also buff terra-cotta chimney-pots, flower vases, white and coloured glazed bricks, fire-bricks, &c.

The Sneyd Collieries, of Burslem, have a small exhibit in the entrance hall of their bricks, glazed white, yellow, green, and other colours.

The Newellite Glass Tile Company, already mentioned in our former article, show their patent glass tiles, which have a special key or backing of a bituminous nature, enabling them to be readily fixed in position, and which also prevent cracking of the opal glass by the alternate expansion and contraction due to rapid changes in temperature.

The British Opal Wall Glazing Company also have a neat exhibit. Their tiles differ from those last mentioned, amongst other things, in that the backing is composed of little rough knobs of glass projecting from the back of the tile, to give it a hold to the cement or other substance in which it may be embedded. The tiles are usually set in adamant cement, and the firm makes its own glass. To show the use of the material from a decorative standpoint there are exhibited some Japanese and floral hand-painted panels on opal glass. The normal effect of the opal glass as a wall glaze is exemplified by an erection in the centre of the exhibit.

Messrs. Mintons have a display of wall tiles representing the general scope of their recent methods of wall decoration, including bird panels with raised outline, and painted in coloured glazes; another panel shows figures in slight relief; a third panel of fish; and a fourth pheasants and partridges.

The Artistic Tile Company exhibit some new designs in hand-painted and other wall tiles, also a large assortment of flooring tiles, marble mosaics, &c. The white terra-cotta shown is a pleasing material, and is employed both for interior and exterior purposes.

Messrs. Colthurst, Symons, & Co., of Bridgwater, have erected a hut, tiled and finished by their red tiles, and many other patterns made by the firm are shown.

There is much to interest in the sanitary exhibits, and great and general advance is being made on all sides, which is quite a revolution on appliances in vogue twenty years ago. In examining the several groups, it will probably be noted how the minds of manufacturers have been directed to meet what are the needs of the day, and it is interesting to note the similar results which have been arrived at. Mr. George Jennings has a fine exhibit of water-closet appliances of every imaginable kind, from the new arm-chair pattern water-closet for Windsor Castle to the ingenious arrangement for water-closets for steamship above or below the water-mark; and a very clever and very complete portable water-closet is also shown. Part of the exhibit from the Paris Exhibition is here on view. Messrs. Cliff's manufactures are too well known to require description and are fully shown, among which is a decorative item that may be referred to—viz., Lethaby's rough surface bricks. This is a glazed enamel of beautiful and varied colourings, and intended for building up mantelpieces; its use suggests many combinations. Messrs. Shanks & Co. have an excellent show of baths, siphonic and

other closets. Among these the new Aqua jet-flushing cistern will certainly attract attention. This clever invention entirely does away with the pulling of a chain to discharge the siphon. The chain, so constantly a cause of trouble, and at times, ineffective, is discarded. The Aqua jet-flushing cistern is pneumatic in action; an indiarubber ball, which can be replaced at small cost, is enclosed in a porcelain case held by screws. Switching a lever discharges a column of water which impinges on the siphon and effects the discharge.

One of the best sanitary exhibits is that of Mr. Walter E. Mason, of Horwich, the whole of which is of his own manufacture. Among the water-closets may be noted the "Maelstrom," siphonic in action and very powerful in flush. We saw quite 10 ft. of a ribbon of paper carried away by this apparatus. Another noticeable feature was a urinal with a patent flushing nozzle, doing away with the intermittent sparge discharge. The flush was one of the most effective we have seen. An excellent mixing tap for baths was also shown. Others, equally good, are exhibited by Messrs. Jennings and Shanks respectively.

Messrs. Oates & Green, Halifax, show a hospital closet above the floor, and not of the corbel pattern, being fixed upon iron brackets into the wall, the advantage claimed being that it may be removed for repair if necessary. An ingenious arrangement is also shown for school lavatories to meet the objection of children using the same water for washing purposes; and to prevent the conveyance of ophthalmia a supply is provided with a rose instead of a sparge pipe, and the supply can be either intermittent or a continuous flow from the valves, being turned on or off by the caretaker for a fixed period or manipulated by the child using same. The salt glaze work exhibited is excellent in quality.

A novelty in lavatories is the "Runwell," (Messrs. Mason), which obviates all the objections generally attendant upon such basins, and is distinguished by the absence of plug, chain, and lead trap, and is siphonic in action; it cannot overflow and is automatic, and very quick in action. The waste is easily accessible, and there seems to be nothing to get out of order.

In the gallery, and coming under the sanitary survey, is a somewhat novel and remarkable machine, Ravenor's patent drain tester, by means of which defects are indicated upon a water-gauge for low pressure, or a gauge-dial indicating the pounds pressure. Testing for high pressure, the procedure is the same for vertical as horizontal pipes; stop outlets connect with drain, and work the bellows. This creates a pressure on the water in an annular channel, and causes same to rise in a gauge-glass; if this column of water be maintained the drain is sound, but if the water falls the drain is defective. The next operation is to detect the leakage; a cap is removed and a smoke rocket introduced, and the powerful bellows again used. The machine also provides a test for high pressure. When the bellows are worked the pressure is indicated on a pressure gauge; if the dial pointer maintains its position the drain is sound, but if it falls towards zero the drain is defective. Some idea of the power may be gathered from the fact that the bellows will give a pressure of 4 lbs., equal to a column of water 8 ft. high. A higher pressure can be obtained by attaching a bicycle inflator to a special valve provided, but 8 lbs., equal to a column of water 16 ft. high, should be the maximum. The machine is quite portable, is made of brass, and costing but 5l. 5s., is within the reach of all. We consider it to be an effective and very useful invention, and architects would do well to insert the test by this machine in their specifications.

Mr. Fewster Wilkinson exhibits what he calls a new system of stairs. We greatly doubt if there is anything new in the idea, which is the principle of two risers to one tread, not uncommon in mediæval buildings. The sample shown is "designed to afford the cottager as easy a means of getting upstairs as his richer neighbour enjoys." If he has no children this may be desirable, but if he should in addition be given to excessive drinking, neither his life nor those of his children will be worth many years' purchase. The stairs are designed to combine easier risers with wider treads than can be arranged on the ordinary system. For instance, at an angle of 45 deg. the risers and treads can be in the following proportions, 5½ in. by 11 in.

or 6 in. by 12 in. or 7 in. by 14 in., instead of equal risers and treads, as in the ordinary system. At lesser angles easier risers and wider treads can be provided. The stair exhibited is at the angle of 50 deg.; there are eleven risers for a rise of 5 ft. ½ in., each riser being only 5½ in. high. The treads are 9½ in. wide. The "going" is only 3 ft. 10½ in. However, we think the system may be very usefully employed in positions where access is difficult to be obtained, but it is a questionable advantage for the cottager.

A very useful plunger is exhibited by Mr. Cooper, Finsbury Park. It is used for cleaning closet traps, drains, soil pipes, baths, sinks, stackpipes, &c., by suction. It is easily applied to water-closets and basins, and after ventilation pipes and overflow waste pipes have been stopped up any obstruction in the trap can readily be removed.

Sash and casement windows appear to still afford suggestion for variation and combination; climatic conditions, however, render it impossible to adopt continental systems here, and while reversible and other fittings are introduced to mitigate what are supposed to be evils in the older forms of English windows, which are both familiar to us in appearance and use, there is, however, generally an absence of charm in modern windows as compared with those of a century or so ago. Reference may be made to some ingenious arrangement shown, as, for instance, Carey's patent sashes, which are a clever combination of both sash and casement, in which the advantages of both are procured. The sample shown has the appearance of an ordinary double hung sash, by releasing a long flat bolt under the meeting rail and two smaller ones at the sill level, the whole is converted into four hung casements, which open inwards. The whole seemed to work freely enough in the example illustrated. The casements or sashes are hung on bolts, kept in place by other bolts at sill level, and are provided with water hollows against the side of the sash boxes. The sashes slide on iron or brass slips screwed to the beading and inserted into the sash.

The meeting of the sashes is unprotected by water-hollows, and would probably share the defect of all casements in not being so weather proof as the time-honoured sash. The advantages are, however, the absence of friction on the reversible joints of other systems, the possibility of cleaning the windows from within, and the opening of the whole area; the slides are of brass or iron, the latter painted which would show wear.

Another variation in window fittings is demonstrated in the exhibit of the Moore's Patents Company, when the sashes are at the bottom, by application of a handle the sashes turn inward. The opening side of the sash-box is solid and the weights are on one side only. This has elements of economy. The hinge side, however, presents at the level of the meeting rail an ugly cut, the advantage again being the sashes are not cut by a joint. The patent casement is even better. By moving a catch the outside will turn inside for cleaning, which seems paradoxical, but it works in a groove and, like all clever things, is very simple. In Moore's patent two-way door springs and hinges there is nothing to get out of order. They are screwed on the floor, are ball bearings, and by an ingenious arrangement will remain open without swinging back and without attachment.

An excellent one-way door spring is also shown, in which the spring on a wheel comes down a decline and gathers impetus thereby. Both these springs are quite inexpensive, and should demand a large sale. Another good exhibit is the New Idea Double Action Spring Hinge. It is an American invention. The spring—a spiral—is mortised into the door and fixed with screws; it can be tightened up without removing the fitting. We found this hinge to work quickly and efficiently, and will be of especial value when spring hinges are required over girders, its merits being simple in construction, inexpensive in cost.

A useful material is provided in Solignum (wood saver), a preservative for wood, stone, and brickwork. In appearance it is not unlike some qualities of tar. While being a preservative and soaking into the material, destroying all germ life, it at the same time possesses very pleasing qualities of colour and texture, shows the grain, and is capable of polish, although we prefer its pleasant flat appearance. It is produced in several gradations of

brown colour, and is most suitable for fences and half-timberings.

Among the most direct artistic exhibits must be mentioned the small but most interesting collection shown by the Terra Cotta Home Arts, Compton, Surrey (Mr. G. E. Watts). These consist of red terra-cotta sundials, garden vases, and other delightful works. In a stall adjoining the latter is also an interesting collection of decorative pottery. The Della Robbia Pottery Company, with which Mr. Harold Rathbone, of Birkenhead, is associated, have a small and representative stall.

Messrs. Carter & Co., of Poole, have an excellent collection of lustre tiles of all kinds. We were much struck with their richness. A raised tile with a Medusa head is shown which, in conjunction with others, is suggestive of successful fireplace treatment.

The Conduit and Insulation Company* have an exhibit of steel-armoured insulating conduit for electric wiring which will repay study. In their system of wiring the electric cables are not only completely protected from mechanical injury, as the steel conduit is nail-proof, but leakage of current is prevented by an insulating material which prevents the covering of the cable ever coming into contact with the metallic tube. When buildings get their electric supply from the mains of a public company, then it is notorious that in many cases the electric pressure between one of the mains and the steel conduit is greater than the pressure between the mains; hence in these cases it is imperative that when steel conduit is used it should be insulated. The method of making joints, and the useful patterns of joint boxes, switches, and fuses exhibited, show that this Company has perfected a very substantial and, from the wealthy consumer's point of view, a most desirable system of wiring for the electric light.

To electricians the exhibit in miniature of earthenware tubes for electric cables by Eredi Frazzi, of Cremona, Italy, for whose firm Mr. Arthur Brown is the sole representative in this country, will prove most interesting. The advantages of earthenware tubes for use with underground mains are well known to English electricians, and Messrs. Doullon have supplied them for many electrical undertakings. The advantages claimed for the Frazzi tubes are the great strength of the material used and its excellent insulating properties. The conduits are of two kinds. In the first kind it is formed of two distinct parts, the rectangular trough and the earthenware capping. If several cables are put in the trough leakage may take place between them, although they are well insulated from earth. Owing to the difficulties of getting a perfect fit for the cap for long lengths, the pieces are only about 2 ft. long. We were more interested in the second kind of conduit, which will be useful for many electrical purposes. In this case each cable has a separate compartment for itself, and the lengths are all in one piece. These conduits are excellently adapted for polyphase working, which is now the standard system in Italy.

On Tuesday afternoon Sir John Taylor, of H.M. Office of Works, and Mr. Edwin O. Sachs, architect to the Royal Italian Opera House, entertained on behalf of the Council and Executive of the Fire Prevention Committee some 600 members and visitors to view the special Fire Prevention exhibit which has been organised under the auspices of the Society. Sir John Taylor addressed the members and visitors, dealing exhaustively with the necessity of popularising the subject of fire protection, and he thanked the exhibitors for the spirited way in which they had co-operated, not only in their own interest, but with a view to putting before the public the scientific aspect of fire protection.

Mr. Edwin O. Sachs thereupon addressed the members and visitors as to the advisability of making the Exhibition a permanent one, similar to the permanent Sanitary Exhibition organised under the auspices of the Sanitary Institute.

The last Spring visit of the Architectural Association was also made to the Exhibition, on Saturday last, when the members found a good deal to interest them, especially the different forms of plaster partitions and forms of adapting the most recent developments of slabbed plaster to modern requirements. The general verdict was that this year's was one of the best that had been held.

Correspondence.

To the Editor of THE BUILDER.

THE SPECIAL MEETING AT THE INSTITUTE.

SIR,—Whatever individual opinions may be as to the limited architectural competition for the National Memorial—or, indeed, upon the whole question—the Institute meeting called for Monday next is most unfortunate; and it is to be hoped that the majority of those who attend will make a point of preventing any outcome from it, for the following reasons:—

1. Any recommendation made to the Memorial Committee should emanate in a dignified manner from the Council, not from a general meeting forced on by the action of a few members.
2. The member who has been chiefly instrumental in calling the meeting, is not one with whose procedure the general body of the Institute should desire to associate themselves.
3. The position is illogical, the President of the Institute being himself a member of the Memorial Committee.
4. It is far from likely that the recommendations made will be attended to, as the President, in his capacity of member of the Memorial Committee, will know exactly the value of this demonstration, and the Institute—should the meeting adopt the resolutions—will merely sanction a procedure leading to no result—and with loss of dignity.

F. R. I. B. A.

THE QUEEN VICTORIA MEMORIAL.

SIR,—It would appear, from the large number of letters appearing almost daily in the Press, and from the reports of meetings, that the disappointment at the very limited competition for this work is very widespread, and that there is a strong wish, if not a faint hope, that the committee may be induced to change their minds and open the competition to all artists of the British Empire.

Two mistakes seem to have been made, firstly, hasty decision before, at any rate, sounding the public; secondly, the assumption that a competition for a work of this kind is on all fours with a competition for a great public building.

It is more than likely that the advice of the authorities at H. M. Office of Works, as experts on the subject, was sought and followed. But in selecting architects for great public buildings artistic qualities are not the only essentials, for there must be present also great practical knowledge, wide experience, and business capacity. Here, however, before all things, we want art, and without presuming to say a word against the selected architects as artists, one feels compelled to exclaim that "There are others."

It is not only in the upper ranks of the architectural profession that there is at the present time a great amount of ability, but I believe that there is also a most exceptional amount of young talent only waiting an occasion to show itself. An open competition for this work would be a splendid opportunity—and when will there be such another, bringing such equal opportunities to the experienced and inexperienced? I feel sure that the results would be both a revelation and an education to the public; and judging by the large number of amateur suggestions, it is evident that there is a great amount of public interest taken in the subject.

But for an open competition there should be plenty of time, in order to put the small man more on a level with the great. The small man wants more time to work out his scheme than the great man, with an office full of assistants; and the great man would also be able to give more of his personal attention than he could do if he had to snatch short intervals in the midst of his large business.

If there is plenty of time there will be plenty of designs, and there will be more money also. Let the exhibition of designs be NEXT SPRING, and allow every one to illustrate his ideas in his own way, fixing a limit of size only. If the competition is open the public will take more interest in the scheme and more money will come in.

It was a surprise to many of us to learn that there is only one sculptor worthy of mention. Surely there are others.

F. B. WADE.

SIR,—I think most architects and others will agree with the remarks in the recent leading article you published, that there should be an open competition for this work; it might be for the memorial only, never mind about the avenue in front of it. It should consist of sketches only, and five artists from the competitors should be selected, and these should be added to the five architects already chosen. This, I venture to think, would satisfy the desire of many who would like to submit a design, and also would admit the already selected architects without their being subject to an open competition.

L. DE VILLE.

SITUATIONS VACANT :

SUGGESTIONS TO APPLICANTS.

SIR,—Replying to advertisements of situations vacant, by young men and old, is no doubt a necessary evil, but something might easily be done to improve matters, both in the interests of employers and employed.

In recently reading through some sixty or more applications with the accompanying testimonials, I confess to being greatly surprised that the young workers in our profession should send out manuscripts with so many defects. There were exceptions, of course, but I refer to the general rule.

Granted that the applicant considers himself suitable for the berth advertised, the first essential for a good application is good thinking, for an employer wants replies in a consecutive business-like way, and this can only be done after carefully thinking out what should be put into writing. A well-known writer says "The chief labour in writing is thinking." Let the applicant first jot down in regular order what seem the important points, carefully including any matter referred to by the employer in his advertisement and excluding the unimportant and trivial. Do not duplicate statements; cut out unnecessary words and phrases, remembering that the person who is to read the letter is very possibly a busy man. Applicants should study how to express themselves with the greatest force and grace, but, above all, seeking clearness and truth of expression.

It cannot be too plainly pointed out that failure must necessarily follow the loose ways of many who take no thought, but evidently pick up pen and proceed to put on paper such things as may chance to come into their minds during the process of writing.

Successful writing means thought.

G. A. HUMPHREYS.

ELTHAM PALACE.

SIR,—The present is a favourable opportunity for students to measure the ancient roof of the hall and the hall itself, as Messrs. Shillitoe & Son, of Bury St. Edmunds, are engaged in "strengthening" the roof. There are ladders and platforms put up. No doubt facilities would be given to students.

THOMAS BATTERBURY, F. R. I. B. A.

LONDON BRIDGE.

SIR,—Would you kindly, or possibly some of your numerous readers may be able to, enlighten us as to the probable fate of London Bridge? One of the daily papers informs us "that the Bill for the widening came before a Select Committee of the House of Commons on March 29 last. It was unopposed, and the preamble was passed and ordered to be reported to the House for third reading."

If the widening is to be effected by some overhanging arrangements without increasing the width of the foundations and the masonry from the base upwards, a permanent injury and weakening of the structure must result.

If the state of the foundations is such that they must not be interfered with, by all means leave the bridge alone.

I fear it will be too late to protest when the Bill has passed the third reading.

J. STANNAH.

VICTORIAN MEMORIAL, SCARBOROUGH.—A meeting of the committee appointed to deal with the proposed memorial to the late Queen Victoria at Scarborough was held on the 18th inst. Various schemes were submitted—namely, a Victorian Memorial Institute, including reading-room, reference library, and a fine art gallery; the erection of a statue, the erection of almshouses, and the provision of scholarships to encourage pupils to remain at school who would otherwise leave to earn a wage. One member said the erection of an obelisk on Oliver's Mount had been mentioned outside the committee. It was generally thought that the money subscribed should be devoted to what would obviously be a Victorian memorial, but eventually small sub-committees were appointed to report on various schemes to a full committee on May 2.

INSTITUTE OF SANITARY ENGINEERS.—At a meeting of the Election Committee held on the 10th inst. the following were elected as Associates:—S. L. Bartolomew, Clapham; C. E. S. Crawcour, Bray, Ireland; J. Moore, Whitley.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.
16.—WATER-CLOSET FLUSHING APPARATUS, &c.

NO water-closet, however good it may be, will be satisfactory unless it is adequately flushed. The dribble of water which was formerly admitted to the basin through a small pipe was insufficient to cleanse the basin, and was absolutely useless for flushing the trap, soil-pipe, and drain. In the case of valve-closets, where the basins retain a considerable quantity of water, the soil may be carried through the trap by the rush of this water alone, but other closets require an adequate supply of water discharged in sufficient volume and at a sufficient velocity. In order to prevent waste of water, public water companies almost invariably insist on some kind of "water-waste preventer" being fitted to every closet, so that no more than a stipulated quantity of water can be used at each flush. The limit is usually fixed at 2 gals., and in such cases a closet and trap must be selected which will be thoroughly cleared by the proper discharge of this quantity of water.

Experiments have shown that, while this quantity is sufficient to clear a good wash-down closet and trap, it is not sufficient to carry the soil through a moderately long branch-drain and through the disconnecting trap placed between the house-drain and sewer, nor is it sufficient to carry the soil through the trap of a wash-out closet in every case. Eighteen tests were made by Dr. Charles Porter, of Stockport, with a well-known wash-out closet. In six tests a 3-gallon flush was used, and although the closet-trap was cleared in every case, the 4-in. disconnecting trap was cleared only twice; twelve tests with 2½-gallon and 2-gallon flushes showed that these were utterly inadequate—in eight cases the closet-trap was not cleared, in five the drain was not cleared, and in every case the disconnecting trap retained a portion of the soil. The results of tests with a wash-down closet were much better; the closet-trap and drain were cleared by a 2-gallon flush, but in no case was this sufficient to clear the 4-in. disconnecting trap. A 2½-gallon flush was not very much better, but three gallons invariably cleared the closet, drain, and trap. In all cases the drain was 47 ft. long with a gradient of 1 in 40, and had one rounded right-angle bend. With a 6-in. drain (gradient 1 in 60) and a 6-in. disconnecting trap, even a six-gallon flush cleared the trap only twice in four tests. These and other experiments show clearly that the limit of 2 gallons is too low, and there is a growing feeling that all water companies ought to be compelled by law to follow the example of Brighton and some other authorities in allowing at least 3 gallons for flushing a water-closet. The extra cost of a 3-gallon cistern is very small, and this size ought to be used in every case where the regulations admit or where the water supply is private. Many siphonic closets require a 3-gallon flush to ensure siphonic action.

It was at one time the practice to supply water-closets through a valve (either simple or regulating) placed in the cistern used for storing drinking water, but this arrangement is now almost universally condemned by sanitary authorities, and ought never to be adopted. Valve-closets are often supplied through some kind of valve fitted on the supply-pipe under the seat of the closet. The simplest forms are the "Stool" and "Cottage" valves, but as these continue to supply water as long as the handle is held up, they are not as a rule approved by water companies. Regulating valves were therefore introduced, which close automatically after the passage of a certain quantity (usually 2 gallons) of water, whether the lever is held up or not. All these valves are apt to get out of order, and water-closets are now generally supplied directly from a separate cistern having an inlet controlled by a ball-valve, so that the supply is automatically shut off when the cistern is full.

Water-closet flushing cisterns are of three main types—the valve, the siphon, and the tipper. A fourth kind, which may be called the pneumatic, may be used with high-pressure supplies.

1. Valve Cisterns.—The simplest form of cistern contains a single valve. Fig. 1 shows

Illustrations to Student's Column.

a wooden cistern of this kind lined with lead. When the lever at A is depressed, the valve B is raised from its seating, and the water continues to flow down the flush-pipe as long as the lever is depressed or until the cistern is empty. In order to prevent a continuous flow of water, the flushing lever in this example is attached to the lever of the ball tap by the link C, so that the ball is raised and the water shut off as long as the flushing lever is depressed at A. An arrangement of this sort is demanded by many water companies. The inlet is shown at D and the overflow at E.

Double valve cisterns consist of two chambers, usually formed by means of a longitudinal partition; in the first chamber the inlet and ball-cock are placed, and also a valve fitted on a small compartment communicating with the second chamber, in which the flushing-valve is placed. The two valves are so connected to the flushing lever that one is closed while the other is open. Fig. 2 shows such a cistern fitted with an after-flush box for use with a valve-closet. When the cistern is being filled the valve A is open, and the water passes through the opening into the small compartment B, and thence into the second chamber of the cistern, until both are filled to the level at which the ball-valve is closed. When the flushing lever at C is depressed it closes the small valve A, and thus closes the communication between the two chambers, and at the same time opens the flushing valve D so that the water in the second chamber pours down into the after-flush box E and the flush-pipe F. On releasing the lever, the valve C is closed and the valve A opened, and the water stored in the first chamber passes into the second, thus lowering the ball and admitting a fresh supply. A small hole G in the flush-pipe near the bottom of the after-flush box allows the water in this to drain away after the valve D is closed; and an air-pipe carried up from the box to the top of the cistern supplies the necessary air.

Sometimes the two chambers are above each other, the lower containing the amount allowed for flushing. In cisterns of this kind a stand-pipe passes upwards from the top of the lower chamber through the upper chamber to a point above the water-level, and the spindle attached to the flushing-valve is carried down the stand-pipe, which also serves as an air-pipe for the lower chamber.

The upper chamber of such cisterns is sometimes large enough to hold four to six gallons, an arrangement which is advantageous where the water-supply is intermittent.

It is obvious that if the flushing lever of a valve cistern is released too soon, only a portion of the water will be discharged, and although this may be sufficient to clear the basin, it may be utterly inadequate to flush the soil through the closet-trap and drain. The chief advantage of these cisterns is that they are less noisy than the common siphon cisterns, which are objectionable on account of the loud gurgling and sucking sound caused by the inrush of air as the water reaches the foot of the short leg of the siphon. The double-valve cistern has the further advantage of being more silently filled, especially if a pipe is carried from the outlet of the ball-valve to the bottom of the first chamber, as the end of this pipe will be always below water. In some valve-cisterns a float is attached to the flushing-valve, so that this does not return to its seating as soon as the handle is released; this device ensures the discharge of practically the full flush every time the handle is pulled.

2. Siphon Cisterns.—The water in these is discharged by siphonic action, and the principal difference between the various kinds lies in the method of starting this action. Four methods are in general use—the valve, the dome, the plunger, and the displacer. In the valve siphon cistern (fig. 3), the depression of the flushing lever A raises the valve B and admits water into the long leg of the siphon; on releasing the lever, the valve closes and the greater portion of the remaining water is drawn up the short leg C and siphoned out. If, on the other hand, the lever A is held down, the water continues to flow through the open valve B (exactly as in an ordinary single-valve cistern), but the discharge is less rapid than when the siphon is in action. In the illustration the cistern is of cast-iron and the siphon of brass; in cheaper cisterns the siphon is of cast-iron. A link connects the flushing-lever and the ball-lever, so that the latter is held up and the water shut off as long as the end A of the flushing-lever is depressed. An objection often raised to this type of cistern is that the valve may get out of order: on the other hand, the valve is noiseless in action and starts the siphonage most effectually.

Two examples of the dome siphon cistern are given in figs. 4 and 5. Winn's "Acme" cistern (fig. 4) has been very largely used. The dome or cap A forms with the stand-pipe B an annular siphon. On depressing the flushing-lever at C the dome is raised, and the water in the annular space rises with it and charges the siphon. The lever may then be released, and the siphonic action will continue till the cistern

is practically empty. The trap at D renders the starting of siphonic action more certain and more easy. The mechanism is extremely simple, and there are no valves (except the ball-valve) to get out of order. The cistern is made with tapered sides to reduce the risk of breakage by frost, and can be obtained of cast-iron, as shown, or of wood lined with lead, and in sizes from 1 to 4 gals.

The cistern illustrated in fig. 5 is made of white or amber enamelled stoneware with the movable dome of the same material. The stand-pipe is of lead 1½ in. in diameter, extending a little above the top of the cistern to prevent secret waste, and the flushing-lever is of cast iron. Although known as Duckett's "A1" Plunger Cistern, it is really of the dome type. The flushing-lever is forked at the inner end and attached to the dome by a link on each side as shown by the dotted lines. The lower portion of the dome is of greater diameter and fits somewhat closely into the sunk portion of the cistern. On depressing the lever at A, the dome B is raised, and when the lever is suddenly released, the dome acts as a piston sliding in the sunk portion of the cistern, and forces the water upwards over the lip of the stand-pipe, thus starting the siphonic action, by which water is drawn through the holes in the lower part of the dome until the cistern is nearly empty. Very similar cisterns are made of cast-iron with cast-iron domes. In order to ensure a sufficiently rapid descent to force the water over the lip of the stand-pipe, the dome must be heavy, it is therefore almost invariably noisy in action, and even in the best cisterns of this type the siphon cannot always be started at the first or even second attempt.

In the plunger siphon cistern the siphon is started by water forced into it by means of a plunger or disc. In some cisterns of this type, siphonic action stops when the handle attached to the flushing-lever is released; these have the disadvantage of the ordinary valve cistern in not giving the full flush every time the closet is used. Others, however, continue to act after the handle is released. Fig. 6 is an example of the latter kind, known as the "Monarch." When the handle is pulled, the disc A (shown by dotted lines) is raised and forces a small quantity of water over the bend at the top of the siphon, and thus starts the siphonic action. In other cisterns of the same type, the plunger works horizontally, and in others vertically. These cisterns are less noisy than those with heavy domes, and siphonage is more readily started. They are,

however, somewhat more complicated. The plunger and cylinder in the best cisterns are made of brass.

Siphonage is sometimes started by means of a larger "displacer" attached to the flushing-lever and dipping into the water. The displacer is so designed that, when the lever is depressed, the bulkier portion of the displacer enters the water and raises the level of the water sufficiently to cause it to overflow the standpipe of the annular siphon. In these cisterns, the top of the standpipe must obviously be below the top of the cistern, and secret waste may possibly occur.

3. *Tipper Cisterns.*—Cisterns of this type are not often used for water-closets, as they give rise to a considerable amount of splashing, and are also somewhat noisy. The essential part of the apparatus is a tipper or tumbler swung on pivots and attached to the flushing lever in such a manner that, when the handle is pulled, the tipper is partially turned and the contents are discharged into the chamber in which the tipper is swung, and pass thence down the flush-pipe.

4. *Pneumatic Cisterns.*—These are only adapted for high-pressure supplies. The cistern is a closed galvanised iron cylinder regulated to hold a certain quantity of water in addition to a quantity of compressed air. When the closet is not in use the cistern is empty, and there is therefore no risk of breakage by frost. In one apparatus of this kind pressure on the seat of the closet opens the supply valve, closes the lower portion of the flush-pipe, and allows water to flow up the flush-pipe into the cistern, where the contained air is compressed to an extent corresponding with the pressure of the water. With a water-pressure of 70 lbs., 2 gallons will enter the cistern in less than a minute. As soon as the pressure on the seat is withdrawn the supply-valve closes automatically, and in so doing opens the flush-pipe, down which the water in the cistern is forced by the compressed air with great velocity into the closet-basin. There is, of course, a possibility of the valves and other mechanism getting out of order. The apparatus has not proved satisfactory, and cannot be recommended.

In "combination" closets the cisterns are fixed immediately above the seats, and may be either of valve or siphon type, but with specially large outlets. In some valve-cisterns of this kind the outlet is 4 in. in diameter. Three-gallon cisterns ought to be used where possible. Siphonic closets must be fitted with special cisterns, adapted for the several closets, and designed so that the full flush will be discharged whether the handle is continuously held or immediately released. Valve-cisterns with floating valves may be used, or suitable siphon cisterns. The capacity ought to be that recommended by the maker of the closet. Some makers say that their siphonic closets will work "perfectly" with a 2-gallon flush, but at the same time they "strongly" recommend a 3-gallon cistern "where permitted by the water companies." This strong recommendation appears to throw some doubt on the perfection of the action with a 2-gallon flush, and the larger cistern ought therefore to be used.

Cisterns are commonly made of cast iron painted inside and outside, but the paint soon wears off, and the metal rusts and discolours the water, and eventually stains the basin. Galvanised-iron cisterns (either cast iron or sheet iron with seamed or riveted joints) are very little better in this respect if the water is soft. Vitreous enamel is often applied to cast-iron cisterns, and is a much better protection. Iron cisterns are, however, somewhat noisy, and are apt to be cracked by frost, especially if fixed in external closets. Wood cisterns are better in both respects, and may be lined with lead weighing 4 lbs. or 5 lbs. per superficial foot, or with copper. Glazed fireclay or porcelain cisterns are also occasionally used, but are not suited for external closets on account of the risk of breakage by frost. All cisterns in houses ought to be provided with covers to deaden the sound, or entirely cased with woodwork.

Many water-closets are undoubtedly very noisy in action. The rush of the water in the basin cannot be entirely prevented, but the sound may be deadened by the use of a hinged lid over the seat, and by fixing the cistern at a low level with a correspondingly larger flush-pipe and valve or siphon; it is one advantage of the "Combination" closets that the discharge creates very little noise in the basin. Flushing cisterns are often very faulty in this respect.

The ball-valve may admit the water with a loud hissing sound, or may give rise to "water-hammer" in the pipes; the mechanism (as in some dome siphon cisterns) may be very clumsy; and in siphon cisterns the inrush of air at the conclusion of the flush may cause a loud gurgling and sucking sound. In the case of high-pressure services it is a good plan to fix a screw-down stop-cock on the supply-pipe, so that the supply to the ball-valve can be regulated. If this is done, and the ball-valve is of the full-way type, hissing and water-hammer will be almost if not altogether prevented. A simple device for deadening the noise of the supply consists in attaching a pipe to the outlet of the ball-valve and carrying it down to the bottom of the cistern, so that the end is either permanently below the water remaining in the cistern after each flush, or is soon covered by the incoming water. Such pipes are shown at D in fig. 5, and at B in fig. 6. Cisterns with heavy mechanism ought not to be selected. Several devices have been designed for preventing the noisy rush of air in siphon cisterns. One of these (Baxendale's "New Pattern") is shown in fig. 7. The cistern is of the dome type, and an air-pipe A is connected near the foot of the stand-pipe, and carried up above the water-level and bent downwards again nearly to the bottom of the cistern. In this pipe a hole B is bored. When the siphonic action is in progress the float C descends and covers the hole, but as it does not fit closely against the pipe, a small amount of air is admitted at B during the descent of the float. This gradual introduction of air checks the siphonic action very slightly, but greatly reduces the rush of air when the cistern is emptied. The makers claim that "the sucking, swirling noise is entirely prevented."

Many cisterns are fitted with $\frac{3}{4}$ -in. ball-valves, but this size is too small for rapid filling if the pressure is low, and for silent action if the pressure is high. It is much better to have a larger ball-valve, controlled where necessary by a stop-cock on the supply-pipe.

Cisterns are usually actuated by means of a chain and handle attached to the flushing lever, but for asylums a brass slide working in a dovetailed groove is sometimes used; this is a convenient arrangement, and has a good appearance. A more novel device is a press-button, like that used for electric bells. Automatic seat-action is desirable in certain places. Numerous devices have been designed. One example was illustrated in the preceding article, and another has been described under the heading of pneumatic cisterns. The mechanism ought to be as simple as possible.

Flush-pipes from cisterns fixed in the usual manner about 6 ft. or 7 ft. above the floor are commonly $\frac{1}{2}$ in. or $\frac{3}{4}$ in. in diameter according to the type of cistern, and may be of lead (not less than 9 lbs. per yard for $\frac{1}{2}$ -in. pipe and 10 $\frac{1}{2}$ lbs. for $\frac{3}{4}$ -in.), or of galvanised iron, copper, or brass. Flush-pipes of the three last-named metals, bent to the proper curves, are supplied by the makers of the cisterns and closets, and are more easily fixed than lead pipes; they have also the advantage of being of the length which has been found by experience to be best suited to the closet and cistern. Galvanised iron can only be recommended for cottages, workshops, and other places where strict economy as well as rough usage must be considered. The brass pipes may be either polished or nickel-plated, and the copper may be finished in various ways.

OBITUARY.

MR. W. BASSETT-SMITH.—We regret to announce the death at Clapham, on the 10th inst., in his seventy-first year, of Mr. William Bassett-Smith, of North Side, Clapham Common, and of Drummond-chambers, No. 10, John-street, Adelphi, W.C. Mr. Smith was a member of the firm of William & Charles Aubrey Bassett-Smith. Of his architectural works we may mention Christ Church, Penge (1884-5), St. John's Church, Highbury Vale (1881-2), and the addition of the tower, spire, and south aisle, St. Mary's Church, Caterham—of which we published an illustration on November 21, 1883. The firm prepared plans and designs for the church of St. Barnabas, in North Side, Clapham Common, at the corner of Lavender-gardens, four years ago, and for the reredos—the latter being executed by Mr. Thomas Rudge, of Clapham Common. On April 20 last year a faculty was granted by the Consistorial Court, sitting in St. Paul's, under the presidency of Dr. Tristram, K.C., Chancellor of the Diocese of London, for carrying out, at a computed cost of about 6,000*l.*, alterations

and an enlargement of the church of St. Stephen, Westbourne Park-road, Paddington (Messrs. F. & H. Francis, architects, 1855-6), to embrace the taking down of the end of the church, which faces westward, the building of a new chancel with an apsidal end, a sanctuary, a new gallery staircase, a new vestry, new porch, new south chancel aisle, and a rearrangement of the interior, the re-pointing of the walls and general repair of the fabric, after the plans and designs prepared by Mr. Smith and his partner; the reredos and altar are by Mr. Pippet, of Solihull. The firm carried out the recent extensive restoration of the parish church of Stickeney, in Lincolnshire, at a cost of about 2,500*l.*, in accordance with a report made by Mr. Smith, in 1884 upon the condition of the tower, which, constructed principally of local sandstone, had become unsafe, and at the late Mr. Butterfield's suggestion had been fitted, though, as it proved, to little purpose, with an interior wooden frame for taking the weight of the bells off the wall. Mr. Smith recommended the removal of the bells, as well as of the upper half of the tower; this was done in 1887, and the porch was rebuilt. In the following year a tender of 1,735*l.* by Mr. T. F. Halliday, of Stamford, was accepted for the rebuilding of the tower and re-hanging of the bells; other repairs were also made, and Messrs. Warner, of London, have rehung the bells. Messrs. W. & C. A. Bassett-Smith superintended a remodelling of the sanitary arrangements at St. Mary's National Schools, West End-lane, Hampstead, and were the architects of the Church of St. Paul, Plumstead Marshes, which, when completed, after the entire designs, will accommodate 625 persons at a cost of about 4,800*l.* They were also architects for the restoration (Messrs. King & Ridley, of Lutterworth, contractors), at a cost of about 1,800*l.*, of New Wolvey parish church, Warwickshire, including new oak roofs for the nave and two aisles, a parapet on the nave roof, &c. (Mr. C. A. Bassett-Smith); and, in conjunction with Mr. R. Philip Day, of the Church of St. Gabriel, at Willesden Green (1897), Mr. J. Bentley being the contractor.

GENERAL BUILDING NEWS.

MARBLE HALL AND LOUNGE, DE KEYSER'S ROYAL HOTEL, VICTORIA EMBANKMENT.—De Keyser's Royal Hotel was opened in 1874, taking the place of a former hotel which existed in Chatham-place before the completion of the Embankment. When the present hotel was opened it was not intended that it should accommodate the number of visitors (over 400) which it now does, as the hotel has, since the above date, been twice enlarged. To comply with the requirements of hotel visitors of the present day, it became necessary to have a lounge in addition to the existing drawing-smoking, and reading-rooms, and it was therefore determined to abandon the courtyard into which vehicles then drove, and to form the lounge that has now been completed. This lounge measures 58 ft. by 52 ft., and has a central dome 35 ft. in diameter and over 30 ft. high. There is also an outer entrance-hall nearly 40 ft. long and 24 ft. wide. The work has been carried on without interrupting the business of the hotel, a temporary entrance being provided during the execution of the works. The new addition is paved with marble mosaic with a solid pattern to mark the circular floor under the dome. The dado is formed with a bronze base, alabaster die, and grand antique coping. The columns are of Languedoc marble with bronzed caps, the cornices in plaster, and generally painted white, and the walls are lined with gilt Japanese leather paper. The alterations have been carried out under the superintendence of the architects, Mr. E. A. Gray and Mr. H. A. Pelly, by Messrs. Holland & Hannen, of Bloomsbury, their foreman in charge being Mr. W. Mann. The alteration has necessitated the entire reorganisation of the offices and control of the hotel business. The following firms have carried out certain works: Messrs. Burke & Co., Newman-street, W., the marble work; Messrs. Dent & Hellyer, Newcastle-street, W.C., the sanitary work (which has been materially improved and extended); Messrs. A. L. Moore & Co., Southampton-row, W.C., the ornamental glazing of the dome and other parts; Messrs. Adams & Co., the electric bells; Messrs. Rasleigh, Phipps, & Co., the wiring for electric light; Messrs. Bennett, the electric light fittings; Messrs. Peacock & Co., Clerkenwell-road, E.C., the house telephones; Messrs. Simpson & Co., Fimlico, certain alterations to the hydraulic lifts; The Van Kannel Door Co., Finsbury, have also supplied two of their revolving doors for the entrance hall; Messrs. Lindsay, Neale, & Co., of Paddington, did the constructional steelwork; Mr. J. Annan, of Picnic, executed the cornices, which are in fibrous plaster, and prepared all the modelling for the plaster work.

THE NEW IMPERIAL THEATRE, WESTMINSTER.—In the new Imperial Theatre, which has just been opened, nothing remains of the old, except the outer walls and the fabric of the old dressing-rooms at the back of the stage. The work of reconstruction has included a new roof, an entirely new auditorium, new staircases and foyers, a new stage, and the most modern system of electric lighting. This has been carried out by Mr. Frank Verity, the architect, under Mrs. Langtry's personal

direction. The whole work has been finished in three and a-half months, having been commenced on January 1. The theatre has a holding capacity of 1,150 persons. The auditorium is 50 ft. wide, the proscenium opening 30 ft. wide and 25 ft. high, with a stage 40 ft. in depth and 65 ft. in width. The conventional scheme of modern theatre decoration has been disregarded, the whole treatment being of a purely architectural character, in which marble and burnished metal are the dominating materials employed. The style is that of the period of the First Empire. The general wall surface is of Pavonazetta marble, broken by the vertical lines of plasters of Sienna marble with metal caps and base. The proscenium opening represents the façade of a temple; on each side of the opening are two monoliths of Greek Cipollino marble upon Pavonazetta pedestals, the whole surmounted by a pediment of statuary marble. Metal enrichments are employed throughout the auditorium. Apart from this, the colour-relief is obtained from the burnished metal and the draperies of the two Royal boxes, and the draperies on the principal tier front, on the side boxes, and on the wall surfaces behind the various ranges of seats. No decorative painting or gilding of any description will be found in any part of the auditorium. The two Royal boxes, one on each side of the proscenium, form the most prominent feature of the interior, standing out in semicircle and carried up through the height of the two tiers, each surmounted by a dome from which are suspended curtains of a lustrous yellow silk with white powderings of fleur-de-lis. The drapery over the front is of green silk, richly embroidered with gold. The curtains, hangings, and embroideries have all been designed by the architect and executed by the Royal School of Art Needlework under the supervision of Mr. Verity. There is no painted act drop and there are no tableau curtains; but an adaptation of the old-fashioned drop curtain (of hideous green baize) in rich green and gold, which lowered hangs in graceful festoons with a deep valance and embroideries; thus, when the curtain is raised, forms an architectural frieze—a decorative substitute for the more conventional "proscenium border." A velarium forms the ceiling of the gallery, which in the general scheme partakes of the character of an atrium or forecourt. All the reserved seats in the house are upholstered in buttercup yellow. The principal foyers are decorated with an arabesque colour treatment in two tones, green on white or black on white. The lighting of the theatre depends throughout on electricity. The main source of light in the auditorium is by lamps concealed over sheets of amber-tinted glass in the ceiling; the effect of warm sunlight is thus produced. Electric torches are fixed round the tier fronts, and hanging lights of classical design are suspended from the marble walls. The tiers are built on the cantilever principle. Each section of the house has its independent foyer accommodation in the stalls and balcony, this is in addition to the buffet. Messrs. John Allen & Sons, Limited, of Kilburn, were the builders, and the clerk of works was Mr. E. W. Hands. The modelled plaster work and metal enrichments by Messrs. Geo. Jackson & Sons; the steel work by Messrs. R. Moreland & Sons, Limited; the electric lighting, both for stage and front of house, was carried out by Messrs. Vaughan & Brown, who also supplied the gas braziers, fire hydrants, wrought iron and glass ceiling for sunlight effects, are lamps, fireproof curtain and outside iron escapement, and ventilation. The marble work was by Messrs. Farmer & Brindley.

TOWER, CHICHESTER CATHEDRAL.—The Archbishop of Canterbury visited Chichester on the 16th inst. to take part in the dedication of the north-west tower of the cathedral, which has been rebuilt at a cost of just over 8,000*l.* No authentic records are in existence as to the exact circumstances in which the old tower fell, but the disaster is supposed to have happened about the year 1634, the cause most probably being the defective nature of the foundations. Not until the episcopate of the late Dr. Durnford were any active steps taken towards the rebuilding of the tower. When a fund was started for a general restoration of the cathedral the executive committee found that, owing to the insecurity of the west bay of the nave vault, the rebuilding of the north-west tower was the work which most demanded attention. The late Mr. J. L. Pearson prepared a design for the rebuilding of the tower, which, subject to certain modifications, was ultimately adopted. The south side of the tower, forming part of the nave of the cathedral, was intact, although the arches of the triforium and clerestory stages were walled up. All that remained was to carry the same design round the three remaining sides, but there was a good deal of controversy as to the character of the exterior of the building before a satisfactory agreement was arrived at. Messrs. Luscombe & Son, of Exeter, were given the contract for the work, which was carried out in sections, the money for each section being first obtained in subscriptions before the next stage was proceeded with. Mr. Frank Pearson succeeded to the duties of architect on the death of his father. The new tower, which resembles in its general character the south-west tower, is about 34 ft. square over all, and from floor to ceiling, a height of nearly 100 ft.

is open to the cathedral. The work has occupied about 2½ years.—*Times.*

DISPENSARY, CANTERBURY.—The foundation-stone of the new Canterbury Dispensary premises has just been laid by the Archbishop of Canterbury. Mr. F. T. Gentry is the architect, and Mr. A. Bromley is the architect.

PROPOSED NEW MUNICIPAL BUILDINGS FOR BOSTON.—A special meeting of the Boston Town Council was held recently, the Mayor (Ald. W. T. Simonds) presiding, to consider the advisability of purchasing a site in West-street for the new municipal buildings which it is proposed to erect at a cost of 16,500*l.* The Mayor proposed that a site in West-street, consisting of 1,140 square yards, be acquired at a cost of 1,400*l.*, and that a contract to that effect be signed. This was agreed to after discussion.

BRIGHTON PUBLIC LIBRARY.—The ceremony of laying the commemorative stone of the new municipal buildings in Church-street, Brighton, which are to include a public library, museum, and art gallery, took place recently. On the ground floor there will be a separate entrance to the Dome, 20 ft. wide, in Church-street, and separate entrances will also be provided to the library, museum, and art galleries. There will be a public newsroom, 73 ft. long and 28 ft. wide, and the dimensions of the leading library will be 88 ft. 6 in. by 44 ft., with a counter 65 ft. in length. There will also be a public reading-room for adults, and one for boys. The reference library will be a room 6 ft. long and 28 ft. wide, and the museum will also have on the ground floor, a committee-room, 28 ft. by 24 ft., and a pottery-room, 50 ft. by 28 ft. On the first floor, facing Church-street, will be a new picture gallery, 110 ft. long and 28 ft. wide. The present gallery will be used for loan exhibits, and there will be another room which will be used for local views. The entrance to the Dome in the Pavilion grounds will be improved by erecting a porte-cochère in the place of the old wooden pent-house which at present exists. The buildings have been planned by Mr. F. J. C. May, Borough Engineer and Surveyor.

ELECTRICITY WORKS, KEIGHLEY, YORKSHIRE.—The electricity works at Low Bridge, which will supply Keighley with electric light, have been completed. The contractors were as follows:—Masonry and concrete, carpentry and joinery and floor tiling, Mr. T. E. Sugden, Keighley; constructional steel work, Messrs. Carter Bros., Limited, Manchester; plumber and glazier, Messrs. W. & J. Harrison, Keighley; slater, Mr. W. Thornton, Keighley; plasterers, Messrs. Edmondson Bros., Keighley; painting, Messrs. W. Seaton & Co., Keighley; wall tiling, the Lancashire and Cheshire Opalite Tile Company. The architect, Mr. H. Chilvers, was recently presented by Alderman Paquet with a dressing-bag on behalf of members of the staff and some of the contractors.

SCHOOLS, ST. ALBANS.—New board schools have been erected at St. Albans in the Old London-road. The site is at the end of the road nearest the town, and is situated about 275 ft. above the sea level. It has a frontage to the Old London-road of 105 ft., and an average depth of 160 ft. The Education Department sanctioned a scheme of four classrooms, each for fifty boys, with provision for a future increase by two classrooms, also to accommodate fifty boys each. In the school, as now built, there is a schoolroom for 100, hereafter to be divided by a sliding partition, into two classrooms, each for fifty. The precautions has been taken to build the lozenges, cloakrooms, &c., of the size that will be required for 300 scholars; so that enlargement in this portion of the buildings will be unnecessary to complete the school. The storeroom of the larger school is to be used as a masters' room for a time before the permanent masters' room is built. The walls of the buildings are carried out in local red bricks, and the roofs are covered with Woburn red plain tiles. In the oak bell-turret is hung the bell from the house at Colney Park, which was sold when the old manor was pulled down. The floors in the passages are of Stuart's granolithic, and the rest of the floors are of Duffy's pitch-pine blocks. The heating is by Shorland's stoves. Fresh cold air is admitted by Tobin tubes. The floors of the classrooms are in steps. The plans for the schools have been prepared by Messrs. Clarkson, architects, of St. Albans, who have now completed four school buildings for the Board. Messrs. Whitley & Jarvis, of St. Albans, were the builders, and their contract was for 2,700*l.* Mr. H. Tanner was clerk of the works. The lavatories and other sanitary appliances are from Messrs. Adams, of Leeds. The whole of the building is lighted by gas, the fittings having been supplied by Messrs. Strode & Co.

THE PORTMAN MARKET.—The Portman Market in Church-street, Edgware-road, was opened on the 18th inst. The market, which is for meat, fish, and vegetables, contains 175 stalls and twelve shops, which are divided by avenues running diagonally as well as straight across. The building was designed by Mr. H. T. Gunton, of Messrs. Gordon & Gunton.

HOTEL, GLASGOW.—The New Century Hotel in Holm-street, Glasgow, was opened on the 10th inst. The building, which is intended for the middle classes, is 130 ft. by 60 ft., and has seven flats, containing upwards of 400 bedrooms. The building is fitted with lifts and is lit by electricity. Messrs.

Frank Burnett & Boston, of Glasgow, were the architects.

PROPOSED SCHOOL OF COOKERY, NEWCASTLE.—A Local Government Board inquiry was recently held in the Council Chamber, Town Hall Buildings, Newcastle, by Colonel A. J. Hopper, R.E., regarding the application of the Corporation to borrow 10,000*l.* for the erection of a school of cookery in Northumberland-road, Newcastle. Mr. Dyson submitted the plans for the school, which he explained to the Inspector.

HOTEL, SEATON HIRST, NORTHUMBERLAND.—The new hotel built by Mr. Deubar, Newcastle, at Seaton Hirst was opened recently. The building was erected by Messrs. J. G. Douglas, of North Seaton, at a cost of 10,000*l.*, from plans by Mr. Benjamin F. Simpson, F.R.I.B.A., Newcastle.

CONGREGATIONAL CHURCH, HANLEY.—On the 18th inst. the foundation-stones of a new Congregational chapel were laid at Hanley. It is to be called the Park Congregational Church. Messrs. Wood & Hutchings, of Tunstall, are the architects, and at present the school and classrooms alone are to be erected, at a cost of 2,000*l.*

BATHS, BATTERSEA.—On the 20th inst., Sir Charles Dilke, M.P., opened the new baths and washhouses which have been constructed at Nine Elms by the Battersea Borough Council. A site was selected in the Battersea Park-road, abutting upon Cringle-street, and the plans of Mr. Francis J. Smith, of Westminster, were accepted in competition. The new baths have been erected by the Works Department of the Borough Council, under the supervision of the Surveyor, Mr. J. T. Pidditch. The area of the land upon which the baths are erected is 83,020 superficial ft. but an additional 10,000 ft. of ground adjoining has since been purchased, so that future additions can easily be carried out if deemed advisable. The whole of the establishment devoted to public purposes is arranged on the ground floor, the upper floor in the Battersea Park-road being occupied by the rooms required by the Baths Committee and the superintendent's residence, other portions in the rear being used for the establishment laundry and artists' and club-rooms. The three chief entrances are in the thoroughfare mentioned, the private entrance to the board-room and superintendent's apartments, the men's entrance to the swimming-baths and slipper baths (of which latter there are thirty-eight), and the women's entrance to their slipper baths, of which there are twelve. The private baths are to be of enamelled iron, with divisions of marbled slate. The swimming-bath has a water area of 150 ft. by 50 ft., and faces Cringle-street. Steam is also to be used for heating the buildings and water for the slipper baths. Attached to the swimming-bath are the club-rooms, as provision has been made for utilising the structure as a public hall during the winter months for concert and other purposes. A gallery runs round three sides of the bath, with staircases for ingress and egress; and it is estimated that the accommodation at the disposal of the authorities will suffice for about 1,000 persons. The bath will be 3 ft. 6 in. deep at its shallow end, and 6 ft. 6 in. at the deep end. The entrance to the public laundry and washhouses will be at the extreme or northern end of Cringle-street. This establishment is designed to meet the requirements of sixty-four persons. Fifty-three washing compartments are provided, with three washing machines, sixty-three drying-horses, and four hydro-extractors. In the ironing-room adjoining will be four mangles, with ironing and folding tables. The house handy on the first floor is to be fitted up with the necessary machinery for doing the whole of the washing in connexion with the establishment. The buildings are of fire proof construction. They are erected with red bricks and Portland stone dressings in the English Renaissance style. Mr. F. R. J. Pearce and Mr. Mark Green have acted as superintendents of the work.

SANITARY AND ENGINEERING NEWS.

WATER SCHEME, ROCHFORD HUNDRED.—Mr. H. P. Boulnois, M.Inst.C.E., a Local Government Board Inspector, held an inquiry recently at the Board-room of the Rochford Workhouse, with reference to the Rochford Rural District Council's application for sanction to the borrowing of 25,000*l.* for works of water supply for Haldon, Hockwell, Hockley, Rayleigh, Rochford, and South Benfleet, and the Rochford special drainage district; and for the construction of works at Thundersley. The Clerk explained that out of an estimated total of 1,282 houses in the six parishes concerned, the scheme could supply 1,039. Mr. G. R. Strachan, engineer, explained the plans in detail. The quantity of water wanted was 100,000 gallons a day, and he was quite confident from tests that there would be that yield. Dr. Thresh, the county medical officer, had reported that the water was not only pure and soft, but the well was so constructed that contamination was practically impossible. The population to be served was between 3,000 and 4,000; and Mr. Strachan reckoned the well to be capable of supplying 6,000. The tower was to be 80 ft. high, and the tank would hold 40,000 gallons.

WATER WORKS FOR BEWDLEY.—The ceremony of turning the first sod of the Bewdley Water Works was performed on the 15th inst. by the Mayor of that borough. A scheme put forward by Mr. Berrington, C.E., of Wolverhampton, has been adopted. The contract for the works is 10,600l.

THE DOCKS AT BARROW-IN-FURNESS.—The lowering of the Ramsden Dock lock sill 24 ft. having been successfully accomplished, water has been let into it preparatory to drawing the piles of the coffer-dam. The contract has been executed by Messrs. John Aird & Co., and has involved the expenditure of 200,000l.

FOREIGN.

FRANCE.—At the Church of Sacré Cœur, Montmartre, the foundations for the tower have been commenced under the direction of the present architect, M. Rauline. M. Pagel, the sculptor, is completing the decoration of the Chapel de l'Armée, where the bas-reliefs represent military subjects. At the adjoining ancient church of St. Pierre the restoration work is being pushed on, and the choir is now detached from its surroundings and seen in its ancient condition.—The Municipal Council of Paris has decided on the formation of a new metropolitan line of railway connecting the Opera House on the one hand with Auteuil, on the other hand with Buttes-Chaumont. The Council is also considering the re-erection on the Place Dauphine of the monument to Desaix, the remains of which are at present preserved in the Magasins des Beaux-Arts at Auteuil.—M. Morin-Goustiaux, the architect, has been commissioned to prepare plans for the Cirque-Palace des Champs Elysées, which will replace the old Cirque des Champs Elysées.—The new buildings of the Sorbonne are to be traversed by a passage leading from Rue Saint-Jacques to the Place de la Sorbonne, which will be open to the public. It will be called Galerie Cuvier.—The widow of M. Falguère, the late sculptor, is about to arrange, in one of his former studios, a collection of the first models or *maquettes* of the most remarkable works of the great sculptor, also some of his works in marble and of his paintings.—The "Commission des Grande Travaux" of the Department of the Seine has issued a Report in favour of the completion of Boulevard Haussman from Rue Tailbot to Boulevard Montmartre, a work which has long been called for.—The Government has decided on the creation of a corps of Colonial architects, who will be employed in Indo-China, Guadeloupe, &c.—M. Bussière, of Bourges, has been elected President of the Society of Architects of the Centre of France.—The "Société des Amis des Monuments Rouennais" has bought the old house in Rue St. Romain, Rouen, which the municipality had intended to destroy.

The Minister of Public Instruction has been commissioned to institute a commission to inquire into the means of creating local provincial schools of architecture in France.—M. Weissenburger, architect, has been commissioned, along with M. Bussière as sculptor, to design a monument to be erected at Luneville to the memory of the late M. Erolmann, the joint author of the popular Erekmann-Christrian military novels.—The municipality of Troyes have opened a competition for a circus theatre, at a cost of 350,000 fr.—M. Girault, the architect who designed the monument to Pasteur at the Institute in the Rue Dutot, has completed a reliquary intended to receive the mask of Pasteur. It consists of a crystal coffer ornamented with six garlands of laurel in bronze chased and gilt, connected by an oak crown with a poppy finial.—The Architectural Department of the city of Paris is proceeding with a restoration of the Gothic fountain in the square of Notre Dame, the work of the architect Parfait Merlieux.

THE IMPROVEMENT OF THE NILE.—Sir William Garstin, Egyptian Under-Secretary of State for Public Works, has just returned here from a fifty days' journey of inspection up the Nile, which extended to Gondokoro, on the Uganda frontier. South of Gondokoro the Nile is now unnavigable, owing to its exceptional lowness. The main object of Sir William Garstin's journey was to inspect the *sudd* cutting with a view to deciding what further work should be undertaken and also to ascertain by measuring the river discharge above and below the *sudd* the amount of water lost in the marshes. The *sudd* has now been removed from the whole of the Bahr-el-Gebel, except for 23 miles. Owing to the early rainfall, the clearing of the last portion has been postponed to October, and will be completed by January next. The portions of the river cleared in 1900 by Major Penke are in good order, and there is no visible sign of fresh blocks. Lieutenant Denny, R.N., cleared four blocks at the south end of the swamps this winter, with excellent results. When the above-mentioned blocks have been cleared there will be a free navigable channel from Refaj to Omdurman, a distance of 1,200 miles.—The Cairo correspondent of the *Times*.

THE ARCHITECTURAL MUSEUM.—We learn that the King has been pleased to become the patron of the Royal Architectural Museum and Westminster School of Art in Tufton-street.

MISCELLANEOUS.

INCORPORATED CHURCH-BUILDING SOCIETY.—This Society held its usual monthly meeting on Thursday, the 18th inst., at 7, Dean's Yard, Westminster Abbey, S.W., the Rev. Canon C. F. Norman in the chair. Grants of money were made in aid of the following objects, viz.—Building new churches at High Wycombe, St. John, Bucks, 175l.; and Holloway Christ Church, in the parish of Dethick Lea and Holloway, near Matlock Bath, 80l.; and towards enlarging or otherwise improving the accommodation in the churches at Chevening St. Bobolph, near Sevenoaks, 30l.; Llanddwywe St. Dwywe, near Dyffryn, Merioneth, 20l.; Lybury North St. Michael, Salop, 20l.; Walskington Holy Trinity, Middlesex, 35l.; Wendlebury St. Giles, Oxon, 25l.; and Worlington All Saints, near Soham, 15l. Grants were also made from the Special Mission Buildings Fund towards building mission churches at Latchford St. James, near Warrington, 15l.; Leytonstone St. Augustine, Essex, 40l.; and Bishopswearmouth, St. Gabriel, Durham, 50l. The following grants were also paid for works completed:—New Foundry, St. Augustine, Leicester, 500l. on account of a grant of 1,000l.; Christy Church, on account of the Virgin, London, 50l.; Surfleet, St. Lawrence, near Spalding, 20l.; Newport, St. Cuthbert, Middlesbrough, 80l.; and Broadheath, St. Alban, near Altrincham, 30l. In addition to this the sum of 225l. was paid towards the repairs of twenty-eight churches from trust funds held by the society. The grants voted at this meeting have nearly exhausted the funds at the disposal of the committee, and contributions are invited to enable the committee to vote substantial grants and to continue the work which this society has carried on during the past eighty-three years. The annual general Court of the society will be held at three p.m. on Friday, May 17, at the Church House, Dean's Yard, Westminster Abbey, when the chair will be taken by the Archbishop of Canterbury, president of the society.

BIRMINGHAM ARCHITECTS AND THE UNIVERSITY BUILDINGS.—The statement that in the opinion of the University Council the principle of selecting designs by competition could not be advantageously adopted in the case of the new University building has raised considerable feeling among some of the subscribers to the funds of the University, as well as the architects of Birmingham, inasmuch as it will entirely exclude the latter from the opportunity of testing their ability to produce a suitable design for the proposed buildings. It has, therefore, been decided to request the Chancellor of the University (Mr. Joseph Chamberlain) to receive a deputation of architects and subscribers, who will place before him reasons why he should use his influence to have the question reconsidered, in the hope that, by means of a carefully-conducted competition, the best available architectural talent may be brought to the front. A requisition to Mr. Chamberlain asking him to receive such a deputation is in course of preparation.—*Birmingham Post*.

HOUSING SCHEME, &c., MANCHESTER.—At a recent meeting of Manchester City Council, the Sanitary Committee submitted for adoption a number of recommendations comprising the Blackley housing scheme, the extension of Monsall Hospital, and other measures for the provision of sanitary requirements in the city. The approval of the Council was asked to the following loans:—203 dwellings at Blackley, 60,000l.; labourers' dwellings (extras), 4,651l.; Monsall Hospital, 14,500l.; lavatories in city, 21,000l. Alderman Walton Smith, in presenting the proposal of the committee to the Council, said the housing scheme was intended to provide homes for a total of 650 persons who were displaced in consequence of the Long Millgate and Rochdale-road improvements, and the cutting of a new street from London road station to Ardwick. Estimating five persons to a family, 132 houses would be required, but they proposed to erect 203, which would leave seventy-one ready for further requirements. Cottages similar to those built at Miles Platting by the Corporation were to be provided, but larger gardens would be given. At 215l. per cottage the actual cost of building would be 43,045l., but the necessary sewerage and forming of a road on the estate brought the amount required to 60,000l. The extensions contemplated at Monsall comprised a laundry and a commodious waiting-room for friends who visited the patients, together with accommodation for convalescent patients who could not be kept in the wards. Alderman M'Dougall, in seconding the motion, said the houses at Blackley were to be built on land belonging to the Corporation. Sir John Harwood expressed the opinion that the dwellings built by the Corporation, according to the requirements of the Local Government Board, were far too expensive. They could be well built, he believed, 30 per cent. cheaper. Alderman Smith, in reply, said the Local Government Board would not allow them to deviate from their own by-laws. No Corporation dwellings were unoccupied, except a few in Post-street. Mr. Boyle moved an amendment proposing that the proposal be first submitted to the Council. The amendment was rejected and the proceedings and proposals of the Sanitary Committee approved.

PROPOSED WORKS DEPARTMENT, SHEFFIELD CORPORATION.—The Special Works Construction Committee, recently appointed by the Sheffield City

Council, have had before them a report by Councillor George Carr in regard to the proposal to establish a works department in connexion with the Corporation. In a lengthy report on Mr. Carr's scheme the Committee recommend the formation of a works department to execute certain work which in the past, has had to be done on behalf of the Corporation. The capital expenditure is estimated at 7,000l.

PROPOSED IMPROVEMENT OF MARINE PARADE, WESTON-SUPER-MARE.—On the 11th inst., at the Town Hall, Weston-super-Mare, Colonel A. G. Durnford, R.E., an Inspector to the Local Government Board, conducted an inquiry into an application by the Urban District Council for sanction to borrow 4,250l. for the widening and extension of the Marine Parade from Madeira Cove to a point westward, about 576 yards, terminating at the Pier Hotel. The scheme was explained in detail by Mr. Hugh Nettleton, the Surveyor to the Council.

PROPOSED BRIDGE, CATCLIFFE, YORKSHIRE.—On the 12th inst. Mr. A. G. Malet, A.M.Inst.C.E., an inspector to the Local Government Board, held an inquiry in the Board School, Catcliffe, relative to an application made by the Rotherham Rural District Council to borrow 2,600l. for the construction of a bridge across the river Rother, between the townships of Catcliffe and Treetor, and for the construction of the approaches. Mr. R. Bradbury, surveyor, handed in a detailed estimate and plans.

THE HOUSING QUESTION AND INSANITARY DUNDEE TENEMENTS.—The question of the housing of the working classes engaged the attention of the Works Committee of the Dundee Town Council on the 9th inst. A report by the inspector bearing on the provision of sanitary conveniences for city tenements was submitted. The report gave details regarding the nature and extent of such accommodation existing in the six registration districts of the city, viz. St. Peter's, St. Mary's, St. Clement's, St. Andrew's, Lochee, and Mains. The results, summarised in a letter from the inspector, showed that over the whole city there were 1,111 properties having either no sanitary convenience or what there was was of a very imperfect or deficient character. Of that number, 183 were devoid of any accommodation whatever, 734 had privy and a single accommodation, 102 had one water-closet, fifty-six had one water-closet and one privy, and thirty-six had more than one water-closet; but the accommodation under the three last heads was not, in his opinion, sufficient for the wants of the population and the separation of the sexes. In a large majority of the properties where only one water-closet was placed at the bottom of the main stair, with in some instances a privy and ashpit added, for the use of the whole male and female occupants of the building, the plans for those tenements had during the past thirty years or thereby been passed by the Works Committee of the Town Council as having sufficient sanitary conveniences for the male and female population, and the buildings had been erected in conformity with the plans thus passed. The Committee expressed the opinion that the information contained in the report was of great value, and ordered it to be printed and circulated among the members of Council, after which it was resolved to deal with the whole matter.

LORD PEEL ON CHAPEL ARCHITECTURE.—Lord Peel, a former Speaker of the House of Commons, in opening a bazaar in the Winter Hall at Leamington on Tuesday, April 23, for the object of raising funds for the erection of a new Wesleyan chapel at Kenilworth, had some words of criticism to offer with respect to chapel architecture. Lord Peel said he was happy to see in the account given of their object that they said the building they were about to erect would be in keeping with the historical associations of Kenilworth. He knew no reason why a place of worship—or any other house—should be ugly in its outside proportions. He thought we were outliving the day when those hideous erections that we saw in town and country were allowed to offend the eye and deface the recollection of places. He knew that in some cases—happily it would not be so in theirs—a deficiency of funds might oblige the erection of a very humble building, but in the humble building there was no need for disregarding the principles and axioms of taste. There was an exhibition now going on in London—he believed at the Agricultural Hall—where were shown a number of appliances by which buildings could be made of different kinds of materials, and it was hoped that by this means a stimulus might be given to street architecture. He hoped the funds collected by that bazaar would be sufficient to erect not only a place of worship convenient and capable of accommodating those of their persuasion and their church in Kenilworth, but one which would be a worthy adjunct to the surroundings of that most picturesque and interesting spot.

AMERICAN LUMBER.—The Baltimore Lumber Exchange expended 9,000 dol. on the exhibits it sent to the Paris Exhibition and to the Export Exposition at Philadelphia, and it claims that the money thus used brought a good return in the shape of greatly increased exportations. It publishes the statement that Baltimore's exportations of lumber and logs in 1900 exceeded that of New York and Philadelphia together. In consequence of the high price of poplar, which is much used in the manu-

facture of boxes, several cargoes of Nova Scotia spruce were imported to replace it. Some twenty years ago what is now known as North Carolina pine was unheard of in the home or foreign markets. Previous to that time no care was taken in preparing it for market; it was dried in the open air, and it soon became black and discoloured and almost useless, and the quantity shipped from Hampton Roads did not amount to 20,000,000 ft. a year. The process of kiln-drying has for some years been in operation, and the lumber is now brought from the mills bright and dry, and its quality is such that it is very extensively used in the home markets and in Europe generally. The quantity exported from Hampton Roads has risen greatly, and about 500,000,000 ft. are the figures for last year. It is very cheap and takes the place of white pine, cypress, and Georgia and Florida pine, to a great extent for inside finishing purposes. It takes a fine polish. The lumber is what is called short leaf or short straw pine. It is free from pitch and is manufactured by hand sawmills, which have taken the place of the old circular-saw. According to statistics obtained from Mr. Fraser, the British Consul, the quantity of lumber received at Baltimore during 1900 amounted to 37,941,350 ft., being an increase of 32,736,350 ft. over 1899. The British Isles were supplied for the greatest customers abroad, and of the 70,277,000 ft. of lumber and logs, and of the 1,046,521 pieces of staves and headings, valued at 547,103*l.*, exported, they took 41,280,000 of the former and 627,147 pieces of the latter, valued at 304,503*l.*, or considerably more than half of the whole exportation. There were exported to Germany lumber, staves, and headings to the value of 88,418*l.*; then came the Netherlands, Belgium, and France; but the value of the exports to the latter country amounted to only some 30,000*l.*

MIDLAND MASTER BUILDERS AND FEDERATION.—A quarterly meeting of the executive of the Midland centre of the National Federation of Building Trades Employers was held on the 19th inst. at the offices, Birmingham, and from the reports submitted from various parts of the Midland counties it would appear that a general depression is being experienced in the building industry. The president (Mr. A. Chambers, Leicester), occupied the chair, and amongst those present were County Alderman Bowen, Messrs. William Sapote, F. G. Whittall, and Albert S. Smith (Birmingham); Mr. E. Fox (Leicester); Messrs. J. Wright, H. Vickers, and F. Hodson (Nottingham); Councillor Green (Northampton), T. Skett and J. Herbert (Wolverhampton), D. Jaleman (Dudley), County Councillor Dallow (Stourbridge), H. Smith (West Bromwich), J. Sherman Wood (Worcester), W. Wistance (Walsall), H. Smith (Kidderminster), &c. A long discussion took place in connection with notices given to or received by workmen in the various branches of the trade at Burton-on-Trent, Coventry, Nuneaton, Newark, Dudley, Kidderminster, Sutton Coldfield, and other places, and it was pointed out that under the conditions generally observed in the trade these notices now expired at a period of the year when work, as a rule, was most plentiful, and consequently the employers, in order to carry out their contracts, were frequently compelled to make concessions that were unjust to themselves and extracted an unreasonable amount from the president remarked that as no body master builders had no desire to act arbitrarily against their workmen, but from experience they were aware that many of the conditions the workmen's trades-unions tried to enforce were detrimental to the best interests of the trade. Mr. J. Wright (Nottingham) said that one of the bugbears of the trade was what was known as the line of demarcation laid down by the trades-unions. Master builders were for the most part practical men, and were fully competent to carry on their business, but in many cases they were not permitted to do so with anything like reasonable freedom. The question was one of great importance to the welfare of the building trade throughout the country, and it behoved the National Federation of Employers to take steps to prevent unjust and meddlesome interference with the masters' common rights. Several speakers took a similar view, and a resolution was passed affirming the necessity for more combined action throughout the kingdom in dealing with disputes in the trade, which too frequently led to strikes and lock-outs. Another point discussed was the desirability for a uniform contract form containing clauses applicable all over the country in relation to such matters as strikes, lock-outs, arbitration, and weather.

ARBITRATION CASE.—At the Surveyors' Institution, Westminster, on the 11th inst., Mr. Arthur Cates sat as umpire to decide the amount of compensation to be paid to Messrs. Metcalf & Greig for land which the Borough Council of Kensington had acquired for the widening of Brompton-road. Mr. R. Vigers was arbitrator for the claimants; and Mr. T. W. Wheeler, the Borough Surveyor, for the Council; Mr. H. E. Duke, K. C., M. P., and Mr. Schiller appeared for the claimants; and Mr. Freeman, K. C., and Mr. Courthope-Munro represented the Kensington Council. Mr. Duke, in opening the case, said that the land was situated on the north side of Brompton-road, between Brompton-square and Cheval-place. The claimants were surveyors and architects of Serjeants'-Inn, and purchased the site in 1880, which was occupied by two old build-

ings, for the purpose of erecting residential flats. The price was 6,500*l.*, of which 1,000*l.* was paid as deposit. When they obtained possession the claimants proceeded to release the site from the dominant lights which prevented the erection of any large building; and in 1890, at some expenditure of time and money, they succeeded in making the building fit for their purpose. At the end of that year they prepared plans which were afterwards duly passed. In February, 1900, they contracted for the erection of the block of flats. The work was proceeded with, and in April they wrote to the vestry of Kensington offering to sell to them a strip of vacant land for the widening of the road. The parties did not agree as to the price, and on April 13 the Vestry Clerk wrote that the vestry proposed to acquire compulsorily half of the site under the powers of Michael Angelo Taylor's Act. The matter was, by an agreement of July 16, 1900, referred to arbitration, and the claimants contended that they were entitled to the sum which the site had undoubtedly cost them and to the profits which they would have realised if the building had been completed. The site was in an exceptionally good position for the erection of flats, and there was every prospect that the scheme would be successful. The learned counsel then called Mr. Andrew Metcalf, architect and surveyor, who said the building proposed was to be of seven floors, with electric light, telephone, and hydraulic lifts. He estimated the rentals of the flats at 3,380*l.*, which would leave a net profit of 2,564*l.* per annum. Their claim was for 46,722*l.*, 23,100*l.* of which was the value of the land, and 23,622*l.* the value of the profits of the undertaking. Mr. Freeman contended that the original plans were not in conformity with the County Council's building regulations, and the witness admitted that was so, but admitted that had been prepared by Mr. H. H. Collins, which he asserted would give the same accommodation and produce the same rental. —At a subsequent hearing the first witness for the Borough Council was Mr. A. R. Stenning, surveyor, who expressed his opinion that the claimants' original plans could not have been carried out, and that the amended plans of Mr. Collins were in many respects open to question. They would in any case require the consent of the London County Council, who might reasonably object that some of the provisions of the Building Act had not been complied with. In his view the best plan for utilising the land would be to provide three shops in Brompton-road, with three floors of residential flats above. The ground-rent of 700*l.* which had been created was an impossible rent and could not be secured by any building which could be erected on the land. The full rent was 315*l.* per annum, which at twenty-five years' purchase and the usual 10 per cent allowance for compulsory sale gave 8,652*l.* He did not admit that there was any other interest, but he considered the claimants were entitled to 1,000*l.* for loss of interest and expenses in connection with the undertaking, and to 650*l.*, the amount paid to the builder for work done. His estimate of the full compensation was 10,312*l.* Mr. A. D. Young, valuer to the London County Council, valued the ground-rent at 300*l.* a year, and the full compensation at 9,000*l.* Mr. Daniel Watney, surveyor, valued the land at 9,350*l.*, on the basis of 2*s.* 6*d.* per foot, and Mr. Snell (Robins, Snell, & Gore) and Mr. Knighton, house agents, gave evidence that the estimated rentals of the proposed flats were very high. The proceedings then closed, the umpire reserving his award.

LYCH GATE, HOLLINGBOURNE, KENT.—A new lych gate was dedicated recently at the parish Church of All Saints at Hollingbourne. The lych gate is constructed of Kentish grown oak, the whole being placed upon a low stone wall. The tympanum in the gables to front and rear are filled with tracery, and the sides are supported respectively by uprights, each separated from one another by pierced and carved tracery. The gabled roof is covered in by oak shingles. The actual gates are double ones in oak, and another gate of similar conception has also been placed as an additional entrance upon the right hand side of the lych gate proper. The work has been carried out by Messrs. Harry Hems & Sons, of Exeter, and the fixing has been superintended by Mr. E. A. Burgess.

CAPITAL AND LABOUR.

THE LONDON BUILDING TRADE.—The Amalgamated Society of Mill Sawyers and Wood-cutting Machinists and the London Labourers' Council have given formal notices to the London Master Builders' Association that the existing codes of working rules with them will terminate on May 1, 1901. In each case the notice was accompanied by a demand for an advance in wages of 3*d.* per hour. These demands have been carefully discussed, and the workmen's representatives have been met in conference thereon, with the result that the Master Builders' Council, considering the present state of the trade, has declined to grant the advances asked for.—The Conciliation Board, duly appointed in accordance with the provisions contained in Rule 10 of the agreement between the London Master Builders' Association and the Amalgamated Society of Carpenters and Joiners, met at 31-2, Bedford-street, Strand, W.C.,

on the 2nd inst. to determine a difference between the Amalgamated Society of Carpenters and Joiners and a member of the London Master Builders' Association, it being alleged that the employer referred to had violated the rule relating to hours of employment by keeping his joiners' shops open sixty hours per week at the ordinary rates of wages. Having heard and considered the statements of the parties concerned, the Conciliation Board unanimously decided:—(1) "We are of opinion that there has been no technical breach of the agreement by the employer." (The shop having been kept open at the request of the workmen. See Rule 3.) (2) "That though this is so, it should not be assumed that the provision in Rule 3, relied on by the employer, is to be construed as a cover for systematic overtime."

ABERDEEN PLASTERERS.—It is now reported that the men and Employers in Aberdeen met privately one night in the end of last week, when it was agreed that the rate of wages should be 8*d.* per hour, and that the operatives should resume work at once. The previous report of the Operatives' Central Executive in Glasgow blocking the proposed compromise seems therefore to be unfounded.

BRADFORD BUILDING TRADE.—Bradford is anticipating a complete stoppage of operations in the building trade on May 1, as a result of a demand by the employers for a reduction of 1*d.* per hour in the wages of masons and joiners. In the case of the masons the employers also ask that an alteration shall be made in the rules, so that union and non-union men shall work one job. After considerable correspondence and meetings, the men have declined, it is stated, the offer of the masters to submit the matter to a arbitration. Except with regard to the refusal to arbitrate, a similar state of things prevails between masters and men in the joinery trade. Other cognate trades sympathise with the men, and a general strike is feared when the intended reductions come into force.

LEGAL.

ERECTING STRUCTURES WITHOUT NOTICE.

At Westminster Police-court, on the 16th inst., several summonses were heard against the occupants of premises in the Victoria district for infringements of the London Building Act by erecting structures without the consent of the London County Council. Mr. Chilvers, who supported the summonses, said they were taken out in reference to stands erected on the day of the funeral of Queen Victoria. Some of the erections were in shop windows, and one on the roof of a house, and he submitted these were structures for which plans should have been approved. The stands were put up at the last moment, and sometimes in a very loose manner, and unless they were submitted to the Council the District Surveyor had no knowledge of where they were.

Fines were imposed varying from 5*s.* and 2*s.* 6*d.* costs to 40*s.* and two guineas costs.

CASE UNDER THE METROPOLIS MANAGEMENT ACTS, 1855 AND 1862.

The case of the Property Exchange Company (No. 1) v. the Wandsworth Board of Works came before a Divisional Court of King's Bench composed of the Lord Chief Justice and Mr. Justice Lawrence on the 17th inst. on appeal by way of special case stated from the order of a Metropolitan Police Magistrate ordering the appellants to pay to the respondents the sum of 60*l.* 11*s.* 3*d.*, the amount of the expenses apportioned to them of paving an alleged new street called Totterdown, Tooting.

It appeared from the special case that Totterdown was a roadway leading out of High-street, Tooting, and ran in an easterly direction. For some years prior to 1885 it was a formed road 16 ft. wide used for wheel and foot traffic, and led into meadows open only to foot passengers. It was a public thoroughfare, and has been repaired since 1855 by the Board. On the south side of the roadway is a row of houses which have been built about seventy-five years. In 1808 the roadway was widened to 40 ft., and a new street known as St. Cyprian-street was made running into Totterdown from the north, and the lands on the north side of Totterdown were laid out for building. The premises or walls now on the north side of Totterdown are the flanking wall of the premises owned by the appellants, known as No. 20, St. Cyprian-street, the flanking wall of No. 28, St. Cyprian-street, a yard and premises belonging to the London General Omnibus Company opening into Totterdown, a passage entrance to the rear of houses in High-street, and the flanking wall of premises facing High-street, and having a side entrance in Totterdown. The Board resolved in April, 1889, to pave Totterdown from High-street to a point 310 ft. east, and to charge the expenses upon owners of property abutting thereon. The owner of the houses on the south side resisted the apportionment, and the summons issued against him was dismissed on the ground that the southern side of Totterdown was an old street, and that it therefore could not be treated as a new street. The Board

then passed a fresh resolution, ordering that "a certain new street situate and being Totterdown on the north side thereof" be paved so as to make it conform to the adjoining part of the existing carriage-way, and that the estimated expenses of such paving be apportioned and charged on the owners of the houses forming and the land bounding or abutting on such new street. Under this resolution the expenses were apportioned among the owners of property on the north side of Totterdown only. The appellants contended that the portion of Totterdown proposed to be adopted was not a new street within Section 105 of the Metropolis Management Act, 1855, and Sections 77 and 112 of the Metropolis Management Act Amendment Act, 1862, and that the resolution of the Board was invalid and further that the apportionment was bad, as the owners on the south side of the roadway were not made contributory. The magistrate held that the portion of the roadway ordered to be paved was a new street and that the resolution and apportionment were valid.

After hearing the arguments of counsel, their lordships affirmed the decision of the magistrate and dismissed the appeal.

Mr. Richards appealed for the appellants, and Mr. Mattinson, K.C., and Mr. J. C. Earle for the respondents.

WORKMEN'S COMPENSATION ACT.

WHAT IS AN "ACCIDENT" ?

AT Marylebone County Court, Friday last week, before Judge Stonor, Richard Perry, carpenter and joiner, Napier-road, College-park, N.W., brought an action, under the Workmen's Compensation Act, against Messrs. Baker and Sons, High-road, Willesden-green, N.W., the claim being in respect of personal injuries said to have been sustained by the applicant whilst in the respondents' employ. Mr. A. H. D. Nonweiler, solicitor, appeared for the applicant, and Mr. W. Berryman, solicitor, for the respondents.

The applicant's case, briefly, was as follows: For about three years he had been in the employ of the respondents, his average weekly earnings being 2*l.* 4*s.* 8*d.* On September 18 last he was ordered by the foreman to make a large, heavy seat. While lifting the piece of work, to see a joint underneath, he strained a muscle in the side of his abdomen. In consequence of the injury he was confined to his bedroom for about five months, and still felt great pain and experienced difficulty in walking. Two medical men, called on behalf of the applicant, expressed an opinion that the man's nervous system was seriously affected by the injury.

A medical man, called by the respondents, said that during the whole course of his experience in the profession, extending over some twenty years, he had never heard of such a thing as a muscular strain causing shock to the nervous system. He considered that the man was not now suffering from the injuries sustained in September.

Edwin Prestige, the respondents' foreman, stated that he told off a lad to assist in moving the seat in question, and directed the applicant not to attempt to lift such a heavy thing himself. The applicant, recalled, denied that the foreman had told him not to attempt to lift the seat without assistance, and added that he heard nothing, until after he had injured himself, about a lad being told off to assist him.

The chief point of law raised by the solicitor for the respondents was that there had been no "accident" within the meaning of the Act. He referred particularly to the case "*Roper v. Greenwood*," 83 *Times* Law Reports, 100, in which it was held that an accident was the occurrence of "something unexpected and fortuitous."

The Judge: Nothing unusual appears to have occurred as regards the work itself, and it is difficult, therefore, to see how there could have been an accident.

Mr. Nonweiler: According to their own showing, there was something unusual in the work, for they say that they told off some one to assist in lifting the seat.

The Judge: I will consider the point. The case must be adjourned.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

25,353.—AN ELECTRICAL RESISTANCE: *E. F. Moy, P. H. Basile, and E. F. Moy, Limited.*—Within an exterior container which holds the liquid resistance is suspended an earthenware insulating tube, and a tubular leaden electrode which is cast integrally above a conical electrode which is cast integrally with a connecting strip, which is passed between the container and the insulating tube (through a slot in the flange of the latter) and is fitted with a terminal; the electrode is cast in one piece with a bridge and a connecting bar enclosing a brass strengthening rod and having an insulating pulley and a terminal.

25,384.—CANS, &c.: *W. Jones and J. Roberts.*—On to the neck of the can is hinged a funnel that under normal conditions will remain inverted over the neck, but when the can is being used for, say, filling

purposes, it is tilted on the hinge so as to turn the neck of the can into the funnel.

25,417.—ELECTROMAGNETS: *L. J. Delacaux.*—The inventor provides a movable armature or core having a long play for a sheathed electro-magnet, and makes the casing or sheath in one piece or more with a rounded opening at each end, a bobbin or reel wound with insulated wire being held within. A hollow cylinder or a solid shaft of soft iron constitutes the armature or core at one end or at both ends of which is a series of discs or washers, which may be made with varying cross-sections or diameters, and he set apart at different intervals.

25,450.—AN APPLIANCE FOR USE WITH HOISTS, LIFTS, &c.: *G. M. Brenner.*—The inventor seeks to prevent an accidental running down of the load. The self-sustaining appliance comprises a containing-box, across which is the power-shaft, from which project diagonally two arms for engagement with jugs upon loose discs; the annular rim of one of the discs takes rollers in recesses which are cut in it. Four flats are cut upon the other disc, whereby no jamming action will arise when the load is being lifted, but when the power is removed, the load as it starts to fall turns the latter disc a little with respect to the former disc, whereupon the consequent jamming of the rollers against the casing locks the latter disc and so holds up the load.

25,512.—TREATMENT OF LIME, HYDRAULIC CEMENTS, &c.: *Soc. J. et A. Parin de Lafarge.*—The wetted lumps of lime or cement are passed from a hopper into a rotating receiver having a steam-jacket. A slow movement of the material along the receiver is imparted with mutilated helices, whilst it is shaken and crumbled with ribs set lengthwise. It is then similarly treated in other cylinders, between which is put a reheating chamber, fitted with a continuous coil of steam pipes, in some instances the slaked hody should be kept for from twenty-four to forty-eight hours at 100 deg. C. in a pit surrounded with some non-conducting material.

25,518.—TAPS AND COCKS: *M. L. T. E. Vaïsse.*—Upon the end of the screw-threaded rod or working spindle is a collar from which hangs a socket into which the plug is screwed; the lower portion of the plug is kept in constant engagement with the seat in the valve, and another plug can be easily substituted.

25,526.—WALL, CEILING, AND SIMILAR COVERINGS: *Soc. Joss et Fils et Compagnie.*—An acid and weather-proof covering for walls, ceilings, and so on, is formed of paper, textile fabric, cloth, or other material by first steeping it in a solution composed of gutta-percha dissolved in an essential oil, 1 part; mineral pitch similarly dissolved, 1 part; Venice turpentine, 1 part; and a liquid dryer, 3 parts. Then it is dried and coated upon both sides with white lead that has been pounded up together with a drying oil that contains one-tenth part of liquid gutta-percha; to the material, having been dried again, is applied upon one side a coating of zinc white ground in clear linseed oil and copal varnish. It may then be impressed ornamentally and be secured in its position with a liquid cement composed of white lead, linseed oil, and a dryer containing one-twentieth part of liquid gutta-percha or some similar substance.

25,540.—MECHANISM FOR USE IN MOULDING BRICKS: *T. C. Fawcett, Limited, and J. D. Fawcett.*—For working the cutting-table of an extrusion-machine the inventors hinge a stop-piece on to the outer end of the table and join the stop-piece, with a rod and a bell-crank lever, to a weighted sliding rod that is disposed so as to engage with a stop and a fixed cam. As the stream of clay flows against the hinged stop-piece the sliding rod becomes lifted clear of the last-named stop, and the table is then moved together with the clay. With the forward movement of the table a lever attached thereto is passed clear of a cam, whilst a weighted lever that reposes upon the former lever falls down upon a clutch, which it puts into action to shift the table sideways. The clay is then cut up into bricks, and the table is next moved lengthwise at a speed faster than that of the clay by means of a second cam operated by the clutch. The cam is rotated beneath the lever of the table upon the return stroke of the latter; a roller of the sliding-rod begins to run upon the cam when the outward stroke of the table is finished, so that the hinged stop-piece shall be diverted outwards and clear of the end brick. In another form the motion of the table may be communicated by the band, the automatic clutch mechanism being in that case disconnected from the machine.

25,541.—OVERFLOW OPENINGS FOR BATHS, SINKS, URINALS, CLOSET AND OTHER BASINS, AND SIMILAR PURPOSES: *J. Jarvis.*—In order that the overflow openings may be protected and hidden from sight is devised a hanging lip which is fashioned out of the detachable part of the mould of plaster of Paris upon which the articles named are formed.

25,584.—PILES FOR THE BANKS OF RIVERS: *W. Baudisch.*—After the piles have been driven into the bank or bed of the river, their tops are cut off evenly, beams are then placed over the piles, vertical iron rods or tubes are thrust into holes bored through the beams into the piles, and a concrete wall is then constructed upon the beams about and around the vertical rods. When the work is done in part under water, stone foundation blocks should be interposed amongst the piles as high as

the level of the water, and grooves should be cut at the ends of the blocks to form means of hold-fast with the piles.

25,594.—A PROCESS OF ORNAMENTAL METAL ENLAY: *F. Eppler.*—For inlaying metals in marble, granite, syenite, or other materials by electro-deposition, and for filling, surfacing, chasing, and engraving purposes, the inventor fashions recesses in the metal by sand-blasting. The recesses may be undercut, or inclined holes may be made beneath them for the deposited metal, or metal pins of brass or copper or silver, gold, or platinum is to be deposited. When the recesses are wide, pieces of fine gauze should be pressed into them, and continuous metal wires which have been threaded through the holes or placed within the recesses may be brought up to the surface of the metal deposited. In order to render the surfaces conductive they should be chemically silvered or be rubbed with some soft metal, such as zinc, tin, or aluminium.

25,621.—ELECTRICAL SWITCHES FOR DOMESTIC USE: *A. P. Lundberg and G. C. Lundberg.*—The appliance concerns two-way and similar switches which are devised especially for regulating an installation from two points, as, for instance, in the lighting of staircases, and so on; for a two-way switch having a quick make and break the inventors apply on to the base three terminals provided with spring contacts, and mount a moving contact loosely upon a spindle, four pins are passed through that will engage underneath with a pair of flattened springs so as to effect a quick break and will engage above with a spring of which the projecting ends fit into recesses in the handle and thereby ensure a spring connexion.

25,646.—CHIMNEY TOPS, &c.: *W. B. Ramsey, C. Davies, and J. Leese.*—A chimney for the top of a chimney or a ventilating shaft is made in the shape of a truncated pyramid, square on base, in each side of which is made an opening over which are hung two pairs of shutters mounted at right angles upon two rocking beams.

25,681.—AN APPLIANCE FOR AN ELECTRICITY ENERGY METER: *Algemeine Electricitäts G.*—The electro-dynamometer is intended to be used with an alternating current. In the space surrounded by a horizontally laminated iron block is fixed a set of coils around a separate and movable coil mounted upon a vertical axle fitted with a pointer, the movement being damped by means of a metal plate within the fields of two permanent magnets. Under that arrangement the outer portions of the magnetical circle of the fixed set of coils exert no influence upon the permanent magnets, since they rest within the iron block.

25,716.—CRAMPS: *Dodd Kimbley & Sons' Tool Manufacturing Co. and W. Kimbley.*—The invention relates to cramps for flooring and other cramps. Projections are made upon the head of the tool in order that as they lie upon the top of the flooring-board or other work, they shall serve to maintain the cramp and the board together in their relatively proper places.

25,723.—EXTENSIBLE LADDERS: *S. Deau.*—Two sections whose widths are equal constitute an extensible ladder, and are so fitted together that the upper section will slide in grooves or brackets upon the lower section, and will be sustained at the height desired by means of brackets upon a shaft which is turned and regulated by means of a pulley and an endless cord, the movement of the shaft being limited in its extent by projections from the brackets which are pressed against the sides of the lower section. To the ends of the two sections is attached a lifting-cord that is passed around a pulley upon the lower section. A spring (to be liberated with a cord) may be employed for holding up the sustaining brackets automatically when they are in action, and a crossbar provided with collars and rollers may be adopted for holding the upper section in its place.

25,734.—ARTIFICIAL STONE FOR BUILDERS' USE: *P. Timofeff.*—The invention comprises the manufacture of artificial stone for building and paving blocks and slabs and similar goods, and the manufacture of a cement for uniting the blocks and slabs together; the component materials consist of limestone, clay, brick, stone, and rubbish, mixed with fluxes, alkalies or alkaline earths, limes, oxides, mineral colouring substances and so on, all finely pulverised and melted at a high temperature in furnaces. The moulded blocks are then annealed in the same manner as glass is. For a cement is made an admixture of lime and calcium silicate, or a pulverised artificial stone mixed with ordinary cement. If very hard goods are needed a part of quartz sand is thrown into the molten compound just before it is cast.

25,741.—A LIGHTNING ARRESTER: *A. J. Wurts.* A common spark block is secured to divided spark blocks with wooden strips set with their grain at a right angle to the spark block, and charred grooves are made between the blocks. Sockets of the spark blocks carry resistance rods (composed of a dried mixture of starch, graphite, and kaolin), are socketed at their remote ends in an earth plate, and each of them is partially covered with rough paper wetted and lined with shellac or some other adhesive substance. With the specification should be read the United States specifications Nos. 509, 783-4 of 1893.

LIFE INSURANCE SOCIETY.—BY MR. C. H. HEATHCOTE, F.R.I.B.A.

25,768. — CONTRIVANCES (ELECTRICAL) FOR LIFTS. H. Rowntree.—Electricity is employed as a motive power. At every landing is a push-button, and in the cage is a corresponding push-button, for regulating a circuit which embraces a magnetical switch; every switch regulates a circuit which embraces either the one or the other of two solenoids, and every solenoid circuit embraces a contrivance for making contact, which will be automatically broken upon the arrival of the cage at the landing which corresponds with the particular button that is manipulated, and will automatically reduce the speed of the motor with the approach of the cage to the landing where its arrest is desired. The various objects of the invention comprise the impossibility of bringing the lifting apparatus into play until all the well doors shall have been shut, the automatic arrest of the cage at any particular landing (together with its movement to that landing) by means of the working of a push-button at the landing or in the cage, the regulation of all the movements of the cage by push-buttons in the cage as well as at the landings, and the automatic regulation of the motion of the cage when it is started and stopped.

MEETINGS.

FRIDAY, APRIL 26.

Society of Arts (Howard Lectures).—Mr. Alfred C. Eboral on "Polyphase Electric Working." I. 8 p.m. Glasgow Architectural Craftsmen's Society.—Business meeting. 8 p.m. Building Trades' Exhibition.—Conference on standardising of bricks. 4 p.m.

SATURDAY, APRIL 27.

St. Paul's Ecclesiastical Society.—Visits to the churches of St. Mary, Willesden, and St. Andrew, Willesden Green. Members meet at St. Mary (the old Parish Church) at 3 p.m. Builders' Association (Memorial Hall, Farringdon-street).—Quarterly meeting. 7.30 p.m. Northern Architectural Association.—Excursion meeting. Members to assemble at the south end of Sunderland Central Station at 3.5 p.m.

MONDAY, APRIL 29.

Royal Institute of British Architects.—Special General Meeting to consider various resolutions as to the competition for the proposed national observatory to Queen Victoria. 8 p.m. Society of Arts (Howard Lectures).—Mr. A. Clavell Salter on "The Ownership of the Highways." 8 p.m. Society of Arts (Howard Lectures).—Sir William Chandler Roberts-Austen on "Alloys." II. 8 p.m.

WEDNESDAY, MAY 1.

Royal Archaeological Institute.—(a) Mr. A. R. Whitehead, M.A., on "The Pyrenean Neighbour or the Vicinal System in the Western Pyrenees." (b) Mr. H. Longden on "Cast Iron." 4 p.m. British Archaeological Association.—Annual general meeting. A paper by Mr. T. Cato Worsfold upon "The Porta Nigra, a Treasure of Treves." 4.30 p.m. Builders' Foremen and Clerks of Works Institution.—Ordinary meeting of the members. 8 p.m. Edinburgh Architectural Association.—Annual business meeting and President's valedictory address. 8 p.m.

THURSDAY, MAY 2.

Institution of Electrical Engineers (at the Institution of Civil Engineers).—(1) Messrs. C. G. Lamb, M.A., B.Sc., and Miles Walker, B.A., on "An Instrument for Measuring the Permeability of Iron and Steel," and (2) Mr. Frank Holden on "A Watt-Hour Meter." 8 p.m. Society for the Encouragement of the Fine Arts.—Mr. Ernest Hunt on "Stencil Painting as an Art." SOME RECENT SALES OF PROPERTY: ESTATE EXCHANGE REPORT.

Table listing property sales including Milton, Oxon., Berkhamstead, and Stamford Hill, with prices ranging from £1,100 to £5,100.

Main table of property listings with columns for address, area, and price. Includes listings for Stoke Newington, Manor Park, Putney, Edmonton, Fairfield, Margate, Hackney, Walthamstow, and various other districts.

Table of property listings including Highbury, Pimlico, Holloway, Homerton, Paddington, Notting Hill, Hampstead, Bournemouth, and Kentish Town.

PRICES CURRENT OF MATERIALS.

* * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quantities and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Detailed price list for building materials including bricks, stones, and various types of bricks and slates, with prices per 1,000 or per yard.

[See also page 429.]

TO CORRESPONDENTS.

G. E. S.—W. R. (Below our limit). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the article, when written, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.] * Denotes accepted. † Denotes provisionally accepted.

Architecture at the Royal Academy.

THE collection of architectural drawings in the Royal Academy this year is curiously heterogeneous in character. It would certainly be very difficult for any one unacquainted with English architecture to gather from it what were the dominant tendencies or convictions of English architects at the present moment. There is little to suggest the consideration of new paths in architecture; on the contrary, Classic on the one side and Gothic on the other seem more than usually emphasised. There is rather a want also of any really leading drawings of a powerful and effective type, such as are usually selected to occupy central positions; the hanging committee seems, in fact, to have been rather in a difficulty as to grouping the drawings, on this account; they have adopted the drawing of one Academician, Mr. Jackson, to occupy the centre space on the east wall, and three church interiors by another Academician face it on the west wall; but the south wall is a medley with no centre and no leading motif.

The unexpected change of "Press view" day from the usual Wednesday to Thursday, for no obvious reason, must have occasioned considerable inconvenience to the representatives of many weekly papers, and obliges us to be content, in this first article, with rather hurried notes of some of the principal designs. To begin with the Academicians, Mr. Jackson's drawing before referred to (1,568) represents, in two long coloured elevations, his new buildings at Cambridge, which if we remember right were represented either in perspective or in another elevation last year. The buildings, in red brick with curved gables, and red-tiled roofs, are completely collegiate in character, and convey the impression of having been purposely assimilated to Cam-

bridge surroundings, as the same architect's buildings at Oxford are assimilated to Oxford surroundings. The manner in which the large windows of the Law Library, which show on both elevations, are slightly varied in treatment though kept to the same general proportions, is a nice little point in the detail. We are glad also to find an Academician architect setting the example of illustrating buildings in geometrical drawings in this exhibition. Another Academician, Mr. Aston Webb, also exhibits a large geometrical drawing (1,616), a coloured detail elevation of a portion of the intended façade of the completion of the South Kensington Museum. This shows a terra-cotta-faced building with multioned windows, a column between them in the lower story, while in the upper story the windows are separated by niches containing statues of artists (Donatello and Matsys are the two shown here—a curiously-assorted couple), shadowed with canopies. In this case the character of the design shows that kind of eclecticism which we noticed as less conspicuous than usual in this year's exhibition. The detail shown is suitable to terra-cotta, and is not too exuberant—the besetting danger in detailing with such a plastic material. Mr. Webb also exhibits a view of a more unambitious and practical building, the block for the "sick quarters" in connexion with the Britannia Royal Naval College at Dartmouth, which is illustrated in our present issue. As will be seen from the plan, it consists of three blocks of wards with two-story connecting corridors; these, and the loggias facing south-east at the end of the wards, are made use of so as to gain a little suitable and unpretending architectural effect. We also illustrate in the present issue the interior of the church of St. Matthew, Chapel Allerton, near Leeds (1,654), by Mr. Bodley; the drawing forms the centre of his group of three church interiors at the end of the room already referred to. The architecture, as will be seen, is of that perfectly orthodox and conservative type of the Gothic revival which we rarely meet with in new church designs now. The organ is placed

in the old cathedral portion, over the chancel screen—a very good position for sound and for effect, provided the building is on a scale to afford proper space for it. In the present instance the organ gives the impression of being rather small, and we should like to know where the 16-foot pedal pipes are provided for; and it strikes us also that the appearance of the base to the organ-case, from which it is corbelled out, is not adequate to carry the super-structure; but it might have a different effect when seen in detail. We have no doubt that the colour effect of the nave and aisle roofs will be very agreeable and harmonious. Mr. Bodley exhibits, too, a perspective view of a house, "Hayes Lodge, Morley" (1,647), of which also we are enabled by his kindness to give an illustration in the present issue. There are some interesting points in the plan of the house, but we should not ourselves have thought a very large end window, facing full south, a good way to light a dining-room. The question of prospect, however, may have influenced this. We may observe that both this house and the church, in their architectural character, illustrate very well what Mr. Bodley said a year or two ago in an address at the Institute, in regard to the value of refinement and repose in architecture. Some of us may consider these two buildings wanting in originality; they repeat well-known types of Gothic architecture. But they certainly possess that quality of refinement to which their architect attached so much importance, and which he considered (we fear not without reason) was too often wanting in modern architecture.

Of Mr. Bodley's two other church interiors—"St. Mary's, Eccleston" (1,651) and "New Church, Kensington" (1,657), the former shows a vaulted nave, the latter a painted barrel ceiling carried by (apparently) stone arches acting as principals. One is inclined to think that in such a case more of the stone arch should be shown below the ceiling; we know that there must be a sufficient depth of spandril to make such an arch stable, but the eye rather wants to see some of it. Both these churches are

in the arcade design, of Early Decorated character, the first somewhat massive in proportion, the second with slender piers which rather remind one of Pugin's habit of design; in both of them the east window represents a late period of Gothic, verging on Perpendicular. We presume that Mr. Bodley thinks it allowable to play with and mix the details of past styles in this manner. It is open to question; perhaps, if we consent to the use of imitation mediæval at all, we have a right to pick and choose, and combine as we please. A fourth exhibit by Mr. Bodley is of considerable interest, it is the new tower designed by him (we know not if already built) for the splendid church of Long Melford in Suffolk. However one may in general object to the addition of modern Gothic to an ancient building, the former Georgian tower was so utterly devoid of interest and such a disfigurement to the church that we would certainly rather see a modern tower designed to harmonise with the rest of the building. Mr. Bodley has kept, of course, faithfully to the architectural tradition of the church, introducing the characteristic flint decoration in the basement and parapet; the angle pinnacles of the tower are very finely and effectively designed; the whole thing is done, in fact, as well as it is possible to do in such a difficult task as adding a new feature to an ancient building.

Two notable competitions, the Old Bailey and the Strand Improvement scheme, have furnished their quota to what may be called the show drawings of the exhibition. Mr. Flockhart exhibits a fine perspective drawing (1,561) of his design for the Public Building block for the Strand Improvement scheme; a very effective piling up of classic materials out of what Mr. Lethaby called "the Renaissance box of bricks," which is shown extending on a curved line behind St. Mary-le-Strand; but it must be observed that it quite crushes the church, both in respect of scale and tumultuous character of detail; and this is hardly to be wished. Messrs. Runtz & Co. exhibit two drawings of their design in the same competition; "Sketch for Exterior of Gaiety Theatre and Morning Post Offices" (1,560), and "Suggested Scheme for Municipal and Commercial Buildings" (1,559). The former shows a picturesque irregular grouping of blocks of building lying in different directions, with a low tower, crowned with a dome and angle pavilions, coming unsymmetrically into the composition. All this looks well enough, but a key-plan at least should have been given. In the other drawing (1,559) the towers at the extremities of public building block are very pleasing in effect, with graceful cupolas mounted on nearly plain masses of masonry which serve to flank and terminate this part of the composition; the general architectural treatment, while dignified, is quiet and reserved; but somehow the columned portico and pediment in the centre seem out of place, and as if they belonged to another building. Near these, and in the centre of the wall, a considerable space is occupied by a very large perspective drawing of some street buildings at Finsbury-circus, which is entirely without architectural or artistic interest; it is just a big drawing of "new premises." Why is this kind of thing hung, to the exclusion of works of artistic in-

terest? We know of drawings far superior in interest to this, which have been refused; four good works illustrated in smaller drawings might have hung in the space occupied by this large piece of commonplace; and if the Academy is to act up to its title as an Academy of Arts, it should surely prefer artistic quality to superficial area in a drawing.

Two of the Old Bailey competitors are represented; Mr. Mountford by a beautifully neat and finished perspective drawing shaded in Indian ink, of his exterior design (1,611), and an equally well executed one of the interior of the central hall (1,608). The latter represents a very dignified domed interior; the exterior design is of the kind that is called "imposing;" it looks exceedingly well and there is no fault to find with it, but somehow it does not interest one very much: it is correct and cold. In the draughtsmanship, by the way, there is a fault in the drawing of the curves of the dome cornice where interrupted (to the eye) by the angle feature; the curve on each side is "tucked in" too much, and does not appear like a continuous curve interrupted; so exceedingly rare is it to see the perspective curves of a dome cornice correctly drawn, even in a careful drawing presumably by an architectural draughtsman. As to painters, they are hopeless in such a case; none of them can draw a dome. Mr. Baggallay's design for the Old Bailey Sessions House is also represented in a large perspective drawing (1,612); as we said at the time of the competition, we considered this the most characteristic and suitable design in the competition, and it presented also the best plan. The plans are not given in either case. Mr. Belcher also exhibits the perspective view of his exterior design in the same competition.

Messrs. Ernest George & Yeates, from whom we are accustomed to see drawings of pleasant and picturesque domestic interiors and exteriors, exhibit this year only one work of quite a different class, viz., the North London Crematorium in Finchley-road. They succeed in showing, however, that a crematorium may be made the occasion for an interesting and picturesque architectural grouping. The plan is given, showing an entrance forecourt with the chapel on one side of it, and a door at the further side leading into a long round-arched cloister which connects all the buildings together. A kind of Lombard-Romanesque style is adopted; above the furnace rises a tower stopped short with a cornice and a flat roof, which acts as campanile to the chapel, the bells being visibly hung in the openings of the tower; but we presume this tower also acts as an escape for the fumes from the furnace. Connected with the cloister by a portico is a small octagonal dome building, not named on the plan, but perhaps the columbarium, which groups well with the rest. What one notes in this design is that it is treated with a picturesque simplicity, added to by the plain tiled roofs, which forms a complete contrast to the dead kind of official architecture often found in erections of this class, built for public authorities.

Among others of the more important buildings illustrated is Mr. A. C. Blomfield's "Rebuilding of Bank Buildings, E.C.," for the Bank of England (1,646). This is a classic design shown in a careful outline

drawing; a treatment of an angle site, the centre block at the angle being kept in a flat mass, contrasted by a pavilion crowned with a cupola at a little distance on each side of it, the intervening portions of the front being treated as subordinate. The prominent portions are decorated with an order, and the whole tied together by a continuous rusticated ground story. The effect of the contrast of the centre and side pavilions is very good; but the whole façade seems to want something rather stronger at the ends to flank it. Profess Aitchison exhibits a drawing of offices at 44, Mark-lane (1,538); it may be described as a Romanesque design of very North Italian character, in three stories of round-arched windows, the arches carried on columns with very widely-projecting caps; the voussours of the arches have an ornamental device hatched into them, and over the ground story is a frieze composed of a flowing inlay of coloured marbles. The whole treatment is very original. Mr. Colcutt's perspective view of Lloyd's Register Offices (1,561) represents in complete form a building of part of which there was a very effective drawing in last year's Academy.* This building is a fine example of remarkably bold and picturesque treatment of columnar orders, rendered possible by walls evidently of ample thickness; the design of the piers of the attic, a collection of colonnettes bonded together in a bold rustication, is remarkable effective. Sculpture is well introduced in the spandrels of the grand story arches. The corbelled-out angle turret, a very effective feature, would be the better for a little more simplicity; it is rather too much cut up with small detail.

We may conclude our present notice by drawing attention to two small drawings, both hung low and which might easily be passed over, but remarkable for their originality. One is Mr. Beresford Pite's perspective sketch for "A Memorial Bridge" (1,672), showing a bridge with a triple archway built across the centre, crowned by a sculptured trophy in the centre of the block, while on each hand, to right and left, a double colonnade extends, covering the footways, and stopped at the ends by an arcaded pavilion. The idea is fine and original, and worth working out on a larger scale. The other is Mr. Ricardo's remarkable design for the "Terminal Station for the East Indian and Bengal and Nagpur railways, at Howrah (Calcutta)" (1,588). It has been maintained that it is impossible to absolutely originate an architectural treatment which is not more or less based on precedents, but Mr. Ricardo really seems to have succeeded in doing it, for this is like no other architecture we have ever seen, and seems to be a treatment growing directly out of the practical requirements, without regard to what are generally looked on as architectural features. It is impossible to describe the design, because it eludes the usual terms to be found in architectural glossaries; but we shall be able to illustrate it shortly. We should have liked better if the open loggia in the upper stage had stopped against the towers instead of partly extending in front of them, which produces rather a piecemeal look. But the whole thing is a healthy contrast to the "Manchester Gothic" terminal station which has hitherto excited the admiration of the Anglo-Indian.

* Illustrated in the *Builder* of September 22, 1900.

SPANISH ART AT THE GUILDHALL.

THE idea of making the popular Guildhall Exhibition this year an illustration of Spanish art was a happy one, since it was likely to interest artists as well as the general public, by bringing before them the works of some modern painters who are not very well known in this country. Modern Spanish pictures do not come this way very much, or are the names of their authors familiar. But we do not know that the collection in the large gallery, entirely composed of works by living or recently deceased Spanish artists, is calculated by itself to awaken much enthusiasm. There is a head of a Morocco negro by Fortuny (5) which is of amazing power; but then Fortuny stands alone. There is a large sketchy picture by him of "Acrobats at Tetuan" (7), which in every way reminds one of Decamps. Of the larger works in the same gallery those of Goya and Velasquez are of a grandeur of radilla are the most important in scale and subject; his "Boabdil Surrendering the keys of Granada" (8) is a well-composed historical picture, in a broad full style of execution, but, like some other works in the gallery of the same class, it seems to fall short of dramatic point and expression. What interests one in general in the large gallery is a certain special quality of painting which strikes the eye as unusual; a very bold use of colour without a corresponding attention to detail; a very strong and vivid effect of sunlight in outdoor scenes, as in Rodriguez' "Garden in Seville in November" (11). We say outdoor scenes purposely, for of landscape painting the real sense of the word there is nothing; if we are to judge by this show, it does not exist for the Spanish artist. The elaborate interior by Salvador, "A Late Concert" (22), in which a scene, common-place enough in its incident and its personages, is made the occasion for a kind of gem-like effect of points of colour, is a remarkable work of its kind, but it is of a type which the French would call *cliquant*, and appeals rather to the eye than to the intellect. Gallegos' elaborately finished ecclesiastical interiors are familiar to the requesters of Messrs. Tooth's Gallery, and are admirable of their kind. Among the pictures which have some interest of character and expression is Melida's "The Communion of the Nuns" (31), in which the group of heads forms a remarkable example of contrasted character. Cordero's architectural pictures are very good. But in general the interest of execution is beyond the intellectual interest. Such a picture as Tusquets' "A Roman Shepherd" (26) is hardly to be called art at all, any more than wax-work is art.

There are in fact only two real painters among the Spanish—Velasquez among the ancients and Fortuny among the moderns; and the best of all the others are bad seconds, or hardly seconds to them. It is they who in this case really make the exhibition, which is not confined to modern work. The second gallery contains a sad and sombre collection of the respectable mediocrities of the Spanish school, reminding us—

"how Spagnoletto tainted

His brush with all the blood of all the sainted,"

and how Zurbaran produced unhealthy-looking monks painted as if his brush were dipped in an inkpot. Murillo's one sweet

and lovely though sentimental ideal in painting, "The Immaculate Conception," is represented in the picture lent by Sir Cuthbert Quilter (84), shining here like a light in a dark place; his "Infant Jesus Asleep" is also worth attention, and has a little of that expression of supernatural power which we see in Raphael's wonderful infant. Two or three portraits by Goya have character and colour; and his picture of "The Bulls" in the arena (72), black and dingy as it is, is certainly not lacking in energy. But otherwise this room is a melancholy spectacle, from which we escape up two or three steps to find ourselves, in Gallery 3, amid a whole collection of Velasquez pictures; a culmination which takes one by surprise. At the first sight of his masterful portrait of Quevedo the mediocrities of Gallery 2 fade from one's recollection. Here we are in a room where nearly every work is a masterpiece. Among the collection is the "Water-carrier of Seville," the picture which came by such odd fortune of war into the hands of the Duke of Wellington; one of those works in which an ordinary incident of lower-class life is raised into intellectual interest by the power of art. Compare this with Tusquets' "Roman Shepherd" before mentioned, and realise the distinction between art and mere realistic painting. "The Omelet" is another lesson of the same kind. Among the exhibits is the splendid portrait of Philip IV.; that of Isabel de Bourbon, and that of Olivares, a political scoundrel whose chief value to us now lies in the fact that Velasquez painted his portrait, a perfect embodiment of dignity of manner and rationality of character. The picture is here in two editions, of which that belonging to Mr. E. Huth (127) is undoubtedly the masterpiece; it is possible to imagine that the other (130), lent by Captain Holford, is a copy; at all events, if there is any question of authenticity, this is the one that must give way; compare the painting of the hands in this with those in No. 127. The whole roomful is a delightful and exciting surprise, led up to in a most effective manner.

There is a further surprise in store for the visitor, however, in the works by Fortuny in Gallery 4. As we have said, Velasquez and Fortuny are the two real Spanish painters, and it is curious that Fortuny, like Velasquez, should be notable for that kind of artistic power which compels our interest in commonplace and even repulsive subjects by mere power of treatment. We confess that, to our thinking, Fortuny's picture called by the beautiful title "The Garden of the Poets," suggesting associations so far from those conveyed in the painting, is in feeling and character detestable—one is inclined to dislike the man who painted it; but it is a work you cannot pass over. The interior entitled "The Spanish Marriage" (177) has not this kind of drawback, and it is a perfect triumph of brilliant effect, and splendid indication of detail all subordinated to the total result—indication of detail, for Fortuny had that power which only belongs to the first class of masters of the brush, of indicating everything without any hardness of mechanical finish. In the same gallery there are a good many other small works of interest; various architectural subjects by Cordero; Fortuny's charming fancy entitled "The Butterfly"; and others worth atten-

tion. It is in this gallery and the Velasquez room that the real interest of the exhibition lies; the rest is of comparatively little consequence.

NOTES.

Architects
Certificates.

OUR readers must be all acquainted with the cases of Chambers v. Goldthorpe and Restell v. Nye, in which it was decided that an architect in giving a certificate was in the position of an arbitrator, and, therefore, was not liable for negligence. When they were decided we commented on these cases at length. It is, therefore, now sufficient to say that in the official Law Reports for April there will be found the opinion of the Court of Appeal on these two cases. The decision of that Court confirms the lower Court, and it is now definitely settled that an architect under the circumstances above stated is to all intents and purposes an arbitrator. The case of Rogers v. James, which was also a decision of the Court of Appeal, is distinguished, and we may regard the point as now beyond discussion for good or for evil. It is desirable, however, to mention that Lord Justice Romer differed from the other two Judges. He considered that the authorities did not bear out the contention of his brethren, and he added that he considered that the liability of the architect to his employer for negligence was "more in consonance with natural justice." "It would be lamentable," he said, "that in cases of this kind an employer who pays an architect for supervising work, and who has sustained damage by his negligence, should have no remedy against him." It may fairly be said that the law as it stands does not tend to care on the part of an architect, and puts a careless in the same position as a careful practitioner.

By the Electric Lighting Act of 1882 the Board of Trade is empowered to make, amend,

or repeal regulations for securing public safety or for ensuring a proper and sufficient supply of electrical energy. We cannot congratulate those who drafted the amendments issued this week to the old regulations. In the first place, the amendments are an almost unintelligible mass of verbiage, and in the second place we fail to see how they are going to help to secure the public safety or to ensure a steady supply of the electric light. So far as we can understand the second amendment, it amounts to this, that the Board of Trade is ultimately to have the power of forcing a consumer to give up his vested interest in a low-pressure supply. If they think it necessary they can employ a single arbitrator to fix the amount of compensation due for any loss or damage incurred in the changing from low to high pressure. The position of this arbitrator would not be an enviable one, as it is notorious that electricians are at present divided amongst themselves as to the merits and demerits of a high-pressure supply. The Board of Trade cannot be accused of unduly oppressing the supply companies; when their regulations tell against the companies the penalties are not enforced, and when the regulations favour the consumer they are amended. If these amendments are legal, then high-pressure supply will become practically universal, and it is to be hoped that inventors will design new systems of

distribution in which there is no danger from shock, and in which no damage is done by leakage currents.

The ninth "James Forrest" "James Forrest" lecture was delivered by Dr. Frank Clowes before the Institution of Civil Engineers on the 25th ult. The subject of the lecture was "Chemistry in its Relations to Engineering." Dr. Clowes emphasised the importance to engineers of at least an elementary practical acquaintance with the science of chemistry. Chemists and engineers should, he thought, work together. Engineers should have some knowledge of chemistry, and chemists should know something of engineering. As a rule, in this country engineers knew too little of chemistry, and chemists too little of engineering. He recognised that engineers could not possibly devote sufficient time to chemistry to become expert chemists or analysts, but with an elementary acquaintance with chemistry they could co-operate more intelligently with the professional chemist. As Chemist to the London County Council, Dr. Clowes has had experience of the utility of the joint application of engineering and chemical skill to the study of sewage disposal, and he considers that the success of his oil and hydrogen safety-lamp, which is now so extensively used in mines and for testing the condition of the atmosphere in the tanks of oil-tank steamships, is due to the assistance he received in its construction from engineers. Much that Dr. Clowes said concerning the relationship of chemistry to engineering might be applied with equal truth to chemistry and building construction. We have repeatedly drawn attention to the necessity for more co-operation between the members of the allied professions, and pointed out how such co-operation has been adopted with advantage on the Continent. We are glad that so eminent and able an officer of the London County Council as Dr. Clowes has taken this opportunity to demonstrate the desirability of reform.

THE papers by Mr. Campbell and Mr. Crawley on electrical measurements which were read to the Institution of Electrical Engineers treated of a subject of great importance to the industry. Mr. Campbell in the first part of his paper dealt more particularly with alternating current measurements, and the many methods he described showed the great variety of problems connected with measurement that have to be solved in a busy test room. One of the members who spoke criticised severely this part of the paper. In his opinion a good watt-meter would make all the measurements better than any of Mr. Campbell's combinations of instruments. In our opinion, however, he overlooked the fact that these methods were supplementary to the ordinary watt-meter methods, and, in fact, are absolutely necessary in order to check them. We can hardly be expected to take alternating current watt-meters on trust from the makers; tests must be devised in order to see whether they read correctly, and some of the methods described by Mr. Campbell answer this purpose excellently. In the second part of his paper he described various methods of getting a constant current or a constant

voltage from a varying supply. These arrangements, as pointed out by Dr. Glazebrook, will be valuable in standardising laboratories for testing ordinary electric meters. Mr. Campbell makes use of the fact that the electric resistance of a nickel wire varies in an extraordinary, but well-defined manner with its temperature. He showed experimentally how he could maintain a lamp at constant brightness by his regulator, although the pressure of supply altered between wide limits. Mr. Crawley described a method he had perfected of measuring resistances accurately and with great rapidity by means of a differential galvanometer. This method has been tested at the Board of Trade laboratory, and has been found of great use for many every-day tests.

A PAPER read by Mr. Gill before the Dublin Section of the Institution of Electrical Engineers, on the 18th ult., describes a most remarkable experiment with a telephone and a microphone. An ordinary microphone transmitter is placed in series with an electric battery and the primary circuit of a small induction coil with the vibrator screwed tight. A telephone is then connected across the secondary terminals of the induction coil. Now, on bringing the telephone within an inch or two of the diaphragm of the transmitter, an extraordinarily loud musical note is emitted, and this note continues as long as the telephone is held near the microphone. On first reading Mr. Gill's paper we thought that very careful tuning would be necessary, and we were agreeably surprised to find that we could reproduce the experiment with the first apparatus we tried, and that no tuning is necessary. In fact, it is very difficult to put it out of tune. Placing a small variable condenser across the telephone, we were able to alter the note by moving the condenser plugs, and hence could attempt to play a tune on the telephone which could have been heard in a large concert hall. The explanation of the phenomenon is difficult. Mr. Gill is probably right in attributing it to electrical resonance, the vibrations being transmitted between the diaphragms of the telephone and the transmitter by the air. On putting a thin wooden board between the two diaphragms the note at once ceased. This experiment is very much easier to reproduce than the one shown by Mr. Duddell at the Institution last December, when he made the electric arc between the carbons of an arc lamp emit a musical note, and the note emitted is quite as loud. Mr. Gill's discovery, that the pitch of the note is altered when the telephone connexions are reversed, is very remarkable, but we are not altogether satisfied with his theoretical explanation of this effect.

