H. H. WINDSOR, Editor.

F. S. KENFIELD, Business Manager.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 9. JANUARY 15, 1899. NO. 1.

The Indiana legislature started out on its first day's session by introducing a 3-cent fare bill; and regulations relating to heating, speed, manner and time of operation, and several other matters which are and always will be questions of local condition. If the Hoosier statesmen would only go out and undertake the management of even a 10-car road for a few weeks they would return and make short work of these biennial bills.

As the opening days of the new year grow into weeks the outlook for construction, reconstruction, betterments and increased service becomes more and more promising. A single supply house in this city has already made bids on the line of material it handles to no less than one hundred and fifty roads existing or proposed,and this instance is duplicated in the experience of many others. The inevitable result will be a grand scramble upon the advent of warm weather for materials, machinery and cars, and those who delay will have to pay the penalty in waiting for delivery of their orders.

The question of speed is one which will interest operators of interurban roads, as the latter come to compete more frequently with the steam lines. To obtain motors is an easy matter, and trucks and cars will safely travel as fast as the motors can drive them. The vital point is in the track, as is being demonstrated in the present competition for the fast mail contract between Chicago and Omaha. Builders of interurbans will do well to sacrifice something of ornament if need be in their buildings, and at the start make retrenchments if necessary along other lines, but by all means have a good roadbed. It will wear out fast enough under the most favorable conditions, and high speed is neither pleasant or desirable on a poor track.

The mayor of Chicago continues his persecution of the local street car companies, and apparently is losing much sleep in his efforts to devise new methods of annoyance. In the meantime our streets are left uncleaned, and their condition would disgrace a town of five thousand. Citizens are waylaid and held up at all hours of the day and night, and within ten days this has been carried to the extent of holding up a passenger on a passenger train in broad daylight, and before the train had gone a mile from the depot. As usual no arrests were made. Policemen are being constantly attacked and shot and one was killed by these bandits. But the chief executive appears to have no time for such incidents as long as he can harass a street car company.

A Brooklyn divine in a sensational sermon characterizes corporations, notably street car companies, as robbers, against whom the public has no voice. The average manager is laboring under the impression that it is the dear public which deems it a virtuous act to "beat" a company; and as for the public having no voice, we have always found it one grand chorus of kicks when through some accident or inadvertence a car was late, or the customary comforts were temporarily disarranged. Then he goes on to commend what he calls "the Chicago rope and gallows act" in language for which if he was in the least informed of the actual facts would make him blush or stamp him as an anarchist. Business men and reputable citizens had nothing to do with the threats of which he speaks with so much commendation, except to disown them. The Rev. Frank is evidently either the victim of a wild hallucination or easily gullible.

The necessity of signals or interlocking devices at grade crossings of street railways with steam railroads has frequently been mentioned in these columns, and recent accidents as well as some narrow escapes call again attention to the subject.

At Scranton, Pa., last month a motorman ran his car through the gates at a railroad crossing and it was struck by a freight train, one of the 14 passengers on the car being fatally injured.

From San Francisco comes the story of a narrow escape; a train of two coupled street cars was stopped on the tracks of the Southern Pacific by an accident to the electrical apparatus while crossing. In this instance the passengers, over 100 in number, left the cars and the men of the party were able to push them across the tracks, just in time to avoid a collision with an approaching train.

At Indianapolis recently, the trolley left the wire while a car was crossing the tracks of a steam railroad, and the car stopped directly in front of an approaching train. By an emergency application of the brakes the train was stopped within four feet of the car which was filled with passengers. It so happened that the brake leverage on this particular train had been increased a short time previously and a quicker stop was made than would otherwise have been possible.

In any of these cases there might have resulted an accident, to settle the damage claims arising out of which would have paid for the installation of several interlocking systems.

During the late controversy over the franchise question in Chicago there were some astonishing figures and arguments presented in the newspapers regarding street railway properties. The ignorance of the contributors and the editors of the Chicago dailies was painfully evident. Possibly they had not informed themselves on the subject, but that did not deter them in the least from discussing the financial and operating affairs of the street railway corporations. The printing of such matter holds the writer up to ridicule to those conversant with the actual conditions, but the harm comes from the impression made on the public mind. An ordinary business man has no time or inclination to figure out the receipts of the company by the number of nickels collected by the conductor on the car in which he rides, and it is impossible for him to estimate the expense of operating a large railway system, for there are hundreds of items which go to make up the total. For this reason figures utterly at variance with the truth can be taken as an hypothesis, and false and impossible conclusions deduced therefrom, and at the same time be received with credulity by the public.

Last month attention was called to a statement which was credited to the REVIEW in an article printed in the "Chicago Record" which never appeared in our columns. In the next contribution on street railway affairs in that paper, it is one of our contemporaries which suffers from the legerdemain method of making copy. Under the caption of "Underground Traction" (the article, however, treats of conduit, not a tunnel system of railways) Edward W. Bemis argues that the "unsightly trolleys" should not be tolerated longer. Mr. Bemis is the professor who about two years ago proved decidedly obnoxious to Chicago on account of his socialistic utterances, and had to seek employment elsewhere.

Reference is made to a report by F. S. Pearson (who for years was chief engineer of the Metropolitan Street Railway Company, of New York) to the city of Liverpool, and from this an argument is deduced against the trolley. Elsewhere in this issue is a description of the first trolley line in Liverpool, just completed. Mr. Pearson's report is not against the trolley and Liverpool wisely decided upon that system in preference to all others after the most extensive investigations in Europe and America.

The most glaring fabrication in this article is contained in the following figures: Receipts per car-mile—Cable, $33.27; Electric, $26.03; horse car, $28.82. Operating expenses per car-mile—Cable, $17.55; electric, $10.06; horse car, $17.89. To the casual reader this does not appear so ridiculous as a few more figures will reveal. The statistics are credited to the report of the Metropolitan Street Railway Company, of New York, for the quarter ending September 30, 1898. For the three months referred to, the car-mileage of the cable lines was 2,804,383, for the electric 4,059,756 and for the horse cars 3,501,088. According to the above table the receipts of the company for that time would be $299,879,626.15, and which would make an annual income of $1,199,518,504.60. Under these financial conditions there would be good reason for the 4-cent fare clamor, and compensation sufficient to run the entire city government, which would be a mere incidental expense of $30,000,000 a year, and in addition the company could well afford to help out the government by assuming the entire pension roll which might be enlarged to include worn out professors of political economy who are no longer acceptable in our universities; municipal reformers, theorists and others of that class.

Apparently it makes no difference to some newspaper proprietors what they say as long as it hits street railways and they appear to delight in prostituting their columns to these malicious falsehoods.

A street railway company is one of the largest, if not the largest, consumer of power in any community, and where there is current available from a water power plant a great saving can be effected. As a rule the current has to be conducted for some distance and alternating current transmission is adopted for the sake of economy. For lighting and general power purposes it is only necessary to reduce the voltage by means of static transformers, but for electric railways direct current is necessary and some means must be used to convert the alternating current to drive the direct current machinery of the street railways.

The most natural solution was to operate a direct current generator by an alternating current motor and this has been done successfully. The two machines have been combined in one and the name rotary converter applied to it. The advantage is obvious as the same fields and windings are used both for the alternating and direct currents and the functions of an alternating synchronous motor and a direct current generator are performed by the converter. It is merely an ordinary generator with collector rings connected to the windings at one end of the armature; of course no driving attachment is necessary. It is well understood that alternating currents are generated in every armature winding and rectified by the commutator. In the converter the alternating currents are led into the winding from the transmission lines by collector rings and as the commutator segments from each winding pass under the brush the process of commutation goes on as with an ordinary direct current generator. The converter is not only simpler than two machines but it is cheaper in first cost and less expensive to maintain; it has a much greater capacity for the same weight; there are no serious armature reactions, due to combining the functions of a motor and a generator armature in one, and for the same reason there is an absence of mechanical torque and field distortion. The effect of the current driving the armature balances the dragging effect of current generation. In some converters of the earlier types there were two sets of windings on the armature but this practice is now obsolete for there is no advantage in having more than one set of windings.