WE learn that under a revived scheme for making an underground railway from the West End of London into the City, the church of St. Mildred is again threatened with demolition. Nearly three years ago the vaults were cleared to a depth of from 16 to 17 ft., their contents were removed to the City of London Cemetery at Ilford, and a new floor, constructed of steel girders and concrete, was laid by Messrs. Dove Brothers, under the superintendence of, we believe, Mr. Charles Innes. The interior of the church—

illustrated in our number of July 3, 1880—had been repaired and beautified in 1856, when the cherubim placed in pairs and holding crowns, badly executed in high relief, were removed from the dome ceiling. It has, however, escaped from the untoward fate that has attended many of Wren's London churches, for it stands, undisfigured with mediæval adornments and nineteenth-century rearrangements, just as the master left it upon the completion of the fabric in 1683, at a cost of 3,705*l.* The plan is an oblong with a brick tower, 18 ft. square at base, at the south-eastern angle. The tower carries a lead-covered spire, rising to 140 ft., comprising a concave pyramidal roof above the blocking course of the tower, above which are a lantern having large openings with a slender spire surmounted with a ball and vane. The roof of the church, too (as constructed by E. Strong the elder), is noteworthy, the cupola, which rests upon four pendentives, being formed within the external roof of the ordinary tie-beam and king-post kind, with slight deal ribs secured to the principal timbers and lathed and plastered, whilst in order to give space for the swell of the cupola, some of the tie-beams, instead of being attached to the feet of the principal rafters, are lifted about half-way up, so as to constitute collar beams, and diagonal braces from rafter to rafter are inserted. The beautifully carved work of the altar-piece, the pulpit, and sound-board is attributed to either Grinling Gibbons or one of his pupils.

THIS interesting property, extending over 215 acres, is placed in the market. The house and grounds, encompassed with beech trees, are situated at an altitude of about 400 ft. upon the chalk range in the northern part of the county. The property, however, is chiefly notable for the ancient British camp, which lies just within the north-eastern angle of the crossing of the main road from Basingstoke to Salisbury, and the main road from Winchester to Silchester. The camp, which is circular on plan, is in a field along the eastern side of a portion of the ancient military road, the Herepathe, that may yet be traced across the country, extending almost due north and south to Southampton. At Winklebury and in the immediate vicinity have lately been discovered various early remains, including what are taken to be the horns, bones, and teeth, as burnt for sacrifice, of the *Bos longifrons*, or Celtic short-horned ox, a species that lived, as we are told, from the later Neolithic period to the close of the fourth century of the Christian era. It is believed that the fort existed at a time long antecedent to that of the Roman occupation of Great Britain. At a later period (870-1) it formed the stronghold of Ethelred, son of Ethelwolf, and of his brother Alfred, who, it is said, sallied forth from Winklebury camp at the head of the men of Wessex to meet the Danes who had advanced from Reading, at Basing, three miles distant. The camp was held by the Parliamentary forces when in 1643-5 they laid siege to Basing House.

INK-PHOTO, SPRAGUE & CO. LTY 4 & 5 EAST HARDING STREET, FETTER LANE, E.C.

has been concentrating her work on her own exhibition to open next week at the Fine Art Society's rooms, is a loss; some able contributors are not equal to their best; there are both dull and eccentric works to be found on the walls; the contents of the two screens are unusually devoid of interest. Mr. Robert Little, who is one of the irreconcilables, and whose style constitutes a "rendering" rather than an imitation of Nature, is nevertheless very powerful in his landscape "A Jacobite Gathering" (10); he has at all events a style. Mr. Albert Goodwin's views of cities and cathedrals become more and more delicate and beautiful but also less and less like reality; his "Naples" (15), with the pile of buildings in the foreground and Vesuvius in the distance, is a lovely composition, but too artificial. He gives among other things a view of the front of Wells seen at a little distance across the lawn, with the twilight just allowing the lights in the interior to show a glimmer; a very charming effect. Mr. Tom Lloyd's "Evening in June" (22) is one of the larger and more highly finished landscapes, the repose of which seems a little marred by the strongly marked oblique line of the mass of western clouds; this may be after Nature, but if so, Nature did not compose well in this case. Mr. R. W. Allan exhibits his bold and bright effect of open air and light very powerfully in "Scotch Fishing Village" (37), one of the most successful works in the room in giving the effect aimed at. Two of the finest landscape-painters in the Society, Mr. Eyre Walker and Mr. Cuthbert Rigby, have both painted winter scenes (99 and 92). Mr. Rigby taking Ennerdale, and giving us an unaccustomed aspect of the Lake district. Mr. Colin B. Philip's "At Barmouth, North Wales" (100) is also a very fine work. Mr. Arthur Melville is an experimenter, and is now trying to see "A Highland Autumn" (33) in masses of blue, instead of treating human figures in that way; but the experiment is hardly convincing. Mr. Pilsbury's "Golden Autumn" (82) is one of the best things he has produced in his peculiar highly-finished (rather too finished) style of landscape painting. The Exhibition boasts two contributions from Sir L. Alma-Tadema, both of them drawings made for scenes for "Coriolanus," and from their point of view very interesting, archaeologically and architecturally. Among other architectural drawings are two "Christ's Hospital" subjects by Mr. S. J. Hodson (19 and 36), "The Gate of the Apothecaries' Garden, Chelsea" (26), by Miss Rose Barton; "The Old Street of Paris at Senlis" (120), by Mr. Rooke, and "A Mosque Door, Cairo" (144), by Mr. R. Barratt. Among other works which we like are "A Cornfield in Sussex" (54), by Mr. Thorne Waite; "The Pillar Rock" (80), by Mr. Cuthbert Rigby; "View from above Aysgarth Force" (83) by Mr. Eyre Walker; "The Bristol Valley" (117), by Mr. Thorne Waite, a small but beautifully balanced landscape in a slightly old-fashioned style; and "Evening" (152), two women burning weeds, by Mr. A. H. Marsh. Mr. E. Alexander exhibits a very large "Study" (146) of a peacock, in which he seems to have got all of the peacock but the brilliant colour—a peacock glazed over with lampblack. Surely the colour is the most important element in the glory of the peacock.

Society of
Fine Arts.

THE collection of pastels by Mr. Sutton Palmer, now exhibiting at the Society of Fine Arts, shows admirable treatment of the material, but also indicates its limitations. The subjects are all landscape; and we hold that it is almost impossible to represent in pastel all the gradations of colour in landscape. In the evening scenes, a time when the meadows, &c., have lost much local colour and are rather blended into half tints, pastel may be more successful than with scenes in full daylight; this is illustrated, we think, in some of the works here; Nos. 7 and 12, for instance, and 20. There are some charming daylight landscapes however: "Stream near Barnard Castle" (35), showing masses of tree-clad hills and masses of white cloud; "Water Meadows" (39), and "Hayes Common" (16). Perhaps it may be said that Mr. Palmer has done with pastel all that can be done in landscape, and more than one could have expected; but for all that we think figure-subjects are the proper field for this medium. The drawings of hunting scenes, made by Mr. Jalland for *Punch*, exhibited in the same gallery, come under the head of comic or humorous art; they are very clever, but seem a little out of place here. Those who are familiar with them as engraved will be perhaps surprised to find that the originals are water-colour drawings, on a much larger scale than the *Punch* illustrations. On the whole they show more to advantage in black and white.

LETTER FROM PARIS.

THE work for the completion of the basilica of the Sacré-Cœur at Montmartre is now being rapidly pushed on under the direction of the architect, M. Rauline. Two wells, 110 ft. deep, have just been completed for the foundations of a belfry. The electric-lighting installation is being prepared for the crypt and the church. The sculptor, M. Fagel, is putting the finishing touches to the decoration of the chapel dedicated to the Army. In each metope are finely sculptured military scenes, and groups of soldiers representing various arms; on either side of the chapel are figures of Saints Maurice and George, the patron saints of the Army. The decoration of the other chapels dedicated to the Navy, Agriculture, Commerce, Industry, and Medicine, will shortly be put in hand. The restoration of the old Roman church of Saint Pierre, close under the basilica, is rapidly proceeding.

The jury has made its awards in connexion with the competition of facades of houses lately erected at Paris, as follows—House No. 81, Rue de Lota, architect, M. Bouwens-Van de Boyen; No. 270, Boulevard Raspail, by M. Breneau; No. 17, Avenue de Breteuil, by M. Marcel; No. 1, Rue Peletier, by M. Morin-Goustiaux; No. 11, Rue Edmond-Valentin, by M. Sinell; and No. 45, Rue du Chateau-d'Eau by M. Rives.

The plans for the enlargement of the Bourse having now been at the disposal of the public for the past fortnight, the necessary authority will be given, and the architect, M. Cavel, will at once proceed to start the foundations for the two important new wings. The postal and other services will be installed in temporary buildings in the square surrounding the Bourse.

The Commission du Vieux Paris at its last meeting, when welcome was given to the two new members, MM. Henri Lavedan and André Hallays, decided to submit to the necessary authorities its wishes with regard to the preservation of the old Hôtel Rohan, now occupied by the Imprimerie Nationale; the preservation of the house occupying the angle of the Quai des Orfèvres, in front of the Pont Neuf, in order to maintain the physiognomy of this seventeenth-century portion of Paris; the maintenance of the still existing pavilions of the old barriers of Paris, erected by Ledoux at the end of the eighteenth century; and the

respect to the characteristic names of some of the oldest streets of Paris so interesting in the history of the town. By the request of the Société des Amis des Monuments Parisiens, M. Selmersheim, Diocesan Architect, has decided to re-erect, in the small square close to the Cathedral of Notre Dame, the fine old railings characteristic of one of the best epochs of French art, which once divided off the choir from the nave, and which were suppressed by Viollet-le-Duc when he undertook the restoration of the cathedral. These railings once formed portion of the interior decoration designed by Robert de Cotte, under Louis XIV., in execution of a vow made by Louis XIII.

The prolongation of the Rue Villebois-Mareuil makes it necessary to demolish the interesting old pumping station of Chaillot, situated at the angle of the Quai de Billy and the Avenue du Trocadéro, called the "Pompe à feu de Chaillot." The building still carries on its front the date 1781, that on which the brothers Perier constructed the pumping station and installed therein two English pumping engines of the Newcomen system, brought over by them from England. These two engines, known to all Parisians as "Augustine and Constantine," distributed all the drinking water at Paris from 1782 to 1857, pumping the water from the Seine to the high-level reservoirs constructed on the present Place des États-Unis, the supply descending thence to the four principal water fountains in Paris, at the Porte Saint Honoré, the Chaussée d'Antin, the Porte Saint Denis, and the Rue du Temple, whence it was fetched by the water carriers. These two engines, which inaugurated the water service at Paris, have been constantly at work up to a few years ago.

The competition for the construction of the new Hôtel de Ville for Sens has been gained by MM. Dupont et Poivert, architects. The building will be a rather important one in Renaissance style. The summit will receive an imposing figure of the warrior Brennus by the young sculptor Anatole Guillot, a homage done to the memory of the warrior so closely related to the history of this warlike city of old central Gaul, a souvenir of the taking of Rome in 388 B.C. The figure, which will be 9 ft. high, will be made of hammered copper, gilt.

The leading event in the artistic world of Paris at the moment is of course the opening of the two Salons for the first time in the new Art-Palace; but the contents of these will be described and criticised in our usual reviews of works of architecture, painting, and sculpture at the Salons, which will appear in the two next issues of the *Builder*.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

THE MEMORIAL TO QUEEN VICTORIA.

A SPECIAL general meeting of the Royal Institute of British Architects was held on Monday evening at No. 9, Conduit-street, Regent-street, W., Mr. E. A. Gruning (Vice-President) in the chair.

The minutes of last meeting having been taken as read,

The Chairman said that, on the written requisition of twelve subscribing members so to do, under By-law 60, the Council of the Institute had summoned the meeting to consider various resolutions as under, submitted by Mr. W. Woodward:—

1. That in the opinion of this meeting the proposed National Memorial to Queen Victoria should be open to the competition of all British—including, of course, colonial—architects, sculptors, and artists.

2. That the first designs should be in the hands of the Committee at the date already fixed—viz., the end of June next—and that from those designs six should be selected, the authors of which should be engaged to perfect their schemes, and submit them at a date to be decided upon by the Committee.

3. That the author of the design selected from the six should be employed to carry out the work in collaboration with the sculptor, or sculptors, whom the Committee may designate.

4. That in the event of the memorial being thrown open to general competition, as above suggested, the information furnished to the five architects already appointed, for their guidance in the designs, be immediately made public.

5. That the whole of the preliminary designs, as well as the subsequent perfected designs, be publicly exhibited.

6. That these resolutions be at once transmitted

to the Viscount Esher with a request that they be laid before his Majesty the King."

The Chairman also stated that several letters on the subject had been received, and he would ask the Secretary, Mr. W. J. Locke, to read them.

The letters were from the President, Mr. Wm. Emerson; Mr. Macvicar Anderson, past-President; Mr. J. C. Nicol, of Birmingham; and Mr. P. A. Robson, of London.

The President wrote:—

"DEAR MR. LOCKE.—With regard to the meeting convened for Monday the competition for the Queen's Memorial, will you—as I shall not be in town—inform the meeting from me that the Committees discussed and considered the three points as to whether—

- (a) An architect of eminence should be selected to prepare designs;
- (b) There should be an open competition;
- (c) If a few names should be selected to prepare designs, being remunerated for the same.

The Committees, after considerable discussion, agreed to adopt the latter course.

Beyond supplying this information, I do not think there is anything further for me to say on the matter.—Yours very truly, Wm. EMERSON."

Mr. Macvicar Anderson wrote:—

"DEAR SIR.—I regret that I am unable to attend the special general meeting of the Royal Institute of British Architects this evening, and that I am thus obliged to resort to the less satisfactory medium of pen and ink in order to express my views, which I hope you will do me the favour to convey to the meeting.

I wish to enter the strongest possible protest against the object for which the meeting has been convened as expressed in the resolutions to be submitted.

It may be matter of opinion what might have been the best course to have adopted in regard to the Queen Victoria Memorial—whether to have selected an individual in whom confidence could be reposed, or to have a limited competition, or to have an open competition. Personally, the last proposition is the one against which I should have voted, but that is not the point of my protest. If the nation desire that it be left open to all to submit suggestions, let this be expressed through the nation's representatives or the Press. What I strongly feel is that the very last body which should express such views as are embodied in the resolutions to be submitted this evening is the Royal Institute of British Architects, for its doing so would be tantamount to asking that its members who have not been invited to submit suggestions should be permitted to do so. Anything more undignified or less professional I cannot conceive. The matter has already been carefully considered by the responsible advisers of the Crown and by a Committee, composed of the official representatives, of experts—among them the President of the Royal Institute of British Architects—and the procedure recommended by them and adopted by the King should, in my opinion, be accepted by all in a spirit of loyalty, as I feel sure would have been the wish of our much-lamented Queen.

For the foregoing reasons—which I hope I have expressed clearly and concisely—I most strongly protest against the resolutions which are to be submitted to the meeting this evening; and should the Institute be so devoid of what, in my judgment, is due to itself in point of dignity and professional etiquette as to adopt them, I must respectfully request that such adoption may be accompanied by this protest.—Believe me, yours very truly, J. MACVICAR ANDERSON."

The following were the letters from Mr. Nicol and Mr. Robson:—

"DEAR SIR,—Referring to your circular calling a meeting of the Institute for Monday next, I regret my inability to be present at this special meeting to support the resolutions submitted by Mr. Wm. Woodward, but trust that they will be carried as, in the interest of the profession, they deserve to be. It is also most desirable at the present juncture that your President and individual members of your Council should state at this meeting, for the guidance of those who are asked to elect them, what their views are and what their action has been with regard to this national subject, and whether they are prepared to support the general principle of competition amongst architects or otherwise when asked to advise or express an opinion to public bodies; also whether they are prepared to support and actively assist the Birmingham Architectural Association in their present endeavour to induce the Council of the New University to reconsider their decision with respect to the appointment of Messrs. Webb & Bell as architects for the proposed technical buildings at Birmingham.

Awaiting your report, I am, yours faithfully, JOHN COULSON NICOL, A.R.I.B.A."

"DEAR SIR,—The great stir which the decision of the appointed Committee has created on their selection of but six gentlemen—five architects and one

sculptor—to compete in designing the national memorial—to the greatest of all queens augurs most hopefully for the future of the arts during this century. It has been said that the memorial should be the best that the British can produce. But why British? Why narrow the scheme? Our late Queen not only merits the best possible memorial, but the universal love she inspired should alone be sufficient reason to check this insularity. The precise form of the memorial is a matter of hot debate, but it is surely clear that there must be no poverty of broadmindedness, that the scheme must be sufficiently comprehensive to be at once a Valhalla of a splendid monarch and of her greatest men. Let there be three architectural competitions. One, universal, with designs on a very small scale, adjudicated by a strong international committee with a British predominance; two, a selected competition, the number being dependent on the merits of the designs sent in for the first (but not exceeding one hundred)—the competitors for this second competition to be adequately paid for elaborating their previous schemes and preparing models; lastly, the final competition, limited to three from which one design is to be selected. Then let the final design be elaborated, and let there be a single competition for the sculpture by means of models. All these competitions would be adjudicated by the same committee, and the designs publicly exhibited for the benefit of the fund. Mr. Norman Shaw has said that there is no classic school of design in Britain. Even if this is so, surely here is the one great opportunity for stimulating the desire to create one. A competition on this scale could not fail to increase the national prestige, to revivify the arts, and revere our late beloved Queen in a lasting way. I understand that the Committee desired to give one architect the commission in the same way as they have appointed Mr. Brock as sculptor, and that the profession have to thank the President of the Royal Institute of British Architects for even this limited competition. However, the matter having gone thus far, there are, at present, only two courses open—(1) for the selected gentlemen to proceed with their competition, (2) for them to resign *en bloc* in deference to the loud note of disapproval which is being rung throughout the Press; and there is no question but that the latter course would meet with unqualified approval from the public, which asks very rightly, 'If five, why not twenty?' and further still, why impose a limit? The commonwealth of the arts is neither national nor racial, but universal. If the thing is to be done well, let it therefore be universal.—I am, dear Sir, faithfully yours,

PHILIP A. ROBSON."

Mr. Woodward said he must thank the Council for affording them the occasion of meeting at the earliest possible opportunity. He and those who thought with him desired to show that art in this country was not on the ebb but on the flow, and they desired to give young men and others who might have grand conceptions an opportunity of giving expression to them. The Press was practically unanimous on the matter, and the memorial was one which the nation desired to be open to public competition. Seeing that the money was to be subscribed by the public, the public had a right to say, as they had said, that the memorial should be open to public competition. The object of the meeting was to declare that, seeing there was an opportunity to erect a monument to our great Queen which would last for ages the memorial should be an exemplification of the artistic feelings of the time. As the meeting was aware, a general Memorial Committee had been formed, and from that committee a special sub-committee, which included the President of the Institute. The President had not told them in his letter what steps he took to represent the feelings of the Institute. One would have thought that the President would have desired to give his Institute and the members an opportunity to show what they could do. There was not one of his opinions were, and he ventured to express the deepest regret—

The Chairman: It was quite impossible for the President to let any one know what were the confidential opinions of the committee.

Mr. Woodward, continuing, said that no one had one word to say against the five selected architects; but it was impossible for any of those five architects to know more than any other five architects what was the particular character required in this memorial. Had the asylum, he could have understood the committee selecting five expert architects, but no one had opportunities of showing their skill in the design of memorials of the sort proposed. It had been said that open competition would involve considerable trouble on the part of the assessors; he was not so sure, for he doubted whether the committee would be overrun with

designs for the memorial. Even if they were it would be easy to reject the designs which would have no chance. There were two great buildings which would have been lost to the world but for open competition, viz., the Paris Opera House and our own Houses of Parliament, and in this case we were more likely to get the best talent possible by open competition than by a competition restricted to five gentlemen.

Mr. Woodward then moved the first resolution.

Mr. Wilson seconded. He was sorry the Council of the Institute did not call a meeting to discuss the matter. They had heard that five architects had been appointed, but very few people seemed to have any real knowledge of what had been happening. It was for the Institute to look after its members, and they should have protested against what had been proposed and against matters being done in a hurry. He had heard remarks as to the difficulty of assessing in open competition, but the assessing in this competition might have been done by the competitors themselves.

Professor Beresford Pite said he was heartily in sympathy with Mr. Woodward's position, but he desired to move an amendment on the first resolution. Mr. Woodward's first resolution was inconsistent with his second, for how could the competition be open to all British architects, including colonials, when the designs were to be in the hands of the committee by the end of June next? His amendment was:—

"That, considering the deep and widespread interest manifested throughout the Empire in the proposed National Memorial to her late lamented Majesty Queen Victoria, and in view of the limited opportunities for the exercise of monumental design in London that have been offered during recent years, and the absence of useful precedents, this Special General Meeting of the Royal Institute of British Architects, of which her late lamented Majesty was patron throughout her long reign, respectfully urges upon the Executive Committee of the National Memorial its earnest conviction that designs should be invited in open competition from all British architects for this most important and unique monument, which, it hopes, would thus become representative of the best and most enthusiastic efforts of modern monumental architectural art. And further, this meeting would suggest to the Executive Committee the necessity of affording sufficient time for the preparation and submission of designs by architects resident in all parts of the Empire, of whom many are members of this Royal Institute."

As a member of the Council, he should like to say that the subject had not been before the Council in any form at all—no doubt, because the President had been selected to act on the Executive Committee, which was an honour done to the Institute, and a recognition of the Institute by those in authority, for which they ought to feel thankful. As to the action of the President on that committee, he thought they could all feel certain that whatever action the President had taken had been taken in the best interests of the dignity of the profession, and in what the President conceived to be the true interests of the Institute. The nature of that action the President had in no way revealed to them, and in that, of course, he was perfectly right, for he was a member of a concrete body and was not in a position without their authority to reveal what had taken place at their discussions. But the President had written them a letter which left it perfectly open to them to discuss with respect one or other of the courses which had already been before the committee. If a mistake had been made, surely that mistake must be rectified? They must not admit that because a mistake had been made officially it could not be rectified. He did not think that any one would thoughtfully assert that a mistake had been made in form or in manner by the committee; the mistake had been made in judgment and in judgment only, and if they confined their discussion to that point any decision they might come to would have more dignity than if they discussed at large the mistakes which they imagined had been made in other directions. With regard to the whole subject of competitions, it must be remembered that the Council of the Institute and its President had from time to time been most energetic in repressing the competition fever, feeling that it had been the cause of many disastrous ills. But there were occasions, and the Queen's memorial was an occasion, when competition could do good. Reasons for this he had indicated in the amendment, because he thought it well that they should be given in the expression of

opinion of the meeting. What they objected to in the competition system, and what the Council and the Competitions Committee objected to, was the abuse of the system; but they must not let their dislike of that abuse drive them to the opposite extreme and dam up the channels of originality. There was one point on which he knew the President felt strongly, and that was as to the enormous waste of money which the competition system caused the profession; but that objection did not apply in this case at all, for it was a case in which the lamp of sacrifice would be burnt very willingly. In regard to the possible success of competition in such a subject, it must be remembered that in monumental architecture there was very little basis in facts for stimulus to build upon. The conditions were of the widest character, and unless the mind was kept fertile, and kept on what might be called the imaginative plane, no success would be achieved. He would remind them of the competition which resulted in the only fine monument of our era, *i.e.*, the Wellington monument in St. Paul's. That was a monument about which sculptors and architects would agree, and that monument was the result of open competition, and he could not imagine any committee of selection having selected Stevens before he had produced such a splendid memorial. The fine monuments of the world had been the result of competitions, and he did not think competition should be stamped out in this case because it was abused in small particulars.

Mr. H. V. Lancheater seconded the amendment. Mr. Macvicar Anderson had said in his letter that the Institute should be the last body to move in the matter, but surely it was for the representative body of architects to take a lead in expressing an opinion on an architectural question. Where were the public to look if they did not look to architects in regard to a subject that was so largely architectural? They were surely right in expressing what they thought—not for the sake of architects, but for the sake of the public; for no one believed that the work which would be put in the memorial *con amore* would, in the financial result, represent more than labourers' wages. Architects would give of their best, because they would feel proud to do so, and they desired the competition to be an open one, so that every chance should be taken to secure the very best result. He was rather sorry to see in one of the building papers a letter, signed "F.R.I.B.A.," discouraging action in the matter—not discouraging action on the ground that action was undesirable, but on the ground that they did not wish to be associated with the gentleman who had taken the matter up. To take such a course was not a sportsmanlike way of attacking a question.

Mr. Woodward: The letter appears in a journal the editor of which is a member of the Council of this Institute.*

Mr. E. W. Wimperis supported the amendment, and said that some attempt should be made to put their proceedings that night above the plane of personality. There was a consensus of opinion in regard to the five selected architects, who, it was recognised, had done a great deal to raise the standard of architectural art. Beyond that, those gentlemen had helped to found a school of national architecture of which young men of the present day would in time be the exponents. Still, the official recognition of those five architects (which other architects did not grudge them in the slightest) was also an official rejection, for there were other names which they could think of which ought to have been included. The situation was a peculiar one, for anything that might be done in the matter must be done by the younger and comparatively unknown men, for those architects who by their position might make an effectual protest were obviously not able to make any protest at all. That fact indicated a possible criticism of the proceedings that evening, *i.e.*, that the protest was by young and unknown men. That criticism was to be met by the simple fact that those who could have helped by virtue of their position were unable to do so because

of the official recognition already made, and because they would be charged with personal enmity.

Mr. A. Frampton having made a few observations,

Mr. Maurice B. Adams said he agreed with everything that Professor Pite had said, but if that meeting carried a resolution, they would make a great mistake. It was no use hitting unless they hit hard, and unless they wanted to make themselves ridiculous they had better let the matter alone. The President of the Institute was a member of the Committee, and it was quite certain that he would do his utmost in the direction indicated that night.

Mr. Woodward said, as his only object was to secure open competition, he desired to withdraw his resolution and to support Professor Pite.

Mr. Silvanus Trevail protested against ignoring the Colonies in the matter. For his part, he would like the competition to be open to the world, and the best that the world could produce in art to be obtained.

Mr. Elkington said the Institute ought to lead public opinion on a matter of that kind. He could see no sufficient reason why there should not be an open competition, and he did not think they need feel they were on unsafe ground in passing the resolution.

Mr. J. Douglass Mathews said he thought there was a middle course. As five architects had already been selected, the Institute would put itself in a very invidious position if it took up an attitude against what had been done. He had drafted a short amendment, to the effect "that the proposed memorial to Queen Victoria be of intense interest to the people of the Empire, that, prior to the preparation of designs by the architects invited to compete, an opportunity should be afforded to any person so disposed to submit suggestions, either written or drawn, which shall be publicly exhibited, with the author's name attached." There ought to be every opportunity given to those interested to submit suggestions, and his proposal would make that possible, while it did nothing to reject the architects already selected.

Mr. F. Lishman and Mr. H. T. Bonner having made a few remarks,

Mr. A. W. Tanner said they were in a very awkward position. Their President was a member of the executive committee, and that committee was practically presided over by his Majesty the King. He did not think a formal resolution should be sent to the committee. He thought it would be better to have their views submitted to the committee by a friend in court.

Mr. E. W. Hudson said he hoped that that meeting would not consider what it was expedient to do, but what it was right to do. There were occasions on which a great Institute like theirs should rise above expediency, and express itself according to its convictions.

The Chairman then put Professor Pite's amendment to the meeting, and declared it carried by a large majority.

The Chairman said there was a precedent for what had been done by the King's committee, for at the time of the competition for the monument to the Prince Consort the same course was adopted; six architects were then invited to compete.

It was announced that the annual general meeting will be held on May 6.

The meeting then terminated.

On the 20th inst. a meeting will be held when a paper will be read by Professor Flinders Petrie, entitled "The Sources and Growth of Architecture in Egypt," and on June 17 Professor W. R. Lethaby will read a paper on "Education in Building."

The annual dinner will be at Glasgow on October 3.

BOARD SCHOOL, OPENS HAW.—The memorial stone of a new Board school was laid on the 27th ult. in Wheeler-street, Openshaw. This is the thirty-fifth school erected by the Manchester School Board, and it will provide accommodation for 1,400 children. The new building, which has been designed by Mr. Frank Edwards, architect, Manchester, will have classrooms on the ground floor for the infants' department and the first standard of the seniors' department, and the remaining standards will occupy the second floor. Manual instruction for boys will be provided in the basement; there will be a special room for drawing instruction, and a cookery-room and laundry area to be built apart from the main building. The contractors are Messrs. Young, Tinker, & Young of Cheetham.

THE SURVEYORS' INSTITUTION.

A MEETING of this Institution was held on Monday at No. 12, Great George-street, Westminster, when Mr. A. Clavell Salter read a paper on "The Ownership of the Highways," of which the following is an abbreviated report:—

The simplest and most ancient form of highway was the footpath, the right of public passage on foot only; the next, the driftway or bridle path, the right of passage on horseback or with pack horses, or, of course, on foot; lastly, the full highway, the complete right of passage in any manner, on foot, on horseback, or in vehicles. There was no difference in principle between these classes of highway, and the same rules of law governed them all. A considerable number of highways in this country were made in times comparatively recent under Acts of Parliament, such as Turnpike and Enclosure Acts. But, with these exceptions, all highways had their origin in a dedication by the owner of the soil of a right of passage over his land. Instances of such dedication were seen daily when new roads and streets were opened, and used by the public. In the case of ancient highways, it was, of course, impossible to say that any express dedication, or any actual dedication, ever took place. The highway had existed from time immemorial, and that is all that is known. In such cases the law assumed from the fact of public user that there had been at some time a dedication by the then owner of the soil. No highway, therefore, could be made without a voluntary dedication by the owner of the soil, except, of course, by the authority of an Act of Parliament. On the other hand, a dedication to the public once made could never be revoked, and a highway which had once come into existence could never cease to be a highway, except by Act of Parliament or the Order of Quarter Sessions. In a reported case a highway had been so long disused that large trees had grown where it formerly ran; but on the existence of the public right being proved, the trees were ordered to be removed and the highway to be reopened for public use.

Dedication, however, might be subject to limitations. A person who dedicated a highway to the public did not divest himself of the property in the soil. He continued to own the soil subject to the public right of passage over the surface. In the absence of express enactment, the property in the soil remained in the former owner. Thus, where waste of a manor, the property of the lord of the manor, was enclosed under an Enclosure Act, and highways were set out, the soil of such highways remained the property of the lord, unless the Act expressly directed otherwise. Most of the highways in this country were of great antiquity, and no record of their origin existed. In such cases it was presumed that the soil of the highway to the middle of the road belonged to the owner of the adjoining land. This presumption was applied in the construction of conveyances, where the land conveyed was stated to be bounded by a highway, and such conveyance was construed to pass the soil of the highway to the middle points, even though the measurements and the colouring of the plan did not include the highway, unless the other terms of the deed made it clear that the parties intended the highway to be excluded. This presumption as to ownership applied equally where the space between the enclosed lands was occupied entirely by a metalled road, and where the space consisted of a metalled road with strips of waste on each side. Where a highway runs between enclosed lands, the law presumes that the whole space from hedge to hedge is dedicated and forms part of the highway, although only a strip in the middle may be metalled. But, notwithstanding this presumption, it is probable that most of these roadside wastes were not originally any part of the highway. There was an ancient right, when the highway was foundrous, to pass over unenclosed land adjoining the highway; and in the days when highways were always bad, and often impassable, this right of deviation was of great value. The land over which this right existed was not part of the highway, and could be enclosed; but an owner who enclosed such land, and thus made deviation impossible, incurred a liability to keep that portion of the highway in a certain state of repair. To avoid this liability owners of unenclosed lands adjoining a highway, when they enclosed such

* The letter referred to was written by an eminent architect who has no sort of connexion with this journal, and in its original form was much more strongly expressed than what we actually printed; and we may point out to Mr. Lancheater that the first and most important point made by the writer of it was, that it was not dignified for the Institute to interfere in the matter; a view strongly echoed in Mr. Macvicar Anderson's letter read at the meeting.—Ed.

lands, left between their fence and the highway itself a strip of land over which the right of deviation might be exercised. Such was, probably, the origin of most of the roadside wastes which were, happily, so common a feature in this country.

Certain recent statutes had made important alterations in the ownership of the soil of highways, and had vested such soil, to a certain extent and for certain purposes only, in the highway authority. But subject to the special property thus conferred on the highway authority, all the former rights of the private owner of the soil remained in him. The owner of the soil of the highway could use and enjoy his property in any way not inconsistent with the public right of passage. The trees and herbage on the highway belonged to him. He could let the right of pasturage on the roadside waste. If cattle are not using the highway to pass along it, but were depastured on the roadside waste, he could maintain trespass against the person so depasturing them. He can resist any encroachment on the highway as an encroachment on his land. He can remove anything put upon the highway not necessary to aid or regulate the public right of passage, and this whether the thing were an obstruction or not. He might excavate under the highway, make a tunnel, take minerals, provided he does not interfere with the public right of free passage over the surface. In the absence of statutory authority no pipes could be laid in the highway, no posts erected thereon, and no wires carried over it, without the permission of the owner of the soil. This applied to the whole highway, whether metalled road or roadside waste. There might be a valid dedication of a highway subject to the right of the owner of the soil to plough it up in course of husbandry along with the adjoining land. And when a footpath had always been so periodically ploughed up, the dedication was presumed to have been so limited. In the case of *Arnold v. Blaker** a footpath had been so dedicated. The highway authority repaired the path with hard materials which made it impossible to plough it up. It was held that their act was a trespass upon the rights of the owner of the soil. The rights of the owner of the soil of the highway were further illustrated by cases in which persons had made improper use of the highway, and had then endeavoured to rely on the public right of passage. In the case of the *Queen v. Pratt*† there was a highway bounded on both sides by the land of one Mr. Bowyer, who was, therefore (as they had already seen), the presumptive owner of the soil of the highway. Thomas Pratt was seen on this highway with a dog and carrying a gun. He sent the dog into a covert next the highway. The dog drove out a pheasant which Pratt shot at. Pratt was charged with trespassing in pursuit of game on land in the possession and occupation of Mr. Bowyer. He had never left the highway, and relied on his right as a member of the public to use the highway. The court held that he was not lawfully using the highway to pass along it; that the highway was land in the possession and occupation of Mr. Bowyer; and that Pratt was guilty of trespass on that land in pursuit of game. Several other examples of a similar reasoning were cited. These cases showed how completely the rights of the owner of the soil of the highway were recognised by the law, subject only to the full public rights of passage over the surface.

On the other hand, the highway authority or any member of the public might remove any unlawful obstruction of the highway, or proceed by indictment against the person responsible for such obstruction. In view of these wide powers, many people probably asked themselves how the erection of telegraph posts in the highway, the excavation of the surface, and the constant obstruction of the right of free passage can be justified in law. It might probably be safely said that no such acts would nowadays be attempted without the express sanction of Acts of Parliament, public or private. He had next to refer to those statutes which had vested the soil of certain highways in the local highway authority, and had therefore, to the extent of such vesting, deprived the former owner of his property in the soil.

Within the metropolitan area the matter was governed by the Metropolitan Management Acts, 1855, which by Section 90 provided as follows:—“All streets being highways, and the pave-

ments, stones, and other materials thereof, and all other things provided for the purposes thereof by any surveyor of highways . . . shall vest in and be under the management and control of” the Local Highway Authority. As regards urban districts throughout the country the Public Health Act, 1875, Section 149, provided that “All streets being or which at any time become, highways repairable by the inhabitants at large within any urban district, and the pavements, stones and other materials thereof, and all buildings, implements, and other things provided for the purposes thereof, shall vest in and be under the control of the Urban Authority.” As soon as a street was made up and taken over by the Highway Authority, the soil of such street was divested from the former owner and vested in the Highway Authority. In rural districts, the only statutory vesting of highways was in the case of main roads, as to which the Local Government Act, 1888, Section 11, provided that main roads should be wholly repairable by the County Council, that an Urban District Council might claim to maintain a main road within their district, in which case the County Council shall contribute to the cost, and further that “A main road and the materials thereof and all drains belonging thereto shall, except where the Urban Authority retain the powers and duties of maintaining and repairing such road, vest in the County Council.” The result, therefore, was that in the metropolis and in all urban districts, the property in the soil of the highways was taken from the private owners and vested in the Local Highway Authority. In rural districts only the main roads were so vested, all other highways remaining vested as before in the private owners of the soil.

It would be seen that these statutes made an important distinction between the status of Urban and Rural Highway Authorities in regard to the highway itself. He proposed now to shortly consider the nature of the statutory property so conferred. The property in the soil of the highway which was thus given was not by any means so complete as that of a private owner. It was limited in nature and extent. The rights of a private owner of land extended to an indefinite distance above and below the surface of the soil. The rights of property of the Highway Authority under these statutes extended only to such depth as was necessary for the due maintenance and repair of the road, and only to such height as was necessary to enable them to prevent any obstruction to the traffic. Outside these limits, both above and below, the property remained in the owner of the soil. In the case of the Corporation of Tunbridge Wells v. Baird, in 1896, the Corporation were desirous of excavating and constructing lavatories under the surface of the well-known highway called the Pantiles. The highway was vested in them as the Highway Authority. They proceeded with the work, and an action was brought to restrain them by the person who owned the soil of the highway subject to the statutory vesting in the Corporation. The Corporation contended that, as the soil of the highway was vested in them, they were entitled as owners to excavate the lavatories. But the House of Lords held that their statutory property did not go so far, and that the excavation was a trespass on the rights of the plaintiff as an owner of the soil.

Again, in the case of the Wandsworth Board of Works v. The United Telephone Company, the Telephone Company had erected a wire across a London street, but at such height as not to impede the traffic or to cause appreciable danger to the public. The Board, as the Local Highway Authority, sought to enforce the removal of the wire. They contended that, as owners of the soil of the street, they had a right to object to anything being erected over their land at however great a height. A private owner could certainly so object. But it was held that their statutory property did not go so far, and that, as the wire did not impede traffic or endanger passengers, there was no infringement of the rights of the Highway Authority. If the private owner of the soil of this highway had taken action, he could probably have enforced the removal of the wire. These and other cases served to show that the ownership of the highway by the Highway Authority was very limited in extent as compared with the rights of an ordinary landowner. Moreover, the rights of an ordinary owner were perpetual, but if a highway ceased to exist as such, as by being lawfully stopped

or diverted, the property in the soil immediately ceased to belong to the Highway Authority, and reverted fully in the private owner.

The cases cited assisted in defining the nature and extent of the ownership of the soil of the highway by the Highway Authority. The tendency of the decisions was to restrict such ownership within very narrow limits, and to trench as little as possible upon the right of the private owner of the soil. The position created by these vesting sections is somewhat anomalous. There appeared to be something in the nature of a dual ownership. The private owner of the soil remained the owner. He remains the sole owner outside the narrow limits to which the statutory property of the Local Authority was confined. Within the limits of the property of the Local Authority the ownership of the private owner seemed to be in abeyance. It was certainly not extinguished, because, if the land ceased to be a highway, the rights of property of the private owner immediately came into full force.

STANDARDISING SIZE OF BRICKS.

A CONFERENCE between representatives of the Institution of Civil Engineers, the Royal Institute of British Architects, and representatives of brickmakers was held on Friday last week at the Building Trades Exhibition, Royal Agricultural Hall, Islington, to discuss the question of standardising the size of bricks.

Mr. Thomas Blashill, who presided, said that the meeting was the outcome of meetings of a Joint Committee of the Institute of Architects and the Institution of Civil Engineers appointed to consider what appeared to be a very important matter, viz., uniformity in the size of bricks. Great difficulties arose in building works because of the difference of size in bricks which had to be used together in the same wall. The Joint Committee had drawn up certain regulations which they thought might be adopted, but before going further with them they desired to hear the view of brickmakers and others on the subject.

Mr. H. D. Searles-Wood, the hon. secretary of the Science Committee of the Institute of Architects, then read the following statement of the standard suggested by the Joint Committee:—

“The standard suggested by the Joint Committee of the Royal Institute of British Architects and the Institution of Civil Engineers is as follows:—

1. The length of the brick should be double the width plus the thickness of one vertical joint.

2. Brickwork should measure four courses of bricks and four joints to a foot.

Joints should be $\frac{1}{4}$ in. thick and an extra $\frac{1}{8}$ in., making $\frac{3}{8}$ in. for the bed joints to cover irregularities in the bricks; this gives a standard length of 9½ in. centre to centre of joints.

The bricks to be measured in the following manner:—

Eight stretchers laid square end and splay end in contact, frog upwards, in a straight line to measure 72 in.

Eight headers laid side by side, frog upwards, in a straight line to measure 35 in.

Eight bricks laid, the first brick frog downwards, and then alternately frog to frog and back to back, to measure 21½ in.

This is to apply to all classes of walling bricks, both machine and hand made, and facing bricks.”

Mr. Searles-Wood also read letters on the subject from Messrs. Thomas Lawrence & Sons, brick and tile manufacturers, of Bracknell; Mr. E. Holwill, of London; and Mr. Arthur Harston, of London.

Messrs. Lawrence & Sons wrote that they quite agreed with the idea, but they pointed out that with regard to red bricks there were bound to be some bricks from the bottom part of the kiln that would be shorter than those from the upper part; in fact, to burn the darkest red colour it was necessary, or usual, to burn these bricks stood on end, and consequently the weight of the bricks above, and the heat of the fire below, made these often-times shrink nearly half an inch in length. As dark red was the most difficult colour to procure, they saw, as brickmakers, very serious objection to it being specified in contracts that bricks shall be of the standard size.

Mr. Holwill wrote that he considered the most simple rule to adopt would be that the size of bricks should be such that they should in the work run four to the yard and rise four to the foot, which would enable the quantity to be estimated easily at per foot super or per

* L. R. 6 Q. B., 433.

† 4 E. & B., 860.

ward super. That, of course, included joints—and naturally the width of a brick should be half the length less thickness of joint. The question then became one of the thickness of joint—and different classes of bricks required necessarily different thickness of joint. Glazed bricks and some classes of facing bricks required $\frac{1}{4}$ -in. joint, and the sizes of these would then be $8\frac{1}{2}$ in. by $4\frac{1}{2}$ in. by $2\frac{1}{2}$ in. For bricks that required $\frac{1}{4}$ -in. joint the sizes would be $8\frac{1}{2}$ in., viz., $8\frac{1}{2}$ in. by $4\frac{1}{2}$ in. by $2\frac{1}{2}$ in. Personally, he had always worked on the above rule and found it adjust itself to the present requirements, giving less trouble than in cases where other size bricks have been introduced. The question of the thickness of the joint had in his experience been the greater source of trouble.

Mr. Harston wrote that if a uniform size could be effected to be recognised as a standard a very useful work would be done. The size he endeavoured to promulgate was $8\frac{1}{2}$ in. long, $4\frac{1}{2}$ in. wide, and $2\frac{1}{2}$ in. thick. He had had to reject very good stock bricks because the length exceeded $9\frac{1}{2}$ in. without any proportionate increase of width; but the maker took no interest in altering to proper size, as he could sell faster than he could make. On the other hand, he (Mr. Harston) had had red pressed bricks sent to build a 9-in. wall, fair on both sides, where two widths of the stretchers placed dry, side by side, without space for joint, exceeded by $\frac{1}{2}$ in. the length of the stretchers, and the brickmaker appeared to be quite unaware of the fact. He had to convince the brickmaker by asking him to experiment by building a dry 9-in. wall without having recessed headers, which, of course, he failed in attempting. Some of the Staffordshire blue-brick makers were especial sinners. They made a thin brick for the purpose of bonding with London stocks, but their bull-nose quoins were so short that they required a $\frac{3}{8}$ -in. wide vertical joint at the square end, which made very unsightly facing work. The sizes suggested by the Joint Committee were $\frac{1}{8}$ in. more each way than his figures, and left too tight a joint in heart of wall between stretchers, which joint should not be less than $\frac{3}{8}$ in. It was always difficult to get it flushed in; but he thought that a brick which was to be used only for facing might be $\frac{1}{8}$ in., or even $\frac{1}{4}$ in., more than his figures, so as to get a neat joint, and because, being more square and truer in its surfaces, less allowance had to be made for inequalities. But he was not an advocate for a very thin joint even in facing; given true bricks and good mortar, with sharp and perfectly clean sand, a $\frac{1}{8}$ -in. joint for beds was an excellent thickness—better than $\frac{1}{4}$ in., both for appearance and strength. There was the difficulty of making London stocks and true-shaped facing bricks exactly of the same dimensions. He thought there might be a rule that the latter should be thicker in each dimension by $\frac{1}{8}$ in. or $\frac{1}{4}$ in.—preferably, so far as he was concerned, by the $\frac{1}{8}$ in.

Mr. Joplin said that the difficulties from the brickmaker's point of view were easily got over in one sense, but not in another. The difficulty of altering the moulds or dies was not insurmountable, but there would be a great difficulty in burning the bricks so as to keep them to the standard unless the greatest care was taken in the selection of the clay. There was no difficulty, so far as he could see, in making a standard size for bricks; that was in the hands of those who specified, who could reject bricks which deviated from standard. One difficulty, however, was that in some districts two sizes of bricks were made—London sizes and north-country sizes. Another difficulty would be the apathy of a great number of brickmakers, who would not care what the standard was so long as they could sell their bricks. The thickness was not so important as the length and width, and he considered $8\frac{1}{2}$ in. by $4\frac{1}{2}$ in. to be a satisfactory standard size. He thought a committee should be appointed, consisting of architects, engineers, surveyors, contractors, brickmakers, and others, representing the views of the conflicting interests, who should decide what the standard should be. Then, if the various professions would specify that size, the main difficulty would be got over. The difficulty from the brickmaker's point of view was that of shrinkage, for in the case of a mould—say, for a 9-in. brick—the shrinkage might be as much as $\frac{3}{8}$ in.

Mr. H. W. Richards (Northern Polytechnic) said it mattered very little what the length was so long as a just proportion was kept between the header and stretcher, and that was the diffi-

culty. The Joint Committee apparently agreed to accept one splayed end to a brick, but bricklayers found a difficulty in laying bricks with splayed ends, and could that difficulty be got over? Was it necessary to have a splayed end in a hand-made brick such as an ordinary stock brick? As to shrinkage, no one could tell the amount of contraction that would take place in burning, and he did not think it could be provided against; and to get a perfect standard would be a very difficult matter. He thought it could be said that bricks should be made of a certain thickness, but as to length, so long as one standard was aimed at, if they could maintain the proportion between stretcher and header, a great deal of good would have been done. If a rule were made that bricks were to be a certain length, with no allowance for uncertain contraction, they would have to be sorted, and hence become more expensive.

Mr. J. C. Hill, past President of the Institute of Clayworkers, said he could well understand that there was great difficulty with wire-cut brickmakers as to getting a standard size; but the Fletton brickmakers had not the same difficulty, for they did not put that amount of moisture with their bricks that the slop-brickmakers did. The dry earth they used did not shrink, and they put their bricks straight from the machine into the kilns, and any shrinkage there might be could be fully gauged. It was true they had some difficulty in the wearing of the boxes, for all boxes naturally wore as they got a little old, and the die became smaller and the boxes a little larger. Of course, all the machines could not be put under repair at once, and the result was that the boxes differed slightly in size; but the variations were so slight as not to be worth consideration. He thought that architects and others might confine themselves to a standard size for bricks for all work, and leave it to the makers to produce what was required. If they did not produce the size they would lose orders—that was, if the architects would insist on having a brick that would bond.

Mr. G. Wragge, Chairman of the Kent and Essex Brickmakers' Association, said that as a somewhat large stock brickmaker, the term "slop" brickmaker was a little painful, and, on behalf of the stock brickmakers, he desired to say that the bricks they made were sand-faced stock, and were not slop-moulded at all. It was a question not of Fletton bricks or stock bricks, but whether brickmakers were to make a brick according to architects' specification. The brickmakers were quite capable of making any size or any shaped brick that engineers or architects might require, if architects or engineers would pay the price for it; but the fact was that the engineer required the very best brick he could get, and he wanted to give the very lowest price for it. Generally speaking, the further south one went, the smaller were the bricks, and it would be a great advantage if architects, engineers, and brickmakers would come to some understanding with regard to size. There was no great objection to the sizes proposed by the Joint Committee, for practically the London stock bricks nearly came up to the proposed standard; but if they were going to have eight stretchers to measure 72 in., was that size of 72 in. to apply to the hard, well-burnt, stock brick, or was it to apply to a brick which was "golden tinted in colour"? For, to get a hard and strong brick, a great deal more firing was required than in the case of the soft brick, and the size would vary according to the amount of burning. The brick which approached nearest to what was wanted was the stock brick and the Suffolk, and the brick which least approached it was the Fletton.

Mr. Bernard Dicksee, member of the Joint Committee, said that the Committee thought they ought to assume a size that was most in use at the present day, though they would have preferred 9 in. centre to centre of joint. They measured a large number of bricks and they found that nearly all of them were about 9 in. long, and it was felt undesirable to reduce the size, because they did not think that bricklayers would lay any more in the same time, and, if not, work would cost more. The Committee, therefore, selected $9\frac{1}{2}$ in. centre to centre as their standard. As to the difference in joints, according to the quality of the work, that had been taken into consideration in their method of measurement. For a rougher brick there was a thicker joint allowed because the most projecting portions would come in contact, and, therefore, to satisfy the measurement the bricks would really be slightly smaller. As to the

point of the last speaker, that the size of the stock brick would vary according to the amount of burning, that was one of the points dealt with by the Committee. He (the speaker) thought that the difficulty was that in many cases bricks were supplied as "stocks" that did not properly come under that description. He had had to condemn a large number of such bricks, which he called "shuffs." The difficulty, he thought, might be got over by kiln burning, which would burn them more equally.

Mr. S. G. Collier, of Reading said there were very few brickmakers present, and it would be impossible for those present to commit the others. The difficulty of one maker's bricks varying in size he did not suppose could be got over entirely, for the harder the brick was burnt the smaller it would be. It would be impossible to introduce a standard at once, but if they could get the opinion of the brickmakers of the country as to whether there was sufficient advantage in doing so, and whether they would be willing to do so, a step forward would have been taken. It would be a great advantage if all bricks were of the same size. He thought a brick ought to be rather less in width than half the length.

Mr. Goodenough, of Sittingbourne, said it would be impossible for all makers to enter into contracts for any considerable quantity of bricks of a stipulated size unless a price were paid that would enable them practically to throw away all those bricks which did not come up to the size required. They were face to face with the fact that it was practically impossible to recommend a specified size when makers from all the surrounding districts were supplying the London market.

The Chairman said perhaps the meeting might see fit to pass a resolution to the effect that it was desirable to get bricks as much of the same size as possible. They could hardly differ as to that; if they then formed a committee to decide what that size was to be, and if brickmakers were to do the best they could to supply the architect, engineer, and contractor with such sizes, that would help to get a standard size fixed. All manufacturers were standardising things now, and it was found a very useful thing to do.

Mr. Bates, teacher of brickwork at the Northampton and Chelsea Polytechnics, said that Mr. Richards had mentioned the real difficulty from the practical bricklayer's point of view. The bricklayer would produce good work if the width of bricks was made in proportion to the length. Brickwork was done cheaper in America than anywhere else, and was it not a fact that the brick there was smaller than the average brick in England? He would recommend the Committee, should they alter the size of bricks here, not to make them larger if they wanted the cost of the work kept down. He did not advocate any absurd size, but he might say that it was fatiguing to lay bricks, and as a practical bricklayer he could do more work with the South of England brick than he could with the North of England brick.

Mr. Hill said he would suggest that there should be a standard size for facing bricks and a slightly smaller size for inside bricks. That would give the bricklayer a chance of making a neat joint. They did not want to "hammer down" the inside bricks.

Mr. A. Saxon Snell said that was a retrograde suggestion. In building in cement it did not much matter, but the difficulty was that in building with ordinary mortar they had different sizes of bricks and different thicknesses of mortar, and that was unscientific. What they wanted was to get all the joints of the same thickness, and that should be done even with facing bricks. If they were going to have a gauge brick face they must have the wall built specially for it, and have it thick enough to carry the weight on the internal part of the wall.

Another speaker said that bricks were sometimes not made to specification, and if architects were to specify a certain size and brickmakers were to do their best to meet the requirements, the bricks which deviated from the standard could be disposed of to builders who had no specifications to work to.

Mr. Blizard said there was evidently great fear on the part of some brickmakers of being tied down to a specification of any kind, knowing, as they did, the limits of their material; for there would always be variation in the size of bricks manufactured, and the brickmaker would have great difficulty in a large job in meeting the requirements of an architect who

kept him closely to the specification. It would be a very good thing to have a standard fixed for the whole country, for the difference in shrinkage was a small point compared with the difference in the size of bricks North and South.

Mr. Searles-Wood then moved that a committee be formed to consider the desirability of making the size of bricks uniform all over the country.

Mr. Smart, of Notts, said he could see no objection to forming a committee as proposed. As a maker of wire-cut bricks and sand-facing bricks he saw no difficulty in having almost any standard size architects and engineers would agree upon, though he would prefer to make a smaller rather than a larger brick.

The motion, having been seconded, was put to the meeting and carried.

The Chairman said that Mr. Searles-Wood would enter into communication with gentlemen interested in the matter.

A vote of thanks to the Chairman concluded the proceedings.

THE MODERNISING OF THE COVENT GARDEN OPERA HOUSE.

The alterations recently made at Covent Garden may be taken in three groups:—

- I. Structural alterations for the audience.
- II. Structural alterations for the management.
- III. Equipment of the stage.

I.
Regarding the alterations for the audience, these comprise the remodelling of the exit and entrance arrangements of the stage and the formation of a special stalls corridor, so that the stalls, with their corridors, now form an independent whole, having their own conveniences, cloakrooms, &c., and do not, as formerly, have to encroach upon the accommodation of the pit-tier boxes, or the entrances and exits of other parts of the house.

Entering from the main vestibule, there are now two sets of swing doors into the stalls corridor. From this corridor there is a central entrance into the stalls, and one on either side (right and left). There are pass staircases from the other tiers to the stalls corridors, and a special extra exit to Floral-street.

It is needless to say that the rearrangement of entrances and exits to the stalls is of considerable importance in case of panic or fire, quite irrespective of their general convenience.

In connexion with the stalls alteration, the old-fashioned front and apron of the stage, which used to protrude into the auditorium, has been abolished, and the orchestra set closer to the curtain line. This will considerably affect the lighting arrangements of the stage and bring the "picture" more in accordance with modern ideas. It also leads to the arrangement of extra rows of stalls. Two new boxes have also been formed in place of the old entrances to the stalls from the pit-box tier.

A number of minor improvements have also been made in different parts of the house, although perhaps these do not call for any special comment.

The carriage approach from Bow-street has been improved by the formation of extra doors, so that two lines of cabs and carriages can now "pick up" and "set down."

The arrangements for the electrical illumination of the stage had naturally to be remodelled and elaborated to meet the altered circumstances, the whole of the plant installed some two years back, of course, being re-used. Similarly, the steam appliances, telephone, speaking-tube, and other minor technical installations to be found on a modern stage were remodelled. The system of gas lighting was entirely abolished, and similarly the system of limelight for special effects.

II.
The structural alterations for the management, at the back of the house, comprise a number of important items: an entire remodelling of the storage and wardrobe arrangements, as well as the equipment of new workshops.

In the first place, the large property shop, which used to be over the auditorium, has been accommodated on a large additional floor, erected over the whole of the back wing of the building. This back wing has been remodelled, and now contains fine suites of rehearsal-rooms, both for solo artists, for the chorus, and for the ballet, distributed on three floors, well lighted and aired, and equipped

with all modern sanitary arrangements, an independent staircase, and an independent exit. The entire wardrobe, dressmaking, and tailoring department has been housed on the south side of the stage, in suites of rooms comprising three upper floors, having two independent staircases and inter-communication by means of a hydraulic lift.

On the north side of the house a suite of one of the upper floors has been retained as an armoury, a second has been remodelled for storage purposes, whilst a third now comprises a fine set of offices for the stage department. Here, again, an independent staircase connects the various floors, and inter-communication is also obtained by means of a new hydraulic lift. Below the stage level on either side of the house the various suites of rooms have been remodelled and modernised as far as possible; one suite next to the stage entrance, for instance, comprising the offices of the fireman, stage mechanist, and electrician, all in close proximity to one another, and in close touch with the stage manager's offices by the independent staircase just mentioned, and with the stage by a pass stairs on the other. Even the stage door has been remodelled, inasmuch as the doorkeeper's office now has a small waiting-room, and an entirely separate entrance, with timekeeper's office, has been formed for the working staff, by which means the crowding of the stage-door will be reduced. The back portion of the stage has been separated off from stage level downwards, with the view of forming a large scenery store built on fire-resisting lines, and equipped with all the necessary racks for holding the "cloths" used in the usual repertoire. Similarly, in the back wing, an old store, formerly known as the "infrimary," has been enlarged and remodelled with the view of forming a "wing" store. In spite of these two modernised storage arrangements, the accommodation for scenery at Covent Garden is still necessarily of a very limited character compared with that of Continental houses, and must remain a source of constant anxiety and trouble to a management who produce an average repertoire of twenty-five operas in the short space of ten weeks.

III.

We now come to the great alteration of the stage, an enormous undertaking at all times, but rendered particularly difficult owing to the short period available, the existence of a ball season during the major part of the winter, and the presence of an enormous stock of scenery, &c., which it would have been impossible to have moved out of the house except at a very great cost.

The alteration of the stage comprised entire gutting from top to bottom, so that nothing of the old stage from "gridiron" to cellar remains, with the small exception of a couple of wood fly galleries. Further, the alteration comprised the entire unroofing of the stage, raising the structure by 20 ft., and re-roofing on modern lines. Further, it involved a considerable amount of excavation work, with a view of forming deep pits to take certain parts of the mechanism. An entirely new "gridiron" had to be constructed right across the stage; two "gridiron" galleries had to be constructed on either side, and a number of light connecting ways running across the stage. An entirely new stage, including all constructional parts, had to be provided, together with a mezzanine floor. The opening of the stage towards the auditorium had to be equipped with an enormous fire-resisting curtain (the largest in London), and a strong party-wall built from stage level downwards into the cellar. In connexion with this constructional work, the whole of the "gridiron" galleries, stage, and mezzanine had to be re-floored, and the entire cellar or superficial area of the stage concreted over. The scene docks on either side of the stage had to be remodelled, one of them, for instance, being equipped with a large scene door with revolving shutters, measuring 28 ft. in height, another being provided with several floors to take planned scenery, such as rocks, groups, &c. The exit and entrance arrangements of the stage also had to be remodelled in such a way as to allow of greater convenience, and for the greater safety of the employes in case of accident.

In connexion with the constructional alteration of the stage, an entirely new stage equipment had to be provided on modern lines, everything above stage being now worked on the Brandt patent counterweight system, and

everything below stage on the Sachs patent electrical bridge system.

Without entering into detail, the stage may now be described as comprising a series of six horizontal sections running parallel with the curtain line from front to back, each section being 8 ft. wide, and the whole being followed by a large back stage or rear stage. The first section contains nothing but a plain "carpet cut" and openings to take the old-fashioned "grave" trap, "star" trap, or other similar contrivances. The second and third sections comprise large bridges, which can be raised 6 ft. above the stage, or lowered 8 ft. below the stage, constructed in two levels, on the lower level of which appliances can be installed for the purposes of raising minor platforms above stage level, or sinking traps and the like. The fourth, fifth, and sixth sections comprise large bridges running right across the stage front, which can be raised 6 ft. above the stage, or lowered 8 ft. below. The back stage has no openings or mechanism, beyond certain trapdoors to a scenery store and the necessary electrical mechanism for raising and lowering scenery for storage purposes.

Between the various sections of the stage, long longitudinal flaps, 2 ft. wide, have been formed, and these can be easily opened to allow scenery to be passed through below for transformation scenes and the like. Each section is equipped with what is termed a pair of chariots, to hold "wing" lights placed on so-called wing-ladders. All the electrical bridges are worked from mezzanine level and from ordinary switch boards, and can be raised and lowered at various speeds, and take loads up to two tons. They can be moved without vibration or noise, at a cost of about $\frac{1}{4}$ d. for power on a full rise when loaded.

Above the stage level, each section has its series of lines to take cloths, borders, &c. Each section has a batten, from which the electric battens are suspended; and each section has a large wooden lattice girder from which heavy pieces of scenery can be suspended. There are, on the average, about ten lines for ordinary battens, a girder batten, and a light batten to each section; besides these lines there are the equipments of flying apparatus and the like, whilst in front there are, of course, the necessary lines for tableaux curtains, act-drops, and draperies. Everything that is suspended from above can be worked at stage level, or at either of the gallery levels, every scene being counterweighted to a nicety, and one man can easily handle any scene. No mechanical contrivance is required, and in practice quite a number of scenes can be rapidly changed in a minimum of time.

Throughout the structure and mechanism steel has been used, iron pulleys, and wire cable; and the inflammable materials have been absolutely reduced to the flooring of the gridiron and galleries and the hard wood flooring of the stage and mezzanine. In other words, an absolute minimum of inflammable material replaces what was almost a maximum, and, seeing that the electric light has been installed, the risk of an outbreak of fire or its spread has been materially reduced.

The work was carried out under the direction of Mr. Edwin O. Sachs, architect to the Theatre Syndicate, Mr. Thomas Kissack acting as clerk of works. The general contractors were Messrs. Colis & Son. The ironwork contractors for everything above stage level were Messrs. Lindsay Neal & Co., Limited, whilst the entire complicated structural and mechanical ironwork below stage level, including the stage "bridges" and lifts, was by Messrs. Drew-Bear, Perks, & Co. The electrical power plant for the "iron" machinery was provided by the Thames Ironworks Shipbuilding Company, Limited, of Blackwall; whilst the whole of the elaborate counterweight mechanism above stage level was provided by the Berlin stage mechanist and contractor, Mr. F. Brandt, who personally attended to the installation of his appliances in London.

The fire-resisting curtain was by Messrs. Merryweather & Sons, Limited, and the alterations in the auditorium by the Army and Navy Auxiliary Supply, Limited (manager in charge, Mr. Player).

The building operation is the second structural improvement to the Opera House undertaken since its ownership, dating from spring, 1899; and this second building operation has involved the further considerable outlay of approximately 25,000*l.*, or, by way of comparison, the cost of the total erection and equipment of a provincial playhouse.

THE ART UNION OF LONDON.

The annual general meeting of members of the Art Union of London was held on Thursday last week in the lecture hall of the Society of Arts, John-street, Adelphi, to receive the report of the Council and for the distribution of prizes of works of art for the year 1900-1901.

We print the following extracts from the report of the Council:—

"The year just closed has been one of average success, and after setting aside the sum of 1,318*l.* for engravings, &c., the Council have been able to devote 544*l.* to prizes, making, with the consolation prizes awarded during the year to unsuccessful members of ten consecutive years' standing, a total of 207 prizes. Among the works of art specially selected by the Council for prizes are:—original oil painting, 'The Meadow Pool' (48 in. by 30 in.), by J. Clayton Adams; two bronze copies of the Chantry bust of Queen Victoria; six terra-cotta copies of 'The Jester' statuette, by Mr. George Tinworth; six electro-bronze copies of the statuette 'Hebe,' by Miss Ruth Canton; six framed sets of electro-silver album mounts, by the late Miss Simpson; six dragon jugs in Copeland ware; twelve blue reppsoué Douillon eners; fifty bound sets of 'Scenes from English History,' after designs for Westminster Palace.

As the presentation picture for the forthcoming year the Council have commissioned Mr. W. Wyllie, A.R.A., to etch a plate representing the naval pageant in the funeral ceremonies of her late Majesty Queen Victoria.

The Council are glad to be able to state that the number and value of the oil and water-colour drawings selected by subscribers during the past twelve months from the permanent exhibition in the Society's gallery has been more than double that of any preceding year. The increasing demand for fine specimens of steel engraving, now a practically extinct art, gives a new importance to the Society's collection of steel plates—probably one of the best and most extensive in the world. There are no more perfect examples of the art of Lumb, Stocks, Sharpe, Willmore, Goodall, and other leading engravers of their time—and it was the golden age of English line-engraving—than those by which they are represented in the Art Union gallery; and since, from the durability that can be given to a copper plate by steel facing, it is in the highest degree improbable that the costly and laborious process of engraving upon steel will ever come into general employment again, the existing fine examples of the art must become more and more valuable as time goes on. As a result of the deliberations of the advisory Council for Art appointed to reorganise the system of education at the Royal College of Art, many important changes have been made. In the new scheme the number of students is limited to 350, of whom 150 may be paying students. The College is divided into an upper and a lower school, each of these again divided into four sections: (1) Ornament and Design, (2) Drawing and Painting, (3) Modelling, (4) Architecture. An interesting decision may also be noted—that in future the diplomas of the College will not be awarded solely on the results of examinations; but that the Council of Advice and the professional staff will take into account the special aptitude of a student, not merely for the practice of art, but for teaching its principles and methods to others. Mr. Augustus Spencer retains the beadmastership of the College, and Mr. Lanteri the Professorship of Sculpture and Modelling; Mr. Beresford Pitt is appointed Professor for Architecture, Mr. Gerald Morda for Painting, and Mr. W. R. Lethaby for Design. The same committee of eminent artists which acts as a Council of Advice to the Royal College is entrusted with the function of advising in the matter of purchases for the Victoria and Albert Museum."

The report also stated that Lord Windsor has been elected as President.

In the drawing for prizes, the principal prize, 'The Meadow Pool,' by J. Clayton Adams, was won by Sir Thos. Lucas, Bart., of London.

BUILDING TRADE, STAFFORD.—The building trade is fairly maintained, the operatives generally are well employed, but the principal builders are not very busy. The County Council are enlarging both the County Council buildings and the technical school buildings. The local Corporation, at their monthly meeting on the 25th ult., sanctioned a contract for thirty-one new cottages, or 6,050*l.* In the case of the cottages referred to we are informed that none of the local builders belonging to the National Builders' Association tendered, owing to the Corporation declining to supply them with quantities.

MARBLE HALL, DE KEYSER'S HOTEL.—In our account last week of the work just carried out at this hotel we stated that the electric fittings were by Messrs. Bennett. It should have been Messrs. W. A. S. Benson & Co., Limited, of New Bond-street.

HOW IS THE FUTURE WORKMAN TO BE TRAINED?*

THE best method of training young workmen has become a burning question, especially in the building trades, for it is generally admitted, by those qualified to form an opinion on the subject, that the skill in handicrafts displayed by the workmen of the present time compares very unfavourably with that of the workmen of a quarter of a century since; various attempts to arrest the deterioration have been made, but apparently without much success. It occurred to me that the Institute of Certified Carpenters numbers in its ranks many men pecuniarily qualified, in virtue of their position and experience, to give opinions of value upon this question, and it is with a view of eliciting those opinions that I venture to lay before you the outlines of a scheme that may possibly furnish the solution to the problem propounded in the title of this paper. Before dealing with the proposition it will be as well to briefly summarise the conditions governing the training of young workmen formerly and to compare them with present conditions, and although these remarks are confined more particularly to carpentry and joinery, the broad facts are equally true in regard to other trades. The custom that used to obtain in old-fashioned workshops for training a boy entering these trades was to place him practically under the control or in charge of a good workman, usually the oldest or ablest hand in the shop, whose "bench-mate" he became. From this man the embryo carpenter and joiner learned the rudiments of the craft, partly by instruction, but chiefly by observation and imitation of his preceptor's methods, and if fortunate in ingratiating himself, he would be initiated into the personal "wrinkles" or trade secrets that were the especial possession of the old-time, experienced handicraftsman. But with the alteration in the methods of production introduced by machinery all this was changed; gradually the skilful handworker—the man who could take a rough drawing and translate it unaided into a highly-finished piece of work, or who could be entrusted to carry out successfully anything that might come to hand in the way of joinery—has disappeared, and the joiner of to-day is to all intents and purposes simply an accessory to a machine; and in most cases he is necessarily subordinate to the latter, not even being practically acquainted with its manipulation, which is entrusted to a special operative.

The machines produce parts of a whole with enormous rapidity and wonderful precision (subject, of course, to the ability of their operators), but as no single machine will complete any entire fitting, the chief duty of the modern joiner is to fill in the interstices, if I may so term them, between the several productions, and to adjust and fit up the various parts so prepared. All the expertness and knowledge which his prototype gained in the actual preparation of the several portions is denied the worker under the present system, which has thus developed a type of narrow specialising having an extremely limited range of usefulness; and, consequent on the want of general knowledge of construction inevitably displayed by workmen so restricted, further specialising has become necessary, and in this direction the latest product of the system is the "setter-out," a workman who confines himself to the drawing or marking out of the sizes of the several pieces preparatory to machine operations, and thus even the insight into the methods of construction which this work entails, with its educating influence on the mind, is withdrawn from the workman; and the result of such irresponsible deadening, monotonous, unthinking toil is to be seen in that apathy, want of intelligence, and carelessness with which the modern workman is charged. It is obvious that in the continuance of such a system matters will go from bad to worse, from the point of view of good handicraft. As the leaven of the old-time workman gets exhausted, so the whole mass will settle down to deeper ignorance of their craft; and to place boys into such workshops and under such influences, and to expect them to acquire a comprehensive knowledge of the trade, is absurd; and the question arises, How is such knowledge, then, to be imparted? It would

be worse than useless to suggest even a curtailment of the use of machinery, the tendency of the age being to substitute the latter for hand labour wherever possible; so if we cannot remove the initial cause of the mischief, we must counteract its ill effects by an antidote suitable to the conditions. It may be deduced from the above premises that to obtain a craftsman at once skilful, intelligent, and resourceful, the youth must be educated in, or made practically acquainted with, the whole of the craft which he is learning; not necessarily to be equally expert in all its branches, but to have sufficient general experience to enable him to successfully negotiate any unfamiliar work that may come to his hand. In workshops where machinery is employed, the acquirement of such knowledge is, as I have pointed out, practically impossible. There is no opportunity for instructing lads, unless a man is told off specially for the purpose, a method too expensive to be feasible, as in large establishments every man has his allotted work to perform, which is so interwoven or dependent upon that of others, that if it be neglected or delayed the whole establishment is more or less thrown out of gear. And most employers of labour, having realised the futility of attempting to teach trades in the workshop under present conditions, have abandoned the system of talking apprentices, with the consequence that whilst they are crying aloud for skilled workmen, boys are seeking in vain how to enter and learn the trade.

Attempts to remedy this state of affairs have been made by several public bodies, some dealing with boys before they enter a trade, and others after they have gained admission. The former necessarily confine themselves to the inculcation of the broad principles of precision and method underlying all trades, and also a little elementary instruction in the use of tools, &c.,—excellent in themselves, but not sufficient to make a boy of immediate service in any trade, which is now the only key to entrance of the workshops of reputable firms. Of the latter, the most noteworthy are the Trades Training Schools of the Worshipful Company of Carpenters. These are probably the nearest approach to a solution of the problem that has yet been attempted, and, but for a difficulty incidental to the system, would doubtless provide a sufficient remedy. I cannot for obvious reasons say all that I should desire to in praise of these schools, and in drawing attention to the one serious obstacle in the way of their complete success, I do not intend to reflect in any way upon their value as a means of improving the knowledge and skill of those already engaged in the trades by supplementing their workshop experiences, but rather to indicate the direction in which they could be made even more useful. To render these remarks clear, I will briefly outline the routine work of my own class, the result of several years' experience, and which is fairly typical of the methods pursued in the other trade classes. The workshop is fitted similarly to that of a first-class builder's, with practically every necessary tool used in the trade, and drawing apparatus are provided in addition; the work done is nearly all made full size, and under much the same conditions that obtain in a good-class hand shop. Lectures are given weekly, explaining the principles underlying the practice of the trade and their application in various familiar subjects. One night a week the student is instructed in, and practises workshop drawing; and once a week he is engaged in practical benchwork; the method generally pursued with respect to the younger lads being to instruct them first in the correct formation of framing, &c., more particularly those things that are now generally executed by machinery; and when these have been accomplished successfully, to entrust them with a complete piece of work, which includes the components they have already mastered in detail. This is made either full-size or to large scale, and the youth going steadily through this course gains in manipulative experience and constructive knowledge. The above routine does not apply to the men's classes, which are treated somewhat differently, but as these are beside the subject we are now considering, I will not trouble you with their details. The course I have described, you will probably agree provides a very complete preliminary training when it can be carried out in its entirety, but unfortunately it seldom can. The weak point

* A paper read on the 13th ult. at the monthly meeting of the British Institute of Certified Carpenters at Carpenters' Hall, by Mr. G. Ellis, Instructor at the Trades' Training School. The President, Professor T. Roger Smith, occupied the chair.

in this method is the continual interruption in the attendance, brought about by circumstances which are mainly, I am convinced (by the numbers of apologies received), beyond the student's control. The weekly interval arising between the cessation and resumption of work is a quite sufficient tax on the lad's memory, about instructions he has received, and when this interval is prolonged to from three to five weeks, as not infrequently it is, it is obvious that all such instruction must be repeated, to the occasion of much waste of time and interruption to the work of others. Added to this, another drawback to classes held in the evening is that they necessarily lengthen the day's work, already sufficiently long in most cases. The alternative I propose is, the establishment of an apprentice school (or series of schools) in industrial centres in connexion with the firms or workshops in the neighbourhood for the training of boys in the various trades, on lines similar to the Carpenters' Company's School but carried on during ordinary working hours. A boy desirous of entering any trade would be apprenticed as it were to the school instead of as formerly to an individual master for a stated period; he would become party to an agreement which would bind him to attend regularly daily from, say, 9 a.m. to 5 p.m., with the usual interval for meals, throughout the first year of his term, during which he would obtain continuous practical instruction of the best kind from properly qualified workmen, and also acquire methodical habits, and be subjected to a wholesome restraint, that can seldom be exercised in the ordinary workshop, but which would be of incalculable benefit to him in the future. From the school, as opportunity offered, he would be drafted into the workshop of one of the firms connected with the scheme, well-grounded in the rudiments of the trade, and familiar with the use of tools, and where his services could be at once utilised, to the advantage of his employer. During the second year of the term he should attend the school for further improvement, either three consecutive mornings, or three afternoons, per week, as might be the more convenient to his employer; the latter, having now become party to the agreement, being compelled by its terms to provide the necessary facilities for his attendance, the remainder of the lad's time being spent in the employer's service under the usual conditions governing the trade. For the third and fourth years the apprentice should attend one afternoon per week, in which he would practice more advanced work, and finish off his education as an operative. Further theoretical and practical instruction should be open to him to enable him to qualify for advanced positions, but not be compulsory. This could well be supplied in the voluntary evening schools such as those of the Carpenters' Company. The course of training thus indicated, combining the theoretical and expert instruction of the school with the everyday experience of a competitive workshop, would, I am confident, produce artisans equal, if not superior, in skill and adaptability to those of former generations in less time, and therefore more economically, than the old method of personal apprenticeships.

The organisation, provision of funds, and limitation of numbers in such schools are points upon which there will probably be diverse opinions, and in offering the following suggestions, I rather indicate a possible arrangement than attempt to formulate a definite policy.

Expenses.—These could be largely met by: 1. Contributions on the part of parents, in the shape of smaller ones, be made payable by instalments; and 2. By contributions from the firms assisting in the scheme. These might take the form of a money grant, equal to the expense of training a boy in their own works, or in kind, as tools, materials, &c.; also by the purchase, at an agreed price, of such of the work made in the school-shop as would prove serviceable to them, what may be termed stock sizes and articles being made to that end. Of course especial care would have to be taken by the management that this method of raising income did not lead to any abuse of the system. Further, other employers, not parties to the scheme, but who might be desirous of obtaining qualified apprentices, could be asked to pay a specified sum bearing some relation to the commercial value of the apprentice chosen. In addition to these sources of income grants might be obtained from the funds pro-

vided by taxation for the furtherance of technical education, as the proper training of workmen is undoubtedly a national question.

Management.—This probably offers the most difficulty, but the scheme as outlined above will, at least in its initial stages, have to be carried out voluntarily, and those taking the lead in the preliminary formation will arrange this to meet their requirements; afterwards experience will indicate the best method to pursue.

To obtain the confidence of both employers and workmen the directorate should include representatives of each body, also representatives from any public body willing to give its adhesion to the scheme. Architects should be represented, as they perhaps more than any others are interested in the production of capable workmen.

In conclusion I ask for your impartial criticism of the scheme outlined, which has purposely been kept free from detail, for such a variety of interests being involved, the latter is essentially a matter for collective council. I have anticipated, however, two possible objections that may be raised, and with the view of facilitating discussion, will state and reply to these before finishing.

It may be asked—Is it necessary to train youths to handwork if machinery is to supplant the same in the near future?

I would reply yes, unhesitatingly, for three reasons. 1st. The further introduction of machinery will be retarded by a supply of skilled handworkers, as, especially in the joinery trade, it is chiefly the dearth of the latter that makes it profitable to employ machinery, and it is opposed to the best interests of the trade, and also to the nation, that there should be persistent deterioration in skilled handicrafts. 2nd. In addition to the large establishments which increasingly use machinery, there are great numbers of smaller firms throughout the country who are often better supporters of good workmanship than their bigger competitors, and these depend largely upon handworkers, and will, if the supply continues to decrease, be absorbed the sooner, to the detriment of the trade. 3rd. The more extensive a man's capacity, the more readily will he find employment when one or other branch is over supplied, and thus prevent a general reduction in wages, which tend to fall automatically when there is any considerable excess of supply over demand in the labour market.

How is the overstocking of a favoured trade to be prevented?

The law of supply and demand would govern these institutions just as it does the present workshops; and, as a matter of fact, the directors would be in a better position to gauge the demand than are the parents under present conditions. Further, the institution could be the means of finding out the capacities of boys for certain crafts, and, by drafting them into those for which they were best suited, prevent the manufacture of "bunglers." This might be managed by providing for a short probationary course on entry, during which each boy should pass through the hands of various instructors, who would report upon his ability, and from these reports the management would deduce which trade he showed most aptitude for, and, provided there was an opening, he would be advised to follow up this particular trade, or, if conditions were not favourable, then the next one for which he seemed most fitted.

How and where would you organise your schools?

Probably it would be best to make a trial with one first, and if the venture were successful, others would be established where there was a demand.

The Carpenters' Company's Schools occupy a very central position in London, easy of access from all parts, and already possess the nucleus of an equipment and organisation such as is required.

I have, of course, no authority to state that the company would assist, but I feel sure, from the great interest that they have displayed in everything concerning the welfare of the trade, that if they were convinced that the scheme had the approbation of the building trade, they would not place any obstacles in the way of those wishing to give it a trial. Possibly they might be induced to take the initiative if they received guarantees of assistance from master builders; that they would from parents goes without saying.

THE LONDON COUNTY COUNCIL.

The London County Council re-assembled on Tuesday after the Easter recess, at the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee, it was agreed to lend Battersea Borough Council 3,515*l.* for brick sewer works; Shoreditch Borough Council 13,740*l.* for purchase of land, paving works, and erection of loose box at the wharf; Battersea Borough Council 10,600*l.* for electric-light installation and 3,230*l.* for provision of disinfecting station; School Board for London 37,669*l.* for schools; St. Pancras Borough Council 830*l.* for lighting of public buildings by electricity; and the Metropolitan Asylums Board 1,440*l.* for the purchase of land.

A City Street Improvement.—The Improvements Committee brought up a recommendation in favour of the Council contributing 16,800*l.*, one-half the net cost of the widening to 50 ft. of Blomfield-street, City, between East-street and Eldon-street, proposed to be undertaken by the City Corporation.

An amendment moved by Mr. Austin and seconded by Mr. Hubbard, to postpone the consideration of the subject was rejected by a large majority.

Dr. Cooper then moved that the recommendation be referred back, and contended that the City ought not to come to the Council for contributions towards City improvements until they brought up their assessments to a proper level.

Mr. Radford seconded the amendment, and said it was a great evil that the City should escape its proper obligations.

Mr. Davies, chairman of the committee, said they were unanimous in their recommendation, which would secure the completion of an improvement two portions of which had already been carried out.

The amendment was rejected, and the recommendation was adopted.

Purchase of a Motor-car.—The Fire Brigade Committee recommended the purchase, at a cost of 280*l.*, from the Locomobile Company of America of a motor-car for use by the Fire Brigade.

Mr. Beachcroft objected to going to America to purchase the car when any number could be obtained at home.

Mr. Gilbert said the Chief Officer had recommended that particular type of car.

The recommendation was adopted. *Theatres, &c.*—The Theatres and Music Halls Committee recommended as follows, the recommendations being agreed to on certain conditions:—

"That Mr. Matcham be informed that, provided the works shown on the eight plans submitted by him in regard to a building to be known as the Hackney Empire, and to be erected with frontages to Mare-street, the Grove and Grove-passage, Hackney, are commenced within six months, the Council will be prepared to grant a certificate under Section 12 of 41 and 42 Vict., cap. 32, to the owner of such building.

That Mr. Collard be informed that the Council has no objection, so far as its regulations under Section 12 of 41 and 42 Vict., cap. 32, are concerned, to the arrangements shown on the plan submitted by him in regard to the new offices at London Exhibitions.

That Mr. Verner be informed that the Council has no objection, so far as its regulations under Section 12 of 41 and 42 Vict., cap. 32, are concerned, to the arrangements shown on the plan submitted by him in regard to the military tournament at the Royal Agricultural Hall.

That Mr. Caroe be informed that, provided the works shown on the five plans submitted by him in regard to a building to be known as the St. James's Parish Hall, and to be erected at St. James's, Upper Clapton, are commenced within six months, the Council will be prepared to grant a certificate under Section 12 of 41 and 42 Vict., cap. 32, to the owner of such building."

Greenwich Tunnel.—Progress of the Works.—The Bridges Committee reported as follows:—

"We desire to call the attention of the Council to the progress that has been made in the construction of the Greenwich tunnel. The Greenwich shaft of the tunnel was sunk to the required depth on March 19 last, but little permanent work was done during the remainder of the month. The invert of the shaft is now being filled with concrete under compressed air at about 25 lbs. pressure. At the end of March the face of the tunnel was 842 ft. from the centre of the Poplar shaft, or more than two-thirds of the entire distance to the Greenwich shaft, and during the month a length of 260 ft. was completed. Since February 22 last the work has advanced 10 ft. every working day, which is an un-

precedented achievement in sub-aqueous tunnelling. The material passed through has been chiefly clay and close sand. The air pressure has varied from 19 lbs. to 25 lbs., and the weekly analyses of the air in the tunnel show a very satisfactory purity of the atmosphere. The estimated value of the permanent work executed up to the end of last month is 65,626*l.*, or about 60 per cent. of the contract amount."

Greenwich Tunnel, Electric Lighting.—The same Committee recommended and it was agreed that the offer of the Council of the Metropolitan Borough of Poplar to supply electricity to the Greenwich tunnel at 18*d.* per unit upon an estimated minimum quantity of 100,000 units per annum be accepted.

Having transacted other business, the Council adjourned.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:

Lines of Frontage and Projections.

Peckham.—A four-story block of residential flats, with shops on the ground floor, and a scene-dock at the rear, on the north side of High-street, Peckham, at the corner of Stairford-street (Mr. A. Stuart for Mr. H. T. Holdron).—Consent.

Norwood.—A public hall and houses with shops on the west side of Norwood-road, Norwood, to be also upon, Ulleswater-street, York-road, and Harpenden-street (Mr. J. S. Quilter for the freeholders).—Consent.

Clapham.—A two-story house, with a shop and gateway on the ground floor, on the site of No. 74, Southville, Wandsworth-road, Clapham (Messrs. H. Wakeford & Sons for Mr. G. Taylor).—Consent.

Lewisham.—A church on the east side of Trewsbury-road, Sydenham (Mr. G. H. Fellowes-Pryne for the vicar and churchwardens of Christ Church, Lower Sydenham).—Consent.

Dulwich.—A projecting wood and tile pent over the entrance to a dwelling-house on the south-west side of Townley-road, East Dulwich (Mr. F. A. Clark for Mr. W. A. Bois).—Consent.

Finsbury, East.—An entrance porch and three six-story projecting windows in front of Cocker's Hotel, Charterhouse-square, Finsbury (Mr. E. Haslehurst for Messrs. Wheeler & Warren).—Consent.

Hammersmith.—A one-story shop on the forecourt of No. 228, Uxbridge-road, Shepherd's Bush (Messrs. Holcombe, Betts, & West for Mr. J. Vellener).—Consent.

Hampstead.—An addition to No. 24, Belsize-grove, Hampstead (Mr. C. J. Strachan for Mr. G. R. Simmons).—Consent.

Hampstead.—Wooden hoods covered with lead at the entrances to Nos. 27 and 28, Lyndhurst-road, Hampstead (Mr. W. A. Burr for Mr. J. Tomblin).—Consent.

Lewisham.—That the application of Mr. A. Stuart for an extension of the period within which the erection of one-story shops on the west side of Catford Hill, Lewisham, at the corner of Ravensbourne Park, adjoining the arches of the London, Chatham, and Dover Railway Company, was required to be commenced, be granted.—Agreed.

Marylebone, West.—A two-story addition in front of No. 47, Hamilton-terrace, St. John's Wood, Marylebone (Mr. L. Solomon for Mr. H. J. Waldorf).—Consent.

St. Pancras, South.—A two-story oriel window in front of No. 167, Tottenham-court-road, St. Pancras (Mr. A. Whitehaw for the London and North-Western Railway Company).—Consent.

Wandsworth.—A one-story coal-order office building on the north-west side of Mitcham-road, Tooting, at its junction with Longley-road (for Messrs. R. Reid & Co.).—Consent.

Wandsworth.—Retention of a wood and slate porch at the entrance of No. 16, Abbotstone-road, Putney (Mr. H. G. Leslie for Mr. T. Osment).—Consent.

Hackney, South.—Residential flats, with shops on the ground floor, on the site of Nos. 112 to 120 (even numbers only, inclusive), Lower Clapton-road, Hackney, at the corner of Laura-place (Mr. H. Riches for Messrs. W. H. Tilley & Co.).—Refused.

Kensington, North.—An addition to No. 47, Lambrook-square, Notting Hill, to be upon Kensington Park-road (Mr. C. R. R. Clark for Dr. G. L. Turnbull).—Refused.

Kensington, South.—An iron and glass covered way at the entrance to No. 3, Pembroke-road, Earl's-court-road, Kensington (Mr. R. Phené Spiers for Mrs. Pidgeon).—Refused.

Lewisham.—That Mr. W. C. Green be informed that the Council is not prepared to accede to his request for permission to retain a shed at the side of No. 108, Catford Hill, in advance of the general line of buildings in Beechfield-road.—Agreed.

Marylebone, East.—An iron and glass covered way at the entrance to Bechstein Hall, No. 36, Wignore-street, St. Marylebone (Mr. T. E. Colclutt for Mr. E. Bechstein).—Refused.

Strand.—A projecting metal sign at the Peninsular and Oriental Steam Navigation Company's premises on the north side of Northumberland-avenue, Charing Cross (Mr. T. E. Colclutt for the company).—Refused.

Width of Way.

Bethnal Green, North-East.—Twelve houses on the south side of Prospect-terrace, Usk-street, Bethnal Green, at less than the prescribed distance from the centre of Prospect-terrace (Mr. A. P. Stokes for Mr. C. Lacey).—Consent.

Greenwich.—That the request of Messrs. Potheary & Co. for the Electric Timber Seasoning and Preservation Company, Limited, for permission to retain the forecourt fence in front of a building distance from the south side of River-side, Charlton, between the Albion Chemical Company's works and the silicate works, at less than the prescribed distance from the centre of the street, be acceded to.—Agreed.

Holborn.—Buildings, to be used as warehouses, on the north side of Castle-street, Holborn, at less than the prescribed distance from the centres of Castle-street, Onslow-street, and Great Saffron Hill (Mr. E. J. May for Messrs. Falk, Stadelmann, & Co., Limited).—Consent.

Hackney, North.—A one-story addition to No. 21, Sanford-terrace, Stoke Newington Common, Hackney, less than the prescribed distance from the centre of Sanford-lane (Mr. G. Treacher for the Governor and Committee of the Incorporated Society of Licensed Victuallers).—Consent.

Poplar.—A cottage, a barge-building shed, and a saw-mill on the west side of Moisty-street, West Ferry-road, Millwall, at less than the prescribed distance from the centre of the street (Mr. G. H. Lovegrove for Messrs. Flower & Everett).—Consent.

Deptford.—That the Council do make no order with respect to the application of Mr. J. Webster for Mr. J. E. Pryor, for consent to the erection of a one-story stable on the east side of a passageway leading out of Ashby-road, Brockley-road, Deptford.—Agreed.

Chelsea.—Greenhouses and a potting-shed at the Physic-garden, Queen's-road West, Chelsea, at the corner of Swan-walk (Mr. E. G. Rivers for the Trustees of the Apothecaries' Company's Physic-garden).—Refused.

Woolwich.—A one-story building at Warren-lane Works, High-street, Woolwich, at less than the prescribed distance from the centre of the street (Messrs. Kirk & Randall).—Refused.

Space at Rear.

Lambeth North.—A modification of the provisions of Section 41 of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of a block of residential flats on the site of Nos. 101 and 103, Lambeth-road, Lambeth, with an irregular open space at the rear (Mr. C. Ansell).—Consent.

Whitechapel.—A modification of the provisions of Section 41 of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of three houses, with shops, on the north side of Commercial-road, Whitechapel, at the corner of Church-lane, with irregular open spaces at the rear (Mr. H. O. Ellis for Mr. S. Kirstein).—Refused.

Deviations from Certified Plans.

Clapham.—Deviations from the plan certified by the District Surveyor, so far as relates to the proposed erection of an addition at the rear of No. 2, Currie-street, Nine-Elms, Lambeth, at the corner of Everett-street (Messrs. Hibbert Brothers, Limited, for Mrs. C. Despard).—Consent.

Hampstead.—Deviations from the plans certified by the District Surveyor, so far as relates to the proposed erection of a building on the site of Nos. 74, 76, and 78, High-road, Kilburn (Mr. T. Ballantine for Messrs. Parrs' Bank, Limited).—Consent.

St. George, Hanover-square.—That the application of Messrs. W. H. Romaine-Walker & Besant for the Duke of Marlborough for an extension of the periods within which the erection of a dwelling-house on the south side of Curzon-street, Mayfair, on the site of Curzon Chapel and No. 30, Market-street, was required to be commenced and completed, be granted.—Agreed.

Lines of Frontage, Projections, and Width of Way.

Hampstead.—The retention of a raised pavement over an area on the west side of Goldsmith-place, Kilburn, at the rear of No. 36, High-road, at less than the prescribed distance from the centre of Goldsmith-place (Mr. W. T. Farthing for Messrs. Roper & Co.).—Consent.

Brixton.—A block of residential flats on the site of Nos. 400 and 402, Coldharbour-lane, Brixton, at less than the prescribed distance from the centre of the street (Mr. F. A. Powell for Mr. A. G. H. Brown).—Consent.

Hackney, South.—A church and school building on the site of Nos. 122 and 124, Lauriston-road, Hackney, at the corner of Rutland-road, at less than

the prescribed distance from the centre of Rutland-road (Mr. P. M. Horder, for the trustees of the Trinity Congregational Church).—Consent.

Clapham.—Eleven houses with bay windows on the east side of Loats-road, and seven houses with bay windows on the west side of Lyham-road, Clapham (Messrs. Down Brothers for Mrs. R. S. Gray).—Consent.

Holborn.—Four one-story, and one three-story, oriel windows to an addition at the rear of No. 28, John-street, Bedford-row, Holborn, to be upon Little James-street (Mr. T. J. Anderson for Mr. T. H. Fankhurst).—Consent.

Woolwich.—That the application of Mr. J. O. Cook for Mr. C. Beasley, for an extension of the period within which the re-building of the Red Lion public-house on the north side of Shooter's-hill, Plumstead, was required to be commenced, be granted.—Agreed.

Width of Way and Construction of Building.

Poplar.—An open iron shed at the Regent Dry Dock, West Ferry-road, Millwall, without the site of such shed being covered with a layer of good concrete at least 6 in. thick, with the forecourt fence at less than the prescribed distance from the centre of Regent Dock-road (Mr. T. J. Anderson for the Gt. Gilling Iron Works Company, Limited).—Consent.

Lewisham.—A temporary wood, iron, and glass photographic studio on the forecourt of No. 84, Kirkdale, Sydenham, with the forecourt fence at less than the prescribed distance from the centre of Peak Hill (Mr. J. R. Vining for Mr. E. J. Pritchett).—Refused.

Width of Way and Height of Building.

Bow and Bromley.—A warehouse building on the west side of Fawe-street, Morris-road, Bromley-by-Bow (Mr. Max Clarke for Spratt's Patent, Limited).—Consent.

Formation of Streets.

Woolwich.—That the application of Mr. J. O. Cook for Mr. C. Beasley for an extension of the period within which the erection of five cottages next the Red Lion public-house, Shooter's Hill, Plumstead, was required to be commenced be granted.—Agreed.

Fulham.—Extension of time within which to complete the formation of a street to lead out of the northern side of Fulham-road, Fulham, and to be named Upham-road (Mr. A. Blackford).—Consent.

Fulham.—Retention of a wooden fence across the entrance to Vera-road, Fulham, near its junction with Colehill-lane (Mr. E. Messiter).—Consent.

Wandsworth.—That an order be issued to Messrs. Marler & Co., sanctioning the formation or laying out of a new street for carriage traffic on the Furzedown Park Estate, to lead out of the north side of Mitcham-lane, Streatham (Colonel R. J. Aspinall). That the name Welham-street be approved for the new street.—Agreed.

Kensington, South.—That an order be issued to Mr. E. J. Halsey refusing to sanction the formation or laying out of a street for carriage traffic on the east side of the south side of Sussex-place, Old Brompton-road, South Kensington.—Agreed.

Cubical Extent.

Kensington, South.—A building at rear of buildings on the south side of Sussex-place, Old Brompton-road, Kensington, to exceed in extent 250,000 but not 450,000 cubic ft., and to be used only for the purposes of a riding-school and repairing shop for motor-cars (Mr. E. J. Halsey for the Locomobile Company of America).—Refused.

Hackney, North.—A factory building with divisions to exceed in extent 250,000 cubic ft., and to be used only for the purposes of cabinet and joinery works, Tyssen-street, Dalston-lane, Hackney (Mr. E. O. Sachs for The Shannon, Limited).—Refused.

Dwelling-Houses on Low-Lying Land.

Woolwich.—Six buildings, to be used wholly or in part as dwelling-houses, on low-lying land situated on the north side of Bostal-lane, Abbey Wood, Plumstead (Mr. T. J. Young for Mr. W. Richardson).—Consent.

The recommendations marked † are contrary to the views of the Local Authorities.

BATHS, BECKENHAM.—The new public baths were opened at Beckenham on the 20th ult. The buildings, which, with a technical institute, have cost about 25,000*l.*, include a first-class, or covered, swimming bath, a second-class, or open-air, bath, slipper baths, and a laundry. The architect of the buildings was Mr. J. A. Angell, the Beckenham Council's Surveyor. The contractor was Mr. T. W. Jones, and the terra-cotta was supplied by Messrs. Gibbs & Canning. The mosaic and tiling work was carried out by Messrs. Minton & Co., the roofs were glazed with Messrs. Rendell's patent water-tight glazing, the hot-water heating work was executed by Messrs. Boaz & Sons, and the wrought-iron rails and gates were manufactured by Messrs. Hill & Smith. The electric light was installed by Messrs. Tamplin & Makovski. The clerk of works was Mr. A. J. Dorey.

Illustrations.

BRITANNIA ROYAL NAVAL COLLEGE,
DARTMOUTH:

THE SICK QUARTERS.

THESSE buildings are being erected by the Lords of the Admiralty on a sheltered site beyond the new college. The site falls rapidly towards the south, which keeps the wards well above the ground.

The wards are arranged in three blocks, one the general infirmary or non-infectious block with twenty-four beds, in which block also are the kitchens, stores, and servants' quarters for the whole building. The other two blocks are for infectious cases, and provide twenty beds each. Each large ward has a balcony towards the south, with a fine view towards the sea and the mouth of the Dart.

Consulting-room, dispensary, and dayroom for convalescents are provided in the block to the right, and separate dayrooms for infectious cases are provided in the infectious block, and also a small house for the doctor. At the west end is a small block for the accommodation of the infectious nurses.

The walls are faced with red bricks and Portland stone dressings, and the roofs covered with Delabole slates in graduated courses.

The buildings are warmed throughout by hot water, with combination stoves in the larger wards. The tower contains the tanks, which hold the water pumped up from the Sand Quay quarry.

The builders are Messrs. Higgs & Hill, and the clerks of works are Mr. S. E. Wallis and Mr. C. H. Hill. The architect is Mr. Aston Webb, A.R.A. The drawing is exhibited at the Royal Academy, the private view of which takes place to-day.

ST. MATTHEW, CHAPEL ALLERTON,
LEEDS.

THIS church has been recently built from the design of Mr. G. F. Bodley, A.R.A. The plan comprises nave and aisles and chancel, and a south chapel. The nave is long and is of six bays. There is a detached tower connected with the church by a cloister-like passage. The building is of strictly English character and is of the Decorated style. There is some excellent stained glass and the roofs are painted throughout.

The church is continuous, there being no chancel arch, and only a high and open screen dividing the nave from the chancel. On this screen the organ is placed after a manner usual in times past. This position is good acoustically, and the instrument does not obstruct the floor space. There is much to be said for this position of the organ, answering, as it does, for both nave and chancel. The work has been carried out by Messrs. Stephens & Baslow, of Bristol.

HAYE'S LODGE, NEAR DERBY.

THIS house has been built from the design of Mr. G. F. Bodley, A.R.A. It has an exterior of red stone, with deep bay windows having mullions and transoms, and some stained glass with armorial shields.

The character is that of an old English mansion, quiet but dignified. There is a garden, planned by the architect, in the style harmonious with old English domestic architecture. There is a good deal of oak panelling. The house has been built for Mrs. Sacheneral Bateman, on the site of a former building.

BOOKS RECEIVED.

FERGUSON'S SURVEYING CIRCLE AND PERCENTAGE TABLES. By John C. Fergusson. (Published by the author.)

ST. DAVID'S: THE CATHEDRAL AND SEE. By Philip A. Robson, A.R.I.B.A. (Geo. Bell & Sons.)

TRANSACTIONS OF THE MONUMENTAL BRASS SOCIETY. Vol. IV. Part 3.

NEW BUILDINGS, ABERGAVENNY Y.M.C.A.—The new buildings of the Abergavenny Y.M.C.A. were opened recently. The structure, which is situated in Frogmore-street, is erected from plans by Alderman Edwin Foster, Abergavenny. The accommodation includes a large assembly hall, reading-room, class and Bible-class rooms, ante-rooms, &c. The contract has been given to Mr. T. S. Foster, the price being 1,430l.

Books.

Works in Architecture of Robert and James Adam. Reprinted by Thézard fils. Books 2 and 3.

Mentioned in a former notice this republication of the great work of the Adams, which is being carried out by M. Thézard simultaneously in France and England, with a French and English text. The book is in fact as nearly as possible a facsimile of the original publication. It is being issued in parts, and we have now before us Parts 2 and 3.

Book 2 contains the elevations and details of Kenwood, one of the most elegant, in its formal way, of Adam's mansion designs, with its South front with carved pilasters contrasting with the plain rusticated basement story beneath them. A great many of the furniture designs are also given.

Book 3 contains the elevation of Luton Park (the plan is given in Book 2), a perspective showing Whitehall with the Admiralty, and the elevation of the Society of Arts house in John-street.

Considering the part which Robert Adam (for his brothers were but his shadows) played in the national architecture of his day, his great publication is to be regarded as a work of permanent value, and those who attach importance to their architectural library may feel glad that they have here an opportunity of securing what is essentially Adam's book, only on new paper, considering that copies of the original are hardly to be had now.

The Decorative Work of Robert and James Adam. London: B. T. Batsford. 1901.

THIS is a re-issue, with some alterations, of a folio volume of twenty-five plates of decorative subjects from Adam's works on architecture, which was issued by the present publisher a good many years ago, and is now out of print. One plate of the old selection has been withdrawn—the elevation of Sion House, and six new ones added, making a folio volume of thirty plates, the subjects of which are confined to furniture and decorative work, excluding architecture proper.

The fashion for the style of decorative work invented by the Adams has been so decidedly revived at present that there is no doubt that a republication like this will be welcomed by many; and even if we do not approve the school of ornament represented by it, one must admit that the work of the Adams in this class is remarkable for refinement and grace of treatment of the materials employed.

It should be remembered, however, that these materials are not those which go to form the highest class of ornament; they are mostly based on the imitation of artificial objects, and they show a vast amount of repetition of the same idea and the same details with only slight variations of arrangement. Such a style can never take rank as among the higher class of architectural decoration; it has no grandeur of line and no intellectual invention; and the time will come when this will be recognised, and the fashion for it will subside again. Meanwhile, Mr. Batsford's book will no doubt be useful, and will also have a permanent value for libraries, as a representation of this particular school of ornament.

The New Education: Manual Training; Woodwork. By RICHARD WAKE, Instructor to the Hull School Board. London: Chapman & Hall, Limited. 1899.

Art Crafts for Amateurs. By FRED MILLER. London: H. Virtue & Co., Limited. 1901.

IF it be possible to treat a practical subject too thoroughly, Mr. Wake may have laid himself open to that criticism. Both master and pupil are subjected by him to a system from which no loophole of escape presents itself. Yet it must be remembered that the teaching of benchwork in Board schools is in its infancy, and that the master has often to learn as well as the pupil. For it may be quite possible that the practical man has never before had to impart his knowledge, while, on the other hand, the trained teacher may find his subject a novel one. The method which is here proposed has been in operation, and has, upon the authority of the author, been found successful. Experience is the only possible test, and in this way Mr. Wake has the advantage of us. Yet we may say that the

system advocated, if it appears to err toward an excess of minutiae, grasps firmly the desirable principles, setting forth with clearness the kind of work that a particular tool is especially adapted for, and the best way of getting this especial kind of work out of it. The explanations are assisted by very good photographs of boys working at the bench, marking the positions necessary for the various tools and processes. We are quite sure that the introduction of some method would be found most desirable in many of the continuation classes, particularly those which are held in some of the outlying country schools, where we have noticed the want of it, and we shall take the opportunity better to inform ourselves upon the method in question by introducing it into a class of this description.

It would be difficult to find a book presenting more obvious contrasts to that just described than "Art Crafts for Amateurs."

The earnestness of the amateur would seem to exist in an inverse proportion to the opportunities at his command towards conquering his difficulties. He consequently possesses an inordinate craving for short cuts and sketchy treatment, forgetful that these are the privileges of the experienced. As Mr. Miller's book is ostensibly written for this class of worker, it would be pedantic in us to advocate the desirability of a knowledge of tools and materials, or a thorough acquaintance with old and approved examples before rushing into modern and original design. Yet a student would thus learn what forms are by their nature most suitable to the particular craft he professes, and further, what are the designs that have successfully withstood the criticism of ages. He would later on find his original faculties burst into bloom with a vigour that the pruning-knife can alone create. But he who engages in wood-carving or in copper-beating in the light of a healthy and blameless recreation will find many designs, both old and new, in Mr. Miller's book from which he may make selection, and a short and explicit introduction to the processes involved.

The Cottage Homes of England. By W. WALTER CROUCH. Second edition. London: P. S. King & Son.

"**T**HE Case against the Housing System in Rural Districts" is the supplementary title given by the author to his small book, which is an explanation, and at the same time an *exposé*, of the working of the Housing Acts of 1890 and 1900. So little time has elapsed since the passing of the amended Act, that criticism must be justified by inference rather than by experience.

These Acts, it may be remembered, have been passed with a view of enabling a Parish Council to provide the accommodation necessary for parish requirements by means of a loan sanctioned by the Local Government Board. But before these two bodies can be brought together there are obstacles to be surmounted which, in the author's opinion, are well-nigh insurmountable. The Rural Council has, in the first place, to be brought into line, and this in turn has to satisfy the County Council, which has again to satisfy the Local Government Board, a curriculum that has been known to extend over a space of five years.

The later Act has reduced the number of formalities, yet the bodies named still remain interested. Mr. Crouch thinks that the County Council might well have been kept out of the negotiations, unless called in as referee by a Parish Council in the event of the District Council proving intractable, for this latter is sometimes obstinately opposed to an increased rate.

These Acts, however, as the author admits, do not touch the question of cottage homes in the more actual sense—the cottage, that is, of the farm labourer. Neither sentiment nor obligation must be reckoned as a serious factor towards the preservation of these. A rental of one shilling a week allows no margin for repairs, and these cottages are in large numbers either falling into a condition that renders them scarcely habitable, or are disappearing altogether.

The Housing of the Working Classes Act. BY CHARLES E. ALLAN, Barrister, assisted by FRANCIS J. ALLAN, Medical Officer of Health to the City of Westminster. Second edition. London: Butterworth & Co. 1901.

This is a useful and clear work, not overloaded

with detail. The introduction gives a sketch of the legislation which has taken place during the last half century, and is then followed by the Acts duly annotated. Those who have to consult the statutes on this subject will find it a book brought up to date. We have the usual corollary, however, to make that the price, seven shillings and sixpence, is excessive. These legal handbooks, intended not only for lawyers but to many of the general public, should be published at a more reasonable price.

The Workmen's Compensation Act, 1897: a Plea for Revision. By R. T. THOMSON. London: E. Fingham Wilson, 1901.

So much has been written upon the many anomalies of the Workmen's Compensation Act that the publication of this work seems scarcely necessary. The first chapter appears to be a reprint of an article in the *Nineteenth Century* for June, 1898, since which date the House of Lords has given somewhat more coherence to the interpretation of this statute. The criticisms contained in this little book are sensible enough, but whether they were worth publishing, having regard to the fact that every newspaper in the country has been filled with similar comments, may, perhaps, be doubted.

Engineering Estimates and Cost Accounts. By FRANCIS G. BURTON, A.S.A.A. Manchester: The Technical Publishing Company.

IN these days of international competition in the engineering, as in other industries, to be up to date in method as well as in equipment has become a matter of stern necessity; and the author's experience is placed at our disposal with a view to rendering assistance in regard to the matters indicated by the title of his treatise. Points liable to be overlooked, but really requiring careful attention, are emphasised; traps and pitfalls into which the unwary and inexperienced estimator may fall are exposed; and many useful hints and valuable information given.

The difficulty of dealing with and anticipating fluctuations in wages is alluded to, and many, unfortunately, besides engineers will confirm the remark that "the modern practice of trade-unions is not guided so much by fixed principles or general considerations, as by the opportune advantages to be obtained from the exigencies of the employers." In a recent paper dealing with this subject, we were told of an employer being calmly informed by his men (on his pointing out to them that their action would inevitably drive away his trade) that they could follow trade if it went elsewhere. But even in this respect the workmen of the States are more advanced than in this country, as the recent prolonged struggle in the building trade at Chicago testifies.

Useful hints are given to those about to tender for Government work for the first time. "No mistake must be made in supposing the stringent requirements to be a mere bogey intended to frighten the builder into reasonably good behaviour; the clauses will, on the contrary, be strictly enforced, and nothing will be accepted unless it is of the very highest class in both material and workmanship." The foregoing refers particularly to shipbuilding, but every one who has any acquaintance with Government contracting knows that it is of very general application.

Mr. Burton ventures to give some advice, for which, seeing that he adopts a somewhat apologetic tone in tendering it, he evidently does not anticipate a ready acceptance. He considers that the managing staff often have to work too much in the dark after a certain point, especially in regard to such matters as the amount or percentage employed to provide for the item of "profit" in the preparation of estimates; and he pleads for "free and cordial co-operation between members of the staff on matters of cost and finance." In unwelcome contrast to this, and in questionable taste, is the cheap sneer in the preface at those "whose knowledge of business is limited to the making of artistic ticks and the checking of additions."

Spon's Architects' and Builders' Price Book, with Useful Memoranda and Tables. By W. YOUNG, architect. Twenty-eighth edition. Edited by CLYDE YOUNG, A.R.I.B.A. London: E. & F. N. Spon, Limited, 125, Strand, 1901.

This volume, although professing to be an "annual" one, is "annual" only in name, and

as far as its use as a price book is concerned, one edition is as good as another. Even the time-honoured preface, with its reference to "additional information," appears as usual, the only variations being in the date and the initials, the latter caused by the lamented death of its late editor.

The "editing," as far as we can gather, consists in the displacement of a few special manufactures and the substitution of others, but even these are very few. As a general work of reference it is very useful, but as a price-book its usefulness is nil, and we can only reiterate what we said respecting the immediately preceding edition: that the book should either be thoroughly revised—in fact, in a great part rewritten and rearranged—or, on the other hand, the price-book omitted entirely, thereby reducing the bulk about one-half and issuing it boldly as a general handbook with the "useful memoranda and tables" as the chief feature.

A Handbook of Practical Gasfitting for the use of Students, Plumbers, Gasfitters, and Gas Managers. With 143 illustrations. By WALTER GRAFTON, F.C.S. London: Published by B. T. Batsford, 1901.

This book contains much useful information relating to gasfitting and gas appliances. It is divided into twenty-three chapters, and concludes with a satisfactory index. The first chapter is devoted to "regulations affecting gasfitting" and the third to "the law affecting gas supply." Other chapters deal with meter fixing, gas fires and burners, incandescent gas lighting, and the materials and tools used in gasfitting. The final chapter discusses the lighting of railway carriages and signals.

The author is a recognised authority upon the subject of gas lighting, and gasfitters and others who intend to study gasfitting in practical detail will find the book most serviceable. We fully agree with the author in his statement that "there is plenty of improvement needed on the part of many employed in running services and erecting fittings," and that "intelligent ideas on proportioning services, and on the principles of combustion and burners, will tend to the employment of fittings and burners giving higher units of efficiency." The author might in many instances improve the wording of his sentences, although it is not difficult to grasp their meaning.

In the chapter on "gas supply for dwelling-houses" we read that "many landlords will not pay for iron piping, principally because of damaging the walls, consequently the work has to be done with composition pipe, which is far inferior and cheaper. This is used entirely from outlet of meter, but no soft piping should be fixed in plaster, where it may eventually get damaged by nails. In Scotland this method is much practised. Iron piping is the best material to use, and in the end gives the greatest satisfaction." The author then proceeds to describe in detail how to fit a house with composition pipe.

Many of the illustrations are already familiar to our readers, as they are merely reproductions of figures to be found in various trade catalogues; and a few of them, such as those on pages 211 and 306, are reduced to so small a scale as to appear ridiculous. Considered as a whole, the book is a welcome addition to the existing literature on the subject, and as a work of reference will be found useful in the office of every architect and builder.

"Who's Who?" 1901. London: Adam & Charles Black.

LOOKING at this annual publication from our own point of view, we find, as we suppose members of other professions or pursuits will find, a curious irregularity in regard to the degree of celebrity which entitles a man to notice, which seems to argue that the length and importance of a notice, or its existence in this book at all, must be a good deal influenced by the personal ambitions of the people who desire to be noticed. So obscure indeed are some of the names included, that it may be doubted whether they could be said to be known at all until they got between the covers of the publication in question. This perhaps is one gate of Fame—send your biography to the publishers of "Who's Who?"

Looking through the architects, we find among the architects whose names are not mentioned Mr. Brydon, the architect of the new Government Offices; Mr. Emerson, the

President of the Institute of Architects; Mr. Carøe; the late Mr. Young, the architect of the new War Office, who was still living when this volume must have been in process of compilation; Mr. Philip Webb; Mr. Lethaby; Mr. Ricardo, &c. Mr. Belcher's name and address are given, but no further information. On the other hand, we find people of much less importance noticed at some length. The publishers or editor ought to endeavour to find out who are the really eminent persons in a profession, and deal with them accordingly, so as to observe a due proportion in their notices.

TRADE CATALOGUES.

THE Acetylene Corporation of Great Britain Limited, send us a price-list of "Auto-Simplex" generators and other apparatus for acetylene gas lighting. If 20 c.p. burners are employed, the cost of an installation to feed 100 burners for six hours is quoted at 85l.; for 200 lights for six hours at 150l.; and for 500 lights for six hours at 330l. The price of carbide purchased in quantities of not less than 1 cwt. is quoted at from 24d. to 27d. per lb., according to the distance from the storage depot. The corporation supplies all the common accessories for the use of acetylene, and also portable lamps. We are glad to observe that these portable lamps are not recommended, for although we are acquainted with most of the acetylene table lamps on the market at the present time, we have never met with one suitable for daily use in a dwelling-house. When the lamps are recharged the odour of the gas penetrates the entire building, and most of the lamps have other objectionable features.

Correspondence.

To the Editor of THE BUILDER.

THE R.I.B.A. COUNCIL.

SIR.—It is somewhat remarkable to note what an unrepresentative list of Associate Members nominated for the Council of the R.I.B.A. is presented to the general body of the Institute, from which to select four names. In my humble opinion, only the first name should receive support, the remaining six having been in the class of Associates for the past eleven to thirteen years, paying the minimum subscription and receiving practically the maximum advantage. Of the six names I refer to, five are old and much-valued friends of mine, who, without exception, to be in the class of Fellows, and upon the Council as such.

This anomaly is absolutely reprehensible; three of these gentlemen are in the forefront of the profession, their names are household words, their works are well known and appreciated, and their practices large. I am sorry that they should exhibit such a lack of loyalty to the body politic they profess to adorn and assist.

Their position is but a sample, as there are hundreds of others in the general body, who assume a similar attitude; the financial condition of the Institute, and its progress would be much facilitated by a little thoughtful loyalty on the part of these "aged" Associates.

It seems to me that the new Council should take means to make this state of things impossible in the future, and that means should be devised by which it is obligatory upon Associates to proceed to full membership, and so contribute to the wellbeing of our representative body. I respectfully commend this to the notice of the Council and to the attention of the general body in particular.

A CANDID CRITIC.

THE MANCHESTER FIRE STATION COMPETITION.

SIR.—I have not seen the amended instructions issued by the Manchester Corporation for the intended competition for the new fire station, but, as far as I can gather from the professional papers, the essential objection to the competition remains unaltered—viz., the condition that the architect whose design is awarded the first premium may not be appointed architect for the building, the Corporation reserving to themselves full power to appoint any architect.

It is probably only locally known that an architectural department is to be formed at the Manchester Town Hall, with a prominent architect as chief. It is quite possible, therefore, for the Corporation to pay the premiums, and take the brainwork of competitors, and hand over the working-out to the new department.

Should that occur, the amendment of the 3 per cent. commission first offered to 5 per cent. would be a very nominal improvement.

The whole thing as it at present stands is very speculative; every competitor has to face the possibility that, should he succeed in taking the first premium, he may be appointed architect for the carrying out of his design, or he may be politely told that his services are not required, as the new department will carry it out.
To deliberately face eight or ten weeks' work and considerable expense with such alternatives is not very attractive. ARCHITECT.

THE DESIGN OF THE PIANOFORTE.

SIR,—In the notice in your issue of March 23 of the visit paid by the Architectural Association of London to Broadwood's Exhibition doubt is expressed of the desirability of any departure from the usual shape of the horizontal pianoforte. The remark that the square shape appears to necessitate "padding" is very natural, seeing that the wing form is universally adopted; but I shall be glad if you will permit me to say that the conclusion is not justified by a closer inquiry.

The shape of the harpsichord is the natural result of the disposition of the strings. The long bass strings run at right angles to the keyboard, and the other strings are parallel to them, and the graduated sounding lengths give a sweep to the bridge which is closely followed by the outline of the case. The vibrations of the strings are feeble, and can set in effective motion but a very limited extent of very thin sounding-board.

The grand pianoforte followed the lines of the harpsichord, and the wing shape was, therefore, its natural form. The more powerful vibrations of the strings, however, permitted the use of a larger sounding-board and the elegant lines of the harpsichord were lost. When, later, the strings were crossed (or overstrung), the bass bridge took a more advantageous position upon the sounding-board, which was broadened out at the tail end to the shape which is now familiar. The pianoforte referred to in your notice of the visit is the result of an attempt to utilise the still greater sound-board afforded by a yet further expansion to the rectangular shape, which, for decorative purposes, Mr. Ashbee preferred.

There is no "padding" about this instrument. By the disposition of the strings, the increased dimensions are utilised with very marked gain in power, due to the larger sounding-board, which also, by reason of its greater sensitiveness, produces piano effects of peculiar freedom and beauty. As an experiment the instrument is a success, and in Mr. Ashbee's hands it will become a thing of beauty to the eye. Some persons will, no doubt, object to the shape of such a pianoforte, and to them I would reply that, though an excellent pianoforte can be made upon the usual lines, the square shape produces a still better musical instrument.

GEORGE ROSE.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

17.—TROUGH-CLOSETS, LATRINES, AND WASTE-WATER CLOSETS.

TROUGH-CLOSETS.—Trough-closets are a simple kind of water-closet, and have been extensively used in connection with factories, barracks, schools, and other buildings, where accommodation is required for a large number of persons, and where simplicity of construction, strength, and automatic action are desired. They consist of a trough—generally of salt-glazed fireclay—with a weir at one end, so that a certain amount of water is always retained in the trough for the reception of the soil, and with a flush-pipe at the other end fed from a cistern usually automatic in action. Longitudinal and transverse sections of a simple type are given in fig. 1; the top of the trough is open from end to end, the seat being simply a continuous wood rail bolted to the edge of the trough. A course of splayed bricks is shown along the back to prevent liquid or solid matter falling into the space behind the trough. As dirt from the floor of the closet is certain to be blown or swept into this space, it is a good plan to fill it with fine cement concrete; the trough has been tested; the angle above the top of the trough can then be finished with glazed bricks or with a triangular fillet of cement. The water from the flush-pipe is in this example discharged through a bent inlet nozzle opening near the bottom of the trough—an arrangement which reduces the splashing and ensures a better flush.

The troughs are generally made in lengths of about 2 ft., but in order to reduce the number of joints special troughs can be obtained up to 3 ft. 0 in. long. The troughs must be set perfectly level; if the outlet end is too high

the soil will be difficult to flush out, and if it is too low, the depth of the standing water will be reduced towards the inlet end. The joints ought to be made with neat cement, and the troughs tested by filling them with water after plunging the outlet.

The points to be observed in the design of troughs are (1) that the sides of the trough above the water level are so designed that they cannot easily be fouled, (2) that the depth of the standing water is sufficient to cover the soil, while at the same time the quantity of water is not unduly increased, and (3) that the shape of the trough is such that the contents are easily flushed out. Various sections are given in fig. 2, E being peculiar in having a perforated flushing rim along both sides.

Trough-closets are also made with a siphonic discharge. Duckett's apparatus is shown in fig. 3. The trough is of improved shape, and has a channel bolted along the back edge to serve as a flushing rim and as a conduit for the water. The inlet A is 3 in. in diameter, and is supplied from an automatic siphon flush-tank. An air-pipe B is carried up from the top of the bend between the two outlet-traps, and is so connected to the flush-tank that siphonage in the trap C is stopped before all the contents of the tank have been discharged; the last portion of the flush is therefore available for recharging the trough. The whole of the flush-water passes through the troughs, and the outlet-traps can, of course, be turned in any direction.

Instead of the continuous open top, trough-closets are often made with the top of each section partially covered, so that wood seats of ordinary form can be attached. In other cases the trough is replaced by a round or oval tube, with a junction at the top for the reception of the seat, as shown in fig. 4. The vertical portion ought to be specially designed to prevent fouling. The space behind such closets cannot possibly be kept clean, and ought therefore to be filled with fine concrete. Fig. 5 shows another modification, in which the only standing water is in the dish-shaped junction piece under each basin. It cannot be recommended.

Trough-closets require a large volume of water. A discharge of fifty gallons is sometimes allowed for ranges up to 12 ft. in length, seventy gallons for ranges from 13 ft. to 17 ft. long, and 100 gallons for ranges from 18 ft. to 22 ft. long. These quantities give a minimum flush of about ten gallons per seat, but smaller quantities down to six or even four gallons per seat are often allowed, although of course the result is less satisfactory. The discharge of these large volumes of water causes a considerable amount of splashing, which is often very annoying. The flush-tank may be regulated to discharge automatically at stated intervals. No hard-and-fast rule can be laid down as to the number of flushes required daily, as so much depends upon the amount of usage which the closets receive; but it is always best to err on the side of cleanliness. Sometimes a "controlling vessel" is fitted to the trough and so arranged as to receive the overflow of water caused by the deposits. The filling of this vessel brings on a supply of water to the flush tank (which has already been partially filled through a pipe controlled by a ball-tap), and starts the siphonic action. The frequency of the discharge is thus automatically regulated by the usage of the closets. An objection to such an apparatus is that the closets may remain unflushed for long periods, although containing a considerable amount of objectionable matter.

Latrines.—Trough-closets are far from satisfactory. The standing water is as a rule too shallow to cover a number of deposits, and emanations from one part pass through the whole range, thus increasing the risk of infection. It is much better to have a range of separate basins trapped from each other by the standing water. The name "latrines" may with advantage be confined to closets of this kind in order to distinguish them from trough-closets. They are discharged by siphonic action, which is started by the discharge from a flushing-tank, generally automatic, but sometimes operated by a pull. Fig. 6 shows the longitudinal and transverse sections of a range of latrines of this kind. The basins are usually fixed 2 ft., 2 ft. 3 in., or 2 ft. 6 in. from centre to centre, but longer connecting pipes can be obtained if required. The flush-pipe A for ranges of not more than six closets is 2½ in. in diameter with 1½-inch branch to each basin. The basins are provided with flushing rims, and contain a considerable

quantity of water, which is held up by the weir of the siphon at B. Below the long leg of the siphon a trap C is fixed, of P or S shape, fitted with a nozzle for an anti-siphonage D. The connecting pipes E and the siphon and trap are 4 in. in diameter. From the top of the siphon bend a ¾ in. air-pipe F is carried up and either bent down into the cistern or connected with the flush-pipe, in such a manner that the siphonic discharge of the closets will cease at a certain point in the discharge of the flush-tank; the last portion of the flush is thus utilised for recharging the closets. It is difficult to regulate this exactly, and the standing water is often considerably below the level of the weir at B. To obviate this, a small vessel with a separate supply-pipe controlled by a ball-valve may be advantageously fixed on the floor at one end of the range, and connected to the junction-pipe under the first basin. The ball-valve is arranged to shut off the supply when the water standing in the range approximates to the level of the weir at B. With high-pressure supplies secret waste may easily occur, and many water companies consequently object to the arrangement except in the case of buildings supplied by meter.

The connecting-pipes in fig. 6 are above the floor, which is a convenient position when the range is in an upper story, but the space behind the pipes cannot possibly be kept clean, and ought therefore to be filled with concrete. The stopper G facilitates access to the connecting-pipes. In many cases longer hoppers are used and the connecting-pipes are laid below the floor. It is obvious that when (as in fig. 6) the hoppers are fixed on the top of the pipes the contents of the first hopper are drawn under each successive hopper, and perfect isolation is not obtained. A more recent form of latrine has the pipes behind the hoppers, each hopper having an oblong outlet at the back fitting into a corresponding socket in the side of the pipe. This ensures an almost perfect isolation.

As a rule, not more than six closets are fixed in one range, but occasionally as many as ten closets have been flushed from one tank. Where more than six closets are used, the tank must be at or near the middle of the range. For such ranges the tanks are of large size, and care must be taken in designing the building to allow sufficient height at the points where the tanks must be fixed. The height from the floor to the bottom of the tank is generally about 6 ft., but some makers recommend 8 ft. or even more, to which must be added the depth of the tank and sufficient space above for removing the parts of the siphon in case repairs are required; the dome of an annular siphon is very nearly equal to the depth of the cistern, and space must be allowed for removing this. The following dimensions of the "Tubal" closet-range may prove useful:—

Number of basins	3	4	5	6	7	9	10
Connecting-pipes	in. 10.	in. 10.	in. 10.	in. 10.	in. 10.	in. 10.	in. 10.
Trap	5½	5½	5½	5½	8	8	8
Flush-pipe, Vertical	3	3	3	3	3½	3½	3½
" Horizontal	3	3	3	3	3	3	3
Tank Length	20	28	30	30	30	44	47
" Breadth	17	17	17	18	20	20	20
" Depth	24	30	30	30	30	30	30

The hoppers are usually of salt-glazed or enamelled fire-clay, and the connecting-pipes and traps of similar material or of glass-enamelled cast iron.

Latrines are often fixed in well-ventilated outbuildings with thin walls, and are thus practically unprotected from frost. The result has been that in many cases the basins and connecting-pipes have been cracked in severe weather. It is, therefore, advisable to use fittings made of strong fireclay of considerable thickness, and also to adopt some arrangement whereby the water can be drawn from the range, the outlet-trap being, of course, left charged to prevent the passage of sewer air into the buildings. In Duckett's siphonic latrines a cock is fixed in the air pipe connecting the siphon and tank; when this cock is closed and the flush tank discharged, practically the whole of the water is siphoned out of the latrines.

Wash-down closets are often fixed in ranges to form latrines, and flushed by a single tank. The outlets of the closet-traps may be flanged and bolted to a cast-iron pipe above the floor, or may be connected by short branch pipes to a pipe laid below the floor. The flush-tank should be large enough to give a flush of five or six gallons to each basin at each discharge.

Flush-tanks.—Flush-tanks for trough-closets and latrines are almost invariably of the

Illustrations to Student's Column.

siphonic type, and ought to be designed so that the action will be started by a drop-by-drop supply. In some cases the tank is filled by repeated discharges of a tipper, and when the tank is filled to the top of the siphon-pipe another discharge of the tipper starts the siphonic action; an additional supply-pipe controlled by a tap can be used to fill the tank more rapidly if required. Sometimes large tippers are used instead of siphon-tanks. These discharge the water with great velocity, and may be used for ordinary trough-closets, but do not give the after-flush required for recharging siphonic latrines.

Waste-water Closets.—Many water companies make an extra charge for ordinary water-closets, and as this charge was felt to be somewhat burdensome to the occupiers of small cottages, closets were designed for flushing with the waste water from sinks. The early closets of this kind were all objectionable on account of the great length of the tube (in some cases 4 ft. 6 in.) from the seat to the trap; this tube was soon fouled, and the closets became almost as evil-smelling as the rail-closets they were intended to supersede. Improvements of various kinds have, however, been effected in order to prevent or diminish this fouling, such as fixing the tube in a slightly-inclined position instead of exactly vertical, or making the lower portion of the tube of larger area than the pedestal, so that fouling would be confined to the latter, which, being nearer the seat, could be more easily cleaned from the top.

The essential part of all waste-water closets is the tipper for the reception of the waste water from the sink or yard gully. This tipper is swung on pivots, and is so designed that, when filled with water, it overbalances and discharges the water with considerable velocity, and, when empty, returns to its horizontal position. It is usually made of glazed fireclay, with a capacity of three gallons, rubber buffers being provided to prevent jarring and fracture. In some closets, as, for example, Day's "Stafford" closet (fig. 7), the tipper is placed directly below the seat, so that it receives the soil as well as the waste water. The tipper A is swung in the container B, which has a 6-in. outlet at the bottom, and fits into a trap C tapering from 6 in. to 4 in. The waste-water inlet is shown at D. Lengthening pipes are made for fixing between the top of the container and the pedestal in those places where the invert of the inlet is more than about 11 in. below the floor of the closet.

In courts and other places where two closets must be flushed from a single gully the first closet may be as in fig. 7, with the exception that a diminishing bend takes the place of the trap C. From this bend 4-in. drain-pipes are laid to the base-piece of the second closet, and the trap is fixed under this base. Plain tubes are carried up from the base to the pedestal. The water discharged by the tipper in the first closet passes, therefore, through the base of the second closet.

J. Duckett & Son's "Perfect" waste-water closet is a great improvement on the older

types. The long tube between the trap and the pedestal is abolished by raising the tipper to a higher level. The general arrangement is shown to a small scale in fig. 8, A being the plan below the sink, B the plan above the sink, and C the section on the line XX. The pedestal has an annular channel containing water, and the inlet from the tipper-container is connected so as to give a whirlpool motion around the channel, thus effectually cleansing it. The small chamber containing the tipper is open to the yard on one side; a light wrought-iron gate is hung in the opening to protect the tipper from injury, while at the same time affording ready means of access. The brick-work around the chamber ought to be laid in good cement mortar and well grouted, and the sink to be well bedded in similar material, in order to prevent foul air passing through to the scullery. A ventilation-pipe is carried up from the trap of the closet. In a still more recent closet introduced by the same firm the basin is practically an ordinary wash-down basin with trap, but with a side inlet for the waste water instead of the usual flushing-rim.

Experiments in several towns have shown that houses provided with waste-water closets require less water than those provided with ordinary water-closets, and this is an advantage not to be overlooked when the water supply is limited. The sewage is also slightly less diluted, and this results in economy at the outfall works. Waste-water closets are also less liable to injury by frost, as the water used in flushing is warmer and as the trap is fixed

below the surface of the ground. The Sanitary Inspector of Burnley reported in 1895 that during the year ending March 25 65 per cent. of the waste-water closets had been "noted as being out of order, and 37 4 per cent. of clean-water closets . . . mainly on account of the frost."

The great disadvantage of many waste-water closets is that the sides of the tubes are quickly fouled, with the result that the closets are more odorous than pleasant. The writer has used several different kinds in various blocks of cottages, but, while admitting that they are very much better than pail-closets, he cannot regard them as equal to a good wash-down closet.

OBITUARY.

MR. W. BASSETT-SMITH.—In addition to the particulars given in our "Obituary" column of last week, we may add that Mr. Bassett-Smith's work as a church architect was not confined to this country. He built several churches in Australia and the West Indies, his most prominent work in the colonies having been the remodelling of Trinidad Cathedral, the choir of which has been completed.

GENERAL BUILDING NEWS.

RESTORATION OF LITTLE BOWDEN CHURCH, MARKET HARBOROUGH.—It is proposed to restore Little Bowden Parish Church at a cost of about 2,200l. Mr. G. F. Bodley, A.R.A., of London, is the architect engaged, and the contractor is Mr. Halliday, of Stamford.

CHURCH, ST. MARTIN, UPPER KNOWLE, BRISTOL.—The new Church of St. Martin, Upper Knowle, the foundation-stone of which was laid in June last, has just been consecrated. The scheme provided for a building to accommodate 700 worshippers, but the work completed is limited to the chancel, vestries, &c., and two bays of the nave. The style is Early English, and the building is of pennant stone with Bath stone dressings. The portion completed will cost about 3,000l. Mr. W. V. Gough is the architect, and Mr. M. Durnford the contractor.

BAPTIST CHURCH, PRESTWICK, Ayrshire.—A new Baptist church has just been opened at New Prestwick. The church is 58 ft. 3 in. by 29 ft. 6 in. The accommodation will be for about 250; there are three exits, two to the front, and one at the back of the building entering by the side of the pulpit, which is of the platform type, with stair on either side. In front of the pulpit is the choir platform, underneath which is constructed the baptistry. Immediately behind the pulpit are a classroom, a vestry, lavatory, and heating-chamber. The church is heated with low-pressure hot water, and there is an electric light installation throughout the building. The cost of the building will be about 1,200l. The architect was Mr. William Kerr, and the contractors were:—Mason work, Mr. A. Hunter, builder; joiner work, Messrs. McLauchlan & Son; plumber and slater work, Mr. A. Dalrymple; plaster work, Messrs. D. & T. Bone; painter work, Messrs. J. E. Bennett & Sons; electric lighting, Messrs. Reid & Co.; and upholstery, Mr. Lauchlan Morrison.

RESTORATION OF THE PARISH CHURCH, MACCLESFIELD.—The parish church of Macclesfield, which has been restored at a cost of 21,000l., was reopened on the 24th ult. The old church was first built in 1278. It was rebuilt in 1710, but about fifteen years ago it had become so dilapidated that the people of Macclesfield determined to restore the building. The late Sir Arthur Blomfield prepared plans for the restoration. The chancel was first dealt with, and then the work stopped for a time for lack of funds. In 1898 there was a revival of interest in the project, and a movement was begun which has ended in the complete restoration of the church. The nave and tower have been entirely rebuilt. The Savage and Legh Chapels have been restored, but the ancient monuments are untouched.

KELVIN GROVE SCHOOL, GATESHEAD.—The Gateshead School Board are about to commence Kelvin Grove School from the design of Mr. J. Landell Nicholson, architect, Newcastle-on-Tyne, which design was placed first in competition last year, and which has been delayed through the bricklayers' strike settled recently. This, the first block of the two in the complete scheme, gives accommodation for 400 infants on the ground floor and 300 junior boys and girls on the first floor, at a cost of about 7,000l.

CONGREGATIONAL LECTURE HALL, WOKING.—Last October memorial stones were laid at Woking of a Congregational lecture hall, with infants schoolroom, church kitchen, and necessary offices. The building has just been opened in York-road. Designed by Mr. W. Howard Seth-Smith, and built by Messrs. J. Harris & Son, the lecture hall, which will be used as a temporary church, accommodates 250 people, and is constructed of red brick, with tiled roof, and external woodwork of teak. Provision is made for the addition of classrooms when the necessity arises. The building is electrically lighted, and is heated by hot-water pipes, ventila-

tion being secured by a silent electric exhaust fan in the roof.

PUBLIC HALL, MANSFIELD, NOTTINGHAMSHIRE.—A new hall, the Victoria Hall, has been erected at Mansfield. It occupies a position at the top of Leeming-street, on the site of the old courthouse and the old-established inn known as the Bowl-in-Hand. The building is of red brick, relieved by stone dressings. The chief hall measures 78 ft. by 39 ft. and 28 ft. high, providing accommodation, with balcony, for upwards of 800 people. It is lighted by six semi-circular windows on the north side, and a seventh in the gable and overlooking Leeming-street. A stage, fitted with appliances for theatrical performances and provision for an orchestra, occupies one end of the room, whilst four dressing-rooms or retiring-rooms are placed at the rear. Under the hall is a supper or dining room, which will also be used for smoking concerts, meetings, &c. The architects are Messrs. Vallance & Westwick, of Mansfield; the builders Messrs. J. Hutchinson & Sons, Nottingham; whilst the decorating has been done by Mr. C. E. Greenwood, Mansfield.

SUNDAY SCHOOLS, GRANTHAM.—The foundation-stones were laid on the 18th ult. of new Sunday schools in connexion with the Wesley Chapel, Spittlegate, Grantham. The building adjoins the chapel, and, with a caretaker's house, involves an outlay of 2,330l. The main room will be 59 ft. 6 in. by 39 ft. 6 in., with seating accommodation for some 400 children. In addition there will be six classrooms, each 11 ft. by 10 ft., and at the rear a kitchen and the usual out offices. The heating will be by water. The contractor is Mr. Corah, of Loughborough, the stonemason Mr. G. H. Linnell, Grantham, and the plans were prepared by Mr. G. Camplin, of Grantham.

CONVALESCENT HOME, SHEFFIELD.—The Woodfin Convalescent Home, Whiteley Wood, Sheffield, is now complete. Messrs. Hemmell & Paterson were the architects. Mr. Woodfin's estate, which amounted to over 13,000l., was, after certain private bequests, left for charitable purposes. Two-thirds of his residuary estate were to be devoted to providing a convalescent home and one-third for almshouses. The latter, in Ecclesall-road, are already occupied, and in a few weeks the home will be ready for patients. Accommodation has been provided for about forty. Additional room has also been provided for patients who might care to avail themselves of the benefits of the institution and are able to contribute towards the cost of their support. Between twenty and thirty convalescents can be admitted under the latter scheme. The institution, which has a southern aspect, stands in 10½ acres of land. The building is two stories high. On the ground floor is the dining-hall, which, together with the principal entrance-hall, occupies the centre of the front. To the east and west of the central portion are respectively the women's and men's wings. The women's wing contains reading and writing rooms, and a parlour lighted by a large bay window, as well as the office and the matron's sitting-room. On the men's side there is also a reading and writing room, and a billiard and smoking room. On the first floor are the bedrooms, those for men being, as in the case of the day-rooms, in the west wing, and for women in the east. In these the cubicle system has been adopted, the space being divided by means of wood partitions into rooms for two or three beds. The windows of the cubicles on the south front are treated as French casements. The central portion over the dining and entrance-hall is divided into two parts—that to the front being sub-divided into cubicles, and so planned that it can be used as an alternative ward for either wing, so as to provide for the fluctuation of the relative number of patients of each sex; that to the back being sub-divided into cubicles, baths, &c., for servants. At the end of each wing there is an emergency door and an outside escape staircase in case of fire. The building is lighted by electricity.

WESLEYAN CHURCH, PLATT BRIDGE, WIGAN.—A new Wesleyan church is being erected at Platt Bridge from the designs of Mr. J. Wills, architect, of Derby.

BUSINESS PREMISES, BRISTOL.—New premises have been erected in Wine-street and Union-street, Bristol, for Mr. J. Chambers. The artificial light throughout the buildings is electricity (installed by Messrs. Buchanan & Curwen, under the supervision of Herbert Thomas Sully, A.I.E.E., electrical engineer). The contractor for the building was Mr. R. F. Ridd. The carving was executed by Mr. W. Smith, of Montpellier. Messrs. Foster & Wood were the architects of the building.

SANITARY AND ENGINEERING NEWS.

LIVERPOOL WATER WORKS.—At a recent meeting of the Liverpool City Council, Alderman Burgess (chairman of the Water Committee) moved that the salary of Mr. Joseph Parry, the water engineer, be advanced from 1,200l. to 1,400l. In reply to Alderman Salvidge, who asked for the reasons, he added that Mr. Parry had been in the service of the Corporation for nearly forty years. The water revenue had increased by 34,702l. since 1895, while the expenses had been decreased by 1,511l. The population supplied with water outside the city alone was 330,000, the revenue for that area, which

was nearly increasing, being about 12,000l. per annum. Then there were some important new works in course of construction, including at Prescott the largest service-reservoir of the Corporation, while a second pipeline from Wyrwy and a water supply to Wallasey were in contemplation. The recommendation was adopted.

LIANDUDNO WATER AND GAS SUPPLIES.—An inquiry on behalf of the Local Government Board was held on the 24th ult. at the office of the Urban District Council, Llandudno, by Mr. A. G. Malet, Inspector of the Board, with reference to applications for leave to borrow 4,700l. for gasworks purposes, and 16,301l. for works of water supply. Mr. E. P. Stephenson, engineer, stated that Llandudno derived its water supply from Duly Lake, some eight miles from the town, and from the lake to Llandudno there was a main line 9 in. in diameter. It was found that this did not give a sufficient flow, and an additional main, 15 in. in diameter, was laid from Caerhun, at the foot of the hills in which the lake is situated, to Crean Hill. The application now was for money to extend this main to Llandudno, a distance of 3½ miles. The 15-in. had also been laid along Mostyn-street. The estimated outlay of 16,301l. included that already incurred on the Mostyn-street extension. There was no opposition

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—The Sanitary Tint Company have removed to new premises in Rivers-road, Liverpool.—Mr. E. Kilburn Scott, A.M. Inst. C.E., has taken the post of engineer and manager, for the United Kingdom, Colonies, and Egypt, to the International Electric Company of Liege; the London offices being at Clun House, Surrey-street, Strand.

ARBITRATION CASE.—At the Surveyors' Institution, Westminster, on the 23rd ult., Mr. Daniel Watney sat as sole arbitrator to assess the compensation to be paid to the Rev. Septimus Streeton for a small portion of land in Gipsy-lane, which the London School Board had taken for the extension of their school there. From the opening statement of counsel it appeared that in May, 1883, the claimant succeeded to a moiety of a piece of land in Gipsy-lane, with a frontage of 16 ft. and a depth of 235 ft., which was copyhold of the manor of Lambeth. According to the custom of the manor, any copyhold land sold to a purchaser who is not a tenant of the manor is subject to a fine to the lord of the manor equal to twice the annual value of the land, whilst a copyholder escapes the fine. The claimant took advantage of this, and sold small and undivided shares of his copyhold to enable the purchasers of any copyhold land to become copyholders of the manor and so escape the fines leviable on their purchases. In this way claimant sold one-third of his moiety in July, 1885, for 25l.; another third in October, 1885, for 50l.; and then he sub-divided the remaining third into three portions, one of which he sold in 1884 for 50l. and another in 1880 for 75l. The other portion, one-eighth of the whole plot, claimant still held when the School Board served him with notice in 1894; and he claimed for 150l., which he estimated he could have secured by selling it in the way he had disposed of the remainder of his moiety. Mr. F. Parish, solicitor, and Mr. W. E. Parish, surveyor, proved the facts as stated by the learned counsel. The latter valued the land at 9l. on a basis of 10l. per foot frontage, but he considered 150l. could have been secured by dividing it. On the part of the School Board Mr. Howard Martin, surveyor, estimated the value of the whole land, at 6l. per foot frontage, at 96l., the claimant's share being 4l. 5s. In his opinion 5l. would be a liberal compensation. Mr. G. A. Wilkinson, surveyor, corroborated this view. Counsel having addressed the arbitrator, Mr. Watney reserved his award.

DEMOLITION OF HISTORIC HOUSES AT WINDSOR.—The Corporation of Windsor have begun the demolition of seven historic houses which were good examples of the architecture of the reign of Charles I. The houses adjoin the present vicarage of Windsor, which formerly was a residence attached to Windsor Castle. They also adjoin a large piece of waste Crown land which was offered to the Corporation some time ago. Upon this and the site rendered vacant by the demolition of the houses, it was proposed to erect a volunteer drill hall, as a memorial to the late Prince Christian Victor, but the project fell through owing to lack of support. The Corporation having condemned the houses—their own property—as unfit for human habitation, their destruction is being proceeded with.

THE HOUSING QUESTION IN BIRMINGHAM.—The Housing Committee held another meeting on the 22nd ult., under the presidency of Alderman Cook, but though they had four schemes for a block of flats in Potter-street before them, they came to no definite decision. However, the members of the committee present favoured one of the schemes presented, and this scheme, amended in accordance with certain alterations which were made, will be again brought up at a special meeting of the committee, when it is expected that it will be approved for recommendation to the Council. This scheme provides for a four-story block containing between sixty and seventy tenements. At the meeting of the

committee a deputation from the Birmingham Architectural Association was introduced on the question of throwing open to general competition the designs and plans for the dwellings which the committee propose erecting. It was, however, pointed out by the chairman that with regard to the Potter-street and Bordesley Green schemes the arrangements had progressed too far for the proposal to be entertained, but the deputation were informed that their suggestion would be considered with regard to any other house building scheme which the committee might formulate.

SCOTTISH BUILDING TRADES FEDERATION.—The half-yearly meeting of the Scottish Building Trades Federation was held in Dundee on the 25th ult., when representatives attended from all parts of the country—Mr. A. Beveridge, builder, Perth, President, in the chair. The Secretary, Mr. J. L. Selkirk, C.A., Glasgow, submitted the report of the work of the Federation for the past half-year, which spoke of the earnestness and hopefulness with which it had been carried on, and of the advantages which could alone be secured by hearty combination among the various branches of the building trades. It urged the importance of a visitation by the Executive of the various branches' Associations throughout the country. Reference was also made to the recently-appointed Consulting Committee, which consisted of four representatives from each of the four principal cities, whose duty it was to consider all questions affecting wages, working agreements, &c., with a view, when necessary, to united action. The Committee had already made a most encouraging commencement. Special reference was made to the steps which had been taken to secure the adoption of such conditions of contract as might be mutually arranged with the Institute of Architects, with a view to meeting, if possible, certain difficulties and grievances which tradesmen allege they had under the existing system of carrying out contracts, more especially in reference to the delay in obtaining measurement of their work. It was agreed that a deputation should seek an early opportunity of meeting representatives of that body with a view to a conference on the subject. The National Association of Master Builders of Great Britain and Ireland having decided to hold their next annual meeting in Glasgow in the beginning of July—the Exhibition being the chief attraction—it was resolved to extend to them a most cordial welcome on the occasion, in which, it was confidently anticipated, the members of the various branches of the building trade would cordially join.

WEST DRYHAM CHURCH.—The roof of the nave of the ancient Church of St. Andrew, West Dereham, recently collapsed and fell in. Although it has been apparent for some time that the timbers were giving way, it was not considered that the catastrophe was so imminent. The church is an ancient fabric, chiefly in the Perpendicular style. The chancel was restored in 1895, and still remains intact.

WIDTH OF LEEDS STREETS.—At a meeting of the Improvements Committee of the Leeds Corporation on the 25th ult., a new series of by-laws with reference to the construction of streets were discussed and adopted. These proposals have been for some three years under consideration, and now that they have been finally shaped it only remains for them to be sanctioned by the City Council and the Local Government Board. They are intended to have the effect of improving the character of ordinary dwelling-houses, besides widening the streets. In future no street is to be less than 42 ft. in width, but provision is made allowing streets to be made 36 ft. wide with a forecourt (or garden) in front of the houses on each side of 6 ft. in width, and at intervals of not more than 150 yards there must be a street not less than 42 ft. in width. The existing by-law provided simply for a 36-ft. street. At the meeting a deputation attended from the Leeds and Yorkshire Architectural Society consisting of Mr. T. Butler Wilson, President, and Mr. H. Chorley, secretary.—*Leeds Mercury.*

THE MONUMENTAL BRASS SOCIETY.—The sixteenth annual meeting of this Society was held on Thursday, the 25th ult., at 32, Sackville-street, London, the Rev. R. W. M. Lewis in the chair. The Society still continues to carry out its original object, viz., the study, cataloguing, and preservation of these very interesting memorials of the dead. At present a series of articles by Mr. Mill Stephenson, F.S.A., on "The Palimpsest Brasses of England," is being continued in the *Transaction*, copies of which and particulars of membership can be had from Mr. F. W. Short, 51, Mornington-road, Leytonstone, Essex. It might be interesting to mention that Part XXVII, comprises the Counties of Essex, Herts, and it contains over a score of illustrations.

APPOINTMENTS.—The Local Government Board have sanctioned the appointments of the following sanitary officers, viz.:—Mr. E. G. Annis, medical officer, Greenwich; Mr. G. Millson, medical officer, Southwark; Messrs. H. Neighbour and S. Addison, sanitary inspectors in Hammersmith; Mr. J. H. Danson, sanitary inspector in Deptford; Mr. W. Barnes, sanitary inspector in Woolwich.

REGISTRATION OF PLUMBERS.—A meeting of representatives of district councils for the national registration of plumbers was held at the Guildhall on Wednesday, the 24th ult. Belfast, Birmingham,

Bradford, Cardiff, Edinburgh, Glasgow, Leeds, Manchester, Nottingham, and Plymouth sent delegates, and reports were presented showing that since the Conference of Health and Water Authorities and Plumbers was held in Birmingham in October last 2,082 operative plumbers and 404 master plumbers had been registered, and that the applications for registration were so numerous that a vast number still remained to be dealt with. On the motion of Dr. Williams, Medical Officer of Health, Plymouth, it was decided to increase the facilities for the examination of applicants. Various arrangements for securing the more systematic training of plumbers were discussed, and on the motion of Dr. Alfred Hill, Medical Officer of Health, Birmingham, it was resolved that apprenticeship should be encouraged in connexion with the national registration of plumbers, and that a special form of indenture for plumbers' apprentices framed by the Plumbers' Apprenticeship Board of London should be circulated for adoption throughout the kingdom. Mr. Marchbank, Edinburgh, undertook to adapt the form to the requirements of Scotch law.

REGISTRATION OF TITLE TO LAND.—At a general meeting of the Incorporated Law Society held on Friday, the 26th ult., Mr. J. S. Rubinstein moved a resolution to the effect that, in view of the fact that the experimental period of three years mentioned in the Land Transfer Act, 1897, would expire in July, an inquiry into the system of compulsory registration of title in London should be held, in order to ascertain whether or not additional difficulty, expense, and delay are occasioned thereby without corresponding advantage to persons dealing with land. The resolution, after full discussion, was carried unanimously.

WINDOW, TIMBERSCOMBE CHURCH.—In the parish church of Timberscombe, in the heart of Exmoor, a stained glass window has been erected in memory of the late vicar. The subject of the window is the Annunciation. It was designed and executed by Messrs. Fred Drake & Sons, of Exeter.

CAPITAL AND LABOUR.

BUILDING TRADE DISPUTE IN LEICESTER.—About sixty bricklayers and builders' labourers have ceased work at the new wholesale market, in Halford-street, in consequence of a dispute as to the introduction of navvies to mix concrete. The builders' labourers, who receive 6d. per hour, claim that the work in question is work of a character which, under Sir William Markby's award, should be done by them, and not by navvies, who are, it is alleged, paid at a less rate per hour. The Employers' Federation claim that the work is essentially work for navvies, and that the bricklayers' labourers are violating the rules mutually agreed upon by their society and the federation in insisting on the discharge of the navvies. The federation contend that things should be continued now as they were, pending arbitration, but the bricklayers' labourers demand that these navvies should be discharged before arbitration is entered upon.

HARTLEPOOL BUILDING TRADE.—A complete stoppage of the building trade in the Hartlepool has just taken place, owing to a strike of bricklayers and plasterers' labourers, who met the proposal of the masters for a decrease of 1d. per hour by making a demand for a 3d. per hour increase in wages. Several hundred men are affected.

THE BRADFORD BUILDING TRADE.—For some time past the conditions of labour in the Bradford building trades have been under active consideration by both employers and employees. There appears to be present to be but little hope of an amicable settlement. The history of the present crisis is briefly as follows:—Six months ago, in consequence of slackness of trade, the master builders gave notice to the men of three alterations of existing conditions; stipulating (1) for a reduction in wages of 1d. per hour; (2) that society and non-society men should be allowed to work peaceably together; and (3) that notice of alteration of rules should expire either on May 1 or November 1, instead of between April 1 and July 1, as at present. The present wages are 9½d. for masons and bricklayers and 9d. for joiners, and the joiners replied to the masters' action by giving notice ten days later of a demand for the increase of their wages by 1d. per hour. In the course of the past few days some attempts have been made to arrive at a settlement. The joiners met the masters about a fortnight ago with no result, and nothing further was arrived at until the 29th ult. The operative masons met their employers on Saturday night, and were offered 9d. per hour—a reduction of ½d. in place of 1d. The condition as to society and non-society men working together was adhered to, but the demand for alteration as to the expiry of notice was waived. The masters, moreover, offered to put all questions at dispute to arbitration. These new terms were considered by the men at a meeting at Barry's Hall, and they decided with practical unanimity to abide by the existing conditions, and refused the proffered arbitration. A meeting of the Bradford Master Builders' Association was also held at the Stone Exchange, Chapel-lane, Mr. Phineas Drake, presiding. The masons' decision was conveyed to the meeting and discussed, and ultimately it was decided

that the following notice should be issued and placarded in all the workshops:—"Bradford Master Builders' Association. Notice.—On and after May 1 the rate of wages will be as follows:—Masons 9d. per hour, joiners 8½d. per hour. Rules.—Society and non-society men to work together. Six months' notice of alteration of rules to be given on either side, to expire on April 30 or October 30." The present situation, therefore, is that the men of both branches of the trade are offered a reduction of ½d. per hour, and that the masters' original claims in the other two respects are maintained. It is understood that the masters viewed with surprise the operatives' refusal of arbitration, but that the offer of arbitration is not withdrawn so far as the masons are concerned. It is also understood that the men are less disposed to accept the other conditions than they are to submit to a reduction of wages. The masters explained that as the state of trade had caused them to give notice of a reduction in the wages of masons and joiners, they could not see their way to grant the advance asked for.—*Bradford Observer.*

BRADFORD JOINERS.—Since the Bradford branch of the Amalgamated Society of Joiners received notice of a reduction they have started a workshop of their own.

BRICKMAKERS' STRIKE, EDMONTON.—The strike of brickmakers which has been in progress for some weeks at Edmonton has ended. The dispute arose on the masters wishing to reduce the rates of pay. The masters have now given way, and the brickmakers return to work on the same wages as last year.

LEGAL.

THE NEW STREET FROM HOLBORN TO THE STRAND.

The case of the London County Council v. the Metropolitan Electric Supply Company, Limited, was concluded on the 25th ult. before Mr. Justice Farwell in the Chancery Division. The case raised a question of interpretation of a section of the London County Council (Improvement) Act, 1890.

It appeared that under the Metropolitan Electric Supply Company Mid-London Lighting Order, 1886, confirmed by the Electric Lighting Orders Confirmation (No. 5) Act, 1890, the defendant company had power to supply electrical energy within the district which includes the whole of the area which might be taken by the County Council under the powers of the London County Council (Improvements) Act, 1890, for the intended new street from Holborn to the Strand. When this Act was passed the defendants had a station, buildings, machinery, and works for the purpose of electric lighting on a site partly freehold and partly leasehold in Sardinia-street, the whole of which was required to be taken by the County Council for the purposes of their proposed improvements. A statutory bargain was arrived at between the plaintiffs and the defendant company, which was embodied in Section 55 of the Improvements Act which provided shortly that (1) the Council should not enter upon or take any part of the existing site of the defendants' station until after the expiration of two years after they had provided at their own expense and vested in the defendants a site available for the erection of a generating station, and (2) that the Council should acquire the freehold and all other interests in the new site and should convey to the Company the freehold of so much of the new site as should be equal in area to the freehold portion of the existing site free of expense to the Company, and should also grant to the Company free of expense a lease of the remaining portion of the new site upon terms equivalent to those of the lease under which the Company held the leasehold portion of their existing site; (3) that it should be lawful for the Company on the site so provided to erect, maintain, and work a station for generating, transforming, and transmitting electrical energy. The important question arose under Sub-Section 7, which provided:

"The Council shall, on or before the date of the conveyance and lease of the new site, pay or secure, to the satisfaction of the Company, a sum equal to the costs and expenses of erecting and fitting up a new generating station upon the new site with new plant of a capacity to generate and supply electrical energy to an output of not less than 4,000 kilowatts, and all expenses incurred in and in connexion with taking up and replacing, relaying and altering mains and lines owing to the carrying out of the provisions of this Act." A dispute arose as to the interpretation of this sub-section, and the plaintiffs sought a declaration that, according to the true construction of the section, they were only bound to pay or secure to the satisfaction of the Company a sum equal to the costs and expenses of erecting and fitting up a new generating station upon the new site with new plant of a capacity to generate and supply electrical energy to an output of not less than 4,000 kilowatts, and were not bound to pay or secure any sum equal to the costs and expenses of erecting and fitting up a generating station with new plant of a capacity to generate and supply electrical energy to an output of 5,000 kilowatts or any number more than 4,000 kilowatts, on the ground that under unusual circumstances a more powerful plant might be required to generate and supply 4,000 kilowatts or

on any other ground whatever. The defendants contended that the sum claimed by them was based on the station and plant being of a capacity to generate and supply such output as a matter of practical commercial working, and that it was impossible for them to generate and supply an output of not less than a fixed amount without having, in addition to the *minimum* plant capable of generating or supplying such an amount temporarily, spare or extra plant in case of a breakdown or repairs, &c.

Mr. Justice Farwell, having heard expert evidence, held that the plaintiffs were right in their contention, and granted a declaration to that effect. He also awarded them the costs of the action.

Mr. Haldane, K.C., Mr. C. E. Jenkins, K.C., and Mr. Metbald appeared for the plaintiffs, and Mr. Balfour Browne, K.C., Mr. Cripps, K.C., Mr. Butcher, K.C., and Mr. Sargent for the defendant company.

CASES UNDER THE LONDON BUILDING ACT, 1894:

DICKSEE v. HOSKINS.

THE case of Dicksee v. Hoskins came before a Divisional Court of King's Bench on the 25th ult., on the appeal of the District Surveyor from the decision of a Metropolitan Police Magistrate allowing an appeal under the London Building Act, 1894, from a notice of objection to a proposed building served by the appellant upon the respondent, a builder. The question to be decided was whether the proposed building came within Section 74 (2) of the Act of 1894. Sub-Section 2 of the section runs as follows:—"In every building exceeding ten squares in area used in part for purposes of trade or manufacture and in part as a dwelling-house, the part used for purposes of trade or manufacture shall be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials, and all passages, staircases, and other means of approach to the parts used as a dwelling-house shall be constructed throughout of fire-resisting materials." The building in question was No. 57, Old Kent-road, and was the re-erection of an old beerhouse called the Horseshoe. It was when erected to exceed ten squares in area, and was intended to contain in the basement beer and wine cellars; on the ground floor a bar, public lobby, saloon-bar, private-bar, parlour, and a public room; on the first floor a sitting-room, three bedrooms, and a kitchen; and on the top floor attics. The old house was, and the new when created was to be, used for the sale of wine and beer to be consumed on and off the premises. The trade was to be carried on in the basement and ground floor, and the licensee and his family were to reside in the upper floors of the building, and the whole of the building was to be covered by the Justices' certificate and Excise licence. The floors separating the ground floor from the first floor and the staircase leading to the first floor were not intended to be constructed of fire-resisting materials, and the magistrate found that if Sub-Section 2 of Section 74 of the Act applied to the building, the provisions of that section would be contravened. He also found, as a fact, that the basement and ground floor of the building were intended to be used for the purposes of the trade of the beerhouse, and that the part above the ground floor was intended to be used as a dwelling-house for the licensed occupier, but held that the case was governed by the decision in "Carritt v. Godson," and allowed the appeal, overruling the objection of the District Surveyor. Hence the present appeal of the District Surveyor.

At the conclusion of the arguments of Counsel, the Lord Chief Justice held that the section was intended to apply to buildings part of which were used for trade and manufacture and the other part as a dwelling, and that it was not intended to apply to a building certain rooms of which were used as a dwelling. He thought, therefore, that the appeal should be dismissed.

Mr. Justice Lawrence concurred, and the appeal was accordingly dismissed.

Mr. Horace Avory, K.C., and Mr. Rowsell appeared for the appellant; and Mr. Danckwerts, E.C., and Mr. Craice for the respondent.

CROW v. WHITECHAPEL BOARD OF WORKS.

IN a specially constituted Court of King's Bench composed of Justices Grantham, Kennedy, and Darling, the hearing was resumed on Saturday, the 27th ult., of the case of Crow v. the Board of Works for the District of Whitechapel. The case was argued before Mr. Justice Kennedy and Mr. Justice Darling last December, but their lordships then disagreed, and the case now came on for a rehearing before an additional Judge, Mr. Justice Grantham.

This was the defendants' appeal from a decision of Mr. Dickinson, the magistrate sitting at the Thames Police-court in June last. It appeared that a summons was taken out by Mr. Crow, the District Surveyor, against the defendants for not having given him notice under Section 145 of the London Building Act, 1894, before commencing the construction of a number of boxes or inspection cham-

bers under the streets in the district for the purpose of electric lighting. The defendants were the local authority within the meaning of the Electric Lighting Acts, 1882 and 1888, for the district, and in the year 1892 were granted by the Board of Trade, pursuant to the Electric Lighting Acts, 1882 and 1888, in respect of such district a provisional order called the Whitechapel District Electric Supply Order, 1892, which was afterwards confirmed and came into force on June 27, 1892. By Sections 11 and 12 of this order, the "undertakers" were authorised to construct in any street any such boxes as might be necessary for purposes in connexion with the supply of electric energy, including apparatus for the proper ventilation of such boxes. The sections further provided that "every such box shall be for the exclusive use of the undertakers and under their sole control, except so far as the Board of Trade may otherwise order, and shall be used by the undertakers only for the purpose of leading off service lines and other distributing conductors, or for examining, testing, regulating, measuring, directing, or controlling the supply and energy, or for examining or testing the condition of the mains or other portions of the works, or for other like purposes connected with the undertaking, and the undertakers may place therein motor switches and other suitable and proper apparatus for any of the above purposes. Every such box, including the upper surface or covering thereof, shall be constructed of such materials, and shall be constructed and maintained by the undertakers in such manner as not to be a source of danger whether by reason of inequality of surface or otherwise." Section 12 further provided that the undertakers should one month before the commencement of such works, serve a notice upon the Postmaster-General describing the proposed works, together with a plan of the proposed works, and, in addition, a like notice and plan upon the County Council. The defendants did not, before commencing the construction of the boxes, serve Mr. Crow with notice of the intended work, under Section 145 of the London Building Act, 1894. Mr. Crow's contention was that the boxes came within the definition of "building structure or work" in Section 145, and that the defendants were bound before commencing the work to serve upon him as the District Surveyor a "building notice" as prescribed by the section. The defendants contended that the Act of 1894 did not apply at all to boxes constructed in the streets under the Provisional Order, inasmuch as the order contained a complete code regulating the materials, situation, and mode of construction of such boxes, and provided a complete machinery for enforcing such regulations, and with which special code and machinery the London Building Act of 1894 was inconsistent. The magistrate found as a fact that the boxes so constructed were "building structures or works" within the meaning of Section 145 of the London Building Act, 1894, and having regard to Sections 72, 201, and 203 of the said Act, he held that the provisions of Section 145 were not inconsistent with the special Act and imposed on the defendants the nominal penalty of 1s. and ordered them to pay 10l. 10s. costs. Hence the present appeal of the defendants.

Mr. Dickens, K.C., and Mr. Talbot appeared for the appellants (defendants); and Mr. Horace Avory, K.C., for the respondent (plaintiff).

At the conclusion of the arguments their lordships reserved judgment.

EMPLOYERS' LIABILITY ACT.

HOW SHOULD A CEILING SCAFFOLD BE FORMED?

AT Marylebone County Court on Monday, before Judge Stonor and a jury, Thomas Davies, a plasterer, Kensal Green, N.W., sought to recover damages, under the Employers' Liability Act, from Mr. David Henry Nash, builder, &c., Paddington, W., the claim being in respect of personal injuries sustained by the plaintiff owing, it was alleged, to a defect in the plant provided by the defendant, and negligence for which he was responsible.

Mr. H. Morris, counsel, appeared for the plaintiff, and Mr. E. Meller, counsel, for the defendant.

The plaintiff stated that on October 19 last he was in the employ of the defendant, doing plastering work at some new houses in Harvist-road, N.W. A scaffold, or platform, about 5 ft. high, had been erected in one of the rooms to enable the plasterers to put up the ceiling. This scaffold extended over the whole room, with the exception of a small space at the doorway, where there was a hole through which the men could pass up to the scaffold or down, and by which the plasterers sent up "course stuff" and the plaster. While working upon this scaffolding, and looking up at the ceiling, he (the plaintiff) slipped down the hole near the door, dislocating his right shoulder and bruising some of his ribs. In consequence of the accident he was prevented from doing any work for thirteen or fourteen weeks, for which he claimed 2l. a week. He further claimed with respect to the pain and suffering.

Cross-examined: He had got upon the scaffold and down again by means of the hole near the doorway both on the day of the accident and the previous day. He had been a plasterer for many

years, and considered that a hole in a scaffold, such as the one in question, was dangerous. A short board, he maintained, should have been used to cover the hole, the board being pushed aside when necessary.

No other witnesses were called for the plaintiff. The defendant maintained that the scaffold in question was erected in the ordinary way, and that it was customary to leave a hole in the platform without covering it with a small board.

The Judge: It is not practicable to put a short plank across the hole?

The defendant: I have never seen a plank or board put across.

Mr. Ernest George Harvey, builder, said that the defendant was doing certain work upon the houses in question under a contract with himself (witness). He had inspected the scaffold, and found it erected in the only way that he had ever seen such scaffolds put up.

The Judge: What about the hole?

The witness: It is usual to leave a hole as described.

George Townsend, foreman to the last witness, said that the scaffold in question was a very good one. It was usual, so far as his experience went to show, to have a hole in the platform.

The Judge: The only question of importance in this case is whether the hole was necessary and proper, and the balance of evidence is to the effect that it was so.

The jury found that the scaffold was properly and safely erected, and that the hole was necessary and proper. This was a verdict in favour of the defendant, for whom his honour gave judgment.

The Judge: There can be little doubt that the man is entitled to claim under the Workmen's Compensation Act.

Mr. Morris: There seemed to be some doubt with regard to a certain point in connexion with that Act.

The Judge: I cannot see the slightest reason to doubt. I think I cannot not find that there was "gross negligence" on the part of the plaintiff.

It was understood that the plaintiff would bring another action under the Workmen's Compensation Act, joining Mr. Harvey as a respondent. The whole question of costs was reserved.

IMPORTANT ACTION BY CONTRACTORS.

IN the Court of Appeal, composed of the Master of the Rolls and Lord Justices Collins and Romer, on the 20th ult., judgment was delivered in the case of Leslie & Co., Limited, v. the Managers of the Metropolitan Asylums District on the appeal of the plaintiffs from the judgment of a Divisional Court of King's Bench, composed of Justices Bigham and Phillimore, on April 2, 1900, the question in issue arising upon a contract entered into between the plaintiffs and the defendants for the erection of a hospital for infectious fevers at Hillier Green, Lewisham, the case coming before the Divisional Court by way of appeal by the defendants from the decision of an Official Referee. The case was reported fully in the issue of the *Builder* for April 7, 1900. A great part of the work in question had been let out to sub-contractors and experts called specialists, and the question for decision was as to who was to be responsible for alleged delay on the part of these sub-contractors. The contract was dated July 23, 1895, and it provided that the plaintiffs should execute "the works" shown on the plans, including the chimney stacks and heating apparatus. The work had to be completed in two years, and the price was to be 210,688l. The material clauses of the contract were these:—"The managers (*viz.*, the defendants) reserve to themselves the right to employ other parties to execute the works for which provisions are made, and to deduct the full provided amounts (*i.e.*, the prime cost plus 10 per cent. thereon) from the contract sum. In such cases the contractors (the plaintiffs) are to allow such parties every facility for the execution of their several works simultaneously with their own. The managers are to be at liberty to omit any provisional sums or quantities. The contractors are to pay the sub-contractors the amount provided in the contract for such purpose, or less or more as may be certified, and the payments thus made will be considered as work done by the contractors, and will be included in the certificate to the contractors next following such payment. No payment is to be made to such sub-contractors, except upon the architect's certificate. The contractor is to pay such amount as may be certified from time to time, within seven days from the date of the certificate, and should the contractor neglect, or refuse, to make such payment within the said period, the managers shall be at liberty to pay the amount direct to such sub-contractor, and to deduct from the contract sum the gross amount which the contractors have included in their estimate in respect of such work and his profit thereon, the amount so to be deducted not being less in any case than such amount so certified. The contractors are to attend with all building trades upon the sub-contractors, which is to include "cutting away from the same and making good after the same, and allowing the free use of such plant, tackle, and scaffolding as the contractors may be using for their

own purposes." The contract also provided that the contractors were to allow such persons full opportunity to carry on their works simultaneously with their own. The contract also provided for the retention by the defendants of 10,000*l.* as security for its due performance. Alterations and omissions from the specifications were to be allowed, and made only on the direction in writing of the architect. Among the works to be erected were twenty-nine chimney-stacks at the price of 137*l.* 10*s.* for each stack. The contract went on: "The contractor shall provide the sum of 137*l.* 10*s.* prime cost for each central stack of flues in large wards above the level of the ground floor." It then provided how they were to be constructed, and that they were to be finished complete by a specialist potter. It also provided that the contractors were to supply all necessary "scaffolding, plant, water, and hoisting." The plaintiffs then communicated with Messrs. Doulton, who agreed to do the necessary work. Part of the claim in the action arose from the alleged delay on the part of Messrs. Doulton to do the necessary work. Another claim arose from a sub-contractor for the supply of the necessary steam and hot-water apparatus. The clause relating to that provided that the hot-water supplies to baths, lavatories and sinks, except where otherwise specified, should be done by specialists; but the contractor was to attend on, and cut a way for, and make good after them. A sub-contract was made on February 2 between the plaintiffs and Messrs. Berry & Sons, by which the latter agreed to supply this apparatus for 11,000*l.*, and it was said that Messrs. Berry had been guilty of delay in executing this work. Owing to these alleged delays, the plaintiffs could not complete the works as per the architect's certificate and payment accordingly. The plaintiffs therefore claimed damages on the footing that there was an obligation on the defendants to see that the work was done by the specialists and sub-contractors within a reasonable time. The case was referred to an Official Referee, when counsel for the defendants asked the learned Referee to non-suit the plaintiffs on the ground that Messrs. Doulton and Berry on the contract were the sub-contractors with the plaintiffs, and any delay lay against them and not with the defendants.

The learned Referee refused to non-suit, and from this decision the defendants appealed to the Divisional Court, which held that in the circumstances the plaintiffs were not entitled under the contract to recover the damages from the defendants. From this decision the plaintiffs now appealed.

Mr. R. M. Bray, K.C., and Mr. T. Ribton appeared for the appellants (plaintiffs); and Mr. English Harrison, K.C., and Mr. H. Smith for respondents (defendants).

The Master of the Rolls in giving judgment, having referred to the material clauses in the contract and to the facts, said that two instances as to what took place with regard to the specialists had been argued before them; one relating to Messrs. Doulton & Co.'s work and the other to Messrs. Berry & Co. for the hot-water arrangements. Having gone in detail through the matters relating to Messrs. Doulton & Co.'s work, in his lordship's opinion it would not be necessary to go in detail as to what took place with regard to Messrs. Berry & Co. Messrs. Doulton & Co. were behind in the erection of their work whereby the plaintiffs were hindered in getting on with the other work contracted for under their contract. How in these circumstances were the defendants liable for the delays of Doulton & Co.? The plaintiffs' case was that the defendants were liable to them for these delays. How so? The defendants never contracted with Messrs. Doulton & Co. The persons who contracted with Messrs. Doulton & Co. were the plaintiffs, and the plaintiffs alone. Messrs. Doulton & Co. were sub-contractors, and their work was work which the plaintiffs had contracted with the defendants to provide. The defendants never paid Messrs. Doulton & Co. one penny for their work, and were never under any liability to them. Messrs. Doulton & Co. were paid by the plaintiffs for their work, and his lordship thought that the Divisional Court were right in holding that the defendants were not liable to the plaintiffs for the delays of Messrs. Doulton & Co. If any one had a remedy against Messrs. Doulton & Co. for delay, it was the plaintiffs and not the defendants. It was next argued that if the plaintiffs could sue Messrs. Doulton & Co. for delay, they could sue the defendants as trustees for the defendants, and if the plaintiffs recovered damages against Messrs. Doulton & Co. for delaying them, they would have to hand over the damages recovered to the defendants. His lordship did not agree with that contention. The truth was there was no trust at all. Messrs. Berry & Co. were also behindhand with their work, and what his lordship had said with regard to Messrs. Doulton & Co. applied to them. Their case was fully argued out and he had nothing to say more than this, that Messrs. Berry's case was, if anything, stronger than Messrs. Doulton & Co.'s case, because the order given in that case was more specific in detail than that given in Messrs. Doulton & Co.'s case. In his lordship's opinion the decision of the Divisional Court was right and the appeal must be dismissed.

Lords Justices Collins and Romer concurred, and the appeal was accordingly dismissed with costs.

WORKMEN'S COMPENSATION ACT.

WHAT IS AN "ACCIDENT"?

THE case, *Perry v. Baker & Sons*, reported in these columns last week, came again before Judge Stonor on Tuesday at Marylebone County Court.

The applicant, it may be recollected, was Richard Perry, a carpenter and joiner, 11, Napier-road, College-park, N.W., who brought an action under the Workmen's Compensation Act against Messrs. Baker & Sons, Hythe-road Works and High-road, Willesden Green, the claim being in respect of personal injuries said to have been sustained by the applicant whilst in the respondents' employ. On September 15 last the applicant was ordered by the respondents' foreman to make a large, heavy seat. While lifting this piece of work, to see a joint underneath, he strained a muscle in the side of his abdomen. The chief points in the defence were that the man was told not to attempt to lift the seat without assistance, and, as a point of law, that the man had not met with an accident within the meaning of the Act.

Mr. A. H. D. Nonweiler, solicitor, now appeared for the applicant, and Mr. Hohler, counsel, for the respondents.

Mr. Nonweiler reminded his Honour that the case had been adjourned after the question was raised as to whether there had been an accident within the meaning of the Act. He now wished to draw attention to the fact that the respondents, in their answers to interrogatories, stated that they had paid the applicant all the compensation to which he was entitled under the provisions of the Workmen's Compensation Act.

Mr. Hohler pointed out that in another portion of the answers to the interrogatories it was submitted that the applicant's injuries were not caused by an accident arising out of, and in the ordinary course of, his employment.

Mr. Nonweiler said it was evident that the respondents had admitted that the applicant was entitled to some compensation in respect of his injuries, and having paid the man compensation to January 22, 1901, it was useless for the learned counsel on the other side now to come before the Court and submit that there had been no accident.

The Judge remarked that the respondents, in their answers, distinctly denied that there had been an accident arising out of, or in the ordinary course of, the man's employment.

Mr. Nonweiler, quoting from Pitt-Lewis's "Yearly County Court Practice," pointed out that an accident was there so defined as "to include every phase of personal injuries, provided they involved some fortuitous and unexpected event."

The Judge remarked that in several cases recently decided it had been held that when something happened to a person, without an external cause to produce it, there was no accident. At least, such was the tendency of the decisions, but he could not say whether, after a few more appeals had been brought before the House of Lords, a proper and satisfactory interpretation of an accident might not be given.

Mr. Nonweiler quoted from the case *Hamlyn v. The Crown Accident Insurance Company* (1893, 1 Q.B. 750), where a man, in stretching to pick up a marble which had rolled on the floor, strained and hurt himself; it was held to have been an "accident." In the present case also he (Mr. Nonweiler) asked his Honour to say that there was an accident within the meaning of the Act.

The Judge: I should have no hesitation in saying that, from a common-sense point of view, there was an accident, but I should not be prepared to say that there was an accident within the meaning of the Act.

Mr. Hohler went on to submit that in the present case, although the man sustained "injuries," he did not meet with an "accident" within the meaning of the Act. The man's exertion in lifting the seat might have caused his injuries, but no one could say that there was an accident. Suppose, continued the learned counsel, a man running to catch a train fell, and, putting out his hand, injured it. That would be an accident. But if, on the other hand, the man fell, owing to the failure of his heart, there would be no "accident," although there might be an "injury."

The Judge: In the present case there is evidence of a muscle being strained or giving way, and I cannot see the difference between an instrument or tool breaking and a muscle giving way. There would appear to be an accident in each case.

Mr. Hohler submitted that while the breaking of an instrument might be looked upon as an accident, the breaking or straining of a muscle involved an "injury," and not an "accident."

The Judge: I must reserve my judgment.

ACTION BY AN ARCHITECT FOR FEES.

THE hearing of the case of *Matcham v. The Northern Theatres Company, Limited*, was concluded on the 29th ult. before Mr. Justice Mathew and a Special Jury in the King's Bench Division. It was an action by Mr. Frank Matcham, architect, against the defendants to recover 1,050*l.* 12*s.* for fees and charges for designing plans and obtaining tenders for the erection of a proposed new theatre

at Huddersfield. The case for the defendants was that the charges were excessive and unreasonable, and further that plaintiff was employed as their architect for the construction of the theatre for a commission of 4 per cent. on the cost of the building, subject to the express condition that the cost of the theatre was not to exceed 15,000*l.* That the minimum cost of the theatre if built according to the plaintiff's plans would have been 28,000*l.*, and they therefore decided that the building should not be proceeded with, and that the work executed by the plaintiff was of no use to the defendants. In these circumstances the defendants pleaded that they were not bound to pay the plaintiff anything.

The plaintiff in his evidence stated that on May 3, 1898, he saw Mr. Robinson, one of the directors of the defendant company, with reference to the erection of the theatre, and then it was mentioned that the cost of the theatre was to be about 15,000*l.*, but plaintiff said he could express no opinion as to the cost until he saw the site. He was appointed architect, and was to be paid 5 per cent. on the lowest tender. A local architect was to act with him, and was to receive 1 per cent. out of his (plaintiff's) commission. He did all the necessary work and employed a quantity surveyor to get out the quantities. On January 17, 1900, the directors made up their minds not to proceed with the erection of the theatre. No suggestion was ever made up to the time that he was not to be paid if the cost of the theatre exceeded 15,000*l.* It was at first resolved that the theatre should be built of brick and terra-cotta, but the ground landlord objected to this and insisted on stone being used. This involved greater expense than had been foreseen.

Evidence was given that the plans and quantities were carefully prepared, and that the extras proposed to be added to the theatre involved an additional cost of 7,405*l.* When the work was not carried out the custom was that the architect should receive 2½ per cent. on the estimated cost of the building.

For the defence it was contended that the essential point of the plaintiff's employment was that the cost of the theatre was to be limited to 15,000*l.*, and that he was to prepare plans for a building to be constructed at that cost, but the plans which he had prepared were of no use to the defendants, for the theatre he designed would have cost 28,000*l.*

Evidence having been given in support of the defendants' case the jury in the result returned a verdict for the plaintiff for 325*l.*, and judgment was entered accordingly.

Mr. Crispe, K.C., and Mr. Spencer Bowen appeared as counsel for the plaintiff; and Mr. Lawson Walton, K.C., and Mr. Willes-Chitty for the defendants.

IMPORTANT BUILDING CASE.

THE case of *in re an Arbitration between Ford & Co. and Bemrose & Sons, Limited*, came before a Divisional Court of King's Bench, composed of Justices Kennedy and Phillimore, on the 1st. inst., in the form of a special case stated by Mr. Robert Vigers, the umpire, under a submission contained in a contract dated May 28, 1895, and made between Messrs. Bemrose & Sons, Limited, printers, of the one part, and Messrs. Ford & Co. of the other part. From the case stated it appeared that at some time prior to the date of the contract of May, 1895, Messrs. Bemrose instructed Mr. Ernest R. Ridgeway, an architect, of Long Eaton, to prepare on their behalf plans for the erection of certain works in Park-street, Canal-street, and Carrington-street, Derby, and to invite tenders for the execution of such works. Mr. Ridgeway prepared the plans and invited tenders upon such plans and certain conditions of contract and bill of quantities, and with such tender furnished a schedule of prices. Such schedule of prices was for the purpose of determining the amount to be paid or allowed in respect of any alterations or deviations from the original plans which might be determined upon during the progress of the works, and the prices in the schedule were the prices referred to in the contract as the prices upon which the contract was based. Messrs. Ford's tender was accepted, and the contract in question entered into between Messrs. Bemrose and Messrs. Ford. The contract followed and incorporated and formed one document with a copy of the conditions of contract upon which Messrs. Ford tendered. The material clauses of the contract provided that the work was to be executed in strict accordance with the requirements of the specifications and drawings to the satisfaction of Messrs. Bemrose or their architect. That the drawings and specifications are to be considered as equally binding on the contractors who undertake the execution of the work, and if any part is omitted from the drawings and specifications which is usually noted or given or described in them, and which may be reasonably inferred from them as being necessary to properly carry out and complete the works, the same shall be equally binding on the contractors as if it had been specially shown or described. Any alteration of the works contracted for which may be decided upon during their progress must be carried out at prices on which the contract is based, and the value of the alteration or deviation from the original plans, after being so calculated by the contractors and the architect, shall be added to or deducted from the

amount of the contract as the case may be, but in no case with any alteration or deviation from the original plans and specifications be allowed to invalidate the contract." The contract provided that all disputes should be referred to arbitration under the Arbitration Act, 1880, and contained a covenant by Messrs. Ford that they would "do and perform the whole of the works required in accordance with the plans and specifications for the erection of the new works, and provide all labour, plant, and materials, &c., of whatsoever kind required, at and for the sum of 10,550*l.*" Messrs. Ford completed the work included in the contract, and on April 1, 1900, Mr. Ridgeway, by his final certificate, certified that there was a balance owing to Messrs. Ford of 1,530*l.* 13*s.* 5*d.*; but the latter being dissatisfied with it, and other disputes having arisen under the contract, recourse was had to the arbitration clause in the contract. It was alleged before the arbitrator, and the arbitrator found as a fact, that the quantities set forth and stated in the bill of quantities upon which tenders were invited were in material and substantial respects insufficient, and that the actual quantities of the works required to be executed in carrying out the works in accordance with the plans exceeded those in the bill of quantities. It was also alleged before the arbitrator, and found by him to be the fact, that it was a general usage in the building trade that where tenders are invited for the erection of works in accordance with plans, and a bill of quantities is furnished, a person making a tender is not expected to verify the quantities himself, but is expected to assume that the quantities are correct and to tender upon that assumption; that if such quantities proved to be greater or less than the actual quantities the price was to be reduced or increased by an amount ascertained and determined by the scale of prices given in the tender as the scale by which payment for extras were to be determined. The arbitrator also found as a fact that Messrs. Ford did not verify the quantities, and tendered and entered into the agreement on the assumption that the quantities were correct. He also found that various alterations of the works contracted for were decided upon during the progress of the works, and that the sum of 3,281*l.* was to be added to the contract price in respect of such alterations and deviations; that the total value of the work executed, at the prices upon which the contract was based, was 13,830*l.*; and that 8,730*l.* had been paid to Messrs. Ford by Messrs. Bemrose.

The questions left to the Court by the arbitrator to determine were:

1. Whether in ascertaining the amount to be paid by Messrs. Bemrose to Messrs. Ford regard was to be had to the aforesaid usage in the building trade.

2. Whether Messrs. Ford were entitled only to be paid the sum of 10,550*l.* mentioned in the contract, with such deductions and additions as were by the contract provided to be made in respect of alterations or deviations from the original plans determined upon during the progress of the work, or

3. Whether Messrs. Ford were entitled to be paid the value of all the works actually executed by them at the prices upon which the contract was based, and whether such value should be more or less than the sum of 10,550*l.* mentioned in the contract.

The arbitrator certified that if the Court answered Question 1 in the affirmative, 5,090*l.* remained due to Messrs. Ford; Question 2 in the affirmative, 2,298*l.* 10*s.* was due to Messrs. Ford; and question 3 in the affirmative, 5,090*l.* was payable by Messrs. Bemrose to Messrs. Ford.

Mr. Joseph Walton, K.C., and Mr. Hudson appeared for Messrs. Ford & Co., and the Hon. Alfred Lyttelton, K.C., and Mr. Coventry for Messrs. Bemrose & Sons, Limited.

At the conclusion of the arguments of counsel, Mr. Justice Kennedy, in giving judgment, said that he and his learned brother were both of opinion that the builders were entitled to succeed. The builders accepted a contract to build certain structures for a definite sum of 10,550*l.*, and they accepted that burden upon the basis of a certain plan which formed part of the contract, and which showed what was to be built. They also accepted the contract on the basis that a document furnished by the building owners formed part of the contract, viz., a document which was in a sense a bill of quantities and in a sense a specification. The contract was accepted by the builder by a tender based upon that specification and upon the plan. In his opinion, he thought the builders had a right to say that they had contracted upon the basis of the accuracy of the representations contained in the quantities forming part of the specification. The builder said, "It is true I agreed to erect seventy-two buildings as planned for 10,550*l.*, but only upon the basis that the quantities required to be put into that building to perform my work do not exceed the quantities which you yourself represented in the specification were all that were necessary. In his Lordship's view, the true and logical way to put the builders' case before the arbitrator was that there had been a breach of that which they were entitled to treat as a representation or warranty forming part of the contract, and to the extent to which the warranty was not fulfilled, and they were thereby damaged, they would be entitled to receive compensation. His Lordship was of opinion that there was no reason to decide the question of usage

raised before the arbitrator, because in the circumstances he should hold that the builders were entitled to recover the amount claimed irrespective of any custom or usage in such a case.

Mr. Justice Phillimore concurred, and judgment was accordingly entered for Messrs. Ford & Co., the builders, for 5,090*l.*

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

27.—ELECTRICAL ARC LAMPS: *H. Lyon and J. B. Talbot-Crosbie.*—The frame of an enclosed arc lamp comprises a cover, a central tube, an insulated guide, and other parts; to a screwed projection from a plate is attached, with packing and a coupling-nut, a flanged arc-enclosing cylinder; a packed collar and nut clamp the lower carbon holder on to the cylinder, and a screw-nut fastens the upper carbon in a split socket mounted upon a tube that slides in a guide and is sustained with a clutch worked by the tubular core of series and blunt coils after the kind specified in No. 17,808 of 1894; plates carry the solenoids which have an adjustable stop-nut for limiting the stroke of the core; the tube which carries the split socket is passed through the core, and its piston, mounted upon a rod, acts as a dash-pot.

41.—BUILDERS' WORK: *A. Rincklake.*—For the construction of ceilings, roofs, and arches the inventor employs expanded or perforated metal or else wire gauze to serve as curved openwork permanent centres, to be fixed between the flanges of the girders. Over the centering thus obtained is stretched a cloth of jute canvas, and then layers of mortar, plaster, or cement; a layer of cement and masonry or brickwork should be filled in the space above.

57.—MEANS OF ESCAPE FROM FIRE: *J. F. Bales.*—The main principle of the invention lies in fitting lifts in the interior of hollow pillars or columns that are built up against the front of the building; the pillars are open at their sides, and persons can effect their escape by means of a platform (in front of the windows) from which they can make their way to cages within the pillars, the platform being hinged on the lift, from which it can be lowered out with a rope; in another shape a platform extends between two adjacent cages with which it will both rise and fall.

70.—REFACING OF VALVE SEATS: *A. A. Jones.*—A tool for use in refacing valve seats comprises a cone which is to be screwed into the opening in the valve casing, and a hub (mounted upon the same axis) which is then screwed down until a spiral spring beneath the cone forces the cutter against the valve seat, when the cutter can be turned with a wrench.

90.—TILES FOR ROOFING PURPOSES: *E. Hufters and P. Bräidenbach.*—The upper portion of the tile is dished and has an upper rib with a middle drainage channel or groove. At the top of the side groove is a projection that will prevent water from entering into the groove, whilst its flow is facilitated with recesses that are cut in the underside of the tile. A moulding machine for the tiles of clay, cement, and other materials has a metal mould-plate in a table. After the clay has been levelled with a straight-edge the grooves are fashioned by means of two arms pivoted at 90 deg. in respect of one another at the sides of the table and moved by a counter-weighted foot-lever and links. Another foot-lever, which is pivoted on to a plate having vertical pins that slide through the table and press against the mould-plate serves for lifting the loose mould-plate with the moulded tile.

108.—NIPPERS FOR GRIPPING OR CUTTING PURPOSES: *W. A. Bernard.*—The jaws are pivoted on to connecting-plates as well as on to the hollow handles, and are spread out at their ends. To the handles and jaws are pivoted respectively two bars which extend beyond the handle-pivots, so that they may carry screws for stops. The nipper is held open, under ordinary conditions, by means of a spring that presses upon one handle and one bar. The plates and bars will freely pass over the wire or other work which is to be gripped or cut.

112.—A COMPOSITION FOR FLOORINGS, LININGS, AND OTHER PURPOSES: *S. F. Ridley, G. H. Whitley, and W. R. Whitley (Ridley, Whitley, & Co.).*—The material consists of granulated cork-waste, paper, wood, rags, mealy coals, and other substances mixed with some binding material that contains lime and casein, subjected to great pressure and then heated to a temperature of between 100 deg. and 200 deg. Centigrade that will harden the casein. The compound is described as being available for many various uses, and reference is made to No. 19,459 of 1892.

151.—AN APPLIANCE FOR TRAPS: *W. Kesselring and E. Röhrenbacher.*—The inventors' object is to provide means for preventing the trap from becoming unsealed. They provide it with an auxiliary plate so arranged as to form an additional passage which makes a junction between the top of the outlet chamber and the bottom of the inlet.

163.—ELECTRICAL SWITCHES: *P. C. McFarlane and D. Reid.*—For ensuring a make and a break

periodically a contact-spring is fitted upon one of the arms of an escapement from which, however, it is insulated. The spring is connected by means of a spring to a terminal, and at intervals will make contact with pins which are mounted upon the escapement wheel.

164.—INCANDESCENT LAMPS (ELECTRICAL): *C. M. Stead.*—The central reflector, which is surrounded with a filament, may be suspended with a thin glass stem from either end of the lamp-bulb. The filament consists of either a single coil or of a three or four fold filament carried near the reflector. If the lamp-bulb is made annular in shape it will encompass the filament and have an open recess for taking the silvered glass or opal ribbed reflector.

166.—A SPANNER: *T. W. Wills.*—The fixed jaw is mounted upon a toothed stem upon which the movable jaw slides; a block that slides crosswise through the movable jaw serves to lock it, and teeth upon the block are set in engagement with the teeth upon the stem of the movable jaw. When the plain portion of the block has been forced over the teeth upon the stem, the movable jaw is liberated for its necessary movement.

171.—PROCESS OF SAWING STONE: *J. T. Whellam.*—At the corner-posts of the carriage (constructed of angle and H-bars) are wheels which guide the saw-frame. Cranks and connecting-rods impart a reciprocating motion to the carriage, which is mounted upon wheels that run upon fixed rails, the arc turned upwards at the end of the travel. The stone trolley is caused to run underneath the carriage from one end, and the saw-frame can be raised by means of a winch. The frame has slotted bars at its ends in which the saws are secured with wedges.

187.—COPING-TILES: *W. A. Williams.*—Glass, slate, stone, concrete, metal, or other tiles are fashioned with angular, curved, or M-shaped sections, and with over-hanging gutters in order to prevent water from trickling down and wetting the walls. A stop or flange can be made at the end of the channel of the tile, together with an outlet hole for the attachment of a water-pipe, the end tiles have throated lips for carrying water clear from the wall, and the tiles are set in cement with flanged, rebated, dove-tailed or tongued and grooved joints.

206.—A TOOL FOR LIFTING PURPOSES: *J. C. W. Schöpfer.*—For lifting heavy bodies as well as for extracting nails, and so on, is devised a tool which comprises a lever, of which the rounded end will roll upon the curved face of a frame or block. In order that the extreme point of the rounded end of the lever shall move in a vertical line, the radii of the curved surface and of the rounded end are in the ratio of 2:1. In order that the lever shall not slide downwards, it is pivoted on to a bar that slides horizontally, or it may be fitted with a pin that will slide within a horizontal slot cut in the frame or in a projection from the frame.

225.—MANUFACTURE OF BRICKS: *M. F. Solow.*—The bricks are composed of finely-pulverised and moulded marl dusted with ground clay, again pressed, and then, having been fired, dipped into a glazing solution and fired again. By another process the glaze and clay are mixed with the marl in the press.

230.—A FLOATING BATH, &c.: *T. Bradley.*—The floating bath, that may be used as a circus, theatre, and so on, is intended to be moored to and to form portion of a floating pier. The central bath is surrounded with water-tight compartments, and is fitted with a movable bottom secured with locking bolts to be worked by the hand. Upon the withdrawal of the bolts the bottom will rise and serve for a floor, which can be lowered by causing water to flow into the compartments which constitute the base of the floor. A side-stage is raised and lowered by similar means. Promenades, rows of seats, and stabling, &c., are ranged around the bath.

246.—AN ELECTRICAL CUT-OUT: *F. Headley.*—In a minimum magnetic cut-out the inventor fits a catch upon the connecting-bridge of the lever that will engage with a latch upon one end of another lever whose other end constitutes the armature of a series electro-magnet. The armature is kept out of the way with a spring, but will spring out to release the catch in the event of the current falling below minimum strength, whereupon the circuit-breaker is operated with another spring. For a maximum cut-out it is contrived that the catch shall be retained when the armature is away from the core, the catch being released through the attraction of the armature by the strength of the current.

286.—AN APPLIANCE FOR CRANES: *W. L. Spence.*—In the base of the crane roller chains that travel between skates and the rails are substituted for the ordinary wheels, a ratchet serves for the traversing motion, and a chain may also be employed for driving the winding-barrel.

316.—THE MOULDING OF BRICKS: *J. L. Vandenhovel.*—An endless chain turns an annular channel-iron frame which carries the moulds and is joined with eye-bolts or spokes to a hub, rollers upon cam rails carry forked pressing-plungers and the mould-table runs upon circular rails, provision is made for the automatic turning up and down of the pivoted covers of the moulds which remain closed during the operation of pressing, by means

of rollers—adapted for running upon a fixed cam rail—which carry vertical sliding-ridges at whose upper ends are slotted arms which impinge upon the belt-crank levers on to which the covers are hinged, whilst rollers upon the cover tops press against circular plates beneath a radial beam.

320.—PLATES FOR ROOFING PURPOSES: W. Martin.—For cutting roofing-plates and clipping their corners before the plates are tinned. The feed-roller and a presser-roller of the machine feed the sheet or plate with an intermittent pressure, as spring arms worked with sector-shaped adjustable cams operate the presser-roller; a reciprocating bar carries the knives, and whilst the blank is being cut it is held up with automatically-moved pivoted arms that will again be opened outwards for the falling of the sheet.

MEETINGS.

FRIDAY, MAY 3.

Architectural Association Discussion Section.—Mr. E. Greenop on "The Ethics of Professional Advertising," 7 p.m.

Institution of Junior Engineers (Westminster Palace Hotel).—The Northcott prize paper on "How may the best efforts of Employer and Employed be exerted for their mutual advantage and for the National Benefit?" by Mr. William Powrie, will be read and discussed, 8 p.m.

Society of Arts (Howard Lectures).—Mr. Alfred C. Eborall on "Polyphase Electric Working," II. 8 p.m.

SATURDAY, MAY 4.

Architectural Association.—Visit to Newgate Gaol, 3 p.m.

British Institute of Certified Carpenters.—Mr. W. J. Collins on "Trades Training in the Future," 8 p.m.

Edinburgh Architectural Association.—Geological ramble in Queen's Park.

MONDAY, MAY 6.

Royal Institute of British Architects.—Annual general meeting, 8 p.m.

Society of Arts (Cantor Lectures).—Sir W. Chandler Roberts-Austen and Mr. T. Kirke Rose, D.Sc., on "Alloys," III. 8 p.m.

Society of Engineers.—Mr. T. B. Grierson on "The Treatment of Low-Grade Iron Ores for the Smelting Furnace," 7.30 p.m.

Liverpool Architectural Society.—Annual general meeting, (1) Annual Report of Council and Financial Statement; (2) Election of Officers and Council for the Fifty-fourth Session; (3) Closing Address by the President, Professor F. M. Simpson, 6 p.m.

WEDNESDAY, MAY 8.

Institute of Sanitary Engineers.—General Purposes and Finance Committee at 7 p.m. Election Committee at 5.15 p.m. Council Meeting at 7 p.m.

THURSDAY, MAY 9.

Carpenters' Hall, London Wall (Lectures on Carpentery and Joinery).—Mr. S. Barber on "The Joiney of a Room," 7.30 p.m.

Institution of Electrical Engineers.—Mr. J. S. Highfield on "Storage Batteries in Electric Power Stations, Controlled by Reversible Boosters," 8 p.m.

FRIDAY, MAY 10.

Architectural Association.—(1) Mr. Alfred Hands, F.R.M.S., on "The Protection of Buildings from Lightning" (Illustrated by lantern views); (2) Election of officers, 7.30 p.m.

Society of Arts (Howard Lectures).—Mr. Alfred C. Eborall on "Polyphase Electric Working," III. 8 p.m.

SATURDAY, MAY 11.

Royal Institution.—Professor W. M. Flinders Petrie on "The Rise of Civilization in Egypt," I. 3 p.m.

Northern Architectural Association.—Visit to Collingwood-street and Quayside Buildings, Newcastle, 3 p.m.

ST. MATTHEW'S CHURCH CHAPEL, ALLERTON, LEEDS - MR. G. F. BOBLY, A.R.A., ARCHITECT

PRICES CURRENT OF MATERIALS.

* * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest quality and quantity obviously affect prices—a fact which could be remembered by those who make use of this information.

Table listing various materials like Hard Stocks, Grizzles, Shipping, etc. with prices in £ s. d. and per 1000 or per ton.

NOTE.—The cement and lime is exclusive of the ordinary charge for bags.

STONE.

Table listing stone materials like Ancaster in blocks, Bath, Portland Cement, etc. with prices.

SLATES.

Table listing slate materials like 20x10 best blue Bangor, 16x8 best blue Portman, etc.

TILES.

Table listing tile materials like Best plain red roofing tiles, Best Broseley tiles, etc.

WOOD.

BUILDING WOOD.—YELLOW.

Table listing yellow building wood materials like Deals: best 3in by 11in, Battens: best 2 1/2 by 6, etc.

PRICES CURRENT (Continued).

WOOD.

Table listing various wood materials like Fir timber, Pine, Joists, Girders, Rolled Steel Joists, etc. with prices.

JOISTS, GIRDERS, &c.

Table listing joists and girders materials like Rolled Steel Joists, Compound Girders, etc.

METALS.

Table listing metal materials like Iron—Common Bars, Sheet Iron, Galvanised, etc.

PRICES CURRENT (

METALS.

Table listing metal materials like Brass—Strong Sheet, Tin—English Ingots, Solder—Plumbers, etc.

ENGLISH SHEET GLASS IN CRATES.

Table listing English sheet glass materials like 15 oz. thirds, 21 oz. thirds, etc.

OILS, &c.

Table listing oil materials like Raw Linseed Oil in pipes, Turpentine, etc.

VARNISHES, &c.

Table listing varnish materials like Fine Elastic Copal Varnish, Best Hard Copal Varnish, etc.

TO CORRESPONDENTS.

E. L. (Next week). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays, N.B.—We cannot publish tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.]

Table listing tender information for Aberdeen, including contractors like Pringle & Glessor, Plastering—Stephen & Sons, etc.

[See also next page.]

AYTHORP ROOTHING (Essex).—For a pair of cottages. Mr. R. Mawhood, architect :—
E. Hockley..... £395 | F. Harman, Dunmow* £320
T. Harris..... 350

BARROW-IN-FURNESS.—For the erection of school buildings, Vickerstown, for the School Board. Mr. H. T. Fowler, architect, Ramsden-square, Barrow-in-Furness. Quantities by the architect :—

<i>Excavating, Drainage, Bricklaying, and Joinery.</i>

Architecture at the Paris Salon.

HE present year starts a new epoch for the Paris Salons, for having been driven about, for several years back, from one position to another, since the

commencement of the preparations for the 1900 Exhibition, they have now at last got into a building which is to be their permanent home for many years to come, viz., the Grand Palais de l'Art which was erected in connexion with the Exhibition in the first instance, but also as a permanent art-gallery for the future. The building seems almost to have been designed with a view to providing for the separation of the two Salons, the Old and New; since the plan, as described last year, consists of two main divisions, differently arranged and treated, but connected internally. The larger division of the plan, next the gardens, consists of a block of building in this shape with a grand double staircase in the shank opposite the main entrance; this has two stories of galleries surrounding a great central court roofed with glass. The other division forms a long block joining on to the shank, and nearly but not quite parallel to the larger block, the line of its outer façade being governed by the line of the Avenue d'Antin, to which it faces. In this block there is a circular central hall and dome, with staircases ascending to right and left parallel with the long elevation; and in this block, which is the smaller but architecturally the more effectively arranged of the two, the new Salon has its abode, the larger block, with nearly the whole of the central court, being occupied by the Old Salon. The amicable arrangement by which, at the Galerie des Machines, one entrance fee admitted to both Salons, has been abandoned; there are separate entrances, and a "wicket" between the two Salons, which cannot be passed in either direction without payment. The arrangement is not convenient, nor is it the best in the interests of the two exhibitions.

In our title we have only named "the

Paris Salon" in the singular number, for at the New Salon there is this year no architectural department worth mention, the exhibits being confined to a few specimens of furniture designed by architects. At the Old Salon the upper story of galleries is devoted to paintings, the ground stories to engravings, drawings, and architecture, the latter occupying one-half the ground-floor space, so that it is provided for in a better and more dignified manner than at the Palais de l'Industrie, where it had only two rooms and the gallery round the central court, into which no one ever went. It cannot be said that the present architectural galleries are very much frequented, but they are part of the main suite, at all events.

As usual, the leading exhibit of the year is one of those collections of classic restoration drawings on an immense scale, which come from the Villa Medici. This is M. Tournaire's "Delphi"—drawings of the actual state of the ruins, and a complete restoration of the whole site. As to the disposition of the temples and shrines, the *état actuel* gives more data than is the case with many of these restorations. The restored elevation shows a crowd of temples, shrines, treasure-houses, &c., rising up the hill and flanking the Sacred Way, and at the top the long side façade of the Doric temple, with an ugly break cut out of its line of roof for a hypethral opening, with an effect which seems in itself the best argument against this theory of the mode of lighting a Greek temple; the Greek architectural eye would surely never have put up with that. Towards the right of the mass of buildings is a colossal nude statue of Apollo. There are two exceedingly good drawings of two of the recovered bronze statues in their actual state, and a drawing of a curious column, for which we are not given the data, in which the fluting is interrupted at regular intervals by a growth of acanthus leaves. If this is a true detail, based on facts, it adds to the other evidence, which crops up from time to time, that Greek architectural design was not so devoid of varieties and even eccentricities as we are in the habit of supposing.

Besides the usual classic restoration scheme from Rome, we have also the usual ultra-sublime conceptions of the students of the Ecole des Beaux-Arts at home, who are given an abstract idea to put into architectural

form, without apparently the slightest limiting condition as to size, cost, or practicability of execution. This year the subject is "Monument aux Héros de l'Indépendance," and the design made by M. Ferret and M. André Collin for this (numbered 3,801 in the catalogue) contains some really fine ideas in architectural treatment, the whole spoiled and the scale reduced by the enormous colossal figure cut in the rock above it. There are two or three other drawings by competitors in the same subject, which are simply preposterous, and represent things which, in a practical and economic sense, could never possibly be built. Is it any real benefit to architectural students to be encouraged to do this kind of thing? It is so easy to be sublime (on paper) when you are left without any limits as to size or cost; it would surely be better if students were either given the limit of size of the site, or a limit of proposed cost. It would be much better practice for them to see what effect they could produce within that limit, than to draw out these architectural nightmares.

Apart from these, there is rather more representation of current architecture actually carried out, or to be carried out, than we usually find among the Salon exhibits. Among these is the new Hôtel de Ville of Versailles, by M. Le Grand, illustrated in a fine set of drawings. It presents the usual general type of a French suburban hôtel de ville, with high roofs and a flèche or spirelet on the ridge, and triple entrance doors in the centre of the ground story; but it has a character of its own, produced partly by the bold projection of the two ends of the façade, partly by the breadth of treatment of the upper story with its coupled rusticated columns and mullioned windows between; in the photograph from the actual building it looks even better than in the drawings. M. Doré exhibits the drawings of his Hôtel de Ville for Lens, a building of considerable originality, in a very free Renaissance style; the principal story shows large square-headed windows with a carved enrichment worked along the top and half-way down the jambs, the rest plain—a piquant effect. Above these windows is a very boldly-carved frieze in high relief, of figures and scrolls combined.

Two of the best, perhaps the best, exhibits of recently executed work are shown by M. Hermant; the Caserne des Célestins,

Boulevard Henri IV., and the houses forming Nos. 132 and 134 in Rue Réaumur. The caserne is a military barracks in three blocks separated by a space and entrance gates; in the general design of the blocks there is a certain similarity, but the centre block is kept lower than the side ones, and the outer blocks have a modillion cornice, the centre one a plain cornice. On the other hand, the entrance in the middle of the centre block is the ornamental point of the building, with decorative iron gates of fine design, and sculptured spandrel figures above the arch. This centre portion is shown in a remarkably fine and very large washed detail elevation,* about as fine an example of architectural drawing as one could wish to see. The whole design is an excellent example of interesting treatment given to a practical building, without over-ornamenting it or departing from its true character; the slight variation of design between the outer and the centre blocks gives a good effect of contrast, while the strong rusticated ground story, the same in all three, binds the whole together. The Rue Réaumur buildings form an immense block of apartment houses, with the windows, above the ground story, grouped under lofty arched bays, and enriched with well-designed iron balcony grills; above the entrance a block is carried up as a kind of tower, with bold rusticated treatment and a cupola over; the upper part occupied by a clock face supported by carved figures in low relief. This and the "caserne" are among the class of works in which French architects are seen at their best, where the problem is to give some architectural interest to an essentially utilitarian building.

Among ideal compositions one is shown which is not utopian, and which might very well be carried out with fine effect. This is M. Henry's "Monument à la Concorde," a design for a monumental architectural screen to be erected across the west end of the Tuileries Gardens, and therefore flanking the east side of the Place de la Concorde. It consists mainly of a colonnaded and vaulted loggia, straight at the two ends and parallel to the Place de la Concorde; the centre portion is recessed by means of two quadrant colonnades falling back to a triumphal arch gateway, the axis of which is of course in line with the axis of the fountain in the centre of the Place. This leaves an open space, the centre of which is proposed to be occupied by the monument to "Concorde," a pyramidal sculpture group in bronze. The design is fully illustrated by plan, elevations, and perspective drawings; it is highly creditable to its author, and a design which could be carried out at no abnormal or disproportionate cost; and it would render more complete the fine vista of architectural effect extending in one axis from the Arc de l'Etoile eastward to the court-yard of the Louvre.

In church architecture there is not much of interest shown—there seldom is much of modern church architecture at the Salon, and what there is usually little sympathetic to the English eye. For modern churches the French seem for the present to have settled down to a kind of hard and somewhat clumsy neo-Romanesque, the designs showing generally little charm either of grouping or detail, though there are sometimes new

ideas in planning, as in M. Eschbaecher's "Projet de l'église pour le ville de B—"; but one never knows exactly whether these "projets" are *bona-fide* or not. Among the modern designs for churches the only one which pleased us at all was the competition design for a church at Grenoble by M. Chesnay; this is not a Romanesque but an Italian design, with a campanile at the south-west angle; the exterior is illustrated in a pretty sketch, the interior in a perspective showing a very elaborate scheme of colour decoration, in which the prevailing tone is a little garish; but there is much more refinement of style and detail in this design than in most of the Gothic ones. France was the cradle of Gothic architecture, but the feeling for it has fled from modern France. The best drawings the French architects of to-day produce in connexion with mediæval work are their restorations of half-ruined mediæval structures, which are always admirably drawn. An example is shown in M. Ernest's "Abbaye de Longpont: Essai de Restauration." Apparently the nave remains up to the crown of the aisle vaulting, and part of the east end with the flying buttresses, and sufficient of the transept and west-end walls to offer pretty good data for restoration. The drawings both of the existing remains and the restoration are admirable in completeness and finish.

Among theatrical designs is an Ecole des Beaux-Arts design (as we take it to be) of a "Projet de Théâtre pour une petite Ville," by M. Paul Huillard, which shows how everything is exaggerated in these academical designs; the design is quite beyond and out of keeping with a "petite ville," and looks more as if intended for a principal street in a large city. That we take to be an effect of the competition in the preparation of ideal designs on an enormous scale, already referred to; the Ecole des Beaux-Arts student loses all feeling for simplicity and restraint in architectural design, and cannot design a theatre ostensibly for a small town without trying to give a grandiose effect to it quite out of keeping with the assumed circumstances. M. Gosset exhibits a "Projet de Théâtre populaire," the special object of which seems to be to provide a system of exit doors all round the back of the auditorium, at equal distances. The plan seems a good one enough for the purpose. As far as we observed, there are no plans of actual recently-built theatres exhibited.*

There are some examples of domestic architecture which are of interest to the English visitor, from the special treatment of the plan and arrangement, arising out of French habits of living. Among these is M. Van der Boyen's "Hôtel, Rue de Lota," shown in a nearly complete set of plans, elevations, and sections. This small plan shows three staircases; the first a semi-circular staircase as dignified as the space will allow, from the porte-cochère entrance to the lobby outside the entertaining-rooms, of which the salon occupies the whole front of the plan, and the salle-à-manger most of the side space between it and the courtyard. From this point commences the "escalier de famille," leading to the diminutive bedrooms, &c. The salon,

with its curved and painted ceiling, is evidently, for the size of the house, a most sumptuous room; it is a case in which everything is sacrificed for a spacious appearance in the entertaining rooms. The clever planning of the other rooms, however, and of the servants' stair, is worth attention. The front elevation shows a stone basement with brickwork above and a good deal of colour introduced into it; an unusual treatment in a Parisian house. Among other examples of domestic architecture one of the best is M. Paumier's "Hôtel de M. de B . . . , à Paris." Architecturally this is more in the usual style of the Paris private house, with some nice little points in the detail, such as the suggestion of an Ionic volute in the treatment of the crowning moulding above the windows. There is a good deal that is good in the plan, although we observe on the upper floor the old blunder of French planning, the internal water-closet with no window or ventilation, which French architects seem still unable to part with. M. Dussart's "Une Villa au Bord de la Mer" is a picturesque house with an angle tower with balcony rising from a lofty bastion of masonry; the whole is very picturesque, but it is rather doubtful whether it is not a castle in the air rather than an actual house. M. Degréve's "Habitation de Campagne" is less eccentric than the designs we usually find under this title in the Salon; the lower walls are built of herring-bone brick or tile work with stone angles, the upper portion half-timber. In M. Pottier's "Villa de M. P . . ." we have the "Maison de Campagne" in all its tawdriness of barge-boards run mad, as also in another villa by M. Bernard, capped with enormously projecting roofs, as if it had a bonnet on. This may perhaps have a practical defence as a means of keeping the sun off the walls, but the appearance is very bad.

M. Perronne's plans and model of the "Pavillon de Chirurgie, à l'Asile Clinique" are worth attention, and appear to represent an executed work, though the locality is not stated. Two large rooms with semi-decagon bays form, on the ground plan, the operating rooms, connected with rooms for the sterilisation of instruments, for anaesthesia, &c.; situated between them is the surgeons' room, with a bathroom opening out of it. The whole building is very carefully and practically planned.

In connexion with the recent exhibition we have M. Louvet's drawings of the Palais des Beaux-Arts, and M. Formigé's studies for the admirable Roumanian pavilion, including a very fine coloured detail elevation. This was one of the best designed pavilions in the great Exhibition. Then there are two models which are worth attention. One is that of a funeral monument to a poet, whose initial only is given; it consists of a stele bearing the bronze bust of the poet, on a capital of rather Byzantine type; a nude female figure is prostrated at the base, clasping the stele in an attitude of grief. It is this figure, full of expression, which gives the real value to the design. The other model is also sepulchral; it is that of a mausoleum of a private family, and takes the form of a kind of apse, in horse-shoe shape both in section and plan; in the centre of the floor is a sculptural group, and floor and wall are decorated with conventional foliage designs, probably in-

* As those of our readers will know who have been in the habit of visiting the Salon, it is impossible to find the whereabouts of anything from the arrangement of the catalogue.

tended to be executed in mosaic. M. Narjoux's "Château de Chambeau—Construction et Restauration," does not show in what the "restoration" consists nor how far it is carried; but this is a beautiful set of drawings of a house in château style, very effective in grouping, and very quiet and refined in general character. M. Tailless' design for an "Auberge-relais" (a posting-inn), apparently a "projet" only, is picturesque and original, with its large arch opening into the courtyard and decorated with sculpture suitable to the occasion; this portion of it is shown in a pencil detail elevation on large scale. M. Ridet's grille for a garden enclosure is an excellent piece of metal design, very different from the English school, but good of its kind. This cannot be said of the Pavilion of the "Société des Acieries" erected in the recent Exhibition from the designs of M. Botrel; masonic forms of architecture imitated in metal. In connexion with this class of work may be mentioned M. Meissonnier's design for a lamp for electric street lighting, "Eclairage par lumière diffuse"—a lampost with a kind of umbrella feature at the top, the under surface of which is a reflector; the electric light strikes directly on that, and is hidden from the eye of the spectator, who only has the reflected light. This is an idea which was long ago suggested in England as a method of lighting interiors. Among these miscellaneous items may also be mentioned the interesting design of the "Bibliothèque Schoelcher" at Fort-de-France (Martinique), by M. Picq. This is a decorative treatment of a library and small museum standing alone on the beach (apparently), designed with a rather playful adaptation of classic details, and certainly a very original little building.

Among what may be called the "ideal" designs not previously mentioned—*i.e.*, designs which are merely conceptions on paper, is a very grandiose one by M. Bois for a school of artillery and engineering; a design of M. Delhaut for a provincial Conservatoire of Music and the Fine Arts, which illustrates the good effect that may be got by contrasting a richly decorated central block with two nearly plain wings, only ornamented by carved festoons between the upper windows; and M. Auburtin's design for a Palace for the reception of Sovereigns at Paris; an immense drawing showing a design which is fine in the general laying-out both of the building and the grounds, but contains only commonplaces in detail.

Among the large number of drawings illustrative of ancient work one of the most interesting is M. Chauvet's elevation of the woodwork and fresco paintings decorating the ancient manoir of Challant, at Issogne. The frescoes fill up the arches above the line of the wainscoting, and appear to be illustrations of industrial arts. The perfect manner in which the surfaces of wood and the masonry of the doorway, with its alternate white and bluish stone, is imitated, is quite a triumph of realism. The walls of the old house are scribbled over with curious inscriptions in old French, some of which are given. One runs as follows:—

"L'esprit humain ne se doit hazarder de contredire aux dieux ou retarder leur volonté, la puissance divine et du tout grande et faut qu'elle domine."

On the stone jamb of the door in the prin-

cipal drawing is an inscription roughly chalked and carefully copied in the drawing to the effect (not quite legible) that he who speaks ill of another may not enter by this door, concluding "car que d'aultry mal dira le diable lemporera."

Among other illustrative works we may mention three careful sets of drawings by M. Paquet of three Romanesque churches, those of Rhuis, Pompoint, and Fontenay-lès-Louvres; the plans of these are interesting. The curious little Palais de Justice of Briollay, a single rectangular building with a room partitioned off inside, is the subject of a set of drawings by M. Le Tourneau. M. Delaporte exhibits six good water-colour drawings in the grounds at Versailles. There is a view of Carcassonne by M. Pulsifer, and a very fine set of drawings by M. Pottier-Delinge of the ancient and celebrated château of Villers-Cotterets; the pencil sketches of detail are particularly good and very interesting, for the carved detail of this château represents the finest class of decorative work of the French Renaissance. Then we notice a restoration of the piscina of the church of "Ferté-Bernard," by M. Viatte, which introduces us to a most curious and interesting piece of Renaissance church detail; a photograph of its existing condition is added—the restoration does little more than complete some broken and partially defaced features.

It is regrettable to observe that the fine colossal statues of the arts, in white stone, in the portico of the Palais des Beaux-Arts, have already suffered so much from rain-stains as to have a rather unhappy appearance. Perhaps this will be least evident when the whole surface gets somewhat toned down by weather.

NOTES.

At the Royal Institution, on Friday the 3rd inst., Dr. Mercier gave a lecture on the subject of "Memory," in which he illustrated the action of the brain in memory by analogy with the action of inanimate substances under certain stresses. A bar of iron, under the stress of a slight weight, after bending, returned to its original position; under the stress of a heavier weight it acquired a "set," the "memory" of the strain to which it had been subjected. From this "set" it did not recover. The result, however, was different with an organised substance, such as a rod of wood, illustrated in this instance by a long slender whip-stock, which, though it took a set from a heavy strain, tended to recover from that set, at first comparatively fast, and then with diminishing speed until the normal position was at last recovered. The analogy with the action of the brain was, that the brain was only affected momentarily by slight impressions, but that stronger impressions left a "set" on it from which it only slowly recovered, the very stongest impressions leaving a permanent "set." Thus, if we looked out of a window at a new scene, and then turned away, the brain would retain for a time the main impressions—a mountain on the left, for instance, a wood in the middle distance, and so on; but the lighter impressions of smaller details it would almost at once lose; they did not overpass its limit of elasticity, and in re-

gaining its normal state the brain was like other organised substances—it tended to forget, to lose the impression, quickly at first, then more and more slowly, till the impression was totally effaced. The phenomenon of active memory, the effort to recall an impression which had faded, was touched on at the close of the lecture, especially the familiar case of the memory-searching for a word which it cannot at once find, and which seems afterwards to emerge of itself from some recess of the brain. That the philosophy of this aspect of the subject was not further elucidated was probably due to the Institution clock marking the expiration of the allotted hour for the lecture. We may add, however, on our own account, that the analogy of structural memory with mechanical suggests the curious and rather startling idea that memory is the result of a diseased condition of the brain; and that the physically healthy savage, occupying his brain only on matters of immediate importance to him, would be untroubled by memories. This certainly seems the natural deduction from Dr. Mercier's thesis.

The foundation stone was laid The New Baptist Church House, a few days ago of the new High Holborn. Baptist Church House to be erected at a cost of about 34,000*l.*, after Mr. Arthur Keen's plans and designs, Mr. John Belcher, A.R.A., having acted, we understand, as consulting architect to the trustees. The buildings, which will be distinguished by a central clock tower, with belfry stage and lantern, comprise a council chamber, a library, visitors' and committee rooms, together with various offices for the Baptist Tract and Book Society, and cognate purposes, and the first floor will be occupied by the Baptist Union upon their removal from their Missionary Society's House in Furnival-street, Holborn. The site has a frontage of 80 ft to Southampton-row (as widened), and one of 140 ft to Eagle-street; a portion of the ground was given to the trustees in compensation for the demolition in February last of their old Baptist chapel in Kingsgate-street, of which the southern end has been taken by the London County Council for the metropolitan improvements now in progress at High Holborn and Southampton-row. The chapel in Kingsgate-street was built in 1855-6, after C. C. Searle's designs, to replace the former chapel in Eagle-street, founded in 1735.

Some Rebuilding in Fleet-street. THE rebuilding, with an enlargement on the east side, of the offices of the Law Life Assurance Society, No. 187, Fleet-street, has now been completed by Messrs. Howard & Co., contractors, after plans and designs prepared by Mr. W. E. Clifton. The original offices were designed by John Shaw, the younger. The extension stands upon the site of the forecourt on the west side of the tower of the church of St. Dunstan-in-the-West; it has been erected against the side of the tower, and is carried up as high as the top of the second stage of the tower. The western forecourt was sold for 4,500*l.* to the Insurance Society by the trustees under the Act of 10 Geo. IV., cap. 96, for rebuilding the church, and it has been proposed to devote the purchase money to the building of a rectory house against

the eastern side of the tower. In that event the whole character of John Shaw the elder's church will be entirely spoiled. Upon the south side of Fleet-street, immediately opposite, a large space has been cleared by the demolition of Nos. 23-8, for the erection of a block of offices and shops from the plans and designs of Messrs. N. G. Joseph, Son, & Smithem. The present opening affords a view from the north of the Temple church. Descending the street we obtain a better prospect of the church of St. Bride, as we look down the recently-widened St. Bride's-avenue, where the houses, built from John B. Papworth's designs after the fire in 1823, have been pulled down, their sites (in part) being taken for new premises, in concurrence with the scheme for the gradual setting back of the line of frontage on that side of the main thoroughfare.

PROFESSOR WALDSTEIN, on Thursday last week, gave an interesting lecture at the Hellenic Society under the title "A Discovery of the Marbles related to the Pediments of the Parthenon." The marbles in question are not newly discovered; they have been for some years in a museum at Dresden, where no special value has been attached to them until Professor Waldstein noticed that they appeared to reproduce to some extent the line and attitude of the Ilissus and Theseus figures of the Parthenon, as if based on these as models. There are two statuettes, a male and a female figure, of which the former, the photograph of which was thrown on the screen, at once suggests the recollection of the Theseus figure, and some other examples were shown of statues which also showed certain derivations from this and the so-called Ilissus figure. Professor Waldstein's idea seems to have been that the Parthenon sculptures became to some extent a kind of model or school, and other works were produced which resembled them, not as copies, but as showing the influence of the recollection of these figures on the work of other sculptors. This is quite possible—perhaps even probable; but is it not also possible that the Parthenon figures of river-gods and heroes themselves represented an accepted type, which Phidias followed out for what may be called ritual reasons, while imparting to them a special power derived from his own genius?

MR. HOLDEN described last week in a paper read to the Institution of Electrical Engineers a meter which he had invented to register electric energy. At first sight the meter appeared to be a very complicated one. It did not register continuously, the electrical mechanism only operated for a second in every minute. This was effected by means of clockwork, which closed a circuit once every minute. Hence a magnetic impulse was given to the spindle of the meter sufficient to make it register two complete turns exactly at full load. It started to register with a current less than the fifth of its maximum current and the impulse made the spindle turn only the twenty-fifth part of a complete revolution. The wonderful accuracy of this meter was obtained by means of an iron disc fitted on the spindle and rotating in the neighbourhood of a permanent magnet. Hitherto in

most meters it has been customary to use a copper disc and to depend on the eddy currents induced in it for the "braking" effect. Mr. Holden's paper is a most scientific one, and whether his meter is the meter of the future or not, the theory which he has worked out is most instructive, and his paper, in our opinion, is a model of what a technical paper ought to be. Professor Ayrton suggested possible ways in which a consumer might attempt to get electric light for nothing by turning off his lights for the second when the meter was registering, but as Mr. Holden pointed out the chances were equally divided as to whether he would cheat himself or the company by this procedure. One curious point that Mr. Holden mentioned in his paper was that the reading of the meter was affected at light loads by its position relatively to the magnetic meridian. For example, if calibrated with the face pointing north and set up in the house with its face pointing south the error might be 4 per cent. in excess or defect. We had previously noticed this phenomenon in connexion with other meters.

MR. GAVEY, the electrician to the Post Office, showed the Poulsen telegraphone in action to the Institution of Electrical Engineers last week. The telegraphone, which was considered the greatest electrical novelty shown at the Paris Exhibition last year, is a magnetic rival of the phonograph. In the phonograph the sounds are registered mechanically on a wax cylinder, in the telegraphone they are registered magnetically on a long strip of steel ribbon. The same ribbon can be used over and over again to record conversations. To wipe out the preceding conversation it is sufficient to pass a magnet along the steel tape. The tape is made to pass either by clockwork or by an electric motor close to a telephone diaphragm, and the induced magnetism forms a permanent record of its vibrations. On moving the ribbon in front of the diaphragm again, identically the same vibrations are produced. Mr. Gavey by means of loud-speaking telephones reproduced perfectly a Danish song which had been sung into a Poulsen telegraphone four weeks before at Copenhagen. This illustrated that the steel tape retains its magnetism and makes a permanent record. The tone of the instrument is far superior to that of the phonograph, and to us it appeared practically perfect. Whether it will ever come into general use is another matter, but if it does it will have completely solved the problem of a relay for long distance telephony.

THE rejection by the House of Commons last week, on the second reading, of the Railway Company's "Omnibus" Bill prevents the Company from proceeding, for the present, with their schemes for various works, embracing an improvement of Holyhead harbour, new docks at Garston, on the Mersey, the widening of their line in the Trent Valley, and other projects. They are carrying out extensive alterations in St. Pancras Parish for an improvement of their lines into the terminus at Euston-square. It is on account of their default to discharge their obligations in respect of re-housing persons dispossessed by them on

the Stanhope-street, Granby-street, and Mornington-road area, that, as we read, the Home Office has preferred a claim of 16,000*l.* penalties under the Company's Act of 1898. The pulling down of house property in that quarter will ultimately extend to the villas and lodges with their pleasant gardens in Park Village East, along the Regent's Canal, Augustus-square, Mornington-road, and the immediate vicinity.

THE gallery of the Society of Mrs. Allingham's Fine Arts again contains a special exhibition of Mrs. Allingham's beautiful watercolours—a collection entitled "The Seasons (Spring, Summer, and Autumn)," the result of two years' work. The subjects are of the same class as usual; rural English landscapes, peopled with exquisitely-finished little figures, and the art displayed in them is as perfect as ever. There are a few studies of figures only, including two portraits of Carlyle, some children, and a lovely head entitled "A Country Lass" (37), the best of the works of this class; but for the most part the subjects present the usual programme; compositions chiefly of foreground and middle distance, consisting of cottages, foliage, and the little figures which give life to the scene without asserting themselves prominently. The variety in composition is so great that there is no feeling of monotony and the artist shows true judgment in keeping for the most part to the style of picture which she has made her own and in which she has achieved perfection. When she goes beyond it, as in the wider landscape entitled "Leith Hill from Haslemere" (56), there is just a suspicion of weakness—a too delicate treatment of a subject which requires more breadth and power of style to do it justice. But of the majority of the drawings we can only say that one seems as beautiful as another, and it is difficult to select any as specially attractive beyond their companions. The charm of composition is illustrated perhaps more especially in "On a Kentish Down" (5), "On a Blue-bell Hill" (7), "The Runaway" (10), and "On the North Downs in Early Spring" (23). In "The Cuckoo" (27) and "Into the Daisy Meadow" (66) we have the charm of extreme simplicity, little more picture material than a hedge and a gate and a single figure which gives the human interest to the scene. There are some flower garden studies, too, which are delightful; one subject out of the artist's usual range is "A Yorkshire Moor" (39), which is perfectly successful, and a few in which the building is the principal interest—"In a Kentish Village" (33), "Old Kentish House" (45), with its vertical lines of half-timber work, and "Cottages at Godalming" (65). "On Ide Hill, Kent," is one with rather more extent of the subject than usual; the village green and cottages in the foreground, and an extended distance are treated with the greatest delicacy. The beauty and sentiment of rural England has no such interpreter in painting.

M. LEON LHERMITTE, the French painter, is better known in this country by his charcoal drawings, which were first exhibited by the Black and White Society in the seventies, and received an enthusiastic reception. Since then his reputation has long been secure as a painter of a high order, who has year by

year been one of the foremost exhibitors at the Salon. An exhibition of his work in London, although limited in extent, gives an opportunity for studying some of this artist's remarkable work. The collection at the Goupil Gallery consists chiefly of pastels; there are a few pictures, and a number of charcoal drawings. The charcoal drawings are instructive for the refined handling of light and shade. "A Pastoral Visit" is one of the best; a scene inside a large Gothic church, a kneeling crowd receiving the benediction of their bishop; the drawing of a "Market Place" is also remarkable for the crowd. "At Mass" is a fine architectural interior. Pastels are often an excuse for carelessness and slipshod work. This artist's are worthy of study for the remarkable effects obtained in this medium. He is very fond of long shadows and shady foregrounds with a sunny distance, beyond, such, for instance, as "Gathering up the Hay," "Sunset in Autumn," "Le Pont de St. Père." A beautiful little picture of a different character is that entitled "Early Morning Fishing." The oil paintings exhibited are few and of less interest than the pastels.

At the Dowdeswell Gallery is an exhibition of paintings in oils by Vereker Monteth

Hamilton, consisting principally of sunrises and sunsets in Brittany and Kashmir. A collection of similar subjects from such widely different parts of the world is an interesting one. Kashmir—well known as it may be to soldiers and travellers, who have described its wonderful scenery with the pen—is not so well known on canvas, especially some of the out-of-the-way country here illustrated. A remarkable picture is that of "Sniping the Rearguard," in which two ragged Afghans, secure in the mountain heights with night closing down, are taking a long shot at the invisible enemy (presumably ourselves) beyond the ravine. A companion picture to this is "The Shot at Daybreak," a sporting picture of a more dramatic character than the first. The smaller pictures have on the whole the best work in them, such, for instance, as "Rose and Gold on the Jhelum" and the "Yellow Tree at Gunderbul," rare pieces of colour finely handled. "Après le Coucher du Soleil" is a clever little picture; and "La Grande Route" is a characteristic French highway with a fine avenue of poplars yellow with the glow of the setting sun.

THE Society of Miniature Painters are holding their sixth annual exhibition. The exhibition is held in a room to itself at the Modern Gallery, free from other pictures that so often render it impossible to study miniatures to the best advantage. A miniature, like a sonnet, may contain a whole world of beauty and imagination; it is, besides, one of the most charming forms of portraiture. It is an art of perfection, and for this reason, perhaps, attracts only a limited number of artists. These provide the real interest of such an exhibition as the present, while the large number of exhibits are of the dull and worthless coloured-photograph type. Mlle. Cécile de Chausse has a work notable for size and for its vigorous treatment—it is one of the largest ivories we have seen—entitled "Judith." It is not quite our idea of the appearance of that

remarkable character, who we imagine as rather an inspired patriot than as a haughty amazon; but the work is a telling one. Interesting, too, is a work entitled "Vivien," very much spoilt by the exuberance of the frame. For good technique and for values, Miss Winifred Hope Thomson's portrait of the Lady Elizabeth Manners may be considered the best thing in the exhibition. "Pieces of Eight," by Mr. John Hassall, is a fine piece of work, and would, we think, have satisfied R. L. Stevenson himself. Noticeable also is a portrait entitled "Madge," very direct and simple in treatment; and in the same case, by a different hand, is a well-drawn portrait called "Olivia." For variety, we suppose, is shown an extraordinary little picture entitled "The Yellow Book," by Mr. Dudley Hardy, full of cleverness and careless decadence.

PICTURES AT THE ROYAL ACADEMY.

THIS may be described as an interesting but not a remarkable Academy. There is no picture that imposes itself on one as the great work of the year; for M. Benjamin-Constant's portrait of the late Queen owes its ostensible pre-eminence to position and subject. At the same time we must say that we can neither understand nor sympathise with the tone of detraction applied to this picture by critics and visitors. It is not a great work, but it is on the whole a very fine one, a dignified and expressive portrait of a great sovereign. The mistake in it seems to lie in the over-accentuation of decorative details which should have been kept subordinate to the figure; it is not so much a portrait of Queen Victoria as an interior in the midst of which she is seated; the figure does not detach itself sufficiently from the surroundings. But that is not a reason for speaking of it as a poor work, which it certainly is not.

Of the pictures which deal with the human form and with human interest (apart from portraits) the first important one which we meet with, Mr. Dicksee's "Yseult" (52), suffers under the same disproportion as M. Benjamin-Constant's portrait just referred to; the accessories kill the figure; it is a mass of gold throne and crimson drapery, powerfully and brilliantly painted, but the head is tame and devoid of character and power, and might belong to any name of a mythical queen or princess one chose to put to it. The most important works of the figure class are perhaps Sir L. Alma Tadema's "Under the Roof of Blue Ionian Weather" (220), Mr. Abbey's "Crusaders Sighting Jerusalem" (163), and Mr. John Collier's "In the Venusberg" (724). In point of scale and finish the latter might be called the most important work of the year; in a decorative sense it is superb, but it is entirely destitute of the romantic spirit which such a subject demands. Mr. Collier is an admirable painter but no poet; and but for the nudity of the figures this might pass for a stage scene. Venus, her lower limbs enveloped in a rich drapery, sits under an alcove in a carved marble screen which extends across the picture; a knight in armour kneels before, and a nude damsel stands beside her in an attitude of beckoning to some one, her beautifully designed figure relieved against the marble background. As a decorative picture it is of a high order, but its interest goes no further than that; there is none of the glamour about it which we associate with the idea of the Venusberg. Mr. Abbey's "Crusaders" is a work of much more serious aim; it is an upright in which the main lines of the composition are carried up in a very effective manner obliquely across the canvas, culminating in the flag which the standing figure holds up. There are only three principal figures, the one on the right kneeling; there is a fine general impression of triumph and earnestness of purpose conveyed in the group, but the countenances, taken separately, are somewhat deficient in definite expression. In background a portion of a crowd of figures is seen struggling up the hill, dragging with them what appears to be a catapult or some such medieval engine of war. A fine work, but certainly not equal to the best we have had from its author. Sir L.

Alma-Tadema does not aim at any meaning or story in his works; they are "simple beauty and naught else," which we are told on high authority is "about the best thing God invents," and in this respect he has seldom surpassed "Opus cccxliii." (so it is inscribed), which occupies a centre position on the south wall of the long gallery, instead this artist's customary position near the doorway. The scene is occupied largely by the semicircular marble steps of a small theatre, with a sculptured altar and balustrade on the right—more marble even than usual; on these recline or stand various figures in delicately harmonised draperies; over the boundary wall of the semicircle is seen the distant deep blue sea; as a bit of classic beauty the whole is perfect. The President's "Helena and Hermia" (169) faces it on the opposite wall, "like two artificial gods," as the quotation from the "Midsummer Night's Dream" has it; one is tempted to make a pun and suggest "too artificial" as the appropriate reading; they are two very hard and mechanical young women. Mr. da Costa's large picture above it of "Serena Captive" among the forest robbers ("Færie Queene") is bold and effective in colour, but if Serena wore all the "rich array" they are robbing her of she must have found her apparel a heavy drag upon her. Mr. Waterhouse's "Nymphs Finding the Head of Orpheus" (231) deserves appreciation as a beautiful piece of colour and design, though suggesting that the head of Orpheus floating in the water, and to which the nymphs seem to pay no attention, has been added as an afterthought for the sake of a title to the picture. Beyond these the long gallery displays nothing of importance in the way of ideal figure subjects.

Gallery IV. contains two large and bold attempts at pictorial allegory, Mr. Stock's "Pain bringing Wings to a Soul" (251), and Mr. Mulock's "Dying Day" (255), the latter represented by a large powerful semi-nude figure embedded in a mass of foliage and reddened one may suppose by the setting sun. Mr. Stock's group is of the nature of a Blake design on a large scale, and does not quite escape a suspicion of the ludicrous; the idea intended is perhaps a little too complicated for expression in painting; but we feel every sympathy with artists who are thus endeavouring to use the figure in an abstract and poetic sense. Mr. Sims's large picture between these, "Spreading their Wings" (254) does not explain itself very well; it seems to represent a party of people who have landed from a yacht and are flirting in a deserted churchyard; it is a kind of work one would have expected to find in the Salon rather than in the Academy; there is in fact a very French feeling about it, and the figure of the girl walking on the bank and relieved against the sky reminds one rather of Fragonard, but the picture has not point or meaning enough to justify its scale. Mr. Shannon's small picture "The Flower Girl" (274) is a real work of art, a vision of colour and light. Mr. Seymour Lucas has a clever picture (300) of Wolsey, in the garden of Hampton Court, mocked by three courtiers after his fatal interview with the King—it is evidently suggested by Act III., Scene 2 of Henry VIII., though this did not take place at Hampton Court. Miss Dicksee's picture of Laurence as a little boy, taking the portrait of a lady passenger who stopped at his father's inn, is a pretty and natural work of its class. Two pictures of curious originality and novelty claim mention. One is Mr. Lybaert's "The Evening of Life" (80) a very medieval-looking painting of an aged *religieuse* with pinched and furrowed face, clad in a crude green mantle; a piece of elaborate embroidery stretched across forms a background, and is painted with astonishing realism; it is an affected form of art, but undoubtedly very clever, and we shall probably hear more of its author. The other is Mrs. Hunter's little picture of "Joy and the Labourer" (497); "Joy" being personified by a girl seated on the wall and singing to the labourer; it illustrates a passage from one of Miss Ingelow's poems. This also is not beautiful; but it is original and sincere.

Mr. Stanhope Forbes's "The 22nd of January, 1901," a cottage interior group gathered over the paper containing the news of the Queen's death (320), is his most interesting picture, not however by any means equal to various former works of somewhat the same class. "Good Bye—Off to Skibbereen" (495), a larger picture by the same artist, is a harbour scene

which does not interest us very much. Mr. Boughton's "Dreamland" (355), where a girl lies asleep in a very faintly coloured landscape, looks at first rather weak and washed out, but seen from a greater distance, across the room, it falls together into the pretty half-visionary effect which was evidently intended. After many commonplaces we find in Mr. A. Goodwin's "The Phantom Ship" (438) a work of real power; the actual ship is in the foreground, with the crew gazing at the "phantom" which passes in the middle distance, all the wind in her sails, and with an indefinable supernatural something about her which is very telling. In connexion with this subject may be mentioned Mr. P. W. Gibbs's clever picture of "The Ancient Mariner" (822) standing against the mast in his heat-baked ship with the bodies of his former companions strewn about, the dead albatross lying between his feet with supernaturally cynical expression in its head; able work, showing a vivid imagination. Of other works of the class we are now speaking of may be mentioned Mr. C. M. O. Orchardson's "Memories" (520), an expressive figure of a girl playing the piano; Mr. Denny Sadler's "Marriage by Registrar" (570), the nature of which every one will be able to figure to himself; and Mr. F. D. Millet's "An Accusation of Witchcraft" (857). Mr. Draper's "Tristram and Iscult" on board the ship (561) is an important work in intent, but the figures are totally short in dignity and are not worthy of the subject; nor has Mr. Chevallier Tayler made much of "The Origin of the Order of the Garter" (586), a hard painting of a subject out of his usual work, and which he has not rendered interesting.

Portraits are well represented this year, and one of the very best, both as to likeness and artistic character, is Sir L. Alma-Tadema's portrait of Professor Aitchison (211) painted for the Institute of Architects. The Professor is characteristically represented with a book in one hand and a finger of the other hand raised as if enforcing an argument—perhaps a point as to the authority of Vitruvius. Another architect portrait is an exceedingly good likeness of Mr. T. G. Jackson, seated before a table covered with plans; by Mr. Hugh G. Riviere. Among the leading works in portraiture of the year is Mr. Sargent's of the two Misses Wertheimer (178), effectively contrasted in a dark crimson and a white satin dress respectively, and painted with the artist's highest power of broad and effective execution. Mr. Dicksee's "Duchess of Buckingham and Chandos" (122), like his "Ysult," is too much like a painting of a rich costume to which the face is entirely subordinate—what we call a portrait *de luxe*. Mr. Shannon's portrait of Mrs. Walter Fenwick (498) is remarkable for the bold treatment of the composition in flowing lines. Mr. Orchardson in his portrait of a gentleman seated under a tree with a gun (377) has shown his usual power of getting harmonious colours out an ordinary man's costume—shooting-dress in this case. One of the most characteristic and energetic portraits of the year is Mr. Sargent's half-length of Mr. C. S. Loch. In several portraits of children Mr. Ralph Peacock has shown uniform and conspicuous success in combining character with a fine and rich effect of colour.

War pictures are rather numerous but not remarkable, unless we except Mr. Furse's fine equestrian portrait of Sir Charles Nairne (222), which however is not in an active sense a battle scene, and Miss Kemp-Welch's "In Sight" (417), in which this lady has turned her facility for painting horses to illustrating "Lord Dundonald's dash upon Lady Smith." Among the pictures in which figures are combined with landscape Mr. Clausen is, as usual, very successful, especially in "Sons of the Soil" (378), and Mr. La Thangue in "Gathering Plums" (308). Mr. John R. Reid has a fine coast scene in the first room "Sons of the Sea" (45) in which the human element consists in a row of little boys of the fishing population seated on the jetty; the picture has that clear open-air effect which this artist always succeeds in obtaining. Mr. Tuke's youths amuse themselves with a boat in "Summer Evening" (396), but this time they are clothed; as a matter of pictorial effect we prefer them nude. "Idlers" (411), by Mr. Dudley Hardy, is a curious but truly artistic work the subject consisting of a set of figures in Turkish costume seated on the ground in combination with a fine and very broad-painted bit of landscape which, however, shows no sign of being the natural abode of Turks;

it might be an English scene; but this is a fine little picture. Nor should we omit to mention Mr. Orchardson's charming little idyll, so original in colour and conception, entitled "In the Gloaming" (126).

The finest landscapes of the year are the sea-pieces, if one may put it in an Irish kind of way. Mr. Somerscales has two pictures which repeat his usual materials—a dark sea and one or two craft on; probably it is because he rather repeats himself that the Academy have taken to sending his pictures up aloft, as a hint that something more is expected of him. Mr. Hemy has an admirable work in the second room, "The Home Wind" (85), with a fishing smack running before it in fine style (Mr. Hemy can make a boat go through the water better than most men), but his most important picture is "Birds of Prey" in the fifth room (383), the title being derived from the figures of some wreckers on a rocky shore against which beats a sea driven by a strong gale; a very fine wild scene. But this again, to our thinking, is outdone by its companion by Mr. Wylie in the same room, a Bay of Biscay sea suggested by Mr. Kipling's spirited poem which describes "how we threshed the *Bolivar* out across the bay"; the funnel and the mast are seen in the background "lurching through the spray." This is no conventional sea; hills of water come along with foam on their backs; it looks like a study from reality, and is perhaps the most powerful thing Mr. Wylie has done. The same artist has a fine picture of the naval funeral procession of the late Queen (272).

There are a good many pleasing landscapes; some very good ones; no great one. Mr. Waterlow seems to be the landscape-painter now who best understands composition and unity in landscape painting. One may appreciate this by comparing his small picture "The Old Sandpit" (919) with Mr. Murray's "Lush Meadows of the Test" (912) which hangs near to it. The latter is the larger and more elaborate work, but it is only a scene—Mr. Waterlow's is a picture. In his larger works, such as "Sheltered Pastures" (49) and "Hoghton Mill" (147) we see the same fine quality of composition, though neither of these are quite equal to his pine-forest by the sea of last year. But this is really landscape art, and not mere transcription of nature. Mr. Arnesby Brown's "Morning" is a fine work. Mr. Adrian Stokes, another genuine landscape artist, has chosen only scenery this year, his sole contribution being a view of Trafalgar Square, which is not hung in a very favourable light. Mr. A. Goodwin's "Sinbad the Sailor in the Harbour of Salaha" (784) may also be counted as a city landscape, in this case not trammelled by hard facts. The "Arabian Nights" has furnished him with matter for another landscape, under the title "Ali Baba and the Forty Thieves" (53), which at first sight is rather startling in colour and effect; it is an attempt to represent the glitter of everything under an intensely hot sun; the sprays of foliage look as if cut out in steel; the effect seems exaggerated, but there may be the intention of giving an unreal and dreamlike effect. A perfect little work is Mr. Mark Fisher's "Summer Afternoon" (289); the treatment of the water is beautiful, it seems actually to ripple, and we quite lose the feeling of paint. Of Mr. H. W. B. Davis's works we like best the small one, "Evening" (127), in the second room; "The Nearest Way Home" (162) is rather a repetition of former effects. So, in another way, is Mr. Graham's "Collecting the Flock" (164), a fine and powerful landscape, if we had not seen so many like it before. Mr. Mostyn's large landscape "Stepping-stones" (171), which hangs near the ceiling in the large room, though rather crude in tone, has a fine breadth and breeziness about it which seems to give promise of further work from its author. Mr. R. W. Allan's "After the Boats Came In" (256) is worth a note in respect of the fine way in which the wash of the sea on the coast outside the harbour is conveyed. Mr. MacWhirter has painted two views of Edinburgh, the New Town and the Old Town (333, 341); Mr. J. H. Reid's "Ferryden" (431) is a fine coast landscape; Mr. East's best work is "A Glean Before the Storm" (486); Mr. North exhibits a fine picture of "Earth's Children of the Quarry" (562) representing masses of trees which have overgrown the declivities of a huge deserted quarry; Mr. John Brett, who unfortunately has contributed no large work, has some beautiful coast scenes in the "small" gallery, No. IX.,

especially "Cataclew Point" (687), and in the same room is a beautiful little landscape by Mr. Clausen "The Spreading Tree" (652), and another by Mr. La Thangue "December in Provence" (669). Mr. Corbet's long narrow picture of "Val d'Arno—Evening" (863) not striking at first sight, is a work that grows upon one, as an illustration of evening effect over an extended Italian plain.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

ANNUAL GENERAL MEETING.