One peculiarity of the converter is that the ratio of voltages in converting the currents is practically fixed, being approximately as 1 is to 1.41, or, to illustrate, with an impressed effective e. m. f. of 350 volts at the collector rings a current would be taken from the commutator at 500 volts. This would not be so if there were two machines, a motor and a dynamo, for in the latter case the voltage could be regulated by the field excitation. However, nearly the same effect can be accomplished as over-compounding with direct current generators by a certain amount of self-induction being interposed in the alternating current lines feeding the converter which is excited by a compound winding.

On another page may be found the reprint of a paper read by Prof. S. P. Thompson before the Institute of Electrical Engineers on "Rotary Converters" which is well worth the time required for its perusal. The paper is quite long and complete, including several tables and diagrams, but the subject is treated without resorting to mathematics. The author mentions the growing favor for alternating currents in railway work and the fact that in America the converter has found its application on a larger scale than in Europe, which is largely due to the numerous water-falls in this country. The street railways about Niagara Falls, Buffalo, Salt Lake City, Ogden, Sacramento, the interurban between Barre and Montpelier, Vt., and others receive currents from water power plants which after passing through converters is fed into the lines.

But alternating current transmission is not by any means confined to water power plants. The economy of large power stations with units of great capacity is recognized. Recent progress in alternating current transmission and the development of the converter has made it more economical to generate the current in a large central station, transmit it a high voltage and convert it at suitable points to feed the lines. The tramway system of Dublin has a three-phase transmission for the lines at a distance from the station and those nearby are fed direct from the generators which are steam driven. The same plan has been carried out on the Chicago & Milwaukee Electric Railway, the alternating current being transmitted at 4,500 volts. The power station of the Metropolitan Street Railway Company, in New York, of 70,000-h. p. capacity, is designed for supplying current to all parts of the borough of Manhattan at a voltage of 6,000. The current will be reduced in potential and converted at eight sub-stations conveniently situated with reference to the various railway lines. The same system has been adopted for the Central London Railway.

The latest and most complete feeding systems in our large cities provide for alternating current transmission. From a theoretical and practical standpoint this is even more applicable to interurbans with long straight lines. For the interurban systems now being planned high voltage transmission is in nearly all cases favorably considered, for it is recognized as a step in advance. The rotary converter has made this possible and it is particularly fortunate that it should be developed just at the time when electric railways are lengthening and alternating current transmission is finding wide application. The development of the converter has been so recent and rapid that literature on the subject is very meager; so that a comprehensive paper by so eminent authority as Prof. Thompson commends itself to street railway men who are keeping abreast of the times.

The reorganization of the naval personnel is a subject which should interest our readers for two reasons. First, as citizens of the republic we should all wish for what will increase the efficiency of the navy. Second, as men engaged in a business (like so many modern industries) having its foundation upon the work of the engineer, civil, mechanical or electrical, we can appreciate the importance of the naval engineer, as well as the injustice of the system which denies him proper recognition.

We have nowhere seen a better statement of some of the facts which render necessary a reorganization of the United States navy than that presented by Arthur Warren in current issue of the "Engineering Magazine," in his article on the "Fighting Engineers at Santiago."

A few weeks after the battle in which Cervera's fleet was destroyed one of our technical contemporaries, in rebuking the author of an English comment on the battle,said editorially: "We venture to say that when the full official reports are made public that editor will be convinced that the blockade of the Spanish fleet in the harbor of Santiago was one of the most beautiful examples of sustained vigilance and discipline that he ever heard of. There is no probability that the ships of the blockading fleet lay off the harbor with their fires banked. There is, on the other hand, great probability that every one of those ships was always ready for instant motion and action." This is an engineer's view of what should have been done during the blockade, and knowing the professional ability of the engineer corps of our navy the natural conclusion was that this is what was done. And we thought, judging by the result accomplished, that these were the facts.

If Mr. Warren's information is correct, and at this late date there is no good reason why it should not be, the fleet at Santiago was far from ready for instant motion and action. Mr. Warren says: "The American ships had been off the coast for weeks, waiting for the enemy to come out. When the enemy came out, the American ships were ready to shoot, but not to give chase. This was no fault of the engineers. It was not the effect of over-confidence. It was the result of a condition. The condition is peculiar to naval practice. It was long ago discarded in the merchant service. In the merchant service the chief engineer controls his department. In the navy the captain controls the engineers and is in turn controlled by the commanding officer of the fleet. The chief engineer of an Atlantic liner looks to his captain for starting and stopping signals only; for the rest he takes his orders from his owners and reports to them. The chief engineer alone is responsible for the care, operation and economy of the machinery. In the navy the ship's captain decides how many boilers shall be used, how much coal shall be burned, what pressure shall be carried. And the American captains at Santiago had everything in readiness except their engines and boilers. There were two exceptions,—the Oregon and the Gloucester."

On nearly if not quite all the vessels, save these two, engines were uncoupled, fires out, boilers empty, and some of the commanding officers were seeking to make records for coal economy! As it is aptly put, "in time of war the boiler rooms were prepared for peace."

In railroad service the conductor has charge of his train, but that does not enable him to direct what steam pressure his engineer shall carry or how much oil he shall use. The engineer is given his locomotive and held accountable for results.

The naval personnel bill now before congress is a well-considered attempt to remedy some of the recognized defects in the present organization. By it the engineer officers are to be transferred to the line and thus given the rank heretofore denied them, and henceforth all officers must be to some extent engineers. It would be well if the engineer officers were further given the same authority in their special department as is enjoyed by engineers in the merchant service.

THE GRAB-HANDLE MAN GETS SIX MONTHS.

In the Review for December, 1898, page 852, was published an account of the operations in Massachusetts of a man of many aliases whom we have named "the grab-handle man," together with references to former numbers giving details as to the attempts made by the same man to defraud other companies.

Jas. J. Valentine, treasurer of the South Middlesex Street Railway Company of South Framingham, Mass., sends us the following account of the trial of this man, from which it will be seen that he was quite active in Massachusetts:

"Sidney A. Phillips appeared as counsel for the South Middlesex Street Railway Company, into whose meshes the man of so many aliases had become entangled within one short week. The following witnesses appeared: W. B. Rockwell of Staten Island, N. Y., president of the Staten Island Midland Railway Company, also holding the same position with the Electric Mutual Casualty Assurance Company of Philadelphia, which makes a specialty of electric railway accident risks; Benjamin J. Weeks, superintendent of the Quincy & Boston Street Railway Company; Dr. Fred E. Jones, employed by the same company, Charles C. Barron, superintendent of the Lowell Suburban Railroad; Chief of Police Michael Eagan of Framingham; Superintendent John W. Sullivan of the South Middlesex Street Railway Company; Conductor Osgood D Childs of the same company, and Dr. Peter Owen Shea of South Framingham. Nearly all testified against Zimmerman in the most positive manner. Chief Eagan, the arresting officer, in his testimony, read a letter from Chief of Police Homer G. Bradley of Joliet, Ill., in which he stated that the person in question whose photograph (Street Railway Review, September, 1897, page 559) he inclosed had served a short jail sentence.

"President Rockwell fully identified the prisoner as the man who in July, 1898, made a claim in his office for $35 for personal injuries alleged to have been received by a defective grab handle on his system, but which he was not paid. He then gave his name as John Schaeffer (Street Railway Review, August, 1898, page 583) and his residence as a certain number on Fifth avenue, New York, which proved to be fictitious on examination.