The annual general meeting of this Institute was held on Monday evening at No. 9, Conduit street, Regent-street, W., the President, Mr. Wm. Emerson, in the chair.

The minutes of the last meeting having been taken as read, the Report of the Council for the official year 1900-1901 was submitted. The Report stated that his Majesty has graciously consented to continue as King the patronage which he has extended to the Institute as Prince of Wales since the year 1863, and it is also his Majesty's pleasure to continue her late Majesty's generous grant of an annual Royal Gold Medal to the nominee of the Royal Institute. The non-award of the Royal Gold Medal for this year has been unavoidable, and though the Council regret a break in an institution that has been continuous for fifty-three years, yet they feel that, in future years, the gap in the list of Gold Medalists opposite the year 1901 will in itself be a mute and pathetic record of the irreparable loss of the Royal and gracious donor.

Since the publication of the last annual Report the Council have held twenty meetings of which the Council elected in June last have held sixteen. There have also been meetings of the following Committees of Council—Finance, Professional Questions, Annual Dinner, Conditions of Contract, Paris Exhibition, Professional Advertisement, New Institute Premises, Special Congress, Architectural Museum, Heating and Ventilating Engineers. Meetings of the following Institute Committees have also been held:—The four Standing Committees, Board of Examiners, Statutory Board of Examiners, Competitions, Prizes and Studentships, Professional Status, Ancient Lights (joint with Surveyors' Institution) Local By-law, General Congress.

The following tabular statement shows the present subscribing membership of the Institute, compared with that of the corresponding period last year:—

Year.	Fellows.	Associates.	Hon. Associates.	Total.
1900	620	1,013	45	1,678
1901	626	1,028	46	1,695

During the official year since the last annual general meeting twenty-nine Fellows have been elected, forty-six Associates, three Hon. Associates, and one Hon. Fellow. Two Hon. Corr. Members have been elected: J. Antoine Bouvard (Paris) and J. G. Pedro d'Avila (Lisbon).

The Council must attribute the smallness of the increase in membership in the class of Fellows to the more than usually heavy losses by death, by resignation, by transference to the class of retired Fellows, and by other removals from the list. There have been only three special elections to the fellowship by the Council under the new proviso to By-law 9, as compared with eleven last year and twelve the year before. On the other hand, the ordinary elections to the fellowship by the general body have been twenty-seven, as against twenty-one, fourteen, and eight respectively in the three preceding years.

The losses by death have been as follows:—Fellows: Charles Barry, Henry Cowell Boyes, John Burnet, John Butler, Francis Chambers, Henry Currey, Charles Henry Driver, William Charles Evans-Vaughan, Joseph Goddard, Horace Gundry, Edward Joseph Hanson, Thomas Harris, William Hepper, Newton Edward Jennings, Thomas Meakin Lockwood, William Henry Powell, John Murray Robertson, Lloyd Taylor, James Buckley Wilson, William Young. Associates: John William Blakey, Frederick Boreham, Henry Greenslade Wade. Retired Fellows: Henry Astley Darbishire, William Milford Teulon, John James Thomson. Hon. Corr. Members: Giuseppe Poggi, Antoine Henri Revoil, Jules Jacques van Ysendyck.

The usual progressive examinations were held in June and November, 1900, and the

COMPETITION DESIGN FOR GLASGOW ROYAL

View from Cathedral Square

PHOTO-LITHO SPRAGUE & CO. LTD. 4 & 5 EAST HARDING STREET, FETTER LANE, E.C.

Council have to report a steady increase in the number of candidates for each of the examinations. The Preliminary and Intermediate were held in London, Birmingham, Bristol, Cardiff, Manchester, Newcastle, Nottingham, and York, and the very cordial thanks of the Council are again due to the hon. secretaries and examination committees of the various allied societies for their ready and valuable assistance. The Final and "Special" examinations were held in London only. The total number of candidates examined during the year was 603, as against 548 in 1900. The number of probationers of the Institute now stands at 1,507, and of students at 368.

The Council again regret to say that the Arthur Cates prizes for the best testimonies of study (supplemented by certain specified sheets of drawings) submitted by students for admission to the final examination have not been awarded this year, no student who had passed the examination having fulfilled the conditions. The Ashpitel Prize has been awarded to Mr. Shirley Harrison, who passed the Final Examination in November, and extra prizes to Messrs. C. E. Vardell and Heaton Comyn. The "Special" Examination will be held this June in Sydney and Montreal. The Council desire to tender to the Board of Examiners their very warm thanks for the arduous task they have performed with such devotion and energy. Statutory Examinations were held in October and April last, when Certificates of Competency were granted to Messrs. Richard Dominic Hanson, Herbert Alfred Legg, James Edwin Webb, Sidney Joseph Halse, and Frank Sizer Capon.

The collection of paintings of the Royal Institute has been enriched by an admirable portrait of Professor George Aitchison, R.A., Past President, by Sir Lawrence Alma-Tadema, R.A. As a mark of their appreciation both of the constant and kindly services Sir Lawrence has rendered to the Institute for the twenty-four years of his membership as an Hon. Associate, and of the great eminence to which he has risen in his art, the Council took the opportunity of his painting this portrait to ask him to allow them to propose to the general body his election as an Hon. Fellow. Sir Lawrence was duly elected at the general meeting on February 18.

The Council have the pleasure to record the fact that the President, Mr. William Emerson, is a member of the advisory sub-committee of the general committee on the question of the National Memorial to her late Majesty. The President was also a member of the Art Committee of the Royal Commission for the Paris Exhibition, 1900.

The Council have been invited by the authorities of the Glasgow International Exhibition, 1901, to contribute to the Fine Art Section an exhibit from the collections of the Royal Institute, a bay in one of the galleries being placed at their disposal. The Council have complied with the request, and have sent the portraits of Professor Cockerell, Sir Gilbert Scott, and Mr. F. C. Penrose; marble busts of Inigo Jones, Sir Christopher Wren, Sir Charles Barry, and George Edmund Street; and a large number of drawings. The Council have acceded to the request of the Glasgow Institute that the Royal Institute of British Architects' Annual Dinner shall be held this year in Glasgow. It will take place on Thursday, October 3. An interesting programme has been drawn up for the visit, and the Corporation of Glasgow have kindly arranged to entertain the Royal Institute at a reception on Friday evening, October 4. The Council most earnestly hope that as many members as possible will attend, so as to ensure the success of the gathering.

The Council have had long negotiation with the London County Council with reference to the Holborn-to-Strand improvement scheme. With a view to securing proper architectural treatment for the crescent site, the Council were asked by the London County Council to co-operate in a scheme whereby eight architects, four to be nominated by each body, should submit designs, on certain conditions, each architect receiving an honorarium of 150*l.* A deputation of the Council waited on the Improvements Committee of the London County Council and protested against the proposed conditions. They suggested that there should be a competition among the eight architects, and that three should be chosen to carry out specified blocks, working together, however, as a consultative committee on the whole scheme. The interview resulted in a few modifications in the conditions as to the

details of drawings required and an increase in the honorarium offered to 250*l.* The Council were given to understand that there could be no guarantee that any of the eight architects should execute all or part of his design, and the invitation to co-operate was renewed on the slightly modified basis. Desirous of aiding the London County Council in their efforts to secure architectural treatment for the new street, the Council accepted the invitation under strong protest, and nominated four architects. Their names were Messrs. Reginald Blomfield, T. E. Colclutt, Ernest George, and R. Norman Shaw. Two of them, Messrs. Colclutt and Shaw, declined the nomination. The Council were requested to nominate two others in their place. In view of the London County Council's disregard of their protest accompanying the original nomination, the Council considered that they had gone as far as was consonant with the dignity of the Institute, and the profession which it represents, to meet the wishes of the London County Council, and formally declined to make further nominations.

Another matter to which the Council have given their attention is the alteration of the steps of St. Martin's Church. The London County Council were asked by the St. Martin's Vestry (now merged in the Council of the City of Westminster) to contribute towards the cost of the proposed alterations, which consisted in doing away with the broad platform in the middle of the flight and moving up the lower steps, thereby widening the pavement. The London County Council sought the advice of the Council of the Institute. Acting on the Report of the Art Committee, the Council protested against any proposal to touch the steps, both for artistic reasons and on the ground that the traffic was not so great as to necessitate any widening of the pavement. They urged, however, should the need for widening be found imperative, and consequently the abolition of the landing on the west side, that at all events the landing on the south side should be retained for the sake of architectural proportion. The London County Council adopted the Council's view, and refused the St. Martin's Vestry and the City of Westminster any financial assistance. In reply to a protest from the Council, the Town Clerk of Westminster replied that the work, having been already begun, must be proceeded with.

The London County Council also submitted for the opinion of the Council their draft by-laws under the Metropolitan Management Acts as to the deposit of plans with reference to pipes, drains, and other means of connecting with sewers. The main suggestion of the Council was that in lieu of elaborate duplicate plans and sections, which it was proposed that any one about to construct or reconstruct drains, &c., should deposit with the Sanitary Authority, it would be sufficient if one carefully-prepared block-plan were sent.

The Council, having been invited by the Bridge House Estates Committee to offer their suggestions on the proposed plans for the widening of London Bridge, referred the matter to the Art Committee, and adopted their Report. While deprecating any interference at all with the structure, they suggested, in case of necessity, an alternative scheme whereby the face of the parapet should be restricted to the line of the existing piers instead of overhanging them. The latest information received from the Corporation is that consideration of the scheme has been referred to a Sub-Committee of the Bridge House Estates Committee.

Adopting the Report of the Art Committee, the Council have addressed a protest to the Ecclesiastical Commissioners and the Lords of the Privy Council against the Union of Benefices Bill as drafted when introduced before Parliament last year. They urged that this Bill to extend the Union of Benefices Bill, 1880, to the whole of England and Wales should contain provisions whereby precious architectural monuments should be safeguarded against the destruction that has been permissible and practised in London under the provisions of the existing Act.

The Council adopted the Report of the Science Committee on the new regulations proposed by the London water companies, and sent in a protest, together with criticisms of the proposals, to the Local Government Board, by whom they were invited to send representatives to the inquiry held at the Guildhall, Westminster. Before final arrangements could be made for receiving the evidence of

these representatives, the water companies withdrew their proposals and the inquiry terminated. The thanks of the Council are especially due to Mr. H. D. Searles-Wood for the time and trouble he devoted to the matter on behalf of the Institute.

The Council, adopting the suggestion of the Science Committee, sent out in January to the Corporation of the City of London, the London County Council, and all the new Metropolitan Borough Councils a circular letter with reference to the administration of the various Acts of Parliament in relation to the construction, &c., of drains and sanitary appliances and the structural removal of nuisances. They suggested that the question of detection of nuisances should remain in the department of the medical officer to the authority, and that matters relating to the construction, &c., be placed in the department of the surveyor to the authority.

The Council have also adopted the Report of the Science Committee with regard to a scheme suggested by the Plumbers' Company for the half-marking of plumbers' work, and they have arranged with the Plumbers' Company for a conference to be held between the Company, the Royal Institute, and the water authorities, with a view to settle the best kinds of materials and forms of fittings used in plumbers' work, and to provide a basis for regulations on the subject.

The changes in By-laws 25, 29, and 30 were approved by the Privy Council on May 15, 1900. The approaching elections will be conducted, therefore, under the new regulations. The total number of the Council will be thirty-eight; there will be four Associate members; any Associate will be eligible for election; and the asterisks against the names of members of the existing Council and Standing Committees will be omitted.

The Council regret that their negotiations with the Institute of Builders, extending over a space of two years, have come to a fruitless conclusion. After much effort, suggestions for a revised form of contract were agreed upon by representatives of the two Councils. The arbitration clause was found, however, to be so unacceptable to the general body of members that no resolution was moved from the chair at the general meeting. The form was discussed, and the Chairman, on behalf of the Council, promised a revision of the arbitration clause before presenting it again to the Institute. The Council submitted to the Institute of Builders a revised arbitration clause in which "Clause 16" (Materials) was inserted among the clauses exempt from the operation of the arbitration clause. The Council of the Institute of Builders accepted this proposal on the condition of certain changes being made in Clause 16 itself, which practically rendered its inclusion among the exempted clauses nugatory. A deadlock occurred, and the Council reluctantly declined further negotiation on the subject with the Institute of Builders.

In accordance with the resolution of the general meeting held on April 9 last year a joint committee of the Institute and the Surveyors' Institution have had many meetings to consider alterations in the law of ancient lights. This Committee—which received the most valuable assistance from Mr. J. Fletcher Moulton, K.C., M.P., and Mr. G. Malloes Freeman, K.C.—issued a Report to the Councils of the two bodies. The Committee has been further authorised to draft a public Bill on the lines of their Report, and to submit it for consideration to the two Councils. The Bill is now in the hands of a Parliamentary draughtsman.

The Institute's publication, "Suggestions for the Conduct of Architectural Competitions," has been reissued as amended at the general meeting on January 7.

The Competitions Committee have caused stamped and addressed postcards to be sent to the hon. secretaries of all allied societies, with a printed form at the back, to be filled up by them with details of any proposed competition in their districts of which they may hear. On receipt of one of these, the Secretary has instructions to write at once to the promoters, urging that the competition be conducted on the lines of the Institute "Suggestions," a copy of which is enclosed.

The Council have renewed the representations made in 1889 to the Local Government Board concerning the Administration of Building By-laws in non-Metropolitan Districts. A deputation was received by the Parliamentary

Secretary, Mr. Grant Lawson, at the Local Government Board, on March 12, when a draft set of By-laws for the use of Rural District Councils, drawn up by the Local Government Board, was submitted for the opinion of the Institute. The Council have forwarded to the Local Government Board the suggestions of the By-laws Committee with regard to this draft.

The Council, having learned that the University of London were about to proceed to the appointment of a Board of Studies for Fine Art (including architecture), took measures to lay before the authorities the desirability of the Royal Institute being specially represented on the Board. The Council are gratified to report that the choice of the Senate has fallen upon Mr. Arthur Cates, who has further been elected by his colleagues as Chairman of the Board.

The Council have reappointed Mr. Thomas W. Cutler as the representative of the Institute on the Sanitary Inspectors' Examination Board.

At the Congress of the Royal Institute of Public Health, to be held at Eastbourne in July, Mr. Herbert Spurrell has consented to represent the Institute. Messrs. Alexander Graham and Edwin T. Hall will represent the Institute at the British Congress on Tuberculosis, to be held in London this year, also in July.

At the instance of Mr. Killingworth Hedges, M.Inst.C.E., and following a suggestion made by him in his paper on "The Protection of Public Buildings from Lightning," read before the Institute on April 23, 1900, the Council have aided in the formation of a "Lightning Research Committee," whose object is to tabulate information as to the destruction caused by lightning. Expert observations, exact measurements, photographs, plans, &c., will be welcomed by the Committee. Mr. John Slater and Mr. H. H. Statham represent the Council on the Committee. The other members up to the present are Major-General E. R. Festing, C.B., F.R.S., Messrs. J. Gavey, M.Inst.C.E., W. P. Goulding, F.S.I., Dr. Oliver Lodge, F.R.S., W. N. Shaw, F.R.S., A. R. Stenning, F.S.I., Arthur Vernon, F.S.I., Killingworth Hedges, M.Inst.C.E. The Council have voted a sum of 25*s.* per annum for three years towards the expenses of the Committee. Other societies are also lending financial aid to the scheme. Mr. John Slater is chairman, and Mr. G. Northover is secretary.

The Council recommend to the attention of members the Architectural Museum, Tufton-street, Westminster, which is somewhat in need of funds for purposes of repairs, maintenance of the 4,000 casts of examples of Gothic work, and the purchase, if possible, of casts of Classic and Renaissance examples. They feel that the support of the profession at large is deserved by a most valuable institution, whose foundation and maintenance have been the devoted work of a few men. The Council have decided to make the Museum an annual grant of twenty guineas, on the condition of the Council being adequately represented on the Committee of the Museum.

The question of architects' names appearing on advertisement boards has come before the Council, and they have issued a resolution which has been printed several times in the *Journal and Supplement*, and in the current *Kalendar*, to the effect that the signing of an architect's name on his building is not derogatory to the profession, but that "it is undesirable for architects to place their names on boards and hoardings in front of buildings during course of construction for purposes of self-advertisement." The Council earnestly hope that members will co-operate with them in making this resolution as effective as possible.

The Council take this opportunity of drawing attention to the needs of the Architects' Benevolent Society, and express the hope that the names of more members of the Institute will appear in the list of subscribers.

The Council are much gratified in being able to draw attention to the satisfactory financial condition of the Institute. Early this year the sum of 1,050*l.* was invested in Queensland Government Three per Cent. stock, thus bringing the total amount of the invested capital of the Institute up to 10,000*l.* A statement of income and expenditure, and balance-sheet for the year ending December 31, 1900, and an estimate of the income and expenditure of the present year are appended.

Reports of the various committees were also

submitted. The Report having been adopted, the election took place of scrutineers for the annual election of the Council and standing committees.

The following gentlemen were then elected as Fellows: Messrs. Hippolyte J. Blanc, R.C.S.A., F.S.A.Scot., Edinburgh; C. Fitzroy Doll, of London; and E. H. Sedding, Plymouth; as Associate: Mr. R. Douglas Wells, B.A., London. Mr. Lacy W. Ridge then moved the following resolution:—

"That in the opinion of this meeting it is not desirable that By-law 26 be repeatedly suspended. The Royal Institute looks to the Council to put forward each year a nomination for the Presidency in accordance with the constitution of the Institute as laid down in the by-laws."

This was withdrawn after some discussion, and the meeting terminated.

MAGAZINES AND REVIEWS.

THE *Art Journal* includes an article by Mr. Lewis F. Day on "Modern Stencilling" with illustrations of the work of one or two stencil designers who have endeavoured to extend the scope of the art by applying it to portraits, repeat figure friezes, &c. This is done in a very clever way, but it does not convince us, and we prefer to see stencil reserved for mere pattern. Designing for stencil is, however, no doubt good practice in the art of conventional design, or reducing natural foliage, as well as representations of symbolical objects, to decorative form. A good article is contributed by Mr. A. A. Bone on "The Frieze and its Origin." The writer does not throw any new light on the origin of the frieze, but he has a good word to say in regard to its sculptural treatment. "A well-planned frieze," he observes, "has much in common with a march in music, of which rhythm, proportionate determination of phrases, and continuous sustentation of force are the characteristics"; so the frieze must be designed with the same attention to symmetry of disposition as would be necessary among a body of men marching to music, who could not so march if irregularly disposed. This is a suggestion that will bear working out.

The *Magazine of Art* contains an article on "Modern Steamship Decoration," which we know has been carried to great elaboration of late, and often in excellent taste. We must say however, that we do not approve of tiles as steamship decoration. The fact that tile decoration can be successfully applied in an ocean-going steamer may no doubt be taken as a strong practical proof of her stiffness and solidity of build, but it seems out of place; one is accustomed to think of a ship as subject to constant strain in every direction, and tiles seem too rigid a material to harmonise with our idea of a ship, wood and fibrous plaster (which latter is no doubt largely used) seem more appropriate. An article on "The Newly-discovered Frescoes at Boscoreale" gives information and illustrations in reference to the most interesting find in Roman domestic art since the unearthing of Pompeii.

The *Studio* (April 15) contains an article, written and illustrated by Mr. E. Borough Johnson, on the subject "How to Use a Lead Pencil," a practical subject on which many persons who handle lead pencils but do not know how to use them have much to learn. The advice given seems to be excellent, only we cannot agree that what the writer calls "the searching-out lines" in drawing from the figure should be left, and not rubbed out, "as they will give interest and spirit to the drawing," the right outline when found, being merely strengthened. This is a piece of cant in modern art-practice; we observe that some young architects, also, who send us sketches of detail, seem to consider that there is a kind of merit in leaving visible the incorrect lines by which they first made a bad try in curve or scroll. We call that simply slovenly workmanship. And then, too, the question might be put, ought there to be searching-out lines at all, and is not the finest practice to study the line so well before you draw it that you do it correctly without trial lines? As far as architecture is concerned, we know that sketching in ink is most valuable practice in this way, compelling the sketcher to take the whole proportions and understand the meaning of all the lines before he begins drawing them. However, the pencil is a pleasanter medium both in

actual working and in final effect, and we are glad to see a good paper on the subject.

In the *Artist* is an article by Mr. Wentworth Huyshe on the lately recovered Greek statues which have been fished from the depths of the sea. The article, however, seems to be a summary of information and opinions rather than original: the illustrations give it, however, considerable interest. An article on "Art in Picture Frames," by Mr. Aymer Vallance, is far too short for the subject, on which there is in reality a great deal to be said.

The *Architectural Review* (Boston), No. 3 of Vol. VIII., contains a short article by Mr. Lewis F. Day on "Lettering in Ornament," which is to be continued, and a long one, with a good many illustrations, on "Doorways of the Bristol Renaissance," by Mr. J. W. Dow. What is "the Bristol Renaissance"? The inquiry introduces us to the fact that there are five towns named Bristol besides our own time-honoured city—one in Nova Scotia; one in Quebec; one in Nevada, U.S.; one in New Hampshire, U.S.; and one in Rhode Island, U.S.; which last is the locality of the chapter on architecture called by the rather large title of the Bristol Renaissance. This is described as "a unique local development entirely disconnected in American architectural genealogy." The doorways figured are mostly exceedingly what would be found in English eighteenth century houses, and are interesting enough, but the title is certainly too large for the subject. The illustrations include a fine geometrical drawing of the tower at the Buffalo Exhibition (Mr. J. G. Howard, architect); a fine erection of its class, both in general design and detail.

The *Edinburgh Review* includes an article on "Woodcuts and the Illustration of Books" apropos of the exhibition at South Kensington, but which does not throw much new light on the subject.

The *Quarterly* has an article on "The Housing Question," partly historical. As far as it deals with the present state of things, the tendency of the article is to recommend business methods of working. The author speaks strongly, among other things, against the unreasonable demands which are made on railway companies to run workmen's trains at a financial loss, especially on the part of the London County Council. "No sound economic development can take place by this method of extorting service." An article on "The Game of Billiards" will probably interest a good many of our readers; and the number contains also what is perhaps the best and most interesting article on the late Sovereign which has appeared in any magazine.

The *Monthly Review* contains an article by Professor Waldstein on the recently recovered Greek sculptures. He directs attention especially to the "bronze Hermes" and to the marble sculpture which has been called the "crouching warrior." The importance of these works Professor Waldstein considers to be partly due to the fact that they are separate sculptures, made for their own sake as sculpture, and not as decorations to a building. The article should be read by those interested in Greek art.

Scribner, under "The Field of Art," gives an interesting description, with illustrations, of the work of the Sèvres manufactory at the recent Paris Exhibition, considered as an example of French architectural decoration.

Harper contains an article by M. Benjamin-Constant on "My Portraits" which it is needless to say is of considerable interest. More especially are the following remarks on his portrait of Queen Victoria, now at the Academy of interest at the present moment; they explain to us what the author was aiming at:—

"Recalling my visit to the House of Lords one beautiful day in autumn, when the yellowish rays of the westerling sun shone through the glass windows, I seemed to see one of those interiors of a golden obscurity in which Rembrandt so loved to place his figures; and I beheld as in a vision . . . the Sovereign, seated on the throne of England, motionless, her gaze deep in retrospection, almost hieratic—the idol of her subjects. I saw this Queen, in gorgeous robes covered with jewels, and bathed in the rays of the setting sun from head to foot. With this sublime apparition in my mind, I wished to express, as it were, an entire reign. . . . I returned, then, to London for my preparatory work in sketches with sunshine effects, and the weather conditions were favourable too, although it was in March, towards the close of the wintry season. I saw once more the throne in the same clear-obscuré (light and shade), in the same golden

ARTHUR STRATTON
ARIBA. ARCHITECT.

vapour, so sumptuously poetic, which enraptured my vision on my original visit to the House of Lords.

The studies finished, I went back to Paris, realising thoroughly what I had to do, but not knowing positively if I should succeed. I started my work then, having before me a small, very exact likeness of the Queen's face. This, be it understood, was not the copy in enamel of a nose, of a mouth, that I was going to execute, but the portrait of the Queen of England, the Empress of India, seated a little in the background, in a semi-obscurely traversed diagonally by two or three rays of the declining sun, like bars of gold, which attached themselves to the carved corners of the Royal stall, or lighted up the red tapestry hangings. In short, I proposed to myself to express, so to speak, a synthesis of resemblance; a resemblance, moreover, rather moral than physical; almost a historical vision.

The *Century* contains two descriptive articles on ancient cities, one on "The Deserted Capital of Rajputana," the other on the ruins and remains of Priene, described as "a recovered city of Alexander the Great." Unfortunately they both appear to be the work of popular writers rather than learned archaeologists. Some trouble, however, has been expended in illustrating them.

"Dunvegan Castle" is the subject of an illustrated article in the *Pall Mall Magazine*.

The *Church Builder* (quarterly) contains No. 7 of a series of articles by Mr. J. T. Mickelthwaite on "Church furniture and arrangement," this one dealing with "The Basilican plan." The tendency of the article is to the effect that there is no basilican plan, and that if there is we can find it without going out of the range of mediæval churches, since at St. Peter's, Mancroft (Norwich), St. Margaret's, Lynn, and St. Margaret's, Westminster, and a hundred other places, we have the unbroken nave and aisles from end to end, just as in the early Greek and Roman churches. There are other qualities besides plan, however, in the type of church called Basilican, a title which defines what is meant well enough, whether it be regarded as historically correct or not. The protest in the article is that of a mediævalist church architect, in fact.

Feildon's Magazine contains articles on "Motor Cabs in Paris" and on "Electrical Ties," the latter a continuation of the essay by Mr. Brew commenced in a previous number.

The *Essex Review* (quarterly) contains a long article, with a good many illustrations, on "Some Interesting Essex Brasses."

In *Knowledge* the interesting investigation as to the height and action of ocean waves, by Mr. Vaughan Cornish, is continued, accompanied by a diagram showing the relation between what are recognised as waves are the larger and longer undulations on the surface, which occur on a vast scale in the Pacific especially, the normal "waves" being com-

paratively smaller undulations on the surface of the greater and slower ones.

We have received also the *Revue Générale* and the *Gentleman's Magazine*.

FAIRMEDE, NEW SOUTHGATE.

THE illustration shows a small country house erected in the Bowes-road, New Southgate. The disposition of the plan was dictated by the nature of the site and the points of the compass. It is very simply treated throughout; the walling is of local brick with slightly dark-toned quoins, &c.; the roofs are covered with green Westmorland slates, and the paintwork generally is white. The contract was carried out by Messrs. Brown & Sweetland, of New Southgate, under the superintendence of the architect, Mr. Arthur Stratton, of London.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Licenses.—On the recommendation of the Finance Committee it was agreed to lend the Battersea Borough Council 2,460*l.* for the erection of a sawmill, the Stepney Borough Council 5,160*l.* for street-lighting purposes, the Woolwich Borough Council 2,170*l.* for the erection of a library, and the Poplar Borough Council 6,040*l.* for the erection of a wall.

Improvements.—On the recommendation of the Improvements Committee it was agreed that the estimate of 10,000*l.*, submitted by the Finance Committee be approved; and that, subject to the Council of the Metropolitan Borough of Wandsworth agreeing to contribute one-third of the net cost, and subject to the terms of an agreement to be prepared by the solicitor, the offer of Messrs. Holloway Brothers to surrender their leasehold interest in the part of the Magdalen College estate required for the widening of Garratt-lane, Wandsworth, to 54 ft. be accepted.

Theatres.—On the recommendation of the Theatres and Music Halls Committee the following applications were agreed to on certain conditions:—

London Exhibitions.—Model of a Boer farm, to consist of a cottage of five rooms, constructed of studding and plaster slabs (Mr. A. O. Collard).

London Exhibitions.—Addition to the southeast side of the Quadrant Restaurant (Mr. A. O. Collard).

Lyceum Theatre.—Certain structural alterations.

Tramways.—The Highways Committee reported as follows:—

"We have to report, for the information of the

Council, that the Board of Trade has, by letter dated April 24, 1901, signified its approval, required by the London County Tramways (Electrical Power) Act, 1900, of the plans, submitted in accordance with the resolution passed by the Council on November 27 last, showing the rail and substructure proposed to be used in the reconstruction, for electrical traction, of the tramways between (a) Westminster Bridge and Upper Tooting-road, (b) Kennington Park-road (at its junction with Kennington-road) and the Blackfriars terminus, and (c) St. George's Circus and the terminus in Waterloo-road. The Board has also approved, provisionally, the proposed system of traction so far as the use of a pressure not exceeding 500 volts is concerned, such approval being subject, however, to any requirements which may be considered necessary on the inspection of the completed works. The Board has asked to be furnished with further details of a technical character with regard to the supply of energy at a pressure of 6,500 volts to the proposed sub-station at Balham; and we have given instructions for these further details to be prepared and submitted as soon as possible for the approval of the Board.

The Council will be able after June 29, 1901, to give notice to the South London Tramways Company of intention to purchase, under Section 43 of the Tramways Act, 1870, the tramways authorised by the South London Tramways (Extensions) Act, 1880. These tramways are about 4½ miles in length, and are situated in York-road, North-street, St. John's Hill, Lavender Hill, Wandsworth-road, Falcon-road, Queen's-road, and Victoria-road. They constitute rather more than one-third of the company's system, various other parts of which will become purchasable in 1902 and 1903 respectively. The Council, it will be remembered, served a notice upon this company last year to purchase the portion of its undertaking which then came under the operation of the section above referred to."

Having transacted other business, the Council adjourned.

SANITARY INSPECTORS' ASSOCIATION: SANITATION IN SOUTH AFRICA.

AT the monthly meeting of the Sanitary Inspectors' Association, held at the Carpenters' Hall, E.C., on Saturday evening, a paper was read prepared by Mr. J. S. Dunn, Sanitary Inspector to the Bulawayo Council, on "Sanitation in South Africa." Mr. W. H. Grigg, the Chairman of the Association, presided.

In the absence of Mr. Dunn the paper was read by Mr. O. C. Hills. In the course of the paper the author described South Africa as a country without sanitation. With regard to Cape Town, although it was making advances, it would be some time before it could be favourably compared with towns of similar population and importance at home. The roads and footpaths and gutters required much attention. The subsoil in places must be frightfully polluted from slop and kitchen waer. Much slum property existed; rents were high even in these quarters, and conse-

quently overcrowding was prevalent. Passing on to discuss the condition of Bulawayo, he pointed out that that township was just over six years old, and stands where Lobengula's cornfields formerly flourished. Practically no attempt had been made to construct proper roads and footpaths, and he (the writer of the paper) left it to the imagination of those who had not visited the spot to picture the condition of things after a downpour of five or six days' duration. The population was now about 4,000, and the pail system was in vogue for the removal of night soil, the work being performed nightly, an advantage which no other South African town enjoyed to his knowledge. The work was carried out departmentally, clean disinfected buckets being provided about twice a week. The night soil was conveyed to the municipal depositing site, about three miles from town, and emptied into trenches, which were then prepared for tree planting. Rubbish, slop water, dead horses, &c., were also removed by the Council. At present the system in vogue for rubbish removal was not quite a happy one. They endeavoured to persuade occupiers to enter into monthly contracts with the Council, when their rubbish was removed periodically for a stated amount, but as this system was not compulsory, they could not always bring the public to see things from their point of view; consequently large and offensive accumulations were not an unknown fact. The removal of slop water was a burning question at Bulawayo, as it was in the majority of South African towns. Let them imagine a town with only surface drainage. Refuse water could not flow down the street gutters, removal by slop wagon was costly, and only compulsory in the event of a nuisance arising; consequently the usual way of disposing of the water was by scattering it over the stands. Thus the subsoil was being polluted wholesale, and the purity of the well waters endangered. There was a water supply, but owing to the fluctuating quantity of water available, its variable quality, and the high tariff charged, the demands on the company were not great. Moreover, as over 350 wells had been sunk in the township, frequently a costly undertaking, their use would not be abandoned for trifling reasons. It was regrettable that more care was not exercised in selecting positions and in their construction, so as to guard against possible pollution.

Too frequently one found that every opportunity was offered for the entry of surface water and foreign matters at the mouth of the well, and that contamination by percolation from closets, dustbins, stables, washing water, &c., was easily accomplished. However, the Council realised that well water could not be regarded as a permanent supply, and the necessity of obtaining a wholesome and abundant one for the people was now receiving their earnest consideration. In the meantime all doubtful well waters would be carefully analysed. With the exception of typhoid fever they had been remarkably free from infectious disease. It was well they had, for an outbreak would find them unprepared. Notification was compulsory, but there the law as regarded infectious diseases practically ended.

Dealing with the slaughter site, he described it as unsatisfactory in the extreme, simply consisting of poles erected about a mile from the township. The blood soaked into the ground, the water supply was totally inadequate, carcasses were exposed to the weather; pigs, dogs, and Kafirs acted as scavengers. The stench was unbearable. The Council had, however, after two years' deliberation, at last decided to erect municipal abattoirs. There were other steps being taken which would make Bulawayo a more pleasant place to live in. Some of the recently erected permanent buildings would be a credit to any European capital. Touching upon the condition of colonial villages, he regretted that the defects were very glaring. He concluded by expressing the opinion that had South Africa been in a better condition as regards sanitation, probably the sickness and mortality among our troops in the present campaign would have been greatly lessened. He feared that with the present sanitation preventive disease would take a long time to stamp out.

Mr. Hills (City of London) said the facts given had come as a revelation to many of them. He certainly did not know that so many defects characterised sanitation in South Africa. Now that a large number of Englishmen were being appointed to posts better results would arise.

Mr. Young (Battersea) was surprised to hear

of the condition of things in Cape Town, and trusted that before long the attention of the British public would be called to the matter.

Mr. E. Tidman, on the authority of a military officer, confirmed the statements as to the condition of Cape Town.

A vote of thanks was passed to Mr. Dunn for his paper, and to Mr. Hills for reading it.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated.—

Lines of Frontage and Projections.

Wandsworth.—The retention of a tool-shed in the garden at the rear of The Beeches, No. 21, Melrose-road, Wandsworth, abutting on Avenue-road (Dr. G. G. Sharp).—Consent.

Wandsworth.—School buildings on the east side of Garratt-lane, Wandsworth, at the corner of Swaffield-road (Messrs. Lansdell & Harrison for the Guardians of the Wandsworth and Clapham Union).—Consent.

Hackney, North.—Houses, with shops on the ground floor, on the forecourt of No. 50, Green-lanes, Stoke Newington (Mr. J. Phoenix for Mr. F. W. Britton).—Consent.

Wandsworth.—Thirteen one-story shops on the east side of Balham High-road, between No. 207 and Elmfield-road (Messrs. Dale & Gadsdon for Mr. J. Stone).—Consent.

Width of Way.

Deptford.—Gates and a boundary wall at the entrance to the chemical works, on the east side of Creek-street, Deptford (Messrs. F. C. Hills & Co.).—Consent.

Hoxton.—A two-story warehouse at the rear of No. 110, New North-road, Hoxton, at less than the prescribed distance from the centre of Salisbury-street (Mr. R. Matthews).—Consent.

Deviations from Certified Plans; and Projections.

Strand.—Deviations from the plans certified by the District Surveyor, under Section 43 of the Act, so far as relates to the proposed rebuilding of No. 20, Cockspur-street, Charing Cross, with projecting oriel windows and turrets (Mr. W. Woodward for the International Sleeping Car and Express Trains Company).—Consent.

Deviations from Certified Plans.

Lambeth, North.—Deviations from the plans certified by the District Surveyor so far as relates to the proposed rebuilding of No. 22, Westminster Bridge-road, Lambeth, at the corner of York-road (Mr. F. Waghorn for the Camden Brewery Company).—Consent.

Lines of Frontage, Width of Way and Space at Rear.

Walworth.—That the application of Messrs. Spalding & Spalding for an extension of the period within which the erection of a building, to be used as a working men's club, on the east side of Walworth-road, Walworth, at the corner of York-street, was required to be commenced and completed, be granted.—Agreed.

The recommendations marked † are contrary to the views of the Local Authorities.

NEW WING, EYE AND EAR HOSPITAL, TUNBRIDGE WELLS.—A new wing has been added to this hospital; it was opened on the 30th ult. Mr. H. M. Caley was the hon. architect.

OPEN SPACES.—Walpole Park, at Ealing, has been purchased from Sir Spencer Walpole by the Ealing District Council for 40,000l., and converted for purposes of a public recreation ground; the property, including the mansion and grounds of about thirty-one acres, was occupied by the late Right Hon. S. H. Walpole, Secretary of State, and the offer to the District Council was made in December, 1898, subject to the life-interest in the property of Miss Frederica Elizabeth Perceval (youngest daughter of Spencer Perceval), who died at a greatly advanced age in May last year.—The Hampstead Borough Council have appointed a special committee to consider and report upon the project of the School Board for London to acquire part of the site of the old mansion with its grounds, known as the Grange, at Kilburn, for the erection of a Board School; the Board's proposal has aroused considerable opposition in the locality, where it is desired to preserve the property as an open space.—The Corporation of the City of London have ratified a code of by-laws for the regulation and use of the garden space within Finsbury-circus, which they have taken over for the benefit of the public, in pursuance of an Act passed in that behalf last year.

ARCHÆOLOGICAL SOCIETIES.

ROYAL ARCHÆOLOGICAL INSTITUTE.—A general meeting of this Institute was held on the 1st inst., Mr. E. W. Brabrook, C.B., V.P., in the chair. Mr. E. Green, in the absence of the author, read a paper by Mr. A. R. Whiteway, M.A., on "The Pyrenean Neighbour, or the Vicinal System in the Western Pyrenees." Mr. Whiteway, long resident at Pau, having given attention to and mastered the difficult Bearnais tongue, has followed up his advantage by a close examination and study of the local archives, from which he has gathered many notes on local customs, and especially this vicinal system, hitherto a neglected and unwritten chapter in the history of social institutions.—Mr. H. Longden read a paper on "Cast-iron" and dealt principally with cast-iron firebricks, examples and photographs of which were exhibited. One specimen shown bore the Royal Arms of James I, 1604; another of "Richard Lenard, founder at Bred Fournis, 1636," showed a portrait of Richard Lenard standing in the middle of the implements of his trade and of the products of his foundry; a Puritan book showed the sacrifice of Isaac, the Patriarch, Jacob blessing the sons of Joseph, Joseph being put into the pit, and Jacob being informed of the death of Joseph; another showed the Rose surmounted by the Crown, 1650; and a very fine one "Fairfax Councillor, 1640," gave the general on horseback finely modelled. A note was made of a fire-back belonging to Mr. Edmund James, where an earlier model of St. George and the Dragon was surmounted by the legend "Cursius" and "Nil Desperandum, 1650," and placed at the side of the figure. It was thought that this back had a Royalist significance in contrast to the Fairfax back. A rubbing of a grave slab of Anne Forster, 1591, was shown and a description of how the model was prepared for casting was given. A casting, lent by Mr. E. James, of the Baptism of our Lord, apparently of the sixteenth century, was also exhibited. It is not a fireback, but has evidently been fitted to other work. The Almighty and the Holy Spirit, each surrounded by a nimbus, are in the upper part of the panel, and St. John Baptist and our Lord are in the lower part. Mr. James Hilton exhibited a pair of German iron carings of very delicate casting, originally made to replace similar articles of gold and jewellery which were given up by the ladies of Germany at the time of the Napoleonic wars. In the discussion on this paper Mr. R. G. Rice gave many quotations from Sussex wills in which the names of ironfounders were mentioned, and references made to iron grave slabs, &c.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

The annual general meeting was held on the 1st inst., Mr. C. H. Compton, J.P., in the chair. An interesting account of the exploration of a tumulus in Buckenham Fields, Norfolk, was contributed by Lord Amherst of Hackney, and read by the Rev. H. J. D. Astley. The tumulus is one of two large tumuli on Lord Amherst's property, situated about seven miles north of Brandon, and was opened by him in August last in the presence of a large party interested and experienced in such operations, including Prof. McKenny Hughes, Prof. Mahaffy, and others. The work proved somewhat heavier than had been anticipated owing to the tumulus having been thrown up on the brow of the slope so that it depended on its lower side more than had been foreseen. It is often very difficult to find the exact centre of a sepulchral mound, as the additions, whether of earth or stones, would be originally larger on the side where it was most easy to procure material, and, in after ages, the crumbling down of the mound would be greater where it was helped by the slope of the ground. In this case the centre of the mound, as obtained by measurement from its inferred marginal outline, did not coincide with the highest point, nor did the position of the only interment met with agree with either. The mound was divided by the explorers into quadrants, separate parties undertaking each, so as to insure that nothing could be overlooked, and the whole face was dug clean down to the undisturbed sand and gravel. Notwithstanding the care exercised no secondary or contemporary marginal interment was found. In the north-west quadrant an old horseshoe without catkins was met with, raising the hope that Saxon remains might be near, and in the south-west quadrant some bones of domestic animals, suggesting

relics of the funeral feast, but nothing came of them. In the north-east quadrant, however, in the afternoon of the last day's work, a skeleton was uncovered lying in a posture which indicated a British interment. After Professor Hughes and others of the party had left a further interesting discovery was made, consisting of a circle of charred earth and ashes, some 6 in. in width, forming an almost complete ring round the skeleton at a distance of about 2 ft. from it. As the body did not occur in the centre nor at the bottom of the mound, but at a great depth near the centre, it seems quite possible that it may be a contemporary burial of secondary importance, and that the principal interment may still be concealed under the deepest part of the mound not yet explored.—Mr. T. Cato Worsfold gave an interesting description, based upon his own research and observations, of the Porta Nigra, or Great Gate of Trèves. After discussing the origin and foundation of the grand old town, whose rise to eminence gained for it from the poet Ausonius the title of "Rome beyond the Alps," Mr. Worsfold described the numerous and splendid relics of the Roman occupation which remain to the present time, and then explained the construction of the Porta Nigra and the theories put forward as to the date of its erection, which he himself assigns to the commencement of the fourth century, when it became necessary to erect defences against the rush of Rome's Teutonic foes. From this period the history of the Porta Nigra was traced onward through the Middle Ages until its final restoration in 1876. Mr. Blashill, the Rev. Evelyn White, Mr. Gould, Mr. S. W. Kershaw, and others took part in the discussion which followed the papers.

ARCHITECTURAL SOCIETIES.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.—A general meeting of members was held at the rooms of the Institute, 20, Lincoln-place, Dublin, on the 2nd inst. The chair was taken by Mr. J. Rawson Carroll, F.R.I.B.A. The following resolution was proposed by Mr. J. J. O'Callaghan, seconded by Mr. F. Franklin, and carried unanimously:—"That the draft by-laws of the Ulster Society of Architects be approved of, and that the Council of this Institute be authorised to make the necessary alterations in the by-laws of the Institute to make them conform with those of the Ulster Society." The following candidates for membership were declared duly elected:—William A. Scott, London; Jerome O'Connell, Curragh Camp; Henry Seaver, Belfast; and Anthony Thomas Jackson, Belfast. The proceedings then terminated.

ENGINEERING SOCIETIES.

SOCIETY OF ENGINEERS.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on the 6th inst., Mr. Charles Mason, President, in the chair, a paper was read on "The Treatment of Low-grade Iron Ores for the Smelting Furnace" by Mr. Thomas B. Grierson, M.Inst.C.E. The author first alluded to the serious condition of the British iron trade owing to foreign competition, which condition the great American Steel Combine had served to accentuate. One of the difficulties against which Great Britain had to contend in its export trade was, he said, the foreign protective tariffs. The want of more advanced appliances and processes in British steelworks was given as one reason for our being unable to compete successfully with foreign producers, particularly Americans, who were more to be feared as trade rivals than other competitors. American steel-makers, as well as those of other countries, had been adopting new machinery and new methods, whilst we had been standing still. The author then pointed out that the remedy for this unsatisfactory condition of matters was for the British steelmaker to set his house in order, firstly, by adopting improved plant and methods of production, and, secondly, by utilising low-grade iron ores, of which there is an almost unlimited supply. Low-grade ores were mainly of two kinds, magnetic iron ores and magnetic iron sand. The low-grade ores would not pay to smelt in lumps, but required to be pulverised and concentrated. In that condition, however, they, as well as the iron sand, are unsuited for the blast furnace. It was, therefore, necessary to combine them

with some cohesive material, and to make them into briquettes. This preparation had been effected by heat alone, but that method was only successful with ores containing silicates. Lime formed a good binding material, whilst concentrates had been variously mixed with tar, pitch, and bituminous coal, and pressed into briquettes and coked. The matter resolved itself into the mechanical reduction and concentration of the poor ore, the incorporation of the concentrates with a suitable coherent, and the conversion of the mass into briquettes. The author described Mr. Edison's process, respecting which there has recently been a considerable amount of discussion in the Press. This process consists in crushing the ores in a mill and in concentrating them. The concentrates are mixed with certain ingredients which are not publicly known, and the mass is then pressed into briquettes and baked. The briquettes were stated by the author to be of a porous nature, and unsuited to the requirements of the blast furnace. Mr. R. F. Strong had also invented a method of treating low-grade iron ores. The ore was first reduced to powder, and concentrated by any suitable appliances. The concentrates were mixed with binding materials in the proportion of 85 per cent. of concentrates, 5 per cent. of powdered quicklime, and 10 per cent. of pyroigneous tar. The mass was pressed into briquettes, which were immediately ready for use in the blast furnace, not requiring to be baked like Edison's. Strong's briquettes had been proved to be specially adapted by their density and compactness for the blast furnace. For countries where charcoal fuel is used, that ingredient is incorporated in the briquettes. The author recommended that blast furnaces should be erected at the low-grade iron ore deposits, and the pig-iron made there. The cost of transport to steel works would thus be that of the metallic products of the ore, the matrix being left behind in the form of slag.

BUILDING TRADES IN WARSAW.

REPORTING on the trade and agriculture in Poland and Lithuania for the year 1900, Mr. Murray, British Consul-General, writes under date April 5.—The financial crisis has had a very bad effect on the building trades throughout this district, and especially at Warsaw, where also the large number of houses built in the last two or three years has had a similar effect; 904 plans for new houses for rebuilding were presented to the Government Architect for confirmation in 1898, and 846 plans in 1899, whilst in 1900 only 501 plans were submitted. Again, in 1898 the builders declared their intention of carrying out 512 of the buildings; in 1899, when the crisis began to be felt, the number dropped to 294, and in 1900 to 230. Taking the time required for the construction of a house at two years, this would mean that work was done on 800 houses in 1899, on 500 houses in 1900, and will be on 370 houses in 1901. On the other hand, the amount of the work done on public and block buildings increased in 1900 as much as that on private houses diminished. For instance, there were the Polytechnicum, which is to cost 300,000*l.*; the new building for the "Child Jesus" Hospital, also to cost 300,000*l.*; the "Kossia" Insurance building, to cost 110,000*l.*; the Hotel Bristol, the Fine Arts Exhibition, the Philharmonic Hall, the block of shops in the Diaga-street (60,000*l.*), the block of buildings being built in the Smolna, and others. In several of these constructions use is being made of materials which are new here; for instance, in the Hotel Bristol the new here; for instance, in the Polytechnicum some are made of mixed iron and cement on the ceilings. The Matray system, in the Polytechnicum some are Matray and others Klein, whilst in several other buildings they are on the Monier system. In almost all buildings use is still made of the unhealthy and heavy clay plaster instead of plaster of Paris. Lifts are beginning to be introduced, but unfortunately no control is exercised over their construction, so accidents are to be feared. An improvement that is becoming general is the arrangement of windows to open inwards, and this, it is to be hoped, will diminish the number of accidents to servants while cleaning them. Steam heating for the whole of a house is coming into vogue. It is usually carried out by means of a central installation with a low pressure of steam. Electric light has also been installed in several houses, but it is found necessary to have accumulators and also to find lodgers who wish it, which is very few do at Warsaw on account of the expense. Although there is very little building of dwelling-

houses likely to be done in Warsaw itself in 1901, a good many villas and houses are to be built in the suburbs, which become more and more popular, rent there being much lower, and the increased number of steam and other tram lines render communication easier. Several factories are to be built in the suburbs of Czysta and Wawer. The villas and dwelling-houses will be mostly at Czysta, Willanow, and along the lines of the steam tramways. 1900 was a bad year for all suppliers of materials for building, as they had arranged their output on an estimate in accordance with the amount of building done in 1897-98-99, so that there was a considerable over-production, especially of bricks. Many brickfields had to close altogether; others sold their stocks of bricks, which they had prepared at the beginning of the season, at any price they could get, the price per 1,000 falling from 2*l.* 5*s.* in 1899 to 1*l.* 1*s.* in 1900, which barely covered the cost. Glazed tiles for stoves were also in small demand, and two works closed altogether, after existing only three years. Cement works also did badly in 1900, and few of them paid any dividend. The demand was so much smaller than in previous years, that they had to diminish production and lower prices. The cement works, however, form a strong syndicate, which already had an arrangement with the German works that neither should export cement; strong in the knowledge of which they have now decided to raise prices 25 per cent. in 1901, as there will be no competition from abroad. The price of cement in 1900 was 6*s.* per cask wholesale and 8*s.* per single barrel. This price was only maintained thanks to a considerable demand in Russia. Had the works depended on local demand alone, they might just as well have closed. Lime did better than any other material used for building, and prices were maintained. The lowest prices paid were 1*s.* 2*d.* to 1*s.* 1*d.* per cwt. for first quality and 1*s.* 1*d.* to 1*s.* 0*d.* per cwt. for second quality. The price of plaster of Paris was 2*s.* 3*d.* to 2*s.* 3*d.* per cwt. The manufacture of mineral colours has been carried on in the kingdom of Poland for about thirty-five years. The first factory established was one which still exists at Grodzisk, near Warsaw. There are also factories at Winnica, near Warsaw, and at Koniki, Szaryszko, Radom, and Bendzin. The colours manufactured consist of various ochres, umbers, English reds, and various kinds of black (bistre). The washing process has only been introduced at one factory, all the others employing the dry process. The clay is dried, burnt to the proper hue, ground by millstones and sifted through silk muslin. The various ochres employed are found in the country, the best qualities being found in the Konecki district of the Government of Radom, and in the Bendzin district of the Government of Piotrkoff. Iron oxides (refuse of iron workings) are imported chiefly from the United Kingdom, "Cassel brown" and various kinds of bistre from Germany. The colour supply having increased until there was an over-production, there is now a great stagnation in the trade. No other kinds of colours except those mentioned are made in Poland.

ELECTRIC LIGHTING IN LEEDS.—The City Council of Leeds have made application to the Local Government Board for sanction to borrow 500,000*l.* for purposes of electric lighting, and this application formed the subject of a public inquiry held at the Municipal Buildings on the 18th ult., by Mr. H. H. Law, M.Inst.C.E., an inspector appointed by the Board. The Council's scheme includes the extension of the present works in Whitehall-road, the installation of engines and the dynamos, the introduction of new plant, and the laying of mains in various parts of the city. The Town Clerk (Mr. W. J. Ieaves) gave the inspector a brief sketch of the history of the electric lighting undertaking, which was acquired by the Corporation in December, 1898, by purchase from the House-to-House Electricity Company. The number of units sold in the year ended December 31, 1893, was 130,000; in the year ended March 20, 1901, it had increased to 2,520,414, which was an increase of over 500,000, or more than 25 per cent. on the pre-1893 year. The number of lamps in 1893 was 10,647; this year it was 132,293, an increase of 26,000 on last year. The gross revenue had gone up from 1,001*l.* in 1893, to 43,624*l.* in the year ended March 20, last, which latter amount showed an increase of 7,404*l.* on the revenue of the previous year. The working expenses had, of course, also increased, beginning with 2,700*l.* in 1893, and being this year 15,770*l.* The profit this year was 3,600*l.* greater than last year. They started at December 31, 1893, with a year. They started at December 31, 1893, with a gross profit of 1,205*l.*, and this year it was 20,884*l.*, but naturally there was also an increase upon interest and sinking fund, that increase being altogether about 5,000*l.* Mr. Charles France (of Messrs. Mines & France, Bradford), the architect for the new works in Whitehall-road, explained the scheme. The works are really an extension of the present buildings in Whitehall-road, and are being erected on adjoining land which the Corporation acquired by purchase from the company who formerly owned the electric supply works. The area of that land is 5,700 yards, practically the whole of which will be covered by buildings, within which there will be provided all the plant requisite to the growing demands of the undertaking.

RAILWAY STATION, HOWRAH,
CALCUTTA.

ROR some long time past the present terminus of the East Indian Railway has, owing to the growth of the line and its consequent increase of traffic, been found inadequate, and the advent of the Bengal and Nagpur Railway determined the directors to rebuild their station so that it should accommodate both railways.

Howrah is a suburb of Calcutta, across the Hooghly (about three-quarters of a mile broad at that part), connected with it by means of a swing bridge.

The new station, with its length along the riverside, is adjacent to the bridge and faces Calcutta. The disposition of the ground floor is shown on the plan; the first floor is devoted to the offices of the superintendent of traffic, telegraphs, &c., and the third floor contains the residences of the officials connected with the railways.

The station consists of two blocks connected on the first floor by means of a bridge of 47 ft. span, and the façade measures about 600 ft. in total length, with return wings 200 ft. odd in depth.

The main (Chandmarce) road from Calcutta over the bridge passes on the north side of the station, and the tower—with a clock—is placed at the angle to inform the traveller, as he drives to catch his train, of the amount of time available for him. The third-class waiting halls are open the full (40 ft.) height. The discrepancy between the perspective and the plan is due to the fact that the former was made almost at the outset, whilst the plan represents the building as it is to be executed.

HALSEY RICARDO.

NORTH LONDON CREMATORIUM.

This building is to occupy a site near the Finchley-road, where some acres of hillside are to be judiciously planted by Mr. William Robinson. This ground, or garden, will not be dotted like a cemetery with tombstones, as by the scheme a cloister will form the "columbaria" for urns, and will bear the various monuments and memorials on its walls.

The building will be entered from a forecourt, with the chapel on one side, and the superintendent's cottage, office, &c., on the other side.

The chapel has a carriage porch. It has two retiring or waiting rooms, with separate exits for mourning parties who may be using the building simultaneously.

Four furnaces are provided, as these burn themselves out quickly and want frequent reneving. The furnace flue forms a centre to the belfry, from which, however, no smoke should issue, there being a second small furnace in the throat of the flue for the consumption of smoke or gas.

This brick building is broadly and simply treated in the round-arched style of Lombardy—the low-pitched roofs being of Italian tiles.

The small domed building in the architects' drawing shows a family mausoleum, or columbaria. It is thought that separate bays of the cloister will be secured by families, and their monuments of stone, marble, or bronze will have the benefit of shelter.

The architects are Messrs. Ernest George & Yeates, and the drawing is now in the Royal Academy Exhibition. It is the only drawing they exhibit this year.

THE REBUILDING OF THE ROYAL
INFIRMARY, GLASGOW.

THE competition for the rebuilding of the Glasgow Royal Infirmary was a limited one, ten architects or firms of architects being invited to compete. Seven of these were Scotch practitioners, and three were from London. Dr. Rowland Anderson was the assessor. The scheme was one of great interest, involving, as it did, the pulling down entirely of the present infirmary, and erecting upon the site a thoroughly up-to-date building in arrangement and appointments. The accommodation required for the reconstructed buildings was 650 beds, divided as follows—viz., 225 on the medical side, 300 on the surgical, and 100 for special diseases. These were to be distributed into five medical services of forty-five beds each = 225; six

surgical services of fifty beds = 300; and about 100 beds for diseases of women, throat and nose, skin, venereal, burn, isolation, and emergency cases. The site, a very fine one, situate close to Glasgow Cathedral, was very restricted in its extent, necessitating the adoption by all competitors of six stories of wards generally throughout. The author of the design we illustrate this week endeavoured to avoid the parallel arrangement of pavilions, the area of the site not permitting of sufficient distances between the six-storied pavilions; hence the nature of the general arrangement of the scheme. Each ward suite has its zone of aeration, the administration of the whole establishment practically being concentrated in the central longitudinal block. It being desired to utilise the southern portion of the establishment in the commemoration of the Queen's Diamond Jubilee, due effect was given by the projecting circular ward, with its twin towers and colonnade upon the ground floor. A fresh departure in the new hospital is the provision of some seven or eight operating-theatres, each visiting surgeon having his own separate theatre, out-patients' room, test-room, laboratory, &c. In a similar manner separate lecture-theatres have been provided for five visiting physicians. Each service throughout had suitable apartments for the house surgeon or physician, as the case may be—in each case closely adjoining the respective services. The author provided in the basement a special arrangement of medicinal baths, derived from the best German examples; whilst attention was paid to the now necessary electrical department and a gymnasium for orthopedic cases. Liberal accommodation was provided as required for dining and billiard rooms for the resident doctors; mess and sitting room accommodation for the nurses and the male and female servants. An important provision comprised the working and store rooms of the following departments—linen-rooms, dressmaking, mattresses, and the Dorcas. The general kitchen and its accessories were placed in what in the front is a basement story, but which at the back stands clear, the tradesmen's entrance being through an archway under the easternmost sanitary towers of the male surgical wards suite.

A committee-room, superintendent's and matron's suites of offices, journal-room, and a chapel, were provided in the central administrative block. The present laundry was in this scheme simply extended, with new boilers, incinerator, and disinfecter.

The ear, throat, and nose, emergency, and isolation wards are of two stories only, above the ground floor. The exterior design has been kept somewhat severe in character, and its style and architectural proportions are in contrast, so as not to suffer by the juxtaposition of Scotland's chief cathedral.

The estimated and complete cost of this scheme was stated by its author, Mr. A. Hessel Tiltman, of London, to be 297,765*l*.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

18.—SLOP-SINKS AND URINALS.

SLOP-SINKS.—In small houses the water-closet generally serves also as slop-hopper, and is well adapted for the purpose of removing the slops, but affords no facilities for cleansing the bedroom utensils. There is also a danger of the enamel being damaged by the pails, and a further objection is the risk of splashing either on to the floor or the seat. As already pointed out, some siphonic closets are set in action by a painful of slops, and are therefore unsatisfactory unless fitted with an automatic arrangement for starting the flushing cistern. Valve-closets are also unsuitable for the purpose, as the slops may overflow if the handle of the closet is not pulled at the moment of emptying. When the water-closet is intended to serve as a slop-hopper it ought to have a wide rim sloping inwards, or to be fitted with a "slop-top," in order to reduce the risk of splashing. If the closet is enclosed with woodwork, a square slop-top ought to be fixed to the basin under the hinged seat, as otherwise the floor is certain to become very foul.

A proper slop-hopper or sink is, however, a great convenience, and a suitable number must

be provided in all large houses, and also in hotels, hospitals, asylums, boarding schools, and other important buildings where a large quantity of slops may be produced. The term "slop-hopper" is often applied to fittings for the simple removal of slops, and the term "slop-sink" to those provided with hot and cold water in addition to the flushing apparatus. The simple slop-hopper is in shape very similar to a wash-down pedestal closet; a movable grate of porcelain or brass (the latter being the better material) is often fitted in to prevent brushes and cloths being carried into the waste-pipe and drain, and the apparatus is all the better if the sides and back are raised to prevent splashing. The material may be enamelled cast iron, or some kind of glazed pottery. A wood rim is sometimes fixed along the front to prevent the enamel being chipped by pails.

The slop-hopper shown in fig. 1 is of cast iron, and may be painted, vitreous-enamelled, or white porcelain-enamelled. Plain painting cannot be recommended. The hopper is of the ordinary short-hopper water-closet type, but with a square top and raised back and sides. A flushing rim is provided with a nozzle for connexion to the flush-pipe of a cistern or to a simple supply-pipe. The trap may be of S or P shape. Similar hoppers are made of enamelled fireclay. This form of hopper is, however, objectionable in several respects. The large exposed surface of the hopper renders cleansing more difficult, and the outlet of the S-trap is not above the floor. The pedestal slop-hopper (fig. 2) is of better design. The back part is raised to reduce the risk of splashing, the basin and trap are in one piece of enamelled fireclay, the outlet of the trap is above the floor and clear of the wall, and a hinged brass grate, A, is fitted in the hopper to form a stand for jugs and other utensils which are being washed or filled from the draw-off taps projecting from the wall above. In addition to these taps, a flushing cistern, having a capacity of 2 gallons or 3 gallons, is connected to the nozzle at B, and operated in the same manner as a water-closet flushing cistern. Fig. 3 shows a "bracket" or "projector" slop-hopper on the same general lines, but with the back part of the top inclined upwards towards the wall instead of the raised back and sides.

Adam's slop-sink (fig. 4) has a flat back, so that the pottery fits closely against the wall; the trap is of P-shape, with the outlet in the side of the pedestal. The hopper has a raised back and side, flushing rim, and hinged brass grating, and can be fitted with a bed-pan flushing nozzle for hospital use. At one side an enamelled draining slab is fixed to receive the washed utensils.

Many slop-hoppers are fixed without flushing rims and cisterns, but cannot be recommended. Urine is a very foul liquid, and slop-hoppers are as difficult to keep clean as water-closets, and ought therefore to be flushed in a similar manner. The joints at the outlets of the hoppers ought also to be designed on similar lines. Slate or marble skirtings are sometimes used instead of pottery, and may be supported on iron brackets or on a framework of wood, but the latter is not a suitable material.

In slop-sinks for hospitals provision must be made for washing bed-pans. The "Victorian" slop-sink (fig. 5) is a good example. The hopper and trap are in one piece of glazed ware. A brass grating, A, covered with impervious vulcanite, is hinged at B in such a manner that it can be swung upwards and held by a catch when not required. The grating is fitted with a rose and jet, C, for washing bed-pans, one of these being shown by dotted lines. Water is supplied to the rose and jet by means of two taps (for hot and cold water respectively), one of which is shown at D. Two other taps, E, supply water to the draw-off nozzle, F, which is swivel-jointed at G, so that it can be turned up out of the way. The sink is flushed from a cistern containing 2 gallons or 3 gallons, the down-pipe being shown at H; the flush can be started in the usual way, or by pressing a button. The nozzle for receiving the flush-pipe is vertical, thus facilitating the formation of the joint. The outlet of the sink is well above the floor and clear of the wall, and is flanged to receive the soil-pipe branch, which is of cast iron, glass-enamelled inside, with a socket for the trap-ventilation pipe.

A scalding, or washing-up, sink is often fixed at the side of the slop-sink, and forms a most useful adjunct. The example given in

Illustrations to Student's Column.

Fig. 6 is known as the "Middlesex," and consists of a sloop-sink with rectangular top, flushing-rim, and P-trap in one piece of enamelled fireclay, and a washing-up sink of similar material with standing waste, A, and overlap joint, B. A rose, C, can be fitted in the sloop-sink for the purpose of washing bed-pans. The waste outlet of the washing-up sink is connected to the trap of the sloop-hopper as shown. The sinks are supported on three enamelled cast-iron brackets, and a three-gallon cistern is provided for flushing the hopper, in addition to the hot and cold supply taps. An "Inserta" wood rim can be fixed along the front of each sink, after the manner illustrated in figs. 1 and 2, page 142, and has the advantage of protecting the enamel and of reducing the risk of breaking pottery utensils.

Urinals.—In ordinary houses special urinals are not required, as the water-closets serve the necessary purpose, provided that they are not enclosed with woodwork. A sloop-top renders the closet more serviceable, but is not indispensable. In large houses (especially those containing billiard and smoke rooms), and in hotels, schools, railway stations, and other places where men congregate, urinals are, however, a necessity. They may be broadly divided into three classes—basins, troughs, and stalls. When basins and troughs are used the adjacent walls and floors ought to be of impervious materials, such as glazed tiles or glazed fireclay slabs, as a certain amount of splashing is almost unavoidable. All urinals ought to be provided with some kind of flushing apparatus, as they are extremely difficult to keep clean. Urine soon forms a coat of "fur" even on the smoothest surfaces, if these are not thoroughly flushed. The objectionable smell of urinals is greatly reduced, if not entirely removed, by keeping a piece of soda in each basin, trough, or stall.

Urinal basins may be of enamelled cast-iron or of glazed pottery, the latter being the better material. Fig. 7 shows a "cradle-back" basin of cast-iron with fan-spreader inlet. It is obvious that the flush cannot reach every part

of the basin. As in water-closets and sloop-sinks, a flushing rim is essential for the proper cleansing of the fitting; such a rim is shown in section in fig. 8, which represents a "flat-back" porcelain basin of good shape. Urinal basins may be "wide-fronted," as in fig. 7, or "lipped," as in fig. 9. The lipped urinal was introduced with the idea that the projecting lip would prevent urine dropping on to the floor, but it has not fulfilled the inventor's expectations; men are afraid of soiling their clothes if they stand sufficiently close for the lip to serve the purpose for which it was intended. The urinal shown in fig. 9 is designed for fixing in the angle of a room.

One of the difficulties connected with urinal basins is that the users seldom take the trouble to flush them. When the water companies have no regulations to the contrary, a stop-cock is often fixed in the supply-pipe immediately above the fitting, but comparatively few people take the trouble to turn it. In some places where the basins are largely used the water is kept constantly running throughout the day, but this is a practice to which water companies object. A supply of water during the usage of the fitting is, however, most important, as it cleanses the basin and at the same time dilutes the urine, and thus reduces the risk of "fur" being formed in the trap and waste-pipe. The apparatus shown in fig. 10 is a simple contrivance for effecting this object. The basin is fixed in a wooden framework and is covered, when not in use, by a lid hinged at the top. The raising of the lid opens the supply-valve, and the water continues to run until the valve is closed by shutting the lid. There is more woodwork around the fitting than is desirable, and the part below the basin might with advantage be omitted. Other methods of flushing urinals will be considered in the next chapter.

Folding urinals, generally of enamelled cast-iron, are sometimes fixed in offices and houses, but are apt to become very foul on account of the difficulty of flushing the surfaces of the

containers into which the urine falls when the basins are lifted up.

The ordinary urinal basin has a grating in the bottom or back with a nozzle for connexion to the waste-pipe, and does not retain water. This cannot be regarded as an entirely satisfactory fitting, and basins are sometimes made to retain a quantity of water, either by forming a trap in one piece with the basin after the manner of a wash-down closet, or by raising the waste-pipe so as to form a trap behind the basin. A trapped basin was designed by Mr. Hellyer some years ago, but the outlet of the P trap was behind the basin, and the joint was therefore in the wall and difficult to inspect and repair. This objection has been removed in Tylor's urinal basin (fig. 11), but the seal of the trap is very small and the outlet appears to be very contracted, and therefore difficult to clean.

Urinal basins are generally fixed with brass screws, but sometimes lugs are provided at the back for fitting into slots in the wall-slab. As pottery often warps in the kiln, the backs of good fittings are ground to a level surface after burning, so that they will fit closely against the wall.

PRIMITIVE METHODIST CHURCH, TREDEGAR, SOUTH WALES.—The memorial-stones of a new chapel to be erected for the Primitive Methodist connexion at Tredegar were laid recently. The new chapel, which will be erected in Commerce-road, is to replace the old building in Mount-street. The new edifice, which is being erected by Mr. Rees Edwards, Tredegar, from plans prepared by Mr. S. Williams, Tredegar, will provide accommodation for between 600 and 700, and will cost about 1,700*l.*

DECORATION, ST. AUGUSTINE'S CHURCH, DUBLIN.—The decoration and carving of the Chapel of the Sacred Heart, St. Augustine's Church, Thomas-street, which has been in progress for some time past, has just been completed. The whole of the work has been carried out from the designs of Mr. George C. Ashlin, R.H.A., Dublin, and the supervision of the work for him was done by Mr. Thomas A. Coleman.

GENERAL BUILDING NEWS.

CHURCH, HETTON-LE-HOLE, DURHAM.—A new church has been erected at Hetton-le-Hole. The building, which stands on the site of the old one, was designed by Mr. S. Piper, architect, of Newcastle-on-Tyne, and is of the Early English style, and will seat 800 people. One of its chief features is the large chancel, in which, on either side, there are three rows of carved oak stalls, the work of Mr. R. Hedley, of Newcastle-on-Tyne. On the right of the chancel, looking east, is a side chapel capable of accommodating from sixty to seventy people, in the east end of which is a stained-glass window in memory of the late Mr. Nicholas Wood, which occupied a position in the old church. The other stained-glass window, in memory of the first rector of Hetton (the Rev. J. S. Nichol), also removed from the old church, has been enlarged and placed in the south transept. The aisles of the church are narrow, with lofty arches and stone pillars. At the west end of the church there is a baptistry, formed by an arcade of three arches, with octagonal pillars, over which is a five-light window. In the north-west corner the choir vestry has been placed. The chancel is paved with black and white marble tiles, the work of Messrs. Borrordale Brothers, Sunderland. Within the sanctuary the tiling is entirely white. At the east end is the clergy vestry. The font, supplied by Messrs. Jones & Willis, London, is of Caen stone, with four marble columns. The pulpit is of carved oak, by Mr. R. Hedley, of Newcastle. All the aisles are laid with wood block in the herring-bone pattern. The builder was Mr. W. Sparrow.

CHURCH OF ST. PETER, NEWTON-IN-MAKERFIELD, LANCASHIRE.—A new tower and two porches have just been erected at the parish church of St. Peter, Newton-le-Willows. Mr. A. W. Smith, architect, of Manchester, prepared the plans for the tower and porches. The base of the tower, which rises to an altitude of 77 ft., and also in the porches, the walls are covered with an oak dado, the doors being of the same kind of wood and carved, whilst a wood block floor has been introduced. In the belfry it is proposed to have a peal of bells, and provision is also made for fixing a clock on the outside. The contractor for the work is Mr. Peter Fiekle, of St. Helens.

REBUILDING OF ST. PAUL'S, THORNTON HEATH.—The memorial-stone of the first portion of the new church of St. Paul, Thornton Heath, was laid recently. About 6,500*l.* is to be spent on this work, which is being undertaken from the completed plans of the whole building drawn by Mr. R. Philip Day, the diocesan architect. The present instalment consists of the nave and aisles on the western side, from the extreme end of which the baptistry will be built out. The open timbered roof, tiled outside, will reach a height of 70 ft. Messrs. D. Stewart & Sons, of Wallington, are the builders.

NEW AISLE, ST. SAVIOUR'S CHURCH, DUBLIN.—On the 28th ult., the new aisle, which has been erected in St. Saviour's Church, Dominick-street, was opened. The new aisle, the erection of which was commenced in September, 1899, consists of seven bays, making a total length of 124 ft. and width of 20 ft. inside on the south side of the church, and is built in Bath stone with clustered piers and moulded caps and bases, supporting segmental moulded arches which divide it from the old aisle. There are likewise moulded cross arches dividing each bay of the aisle. The groining is in pitch pine, with moulded ribs and carved bosses at the intersections. The floor is laid with pitch pine block-flooring and the passage at the sides with tiles. Each bay is lighted with a three-light tracery window, while the end window, where the altar stands, is filled with stained glass, which will be repeated in the side windows. The exterior of the aisle is built in ashlars limestone, with cut stone dressings, and finished with gables and foliated crosses. The new aisle is to be dedicated to St. Joseph, and it is the intention to erect an altar which will be in keeping with the other altars in the church. The communion railing is in Carrara marble, moulded and carved with columns in coloured marble. This work has been executed by Mr. Ryan, while the contract for the new aisle was carried out by Mr. James Donovan, from the designs and under the supervision of Mr. G. C. Ashlin, R.A., architect, Dublin.

CHURCH, OCKLYNGE, EASTBOURNE.—A new church is being built at Ocklynge from plans by Mr. G. E. S. Streetfield.

BAPTIST CHURCH, BURY-ROAD, HASLINGDEN, LANCASHIRE.—This church was opened recently for public worship, and will accommodate on the ground floor 328, in the galleries 279, and in the choir twenty, total 627, or a mixed congregation of over 700 persons. There are four vestries attached, also a choir vestry adjoining the organ-chamber, which is in the form of a semi-circular apse, with the choir in front of organ and behind the pulpit. The seating is pitch pine, varnished; gallery fronts, pitch pine with carved oak panels, pulpit of oak with carved panels. The ceiling is of plaster, curved in centre with open timber trusses. The walls are of rock-faced stone, with ashlar stone dressings. The cost is over 4,000*l.* The architects are Messrs. George Baines and Reginald Palmer Baines, London. The schools adjoining were

erected previously from plans by the same architects.

NEW WING, HOLY INNOCENTS' CHURCH, HAMMERSMITH.—The new west wing of this church was dedicated on the 27th ult. The first portion of the church was consecrated some ten years ago. The second portion has now been completed at a cost of 5,000*l.* The building is of red bricks, with Bath stone dressings. Messrs. Faulkner & Sons were the builders, the architect having been Mr. James Brooks.

NEW SYNAGOGUE, FINSBURY PARK.—The foundation stone of a new synagogue in Princess-road, Finsbury Park, was laid on the 1st inst. by Mr. F. D. Mocatta. The new building, which, when completed, will be the northernmost synagogue of the metropolis, takes the place of temporary premises in Portland-road. When completed it will provide accommodation on the ground floor for 199 gentlemen, and in the galleries for 144 ladies. Mr. Delissa Joseph is the architect, and the work of construction is being carried out by Messrs. L. Whitehead & Co.

COTTAGES, YATTON.—Two cottages have recently been erected on the Claverham House Estate, Yatton. The ground floor contains living-room, kitchen, and wash-house with outhouse, and the first floor three bedrooms. The total cost was 400*l.* for the pair. Messrs. Needham, of Yatton, were the builders; and Mr. C. A. Rowley, of Bristol, the architect.

Y.M.C.A. NEW PREMISES, BURTON.—The memorial stones of these buildings have just been laid. The new premises extend from High-street to Friars-walk, with a frontage the whole depth along Whitehurst's-passage. The main entrance will be in High-street, which leads from the entrance passage into a large entrance-hall, about 20 ft. square, and from this entrance-hall access may be obtained to all parts of the premises. On the ground floor will be found a waiting room, to be utilised for the general secretary's office. Beyond this room is a large recreation and tea room, boiler-house for the heating-apparatus, and a lavatory block with bath-room, &c. Connected from the entrance-hall by means of a glass-covered corridor is the gymnasium, the length of which is 48 ft., the width 20 ft., and the height to ceiling 19 ft. This room will be provided with a glazed brick dado and a boarded ceiling. The remainder of the ground to Friars-walk is occupied by a lecture-hall (82 ft. long, 30 ft. wide, and 26 ft. high to the ceiling). This hall will have a wood block floor sloping from the entrance end to the platform, and will have a wooden dado 6 ft. high; the roof will be of heavy pitchpine timbers, resting on carved stone corbels, and all the woodwork is to be stained and varnished. Entrance and egress may be obtained by means of five doorways in this hall, and all the doors are made to open outwards. In connection with this hall are gentlemen's and ladies' cloak-rooms with lavatories attached. On the first floor, which is approached by a stone staircase, is provided a reading-room, with an open timbered roof, and the various other rooms consist of committee-rooms, classrooms, photographic studio and dark-room, with rooms for the caretaker. In addition to the portion of the premises occupied by the Y.M.C.A., other portions of the premises have been let off into suites of offices and a café restaurant, and in connection with the restaurant a basement kitchen is provided. The premises will be lighted by electricity. The general contractor for the work is Mr. R. Kershaw, and his sub-contractors are Mr. A. Geary (for the joinery), Messrs. T. Turner & Son (for the plumbing and painting), and Mr. T. Biddulph (for the plastering and concrete floors). The architect is Mr. Thos. Jenkins.

BUILDING NOTES, ABERDEEN.—It has now been found that the operations in connection with the extension of Aberdeen Joint Passenger Railway Station will not be proceeded with for about two or three years from this date.—A day or two ago the United Free Presbytery of Aberdeen approved of the plans of the new church at the corner of King-street and Urquhart-road for St. Clement-street Free Church congregation, who have now succeeded in selling their old place of worship. Messrs. D. & J. K. Macmillan, Aberdeen, are architects for the new station, which will cost about 7,000*l.*—The master slaters of Aberdeen have formed an association which will enable them to receive scales of measurement and schedules from the Aberdeen Society of Architects for enabling them to estimate for new buildings.—A new theatre is to be built in Rosemount-viaduct for the Robert Arthur's Theatre Company.—The following tenders for new Corporation Electric Station at Dee village have been accepted:—Six boilers, Babcock & Wilcox, 10,175*l.*; joiner work, Geo. Jamieson, Aberdeen, 2,190*l.*; plumber work, Walter Simpson, Aberdeen, 698*l.*; plaster work, Adam & Co., Aberdeen, 499*l.*; slater work, Adam & Co., Aberdeen, 350*l.*

FLATS, HAMPSHIRE, N.W.—"The Chimes," West End-lane, built from designs by Pugin, for the late E. Herbert, R.A., has just been demolished, and blocks of residential flats are to be erected upon the site, approached by a garden court, with carriage-drive, and will be called "King's-gardens," Hampstead. The building will contain 380 rooms, divided into fifty self-contained flats, carrying from six to eight rooms approached by halls and four electric lifts. The halls, bathrooms, and water-

closets will be laid with mosaic. The principal doors and decorative woodwork will be in Spanish mabogany, with marble steps to entrance doorways. The fronts will be carried out with cherry red bricks, gauged arches and aprons, with freestone dressings, and roof covered with green slates. The buildings are to be carried out from designs and under the direction of Messrs. Palgrave & Co., architects, Victoria-street, S.W., and Messrs. Collins & Co. are the contractors.

HOSPITAL, RICHMOND, IRELAND.—The new Richmond Surgical Hospital was opened recently by the Lord Lieutenant of Ireland. The architects of the new building were Messrs. Carroll & Batchelor. The site was previously occupied by old dairy yards and dilapidated buildings, and lies fronting North Brunswick-street, the northern flank being on the avenue leading to the Whitworth and Hardwicke Hospitals and the North Dublin Union. The hospital consists of a central special block containing entrance hall and matron's and resident surgeons' offices and sitting-rooms, and visiting surgeons' consulting-rooms, &c., to the right, and to the left the boardroom, children's wards, &c. The central block is connected by wings to the east and west pavilions for women and men respectively. From the west pavilion a corridor leads to the Whitworth Hospital and also to the administration block and nurses' home, which latter buildings are situated on the left-hand side of this corridor. The principal entrance gates are in North Brunswick-street, and a separate entrance for stores is provided from the same street by the side of the old Richmond Hospital. The road leads direct to the delivery yard, which adjoins the kitchen department. The new power house and steam laundry abut on this road at the rear of the old hospital. The new hospital contains accommodation for eighty-four beds, but the scheme provides for a considerable extension in the future. The buildings are faced with bricks, with dressings of Ruabon red terra cotta, whilst the roofs are covered with Cumberland green slates, with the exception of the southern towers and ventilating flues, which are covered with copper. One of the principal features in the hospital is the operating theatre block. It is approached from the main corridor, the two doors from which open into a waiting corridor or lobby, with windows at each end for the purpose of providing cross ventilation, and thus cutting off this block from the rest of the hospital. The room for administering anaesthetics adjoins this lobby, and is fitted with sinks and lavatory basins, and also an apparatus for sterilising instruments and other utensils in use in the operating theatre. This room communicates directly with the operating theatre, which is one story high, about 29 ft. long by 23 ft. wide. It is lighted by three north windows, and also from the roof. The wall lining in this room, as well as that in the adjoining rooms, is of white glazed bricks, relieved by bands of blue. The floor is of dark red adamantium tiles, and the gallery for the accommodation of students is of white Sicilian marble. The theatre is warmed and ventilated on the Plenum system. Adjoining the theatre is a smaller room for operations. The wards generally (with the exception of those for children) are of one size—viz., 60 ft. by 25 ft., and 14 ft. high—each providing accommodation for fourteen patients with a cubic space of 1,500 ft. per bed. Attached to each ward are a ward kitchen fitted with a small range, sink, plate rack, &c., a sister's room, linen-room, and separation-room for two patients. At the south end of each ward are provided, in projecting towers separated from the wards by cross ventilated lobbies, a bathroom and lavatories, &c. Between these projecting towers are arranged sun verandahs for the use of the convalescent patients, communicating with the wards by means of French windows. The new kitchen, sculleries, and stores have been designed to serve the whole group of hospitals. Near the hydraulic lift in the basement is situated the admission, waiting-room, and bathroom for newly-admitted patients, also the stores for patients' clothes, &c. The corridors and staircases throughout the hospital and nurses' home are heated by steam radiators. The wards are warmed by open fires in octagonal faience chimney breasts, which are carried through the centre of the wards. The nurses' home can now accommodate thirty-one nurses, principally in dormitories and associated rooms, and is provided with dining and sitting rooms, scullery, and bathroom and sanitary accommodation.

BISHOP OTTER COLLEGE, CHICHESTER.—A new wing has just been added to the Bishop Otter Memorial College, Chichester. The wing is 120 ft. long, 28 ft. wide, and 54 ft. high from basement floor to ridge. On the basement there are two boilers, one for the general heating of the building and the other for supplying hot water for domestic purposes, bathrooms, and lavatories. The ground floor of the building comprises a hall, 58 ft. 4 in. long, 25 ft. 11 in. wide, and 15 ft. high; senior students' classroom, 31 ft. long and 25 ft. wide; corridor, 40 ft. long by 6 ft. wide; seniors' and juniors' cloakroom, storeroom, laboratory, and range of sanitary offices. The hall has emergency doors opening outwards. The first floor consists of fifteen sleeping dormitories for students, one mistress's room, a library 31 ft. by 25 ft., two bathrooms, wardrobe accommodation, &c. On the second floor there are

twenty-four similar sleeping dormitories, one mistress's room, bathrooms, boxrooms, and other necessary conveniences. Access to the new wing is obtained from the old part of the college by means of wide archways while there are fireproof staircases. In connexion with the work for extending the college, alterations have also been carried out in the old part of the building, where several rooms have been thrown into one so as to make a dining hall capable of seating at table a company numbering over 100 persons. In another part several small rooms have been made into one classroom for junior students. The total cost will fall little short of 4,000. The architect was Mr. Gordon P. G. Hills, and the builder was Mr. J. O. Holt.

BOARD SCHOOL, NEWPORT, MON.—The Clytha School, intended to serve the Risca-road district of Newport, was opened recently. The new school building is in the Renaissance style, and has been constructed of red brick with freestone dressing. The school will be a mixed one, and is intended to accommodate 350 scholars. There is a large central hall, and five classrooms leading from it. Separate rooms have been provided for the head-master and assistant teachers. The building is one-storied, and the floor is laid with wood blocks. An asphalted playground has been provided. The total cost has been 3,500. Messrs. Habershon, Fawcner, & Groves were the architects, and Mr. Charles Locke was the builder.

SANITARY AND ENGINEERING NEWS.

RESERVOIR, BRISTOL WATERWORKS.—Particulars are given in the Chamber of Commerce report with regard to the new Yeo reservoir of the Bristol Water Works Company, which is approaching completion and is the sixth largest in Great Britain. The water area of the reservoir, when full, is approximately 450 acres, and the reservoir when filled will hold about 1,700,000,000 gallons. The reservoir has been formed by constructing an earthen embankment of dam across the valley of the Yeo at a point close to Blagdon. The embankment at its highest point is 43 ft. above the surface of the ground, and the greatest depth of water in the reservoir will be 37 ft. The length of the embankment is 530 yds., and over the top a carriage road has been constructed to take the place of a portion of the old road to Blagdon, which is submerged in the bed of the reservoir. The length of the lake formed by the reservoir will be about 1½ miles. The water is taken from the reservoir by means of a brick tunnel 10 ft. in diameter, the water being controlled by large outlet valves. Compensation water has to be provided for the river, and to regulate this water special apparatus has been designed and constructed. The bywash (for the purpose of discharging flood waters), 360 yds. long and 188 ft. wide at the crest of the weir, has been constructed in masonry, lately with Cheddar and Thertington stone, pitching, set in cement, while Forest of Dean stone has been largely used in a bridge constructed over the bywash, and in other ornamental parts of the work. The weir stones and the pitching of the inner slopes of the embankment are of Dartmoor granite. At the Rickford spring an ornamental gauge house has been erected for measuring the water, which is conveyed to the reservoir by means of a 27-in. cast-iron pipe, the distance being about two miles. Similar arrangements have been made with regard to the Langford spring, and the distance in this case to the reservoir is nearly 3½ miles, the pipe being 21 in. in diameter. Adjoining the reservoir, engine and boiler houses are in course of erection for the reception of pumping machinery, by means of which the water will be pumped through cast-iron pipes to the existing North Hill tunnel of the Bristol Waterworks Company, a distance of about five miles. The engines are of the compound rotative beam type. The engineers are Messrs. T. & C. Hawksley.

SOUTHWARK AND VAUXHALL WATERWORKS.—On the 30th ult. a party of engineers and other gentlemen interested in waterworks visited Harpington Court, at the invitation of the Southwark and Vauxhall Water Company, to inspect the company's new works and cut the sod of the large storage reservoir about to be constructed at Walton. The party included Sir John Aird, M.P., Professor Frankland, Professor T. E. Thorpe, and Mr. J. W. Restler, engineer to the company. The works inspected include a new pumping station, new filter beds and storage reservoirs. The pumping station consists of three triple expansion engines of 780-h.p. each, built by the North-Eastern Marine Engineering Company, of Sunderland. The boiler-house contains ten Babcock & Wilcox water-tube boilers (land type). The engine-house is lighted by electric arc lamps, the power for which is supplied by one of the patent double triple-expansion engines invented by Mr. Restler. The six new filter beds have just been put in, and were charged with sand for the first time in the presence of the visitors, who watched the process of admitting the river water. The filtering layer is 3 ft. 6 in. in depth, of which 2 ft. 6 in. is sand. Seven additional filter beds are under construction in the same area. A new instrument for measuring and recording the rate of filtration on the principle of the waste water meter is on

trial at the waterworks. After inspecting the filters the party proceeded to the large storage reservoirs, which hold 300 million gallons, and were built in 1890. They form two sheets of water nearly half a mile in length. Before their completion the storage capacity of the company was only 90 million gallons. It is now intended to increase it to 1,512 million gallons by means of a new large reservoir, to be built by Messrs. John Aird & Son, and to hold 1,076 million gallons.

PROPOSED BRIDGE, BARDONKEY FORD, PERTH.—Plans have been passed by the Blairgowrie District Committee of Perth County Council of a bridge which it is proposed to construct over the River Isla at Bardonkey Ford. Messrs. Blyth & Westland, of Edinburgh, are the engineers.

SEWAGE WORKS, SHERINGTON, BUCKS.—A Local Government Inquiry was held by Colonel J. T. Marsh, R.E., at Sherington as to the application for a loan for works of main sewerage and sewage disposal, per plans by Messrs. D. Balfour & Son, of London and Newcastle. The scheme comprises laying of 3½ miles of main sewers with manholes, flushing arrangements, also the construction of bacterial tanks and the laying-out of the land, the effluent from which will discharge into the River Ouse.

ENGINEERING FEAT AT NEWCASTLE.—An interesting engineering feat was accomplished on the Tyne on the 5th inst., when the spans and roadway of the bridge connecting Newcastle and Gateshead, which had been built 4 ft. 6 in. to the eastward of the position they were ultimately to occupy, were moved over into place. An old bridge existed, and the new bridge has been built on precisely the same site the old one occupied. The traffic has yet gone on uninterrupted. The new piers were built round about the old ones, and the roadway and spans were erected a little above and 4 ft. 6 in. to one side of the old roadway and spans, a temporary footway meanwhile being provided for foot passengers. The old piers were then taken away and the new roadway was lowered to its proper level, and on the 5th inst. moved over into its permanent position. This was accomplished by means of hydraulic jacks. The total weight of the bridge was 1,600 tons, and the jacks were capable of exerting a pressure of 1,500 lbs. to the square inch. The bridge is built of steel, and is of the American type, but the details are strictly in accordance with the best English practice. There are four spans, two of 252 ft. and each of the others 170 ft. The total length of the bridge and its approaches is 1,900 ft. Its total weight is 2,000 tons. The bridge is carried on cylinder foundations, each 8 ft. in diameter, and sunk to a depth of 50 ft. below low water. There are four cylinders to each pier. The engineers of the bridge are Messrs. Sandeman & Moncrieff, of Newcastle, and the builders are Sir William Arroll & Co., Glasgow.—*Times*.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Lowe's Patent Sanitary Pipe Joint Syndicate, Limited, Dashwood House, New Broad-street, E.C., have recently effected an arrangement with Messrs. J. Stiff & Sons, of Lambeth, whereby this firm become their sole agents for London and suburbs.

—In consequence of the death of the senior partner, the late Mr. Alderman Samuel Green, the firm of Messrs. Green & Son, Auctioneers, &c., St. Swift's-lane, E.C., will be carried on by his sons and partners, Mr. E. Horace Green, F.S.I., and Mr. Fred. A. Green, F.S.I., under the old name of Green & Son. The "Property Register and Mortgage List" (founded in 1853) will be published monthly, as hitherto.

ELECTRIC LIGHTING, BURY.—Mr. W. O. E. Meade King, M.Inst.C.E., opened an inquiry recently in the Guildhall, Bury St. Edmunds, the Town Council having applied to the Local Government Board for sanction to borrow 12,000l. for the purposes of electric lighting. The Mayor (Mr. T. Shillito), the Town Clerk (Mr. C. E. Salmon), the Borough Surveyor (Mr. J. C. Smith), the Assistant Electrical Engineer (Mr. Grefg), the Borough Accountant (Mr. J. H. Wakefield), and several members of the Council attended.

GASWORKS, PERTH.—The new gasworks which the Corporation of Perth has erected at Friarton were opened on the 26th ult. The following is a list of the contractors.—Excavator, brickwork, &c., Mr. T. D. Jamieson, Baillieston, near Glasgow; carpenter and joiner work, Mr. William McQuibban, Perth; slater work, Messrs. William Brand & Son, Broxbroth; plumber work, Mr. J. MacLeish, Perth; plaster work, Mr. Alexander McRitchie, Dundee; painter and glazier work, Messrs. G. R. Douglas & Son, Perth; iron and steel roofing, railway girders and tank, Messrs. H. Balfour & Co., Limited, Leven, Fife; retort bench, brick and iron work, elevator, coal breaker, floor and charging machinery, Messrs. West's Gas Improvement Company, Limited, Manchester; condensers and purifiers, Messrs. Clapham Brothers, Keighley, Yorks; exhausters and engines, Messrs. Bryan, Donkin, & Clench, Limited, London; station meter, gauges, &c., Messrs. John Milne & Son, Limited, Edinburgh; sulphate plant, Messrs. R. & J. Dempster, Limited, Manchester; boiler and heater, Messrs. Babcock & Wilcox, Rostrevor.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.—The annual meeting of this Association will be held at Birkenhead on July 9, 10, 11, and 12. A number of interesting papers will be presented for discussion, and a lecture on "Rainfall" will be delivered by Mr. Plummer, the Astronomer to the Dock Board. Visits are also being arranged to various waterworks and other places of interest in the vicinity.

HOUSING, HAMMERSMITH.—At a meeting of the Hammersmith Borough Council on Wednesday evening the question of providing housing accommodation for the working classes was discussed at considerable length. The Works Committee had been considering as to the advisability of erecting tenements on the Council's land near the Electricity Station, Fulham Palace-road, having a frontage of 109 ft. 6 in. in Yeldham-road. They had had before them plans prepared by the Borough Surveyor, in which provision was made for three double buildings of eight tenements each—equal to twenty-four tenements in all—of which twelve consist of three rooms each, and twelve of four rooms. It had been feared by some of the members that an old water-course, known as the "Black Bull Ditch" was in close proximity to the land, but the Borough Surveyor found that the ditch would not interfere with the foundations of the buildings. Ultimately the Council decided that the plans prepared by the Surveyor be approved, and that instructions be given for carrying out the scheme under the provisions of Part III. of the Housing of the Working Classes Act, 1890, subject to the approval of the Local Government Board.

BUILDING SOCIETIES.—Mr. E. W. Brabcock, C.B., F.S.A., Chief Registrar of Friendly Societies, has just made his report for the year 1900 of the proceedings of the registrars under the Building Societies Acts. He states that seventy-three unincorporated societies—that is, Benefit Building Societies which were certified under the Act of 1850 before December 31, 1856, and have not yet been incorporated under the Acts of 1874 to 1894—still remain on the register. The number of members was returned as 21,771, or 809 for each society stating the number of its members. The total receipts of these incorporated societies during the financial year were 19,421,075l. or 303,468l. for each society stating the amount of its receipts, being nearly thirty-seven times the average of the incorporated societies; but this is accounted for by the exceptional case of a society in London (the Birkbeck) the receipts of which are returned as 17,857,620l. If that society were omitted the average income of the other societies falls to 21,831l. This interesting group of old societies, all of which have existed more than forty-four years, increased its business during the year 1899 in every respect. They are all English, there being no unincorporated societies in Wales, Scotland or Ireland. Five societies that had formerly been unincorporated obtained certificates of incorporation in the year 1900. Thirteen new societies were incorporated in the same period in England and Wales and one in Scotland. There are now 2,160 societies on the register in England and Wales, 136 in Scotland, and sixty-five in Ireland. In all three parts of the United Kingdom the Societies increased their capital and mortgage balances during the year. The number of members belonging to the societies in the year 1899 was 550,531 in England, 36,831 in Scotland, and 15,619 in Ireland—total, 602,981. The aggregate receipts during the financial year were: England, 36,928,231l.; Scotland, 609,248l.; Ireland, 487,099l.—total, 38,025,368l. The liabilities at the close of the financial year were (for England): To holders of shares, 31,136,804l.; to depositors and other creditors, 22,082,097l.; undivided profit, 3,263,777l.; total, 56,482,688l. (For Scotland): To holders of shares, 1,322,680l.; to depositors and other creditors, 262,959l.; undivided profit, 112,190l.; total, 1,697,829l. (For Ireland): To holders of shares, 646,720l.; to depositors and other creditors, 235,395l.; undivided profit, 71,137l.; total, 953,268l. In the assets were (for England): Balance due on mortgage, 43,140,631l.; other assets, 14,987,048l.; balance deficit, 354,909l.; total, 58,482,688l. (For Scotland): Balance due on mortgage, 1,547,375l.; other assets, 148,851l.; balance deficit, 1,603l.; total, 1,697,829l. (For Ireland):—Balance due on mortgage, 865,413l.; other assets, 87,190l.; balance deficit, 6657l.; total, 953,268l. As compared with the previous year (1898), there are shown (1) an increase in liabilities to shareholders of 499,771l.; (2) an increase in liabilities to depositors of 1,046,811l.; (3) an increase in undivided profits of 112,991l.; (4) an increase in balances due on mortgage of 1,104,411l.; (5) an increase in other assets of 659,123l.; and (6) a decrease in balances and deficit of 103,975l. It thus appears (comments Mr. Brabcock in his summing-up) that more than 58 millions of money has been received by building societies in the year, and that their capital or accumulated capital is more than 60 millions, of which 75 per cent. is in mortgage securities. The improvement which began in 1898 has continued, and the societies have continued considerably to reduce their properties in possession.

ELECTRIC LIGHT, BRISTOL.—The annual report of the Bristol Chamber of Commerce contains an account of the progress made in the electricity department of the Corporation of Bristol. The demand during the past twelve months for elec-

trical energy for lighting, heating, and power is said to have been unprecedented. The increasing popularity of electricity is evidenced by the fact that during the period referred to no less than the equivalent of 22,707 8 c.p. additional lamps have been connected to the Corporation mains; 35,314 yards of additional mains have been laid, including power mains in Portland-square and King-square, and extensions of the lighting mains in all directions. As proof of the increased demand for electricity, it is mentioned that during the month of December 291,064 units were sold, as against 245,320 during the same month of the previous year. The works at Temple Back not being of sufficient capacity to cope with the demand in the near future, the Corporation have purchased 9½ acres of land by the Feeder-road, at Avonbank, on which it is proposed to erect a large station, the ultimate capacity of which will be 96,000 h.p. At present the contractors are busy constructing the foundations for the first instalment of the scheme, which it is hoped will be ready for running by the coming winter. The contract for the buildings has been let, and tenders for practically all the plant have been accepted. The first instalment of the station will be equipped with Babcock & Wilcox water tube boilers of the largest size, working at 200 lb. per square inch (as compared with 125 lb. per square inch at the Temple Back Works), two alternators of 0.75 K.W. (1,500 h.p.) capacity each, driven by Willans's high-speed engines.

THE ANCIENT CROSSES AND HOLY WELLS OF LANCASHIRE.—At a meeting of the Lancashire and Cheshire Antiquarian Society, held at Cheetham College, Manchester, recently, Mr. Henry Taylor read the fourth paper of a series of seven on the ancient crosses and holy wells of Lancashire. He dealt with the Hundred of West Derby, which measures, roughly, twenty-six miles from east to west, its southern boundary being the Mersey. A map exhibited by Mr. Taylor showed the sites and remains of no fewer than one hundred ancient crosses. This large number, he said, was due no doubt to the fact that in this part of Lancashire the Reformers never succeeded in exterminating the old Roman Catholic faith. Many of these crosses were put up in the thirteenth century, or even earlier, to mark the boundaries of church and other lands, and others were erected as market crosses. The demolition of most of these market crosses was in part due to sheer vandalism, and to the fact that it had been found more convenient in modern times to conduct business in town halls or other buildings. Other crosses were placed near holy wells, of which there are several in the Hundred, justly noted, and still occasionally used for medicinal and healing qualities. A medieval well adjoining Lathom Park, dedicated to St. Mary Magdalene, was converted by the impoverished sixth of the seventh Earl of Derby, at the end of the Cromwellian epoch, into a fashionable spa. The spring dried up when mines were sunk at Skelmersdale. Near Ormskirk there was a remarkable group of crosses. Within a circle four miles in diameter there used to be no fewer than eighteen crosses. Several of these were in existence at the time of the complete example remained to-day. The group of crosses appeared to lead in three lines from Scarisbrick Priory to the churches at Halsall, Ormskirk, and Burscough Priory, and until quite recently they were used for devotional purposes in Roman Catholic funeral processions, the mourners stopping at the site of every cross to offer prayers for the dead. Another noticeable group of crosses was found near the ancient parks of Ince Blundell, Little Crosby, and Sefton. The landowners in this part of the Hundred had been Roman Catholics for many generations, and the crosses had been well attended to. An ancient cross standing in the Little Crosby Park was said to have been moved there for safety from the village green at Great Crosby. At its foot the proclamations of the manorial court were made, and the ancient custom of flowering the village cross was kept up on St. John Baptist's Day so late as the year 1708. In the twelve miles of country between Liverpool and Warrington the remains or sites of upwards of twenty ancient crosses were recorded on the Ordnance maps. Very few of these remained, but some had been restored or rebuilt.

PROPERTY SALES.—In June next, by direction of Earl Wharnclyffe, will be offered for sale the freehold estate known as Wharnclyffe House, No. 15, Curzon-street. The house, which stands within its own grounds covering about 29,000 feet superficial, is set back from the line of the street and is situated on the site of Beilby's "Old Chapel" (the earlier one)—notorious for the Mayfair marriages. The house has an elevation in three floors, with a tetrastyle Ionic order and pediment upon a rusticated base in the centre, the two wings having rounded bays. The frontage extends over 133 ft. The house has belonged during a long period to the Stuart Wortley family, and was the home of James, first Lord Wharnclyffe. (2) The Thorney House estate, which extends over 40,000 feet superficial, at a frontage of about 174 ft. to the high road and a return frontage of 275 ft. along Palace Gate. The house was built after the Tudor style by Messrs. W. Cubitt & Co.

in 1869-70 for William, eighth Duke of Bedford who had purchased the land from that firm. Our readers will remember that the Duke's covenant to erect not more than one dwelling-house, which was to be used for a private residence only, gave rise to a suit in Chancery, brought against Mr. Hoesgood, the owner of the estate, by Mr. G. M. Rogers and the owners of the house in Palace-gate which P. C. Hardwick designed (1873-4) for the late Sir John Millais. (3) The Royal Orthopedic Hospital (about 7,240 ft. superficial in Oxford-street, the site of which was valued at 36,000, two years ago by a well-known surveyor. The hospital, established in Bloomsbury-square in 1838 by Dr. Little, migrated to its present quarters about sixty years ago; in 1899 the premises were enlarged and altered, at a cost of nearly 2,000, after Mr. Keith D. Young's plans and designs, the sanitary works being executed under Professor Corfield's directions. We understand that an offer of 37,700, has been made for the property, which is freehold. (5) Building land at Isleworth, which forms a portion of the Kendal House Estate, the residence of the Duchess of Kendal, *temp.* George I. After her death the grounds were opened as a place of public resort, a dancing-room was built, and an orchestra was erected by the water side; (4) Lauriston House, Wimbledon Common, the home, in his boyhood, of William Wilberforce; (6) Sipton Court, near Chipping Norton, about 1,600 acres, with a fine old Elizabethan house, during many generations past the home of the Reade family, has been sold for nearly 61,000, and the Kursaal at Margate has been purchased for 16,000, the sale having been made in the matter of Samuel Allsopp & Sons Limited, Margate and Southend Kursals, Limited, and others. The defendants in that case acquired the property in 1898, at a cost of 45,000, and have expended about 2,500, in building operations on the Undercliff, adjoining Fort-parade, for the new frontage, with a sea-wall, 500 ft. long. Mr. George Sherin and Mr. John Clarke were appointed as architects jointly, to the company. The plans and designs for the Kursaal at Margate, estimated to cost 90,000,—were prepared by Mr. John Clarke.

AUSTRALIAN MALACHITE.—Hitherto the principal supply of this beautiful marble, which is largely used in Europe for mantelpieces, pedestals, and similar decorative purposes, has been obtained from Russia, but it is equally abundant and fine in quality in New South Wales, where its colour ranges from pale emerald to deep green, the various layers often possessing different shades of colour, and forming a most beautiful and valuable stone for ornamental and inlaying purposes. Crystals are occasionally met with, and sometimes of large size; those from the Cobar mines are particularly beautiful. It is found in most of the upper workings of New South Wales copper mines, as in the Bathurst district, with chlorite, vitreous, yellow, and other copper ores; at Cambalong earthy and fibrous malachite is associated with barites or heavy spar, and with yellow and peacock ore; at Cobar, County Robinson, with steatite; at Mitchell's Creek, Wellington county Wellington, mixed with other surface ores, and often containing large quantities of gold and silver.

CAPITAL AND LABOUR.

CARPENTERS' STRIKE, WESTON-SUPER-MARE.—The master builders having refused to comply with the demands made some months ago by the carpenters and joiners for an increase of wages by 4d. per hour, the men have gone out on strike.

STRIKE IN THE LEICESTER STONE MASONRY TRADE.—The dispute in the stone masonry trade in Leicester reached a climax on the 1st inst., when the men, in accordance with notice given to the masters, refused to continue to work under the conditions which have hitherto prevailed. As a result about 170 men are idle, and their present determination is not to resume work until their demands are conceded. These, briefly, are for an advance of 1d. per hour, making the total 10d. for masons who work in the sheds, and 10½d. for men who work on buildings. They also demand an alteration of the rules governing their employment. The masters refused both demands, hence the strike.

CARPENTERS' STRIKE IN LIMERICK.—The carpenters of Limerick struck work on the 1st inst. in all the shops where their demand for an increase of wages from 32s. to 34s. per week was not entertained. All the local firms save one refused the claim, which, in addition to increased wages, involves questions regarding the imposition of finished woodwork and a limitation of the number of apprentices to be employed.

THE STRIKE IN THE BRADFORD BUILDING TRADE.—A meeting of the master builders of Bradford was held on the 6th inst., and it was reported that masters who were not associated with the society, and who had been paying the old rate of wages, had now ceased to do so, and were demanding a reduction. It was also reported that in one instance the joiners and masons had resumed work at the new rate. In reply to a statement issued by the master arguing that contractors, when taking contracts under

the Corporation, should adhere to the standard rate of wages when these jobs were taken, the masters say that some of the principal contracts now going on under the Corporation were taken prior to the last advance given to masons and joiners. For instance, the heaviest contract in the city—the Cartwright Memorial Hall—was let in March, and the masons' advance took place in May, and consequently the contractor has presumably been paying 3s. a week more to his men than he calculated upon. The same conditions apply to the joiners. In the same way as the Cartwright Hall the contracts for the new fire station were let in March, prior to the last advance to masons and joiners. The master masons say that they would have no objection to paying 1s. per hour if the trade would justify it. They declare, however, that the men know the trade has fallen off greatly since the last advance.

LEGAL.

POINT UNDER SECTION 145 OF THE LONDON BUILDING ACT, 1894.

In a Divisional Court of King's Bench composed of Justices Grantham, Kennedy, and Darling, on Friday, the 3rd inst., judgment was delivered in the case of Crow v. the Board of Works for the District of Whitechapel on the appeal of the defendants from a decision of Mr. Dickinson, the magistrate sitting at the Thames Police-court, in June last. The case was argued before Justices Kennedy and Darling last December, but their lordships then disagreed and the case was accordingly reheard on April 27 before an additional Judge—Mr. Justice Grantham—and judgment was then reserved. The case was reported in the *Builder* of May 4.

A summons was taken out by Mr. Crow, the District Surveyor, against the defendants, the Local Authority within the meaning of the Electric Lighting Acts, 1882 and 1888, for the district, alleging that the defendants had not given him notice under Section 145 of the London Building Act, 1894, before commencing the construction of a number of boxes or inspection chambers under the streets in the district for the purpose of electric lighting. The magistrate found as a fact that the boxes so constructed "were buildings, structures, or works" within the meaning of Section 145 of the London Building Act, 1894, and having regard to Sections 72, 201, and 203 of the said Act, he held that the provisions of Section 145 were not inconsistent with the provisions in the Special Act, and imposed on the defendants the nominal penalty of 1s., and ordered them to pay 10l. 10s. costs. From this decision the defendants appealed.

Mr. Justice Grantham, in the course of his judgment, said he thought that the magistrate had come to a proper decision on the matter. The question was whether the London Building Act of 1894 revoked or altered by the construction of general words the Electric Lighting Acts of 1882 and 1888? Was the language of the former Act, where it directed that notice should be given to the District Surveyor before commencing work, inconsistent with the powers given to the appellants by the Electric Powers Act, 1882 and 1888, and the Provisional Order of 1892, for the supply of electricity to their district? In his Lordship's judgment it was not. It was true that the appellants had power given them to provide electricity for their district, and that they were obliged to lay the scheme they proposed to adopt and the plans by which they proposed to give effect to it before the Postmaster-General and the County Council, but neither one body nor the other was bound to see how the work was done. The necessity for the sanction of the Postmaster-General was for the purpose of enabling him to see that the interests of the Post Office were not prejudiced, and not in any way to provide for supervision of the work done. In the same way the notice to the London County Council as the superior Municipal Authority of the district was desirable, if not necessary, in order that the Council might be cognisant of what was going to be done in one of the districts included in its municipal area, and such an important matter as the provision of electricity. Not one of these notices, however, had reference to any control of the way in which the work was to be done, or as to the compulsory supervision of the work during its construction, but Section 145 of the London Building Act, 1894, required such a notice to be given to the District Surveyor as would enable him to know when the work was to be commenced, and the details of the proposed work so that he could survey the work when commenced and see that the details were carried out in conformity with any by-laws that might have been passed with reference to such buildings. He did not see how it could be said that it was inconsistent with, or contradictory to, the general provisions of the Electric Lighting Acts under which the appellants obtained their authority to provide the electricity for their district. For those reasons his judgment must be for the respondent.

Mr. Justice Kennedy concurred, and Mr. Justice Darling added that although the notice under Section 145 of the Act did not see his way to agree with the judgment of the Court he was at the same time unwilling to differ.

The appeal was accordingly dismissed with costs.

* See the *Builder*, November 12, 1899, "Legal: Rogers v. Hoesgood;" and June 10, 1896 (illustrations).

A CONTRACTOR'S DILEMMA.

The cases in an arbitration between George White and Arthur came before a Divisional Court of the King's Bench composed of Justices Kennedy and Phillimore on May 2, and which raised a question of some importance to contractors as to the construction to be put upon the word "penalty" as used in a contract. The case came before the Court in the form of a special case stated by the Arbitrator from which it appeared that Mr. George White was the assignee of Mr. H. D. Barclay, who had entered into a contract with Mr. Robert Arthur for the supply of an electric light installation for the Princess of Wales's Theatre at Kennington for an agreed sum of 5,000l. A clause in the contract provided that the whole of the work, except the plant, should be completed before November 20, 1898, subject to a "penalty" of 15s. per day, and that the plant should be completed by December 10, 1898, subject to a penalty of 3s. a day for every day the work remained unfinished. The work proceeded until April 5, 1899, when the contractor received notice determining the same. The contractor claimed a considerable sum under the contract, but Mr. Arthur counterclaimed for a large amount including 1,980l. as penalties for non-completion of the work within the time provided by the contract. The matter went to arbitration, when on behalf of the contractor it was contended that the sum of 1,980l. was not recoverable from him on the ground that the claim was for penalties proper and not for liquidated damages. The arbitrator stated the case to have the opinion of the court as to whether the amounts specified in the contract were "penalties" or "liquidated damages."

Mr. E. Tindal Atkinson, K.C., and Mr. Longstaffe appeared for the plaintiff (the contractor); and Mr. Eldon Banks, K.C., and Mr. M. V. Banks for the defendant.

Without calling upon counsel for the defendant, Mr. Justice Kennedy, in giving judgment, said it seemed to him, both from the difference in the two sums mentioned in the contract, and looking at the nature of the work to be done, and the place where it was to be done, that the amounts were intended to be liquidated damages. He was strengthened in that view by the clause in the contract which gave the engineers power, if necessary, to employ other contractors to complete the work, and provided that the defaulting contractor should be liable for loss so incurred, without prejudice to his obligation to pay the penalties incurred by him under the contract. He thought, therefore, that in a contract of that kind, whilst the presumption was in favour of that meaning being attached to the words which they bore *primâ facie*, the real intention in the present case was that the amount specified should be treated as liquidated damages. Mr. Justice Phillimore agreed.

A DISTRICT SURVEYOR AND HIS FEES.

The case of Corbett v. Badger came before a Divisional Court of King's Bench, composed of the Lord Chief Justice and Mr. Justice Lawrence, on the 3rd and 4th insts., on an appeal from an order of a Metropolitan Police Magistrate, under the London Building Act, 1894, holding that the respondent was entitled to recover from the appellant fees amounting to 546l. 7s. 6d., alleged to be due to him as District Surveyor of Lewisham, under the London Building Act, 1894.

It appeared that in 1899 the appellant was the owner of the St. Germain's Estate, Hither Green, Lewisham, and he contracted with a Mr. John Lawrence, a builder, to erect certain houses on the estate. Mr. Lawrence erected the houses and was paid the contract price, which included any fees which Mr. Lawrence was liable to pay to the respondent under the Act. Section 154 of the Act provides that certain fees shall be paid by the builder or, in his default, by the owner or occupier. Section 157 limiting the time within which they shall be paid, viz., within fourteen days after the roof of any buildings surveyed by the District Surveyor under the Act has been covered in. The latter Section also provided that if the builder, owner, or occupier refused to pay the fees, they might be recovered in a summary manner on its being proved to the satisfaction of the court that a proper bill specifying the amount of the fees was delivered to him in a registered letter addressed to his last known residence. It was admitted that the claim was by the respondent for fees to which he was entitled under the Act. The only question now was whether the complaints had been made within six months after the matter of complaint arose, as was required by the provisions of the Summary Jurisdiction Act, 1848. The facts, as disclosed by the special case stated by the magistrate, showed that the roof was completed in December, 1899, and between January 17 and September 10, 1900, he delivered to the builder the bills contemplated by Sub-section 2 of Section 157 of the London Building Act, 1894. The builder became bankrupt on July 2 and on November 8, summonses were taken out by the District Surveyor against the owner. The question the Court had to determine was whether the six months ran from the expiry of the fourteen days before referred to, or whether

they ran from the time the bills were delivered to the builder when some of the summonses would be out of time, or whether they ran from October 20, 1900, the date of the notices to the owner, in which case none of the summonses would be out of time.

After hearing the arguments of counsel their lordships affirmed the decision of the magistrate, holding that none of the summonses were too late. Judgment was accordingly given for the District Surveyor, and the appeal dismissed with costs.

Mr. Macmorran, K.C., and Mr. R. C. Glen appeared for the appellant; and Mr. Ruegg, K.C., and Mr. Montague Shearman for the respondent.

POINT UNDER THE METROPOLIS MANAGEMENT AND BUILDING ACT, 1878.

In the King's Bench Division, on the 7th inst. Mr. Justice Channell delivered judgment in the case of the St. James's Hall Company v. The London County Council, an action tried before his Lordship, sitting without a jury, in order to obtain a decision upon the true interpretation of Section 11 of the Metropolis Management and Building Act, 1878, which gave to the Metropolitan Board of Works (now the London County Council, their successors), certain powers for the prevention of danger from fire in music-halls which had been licensed for the first time prior to 1878.

The Metropolitan Board had exercised those powers in 1885 in reference to the St. James's Hall owned by the plaintiff company, and the company contended that the powers of the section must be exercised once for all. The defendants had served another notice purporting to be under the powers of the section, and the plaintiffs brought the present action for a declaration that the notice was *ultra vires* and for an injunction. The plaintiffs had obtained an interlocutory injunction restraining the defendants from acting upon the notice until the trial, and the question for his lordship was to determine whether the plaintiffs' view of the section was right.

The facts as appeared from the judgment were as follows:—In 1885 the Metropolitan Board, proposing to proceed under the section, prepared a draft notice of their requirements, which was the subject of negotiation between Mr. Walter Emdin, the plaintiffs' architect, and the defendants' architect. The result was that modifications of the first proposals of the Board were agreed to which were embodied in the formal notice served and dated August 10, 1885. The works in that notice were done by the plaintiffs at a cost of more than 7,000l. The original proposal of the Board included the pulling down of an existing staircase, and the re-erection of a better staircase at the same place. The modifications agreed on included the pulling down of the staircase, but it was agreed that it should not be re-erected, the necessary accommodation being provided elsewhere. One of the things which the defendants now directed was the erection of a staircase at the same spot. Since the works were completed in 1885, the plaintiffs had from time to time at the suggestion of the defendants voluntarily made some alterations in such matters as the seats in the hall and otherwise, but they had done so without admitting the right of the defendants to require them to do those or other alterations. The defendants claiming power under Section 11 of the Act required the plaintiffs to execute further works, the cost of which was estimated at upwards of 4,000l., and had obtained the leave of the Secretary of State to make the requirements, but without prejudice to the question now raised. The question his lordship had to decide was whether the defendants had power under the section to require the plaintiff company to comply with their requirements. His Lordship said it must be assumed that when the works done in pursuance of the former order were completed the defects were remedied, or, at all events that, in the opinion of the Board, they were remedied, and that they could not in the next year have said that they had made a mistake and ought to have ordered something more or something different; and if they could not, neither could the London County Council, who succeeded to their rights. Undoubtedly the Board did exercise in 1885 the powers of Section 11, and if there were any defects now, they either existed prior to the order of 1885, and ought to have been dealt with, or they were occasioned by the works done in pursuance of that order. In either case the powers under Section 11 in his opinion were exhausted and therefore the defendants could not now exercise the powers. In these circumstances he must give judgment for the plaintiffs with costs. Judgment accordingly.

ACTION AGAINST A DISTRICT COUNCIL FOR NOISANCE.

The case of Hawkes v. the Leyton Urban District Council came before the Court of Appeal composed of Lords Justices Collins and Stirling on the 6th, 7th, and 8th insts., on the appeal of the defendant Council against an order of Mr. Justice Buckley in the Chancery Division, ordering that a writ of sequestration should be issued against the defendants for disobeying an injunction granted in April last year restraining the defendants, at the suit of the

plaintiff, a resident at Leyton, from carrying on their works in connexion with electric lighting in such a way as to cause a nuisance by noise and vibration. On two occasions the operation of the injunction was suspended on undertakings given by the Council, on whose behalf it was stated that they were erecting steam plant, which would be no nuisance. Upon appeal this Court confirmed the order of the Court below, but limited the injunction to noise and vibration by the use of gas-engines. The steam plant had since been brought into operation, and it was represented that the gas engines were now only worked for certain hours a day as auxiliary to the steam plant. The plaintiff, contending that the Council had broken their undertaking and disobeyed the injunction, applied for a writ of sequestration, which Mr. Justice Buckley granted, on the ground that the defendants had deliberately and wilfully disobeyed the order of the Court.

Mr. Henry Terrell, K.C., and Mr. Dibdin, K.C., appeared in support of the appeal; and Mr. Astbury, K.C., and Mr. A. Beckett Terrell for the plaintiff.

At the conclusion of the arguments their lordships held that there had been a breach of the injunction, and that the writ must go. It could, however, lie in the office for a week to enable the defendants to apply to Mr. Justice Buckley for any indulgence they might think themselves entitled to.

FORD v. BEMROSE & SON.—In the report of Ford v. Bemrose & Son in the BUILDER last week the sentence in the judgment "It is true I agreed to erect seventy-two buildings" should read "It is true I agreed to erect your building."

RECENT PATENTS.

ABSTRACTS OF PATENTED INVENTIONS.

318.—KILNS: C. Czerny and C. Schlump.—Gas-fired continuous kilns are built up of two rows of arched chambers, set cross-wise, with an intermediate passage and flues below them; the gas flows through passages underneath the kiln-chamber floor, and thence through passages in the corners of the chamber at a point just under the spring of the arch, whilst the air flows from the chamber which is being discharged through gratings in the floor, and so through all the chambers that are being cooled into the chamber wherein the goods are being burned, that it may mix with the gas therein. The products of combustion are conveyed through the chambers in which the preliminary heating is in progress, and thence follow the course of the air, finally escaping from the most recently charged chamber into the chimney flue. The flues and dampers are duplicated, so that one set may be repaired whilst the other set is being used.

403.—SAWING OF STONE, MARBLE, &c.: S. Holgate.—Sliding sleeves, united with girders and cross girders that constitute a frame, are mounted upon three pillars at each side of the machine, and have bearings for the pendulum rods from which the saw-frame is suspended, the upper ends of the rods being T-shaped in order that they may raise weights or touch springs when the stroke is nearly ended. The driving gear, which rises and falls with the saws, is mounted upon the girders, and consists of a crank shaft with a fly-wheel and connecting rods; chains which pass around the drums of shafts driven with worm-gearing, cone pulleys, and fast and loose feed-regulating pulleys feed the sleeves up and down the pillars. Provision is made for driving the crank shaft in any position of the girder-frame by means of a belt around the main and other pulleys.

422.—AN APPLIANCE FOR DRAWING PURPOSES: J. A. Jones.—The instrument is devised for use in measuring angles in perspective in drawing from models, and determining the proportional dimensions of the parts of the models. Two graduated arms are pivoted on to a cross-piece of a rectangular frame, on the sides of which is marked a scale of degrees to be traversed by the ends of the arms; two additional arms are adjustably pivoted on to a sleeve that slides upon the cross-piece. When the frame is held at arm's length the required angles and dimensions may be observed, the latter pair of arms serving for use in respect of drawing parallel lines of the models; the four arms may be otherwise mounted between two parallel and graduated frames.

426.—HOISTS FOR BUILDERS' USE: F. Fishburn.—The apparatus is intended especially for lifting building materials in wheel-barrows. The lifting-rope is wound around two pulleys at a height above the level up to which the load is to be raised, and engages with a winding groove cut in the winch barrel. When its one end is at its highest level, the other end is at the level of the ground. In the case of heavy loads, the rope should be turned round the barrel more than once, the coils being kept in their places with small pulleys upon spindles that will move and follow the winding groove in the winch, and adjustable guide-pulleys set lengthwise upon a bar will serve to increase the extent of contact of the rope with the barrel.