"Superintendent Weeks' testimony was to the effect that in consequence of a claim for damages made in his office October 17, 1898, the same party got $25 in settlement and his receipt, which was produced in court, the name of John Dietz being signed. He gave his residence to Superintendent Weeks as Weymouth landing, but it is proved that he lied in that regard. The Quincy & Boston official brought in his pocket a warrant issued from the district court of East Norfolk in which Dietz was charged with obtaining money under false pretenses.

"Superintendent Sullivan detailed the facts leading to the arrest of the swindler last week in South Framingham, as the result of his claiming $25 damages for an alleged accident on his road and in Natick.

"Dr. Peter Owen Shea, who was called to examine the prisoner and who, after considerable effort, made him unloose the bandages on his arm at the time of his arrest, stated on the witness stand that Zimmerman was afflicted with 'pure faking,' and that he found nothing at all the matter with him, although on the day he was called the man feigned both sickness at the stomach and injury to his arm.

"Chief Eagan exhibited in the court the tools found in Zimmerman's room, which consisted of a screw driver, covered with cloth way down to the point, a wrench and two pairs of pliers.

"The man was sentenced by Judge Kingsbury to six months in the house of correction for vagrancy. It is believed that the career of a successful swindler has been temporarily checked.

"It quite likely that all the other corporations will also lodge complaints against the swindler as soon as he serves the sentence meted out to him yesterday."

Mr. Valentine also advises us that "John Walter," in March, 1898, attempted a similar fraud on the Cleveland (O.) City Railway Company, and "Charles Zimmerman," on the North Jersey Street Railway Company, Jersey City, N. J., April 23, 1898.

THE SHOREDITCH REFUSE BURNER.

In the "Chicago Record" of December 28, 1898, William E. Curtis, the Washington correspondent, makes the following statement:

"In a letter from London a year ago last summer I described a novel enterprise which had been entered upon by the Shoreditch parish of London to supply electricity for lighting the streets dwellings and public buildings by using the street sweepings for fuel. Up to that date the parish had paid about $30,000 per year for carting the refuse to a barge on the river Thames and towing it to a dumping place in the sea, and about $20,000 annually for gas to light the streets and parish buildings. About $60,000, or $10,000 more than these annual charges, which was met by taxing the people, was invested in an electric plant, which has since been run 24 hours for six days in the week, and 12 hours on Sunday, furnishing electrical power for small manufactories during the day and for illuminating purposes at night. The street sweepings have furnished almost all the fuel necessary. The cost of coal in addition was only $432. The total expenditures for the first year were $19,070 for wages, stores, supplies, insurance, repairs and other purposes. The interest, sinking fund, rents, and the ordinary allowance for the depreciation of the property was $10,205, making a total of $29,275.

The gross receipts for the sale of light and power, including a credit equal to the average charge for street lighting by gas, were $45,205, thus leaving a net profit of $15,930 for the benefit of the parish treasury, which will be used in enlarging the plant."

This article resembles many of the statements we see concerning the municipal enterprises of English cities in that it is inaccurate. The Shoreditch undertaking is a joint one comprising the electric light plant and the refuse burning plant, the accounts of which are presented separately. The figures quoted by Mr. Curtis and given above were taken from the report for the electric light plant only, the reduction from pounds to dollars being made by multiplying by five. The cost of coal is given above as $432; in the vestry accounts this is £432 ($2,160).

The net profit in the electric light plant is stated by the vestry to be £3,184 ($15,930, if we call $5 equal to £1). The refuse burning plant, the accounts for which were overlooked by Mr. Curtis, showed on their face a loss of £2,679 ($13,395) without making any allowance for interest and sinking fund, or for depreciation of the boilers and furnaces. An allowance of £1,435 ($7,175) was made for interest and sinking fund, and the sum charged to the general taxes levied on the parish, but none whatever for the depreciation.

These accounts have caused much discussion in England, and the "Electrical Review" after analyzing the combined accounts which show a net profit and saving of £2,679 ($13,395) says: "The profit has been arrived at by making no proper allowances for depreciation and repairs, which we roughly estimate at £2,000; by charging £1,435 for interest and repayment of capital on the destructor, to the general rates; and further by taking credit for an imaginary saving of £1,253 on the old system of scavenging, making a total of over £4,600 ($23,000) which has been 'hocussed' out of the accounts."

It must also be stated that even this showing is made only by charging the scavenging department of the parish 50 cents a ton for all the refuse that is burnt; another parish in London has contracted for the same service at less than 25 cents per ton. In fact it was freely stated at the meeting of the Shoreditch vestry that the burning of the refuse cost the scavenging department more than the old method of barging.

One thing of interest in this connection is that the vestry clerk has, up to the date of our latest advices, refused to sign the accounts; one reason given was that £1,255 advanced out of the general rates to pay deficits in the electric light plant between March, 1895, and March, 1897, was credited as income earned during the year ending March, 1898.

DAM WRECKED AT TAMPA, FLORIDA.

By the courtesy of George D. Munsing, general manager of the Consumers' Electric Light & Street Railroad Company, we have been furnished with an account of the explosion which wrecked the dam of the company on December 13 last. The dam which was built across the Hillsborough river about six miles from Tampa was described in the REVIEW for October, 1897, page 687. The flumes and weir were built of concrete masonry; the flumes occupy a space 110 ft. by 24 ft. and 30 ft. high from the base, and the weir is 132 ft. long and 19 ft. high. The power-house is on the south side of the river, just below and parallel to the masonry flumes, and is 150 by 50 ft., containing two 300-k. w. alternators, two 200-k. w. direct current generators and other smaller apparatus; there are two 400-h. p. engines for use as auxiliaries in times of low water.

North of the weir, that is on the side opposite the flumes, were the flood-gates, which were 15 ft. wide; beyond the gates the dam was built of dirt with sheet piling of timber through the center. The masonry wall which held the dirt at the end of the gate was 100 ft. long, 7 ft. thick at the base and 30 ft. high.

On the night of Tuesday, December 13, three charges of dynamite which had been placed against the lower side of the retaining wall, one near the bottom, one half-way up and one at the top, were exploded, shattering the wall and breaking through the gates. In less than half an hour 225 ft. of the earth wing dam, including the retaining wall, was carried down the stream.

The fall from the dam to the mouth of the bay is only a few feet, the water could not pass away very rapidly and hence backed up into the power-house. All the machinery was submerged for some three or four hours. The loss including the damage to machinery is estimated at $75,000. The accompanying illustration is a view of the dam taken after the water had subsided; the point of view is on the south or power-house side.

No explanation is given of the dastardly outrage, but one of the watchmen is now under arrest.

A local paper states that J. A. Tucker, one of the watchmen who was on duty at the time the explosion took place, and on whose side of the dam the great catastrophe occurred, has been arrested, charged with complicity in the affair, and is now in the county jail. In three minutes after the affair, the other watchman by the name of Morgan, whose post was on the opposite side of the river, says that Tucker had crossed the stream and was talking to him about

DAM AFTER THE EXPLOSION.

the affair. He is reported as having told several very fishy tales concerning it, and it is believed that this man knows a good deal about the matter. Morgan shot twice at a moving object just as soon as the explosion had occurred, but thinks now that it was Tucker who was crossing the river in a boat. Tucker's post is located at the far end of the dam, and it gave way up to a few feet from where he says he was sitting when the explosion happened. There are 12 electric lights strung on top of the dam clear across the river, and it would be impossible for a man to get within 50 yards of it without being discovered by the watchmen if they were doing their duty, and it cannot be conceived how this man Tucker was on duty and at the same time allowed a person to slip by him and set the dynamite cartridge which played so much havoc, without noticing him.

MORE THIRD RAIL FOR N. Y., N. H. & H.

The announcement is made that the New York, New Haven & Hartford Railroad is to use electricity (third rail system) on the New Haven and Derby division between New Haven and Ansonia. In case this improvement is immediately carried out it will probably result in the abandonment of the fight for a trolley line between Derby and New Haven.