431.—WORKMEN'S CLAMPS: F. Beck.—Upon the top bar is a dove-tailed projection on which the board that supports the work will slide; a screw,

which is to be screwed into the bottom bar, is screwed to the top bar and will adjust the distance between the two bars accordingly with the thickness of the bench or other support, which is gripped firmly by turning the other screw, that is passed through the bottom bar and is pressed against the top bar.

435.—SAFETY APPARATUS FOR USE WITH LIFTS: F. T. Hollins and H. C. T. Amundt.—When each well-door is closed, its fastening and an electro-magnet above the door are in the circuit of a battery, and the circuit can be completed only with the pressing down of a treadle in order to lock the hand-ropes whereupon one can draw the bolt of the door; an electro-magnet (to be energised only when every door is shut) pulls out of engagement a catch which locks the pressed-down treadle. For opening the closed door, a pivoted arm can be reached from only the outer side of the door works the bolt which holds up a catch consisting of the armature of an electro-magnet, contact becomes broken with the motion of the arm towards the left, and another contact is made by means of which (the treadle having been pressed down) circuit through the magnet becomes complete and the armature is sustained so that the bolt may be drawn. The invention provides, generally, that the doors shall be unlocked as the cage is stopped, when one door is opened the others (as well as the locking-lever of the hand-ropes) shall be locked, and all the well-doors shall be locked whilst the cage rises or falls within the well.

444.—A SOLDERING-IRON: C. Shields.—Benzine or other spirit fuel is stored within the hollow handle of the soldering-iron, from which a tube extends into a chamber which is covered with a pierced diaphragm. Upon the extended part is a slotted case for the admission of air, and two soldering-irons are mounted upon the head of the case. The supply of vapour to the chamber is regulated with a screwed valve spindle; when vapour has been generated by the heating of the extension, it passes into the casing, where it will become ignited and play upon the irons within a shielded space between the head and one of the irons.

464.—HEATING BUILDINGS WITH HOT AIR: W. C. Macey.—At one corner of a rectangular casing is a fire-box from which gases and smoke are conveyed through pipes set with a slight fall and crossing air-chambers around the inner side of the casing. As the air which enters into the lower portions of the chambers becomes warmed, it finds its escape through slots in the tops of the chambers to the upper parts, whence it is conveyed for heating the building.

487.—AN APPLIANCE FOR USE WITH BAND-SAWS: F. W. King.—In order that the pulleys may better resist the pressure from the wood, and that the saw may be retained upon them, the pulleys are fashioned with recesses at the centres of the rims, into which are inserted bands of some elastic material mixed with bands of webbing or wire-cloth. The curved top of the rubber band projects above the surface of the pulley when it is not forced down by the saw-hand. The specification includes other methods of affixing the band.

507.—ELECTRICAL BELLS: A. Clarke.—The frame constitutes the core of the magnet. It has pole-pieces and flanges, between which the copper wire is wound. The binding screws, the contact screw, the armature, and the cover are carried upon elliptical flanges, and the bell upon the lower extremity.

533.—A COMBINED SET-SQUARE AND BEVEL: A. C. Smith.—Two blades pivoted at one end of a slotted stock with, it may be, a pivoted and slotted blade at the other end, can be clamped in any position required with a set-screw; the blades when not being used can be folded into the slots. Circular slots are cut in the two blades so as to intersect at the middle point between their pivots, and the shank of the clamping screw is passed through the pivots. A stud that works in a cam-slot in one of the blades is attached with an anti-friction roller to the other blade, the cam allowing the motion of one blade to follow that of the other.

552.—KILNS AND FURNACES FOR BURNING LIME, CEMENT, &c.: E. Gobbe.—For cooling the material the inventor contrives that air shall enter the base of the furnace in a volume larger than what is needed to support combustion, and that the surplus air shall be carried away through openings and flues in the walls so as to keep them cool. The "baking-zone," less high than is customary, is built up with ribs, the furnace above it has cross walls that form cells, in which the material undergoes the first stage of the heating process; vertical flues (through which stoking tools and fuel may be introduced) are set across the cell-walls and carry combustion products from the "baking-zone" to the chimneys.

564.—TUMBLER LOCKS: F. Gelle.—The lock, adapted for windows, doors, and so on, has its tumbler and spring mounted upon the bolt. When the bolt is being locked, the end of the tumbler is first lifted clear from a fixed stump by the turning of the key, which will then force the bolt forwards as it presses against the lower portion of the tumbler. In the event of the employment of a key which is just long enough for lifting the tumbler without bringing the bolt, the bolt will be left in a middle position, from which only the proper key can draw it back.

568.—A DRINKING-APPLIANCE FOR HORSES AND CATTLE: A. Conlhorst.—The inventor's object is to lessen the risk of contamination by diseased animals. He provides a separated trough for each animal, and fits the common supply of water with valves and weirs which will prevent it from returning to the supply channel as well as from flowing out of one trough into another, each trough has a non-return valve connected with the common channel, and an overflow pipe conveys surplus water from the troughs.

603.—THE BUILDING OF FLOORS AND CEILINGS: A. Harmin.—For sustaining the concrete until it has become set are devised flat angular telescopic bars, of which the adjustable lugs will fit over the lower flanges of the girders, and boards are laid upon the bars, each of which will slide through a guide or sleeve at the end of its companion bar; the lugs are fastened to the bars with pins that pass through them and through holes in clamping-bands.

639.—ELECTRICITY METERS: F. R. Dick and Reason Manufacturing Company.—So that a single ordinary meter may be available for measuring the sum of the currents or energy employed upon both sides of a three-wire system, the inventors divide the two sides beyond the meter in the shape of independent two-wire circuits, and connect the two inner wires through low equal resistances to the neutral main, thus the meter—which may be after the maximum demand indicator type—will carry a current in ratio to the sum of the supplied currents, being connected between the separate ends of the two low equal resistances.

641.—SLOP SINKS FOR HOSPITALS, AND A CONTRIVANCE FOR GENERAL FLUSHING APPARATUS: F. Shanks.—Ridges, which are formed within the slop sink, act as a support for the bed-pan when it has been inverted upon the sloped bottom of the sink. A vessel, fitted with a tubular outlet valve and an overflow, has a perforated coil at its base, through which steam is admitted for cleansing and sterilising purposes. For obviating the necessity of the discharge of flushing-siphons, a screw, which will regulate the size of the air-inlet, is fitted upon the air-pipe, as specified in No. 27,004 of 1897, and a hanging-tube, either pierced at its end or fitted with a dome, is attached to the ball-and-boat valve. The tube may be provided with an air-vent, or be turned into a V-shape, and may be lined with one of rubber constricted near its middle point.

729.—ELECTRICAL SWITCHES AND CUT-OUTS: C. M. Dorman, R. A. Smith, and H. G. Baggs.—For increasing pressure upon the contacts when the switch is "on," and lessening it before it is moved "off," the main contacts are connected by a contact, mounted on an arm or handle, which bears lightly against the main contacts, to the arm or handle is pivoted a lever that will press against the contacts and be itself pressed by a cam upon a pivotted bracket and worked with a weighted handle, an electro-magnet which holds up the armature retains the parts in a closed position, and upon a failure of current in the magnet the weighted handle drops so as to move the cam and free the lever from its catch whereupon a spring breaks the main circuit; the invention comprises modifications of the arrangements described, for example, a toggle-lever, having either direct or indirect action, may be substituted for the cam, and the cam may be worked by the hand.

734.—PANTOGRAPHES AND SIMILAR INSTRUMENTS: O. Richter.—Upon the last bar of a "lazy-tong" adjustment are mounted a tracer and a fixed graduated wheel. The wheel is contrived to drive a recording-wheel with a worm and a worm-wheel, and for setting the instrument at "zero" the latter gearing can be easily put out of action by means of a lever. One end of a bar which is parallel to the last bar of the "lazy-tongs" carries a pencil for the tracing of a reduced diagram or figure. The first bar of that same parallel group carries the fixing-pivot of the "lazy-tongs" at one of its ends.

MEETINGS.

FRIDAY, MAY 10.
Architectural Association.—(1) Special general meeting for the purpose of approving new by-law. 7 p.m. (2) Mr. Alfred Hands, F.R.M.S., on "The Protection of Buildings from Lightning" (illustrated by lantern views). (3) Election of officers. 7.30 p.m.
Society of Arts (Howard Lectures).—Mr. Alfred C. Eborall on "Polyphase Electric Working." III. 8 p.m.
SATURDAY, MAY 11.
Royal Institution.—Professor W. M. Flinders Petrie on "The Rise of Civilisation in Egypt." I. 3 p.m.
St. Paul's Ecclesiastical Society. Visit to St. Stephen's Chapel and the House of Parliament. 3 p.m.
Northern Architectural Association.—Visit to Collingwood-street and Quayside Buildings, Newcastle. 3 p.m.
MONDAY, MAY 13.
Society of Arts (Cantor Lectures).—Sir W. Chandler Roberts-Austen and Mr. Charles Rose, D.Sc., on "Alloys." IV. (This lecture will be delivered by Dr. Rose.) 8 p.m.

Table listing property addresses and prices, including entries for Bayswater, Regent's Park, Paddington, and various other districts.

Table listing property addresses and prices, including entries for Old Charlton, Barnes, Mile End, and various other districts.

Table containing 'PRICES CURRENT (Continued)', 'BRICKS, &c.', 'WOOD', and 'BUILDING WOOD—YELLOW' sections.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

Table listing prices for various materials such as Bricks, Hard Stocks, Rough Stocks, and other construction materials.

[See also page 477.]

TO CORRESPONDENTS.

A. S. (Amounts should have been stated). NOTE.—The responsibility of signed articles, letters, and papers read at meetings, rests, of course, with the authors. We cannot undertake to return rejected communications. Letters or communications (beyond mere news items) which have been duplicated for other journals are NOT DESIRED. We are compelled to decline pointing out books and giving addresses. Any commission to a contributor to write an article is given subject to the approval of the article, when written by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance. All communications regarding literary and artistic matters should be addressed to THE EDITOR; those relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

TENDERS.

[Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursdays. N.B.—We cannot publish tenders unless authenticated either by the architect or the building-owner; and we cannot publish announcements of tenders accepted unless the amount of the tender is given, nor any list in which the lowest tender is under £100, unless in some exceptional cases and for special reasons.] * Denotes accepted. † Denotes provisionally accepted.

The Technical Instruction and Secondary Education Bill.

THE readers of this journal well know that long before the present interest in Technical Education arose we advocated a more systematic teaching of the subject.

The present interest arises largely from fear. Englishmen have been told that foreign competition is now more formidable because the youth of this country is not properly equipped by technical education to compete with Germans and Americans. The people are therefore preparing to pay for the education, but somewhat less willingly than they do for guns and soldiers. This is one of the first points which must strike any one who considers the Government Bill on the subject of technical and secondary education. The Education Authority is to be allowed to levy a rate of twopence in the pound; if that is insufficient for a satisfactory system of technical and secondary education, so much the worse for education. The School Board has an unlimited power of rating for the purposes of elementary education, and the rate varies in most places from sixpence to ninepence. It is, therefore, perfectly obvious that the limitation in the Bill is inserted by the Government because the English people are prepared only to pay a limited sum for this purpose of secondary and technical education. This limitation is a very distinct blot on the new Bill; it will be a hindrance to satisfactory work, and it will be a drag on education. But we fear that it will remain in the Bill. By its means the Government hope to have a better chance of passing it into law. To those who object to the payment of rates, and prefer ignorance to education at a considerable cost, the Government will say, "See how cheap it is; it will cost you next to nothing." This is the way we legislate in this country.

We now come to the question of the educational authority. It has been pointed out many times in these columns that the County Councils were becoming more and more the most useful and the most dominant bodies in the country. Many of them show a breadth of view and an administrative grasp which is quite admirable. Many of them have employed the Technical Instruction Acts to very good purpose. It is, therefore, most satisfactory that the County Councils, with co-opted assistance, should be the new Educational Authority. It has been well said that the Bill, if it become law, will give local option in this respect to secondary and technical education. We do not feel much fear on this point. There is a good deal of competition between counties and County Councils, and on the whole the County Councils may be relied on to have a fair system. The members of these bodies are men, as a rule, above the average in education and intelligence. They are the pick of the country. They show signs of progress in the work of administering the highways and other matters. There is no reason to suppose they will be behindhand in regard to technical and secondary education. But there is the fatal financial limitation. There can be no doubt that however desirable technical education may be, a sound secondary education is equally, if not more, necessary. But this implies large schools, and numerous, capable, and well-paid teachers—such schools being placed systematically in the several counties. By this means the more capable scholars in the elementary schools would move automatically upwards, and from these secondary schools the scholars would turn into the practical business of the country. The great railways, the great building-houses, would know where to look for a supply of well-educated employés. But money must be found for the purpose.

Another point in the Bill which requires careful consideration is the position of the existing secondary schools. It does not seem that the educational authority will have an influence upon the grammar schools of the country, many of which, are purely

secondary schools. These schools will have a very anomalous existence. They will neither be part of what we call in this country—much to the bewilderment of Americans and Colonials—the public school system, nor of the county secondary education system. Many of these schools give a feeble classical education, whereas they should—while not dispensing with classical education—give also an education more technical and more modern. It would certainly be desirable that the smaller grammar schools, at any rate, should fall under the management of the County Councils. They would gain new life, and be a valuable adjunct towards a more complete and national system of technical and secondary education.

We have said nothing about what is now known as the Cockerton judgment, by which it was decided that it was illegal for Board Schools to give free education in technical and secondary education to schools without a fee. This point is dealt with in the Bill by allowing such teaching to be continued subject to the approval of the new Educational Authority. This is regarded as a temporary expedient. It may, however, become permanent. For it would be very convenient in many places if the secondary education could be brought close to the primary education. This point is likely to receive practical development. We have constantly pointed out that a sound system of primary education is the basis of all technical education, if the latter is to be worth anything. The Bill does not touch this question—oddly, and unfortunately, there is still mixed with elementary education the religious bogey, largely used by the clergy, because they wish to keep some personal authority over the voluntary schools. Once, however, the County Educational Authority gets to work, we believe that in those places where there is not now a strong elected educational body there will be a desire on the part of the people to see elementary education placed in the hands of the County and Borough Educational Authority. We can imagine nothing more absurd, nothing more likely to

offend English common sense, than that in some town there should be a Town Council managing a system of technical and secondary education while the primary education is in the hands of a vicar, churchwardens, and a few voluntary subscribers, who are at their wits' end how to make both ends meet. There will be many such instances, and they must cause public opinion to desire that the new authorities should have the power, sooner or later, of becoming the sole educational authority. It would be a great service to elementary education, and so to technical education, if many of the wretched little School Boards and small voluntary managing bodies could be absorbed by the County or Borough Council. But the main points which, finally, we desire again to emphasise are that this Bill creates an authority all over England for technical and secondary education; that it has the power of levying a rate for this purpose, to which will be added certain monies now used for technical education; that it rests with each locality, be it county or County Borough, to create a systematic series of schools for technical and secondary education. There are minor points which might be discussed, such as the amount of control to be exercised by the Board of Education; but it appears to be desirable to present to our readers the broader aspects of this most important change.

FRENCH ART IN 1901.—I.

 THE Old Salon is on the whole a better exhibition than for three or four years past. It suffers, of course, both in the actual quality of its contents and in its effect on the visitor, by the immense extent of wall space and the immense number of works that are hung. The range of galleries appears, as far as one can compare by recollection, even larger than that in the old Palais de l'Industrie; the natural consequence is that many pictures have to be accepted merely to fill the walls, which in a smaller exhibition would be excluded as below the mark, and that the eye is almost bewildered and fatigued in the effort to pick out the fine things from such an immense mass of paintings. On the whole it may be said that the proportion of good to bad or uninteresting works is higher at the Royal Academy than at the Salon, but the actual numbers at the latter exhibition are so much greater (2,092 oil paintings against 923 at the Academy) that a larger number of fine works could be culled from among them, including some few, certainly, which are superior in power and interest to anything in our London exhibition. Also, of course, we find some of those monstrous and repellant vulgarities or cruelties on a large scale which French art alone seems to produce, and French taste alone to tolerate. M. Lalire contributes his usual huge hash of contorted nakednesses; M. Surand paints, on a very large scale, the pleasant subject of Caligula feeding his lions and tigers on living criminals; M. Danger represents Pestilence ("Fléau") by a naked giant, the height of the houses, walking down a street like Gulliver among the Lilliputians, and knocking the inhabitants over with a club; and M. Chocarne-Moreau, in "La Main Chaude," perpetrates a piece of sheer vulgarity which is honoured with a place in the great gallery.

It is satisfactory to feel that such examples of brutality, absurdity, and vulgarity in art would at all events not find a place in any English exhibition.

In the aforesaid large gallery, to which the main staircase leads up, are of course collected those enormous canvasses which are a special characteristic of the Salon. Prominent among them is M. Bérourd's "Paradis Perdu," in which a colossal Adam and Eve, respectively brown and white, descend a rocky slope from the gate of Eden; a very theatrical work, and yet not without a certain power which grows upon you. M. Bonnat has a large ceiling painting, an allegorical representation of "Justice," intended for the first Chamber of the Cour d'Appel at Paris; it is painted in a curious method, with a criss-cross of brush strokes making it look like a huge pastel; it is totally unsuited for a ceiling, being far too heavy in colour, and when in position the seated figure of Justice will be horizontal instead of upright. A painting like that on a ceiling upsets all one's ideas of the wrong and right way up of things. Now, M. Marioton, in the opposite corner of the gallery, a confirmed ceiling-painter, knows what to do with a ceiling; his "Symphonie des Fleurs" is bright and aerial in colour, and the figures seem to float and not to stand. M. Ferrier's ceiling painting for the foyer of the theatre at Nîmes has also a fine quality of the same kind, and will look well in position, and there is a great charm in one or two of the figures. M. Chalon's "Phryne aux Fêtes de Venus" is uninteresting, nor has Phryne that beauty which would be the best excuse for the picture. M. Thomas's "Les Bergers," a decorative classic landscape and figures for the Mairie of Tours, is an imitation of Puvion de Chavannes without his brightness and delicacy of tone. Mr. Smith-Lewis exhibits here too his usual immense farm painting with unkempt horses the size of life, redeemed from artistic nothingness by a certain boldness of brush work. What a contrast to all the more or less violent works is M. Benner's calm and idyllic sacred picture, "Retour de la Fontaine," the Virgin with the infant Jesus walking before her; there is a simple and pure beauty about the child which is delightful. Also may we note with sympathy M. H. Flandrin's "Jeanne d'Arc en prière," kneeling with a sympathetic circle of spectators around her; there is more character in the faces of the spectators than in that of the principal figure, but it is a fine work in feeling, painted for the church of Sèvres, and having something of the severe style proper to a church painting, which must to a certain extent be regarded from a decorative point of view.

All these, and others, are in the great entrance gallery. From out of the rest of the long range of galleries, what can one select as of special interest? A selection it must be, for after all said, there are more interesting or clever pictures than one could have space to name in this article. The popular sensation of the year is M. Rochegrosse's triptych of Solomon and the Queen of Sheba, an exceedingly clever work in a superficial way; that is, the interest consists in the painstaking and brilliant manner in which a profusion of Oriental details of dress, ornament, and architecture has been painted, and the originality of invention displayed. It is a moderately large painting framed between

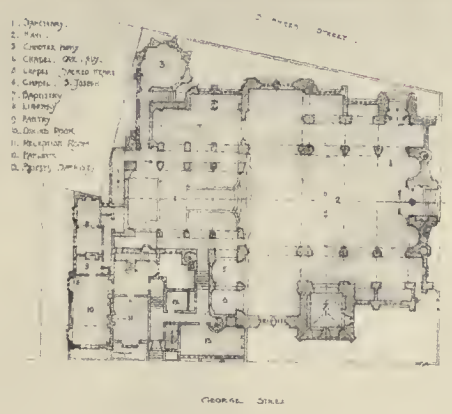

two small uprights; on the left the Queen of Sheba solitary on her own throne, on the right her introduction into his harem by the king (which it appears is one form of the legend), in the centre her reception in state by Solomon. There is admirable detail in this; the helmets of the cavalry guard, for instance, are delightful; but it perhaps hardly rises higher than what may be called a superior piece of bric-à-brac painting. The specially-designed symbolic frame is a curiosity in itself. Perhaps the two most important of the pictures in which figures are the prominent subject are M. Gervais' large painting of "A Fête in Honour of Bacchus and Ariadne," and M. Henri Martin's "Bucolique." The former is a large open-air scene with a crowd of Greek figures, some grouped around a term-figure of Bacchus with a fire on a small altar before it, others coming in procession along the cliffs, with flowers and musical instruments, the whole backed by blue sea and hills in clear light. The painter has thoroughly caught the spirit of Greek Paganism, and there is a great deal of fine drawing and fine colour in the work; but compared with some of his previous works the figures seem a little hard and artificial. M. Martin's picture, painted in his usual peculiar touch-upon-touch method, which makes the texture of his pictures different from those of any other painter (no one seems to have thought of imitating him yet), is as completely Christian as the other is completely Pagan. It is a scene in a sloping partially wooded glade, on the right of which, among the sheep, are some figures of rustics and their children, on the left approach two floating figures which seem as the guardian angels of the pastoral life. There is great deal of tender and pathetic feeling in the human figures, and the whole picture is equally pleasing in a decorative and in what one may call a moral sense; there is a certain holiness about it.

M. Bouguereau, alas! exhibits that foolish and weak piece of prettiness which has already been seen in London at Messrs. Tooth's Gallery, "Amour voltigeant sur les Eaux;" a sad piece of stuff for an eminent painter to put forth as his principal work of the year; a fancy destitute of point or meaning, and cold in colour; redeemed only by good drawing. He exhibits a good portrait also, but with the same characteristics of hard surface and cold colour. Among the other figure pictures of this class one may distinguish between the merely vulgar nudes, coarse in execution and devoid of sentiment of any kind; the innocent healthy nudes, prompted by an honest delight in the figure; and the paintings in which the nude figure is made the medium of expressing a poetic ideal. The first class may be dismissed from notice—there are plenty of them, twisted into various contortions. Of the second are M. Chantron's pretty, but senseless and rather hard painting, "Les Nymphes s'amusement," and M. Nicolas Laurens' curious fancy of symbolising the fall of the leaf by three nude figures seated or clinging to a tree, and ready to drop off from exhaustion. Possibly the artist would claim that this came under the head of poetry, but it is too odd and far-fetched an idea to appeal much to one in that sense. M. Sezille's "Madeleine" is one of the best painted nudes, prostrate at full length, and hung so as to incline towards

Home Arts
and
Industries.

THE annual exhibition of the Home Arts and Industries Association is now open at the

Royal Albert Hall. The best work of the Association lies in developing local industries where they already exist, awakening the interest of workers in design, and showing them the best models and methods of work; where nothing of the kind exists, classes are started of a useful and instructive nature. We always wonder at these exhibitions that we see no carpentry exhibits. Good simple carpentry is an uncommon accomplishment; it is not showy, but it is very useful and is the high road to a right appreciation and perception of more beautiful things. The best wood-work exhibits are amongst the inlay work, especially that of Miss Mabel de Grey from Pimlico, whose very clever work is within the limits of the material and the bounds of good design. A very good chair and music cabinet come from Bolton-on-Swale. Of a great deal of wood carving there are some good panels from Altrincham; the majority is poor and useless. The fact is that carving is out of place on the ordinary furniture of a house, and in perfection is only found in conjunction with architecture. Interesting architecturally are the terra-cotta exhibits from Compton, most of them from the designs of Mrs. G. F. Watts; they consist this year chiefly of useful garden ornaments—flower-vases, urns, and decorative work of an allegorical nature. In the needlework and fabric section the strongest work is that from Haslemere by Mr. and Mrs. Godfrey Blount, appliqué work in rich coloured lins of their own weaving and design, essentially modern in character. The tapestry from Aldeburgh, Suffolk, is very beautiful both in colour and design, and is the work of crippled girls. Incidentally the Association finds employment of a worthy character for cripples, the blind, and disabled soldiers and sailors.

A CORRESPONDENT, an architect, writes to us to draw attention to the fact that the Mayors' chains and badges which are being presented to some of the newly created London Boroughs are being, as he puts it, "executed by limited liability companies;" that is, they are the production, not of artists, but of trading firms. That is the usual way in England, and it will probably be some time before we see anything better, except in rare instances. Our correspondent adds that he was looking at one of these when another person came up and remarked "There's a lot of gold in that; it must have cost 200*l.*" That is the English standard of value in such matters—"a lot of gold." What kind of design is made out of the gold is of no consequence, so long as the bullion value reaches a respectable figure.

JOINT HOSPITAL, CHORLEY, LANCASHIRE.—The new isolation hospital at Heath Charnock, near Chorley, has just been opened. There are five buildings—the administrative, the working, the scarlet fever, the typhoid, and the diphtheria blocks. Each of the buildings of the hospital proper has a glass verandah. The working block contains the disinfecter house, the laundry, the mortuary, stables, and the ambulance house. The buildings stand within an enclosed area of something over six acres. The architects are Messrs. Jolly & Buckley, of Chorley; the contractor, Mr. Robert Brownley, of Chorley, with Mr. L. Fairclough, of Adlington, as sub-contractor for the stonework; Messrs. J. Fairclough & Sons for the slating and plastering; and the executors of Mr. Heald for the plumbing, painting, and the glazing.

THE ARCHITECTURAL ASSOCIATION:
SPECIAL GENERAL MEETING.

A SPECIAL general meeting of this Association was held in the Meeting room of the Royal Institute of British Architects, No. 9, Conduit-street, W., on Friday last week, at 7 p.m., to consider the Committee's proposals to add to or amend the following by-laws—

To add to By-law 27: "The Committee shall appoint four trustees, who shall be members of the Association, in whose names the investments belonging to the Association shall be invested on behalf of the Association. Any vacancy in the number of trustees shall be immediately filled by the Committee."

[The Committee of the Association recommended the names of the following gentlemen to act as trustees: The President (Mr. W. H. Seth-Smith), and Messrs. G. H. Fellowes Prynne, Arnold Mitchell, and G. B. Carvill.]

By-law 26: After "Treasurer" add "or Secretary."

By-law 27: After the words "shall be paid by the Treasurer" add "or Secretary."

By-law 33 to read: "The office of President, Vice-President, or Librarian shall not be held by any member for more than two consecutive sessions. The office of Treasurer and Hon. Secretaries shall not be held by any member for more than five sessions and four sessions respectively."

The President (Mr. Seth-Smith) occupied the chair, and moved the adoption of the committee's proposals. In reference to By-law 33, he said that the Committee considered it objectionable on principle that offices of great responsibility should be held very long, and that it was far better to get fresh officers periodically.

The proposals having been agreed to the special meeting terminated, and the ordinary meeting commenced.

The minutes having been read and confirmed, some nominations having been read, and some donations to the library announced.

The Chairman said he proposed with much pleasure the names of Mr. Ernest George and Mr. J. M. Brydon for election.

These gentlemen having been elected by acclamation. The Chairman announced that the annual dinner would be held at the Criterion Restaurant on Friday, May 31. The Committee desired to make the dinner a thorough success this year with the special view of saying what could be said as to the new educational departure the Association was taking, viz., the establishment of a Day School. It was hoped, therefore, that there would be a good attendance at the dinner.

Messrs. Ralph Berrill, A. E. Chasemore, A. D. Jenkins, J. H. Cooper, and J. H. Shearer having been elected members of the Association.

Mr. R. S. Balfour, Hon. Secretary, announced that a visit would be paid to Chesterfield House, South Audley-street, on the 18th inst., by permission of Lord Burton.

Mr. Alfred Hands, F.R.Met.Soc., then read the following paper:—

The Protection of Buildings from Lightning.

The popular idea of lightning comprises little more than that it is something stored up in a thundercloud which is apt to leave it and travel to earth, doing damage to objects which obstruct its course; that it is attracted to and conducted by metals; and that when it reaches the earth it disperses or becomes lost, more especially if it gets to water. These ideas give a very incorrect view as to what the problem involved in protection from lightning really is. As a consequence, it is popularly supposed to be a very easy one. All that is thought to be necessary is to have a lightning-conductor raised sufficiently high to attract the lightning; it must be of large size to allow an easy path for the discharge, and its lower end must be taken into moist ground or into water, and there the matter ends. This view also contains an element of truth, but it is very far from being the solution of the problem. Instead of being a simple matter, protection from lightning is a most complex subject, and probably one of the most difficult among the many which architects are called upon to deal with in the course of the erection of buildings.

I cannot within the narrow limits of a paper place before you the whole subject, but I hope to be able to show something of the principles which are involved, and more especially as to the common-sense view, for,

although it is very often ignored, there is such an aspect. I think that little could be said in favour of lightning conductors if they would not bear the searching light of common sense. It is not a subject which can be taken up lightly and disposed of in a few words, and a thorough knowledge can only be obtained by very close study, exhaustive experiments, a careful investigation of the phenomena exhibited by nature when objects are damaged by lightning, and a very extensive experience of the questions to be considered in the protection of buildings. It is a subject which, when one has studied superficially, one is apt to consider easy and that one has mastered, but that after studying in all its bearings for a few years one finds it very much more difficult than one thought, and requires long and close application before it can be thoroughly mastered. There are so many subjects which it is necessary for architects to be thoroughly conversant with that I think few could spare the time necessary to render themselves experts in this one. At the same time it is advisable that they should know something of the principles involved, for until they do, cases of so-called failure of lightning conductors, which are far more frequent than they should be, will continue to occur.

The subject is, I consider, a most important one, because, apart from human life being at stake, a vast amount of property is annually destroyed by thunderstorms—losses which could be prevented by a scientific application of conductors which would render their destructive effects nugatory. It is impossible to arrive at the amount of damage to property which occurs yearly in this country, but I believe I am below rather than above the actual figures in saying that it must be between 50,000*l.* and 100,000*l.* I have for many years been collecting particulars of damage of this nature, but I do not suppose that my record is anything like a complete one, because the list of papers searched has necessarily been limited, and besides there are very many cases which are not reported, even in the local Press—every year many unreported cases have been brought to my notice. From these particulars I am at present preparing a map of England showing the positions and nature of the objects struck. This work takes considerable time if one desires to be accurate, and I have at present only completed from the beginning of 1898 to the present time, but thinking it might be of interest to you I have prepared a copy. This map has spots of various colours representing buildings, ricks, trees, and other objects damaged or destroyed, and human beings and animals killed or injured. I particularly wish to draw attention to the fact that most of our large towns, and particularly the manufacturing ones, are indicated by the number of cases of damage; I think this ought to dispose of the mistaken idea sometimes expressed that the smoke in towns acts as a protection.

I do not propose going into the question of the origin or process of formation of thunderstorms, but in order to understand the principles involved in the science of protection, it is necessary clearly to understand the electrical action in a storm of this kind. You are aware, of course, that lightning is merely electricity differing in no respect from that generated by a frictional or influence electrical machine, except that it is on a gigantic scale. You are also doubtless aware that this form of electricity called static is of a dual nature generally called positive and negative; that it is impossible to produce one without the other, and that by a process called induction, where the one state is existent the other will be near it, being only prevented from joining by whatever insulating material is interposed. The existence of one electrical state is proof of the existence of the other, and that it is as near as the insulating material will allow it to get. This is precisely what occurs in a thunderstorm. The storm clouds provide the charge of one nature, and the earth with the buildings and other objects on it has by induction the other—the air between is the insulator which tends to prevent their joining. Of course, it frequently happens that different clouds in one storm are oppositely electrified, and hence we get flashes from one cloud to another, but as these discharges do not affect our safety, we may leave them out of account. Presuming that the cloud is positive, the earth and the objects on it are necessarily negative, and therefore there is a state of tension between the two which becomes more acute as the

respective charges increase, until at last the tension becomes too great, the insulating material gives way, and momentarily the path of the strain becomes visible by a line of matter rendered incandescent, and this we call lightning. The strain has existed before the flash appears, and the path it follows is all prearranged. One cannot say that anything has left the cloud to come to earth, any more than that something has left the earth to travel skywards. It is merely the re-uniting of the two states, or rather the restoring of the equilibrium which had before been disturbed.

Franklin at one time used the terms plus and minus in place of positive and negative, and they are in a way convenient; but it will be more correct, and, I think, more simple, if we treat the matter merely as a difference of potential, for one state is only negative or minus relatively to the other. Adopting the terms plus and minus for the moment, however, we may say that if we regard a mild so-called positive charge as +1, the corresponding negative charge would be -1; or a more powerful positive charge as +1,000, the negative would be -1,000. In either case the total of the two joined would be 0, or a state of quiescence, and the difference between the two values +1 and -1, and +1,000 and -1,000 respectively, would represent the difference of potential. But it is not necessary that difference of potential should be above and below zero, it may be all on one side, thus it may be compared to the difference between +1 and +2 or -1 and -2. Now, wherever a difference of potential exists there is a strain due to the necessity of restoring the equilibrium or level, and if the strain is great enough to break down the insulating material, a spark will pass. Therefore, if we could do away with the strain, or reduce it in time, we should prevent the breakdown, or in other words prevent the discharge taking place, and this is what we endeavour to do when we provide a lightning-conductor with points. They possess this power; they may almost be considered as safety-valves. While the potential in the clouds is being raised in the process of the formation of the storm, every point is reducing the strain by what is called brush or silent discharge. Theoretically, a lightning-conductor should never be struck by lightning; practically, it may be because the potential may be raised so rapidly that the points cannot reduce the strain quickly enough. Points, however, possess a very considerable protective effect and form a most important function of a lightning-conductor, although not absolute. The conductor might even be so far inefficient that it would not convey a lightning discharge harmlessly and yet the points would still exert their protective effect in this way. During a thunderstorm the points of a conductor may frequently be seen to glow with the light of the brush discharge, and this may even be concentrated into short sparks or a spitting effect, as Professor Lodge graphically put it. Then we hear people say they have seen the lightning playing about the lightning-conductors. When this occurs the tension must be enormous, and it is just a question whether the lightning flash will occur or not.

If the points are not able to prevent discharge, the second function of the lightning-conductor, its power of conduction, should prevent any harm occurring to the building on which it is fixed if it has been applied on scientific principles, but it is just in this that the complicated and difficult nature of the matter consists.

I think it will make the matter clearer if I digress to touch briefly on what may be called the principal epochs in the history of protection.

It has been claimed that the invention of the lightning conductor was complete in its first inception, like Minerva springing into being from Jupiter's head; but this is very far from being so. When, in 1752, Benjamin Franklin established the identity of electricity and lightning, he immediately suggested the possibility of preventing the damage which this force caused to buildings. Knowing the effect of a point in neutralising an electric charge, his original idea, I am inclined to believe, was that buildings should be provided with a metal point on the highest part and that this should have the effect of preventing their being even attacked by lightning. The necessity for having a continuous conductor of metal from the point to the ground became evident, but this also was found to be insufficient. Then he realised that it was necessary

to have the conductor carried deep enough into the ground to be in connexion with conducting earth—that is to say, moist earth or water. So the idea of the lightning-conductor as regards its main principles was evolved. Buildings in Franklin's day were easy to protect; those of to-day are very different.

The next important epoch was when William Snow Harris became interested in the subject, more especially as regards the protection of ships from damage by lightning, the losses sustained from this cause both by the Royal Navy and the mercantile marine being at that time very considerable. Snow Harris succeeded in getting his system of protection adopted by the Admiralty, and became the premier authority of his day on this subject, ultimately receiving the honour of knighthood for the services he had rendered. Many of our important public buildings were protected in accordance with the plans and specifications of this distinguished scientist, and no case of failure occurred to show that he had blundered. I have had the opportunity of examining some of the buildings fitted in accordance with the plans of Sir William Snow Harris, and have been particularly struck with the thoroughness with which they had evidently been studied. One could clearly see the master mind in the way in which the work had been done. Snow Harris advocated copper as being the best conducting and most durable metal, and therefore the most suitable for lightning conductors. His system, which generally comprised a number of conductors on one building, was to connect all the metals about the structure to one another and to the conductor system so as to bring the whole mass into a state of uninterrupted conduction. A most interesting controversy took place between Mr. C. V. Walker, F.R.S., who was at one time President of the Meteorological Society, and Sir William Snow Harris on the question of side-flash or lateral discharge. Walker contended that sparks might pass between a lightning conductor and other metals about the building adjacent to it. Snow Harris made a distinction between metals which were earth-connected and would therefore form alternative paths for the discharge, and insulated metals which would not assist its passage to earth. He argued that while there would be a division of the discharge between the conductor and the alternative path, sparking to the insulated metals was impossible. One wonders in reading his works whether he really believed that sparks would only occur to metals leading to earth. The elaborate precautions that were taken to connect his conductors with all the metals about the building, whether going to earth or not, do not bear out this contention, or rather would have been the necessity for such connexions? The only construction I can put upon the matter is that he meant that with his system of protection side flash was impossible. I acknowledge that this argument savours of special pleading for Snow Harris, for his writings seem to indicate that his words are to be taken literally. In his work on "Thunderstorms" he discusses the matter at some length and illustrates his arguments by two diagrams. In No. 1 he shows the alternative paths in which case he declares side flash would occur, owing to dividing of the discharge between the different paths afforded. In No. 2 he shows near his conductor insulated metals to which he says side flash will not occur. At least that is I presume what he intends his readers to understand but his words are rather ambiguous. He says, "Can the bodies *a, b, c*, elicit from the conductor at the instant of its transmitting a heavy discharge of lightning, a destructive lateral explosion upon the parts of the building on which they happen to be placed? This is the legitimate and fair definition of lateral discharge as applicable to a lightning rod." I have no hesitation in saying that if that conductor was struck by a heavy discharge of lightning, as he calls it, sparks would pass, though they would be merely sparks between the conductor and those metals, not "explosions" in the bricks to which they are fixed, and there would probably be no traces afterwards of their passage; but if we altered the conditions slightly by placing the conductor about 3 in. from the corner of a building, and the metals 3 in. round the corner, the bricks between would be slightly damaged.

The next event to which I have to draw your attention is the formation of the Lightning Rod Conference. In 1878 the Royal Meteorological Society decided that it was expe-

dient that a conference should be held to consider the best means of protection from lightning, and issued invitations to certain other learned societies to appoint delegates. As a result the following gentlemen were appointed:—Mr. C. Brooke, F.R.S. (who unfortunately died the following year), Mr. E. E. Dymond and Mr. G. J. Symons, F.R.S., representing the Meteorological Society; Professor Lewis and Mr. J. Whichcord representing the Royal Institute of British Architects; Mr. Latimer Clark and Mr. (now Sir) Wm. H. Preece, F.R.S., representing the Society of Telegraph Engineers and Electricians, as the Institute of Electrical Engineers was then called; and Professor W. Grylls Adams, F.R.S., and Professor G. Carey Foster, F.R.S., representing the Physical Society. Professor W. E. Ayrton, F.R.S., and Professor D. E. Hughes, F.R.S., were afterwards added as co-opted members. We have here a brilliant array of names, and it is difficult to believe that a better selection could have been made for the purpose. Their labours extended to December, 1887, when their Report was issued. During that time they had exhaustively examined all the evidence they could collect as regards damage by lightning, the methods adopted by manufacturers, and the writings of British and foreign authors.

The Report of the Lightning Rod Conference, as it is called, was published by Sporns in 1882, and became the standard work of reference on the subject in the English language. Personally, I consider the rules they drew up, although not faultless, are admirable in the way in which I believe they were intended—that is, as a guide to architects and others interested in buildings, which should enable them to learn something of the methods employed in the protection of such structures, and give them some such knowledge as should enable them to see that the work was being carried out on scientific principles; to do away with prejudices often entertained against the use of conductors; but most of all to try and dispel the extraordinary ignorance displayed at that time by some of those engaged in the erection of conductors.

I cannot believe that the Report was ever intended to serve as a complete guide capable of rendering any one who read it an expert fully qualified to plan the lightning conductor system necessary for the protection of a building. If it was, it was a dismal failure, and I do not believe that it is within the power of any man, or of any body of men, no matter what their scientific attainments, to formulate a set of rules which shall serve such a purpose. This Report contains most of the facts which one requires to know, provided one understands the subject sufficiently well to be able to read between the lines and judge the lines of thought which no doubt induced the delegates to frame the rules. For instance, nothing is said about sparking, or side flash, from the conductor in actual words, but they draw attention to the necessity of connecting all masses of metal about the building with the conductor. As in our criticism of Snow Harris, we can say, if sparking, or side flash, was not admitted, where would be the object of advising these connexions? This rule commences:—"As far as practical, it is desirable that the conductor be connected to extensive masses of metal, such as hot-water pipes, &c., both internal and external." I consider the wording of this rule most unfortunate, because practicability has nothing to do with the matter. The connexions are either necessary or they are not. If they are necessary, practicability must not be taken into account; means must be taken to connect them even if it is inconvenient. This rule has led to the assumption that these connexions are not of vital importance, and therefore they are not generally made. With internal metals, for instance, it is rarely considered practical to connect them, because people naturally object to have their walls cut about in order to have a connexion carried through. The explanation of the anomaly is, to my mind, to be found in the words which follow:—"But it should be kept away from all soft metal pipes, and from internal gas pipes of every kind." Obviously, if connecting to internal metals is not practical, the alternative is to keep the conductor sufficiently far away, but the point is generally missed. Probably the vagueness of the first part has led architects and others to think that the whole rule is unimportant, for in the course of a rather wide experience I have never yet met an architect who took into con-

sideration the positions of inside gas or water pipes or other metals when deciding where he would have his conductors fixed.

The conference clearly stated that lightning conductors may be of iron or copper, but advocated the latter metal as being more convenient and durable, and in the end the cheapest. They stated that the minimum size to be used should be a weight of 6 ozs. to the foot run, which in copper tape, the form now mostly used, would be $\frac{1}{4}$ in. wide by $\frac{1}{16}$ in. thick.

The last epoch that we have to consider brings us to more recent times. In 1888, Dr. Oliver Lodge, F.R.S., was invited by the Society of Arts to deliver two lectures on "Lightning Conductors" in memory of the late Dr. Mann, at one time a President of the Royal Meteorological Society, and who, during his lifetime, had taken a keen interest in the subject of protection from lightning. Professor Lodge is one of our most brilliant scientists, but I do not know that he had paid particular attention to this subject previous to this invitation. Professor Lodge delivered these lectures, and I am speaking mildly in saying that they created a sensation. In the course of these he carried out experiments intended to show that a very thin iron conductor was better for the purpose of a lightning conductor than a thick copper one. Incidentally he showed that small-size iron wire was better than stout iron, and that small size copper was better than stout copper. Here we have what appears to be a paradox—the worse the conductor the better it is. It is necessary to say that Professor Lodge states that "the values given are a record of a definite experiment, but their precise value depends on the circumstance of the experiment. It is easy to arrange so that the iron is less effective than the copper." Nevertheless, he remarked that he looked upon copper conductors as doomed. No discussion being allowed at these lectures, criticism of Dr. Lodge's views was impossible, but it was an open secret that he was strongly opposed by other scientists, of whom Sir William Preece was, perhaps, the most antagonistic. At the British Association meeting at Bath in the July following the matter was discussed, and the battle between what were called the schools of theory and experience was fiercely waged. Neither side could claim a definite victory, and so Professor Lodge was asked to read a paper before the Institute of Electrical Engineers, at which the audience being electricians, it was thought that the arguments on both sides would be better understood. So in 1889 a most interesting paper was read, at which most of the leaders of the electrical world were present. In this paper Dr. Lodge discussed at great length the question of side flash, or sparking, from a conductor, but he did not draw a line, as Snow Harris had done, between sparking to insulated metals, and the dividing of a discharge between a conductor and an alternative path. On the contrary, he appeared rather to treat all side flashes as being portions of the discharge, leaving the conductor to go to earth by other and sometimes worse routes, with the exception of secondary effects or the sparkings caused by induction in metals not connected with the conductor. He contended that the older electricians, as he termed what may be called the votaries of experience, had not taken certain laws and effects into consideration. One of the main points in his arguments was that a lightning flash is not a single discharge, but is oscillatory; that is to say, that it consists of a number of discharges backwards and forwards till it comes to rest, a dozen or more alternations probably occurring in a flash occupying a minute fraction of a second, and that under these circumstances the generally accepted ideas as to the comparative conducting value of copper and iron are changed. Therefore, he now contended, iron of the same thickness as copper was "a trifle better, certainly not a whit worse than the latter metal." I may say here that in the discussion which followed, and which was so lengthy that, including the reading of the paper, it extended over three meetings, Dr. Lodge was opposed by the majority of the speakers. They did not, however, protest against the possibility of side flash, but the ground mainly taken up was that lightning was not oscillatory, and they contended that the older views as to conductivity were sound. It is abundantly proved that the spark from a Leyden jar or any perfect conductor is oscillatory, but Dr. Lodge has himself pointed out that a cloud is not a perfect conductor like the coating of a jar or the sheet of metal generally used to represent

a cloud in laboratory experiments; that it has an enormous resistance owing to its being composed of globules of water separated by air, and therefore theoretically I should say that lightning should not be oscillatory because the resistance would damp out the oscillations. The question is, however, I consider an unimportant one, because if harm was not caused by the first or second swing, the remainder would be harmless. Whether oscillatory, or not, lightning has not suddenly changed its character, and without intending to detract in the slightest from the value of either theory or laboratory experiments, I must point out that the greatest value attaches to the observed effects of lightning.

Dr. Lodge illustrated his lectures and paper by some most interesting experiments, which, however, I consider were not conclusive, because the conditions were not such as occur in Nature. It would take too much time to discuss these experiments, but I may point out that the governing principle was to have a conductor of enormous length compared to the length of the spark used to represent the lightning flash. By doing this, the effect, for instance, with side flash is to exaggerate the sparking out of all proportion, and hence those who did not absolutely disagree with Dr. Lodge appeared to me to get an impression that if his experiments were to be relied upon, lightning conductors would be almost useless, for side flash would occur to metals an enormous distance away. For this reason I have not introduced any experiments this evening, because if I magnified the effects in the same way, similar confusion might be caused in your minds, and if carried out in my own way—that is to say, by making everything more nearly proportional, and so approximating as far as possible to what occurs in Nature—the results would be invisible except to a very few. To this day I often hear it said that Dr. Lodge says lightning conductors are useless, and therefore I may quote his disclaimer. In his book on "Lightning Conductors," published by Whittaker's, he says: "I may be permitted here to repudiate the doctrine which has several times been attributed to me since the Bath meeting, that it is safest to be without lightning conductors altogether. The long experience of persons learned in this art is by no means to be despised, and until an agreement as to improvements has been arrived at, the safest plan for ordinary persons is to adhere to existing practice."

Dr. Lodge's work forms, in my opinion, an important addition to the literature of the subject, if taken as purely of theoretical value, and on which we must base our own ideas of the practical results which are to follow. He has called attention to the necessity for taking certain effects more fully into consideration when arranging our system of defence, and has shown us some of the scientific reasons for their appearance, and for this we owe him a debt of gratitude such as we owe to every man who labours to give us a clearer insight into the mysteries of Nature.

The effect so far of his work, however, appears to me to have been to cause a great deal of confusion in the minds of some people, and I must protest against the exaggerated views that are often expressed in relation to these effects. For instance, Dr. Lodge has referred to side flash and to the surging effect of a discharge, and other writers have referred to these effects as if they were some new invention of the devil tacked on to lightning to render it still more deadly than of old. These effects have existed since the days when lightning conductors were first invented, and even before then to the earliest times in which metals used in the construction of buildings have acted as accidental or partial conductors of the electricity from thunderstorms.

Dr. Lodge has made suggestions as to improvements which he considered might be made in the application of lightning conductors. He prefaced these by saying, "It is a matter on which I have not the slightest wish to be dogmatic; and if I make a few apparently definite assertions, it is only by way of expressing such judgment as I have been able to form at present, and they are to be taken as intended, more by way of suggestion and question than anything else." Leaving out of account those rules which apply only to powder magazines and lightning arresters, and three which refer to testing and which are not of practical value, there are only ten which differ materially from previous scientific knowledge of the subject,

I will give these ten rules together with a few remarks, though my later observations will deal more fully with the matter:—

1. The use of copper for lightning conductors is a needless extravagance.
2. Iron has advantages over every other metal.

My later remarks will deal with the question of copper or iron.

3. It is hopeless to pretend to make the lightning conductor so much the easiest path that all others are protected. All possible paths will share the discharge between them, and a lot of apparently impossible ones.

This rule does not differ, except as regards the "apparently impossible ones," from the dividing of a discharge among alternative paths Snow Harris explained about fifty years before. My later remarks may explain this more fully.

4. At all places where water and gas-pipes come near each other, and in general where one metal ramification approaches another, it is best to connect them metallically.

This rule Dr. Lodge has since admitted is very open to criticism, but I consider that it would be an admirable one if it was only qualified by being made to read that in some cases it may be absolutely necessary to make such connexions.

5. It is not wise to erect very tall pointed rods above the roof of a building.

6. In ordinary houses it may be well to try and insulate the lightning conductor from the walls, so as to lessen the chance of side flash to metal stoves and things inside.

7. In chimneys, it may be well to use insulators to protect the bricks from concussion.

These three rules Dr. Lodge has since described as very doubtful.

8. The orthodox rule "connect all pieces of metal to the lightning conductor" requires modification thus, "connect all pieces of metal to each other and to the earth, but not to the lightning conductor."

9. It may be always reckoned safe to earth things independently. It is often not safe to connect them to the lightning conductor; e.g., an inside lining of a chimney would be well earthed, but should not be used as lightning conductor, nor connected with it. The same with rain-water pipes and gutters. The same also probably with lead roofs.

After each of these two rules Dr. Lodge placed a note of interrogation to show, I presume, that he was doubtful about them, and he has since admitted the force of the criticism to which they were subjected, and says he gladly takes refuge in another rule which contains the truism that the most difficult thing is to know what to connect and what to avoid. These two rules would be of vital importance, and would revolutionise present practice if they could be justified, but I hope to show you that they would be dangerous in the extreme, and far from tending to increased efficiency of conductors, would cause failure. They have, however, been quoted by others as if they were correct, and without Dr. Lodge's subsequent remarks, or even the notes of interrogation after them.

10. Over the top of tall chimneys it is well to take a loop or arch of the lightning conductor made of any stout and durable metal. Dr. Lodge has since modified this rule, but I need only say that the coronal band with points at intervals, recommended by the Lightning Rod Conference, answers the purpose perfectly.

Although Dr. Lodge's views did not, I think, obtain the consideration they deserved, we may still consider that there are in existence the two schools, the one of theory pure and simple, as represented by Dr. Lodge, and the school of experience, as represented by the teachings of the older electricians, as Dr. Lodge called them. Between these two we must discriminate and formulate the method of procedure which will ensure success. Theory and experience are each in their way of the greatest value, but one is useless without the other. Experience without theory is not sufficient. A man might have a lifelong experience of the protection of buildings, but if his methods were not guided by theoretical knowledge, that is, if he did not know why he did certain things, success would be at the best uncertain. On the other hand, a man might have a perfect theoretical knowledge and yet be completely lost when he attempted to put his theories to practical application. It must not be supposed that I refer to the members of the Lightning Rod

Conference as men of experience without theory. On the contrary, if they had not adopted or accepted through their chief speaker, Sir William Preece, the title of the school of experience, I should have styled them a school of theory also, for the Conference consisted of men of science pure and simple, who had probably had very little practical experience of the protection of buildings. Their claim to have founded the rules on experience is probably based mainly on the fact that the evidence they collected and considered was largely of a practical kind. For the sake of distinction, however, we will keep to the terms theory and experience in considering the points in dispute. Experience says, let your conductors be of copper, which is of better conducting capacity than iron or any other metal which it would be practical to use for the purpose; and besides, it is the most durable, and in the end the cheapest. The comparative conductivity of copper and iron, they base on tests made by many distinguished scientists, both British and foreign, who have shown that in the case of steady currents of electricity copper conducts about seven times as well as iron. Theory says, that for sudden discharges such as lightning the conditions are changed and that iron is "a trifle better, certainly not a whit worse than copper," and that the use of the latter metal is a needless extravagance. Also that instead of having single conductors of copper, a number of lines of conduction of iron wire of small size is better (ordinary telegraph wire is suggested); that these wires should be carried down each corner of every chimney stack and on all sides of the building. For a chimney shaft this system is to consist of galvanised iron wires fixed vertically on all sides with other wires carried round the shaft at intervals to connect them all together. On purely theoretical grounds, I see little to choose between the two systems provided the conductors are applied on scientific principles. A man who understood the subject thoroughly would be able to protect a building as perfectly with one system as with the other, but the many iron wires would be more difficult to apply successfully, because it is easier to place one or two conductors so as not to be within sparking distance of metals to which it is not advisable to connect them than to fix a dozen so. We have had a very extended knowledge of the experience type of conductor, and we have had plenty of cases in which they have succeeded. We have also had cases in which they have failed. I have myself inspected a great number, that is to say, nearly every case I have heard of. The number has been on an average about a dozen a year, but in every case that I have examined, with one exception, there have been glaring defects such as rendered the failure certain, and which could have been pointed out beforehand by a competent person who had examined the building before the accident happened. The one exception was Neadwood Church, Staffordshire, where sparking occurred owing to a line of metal having been laid from close to the conductor to near a large metal stove used for heating the building. The line of metal was the lead binding of some matting—insignificant enough in itself, but from an electrical point of view it brought the stove into dangerous proximity with the conductor. Of the theory type of conductor we have had very little opportunity of judging. In one case, in which it has had to bear the test of being struck by lightning, it failed. This was the Hotel de Ville at Brussels, and this was set on fire, curiously enough, about the time that the great Preece v. Lodge controversy was proceeding. I have only had an opportunity of examining one system of this sort erected in this country. So far as I know, it has never been subjected to the test of lightning, but it is nevertheless, an instructive case. In 1861-65 a chimney-shaft was being built for the Islington Electric Light Station, and the chief engineer, Mr. Albert Gay, having followed Dr. Lodge's arguments very closely, decided to try the small iron wire system of conductors. By 1867, however, it was found that this system had perished to such an extent, that, in order to avoid the expense of frequent renewals, it was decided to provide also for the same shaft an ordinary conductor of copper tape, $1\frac{1}{2}$ in. by $\frac{3}{4}$ in. The cost of the copper conductor was 22*l.* I have not ascertained the amount paid for the iron wire system; but, allowing for the same rate of profit that appears to have been made on the copper one, I estimate that the cost must have been between 35*l.* and 38*l.* A few

days since I had an opportunity of examining the two systems, and found that, while the iron one had largely perished at the top where it was exposed to the fumes of the chimney, the copper one was practically as good as when it was fixed. This would, I think, be a fair sample of the theory type of conductor—durability sacrificed and original cost increased tremendously. For it is a very great mistake for Dr. Lodge to suppose that his suggested iron telegraph wire system would be cheaper than the copper tape generally used. Iron is, of course, cheaper than copper, but the cost of fixing is a serious item, and where say several hundred feet of iron wire has to be fixed in place of a hundred feet of copper tape, the total cost must be greatly increased if the work is to be done by competent men under the guidance of an expert. If Dr. Lodge had any idea that a local blacksmith or labourer could be entrusted with the work and the expert and his trained workmen done away with, the result would, I believe, still be increased cost, and instead of hearing of occasional cases where conductors had failed, we should be astounded to hear occasionally that a conductor had actually been successful.

Personally I do not attach very great importance to the kind of metal to be used for a lightning conductor. The conductor may be of copper or iron, or it might even be of lead, so long as it is of sufficient capacity not to be melted by the heating effect of a severe discharge, it will answer if properly applied. It must not be supposed from this that I advocate the use of lead, or even iron. Iron conductors have been used almost exclusively in America since Franklin's day and also in some Continental countries with as good results as in England where copper is almost exclusively used. It is very probable that the older ideas as to the relative conductivities of copper and iron do not apply in the case of sudden discharges, although I do not think that Dr. Lodge has proved his case; but if iron, instead of being "not a whit worse than copper," was seven times as good, it would not prevent the dividing of the discharge between it and other paths afforded, or even sparking to insulated metals, if it was not scientifically applied; and on the score of durability and cheapness, I have no hesitation in saying that the older type, or copper tape conductor, cannot be beaten. On the score of appearance, too, copper tape has the advantage, and appearance has to be considered, for I do not think there are many architects who would consent to have their work turned into what would look like enormous birdcages.

As Dr. Lodge has himself said, it is impossible to make the lightning conductor such a superlatively easy path that the discharge will take that one only if other paths are open for it, but it is here that the skill and scientific knowledge of the expert has to be shown. If one had to protect a structure composed only of brick, stone, or wood, and with not a particle of metal in its construction, nothing would be easier. All that would be necessary would be to have a conductor of metal, pointed at the top and leading down into the earth. It might be made in lengths scarcely touching one another, and the earth connexion might be absolutely bad, and yet the building would be protected. All that would happen would be heating and possible fusion at the joints, and the ground at the foot of the conductor might be blown up. It is very rarely, however, that one is called upon to protect a structure of that kind. Modern buildings are often a mass of what I may call unintentional lightning conductors, for all the metals used in the construction of buildings are conductors of electricity, and therefore conductors of lightning. Some of these metals have good earth connexions—in fact, gas and water supply-pipes have excellent "earths," owing to the extent of their ramifications underground; and it is a matter of considerable difficulty—in fact, in some cases practically impossible—to make the "earth" of the intended conductor as good as these accidental ones unless we actually connect the conductor to the underground mains. This is the common-sense view of the matter. It is no use for a manufacturer to tell you that with his patent coupling, or serrated earth plate, or what not, he can guarantee that sparks will not pass off to accidental conductors placed dangerously near it. If he says that, he either does not know what he is talking about or he is guilty of a deliberate false-

hood in order to sell his wares. There is nothing magical about a lightning conductor; it is merely the adaptation of the known laws of nature to the use of mankind. If you fixed one conductor to the highest part of a building, and another one, say, 6 ft. up the wall, and approaching within a foot or two of it at that point, and both with equally good earth connexions, I do not suppose you would be surprised if the lightning divided and part went down one conductor and part down the other, or, if brickwork intervening, a hole was made through it. Why, therefore, should you be surprised if, when arranging for your lightning conductor, you take no heed of the metal inside the building, and place one conductor down outside and another one in the form of a gas-pipe inside, and the discharge divides between the two, knocks a hole in the wall, and sets light to the gas? Lightning has to follow certain unalterable laws, and one of those laws is that if two or more paths are provided, it must divide between them. It is no use labelling or calling one the lightning route; that will not alter the law. Out of the many cases of true failure of lightning conductors that I have examined I have found that 90 per cent. have been due to neglect of this common-sense view, as I call it.

It is no argument against the use of conductors that the discharge will divide between accidental and intended paths. It merely shows the necessity for arranging the conductor so that the faults which lead to the division of the discharge shall not exist. If such faults do exist, it is obvious that the damage should be very much less, and never in any case greater, than if the conductor had not been applied at all. But this is poor philosophy. We should arrange so that the division shall not take place. We cannot prevent a building being attacked by lightning—any structure, from a cathedral to a hencoop, may be struck. All we can do in this respect is to provide our conductor with points (and the more the better) to lessen the liability of its being struck. We can, however, go further than this. We can, by carefully studying our building both inside and out, arrange our conductor system so that the lightning shall go harmlessly past it through our conductor and leave our building and its contents secure. That is unless somebody who does not understand the matter comes along and alters the conditions that we studied, and so makes our system less effective. Before going further into the matter I must draw a distinction, as Snow Harris did, between side flash to other paths and sparking to metals which do not afford an alternative path, though not agreeing with him as to the impossibility of the latter. In order to make the matter more clear I must dip a little into theory, though I do not think it necessary to go very far.

There is nothing mysterious in lightning sparking through to a gas or water pipe or other metals the other side of a wall. It is not chance, or instinct, or any other quality not explainable by scientific laws. We must reason the matter out by the use of the faculty of imagination, for I know of no simile which would serve to bring the matter to your minds. As Professor Tyndall once said of another scientific matter:—"The question leads us beyond the region of sense and into that of imagination. This faculty, indeed, is the divining rod of the man of science. Not, however, an imagination which catches its creations from the air, but one informed and inspired by facts, capable of seizing firmly on a physical image as a principle, of discerning its consequences, and of devising means whereby these forecasts of thought may be brought to an experimental test. If such a principle be adequate to account for all the phenomena, if from an assumed cause the observed facts necessarily follow, we call the assumption a theory, and, once possessing it, we can not only revive at pleasure facts already known, but we can predict others which we have never seen. Thus, then, in the prosecution of physical science, our powers of observation, memory, imagination, and inference are all drawn upon. We observe facts and store them up; imagination broods upon these memories, and by the aid of reason tries to discern their interdependence. The theoretic principle flashes or slowly dawns upon the mind, and then the deductive faculty interposes to carry out the principle to its logical consequences. A perfect theory gives dominion over natural facts; and an assumption which can only partially stand the test of a

comparison with facts, may be of eminent use in enabling us to connect and classify groups of phenomena." So in the present case we must exercise the faculty of imagination in order to understand what takes place, and if we are omitting certain conditions or considerations which afford a fuller explanation, still, if it enables us to grasp a general idea, and assists us to understand the matter, we shall be in a better position.

When the conditions are proceeding which lead to a discharge of lightning occurring, induction, as I have already pointed out, takes place, that is to say, there is an enormous difference of potential between the cloud and the building about to be struck; this inductive action is stronger in conducting than in non-conducting masses, therefore the lightning conductor and other metals would show this action better than brickwork. If the metal is connected to earth the action would be quick, if the metal is insulated the action would be slower, because the charge would have to filter through the insulating material gradually. Suppose that we have a lightning conductor, and near it, say, a metal safe. Let us suppose for the sake of argument, that the value of this induced charge was I (if the cloud was positive the induced state would more properly be described as a minus quantity, but it will be more simple if we regard it merely as I) both in the lightning conductor and the safe. Then comes the discharge, the conductor has its potential raised suddenly at the moment of receiving the flash to, say, $1,000$, but the safe, which is insulated remains practically at I . There is then a big difference of potential between the conductor and the safe, one being $1,000$ and the other I , therefore there is a strain, and if the safe is near enough a spark passes knocking a hole through the wall so as to bring the potentials nearer in value. Let us say that the safe is raised to 800 . In the meantime the discharge has died out in the conductor, and this returns to I ; but the safe is 800 , so that there is still a difference of potential but the values reversed, and a spark passes back. So backward and forward should the spark pass—possibly half-a-dozen or a dozen times in a minute fraction of a second, a fraction so minute that we could not detect the alternations, and we should perceive only one spark, until the two objects arrive at about the same potential, when the tension dies out. This would be an oscillatory spark. If we connected the safe and the conductor together by a piece of metal, these oscillations would take place through the metallic connection, and there would be no visible effect, unless, say, we had another safe a few inches away from the first one, when there would be again a difference of potential and resultant sparking. Again a third safe near the second and the same thing would occur—in fact, this might be carried on from one to another to a considerable distance, providing each succeeding interval between the safes was less than that preceding it, and sparks would pass between each, but at each interval the spark would be weaker, till we should get to a distance at which no spark would pass.

Let us suppose another case—a long piece of metal, say, 20 ft. in length, connected at one end to the lightning conductor but not otherwise connected to earth. At the moment of the occurrence of the flash the potential of the conductor would be raised, and also that of the long piece of metal; but the rise in the latter would occur at the end connected before it did at the other, therefore we should get an alternative rise and fall of potential at the ends of this piece of metal, or what Dr. Lodge calls a surging effect, but this would be harmless unless another piece of metal at a different potential came near it. If it did there would be sparking. Even if the long piece of metal was not actually connected with the lightning conductor, but just so far away that a spark would not pass to it, there would still be the same surging effect caused by induction, and if other metal approached close to the other end there would be difference of potential and consequent sparking. These are instances of local sparking only, and do not indicate that any part of what we may call the lightning has left the conductor to go to earth by another route. This sparking is not as a rule a very serious matter. A small hole may be made through brickwork or other intervening non-conducting matter, but that is about all, unless some inflammable material intervened, when a fire might be caused.

Now we come to the question of division of

a discharge between a lightning conductor and other paths to earth, which form what I call accidental conductors. Given a lightning-conductor outside and a gas or water-supply pipe near to it inside the building, and this is a very different matter. The action as regards difference of potential and consequent strain and resulting spark is somewhat similar; but the sparking distance is very much longer, and the spark more powerful, because it is actually a portion of the lightning discharge passing. If we knew the respective inductive resistances of the intended and accidental conductors, we could gauge approximately what proportion of the discharge would go to earth by the former and how much by the latter. But even if you got nineteen-twentieths of the discharge through the former and one-twentieth through the latter, it might be a serious matter. I may here refer again to Dr. Lodge's suggestion that metals should be connected to earth and not to the conductor. Let us take again the question of the safe near the conductor. If it was neither connected with the earth nor the conductor we should only get local sparking, as I call it, but suppose we connected the safe to earth and not to the conductor, we should get an alternative path to earth provided by which actual division of the discharge would occur, and this would be a far more serious matter. Besides this, the sparking distance would be increased enormously, so that objects which would otherwise have been at a perfectly safe distance would be in dangerous proximity. On the other hand, the indiscriminate connexion of metals would be almost as fatal.

Now as to the methods for rendering our system of protection perfect. We must first of all decide on which are the parts of the building liable to be struck by lightning, and protect them either by separate conductors or by branch conductors carried to one or more mains to earth as may be necessary, and we must see that these conductors afford as little resistance as possible. The joints must be soldered so that they will not only be perfect at the time they are put up, but will remain perfect. The earth connexion must also be made so that this path is at least as good as one as other paths about the building; and besides this we must carefully study our building, both inside and out. We must take into consideration all the metals used in its construction, both as regards their relation to the conductor system and to one another, and take such precautions that neither division of the discharge shall occur unless we intend it to occur, nor sparking in places where sparking would do harm. It is here that the skill and experience of the expert have to be displayed, and I cannot give you any rules for your guidance on this matter, for buildings differ so much in their construction and arrangement that rules applicable to one case would be absolutely useless for another. Nothing is of use but knowledge and experience, and as I have already indicated, these cannot be imparted or acquired in a short space of time. I can only say that in some cases connexions are made and in others the dangerous metals are avoided, but that great discrimination is required as to what metals are connected and what avoided. Sometimes dividing the discharge between several paths or over a wide extent is the best plan, and sometimes other plans are adopted according to the exigencies of the case or the particular combination of dangers which one may find to exist.

So far I have only touched on what I may call the fringe of this subject. Time will not allow of going much further, though there are many questions, such as the making of earth connexions, which are often misunderstood, and in which the methods of procedure sometimes adopted differ widely from the scientific and common-sense methods. I may, however, in conclusion, discuss a matter which is of great importance to architects, and that is as to what parts of a building are liable to be struck, and which therefore require protection. When we have an important public building to protect, and cost is of no importance, we may be tempted to run conductors in all directions and protect all parts whether likely to be struck or not. It is not often that over-protection will do any harm, though it may do so if the matter is not properly done. In the majority of cases cost is, very properly, a serious consideration, and we do not want to add a penny more to the outlay than is necessary to secure efficiency. It is therefore important to know just what are the places

liable to be struck. I have devoted many years to this question, and have examined many thousands of buildings which have been struck, first with the object of formulating a theory, and afterwards to prove that theory, and I propose putting this before you as briefly as possible. The main principles are simple, and possibly it is the very simplicity of the matter which has led to its being overlooked. The popular idea is that it is the highest point of a building which is struck, but probably some of you may have met with cases in which others very much lower have been damaged. I have come across hundreds such. The explanation is that the nearest part of the building to what I may call the point in the cloud from which the discharge originates gets struck, and the highest is not necessarily the nearest. A discharge occurs between two planes or points one of which is in the clouds and the other is in the ground; the building is merely an object en route, as one might say, which forms a path of less resistance than the surrounding air. Now, a lightning conductor does not attract lightning except inasmuch as, being of metal, induction and consequent difference of potential takes place more strongly in it than in the surrounding non-conducting materials, and in this respect the thin line which is intended to protect the building from lightning is insignificant compared to the other metals used in its construction. Brickwork, although non-conducting to a certain extent, offers a lower resistance than air. Therefore it would be contrary to science for a discharge to pass over a chimneystack or gable-end to strike a lightning-conductor merely because it is metal when probably the gable-end or chimney has a much larger extent of metal just below it. Even if the lightning-conductor affords the best path to earth, the path of least resistance would be through the gable-end or chimney and the house to the conductor, rather than through a corresponding distance of air, to get to the top of the conductor. We have to consider two kinds of discharge, one the most dangerous type, which occurs fairly straight through the air in an almost vertical line, and the less dangerous flashes which occur in a somewhat oblique line, and are generally meandering in their course. These latter flashes are often called forked lightning, though this is a misnomer, and are popularly, but mistakenly, supposed to be the most dangerous. It is the straighter flashes which do the most harm; those which are capable of breaking almost straight through the air without having to go out of their course to take advantage of any little conducting matter, such as moisture, which will assist them on the way. The meandering flashes are not by any means to be ignored, it is only in comparison with the straighter ones that they are mild.

In arranging what parts of a building require protection, we have to consider the various points in the sky from which the discharge may originate, and so arrange our system that the conductor, or one of its branches, will form the nearest part, no matter from what direction the discharge may come. There is, of course, a limit to the angle of obliquity, and this limit should be about 40 deg, and my observations have led me to infer that the greater the angle of obliquity the milder the discharge. We hear reports sometimes of buildings having been struck by lightning in absolutely unaccountable places, such as lightning missing a tall spire and striking the nave close underneath it, or even striking through a window. Like all other so-called vagaries, freaks, or perversity of lightning, such peculiarities do not exist except in the minds of people who do not understand the matter. For a dozen years past I have been scouring the country to try and discover a freak of lightning; plenty are reported in the papers, but on investigation they all prove to be ordinary enough, and merely what one could have predicted had one been informed of the circumstances beforehand. Lightning is a force of Nature, and, like all other natural forces, is governed and regulated by laws more unchangeable than those of the Medes and Persians; therefore if we find cases which do not quite agree with our preconceived ideas, we must admit that we either do not know the law, or that we have overlooked some important factor of the case, and not put it down to a sudden and capricious change in the laws of Nature.

I have prepared a rough sketch showing a house with a turret and gable ends, a tree, a wall and a hen coop, placed in a line and so

arranged that either may be struck according to which is the nearest object to the point overhead from which the discharge occurs. These are all objects which I have known to be struck by lightning, and I have heard great surprise expressed sometimes that the lower object should have suffered and the higher one, not so very far off, have escaped. In arranging as to which parts to protect, therefore, we can consider this question as to which would be the nearest parts, and we can take it that these are parts which might be struck, other parts between them in height may be absolutely safe if they come well within a line drawn from one to the other, provided other circumstances are equal; but they may not be, for metals either inside or outside the building and other circumstances may complicate the question so far that this rule does not entirely apply. Here, again, the expert requires to weigh carefully the whole circumstances, and nothing but knowledge and experience will enable him to decide accurately which places may safely be ignored and which may not. Notwithstanding all the difficulties that I have pointed out, absolute protection is possible if the building is thoroughly studied. We can either protect it so that we can say not a brick or stone shall be disturbed, or we may say we will protect it so that the inmates shall be safe and the building shall not be set on fire or damaged to any extent—we may say that a stone finial at this end may be knocked down, or a few bricks or tiles disturbed there, and that we will risk that as we do not consider this damage worth providing against, but if we do this we must realise that we are running the risk, and if the stone finial is thrown down, or the bricks or tiles displaced, we must consider that we deliberately took the risk, and that it is not a failure of our system of protection. In conclusion, I can only advise you not to make the general error of providing your conductors of exceptionally large size under the mistaken idea that by providing your conducting path of exceptional capacity as it is wrongly called, you can ignore the scientific aspect of the question, for no increase in size of the conductor will compensate for this, and unless you are prepared to devote a number of years and a large sum of money to a very close study of the subject you must be prepared to abide by the opinion of an expert who has acquired the necessary knowledge, and be guided by him, confining yourselves to a close supervision of the work, and to seeing that it is being carried out in a way which will not only render the work efficient when it is completed, but will remain efficient until accident, decay, or the interference of people not acquainted with the subject has impaired its efficiency.

The following communication was also received from Mr. Killingsworth Hedges, M.Inst.C.E.:—I have read Mr. Hands' paper with great interest, and think he has brought to the notice of the members of the Architectural Association a problem which, as he rightly says, "is all the more difficult the longer you study it." I quite agree with his remark as to the immense amount of damage to property which annually occurs through lightning strokes, much of which might be prevented if efficient lightning conductors were installed. Most people think that almost every church has its conductor, when not 70 per cent. are so provided, and in the case of public buildings the proportion is much less. There is a sort of go-as-you-please policy which seems to be the rule with regard to lightning protection. Insurance offices do not seem to care whether a building is protected or not; no individual office likes to insist on the erection of lightning conductors for fear of diverting business to its rivals. In the case of a church there is certainly sometimes a recommendation from the archdeacon that the churchwardens should put up a conductor and see that it is kept in order; but if the vicar wishes to safeguard his church the cost usually has to come out of his own pocket. Architects, too, as a rule, put the erection of lightning conductors in a few lines at the end of their specification, and say nothing as to the way they are to be run or as to the necessity of good earth and of constant inspection, and then we wonder why a building provided with a so-called conductor is struck! The author has mentioned the advantages of having many points, but then goes on to say "that they may not be able to prevent discharge." This inability is, in my opinion,

only a question of their number, as usually installed, without regard to interconnection. Some may be inefficient, but on a properly protected building the number of points should be so distributed that the whole building is bristling with the so-called negative discharge, and therefore an actual disruptive effect is warded off. I have endeavoured to carry this out in the protection of St. Paul's Cathedral, where there are over a hundred points all connected with one another and at intervals to earth. So convinced am I that this is the correct system that in the work now being installed under my supervision at Westminster Abbey the actual number of points in proportion to the area will be still greater. I have already alluded to the researches of Dr. Oliver Lodge in my paper entitled "The Protection of Public Buildings from Lightning," read before the Royal Institute of British Architects on April 23 last year,* and I beg to refer those interested to my concluding remarks under the head of "Practical Questions," in which I have slightly altered Dr. Lodge's rules and added some of my own.

The Chairman said they had listened to a very interesting paper of a practical and scientific character. It was impossible for architects to understand as an expert would the theory of such a subject, but it was necessary, for the proper carrying out of their works, to have a general knowledge of it. The lecturer, by his remarks, diagrams, and lantern views, had indicated certain principles which had been found essential to the protection of buildings from lightning. The point which interested them most of all was that of how to deal with conductors so that they should not disfigure buildings. In Germany and France conductors were of enormous size and height, and there were very many of them—out of all proportion to the number to be seen in this country. It was very difficult to design a refined fleche or any high sky line which would not be injured by a lightning conductor.

Major-General E. R. Festing, C.B., said what was wanted was a more proper record of facts with regard to lightning. He was present that evening as a member of a committee lately formed to collect facts in regard to the matter, and he believed that some good might be done in that way. The accounts generally to be got of damage done by lightning were often of a very unscientific and sensational character, and the Committee hoped to enlist the services of men who were qualified by position or training to record properly these facts, and who would be interested in doing so. In that way he believed the science of the matter might be much more advanced than by trying to theorise too much on the imperfect knowledge and facts we possess at present. If they could get the facts in cases where lightning conductors had failed, and tried to find the reasons for these failures—it was only by examining the matter in that way that they could make progress.

Mr. W. P. Goulding, F.R.G.S., F.S.I., said they were much indebted to the lecturer for the able way in which he had brought the subject before them. He had gone through that weary book, the Report of the Lightning Rod Committee; and those who did so must be surprised at the great diversity of opinion on the part of the scientific men who constituted the Committee. The subject was one about which very little was known. A lightning flash was such an erratic, elastic, and elusive thing that it could not be pinned down. No two flashes were of the same duration, potency, or velocity; but, for all that, we tried to cope with it. In France they erected strong, high conductors, and the effect on buildings caused by them must be considerable when the wind was blowing heavily. He believed that 75 per cent. of our churches had no conductors, and while this was so, and people would not take the trouble to protect their buildings, the data needed on the best method of doing so could not be obtained. Generally speaking, the architect or surveyor could not get the building-owner to go to the expense of a conductor, while the insurance companies paid for losses caused by lightning. The speaker then gave a brief sketch of what he considered a safe and sufficiently protective conductor for all ordinary buildings.

Mr. John Slater, in proposing a vote of thanks to Mr. Hands for his interesting paper, said he was almost disposed to think that Mr. Hands had so often been engaged in examin-

ing the destruction caused by lightning that his paper had been fuller of destructive than of constructive criticism, and he (the speaker) wished that had not been so much the case. The historical account Mr. Hands had given of the matter and the various theories accounting for destruction had been very interesting, but what was wanted was the knowledge how best to protect buildings from lightning. The statement made as to the amount of damage in £ s. d. caused in England during the few years that Mr. Hands had been investigating the subject showed what an enormous amount of loss there was from the effects of lightning; and if means could be found and adopted for diminishing it to any extent it would be a great advantage to the architect and the general public. The most interesting matter to investigate was, as Major-General Festing had said, the case of buildings which had lightning conductors and yet got damaged; and what was wanted to be ascertained and thoroughly known was to what extent lightning conductors would protect buildings, and when they did not what were the reasons.

In one remark made perhaps the lecturer was not quite exact. When Mr. Hands said that a lightning conductor was not struck, he (the speaker) supposed he meant it was not struck by a discharge which looked like a stroke; but, as a matter of fact, the conductor was continually attracting the electric current from the clouds to the ground, and if it did not it was not acting as a conductor. In regard to the statement made some years ago by Dr. Lodge that copper conductors were doomed, he thought that Dr. Lodge would say that he had seen reason for changing his views, for there was not the slightest doubt that copper lasted longer than iron and was, therefore, more economical. Mr. Hands said that the question whether a discharge from a lightning rod was oscillatory or not was not of great importance, because the lightning did not instantly change its character. That might be very true in one sense, but, undoubtedly, the character of the discharge and the effects of the stroke did vary very considerably. He would have been glad if Mr. Hands had given them some more practical hints at the conclusion of his paper. One of Mr. Hands' diagrams appeared to prove a little too much, for to tell which part of a building would be struck one needed to be an expert in clouds. It was all very well to say that if the point of discharge was immediately over a particular building that that building would be struck, but that was begging the question altogether. Architects and others wanted to protect buildings, no matter where the discharge might be. Mr. Hands apparently argued that buildings could be over-protected. He (the speaker) did not see how that could be, and it seemed to him that to be safe every part of a building should be protected, and not only that part immediately under a possible point of discharge. One extremely difficult matter to be dealt with was as to finding out the position of all the metal in a building. One might be consulted about a building where no lightning conductor had been fixed; they could find out where metal was both inside and outside; but how could they get to know where cramps, &c., existed inside the walls, near which the conductor might be placed? In the case of a tower or steeple, damage was frequently caused by the metal inside the stonework being near the path of the lightning as it came down the conductor. As to the Chairman's remarks about the difficulty of getting an artistic form of conductor for an elegant fleche, it seemed to him that architects might copy the means which large chimney constructors frequently adopted. They had a cast-iron cap above the chimney-shaft into which the points forming the lightning conductor were soldered. He thought that the top of a fleche might be covered entirely with metal, where the points to break a discharge might be fixed in considerable numbers. They would not be at all unsightly, because they would scarcely be seen from the ground. The committee to which Major-General Festing had alluded had been formed on the initiative of Mr. Killingsworth Hedges, and with the concurrence of the Institute of Architects and the Surveyors' Institution, with the object of endeavouring to collect material to form, if possible, a sound theory as to lightning strokes. The aims of the committee could be obtained from the Institute and a copy of questions which the committee desired to get answered, showing the data which were wanted. Any useful suggestions would be received with pleasure.

* See our issue for April 25, 1900.

because the more facts they could ascertain as to the action of this extraordinary and erratic fluid, the better would the committee be able to put forward their theories. The difference between theory and experience must not be carried too far. It was no good having a theory and then finding that the facts would not suit it; they must collect the facts and then base a theory on the facts; and the more information and the more exact that information, the more likely that the labours of the committee would be successful.

Mr. G. H. Fellowes Prynn seconded the vote of thanks. When experts differed, as Mr. Hands had shown they did, it was hard for architects to agree as to what was the best means to adopt for the protection of buildings from lightning, and it would be of great value if the newly-formed committee obtained the necessary data on which to base their theories. It would be interesting to know what Mr. Hands considered were the best metals to be connected up with the lightning conductor, and also whether he knew of any cases of lead gutters or roofs specially attracting lightning—whether the lightning was attracted by the masses of lead. Did Mr. Hands consider it advisable to connect the lightning conductor in any way with the lead pipes? The lecturer's remark, that it was unwise to connect with soft metal, seemed contrary to experience. Rain-water pipes, by being connected up to lightning conductors, could be made most valuable channels for lightning discharges, as he knew from experience. In a church he built some five years ago in Cornwall the copper-covered spire, protected at the top, was struck by lightning immediately underneath the tower, on the ridge of the nave roof, close to where the secret gutters were. The discharge was carried down the rain-water pipe, and although it did some damage to the roof it did not set it on fire. Was a pipe or water near a building any protection to that building? Did Mr. Hands know the distance a lightning spark would go from one metal to another?

The vote of thanks having been agreed to, Mr. Hands, in reply, said that as to the French lightning conductors, the French idea had always been that there was a cone of protection afforded by conductors, the base of which was nearly twice its height, and on that ground they generally had their rods about 10 ft. high, placed all over a building. The appearance was most unsatisfactory, and the conductors did not afford any better protection than was afforded by the English method of having points where necessary. He agreed with the Chairman that an ordinary lightning-conductor rod was a most unsightly thing when put on a flèche, but then it was absolutely unnecessary; the idea was far too prevalent that a lightning conductor must terminate in an elevation rod. A vane was a perfect conductor, and it was not necessary to have an elevation rod on that; it was quite sufficient if the conductor was properly connected to it. The theory of a cone of protection had been sometimes misrepresented. Dr. Lodge had said that the cone of protection was quite useless because you can draw sparks from the lightning conductor. That had nothing to do with the matter; the theory was that lightning would not strike any point within a certain cone. In regard to the diagram Mr. Hands had referred to, what he (the speaker) wished to show was that there were certain parts of a building which were liable to be struck by lightning, and one could tell on examination what those points were. He had tried to reduce the matter to a science, and one did not require to be "an expert in clouds" to understand the matter; one could look at a building and study the question of that part a discharge was liable to come on and what part of the building it would strike if it did come. As to Mr. Slater's remark that more of a practical character might have been said in the paper, that was a difficulty. He thought it desirable to say something of the history of the matter, because the history contained the information required and he also wanted to place before them the facts as between iron and copper conductors and the arguments of Dr. Lodge. In doing this he had been compelled to reduce the length of his paper. Mr. Slater asked how over-protection could be done. Well, it could do harm under certain circumstances. In the case, say, of a church spire: in the ordinary way it would be protected by a single conductor, which

if properly applied would render it absolutely safe, but conductors might be taken down the four sides for the sake of extra security, and then there would be a good chance of one of the conductors being within sparking distance of metal in the building, whereas with one conductor the building could be kept safe. As to what metals should be connected, that was a matter that could not be decided by rules; each building must be studied individually as regards the metals in their relation to the conductor and to one another. Lead did not attract lightning; in fact, metals did not "attract" lightning at all. All metals on the outside of a building should be kept in contact with the conductor, and it was perfectly safe to connect lead gutters, &c., or iron rain-water pipes. At the same time, the inside of the building must be studied in order to see what metals there were and what ought to be brought into the conductor system, or avoided. He did not think any rules could be given as to a safety distance of metals in the case of sparking. It depended on the extent of the metals and where they led to. All he could say was that local sparking from a conductor to insulated metal such as an iron cramp would be a matter of inches only, and the damage might be so slight that it might not be noticed at the time, but division of a discharge between a well-earthed conductor and a gas or water supply-pipe would occur to rather over 4 ft., and considerably further if the conductor was not well earthed.

Officers for next Session and Votes of Thanks.

The Chairman then read the result of the election of officers and committee for session 1901-1902, as follows:—

President, Mr. W. Howard Seth-Smith.
Vice-Presidents, Messrs. G. B. Carvill, and E. Guy Dawber.

Committee, Messrs. A. T. Bolton, F. D. Clapham, W. A. Forsyth, H. T. Hare, Hon. A. McGarel Hogg, Arnold Mitchell, W. A. Pite, G. H. Fellowes Prynn, W. H. Raibles, and E. Howley Sim.

Hon. Treasurer, Mr. Francis Hooper.
Hon. Librarian, Mr. F. J. Osborne Smith.
Hon. Secretaries, Messrs. R. S. Balfour and H. P. G. Maul.

The above form the Committee. The other officers are:—Hon. Solicitor, Mr. W. H. Jamieson; Hon. Assistant Librarians, Messrs. C. H. F. Comyn and W. A. Jeckells; Hon. Auditors, Messrs. E. Greenop and Guy M. Nicholson; and Secretary and Registrar, Mr. D. G. Driver.

Mr. G. H. Fellowes Prynn said he desired to propose a very hearty vote of thanks to the President for his services during the past session. He was quite sure that there was no member of the Association who did not feel that during his term of office the President had carried out his duties most thoroughly, and with a genuine love for what he had done. Their President's year of office—to be extended for another year—would always be remembered as an epoch-making year, for during that time they had initiated the scheme of day classes foreshadowed in the President's opening address. They all hoped that those classes would meet with the success they deserved, and it was no small honour for a man to have his name associated with such an epoch-making year in the history of the Association.

The vote having been very heartily agreed to,

The Chairman in reply said it had been and was the greatest pleasure to him to do all he could to forward the work of the Association. In that work he had been most ably seconded by every member of the Committee, by the officers, by the cordial support of the general body of members, and last but not least by the ability and energy of their esteemed secretary, Mr. Driver. He sincerely hoped the day classes would prove successful.

The Chairman then proposed votes of thanks to the hon. secretaries (Messrs. G. B. Carvill and R. Sheleton Balfour), the vice-presidents (Messrs. W. A. Pite and R. Elsey Smith), hon. Librarian (Mr. Arthur S. Flower), the editor of the Architectural Association Notes (Mr. G. H. Fellowes Prynn), the sub-editor (Mr. H. A. Satchell), the School of Design visitors, the Education Committee, the Education Board, the Royal Institute of British Architects (for the use of the Meeting-room), and to Mr. E. W. M. Wonnacott for working the lantern during the session. The hon. secretaries and the vice-presidents had toiled assiduously to further every project brought forward for the good of

the Association, and they had done admirable work. The hon. Librarian, as they all knew, had done more than ordinary work in getting the library into order in consequence of the rearrangement of the premises, and the Association was very much indebted to him and to his assistants for the excellent work they had done. Mr. Prynn's services as editor of the Notes were worthy of special mention, for he had carried out his duties with a thoroughness which distinguished all he did. Mr. Prynn had been most ably assisted by Mr. Satchell, who had done much hard work in sub-editing their journal. The School of Design visitors gave much prestige to the educational work of the Association, and thanks were due to them and other educational bodies for what they had done.

A vote of thanks was also passed to the scrutineers of the votes given in the election of officers, *i.e.*, Messrs. H. G. Collins, C. W. Beaumont, A. A. Carver, and W. A. Jeckells. The meeting then terminated.

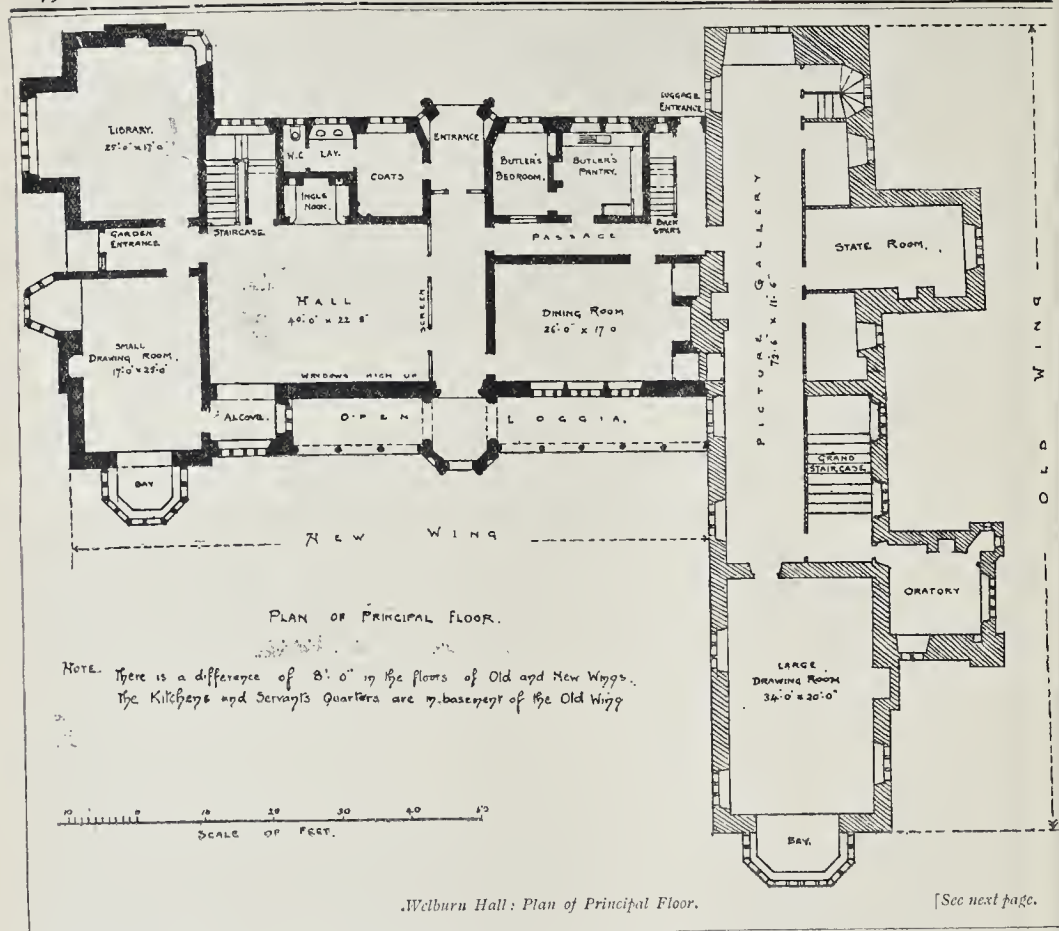

We have received from the Architectural Association a circular in relation to their newly-started day classes in architecture. The Advisory Council consists of eighteen of the leading architects of the day, including three Academicians, *viz.*, Professor Aitchison, Mr. T. G. Jackson, and Mr. Aston Webb.

The following are among the special advantages claimed, and we think rightly, for this course of study:—

Architects feel that pupilage should be preceded by some elementary training preparatory to an office career. Pupils are frequently unable to take advantage of the opportunities offered in an architect's office because they have not previously studied the elements of their work; consequently they are only beginning to learn something about architecture when their articles terminate. A year or two spent in such a school as is now established will enable a student to acquire, at moderate cost, the rudiments of his work, before learning in an architect's office the practical details of his profession. The school will have the further advantage of testing the student's aptitude for the profession. If he should find the work uncongenial he can abandon the pursuit of architecture. Many architects do not care to receive pupils who are beginners, but they would probably take young men if well grounded. In many cases the period of pupilage might be shortened. Students already articulated and unable to attend the studio regularly can make special arrangements for partial attendance if desired. In this case they are also advised to attend the evening lectures. The students will be under the direct control of a thoroughly-qualified architect as master, assisted by such staff as may be necessary.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—The sixth and concluding lecture of the course on "Works Management" was delivered by Mr. A. H. Barker, Wh.Sc., B.A., B.S., at the Westminster Palace Hotel, on April 25, the Vice-Chairman of the Institution, Mr. Ernest King, presiding. The lecturer continued the consideration of the question of cost accounts, treating it with special reference to establishment expenses. The methods necessary to obtain accurate results were indicated, and possible sources of error pointed out. Specimens of the books required were illustrated. The principles of the determination of depreciation charges were discussed at some length, and the desirability was urged of reducing all costs to a common basis, and plotting them in the form of curves from which it would be possible to deduce a law, according to which the costs would vary. The various matters involved in the process of estimating were then entered into, the important bearing upon it of a proper system of costkeeping being dwelt upon. At the conclusion of the lecture a vote of thanks was accorded Mr. Barker, and it was announced that the six lectures would be published by the Institution at the earliest possible date. On May 3 a meeting of the Institution was held at the Westminster Palace Hotel, the Chairman, Mr. Percival Marshall, presiding, when the Northcott Prize paper on the question of "How may the best efforts of Employers and Employed be exerted for their Mutual Advantage and for the National Benefit?" which had been awarded to Mr. William Powrie, was read and discussed. The

adjudicators were Mr. J. A. F. Aspinall, of Manchester; Mr. A. Denny, of Dumbarton; and the donor of the prize (value five guineas), Mr. W. H. Northcott, of London. The author, in commenting upon the relations existing between the employer and employed of the present day, expressed the fear that each class wrongly regarded the other as an antagonist, instead of recognising that their interests were identical. The modern factory system had tended to this condition, and the increase of limited liability companies (whose proprietors had only a financial interest in them) had also done much to discourage the formation of mutual friendship. Trades-unions had not been an unmixed blessing, much bitterness of feeling having been caused by unreasonable interference between employer and employed. Referring to the attitude of the employer, it was unfortunately too common a practice for employers and managers to keep aloof from their men and to treat them as if they were of an inferior race. The workman might hold a different opinion to the foreman as to the best and quickest method of executing certain work. Due consideration should be given to it, and means adopted in every possible way to show that the men's interest in their work was not disregarded. A common cause of increased cost of production was due to the objection of the workmen to run machines at the maximum speed, their stated reason being that more men would be required to do the same amount of work, but the actual result was that future orders were sent abroad, and work altogether lost to the operatives of this country. Time and energy were often spent in devising means for reducing the cost of production, but were rendered to a large extent abortive by the indifference or covert opposition of the workman, who really had it in his power to materially aid to success. There would always be a difficulty in getting human beings,

whether employers or employed, to do all they ought; but a more perfect education, the encouragement of higher ideas in both classes to assist in overcoming ignorance, indolence, and prejudice, would do much to bring about a better understanding between them to their mutual advantage and for the benefit of the nation at large.

Illustrations.

ST. ANNE'S CATHOLIC CATHEDRAL, LEEDS.

THE perspective view of the above shows the west front towards Cookridge-street, and the north towards George-street.

A full description of the proposed building was given in the *Builder* of March 9 last, together with illustrations of ground plan and west and south elevations. It may, perhaps, however, be of interest to furnish a few particulars of the present cathedral and schools.

The present St. Anne's Cathedral, which occupies a very prominent position in Leeds, is a very well-known building, and with its tower and spire at the north end of Park-row forms one of the old familiar architectural features of Leeds, which some of the old residents will be sorry to lose.

The cathedral was opened in the year 1838, the architect being Mr. John Child. The style is Perpendicular Gothic.

The interior is, considering its actual height, very successfully designed, as a great effect of loftiness is achieved by the architect; and the interior was beautifully decorated from the designs of Mr. Bentley, the architect for the Catholic Cathedral at Westminster. The reredos behind the high altar, which is in wood coloured and gilt, is very rich and effective in detail, and was designed by Pugin,

and erected in 1842. The school adjoining the church was erected in 1845, and opened by Daniel O'Connell.

St. Anne's took the place of St. Mary's in Lady-lane, which was built in 1799, on what is supposed to have been the site of a Catholic Chapel dedicated to the Blessed Virgin in Catholic times.

The present cathedral is being built of Horsforth stone, a local Yorkshire grit stone. The parish church is also built of the same stone, as also St. George's Church in Leeds.

J. H. EASTWOOD.

TISSINGTON HALL.

THIS is an old house dating from the time of Elizabeth, and was built by the family now living in it. The back additions are of the time of Queen Anne. The house is in the Peak district, and is a splendid example of mason's work in the beautiful Derbyshire stone. The house is full of rich oak panelling, but throughout this has been covered with painter's graining imitating the genuine article which lies beneath.

The terraced garden and the pictures here are well known, and generally the house is full of interesting things. Various works are in hand with the object of making the house a more liveable one—new roofs, new drains, heating, a kitchen, and sundry servants' rooms. The block of building on the right was an addition of the middle of last century, and without interest; its walls have been retained, but the whole interior remodelled; through neglect it had got into bad repair, and the only alternative was its demolition.

It is interesting to note that in cleaning off the panelling in portions the oak was found to be inlaid with coloured woods—satinwood, ebony, &c.

The works have been going on for a long time, and are being carried out by Messrs.

Irish Candidates.

E. A. Gibbon, Waterford; G. P. Stewart, Dublin; H. P. Stewart, Dublin.

Scottish Candidates.

J. Matber, Brodick; H. Welsh, Motherwell.

The following Candidates passed the direct Fellowship Examination in Division V. —

C. E. Carr, Newcastle-on-Tyne; G. B. Ewing, Edenbridge; A. Gordon, London; W. R. Hobson, London; C. E. Sturt, Wansted.

Twenty Candidates, not included in the above list, passed the examination in Divisions II, and III, as a whole, but failed in their typical subjects. Thirteen Candidates, who passed the examination as a whole in Divisions IV, and V, also failed to pass in their typical subjects. Fifteen out of fifty-four Candidates in the various divisions who came up for re-examination in their typical subjects have failed again this year. It is open to all these forty-eight Candidates to offer themselves again for examination on their typical subjects in March, 1902.

ARCHITECTURAL SOCIETIES.

LEICESTER SOCIETY OF ARCHITECTS.—The twenty-eighth annual Report of the Leicester and Leicestershire Society of Architects shows that at the time of issuing the Report the Society numbered eleven honorary members (among whom are two distinguished water-colour artists, Mr. J. Fulleylove and Mr. James Orrock), forty-five members, twelve Associate members, nineteen assistant members, and thirteen student members. Mr. S. Perkins Pick has been re-elected President. The Council elected consists of Messrs. A. E. Sawday, A. H. Paget, J. Goodacre, and W. A. Catlow, members; and Messrs. A. Herbert and S. Harrison, jun., Associate members. Mr. Stockdale Harrison is Treasurer, and Mr. Howard H. Thomson Hon. Secretary.

* Penfold Gold Medal, 1901. † Crawter Prize, 1901.

THE CHURCH CRAFTS' LEAGUE.

THE half-yearly general meeting of the League was held on Tuesday, May 7, at the Vale Studio, Chelsea, the Bishop of Rochester being in the chair.

The subject down for discussion was "The Importance of Reality in Art and Religion." Canon Scott Holland, the first speaker, said that it was important to remember that individuality in art was not a mere eccentric detachment from the spirit of the time, but was the embodiment of the feeling of the great corporate body. In the matter of Church music, much had been said by expert musicians as to the folly of having a precentor to direct the music in churches where the organist was a competent artist. But it was not as if the art was standing alone. It was called in to assist the worshippers, and therefore the precentor was, for the time being, the expert. The same principle applied to all other branches of art, and it was just this that distinguished religious art from secular.

Mr. Henry Holiday dealt at length with the conditions under which the modern journeyman had to live and work. It was impossible, he said, for a man to take any intelligent interest in, or to put his heart into, his work now, because the conditions of modern commercial life had converted him into a mere machine.

Rev. Percy Deamer, the next speaker, said that when one looked at the homes of the people, one saw an utter absence of beauty. Everything was shoddy and cheap. When one looked at the churches, one found much the same thing. Most of the fittings were made to look as if they had cost twice their real price. There was an entire absence of that reserve which went so far towards making a thing beautiful. In music, the Church had formed a tradition, and many of our greatest musicians had been brought up at our cathedrals, where that art had been carefully nurtured, even in the darkest times. The result of this on the nation was striking. For every ten persons who cared for music, there was only found one who had any appreciation of the other forms of art. Again, if the decorations of a church were so vulgar and bad that one's nerves were affected, that it was impossible to worship, one was considered affected if one said so. But if the music at a church was noisy and vulgar and in bad taste, one was considered to have a very plausible reason for staying away.

Mr. Halsey Ricardo said that art was a man's message to his fellow-men. Every artist had to learn all that his predecessors had learned, and then go on beyond them. Thus Mozart, in one age, learned all that could then be learned about music, and built up his own work on that. Beethoven in another age had gone beyond all his predecessors, and still later, Wagner had done the same.*—A discussion followed, in which Miss Loundes, Mr. T. Stirling Lee, and the Rev. A. W. Hutton took part, after which the Bishop of Rochester spoke briefly, and in summing up the results of the discussion warned his hearers against the danger of hopelessness in thinking of the Church's attitude towards art.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Cumberland Borough Council 10,710*l.* for the purchase of lands and property; Shoreditch Borough Council 2,440*l.* for baths and wash-houses; and Camberwell Guardians 50,000*l.* for extension of infirmary.

Main Roads.—The Local Government Taxation Committee submitted a report with regard to contributions from the Council towards the maintenance of certain main roads. Under the London Government Act the power and duty of maintaining about twelve miles of main roads, discontinued since 1870, had been thrown upon metropolitan borough councils. The Hampstead Borough Council desired the County Council to continue to contribute towards the maintenance of such roads, but the committee recommended the Council to reply that they were not prepared to do so. This recommendation was, after discussion, adopted.

Proposed Conference on Housing.—The Housing of the Working Classes Committee recommended that a conference of delegates from the various metropolitan borough councils should be convened, with the view of arriving at a working agreement upon the housing question, and avoiding the danger of competition between two or more public authorities seeking to acquire the same areas.

This was agreed to, and the date of the conference was fixed for June 28.

Theatre Regulations.—The Theatres and Music Halls Committee reported as follows, the recommendations being agreed to:—

"The Council, on February 9, 1892, revised the regulations made under the Metropolitan Management and Building Acts Amendment Act, 1878, Section 12, with respect to the requirements for the protection from fire of theatres, houses, rooms, and other places of public resort within the administrative county of London. These regulations have, in our opinion, resulted in a great improvement as regards the safety of the public in the places of public entertainment which have been built since the year 1892. The experience we have gained, however, in the last nine years has shown us many points on which they need, in the public interest, alteration and improvement, and we have accordingly amended them. The regulations are now amended will show persons who are desirous of building a place of entertainment exactly what is required by the Council. . . . We recommend that the regulations made under the Metropolitan Management and Building Acts Amendment Act, 1878, Section 12, as amended, be approved, and that they be sealed in duplicate."

Seating in Theatres.

"On April 2 last we called attention to the fact that alterations were frequently made in the arrangement of the seating in the pit and stalls of theatres without any intimation being given to the Council, and at our suggestion a letter was sent to the lessees of all theatres stating that it was necessary in the public interest that notice should be given to the Council whenever it was desired to make an alteration, in connexion with the seating arrangements, in the position of the barrier dividing the pit and stalls portions of a premises. In reply we have received letters on several lessees stating that it would be extremely awkward to comply with the request, as alterations had frequently to be made at very short notice. We think that the convenience of the lessees might be met, with due regard to the public safety, if each lessee who is desirous of being allowed to make alterations in the arrangement of his pit and stalls seating was to inform the Council of the extreme limits within which he was desirous at any time moving the barrier between the

pit and stalls. It would be easy for us to determine the limits within which the barrier might be moved without the safety of the audience in either part of the theatre being injuriously affected, and so long as alterations were kept within these limits and the regulations respecting the width of gangways and the area of seating to be assigned to each person were observed, there would be no necessity for notice to be given to the Council. We recommend that a circular letter be sent to the lessees of all theatres stating that, with a view to obviating the necessity of lessees giving notice to the Council on every occasion upon which it is desired to make an alteration in the position of the barrier separating the pit and stalls seating, the Council will be prepared to determine, on application being made by the lessee, the extreme limits within which the barrier in question may be moved without further notice being given to the Council."

Tenders.—The following tenders have been accepted:—

Docking and the repair of s.s. *Barking*—Mills & Knight, 1,122*l.* 12*s.* 6*d.*

Workshops, Feltham School—Herring & Son, 102*l.*

New Open Space.—The umpire having awarded 10,560*l.* upon a claim of 17,792*l.*, for the purchase of Albert-square, Ratcliff, the Parks Committee asked for authority to expend 640*l.* on laying out the grounds. This was granted.

Workmen's Trains.—Dr. Cooper moved:—"That, having regard to the conditions imposed upon railway companies in return for concessions from taxation and the present extent of over-crowding in London, it be referred to the Housing of the Working Classes Committee to invite all the railway companies having stations within the County of London to confer with it with a view of endeavouring to arrive at a complete scheme for the extension of workmen's trains at the lowest fares; and that if a satisfactory scheme fails to be accomplished, the Committee do report its full requirements to the Council and the objection of the companies thereto."

Mr. Dew seconded the motion, which was supported by Mr. Cousins, Mr. Beachcroft, and others.

The motion was adopted and referred to the Parliamentary Committee.

The Council, having transacted other business, adjourned.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage and Projections.

Marylebone, East.—A projecting balcony at the fourth floor level, to extend along the south and east faces of a block of residential flats, to be known as Harley House, on the north side of Marylebone-road, St. Marylebone, at the corner of Brunswick-place (Messrs. Boehmer & Gibbs for Mr. C. J. Hinsley).—Consent.

Battersea.—A transept and tower on the north side of St. Mary's Church, Albert Bridge-road, Battersea, to abut upon Park-road (Mr. J. S. Quilter for the Rev. Canon Erskine Clarke).—Consent.

Battersea.—A church on the west side of Wycliffe-road, Battersea (Mr. G. H. Fellowes-Prynn for the Rev. F. L. Goslett).—Consent.

Fulham.—Retention of a shed, used as a stable, at the rear of No. 55, Bramber-road, Fulham, abutting upon Mulgrave-road (Mr. W. H. Stilgoe for Mr. W. Roberts).—Consent.

Greenwich.—A wood and tile pent over the entrance to a house in course of erection on the south side of Manor Way, Lee-road, Lee (Mr. L. V. Hunt for Messrs. L. Whitehead & Co.).—Consent.

Greenwich.—Rebuilding of the Baptist Church, Shooter's Hill-road, Blisheath (Mr. J. Willis for the Rev. W. L. Mackenzie).—Consent.

Hackney, North.—A one-story addition to No. 291, Green Lanes, Stoke Newington (Mr. A. H. Jones).—Consent.

Hammersmith.—A greenhouse at the nursery adjoining Oak Lodge, Uxbridge-road, Shepherd's Bush (Mr. G. Frothingham for Mr. J. Harden).—Consent.

Marylebone, West.—The retention of a wood and glass conservatory in front of No. 55, Circus-road, St. John's Wood (Mr. A. G. Langdon for Miss M. Studholme).—Consent.

Westminster.—A one-story porch at the entrance to No. 169, Victoria-street, Westminster, at the corner of Carlisle-place (Messrs. Edmeston & Gabriel for the London and South-Western Bank, Limited).—Consent.

Strand.—That the Erasme Company, Limited, be informed that the Council is not prepared to permit the retention of the wood and iron sign in front of No. 117, Oxford-street, Soho.—Agreed.

Chelsea.—Retention of a wooden trellis screen at the side of No. 456, King's-road, Chelsea, abutting upon Hobury-street (Mr. T. J. Monaghan).—Refused.

Dulwich.—A one-story shop in front of an existing house and shop on the east side of High-street, Dulwich (Mr. W. J. Studd).—Refused.

Fulham.—An addition at the rear of No. 62, North End-road, Fulham, to abut upon Gwendvur-road (Mr. S. G. Goss for Mr. J. Elmslie).—Refused.

Hampstead.—A conservatory, at the first-floor level, in front of Belgrave Mansions, Belgrave-road, St. John's Wood (Messrs. W. Whiteley, Limited, for Mr. C. M. W. Turner).—Refused.

Islington, North.—Retention of an addition at the rear of No. 214, Seven Sisters-road, Islington, abutting upon Coleridge-road (Mr. R. Midworth for Mr. J. Portance).—Refused.

Kensington, South.—An iron and glass shelter at the entrance to No. 10, Bolton-gardens, Kensington (Messrs. W. T. Allen & Co. for Mr. L. Samuel).—Refused.

Lewisham.—Four houses on the west side of Shell-road, Lewisham, at the corner of Sandrock-road (Messrs. Hodson & Whitehead for Messrs. Hodson Brothers).—Refused.

Lewisham.—A house on the east side of Bromley-road, Catford, northward of a house known as Ormound (Mr. W. Bailey for Mr. W. H. Wagstaff).—Refused.

Wandswoth.—Five one-story shops on the south side of Lower Richmond-road, Putney, westward of Martyn's Waterman's School (Mr. F. A. Fowell for Mr. A. C. Ballard).—Refused.

Westminster.—An iron and glass shelter in front of No. 137, Victoria-street, Westminster (Mr. E. Stones for Mr. A. Stinner).—Refused.

Width of Way.

Lewisham.—A boundary wall on the flank of No. 18, Lansdowne-road, Lee, at less than the prescribed distance from the centre of Church-passage (Mr. G. Mitchell).—Consent.

Peckham.—Two cottages on the south side of Green Hundred-road, Peckham Park-road, Peckham, at less than the prescribed distance from the centre of the street (Mr. H. J. Collis for Mrs. McDonald).—Consent.

Kennington.—A two-story building at Five laundry, Southville, Lambeth, at less than the prescribed distance from the centre of Priory-mews (Messrs. Reeves & Styche for Mr. S. Fernie).—Refused.

Wandswoth.—A stable building on the east side of Brewhouse-lane, Putney, at the corner of Memel-place (Mr. H. G. Leslie for Dr. Weistad).—Refused.

Space at Rear.

Peckham.—A modification of the provisions of Section 41 (1) (vi) of the Act with regard to open spaces about buildings, so far as relates to the proposed erection of a house on the west side of Hooks-road, Peckham, next the house numbered 28 in such road, with an irregular open space at the rear (Mr. A. E. Mullins for Mr. D. S. Whitcher).—Consent.

Deviations from Certified Plan.

St. Pancras, South.—Certain deviations from the plan certified by the District Surveyor, under Section 43 of the Act, so far as relates to the proposed erection of a stable, with living rooms over, on the site of No. 1, Doughty-mews, St. Pancras (Messrs. Thurgood & Martin for Mr. A. German).—Refused.

Lines of Frontage and Width of Way.

Woolwich.—Three houses at the south-east end of Elm-grove, The Shade, Plumstead, (Mr. A. E. Habershon for Mr. Stevens).—Consent.

Hackney, Central.—Houses, with shops on the ground floor, on the site of Nos. 3b, 5, 7, 9, 11, 13, and 15, Tower-street, London-fields, Hackney, at less than the prescribed distance from the centre of the street (Mr. J. Hamilton for Mr. S. K. Prager).—Consent.

Lines of Frontage and Space at Rear.

Peckham.—A three-story house, with a one-story shop in front, on part of the site of No. 103, Ryelane, Peckham (Mr. A. Garner for Mr. W. Wilson).—Refused.

Lines of Frontage and Construction.

Rotherhithe.—A steel grain-shoot across Church-passage, Rotherhithe (Messrs. W. A. Crips & Sons for Messrs. Dudin & Sons).—Consent.

St. George, Hanover-square.—That permission be given to Mr. W. J. Smith to retain a projecting sign in front of No. 7, Woods-mews, Park-lane, St. George, Hanover-square, extending beyond the general line of buildings in that street.—Agreed.

Width of Way and Construction.

Newington, West.—A playshed in the playground of the Harper-street School, New Kent-road, Newington, at less than the prescribed distance from the centre of Arnott-street (Mr. T. J. Bailey for the School Board for London).—Consent.

* Is Mr. Ricardo quite sure of that?—Ed.

Formation of Streets.

Battersea.—That an order be issued to Mr. W. M. Wilkins, sanctioning the formation or laying out of new streets for carriage traffic, on the north side of Sheepcote-lane, Battersea (for the Metropolitan Borough of Battersea).—Agreed.

Islington, West.—That an order be issued to Mr. F. Matcham, sanctioning the formation or laying out of a new street, for foot traffic only, to lead from Holloway-road to Waiters-road, Islington (for Mr. F. W. Purcell). That the name Macready-place be approved for the new street.—Agreed.

Lewisham.—That an order be issued to Mr. J. W. Webb refusing to sanction the formation or laying out of a new street for carriage traffic to lead out of Crofton Park-road, Brockley.—Agreed.

Lewisham.—That an order be issued to Mr. W. H. Dawson refusing to sanction the formation or laying out of four new streets for carriage traffic out of the east side of Bromley-road, Catford (for Mr. H. W. Forster).—Agreed.

Height of Buildings.

Islington, West.—A theatre building on the south side of Holloway-road, Islington, to exceed in height the width of a proposed new street to lead from Holloway-road to Waiters-road, upon which new street the building will abut (Mr. F. Matcham for Mr. F. W. Purcell).—Consent.

Cubical Extent.

Bermondsey.—The omission of double iron doors in the party walls between the north wing of a factory building known as Grange Mills, on the south side of Grange-road, Bermondsey, and the two staircases forming approaches to that wing, whereby such wing and staircases will together exceed in extent 250,000, but not 450,000 cubic feet (Messrs. Gordon & Gunton for Messrs. A. Ross & Co.).—Consent.

Means of Escape from Top of High Buildings.
Strand.—Means of escape in case of fire on the fifth, sixth, and seventh stories of an addition to the Hotel Cecil, on the site of Nos. 76-88, Strand, between Carting-lane and Ivy Bridge-lane (the upper surface of the floors of which stories are above 60 ft. from the street level), for the persons dwelling or employed therein (Mr. J. Sawyer for the Hotel Cecil, Limited).—Consent.

The recommendations marked † are contrary to the views of the Local Authorities.

SOUTH KENSINGTON EXAMINATIONS.

SIR,—The examination held by the Board of Education in Building Construction on the 11th inst. has caused a shock to many thousands of hard-working and earnest students throughout the country. For many years past, papers have been set increasing slightly in difficulty, but free from erratic vagaries, and on the whole covering the ground of the syllabus in a straightforward manner. That the examination was a fair one is shown by students year after year being placed in the order that their known capabilities foreshadowed. I refrain from discussing the general question of the value of the certificates and what their possession may be taken to indicate, and beg leave to quote three questions just given:—

“65. What is meant by saying that the height to which a pyramid of any building material may be raised is three times the height of a column of uniform section? Show how, by attending to a cardinal principle of construction, you can build a tower of brick or stone of very great height.

“66. With reference to the previous question: A brick tower of efficient design is built on a square base 60 ft. by 60 ft.; it is 500 ft. high. Allowing 6 tons per square foot as the safe load on a cross section, and taking 120 lbs. as the weight of a cubic foot of brickwork, what is the area of the top? What weight in tons may be safely placed on the top? Given: $\log_{10} 111 = 2.04532$, $\log_{10} 112 = 2.04921$, $\log_{10} 4086 = 3.61130$, and $\log_{10} 36 = 1.55630$. You may assume 1 ft. courses.

“69. Design and sketch a double labourer's dwell-

ing in a rural district; show the necessary conveniences and the enclosure. The site is close to a public road. Take accurate quantities and price them.”

These are samples of five that have to be completed in four hours. Now, I would ask, first, are questions 65 and 66 such as we should train students to expect in an examination in building construction, and, second, how any living man work No. 60 in forty-eight minutes? It should be noted that equal marks were apportioned to each of these questions.

HENRY ADAMS.

THE PROPOSED LIVERPOOL CATHEDRAL.

SIR,—It would seem from what appears in a contemporary—though I have searched in vain in your current number for any tidings of the matter—that some design for a cathedral church is adopted and in process of being collected for. Not a word is there as to the adoption or adaptation of any one of the competition designs prepared for the St. John's Churchyard site.

A hope for something as stately as the effort at Truro may be too visionary, but there may be a more excellent way than cutting up interesting parish churches (Manchester, Wakefield, and Newcastle to wit), which one would prefer to see repeated than the perpetration of a huge conical, which, of our time, designs the late competition called forth, the late lamented Bishop is said to have sympathetically striven for. I believe that another competition ought to be called for, in recognition of the fact that there is well-nigh a fresh generation of architects capable of expressing on paper the prospective requirements, and giving sound suggestions for meeting them.

A sort of church house on one side of an enclosure and a spacious and lofty cathedral on the other would be worth subscribing for, and possibly worth while competing for; but to rush something through without giving the profession a fair chance is not quite what we may have a right to expect, and yet this is what we may come to if subscribers do not have a care that their contributions are devoted to a bona-fide design and not a sort of basilica.

** We are quite in sympathy with the general purport of our correspondent's letter; and if it be true that a design for the cathedral is to be prepared by the City Surveyor, we can only say that it is a most miserable anti-climax after the important competition held a good many years ago, and which excited so much public interest. Either one of the former competitors ought to be recognised, or there should be a new competition. We may however point out to “H. W.” in view of the last paragraph of his letter, that there is no reason that we know of why a “basilica” should not also be a “design.”—ED.

OBITUARY.

MR. ARTHUR CATES.—We regret to announce the death, in his seventy-third year, at his residence, No. 12, York-terrace, Regent's Park, of Mr. Arthur Cates, formerly of No. 7, Whitehall-yard, S.W. Mr. Cates was born in London on April 29, 1829, and received his earlier education at King's College School, Strand. He then became a pupil of Sydney Smirke, R.A. He was elected an Associate member of the Royal Institute of British Architects in 1856, and a Fellow in 1874; he was for some while a member of the Council, and Vice-President during the period 1888-92; in 1847 he had been elected a member of the Architectural Association. He was also a Fellow of the Surveyors' Institution. In 1870 Mr. Cates succeeded Sir James Pennethorne in the appointment of Architect to the Land Revenues of the Crown, under the Commissioners of H.M. Woods and Forests. As Surveyor to the Honourable Society of the Inner Temple, he designed the archway and gate-house which form the entrance from Tudor-street into King's Bench-walk (1887). For some while he was honorary secretary to the Council of the Society of Biblical Archaeology, and honorary secretary to the Architectural Publication Society, who brought out “The Dictionary of Architecture.” He served as chairman of the Board of Examiners, R.I.B.A., and was appointed a member (being chairman) of the Tribunal of Appeal under the London Building Act, 1894; to that office he was re-appointed for a term of five years from January 1, 1900, under Sections 175-6 of the Act, by the Council of the Institute. In January last year Mr. Cates founded a prize, to be awarded by the Architectural Association, for a descriptive and illustrative account of the Paris Exhibition, 1900, in the form of a Paris Exhibition travelling studentship of 20l., to a member of the Architectural Association; the prize was awarded to Mr. E. W. M. Wonnacott. He also was founder of the “Arthur Cates Prizes,” consisting of books to the value of ten guineas, for students admitted to the Final Examination. His warm and active interest in all matters relating to the professional education of architects is well known. We may here cite his

article upon “Architectural Education in the United States of America,” which appeared in Volume VI. of the Royal Institute of British Architects' Journal. In 1890 Mr. Cates was elected honorary treasurer to the Architects' Benevolent Society, an institution in which he took the warmest interest, and was re-elected in that capacity for 1895-6; in March last he was appointed a trustee of the society vice Mr. Henry Currey, deceased. In the course of the last professional year Mr. Cates was nominated by the Senate of the University of London as member of the Board of Studies for Fine Art, including architecture, as representative of the Institute; his colleagues elected him chairman of the board. On April 14, 1900, we reported a paper upon “Ancient Lights,” read by him at a special meeting of the Institute on April 9 of that year.

GENERAL BUILDING NEWS.

MALMESBURY ABBEY CHURCH.—A meeting of the Restoration Committee was held at the Town Hall, Chippenham, recently. The architect, Mr. Harold Brakspear, reported that the contractors had completed the repairs of the flying buttresses of the south side, with the exception of the double buttress at the west end, which they were unable to repair with safety until the south-east corner of the ruined aisle had been made good. As the restoration was carried out by Mr. Mark Gunning, of Holbrook, and Mr. Heming, of Wick, under the direction of Mr. Edmund Buckle, M.A., of London. The roof of the nave is completely new; the floor has been covered with concrete, and laid with wooden blocks; the old pews have been removed, and the oak of which they were made has been used as panelling round the church. The new seating has been provided by Messrs. Stephens & Bastow, of Bristol, and the church has also been furnished with a small organ from Messrs. Vowles.

REOPENING OF ABSON CHURCH, GLOUCESTERSHIRE.—The old parish Church of St. James, Abson, was reopened recently by the Bishop of Bristol after having been repaired. The work of restoration was carried out by Mr. Mark Gunning, of Holbrook, and Mr. Heming, of Wick, under the direction of Mr. Edmund Buckle, M.A., of London. The roof of the nave is completely new; the floor has been covered with concrete, and laid with wooden blocks; the old pews have been removed, and the oak of which they were made has been used as panelling round the church. The new seating has been provided by Messrs. Stephens & Bastow, of Bristol, and the church has also been furnished with a small organ from Messrs. Vowles.

IMPROVEMENTS TO PARISH CHURCH, ALFRETON.—A year or two ago it was decided to carry out certain work at the parish church. The proposal of the vicar was to lengthen and raise the height of the chancel, to build an organ-chamber on the south side of the chancel, and raise a choir vestry and a ringer's loft at the west end of the church. The scheme was estimated to cost between 1,100l. and 1,200l. Messrs. Fisher Bros., of Mansfield, were given the contract for the work, of which Mr. Hodgson Fowler, of Durham, is the architect, and it has now been completed.

NEW FISHERWICK PRESBYTERIAN CHURCH, BELFAST.—The new Fisherwick Presbyterian church was opened on the 28th ult. The new building, which has cost about 16,000l., comprises chancel, nave, transepts, aisles, organ-chamber, choir, practice-room, vestry, and committee-chambers, and a small western gallery. The style is the Early Perpendicular, and the church is apsidal. Contiguous to the choir is a chamber on the north side of the chancel for the organ. The nave is divided into five bays and transepts, having lofty stone arches resting on pillars. Each bay is furnished with tracery windows and stained glass. The western end has a small gallery, under which is the porch and principal entrances. On the north-west side are the tower and spire, rising to a height of 158 ft. The length of the nave inside is 82 ft., and the length of the chancel 30 ft. The width of the nave inside is 45 ft., and of each of the side wings 12 ft. The roof is open-timbered. There are five east windows filled with stained glass. The church has been connected by telephone with the houses of several members of the congregation who are too infirm to attend the services. In addition to the church buildings proper there is a lecture hall, with schools and catechist's residence. These are carried out in harmony with the style of the church. The stained glass was provided by Messrs. James B. Campbell & Co., and the mosaic pavement by Messrs. W. D. Henderson & Sons. The heating, which is on the Plenum system, has been carried out by Messrs. Davidson & Co., Belfast. Messrs. Wm. Coates & Sons were responsible for the electric lighting and fittings, from particulars given by Mr. W. D. Ferguson, electrical engineer. The carved oak pulpit was made by Messrs. Hurdy & Millard. Mr. Robert Corry, J. P., had charge of the building contract, and Mr. Samuel P. Close, whose designs were selected in competition, acted as architect.

BAPTIST CHURCH, EXMOUTH.—The new Baptist church, Exmouth, was opened on the 1st inst. The building, which is situated in the Victoria-road, has been erected from plans prepared by Mr. Philip Kerley, architect, of Exmouth, the builder being Mr. G. Hayman. The cost is about 1,150l. The dimensions of the oblong are about 50 ft. by 32 ft., and it has seating accommodation for 500 and choir. There are two entrance porches, a large organ-chamber, and two vestries. The rostrum is partly set in a bay-shaped recess. The whole of the floor

ing is in wood-block, whilst heating has been provided for on the hot-water system. The elevation has been carried out in limestone, with Bath-stone dressings. A large tracery window in the centre gable is a chief feature of the front. Sufficient space has been left at the back of the church buildings for the erection at a later date of schoolroom and classrooms.

RE-OPENING OF MACHEN CHURCH, MONMOUTHSHIRE.—This church was re-opened recently after restoration. The work was carried out under the direction of Mr. C. B. Fowler, of Cardiff, and has included the provision of nearly new roofs. The old ceiling has been removed, and a wooden ceiling substituted with moulded ribs. The old west desk fixed, whilst a portion of the walls was rebuilt. The plaster has been taken off the interior and exterior walls and the masonry pointed. The square tower has also been restored, and a new ringing floor provided. According to the *South Wales Daily News*, during the progress of this work several finds of interest were made. Chief of these were road loft steps and entrances, three niches, an old piscina, a west window opening, the remains of a rood screen, and a priest's doorway in the chancel.

WESLEYAN CHURCH, SUNDERLAND.—The foundation stone was laid on the 8th inst. of the Wesleyan Church and schools which are to be erected on the Holy House site, at the junction of the Durlam and Tunstall-road, Sunderland. The church will be cruciform on plan and be entered by vestibules at the junction of the two roads. At either side of the main entrance will be the staircases leading to the gallery, and there is to be a separate entrance to each transept. At the rear of the church the minister's and choir vestries will be situated, with direct access to the pulpit and choir stalls, the organ being placed in a recess behind the pulpit. The accommodation will be for 800 worshippers. The seats, pulpit, choir stalls, &c., will be in pitch pine, while the windows will be glazed throughout with cathedral lead lights. Behind the church is to be a spacious schoolroom with gallery running round, of which eight classrooms open. There will be also a large school for infants, together with numerous society classrooms, ladies' parlour, kitchens, lavatories, and cloakrooms, &c. The buildings will be faced externally with stone. The lighting throughout will be by electricity. At the left-hand side of the main entrance to the church and at the junction of the roads, will be a tower and spire, rising to a height of 100 ft. The building has been designed by and is being erected under the superintendence of Mr. J. Jameson Green, architect, of Liverpool. The builder is Mr. John Stott, of Sunderland, and the clerk of the works is Mr. W. A. Lovry, of Liverpool.

CATHOLIC CHURCH, DUMBERTON.—The foundation-stone has just been laid of the new edifice for St. Patrick's congregation, Dumberton. The building is now in course of construction, which is situated in Strathleven-place, has been designed by Messrs. Maule & Hanson, of Newcastle, and is estimated to cost 12,000*l.* and seat 1,200 people. It is in the Early English style, and is being built of red sandstone from Dumfries.

ST. PATRICK'S NEW CHURCH, BROOMFIELD, CO. MONAGHAN.—This church is now practically finished. The dedication has been fixed for September 15 next. Mr. G. L. O'Connor, Dublin, is the architect, and Mr. Wynn, Dundalk, the builder.

BAPTIST CHURCH, EAST HAM.—A Baptist church has been erected in Plasket-grove, East Ham, from designs by Mr. Edgar Stones. Messrs. Holliday & Greenwood were the builders. The cost has been about 9,000*l.*

CHURCH OF THE ASSUMPTION, ACHADOWEY, COLERAINE.—The building of this church has just been completed. The church measures 98 ft. by 32 ft., and is built of local bluestone, with dressings of Dungannon freestone. Mr. J. John O'Shea was the architect. The builders were Messrs. M'Nally & Son, Cookstown.

CONGREGATIONAL CHURCH AND SCHOOLS, WALSLEND.—The memorial stone has just been laid of a Congregational church and schools at Walslend. Mr. J. Walton Taylor, of Newcastle, is the architect.

BOARD SCHOOLS, INGWOL, YORKSHIRE.—New schools erected at Ingwolv by the Keighley School Board, at a cost of 16,000*l.*, have just been opened. The schools abut on the west on the new Queen's-road, which runs from Victoria-road to Ingwolvane. The infants' school, which is the one nearest Ingwolv Church, and is erected on the central hill principle, will accommodate 200 children, and the building is so arranged that three classrooms, giving additional accommodation for 180 children, can be erected at the south end at comparatively little outlay. The central hall here is 48 ft. by 30 ft., and the five classrooms each about 24 ft. by 22 ft. The entrance is on the ground floor. The mixed school is reached by a covered stone stairway, and here accommodation is furnished for 480 scholars. There are seven classrooms, on an average 26 ft. by 24 ft., and a central hall, 60 ft. by 30 ft. On the upper floor of the mixed school, and reached by a stone stairway from the east entrance, is a classroom for cookery, 30 ft. by 25 ft., having a large cooking

range, sinks, and provision for gas cooking-stoves, &c. There are separate entrances, cloakrooms, and lavatories for each sex; in each school there are retiring-rooms for the headmaster, headmistress, and assistants. Block flooring has been adopted almost throughout. The warming and ventilation is on the Leicester Plenum system. A tower is erected between the two schools for the fresh air supply. The whole of the ventilating and warming apparatus has been supplied and fitted up by Messrs. Ashwell & Nesbit, Limited, London. There are two large covered playgrounds, one under the mixed school, above the open playground level, for girls and infants, and one behind the mixed school for boys. At the back portion of the girls' playground is a laundry and washhouse, 40 ft. by 24 ft.; and over the boys' covered playground is a manual training room, 42 ft. by 25 ft. The area of the site, inclusive of the part reserved for the future senior school, on the west, is 12,000 square yards; and the total cost of the site and works and fencing is 16,000*l.* The following firms have been engaged upon the works:—Mr. Michael Sunderland, mason, Keighley; Messrs. Foster & Fortune, joiners, Keighley; Messrs. Hiram Emmott & Co., plasterers, Keighley; Mr. William Thornton, slater, Bingley; Mr. Samuel Rushworth, plumber, Shipley; Messrs. Holmes & Sons, painters, Steeton. The wrought-iron gates and railings are by Messrs. Longbottom Bros., Bingley; gas and cloakroom fittings by Messrs. Longfield & Co., Otley; block flooring by Mr. Roger Lowe, Farnworth; desks, &c., by Messrs. Hingwood, Ingham, & Co., Leeds. The architect was Mr. Wilson Bailey, Bradford and Keighley; and the clerk of works Mr. James Bottomley, of Haworth.

PROPOSED TOWN HALL, CHELTENHAM.—The Cheltenham Town Council having proposed to erect a town hall on land near the Winter Garden, a Local Government Board inquiry into an application for sanction to borrow 35,000*l.* for the carrying out of the scheme was held recently by Colonel Marsh, K.E. The architect is Mr. Waller. The scheme has met with considerable opposition from the townspeople, who allege that the site is unsuitable.

SCHOOL, PLYMOUTH.—The Plymouth School Board propose to erect new schools in Salisbury-road. The architect is Mr. H. J. Snell.

WORKING MEN'S HOME FOR WISHAW, NEAR EDINBURGH.—A company has been formed in Wishaw for the purpose of erecting a working men's home in the district of Craignuk. The capital is 4,000*l.* Plans will be immediately prepared by Mr. Cullen, architect, Motherwell, and the home will provide 150 beds.

SAILORS' HOME, CHATHAM.—The foundation-stone was laid recently of the Sailors' Home, adjoining St. Mary's National Schools, and close to the Town Hall, Chatham. It is intended to construct buildings covering an area of 165 ft. by 245 ft., including a central hall 100 ft. by 48 ft., billiard and retiring rooms, and some 600 cubicles. The building now in hand is only a sixth part of the whole scheme. It has a frontage of 88 ft. to the Upper Drawbridge-road, and a depth of 50 ft. It is set back 50 ft. from the road, and it will ultimately have a lawn in front and be approached by two carriage drives. The building will be constructed of stock bricks with stone and red brick dressings. It is to be four stories high, and brick drainings in the basement for a kitchen, bathrooms, pantries, scullery, beer cellar, and various stores and offices. On the ground floor there are separate rooms for petty-officers and men, with buffet and manager's offices. The first and second floors, overlooking the Drawbridge-road, will contain fifty-two cubicles, each 8 ft. by 5 ft. 6 in. The building is to be heated by hot water. The architect is Mr. G. E. Bond, and the builder Mr. H. E. Phillips, of New Brompton; the contract price being 510*l.*

SCHOOL BUILDINGS, ELY, GLANORGANSHIRE.—At a meeting of the Cardiff Board of Guardians' School Committee recently, a scheme for the extension of Ely Schools was considered. The sub-committee appointed to confer with the architect and to suggest to the committee what buildings they considered were the most suitable for and in connection with grouped homes at Ely reported that they had instructed the architect to prepare plans for the schools visiting committee. The plans were submitted and explained by the architect, Mr. Seward. They include an administrative block containing superintendent's house, office, grocery store, and sewing-room, to include clothing and drapery stores, one large cottage for twenty-four children, and four ordinary cottages for twelve children each, being accommodation for seventy-two children altogether. The architect's estimate of the cost of these buildings is 5,074*l.*, in addition to 400*l.* for draining and laying out the site, and 450*l.* for the dividing wall between the adults and children. The old hospital, which is no longer used for children, must, the committee suggested, be removed, but the new hospital will be available without any alteration.

NEW BUILDINGS IN ABERDEEN.—The Plans Committee of the Aberdeen Town Council has sanctioned the plans of the following new buildings:—Two dwelling-houses on the south side of Hamilton-place, for Mr. John Henderson, builder; dwelling-house on the east side of Albury-place, for Mr. Lewis Ross, per Messrs. D. & J. R. M'Millan, architects; dwelling-house on the north

side of Rubislaw Den South, for Mr. C. J. Davidson, per Messrs. W. & J. Smith & Kelly, architects; two dwelling-houses on the south side of Carlton-place, for Mr. John Rae, per Mr. William Smith, architect; workshop on the east side of Berryden-road, for the Northern Co-operative Company, Limited, per Mr. J. Wallace, joiner; stable and coach-house at the rear of No. 3, Osborne-place, for Mr. William Peters, per Mr. John Stephen, Mile End-place; alterations in connexion with Messrs. John Alexander & Co.'s additions to No. 9, Queen's-road, for Mr. Alexander Gray, per Messrs. Brown & Watt, architects; alterations and additions in connexion with premises, No. 45, Causewayend, for Mr. John Coutts, per Mr. A. Winchester, builder; two dwelling-houses on the west side of King-street, for Mr. George Godsmann, per Mr. John Cameron, architect (amended plan); additions to Walker-road Public School for the Aberdeen School Board, per Mr. J. A. O. Allan, architect (amended plan); alterations in connexion with the premises, Nos. 52-54, Union-street, for Messrs. William Walker & Sons, per Mr. John Rust, architect; additions to Migvie House, North Silver-street, for Mr. W. Kendall-Burnett, per Messrs. W. and J. Smith & Kelly, architects; alterations in connexion with offices, No. 15, Dee-street, for Messrs. Lumden & Davidson, per Messrs. W. and J. Smith & Kelly, architects; two dwelling-houses on the south side of Murray-terrace, for Mr. J. Kynoch, engineer, and Mr. George Moir, per Mr. George Sutherland, architect; shed in connexion with the Aberdeen Royal Infirmary, Woolmanhill, per Messrs. W. and J. Smith & Kelly, architects; piggeries at Ashgrove-road, for the directors of the Royal Lunatic Asylum, per Mr. George Taylor, master of works.

ALMSHOUSES, DROITWICH.—Five new almshouses in connexion with the Coventry Charity and a new infirmary were opened at Droitwich by the Countess of Coventry on the 1st inst. The new buildings are of red brick with stone facings. Mr. Lewis Sheppard, of Worcester, was the architect, and Messrs. Emuss & Harris, Droitwich, the builders.

CATHOLIC SCHOOL-CHAPEL, WORSBRO, YORKSHIRE.—A Catholic school-chapel is being erected at the corner of Henry-street, Worsbro, at an estimated cost of about 1,000*l.* It will be a brick building, having a frontage of 40 ft. to the Barnsley and Sheffield highway, and extending back along Henry-street a distance of 70 ft. The total accommodation will be for about 150 persons, the main room measuring 70 ft. by 30 ft. This will be divisible into two portions by means of a sliding partition. One portion will be used during the week as a school; the other will be exclusively set apart for church purposes. Cloakrooms, lavatories, &c., will be attached to the school premises. Connected with the chapel there will be a vestry or sacristy. Mr. J. F. Brown, of Barnsley, has been entrusted with the builders' work, and the other contracts have also been let to Barnsley firms, viz., joiners' work, Mr. G. Robinson; slating and plastering, Miss Fleming; painting, Mr. H. Cheshire; plumbing and glazing, J. Snowdon & Sons. The architect is Mr. Edward Simpson, of Bradford.

THE DICK INSTITUTE, KILMARNOCK.—The Dick Institute, erected at Elmbank, Kilmarnock—the gift of Mr. James Dick, Glasgow—for the accommodation of the Public Free Library and Museum, including the collections presented to the town by the late Mr. James Thomson, F.G.S., and Dr. Hunter Selkirk, of Braidwood, was opened on the 30th ult. The front portion of the building is two stories in height, and the return wings are one story, the frontage being 138 ft. in length, with a total depth of 114 ft. The leading feature is the portico which forms the main entrance. The pediment terminates with a figure of Minerva, with a sphinx on either side, and in the tympanum the Kilmarnock arms, with supporters. The principal entrance is by the portico and vestibule leading to an entrance-hall. To the right and left are the reading-room and library, and behind the main entrance is a lecture-hall capable of accommodating nearly 500 people. On the second floor there is a large upper hall and vestibule with dome. To the right is the north museum, which has a floor space of 1,750 sq. ft., and on the left is the south museum, with a floor area of 2,000 sq. ft. The museums are lighted both from the walls and the roof. The architect was Mr. R. S. Ingram, and the builder ex-Baillie Calderwood.

PROPOSED COUNTY COUNCIL OFFICES, NEWPORT.—Colonel Duca, R.E., held a Local Government Board inquiry at the Monmouthshire County Council offices, Newport, on the 3rd inst., with reference to an application by the County Council to borrow 10,000*l.* for the erection of a Council Chamber and an extension of the present offices at Pentonville, Newport. Mr. Tanner, the County Surveyor, was in attendance.

WORKMEN'S DWELLINGS, EBBW VALE, WALES.—The Ebbw Vale Urban District Council has decided to erect forty workmen's houses, twenty of which will be commenced as soon as a loan for the purpose has been sanctioned by the Local Government Board and negotiated. Mr. T. J. Thomas, the Council's Engineer and Surveyor, prepared three designs for the approval of his authority. On the ground floor a parlour, kitchen, scullery, and larder

are provided; on the first floor one bedroom, the entire width of the front of the house, lighted by two windows, a lesser bedroom in the main building, and another immediately over the scullery. The dimensions are:—Parlour, 11 ft. 6 in. by 9 ft. 6 in.; kitchen, 13 ft. by 11 ft. 6 in.; scullery, 9 ft. by 8 ft.; larder, 8 ft. by 4 ft.; first floor—bedrooms, 15 ft. by 9 ft. 6 in., 13 ft. by 9 ft., and 13 ft. by 8 ft. In the scullery a fireplace, boiler, and bath are shown, the latter to be supplied from the boiler when required. This part of the building, which is a wing at the rear, can be entered from the back, so that a workman can bathe and change before entering the living rooms at all. The scullery opens into the kitchen, and behind the door is the bath.

NEW BAKERY, ABERDARE CO-OPERATIVE SOCIETY.—A new bakery has been erected at the Gady's on a plot of freehold ground bought by this Society. The block of buildings is 180 ft. long by 20 ft. wide, and two floors in height. It is built of Nantmely white pressed bricks, with red Cattybrook brick dressings to the doors, windows, &c. On the ground floor is a bakery 17 ft. by 20 ft., with cooling-room 13 ft. by 20 ft., both lined with white glazed bricks, fitted up with two pairs of Messrs. Masons' double-decker ovens, dough-mixing machinery, hoist, &c., with stoking 7 ft. 6 in. in the rear. Attached to the bakery by a covered way are an office and engine-room, with one of Crossley's 8 h.p. gas-engines. The cooling-room opens out by means of sliding doors into the large coach-house 38 ft. by 20 ft. The stable block at the south-west comprises eight stalls and horsebox and harness-room. The cart-house and stable are paved with Staffordshire blue brick. On the first floor are two flour stores, each 40 ft. by 20 ft., with hoist from coach-house. Over the stable is a hay and corn loft 73 ft. by 15 ft. The premises have been built by Messrs. John Morgan & Sons, contractors, from the designs and under the supervision of Mr. I. L. Smith, architect, Aberdare, at a cost of 3,000.

SANITARY AND ENGINEERING NEWS.

HARBOUR WORKS, FINDOCHTY, BANFFSHIRE.—The harbour at Findochty is to be deepened and a pier constructed at Sterloch. The Harbour Commissioners have accepted the tender of Messrs. John Adam & Co., of Glasgow, the amount being 4,300. The work will be carried out according to plans by Mr. D. J. Reid, C.E., of Inverness.

WATERWORKS EXTENSION, ST. HELENS, LAN-CASHIRE.—A Local Government Board inquiry was held on the 10th inst. at St. Helens by Mr. H. P. Boulnois, in reference to the application by the Corporation of the Borough for permission to borrow 5,000l. for waterworks purposes. Mr. J. J. Lackland, Borough Water Engineer, explained the details of the undertaking.

FOREIGN.

FRANCE.—Five new rooms are shortly to be opened at the Louvre, for the exhibition of the tapestries, furniture, bronzes, and other objects forming the collection of the *Garde Meuble National*.—A large composition by M. Dagnan-Bouveret, representing "Apollo and the Muses," has been placed in Richelieu theatre in the New Sorbonne.—Various private art exhibitions of interest are now open. At the Durand-Ruel gallery, a collection of Breton landscapes by M. Henry Moret; landscapes by M. Guillaume at the Berthelin gallery; and at Messrs. Toth's gallery the "monotype" paintings on copper by M. Gaston Guignard.—M. Patey, the medalist, has completed his model for the medal commemorative of the founding of Marseilles. The obverse presents the ancient legend of the city, the reverse a view of Marseilles, with the date at the base, encircled by a garland.

GERMANY.—The castle of the Emperor Charles IV. at Tancergunde, is about to be restored, by command of the German Emperor; Herr Möbius, the well-known architect, has been charged by his Majesty to prepare plans for the work.—Designs are invited by Messrs. Seemann & Co., of Leipzig, for a facade to a large building; the competition is open to all architects who speak the German language, and five awards will be made. The designs have to be sent in by the 31st inst., and full particulars may be obtained from Messrs. Seemann & Co.

UNITED STATES.—The President has appointed a Commission to prepare plans for the future development of the city of Washington, composed as follows:—Mr. F. L. Olmsted, of Brooklyn, Mass., who was the architect of the park system of the city; Mr. D. H. Burnham, of Chicago, the architect-in-chief of the recent Chicago Exposition; and these two gentlemen have been authorised to nominate a third person, to act as the remaining member of the Commission.—The great waste of water in Boston is attracting considerable attention; during 1900 water to the amount of 115½ gallons was used per head per day, as compared with 111 gallons in 1899 and 103 gallons in 1898. To abate this waste the compulsory use of meters is under consideration, though much is probably due to leakage from the mains.—It is

proposed to erect a monument in Detroit in honour of General Alexander Macomb, and the design of a Washington sculptor, Mr. Amateis, has been accepted.—Considerable agitation has been made in San Francisco for some time with a view to getting the city supervisors to modify the ordinance which limits the height of fireproof buildings to 120 ft. Several builders have petitioned that the maximum height be increased to 170 ft., and that the limit for a six-story building should be raised from 80 ft. to 100 ft.—The Randolph (Virginia) County Commissioners have decided to erect a courthouse at a cost of about 75,000 dol.

The State of Washington has authorised the purchase of the county courthouse at Olympia, for use as the State capitol, and additions estimated to cost 175,000 dol. will be immediately proceeded with.—The designs for the Westmoreland County Courthouse at Greensburg, Pennsylvania, have been completed by the architect, Mr. W. Kaufmann, of Pittsburgh; the estimated cost of the building is 700,000 dol.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENT.—Mr. W. Scott and Mr. H. G. Gamble, architects, of Lincoln, have entered into partnership.

THE STUDENT'S COLUMN.—Owing to pressure of other matter our "Student's Column article" ("Sanitary Fittings and Plumbing") is held over until next week.

THE SANITARY INSTITUTE.—At an examination in practical sanitary science, held in London, on April 26 and 27, twelve candidates presented themselves, and the following five candidates were awarded certificates:—F. Elgar, G. B. Grave, Kenneth Gray, Percy B. Sands, and Robert Wood.

PUBLIC CREMATORIA.—The Standing Committee of Law of the House of Commons have ordered to be reported with amendments to the House the Cremation Bill, which is in charge of Lord Monkswell and Sir W. Foster. The amendments provide that every public crematorium established by a Burial Authority shall, before it is used, be duly certified by that Authority to the Home Secretary as being complete and properly equipped; that the Secretary of State shall make regulations for the registration of cremations as well as in respect of cremation in general; and that the regulations shall be laid during forty days before both Houses of Parliament. The Bill enacts that in all cases the approval of the plans of proposed crematoria must, in the first instance, be obtained from the Local Government Board.

DERWENTWATER.—The National Trust for Places of Natural Beauty or Historical Interest appeal for contributions towards a sum of 7,000l. to enable them to acquire, on behalf of the public, a portion of the shore of the lake. The property which they seek to purchase covers 108 acres, known as Brandelhow Park, situated on the west side of the lake, below the Catbels slopes, and near Otterfield Bay towards the north. At present the shores of the lake belong to private owners, and there is no general access to them, the landing-places excepted. The proposed purchase would give the public access to about one-sixth of the west-side, and prevent the land from being taken for other purposes, or, at least, from being disfigured with sign-boards and advertisements.

STREET IMPROVEMENTS, HAMMERSMITH.—The Hammersmith Borough Council recently passed the usual statutory resolution for putting into operation Michael Angelo Taylor's Act, for carrying out a large street improvement at the eastern end of the Borough, in the vicinity of Blythe-road. The scheme provides for the acquisition of the whole of the site of the Swan laundry, so that Augustine-road may be continued into Blythe-road; for the removal of the triangular projection now existing at the point of junction of Blythe-road and Dewhurst-road; and for the widening of Blythe-road to 40 ft. on the south side, leaving a valuable area for the purpose of recon-ment.

BRITISH FIRE PREVENTION COMMITTEE.—The Executive of the British Fire Prevention Committee announce that the opening of their new testing station at Westbourne Lodge, Bayswater, which had to be postponed on account of the illness of their Chairman, Mr. Edwin O. Sachs, will now take place on Wednesday afternoon, the 22nd inst., when testing operations will be resumed and the issue of the Committee's reports, which have already reached an aggregate of sixty, will again be regularly proceeded with.

CAPITAL AND LABOUR.

YORK BRICKLAYERS' STRIKE.—Members of the York Branch of the Bricklayers' Operative Society, to the number of over 200, gave an hour's notice at eleven on Saturday morning last to the employers, and left at noon, taking their tools. The difference is one respecting working rules hitherto existing between masters and men.

PENRHYN QUARRIES.—Arrangements are being made for reopening the above and giving police protection to men who work, but it is not anticipated that more than a few hundred will resume work.

LEGAL.

THE NEW STREET FROM HOLBORN TO THE STRAND.

The case of the London County Council v. the Metropolitan Electric Supply Company, Limited, came before the Court of Appeal, composed of Lords Justices Collins and Stirling, on Thursday, the 8th inst., on the appeal of the defendant company from an order of Mr. Justice Farwell, dated April 25 last. The case was reported in the *Builder* of May 4, 1901.

The case raised a question of interpretation of a Section of the London County Council (Improvement) Act, 1899. When the Act was passed the defendant company had a generating station and works for the purpose of electric lighting in Sardinia-street, the whole of which was required to be taken by the County Council for the purposes of the new street from Holborn to the Strand. A statutory bargain was arrived at between the parties which was embodied in Section 58 of the Improvement Act. The dispute arose under Section 7, which provided in effect that the Council before the date of conveyance and lease of the new site (which the Council had to provide for the company) should pay or secure to the satisfaction of the company a sum equal to the costs of erecting and fitting-up a new generating station upon the new site with new plant of a capacity to generate and supply electrical energy to an output of not less than 4,000 kilowatts. The plaintiffs contended that this meant that they were only bound to provide a sum equal to the costs and expenses of erecting and fitting up a new generating station, with new plant, of a capacity to generate and supply electrical energy to an output of not less than 4,000 kilowatts, and that they were not bound to bear the expense of a new plant of a capacity to generate and supply electrical energy to an output of 5,000 kilowatts or any number more than 4,000 kilowatts, on the ground that, under unusual circumstances, a more powerful plant might be required to generate and supply 4,000 kilowatts. The defendants, on the other hand, contended that the sum claimed by them was based on the station and plant being of a capacity to generate and supply such output as a matter of practical commercial working, and that it was impossible for them to generate and supply an output of not less than a fixed amount without having in addition to the minimum plant capable of generating or supplying such an amount temporarily spare or extra plant in case of a breakdown or repairs. Mr. Justice Farwell held that the plaintiffs were right in their contention, and granted a declaration to that effect—hence the present appeal of the defendants.

Mr. Cripps, K.C., Mr. Butler, K.C., and Mr. Sargent appeared for the appellants, and Mr. Haldane, K.C., Mr. C. E. Jenkins, K.C., and Mr. Method for the respondents. At the conclusion of the arguments of counsel, Lord Justice Collins, in giving judgment, said it was obvious that in order to ascertain what sum was to be paid by the County Council, they must have a decision by competent persons on questions of fact. It was substantially agreed that the matters in dispute, and it had been thought desirable to anticipate the arbitration by taking the opinion of the learned judge as to the construction of a point of law arising upon the section in question. The short point of law which the learned judge had to decide was whether, as a matter of law, the arbitrator was to be debarred from allowing, and therefore calling upon the defendants to pay for anything more than for such engines which could fairly be graded up to 4,000 kilowatts. It seemed to him that if he were sitting as a judge bound to disengage the question of law from that of fact he should come to the conclusion that on the section in question the proper direction would be that the sum to be paid would be for such plant as would be required to generate for a reasonable period under all conditions such as might reasonably be anticipated an energy of not less than 4,000 kilowatts. Dealing simply with the matter as a matter of law that nothing, he could not lay down as a matter of law that a jury more than four machines of a capacity of 1,000 kilowatts would be required to accomplish that purpose, nor on the other hand could he lay down that anything more would be required. That would be for experts to determine, and if they said that four such engines were not competent in an ordinary commercial sense to carry out the obligation imposed upon the defendants continually supplying an output of 4,000 kilowatts, then the County Council must find the money and pay for anything more that was required. He thought that the appeal must be allowed. Lord Justice Stirling concurred and the appeal was accordingly allowed.

ACTION FOR LIEBEL BY ASPHALTERS AND TAR-PAVIORS.

The hearing of the case of Grounds and Another v. Hickman and Another concluded in the King's Bench Division on the 9th inst. before Mr. Justice Channell and a common jury, an action brought by the plaintiffs, Messrs. Grounds & Newton, a firm of asphaltes and tar-paviors, to recover from the

defendants, Messrs. Hickman & Leatherdale, the proprietors of the *Woodford Mail* and the *Winstead Mail*, damages for alleged libel.

It appeared that the plaintiffs contracted for some years to do the tar-paving and other work for the Woodford Urban District Council, and that in August, 1900, the defendants published in their two newspapers in question reports of a speech delivered by a Mr. John Knight at a meeting of the Council, and added the following paragraph: "Mr. John Knight made some very forcible criticisms on Monday evening at the Woodford Council meeting on what he fitly described as the 'slovenly manner in which the tar-paving contract work of the parish has been carried out.' He proposed that no further tar-paving be done under the present contract except such as shall be approved after view by the Highway's Committee, and his motion was carried. This is good news. Mr. Knight is an authority on paving work, and we are pleased he has soon given the parish the benefit of the open expression of his opinion that the ratepayers' money is being wasted when contracts are given to incompetent firms."

The plaintiffs' case was that these words referred to them, and were defamatory to them. The defendants denied that the paragraph in question referred to the plaintiffs, but alternatively pleaded that if it could be so construed it was fair comment on a matter of public interest. In another issue of their papers the defendants published the following: "Messrs. Grounds & Newton, the present contractors for tar-paving to the Woodford Council, having taken exception to a paragraph in the *Mail*, stating that the ratepayers' money must not be wasted on incompetent firms, we hasten to make clear to our readers that Messrs. Grounds & Newton's firm was not one of the 'incompetent firms' therein referred to. The paragraph in question was written in a general sense, and was only intended to emphasise the necessity of laying out the public money in the best possible advantage."

In the result the jury awarded the plaintiffs 25s. damages.

Judgment accordingly.

Mr. F. Dodd appeared as counsel for the plaintiffs, and Mr. M. O'Connor and Mr. Campbell Macrae for the defendants.

about 1,000*l.* as interest, and if the smaller sum, only about 400*l.* in interest. There was no suggestion that the plaintiffs were not perfectly solvent people quite able to pay the money back if the appeal of Messrs. Bemrose were successful. They were builders in a large way of business, and it was obviously a great disadvantage to them to have their money locked up in this way.

Mr. Lyttelton said that four years ago his clients tendered to Messrs. Ford 1,500*l.*

Mr. Walton: In full discharge; not on account. Now after a long argument we have got the judgment of the Divisional Court in our favour. The Divisional Court refused a stay, and I submit there is no ground for disturbing the decision of the Divisional Court.

In the result Lord Justice Collins said it seemed to him there was a substantial point of law to be argued on the appeal, and he thought that a stay of execution ought to be granted until the hearing of the appeal, on the defendants paying 2,300*l.* into court and the taxed costs to the plaintiffs' solicitor on his undertaking.

Lord Justice Stirling concurred.

EMPLOYERS' LIABILITY ACT AND THE WORKMEN'S COMPENSATION ACT.

RESULT OF PROCEEDING UNDER THE WRONG ONE.

THE case *Davies v. Nash* (reported in these columns a few weeks ago) came again before Judge Stonor on Tuesday at Marylebone County Court. Mr. T. Davies, a plasterer, Kensal-terrace, Kensal-green, was the plaintiff, and he sought, under the Employers' Liability Act, to recover damages from Mr. David Henry Nash, builder, Fernhead-road, Paddington, the claim being in respect of personal injuries sustained by the plaintiff, owing (it was contended) to negligence, for which the defendant was responsible, in the construction of a ceiling scaffold.

At the previous hearing the jury found that there was no defect in the scaffold, and that the defendant was not guilty of negligence which caused the accident. Judgment was accordingly given for the defendant, but his Honour suggested that the plaintiff might have a claim under the Workmen's Compensation Act.

Mr. A. H. D. Nonweiler, solicitor, appearing for the defendant, now intimated that on behalf of his client he consented to the plaintiff receiving 10*l.*, which was all that he could claim under the Workmen's Compensation Act. He (Mr. Nonweiler), however, applied on behalf of the defendant for costs in the action under the Employers' Liability Act. The case had been adjourned at the request of the other side, with a view to joining another before notice was given to the second builder, the latter could not be made a party to the action.

Ultimately his Honour gave judgment for the plaintiff for the 10*l.*, and allowed the defendant the costs of the previous action.

It was mentioned that the defendant's costs amounted to considerably more than the compensation awarded the applicant.

SLATE MERCHANTS AND BUILDERS.

AT the Southwark County Court, on the 8th inst., his Honour, Judge Addison, K.C., heard a remitted action, in which Messrs. Roberts, Adlard, & Co., slate merchants, of Dockhead, Bermondsey, sued Messrs. Nightingale, builders, to recover 24*l.* 5*s.* 8*d.* balance of account for slating supplied and work done. The defendants admitted the claim, but counter-claimed in regard to five items.

Mr. Bankes was counsel for the plaintiffs, and Mr. Duckworth for the defendants.

The case on the counter-claim was opened by Mr. Duckworth. He said the action was originally brought for 250*l.* odd, but his clients made a payment of 20*l.*, leaving 31*l.* 4*s.* 2*d.* On the day the writ was issued a further sum of 6*l.* 18*s.* 6*d.* was paid, thus reducing the claim to 24*l.* 5*s.* 8*d.* The defendants tendered on a bill of quantities for a contract for the baths in Lattimer-road, Wimbledon, for the Wimbledon Corporation, and they entered into a sub-contract with the plaintiffs for the roofing and the supply and fixing of some slate slabs to form slipper baths. The order was given as far back as December 28, 1899, and there was a provision that certain large thick slabs were to be supplied whole. This was found to be almost impossible, and the architect allowed the slabs to be delivered in two pieces, with a perpendicular rebated joint. There was considerable delay on the part of the plaintiffs in accepting the order for the roofing, it not being booked until March, but the defendants held that that for the slabs was entered in December.

The roofing, however, was proceeded with and was finished within reasonable time, but the slabs were not supplied and fixed until the following September and October, and the defendants contended that this was an unreasonable time to take for such work. The first item in the counter-claim was in regard to a fine edge on the rebate, for which 10*l.* 17*s.* 11*d.* was charged. The defendants contended that this fine edge was included in the price paid for the rebate, as per schedule.

Mr. J. J. Greenwood, a member of the firm of Williams & Co., slate merchants, was called by the

defendants. He said his firm would charge 3*d.* for a rebate, which would include a fine edge. The price of 2*d.* charged by the plaintiffs for the rebate ought to include a fine edge. In his opinion, three months was a reasonable period in which to carry out such slab work as in that case. Seven and a-half months was an unreasonable period to take for such work.

Cross-examined: There was a distinction between sawn edges and rebates. A rebate was not complete without it was rebated, but a sawn edge could either be rubbed or left rough, according to the order. An extra charge would be made for rubbing a sawn edge.

Mr. David, one of the plaintiff firm, said that when the defendants wrote that they would be ready shortly for the slabs, he put the matter in hand, and delivery took place soon afterwards. His firm did not delay the matter. As to the chases, it was no part of a state-mason's duty to make them. The quotation stated that a penny would be charged for rubbing exposed edges, which were edges that could easily be seen or felt. The edges of the rebates were exposed edges, and therefore came within the specification. There were three edges to the rebates, and they charged threepence.

Cross-examined: He charged only for the edges on the exposed rebates which were on the doors. The edges of the rebates where the slabs were joined had not been charged for.

The case occupied nearly a whole day, and his Honour, in giving judgment, said he had heard it because he knew from experience of the enormous expense which would have been incurred had he referred it. He would not go into the matter in detail in giving judgment, except to say that the fine edge was necessary, and the plaintiffs were justified in charging for it as they did. On the whole he gave judgment for the plaintiffs on the claim and counter-claim, with costs.

Judgment was entered accordingly.

THE ACTION AGAINST A DISTRICT COUNCIL FOR NUISANCE.

THE case of *Hawkes v. the Leyton Urban District Council* came before Mr. Justice Buckley in the Chancery Division on the 14th inst., on the application of the defendants for a modification of the order of sequestration granted against them by his lordship and confirmed by the Court of Appeal. The case was reported in the issue of the *Builder* of May 11. Mr. Justice Buckley ordered that the writ of sequestration should issue against the defendants for disobeying an injunction granted in April last year restraining the defendants, at the suit of the plaintiff, a resident at Leyton, from carrying on their works in connexion with electric lighting in such a way as to cause a nuisance by noise and vibration. On two occasions the operation of the injunction was suspended on undertakings given by the Council, on whose behalf it was stated that they were erecting steam plant which would be no nuisance. Upon appeal, the Court of Appeal confirmed the order of Mr. Justice Buckley, but limited the injunction to noise and vibration caused by gas-engines. The plaintiff afterwards applied to Mr. Justice Buckley for a writ of sequestration on the ground that the defendants had deliberately and wilfully disobeyed the order of the Court, and, as before stated, his lordship granted the application and the Court of Appeal confirmed his order, but directed that the writ should lie in the office for one week in order to give the defendants an opportunity to apply to Mr. Justice Buckley for any indulgence they might think themselves entitled to.

Mr. Henry Terrell, K.C. (with him Mr. Dibdin, K.C.) on behalf of the defendants, said that since the order of the Court of Appeal on May 8, a special meeting of the Council had been held at which all members were present with the exception of four, and a resolution was unanimously passed that the clerk should be instructed to make this application for the purpose of telling the Court that the Council were not aware until the motion for sequestration was made that there had been any breach of the order or undertaking; that it was their intention strictly to obey the order, and their desire to apologise to the Court for their disobedience. Those resolutions were proved by an affidavit of Mr. Atkins, the chairman. He (counsel) now asked that the writ of sequestration be discharged upon the defendants undertaking not to use gas engines except in the case of emergency.

Mr. Astbury, K.C. (with him Mr. A. Beckett Terrell), for the plaintiff, left the matter in the hands of the Court.

Mr. Justice Buckley said there could be no doubt that there had been by the defendants a very grave breach of the order of the Court. The order he should make would be one restraining the defendants from working gas engines at all. He imposed the term of the defendants submitting to an injunction, so that in case the order was disobeyed there would be some responsible person who could be sent to prison. He would suspend the issue of the writ of sequestration till June 17 to enable the defendants to take professional advice and be able to tell his Lordship what they proposed to do to enable them then to provide for their requirements without nuisance. If he was then

satisfied with their proposals he should be prepared to grant a further extension of time. The motion would accordingly stand over till Monday, June 17. Order accordingly.

AN ARCHITECT'S ACTION FOR FEES.

The case of *West v. Barclay* came on on the 14th inst. before Mr. Justice Kennedy, sitting without a jury, in the King's Bench Division. This was an action by the plaintiff, an architect, practising in Maddon-street, to recover from the defendant 295*l.*, the balance of fees he alleged to be due to him. The material facts were as follows.—The defendant employed the plaintiff to carry out certain improvements at Gadesby Hall, in Leicestershire, at a cost of 14,340*l.*, and the question in dispute was whether the plaintiff was to be limited to the ordinary 5 per cent. upon the total usually charged, or whether he was entitled to an extra 5 per cent. The plaintiff alleged that he was entitled, by reason of an agreement which he had entered into with the defendant to keep and pass the accounts, and to act as builder and contractor as well as architect, to an extra 5 per cent., making 10 per cent. in all. The defendant, while admitting that there was such an agreement, alleged that 5 per cent. was all that the plaintiff was entitled to.

His Lordship having heard evidence came to the conclusion that the plaintiff's claim for 10 per cent. was clearly untenable, but thought that he was entitled to something beyond the 5 per cent. scale, inasmuch as he had done more than an architect would have done under that scale. He accordingly held that the plaintiff was entitled to remuneration at the rate of 7½ per cent. on the total amount after certain items had been deducted; and in the result, on the state of accounts between the parties, gave judgment for the defendant with costs.

Mr. Reginald Brown, K.C., and Mr. Spencer Bower appeared as counsel for the plaintiff; and Mr. Reginald Bray, K.C., and Mr. H. D. Bonsey for the defendant.

RECENT PATENTS;

ABSTRACTS OF PATENTED INVENTIONS.

770.—A GAS REGULATOR: *R. Hein and T. Hahn.*—The gas flows around a valve to a floating bell which is dipped into mercury, and passes thence through pipes to the outlet. As the bell rises the valve—to the stem of which it is fixed—closes upon its seat, the overlying packing will adjust itself to the upper fixed seating of the valve in the face of which a groove is cut for that purpose, and the exit tube is provided with a regulating screw.

782.—APPARATUS FOR VENTILATORS: *W. B. Johnson.*—In an opening of the wall is fitted a frame which carries a set of curved louvers that will act as baffle-plates, the middle one being extended and pivoted at its sides so that it may serve to regulate the extent of the inlet opening, and also to separate the incoming from the outgoing currents of air.

791.—MANUFACTURE OF ARTIFICIAL STONE: *H. Schürholz.*—After the lime has been wetted in baskets it is spread over a layer of damp sand from the pit in a mixing-cylinder, and is covered with another layer of sand, superfluous moisture and both components being absorbed by the slaking of the lime; water is subsequently added to the resultant dry powder, and the blocks are then moulded and hardened.

800.—A HOLDFAST FOR PIPES: *F. Hague.*—The holdfast is devised for fastening socketed rainwater or waste pipes against the walls of buildings. Elongated and inclined slots are cut in two flat wings or lugs, which are combined with the pipe-socket.

810.—TILES FOR WALLS AND ROOFS: *W. F. Jones.*—The tiles, fashioned in the shape of a lozenge, have their lower ribs on the inside and their upper ribs on the outside, with rebated sides for interlocking purposes, together with inside ribs or ridges and nail-holes for the hanging ribs. The flowing of water beyond the joints and its suction by capillary attraction are prevented by means of grooves made in the side ribs.

818.—CHIMNEY COWLS AND TOPS: *F. Linklater.*—The inventor has devised a spiral band which, when it is mounted so as to rotate upon a vertical spindle, is provided with additional blades that it may be turned by the wind.

885.—A CONTRIVANCE FOR USE IN DRY DOCKS, AND SIMILAR PURPOSES: *R. Lewis.*—A bilge-block, which rests on the vertically-moving portion of a screw-jack, is pivoted to the framing; the lower platform is set to turn about an axle in such a manner that pressure upon the bilge-block will tend to cause the platform to turn in a direction opposite to that of the hands of a clock, the amount of pressure being indicated to the workman at the hand-wheels of the screw which lifts or lowers the movable part of the screw-jack by means of the attachment to a spring balance of the one end of a wire, whereof the other end is fastened to the platform. The position of the screw is shown with an indicator, and—in a variant shape—one hand-wheel may serve to move two bilge-blocks.

891.—LATHING OF "EXPANDED METAL": *R. G. Sykes.*—Lathing intended for fireproof buildings is

made of rolled sheets of which the V-channels or strips are bent in opposite directions; in another shape the joining-strips are twisted, and in that case all the channels are made so as to be opened outwards.

896.—A CLUTCH FOR LIFTING AND SIMILAR GEAR: *F. T. F. Conti.*—For an automatic disengagement of the clutch at a predetermined time, and (in the case of control by the governor of a Meyer expansion gear) for rendering the number of revolutions of the valve spindle a function of the extent of movement of the governor, the ascent or descent of the governor moves lengthwise a screwed socket, for each position of which will be established a corresponding position of the expansion slides of the engine; then as the spindle continues to revolve it will, by means of the socket, liberate a projection which has been engaged by the governor with a pinion. That same object will also be attained by substituting for the socket a screwed ring that encompasses a muff around the spindle, and will be moved lengthwise by the governor.

916.—AN APPLIANCE FOR WINDOWS: *E. Kiebbel.*—For opening or closing a window or hinged frame the cord is fastened to a curved pierced stay-rod pivoted on to the window, and is then passed over a pulley mounted upon a lever at the end of which is a catch which (upon release of the cord) a spring draws into engagement with the stay-rod, which a pull of the free end of the cord will again liberate. The movement of the lever is limited in extent by means of a stop formed upon the flanged bracket that carries the lever and has a fixed support.

930.—FITTINGS OF BASINS FOR LAVATORIES: *W. D. Mount.*—A bracket for lavatory basins and similar purposes consists of a front bar and two separated sides, each of which is indented at intervals in order that any length may be broken off. The sides will slide through slotted projections upon angle-irons of the corner-joints, and can be fastened with set-screws. The brackets that have no front bar, the sides consist of two parts, whereof one slides over the other.

940.—REGULATOR VALVES FOR FLUSHING MECHANISM: *F. Shanks.*—In this invention, which is adapted also for use with ships' closets, the valve is attached to the lower end of a weighted cylinder that has a slot in which slides a rod; on the end of the rod is a block through which the lever of the discharge-valve is inserted. As soon as the discharge-valve has been operated the block will impinge against the top of the cylinder and so deliver the flush as it lifts the cylinder and the valve, but the cylinder will, through gravity, sink so as to shut the valve as soon as the handle has been released. In some cases the valve may be fastened to a block which will work within a cylinder as the handle is being operated, a relieving valve being fitted in the block.

955.—FOLDING GATES: *F. Bode.*—Vertical bars pivoted to top and bottom links constitute a folding gate, which is mounted upon a post from which are projections on to which the bars are pivoted. The outer ends of bars pivoted to the top and bottom of the post are bent and provided with rollers that will engage at opposite sides in slots cut in the remotest vertical bar. They are also linked together so that when the handles moved to operate a lever the two bars will move to either open or fold up the gate; a catch retains the lever in either position. Links from the lever, that engage alternately with the bars, have projections that cause the lever to draw some of the bars inwards and to force the other bars outwards at the folding of the gate.

961.—TOOLS FOR ROAD-MAKING AND TRENCHING MACHINES: *H. Morrison.*—Bars and levers forming a parallel motion carry the square spindle upon which the tool is mounted. Since the spindle is rigid as regards the bar, the tool will remain always parallel with itself as it is lifted and depressed by the worm and sector. For removal of broken earth the tool-bolder is fitted with a digger or scoop.

969.—ROOFING TILES: *H. Wilken.*—In order that the outer surface of the roof when tiled shall present no projections, the tiles are fashioned with tongued and grooved edges that will interlock, and with bevelled lower edges that will fit into corresponding angular recesses in the tiles next below, while the lower ends of the side ribs of the tiles next above fit into recesses in the middle of the angular portions, the tiles being laid so as to break joint.

1054.—SIPHONICAL DISCHARGE: *S. Clark.*—The lifting of a valve allows the discharge to enter the longer leg of the siphon, thus starting the action. The valve-rod is joined to a pivoted lever upon the free end of which is a disc that forms the top of a bellows placed in communication with a ball. When the ball is squeezed the valve is lifted for starting the flush, as the lever is thereby forced upwards.

1063.—FLUSHING APPARATUS: *R. Pauls.*—To the float is attached the sliding piston of the stand-pipe, through openings in which, as well as through an annular groove in the piston, the supply-pipe will discharge. The supply becomes cut off with the rising of the float, and when the latter is lifted still higher with the pull the flush will escape through holes in the stand-pipe as they are left uncovered by the piston.

1118.—MANUFACTURE OF BRICKS: *T. Whittaker.*—The upper of the two plungers is mounted upon a cross piece which is vertically reciprocated with

cranks upon the shaft, whilst cams upon the shaft reciprocate a cross head which carries the lower plunger. The surplus clay is squeezed back again into the mill as the lower plunger rises after the upper plunger has been depressed into the mould and clay is filled into the mould. The pug-mill becomes automatically arrested when the lower plunger is lifted above the opening in the mould, the plungers then press the brick between them and ascend to raise it out of the mould. A cross head moves a pusher, which transfers the brick to the second mould or elsewhere, as may be required, and the pug-mill is again started with the action downwards of the lower plunger. The machine to which the improvement relates is specified in No. 7,450 of 1895.

1141.—MEANS OF AFFIXING PLASTIC MATERIALS TO WOODWORK: *S. Elliott.*—For securing plaster, cement, asphalt, and similar plastic materials the inventor has devised flattened discs composed of cement, earthenware, &c., having undercut or bevelled edges which are to be affixed to the wood-work with inclined nails, and over which the plastic coating can then be laid. The discs are described as being available instead of laths in the construction of fireproof ceilings, walls, floors, roofs, and so on.

1148.—CONDUITS FOR ELECTRICAL CONDUCTORS: *Siemens Bros. & Co., A. E. Foster, and H. F. Nott.*—The troughs or conduits have their lids thickened in the middle so as to form fitting shoulders, and they have also portions that project within them which will afford a raised support for the conductor as well as provide a spigot-joint.

1200.—A BRACKET FOR SHELVING: *B. Smith.*—A wedge having inclined teeth is tongued and grooved on to the wedge to which the angle-iron support is fastened; the support has a slot that takes the pin of the former wedge; in the end of the bookcase is a groove which receives the two wedges that become jammed together, the weight of the shelf. The bracket can be freed for its adjustment by a lifting of the toothed wedge.

MEETINGS.

FRIDAY, MAY 17.

Society of Arts (*Howard Lectures*).—Mr. Alfred C. Eborall on "Polyphase Electric Working." IV. 8 p.m.
Architectural Association. *Section.*—Mr. P. E. Newton on "A Tour in Mid-France." 7 p.m.

SATURDAY, MAY 18.

Architectural Association.—Last Spring Visit, to Chesterfield House, Mayfair (Lecture). 7.30 p.m.
Association of Municipal and County Engineers.—Oswestry meeting.
Royal Institution.—Professor W. M. Flinders Petrie on "The Rise of Civilization in Egypt." II. 3 p.m.
Edinburgh Architectural Association.—Visit to Pittarone House and Pittarone House and Glen.

MONDAY, MAY 20.

Royal Institute of British Architects.—Professor W. M. Flinders Petrie on "The Sources and Growth of Architecture in Egypt," illustrated by lantern slides. 8 p.m.
Institution of Junior Engineers.—Visit to the works of the Renewable Electric Lamp Company, Brunswick-place, City-road. 6 p.m.

TUESDAY, MAY 21.

Society of Arts (*Applied Art Section*).—Professor W. M. Flinders Petrie, D.C.L., on "The Rise and Development of Egyptian Art." 8 p.m.

WEDNESDAY, MAY 22.

Institution of Electrical Engineers (*Birmingham Local Section*).—Discussion on Mr. A. C. Eborall's paper, "Some Notes of Polyphase Substation Machinery." 7.30 p.m.

THURSDAY, MAY 23.

Carpenters' Hall, London Wall (*Lectures on Carpentry and Joinery*).—Mr. E. J. Barr on "Timber Houses." 7.30 p.m.
Institution of Electrical Engineers (*Dublin Section*).—Annual general meeting. Mr. W. Tallow on "The Arrangement of Accumulators in a Small Installation." 7.30 p.m.

SATURDAY, MAY 25.

Royal Institution.—Professor W. M. Flinders Petrie on "The Rise of Civilization in Egypt." III. 3 p.m.

some one's large painting of Christ on the Cross; but this attempt at symbolism of position (for which the Hanging Committee are responsible) will not do; the painting is no more a Magdalen than anything else; any name would do for it. With M. Prinet's "Songe d'Automne" we are in a different region; this figure reclined in the forest on the dead leaves is a poem, and a fine one. M. Lenoir's "Eros" is worth notice for fine painting, and bright expression, also M. Zacharie's clever little picture "La Femme à l'Oiseau," a kneeling figure with her face foreshortened, and snapping her fingers at a bird fluttering about—a really pretty and original fancy, and admirable in colour. Pretty also, though much inferior to the last-named in an artistic sense, is M. Le Quesne's fancy of three nymphs decked with coins and little else, representing "La Monnaie Française." M. Henner has a small nude figure in a dark landscape, of his usual type of feeling and execution—called, oddly enough, in the earlier editions of the catalogue, "Portrait."

A fine decorative painting is exhibited by Mlle. Marie Carpentier (a pupil of M. Raphael Collin), under the title "Repos," a richly and broadly treated evening landscape with draped figures; a kind of work which one only sees in a French exhibition—no English artist seems to have the feeling for it; or is it perhaps supposed that neither the Academy nor the public in this country would appreciate such purely intellectual painting, and that therefore the effect would be thrown away? A decorative picture of another kind, and the value of which is more open to question, is M. Quost's curious work, "Panneau Decoratif," consisting of a very flat and artificial treatment of a flowering garden, making a kind of screen of what may truly be called "artificial flowers" in the foreground, while in the background are seen some grey silhouetted figures of girls in the ghost of ordinary costume. This is a State commission—we do not learn for what. It comes as near as is possible to making a picture into a mere pattern.

Among figure pictures which come nearer to life and humanity is the "L'Adieu" of M. Ridet, whose fine works in which figures of everyday life are treated in a poetic manner have been before mentioned in our columns. This consists of two ladies on a pier watching a retreating steamer, one supporting the other; the point of the work is the manner in which a realistic representation is subdued in treatment and colour so as to give a kind of imaginative glamour to it; this is not, however, quite equal to some of this painter's previous works of the same class. M. Maxence's "Le Livre aux Éillettes Rouges," half-lengths of two women with a book, is a very original and clever piece of what may be called mediævalism in painting, worth attention for its originality. Then we have of course the "moral lesson" paintings of modern life, most prominently illustrated in M. Duvent's large triptych "La Joie du Travail," of which the side scenes represent work on the recent great exhibition, and the centre an illuminated fête of the completed exhibition; highly instructive no doubt, but not very valuable from an artistic point of view. Of what may be called idyllic paintings, in which figures and landscape are combined and transfused with the same sentiment, pleasing examples are to be found in M. Lelong's "Un Soir" where

two rustic lovers are seated in front of a landscape and village bathed in evening light; and, in a more pathetic key, M. Voisard's "Coucher de Soleil," where the composition is cut across obliquely by the line of a hillside on which sits a woman in a melancholy attitude watching the setting sun. War pictures are not as numerous as usual, nor mostly very good, but there is one small work (in Gallery 23) by M. Sergent, which should by no means be passed over: "Attendant Sa Reserve". Napoléon at Marengo, still with the look and figure of a young man, seated (according to a contemporary account) on a bank at the edge of the high road holding his horse by the bridle, and looking down the road by which the reserves were to come up; one of the best and most real contributions to the pictorial illustration of Napoléon's career.

There are a good many fine portraits, of which M. Benjamin-Constant's of the Pope may be said to be the most remarkable both in execution and in expression of shrewd and penetrating character. M. Roybet's head of a coarse-looking man wearing eyeglasses is not beautiful, but one of the most forcibly painted things in the Exhibition. Among the portraits of ladies are some exceedingly fine ones; two half-lengths by M. Lauth, superb in colour and dignity; M. Gervais' queenly full length in black velvet, looking back from a window at which she stands; M. Hébert's two small and very characteristically coloured and highly finished half-lengths, in black frames which form a calculated element in the effect; M. Guinier's portrait of a lady in eighteenth century costume and holding a long wand, a picture with a texture and execution rather like pastel; and M. J. J. Lefebvre's exceedingly fine "Yvonne," a seated portrait of great dignity and beauty, and showing a bold and singularly effective line in the arrangement of the costume.

(To be concluded in our next issue.)

NOTES.

THE death of Mr. Arthur Cates removes from the architectural world of London a long-familiar figure which will be held in kindly remembrance by many both of the older and younger members of the profession. Though essentially a surveyor rather than an architect, Mr. Cates took the greatest interest in the advancement of architectural education; it was largely owing to his initiative that the Institute examinations in architecture were started; and even those who differ as to the value of these must recognise the praiseworthy motives which prompted his continued zeal in support of them. As a surveyor Mr. Cates occupied an exceptional position, and the fact of his appointment to be chairman of the Tribunal of Appeal was a notable practical testimony to the confidence felt in his knowledge and integrity. Some further particulars as to Mr. Cates' professional career will be found in our obituary column.

We have received a circular from the "Roads Improvement Association," which was incorporated in 1898 with the object of obtaining better roads in the United Kingdom. The Association now intend to bring organised pressure to bear on Parliament to amend

the existing system of administration. The points to which they specially draw attention are the amount of avoidable wear and tear of vehicles caused by the rough and uneven surfaces of the majority of roads; the increase in road traffic and the development of new methods of locomotion, and the necessity of wider and better roads both on this account and for purposes of national defence (for the movement of troops and the transport of stores). The machinery for widening existing roads is so expensive and so cumbersome that few Local Authorities can be induced to put it into operation. The conclusion of the Association is that "a general improvement can be most readily effected through a central department directly responsible to Parliament." We believe they are quite right, and that this movement should have every support from the public. What strikes one most in traversing the roads of different counties in England is the great difference between the efficiency and the maintenance of the high roads under different County Authorities. In one county we find evidence of care and attention bestowed on keeping the roads in good condition; in another county we find the roads going to pieces for want of proper maintenance. In some districts, too, high-roads which have been set out centuries ago at a width perhaps at that time adequate to the requirements, still retain the same width, now become totally insufficient. A reform is much needed, and the establishment of a central authority would probably be the best way to bring it about.

The South Metropolitan Gas Bill. The preamble of this Bill has been proved, but the transfer of the property south of the Thames, now belonging to the Gas Light and Coke Company, to the South Metropolitan Company, is not to be made until Parliament has granted the former Company power to raise further capital. Any money obtained by the sale of gas at a higher rate to Local Authorities is to be used by the Gas Light and Coke Company for the relief of the ordinary gas consumer. For three years in succession the Gas Light Company has unsuccessfully endeavoured to obtain permission from Parliament to raise more capital, and it is therefore uncertain when the transfer will be made. Meanwhile, the Gas Light Company has, we understand, decided to check its output of penny-in-the-slot meters, because the ordinary consumer is more profitable; this is a retrograde step which will naturally increase the unpopularity of this great company, and will be severely felt by the working classes.

Power Gas at 3d. per 1,000 cubic feet. In the face of strong opposition, the preamble of the Mond Gas Bill has been proved, a few unimportant conditions being attached. Under this Bill a company is to be formed which will supply Mond gas to Smethwick, Walsall, West Bromwich, Wolverhampton, and a number of neighbouring towns. The gas is to be used for purposes other than lighting, and the maximum price is to be 3d. per 1,000 cubic ft. to consumers using more than four million cubic feet per quarter, and 4d. per 1,000 cubic ft. to consumers using less than that quantity. The promoters hope to be able to supply the gas at half the charge mentioned as a maximum. The company is to have the right of refusing to supply any

consumer with less than one million cubic feet per quarter, but as the gas is used at the rate of one million cubic feet per hour at the works of Brunner, Mond, & Co., in Cheshire, it is not anticipated that any works would require less than this quantity per quarter. Mond gas burns with a non-luminous flame, and has a heating value of about one-fourth that of ordinary coal gas. It can be applied to all descriptions of gas engines, including those used for driving dynamos for electric lighting. The scheme is a bold one, and should it prove a financial success, which is somewhat doubtful, a demand will speedily be made for a supply of gas cheaper than coal gas in other large towns. In London, water gas, having half the heating power of coal gas, but double that of Mond gas, would probably be found the most suitable, especially as it can be used without difficulty, after purification, for incandescent gas lighting. The progress of the experiment will be watched with the keenest interest.*

LONDON ought to feel grateful for the memorandum from Lord Rayleigh's Committee on

the vibration caused by the Central London Railway. A short time ago there was so great an outcry from those residing or having business premises along the line, as well as from others, that it seemed probable the extension of tubular railways might receive an untimely check. In the memorandum to which we refer it is stated that the Committee is satisfied of the fact that serious vibration was felt in many houses on the course of the Central London Railway. Self-recording instruments indicated that vibration arose from the large proportion of weight of locomotives not carried by springs, and also from want of rigidity in the metals. The investigations of the Committee are not yet concluded, and when the results of further experiments are known, a more definite opinion than is at present possible is promised as to the steps that should be taken to reduce vibration on the line in question, and as to the features that should be included in new lines of a similar character. Meanwhile, it is gratifying to hear that the Committee believes that, under proper conditions, vibration can be prevented. A new form of locomotive has already been ordered from America by the railway company, and endeavours are being made to improve the permanent way, the unsatisfactory condition of which has been the subject of comment for some time past. Our opinion is that locomotives at all are a mistake, and we venture to think that this view will be fully justified by facts at no distant date.

THE recently published annual report of the Machinery Users' Association for the year ending March 31 last shows how difficult are the questions which are now constantly arising in regard to the rating of machinery. It is pointed out that at Nottingham certain machinery was rated not only on its full value, "but also on the value of certain patent rights." This is somewhat ambiguous, but we understand it to mean that this machinery, being protected by the Patent Law, was regarded as of more value than

* For further information regarding the Mond scheme see the *Builder*, February 9, 1901.

arose from its manufacturing use only. This case is likely to be heard of again in the High Court, and is obviously one of some importance. The value of combination among capitalists is also made clear when it is stated that this Association assists in appeals by manufacturers against new valuations by rating authorities. Combination is, in fact, the only way by which traders or private individuals can appeal against powerful bodies.

Storage Batteries.

MR. HIGHFIELD read a paper on "Storage Batteries Controlled by Boosters" to the Institution of Electrical Engineers last week. Although this was the concluding meeting of the session there was a large attendance, and the discussion of the paper was most spirited. Mr. Highfield suggests that electricians should utilise storage batteries much more largely than they do at present. When central stations are first started it is customary to have only a small battery of storage cells in reserve. As the load increases the engineer is tempted to work this battery beyond its capacity, and hence to ruin it. This is probably the reason why so many stations discard batteries altogether after they have been started a few years. Another reason is that the method of controlling the charge and discharge of the battery by means of regulator cells hitherto in vogue, has proved a failure in practice. Mr. Highfield's suggestion is that a dynamo with a compound-wound armature, which is called a "reversible booster," should be used to regulate the cells. His system is a most simple one, and a year's trial which he has given to it at the combined lighting and traction station at St. Helens, has proved most successful. He has obtained an efficiency of 84 per cent with his combined battery and booster. This excellent result is probably due to the fact that the booster prevents the voltage of the batteries ever falling abnormally. Mr. Trotter mentioned that he had seen the booster controlling the battery on a very intermittent traction load, and that the load on the engine was approximately constant, the battery levelling the load by absorbing and giving out energy alternately. He also mentioned that the direction of the current in the battery could be told by the hissing sound it made when charging. This proves that the battery was working at a voltage greater than two, and therefore at its highest efficiency. Engineers who are trying to find some means of saving the fuel wasted in raising steam and keeping hot long ranges of pipes when there is only a small load on the engine would do well to study Mr. Highfield's paper.

New Inn, Wych-street.

It is stated that the proprietary rights in New Inn will be purchased for 157,000*l.*, the site of the Inn being required for carrying out the London County Council's improvements on the north side of the Strand. It appears that the "Ancients" hold the property under a lease from the Middle Temple, which would not terminate until three hundred years hence, and that the sum mentioned is to be vested in representatives of the "Ancients" and the Middle Temple as trustees in that behalf. Since the destruction of Strand Inn by the Protector Some-

set, this Inn is the only law seminary that has remained in the possession of the Middle Temple Society. Some five hundred years ago the site of New Inn was that of a travellers' hostelry known as Our Lady's inn from its sign of the Virgin Mary. Of its history as a place of legal education the accounts are scanty; in King Edward IV.'s reign the guest inn was acquired at a rental of 6*l.* per annum by Sir John Fineux, Lord Chief Justice of the King's Bench, for some students of the law who were then lodging in St. George's Inn (reputedly the most ancient Inn of Chancery in London), by Sea-cole-lane, in the Little Old Bailey. To New Inn, whence Sir Thomas More when a student migrated to Lincoln's Inn, were subsequently removed the students from Strand, or Chester, Inn, which however must not be confused with the adjacent town-house or "inn" also known as Lichfield and Coventry's Inn, originally built by Walter Langton, Bishop of Chester, temp. Edward I.

New Parish Church.

WE understand that it is proposed to complete the enlargement of the parish church of St. Anne at Kew as a memorial to Queen Victoria, to add a vestry for the clergy and choir, and to renovate the west porch and portico. The original church was built of brick in 1714-15, upon a piece of ground given by Queen Anne; in 1837 it was enlarged by Sir Jeffrey Wyattville, at an expense of 4,500*l.* defrayed by King William IV. and with a grant of 200*l.* from the Incorporated Society. In July, 1884, it was re-opened, after an addition had been made at the east end, from Mr. H. Stock's plans and designs (see the illustrations in the *Builder* of December 31, 1887). The extension comprised an additional bay to the nave and aisles, a new chancel with a low circular concrete dome, carried by an octagon clearstory, and a central apse beyond, an organ chamber, and a south porch. The alterations, costing in all 5,167*l.*, and adding about 40 ft. to the length of the church, involved the re-erection, at the extreme east, of the Cambridge mausoleum with its terminal semidome. It is not commonly known that the burial of Gainsborough in the churchyard was due to his desire to be laid by the side of his friend J. Joshua Kirby, the architect and author of treatises upon perspective. E. M. Ward, R.A., restored and enrailed Gainsborough's tombstone in 1865, and placed a tablet to his memory in the church.

THE Hogarth House Preservation Committee of which Mr. G. C. Haité is chairman, and which includes among its members Mr. Walter Crane, Mr. Austin Dobson, Mr. Cosmo Monkhouse, and other well-known names, is appealing for funds to purchase Hogarth's house, and preserve it as a Hogarth Memorial and Museum. About 1,500*l.* will be required for this purpose. This is a scheme that ought to be supported; the house is an interesting example of the domestic architecture of its period, and Hogarth was too remarkable an English artist for his place of abode to be allowed to be destroyed and forgotten. Contributions can be sent to the Hon. Secretary to the Committee, Mr. Walter H. Whitear, 4, Ravenscroft-road, Chiswick.

COMPETITIONS, CONTRACTS, AND PUBLIC APPOINTMENTS.

Ornamental Fixtures.

I have not conducted to the understanding of the law, in regard to the respective rights of landlord and tenant, or of tenant for life and remainder-man, as to things attached to the freehold, that the title "fixtures" has been given to things that are removable. At first sight the word would seem to imply that it was meant to cover things which must remain fast to a building or to the ground, whereas it is exactly the contrary. The old rule of law was very rigid: whatever was attached to the ground and in that sense to a building, became part of it, and so became the property of the freeholder. But that rule has, under the influence of modern changes, been gradually relaxed, and there are now two great exceptions to it—what are called trade fixtures and ornamental fixtures. We are not now concerned with the former class. The second is, having regard to modern decoration, more and more important, and it includes articles which are becoming and suitable "for the more convenient or luxurious occupation of houses." The way in which the law has grown more elastic on the subject is well exemplified by the statement of the fact that in 1705 it was judicially decided that "pictures and glasses put up instead of wainscot, or where otherwise wainscot would have been put, shall go to the heir and not the executor"—in other words, were not removable by a tenant. No one would now for a moment contend that pictures and pier glasses, however firmly fixed to a wall, became the property of the freeholder. But since the decision of the Court of Appeal in the now celebrated Luton Hoo tapestry case, it is clear that, in order to say if a thing is an ornamental fixture, there is nothing more to be done than to consider in the first place if the thing is for the con-

venience or the ornamentation of a house. The amount of firmness with which it is fixed to a wall becomes immaterial if the thing is originally a separate article, intended for use by itself. Of course the method of fixing must be carefully considered, in order to be sure that the article is such a separate thing. "There might be such an incorporation of the chattel with the freehold that it would be impossible to deny that the chattel had become part of the freehold, and absolutely impossible to admit the exception. Therefore the quantum of fixture is important. One must ask oneself, is there any more fixing than was necessary for the enjoyment of the chattel as such? If you fix a heavy object, such as a heavy ormolu clock, to the wall of a room, you may, in order to make it safe, have to use very substantial fixings. You may have to drive an iron bar right through the walls to rivet it at the back. You might have to employ a mode of fixing which in many cases would be conclusive of an incorporation of the chattel into the freehold. But the moment you come to the conclusion that the mode of fixing which was employed was absolutely necessary for the enjoyment of the chattel the inference does not arise."

These views of Lord Justice Vaughan Williams will, we think, enable any person, be he architect or builder, to understand the question without difficulty. In the first instance, however, one must consider what the article is which is so affixed; but, as already stated, any ornamental object which is complete in itself, seems to be such an ornamental fixture as belongs to a tenant. "If," said Lord Justice Rigby, "the exception applies to such a thing as a chimney-glass, I cannot see why it does not apply generally to all articles affixed for the purpose of enjoyment and ornamentation." This dictum is very broad, and it serves to make the Luton Hoo case one which is a kind of Magna Charta for the tenant, in regard, at any rate, to ornamental fixtures. The effect of the decision is most important and far-reaching, because it should

be noted that, on two previous occasions, tapestries have been held to belong to the house. In one case—Norton v. Dashwood, decided in 1896—the tapestries had for a hundred years belonged to and formed part of the decoration of a mansion house. It is, clear, however, that were a similar case to arise again—with the special circumstances which characterised it—the decision would be different. A still earlier decision by Lord Romilly was distinctly declared to be erroneous. This fact shows how wide is the present judgment, more especially when it is borne in mind that Lord Justice Rigby stated that no doubt these tapestries "were affixed in such a way as, in earlier days, would have been held to make them inseparable parts of the wall." In other words, the modern judicial view of this question is quite different, quite opposed to that of half a century ago.

Certain articles have, by usage and legal decisions, become clearly defined as among those which can be removed by a tenant, however firmly they are affixed to a building. But the recent development of the law has given so wide a definition to the words "ornamental fixtures," that practically everything which is not intended to become a permanent and integral part of a building may be removed by a tenant either for years or for life. Thus a much greater latitude is given to expenditure by those who are not the permanent owners of a building, and it may be said that under the present condition of the law a tenancy is more desirable than was formerly the case.

The words with which Lord Justice Rigby concluded his judgment are, in fact, sufficient to give a tenant for years or for life, or the executor of either, or their advisers, perfect freedom of action. The case, said the Judge, "falls within the proposition that articles set up for the purpose of decoration or ornamentation are excepted from the rule that things fixed to the freehold belong to the owner of the freehold." Care, of course—as he had pointed out—must be exercised in the consideration of the word "articles," but subject to this proviso,

nothing can be broader than the above proposition.

A small but practical point of some importance was also decided in the Luton Hoo case, viz., that though the tenant should pay for any damage done to the walls by taking down his fixtures, he has not to pay for re-decorating the room. "It is not," said the Court, "waste to remove one set of purely decorative ornaments to make room for another." We understand that to mean that a tenant for life or a tenant for years—when there is no term to the contrary in his agreement—may, for example, take off a wall paper, substitute tapestry, and if he likes remove it and leave the wall without either tapestry or paper.

FRENCH ART IN 1901.*

andscape-painting there are still things to be seen at the Salon which make all English landscape painting of the day seem tame. M. Didier-Pouget's two works hang in the great gallery; the largest, "Ajones et Bruyères, Village du Pin," is quite astonishing in its power in the foreground, and very fine in the distance, but this remarkable painter is getting too much into the habit of repeating his main effects—a hill and shrub foreground which looks as if you could walk on it, a misty valley in the middle distance, a sun-lighted plateau beyond; the materials of a most effective scene, but they have been repeated two or three times in a manner that makes one suspect that the painter puts into the scene what he wants rather than merely what is there. M. Quignon, who at his best is (or was) a painter of a broader and finer style than his rival, has only two small landscapes this year, not showing anything like his best powers. M. Simonnet is in danger, in his "Coucher de Soleil," of a little overdoing his rich and solemn effects of woods and sunset light. But the two landscapes of the year are those of M. Harpignies, both scenes in which glimpses of distance are seen through a foreground of forest trees. The whole history of landscape-painting can hardly show a style equal to that of this great artist; he possesses the finest qualities of Constable with a certain refinement of execution added to them; the foliage of the trees is so freely handled that it seems really to grow rather than to be painted. A fine picture by M. Calvé, "La Lagune d'Ous," is a good example of a type of landscape in which French painters excel, and which consists in making a picture out of the simplest and most unpromising materials—in this case a pond in the middle of a waste moor with low hills in the background; but it is a picture, most complete in its way. French landscape painters undoubtedly gain something by the large scale on which many of them paint, and which, as in this case, gives more scope for effect than a smaller canvas; but the more confined spaces of the Royal Academy would not admit of this in England, even if our artists wished to paint landscape on a larger scale. There are, however, a good many smaller landscapes, more than can be mentioned here, of very fine quality for breadth of style and power of atmospheric effect; among

these smaller ones an English painter, Mr. Alfred East, takes an exceedingly good place with his "L'Etang Mystérieux," a better picture than any that he has in London; he was quite right, however, to send it to Paris, where its style will be much better appreciated. Another English painter, Mr. R. W. Allan, has the honour of a place in the great gallery, where his "Une Porte de la Mer" looks certainly a great deal smaller than it did in the Dudley Gallery, but has its effect nevertheless. Seapieces as usual are bad; M. Palézieux, in "Après la Tempête," endeavours to impress us by vast size, but it will not do; his waves are none the better for being big.

The New Salon strikes us as being really on its last legs. Of course the death of Puvis de Chavannes was a terrible loss to it; and their chief support next to him, though in such a very different way, M. Carolus-Duran, exhibits only one portrait, and that not quite of his best, though certainly a fine one. Besides that, he contributes only landscapes; and though it is interesting to see how an artist, whom we know chiefly as a fashionable portrait-painter, treats landscapes, it cannot be pretended that M. Carolus-Duran takes an important place as a landscape-painter. He would serve the New Salon better by sending them the class of picture for which he is famous, and not his experiments in another walk of art. The death of Cazin, who really was a fine landscape painter, is another serious loss; and other painters who have usually been among the most original contributors—MM. La Touche and Carrière in figure subjects, and M. Courten in landscape, are also not at their best. It is true that there are a good many small and unpretending pictures, landscapes and others, which are pleasing and which would be almost crushed in the other exhibition, but the difference is that the Old Salon contains a good many really fine and important pictures, and the New Salon contains none; there is not a work of the first order of interest to be found there; and even the pretence at greater refinement than the Old Salon must now be abandoned, for the management have evidently been obliged to take what they could to fill their walls, and there are things more vulgar and more artistically coarse than anything to be found in the Old Salon—which is saying a great deal. In fact, year by year it becomes more evident that this split in the camp is an artistic mistake, and that the two societies had much better join hands and only try to fill one suite of galleries, since it is obvious that they cannot fill two in a satisfactory manner.

The glory of the New Salon, we presume, consists in retaining possession of M. Rodin, the sculptor whom the esthetic public now gape after with such an exaggerated adulation. He exhibits a nude statue of Victor Hugo, or rather, half a nude statue, as the whole of the right side below the waist, and the right leg, is left unfinished, *en bloc*, for M. Rodin cannot condescend to finish anything now; it is honour enough for the public to be permitted to see his unfinished works, with a head or a limb sticking out of a mass of rough marble. The head in this case is fine, but that is no excuse for this absurd pretence that works in sculpture are better unfinished; the whole proceeding is merely playing upon the folly of the public.

The sculpture generally at the New Salon is not very important, but there is an effective monumental statue of Daudet by M. Saint-Marceaux, who puts an apologetic parenthesis into the catalogue to the effect that it is "unfinished," which might have been more reasonably applied to the Victor Hugo work, which is much more unfinished.

Sculpture at the Old Salon shows the usual tremendous crowd of works, and the usual (of late years) proportion of things which seem to aim at compelling public notice by sensational attitudes and sensational subjects totally alien from the true genius and the proper ends of the art of sculpture. From this crowd, nevertheless, are to be picked out many good and some beautiful works. Thus, M. Vital-Cornu's female figure, "La Nature s'éveille," is one of the most perfect and perfectly-modelled figures it would be possible to see; from whatever point of view you take it, it is fine. M. J. Boucher repeats in marble his fine and poetic conception shown in plaster in a former Salon, "Antique et Moderne," one of the most intellectual productions of recent sculpture.* M. Cordonnier's "Sainte Famille," a group in grey marble, is a fine piece of religious art. M. Gasq's monument to a bishop, who kneels on a sarcophagus beside which is a draped figure representing "Amenitas," is admirable in itself, but the merit of the accompanying figure and its admirably designed drapery is really due to Chapu, from whom it is a palpable imitation. M. Gaudissard's "La Vie de la Maison" is an interesting bas-relief for the decoration of a private house, consisting of figures symbolising the occupations of various hours—reading, music, needlework, meals, sleep, &c.; the names are not appended, but the design tells its own story. Among portrait statues M. Gérôme has a gilt equestrian statuette of "Washington," not particularly remarkable except in being his work; Mr. Goscombe John a colossal statue called in the catalogue "Portrait du lord duc Devonshire," an effective work of its kind (it is catalogued, by the way, under the name of "Goscombe" instead of "John"); M. Jean Hugues a seated statue of Pasteur; and M. Marqueste another of Victor Hugo, of which one must confess that the head looks rather prosaic in comparison with M. Rodin's head, but presumably this is really a likeness, and the other is M. Rodin's impression of what Victor Hugo ought to have looked like. Among monuments a fine and important one is that to Jean Macé, by M. Massoule. We presume M. Macé did something for juvenile education; the monument consists of a large stele crowned by a female figure holding high aloft an open book; on the face of the stele is the medallion portrait of Macé (a system which escapes the difficulty of a realistic full-length statue); at the foot of the stele are pretty figures of a boy and girl on the way to school, applauded and encouraged by a draped female who sits at one side. The whole is a good typical example of a kind of monument in which French sculptors excel. Among ideal works which are worth special mention are M. Manguet's "Bacchante invoking the god Pan," whose sneering head is fixed on a term—a kind of subject the

* Concluded from p. 481 ante.

* The plaster version was illustrated in the *Builder* for July 15, 1899.

French are very fond of; M. Marioton's pretty figure, "Méditation," standing with her feet crossed; M. Gustave Michel's fine and pathetic figure of an aged man—"Au Soir de la Vie"; M. Hector Lemaire's "L'Offrande"; and M. Coutheillas' beautifully modelled recumbent figure, "La Fin de la Cigale." We have seen, however, better sculpture years at the Salon than the present one.

A word on two new architectural works, already frequently mentioned in our Paris correspondent's communications. Only a few minutes' walk from the Palais de l'Art is the memorial chapel on the site of the fire in Rue Jean Goujon, a visit to which seemed a matter of course while one was in the neighbourhood. It is characteristic of the energy of the French in these matters, and their artistic enthusiasm, that they should think nothing less would suffice for such a memorial than a fine stone church filled with sculpture and decorative materials, erected at a cost of 40,000*l.* exclusive of the site; while in London an obelisk with an inscription would have been deemed sufficient. The building, of which M. Guilbert is the architect, was illustrated in elevation in the *Builder* for July 30, 1898. The effect of the actual building is still better than the illustration conveyed; the interior circular church is only spoiled somewhat, to our thinking, by the colossal gilt figure of the Virgin, the "Mater Consolatrix," in front of the altar; a pathetic statue in itself, but far too large for the building, and dwarfing the architecture. This is a kind of religious statue, however, which we believe appeals to the feelings of devout Catholics, and is to be judged from a religious rather than an artistic point of view. Behind the church is a cloister divided into bays each of which is appropriated to a special monument to the friends of those who wished or could afford to have such a monument; the lower part is in marble, with an inscription, perhaps a figure, or a medallion portrait of the deceased; the upper portion in each case is occupied by a silvered metal relief from New Testament history, in a panel; these panels are all alike, the lower portions of the monuments vary in treatment. They are nearly all to titled people, including that brave lady the Duchesse d'Alençon, who quietly died in the fire, refusing to make any effort to save herself at the expense of other persons. Her monument is the central one, with her medallion portrait over it. The whole thing is not only artistically impressive, but in the highest degree pathetic.

Another evidence of the architectural inventiveness and energy of the French spirit meets the visitor in walking up the left bank of the river from the Pont de la Concorde. Is this a new palace that rears its great mass along the road bordering the quay, this vast façade in all the bloom of new bright stonework, and sumptuously decorated with sculpture and carving? Not at all; this is the new railway station of the Orleans line. Entering the station we find, instead of the usual engineers' glass and tie-rod roof, a great semi-circular barrel vault decorated in coffer, with skylights interposed at intervals, following the curve of the roof. Exterior and interior are alike architecturally impressive. Are railway companies so devoted to art in France? Not exactly, explained a Frenchman to whom we commented on this bril-

liant display. It is the City authority which is at the bottom of it. The railway company has to buy the land from the Municipality, and the Municipality will only sell land in such a position with the condition that something is erected on it which shall be an ornament to the city. What a lesson to London, where money considerations alone rule in such a case; where any railway company may build the ugliest erection it pleases so long as it has paid the price of the land; where the City authorities themselves are bent to spoil their grandest bridge under a pretence of needing increased accommodation; where the County Council resent the proposal to introduce architectural design into a new bridge. Truly, "they manage these matters better in France."

NOTES.

The Origin of Egyptian Architecture.

PROFESSOR FLINDERS PETRIE'S lecture on this subject at the Institute of Architects was not only full of interesting matter, but was a model of clearness and logical arrangement. He certainly brought out in a very strong light the manner in which features of Egyptian architecture were derived from nature and from very primitive construction in perishable materials, but he seemed to be rather too much disposed to think that the interest of the architecture diminished as it receded further from the direct imitation of nature and of primitive construction; whereas the real, the aesthetic interest of architecture commences when these natural origins are forgotten. The remark of Sir Martin Conway, that it was interesting to see the same thing going on now, when we were imitating in iron the forms of stone columnar architecture, was still less to the point. The cases are not parallel in the least. All architecture goes back ultimately to the hut or the wigwam; those who first evolved an architecture from these primitive sources were doing the best they could in what was then an entirely new field of human invention; but that is no excuse for modern architects, whose power of aesthetic reasoning ought to be fully developed, imitating in one material the forms proper to another. That is not doing their best with the materials in their hands; it is merely the result of intellectual indolence and want of thought.

Liverpool Cathedral.

WE published a letter last week from a correspondent who complained that nothing seemed to be promised as to the architect or the architecture of the proposed cathedral at Liverpool, if erected. We have since received a cutting from a Liverpool paper describing a meeting held a few days ago, under the presidency of Sir W. Forwood, to discuss the question. Judging from this report, the whole question was discussed solely in regard to its financial side, and the difficulty of raising the necessary funds, and the importance of having a widely extended area of subscribers. Not a word appears to have been said as to the architectural aspect of the matter, but it is announced that steps are to be taken to call a public meeting to consider the subject, and perhaps on that occasion some one will have the courage to suggest that there

are other things to be considered in connexion with a cathedral project besides paying for it.

Abhey Dore Church.

A COMMITTEE has been formed, under the presidency of the Bishop of Hereford, for raising a sum of 6,000*l.* for necessary repairs to this fine church. Mr. R. W. Paul, who has given special attention to this building and made a good many new discoveries in regard to it, is employed as superintending architect, and under his direction we may be quite sure that the work will be confined to *bona-fide* repair, and that no restoration, in the objectionable sense of the word, will be attempted. From Mr. Paul's detailed Report to the Provisional Committee it appears that though the main walls are sound for the most part, some portions of the building are in a dangerous state. The upper part of the tower is seriously out of position and requires immediate attention; and the plaster ceiling is constantly falling, and the floor of the church is in a very damp state, and unhealthy owing to the condition of the vaults. Much of the glazing requires repair, and the roof, covered with old stone tiles, requires to be relaid, and boarding and felt provided. New choir stalls and other fittings are also required to put the church in a proper condition for service. It is estimated that 6,000*l.* will be required for the work contemplated. Abhey Dore was illustrated in our issue of April 4, 1896, in the series of "Abbeys of Great Britain," from drawings made by Mr. Paul.

British Fire Prevention Committee.

THE new testing station of the British Fire Prevention Committee, which was put in use for the first time on Wednesday last, is conveniently situated close to Royal Oak Station on the District Railway, so that it is easier of access than the former one. As before, the Committee have secured an old dwelling-house for offices, and have erected their testing-houses in the grounds. The houses are on the same model as before, but one of them is a good deal larger than any of those on the old ground, for testing larger areas of floor, &c. The principal test on Wednesday took place in this house, the subject of test being a portion of fireproof floor 22 ft. in length (the full length of the testing house), made by the Banks' Fireproof Construction Syndicate, and consisting of rolled beams embedded in concrete, and carrying an armed plaster ceiling underneath supported by metal stirrups from the beams. The test was still in progress when we left; the particulars will no doubt reach us in due time in the usual formal report of the committee. The Syndicate had asked for a three-hour test for this floor; and it appears that there is now a kind of rivalry among fireproof constructors for length of test. This must have a stimulating influence on the improvement of fireproof construction. A model of the testing houses and plant was to be seen in the offices, prepared to be sent to a fire-prevention exhibition at Berlin.

Road Maintenance.

THE seventh annual report of the State Commissioner of Public Roads of New Jersey contains voluminous tables arranged so as to show the characteristics of each piece of road made during the year 1900, the reduction in grade made at the time of improvement, the cost of the stone at the quarry,

and the expense of delivering it on the road. Maintenance of the New Jersey roads is made the subject of a special report by the State Road Supervisor, who advocates a system of continuous repairs according to methods which he proceeds to describe in detail. The figures contained in the reports permit of interesting comparisons being made with those of the Massachusetts Highway Commissioners for the same year. In both these States considerable signs of improvement are evidenced, and practice in the two is becoming more uniform, although local conditions necessarily cause some essential differences. In one respect, however, the states are thoroughly in accord, for the highways are being steadily improved in quality. Similar developments are to be found in this country, for, speaking generally, our local authorities are fully alive to the benefits to be derived from good roads. Much remains to be done in the direction of securing uniformity of practice in different parts of the same counties, as those who have opportunities for inquiry know full well. But, taking them all round, country highways are fairly satisfactory. We should very much like to be in a position to say the same of London streets and roads. Practice is extremely varied, and uniformity is only evidenced in the execrable character of all thoroughfares that have seen any considerable amount of traffic. Rugged macadam, undulating asphalt, and bumpy wood paving, are in evidence everywhere. Some allowance must of course be made for the ruinous effects of heavy traffic, but it ought not to be beyond the resources of modern engineers to construct a roadway of far more uniform resistance than most of those now existing. In some parts of the metropolis the roads are reasonably good; in others, where no more traffic is experienced, they are atrociously bad. Perhaps the worst carriageways of all are those in the quietest and wealthiest parts of the West End, and in the Royal parks where no heavy traffic is allowed. To those responsible for such eccentricities we commend a perusal of the reports to which attention has been directed.

In his recent Friday evening discourse at the Royal Institution Dr. Chunder Bose gave a *résumé* of his experiments proving that there was a regular law underlying certain phenomena exhibited by both organic and inorganic matter. In papers published in the Proceedings of the Royal Society last year Dr. Bose described his discovery of how metals were sensitive to electric radiation, or possessed, as he calls it, "electric touch"—the resistance of some increases when electric radiation falls on them, whilst in other cases the resistance is diminished. In his lecture Dr. Bose passed from the domain of physics into the domain of physiology, and elaborated the analogies between nerve and muscle diagrams and the diagrams got by stimulating inorganic matter mechanically or electrically. For example, he showed, by means of a model apparatus, how the response curves got by dosing a liquid connecting two metallic wires with various "drugs" gave phenomena analogous to the effects produced by these drugs on living tissue. Some produced stimulation, others depression, and "poisons," like corrosive subli-

mate, killed the electric action altogether. He showed a wonderful model of an electric eye, which was sensitive to every kind of radiation. It acts according to physical laws which Dr. Bose has discovered, and seems to work in the same way as the living eye works when it sends an impulse to the brain on being exposed to light. He seems to have discovered principles which explain perfectly certain phenomena which have been known for many years to physiologists. We are glad to hear that he has been given leave by the Indian Government to stay in England to complete his investigations. The scientific world is already deeply indebted to him, and it seems to us that the Bose coherer may have important electrical applications. The drawback to the Marconi and other coherers in use in wireless telegraphy is that they are not self-recovering, but need troublesome and destructive tapping devices. A coherer based on the "Bose effect" would be completely self-recovering and would enormously simplify the required mechanism.

The project is again revived of pulling down the Old Red Hall, at Bourne, Lincolnshire. Its demolition was proposed ten years ago by the Great Northern Railway Company for the construction of their line from Bourne to Saxby, but the scheme was warmly opposed, and the house was spared for a while, being reserved as a residence for the railway station-master, and for purposes of the station. The house is one of the finest specimens of a red brick early sixteenth century mansion of which the county can boast, and formed during a long period the home of the Digby family, including Sir J. Everard Digby, and Sir John Thimbelby, who were implicated in the Catholic rising that followed upon the Reformation. The house, having a gable roof and stone mullioned windows, with a richly panelled and carved interior, and a fine oaken staircase, and standing at the southern entrance into the town, has extensive grounds, and is partly surrounded with water.

This subject was considered in a paper by Mr. Percy Fitzgerald, followed by a discussion, which appears in a recent issue of the Society of Arts *Journal*. Mr. Fitzgerald's main point (which we have met with before) is that "the scene" is the centre in which the action goes on, not the whole stage space; that in Garrick's time the stage was lighted by four large chandeliers hung over the actors, which furnished a central zone of light within which the actors kept, and the surrounding accompaniments were left in comparative obscurity. We should say that such an arrangement would very much hamper the actors in freedom of movement, and that footlights are a most useful addition both in generally lighting the stage, and in partially screening off the audience from the view and the consciousness of the actors. With those who urge that the acting should be the real aim and end of theatrical production we are entirely in sympathy, and it is a fact that the public go to see some plays now more for the spectacle than the acting. But we fail to see any reason for thinking that finished and realistic scenic accompaniments are any bar to good acting; or that, the acting being

good, the effect is not assisted by a well-mounted scene. In plays of modern life, especially, it is important that a large country house, for instance, if the action is supposed to take place there, should be represented by an interior that we might expect to find in such a house, not by a room looking as if it belonged to a seaside lodging. We may like a fine stage effect without being in any way less exacting in regard to the acting; many persons (the present writer included) who go to see a modern spectacular play often come away vexed and disappointed with inferior acting; but there is no reason why the acting should be inferior because the scenery is fine; and where the acting is good, scenic effect helps it. One point we do fully agree with in Mr. Fitzgerald's paper is in regard to the absurd neglect of scale constantly seen in theatrical erections, where the vicar's house, as he says, is only a few feet higher than the vicar, and a whole cathedral is shown no larger than Bonchurch church. The scene in such a case should show part of the building on the right scale, and so designed as to leave you to infer the existence of the portion which cannot be comprised within the stage focus.

THOSE who are interested in seeing the artistic standard of our coinage and commemorative medals improved, should feel grateful to Sir Charles Dilke for pointedly calling attention to this subject in Parliament a few days ago. He asked on what principle the artistic work of the Mint was done, and observed that it was beginning to be realised that the medallist's was one of the highest forms of art; that in foreign countries, especially in France, this art had been revived and carried to a high standard of excellence, and that we were conspicuously behind in this respect. When we consider that in France medals and coins are in the hands of such artists as M. Chaplain and M. Roty, and that in England no one usually cares to ask how or by whom they are designed, one must admit that Sir C. Dilke's protest was not uncalled for, and it is to be hoped that it may not be without some result.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

In continuing our comments on some of the architectural drawings at the Royal Academy, we may perhaps in the first instance notice those of the church designs, not already noticed, which present anything for special remark. The first in order of hanging is Mr. Marshall Mackenzie's "Greyfriars Church, Aberdeen," (1,531) a pen drawing of a western tower with a slender crocketed spire rising from the centre of it, behind the parapet; a treatment rather more suitable to a timber spirelet than to one which appears to be, as far as one can judge from the drawing, of the same material as the tower. A stone spire seems to demand a visible connexion with or growing out from the masonic design of the tower. The general style of the design is a good deal similar to the same architect's fine work in the additions to the Marischal College, and is probably intended for the same material—granite. Another Scottish church is Mr. Stevenson's "New Church at Stirling" (1,539) for the Free Church of Scotland. This is an exceedingly solid piece of building, on the tower of which the architect has again introduced the "crown" modelled on that of St. Giles, Edinburgh, as he did in a former church. The meeting hall planned in connexion with the church is placed at a slightly oblique angle with the main building, probably from some

INK PHOTO SPRAGUE & CO. 3 A S. EAST HARDING STREET, FETTER LANE, E.C.

SIDE, DETAIL OF CHAPELS

unavoidable requirement of the site, and certainly to no injury to the effect. There is a general aspect of massiveness and simplicity about the whole treatment of the church which is satisfactory.

Mr. W. D. Caröe is a large exhibitor in the way of church architecture. His Church and Rectory at Stoke Damerall is shown in an exterior perspective (1,541) with an interior view of the church (1,543); the latter is original and characteristic in treatment; the arch mouldings spring from the piers without the intervention of caps; the roof is carried by what may be called stone principals—stone pointed arches over each pier; the wooden roof between these is also in a pointed arch section, but not concentric with the stone arches, although not differing much from them in line. This seems a mistake; it gives the idea of their having been intended to be concentric and being accidentally set out wrong; it seems to us that in such a case the timber roof should either be decidedly different in section from the stone arches, or should be on the same sectional line: one or the other. This is a church with three complete aisles and two narrow side-aisles for passage; it is the passage-aisle device applied on each side of a complete nave and aisles plan, instead of reducing the church to a nave only. There are a good many nice points in the exterior design; the contrast between the plain and bold treatment of the lower part of the tower and the enriched upper story; the square turrets flanking the east end and finishing with a group of niches and figures, two on each face; and the exterior treatment of the buttresses over the passage-aisles, which is very characteristic. The east end of the church seems a little too much cut up, and might have been simplified with advantage, and we do not for our own part, like the effect of the over-sailing pinnacles at the angles of the tower, rising from gargoyles' backs; of course it is a detail indigenous to that part of the country, and to be seen in old churches, but is it worth imitating? It produces a bad outline at the finish of the tower, and looks rather gimcrackish. High Wycombe Church (1,547), by the same architect, is illustrated in this issue, and under the head of "Illustrations" the reader will find the architect's description, and the reason for the peculiar treatment of the east end. The "Proposed new chapel &c. to the Bishop's Palace, Liverpool," (1,540), also by Mr. Caröe, is illustrated in a frame of drawings; the additions, distinguished from the existing portion on the plan, consist of a long corridor wing with various subsidiary rooms, terminating in the chapel turned round again at right angles; this is a quiet piece of domestic Gothic; the large traceried staircase window adjoining the chapel is ecclesiastical in character to suit its neighbourhood (it looks a little as if the chapel extended to the outer wall and this were its west window). In the interior view of the chapel stone arched principals are again shown, but this time in a much more satisfactory manner, as they are totally distinct in section from the ceiling; the stone arch is a low pointed one with open tracery in the spandrels, and coming well down to the walls; the ceiling is a flat segmental arch, not quarrelling in any way with the line of the stone arches; the effect of this is very satisfactory.

Mr. E. B. Lamb's small drawing for "A Private Chapel in a Nobleman's Park" (1,550) shows a pretty design, but to give a chapel of that kind a picturesque or "rural" character is we think a mistake. A park is more or less artificial scenery, and we should expect to find a chapel in a nobleman's park marked by a somewhat classic architectural character, rather than what is shown here. Mr. Watson's "St. Peter's, Cricklewood" (1,557) is a pretty little drawing of a country church. Mr. J. J. Cresswell exhibits an elaborate tinted perspective drawing of the interior of a design for a stone vaulted church; a very good drawing, showing a vault of the type which was the precursor of the fan vault, &c., a many-pannelled vault with a severe square on plan; we can hardly think this, however, other than an anachronism as the roofing of a modern church; and as a matter of proportion, the vault seems unduly lofty in comparison with the substructure. The "Church of St. Mary, Barry Dock" (1,628), by Mr. G. E. Halliday, and that of "St. Peter's, Oystermouth" (1,643), by Mr. E. Bruce Vaughan, are what we should call highly respectable designs in modern Gothic, not presenting anything of special interest in

character. Mr. F. L. Pearson's "St. Matthew's Church, Auckland, N.Z." (1,666) is shown in a large and fine perspective drawing without any plan; it has very much the character of some of his father's churches, and indeed reminds us a good deal of the late Mr. Pearson's large church in the outskirts of Birmingham—we forget the name of the district. Mr. Fellowes Prynne's "Design for Church, Lower Sydenham" (1,680), is shown in a small very highly finished watercolour drawing, but again no plan; what is shown is apparently the west end; a brick church with stone bands and dressings, the façade flanked by large and bold octagonal turrets, kept plain below and with an enriched upper story and cupola roofs; in the lower portion a wall stretching between these turrets apparently forms a narthex. But this is just the kind of drawing which should have had a plan to explain it.

Mr. Lamb's "Design for a National Monument to British Heroes" (1,664) is in some respects so much like a church that it may be classed with them. It is a fine conception, which would have been worth illustrating in a larger and more finished drawing. It is a design on a square plan with a lofty central tower and spire, and octagonal turrets at the angles, ending in spirelets; the whole making a pyramidal composition, with a kind of slate or professional road up to the main entrance. The detail is Gothic. With church architecture we may class also Mr. Slipworth's charming drawing of a "Churchyard Cross, Erected at Leasingham, near Sleaford" (1,691). The cross, which takes the form of a crucifix, is treated with great originality and refinement of detail; the remainder of the design is very simple, but in excellent proportion and balance of parts.

From the churches we may proceed to notice some of the designs in public and street architecture not before mentioned. Mr. Leonard Stokes's "Central Boys School, Oxford" (1,529), is exceedingly picturesque, with its two stone bays in the centre of the front, and the entrance between them contrasting with the simpler treatment of the remainder of the exterior. The plan, however, is the most interesting feature; it shows a central hall which may be said to consist of a circle inscribed in a triangle, the angles of the triangle forming bays opening out of the circle. The class-rooms, &c., open out of this hall. There is some question, however, as to the lighting of these class-rooms; the two sets face opposite ways, one with east light, the other with west; the former is all right, the latter is not so good, though better than south. It is not obvious how the centre room on the right of the plan is lighted at all; there is no window shown. But this is a very interesting and original plan. Mr. Prior's "New Medical Laboratories, Netley" (1,542) reminds one somehow of the bottom of Essex-street, Strand, with its square mass and large pilasters, but there is a bold contrast given by the rusticated basement with its prison-like round-headed windows, and the light colonnaded open corridor adjoining; it is a very characteristic bit of building shown in a very nice shaded drawing; but it should have had a plan to explain it. Mr. G. C. Horsley, in the drawing of his "St. Paul's School for Girls, Hammersmith" (1,550), shows a plan but no compass, so that we can form no opinion as to the aspect of the class-rooms, which face opposite ways; and aspect is so important in regard to class-rooms that information on this point should never be omitted; the suitability of the plan turns on that more than on any other single thing. The treatment of the centre and wing fronts, with their sculptured panels, is bold and effective in a broad and simple manner; but surely the windows in the portion between these, like ordinary speculating builders house windows, are rather unnecessarily commonplace.

The recent competition for dock offices at Swansea is illustrated by two designs, that by Messrs. Mills & Oldham (1,552-53), and that by Mr. E. Hazell (1,554). The coloured elevation of the former is a very nice bit of work; the building is treated with a ground story of rusticated masonry, and an upper story of brick with stone dressings and with a stone carved shield and ornaments on the upper portion of each pier between the windows. The objectionable feature is the piece of plain brick wall above part of the cornice, which comes in clumsily, and spoils the effect of the whole. No plan is given either with this

design or Mr. Hazell's, the latter a suitable and refined design for the most part, but the corbels under the large projecting angle-turret are much too weak. Mr. Doughty's "The Borough Club, Nottingham" (1,551), is a pretty bit of street architecture, decorated with carved panels, and shown in a pretty drawing.

Mr. Rupert Savage's "Assembly Hall, Belfast" (1,572), is a larger and more important building, of which the plan is shown, a good one in the main, but the corridor running parallel with the entrance part must be rather deficient in light. The general style may be described as Domestic Gothic; the best point in it is the bold treatment of the masses of wall on each side of the entrance; but as a whole the design is consistent and suitable. Messrs. Bradshaw & Gass's "Thomason Reading-room, Bolton" (1,575) is a pleasing building of its class, and has the merit of having a plan with it.

Mr. Emerson's "Hamilton House" (1,582) is the building which was illustrated in our issue of July 22, 1899. Beneath it is his larger drawing in colour and very well executed, of the "Royal Caledonian Orphan Asylum, Bushey" (1,584). This again, like so many other drawings in the room, is merely a picture of a building in which plan is of paramount importance, and one can form no idea of its value apart from that. The building is a pleasing looking one as a whole, but we do not like the detail very much.

Messrs. Young & Hall's "New Premises for the Express Dairy Company," on Ludgate-hill (1,590), is a pretty drawing of a street front with a good deal of character, but does not the arch over the balcony level look a little too heavy for the rest of the design? Messrs. Wimperis & East's "Rebuilding of Reynolds's House, Leicester-square" (1,589) looks very well in itself, but we should certainly have preferred to have seen it carried out in a style more in keeping with the memories of Reynolds and his day and taste; no one who was told that Reynolds's house in Leicester-square still existed would ever think of looking for it behind this front; and this is a case in which the old associations of the Reynolds period might very well have been kept in memory. Apart from this, the two bays with the way line of the iron railing at the top, are picturesquely treated; the windows in the flat of the wall look rather unnecessarily mean and unconnected with the rest of the design. In the same neighbourhood Messrs. Henman & Cooper's "Block of Professional Chambers, Cornwall-street, Birmingham" (1,592) is a very pleasing piece of street architecture, apparently brick and terra-cotta; the manner in which the recess between the two bays is made use of for a bit of architectural effect, by the pier in front of it on one story and the two columns on the other, carrying the line of the wall across, is most praiseworthy.

We will continue our comments on the architectural room on another occasion.

A YEAR'S BUILDING OPERATIONS IN LEEDS.—The report of the Leeds Building Inspector (Mr. W. Towers) for the twelve months ending March 25 last shows that the year was a busy one in the building trade. The total number of plans submitted to the Building Plans Committee was 2,839, or sixty-five more than last year, and the total number sanctioned was 2,199. But the number of buildings shown on the approved plans, 8,952, was 487 less than in the preceding twelve months. Of these buildings, 2,947 (on 531 plans) were houses, and 1,807 mills, warehouses, stables, sheds, and workshops; 2,427 represented additions and alterations, and 1,771 conveniences. In the previous year there were 3,519 houses, and 2,030 mills, warehouses, stables, sheds, and workshops. The 2,947 houses for the building of which authority was given comprised nineteen villas, eighty-eight semi-detached villas, 812 through houses, and 2,028 back-to-back houses. The latter figure is less than in the preceding year, when 2,300 back-to-back houses were sanctioned. The number of through houses is smaller, by 285, and semi-detached villas less by forty-five, while the number of new detached villas for whose construction authority has been given is just the same as last year. During the past year 3,030 houses (including 2,035 back-to-back houses and 997 through houses) were completed and certified for occupation, a decrease of twenty-nine; while 1,597 miscellaneous buildings (including churches, chapels, schools, hotels, and other institutions) have been so certified.

NEW THEATRE, YORK.—The plans for the New Theatre, Clifford-street, York, on the site of the Corn Exchange, prepared by Mr. John P. Briggs, of London, were submitted to the City Council on May 14, and were approved.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute of British Architects was held at No. 9, Conduit-street, Regent-street, on Monday last, Mr. William Emerson, the President, in the chair.

The late Mr. Arthur Cates.

The minutes of last meeting having been taken as read,

Mr. John Slater said that before the business was proceeded with he wished to say a few words in regard to their deceased friend, Mr. Arthur Cates. During the last ten or twelve years he (Mr. Slater), perhaps more than most men, had had opportunities of seeing that side of their deceased colleague's character that was very little apparent to those who only met him in an official capacity. Mr. Cates was essentially a strong man all round, and one sometimes regretted, perhaps, that he was a little too prone to show his strength, but under a somewhat forbidding exterior there lay one of the kindest hearts that ever beat in human breast. He had sometimes thought that Shakespeare's words in describing the haughty, overbearing Chancellor of Henry VIII. were very applicable to Mr. Cates—"lofty and sour to them that loved him not, but to those men that sought him, sweet as summer," and he knew personally that not a few young architects had had occasion to be grateful to Mr. Cates for the kind advice and assistance given them as ungrudgingly as unostentatiously. To see Arthur Cates in his favourite Sunday morning walks around the Zoological Gardens describing the peculiarities of some of his pet animals to a group of keenly interested and laughing children was an absolute revelation to those who only knew him in his official capacity, and his death had left a void in the hearts of his friends and acquaintances which it would be very difficult to fill. Mr. Cates was not only an able man, but he was a very learned man, and he (Mr. Slater) had been much struck on frequent occasions to see the evidence of the very wide reach of his reading and learning. Of his interest in and services to that Institute it was too early to speak, and it was too soon for them to attempt to appreciate his loss. The work that he did in instituting the examinations—whatever might be the opinion of the general public as to their value or not—could hardly be over-estimated, for if it had not been for Mr. Cates he was quite sure that those examinations would never have been started, and the energy with which he pressed forward his views and carried them was a striking tribute to his character. He was an ideal chairman of committee, and the frigidness which sometimes characterised him when he was simply sitting on a board absolutely disappeared when he was in the chair. In that capacity he was always urbanity itself, and the way in which he gave any member of any Board an opportunity of expressing his opinion was remarkable, and it was a perfect treat to see the way in which he got the business through. No doubt in their *Journal* they would have from the pen of some one who knew Mr. Cates longer than he did a record of his life and work. That night they could only regret his loss, and he was sure he was only expressing the feelings of all who knew him when he said "that he was a man, take him for all in all, we shall not look upon his like again." He would propose that a sincere vote of condolence be sent to Mrs. Cates from the Institute in the loss that she and they had sustained in Mr. Cates's death.

Mr. Woodward said that, before the vote was put, he would like, as Mr. Cates's oldest assistant, to add a few words. It was now some twenty-five years ago that he first entered the office of Mr. Cates, and in those early days they worked from morning to night—because Mr. Cates was a very great worker—and he had had the benefit of receiving the strong tuition to which Mr. Slater had referred. Mr. Cates was a man of very considerable literary attainments; he was a great bibliophile and a voracious reader. His passion for work was well known to members of that Institute, and that passion for work permeated his office, and, unfortunately, did not leave him when he went home. He did a very great deal of work connected with the Institute at home. His memory and powers of observation were wonderful, and he was able to describe with considerable minuteness nearly every building that he had seen in his tours abroad. Another feature which his (Mr. Woodward's) acquaint-

ance with Mr. Cates led him to point out was the marvellous facility with which he could grasp the contents of his daily correspondence, and he also possessed wonderful powers of placing his reports in official language in a brief, terse, and marvellous fashion.

Mr. T. M. Rickman said he would like to add a few words to those already uttered in respect to the grief they felt at the death of Mr. Cates. He had had the pleasure of working with Mr. Cates on committees, although not always on the same side, and he was quite satisfied that, though he was at times somewhat pug-nacious, there was no one more upright in the profession, and no one who had the interests of the profession more thoroughly at heart; and although he sometimes spoke of himself as the drill-sergeant, one could never have an interview with him without feeling that one had learned a considerable amount at his hands, and he believed that all those who had had the privilege of being educated by him had left him with great hopes of future progress. He cordially supported the vote of condolence which it was proposed to send to his widow.

The Chairman briefly supported the motion, and said that it was only of late years that he had got to know Mr. Cates well, and he was astonished to note his wide learning and his comprehensive grasp of all subjects connected with the architectural profession and his very deep interest he took in the Institute. His loss was a very great one to them, for his work in connexion with the Institute had been useful in the highest degree.

The resolution was then carried.

The Late Mr. E. Gregg.

Mr. Graham said he had to announce with regret the death of their colleague, Mr. Gregg, who was first elected a Fellow of the Institute in 1870, and whose general presence was always welcomed in that room. He was a very active member of the Institute, and took a great interest in everything that was done, and his services for a number of years as a member of the board of examiners reflected great credit not only upon his ability, but upon his assiduity and his devotion to the Institute. The board of examiners would miss his co-operation very much as he was always willing and anxious to fulfil the work entrusted to him thoroughly and conscientiously. As a mark of respect to the memory of their late friend the Institute sent a wreath to his grave, and it was proposed that a letter of condolence be sent to the relatives of their deceased colleague. He asked the members to approve the action taken by the Institute in the matter.

The motion was carried in silence.

Professor W. M. Flinders Petrie then read a paper on the "Sources and Growth of Architecture in Egypt," of which the following is an abstract:—

The Sources and Growth of Architecture in Egypt.

The author said that in no respect was our view of the origins of the arts more enlarged than in the architecture of Egypt. Ten years ago we were starting with the most highly-finished work of the Fourth Dynasty, the great pyramid of Khufu, and were groping in the dark for any clues to the growth of such surpassing construction. To-day it can be shown how every feature arose, and the adoption of stone for building can be dated to a single generation. The unwrought materials, which were everywhere to hand in Egypt, were palm-ribs, papyrus, reeds, maize-stalks, and mud, together with palm-fibre roughly twisted.

A striking sight of the beginnings of the building art may be seen any day in a nomad settlement on the desert edge. Side by side stand (1) a black goat-hair Arab tent, long and low, open always on the leeward side; (2) a tent fenced along part of the open side with a row of maize stalks; (3) a tent fenced all round with maize; (4) a tent in a maize fence mud-plastered; (5) a dwarf wall of brick round the fence; (6) a high brick enclosure with a tent inside to roof it, the tent ropes stretching out through the wall; and lastly, a roof is put on the wall, and the tent has disappeared.

The early Egyptians seem, however, to have usually roofed their reed huts with domed roofs, to judge from the engraving of a hut on ivory, at the rise of the First Dynasty (4800 B.C.). The best feature is the strengthening of the corners of the hut by placing at each angle a bundle of reeds lashed together, as seen in the hut on the mace of Narmer. Here we

have the origin of the torus-roll down the edges of the buildings, used till the latest stage of the architecture. The lashing together was always retained as an ornament, although the meaning of the roll was long lost.

When papyrus stems were used for walling, instead of reeds or maize stalks, the top was rather weak if stripped of its leaves; hence they were retained and bound together, and the feathery tops served as a barrier above the wall, and finally as an ornament.

Besides these materials, palm-ribs may be seen still used for fences. They are set upright with all the leaves on them, at a few inches apart, and strengthened by other ribs interwoven diagonally each way; just below the weak part of the tip a line of ribs is lashed on with palm-fibre, and the loose nodding tips serve as an effective barrier to men and animals. The whole is finally plastered with mud up to the top lashing, and forms a very strong fence, which will last for many years. Such a fence or wall is figured as the front of an early shrine hieroglyph in the Fourth Dynasty. Translated into stone, this became the constant feature of every Egyptian building, and this cornice retained to late times the palm-leaf ribbing which proclaimed its origin.

We have preserved to us some views of simple shrines made of the natural materials, similar to the huts of maize stalks still used by the peasant. Here we note the roof sloping backward, and carried on far before the open front, so as to cast a shade, while it is supported on two front pillars of stalks. This was the original type of the rustic shrine adopted as a hieroglyph, and preserved to us from the Fourth Dynasty.

The next material to be noticed is mud-brick, one stage beyond the rough mud plastering. Brick houses and town walls remain from the prehistoric age, probably about 6000 B.C.; and a model of a town wall, with watchmen looking over it, belongs to a rather earlier time.

Regular brickwork developed in use in the prehistoric time, and some arched brick tombs are probably of this age. There can, however, be no doubt of the barrel-vaulted passage in the tomb of King Neter Khet (found this year) belonging to the beginning of the Third Dynasty (about 4200 B.C.), and the magnificent brickwork and arching of the Fourth Dynasty (about 3400 B.C.) shows a long familiarity and free use of it.

Coming to wrought materials, wood was the earliest in use for construction. The prehistoric graves were often lined with matting, and this was, in the later prehistoric, sometimes supplanted by a wooden lining. In the royal tombs at Abydos (4700-4500 B.C.) all of the wooden sides have been destroyed; but the evidences remain most clearly on the cross walls that were built to form cells around the wooden chamber for the offerings. These walls are plastered and whitewashed on the sides, but the ends are all rough brick, evidently built against a pre-existing timber wall, as the mud mortar has taken the cast of the grain of the wood wherever it touched it. The floors were usually of wood; one of the most complete shows the boards about 2 in. thick, resting on beams at the sides and down the axis of the chamber. The roofing was also of wood, as in some cases the casts of the rough-hewn ends of the roofing beams remain in the brick walls of the chamber. The author referred to the tombs of King Qa (4650 B.C.) and King Zet (4600 B.C.), and gave details of their construction. This form of construction is the forerunner of the greatest architecture of the pyramids. For the wooden chamber we find a stone chamber substituted, and the beams of the roof are of limestone or granite in place of wood. But the continuity of the general form and system is unbroken. The earliest royal tombs are plain pits roofed in, as in the prehistoric time. By 4650 B.C. a wooden lining forms a complete chamber, with brick cells around it, but no entrance. Under Den-Sefni, 4600 B.C., an entrance stairway is added on the east side. Under Qa, 4500 B.C., the stairway is turned to the north. And the step from this to the usual pyramid form of a north entrance passage sloping down to a chamber, is merely a change of material, but not of form or position. The external form of the mastaba tomb, from which the pyramid was developed (or rather on which the pyramid was super-posed) is exactly that of the rectangular mass of sand above the tomb, held in by the

retaining wall of mud-brick, with a large external batter, as over the tomb of King Zet.

The author, having referred to the favourite lattice-work, the analogue of the mushrabiyyah work of Cairo, went on to trace the course of stone-working. The first actual building of stone is the pit-chamber of King Khasekhemui, in the middle of the Eleventh Dynasty, about 4350 B.C. The limestone courses are tolerably regular, varying one or two inches either way. The faces of the blocks follow natural cleavages as far as possible; but most of the faces are hammer-dressed, and then adzed over to level them. The joints have plaster in them, and also spread over the open joints on the face. The same king also worked in grey granite, as two large building-blocks with inscriptions of his have been found at Hierakonpolis and at El Kab. But building in limestone was still rare, and it is probably to the latter half of the Second Dynasty, about 4350-4200 B.C., that must be assigned a series of rough stone pyramids, which stand at El Amrah, Nubi, and El Qula. These are all built of unworked blocks found loose on the desert and cliffs. Each has successive faces of external finish, which have been coated over with added masonry.

The author next described the fine tomb of King Neter-Ket, probably second King of the Third Dynasty, about 4200 B.C.; the great stone pyramid of Saggara, probably of the same date; and the tomb of King Seneferu at Medum (4000 B.C.).

It is important to see clearly how the pyramid structure is derived from the wooden tombs in unbroken succession, as it has by some been derived from the dolmen and chambered burrow. These structures are quite unknown in Egypt; whereas the continuous stages between the prehistoric pit-grave and the greatest and most accurate structure ever built are clearly traceable. Even the preparation for a pyramid remained just the same as for the wooden tombs of the First Dynasty.

The author concluded with some notes on the subject of pillars. The wooden column appears as an octagon in the models found in the First Dynasty, and in the actual pieces he had discovered in the Twelfth Dynasty, and the copies of such in stone at Beni Hasan. The fluted wooden column is found copied in ivory in the First Dynasty tombs, and is well figured as a hieroglyph in the Fourth Dynasty. The most peculiar form of column is that derived from the tent-pole. This was the origin of the strange form known as the inverted bell capital in the Eighteenth Dynasty at Karnak.

The earliest example known of the lotus column is of the Fifth Dynasty (about 3600 B.C.). The later examples of the Twelfth Dynasty, of the Eighteenth Dynasty, and of the Nineteenth and Twentieth Dynasties, show only a series of lamentable decadence. Each age in Egypt had its special excellence. In the Eighteenth Dynasty a delicate and freely flowing ornamental treatment; in the Fifth Dynasty the finest figure sculpture; in the Fourth Dynasty the grandest constructions; and in the First Dynasty the most lavish use of hard stones for hand objects and table furniture. Doric, porphy, and such materials were cut in thin and beautiful forms with a familiarity which was never known in later times. But every branch of art, when once it had fully grown, decayed rapidly, and the later work in every respect cannot bear comparison with the older triumphs.

Professor Aitchison asked to be allowed to propose a vote of thanks to Professor Petrie for his most interesting paper and for the extraordinary information he had given them about the form Egyptian architecture ultimately took, and how it was entirely a matter of construction. It was unnecessary to say anything about Professor Petrie's discoveries in Egypt, because they were so well known to the whole of England.

Sir L. Alma-Tadema, in seconding the motion, said that Egyptian architecture was like Egyptian civilisation—they always seemed like things which came full-grown into the world. He felt that for so many years that he could hardly admit the truth to himself. The question of the development of that civilisation had been studied, and they all knew, by Professor Petrie specially, and they knew to that civilisation they owed a great architecture and many other things besides. In dealing with Egyptian civilisation, there was the question of time to be considered. They spoke of 6,000 years, and it seemed so

tremendously long that they sometimes felt it was beyond the reach of humanity. But, after all, 6,000 years was only 100 generations of sixty years, and if they began to think like that they would begin to feel with Professor Petrie that the Egyptians were very much akin to them; and to feel so much more interested in that civilisation, which was so essentially human in its development. They had to thank Professor Petrie that night for lifting up a corner of the mystery which covered that great race, that great civilisation, and that great beginning of human development.

Sir Martin Conway said he could only echo the words that had been used in praise of the paper that they had heard and the immense amount of suggestiveness which it contained. He confessed that as he watched the slides upon the screen and listened to what Professor Petrie said, it occurred to him how very strong an illustration he had shown them of one very interesting fact which he thought might be observed throughout the whole history of architecture, and that was how frequently in architecture styles had arisen from the exact contrary to the statement made by Mr. Ruskin. He meant the imitation in one material of forms devised for another. He rather thought it was one of the axioms of Mr. Ruskin that nobody should ever do any such thing as to imitate in one material decorations which were prepared for another. But in the history of architecture he believed it had always been the case. Styles had been developed by doing the very thing deprecated by Mr. Ruskin. In the earliest form of architecture, which they had now had revealed to them, they had the very beginnings of stone architecture—or, at any rate, of the decorative forms used in the earlier stone architecture—derived by direct imitation from the old forms developed when the materials of building were not stone. And just as that occurred then, so it occurred in Greece when stone architecture arose, by the imitation of the forms devised for wooden architecture. He thought they might take the lesson to themselves in the present day, because they were living in an epoch when exactly the same thing was taking place. They saw the metal construction coming in and about to become the dominant constructive feature in all the architecture of the world. He noticed the other day in New York—and he supposed every one had noticed it—that in the great buildings which were really metal buildings faced with other material, the architectural forms were all imitations of those forms which were devised as decorations or even as structural features in old stone buildings. So in the present day they saw going on exactly the same architectural process of development which had been illustrated that night in the extraordinarily interesting beginnings of architectural art described by Professor Petrie. He could only say how fortunate they were to have in Egypt a representative of this country capable not merely of making, as Professor Petrie made, such admirable investigations and of bringing to bear upon newly-opened soil such a bright and intelligent and quickly comprehensive eye, but who was also able and willing almost immediately to reveal them to those at home. He did not, as did so many investigators, keep back his discoveries in his pocket for years and dribble them out in monographs which nobody saw, but came and gave them the immediate benefit of the discoveries which his ability had enabled him to make.