There has been a warm fight waged at the last two sessions of the legislature for a charter for such a trolley line; the first time the matter came up the railroad secured an easy victory, but in 1897 the trolley charter failed only by a small majority, and the present plan is to forestall a rival electric road.

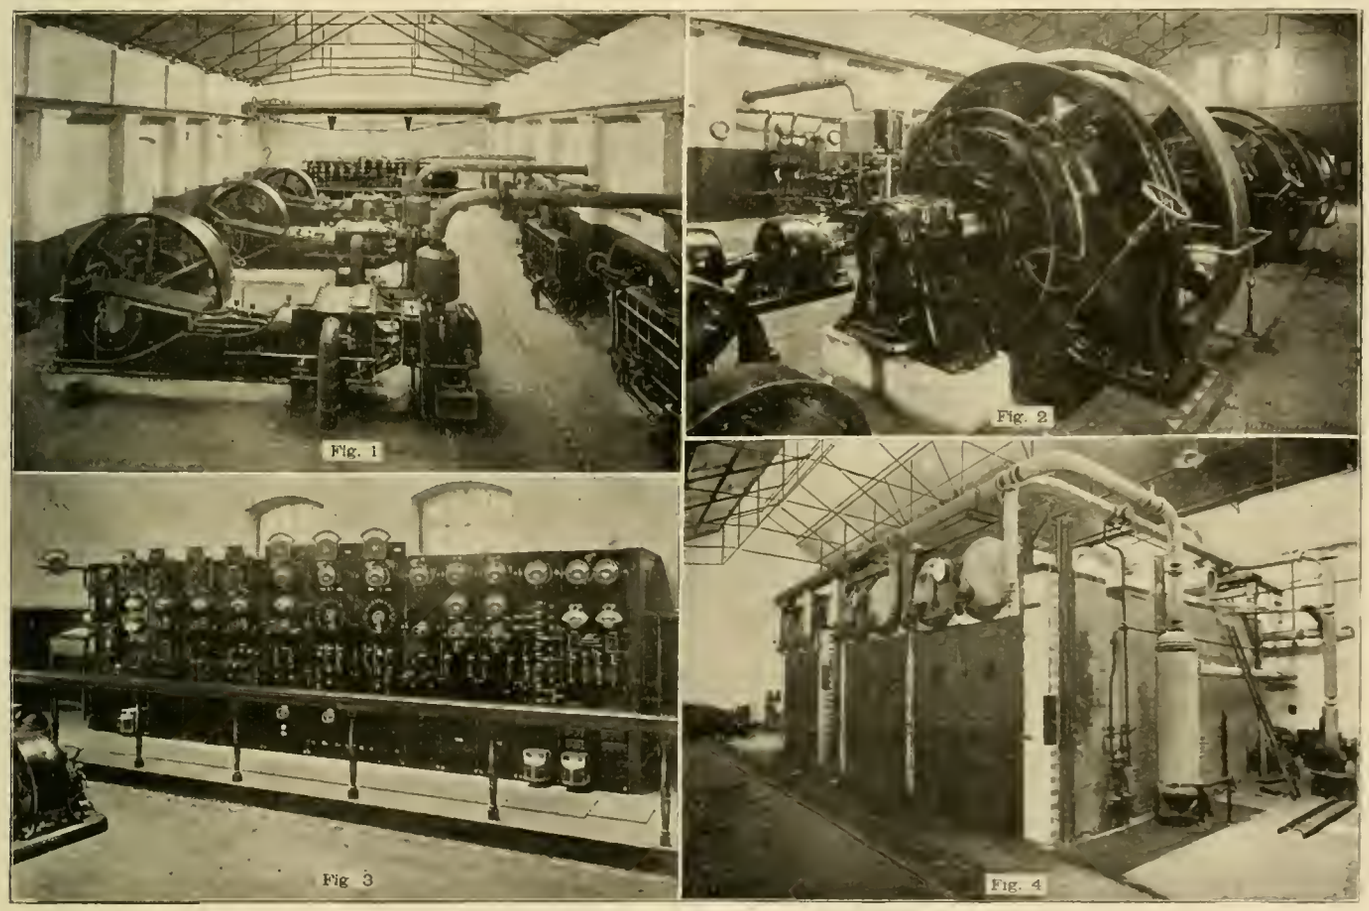
It is said further that Derby is to become the central point of an extensive third rail system, and that with a central power station here the Consolidated will be enabled to replace steam locomotives as far as Waterbury on the north, New Haven on the east, Naugatuck Junction on the south and Botsford on the west. These are all junction places, and including Derby, Ansonia and Shelton, comprise a population of 190,000.

The new street railway between Worcester and Grafton, Mass., was opened on December 15. The first car over the line carried 50 guests of the company who were entertained at dinner in Grafton.

THE ELECTRIC TRAMWAYS OF CORK, IRELAND.

Cork is the third city of Ireland, having a population in excess of 80,000. Until within the present century it was second only to Dublin, but Belfast has become the industrial city of the island and has surpassed its two rivals. Cork is situated upon an island in the River Lee and on both banks, near the southern coast of Ireland. There are numerous handsome public, commercial and church buildings in the city, and many fine residences are in the pretty suburbs on the surrounding hills. The village and laurel groves of Blarney are only four miles distant, and also the celebrated castle of the same name.

In 1896 the municipality obtained an electric light provisional order and later transferred its powers to a company which had been formed to construct a tramway system in the city. The organization then became the Cork Electric Tramways & Lighting Company and carried out the plans for supplying electricity for light, power and traction services. The operation of the tramways for the past month has proved entirely successful. From the station, current is also supplied to 217 customers having 11,622 incandescent lamps and 18 motors aggregating 113 h. p. In addition to this there are 100 city arc lamps. The charge for lighting current is 10 cents per k. w. h. and for power 8½ cents per k. w. h. for the first two hours and 2 cents per k. w. h. afterwards.



VIEWS IN THE POWER STATION OF THE CORK ELECTRIC TRAMWAYS & LIGHTING COMPANY.

A map of the lines, together with feeder circuits and connections, is given in Fig. 5. The tramways are for the most part single lines with turn-outs, and have a total length of 11 miles. Double tracks are laid through the principal streets; branch lines run to Tivoli, St. Lukes, Western Road, Blackpool and Douglas. The longest branch is to Douglas, a village about two miles south of Cork. The tramway crosses the river twice, first over Parnell bridge, a steel swing bridge, and again over Patrick's bridge, which is built of stone.

The rails are of the girder type, of steel, weighing 83 lbs., per yd., and are of American manufacture. They are 30 ft. long, 6¼ in. deep, and are slotted for the tie-bars, and drilled for the fish-bolts and electrical bonding. The fishplates are of steel, 26 in. long, weighing 56 lbs. per pair, and the outer plate is the larger, giving support to the rail head. The tie-bars are of wrought iron 2 in. by ⅜ in., weighing 10½lbs., with two nuts at both ends, placed at 8 ft. centers and 3 ft. from the ends of the rails. The crossings are built up as the work proceeds, and the rails are cut and scarfed for this purpose by a cold steel cutting saw. The scarf is held to the crossing rail by specially made fishplates, forged to suit, and a plate 6 ft. long by 1 ft. 6 in. by ½ in. is placed beneath and bolted up to the rail flange with 10 bolts 2½ in. by ⅝ in. The crossing is completed by cutting a groove through the head of the crossing rail. The rails are laid upon a continuous bed of Portland cement concrete (5 to 1), 6 in deep and 7 ft. wide. The roadway between the rails, and 18 in. outside each rail, is paved with Welsh granite setts 6 in. deep and 3½ in. wide laid on a ½ in. bed of sand, and grouted with Portland cement mortar (3 to 1) well swept into the joints. Outside the city boundaries, the rails are laid on creosoted sleepers, 6 in. by 4½ in. by 9 in. The rails are fixed to the sleepers by 30 dog spikes and 14 fang bolts and chips to each rail length. The switches are cast steel, made by Dick, Kerr & Co.

The steepest grade is 7 per cent, and the sharpest curve has a radius of 27 ft. The turn-outs are 200 ft. in length, and the space between each pair of rails is 4 ft. 6 in.; but when center poles are used the space between the tracks is 6 ft. 6 in. The gage is 2 ft. 11½ in., and was determined with a view to the probable use of the tramway for conveying the cars of the Muskerry Light Railway Company to and from the quays, and for interchange of traffic with the Cork & Passage Company. The Muskerry Company's gage is 3 ft., and that of the Cork & Passage Company is being converted from 5 ft. 3 in. to a 3 ft. gage. A section of double track construction is

shown in Fig. 6. The rails form the return circuit, and are electrically connected at each straight joint by two No. 000 B. & S. Chicago bonds, 35 in. long. At every switch there are two 13-ft. bonds spanning the steel casting, and there are also for each switch four 35-in. bonds, arranged as shown in Fig. 7. At each crossing there are four No. 000 B. & S. 35-in. bonds. The rails are cross-

FIG. 5.—CORK TRAMWAYS.

bonded every 240 ft., and where double tracked, the tracks are also cross-bonded in every 240 ft. These tracks cross bonds are placed half way between the rail cross bonds. Where there is double track with central poles the cross bonds between the two tracks are 7 ft. long, and where there is double track with side poles, 5 ft. long. All the cross bonds on single track are 42 in. in length. In all the loops on the single line there is a cross bond between the two tracks. The return circuit is continued over the river at Parnell bridge by four 250,000-c. m. cables, connected by bonds to the rails on either side of the water; this arrangement is necessary to avoid any interruption in the circuit when the bridge is swung open.

The trolley wire is of hard-drawn copper, double throughout. The portion of the trolley wire over the swing part of Parnell bridge is supported on special poles and brackets fastened to moveable parts of the bridge; the connections on the trolley wire are heavy spring clips, which allow the bridge to be moved in either direction. Center poles with double bracket arms are used in the principal streets, and side poles with single bracket arms elsewhere on the line. Span wires are employed only in a few places. The poles are 31 ft. long, composed of three sections of 5, 6 and 7-in. steel tubing with joints overlapping, and shrunk on while hot.

In the principal streets an arc lamp is fixed on every alternate pole. The lamps are of the enclosed arc type, connected up five in series; they are also connected so that the consecutive lamps are on different circuits. Switches and resistances are contained in the bases of the poles, so that a resistance can be placed in the circuit instead of a lamp, if necessary; also, each circuit can be controlled from any lamp in its circuit. The lighting distribution is the three-wire system, with 460 volts between the outer ones, the mains in the majority of cases consisting of jute covered, lead sheathed, tape armored cables, laid direct in the streets. Altogether over 20 miles of cable for the lighting and traction systems have been laid; the distance between the feeding points, of which there are two at present, and the station is a little less than half a mile.

In their course from the power station to the feeding points, the cables cross the River Lee, and as there is only a swing bridge at this point the cables had to be laid in a trench excavated in the bed of the river, Callender's vulcanized bitumen wire armored cable being adopted as most suitable for the purpose. Four additional feeder cables of 900,000 c. m. have been laid across the river to provide for future extensions; the vulcanized bitumen cables being brought together in a pit on each side of the water, where they are connected to the ordinary jute covered, tape armored cable laid in the streets. The greater proportion of the distributing cables in the center of the city are of the three-core type; the largest distributor used having a sectional area of 200,000 c. m. In all the outlying districts, three single distributing cables are used, and, in addition to their armoring, they are further protected by a covering layer of bricks. At the crossing and junction points of the net work, Callender's disconnecting boxes are fixed, and of these, 19 are at present installed.

The power house is on Albert street near the Cork & Passage river terminus, and about 220 ft. distant from the river. The site upon which the station was built was once a morass, and to obtain solid foundations 137 pitch-pine piles were driven. These are each 37 ft. long, 12 in. in diameter and placed zigzag at 5 ft. centers. Upon these concrete was laid. The building is of brick, faced with Ruabon brick. The arrangement of the power station and car shed is clearly shown in Fig. 8.

Figs. 1 to 4 show views of the engines, generators, switchboard and boilers.

Three McIntosh & Seymour side-crank tandem compound condensing engines, running at 150 r. p. m. are each fitted with expansion governors, with separate exhaust valves on both high and low pressure cylinders. The high pressure cylinder is steam jacketed and exhausts into a receiver, in the interior of which are fixed three copper coils, which can be heated with live steam. The diameter of high pressure cylinder is 12 in., the low pressure cylinder 22 in., with a stroke of 30 in. The crank shaft is 11½ in. in diameter. The fly-wheel is 11 ft. in diameter with a 15-in. face, and weighs 55,000 lbs. The engines are worked condensing with a vacuum equivalent to 26 in. The valve gear is positive and is composed of simple links and levers, and the cut-off can take place at any point between zero and 8-10 stroke. The engines are guaranteed to regulate from no load to full load within 2 per cent variation of speed, and when cutting off at ¼ stroke will develop 313 h. p., at 6-10 cut-off, 557 h. p., the maximum point of cut-off being 8-10 stroke. The engine beds are 6 to 1 Portland cement concrete, 8 ft. in depth, laid upon 96 pitch pine piles, 12 in. by 12 in., driven at 5 ft. centers. The two condensers are of the Wheeler admiralty type. The engines are in the center, the air pump at one end and the circulating pump at the other end, each capable of dealing with 12,000 lbs. of steam per

FIG. 7.—ARRANGEMENT OF BONDS.

hour. The water is taken direct from the river through 12 in. cast iron pipes. There is also an auxiliary supply from the water works which can be relied upon to start the pumps in the event of the suction pipe being emptied, through the retaining valve not being perfectly water-tight.

Direct connected to each engine is a six-pole 200-k. w. compound-wound generator giving 500 volts at 135 r. p. m. The fields are compound-wound, so as to give a potential at terminals of 500 volts at no load and at full load. A field rheostat is provided for reducing the potential to 460 volts for lighting service. The generators are capable of sustaining an overload of 25 per cent for half an hour without undue heating, and of sustaining momentary fluctuations in load up to 40 per cent above the rated capacity without injurious heating or shifting of brushes. There are three motor-driven boosters which are compound-wound. The winding is such as to give 5 per cent rise of voltage from no load to full load, running at constant speed, and the shunt winding is such as to give a range of potential from 220 to 240 volts when the series winding is cut out.