Dr. Murray said he would like to ask Professor Petrie a question which arose from the columns shown on the screen always narrowing towards the top. They would remember that in the frescoes which had been found in Crete the columns widened towards the top, as in the case also of the sculptured column at Mycenæ. He would like to hear whether Professor Petrie had formed any opinion on that subject. Another question that occurred to him was when the lecturer was speaking of those primitive buildings of maize, bound together, from which people built their houses; he was reminded of the passage in the Odyssey where Ulysses described how he built a bridal chamber for Penelope. It was said that he built a stone wall round a living tree and roofed it in. If, as he supposed, a living tree growing in a court was adapted by Ulysses as the supporting element for a room that he built, it would be something analogous to that habit of using natural bodies like maize and so on for the houses in which the people lived.

Mr. R. Phené Spiers said there were one or two questions he would like to ask—relative to those masses of brickwork in curved forms. He would be glad to know whether there was any truth in the first theory put forward that the curved form of those masses was due to the fear of their being shaken down by earthquakes. That theory was put forward twenty-five years ago as a reason for the mode of construction, and they could readily understand that an earthquake would have less effect on a mass built together and leaning one towards another than it would on a vertical wall. Of course, if that was the case, then building in those blocks of brickwork at intervals with those curved lines would give a very solid support, and intermediate lines would tie them together and make them very strong. There was another point he would like to refer to, and that was as to the covering over of that chamber where the roof was a 20-ft. span. He did not quite gather whether it was 20 ft. long or 20-ft. span.

Dr. Petrie: Twenty-foot span.

Mr. Spiers said he had always understood that no timber longer than 17 ft. had been found in Egypt. At the same time there was no doubt that it was the custom to cover over tombs with timber, because there were a number of tombs round about the Pyramids in which the roofs were carved in stone in imitation of earlier ones so that the covering over of houses or of tombs in earlier periods with timber must certainly have been a well-known and recognised custom. He would like to learn what kind of wood it was that was used, because, with the exception of the palm tree, which was not a very strong wood when laid horizontally, it was difficult to understand how so great a dimension as 20 ft. could be covered over by timber, especially if it had to carry 3 ft. 6 in. of sand above it, which must be a tremendous dead weight. Professor Petrie had made discoveries of a remarkable kind, and had set at rest many of the questions which had perplexed the antiquaries of the last century. There was one point which it seemed almost impossible to get people to recognise, and that was the true form of the openings of the doorways. In almost every book they would see it remarked that the doorways in Egypt were always wider at the bottom than at the top; but if one thought for a moment that they were building not with timber but only in crude brick, that would be impossible because the wall would fall over. The only reason he could imagine for the idea was that seen in perspective the batter of the wall came a little more forward, and it made it appear as if the opening in the bottom was wider. There had been much new matter that Professor Petrie had brought before them that evening, and they owed him a great debt of gratitude for having delivered such a delightful and absorbing discourse, full of most interesting facts to all architects. There was one other question he would like to ask, which was whether the fluted columns were shown correctly with hollow fluting.

Professor Petrie replied that they were; they were both flat-sided and curved.

Mr. Stannus said that looking back at the authors who had written on Egyptian subjects, it was interesting to observe that there was a certain analogy between the Egyptian remains and the various crusts of the earth. They remembered that when man in his savage times began to make use of the crust of the earth he could only deal with the tertiary strata of clay. Then later, when he got advanced in civilisation, he was able to deal with the stone and the coal of the secondary strata, and later still, further advancing, he was able to deal with the primary or the metal strata. So it appeared that there was an analogy in that, in the study of the Egyptian discoveries. Reading in the old books they saw that the great idea of Egyptian art was that of the eighteenth and nineteenth dynasties—art which was in a state of effete degradation and debasement was thought to be Egyptian art. Then there came a time when man was able to go further back in the eleventh and twelfth dynasties, and later, since then they had been able to get at the art of the Pyramid builders, and going still further back down to the primary strata, Dr. Petrie had taken them to the art of the first dynasty, and to the art of dynasties even before the first one. They must indeed congratulate themselves that they lived in such times, to have heard all that laid bare to demonstration, and while one congratulated Professor Petrie upon having made such wonderful discoveries

in the fulness of time, there was a certain condolece one might make with him that there was left no more worlds to conquer. It seemed to him that Professor Petrie had almost struck bedrock in Egyptian matters, and that unless he struck another vein his occupation, so far as excavations were concerned, would be gone. Sir Martin Conway was speaking about Dr. Petrie finding things in virgin soil; he thought that Professor Petrie would tell them that it was by no means virgin soil, but that it was ground which had been pretty well picked and hacked over before he had a chance of going over it, and the marvellous things he had discovered just showed the difference between a man who examined them with his eyes open and the man who examined them with closed eyes.

The President said he was sure that they felt, as he did, the very greatest gratitude to Professor Petrie for having given them such a very splendid testimony to his research and careful discrimination in working at the origin of Egyptian architecture. To him it was a revelation, and probably to most of them, unless they had made a particular study of Egypt. He had often, in looking at Egyptian columns, wondered where they got the forms from, and he thought the paper which had been read showed that art was indigenous in Egypt, and grew up with the country. The idea that art in Egypt appeared in full bloom, as Sir L. Alma-Tadema had said, had always added a great charm of mystery to it, and only about ten years ago he believed that people talked of travelling to Arabia to try and find out where the origin of Egyptian architecture took place. But the dream of their childhood and the mystery vanished when men like Professor Petrie looked into the origin of things, and found out what actually was the state of affairs. There was one little point which astonished him, and that was the tremendous length of time to which Professor Petrie went back. They were led to believe years ago that the great Pyramid was built about 2000 years B.C., and now, apparently, it was 3800 B.C. They now talked of discoveries of 6000 B.C., which, according to their lessons in childhood, was before the world began.

The resolution having been carried,

Professor Petrie said that, with regard to the question of art being indigenous, that was a difficult matter. The construction was indigenous, but with regard to art that was another question, and he would have the opportunity of showing there were at least two different arts, and these derived from different sources. With regard to the question of the columns which Dr. Murray mentioned, they must have an illustration of the natural materials used in Greece to explain them. He had no doubt but that the origin of them might be found in the materials used. None, however, had yet brought forward an explanation, and it was useless for him to attempt from Egyptian materials to suggest any material which gave form to another country. The other question of the use of the growing tree in construction was particularly applicable in a woody country such as Greece. Unfortunately, in Egypt wood was comparatively scarce, and as to the question of the nature of the wood, he thought it most likely the wood was not Egyptian at all. He thought it was very probably cedar, but the floor beams were probably acacia grown in that country. The large trunks probably came from Assyria, for they knew at that time there was considerable communication as far as Greece, and the gold which had been found was distinctly from Asia Minor. There was no difficulty, especially in view of the large ships which were by them employed, in supposing that the timber was brought down from the woody parts of Assyria. With regard to the beams, there were beams of greater length than 17 ft. 6 in. remaining. He did not think they need be afraid of the load of 3 ft. 6 in. of sand, for if the beams were laid side by side 33 ft. of sand would be the breaking strain. As to the batter of the walls, he knew there was a suggestion that they would be stronger in view of earthquakes, but he did not think that suggestion solved the question.

NEXT MEETING.

The President announced that the next meeting would be held on Monday, June 3, to receive the report of the scrutineers for the annual election.

BRITISH PATENTS AND THE PROPOSED RESEARCH AS TO THEIR NOVELTY.

THE Committee appointed in May of last year by the Board of Trade to inquire into the working of our Patent Acts of 1883 and 1888 in respect of certain specified questions have issued their Report. The Report sets forth that an examination has been made by the Comptroller and his staff with the purpose of ascertaining the approximate number of inventions for which applications are filed in London that are obviously old, or that, as the official records could demonstrate, have been previously protected under letters patent in England. In the result it is found that an aggregate of upwards of 42 per cent. of the "accepted" specifications appear to have been anticipated either in whole or in part; the detailed figures for one hundred inventions being 57.50 per cent. not anticipated, 6.69 per cent. wholly covered by previous patents, 35.31 per cent. partly novel, 0.29 per cent. obviously old—a phrase of the Committee which the Patent Office construe as meaning known in the industry, but not previously protected—and 0.12 per cent. of which the mode or process of manufacture is not stated or indicated. These figures are calculated upon the basis of "completed" specifications taken and passed during the first week of June in the interval of 1877-1899. The Committee represent that the grant of invalid patents is a serious evil, and are of opinion that in the interests of legitimate trade, and of honest traders and inventors, some inquiry as to anticipation by prior letters patent ought to be undertaken at the Patent Office for discovering whether any invention claimed in a deposited specification has been claimed or described in any, and what, specifications of letters patent granted within the United Kingdom dated less than fifty years before the date of the application. From that inquiry, however, they exclude published "provisional" specifications that have not been followed up to their "complete" stage. They recommend further that an Act or Special Order should be passed to declare that the publication of an invention in specifications of letters patent granted within this country, dated fifty years or longer before the date of the application, or in a provisional specification of any date of the kind mentioned, shall not in itself be deemed to be an "anticipation" of the invention under review. They recommend, too, that the applicant shall be officially informed of the result of the inquiry that is made, upon those conditions, into the novelty, or otherwise, of his application, and that the Comptroller shall decide whether a reference to any, and if so what, prior specifications ought to be made by the applicant in his specification by way of notice to the public, with a right of appeal from such decision to the Law Officer. Inasmuch as the Committee's views, if adopted, will involve a considerable reduction of the annual surplus derived from fees, and also render necessary an increase of the executive staff, they propose that additional expert officers should be appointed in order to carry out their scheme, and that the fee due upon the sealing of letters patent should be raised to the extent of 1*l.* more. A tabulated statement in the Report gives the estimated additional charges upon the income of the Patent Office which would follow upon the new procedure. It is calculated that in the financial years 1902-3, 1907-8, and 1912-3, the net diminution of income would amount to, say, 8,631*l.*, 15,230*l.*, and 23,404*l.*, respectively, since the losses of revenue arising from the consequent decrease of renewal fees would amount, approximately, to the several sums of 15,000*l.*, 24,000*l.*, and 28,000*l.*; and the increased administrative expenses to 36,831*l.*, 53,230*l.*, and 65,404*l.*, in those financial years, respectively, whilst the surplus would be diminished from 117,000*l.* for the year 1902-3, to 111,000*l.* for 1907-8, and to 103,000*l.* for 1912-3, after allowance made of about 14,000*l.* derivable from the 1*l.* extra for the issue of sealed letters patent in each instance.

The Committee express their inability to accede to the suggested adoption of some plan for securing the defeasance of a patent that is not being "worked" in this country, in preference to the current altogether unsatisfactory system of compulsory granting of licences. They propose, however, a transfer, under legislative enactment, of jurisdiction in that behalf from the Board of Trade and their expert referees to the High Court of Justice

with the power of awarding costs. The jurisdiction should, they think, arise when it is made to appear that the reasonable requirements of the public in reference to the invention have not been satisfied, by reason of the patentee's refusal or neglect to work or grant licences upon reasonable terms; and they add the patentee's failure to "work" his invention to the existing grounds upon which a compulsory licence may be demanded. They consider, moreover, as the condition of foreign inventors should be ameliorated in favour of applicants under the International Convention for the Protection of Industrial Property, that the term of seven months' priority enjoyed by applicants may be properly extended to twelve months, provided that an application by a foreigner under the Convention is accompanied with a complete specification, and that the concession for the longer time is reciprocally met by a similar provision in favour of British inventors in foreign countries.

The reference to the Committee has a limited purview, and rehearses a disclaimer on the part of the Government of either desire or intention to establish any general system of examination as to the novelty of inventions. Yet there are many who think that, even with the limitation imposed upon their labours, the Committee ought to have more boldly determined the long vexed question as to the jurisdiction of the courts in contested cases of infringement and cognate suits. The judges administer justice, it is true, yet we commonly obtain justice from them at a price. A dishonest infringer with money in his purse is sometimes enabled to defer, if not to ultimately defeat, the equitable claims of an inventor whose resources are exiguous and who thereby loses the harvest of his ingenuity and skill. The time has not yet come—indeed, one can scarcely hope it will ever come—when for the familiar legend *sans garantie du gouvernement* we shall find substituted a warrant which will fortify its fortunate, perhaps fatuous, possessor against the world at large. Until commercial integrity shall have become universal, the issue of absolute indemnities against all comers would, it may justly be maintained, do more harm than good. There would seem to be no very strong evidence of the existence of what may be termed vexatious patents to any great extent. Why, then, some will ask, interpose between the patentee and his folly? He is content to waste his fees, and more than content to be vested with the part of an original inventor and to exhibit his letters patent to his friends; disillusion comes in the end.

Whilst many competent authorities upon patent law hold that the new indicated procedure does not go far enough, it is manifest that the advocated changes will impart quite an altered scope and aim to the functions and administration of the Patent Office. The inventor of to-day buys a protection that may perhaps lead to fortune; it may prove utterly worthless, or draw him into costly litigation. He must not look to the Office for either encouragement or warning, nor can they in his adversity give him redress. In France, and we believe in Belgium and Italy, where no preliminary examination obtains, a grant of letters patent amounts to very little more than a certificate of deposit or registration, with the declaration that no official guarantee as to novelty is conveyed. In Austria Germany, and notably in the United States of America, a search into novelty is undertaken by the State, and letters patent are withheld from an applicant whose claim is found to have been anticipated, even in the shape of a publication that in itself is not a patent. But there remains the question—what constitutes valid "anticipation"? When that controversy arises recourse is had to the courts, with their concurrent delays, disappointments, and expenses. Our technical staff of trained examiners will at times be sorely tried in their efforts to distinguish, albeit non-judicially, between an alleged new invention and what is apparently an invention in anticipation; still, having in view the care which, as the Committee acknowledge, they bestowed upon the academical investigation we have already mentioned, there seems to be small reason to apprehend, as some do, that any serious failure will ensue in that direction. We should remember, too, that in most cases an astute inventor, who applies in *bond fide*, has made, or caused to be made, the previous search which his prudence and his fears alike may dictate. We do not suppose that the

most strenuous champion of free trade will contend for a common right to trade upon men's brains. Invalid patents are illegal monopolies; the safeguard that is needed is protection against unscrupulous persons who apply their cleverness to gaining profit through the necessity or ignorance of others. The fresh powers that will in all likelihood be conferred upon the Comptroller should enable him to frustrate the designs of so-called "inventors" after that kind by placing on record that they are seeking to obtain what lawfully belongs to some one else. All things therefore considered, we think the measures which the Committee advance for adoption may form, at any rate, the basis of advantageous legislation, and tend to promote, though possibly to a less degree than the more sanguine expect, the legitimate claims of those who may fairly look to the State for both security and guidance.

The report is signed by Sir Edward Fry (chairman), Lord Alverstone, Sir W. H. Houldsworth, M.P., Mr. F. J. S. Hopwood (Board of Trade), Mr. S. E. Spring Rice (Treasurer), Mr. J. Fletcher Moulton, K.C., Colonel T. Walter Harding, Mr. E. Carpmal (Institute of Patent Agents), and Mr. Herbert Hughes (Cutlers' Company, Sheffield). The last three gentlemen add qualifying notes to the general statement, and Sir Edward Carson, K.C. (Solicitor-General), was prevented by illness from appending his signature.

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

A MIDLAND counties district meeting of the members of the Association of Municipal and County Engineers was held in the Guildhall, Oswestry, on Saturday, May 18. The President (Mr. C. H. Lowe, C.E., Hampstead) occupied the chair, and among those present were Messrs. J. Price, Birmingham; A. Greatorex, West Bromwich; H. Richardson, Aston; T. Cole, London (secretary); J. S. Pickering, Nuneaton; G. W. Lacey, Oswestry; J. W. M. Smith, Wrexham; C. L. N. Wilson, Bilston; J. Parker, Hereford; A. T. Davis, Shrewsbury, &c.

The Mayor, in welcoming the members of the Association, said they were naturally proud of their ancient and important history, but they were still more proud of the public spirit and enterprise of their business men. They were the centre of a large agricultural district, and as a corporation had endeavoured by building large and commodious markets to encourage and assist the farmers, so that instead of retreating, as many agricultural towns had done, they were one of the most successful market towns in the United Kingdom. In ten years the rateable value had increased from 31,377l. to 47,939l., and the rates had fallen from 1s. 8d. to 1s. 2d. per half-year.

The Town Clerk (Mr. Parry Jones), Dr. Lewis, Chairman of the Sanitary Committee, and Mr. Smith, Chairman of the Markets Committee, joined in the welcome accorded to the Association.

On the proposition of Mr. A. D. Greatorex, West Bromwich, Mr. J. S. Pickering, of Nuneaton, was re-elected honorary district secretary.

Mr. G. W. Lacey, Borough Engineer and Surveyor, read a paper on Oswestry municipal work and progress. He said the area of the borough was 1,888 acres and the estimated population nearly 10,000. It was an important market centre, drawing large quantities of all kinds of cattle and agricultural produce from within an extensive radius. The municipal buildings, Renaissance in style, faced with Gresshill stone, were erected in 1892 from the design of Mr. Cheers, of Twickenham, with modifications by Mr. T. M. Lockwood, of Chester, the consulting architect to the Council, who superintended the erection of the buildings, which cost 12,000l. The water supply was derived from a gathering ground in the hills of Denbighshire, 5½ miles distant from Oswestry. Prior to the construction of the impounding reservoir there was only a small catch-tank in addition to the service reservoir, so that without proper storage the supply was somewhat precarious in the summer months. The reservoir was formed with an earthen embankment, and the contractor failing to carry out his contract the completion of the work was undertaken by the Corporation. The amount of the tender for the work was 9,341l., but by the time it was completed the cost was 21,866l. It had a capacity of 24,000,000 gallons, which was equal to 117

days' supply at the present rate of consumption. The water was of good quality, but contained peat, which naturally affected the colour, but not its purity or suitability for dietic purposes. The main sewage system was constructed in the year 1867, and all the sewers had self-cleaning gradients. The daily collection of house refuse throughout the town was in operation. The method of disposal was by tipping, but this could not be characterised as satisfactory in these days. The gasworks and electric light works were in the hands of companies, and negotiations with a view to purchasing the latter undertaking last year met with considerable opposition, and the result of the Local Government Board inquiry which was held was against the sanction being granted. The bacterial sewage disposal works were designed and partly carried out by Mr. R. O. Wynne Roberts, and completed under his (Mr. Lacey's) supervision. There were nine primary beds, the surface area of each being 60 ft. by 60 ft., and nine secondary beds, each with a surface area of 60 ft. by 50 ft., and they were constructed partly in the natural ground and partly by earthen embankments, which were 11 ft. wide at the bottom and 2 ft. 6 in. wide at the top. In the secondary bed embankments clay puddle was put as a security against percolation. On the floors of the beds, lines of 3-in. diameter agricultural pipes a yard apart were laid, connecting with brick channels, which terminated in a small brick chamber in each bed, with the exception of the central ones, where they connected with a channel round the valve chambers. From these brick chambers 9-in. glazed pipes were laid to the valve chambers for discharging the effluents. The beds were filled with cinders which were riddled from an old and large accumulation of house refuse; the gauge of them in the primary beds being from 3 in. to 1½ in., though containing very little of the larger size, and in the secondary from 3 in. to 1 in. The depth of the cinders was 4 ft. 6 in. in each series. In the centre of each series there were automatic valves, which were designed by Mr. Wynne Roberts in conjunction with Mr. Henry Roberts, water inspector, worked by water pressure from the town mains, which distributed the sewage and primary effluent to the various beds in rotation, held up the sewage in contact in the beds, and discharged the effluents in due course. Since the completion of the beds it had been found necessary to put in aeration pipes from the end of the collecting channels to the surface in order to facilitate the discharge and complete the drainage of the contents of the beds, and this had had a beneficial effect. The primary beds had since the commencement of their full use been reduced in capacity by about 30 per cent, but no further decrease had been observed for some time; if anything, since the aeration pipes referred to had been fixed the capacity had increased, and certainly the results had been somewhat better than before. No appreciable decrease had taken place in the capacity of the secondary beds. The sewage first of all passed through one or both of the two settling tanks, 70 ft. by 15 ft. by 4 ft. 6 in., and in these a considerable quantity of sludge precipitated, no chemicals being used. The sewage and primary effluent were distributed over the beds by means of wood troughs, and the final effluent passed away through 12-in. diameter pipes and discharged into a small watercourse. The sludge from the settling tanks was pumped out at intervals of from eight to ten weeks, mixed by machinery with fine screened ashes, and found a ready sale to farmers at 6d. per load. It was not contended that this part of the process was desirable to continue, and some time ago he recommended his Sanitary Committee to consider the advisability of adding septic tanks, and in all probability this would eventually come to pass. The average daily flow of sewage last year was 440,000 gallons, and the dry weather flow 387,000 gallons. This included a considerable quantity of spring or surface water, but, notwithstanding this dilution, the sewage was strong, and contained a considerable proportion of brewery, tannery, and fellmongers' refuse. The occasional analyses made of the effluent from the primary beds went to show that a remarkable proportion of the purification was effected by the first contact. Samples of the effluent which had been kept for longer than a year showed no signs whatever of putrescence, and analyses made during very severe winter weather showed but a slight diminution in the

degree of purification. This diminution was but natural, as when the beds were partially covered with a sheet of frozen snow the admission of air into the beds must of necessity be retarded. But this lessening of aeration was not likely to be of sufficient duration to affect materially the results. The cost of construction of the bacteria beds was slightly over 2,000l., and the cost of maintenance 225l. per annum. The cost of construction was delayed out of revenue sanction to borrow the money not being obtained, as the works did not allow for dealing altogether with six times the normal flow of sewage and for after treatment of the effluent on land. Very extensive provision had been made for markets, and extensions were in progress. The tolls of the whole of the markets last year amounted to 1,765l. Plans for a proposed swimming bath were before the Local Government Board, and a number of public street improvements had been carried out, the cost amounting in the aggregate to a very considerable sum.

Mr. J. Price, Birmingham, in moving a vote of thanks to the author of the paper, referred to the new by-laws under the consideration of the Local Government Board, and said it was as important that the Association of Municipal Engineers should have a say as to what the by-laws should be as the Institute of British Architects. As to refuse collection, the town was well ahead, but when they came to disposal he considered they might adopt some better method than tipping in the vicinity of the town. He suggested that the Council should cremate it, even if they did not get £ s. d. from the cremation in the shape of power.

Mr. A. T. Davis, County Surveyor of Shropshire, said he noticed that from 1891 the population had increased by 1,204, while some 446 houses had been built. Therefore it looked as if the town had been overbuilt, unless there had been a good deal of pulling down of old houses. He knew the tendency on the part of builders to put up houses, and of tenants to remove from the old houses into new houses.

Mr. J. Lobley, Hanley, commended the action of the Corporation in undertaking the working of street improvements, but expressed a fear that in a few years a width of 30 ft. and 36 ft., though a great improvement upon 15 ft. 6 in., would be found insufficient. Where they did not wish to undertake heavy capital liabilities, he suggested that they should prevent matters getting worse by insisting that all the new buildings should be put back to a new building line.

Mr. J. Parker, Hereford, expressed the opinion that there was a great future for the destruction of refuse, apart from the first object of sanitation, for each 1 lb. of refuse would evaporate 1 lb. of water for power purposes.

Mr. A. D. Greatorex, West Bromwich, said with respect to bacteria beds they wanted definite information as to the loss of capacity, and he advised every town to have meters fixed. Judging from the cost of the beds at Oswestry, they had been carried out remarkably cheap.

Mr. J. S. Pickering, Nuneaton, also urged the necessity of measuring the effluent from the beds, either by meter or some other equally accurate means. A mere general statement that the beds decrease in capacity was not sufficient. He thought it would be found in every case without exception that this gradual siltling up was taking place, and sooner or later the necessity of resiltling the material would have to take place. He did not know that there was any serious objection to the use of bacteria beds; but it did affect the question of material very considerably. It used to be thought that coke and ashes were the best material to be used. That idea is now exploded, and it seemed to be recognised that any hard material would answer the purpose. He was using granite for the coarse and probably for the fine beds he was laying down. The advantage of that would be seen when they came to sift the material. In the case of coke it would be a difficult matter, as there would be a good deal of disintegration.

The vote of thanks having been carried, Mr. Lacey, in reply, said the cost of bacteria beds came out at 3s. 6d. per square yard. There was a good deal of truth in what Mr. Davis had said, that the town had overbuilt itself, and the old property was left for the new. Under the by-laws all new streets must be 36 ft. wide. The particular improvement carried out at 30 ft. was because the owner

would not sell more land than sufficient to make a 30-ft. road. He was glad to hear Mr. Parker's advocacy of refuse destruction. He would like to see the Council adopt a destructor, and perhaps the discussion would induce them to reconsider their decision. With reference to the bacteria bed, they had gauged the flow by meter almost from the commencement. He was inclined to be at one with Mr. Pickering as to the material forming the beds. With cinders there was a tendency to disintegrate and become finer. It was all right now, but what it would be in ten or twenty years' time he could not say.

The members then proceeded to view the new fire-station and the market extension, after which they were entertained by the Mayor and Corporation to luncheon at the Wynnstay Arms Hotel. The afternoon was devoted to visits to the filter beds of the Liverpool Corporation Waterworks and to the bacteria beds for the treatment of the sewage of Oswestry.

THE ARCHITECTURAL ASSOCIATION DISCUSSION SECTION.

The eleventh meeting of the Discussion Section of the Architectural Association for this session was held at 56, Great Marlborough-street, on the 17th inst., Mr. C. H. Strange, chairman of the section, in the chair. The paper of the evening was entitled "A Tour in Mid-France," by Mr. Percy E. Newton.

Starting with Bordeaux, a city under English rule from 1152 to 1453, it was shown what an important bearing this had on English architecture of the period, a succession of skilled workers being brought over from France by Edward I. The more important buildings of Bordeaux were briefly described, mention being made of the splendid carving on the façade of the church of St. Croix. The modern Place des Quinconces was mentioned as a successful treatment of a public promenade.

The route followed from Bordeaux was the course of the Dordogne, a tributary of the Garonne. St. Emilion was the next place visited, and its curious cluster of buildings, formed round the hermitage of the Saint, described. A most interesting place was the next on the list, Montpazier, a town built by Edward I. of England, and practically unchanged to this day. A plan of the town was exhibited, and its remarkable rectangularity of design and the picturesqueness of its arcaded market place commented on. Rocamadour, the great resort of pilgrims in mediæval and in modern times, and its throng of the faithful moulting the hundreds of steps to the shrine; Souillac, with its great abbey church so mosque-like in character; and the fine fifteenth-century church of St. Géraud at Aurillac were then touched on by the lecturer, who then took his audience through the hilly district of the Cantal to Le Payen Velay, in many respects the most picturesque town in France. Mention was made of its numerous peaks, each crowned by a building or a statue, and of the cathedral of Notre Dame, unrivalled in its situation and approach. Mende and its cathedral were next described, and then a voyage down the Tarn, flowing through gorges 2,000 ft. deep—a country interesting to the admirers of Robert Louis Stevenson, his "Travels with a Donkey" being in this district. Albi was the next town visited, and its unique fortress-church, of which a very complete set of photographs was shown, was described, as well as its marvellous choir screen, one of the glories of Gothic art. The last place on the list was Toulouse, where is the cathedral church of St. Etienne, with its beautiful stained glass and strange disregard of axial lines; the church of the Jacobins, a rare example of a church with a central range of columns; and the important church of St. Sernin, the central tower of which may have served to suggest to Sir Christopher Wren his design for the steeple of St. Bride's—these, with some of the fine old houses of Toulouse, were rapidly passed under review by the lecturer, who concluded by saying that his paper would have fulfilled one useful object if it persuaded any of his hearers to pay a visit to this part of France.

Mr. H. C. Corlette proposed a vote of thanks to the author for his paper. He referred to the church at Albi, and mentioned that the present turrets were introduced by Viollet-le-Duc.

Mr. Cuthbert Harding seconded, and the

discussion was continued by Messrs. G. H. Smith, C. H. Brodie, R. H. Weymouth, and C. H. Strange.

Mr. Newton responded, and in answer to queries put to him as to the best month for a cycle tour in the district described in the paper, gave preference to September, although he considered March or October favourable for touring.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, Mr. A. M. Torrance, Chairman, presiding.

Loans.—On the recommendation of the Finance Committee it was agreed to lend Hampstead Borough Council 1,000l. towards the purchase of Dollis Hill estate; Westminster City Council 11,660l. for street improvements and other works; Battersea Borough Council, 1,410l. for public library purposes; Hampstead Borough Council, 17,251l. for electric lighting purposes; School Board for London, 200,000l. for schools; Central London Sick Asylum Board, 3,390l. for erection of asylum; Fulham Guardians, 111,875l. for purchase of property and conversion of premises into a receiving house for children; Poplar Guardians, 15,900l. for site for officers' quarters and engineering works at workhouse, &c.; St. Olave's Guardians, 18,225l. for erection of workhouse and chapels; and Woolwich Guardians, 15,000l. for erection of homes for children.

List of Rates of Wages and Hours of Labour.—The same committee reported as follows:—

"The Electrical Trades Union have called our attention to the fact that the rate of wages for wiremen in the Council's list, viz., 8½d. to 9½d. per hour, is not that in practice obtained, and they have asked that the rate may be increased to 9½d. per hour. After careful inquiry, we have come to the conclusion that the Council's list of wages and hours should be so amended. We recommend that the rate of wages inserted in the Council's list of rates of wages and hours of labour as payable to wiremen be amended, and that the rate be increased to 9½d. per hour.

This was agreed to.

London County Council Central School of Arts and Crafts.—The Technical Education Board reported as follows, the recommendation being agreed to:—"For some years past we have been seeking suitable premises for its permanent accommodation of the London County Council Central School of Arts and Crafts, at present housed in premises held on a half-yearly tenancy at No. 316, Regent-street, and additional premises held on a three years' agreement at No. 314, Regent-street. . . . Our attention has been called to the premises lately acquired by the Council at the corner of Southampton-row and Orange-street, in connexion with that street improvement. The Council is now in possession of a cleared site at this spot admirably adapted for the erection of a building which will accommodate all the work at present carried on in the London County Council Central School of Arts and Crafts, together with instruction in certain other artistic industries, and will also provide accommodation for the London County Council School of Photo-Engraving and Lithography in the event of that school being unable to continue the tenancy of its present premises after the termination of the existing agreement. . . . We have not yet considered in detail the plan of the building to be erected, but the cost of a suitable building on this site may be estimated at about 60,000l., some part of which, if not the whole, we shall be able to provide out of the sum placed at our disposal by the Council under the head of 'new institutions.' . . . The site in question has a frontage of about 89 ft. to Southampton-row, of about 100 ft. to Orange-street, with a total area of about 11,000 square feet. We recommend that the estimate of 45,000l., submitted by the Finance Committee be approved, and that the site in question be appropriated for the purposes of technical instruction within the provisions of the Technical Instruction Acts, and that the estimated value—namely, 45,000l.—be refunded to the Council by the Technical Board by annual payments extending over six years."

Lifts for Greenwich Tunnel.—The Bridges Committee recommended:—"That the supplemental estimate of 6,000l., submitted by the Finance Committee for supplying and fixing

single lifts in the shafts of the Greenwich foot-tunnel, be approved, that tenders be invited for the erection of the lifts, and that advertisements be issued in the usual journals."

This was agreed to.

Brickmaking on the Norbury Estate.—The Housing of the Working Classes Committee reported as follows, the recommendation being agreed to:—

"The Council in purchasing the Norbury estate purchased also the brickmaking plant which was already thereon, and which had been used by the vendor of the estate in the making of over two million bricks. The estate comprises a large quantity of brick-earth, and as this earth exists just where the land rises and will require levelling, every consideration points to the advisability of our making the best possible use of it. We have, therefore, given the question our careful consideration, and have come to the conclusion that it is desirable that the Council should have bricks made for use in the erection of cottages on the estate. In order that this may be done, we are of opinion that the Council should advertise for a contractor who will undertake the making of the bricks at a fixed price per thousand. It should be mentioned that, on the acceptance of a tender, bricks of a sufficiently good quality would be taken from the contractor as required, and the money necessary for this to be done will be provided in the votes which the Council will pass from time to time for the erection of the cottages. The system which we propose will, therefore, not commit the Council to any expenditure at the present moment other than it already contemplates. Moreover, a considerable saving in the cost of the cottages is anticipated from the adoption of this course. A further consideration, however, arises, and this is in connexion with the standing orders of the Council with regard to rates of work done in brickmaking is done by piecework, and paid for accordingly. The rates paid vary according to the locality in which the work is done and the quality of the brick made, and there does not appear to be any trade union regulating either the rates of pay or the number of hours to be worked. In these circumstances it will be necessary for the Council to fix minimum rates of pay for each kind of work, and a maximum number of hours which shall be worked per week. We have made due inquiry and have ascertained that a maximum of sixty hours per week would be reasonable. We have, also after inquiry, ascertained rates of pay for the various descriptions of work to be performed, which we think the Council may adopt as being fair in the trade. We recommend—

(a) That the following rates of pay and hours of labour be fixed as the minimum rates and maximum hours to be observed by any contractor in the making of bricks on the Norbury estate, and that such rates and hours be inserted in any contract for the purpose—

For hand-made clamp-burnt bricks—		
Description of Work.	Minimum Rate of Pay.	Rate of Work.
Digging	4½d. per cubic yard.	
Soiling	3d. per thousand bricks.	
Sharing out	7d.	" "
Moulding, &c.	6s. 6d.	" "
Skintling	5d.	" "
Setting	2s. 3d.	" "
Daywork	6½d. per hour.	
Engine-driver	8d. per hour.	

For wire-cut machine-made bricks—		
Description of Work.	Minimum Rate of Pay.	Rate of Work.
Pit men	1s. 8d. per thousand bricks.	
Cutting off	1s.	" "
Running out	1s. 6d.	" "
Skintling	3d.	" "
Setting in kiln	1s. 10d.	" "
Drawing from kiln	1s. 3d.	" "
Engine-driver	2s. per week.	

Maximum number of hours to be worked per week under either Schedule A or Schedule B, 60 hours.

(b) That the Housing of the Working Classes Committee be authorised to invite tenders for prices for the making of such bricks as the Council may require in connexion with the development of the Norbury estate."

Additional Accommodation Farnfield Asylum.—The Inebriates' Acts Committee reported that they had had under consideration the following tenders for the construction of additional buildings for female inebriates at Farnfield:—

R. Wallace	£29,571	11	6
Foster Bros.	24,579	0	0
Samuel Redwood	24,191	0	0
Herbert Hutchinson	26,200	0	0
Martin, Wells, & Co.	10,799	0	0
J. Cracknell	19,032	0	0
R. Cook & Sons	18,625	0	0
Potter Bros.	18,560	0	0

Modified and accepted at 17,660l.

The tender of Messrs. Potter Bros. was accepted at 17,600l.

Improvements.—The following recommendations of the Improvements Committee were agreed to:—

"That the amount of the Council's contribution in respect of the widening of Fulham Palace-road, between Bishop's Park-road and St James's Home, undertaken by the Council of the Metropolitan Borough of Fulham, be 982l."

"That the amount of the Council's contribution in respect of the widening of Fulham Palace-road, between Fulham Cemetery and Lygon's Almshouses, undertaken by the Council of the Metropolitan Borough of Fulham, be 200l."

"That the amount of the Council's contribution to the Council of the Metropolitan Borough of Stoke Newington, in respect of the widening of Church-street at the Three Crowns public-house and at Nos. 2, 4, 6, and 8, Church-street, be 4,025l."

Sewer Works.—The following recommendations of the Main Drainage Committee were agreed to:—

"That the expenditure of 1,950l be sanctioned for the execution of repairs to the Islington branch of the London Bridge sewer between Liverpool-road and Canonbury-road, and that the work be carried out by the Works Department as a jobbing work."

"That the expenditure of 1,170l be sanctioned for the execution of repairs to the St. John-street sewer between Northampton-street and Albemarle-street, and that the work be carried out by the Works Department as a jobbing work."

House Refuse.—The Public Health Committee recommended, and it was agreed—

"(a) That by-law No. 7 made by the Council under Section 10 (2) of the Public Health (London) Act, 1891, should be amended so as to read as follows:—

"The Sanitary Authority shall cause to be removed not less frequently than twice in every week the house refuse produced on all premises within their district."

"(b) That a copy of the proposed amended by-law be sent to each of the London Sanitary Authorities for their observations in pursuance of Section 114 of the Act."

Theatres, &c.—The Theatres and Music Halls Committee recommended—

"That Messrs. Runtz and Co. be informed that the Council has no objection, so far as its regulations under Section 12 of 41 and 42 Vict., cap. 32, are concerned, to the arrangements shown on the eight plans submitted by them in regard to the Adelphi Theatre."

"That Mr. Matcham be informed that the Council has no objection, so far as its regulations under Section 12 of 41 and 42 Vict., cap. 32, are concerned, to the arrangements shown on the two plans, dated April 26, 1901, submitted by him in regard to the Marlborough Theatre, on condition that the barrier shown at the back of the upper circle be at least 8 ft. high."

Having transacted other business, the Council adjourned until June 18.

APPLICATIONS UNDER THE 1894 LONDON BUILDING ACT.

At the meeting of the London County Council on Tuesday the following applications were considered. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Width of Way, Line of Frontage, and Construction of Building.

Walswich †—The placing of a temporary wooden watch-box on the forecourt of Nos 160 and 162, High-street, Eltham (Mr. O. Fleming for the Fire Brigade Committee of the Council).—Consent.

Building for the Supply of Electricity.

Lambeth, North.—An addition to the air-compressor house at the generating station, No. 85, Commercial-road, Lambeth (Mr. W. B. Pinley for the Charing Cross and Strand Electricity Supply Corporation, Limited).—Consent.

Formation of Streets.

Wandswoth.—That an order be issued to Messrs. Marler & Co. sanctioning the formation or laying out of new streets for carriage traffic on the west side of Thrale-road, Streatham, and in connexion therewith the widening of Thrale-road (Col. R. J. Aspinall).—Agreed.

The recommendation marked † is contrary to the views of the Local Authority.

BRITISH EMBASSY, PARIS.—The stables at the British Embassy at Paris are to be newly fitted up by the St. Pancras Iron Company.

ARCHITECTURAL SOCIETIES.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The Report of the Society for the year ending April 1901 (the fourteenth annual Report) states that the total number of members at present is 111, as against 109 last year. The Society are hoping to get into more convenient quarters by renting a room from the Literary and Philosophical Society, together with the use of their lecture-hall for six nights in the year. One passage in the Report shows that the Sheffield Society, like some others, has been vainly endeavouring to come to some agreement with the builders in regard to a contract form, and that the negotiations have been rendered useless, in this as in other cases, by the demands of the builders in regard to an arbitration clause. The Report on this point is as follows:—

"It will be remembered that in the last Report the question of the proposed Contract Agreement Form had not been settled owing to the non-adherence on the part of the builders to an informal agreement which had been arrived at with a deputa- tion on August 28, 1899. On April 22, 1900, the following letter was received from Mr. Spink, when the Council unanimously agreed upon the resolution which follows:—

[COPY.]

'53, Broomgrove-road, Sheffield,

April 22, 1900.

DEAR SIR,—In reply to your letter, dated April 11, I am instructed by my Committee to inform you that it is not able to agree to a limited arbitration clause, and further to ask you to allow the matter to stand over for a short time. The Council of the Federation of Building Trade Employers have advised the various Associations that negotiations are about to be made with the architects and surveyors in the federation district for one uniform agreement form.—Yours faithfully,

W. J. SPINK, Sec. M.B.A.

W. C. Fenton, Esq.

[COPY OF RESOLUTION, MAY 16, 1900.]

"That this Council is unable to alter its decision conveyed to Mr. Spink on the 11th ultimo, and regrets that the Master Builders' Association is not prepared to adhere to the agreement arrived at with this Society at their interview on August 28, 1899. Under these circumstances this Council sees no advantage in further continuing negotiations with the Association."

This resolution was followed by a letter on June 13 from Mr. Spink, but the Council considered it inadvisable to reopen the matter. They regret that they have been unable to come to an agreement with the Master Builders' Association on this matter, but the members will see that no time or trouble has been spared by the Council in endeavouring to bring this matter to a satisfactory conclusion."

LIVERPOOL ARCHITECTURAL SOCIETY.—The fifty-third annual report of this Society shows that the Society now numbers 140 members. Among those who read papers during the past session were Mr. Alfred Darbyshire, Mr. Halsey Ricardo, Mr. Baillie Scott, Professor Beresford Pite, Mr. A. W. Paterson, and Mr. Arthur S. Flower. It is hoped that the Society will be incorporated before next session. At the annual meeting Professor Simpson was re-elected President, Mr. Dod Hon. Treasurer, Mr. Dickenson Hon. Librarian, Messrs. Hastwell, Grayson, and G. W. Fraser joint Hon. Secretaries, and the following were elected as the Council:—Messrs. Deacon, Eccles, Hartley, Ould, Strong, Thicknesse, Willink, Hinde, and Thornely.

ARCHÆOLOGICAL SOCIETIES.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—At the meeting on the 15th inst., Mr. C. H. Compton, V.P., presiding, "Early Colonisation of Britain by Highly Civilised and Refined Immigrants" formed the subject of a carefully thought-out and original paper by Dr. Phené, F.S.A., V.P. of the Association. The Doctor, who has travelled extensively in the Levant and on the Spanish and Italian shores and islands, has recently been studying and examining some very ancient records which have reference to the early States in and around Etruria in the pre-Roman age. These States contracted with Carthage not to colonise a particular island, the name of which was carefully concealed under an anagram. By tracing the routes of certain tribes mentioned by Julius Cæsar and Diodorus Siculus, he had been able to find corresponding remains of such tribes with identically the same place name in each case, leading towards and into Britain, which all tended to show that the anonymous island was Britain. By a breach of the

contract with Carthage, the island had been so colonised, and enormous wealth had been accumulated of the gold from Ireland and of many valuable products from Britain, leading to the inference that this secretly-conducted commerce had been heard of by Cæsar, who, in consequence, summoned the congress of merchants to ascertain the particulars, hut, failing to obtain the information, through the reticence of the merchants, invaded Britain and returned with "much booty," as related by Strabo. It is an interesting question whether this booty was gold—several classical writers record gold as a British export. The paper was illustrated by several well-drawn charts and plans.—Mr. Allan Ovenden Collard followed with some interesting particulars of the history of the very ancient body of "Free Fishers and Dredgers," of Whitstable, famous for its oysters from Roman times, for it was about the year 80 A.D. that they were first exported to Rome by Julius Agricola. The history of Whitstable is most closely interwoven with its fishermen, who have a history and ancestry reaching far back in the dim past. Some of the family names can be traced back for centuries in the enrolment books preserved by the present Whitstable Fishery Company.

ENGINEERING SOCIETIES.

THE INSTITUTION OF JUNIOR ENGINEERS.—On Monday evening, May 20, the members of this Institution paid a visit to the works of the Renewable Electric Lamp Company, at Brunswick-place, City-road, London. They were received by the managing director, Mr. H. E. Kershaw. The processes carried on were shown in operation. In addition to the renewing of old lamps by the introduction of a new filament the company are manufacturers of incandescent lamps, the filament being prepared in a special way. Its consumption of current is as low as 27 watts per candle power, and it is guaranteed to burn a thousand hours. In the renewal process, the bulb is reopened, the old filament is detached and a new one inserted, thus avoiding the wastage of the bulb, the cap, the platinum, leading in wires, &c. In the glass-blowing room where the bulbs are expanded, and the filaments inserted, both the Ediswan and the American methods were shown. Entering the mechanical exhausting room, the members saw the system employed for exhausting the bulbs of air, and permanently sealing them; and in the laboratory the filaments were seen in process of manufacture. The flashing of the filaments by being over-run 30 per cent. beyond their nominal candle-power, and the jointing of the platinum filament by electrolysis were shown, as was also the process of jointing the platinum to the copper wire. The apparatus for exhausting by means of the mercury pump was also seen at work. The concluding operations of capping, &c., each lamp having been inspected, the method of testing was fully explained and demonstrated.

THE SURVEYORS' INSTITUTION.

This Institution will visit Southampton on May 30 and 31. The Hartley Council of Southampton has granted the use of the Lecture Hall and other rooms in the Hartley College for the reception and meetings on Thursday, the 30th inst., on which day the following papers will be read and discussed:—"Southampton: Its Past and Present," by Mr. W. Burrough Hill; "The New Forest," by Mr. F. J. Smith (Chairman of the Provincial Committee); "The Liability for Farm Fires caused by Sparks from Railway Engines," by Mr. C. P. Hall; and "Recent Proposals for the Amendment of the Law and Practice as to Ancient Lights," by Mr. P. E. Pilditch.

The Mayor will entertain the members at luncheon in the Pavilion of the Royal Pier at 1.30 p.m., and the members will dine together at the South-Western Hotel at 6.30 p.m. The following day will be devoted to visits to places of local interest.

CONGREGATIONAL CHURCH, HARRINGAY.—The foundation-stone of a new Congregational church has just been laid at Haringay. The new church will contain a chancel and choir, nave, aisles, double transepts, and an end gallery, together with minister's and deacons' vestries. It will be capable of seating some 800 persons. Messrs. D. Church & Sons Finsbury, are the architects.

Illustrations.

RIMINI CATHEDRAL.

THE Church of S. Francesco, now the cathedral, goes by the name of the Tempio Malatestiano. It is an Italian Gothic church of the fourteenth century, with a nave 115 ft. long and 30 ft. broad, three chapels on each side, a choir of one bay, and a semicircular apse. In the first half of the fifteenth century Rimini, like Urbino, was one of the seats of the Early Florentine Renaissance. One of its Dukes, Charles, was a great patron of the Humanists, and tried to attach Ghiberti to his court. Another, Sigismond Pandolfo Malatesta (1428-1468), obtained the assistance of the great scholar and architect, Alberti, and proceeded to transform the inferior Gothic interior of S. Francesco into a magnificent memorial of the wealth and alliances of the Malatesta family, and of the eminent part taken by the reigning Dukes in the revival of classical art and literature. Little is left of the Gothic church except the pointed arches of the nave-arcade and some traceried windows. The façade is unfinished, the intended dome was never built, nor the wooden vault which was to have been where now is a simple open timbered roof. The church was dedicated, with the characteristic Paganism of the day, to the Duke's mistress, "Divæ Isottæ," though it is only fair to add that she afterwards became his wife. As the church was now intended to be the *Malatestorum domus heroidum sepulchrum*, Alberti flanked the nave by seven imposing arches on panelled piers detached from the wall of the church, elevated on a continuous basement, and masking the Gothic windows. Under these arches are placed seven great sarcophagi in the ancient style, in which are deposited the ashes of the great men whom Malatesta had collected around him—poets, orators, philosophers, and soldiers. In the interior are seen everywhere the coats of arms of the Malatestas and their alliances, the most striking cognizances being the rose and the elephant, and the monogram of the united initials of Sigismond and Isotta. There is abundance of classical ornament and emblems, mythological sculptures, and fine bas-reliefs. The walls are covered with very numerous pilasters, large and small, curiously disposed, and with sculptured panels and carved ornament. The rich marbles which ornament the church are largely due to the spoils of other buildings. Alberti commenced his work in 1450. It displays his characteristic scholarship and beauty of proportion and detail, and must have had great influence on the Early Renaissance in Northern and Central Italy. We give illustrations showing the interior of the nave and two of the chapels. An illustration of the exterior, from Gally Knight's "Italian Architecture," appears in Fergusson's "History of Modern Architecture," 3rd edition, vol. i., p. 65.

ST. JOHN, HIGH WYCOMBE.

This church is about to be erected to form the centre of a new district in the rapidly growing town of High Wycombe. It will be situated close to the Aylesbury-road, at the western end of the town, and about half a mile from the old church.

The materials will be local bricks and tiles. The chief characteristics of the plan are the single span nave and the arrangement of the sanctuary and east window. Close to the eastern wall a lofty factory is likely at any time to be erected, and the east window is accordingly set back and elevated over the sacrum arch, a rich redos taking the usual place of the window. In a recent competition among local and other contractors Mr. Flint, of High Wycombe, was successful.

Mr. W. D. Carie is the architect. The drawing is exhibited at the Royal Academy.

S. MARIA DEI MIRACOLI.

The sketch we publish this week is of the doorway in the principal front. The church was built about 1480 by Pietro Lombardo, who also designed some portions of it. It is the most perfect piece of Renaissance architecture in Venice. Very small, it is faced inside and out with marbles of delicate contrast, to which age has lent additional charm, and its propor-

tions are exquisitely marked by the dark colour of the cornices and pilasters.

The church was only opened to the public a few years ago.

S. MARIA DELLA SALUTE.

This church is known to every visitor to Venice as one of the landmarks of the Grand Canal. Though it is not a very remarkable piece of architecture, it possesses the merit of looking well from every point from which it can be seen. It was built in 1631, under the direction of Baldassare Longhena.

The present sketch was taken from the landing steps of one of the hotels on the Grand Canal.

THE INSTITUTE OF BUILDERS' ANNUAL DINNER.

THE annual dinner of the Institute of Builders was held on Wednesday evening at the Trocadero Restaurant, Piccadilly. Mr. Chas. Wall, the President, was in the chair, and among those present were Colonel Stanley G. Bird, Messrs. W. J. Locke (Secretary of the Royal Institute of British Architects), H. J. Moore (Master of the Masons' Company), Basil P. Ellis, S. Bolton, W. Carpenter, G. A. Wall, H. Wall, E. White, L.C.C., F. Wall, A. Boden, W. F. Wallis, F. G. Wallis, R. Preston, M. Sprigg, A. Duffield, J. Bell, F. S. Bywaters, J. Carmichael, A. Ritchie, J.P., F. G. Dove, F. L. Dove, J. D. Greenwood, L.C.C. (past-President), G. Edwards, H. Holloway, W. Hill, T. Hall, H. Smith, A. Dickens, C. O. King, J. W. Garnham, R. S. Henshaw, G. R. Kett, W. T. Tapper, W. F. King, C. King, H. Knight, L. J. Maton, G. Norris, J. Milson, W. Nicholson, A. Dixon, F. A. Nightingale, A. E. Parker, H. A. Heffer, A. Willick, A. B. Jackson, T. W. Farthing, A. Phillips, J. Randall, A. F. Randall, E. S. Rider, E. Strange, W. Shepherd, E. Shepherd, H. P. Shepherd, and A. W. Turnbull.

After the loyal and patriotic toasts, Mr. Edward White, L.C.C., submitted "The Institute of Builders and the President." He said he was not able to decide as to whether this toast had been entrusted to him because he belonged to the London County Council—which body had done its best to do without the services of the builders and failed—or whether it was because he was a friend of the President. He was not intimately acquainted with the objects of the Institute, and had thought that, perhaps, among other things, papers might have been read by members to induce working men to give a fair return for their weekly wage, or to put an end to the stupid and onerous conditions in the building contracts of the London County Council. If such papers had not yet been introduced, no doubt they would be in future. The London County Council had spent something like 200,000l. of the ratepayers' money with the avowed object of securing the large profits that flowed into the pockets of the builders. Three years ago they held an inquiry, in the course of which Mr. Holloway, a member of the Institute, gave important evidence. At the time the Works Department of the Council had been in existence five or six years, and the result of their efforts was that after expending the capital and the sum of 20,000l. per annum for maintenance and management they had succeeded in showing a loss on the estimates of 3,000l. That was considered to be a very serious matter, and a special inquiry committee was appointed to endeavour to ascertain the cause and to try to find out whether it could be avoided in the future. They found, according to the last report, that after three years' more trading the Works Department had managed to increase their total loss from 3,000l. to 65,000l. He had called into question all along as to whether it was the wisest policy to endeavour to dispense with builders, but he was like a voice crying in the wilderness—they did not pay any attention to him. He was not prepared to contend that the profits which builders made were not commensurate with the trouble they had and the capital they invested, and he thought the Council and every other public body should carefully consider whether they were able and entitled to dispense with a body of men who were deserving of every consideration, and who were not dishonest, as certain members of the Council had held them up to be. He was glad that master builders had come to the conclusion—and they had been a long time doing so—that their strength lay in combination. They

had had a very important lesson set them by the working men, who had been able to achieve so much by this means. However, by combining they would be able to hold their own against the organisation of labour. The building trade stood in a better position to-day towards the workers than ever before, and their combination would not only be to their own advantage, but for the benefit of the men themselves. There were many members of the London County Council who were altering their opinion with regard to the Council undertaking its own work, and it was quite clear that the jobs undertaken by the best class of builders were more to the interest of the ratepayers and to the Council, because, while the work was turned out in every respect as good as when done by the Works Department, it was carried out very much cheaper. It was a great, important, and far-reaching question, inasmuch as it affected the great housing question. Recent experiments had shown that where the Works Department had been unable to erect buildings within the estimates of the architect, and the work had been given to highly respectable firms of builders, the cost had been well within the estimates. This was of advantage not only to the ratepayers, but to the class of persons who would inhabit these dwellings, because the greater the cost the higher must be the rent.

The President, in reply, urged the advisability of recruiting among the younger members of the building trade to induce them to join this Institute, the aims of which were well worthy of consideration. In these days a builder must be something more than a builder—he must be a surveyor and a lawyer as well, or he must have one at his right hand. In reference to the question of equitable contracts, he mentioned that in stone work the Council wanted it to be measured according to the bulk of displacement which would take place in water, which meant that the more work a builder put into a piece of stone the less he would get for it. An equitable contract was of advantage both to the client and the builder. If a builder felt that he had an equitable contract he could work far more comfortably and with less friction; but if, on the other hand, his contract was most unfair, he was entitled to get over it as soon as possible. It was most unfair to try to harass builders in their work. They had had many difficulties with their men, but, happily, there was a lull now, and he thought that the leaders of the working classes were coming to the conclusion that it was far better to come to terms with the employers than to irritate them. Employers only wanted a fair day's work for a fair day's money, and that was to the advantage of all.

Mr. William Shepherd proposed "The Architects and Surveyors." He believed that at the present time the members of the architectural profession had many more opportunities to distinguish themselves than they ever had had in this country. Those who took an interest in architecture could see by modern buildings which had been erected in our streets great evidence of the highest ability of the members of the profession. With regard to the proposed memorial to the Queen, he regretted very much that there had not been an open competition. It was a pity that the choice was limited to so few architects, and he considered that the principle should have been followed of throwing open the competition to all the members of the profession in the world. No doubt most of the money would be given in the City, and the general opinion there was undoubtedly in favour of an open competition. He hoped that in future the contracts between builders and their clients through their agents, the architects, would be more equitable and fair, and certainly every effort had been made by this Institute to bring about that result. Unfortunately, they had not yet been able to come to an agreement, but they still hoped that it might be possible to frame conditions of agreement between the client and the builder which might be accepted as equitable on all sides. He coupled with the toast the name of Mr. Farthing, a quantity surveyor. Some architects seemed to regard quantity surveyors as a kind of necessary evil, but he looked upon them as forming an essential element in the building industry. He believed that they formed the very best men to adjudicate in disputes or differences which might arise on building contracts.

Mr. Farthing, in reply, referred to the late Queen's Memorial, and said that he thought the competition should be open to English-

men and colonists, but he drew the line at foreigners.

The President then proposed "The Visitors," which was responded to by Mr. Ritchie. This concluded the toast list.

EXPORT TIMBER TRADE OF SWEDEN.

ACCORDING to a report prepared by Mr. MacGregor, British Consul, on the trade of Stockholm and the eastern coast of Sweden, for 1900, the year turned out most successful for both owners of forests and of sawmills. The demands for red-wood, as also for whitewood of the larger dimensions, were good during almost the whole year, so that exporters were enabled to dispose of their stocks easily and at rising prices. The same favourable state of things cannot be said to have existed with regard to battens and the smaller dimensions of wood, for which good prices could not be maintained. Importers in the United Kingdom, as a rule, had not such a profitable year. In order to keep the stocks in hand they had to purchase at artificial prices, and in a number of instances for sales f.o.b. they were obliged to pay the constantly increasing rates of freight that were ruling during the summer and autumn months. These circumstances combined made it difficult to obtain satisfactory results. During the course of the year the stocks offered for sale for first open water showed an increased proportion of smaller dimensions. This is said to be attributable to inefficient management of the forests, and it is supposed that the quotations for the year 1901 will suffer in consequence. At a meeting of the Sawmill and Wood Export Association held a few weeks ago the report presented showed that, although the quantity of sawn timber was less in 1900 than during the four previous years, the export value of the same was undoubtedly the highest known since 1874. Results would have been still better, it is believed, had it not been for the war in South Africa and the troubles in China. The actual quantity exported to South Africa is given as 4,600 standards more than in 1899. It is confidently expected that great quantities of timber will be required to replace numerous buildings destroyed during the war in South Africa, and that the cessation of hostilities there will immediately have a favourable effect upon the Swedish timber trade. The export from Sweden of planks, battens, and boards, planed and unplanned, during the year was 1,009,948 standards, as compared with 1,026,602 in 1899. Of the total, by far the largest proportion, viz., 450,887 standards, was shipped to the United Kingdom.

Mr. Carrick, Vice-Consul at Gelle, states that there the rise in the prices of sawn and planed wood continued until about the middle of 1900, when the difficulty experienced by the importers of the United Kingdom and other consuming countries in obtaining tonnage to remove their goods suddenly arrested further purchases. This dearth of tonnage caused freights on wood and other goods to rise to a higher point than had been reached for the last fifteen years. So much wood had, however, been sold by shippers for first open water and summer delivery prior to the advance in freights, that they were almost independent of the market for the remainder of the shipping season, and little actual fall in price occurred before the close of the navigation. The quantity, viz., 129,326 standards—was only about 6,000 standards less than that for 1899; doubtless, appreciably less than would have been the case had not the scarcity of tonnage intervened. As circumstances now are, sawmill owners and shippers have to carry over to the new season considerable stocks produced under the combined influences of expensive standing wood and dear labour. Mr. Carrick adds that at the time of writing a much smaller proportion of first open water (1901) stocks had been sold than is usually the case, and shippers, by refusing to meet the demands of British and Continental importers for some modification of prices, are running the risk of causing not only stagnation in business, but likewise considerable losses to themselves further on in the season. The unexpected prolongation of the war in South Africa is also hindering the sale of wood goods to that quarter—now a rather important outlet for certain dimensions and qualities.

The quantity of wood shipped from Lulea (writes Mr. Vice-Consul Westerberg) during 1900 showed a considerable decrease, chiefly as regards balks and square timber. A good many buyers, on account of the heavy freights and the scarcity of suitable tonnage, preferred to let the goods they had bought remain in the hands of the seller till another year; not that they opened with somewhat lower values for both red and white wood, and especially for smaller dimensions.

Reviewing the course of the wood trade in Herosand for 1900, Mr. Vice-Consul Burchardt says it is to be regretted that the close of the season has brought some disappointment with it, although on the whole the year was one of high profits for exporters. While the consumption of timber for the previous three years had been steadily increasing, production, especially in Sweden, has remained stationary, or even (where the large dimensions are concerned) been retro-

gressive. Stocks are therefore generally light both in exporters' and importers' hands. Selling was started in October by buyers practically acceding without any serious opposition to the prices demanded by shippers, which represented considerable advances on those that were current a few months previously. The buying fever extended rapidly, and British buyers, in competition with the Continental importers, most effectually assisted Swedish exporters in raising their quotations. After the turn of the year a certain quietness came over the wholesale trade, most exporters having by that time sold as much as they could dispose of early in the year, with all the uncertain elements regarding logging and floating, which exporters must take into consideration when selling summer and autumn goods. After the end of March, however, the current of business began to be seriously checked, owing to the practical absence of tonnage on offer for removing the goods already purchased, although the prices maintained their good position throughout the year in consequence of the small quantities that were unsold in most of the leading stocks. Mr. Burchardt concludes that "the timber export from Sweden has probably yielded to the exporters larger profits than they have had during any previous year. It is to be supposed that the prices have reached their culmination, and a fall during 1901, as regards smaller dimensions, will doubtless take place. The prices of deals, on account of the limited supplies of larger dimensions, may still be expected to stand firm."

THE PRODUCTION AND CONSUMPTION OF ZINC.

MR. ERSKINE, the British Vice-Consul at Chicago, has collected for the Foreign Office a great deal of information as to the zinc industry in the United States and elsewhere. From his report it may be gathered that the approximate yield of zinc ores in the United States for 1900 was about 425,000 tons of 2,000 lbs., of which 125,000 tons were exported to Europe. The weight of zinc products in the whole of Europe and the United States for the year 1900 was 520,000 long tons, as compared with 361,010 long tons in 1890. During the last fifteen years the European production has increased by 38 per cent., and that of the United States by 187 per cent. These figures not only show the extraordinary expansion in the use of zinc in the past few years, but indicate a continued increasing demand in the future. When it is furthermore borne in mind that for commercial purposes zinc was almost unknown a century ago, that until half the nineteenth century had passed its use was infinitesimal, and that its ores were considered a curse to the miners when found with lead and other ores on account of the trouble given in separating one from the other, this expansion is still more an indication of future demands. Some years ago, hundreds of thousands of tons of this ore could be found lying in the deserts both in the Old and New Worlds, and the variety known as "dry bones" has been extensively used for roadmaking in Wisconsin. The United States' production of zinc oxide, nine-tenths of which is got from the ores direct, has increased 467 per cent. since 1880, and its popularity has spread so much that the largest consumers now complain they are unable to get a supply equal to their requirements. About 85 per cent. of this product is used in the manufacture of paint, while the remainder is used for floorcloth, table-baizes, and wallpapers, and enters into the manufactures of indiarubber, earthenware glazing, ointment, and medicine. In seeking the cause for this phenomenal increase in consumption of zinc products for the manufacture of paints, and in examining the statistics of the production of white lead it is found that the newer zinc products are fast taking the place of the lead, or at least that while the zinc products consumed in paint manufacture were in the United States fifteen years ago only one-sixth of the total quantity of lead used, now the zinc is only less by one-half. These figures show the increasing popularity of the new material, for while lead has been used in paint for centuries, zinc is said to have been first used in this way in 1847 by Leclair, a painter in Paris, who recognised its utility and colour. "Zinc paint" (the Vice-Consul writes) "has a beautiful whiteness, is durable, is non-poisonous, gives off no poisonous gases, and has become indispensable, as it enables manufacturers to produce the most delicate tints. It is light and bulky, and in combination with other materials adds value to them. When cleaned and sent to the furnaces, the carbonates and silicates will assay for metal about an average of 38 per cent., and the sulphides average about 55 per cent. In 1894 a 60 per cent. ore went as low in price as 31.14s. 6d. per ton, while, in 1899, the same quality of ore rose to over 10s. and in February, 1901, was about 41. 12s. The very high prices during 1898 and 1899 caused an extraordinary development in zinc mining, with the usual result that what was thought in 1896-97 to be a prospective ore famine was changed to a considerable surplus, and for the last year the mine owners have been facing the problem, especially in the Joplin district in Missouri, of how to operate successfully about 500 mines, when less than half of that number could supply all the furnaces now in blast in the United States, and

arrangements are being made to ship large quantities of ore to Europe. It is reported on all hands that the European mines are well nigh exhausted, and that some of the Continental smelters are to move to the United States in the near future. There are enormous deposits throughout the United States, and while some are very poor many are very productive, and great care has to be taken in investing, as is shown by the recent failure of the International Zinc Company."

Correspondence.

To the Editor of THE BUILDER.

QUEEN VICTORIA MEMORIAL.

SIR,—The fine scheme you sketch in your issue of April 13 for a monumental avenue from Marlborough Gate to Buckingham Palace leads me to hope that this unique opportunity for improving St. James's Park may not be missed.

Here is a spot which, at a comparatively small outlay, might be made one of the most beautiful gardens in Europe. At present it has no symmetry, no dignity in the neighbourhood of its surrounding buildings, while internally it is intersected at all angles by ugly footpaths.

Your suggestion, sir, that a direct road should connect Marlborough-gate with Queen Anne's-gate is a good one, and if this road bifurcated immediately it had crossed the ornamental water and swept east and west into Birdcage-walk, the distance cabs would have to travel from Victoria to Pall Mall would not be materially increased, while the Palace precincts would, as you observe, be suitably secluded.

Mr. Bodley's poetic conception of the Victoria Memorial rising out of water would best be realised in connexion with your idea of a combined ornamental canal and monumental avenue.

But why stop here? The Horse Guards Parade is the finest architectural piazza in London. If it could be seen at all from the park it would present a series of the most impressive architectural views we possess, but the ground has been banked up and planted, apparently with the special object of excluding (especially in the summer) all view towards, and of the park itself, from the Parade.

The axis of the Parade happens exactly to intersect the Mall-avenue at Marlborough Gate, which points to a circus at this intersection from which another broad avenue should lead direct through the Horse Guards arch to Whitehall. The park boundary of the Parade should be treated systematically and monumentally with piers and fine wrought-iron gates and railings, as roughly indicated on the sketch plan appended by way of explanation. The triangle thus formed should be open to the Mall and be well laid out in formal flower beds.

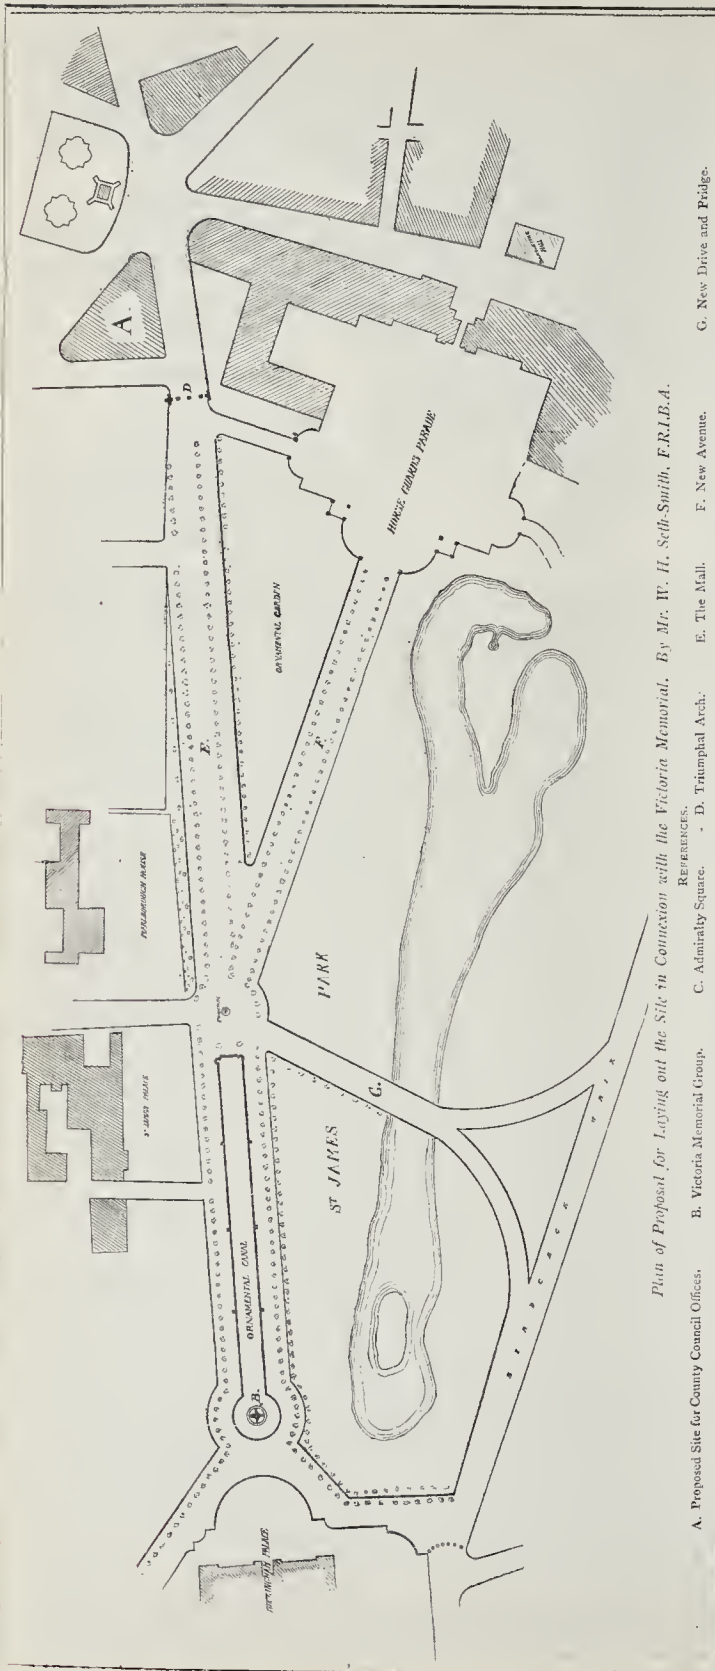

Fortunately there are few trees of any importance on the line of this suggested avenue, and the young planes in the present avenue might easily be moved to improve the width of the Central Mall Avenue.

In this way, views of the ornamental water would be opened out from many points, giving fine foregrounds for the views which this end of the park affords.

A gateway into the park from the Strand would naturally form one of the improvements, and if the large triangular site (which I indicate) facing Trafalgar-square could be negotiated, it would make a worthy one for the housing of our London County Council, and, rightly treated, would be a grand improvement to London architecture.

The laying out of the grounds in detail needs considerable skill. These are merely suggestions for the leading features.

Now, sir, why should not the Government, the London County Council, and the Victoria Memorial Executive Committee work together to accomplish the remodelling of the park belonging to the Royal Palace of the metro-

polis of this Empire with a view to marking more effectually the nation's devotion to England's greatest Queen and the improvement of English taste at the opening of the new century?
 W. H. SETH-SMITH.

SCIENCE AND ART DEPARTMENT'S EXAMINATION IN BUILDING CONSTRUCTION.

SIR,—Kindly allow me to supplement Mr. Adam's letter on this subject in your last issue by calling attention to a far more serious aspect of the paper, viz., the large number of instances in which the questions are totally at variance with the Department's own syllabus. This syllabus prescribes very carefully and minutely the various points which the student is expected to study for the several stages; but the syllabus is one thing and the examination—during recent years—quite another.

In the elementary stage, for instance, this year, Questions 1, 3, 8, 9, could only be answered by those who had prepared for the advanced stage. Question 2, by an honours student; and in three other instances "explanations" are required, a thing only required in advanced and honours. From this it will be seen that a student properly prepared according to the syllabus stands no chance of getting full marks.

In the advanced stage, Questions 21, 23, 24, 27, 30, are all clearly for honours students; see Question 43 in honours, which is almost an exact repeat of 24 in the advanced, while the latter half of Question 28 is outside the scope of any stage in this subject.

In Honours I, questions on hot-water heating, electric lighting, and on sanitation are given, but the syllabus is quite silent on these points. As regards the electric lighting question insufficient data are given; no electrician could possibly quote a price under such conditions.

In Honours II, the absurd nature of two questions has already been touched upon by Mr. Adams, but he failed to drive home the grossly unfair character of Question 69, which, in brief, is—design a dwelling, take accurate quantities, and price them. In the first place the syllabus relegates design to the practical stage of the examination; in the second neither quantities nor prices are even mentioned in the syllabus as points to be taken by students. On the question of time allowance, there is here at least a half-day's work for an architect, one day's work for a quantity surveyor, and another half-day's work for a builder's estimator, even when quotations for materials have been got in. Surely it was never intended that quantities and prices should form part of this examination, which is purely one on construction. Question No. 70 is another instance of totally inadequate time being allowed for an answer; it would take an average architect quite two days in the ordinary course of business. In this question a colour decorative scheme is required; but again no mention in the syllabus.

If this year's questions are to be any guide, we may expect in the future to be examined in—legal matters affecting the trade, designs for furniture, pianos, overmantels, stoves, stained glass, paper-hangings, and laying out gardens, as they are all more or less connected with buildings.

Surely it is not too much to ask the Department, in the interests of the education they are supposed to foster, to either adhere to their syllabus or alter it.
 FAIRPLAY.

SIR,—Mr. Henry Adams is to the point when he states that "the examination held by the Board of Education in Building Construction on the 11th inst. has caused a shock to . . . students throughout the country."

As one of the students who sat, I consider, then, many of the questions were hardly, to say the least, what one would expect, having regard to previous papers.

My object in writing, however, is to find out what is a "shiner." I have asked men whose experience led me to believe that they would know, but beyond humorous replies I have not received an answer. Will one of your readers kindly oblige? Of course it cannot be a good person in a bad world; neither is it at all related to the celestial sphere, although, for all some know, it might be.
 J. W. KAMPE.

METHODIST CHAPEL, SHIREBROOK, DERBYSHIRE.—The memorial-stones have just been laid of a Methodist church at Shirebrook. The building will be a two-story structure. The chapel, on the upper floor, will have seating accommodation for 210. This will be capable of extension to 250 seats by utilising the two vestries, which will be separated from the main building by movable partitions. A classroom will also be provided on the lower floor with a seating capacity of eighty, and the remainder of this floor contains rooms for storage. The exterior of the edifice is of red brick with stone dressings and semicircular red-brick arches to the windows. The contract for the building has been let to Mr. W. H. Feavill, of Ollerton, at 709l. 10s., and Mr. Joseph Perkin, of Shirebrook, is the architect.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

19.—URINALS. (Continued).

TROUGH URINALS.—These consist, as a rule, of a glazed fireclay trough with a weir at one end so that a certain quantity of water is retained in the trough, and an inlet at the other end for the supply of fresh water from a flushing tank. They are therefore very similar to trough-closets, but smaller; the back may with advantage be higher than the front, in order to reduce the risk of fouling the wall, and the front edge ought to slope inwards, so that droppings will not run down the front and on to the floor. The dilution of the urine is a point in their favour, but they are seldom used now for high-class work, as the retention of the urine causes furring, and as users do not always discharge all the urine into the trough, but allow some to soil the front of the trough or the apron and floor below it. Floor-channels and draining slabs must be fixed under these as under urinal basins. Painted cast-iron troughs are sometimes used, but the paint is soon destroyed. Enamelled iron is better. Slate trough-urinals are also made, but the joints and angles are very objectionable.

Fig. 1 is a section of a trough urinal of ordinary form with enamelled fireclay trough and capping, slate apron, back and divisions, and salt-glazed floor-channel. Adams's trough-urinal (fig. 2) is a great improvement. The stalls are 2 ft. 3 in. wide from centre to centre. The trough is of glazed ware, and has a projecting lip in the centre of each stall. The backs are also of glazed ware, semi-circular on plan, with projecting divisions of the same material, and the whole range is finished with glazed-ware capping. Water is retained in the trough by means of a weir at one end, and at the other end the flush-pipe A is connected. When the flush-tank is discharged, the water passes down the pipe A, along the trough, over the weir, and down the waste-pipe B into the floor-channel C, and thence to the gully and

trap D. The trough and channel are therefore flushed by the same discharge. The fluted floor-slab and channel are formed in one piece of glazed ware. The apron slabs at E are also of glazed ware. The range would be all the better if part of the flush were conveyed to a distributing nozzle in the back of each stall, so that the backs would be automatically cleansed as well as the trough and channel. In some trough urinals the outlet of the floor channel is at the same end as the outlet of the trough, and part of the flushing water is conveyed to the upper end of the channel by means of a small pipe connected to the main flush-pipe; this avoids the flooding of the channel with urine-polluted water from the trough.

Stall Urinals.—Urinals of this class are most commonly fixed in ranges. Formerly any kind of stone was considered good enough for the purpose, and many urinals still in existence consist of plain slabs of York stone arranged as backs, ends, and divisions. Stone of this kind soon becomes foul, and is quite unsuitable. Even slate and marble, dense though they are, absorb some portion of the urine. The best material for urinal stalls is undoubtedly enamelled fireclay, but care must be exercised in selection, as these large pieces are often damaged during manufacture. Salt-glazed fireclay is used for cheaper work, and some makers are now able to produce ware of this kind with a very smooth surface. Cast iron is often used for public urinals in the streets, but the ammonia given off by the urine soon destroys the paint, and causes corrosion of the metal.

Stalls composed of flat slabs of stone (including, of course, slate and marble) are difficult to keep clean, on account of the numerous angles and joints, and are not suitable for use in buildings. Slate urinals are, however, often used in the playgrounds of schools, in the open areas of railway stations, and in the yards of factories and other buildings, where a fairly satisfactory urinal is required at a moderate cost. Slabs should be provided for the back, ends, and divisions. Aprons were formerly fixed to prevent droppings falling on to the floor, but are now seldom used, as they cannot possibly be

flushed by the sparge pipe, and as they interfere with the washing of the floor. The stalls vary in width from about 18 in. for children to 24 in. for adults, and in height from about 3 ft. 6 in. for children to 5 ft. or 5 ft. 6 in. for adults. The division slabs project as a rule about 18 in. from the wall, and the end slabs from 18 in. to 24 in. A projection of 12 in. or 15 in. is, however, better for the divisions, as it enables users to stand closer to the back, and reduces the floor area soiled by droppings. The slabs are generally about 1 1/2 in. thick, all edges being rounded and all joints made tight with red lead. Holdfasts ought to be of copper, as iron is very soon corroded. It is not a good plan to carry the divisions down to the floor, as the angles thus formed are difficult to keep clean. Greater cleanliness is obtained by fixing the divisions about 15 in. or 18 in. above the floor, as shown at D in fig. 3; they can be secured by building them about 4 1/2 in. into the wall, and grouting with neat cement. Another form of division is shown at C in the same figure.

The slate used for urinals ought to be rubbed and either oiled or enamelled. The enamel is not very durable. An objection to slate is that it affords a convenient surface for the obscene and inane scribbles of fools. The objection can be removed by covering the slate periodically with a mixture of coal-tar and naphtha, which has the further advantage of preventing absorption.

Thick sheets of opaque glass have occasionally been used instead of slate, but have not proved satisfactory. Slabs of glazed fireclay have been used with much better results. Many urinal stalls in hotels and clubs are constructed of polished marble slabs, but, whatever the material may be, the numerous joints and angles, which cannot be avoided in slab urinals, are a serious disadvantage. As the sparge-pipes as a rule are only continued along the back, the divisions, which often receive a considerable amount of urine, are not adequately flushed.

The stall urinal constructed of slabs exposes a large surface to the action of urine, and is therefore difficult to keep clean and free from

smell. For urinals inside buildings it is a good plan to fix a basin in each stall, as the greater part of the urine is thus confined to a small surface which can be more thoroughly flushed with the same amount of water. Three stalls of this kind are shown in fig. 3. The backs, ends, and divisions may be of slate or marble, and the basins of porcelain, ground to a true surface at the back to fit closely against the slabs. The basin at A has a porcelain down-pipe with flat back ground to a true surface. Down-pipes of this kind often become coated inside with "fur" which gives off an unpleasant odour, and an open arm or socket is therefore sometimes made in it as near the basin as possible so that a brush can be inserted. The basin at B has a vertical channel with curved rims, instead of the down-pipe; every part of the urinal, therefore, can be easily cleansed. The basin and vertical channel are made in one piece of porcelain, the design being Shanks's patent. The floor channel is of white enamelled fire-clay, and the fluted floor-slabs of buff glazed fire-clay. The flush-pipes are of copper, supplied with water from a single automatic flush tank fixed about 7 ft. from the floor.

The great improvements which have been recently made in the manufacture of enamelled fireclay have rendered it possible to produce massive urinal stalls of excellent design, which have been very largely used in high-class work. As a rule, the backs are semi-circular on plan, made to fit on the top of a dished base or channel, but in the most modern urinals the base and back are in one piece. Fig. 4 gives the plan and section of a range of urinals of the former type. The backs, A, and bases, B, are of white enamelled fireclay; the front pillars, C, covering the joints between the backs, are in this example of slate or marble, but a glazed fireclay pillar in one piece is better; the upper backs and divisions are also of slate or marble. The stalls are flushed by copper sparge-pipes, D, following the curve of the backs, and the urine and water pass into a sunk channel, E, covered with a loose galvanised-iron grating. The floor slabs between the grating and urinal are of slate cut out in the centre of each stall, so that droppings will fall into the base of the urinal. The numerous joints are objectionable. The sunk channel is also apt to become foul.

The urinals shown in fig. 5 are of more modern design, the back and base being in one piece of white enamelled fireclay, measuring about 25 in. by 14 in. by 3 ft. 8 in. Slate or marble divisions are used to give the projection and height necessary for privacy. Lips are formed at AA to retain the flush within the curved back. Instead of a sparge pipe, a distributing nozzle (B) is used. A single outlet for the entire range is provided in the bottom of the channel. In other urinals a front outlet is formed in the base of each stall, and connected by a short bend to a drain under the floor. An objection to this urinal is that the stalls are unduly contracted between the lips AA, and persons who have been enjoying themselves not wisely but too well, will almost inevitably soil the angles outside the lips. It is better to obtain the full projection by adopting a deeper fireclay back with fireclay front pillars, as shown in fig. 6.

In some conveniences, where the walls are occupied by water-closets and lavatories, independent or pedestal urinals must be used. These are often hexagonal in plan, as shown in fig. 6. In this, as in many other modern urinals, the backs are made with a forward splay, A, towards the bottom, as this shape reduces splashing and is more thoroughly flushed. A splay of this kind is shown in section in fig. 5 by the dotted line C. The flushing cistern is fixed above the centre of the urinals. The channels are shown at B and the fluted foot-slabs at C. Bolding's "Laydas" urinal is a pedestal trough urinal, the trough having six lips, with slate or marble divisions between. The cistern is placed over the centre, and actuates a siphon by which the contents of the trough are periodically siphoned out.

In all ranges of urinals, except those with front-outlet bases, floor-channels are required. The best material for the purpose is enamelled fire-clay, stone and concrete being too absorbent and iron being soon damaged by rust. The channels must be bedded on concrete, and jointed with neat cement. The floor ought to be laid to fall towards the channel about $\frac{1}{2}$ in. per foot, so that the water will quickly drain away when the floor is washed with water from a hose-pipe. Glazed floor-slabs ought to

be laid between the stalls, and ought to be fluted so that visitors' boots will not be wetted by previous droppings. Dished slabs are often laid under single urinal-basins to receive droppings and drainings from the floor.

The flushing of urinals is a most important point. Many water companies have no regulations on the subject, but others, including the Metropolitan companies, limit the supply to one gallon. The regulations made under the Metropolitan Water Act, 1871, are as follows:—

"Every . . . urinal . . . in which water supplied by the company is used . . . shall be served only through a cistern or service-box . . . and there shall be no direct communication from the pipes of the company to any . . . urinal . . ."

"Every urinal-cistern in which water supplied by the company is used (other than public urinal-cisterns, or cisterns having attached to them a self-closing apparatus) shall have an efficient 'waste-preventing' apparatus, so constructed as not to be capable of discharging more than one gallon of water at each flush."

Other water companies (Bournemouth, for example) insist on urinals being "supplied with water by meter."

In the case of single urinals in private houses a one-gallon cistern actuated by a pull-handle is the best arrangement, but for ranges of urinals an automatic cistern regulated to discharge at frequent intervals is more satisfactory. No hard-and-fast rule can be laid down as to the number of flushes and amount of water required, but it may be stated that in public urinals half a gallon of water per minute per stall is often allowed. As a rule, not more than six urinals should be flushed from one cistern on account of the difficulty of distributing the water equally to all the stalls. Perforated copper sparge-pipes have been largely used for flushing stall urinals, but are not very satisfactory; splashing frequently occurs and some of the holes become choked, so that a large part of the surface is often not touched by the water. Iron sparge-pipes are soon destroyed by corrosion. In more recent stall urinals with curved backs a distributing nozzle is adopted, which is simply a short tube with closed end and with a transverse slit cut obliquely in the lower half; this gives an excellent flush, and distributes the water over the whole of the curved surface below the nozzle. It is also much neater and cleaner than a sparge-pipe. Care should be taken that the nozzle is of such a type that it can be removed without disturbing the urinal.

Urinal cisterns are often constructed with a copper or brass framework and glass sides, so that the attendant can see at a glance whether they are working properly or not. Enamelled fireclay is an excellent material, and marble cisterns with glass panels are also used. Iron is not satisfactory for use in urinals unless vitreous-enamelled. It is best to regulate the supply of water so that the cistern will discharge their contents at fixed intervals; the regulation can be effected by means of a stop-cock on the supply-pipe or by a perforated disc in the union, the latter being required by some water companies. A controlling vessel is sometimes fixed in connexion with trough urinals, by which the number of flushes is automatically regulated according to the usage of the urinals. It economises water, but may lead to furring, as a considerable quantity of urine may remain in the troughs for a long period. In other cases a treadle action is adopted, the flush being started by the weight of the person standing on the grating, but the boxes under the gratings are difficult to keep clean, even when they are made of enamelled iron, and part of the flushing water is conveyed into them. Cisterns actuated by the opening of the door of the convenience have also been used, but this arrangement leads to waste of water.

Public urinals above ground are often constructed of cast iron, but frequent painting is required to retard the inevitable corrosion caused by the ammonia and water. Sometimes such urinals are constructed of vertical slabs of slate with grooved edges into which iron tongues are fitted, but the shoulders of the grooves are soon burst off by frost and by the corrosion of the iron.

"Urnette" is the name given to a fitting intended for ladies' use. These have been occasionally fixed in ladies' public conveniences, as they occupy less space than water-closets, although they are made on the same general lines. In the underground conveniences in Shoreditch the space allotted to each urnette is 2 ft. 3 in. by 2 ft. 9 in.; the divisions

between them are of marble, and a waterproof curtain is hung in front of each basin. The urnette is practically a wash-down closet, with a fixed seat, which is all the better if the front portion is entirely cut away. A range of urinettes may be flushed from a single automatic cistern.

OBITUARY.

MR. EBENEZER GREGG.—Mr. Ebenezer Gregg, of 1A, St. Helen's-place, London, E.C., died on May 14, at Teighmore, Sutton, Surrey. At the early age of thirteen he left school and entered the office of Mr. Sabine, architect, of Old Broad-street, where, before he attained the age of seventeen, he was appointed manager, which post he retained until 1868, when he commenced to practise at 1A, St. Helen's-place. He quickly succeeded in establishing a large and influential connexion. He was elected a Fellow of the Royal Institute of British Architects in 1870, and at the time of his death had been for many years Examiner on Professional Practice and Specification. While his practice was chiefly of a domestic character, he was an architect of wide scope. Some of his chief works were:—Dr. Barnardo's Village Home at Ilford; officers' quarters, ice-house, offices, &c., of the Royal Mail Steam Packet Company, both at Southampton and London; Moody and Sankey's Temporary Mission Hall to seat 10,000, erected in six weeks; the Banks of Adelaide, New Zealand, and New South Wales; and more recently as London architect for the Exploration Company's building at Johannesburg; and the works at 71 and 72, Piccadilly, 24, Austin Friars, and 141, Fenchurch-street may be mentioned. For many years he has acted as surveyor to Jesus College, Cambridge. His death at the age of sixty-eight will be deeply regretted, especially amongst students, for he was always in a helping hand. He will be succeeded in his practice by his son, Mr. Theodore Gregg.

GENERAL BUILDING NEWS.

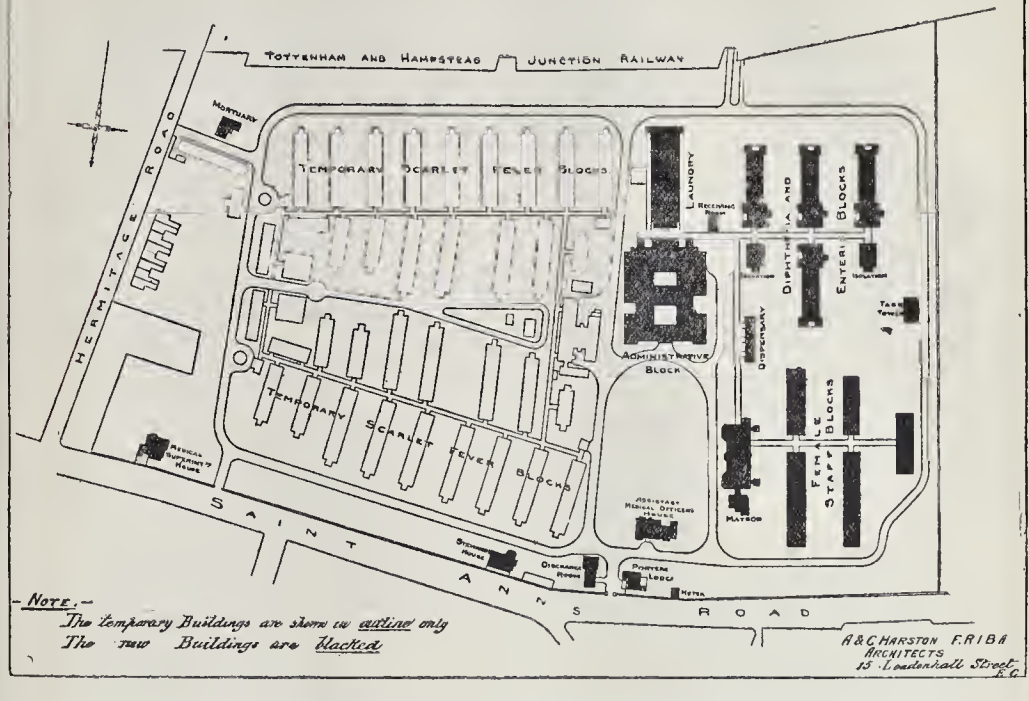

WESLEYAN CHURCH, SUNDERLAND.—On the 8th inst. the foundation-stone of the new Wesleyan church, which is to be erected on the Holly House site at the junction of the Tunstall and Durham roads, Sunderland, was laid. The new church is to be built in the Gothic style, and is 70 ft. long by 41 ft. wide across the nave, and 65 ft. wide across the transepts, with a gallery in the transepts and down the sides and across the ends. It will seat 800 persons. The spire is 104 ft. in height. The building is faced with Patley Bridge stone and Northumberland stone dressings. The school is 50 ft. by 41 ft., with a gallery on three sides. The gallery can be divided into classrooms by means of revolving shutters. The school will accommodate 500 to 600 scholars. There are several vestries and infants' class and a ladies' parlour. The estimated cost is about 15,000*l.*, including site. Mr. F. Jameson Green, Liverpool, is architect, and Mr. W. A. Lowry, Liverpool, clerk of works; and Mr. J. B. Stott, the contractor.

PROPOSED NEW CHURCH, ABERDEEN.—Plans of new Melville Church, to be erected at the junction of Rose-street and Skene-street, prepared by Messrs. Brown & Watt, architects, Aberdeen, have been laid before Aberdeen United Free Church Presbytery, and remitted to a committee with powers. The designs show an elevation to Skene-street with a spire, and also an elevation to Rose-street. In the church there will be sitting accommodation for 705 people, and in the halls in the rear of the building and fronting Rose-street sitting room for 500. The building is to be square, with a circular auditorium, and the total expense is estimated at the sum of 7,000*l.*

CHURCH, AYR.—The new church erected by the Ayr Original Secession congregation as a memorial to the Rev. John Robertson has just been opened. The church occupies a site at the junction of Craigie-road and Dampark-road, facing the new Victoria Bridge. It has been built to the design of Mr. Allan Stevenson, architect, Ayr, at a cost of about 3,000*l.* The style is Gothic, and the building is of Ballochmyle stone. The entrance porch is in the west front, with two double-light tracied windows above. There are small transepts at the north and south sides. The church is seated for about 400. A hall behind the church has accommodation for 200, and the session-house, which adjoins, can be thrown into the hall by folding doors. The other accommodation includes vestry and ladies' room, with lavatories attached. The electric light is used throughout, and the church and hall are heated by hot-water pipes on the low-pressure system. The ventilation is by inlets at walls and windows, and outlets on roofs. The roof is of open timber. The contractors for the work were:—Mason, Trustees of the late Andrew Thompson; joiner, David Milligan; plumber and slater, Wm. Auld & Sons; plasterer, D. & T. Bone; electric light, Wm. Auld & Sons; heating, H. Montgomerie.

CONGREGATIONAL CHURCH, BIRKENHEAD.—The new Congregational church in Old Chester-road, Tranmere, was opened on the 17th inst. The church has been erected on a site to the east of the Old Chester-road facing the Liberal Club, the building being set back from the road, with land

— NORTH EASTERN HOSPITAL. —

erved at the rear for future schools. The church consists of nave, transepts, and end gallery, provision being made in the chancel for an organ. There are three entrances to the church, two from Old Chester-road and one from the rear, and accommodation is arranged for over 500 adults. Two vestries are provided. The elevations are late Gothic in design, a tower being arranged on the north-east angle. White Storeton stone, relieved by red Trammere sandstone, is used for the fronts to Old Chester-road. The woodwork within the building is of varnished pitch pine, and the windows to the main road are filled with leadlights. The contract has been carried out by Mr. Richard Allen, of Birkenhead, the architect being Mr. T. W. Cubbon, Birkenhead.

PROPOSED NEW CHURCH NEAR ABERDEEN.—The architects, Messrs. D. & J. R. McMillan, Aberdeen, have been instructed to proceed with the preparation of working plans for the new United Free church at Cults, in the suburbs of Aberdeen. The site will be a central one in Cults village. The design submitted, which has been generally approved of, is of Gothic type with Scottish features, and is cruciform in plan. There will be a tower on the west and an apse behind the pulpit, where provision is made for an organ; and there will be sitting accommodation for fully 600. There will also be hall, session-house, ladies' workroom, and tea kitchen; and the total cost will be about 4,000.

ALTERATIONS TO COCKS & BIDDULPHS BANK.—This bank, situated in Charing Cross, was built several years since from the designs of Mr. Richard Coad. It is now to be extended into Spring-gardens, where the new front will be. The building now being begun by Messrs. Dove Bros., the contractors, comprises new partners-room, strong-rooms, a considerable enlargement of the bank premises, as well as three floors of offices which will be let. The new front will be of Brackley bricks and Portland stone. The building is fire-proof throughout; the ironwork, &c., being provided by Messrs. Fawcett. The cost will be about 12,000. The design has been prepared by Mr. J. Oldrid Scott.

BUSINESS PREMISES, DUNDEE.—New premises for Messrs. Malcolm Bros., the Dundee auctioneers, have been erected in Commercial-street, Dundee. Mr. J. H. Langlands was the architect, and the contractors were as follows:—Builders, Messrs. James Binny & Co.; joiners, Messrs. Alex. Bruce & Co.; painters, Messrs. Mackay & Son; plumber, Mr. David Brown; electric lighting, Messrs. G. H. Nicoll & Co.; grates and tiles, Messrs. Sinclair & Ewing.

NEW BUILDINGS, NORTH EASTERN HOSPITAL.—The original North-Eastern Hospital consists of a group of temporary buildings hastily erected in 1892, in face of an epidemic of scarlet fever, and intended only to last for one year. The area of the site was then 19 acres, but additional land has since been purchased, and the total is now about 33 acres, including a recreation ground, not shown on the accompanying plan, situated on the south side of the railway. The new buildings, which form the first section of the proposed permanent hospital, are shown black on the plan. They consist of an administrative block, laundry, staff quarters, medical superintendent's and steward's houses, porter's lodge, receiving and discharge rooms, mortuary, dispensary, four diphtheria and enteric blocks, two isolation blocks, and tank tower. The normal number of beds in the reconstructed hospital will be 548. The new buildings provide for diphtheria and enteric patients and eight isolation beds. They also include accommodation for the entire staff of the future hospital. The buildings have been erected by Messrs. McCormick & Sons, whose contracts include all engineering work except kitchen and laundry fittings. The contract amounts were as follows:—Main contract, 113,642l.; laundry, 8,865l. The kitchen fittings were provided by Messrs. C. Kite & Co., whose contract amounted to 1,050l., and the contract for laundry fittings has recently been let to Messrs. Bradford & Co. at 4,580l. The medical superintendent's residence was built by Messrs. Wm. Johnson & Co., of Wandsworth-common, at a cost of 1,968l. Messrs. A. & C. Harston, Leadenhall-street, were the architects, and Mr. W. Lawrence clerk of the works.

PRINCE'S THEATRE, MANCHESTER.—Important structural alterations are about to be made to this theatre to suit the requirements of the City Surveyor, and in accordance with the views of the Watch Committee of the Corporation. The proposed alterations will be made mainly to remodel the entrances and provide additional exits. The exit staircase from the gallery into Oxford-street will involve the complete alteration and reconstruction of the front portion of the building, including a new marble staircase to the dress circle, a new entrance hall lined with marble, and a new box office. The circle staircase will open into a lounge on the circle level, from which is entered a new retiring and cloakroom for ladies. The large folding central doors lead directly into the promenade at the back of the circle seats, and the doors on the Oxford-street side of the new lounge will open direct on to the flat roof of the present verandah. The stall staircases will be widened and constructed of concrete, and exit doors provided in the barrier direct into the pit.

Other structural changes will be made, notably the improved staircase into the saloon bar, the direct exit therefrom into Bale-street, completion of the present gallery entrance staircase in fireproof material, enlargement of the orchestra, and general improvement of the lavatory accommodation. A scheme has been carefully prepared for the complete heating and ventilation of the theatre, and the building will be fitted throughout with the electric light. Mr. John Bland, of Manchester, is the contractor for the structural alterations. These will involve the redecoration of the entire house in front of the curtain. In preparing a new scheme of decoration the architects have, as a matter of course, retained the proscenium frieze painted by the late H. Stacey Marks, R.A., and which has allied so remarkably the Princes Theatre with the painter's art of the time. The side pictures by the late Mr. Phillips will also be retained; they are in harmony with the frieze and contemporaneous therewith. The ceiling below the central dome will have the main panels filled with figure subjects, suggestive of the art of the Theatre, alternating with portrait heads of those who have contributed to the creation and maintenance of dramatic art. The front of the dress circle tier will be enriched with hand-painted panels, containing scrolls, with the names of dramatists and musicians thereon. The panels of the upper circle tier will be treated in a similar manner, the centres being alternately enriched with the Rose of Lancaster and the three feathers. The gallery front will have a continuous scroll ornament, and the various ceilings will receive careful attention in the way of enrichment. The upholstery will be renewed throughout in a blue tone; the hangings will be of blue plush with gold trimmings, all in harmony with the new act drop painted by Mr. Conrad Tritcher. The new lounge will receive special treatment, and the saloon bar will have a new ceiling, frieze of figure subjects, and rich wall-paper. The contracts for the decoration and upholstery will be carried out by Messrs. J. Binns & Sons, of Halifax, the theatre decorators, and the upholstery has been let by them to Messrs. Turner, Son, & Walker, of Liverpool. The whole of the structural and decorative work will be executed from drawings prepared by the architects, Messrs. Darbyshire & Smith, and will be carried out under their personal superintendence.

NEW HOSPITAL, SUTTON, SURREY.—The foundation-stone of the new hospital was laid at Sutton recently. The new building, which is being erected by Mr. J. B. Potter, of Sutton, from the designs of Mr. Cecil Sharp, architect, will cost about 3,000l., with the furnishing, &c. The central building will consist of a doctor's and matron's room, with bedrooms for the matron and staff over, and there will

be pavilions on each side, divided into two wards each, two of the wards containing four beds, and two two each, thus providing for twelve patients.

HOTEL CECIL EXTENSION.—The block of buildings, having a frontage to the Strand between (old) Ivy Bridge-lane and Carting-lane, is nearly completed. The block has supplanted Salisbury and Cecil streets. It comprises shops, offices, and chambers, erected by Mr. J. Carmichael, builder, after the plans and design of Mr. Joseph Sawyer, the sanitary arrangements and fittings being by Messrs. George Jennings, Limited.

FOREIGN.

GERMANY.—The German Emperor has sanctioned the plans for building a new museum near the Polytechnic Academy at Charlottenburg, near Berlin, to contain models and copies of architectural and plastic works of art.—Since the closing of the trachyte quarries near the Drachenfels, in the Siebengebirge, that stone has not been so extensively used in the Rhine valley; but recent discoveries have proved the existence of a very similar rock near Kelberg, in the Eifel, which it is proposed to introduce to the market. Trachyte has for many centuries been a favourite building material with Rhenish architects, many of the churches in Cologne, including a great part of the cathedral, being composed of it.

INDIA.—A large stone bridge is about to be erected over the Chooray river, on the Ranaghat-Kishnagar Light Railway, at the suggestion of the Government of Bengal.—The Anglican community of Rangoon are trying to raise a lakh of rupees as a memorial to Queen Victoria to complete the Rangoon Cathedral.—The harbour improvements at Madras are still under contemplation, though Indian engineers are not sanguine that as at present proposed they will be adequate enough for the purpose.

MISCELLANEOUS.

PROFESSIONAL AND BUSINESS ANNOUNCEMENTS.—Messrs. T. W. Aldwinckle & Son, architects, have removed their offices from 1, Victoria-street, Westminster, to 20, Denman-street, London Bridge, S.E.—Mr. W. J. Morley, architect, of 259, Strand, arcade, Bradford, has taken his son, Mr. Richard Morley, into partnership, and the practice will be carried on in future under the style of W. J. Morley & Son.

ISOLATION HOSPITAL, CHORLEY.—Messrs. Shorland & Brother ask us to mention that the large wards in this building, described in our last issue, are warmed with their central patent Manchester stoves.

HOUSE-RENTS IN STOCKHOLM.—A matter which greatly affects Stockholm at the present time, and helps to make it an extremely expensive place of residence, is (says an official report) the want of sufficient house accommodation. An Inspector of Poor reported last autumn that he feared in the present year things would be worse than ever. As the want of dwellings was very great, and the demand for them still greater, numbers of people were then applying to the authorities for assistance to get or keep a roof over their heads. All one-roomed apartments were taken about September, and so for those with two rooms and a kitchen, even on the outskirts of the town, the enormous rents of up to 27*l.* 15*s.* to 33*l.* 6*s.* were asked. So much for the dwellings of the poor; but rents for people much better off are also exceedingly high. Seven or eight-roomed flats in a second-class street fetch 150*l.* to 150*l.*, and although 18*l.* or 20*l.* per room is dear enough, one hears continually of rents being put up. It may, perhaps, be difficult altogether to account for this state of things, but, as tending towards high rents, there are the facts that houses in Stockholm are built in handsome and expensive styles, and that borrowing capital for building purposes in times like the present is a costly proceeding.

THE LAND TRANSFER ACT, 1897.—An order in Council has been issued whereby the operation of the Order in Council of July 18, 1898, under the Act of 1897, in as far as it affects the City of London, is again postponed until January 1 of next year.

THE STRAND IMPROVEMENT.—The removal to Brookwood Cemetery by the London Necropolis Company of human remains from the churchyards of St. Mary-le-Strand and St. Clement Danes is now completed. The Company's tender to the London County Council for the work amounted to 2,258*l.* 15*s.*, and they have undertaken, at an estimated cost of 650*l.*, to lay the foundations of the dwarf walls and railings around the portions of the churchyards that will remain enclosed. The cost of repaving and other alterations now being carried out on the two cleared sites is estimated at 6,204*l.*; at St. Clement Danes the works in progress comprise a portion of the subway which will be constructed beneath the new thoroughfare—High Holborn to the Strand.

ARCHAEOLOGICAL DISCOVERY.—A discovery, it is stated, has been made at Peterborough Minster. In removing the rubble which filled one of the many pointed arches in the wall at the eastern extremity of the Palace-gardens, a window of beautiful flowing tracery was revealed.

The stonework was in an excellent state of preservation, and only a small portion of one column was missing. It is intended to unseal the neighbouring arches, in the hope that similar archaeological treasures may be found. The wall originally formed part of a passage leading from the cloisters to the monks' kitchen.

STONEHENGE.—Sir Edmund Antrobus has intimated his intention, it is stated, of enclosing Stonehenge in accordance with the advice given to him by various bodies interested in antiquarian and archaeological research. It is his intention, however, without relinquishing any of his rights as owner of the property, to admit visitors within the enclosure on payment of 1*s.* each person on condition that they conform to the regulations.

CAPITAL AND LABOUR.

PENRYN QUARRIES.—The Penryn Quarry will be open on Tuesday, June 11, to all the late employees who have applied for work and have been accepted. The Discipline Rules have been relaxed, and a new rule has been drawn up and agreed upon, which will practically give a half-holiday on the last day of every month; in other respects the Quarry Rules remain as before. (The new rules referred to are printed below.) Applications from "boys" for readmission to the quarry "cannot" be considered until at least a fortnight after the commencement of work by the men. In order to enforce the law concerning intimidation or annoyance by violence or otherwise (under the Conspiracy and Protection Act), police protection has been promised by the Chief Constable, Colonel Ruck. **NEW RULES:—Discipline.**—All punishments will be by "suspension" or dismissal. For instance, if a workman comes late (except through sickness or sudden case of great emergency) he will the first time be "cautioned," the second time suspended quarter of a day, third offence half-day; but persistent offenders would be more seriously punished or dismissed. **Settling Down.**—On the last Tuesday in each Quarry month the employees, after giving up their slates, settling their accounts, and arranging their bargains for the coming month, will be free to leave the quarry if they wish for the remainder of the day.

YARMOUTH BUILDING STRIKE.—The members of the Operative Bricklayers' Union, to the number of about 140, recently met at the Free Stall House, Market-place, Yarmouth, to discuss the rules sent by the Masters' Association a few days since. The principal matters for consideration were the question of the working hours in winter, the apprentice clause, and the rate of wages. Mr. Holdsworth, secretary of the Operative Bricklayers' Society, presided. Rule 1, as submitted by the masters, proposed that the winter working hours, commencing from the last Monday in October, should be as follows:—For first four weeks, 6.30 to 5 p.m. for five days, and 6.30 to 1 on Saturdays, 5*h* 15*m* per week. For the ten middle weeks, commencing on the fourth Monday in November, five days from 7.30 a.m. to 4.30 p.m., and from 7.30 a.m. to 1 p.m. on Saturdays, 4*h* 15*m*. For the last four weeks of the winter term, commencing the first Monday in February, five days from 6.30 a.m. to 5.30 p.m., and on Saturdays from 6.30 to 1 p.m., 5*h* 15*m*. Full time to commence on the first Monday in March, when the hours will be 5*h* 15*m* per week. A lengthy discussion took place on this rule, and it was pointed out that both rent and the price of provisions had increased so much in the last few years that any such arrangement as that proposed by the masters would leave them with but a bare subsistence at a time when they most required as near to full time as possible. So large a reduction of the hours meant a large reduction in their wages, which they considered unfair, and could not accept with justice to themselves or their families. It was unanimously resolved to stand by the old rule, with the exception of the period of a month in winter—a fortnight before and after Christmas—when they would be willing to a reduction of working time from 7 a.m. to 4.30 p.m., and 7.30 to 1 on Saturdays. The men thought that, taking into consideration that they were frequently compelled to lose time in consequence of bad weather and from other causes, these terms should be agreed to. With regard to the wages clause, they were willing to agree to the masters' offer of an advance of a halfpenny per hour, provided that a further advance of a similar amount be conceded in April, 1902. It was also decided that if the employers did not agree to this proposal the men would not come out before submitting the question to arbitration. With regard to apprentices, it was decided to stick to their old rule made in 1897, which stipulated that boys entering the trade were not to work more than six months without being legally bound for a term of four years. In respect to Rule 9, the meeting desired the masters to alter the word "workmen" to "bricklayers," so that it would read "The Bricklayers' Operative Society agree to work in harmony with any bricklayers engaged," &c. The rules which provided for the agreement between masters and men to end on October 1 were not agreed to, the men strongly adhering to their old date, viz., the first Monday in April.

LEGAL.

ACTION BY BUILDERS AND CONTRACTORS.

THE hearing of the case of Graham & Sons v. the Commissioners of Works and Public Buildings was commenced before Justices Ridley and Phillimore on the 22nd inst. in the King's Bench Division. It was an action by the plaintiffs, builders and contractors, to recover from the defendants damages for alleged breach of contract and for wrongful conversion of builder's plant.

It appeared that in September, 1899, the plaintiffs entered into a contract with the defendants to build a post-office at Stalybridge, in Lancashire, and by their statement of claim, they alleged that on December 31, 1900, the defendants wrongfully determined and repudiated the contract and prevented the plaintiffs from executing the work in question. The Commissioners, amongst other pleas, pleaded that they were a corporation under and subject to the provisions of 14 and 15 Vict., c. 42; 15 Vict., c. 28, and 37 and 38 Vict., c. 84, and that the contract in question was entered into by them as servants and agents of the Crown and on behalf of the Crown, and not otherwise, and their case was that no claim in any event could be maintained against them upon the contract; and alternatively that the plaintiffs could only put forward such claim by petition of right. The plaintiffs replied that defendants were a corporation to all intents and purposes. The only question now raised was the question of law raised by the above pleas.

After hearing the arguments of counsel, their lordships held that the defendants expressly contracted for themselves, and must be treated as principals and not liable under the contract. They accordingly gave judgment for the plaintiffs, the builders.

Mr. Scott Fox, K.C., and Mr. Andrew Strain appeared for the plaintiffs and the Attorney-General and Mr. Askwith for the defendants.

RECENT PATENTS:

ABSTRACTS OF PATENTED INVENTIONS.

1,220.—**WALL-TIES:** J. G. McDowell.—The serrated edges of metal strips engage with the bricks, whilst their ends have flanges which will fit on the outside of the bricks and in recesses in the masonry work. For fastening bricks to woodwork, nails are inserted through holes in the strips into the wood sheathing, and the strips are then turned over the bricks.

1,223.—**STAGING AND SCAFFOLDING:** E. F. Palmer and E. T. Palmer.—For a travelling scaffold ladders are fixed in sockets upon a base which runs on wheels, and adjustable screw couplings are provided for the connecting rails, bolts and tie-roads. Boards laid over planks that rest upon the ladder-rounds and have guard-rails constitute a working stage or platform, and two or more ladders can be joined together with channel irons, sockets, &c.

1,241.—**CONVEYERS:** C. Clay.—Sprocket wheels carry a pair of endless chains that move in parallel planes, pins secure tables to the chains, and a distance which is equal to that between the axes of the pins upon each table separates the axes of the two sprocket wheels mounted at either end; the tables, therefore, will remain in a horizontal plane during their movement by the conveyer. The lower run may be arranged upon one roller with the upper run upon another floor, and rollers fitted upon each of the tables will engage with the main and the end rails.

1,246.—**PULLEY BLOCKS:** A. Kelly and The side-plates, between which the sheave is carried, are kept apart at the required distance with flanges, and their extension upwards constitutes a necking, from within which project rings for engagement with similar rings upon the eye-bolt.

1,260.—**A BAND FRICTION BRAKE:** A. Kelly and C. D. B. Hansen.—The brake, intended for use with windlasses and capstans, consists of two bands around the drum, which are joined with links to the outer ends of an equivalent lever linked to the bed-plate and pivoted on to a block that presses against the drum. From the lever projects an arm, to which are linked the worm and toothed quadrant which work the brake.

1,278.—**PARALLEL ROLLERS:** W. P. Johnson.—A projecting straight-edge is mounted upon end plates in which are journaled the rollers, which may be of different sizes. In order that the straight-edge may be easily banded, it is furnished with an ear or a flange.

1,310.—**APPLIANCES FOR CAGE LIFTS:** W. D. Syers.—Friction is reduced by means of the rubber or air tyres of pulleys that run in V-grooved guides around the sides of the well, and the balance weight is fitted in the same manner. For regulating the pressure the pulleys are carried adjustably upon bell-crank levers, and the cage has side plates that will avail in cases of emergency.

1,360.—**WIRE FENCING:** D. Rowell.—The sharp pointed metal standard has perforations through which spikes can be driven when it has been forced into the ground; clips are used for fastening wire-droppers to the horizontal wires, and are to be hooked on to one limb of the dropper.

1,428.—FLUSHING APPARATUS: F. Duckell & Son, G. F. Duckell, and F. W. Unblock. In the case of latrines or multiple closets the water is caused to flow into the siphon and the cistern by lifting the dead-weight valve with the pull, after which it flows through the fall-pipe and so sets up a current of air from the air chamber until a vacuum has been formed in the latter, then the contents of the basins and their connecting trough are siphoned through the middle trap until water in the cistern falls below a certain level, but until the cistern has been emptied and the pipes and basins recharged the upper siphon will continue to act. The closets when not in use may be emptied by means of a stop-tap in the air extractor pipe.

1,445.—TRANSFORMERS (ELECTRICAL): A. H. Loring and H. L. Clark. The casing or box can be affixed to a wall or post, and has a sliding door, the core consists of two pieces, whereof one is secured (for closing circuit) with a bar, yoke, and screw-clamp, and the other should be U-shaped, the coils being adapted to slide on to or from the limbs of the core when its latter portion is detached. A bracket with lugs holds the core in its place within the box.

1,458.—FIRE-PROOFING COMPOSITIONS: C. Schroeder.—Wood, fabrics, &c., are treated with borax and sulphate of magnesia, to which may be added gypsum and ammonium chloride, in order to form an insoluble borate of magnesia. 1,493.—A TUBE FOR BORING AND LINING WELLS: F. Pelike.—The suction or straining piece of a well boring and lining tube is screwed on to it and has the earth borer at its extreme end, it is guarded with a metal sleeve upon the tube, and at its lower end (just above the borer) is a protecting ring in the shape of a wedge.

1,506.—BRACKET FOR RODS AND THEIR FITTINGS: F. K. Drake (Drake & Co.). A grooved or recessed bracket is bent so as to form a circular loop, a projection from the rod is put into the opening of the loop so that it shall engage with the groove when the rod is turned, a plate that closes the bracket end may be fashioned in one piece with the blank, or it may be held in its place with a slide, the end of the barrel being turned over, or by springing it into a recess within the barrel. Various modifications are specified—in one form a cup-shaped bracket has a notched lip that takes the projection upon the rod, and is to be affixed to the retaining screw either loosely or rigidly by a turn of the ends over two discs that are threaded on the screw, one being turned around the head; or the cup having either a plain or a gapped flange is screwed on to the threaded head of the holding screw.

1,515.—EXTINCTION OF FIRE: G. Edwards.—A special fire cases made of cardboard and disposed ready for use filled with a powder composed of gunpowder, sand, and carbonates of lime and soda mixed together.

1,531.—A REGULATOR FOR ELECTRICAL LAMPS: F. K. Halmaker.—A divided resistance and a covered switch constitute a rheostat. The former should consist of a metal wire, which is set in enamel upon a metal tube mounted upon the base and put around the insulating joint of the bracket. The switch comprises a pile of metal discs, whereof those at the top and bottom are riveted together, layers of insulating material being interposed between the several discs. The switch is held up with an extension of the disc which is next beneath the top one and is affixed to the base, and it is encompassed with some insulating material such as asbestos. On the top disc is a lug connected to one supply wire. A handle-turned shaft is carried over the top disc and, and on the shaft is a trailing spring within a series of contacts turned downwards from the lower range of discs whereon are lugs connected with wires to the divided resistance; thus either none, or part, or the whole can be placed in circuit, or the circuit can be opened. In order that the spring may snap from each to the next one the contacts are turned inwards.

1,554.—CONSTRUCTION OF FLOORS, ARCHES, ROOFS, &c.: F. Loxton.—For these the inventor devises perforated blocks of concrete fashioned with rebated ends and with sides inclined so as to interlock with one another. The blocks are to be laid to break joint, and are then united with cement.

1,570.—AN APPLIANCE FOR PAINTERS' USE: F. Neighly.—With the brush are combined a reservoir or the paint, and a flexible tube attached to the root of the bristles which is fitted with a tap; a spring joint together two levers which press the reservoir between them; paint is poured into the reservoir through a capped orifice.

1,650.—APPARATUS FOR USE WITH LIFTS: F. Leather and F. Bolton.—The inventors' object is to provide means of holding open the folding doors whilst the cage is at the floor, and of automatically shutting and locking the doors when the cage moves. Two arms are screwed upon a cross-shaft which extends across the top of the doorway, and are provided with their normal position with springs. When the cage has arrived at a floor, a catch that projects from it engages with an arm upon the hat and rocks the shaft. As the doors are opened they engage with catches that hang upon the two arms of the cross-shaft. Then with the departure of the cage springs shut the doors, which are then with locked with spring catches that engage with a short bar, and will be again raised, so that the doors may be pushed back, by means of their

engagement with a lug upon the shaft as it is turned by the cage.

1,661.—SEATS FOR ASSISTANTS IN SHOPS, &c.: F. J. Boyd.—From a hook or eye upon the upper end of a standard or plate hangs a stirrup on to which the seat is pivoted. As the unused seat hangs down it may be swung aside out of the way, but for use it is secured with a projection that fits into a socket. The latter may be formed in the seat and the plate may be made crank-wise to serve for the former.

1,692.—URINALS: W. Oates.—For urinals after the "stall" type the front edges are fashioned parallel to one another and are vertical, the backs and sides being sloped inwards from top to bottom; it is intended that the diminishing surface thus obtained shall concentrate the flush.

1,704.—AN ELECTRICAL CONTACT-MAKER FOR BURGALAR ALARMS, &c.: D. Prial.—Two terminals connected to the alarm circuit are fitted on the base which is fixed to the door or other part of the building, &c.; from one of two other terminal plates is hung a pendulum of which the rod is passed through a hole in the other of the plates. Under normal conditions the rod rests out of contact with the last-named terminal plate; it is either jointed or wholly or partially flexible. When the pendulum is caused to vibrate by any means the alarm circuit between its rod and the plate will become completed. If it is desired to substitute the appliance for the ordinary contact buttons or pushes of electrical bells, it may be disposed for operation by the hand or otherwise.

1,705.—METHOD OF DRYING BLOCKS OF ARTIFICIAL STONE AND OF SLAKING LIME AT THE SAME TIME: W. Olschewsky.—For the stacking of moulded blocks upon the truck the lower layers are strengthened against the pressure exerted by those above them by being first dried over a chamber into which steam is admitted; the lime in the chamber becomes slaked by the condensed water and the engendered heat contributes to dry the blocks. The blocks are next barded in the drying chamber or furnace to which the truck is conveyed.

1,718.—TRAPS FOR GULLIES: A. S. Chadwick.—The rectangular gully has a top of which the sides are directed inwards down to a middle channel that communicates with the outlet. Besides the customary grating in the top of the gully, another grating is fitted over the outlet.

MEETINGS.

SATURDAY, MAY 25.

Royal Institution.—Professor W. M. Flinders Petrie on "The Rise of Civilization in Egypt." III. 3 p.m. British Institute of Certified Carpenters.—Visit to the Royal Masonic School at Bushey. Meet in Central Hall, Euston Station. Train leaves Euston 2.40 p.m.

THURSDAY, MAY 24.

Surveyors' Institution.—Country meeting at Southampton Institution of Electrical Engineers.—Annual general meeting to receive Annual Report of Council and statement of accounts and balance-sheet for twelve months terminated December, 1900. The announcement of the election of the new Council will be made at this meeting. 8 p.m. FRIDAY, MAY 31.

Architectural Association.—Annual dinner, Criterion Restaurant, Piccadilly-circus, 7.30 p.m. Surveyors' Institution.—Country meeting at Southampton (concluded).

SATURDAY, JUNE 1.

Edinburgh Architectural Association.—Visits to the Round Tower, Abernethy; and Balmano Castle. Association of Municipal and County Engineers.—Home District meeting, Chichester. Mr. J. Saunders on "Municipal Work in Chichester."

SOME RECENT SALES OF PROPERTY:

ESTATE EXCHANGE REPORT.

Table listing property sales with columns for date, agent, and details of the property including location, area, and price.

Table listing property sales with columns for location, agent, and details of the property including location, area, and price.

Table of property listings including addresses, descriptions, and prices. Examples: Camberwell, Linnell-rd., u.t. 6 1/2 yrs., g.r. 64, r. 304; City of London, Paternoster-row, area 724 ft. f.; Twickenham, May-rd., a block of building land, f.;

Table of property listings by T. G. Wharton. Examples: Hendon, Milton-rd., f.g.r.'s 421, reversion in 81 yrs.; Albion-villas, f.g.r.'s 301, reversion in 80 yrs.; Finsbury Park, 33, Portland-rd., u.t. 57 yrs., g.r. 121, 128, r. 551;

Section titled 'PRICES CURRENT OF MATERIALS.' with a note: '*Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.'

Table of material prices including Bricks, Hard Stocks, Rongh Stocks, and various types of Bricks (Glazed, White, Ivory, etc.) with prices per 1,000 or per load.

Table of material prices including Stone (Ancaster in blocks, Bath, Farleigh Down Bath, Beer in blocks, Grinshill, etc.) and Slates (in. in, 20x10 best blue Bangor, etc.).

Table of material prices including Joists, Girders, Rolled Steel Joists, Compound Girders, Angles, Tees and Channels, Fitch Plates, Cast Iron Columns, etc.

WEST HILL SITE (late Bromhill-road), WANDSWORTH.—The Board of Education have sanctioned the erection of a school on the West Hill site, Bromhill-road, Wandsworth (Sub-Division CA of West Lambeth), to provide accommodation for 900 children, upon which site three temporary iron buildings have been now erected and are now in use.