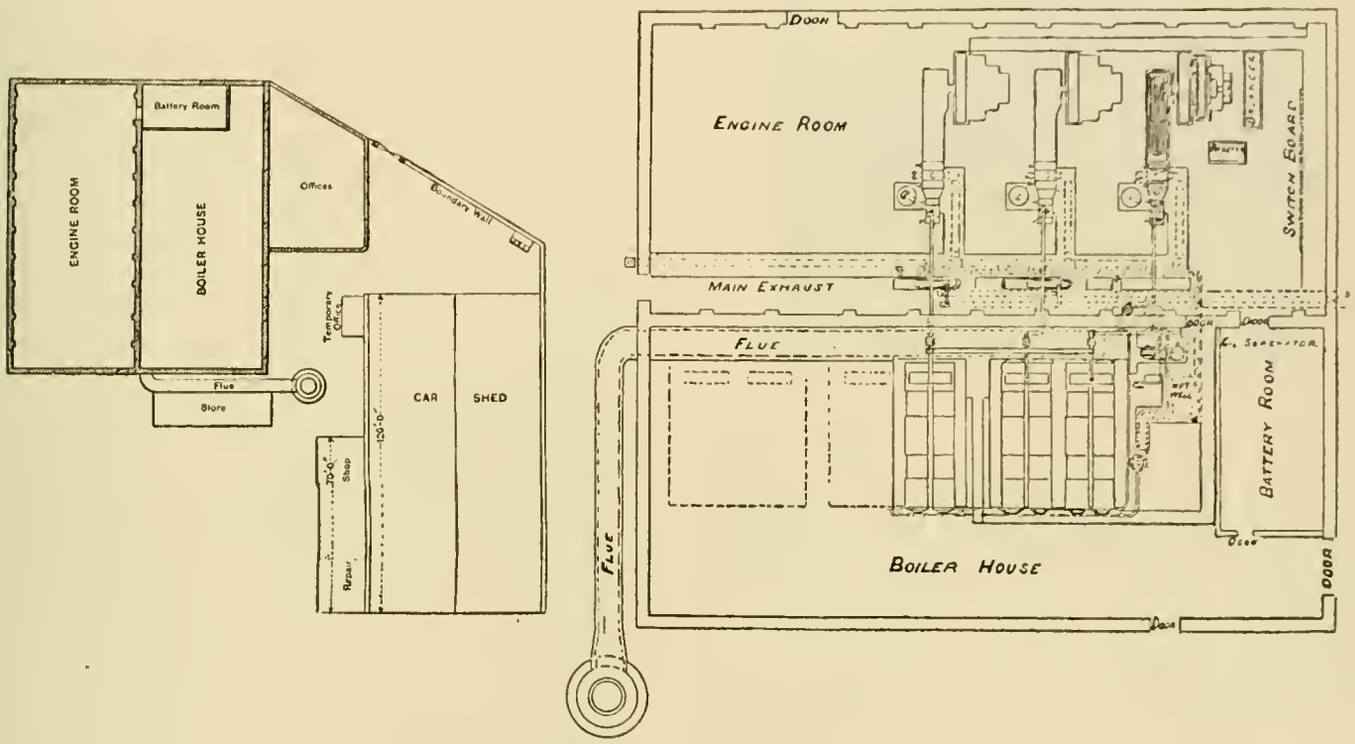

FIG. 8.—PLAN OF POWER HOUSE AND CAR SHEDS.

The arrangement of the switchboard is given in the diagram, Fig. 9. It is situated at the end of the engine room and contains three generator panels, fitted with automatic circuit breakers, with magnetic blow-outs, also the necessary switches, so arranged that the generators can be connected direct to either the lighting or traction bus-bars. The two battery panels are fitted with the necessary regulating switches and magnetic blow-outs, and so arranged that the battery can be either charged from, or discharged to, either the lighting or traction circuits as desired. The two booster panels are so arranged that the booster can, if desired, in the day time be driven direct from the traction bus-bars, or used as an ordinary booster, the two motors being in series across the outside lines of the three-wire circuit and the junction being connected to the neutral wire. In this case, the set is run to give its correct voltage by means of the motor placed in the centre, the electrical connections to which are disconnected after the booster sets are connected to the network. The switchboard is also fitted with a panel containing the necessary instruments required by the Board of Trade for testing purposes.

The battery room contains 256 Tudor cells mounted in three tiers, each cell containing six positive and seven negative plates. The capacity of the battery is 770 ampere hours. The normal rate of discharge is 110 amperes, maximum rate 210. The battery stands are of pitch pine, coated with acid-proof paint and mounted on large oil insulators. This battery can be charged either from the traction or lighting bus-bars as desired, the necessary voltage for charging being supplied by the booster, which can also be driven from the traction or lighting bus bars. The battery booster consists of a 500-volt shunt-wound motor, connected by flanged coupling to a shunt-wound generator and mounted, together with the same, on a combination bed-plate with three bearings. The generator has a rated capacity of 18 k. w., and is adapted to give a range of potential from 40 to 150 volts for running in series with main generators for charging the storage battery.

The boiler room contains three Babcock & Wilcox boilers, each having 2,531 sq. ft. of heating surface and capable of evaporating 8,000 lbs. of water per hour. The normal working pressure is 150 lbs. The feed-water heater was made by the Wheeler Condenser & Engineering Company. The feed water is heated by the exhaust from feed and condenser pumps. The Blake & Knowles feed-pumps are compound, the diameter of high-pressure cylinder being 6 in., low pressure cylinder 9 in., water cylinder 4 in. in diameter, with an 8-in. stroke. The steam cylinders of these pumps are fitted with an improved outside valve gear, so that they can be adjusted to the full length of stroke under all conditions of speed. The steam connections of these pumps are so arranged that, in case of any repairs being required, either pump can be worked independent of the other.

A hot-well is situated in the boiler house. It is fitted with baffle plates, the divisions in which can be filled with coke and straw, if desired, for the purpose of intercepting any oil that may be discharged into the same. It is also fitted with suitable outlets, so arranged that, by opening a valve and filling the tank, the oil, which will be found floating on the surface can be run off. The feed water before entering the boilers can be passed through two Edmiston filters, capable of filtering 16,000 lbs. of water per hour. These filters are arranged on a twin system and fitted with the necessary valves to enable the filters to be used on either range of feed pipes.

The chimney is of steel, and was built by Keeler & Co. of Williamsport, Pa. The height is 130 ft., and the diameter at base is 12 ft., curving in to 7 ft. 6 in. at 12 ft. above ground, and finishing 7 ft. 6 in. at top. The stack is built of riveted plates 4 ft. 6 in. in height, three plates forming a course. They are 7-16 in. thick at bottom, decreasing 1-16 in. for every 32 ft., and finishing ¼ in. thick. The breeching nozzle, 6 ft. wide and 7 ft. high, connecting

the brick flue, is reinforced by the addition of a 2 ft. 6 in. angle iron, forming an arch up the sides and over the top of the nozzle. The stack is lined with 4½ in. radial firebricks, set in fireclay. A water guard is fixed at the top of the chimney, made of 3 in. angle iron turned down to cover the brick lining. The base-plate is of cast iron, 2 in. thick and 15 ft. diameter, in eight parts, strongly ribbed

FIG. 10.—TYPE OF CAR.

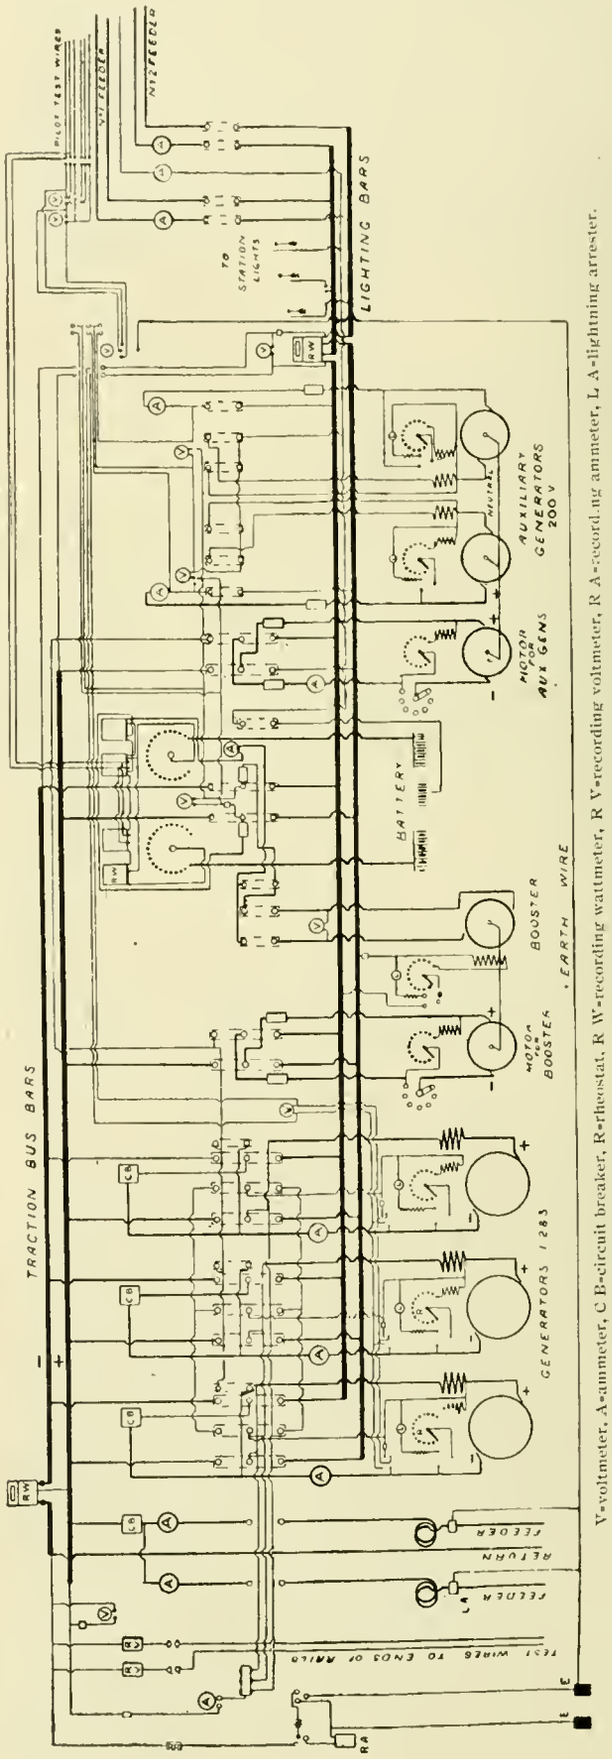
and joined by 1½ in. bolts. The base, 21 ft. sq., is of Portland cement concrete, 6 to 1, and built upon a foundation of 25 pitch-pine piles 12 in. by 12 in., and anchor bolts 14 ft. long by 2½ in. diameter were placed in position before the concreting commenced. The advantages claimed for the steel stack are saving of time in the erection and cost in the structure. The time occupied in erecting was about five weeks, and the brick lining occupied 20 days. The saving in cost over a brick stack was about 25 per cent.

The steam piping is of steel, fitted with heavy screwed steel flanges, so arranged that any engine can be fed direct from the boiler immediately behind it. Necessary valves are inserted to enable any faulty section in the piping to be cut out. This piping is fitted

FIG. 11. END OF CAR SHED.

with an automatic atmospheric valve, which in the event of there being any pressure, due to the failure of the condensing plant, will immediately allow the engines to exhaust direct into the atmosphere; the piping on the atmospheric side of this valve is of thin steel, riveted together in spirals.

The cars, 18 in number, are built to carry 20 passengers inside and 24 outside, and will be electrically lighted. The type of car may be noted from Fig. 10. They were manufactured by the Brush Electrical Engineering Company, Ltd., and are mounted on single Peckham trucks. The motor equipment consists of two G. E. 60 motors with series-parallel controllers; the motors being specially designed for this work on account of the very narrow gage, name-



V-voltmeter, A-ammeter, C B-circuit breaker, R-rheostat, R W-recording wattmeter, R V-recording voltmeter, R A-recording ammeter, L A-lightning arrester.

FIG. 9.—ARRANGEMENT OF SWITCHBOARD.

ly, 2 ft. 11½ in. In other respects the car equipment follows the standard practice.

The car shed, 125 ft. long by 70 ft., is built on ground adjoining the power station, and contains pits for inspecting and cleaning the cars and a repair shop. In Fig. 11 is shown an end view of the shed; its open construction indicates that Cork enjoys a very mild climate. The repair shop is 70 by 18 ft., containing the necessary machines and blacksmith's tools required for the maintenance of the cars and machinery. The entire system was inspected by the Board of Trade on December 8, and the cars are now operating on all the lines on a 10 minute schedule.

DETROIT FORGED TICKET CASE.

The Detroit Citizens' Street Railway Company narrowly escaped having a very serious time with forged tickets which were put in circulation August 10, and it was by the vigilance of some of the officers that the fraud was discovered and run to earth immediately after the tickets appeared. The spurious tickets were hard to distinguish from the originals, but in checking them in the office a young lady clerk noticed a difference in the cardboard and in the strength of some of the lines. Sample tickets were sent to the lithographing company and were pronounced counterfeits.

Detectives were put upon the case and the tickets were readily traced to W. O. Martin, a conductor, and John Cochrane, a motorman. It was discovered that the printing had been done in Chicago and Superintendent John Grant with detectives searched for the printers. J. O. Moore, a State street printer in Chicago, had delivered the tickets to Rufus Johnson, a colored man from Detroit. The engraving was done by Rudolph Lenert, a journeyman engraver, one of the good tickets serving as a model. The engraver was possibly innocent of any intention of wrong doing and the printer claimed that the work was done on an order which apparently came from the company, but he was unable to produce this. Johnson, the colored man, stated that he placed the order for the tickets at the instance of the motorman, John Cochrane.

W. O. Martin, the conductor who was implicated, was convicted and is now serving a three-year term in the penitentiary. Cochrane, who seemed to be the most culpable of all, as well as the negro Johnson and the printer escaped punishment mainly because requisition papers could not be secured. The conductors who sold the counterfeits would give a strip of six of them for a quarter to a passenger and for the fare would turn in a good ticket. In this way the bad tickets were taken up by innocent conductors. Although 36,000 tickets were printed not more than $30 worth were sold. The occurrence cost the company something but it was very fortunate in having discovered that the tickets were being circulated the next day after they appeared. The prompt and vigorous measures taken by Vice-President Hutchins and Superintendent Grant to bring the guilty parties to justice will discourage any future attempts and has had a good effect on the service in general.

STREET RAILWAY LINES FOR VIENNA.

Vienna is one of the largest cities in the world, but up to this time the facilities for local transportation have been very inadequate. The Vienna Tramway Company which holds practically all the valuable franchises in the city depends entirely on horse traction. A contract has now been entered into between the city, the tramway company and a new company, organized by the Siemens & Halske Company of Berlin, which will undertake to reconstruct all the existing lines and build new railways. By the agreement 22½ miles of track must be built in the next two years, 50 miles within four years and after 1903, 21 miles more must be constructed. There will then be a total of 122½ miles of electrically operated railway lines On several of the principal lines a 5-minute service must be maintained and on the rest a 10-minute service. The trolley system has been adopted and Siemens & Halske apparatus will of course be used.

The provisions of the franchise include compensation to the city and municipal supervision in some minor matters, such as the rules regulating employes, etc. Should the dividends for three successive years exceed 7 per cent the city may demand a reduction in fares on the outlying lines. If the city builds electric power stations the company is bound by contract to take current from them. The company is to pay to the city $60,000 for the coming year, $80,000 in 1900, $110,000 in 1901, $140,000 in 1902 and $160,000 in 1903. After five years the annual compensation will be determined by the gross income. If the receipts average $42,000 per mile of track annually 9 per cent shall be paid to the city and for each $800 per mile an additional 1-10 per cent will be added. Then after five years if the profits of the company exceed 7 per cent the surplus will be divided equally between the city and the company. The city reserves the right to construct a subway in the business center for the electric lines and the company must at its own expense erect the necessary plant to operate it.

This provides for a system which is infinitely better than the present horse car traction, but it appears inadequate for a city which is nearly equal to Chicago in population. There is much complaint over the fact that the cost of living in Vienna is greater than any other capital in Europe, especially is this true of house rent. If Vienna were to profit by the experience of American cities more liberal terms would be granted the street railway company, and instead of building 10 to 14 miles of tramway track per year, eight to ten times as much should be constructed which would open up new additions and suburbs where cheap rent and fresh air would prove a great boon to the inhabitants of the overcrowded city.