WICKHAM-LANE SITE, PLUMSTEAD.—The Board of Education have also sanctioned the erection of a school for 600 children on the site which has been acquired in Wickham-lane, Plumstead (Sub-division S of Greenwich). Finished plans of a school to provide accommodation for this number of places (viz., boys, girls, and infants 200 each) were passed by the Committee on January 25. The school is a three-story building, and contains the following accommodation:—Halls—boys', girls', and infants', each 54 ft. by 31 ft. 3 in. Classrooms—boys', girls', and infants', each 56, 56, 48, 40; also drawing-classroom, 1,050 sq. ft. area. Heating by low-pressure hot-water apparatus and open fires. Area of site, 5,445 sq. ft. Playgrounds, area per child—boys', 254, 450 square feet, and infants, about 60 ft. A schoolkeeper's house is also included in the plans:—

WINSTANLEY-ROAD SCHOOL, BATTERSEA. For heating works:—Brightside Foundry and Engineering.....£438 0 0

WOODS-ROAD SCHOOL, PECKHAM.—This school is one of those in connexion with which it is proposed to provide halls and to carry out other improvements, under the scheme adopted by the Board on March 17, 1898, the finished plans of the improvements provide for a hall for each department, 53 ft. by 20 ft., with drawing-classroom over; new cloakrooms, teachers' room, stock rooms, and lavatories; dividing large classrooms and re-estepping five existing classrooms on each floor; providing basement for heating apparatus; enclosing, draining, and tarping the additional land; retaining and adapting old house for the schoolkeeper, and removing existing and erecting new covered playground for boys and girls and new water-closets for boys. The above alterations will result in a reduction of 150 places in the total accommodation of the school (viz., boys, 24; girls, 24; infants, 102), as the accommodation of the old rooms, the seating of which will be altered, will now be calculated on the seat basis. The revised accommodation, on the completion of the improvements, will be—boys, 456; girls, 456; infants, 536. Total, 1,448.—

Tenders for the supply of belts for the use of school-keepers when cleaning windows:—For 96 belts delivered At one time. Each. s. d. Sband, Mason, & Co..... 5 0 0

Architecture of Sydney.

Nan article on the architecture of Sydney, which appeared a few months since,* we mentioned that there were a number of new buildings deserving of notice in addition to those we criticised, and promised to deal with them later on. One of the works specially noticed was the lightening of the Post Office and the difficulties of style in connexion therewith. A more satisfactory example is the Custom House, originally a plain, simple Italian building of three stories with projecting wings, recessed centre, and a loggia with granite columns on the ground floor filling up the recess. In its original form it was an unobtrusive, but satisfactory building, though in comparison with the huge wool stores of Messrs. Goldsborough, Mort, & Co. on the left, and with Harrison, Jones, & Devlin's on the right, it was quite insignificant. The imposition of an income-tax and a land-tax a few years since, and the simultaneous reduction of duties, caused the transference of staff from the Customs to the Direct Taxation Department, and one of the arguments put forward to gild the pill of direct taxation was the frequently repeated statement that the cost of collection would be less. It has, however, proved to be infinitely more, so much so that a very considerable enlargement of the Custom House became necessary, hence the recent alterations. These consist of the addition of two stories to the original building and of an Ionic colonnade of granite columns over the pre-existing Doric colonnade on the ground floor. Broadly and generally, the whole work is harmonious in itself, and the building now fairly holds its own with the wool stores on either hand. It is mainly erected in the golden brown sandstone for

which Sydney is famous, and forms a pleasing object from the Circular Quay, the central landing-place for passengers from most of the ferries and some of the mail steamers serving the city. There are, however, one or two points in the design open to criticism, and as our articles are intended to assist in the development of good architecture, we do not hesitate to point them out. The most noticeable is the very high panelled parapet to the wings, apparently equal in height to the attic story itself, in which also a panel treatment has been adopted. This equality of division and similarity of treatment is not pleasing (although each portion is in itself well designed), for it gives a generally top-heavy appearance to the wings, and the effect is still further intensified by the square dome-like terminals of the angle piers, from each of which rises a short flagstaff. If, instead of the square-domed terminals, some lighter treatment in metal or wood had been adopted as a support to the base of the flagstaff, the same general outline could have been obtained, but with a much more satisfactory result; in fact, the treatment should have formed a base to the flagstaff instead of a terminal to the stonework. The parapet to the recessed central portion consists of a turned balustrade of the usual type and of moderate height. If this had been carried round the wings instead of the high and heavy solid parapet, the effect would, we think, have been much more pleasing. Another slight defect is to be found in the cornice of the attic story, which is somewhat too pronounced in comparison with the main cornice immediately below it; and a very weak effect is given to the range of windows in the central division under the main cornice by flat corbelled pilaster strips between the windows. They would have been much better omitted, especially as there are two colonnaded loggias with strongly marked vertical lines just below them, and the contrast of horizontal treatment is exactly what was needed to give additional force to the colonnades. There is, however, one feature which calls for special

praise, and that is the enclosure of the clock, which occupies a central position in place of one of the windows. It is surrounded by a simple architectural framework almost square in outline, but with well-modelled dolphins as supporters to the circle, with tridents on each side to fill up the space left vacant by the curve of the body. This is a little bit of boldly and artistically treated work which gives genuine pleasure.

Passing up Pitt-street, we reach another building which has just been doubled in height, namely, the Merchants' Exchange. Originally, no doubt, it was an imposing building, but the growth of the city all round, and especially the erection of the huge Lands Office on one side, has left it secondary and insignificant. The original treatment consisted of a building of two stories on a fairly high base. The side elevations have slightly-projecting Corinthian pilasters, and five bays of the front are treated with three-quarter columns, with an entablature of good proportion all round. To add two more stories to such a building and make an architectural success is a task which requires some ability, and this, unfortunately, has not been displayed. The addition is practically a repetition of the two lower stories on a somewhat smaller scale, and with very poor and commonplace detail. The pilasters are thin and meagre, with exaggerated and nondescript caps and high bases. There is also too much cutting up of the surface between the pilasters by strings and bands. Windows with semicircular heads and square heads are also employed in the same range, the impost moulding to the former running through and cutting into the architraves of the square-headed windows—a most objectionable treatment, which makes the square-headed windows look very top-heavy. The three-quarter columns on the lower story are not carried up, but, nevertheless, a large and unmeaning pediment is superposed over three bays of the flat-looking pilasters previously referred to. It is a great pity that a building of such importance and in so good a position, with its three street frontages, should not have been

* See *Builder* of October 13, 1900.

more artistically treated; indeed, the building in its original condition was a much more satisfactory architectural composition, simple and unpretentious as it was, than it is now in its altered guise.

Away to the left up Bridge-street, at the corner where it joins Macquarie-street, is the Treasury, another old and commonplace building which has recently been enlarged by the Government Architect. This also presents a difficult problem, as it was apparently necessary to carry out the original commonplace design. It is a conspicuous example how a difficult problem may be met by genuine architectural skill, and an unpromising subject so manoeuvred that the eye is caught and held by an exceedingly well-designed feature to which the commonplace main lines of the building act as a foil. This feature consists of a projection of two stories thrown out from the front of the building right up to the pavement line. The upper half consists of a portico of three bays of coupled columns, those at the angles being square; they are of unpolished granite with bronze caps and bases, and are surmounted by a well-designed pediment. In this portion of the design the only points to criticise are the caps of the columns, which are somewhat too deep and heavy, and the acroteria which, though well carved, are too large, and, indeed, would have been better omitted altogether. The lower half of the projection forms a high base or podium, and on the face fronting the street is relieved by a semicircular arched opening of bold design, filled in with columns supporting the ground floor landing and a balcony wall wholly covered with carving of very fine design and good execution. The opening is treated in this fashion because the ground floor of the building is considerably elevated above the street, and approach thereto is obtained by well-designed flights of steps on either side. They are unequal in height, as the street has a steep slope, but being subordinate to the main central feature the discrepancy is scarcely noticed. The openings between the small columns in the arch just referred to give light to the basement story, and are filled in with some really excellent ironwork. Taken altogether the composition is one of the best bits of work the Government Architect has given us in recent years, excellent as most of his work is.

Returning to the heart of the city through the region of the clubs and hotels, we pass Dalgety's offices and those of the Australian Mortgage Company, which we criticised in our last article. Adjoining the latter a very ornate building in brick and stone has just been completed for the Jockey Club. The brick is tuck-pointed, the stonework is freely carved, and as much feature as a 30 ft. front could well contain has been lavished on this building. The general idea is not bad, namely, a wide central and narrow side bays subdivided by semi-ocagonal projections. On the ground floor at one side is the entrance, and at the other a passage way to the rear; an elliptical-headed window is placed between, over this is a well-marked square bay window with round corners, and above it on the second story a horseshoe arched opening with a rather heavy stone arch. Ordinary windows fill up the space in the side bays, and the parapet is cut up to give as much

variety of outline as possible. The whole design shows effort and the effect is overdone. It would almost appear as if the client said to the architect, "give us a good handsome front and don't hesitate about the expense." They have got it and it is to be hoped they are satisfied, but from the point of view of the artistic critic this is not the type of building one would care to see repeated, although, unfortunately, there are far too many attempts of the kind in the city. The building has, however, had one good effect, namely, that the somewhat bold stone building of the Mortgage Company adjoining has been greatly improved by the contrast, for its simple lines and the reticence of its design are accentuated, and its front has taken on an air of solidity and respectability which were not previously so noticeable, and should be gratifying not only to its architect but to its owner, as typifying the stability of their institution.

Making our way to the heart of the city, and leaving the General Post Office to the left, one of the most artistic of the warehouses of Sydney—that of Messrs. Paterson, Laing, & Bruce—has recently been added to and enlarged. The original design was very simple in its lines and boldly treated, as befitted a warehouse. It has a basement of rusticated stone with red brick for the walling over; there is no attempt at a cornice, but the original upper story is treated with a range of small windows divided by stumpy and bulbous polished granite columns, and the only projecting feature is a stone hood to the entrance. One cannot label the building as belonging to any special style of design; but, if anything, it is permeated by a slight feeling for the Romanesque. To this satisfactory front an upper story has recently been added, and here again the difficulties of such an addition are apparent. The original design was complete in itself, and it is hard to imagine any treatment that would not have detracted from the composition; as it is, it cannot be said that the upper story with its large semicircular arches is satisfactory. The extension on the Wynyard-square side is merely a repetition of the previous treatment and hence presents no difficulty; but the architect, Mr. Jeafferson Jackson, is certainly to be complimented on the artistic way in which he has incorporated the water tanks necessary for the supply of an installation of sprinklers throughout the interior. This takes the form of a small square tower with a tiled roof, and the perky way in which it stands up above the surrounding buildings is distinctly pleasing as well as amusing.

Passing along York-street, devoted to soft goods (*Anglice*, "Manchester") warehouses, one or two new ones are worthy of notice. The most elaborate is a block on the site of the old Skating Rink, and now being erected for a Melbourne capitalist. It is still incomplete, as one or two stories have yet to be added, but the fronts so far show an ample provision for light, which is one of the chief essentials for buildings of this class. The detail is Italian of somewhat ordinary character, very much moulded and carved, and we should imagine very much too fine in detail for the class of building intended, but it is hardly fair to criticise these buildings in their present incomplete condition. On the opposite side of the way is a very simple brick and stone warehouse for

Messrs. Inglis & Co., which has a distinctly warehouse look about it, and is yet artistic at the same time. It is six stories in height, and is divided by strings or cornices into three separate portions of two stories each. The chief defect is the equal division of the front, but this is somewhat neutralised by the two upper groups approximating in design, while the lower group is differentiated by the use of dark bricks with stone dressings to the windows. On the ground floor they consist of wide openings with strong segmental arches and pairs of windows over, all the arches being rounded. In the middle division red bricks are adopted with a few dark brick bands, and windows of ordinary size are spanned by segmental arches. In the upper group the centre is recessed 9 in., and red bricks only are employed. The general effect is fairly satisfactory, though for a warehouse of its type a somewhat bolder treatment of the window spaces would, we think, have been preferable. Adjoining is a long range of red brick stores for Lassetter & Co., in which a bolder treatment has been adopted, but it is unfortunately bald, mere utility evidently being the aim, so that the architect had probably no scope.

In this quarter of the city several other warehouses have recently been erected, but none of them call for any particular notice except one in Sussex-street occupied by Messrs. Yates & Co., the seed merchants, which in our opinion is far away the most artistic in the city. It has been built two or three years, and being in a very dirty quarter is already much discoloured. The frontage is a comparatively narrow one, and a large amount of light is essential, as the building is deep. This has been obtained by carrying up an arched recess nearly the whole height of the building, filled with windows, whilst solidity of effect is secured by the broad solid pier at the side, in which are single windows. The frieze-like treatment of the upper story binds the whole composition together, and the parapet of bricks in a diaper pattern carries out the general surface treatment of the front. The most noticeable feature of the latter is, however, the bands of light greenish grey tiles let into the brickwork, giving a distinctive character to the building. A further point for commendation is the honest treatment of the steel girders which carry the floors on the different stories over the windows, as they are boldly shown, and the bolts treated with ornamental washers. The whole of the upper part of the building is thoroughly satisfactory, but when we come to the ground story the composition is ruined by the hideously ugly wooden verandah, which a paternal City Council forces on every citizen who wants to make use of the footpath for the purpose of sheltering a shop window. This subject of street verandahs is a very difficult one. At one time any one could put up a design to suit his own building so long as it met with the approval of the City Architect. The majority under these circumstances were, of course, as cheap and commonplace as they could well be, but, on the other hand, some really good and well-designed verandahs were erected. For some years, however, the City Council has insisted on a settled design being followed, and being official it is necessarily common-place, and has to be

applied indiscriminately to all kinds of buildings. It is to be hoped that the new City Council will repeal this obnoxious by-law, and, while insisting on stability, will allow the architects of the city a free hand.

During the last two or three years quite a number of city buildings is the large number of hotels which have been re-erected, owing to the vigilance of the Licensing Authorities. Most of these are of commonplace character, but in some of them, while a simple design has been adopted, a certain amount of artistic effect has been secured by the disposition of the windows and the use of grey and red bricks in different portions of the front. Two occur to us at the moment, namely, at Church Hill and Oxford streets, in which not only simplicity, but fair treatment have been combined. No doubt there are many others worthy of notice. One, however, of very marked original character is to be seen opposite the Town Hall, and, together with a row of six shops adjoining, forms a group embodying several novel characteristics. The buildings are only three stories in height, one of which, the ground story, is completely hidden by one of the obnoxious City Council verandahs, though some little attempt appears to have been made in the columns to improve the design. The shop block is treated with recessed arches, the height of the two stories, containing windows the full width divided by stone mullions. The large tympana over the upper range of windows and the wall space between the upper and lower windows have been covered with majolica tiling. This is the first example we have noticed of the bold use of coloured tiles on the exterior of a building in Sydney, and the effect would have been very satisfactory if the colours of the lower band had been more harmonious with the tiles in the tympana. They are said to be the work of a celebrated London firm of potters. The hotel at the corner, instead of recessed arches, has projecting mullioned bay windows, but the wall spaces above and below are treated with well-modelled shields and other ornamental features in relief. A high parapet crowns the whole composition, and the division between the properties is only accentuated by short terminals.

To make up for the activity of the brewers the Church has not been idle, for the fine Roman Catholic Cathedral has during the last year or two been advanced one stage further towards its final completion. The recent work has consisted of the completion of the transepts, the pinnacled central tower, and of two bays of the nave, which, together with the completed choir, give the observer a fairly good general idea of what the building will eventually be like. The Cathedral possesses the inestimable advantage of a magnificent site, the finest in the city. It is on the highest ridge of ground, and is surrounded on all sides by open spaces, mostly park lands or reserves, so that it has no building to compete with it, and besides possesses the added advantage of trees and foliage as a background. The view from the ecclesiastical south-east, passing out of the gates of the Domain, is really fine, and reminds one rather of an old world edifice with its picturesque surroundings than of one in a new and bustling city in the Southern Hemisphere which, fifty years ago, was but little better than a small country town. The

original designs were prepared many years by the late highly-esteemed architect, Mr. W. W. Wardell, and, considering the disabilities of practice in these Colonies, they are a credit to his memory. The detail throughout is good and pure, though lacking the grace which belongs to the work of the acknowledged modern English masters of cathedral architecture, such as Street, Bodley, and Pearson. The general lines of the building, so far as they at present show, are English, as is also most of the detail. The broad and imposing transept, with its three entrances facing Hyde Park, is, however, rather Continental, and forms now, as it also probably will in the future, the principal entrance to the building. Adjoining this transept on the left is a chapel of two bays projecting beyond the choir aisle, but with no visible roof, a feature that is decidedly wanted to harmonise with the rest of the design. We understand that when the building is completed it is to have two western towers and spires, and that the nave will only be six bays in length, the same as the choir. If this is the case, the present satisfactory proportions will, we fear, be altogether spoiled, and we cannot help thinking that with such a short-naved building as this must be it would be far better to omit the western towers and carry up a central spire instead. Of course, it is a question whether the central tower piers would be strong enough to carry the superincumbent weight; but even if it is impossible to build a stone spire on the supports, one of wood covered with copper or lead would be preferable, or even none at all, rather than crowd the design and upset the balance of the composition by introducing unnecessary and undesirable features.

We cannot close this article without referring to the Federal Commemoration recently held in this city, for although the decorations were, of course, only temporary, they were in the main so good and so well thought out, that they deserve more than passing notice. The work was largely in the hands of Mr. Vernon, the Government Architect, who had the advantage of being present at the Jubilee of 1897 in London, and even took part therein as the officer in command of the New South Wales Lancers. The Venetian masts and interlaced festoons of St. James-square were reproduced in Martin's-place, and each street or section of a street was treated as a unit in the general design. Some of the sections were handed over to different nationalities, as the American, French, and German; and in these the national emblems of each predominated. A noticeable feature of the general street decorations was the use made of bright copper shields or discs on the Venetian poles, and also the rich stamped copper bands thereon, which formed the point of junction of flags and bunting. Many arches were also erected, viz., the Coal, Wool, Wheat, French, American, Melbourne, Commonwealth, German, and South Seas arches. The Commonwealth was an imitation of a Roman triumphal arch in fibrous plaster, enriched with paintings by local artists and large bronzed panels. The Melbourne was mostly of greenery and bunting, the American of wood, plaster, greenery, and bunting, and so on. The South Sea arch, by Mr. Vernon, was not an arch, but a pillared structure with a wide central opening and

entablature over, and perhaps the most artistic of any. The other arches were mostly the work of local architects. But the most novel feature was the treatment of Queen-square, with its many pillars and festoons, and the best the domed pavilion in the Centennial Park, in which the swearing-in ceremony took place. It is proposed to reproduce it in marble as a permanent memorial. The landing pavilion, a slighter structure on the shores of Farm Cove, was also very effective. But best of all was the street and park illumination at night, which for a week turned a comparatively dull and prosaic city into a fairyland of light and colour, and filled its streets with one of the most pleased and orderly crowds it has ever been our lot to see. Such a display cannot but have a good effect on the people at large, and awaken the latent artistic feeling of the masses to a perception of what Sydney might in some measure be made.

THE LATE MR. J. M. BRYDON.

THE sudden death of Mr. Brydon has been painfully felt in the architectural world of London, where he was known to many personally, as well as to every one by name. It is doubly sad that both the architects for the two great new blocks of Government offices should have died before the actual commencement of their buildings, just when each had attained, and might have hoped to enjoy, one of the greatest prizes of the profession. It seems only the other day that the two successful architects were celebrating their good fortune in a congenial manner by a joint dinner to their professional brethren; and now both are gone, and their work left to be carried out by other hands.

Mr. Brydon's success in his profession was a tolerably rapid one, for it can hardly be said to have commenced before the occasion of the Chelsea Vestry Hall competition in 1885. His design which was accepted on that occasion was evidently the outcome of a very careful study of the details and character of late English Renaissance; we should have been disposed to think that the church of St. Martin-in-the-Fields had largely influenced the design. The style of the building which Mr. Brydon produced on these lines was exactly suited to the *genius loci* of Chelsea, a fact which may have partly led to its selection; but it must have been also remarked that it showed a complete acquaintance with the character of detail of that school of English architecture. Whether this reproduction of the style of a past century is the object to be aimed at in a new building is of course a question—perhaps more than a question; the point to be noted is that Mr. Brydon did it thoroughly well, and established himself from that time as a Classic architect of training and knowledge. The lesson to young architects is that such complete study and comprehension of a special style is what often leads to the first step in professional success; but it must be complete. An architect may choose to strive for success by picturesqueness and originality of treatment, in which correctness of precedent is of no consequence, and so long as his picturesqueness is based on good planning, we should perhaps feel more sympathy with that kind of success than with the success of architecture founded on

precedent. But there is something to be said for precedent, especially when learnedly studied, and in this respect Mr. Brydon's Chelsea Vestry Hall was beyond criticism. He had caught the very spirit of the thing, and not merely some of its salient forms.

Hence it was a most natural and fitting sequel that he should have been employed so largely in erecting new buildings and enlarging and altering old ones at Bath, pre-eminently the home of English eighteenth-century architecture. The selection was generally approved, and the result fully justified it. Mr. Brydon's buildings at Bath are entirely in harmony with the Bath architecture to which Wood had given the tone; and this was a case in which anything other than this would have been entirely out of place. Bath is a city so peculiarly specialised in its architectural unity, largely the result of one man's influence, that it would have been a serious mistake to have obtruded into it prominent public buildings in a style out of harmony with the existing public and street architecture of the city. It was fortunate, therefore, that this work got placed in the hands of the architect who probably, better than any one else in England, understood that particular phase of English Classic.

Mr. Brydon had however carefully studied Italian as well as English Renaissance, and his studies in this field showed their result in his treatment of the Roman bath at Bath, in which he kept as carefully the character of Roman detail. Mr. Brydon was also exceedingly successful, in an artistic sense, in some competition designs in which he was not the selected architect. Among these may be mentioned his design for the West Ham Technical Institute, with its dome based more or less on the Radcliffe, and that for the Edinburgh Municipal Buildings, in which the lofty front towards Prince's-street was treated with much power. Some buildings on a smaller scale are interesting as showing suitable and characteristic treatment of a less ambitious kind; among them the Village Hall at Forest-row, a very pretty piece of rural architecture, and the residential chambers in Chenies-street, which, as a treatment of a plain and unpretending building, is one of the best and most suitable pieces of modern street architecture in London.

Mr. Brydon's design for the great building for the Government offices in Great George-street was, we confess, to some extent a disappointment to us; it has an excellent plan, and a fine feature in the circular internal court, but the general design of the exterior is rather correct than striking or impressive. Perhaps it may be said that this represents the nature of Mr. Brydon's talent as an architect; he was not an architectural genius, but a painstaking student who, if he adopted this or that school of architecture as a model, made himself thoroughly acquainted with it, and could be depended upon to treat it in an adequate manner. It was this conviction as to his thorough knowledge of Classic which no doubt led to the general feeling in his favour, on the part of his professional friends, in connexion with the Government Office Commission. In regard to this we may be excused, under the circumstances, for divulging a little incident which is not properly public property. The Government, as will be remembered, had asked the Institute to recommend eight architects who were especially competent in Classic design, from

among whom they would select their architects. There was a ballot in the Council of the Institute for the selection of these names, each member writing down on a piece of paper the names of the eight whom he preferred. When the papers were opened and read, the lists were very various, and Mr. Brydon's name was the only one which was included in all of them. He got on his feet and in a few words, spoken with a good deal of feeling, said that whether he became architect to the Government Offices or not, he should always remember with pride and pleasure the way in which his brethren had voted for him.

Mr. Brydon will be very much missed at the Institute of Architects, where he was an active and energetic member of the Council, taking the greatest interest especially in artistic questions, in regard to which he may be said to have represented enthusiasm guided and tempered by common sense. He made many useful suggestions in discussions on architectural and artistic subjects, and always seemed to see the real point of the matter in hand. In addition to this he was a man generally liked personally, for his pleasant and genial manner, and he leaves a gap in the ranks of the Institute which will not be easily filled.

NOTES.

Liverpool
Cathedral.

The *Liverpool Mercury* of May 28 publishes an interesting and able memorandum drawn up by Mr. George Bradbury, architect, and an ex-President of the Liverpool Architectural Society, on the subject of the three sites now in question for the Liverpool Cathedral, viz.: the site of the present St. Luke's Church; what is called the "Monument" site, in the wide space up London-road, in the centre of which a monument of no great importance now stands; and the St. James's Mount site, adjoining the St. James's cemetery. The St. Luke's site he dismisses because it would be too small for a cathedral without the purchase of six houses near the site; it would be too noisy; and he does not think that public opinion would sanction the destruction of St. Luke's Church. He says, and with this we quite agree, that "as a whole, this church has a fine architectural effect, and on that ground it would be a great pity to have it removed." The other objection which we mentioned—that the cathedral would be only partially seen up Bold-street (the Bond-street of Liverpool), just a corner of it appearing, instead of being central with the street, Mr. Bradbury seems to have overlooked; but it is a very important one in regard to architectural effect. The Monument site he considers also too noisy, an electric tram route running past it, and that property of some value would have to be acquired to extend it sufficiently.

"With regard to the architectural effect, it could be seen on three sides, and would have a very imposing appearance; but owing to the large amount of very small property with which it would be surrounded, it is doubtful whether the weekday or Sunday services conducted in that district would be largely attended by those who are able to support cathedral services."

In regard to this we may observe that the presence of small houses close to the great cathedrals in France is not considered any bar to their usefulness. Of course, if people want to regard a cathedral merely as a place of fashionable resort, it must be in a

fashionable quarter; but that seems a rather vulgar and not very religious view of the matter. The St. James's Mount site is large enough, and presents the advantage of a probable rock foundation not far below the surface; but those who know Liverpool well will probably agree with us that in an architectural sense it is a rather obscure and out-of-the-way site. We are still of opinion that, seeing that Liverpool has let slip the fine site originally proposed near St. George's Hall and the Free Library group, the Monument site, if liberally treated, affords the finest opportunity.

FROM a long communication by the Antiquities of Knossos. Mr. Arthur Evans to the *Times* of Tuesday, it seems that the discoveries amid the ruins of the palace at Knossos bid fair to be among the most sensational ever made by modern explorers. It appears now probable that the palace at Knossos was a small town in itself, with a considerable population of slaves and artisans. The materials used by the artists in their work have been discovered in some of the rooms unearthed; and a great amphora of a veined marble-like stone was found, with carved reliefs on it, and side by side with it a similar but smaller vase only roughed out. A more remarkable discovery was what Mr. Evans takes to be the royal draughtboard, with a framework of ivory, the surface of the board formed with a kind of mosaic of ivory, partly coated with gold, and with crystal plaques backed with silver and with blue enamel; one end of the board is decorated with medallions, and the whole enclosed in a frame of marguerites in relief, of ivory and crystal. But the most startling discovery, to our thinking, was that of a signet-ring impression showing a creature with a calf's head and hoofs and the legs of a man, seated on a kind of throne. Considering the legend of the Minotaur, this is a most extraordinary discovery, and points at all events to some contemporary belief in such a creature. Mr. Evans states that the extent of the ruins appears to be much greater than was at first supposed; so we do not know what more may yet come to light.

Wireless Telegraphy. The paper on "Syntonic Wireless Telegraphy," read by Mr. Marconi to the Society of Arts, was of the greatest interest to electricians, and marks an epoch in the development of space telegraphy. Mr. Marconi has practically abandoned his earlier system of untuned vibrations. The receivers he now uses will only respond to waves of definite wave lengths, and hence in one station we can have several instruments receiving messages from different transmitters at the same time. By this method it would be possible for a ship in a British fleet to signal to any other one without at the same time ringing up the instruments on board all the other ships, as it does at present. Mr. Marconi thinks that the days of untuned telegraphy are numbered. Apparently very little has been done as yet in the direction of guiding Hertzian waves in particular directions. The waves now spread out from the transmitting station in all directions, as light does from a beacon fire on the top of a hill, and hence the energy available in the waves at considerable distances from the source

must be excessively attenuated. Attempts have been made to apply the principle of the heliograph or the telescope to these rays, but the metal reflectors and the sulphur and other lenses used, although they are successful in the laboratory, are very little use for considerable distances. As Dr. Fleming stated, the question of the monopoly of the ether by the General Post Office will soon have to be decided, and perhaps in the future companies will have to register particular frequencies of vibration for their apparatus just as now they have to register telegraph addresses.

A REPORT to the Local Government Board by Dr. S. Monckton Copeman, on the sanitary circumstances and administration of the Borough of Boston, shows that this ancient town is in a very unsatisfactory state in regard to drainage. It appears that the sewage of the more central and oldest part of the town is taken by an ancient sewer called the Barditch, once open, now mostly covered. The whole of the sewage discharged into the Barditch passes from south to north, and is discharged into the river at a point just below the Grand Sluice, whence it has to flow back along the river throughout the whole length of the town, passing in its course all the houses and other buildings on the river bank. The head of water in the river at high tides is utilised for the flushing of a portion of the Barditch, the possibility of obtaining this periodical flushing having apparently been the reason for arranging that the flow of sewage should take place in the reverse direction to that which would appear most desirable. Three systems of sluice gates have been laid down, one at the head of the sewer, protected by a stout iron grating to prevent the entrance of solid floating bodies, a second at a point where the ditch passes close to the Market Place, and a third about 50 yards distant from its outfall.

"I was informed by the Dykereeve that on an average the water in the river was sufficiently high to be turned into the head of the sewer nine times a fortnight, though it would appear that actual flushing of the Barditch is not carried out as frequently as this. The method of performing the operation is to close the Market Place sluice, and open that at the sewer head, by which the upper portion of the sewer, forming roughly about half its length, is more or less filled with the river water. When such an amount of water as is considered sufficient has been admitted, the sluice at the sewer head is closed. The water that has been taken in, together with the contents of the sewer, is of necessity now held up until on the ebb the river has fallen sufficiently to render discharge from the outfall of the Barditch possible. The tide having fallen sufficiently, the two lower sluices are opened, when the lower half of the sewer is flushed out by the discharge of the water which had previously been penned up above the middle sluice. From the description given, it will be seen that for a considerable portion of each twelve hours the contents of the Barditch remain stagnant, and, as during these periods it is nevertheless receiving continuous additions of sewage matter through the contributory drains which join it at frequent points throughout its course, the pressure within it must be considerable at times, more especially as throughout its whole length no provision has been made for ventilation. . . . The smell when the manholes were unsealed was foul, particularly when the sluice at the sewer head was opened."

The other principal drain, the Bargate drain, is of somewhat the same character, with sluice gates, and is said to be extremely offensive in hot weather. According to the Report the great obstacle to amending the

condition of this drain is that joint action on the part of both Boston and Skirbeck is necessary if any useful result is to be obtained; but the two have never united in formulating and executing an adequate sewerage scheme.

DR. REECE'S Report to the Insanitary Devonshire Local Government Board on the sanitary circumstances of, and administration in the Northam Urban District, Devonshire, tells the common and often repeated story of inadequate scavenging and polluted water. The water supply of the district for the greater part is derived from shallow wells. Some of these are only a few feet deep, mere holes excavated in the shillet; others have dry-steined walls, made of large-sized water-worn pebbles, apparently derived from the beach. For the most part these are to be seen at Appledore. From some wells the water is raised by means of a pump, or occasionally by any improvised arrangement, such as, e.g., an old meat tin lowered by a string. Many of these wells are so placed as to be liable to serious pollution. For instance, in a court at Appledore, a pebble-steined well was observed a few yards below certain privies and refuse tips.

"At a conference which I had with the then Sanitary Authority of Northam after my inspection in 1894, I urged the necessity of providing an adequate supply of wholesome water for each household in the district. And subsequently from time to time the Board wrote to the Sanitary Authority and their successors, the Urban District Council, inquiring what steps had been taken to provide a water supply for the district. The usual reply to such inquiries was to the effect that the matter was receiving consideration."

In regard to excrement disposal, there are a certain number of water-closets in Appledore. In the better-class houses these are placed inside the dwelling and are usually flushed with water from a rain-water tank, when this supply fails, hand-flushing is resorted to. Many of the houses are unprovided with water-closets or privy accommodation of any kind. Inquiries instituted at such houses revealed the fact that in some cases commodes were kept in the bedrooms, and that the contents of such were emptied on the beach at irregular intervals. In other instances people appear ordinarily to "use the beach," or in the event of the tide being up, or the weather bad, any other spot convenient for the purpose.

A FACULTY has been granted St. Andrew-by-the-Wardrobe Church, Queen Victoria-street, London, after Dr. Tristram, K.C., Chancellor of the Diocese, had inspected the church and churchyard, for laying out the steep incline of the burial ground on the southern side in terraces, and for lowering the height of the blank wall in order to replace it with a dwarf wall and a light ornamental railing, at an estimated cost of 450/., whereof all (10/ excepted) has been raised by the sale of a plot of ground belonging to the parish. The high wall was erected at the construction by the late Metropolitan Board of Works of Queen Victoria-street, which was completed in October, 1871. A portion of the graveyard was taken for the new thoroughfare. The church had been rebuilt upon a confined site at St. Andrew's (formerly Puddle Dock) Hill, after the Great Fire, of red brick with stone

dressings, by Wren, and finished in 1692, at a cost of 7,060/ 17s. for the united parishes of St. Andrew-by-the-Wardrobe and St. Ann, Blackfriars. The church, originally known as that of St. Andrew-juxta-Baynard's Castle, derived its later style from its proximity to the office and repository of the Master of the King's Wardrobe and store for the Sovereign's robes of state, established in a house built in Blackfriars by Sir John Beauchamp, K.G., a son of Guido, Earl of Warwick, whose heirs had sold the house to Edward III. Shakespeare cites the Wardrobe in his will. A MS. book of accounts preserved in the Harleian collection seems to show that the King occasionally sojourned there, and Richard III. sometimes held his Courts in the Wardrobe. Whilst presenting no very striking architectural features it has a pleasing interior, and the wreaths along the middle line of the panelled ceiling are beautifully carved. The portrait bust on the monument to the Rev. William Romaine (*obit* 1795) is by John Bacon the elder. The similar pyramidal monument to the Rev. William Goode is by John Bacon the younger.

Two artists, Mr. James J. Guthrie and Mr. Andreas D. Carse, have a small exhibition of work held at 4, Bloomsbury-square W.C.

We have seen Mr. Guthrie's black and white drawings in illustrated periodicals and it is interesting to see the original drawings of an artist with such strong individuality. The methods of these two artists are somewhat unusual, Mr. Guthrie using Chinese white on black paper and Mr. Carse making a number of little pictures on gesso, either black or coloured and worked with brush and knife. Mr. Carse's scene from "Paradise Lost" is fine drawing, it has the softness of charcoal and the richness of a pen drawing without the hardness of the latter; the method is one that lends itself to atmospheric effects and to a quality of largeness or breadth that gives these little panels a mark of permanency that is most unusual in this class of work. Very different are the designs of the same artist for the decorative treatment of interiors, which, when they miss being common-place, defy the canons of taste and design, proportion and form being forgotten for pretty colours and scraps of design. The best of Mr. Guthrie's drawings are perhaps the pair entitled "Morning Star" and "Morning," and his book plates are interesting in design and drawing, being, as they should be, rather beautiful badges than intricate pictures.

ARCHITECTURE AT THE ROYAL ACADEMY.—III.

CONTINUING the subject of designs which may be included under the class of public buildings or buildings for business purposes, we next come on a fine water-colour drawing showing Messrs. Henman & Cooper's "Royal Victoria Hospital, Belfast" (1,505), unfortunately without a plan, a matter all-important in this class of building. All we can say therefore is that the architects have succeeded in producing a bold effect of grouping with the wards of this hospital, but that is not what a hospital ought to be built for, and it is really absurd that a mere picture like this, of a building for a practical purpose, should be hung at all; it is not illustrating architecture. A triumphal arch, or even a church, may be considered as a piece of architectural grouping only, a hospital ought not to be; and if the subject were rightly understood at the Academy, drawings of either

dwelling-houses, hospitals, or schools, ought to be rejected if unaccompanied by a plan, as they certainly would be at Paris. We have harped on this string over and over again, but it seems useless; the architectural room at the Academy is obviously regarded, both by Academicians and by the majority of exhibitors, as an occasion for producing pretty pictures of buildings, in water-colour or in black and white: and that is not architecture.

Mr. W. Campbell Jones's "Parish Hall, St. Gabriels, Warwick-square" (1,504), is a very meritorious building of a simple and unpretending character. The double entrance doors, separated by a buttress over which is a niche with a statue, form a pretty incident in a building which is otherwise quite plain, but suitable for its purpose and position. Messrs. Briggs & Wolstenholme's "Blackburn Police Court and Sessions House" (1,602) shows no plan; it is a boldly-treated building with pavilions at each end crowned by cupolas, and a recessed wall with an order between. Messrs. Woodhouse & Willoughby also exhibit a perspective view (without plan) for the same building; either one or both of these is of course a competition drawing only, and ought to be so described in the catalogue; it does not seem quite straightforward for architects to exhibit a mere competition design with a title worded as if it were an actual building. This design is a weak and flat treatment of Classic features, which has not much to recommend it. Mr. Coates Carter's exhibit, No. 1,605, is honestly labelled "Design for a Public Building in a Hot Climate"; it has a good deal of merit; its special character lies mainly in the fact that the actual walls are entirely screened by an open arcade in the ground story and a columned loggia in the upper story; there is a certain appropriate suggestion of Oriental character in the detail, and the general effect is picturesque; but here again, no plan. Mr. Mountford's "New Premises in Cowcross-street" (1,610) is essentially a piece of street architecture—a treatment of a front wall, and therefore does not so much require a plan. As street architecture it is effective, but the pedimented windows in the first-floor story are surely rather heavy in mouldings and detail. The upper story is treated with small square windows with sculpture between, the whole forming a kind of frieze.

Messrs. Silcock & Reay's "British School, Trowbridge, Wilts" (1,614) shows a plan—hung too high to be well seen—and a boldly-treated brick building with stone dressings, with a small stone cupola forming a sky-line feature at each end of the façade; these may do to hang bells in, at all events there is that excuse for them. The large hall forms the central block, with a rather low-pitched roof over it; the classrooms, with their large windows, form a feature at the sides; the whole grouping grows out of the plan, and the character of the architecture is in keeping with the purpose of the building. Messrs. Pite & Balfour's premiated design (third premiated, more correctly) for the "Cartwright Memorial Hall" (1,618) is a severe Classic elevation drawn in very thick black lines; circular-headed windows between coupled columns on the ground story, an expanse of unbroken masonry above (where the picture gallery would come we presume); this is a broad and effective treatment arising out of the nature of the building: no plan. Mr. Ponting's "New Town Hall, Marlborough" (1,618: no plan), is on the type of the old-fashioned rectangular building doing duty as a town hall in so many small towns; it is mainly a red brick building with the upper portion of the walls treated in white cemented or plastered panels, and large mullioned windows. A stone *froulon* with a large balcony on massive cantilevers forms a feature at the entrance end; this portion is rather wanting in simplicity and does not harmonise with the rest. Mr. Tilmann's "Eastern District Hospital, Glasgow" (1,626) is shown in a drawing by Mr. Raffles-Dawson, with a block-plan added; it is in a rather peculiar style, the first-floor windows being partially Gothic in character, but with the small cornice characteristic of eighteenth-century buildings inserted both over the window and over the centre transom; there are largely boldly-spaced round arched windows in the ground story, while in the second-floor story there is a more Classic treatment with pilasters which spring from corbels under the string-course level; this

portion is rather out of keeping with the rest; too much emphasised in comparison with the plain nearly flat treatment of the lower portion.

There has been a good deal of discussion lately at Southampton as to what is to be done with the old Bargate, which as things are at present certainly merits its name as being a bar to traffic, for all the wheeled traffic at present has to pass under the not very wide central arch of the gate. Some vandals in Southampton have even wished to pull it down; but we hope nothing so stupid will be done. Mr. R. M. D. Lucas, an architect practising in Southampton, exhibits his scheme (1,635) for reconciling the demands of traffic with the preservation of the gate. He shows both plan and elevations. The central archway is reserved for tramway traffic; the present side arches are for other wheeled traffic, and, as we make out from the plan and elevations, two new arches are proposed for foot traffic, partly through existing property adjoining the arch, and which are to be treated in a manner to harmonise with the ancient structure. The scheme seems a good one, and ought to have attention.

Mr. E. P. Warren's "Bedales School, Petersfield" (1,632) is shown in a rather roughly-drawn pencil perspective, with a small plan in the corner. It is a quadrangle plan—the most picturesque but not the most healthy plan for a school, with a cloister round two sides of the quad; the architecture is, evidently with purpose, the simplest possible, with rectangular windows with small panes; a large oriel, which appropriately marks the end of the hall, is the only feature that can be called architectural in the usual sense of the word. The general effect is that of a simple, quiet and home-like school. A large and important drawing is that exhibited by Mr. Clyde Young of the John-street front of the Glasgow Municipal Buildings (1,638); it does not represent any new work, but is only a new view, and is a very fine drawing giving the greatest possible effect to one portion of that solid and dignified Classic structure on which the late Mr. Young's reputation was mainly founded. Mr. Gibson's "Walsall Town Hall" (1,639) was illustrated in our issue of October 13, 1900, to which we may refer the reader. A small and not very conspicuous elevation and plan of a "New Bank at Leicester" (1,650), by Messrs. Everard & Pick, shows a good and bold Classic design, with pavilions crowned with gracefully designed cupolas at each side of the façade, the lower part of these pavilions or towers treated in almost plain rusticated masonry. Between them, on the upper stage of the design, is an order in coupled columns. The large banking-room fills the whole central area of the plan, with (apparently) a domed ceiling, which however is not treated as a dome externally. There is a boldness and simplicity of conception about this design which is very pleasing; it is of more architectural importance than some much more showy drawings.

Mr. Keen's "Baptist Church House, Southampton-row" (1,658), has a generally picturesque effect, but is somewhat confused in treatment, it wants simplifying and pulling together; the treatment of the angle is the best feature in it; the employment of a strongly-marked rustification in the upper portion of the design, against plain surfaces in the lower portion, seems rather an inversion of the proper order of things.

Mr. J. Oldrid Scott's design for the new front to Spring-gardens for Messrs. Cocks & Bidulph's bank (1,686) is rather weak in the treatment of the ground story; the projecting wings at each end, crowned with broken pediments have a good and rather bold effect, and the whole looks like a bank. That is just what Messrs. Lockwood & Son's "New Bank Buildings, Chester" (1,690) does not look like; it looks very like a bit of ancient Chester Rows architecture, which we presume is the intention; but this kind of picturesque timber building can never be accepted as properly representative of a bank, which should always have a fortress-like look of solidity about it at all events in the bank story. Among other things that may be mentioned in the class of designs we are now considering are Mr. Atkin Berry's "Offices, Moorgate-street" (1,633), a pretty bit of Gothic street architecture shown in a pretty water-colour drawing; Mr. R. G. Kirkby's "Design for Municipal Buildings, South Shields" (1,665), a nicely-grouped Classic

design (no plan); Messrs. Wimperis & Arber's "Empress Club, Dover-street" (1,677), which fulfils the ordinary ideal of club architecture, but certainly does not rise any higher than that; and Mr. Percy Adams's small pen-drawing of "Dorking Infirmary" (1,679; no plan), which is of interest as showing a certain picturesqueness of effect obtained from grouping of features, in an absolutely plain structure.

In domestic architecture there is nothing of the highest scale or importance, unless we are to regard Mr. Gordon's "Huntercombe Manor, Oxfordshire" (1,678: no plan), as a genuine commission; we must confess it looks rather to us like an imaginary house. If it is really a house to be carried out, the architect must have got hold of a millionaire client whose wealth is superior to his taste, for a more bumptious-looking mansion, and more at variance with what a gentleman's house ought to be, it would be difficult to imagine. The drawing is a fine and effective one.

Mr. Leonard Stokes's "New House, Ascot Heath" (1,528), shows both a plan and a compass (a rare attention in Academy drawings!), and a suitable aspect for the two principal sitting-rooms; but the cook will hardly thank him (in summer) for facing the kitchen south. The design is simplicity itself; materials apparently brick with cement or rough-cast panels, and one hipped roof over all. Mr. Champneys's "House at Heathfield" (1,558) is a pretty sketch; apparently a chapel forms part of the scheme, but there is no plan to explain. Mr. Ernest Newton's "Entrance Front of House at Chislehurst" (1,573) has a plan but no compass; the dining-room and drawing-room face the same way, the dining-room with an obtusely-pointed bay in two cantos, the drawing-room with a bay in four cantos, also coming to a point on the centre line of the room—thus in both instances there is a mullion in the middle of the window instead of a light. To plan windows this way may be amusing as a variation in architectural character, but it is certainly not an advantage in any other respect. Architecturally this is a plain brick house with no ornament but a chequer-work of brick and stone in the upper part of the porch turret, and three lozenges over the door, perhaps for crests. Mr. Newton's other two contributions are "Entrance Front, Steep Hill, Jersey" (1,577), and "Garden Front, Glebelands, Wokingham" (1,578). The former shows an interesting plan but no compass; the drawing-room and library face to the right of the plan, with a verandah between their projecting bays; the dining-room faces to the bottom of it. The exterior is apparently rough-cast; there is a picturesque treatment of one of the chimney-stacks to be noted. No. 1,578 shows no plan, and is a water-colour view of an E-shaped house of the old English domestic type, pleasant and homely.

Mr. Brierley's "Welburn Hall, Yorkshire" (1,576: no plan) was published in our issue of May 18, and we need not say more about it here. "Grimston Court" (1,586), by the same architect, shows a plan of the "irregular picturesque" type, which also characterises the architecture, but there is nothing in the plan to justify or explain the large battlemented mass which rises at the back of the perspective view and forms the most important element in the general effect. The aspects of the principal rooms are properly arranged. Whether it is good to have the servants' hall between the kitchen and the dining-room may be a question.

In Nos. 1,591, 1,596, and 1,597, Mr. C. J. Harold Cooper gives an interesting series of small illustrations of "A House near Piccadilly." The plans are shown to a good large scale, and are interesting as showing the manner in which a good deal of effect is got out of a confined site; the interiors of various rooms are shown in etchings by Mr. Slocombe, and look very well. This is an interesting and unusual exhibit, and might well have been hung lower. Mr. Stratton's "House on the Thames—River Front" (1,598) looks very like a river-side house. Mr. Belcher shows a large but sketchily-executed interior water-colour view of the "Salon, Château Mauricain, Wimereux" (1,599), which shows the usual features of a dignified Classic interior, with nothing special for remark, except that it appears, from the colouring, that the lower surfaces of the modillions in the cornice are gilt. Mr. T. H. Watson, in "Whitney Court Herefordshire" (1,601), shows both a view and a compass, from which we learn that drawing-room, dining-room, morning-room, and library,

THE BUILDER, JUNE 1, 1901

INK PHOTO, SPRAGUE & CO., L^Y, 4 & 5, EAST HARLING STREET, FETTER LANE, E.C.

DRAWING ROOM TO MANSION : SUFFOLK.—MR. A. N. PRENTICE, A.R.I.B.A., ARCHITECT.

A. N. Prentice, 1900.

are all lighted the same way, which cannot be right, unless considerations of prospect have entirely over-riden those of aspect. The connexion of kitchen and dining-room, though they are rather far apart, is well arranged.

Messrs. Mallovs & Crocock's "Terrace and Summer Houses, Dalham Hall" (1,625) is a good piece of garden architecture, showing a semicircular bay on columns projecting from the terrace wall, with a quadrant staircase leading up to it on each side, and a treillage arch behind. The balustrade of the terrace is treated as a small rusticated arcade in place of the usual balusters—a variety at all events. Mr. Arnold Mitchell's "House, Bowden Green" (1,631) is overdone with windows, and seems almost to stand on glass like a shop-front. The same architect's "Additions to Tissington Hall" (1,630) appeared in the *Builder* of May 18, so we need not further describe it. Messrs. Bedford & Kilson send a businesslike frame of plans and elevations of "St. Aidan's Vicarage, Leeds" (1,636), a plain red brick house without any special character—what one may call a sensible house, but the windows might have been treated so as to indicate the staircase. The difference of levels of ground is cleverly made use of in the planning. Messrs. Bateman & Bateman's "House at Barnet Green" (1,640) has some similarity to the one illustrated in the present issue; there is a nice point in the planning of the dining-room, hall, and drawing-room; the hall, with semi-octagon ends, is between the two, the three apartments being *en echelon*; the door-way opening into the lower end of dining-room being opposite to that opening into the upper end of drawing-room. The character of the house is very similar to that of the one we illustrate.

Mr. Bodley's "Hayes Lodge, Morley" (1,647), was illustrated in our issue of May 4. A plan and compass are given, but we must confess that their joint consideration does not lead to very satisfactory conclusions. Drawing-room, dining-room, smoking-room, hall, and boudoir, all face directly south, so that in hot summer weather there is not a sitting-room out of the sun; and the kitchen is at the furthest part of the house from the dining-room, and a circuitous route. If architects who are Academicians plan houses in this way, what is to be expected of outsiders?

Among other drawings which may be mentioned in the group of domestic architecture are Messrs. Cox & Silk's "Residence at St. Albans" (1,642), a pretty residence of which, oddly enough, only the bedroom plan is shown, which is of little use; Mr. Strong's "Design for Forby Golf Club House" (1,645), a low building with three wide segmental bays—very much what a golf club-house should be in architectural appearance—there is no plan; Mr. Ernest Emerson's "New Stables at Oakover" (1,667), which looks a picturesque building of its kind, but is hung too high to see the plan well; and Mr. Figgis's "House at Merstham" (1,675) and Mr. Atkin Berry's "House at Waringham" (1,674 and 1,682), all of them pretty little water-colour views of houses, very fitted for an album of "Rural Architecture," but not of any practical value to architects.

As far as illustrations of domestic architecture go in this year's Academy, they seem to indicate that the taste for the picturesque and irregular in house architecture is predominant, and that there is not much attempt at present at designing houses in a symmetrical manner and on the basis of a predominant idea in plan and architectural treatment.

COMPETITIONS.

MISSION CHURCH, MELTON CONSTABLE.—The plans most approved by the Committee on the recommendation of the assessor are those of Mr. George Fox, A.R.I.B.A., of 1, Southampton-row, Bloomsbury, to whom the work has been entrusted. *Proxime accessit*, Messrs. Godderidge, Witts, & Cleland, of Tamworth.

THE TRIBUNAL OF APPEAL UNDER THE LONDON BUILDING ACT.—The Council of the Royal Institute of British Architects have appointed Mr. Edw. A. Gruning to fill the seat on the Tribunal of Appeal left vacant by the death of Mr. Arthur Cates.

TUNBRIDGE WELLS OPERA HOUSE.—Building operations have been commenced for the Tunbridge Wells Opera House. The architect is Mr. J. P. Briggs, of London, and the contractor for the buildings is Mr. J. Jarvis.

REMOVAL OF SNOW IN LONDON.

THE recently issued annual Report of the Chairman of the Highways, Sewers, and Public Works Committee of the Borough of St. Pancras (Mr. Donald McGregor), contains some remarks as to the clearing away of snow in London, and the totally unreasonable demands made by the public on the vestry officials in respect of this, which merit a wider circulation. Mr. McGregor says:—

"A heavy fall of snow again demonstrated the enormous difficulty (and expense) attendant on its clearance. So much has been said on the subject that it is almost nauseating to answer the unreasonable demands that are always made, and criticism dealt out by persons who have no practical knowledge on the subject. Even if cost were no object, the difficulties would not be reduced thereby, as the number of men and carts available for the work is limited, and notwithstanding a large advance in the wages, there are never enough suitable workmen willing to place their services at the disposal of the Council's officers, and that feature of the case is rendered more difficult by the circumstance that the Legislature has relieved the occupiers of premises of the obligation to cleanse the footways in front. Formerly there used to be almost instantly at the disposal of the public a large army of itinerant workers sufficient for the purpose, but not of the quality that a public body could engage, or pay, and discharge in a summary way. In dealing with public work, many people seem to forget that every hand must be booked, timed, and paid in such a manner as will bear the scrutiny of auditors, and that branch alone absorbs the attention of a large portion of the staff of the department, to the prejudice of other duties they have ordinarily to perform.

It would be as reasonable to expect that a staff of supervisors could be instantly organised, as that an army kept on a peace footing could as quickly be expanded in less than a day to meet an outbreak of war, and, of course, it should be manifest that the Local Body has no power to retain 'reserves' to be called out for compulsory service on the visitation of a snow-fall.

It is true, as people say, that a heavy snow-fall throws thousands out of employment; but it is equally true that very few of those thousands ever offer themselves as scavengers, and the bulk of those who do and are taken on are not of the best class of labour, or who are amenable to the commonest discipline needful for the execution of the required work. Before quitting the subject, I cite one more illustration of the absurdities of the critics. One indignantly asked 'Why the sweeping-machines were not kept at work in double shifts night and day?' That inquirer was not aware of the fact that there is a limit to the number of horses, but yet more so the number of carmen obtainable, for though there may be some few—very few—carmen out of work, the masters know full well how difficult it is to get a supply of good carmen for ordinary work who can be trusted with their animals and other property. In such a case the suggestion to double the number of carmen shows how utterly ignorant the critics are of the inexorable logic of facts."

ARCHITECTURAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—The members of this Association visited Dunfermline recently, where they were enabled to inspect the old House of Pitreuchief, with its various old articles of furniture, pictures, &c. Mr. John Houston, architect, Dunfermline, acted as leader, and read descriptive accounts of the house and the picturesque glen in which it stands. The party then drove to Pitfirrane, where they were received by Sir Arthur Halkett, Bart., who gave an interesting account of the house, and recalled how it had been inhabited by the Halketts of Pitfirrane since 1437.

STREET IMPROVEMENT, SOUTHFOOT.—On the 17th ult., at the Town Hall, Southport, Mr. W. A. Ducat, an inspector to the Local Government Board, held an inquiry into an application by the Southport Town Council for sanction to borrow 15,500l. for the laying of wood blocks in Lord-street, and the widening of certain portions of the street. The Borough Surveyor, Mr. R. F. Hirst, stated that the extent of street to be paved was 1,400 yds. long and 45 ft. wide.

APPLICATIONS UNDER THE 1894 BUILDING ACT.

AT the meeting of the Building Act Committee of the London County Council held on May 20, being the day before the Council adjourned for the Whitsuntide recess, the proceedings were governed by the clause in the order of reference which empowers the Committee at certain seasons to act on behalf of the Council in relation to matters included in the order of reference. Those applications to which consent has been given are granted on certain conditions. Names of applicants are given in brackets. Buildings are new erections unless otherwise stated:—

Lines of Frontage.

Finsbury, East.—Rebuilding of the Star public-house, City-road, and Nos. 226 to 232, and 236 to 246, Old-street, St. Luke (even numbers only, inclusive) (Messrs. Clutton for Ecclesiastical Commissioners).—Consent.

Marylebone, West.—An iron and glass covered-way in front of No. 33, Hamilton-terrace, St. John's Wood (Mr. J. H. May for Mrs. E. Wilkinson).—Consent.

Brixton.—Six houses on the west side of Cowley-road, Brixton, between Nos. 50 and 76 (Mr. J. Fasnaecht for Mr. W. Goodwin).—Consent.

Hackney, South.—Buildings, with shops on the ground floor, on the site of Nos. 112 to 120 (even numbers only, inclusive), Lower Clapton-road, Hackney, at the corner of Laura-place (Mr. H. Riches for Messrs. W. H. Tilley & Co.).—Consent.

Hammersmith.—Two blocks of dwelling-houses on the west side of Wood-lane, Edgware-road, Shepherd's Bush, northward of No. 3, Wood-lane (Mr. T. Athey for Mr. H. Oliver).—Consent.

Hampstead.—An additional story on part of the entrance lodge to a house known as Belsize-court, Belsize-lane, Hampstead (Mr. A. F. Faulkner for Mr. J. S. Berghelm).—Consent.

Holborn.—Two oriel windows at the first, second, and third floor levels, in front of Nos. 108 and 110, High Holborn (Mr. W. C. Waymouth for Messrs. Cardinal & Harford).—Consent.

Kensington, North.—An iron and glass fernery on the balcony at the first-floor level in front of No. 19, Stanley-gardens, Notting Hill (Messrs. Hukins & Mayell for Mrs. Eddy).—Consent.

Lewisham.—Open porches at the entrances to Nos. 24 and 28, Leyland-road, Lee (Mr. E. Petters for Mr. R. B. A. Chambers).—Consent.

Norwood.—Five blocks of residential flats and a house, with a shop on the ground floor, on the east side of Knight's Hill-road, West Norwood, at the corner of Rothschild-street (Mr. H. Bushell for Mr. P. Stock).—Consent.

Poplar.—A projecting lamp at the Duke of Clarence public-house, No. 133, Grundy-street, Poplar, to overhang the public way of Greenfield-street (Mr. J. R. Johnston for Messrs. Taylor, Walker, & Co.).—Consent.

St. Pancras, West.—A porch, with a three-story enclosure to a staircase over, in front of a block of artisans' dwellings proposed to be erected on the north side of Cardington-street, Hampstead-road, St. Pancras (Mr. A. Whitlaw for the London and North-Western Railway Company).—Consent.

Strand.—Balconies, at the second and third floor levels, in front of a proposed building on the site of No. 46, Great Marlborough-street, St. James's (Messrs. W. Dunn and R. Watson for Mr. C. H. Smith).—Consent.

Wandsworth.—That the application of Mr. Perks, on behalf of Mr. R. Simpson, for an extension of the period within which the erection of houses, with one-story shops, on the site of The Hawthorns and grounds, on the west side of Balham High-road, Wandsworth, at the corner of Marius-road, was required to be completed, be granted.—Agreed.

Lewisham.—Four houses, with one-story shops in front, on part of the site of The Priory, High-street, Lewisham (Messrs. Norfolk & Prior for Mr. C. C. Story).—Refused.

Poplar.—A projecting lamp, to overhang the public way, in front of the Steam Packet beer-house, No. 1, Orchard-place, Blackwall, Poplar (Mr. I. R. Johnston for Messrs. Taylor, Walker, & Co.).—Refused.

Strand.—A projecting sign, to overhang the public way, in front of No. 19, Rupert-street, Shaftesbury-avenue, St. James's (Messrs. Nash & Hull for Mr. A. Pauley).—Refused.

Hampstead.—An iron and glass porch at the entrance to a house known as Kidderpore, Finchley-road, West Hampstead (Messrs. W. E. and F. Brown for Mr. G. A. Dunn).—Refused.

Clapham.—A wood and glass conservatory at the entrance to No. 8, Nightingale-gardens, West-side, Clapham Common, to abut upon Kyrle-road (Messrs. H. Wakeford & Sons for Mr. H. Leach).—Refused.

Lewisham.—Three houses, with shops on the ground floor, on the forecourt of No. 4, Belmont Hill, High-road, Lee (Messrs. Daniel Smith, Son, & Oakley for the Earl of St. Germans).—Refused.

Wandsworth.—A two-story addition in front of No. 35, Jews-row, Wandsworth (Mr. A. E. Nightingale for Mr. H. F. Bartle).—Refused.

St. George, Hanover-square.—An iron and glass shelter at the entrance to No. 15, Wilton-road, St. George, Hanover-square (Mr. W. A. Large for Mr. C. Gerli).—Refused.

Width of Way.

Wandsworth.—A boundary fence on the west side of a roadway skirting Putney Heath and leading northward out of Portsmouth-road, Putney (Mr. P. E. Pilditch).—Consent.

Chelsea.—A laboratory-house, greenhouse, and potting shed at the Physic Garden, Queen's-road West, Chelsea (Mr. E. G. Rivers for the Trustees of the Apothecaries' Company's Physic Garden).—Consent.

Southwark, West.—School buildings on the west side of Mansfield-street, Southwark, at the corner of Earl-street (Mr. A. J. Pilkington for the Managers of St. George the Martyr Schools).—Consent.

Whitechapel.—Two houses on the east side of Tenter-street East, Whitechapel (Messrs. N. & R. Davis).—Consent.

Hackney, North.—A factory building on the west side of Tyssen-street, Dalston-lane, Hackney, with a portion of the boundary fence at less than the prescribed distance from the respective centres of Tyssen-street and Tyssen-passage (Mr. E. O. Sachs for The Shannon, Limited).—Refused.

Rotherhithe.—A warehouse on the north side of Tanner-street, Bermondsey, at the corner of Finnimore-court and to extend over Rowland's-court (Mr. G. A. Hall for Mr. G. H. Hughes).—Refused.

Space at Rear.

Hammersmith.—A block of dwelling-houses on the west side of Wood-lane, Uxbridge-road, Shepherd's Bush, northward of No. 3, Wood-lane, with an irregular open space at the rear (Mr. T. Athey for Mr. H. Oliver).—Consent.

Lewisham.—A two-story dwelling-house on the east side of Farley-road, Lewisham, at the corner of Davenport-road, with an irregular open space at the rear (Mr. C. Farley).—Consent.

St. George, Hanover-square.—A deviation from the plans approved on July 31, 1899, under Section 41 (1) (a) of the Act, for the erection of a block of residential flats on the site of No. 25, Hanover-square, at the corner of George-street, St. George, Hanover-square, with an irregular open space at the rear, so far as relates to the erection of a small addition at the first-floor level at the rear of the premises (Messrs. C. Bell, Withers, & Meredith for Mr. G. H. Schofield).—Consent.

Whitechapel.—Three dwelling-houses, with shops on the ground floor, on the north side of Commercial-road, Whitechapel, at the corner of Church-lane, with irregular open spaces at the rear (Mr. H. O. Ellis for Mr. S. Kirstein).—Consent.

Waltham.—The reduction of the area of the open space at the rear of No. 92, New Kent-road, Waltham (Mr. A. S. Taylor for the Committee of the Murphy Memorial Hall).—Consent.

Holborn.—A block of residential flats on the site of Nos. 47, 48, and 49, Hunter-street, and No. 9, Handel-street, Brunswick-square, St. Pancras, with an irregular open space at the rear (Mr. J. Davis for Messrs. Brown Brothers).—Refused.

Kensington, South.—A block of residential flats, with business premises on the basement, ground and first floors, on the south-east side of Brompton-road, Kensington, at the corner of New-street, with an irregular open space at the rear (Mr. C. W. Stephens for Harrod's Stores, Limited).—Refused.

Width of Way and Line of Frontage.

Hackney, Central.—Additions on the east and west sides respectively of a church on the north side of Pembury-grove, Lower Clapton, with the forecourt fence at less than the prescribed distance from the centre of the street (Mr. J. W. Dunford for the Trustees of the United Methodist Free Church).—Consent.

Lines of Frontage and Space at Rear.

Hackney, North.—An addition at the rear of No. 90, Stamford-hill, Hackney, to abut upon Grove-lane (Mr. E. Bates for Messrs. Welford & Co).—Consent.

Battersea.—Seven houses on the west side of Winders-road, Battersea, between Battersea Dispensary and Simpson-street (Messrs. N. S. Joseph, Son, & Smith for Mrs. Simpson).—Consent.

Width of Way and Space at Rear.

Rotherhithe.—A medical officer's house at Southwharf, Rotherhithe, and the erection of two cottages on the east side of a private way out of the south side of Rotherhithe-street (Messrs. T. W. Aldwinckle & Son for the Metropolitan Asylums Board).—Consent.

Alteration of Building.

Hampstead.—A greenhouse on the east side of No. 2, Hampstead Hill-gardens, Rosslyn Hill, Hampstead, with a portion of such greenhouse within a ft. of the party-wall between such greenhouse and the garden at the rear of No. 12, Rosslyn Hill, without such party-wall being carried up as required by Section 59 (2) of the Act (Mr. F. J. Potter for Mr. R. G. Orr).—Consent.

Formation of Streets.

Leamsham.—That an order be issued to Messrs. Daniel Smith, Son, & Oakley, sanctioning the forma-

tion or laying out of a new street for carriage traffic out of the east side of Elliot Park, Blackheath, and in connexion therewith the widening of a portion of Elliot Park (Messrs. Kennard Brothers). That the name Oakcroft-road be approved for the new street.—Agreed.

Poplar.—A deviation from the plan sanctioned by the late Metropolitan Board of Works on June 3, 1881, for the formation of streets in continuation of Portree-street and Lee-place (now known as Lanrick-road), Poplar, so far as relates to the direction and extent of those streets (Mr. C. Dunch for Mr. J. Abbott).—Agreed.

Rotherhithe.—That the Council do make no order with respect to the application of Messrs. T. W. Aldwinckle & Son on behalf of the Metropolitan Asylums Board, for sanction to the formation of laying out of a street for carriage traffic to lead out of the south side of Rotherhithe-street, Rotherhithe, on a portion of South Wharf.—Agreed.

Poplar.—That an order be issued to Mr. H. Hooper, refusing to sanction the formation or laying out of a street for carriage traffic in continuation of Cahir-street, East Ferry-road, Millwall (for Lady Margaret Charteris).—Agreed.

Woolwich.—That an order be issued to Messrs. Farebrother, Ellis, & Co., refusing to sanction the formation or laying out of new streets for carriage traffic on the Bowater estate, Trinity-street, Woolwich-road, Woolwich (for the trustees of the Bowater estate).—Agreed.

Southwark, West.—That an order be issued to Messrs. Hubbard & Moore refusing to sanction the formation or laying out, for foot traffic only, of a street to lead out of the west side of Southwark Bridge-road, near Sumner-street (for Mr. H. Ward).—Agreed.

Buildings for the Supply of Electricity.

Woolwich.—An electricity generating station and works on the east side of White Hart-road, Plumstead-marshes (Mr. F. Sumner for the Council of the Metropolitan Borough of Woolwich).—Consent.

Means of Escape from top of High Buildings.

St. George, Hanover-square.—Means of escape in case of fire on the eighth story of a proposed block of residential flats to be known as No. 10, Park-lane, St. George, Hanover-square (Messrs. Rolfe & Matthews for Sandow's, Limited).—Consent.

Lines of Frontage and Construction.

Islington, West.—Retention of two wooden sign boards on the south-west side of Holloway-road, Islington, one on the site of the proposed Marlborough Theatre, and the other at the corner of Parkhurst-road (Mr. F. Matcham for Mr. F. W. Purcell).—Consent.

Strand.—Retention of a temporary stone landing with a wooden goods shoot under, at No. 71, Jermy-street, St. James's, to abut upon Bury-street (Mr. G. F. Harrington for Messrs. Standen & Co.).—Consent.

Width of Way and Construction.

Poplar.—An iron workshop on the west side of North-street, Poplar (Messrs. T. Evans & Son).—Refused.

Width of Way and Working-class Dwellings.

Lambeth, North.—That the Council's resolution of February 19, with respect to the erection of three blocks of dwelling-houses to be inhabited by persons of the working-classes on a site between Gloucester-street and Burdett-street, Lambeth, be modified, so that the time within which such dwelling-houses were required to be completed be extended to two years.—Agreed.

Conversion of Building.

Hampstead.—The conversion into dwelling-rooms of the first floor over the stables on the west and south sides of a yard out of the west side of Beisze-lane, Hampstead (Mr. F. Wilby for Mr. W. Burdett).—Refused.

Deviations from Certified Plan.

Holborn.—Deviations from the plans certified by the District Surveyor under Section 43 of the Act, so far as relates to the proposed erection of two houses (with shops on the ground floor) and a warehouse building on the site of Nos. 66 and 68, Theobald's-road, and No. 1, Emerald-street, Holborn (Mr. R. L. Cox for Mr. M. Boyce).—Refused.

Naming of Streets.

Battersea.—That the new streets on the site of the Latchmere allotments, Sheepcote-lane, Battersea, be named Burns-road, Council-street, Joubert-street, and Odger-street.—Agreed.

TRINITY HOSPITAL, LEICESTER.—The Mayor of Leicester performed the ceremony of laying the memorial-stone of the new Trinity Hospital, in the Newark, Leicester, on the 20th ult. The new building will accommodate twenty men and seventeen women, with apartments for the matron and other attendants, and the cost is estimated at about 12,000l. The architects are Messrs. R. & J. Goodacre, the builders Messrs. W. Moss & Sons, Limited, Loughborough, and the clerk of the works Mr. J. Esford.

ENGINEERING SOCIETIES.

INSTITUTION OF ELECTRICAL ENGINEERS (DUBLIN LOCAL SECTION).—The first Report of the Dublin Section of the Institution of Electrical Engineers has been issued. The Report commences with commenting on the great loss the Section has sustained by the death of its first Chairman, Professor Fitzgerald. For the Session 1901-1902 Professor W. F. Barrett, F.R.S., has been elected Chairman, Mr. J. W. Towle Vice-Chairman, and the Committee consists of Messrs. C. A. Burge, C. P. C. Cummins, F. Gill, Monsignor G. Molloy, D.D., D.Sc., Messrs. A. E. Porte, W. Tallow, P. S. Sheardown, F. T. Trouton, D.Sc., F.R.S., G. F. Pilditch, and M. C. Olsson.

CHRIST'S HOSPITAL AND ITS SITE.

THE Earl of Jersey's Committee of the House of Lords have found as proved the preamble of the Bill promoted by the Governors of St. Bartholomew's Hospital for their compulsory acquisition of a portion of the site of Christ's Hospital upon arbitration. For 1½ acres the Governors are willing to undertake to pay 17,000l.; Christ's Hospital require 201,000l., but desire rather to sell the entire site for 750,000l. On behalf of the Council of Almoners of Christ's Hospital, Mr. Fitzgerald, K.C., urged that they could not accept arbitration, inasmuch as they owned a site of 5½ acres in the heart of the City of London for which specific offers of 720,000l. and 700,000l. had been made to them. St. Bartholomew's Hospital set forth their need of more room for the adequate treatment of out-patients and casualty patients, for the nursing staff, operating theatres, and mortuary, also for a new pathological department, for isolated blocks for infectious diseases, and for their resident medical staff. At their meeting last week the Court of Common Council carried a report prepared by their City Lands Committee upon the two Bills now before Parliament, recommending that in view of the magnitude of the public interests involved, no opposition should be offered to the acquisition by St. Bartholomew's Hospital of the land shortly to be vacated by Christ's Hospital. In the course of the discussion Alderman Sir George Faudel-Phillips is reported to have stated that in the case of one of the two offers we cite above the tendering parties are now bringing an action against the Almoners for non-fulfilment of their contract, and that under the Charity Commissioners' scheme for removal of the boys' boarding school to Horsham the charity had suffered a loss of between 7,000l. and 8,000l. a year. On the other hand, it is announced that the petition of the London County Council praying to be heard against the Bill for authorising the sale and disposal of the site will represent that there is a great and increasing need for the preservation of open spaces in the neighbourhood; that there is no precedent for abrogating the provisions of the Disused Burial Grounds Act for the purposes of enhancing the value of lands to which that Act applies and enabling them to be sold as ordinary building land for ordinary commercial objects; that the existing buildings would suitably serve for the science school and the girls' day school (1,000 pupils) which the Governors are required to provide on a site distant not further than three miles from the Royal Exchange; that the Council should be enabled to acquire certain parts of the site and buildings which possess historical and architectural interest; and that a clause should be inserted in the Bill for precluding the erection of buildings upon the ground except in accordance with the statutory obligations applying to the County of London generally, and to secure the transfer to the Council or any objects of antiquarian, archeological, or geological interest that may be excavated. The Almoners' Bill will be read for the second time at an early date in the House of Commons. A statement issued by the Governors of Christ's Hospital avers that the cost of the migration to Horsham, though cut down in every possible way, amounts to no less than 550,000l., and that the valuable character of the Newport-street site was indeed the main justification for the compulsory removal of the school from London. We may point out that the Charity Commissioners' scheme includes no provision for a disposal of the hospital buildings and their site. The authority of an Act is required before the Governors can give a good title to the land for building purposes. Some parts of the site are leasehold, and some part has been used for interments.

CO-OPERATIVE BUILDINGS, EXETER.—The foundation stone has just been laid of new premises for the Exeter Co-operative Society at St. Sidwells. The buildings will cost about 10,000l., but the section to be now erected will cost only between 2,000l. and 3,000l. The elevation of the blocks will be of red brick, and the central gable will have a clock tower. Mr. F. J. Comlin, Exeter, is the architect, and the contractor is Mr. G. Herbert.

Correspondence.

To the Editor of THE BUILDER.

THE ORIGINS OF ANCIENT ART.

SIR,—In his recent lecture at the R.I.B.A., Professor Petrie asks for an explanation of the early form of Greek column increasing in size from bottom to top.

I do not think there is any difficulty in explaining the peculiarity. An examination of my old timber building will show that the main posts are always placed butt upwards.

Old workmen, who still retained many old building traditions, have assured me that the object of this was to let the sap run out. It is easy, at any rate, to understand the fancy that damp would not rise from the ground the wrong way of the cells; for aught I know, both theories may be correct.

Internally the butt ends were roughly formed into spreading corbels, that gave extra support to the tie-beams, and externally we are all familiar with the manner in which the corbels of the butts of corner posts were carved into angels and other legendary beings.

The same reasons that influenced the Medieval doubtless affected the Greek builder, and the columns, which were originally of wood, were placed butt upwards, and in time the tops of the butt formed into capitals, the lower end remaining naturally without base.

If the trees were conifers, as is probable, the butts would be more regularly shaped than our English oak.

RALPH NEVILL, F.S.A.

WHAT IS A "SHINER"?

SIR,—In reply to Mr. Kampe's question in your list, I believe "shiner" is a West-country term, and there is used to denote a thin stone built face upwards—being, in fact, a small stone, but looking like a large one when in place. J. H.

The Student's Column.

SANITARY FITTINGS AND PLUMBING.

20.—TRAPS.

A PLUMBER'S trap is a vessel affording a free passage for water but not for air. In its simplest form it is merely a bent pipe (fig. 1); the bend retains the last portion of the water entering it, and as the water occupies the full bore of the bent portion of the pipe, it affords a barrier against the passage of air.

The waste-pipes from all sanitary fittings, except water-closets and perhaps slop-sinks, ought to be disconnected from the drains by being made to discharge over or into trapped siphons placed in the ground outside the building. These drain-traps, however, are not sufficient to prevent foul air passing into the building. The water in the trap may be so charged with impurities as to give off unpleasant gases, and experiments have shown that if the air on one side of a trap is polluted, a small but appreciable amount of the pollution can after a time be traced on the other side; in other words, the foul gases may be absorbed by the water on one side and given off again on the other. An untrapped waste-pipe, even though disconnected from the drain, may thus convey impure air from the drain into the house. But waste-pipes themselves are often seriously fouled by the passage of dirty liquids through them, and the deposits in the pipes decompose and give off foul gases, which are drawn into the house unless a trap is interposed. The waste-pipes from sinks and urinals are often extremely filthy, and those from baths and lavatories are seldom entirely free from soapy deposits. Every sanitary fitting ought therefore to have a trap, either in itself or in the waste-pipe as near the fitting as possible.

A good trap should be self-cleansing, and should have a sufficient depth of seal and a reasonable resistance to siphonage. Round-pipe traps are most easily kept clean, as the water passes through them with considerable velocity and there are no corners for the retention of filth. On the other hand, they are more easily emptied by siphonage than traps of some other types. Siphonage can, however, be prevented by means of an air-pipe carried from a point near the outlet of the trap, and round-pipe traps, if properly ventilated,

are undoubtedly the best. Several modifications of the round-pipe trap have been introduced for the purpose of reducing the risk of siphonage, and will be noticed hereafter. The seal of a trap (other than a round-pipe trap under a valve closed) is seldom entirely destroyed either by siphonage or momentum, unless two or more fittings are connected to the same waste-pipe, but a considerable portion of the water may be drawn out by siphonage or carried out by the momentum of the discharge; the depth of the water-seal is therefore reduced, and, if the fitting is not used again for a long time, evaporation may lower the level of the water to a point below the dip, and air can then pass through the trap.

The D trap has been so frequently condemned by sanitarians that it is now never used by any one with the slightest knowledge of modern plumbing. It cannot possibly be kept clean and becomes in time a miniature cess-pool. Its only advantage is that it cannot be unsealed by siphonage; but this is far more than counterbalanced by its uncleanness. The numerous seams are also sources of danger, and the dip-pipe may be corroded through and allow the passage of foul air, the defect, perhaps, remaining unnoticed for a long time, as the dip-pipe is concealed within the body of the trap. The "mansion" trap, although an improvement on the D trap, soon becomes foul and is now never used.

The "bell" trap (fig. 2) has been very largely used for sinks. It consists of a cup (generally of lead) with a stand-pipe in the middle, over which is placed the brass grate, to the underside of which a "bell" is attached. The bell dips into the water contained in the cup below, and thus forms the seal of the trap. The trap is not self-cleansing, the depth of seal is often less than $\frac{1}{2}$ in., and the flow through the trap is so sluggish that servants often remove the bell and grate, thus allowing a free passage for the air from the waste-pipe. In some cases the grate is hinged, but this is no improvement from a sanitary point of view.

Anti-l lead trap (fig. 3) is better, but cannot be recommended. The form illustrated is intended for sinks, and is made in sizes from $2\frac{1}{2}$ to 4 in. at the top, but a modification of it (in lead or brass) is still used for high-class lavatories. Such a trap is shown in fig. 4. A trap of the same general design, but with side outlet is illustrated in fig. 5. Deposits are certain to occur, and the cleansing screws at A are therefore absolutely necessary. Cast lead traps for sinks are also made of the same design as fig. 4, but with longer necks to pass well through the sink for the purpose of soldering the lead cone to the inlet of the trap. Lead cones (fig. 6) for $1\frac{1}{2}$ in. traps are made to receive 3 or $3\frac{1}{2}$ in. grates, and those for $1\frac{1}{2}$ in. traps to receive $3\frac{1}{2}$ or 4 in. grates. The large grates, of course, ensure a better flow through the traps, but even with this improvement the traps are not self-cleansing, and foul air may pass into the house through perforations or cracks in the concealed midfeather. Traps of the kind illustrated in figs. 4 and 5 are often known as "oval" traps from the shape of the horizontal section of the bodies.

Round-pipe traps are made in various forms, known by distinctive names. Fig. 7 shows an "S" trap, fig. 8 a "three-quarter S" or "open S," fig. 9 a "P" trap, fig. 10 a "bag" trap, fig. 11 a "Q" trap, and fig. 1 a "running" trap. Drawn lead traps of these shapes are often known as Dubois' traps, and are made in sizes from $1\frac{1}{2}$ in. to $4\frac{1}{2}$ in., each size being made in two weights as follows:—

Diameter of Trap.	Weight of Lead per Super ft.
$1\frac{1}{2}$ in.	$4\frac{1}{2}$ lbs. and 6 lbs.
$1\frac{3}{4}$ "	5 " " 7 "
$1\frac{1}{2}$ "	$5\frac{1}{2}$ " " 7 "
2, $2\frac{1}{2}$, 3, $3\frac{1}{2}$, 4 and $4\frac{1}{2}$ in.	6 " " 8 "

All the sizes from $1\frac{1}{2}$ to 3 in. inclusive, are made either with or without cleansing screws as required. The larger sizes are intended for water-closets and slop-sinks, and are not fitted with cleansing screws. Special drawn-lead traps and bends for water-closets and slop-sinks are also made, as shown in fig. 12, the diameters ranging from $2\frac{1}{2}$ to $4\frac{1}{2}$ in.; each size is made in two weights (6 lbs. and 8 lbs.) and in two lengths (28 in. and 33 in.) to suit different thicknesses of wall. The advantage of these is that they do away with the objectionable joint in the body of the wall.

Cast-lead P and S traps (with or without cleansing screws) are made in two sizes, $1\frac{1}{2}$ in. and 2 in., for sinks and lavatories, and P traps

(without cleansing screw) $1\frac{1}{2}$ in. in diameter in two weights, for water-closets, &c. Special 4-in. cast-lead P or S traps of 10 lbs. lead (fig. 13) are made for water-closets and slop-sinks with bases for fixing to the floor, and with sockets for receiving the basins. Similar cast-lead bases and sockets are also fitted to $3\frac{1}{2}$ in. and 4 in. drawn lead P and S traps.

In order to ensure a more thorough flush of water through the trap, the inlet ought always to be considerably enlarged. In many lavatory basins the waste-plug is only 1 in. or $1\frac{1}{2}$ in. in diameter, and the effective area of the opening is reduced by the solid part of the grating below. To fix a $1\frac{1}{2}$ in. trap under such a fitting is a mistake, as it cannot be properly flushed by the discharge. The area of the openings in the waste-grating ought always to be greater than the sectional area of the trap.

Drawn-lead traps are of equal bore throughout, and some plumbers prefer cast or hand-made seamed traps with square dips and weir outlets, as shown in fig. 14. The depth of the seal is thus considerably increased, and a better scour is obtained in the bottom of the trap. The size illustrated is suitable for water-closets, and has an enlarged inlet, and less easy curves, so as to reduce the risk of siphonage.

Cast-lead traps of various kinds are now made for the express purpose of preventing siphonage in the case of single fittings. Smeaton's "Eclipse" trap (fig. 15) has served as the model from which later designs have been produced. It has a round dip-pipe, and the body is designed to give a considerable area of standing water on the outlet side of the trap, and a volume of air in the angle above this water. In Hellyer's "Anti-D" trap (fig. 16) the chief peculiarity is the square outlet. It has the same angular air-space above the standing water as the "Eclipse" trap, but differs from the latter in having two thicknesses of lead between this air-space and the inlet-pipe. The size marked A has a $4\frac{1}{2}$ in. inlet and a 3 in. outlet, and is intended chiefly for valve-closets and slop-sinks; B has a $3\frac{1}{2}$ in. inlet and $2\frac{1}{2}$ in. outlet, the depth below the dip being 2 in., and is intended for large sinks and baths; C is a lavatory trap and has a $1\frac{1}{2}$ in. inlet and outlet; D is similar to C, but with the inlet enlarged to $2\frac{1}{2}$ in., and is suitable for lavatories and small sinks and baths. A is of metal equal to 8 lbs. lead, and B, C, and D, 9 lbs.; the three latter are made with cleansing screws, if required. The depth of seal is in every case $1\frac{1}{2}$ in., and even the largest trap holds only $2\frac{1}{2}$ pints of water, or less than one-sixth of the quantity generally allowed for flushing a water-closet.

The "Kensington" cast-lead trap is on somewhat similar lines, having a flat top over the standing water on the outlet side of the trap. It is made in P or S form (fig. 17) in two sizes, $3\frac{1}{2}$ to $1\frac{1}{2}$ in. and 4 in. to 2 in., for sinks, &c., and in P form (4 in. to 4 in.) for water-closets. These traps are self-cleansing and offer considerable resistance to siphonage.

The "Hadley Anti-siphonic" trap (fig. 18) is guaranteed by the makers "to give a permanent seal under all conditions" without vent-pipe. It is a round pipe trap with an enlargement on the outlet leg, and with a great depth of seal. Partial siphonage of the trap may, of course, occur, but it is claimed that the enlarged portion cannot possibly be emptied; the water in this falls back after a discharge and is sufficient to recharge the lower part of the trap. It is made of lead in S and P shapes, and in the following sizes: 1, $1\frac{1}{2}$, $1\frac{3}{4}$, $1\frac{1}{2}$, 2, and $2\frac{1}{2}$ in. for sinks, lavatories, urinals, &c. There is a possibility of deposits accumulating in the enlarged portion.

Mechanical traps are now seldom used, as they are not self-cleansing. The "Bower" trap (fig. 19) is well known, and, although not the best, will serve as an example. The dip-pipe, outlet-pipe, and upper portion of the body are made in one piece of cast lead, and the lower portion of the body of lead or glass. A light india-rubber ball (A) in the body of the trap is supposed to seat itself against the dip-pipe and form an efficient barrier against the entrance of foul air into the house. The ball obstructs the passage of the water through the trap, and deposits are certain to occur. A perforation in the upper part of the dip-pipe might pass unnoticed for a long time, as it is concealed in the body of the trap.

Lead is the metal most generally used for the traps of those sanitary fittings which are not trapped in themselves, but iron, brass, and white metal are also used. Seamed lead traps

Illustrations to Student's Column.

made by hand are now seldom adopted; they are costly, and are soon corroded along the seams, besides being subject to defects due to careless workmanship. The seams are generally soldered, and may be either wiped or formed with the tool known as the "copper bit," the wiped seam being the better of the two. "Burned" seams require special apparatus, and are not often made by the journeyman plumber. In these seams the joint is formed with lead instead of solder, thus avoiding the galvanic action set up between the tin and lead. Cast-lead traps with burned seams are generally produced in factories. The example shown in fig. 20 is known as Cloughton's, and is cast in two pieces, which are afterwards united by burned seams. Webs are cast on at AA to prevent the drooping of the outgo, which is sometimes so serious as to destroy the seal of an ordinary trap. S and P traps of this form are made in three sizes, 1½ in., 1¾ in., and 2 in., and running traps in two sizes, 1½ in. and 2 in. The lead is equal to 7½ lbs. per sup. ft.

Several examples of cast-lead traps have been given. If properly made, they ought to be smooth inside and the metal ought to be of equal thickness throughout and free from pinholes and other defects. Drawn-lead traps are made by forcing lead through annular dies, as in the process of pipe manufacture, but special arrangements are adopted for bending the pipes to the desired curves. Drawn-lead traps are as smooth inside as outside, and are of uniform bore throughout. When the inlets are of proper size the traps are self-cleansing, but the smooth surfaces and easy curves render them peculiarly liable to unsealing by siphonage or momentum; hence the necessity of trap-ventilating pipes.

Cast-iron traps are made in various sizes for sinks, baths, water-closets, and other fittings; several examples have been given in preceding chapters. Tye & Andrew's sink traps are of P and S shape, with a midfeather between the inlet and outlet portions. They are made in three sizes, 3-in. grate, with 1½ in. outlet; 4 in. grate, with 2 in. outlet; and 6 in. grate, with 3 in. outlet. Brass clip grates are provided for stone sinks, and brass screw grates (fig. 21) for lead and slate sinks. The outlet may be screwed, as in the illustration, for connexion to an iron waste-pipe, or plain for connexion to a lead waste-pipe. For baths and lavatories the inlet and outlet are screwed. The cleansing screw is of brass, and may

be placed in the side or bottom of the trap, the latter being the more convenient position. The traps are without ventilating arms, and any imperfections in the midfeather may pass unnoticed for a long time. The traps are galvanised, but the coat of zinc affords very little protection. Other cast-iron traps are coated with Angus Smith's solution, or by the Bower-Barff process, but better protection is afforded by vitreous or porcelain enamel. The castings ought to be smooth, of uniform thickness, and free from pinholes and other defects. A glass-enamelled iron midfeather trap for lavatories is shown in fig. 6, chap. ix.; cast-iron bath-traps in figs. 6, 7, 9, and 10, chap. xi.; and a cast-iron water-closet and trap in fig. 6, chap. xiv.

Cast brass traps are often used for lavatories, and less frequently for baths and sinks. A common form for lavatories is shown in fig. 4. It is neat in appearance, but is not self-cleansing. The brass midfeather trap with vent-union (fig. 22) is on somewhat similar lines, with 1½ in. inlet and outlet. Two forms of bath-trap were illustrated in figs. 4 and 5, chap. xi., the latter having a coupling for an anti-siphonage pipe. The common defect of brass traps is that they are very rough inside, and deposits are almost certain to occur in consequence. On the other hand, they are stronger and less easily corroded than lead. Some makers prefer to leave the traps dull outside, while others finish them by polishing or nickel-plating. White-metal traps follow the same lines as brass traps, but are not often used.

Glazed-ware traps are made for laboratory and kitchen sinks. They are generally 2 in. in diameter, in P or S shape. An example was given in fig. 8, chap. vi. They are self-cleansing and incorrodible. Glazed-ware traps for water-closets and slop-sinks have been illustrated in the chapters on those fittings.

SADLER'S WELLS THEATRE.—Sadler's Wells Theatre has just been renovated, the work having been carried out under the supervision of Mr. Bertie Crewe. The ceilings, of lath and plaster, have been removed, and silicate cotton substituted. Other improvements include the introduction of a fireproof curtain and the addition of two "extra" exits and fireproof staircases. The work has been carried out without interfering with the nightly performances, the scaffolding having been taken down each day. The whole of the drainage has been reconstructed. The contractors were Messrs. John Weibking & Sons, the general foreman having been Mr. Charles Abbey.

Illustrations.

DRAWING-ROOM TO MANSION, SUFFOLK.

THE dimensions of this room are 31 ft. long by 17 ft. wide and 12 ft. 6 in. high, and in addition to this there is a large bay window facing west on the side opposite the fireplace. The walls are panelled in mahogany, the larger panels being filled with a rich green silk material; the mouldings and enrichments of the wood panels are gilded in an old gold tone. The ceiling is treated with bold fruit enrichments in fibrous plaster, executed by Messrs. Jackson & Sons from the architect's design.

The modelled figures and other ornaments to the mantelpiece were carried out by Mr. Taylerson. A. N. PRENTICE.

HOUSE AT BARN T GREEN, WORCESTERSHIRE.

The site of this house is situated on a knoll sloping towards the S.E., S., and S.W., with long distant views in these directions, which governed the disposition of the plan, and the form it should take with the supporting terraces and garden. Rough cast, stone, stone slates, and old bricks for chimneys, were the materials proposed, with some oak work inside.

The architects are Messrs. Bateman & Bateman, of Birmingham.

HOUSE, ROSE CROFT AVENUE, HAMPSTEAD.

The site required that this house should be planned on the lines of an obtuse angle.

The elevations were carried out in red sand-faced bricks, with lifting sashes, the frames in external reveals with wood dressings, cornices to bay windows, &c. The roof was covered with red tiles and finished by a flat railed around to form a belvedere on account of a very fine view across the country.

This belvedere was reached by carrying up the back staircase. The plan indicates the position of the reception-rooms and offices. On the floors above are eleven bedrooms.

The house was built by Messrs. Boddy & Chapman from the designs of Mr. C. H. B. Quennell.

H. Dare Bryan Archt.

OLD PARISH CHURCH, SHANKLIN: NEW LYCH-GATE.—MR. A. C. BLOMFIELD, F.R.I.B.A., ARCHITECT.

PROPOSED CHURCH OF ST. MARTIN, KNOWLE, BRISTOL.

This design was submitted in a limited competition for one of the new churches under a scheme of church extension in the diocese of Bristol. In harmony with the mother parish church a rather "high" ritual was arranged for, one of the features being the particularly open view of the altar and the ambulatory for processions. Internally the church would be of local stone, with a green stained oak-pannelled door around walls of nave and piers; the spire was to be covered with oak shingles.

The drawing was hung at the Royal Academy, 1899. H. DARE BRYAN.

LYCH-GATE, SHANKLIN CHURCH.

This lych-gate, which was the gift of a resident of Shanklin, is composed of oak, with walling of local stone. Messrs. Cornish & Gaymer, of North Walsham, were the builders, and Messrs. Gillett & Bland, of Croxford, supplied the clock, the total cost being 260l. The architect was Mr. Arthur Blomfield, M.A.

IMPROVEMENTS AT THE COVENT GARDEN OPERA HOUSE.

The circumstances under which opera is carried on in this country are necessarily peculiar, seeing that the Covent Garden Opera House is by no means a public building in the ordinary sense, but merely a structure erected on lease on the Duke of Bedford's estate, held for some forty or fifty years by a syndicate composed for the most part of wealthy amateurs. The principal interest of these wealthy amateurs is to have the musical representations they favour during that limited "run" of eleven weeks which happens to coincide with the fashionable season, and to have the arrangements for the performances made in such a way that the Opera House can also be used as a kind of social rendezvous. Most of the members of this syndicate hold their shares (or debentures) at a small nominal interest; or, in other words, the principal portion of the capital necessary for the opera has not been contributed for the purposes of gain, but solely with a view of making possible that which would be impossible if worked solely on commercial lines. Most of the shareholders must hence be looked upon

as patrons rather than partners in our operatic enterprise.

Covent Garden Theatre is an old building, the principal walls of which have been standing for many years, although the internal arrangements were materially remodelled after the notable fire of some forty years back. As is well known, the famous Opera House is badly located in an insalubrious neighbourhood, cramped in on all sides, and lacking such approaches as one would like to see associated with the Temple of Art.

When this House was taken over by its present owners some three years back, its defects were well known and attention had to be directed to such of the unsatisfactory features as might tend to hamper their scheme.

In the first place, the bad equipment of stage appliances, which were entirely out of date, seemed to prevent any semblance of an artistic production. The offices were so ill-placed, inaccessible, and unpractical in arrangement that the annual expenses threatened to be enormous. Many of the modern protective measures associated with a theatre were absent, and the confidence of the public might be shaken—in fact, when the syndicate took over the House there was merely an installation of gas for lighting purposes, whilst, of course, the electric light should long ago have been installed. In the auditorium, too, there was much to be complained of—the protruding stage was exceedingly ugly, to say the least of it; the orchestra, which was built so far into the auditorium, made the seating arrangements difficult. Further, the approaches, particularly to the stalls, were highly inconvenient, not to say dangerous. The approaches for carriage traffic, difficult in any case, were complicated by the fact that only one line of carriages could put down or pick up; whilst an additional exit used by the box-holders into Floral-street also left much to be desired.

Notwithstanding the financial position of the owners, which, as has already been explained, is based primarily on what we might term a patronage rather than a business basis, money has been procurable to assist the Directors in overcoming some of these defects, and it is the successful overcoming of the primary defects and difficulties that we now have to deal with, bearing the peculiar circumstances of the case in mind.

Firstly, the stage had to be remodelled, the actual structure raised and fully re-equipped; secondly, the entire offices, stores, &c., had to

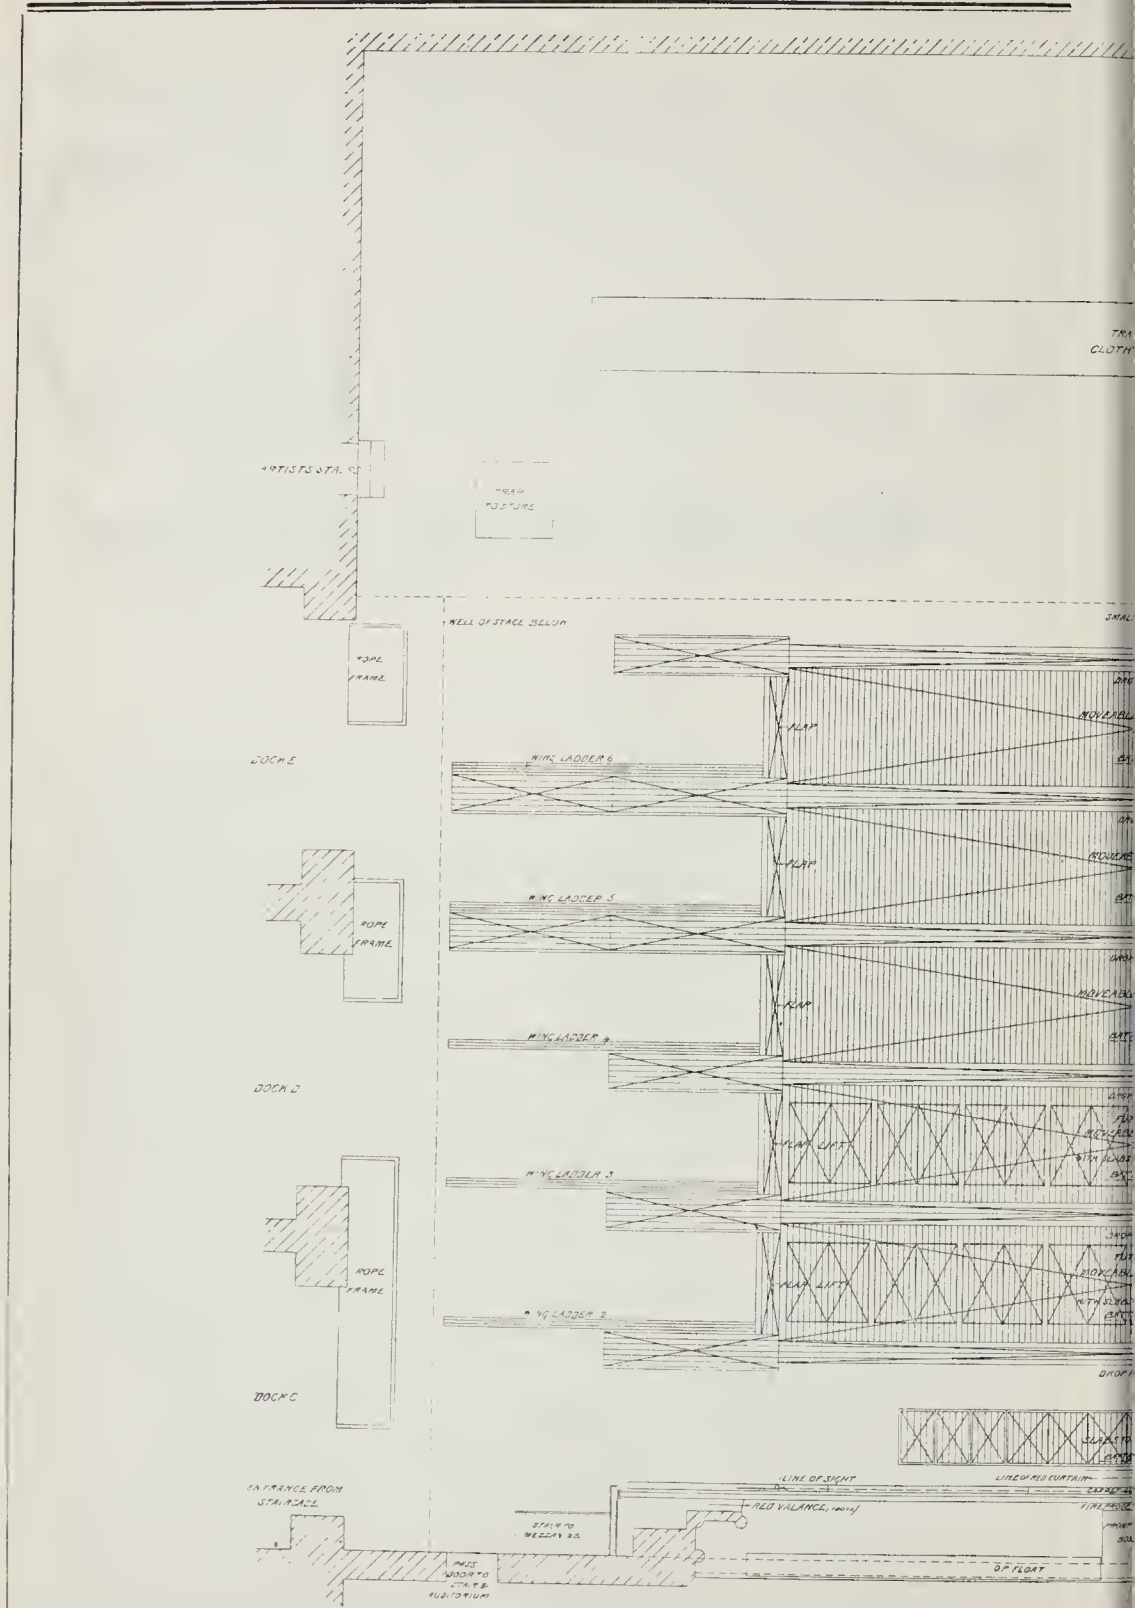

be remodelled; and thirdly, the auditorium with its approaches had to be improved. Lastly, innumerable installations, such as that of the electric light, had to be dealt with.

As far as this electric lighting was concerned, the directors proceeded with it from the very outset, as also with a number of minor improvements which were undertaken during the odd months intervening between the opera season and the ball seasons of 1899 and 1900, but the really important part of the improvement scheme only saw its completion during the last six months, when, by a bold stroke, it was decided that, ball season or no ball season, a winter of eight months was to see the final rejuvenation of the Opera House stage. The opera season of last year closed on August 3, 1900, and it required three or four weeks for the scenery to be cleared in the usual way. Work was, however, immediately commenced on the morning after closing. The first operation, comprising the alteration of the auditorium and the formation of a special corridor and some new entrances, was taken in hand contemporaneously with the second, which comprised the raising of the roof over the stage. The whole of these two sections of the improvement scheme were completed by October 15, the main roof alteration being ready on October 8.

The roof alteration comprised a span of 90 ft. to a width of 70 ft., at a height of 90 ft. above the ground, without any facilities for storage accommodation in the vicinity; the building had to be kept waterproof during the alteration; and the stage hands and mechanics were working below whilst the alteration was going on above. The scaffolding arrangements alone were most complicated, for a system of suspended scaffolding had to be applied, no vertical support being obtainable on the span of 90 ft. When the raising of the roof was completed, the "gridiron" had to be laid in a similar way from suspended scaffolding.

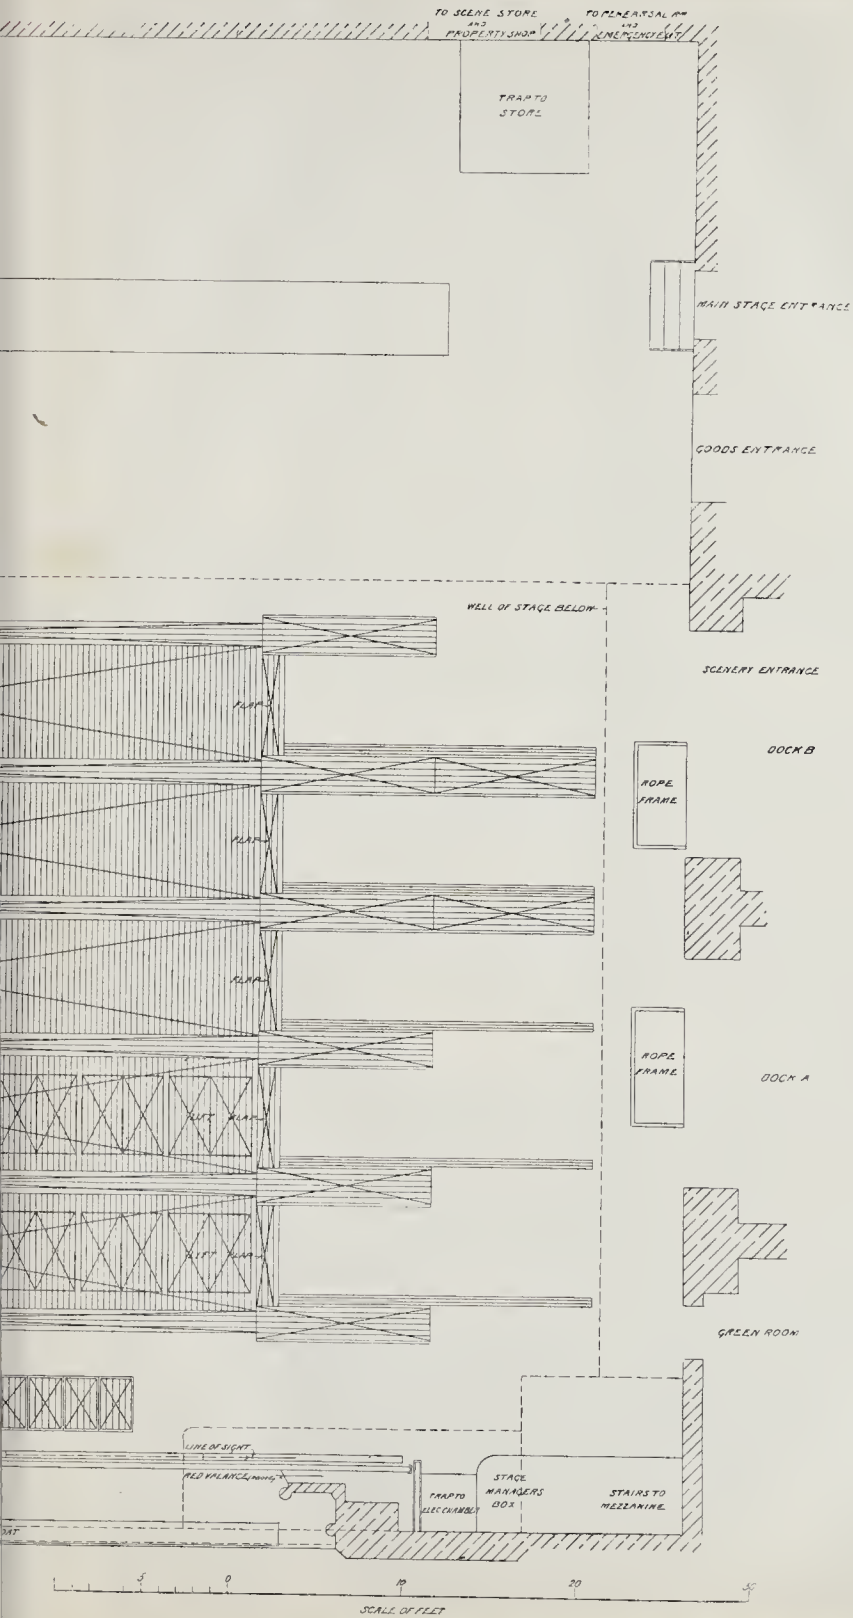

Almost contemporaneously with these alterations, a large fire-resisting curtain was being fitted in the proscenium opening, and the walls between stage cellar and auditorium being built. The curtain was put into position by October 15, so that Mr. Rendle was able to take up his tenancy for his ball season, and the first ball was actually given on October 20.

A large scene store at the back of the stage was taken in hand somewhat later than the first-named work, i.e., in September, and was completed by November 1, 1900.

STAGE

Plan of Stage, Covent Garden Theatre. As remodelled.

in the direction of Mr. Edwin O. Sachs, architect.

A general remodelling of a large wing at the back of the house was thereupon taken in hand, and was completed by January 1, 1901, by which time the new hydraulic lifts in the staircases were in working order, and the great removal of stores into their different new places could be undertaken.

On January 4 the stage floor was opened and gutted. The stage was reconstructed, and the new stage floor was closed in on April 4, when the whole of the work was practically completed, with the exception of some minor mechanical details which, trifling in themselves, were, however, of such a character as to prevent entire freedom on the stage until May 1. The gutting of this lower portion of the stage comprised by itself a wreckage of nearly 1,000 cartloads of timber and the erection of 150 tons of complicated steelwork and a very large amount of machinery.

It will thus be seen that the two principal problems, *i.e.*, that of raising the roof and that of gutting the stage, occupied respectively two and three months. The circumstances were, of course, very peculiar, owing to lack of space and the enormous quantity of scenery that had to be handled to make room for the men, and much of the work was of an exceptionally dangerous character and of considerable risk to the workmen employed. Nevertheless, not a single accident, much less fatal casualty, occurred.

The results, both in time and in lack of accident, must be attributed to a great extent to the co-operation of all parties concerned, not forgetting the artisans and labourers, who were, to a great extent, new to the class of work required, and Mr. Sachs, who acted as architect for the work throughout, is particularly anxious to acknowledge the assistance rendered him by the contractors and their representatives, and the cordial manner in which the various firms worked hand in hand under very trying conditions.

The new opera season actually commenced on Monday, May 13.

Turning now to the drawings which we illustrate, we see the Opera House as it stands after the improvements, and it will be observed that much that used to seem very ragged in plan has now been squared up in such a manner that the general scheme might almost be termed symmetrical. Thus, when we enter the main vestibule, which can now be approached by two rows of carriages—*i.e.*, private carriages under the porchway and cabs under a Bow-street awning—we find a double entrance leading into a broad stalls corridor, which formerly used to serve the purpose of a kind of lumber-room and general store. From this corridor we can either reach the stalls by going up some steps that are centrally placed, or by two entrances at either end of the corridor. There are hence now three exits for the stalls, and it will be seen that besides the ordinary exits through the grand vestibule, a special lobby and exit leading directly on to Floral-street has been created.

Next, in the auditorium itself, the apron of the stage has been cut off and the orchestra now practically takes the place of the apron. The members of the orchestra are no longer hidden underneath the stage, and as the wall against which they play has been equipped with light pitch-pine casing and a double flooring put underneath the orchestra, affording a vacuum of 3 ft. or 4 ft., the sound has naturally improved both in clearness and carrying power.

Of other improvements noticeable on the plan as far as the orchestra is concerned, it may be noticed that the management have better office accommodation, and that the lavatories have been improved.

Turning now to the stage, but without going into any question of mechanical detail, we find a thoroughly modernised symmetrical stage, with a good-sized back stage cut off from the auditorium by a fire-resisting curtain. The stage has now its proper height, which allows for cloths to be taken up without any kink; all superfluous wood and rope work has been removed; and whilst the stage itself has been divided up into sections which can be raised and lowered on the Sachs patent-bridge principle, worked electrically, everything above stage level has been equipped on a counter weight system, according to the Brand patents.

With the stage as we now find it, every effect that a stage-manager can desire is obtainable with a minimum of manual labour, but it is only to be anticipated that it will be

some time before those in charge of the stage can appreciate the possibilities at their command, or comprehend what the systematic stage management of the Continent really means. At present, to judge from the performances of the first couple of weeks, one would think that the captain of a fishing smack was trying to manage a torpedo-catcher. Of course, there has been little or no time for rehearsal, but given mechanics rather than stage-hands, and stage engineers rather than stage-carpenters, things will, no doubt, gradually right themselves.

If we now turn to the back wing of the house we see that the storage arrangements have been entirely remodelled and a good supply of rehearsal room provided; and facilities for storage and rehearsals are at last available at the Opera House, and it is to be hoped that proper use will be made of the modernised accommodation provided.

Speaking generally, one might say that the Opera House has at last been brought up to date, and that it has been brought up to date after careful consideration of the Continental models, but without the slavish imitation which would be out of place where the circumstances are so peculiar.

Irrespective of the technical assistance obtained by the management, the members of the Syndicate, and particularly Lord de Grey and Mr. H. V. Higgins, may be considered to have done a great deal towards giving England better scenic equipment, for by one bold stroke London can at last boast of an example of stage mechanism which accords with the position of technical science in this country, and should serve as a pattern to other theatre owners.

The following are the contractors engaged by Mr. Sachs for the execution of the work—

The general contractors were Messrs. Colls & Son (manager in charge, Mr. Collins; foreman, Mr. Dowse). The ironwork contractors for everything above stage level were Messrs. Lindsay, Neal, & Co. Limited; whilst the entire complicated structural and mechanical ironwork below stage level, including the stage "bridges" and lifts, was by Messrs. Drew-Bear, Perks, & Co. (manager in charge, Mr. Simco). The electrical power plant for the "under machinery" was provided by the Thames Ironwork Shipbuilding Company, Limited, of Blackwall (manager in charge, Mr. Flood); whilst the whole of the elaborate counterweight mechanism above stage level was provided by the well-known Berlin stage mechanist and contractor, Mr. F. Brandt, who personally attended to the installation of his appliances in London. The fire-resisting curtain was by Messrs. Merryweather & Sons, Limited, and the alterations in the auditorium by the Army and Navy Auxiliary Supply, Limited (manager in charge, Mr. Player).

OBITUARY.

MR. BRYDON.—We greatly regret to announce the death on Saturday last, after a short and painful illness, of Mr. John McKean Brydon, a Vice-President of the Royal Institute of British Architects, of No. 77, Newman-street, Oxford-street, and No. 31, Steele's-road, Haverstock-hill, N.W. Mr. Brydon was born in 1840 at Dunfermline, where he received his earlier education. In after years he became a leading and highly popular member of the Fife Association in London. When sixteen years of age he began his professional career, for which he had already displayed a marked aptitude, in Liverpool. Then, having served under Mr. Bryce, of Edinburgh, and Mr. Campbell Douglas, of Glasgow, he came to London as a member of the staff of Messrs. Shaw & Nestfield. He was elected a Fellow of the Institute in 1881, and a Vice-President for the sessional years 1899-1900 and 1900-1901; he was also appointed a member, 1900-1901, of the Art Standing Committee. He had been on the Council of the Institute during many years, taking an active part in its general work, and especially in that of the Art Standing Committee; indeed, it is not commonly known that when he first began to practise independently in London he devoted most of his powers to the designing of furniture. From that comparatively limited sphere he turned his attention to domestic architecture, and at length found his range in the planning and designing of public buildings. Meanwhile, he had made many visits to Italy for the purpose of increasing his knowledge of the traditions and examples of classical architecture and design.

Amongst the earlier works which brought his name and talents prominently into public notice we should mention the St. Peter's Hospital for the Stone in Henrietta-street, Covent Garden, in 1883-1884, and the Chelsea Vestry Hall, of which

latter building we published drawings of the south elevation, with details and two sections, on May 2, 1885. In 1887 he exhibited at the Royal Academy the designs for the West Kensington Congregational church prepared by him conjointly with Mr. James Cubitt, and in the following year his competitive designs for the new Municipal buildings at Edinburgh, two elevations and two plans of which we had illustrated on June 18, 1887. On May 7, 1889, the present Queen Consort laid the first stone of his New Hospital for Women in Euston-road, St. Pancras. On November 9 of that same year, we published a perspective view of his design for the Ladies' Residential Chambers in Chancery-street, Bloomsbury. Of his other architectural works at and about that period we may cite the Village Hall erected at Forest-row, Sussex, in 1892; for Mr. H. R. Freshfield, of Kidbrook Park (May 20, 1893*), and, amongst country houses, "Lewins," in Kent, for Mr. Joseph Robinson; "Bournemead" at Bushey, Hertfordshire (May 20, 1893*); "Pickhurst," Surrey; the studio at the well-known French painter M. James Tissot's Château de Buillon, near Besançon, together with the enlargement and remodelling of that old château (June 15, 1895, and May 1, 1897*), in respect of which M. Vielle, of Besançon, acted as resident architect on the spot. Shortly after that time Mr. Brydon won the first premium, upon the award of Mr. William Young as assessor, in the competition for the Municipal Buildings at Bath, which were opened on June 11, 1895. His designs are published in our columns of January 9, 1892 (elevation in High-street and two plans), May 28, 1892 (perspective view), and July 10, 1897 (the Council chamber). The designs for the furniture of the Council chamber were prepared by himself. Mr. Brydon's architectural employment in that city extended over a period of some seven or eight years. His works there comprise (1) the Technical Schools (1895-6); (2) an extension, at an estimated cost of 25,200*l.*, of the Pump Room, of which his first premiated designs we illustrated on March 10, 1894 (north elevation, section, and two plans), June 9, 1894 (perspective views of the interior and exterior), and May 25, 1895 (exterior view, revised design, proposed treatment of the interior of the Roman bath, plan of additions to pump-room, and plan of pump-room ground floor). His designs as ultimately carried out for the Mineral Baths Committee, after consultation with Mr. Alfred Waterhouse, were in some degree modified as compared with those he had submitted in the competition, less prominence being given to the concert-room, the other accommodation being reduced in extent, and the *schola* only of the old Roman bath being covered over; (3) the Victoria "Diamond Jubilee" Art Gallery and Library, opened in May of last year—see our illustrations of May 7, 1898; and (4) his architectural treatment of the Roman bath—see our illustration (from a photograph), October 23, 1897. The Victoria Art Gallery at Bath completes an imposing block, which embraces the Municipal Buildings, the Courts of Justice, the City Hall, the Technical Schools, and the Reference Library. In a competition held ten years ago for the rebuilding of the Whitefield Chapel in Tottenham Court-road, Mr. Brydon gained the second premium for his designs upon the report of Professor T. Roger Smith. In the competition (May, 1898) for the Taunton Town Hall he was awarded the second premium of fifty guineas, upon the adjudication of Mr. Mountford as assessor; and in that for the New Free Library, Wolverhampton, he won the second premium, Mr. Alfred Waterhouse being the assessor (February, 1898).

His successful work at Chelsea was followed by the selection of his plans and designs for the South-west London Polytechnic in Manresa-road, Chelsea, of which the then Prince of Wales laid the foundation-stone on July 23, 1891 (March 21, 1891, perspective view with two plans*), and by his winning the first premium for the Free Public Library (June 8, 1889, front elevation in Manresa-road, with plan, and January 24, 1891, perspective view and two plans)* opened on January 21, 1891. To the Free Library he added in 1897 the Queen Victoria Gallery, erected after plans which provide for its enlargement hereafter. Mr. Brydon entered the competition for the West Ham Technical Institute and Free Library, his design for the public library portion of which we published on August 1, 1896. He prepared the plans and designs for the science laboratories at the London School of Medicine for Women in Handel-street, Brunsvick-square, to which he subsequently added another story (1897-9). Last year Mr. Brydon was nominated, with five other architects, to furnish competitive designs to the Corporation of London for the rebuilding of the Sessions House and Central Criminal Courts in the Old Bailey, on which occasion Professor Aitcbison was appointed assessor. The designs which Mr. Brydon prepared, we understand conjointly with Mr. J. S. Gibson, are illustrated in our number of August 25, 1900. In 1898, being one of the eight architects who were recommended to the Government by the Royal Institute of British Architects for the new public offices, he was appointed architect of the block to receive the Local Government Board and the Board of Educa-

*Illustrations in the *Builder*.

tion, for which a site has been cleared in Parliament and Great George streets. Mr. Brydon was engaged upon that, his most important work, at the time of his death, and it is painful to recall that Mr. Young, who at the same time was appointed architect for the War Office block in Whitehall, was similarly deprived through death from seeing the fruition of his labours. Mr. Brydon's designs are illustrated in the *Builder* of March 25, 1899 (Parliament-street front and plan), and May 5, 1900 (the Circular Court), and were on view in the Royal Academy Exhibition, 1900. In February, 1897, Mr. Brydon was nominated by Professor Atchison, R.A., as the then President of the Institute, for the post of assessor of the competitive designs for the Technical College at Sunderland. He also acted in that capacity in respect of the South-end-on-Sea Municipal Buildings competition, awarding the first premium to Mr. H. T. Hare (1898). He was author of several essays and treatises upon professional subjects, including the following papers, reported *passim* in our journal:—On "The English Classic Revival of the Seventeenth and Eighteenth Centuries" (February 23 and March 2, 1899)* and "The English Renaissance of the Eighteenth Century" (February 14, 1891)*, both read at meetings of the Architectural Association; "Public Libraries" (February 25, 1893)* and "The Work of Professor Cockerell, R.A." (May 26, 1900)*, both read at meetings of the Institute. He was invited to read the last-mentioned paper to a meeting of the Edinburgh Architectural Association in March of the current year.

GENERAL BUILDING NEWS.

CATHOLIC CHURCH, LIVERPOOL.—On the 26th ult. a new church of the Order of Lourdes and St. Bernard's, the foundation stone of which was laid by Bishop Whitehead on June 17 last year, was opened. The church, which has been built next to St. Bernard's Schools, on a plot of land between Kingsley-road and All-street, consists of a nave and aisles, with baptistry and porches at the western end, and a chancel, with two chapels, sacristy, &c. The nave, which is 83 ft. long with a breadth of 48 ft., consists of five bays, in four of which the centre space is divided from the adjoining aisles by an arcading with stone shafts and moulded caps and bases, the fifth bay being occupied by the organ gallery. The body of the church is lighted by four-light tracered windows in each bay, and by two similar three-light windows, with a circular window above in the western gable, which adjoins Kingsley-road. The principal elevation faces Kingsley-road, in the centre of which is a niche filled by a statue of the Virgin to whose honour the church is dedicated. Two entrance porches, one at either side of the west wall, extend the width of the front to 77 ft. The chancel, square-ended and flanked by a chapel on each side, is lighted by two side windows, and by a rose window in the gable, the latter being filled with stained glass, while a second window, representing Our Lord, with St. Bernard and St. Mary Alacoque, has been placed in the north chapel. The building is constructed of St. Helena grey bricks, with facings of red Runcorn stone to the windows and doors. The roof, which is open to the ridge inside, and panelled between the principals with moulded ribs, is covered with Welsh slates. The floor is of wood, with the exception of the baptistry and porches, which are laid with brown tiles. The church will be heated by means of hot-water radiators, and the building has been provided with electric light. The cost of the fabric is about 5,500. The building was done by Messrs. Roberts & Robinson, contractors, Liverpool, from designs and under the superintendence of Messrs. Pugin & Pugin, architects, of London and Liverpool, for whom Mr. M. Shanley has acted as clerk of works.

CATHEDRAL, BRISBANE.—The foundation-stone of the new cathedral at Brisbane was laid by the Duke of Cornwall and York on the 22nd ult. The designs were prepared, it is stated, by the late Mr. J. L. Pearson, R.A., and will be carried out by Mr. F. L. Pearson, in conjunction with Mr. W. D. Carole. The complete design, of which the probable cost will be 100,000, and which will provide 3,000 sittings, will not be carried out at present for want of funds, but it is proposed to begin with the choir and transepts to accommodate 1,200 worshippers. This will cost 25,000.

TRURO CATHEDRAL.—Mr. J. H. Dennis has increased from 10,000, to 15,000, his gift for the building of the central tower, to be known as the Victoria Tower, as a memorial of the late Queen. Mr. Pearson, the architect, has obtained an estimate for the erection of the tower, which, it appears, can be carried out at a cost somewhat less than the sum which Mr. Dennis undertakes to subscribe.

RESTORATION OF ST. JOHN'S CHURCH, SUNDERLAND.—The Church of St. John, in the east end of Sunderland, was re-opened on the 15th ult. after having undergone restoration. The work of restoration has apparently included in its scope everything except the shell of the building, the walls having required but little attention. The most noticeable of the alterations has been the removal of the three old galleries which ran round the church, and which, in