INDIANAPOLIS STREET RAILROAD LITIGATION.

The Citizens' Street Railroad Company of Indianapolis, Ind., for the last six years has been engaged in litigation with the city of Indianapolis and a would-be rival, the City Railway Company.

In 1893 the city attorney of Indianapolis gave an opinion to the council that the Citizens' Company's franchise expired in 1894 and thereupon the city made a contract with the City Railway Company for a term of 30 years from January 1, 1894. This contract, covered in a general way, the entire existing system and it was the intention, no doubt, to force the company out of the way. The U. S. courts, however, held that the Citizens' franchise was good beyond question until 1901 and granted a permanent injunction restraining the City Railway Company from interfering with its rights. Subsequently the legislature passed an act, the purpose of which was to terminate the franchise, or at least a part thereof, in 1901. This act contemplated the letting of a new franchise for a term of 30 years from that date. For the purpose of clearing up the situation and ascertaining what rights the city had in the premises, a bill was filed in which the city of Indianapolis was the plaintiff and the Citizens' Company and the City Railway Company the defendants. The lower court held that so far as the Citizens' Company was concerned, the rights derived from the original ordinance expired in 1901; it also held that the contract made with the City Railway Company was invalid for the reason that the council of 1893 had not the power to make a contract of the character in question which could not become effective until 1901, as such an act would deprive the council of 1901 of its rights in respect to the street railway question. Upon appeal to the supreme court of Indiana the lower court was reversed by a decision rendered December 16 wherein three of the judges were in favor of a reversal and two against it.

As the three judges who constituted the majority in making this ruling retired from the bench on January 1, there is a possibility that a rehearing may be granted and the decision of the lower court affirmed. To us the recent action of the court appears to be one of political decisions which have not been unknown in Indiana.

The 3-cent fare act of 1897, which has also caused much litigation, was passed in pursuance of a plan to force the Citizens' Company to come to terms after the City Railway had lost its case The history of the 3-cent fare act has been quite fully reported in previous issues of the REVIEW; the case is now pending in the United States supreme court.

The Metropolitan Street Railway of Kansas City, Mo., has experienced some trouble from "tight slots" on its cable lines. The difficulty is due to water entering between the paving blocks between the rails and on freezing the slot rails are forced together.

TRIP AND MILEAGE ACCOUNTS ON THE LYNN & BOSTON.

BY F. E. SMITH, AUDITOR, LYNN & BOSTON RAILROAD.

The following is an explanation of the details of the system used by the Lynn & Boston Railroad Company in keeping an account of the trips run from which the mileage is computed. Conductors are furnished with a book which contains all the trip numbers for all the routes of a division, of which a sample page reads thus:

Routes run from Broadway station—Beachmont and Boston.

From Beachmont.

To Cornhill (Scollay Sq.), via Subway	41
Court and Hanover Sts.,	43
Broadway Station,	45

From Broadway Station.

To Cornhill, via Subway	47
Court and Hanover Sts.,	49
Beachmont,	46

From Scollay Sq., via Subway.

To Beachmont,	42
Broadway Station,	48

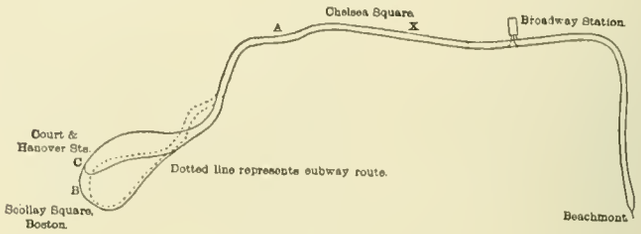
From Court and Hanover Sts., via Hanover St.

To Beachmont,	44
Broadway Station,	50

Use Court-Hanover St. numbers for trips to and from Scollay Sq. on the surface.

As the conductors are frequently sent from one station (which is our name for a car house) to another to help out during a rush, supplying them at the start with numbers covering all the routes on the division, makes it unnecessary to give them this information every time that they are changed.

Form A is the day card in use on the Chelsea division. Conductors are required to send in a separate day card for each of the routes on which they run, for the convenience of the accounting department. This blank is 6¼ by 9 in. The numbers show which route the card covers. The conductors use the column headed "Route Numbers as shown on List of Routes." The numbers given on blank B illustrate a run from the station to Beachmont, then two full round trips to Boston and return to station from Beachmont. Under the system formerly used here, and one which is still in use by many roads, this would have been called two round trips, and the mileage from station to Beachmont on the first half trip, and from Beachmont back to station on the sixth half trip, would not have been counted unless this conductor was relieved at the station by another who continued to Boston with the car, in which case the second conductor would have marked his card as starting from Beachmont. This plan would have covered the mileage of that part of the trip from Beachmont to the station that was run by the first conductor, but neither card showed the actual run



BEACHMONT ROUTE.

of the men. Under the present system, the second conductor starts his card with No. 47. This No. 47 and the No. 45 of the first man equal No. 41, which is a full half trip. When the cards have been checked and assorted into routes, the total of each number run by each conductor is entered on Form B, and this is added and proved. Form B is 8½ in. by 14 in. We prove it in the following manner. Knowing that there must be the same number of trips away from each point as there were to that point (except the starting point or station, and then the rule is reversed), we say the sum of Nos. 41, 43 and 45 should equal the sum of Nos. 42, 44 and 46; the sum of Nos. 42 and 48 should equal the sum of Nos. 41 and 47, etc. If they do not balance, some conductor has given the wrong number for some trip, and it becomes necessary to balance the trips of each conductor until the error is found. We seldom have to resort to this, however, as the clerks who take off the trips become so familiar with the combinations that should go together that they lo-

BLANKS FOR TRIP AND MILEAGE ACCOUNTS

The two forms marked "D" are

cate errors at the time of taking off. They can tell at a glance the number that is wrong and what should be substituted for it from the number that precedes and the one that follows; besides, the time consumed by the trip would indicate whether it was a full half trip or only one to the station, and the nature of the tickets collected on that particular half trip would show whether it was into or out of Boston. We are pretty certain, with all these guides, that the number we substitute is absolutely correct.

The footings of Form B are transferred to Form C and multiplied by the per cent of the round trip, and the sum of the result equals the total trips on that route for that day. Blank C is 8½ in. by 13 in.

The per cents for the Beachmont route are:

No. 41	50.0	No. 46	17.4
No. 42	50.0	No. 47	32.6
No. 43	49.5	No. 48	32.6
No. 44	49.5	No. 49	32.1
No. 45	17.4	No. 50	32.1

The percents are computed from maps prepared by our engineers for each division, which show the distance in feet from one point to both ends of every turnout and cross over, every crossing point and all the termini of the division. This idea was copied from the West End Street Railway Company's system.

On the Chelsea Division, zero is at the point A shown on the sketch of the Beachmont route, this being the point where the tracks of this company join those of the West End Street Railway Company. We add the distance from A to Beachmont and return to the round trip distance from A around the loop at B and back to A together, which gives us the length of the round trip, 66,024 ft. Half of this we allow to No. 41 and the other half to No. 42, each of which is equal to 50 per cent of the round trip. We subdivide No. 41 into No. 45 and No. 47 and No. 42 into No. 46 and No. 48. Treating the route to Court and Hanover streets in the same manner gives us all the per cents as shown in the table. We find this plan particularly useful when less than a full trip is run, as is illustrated on Form B in the case of Conductor Steele, who went from Broadway Station to Beachmont on No. 46 and started for Boston on No. 41, but getting blockaded at Chelsea Square was sent back to the station. On his day card, in place of putting down No. 41, he would write in the space provided, Beachmont to Chelsea square, and on the next line, Broadway station, there being no numbers to cover this trip. We enter on the card on line after No. 46, No. 45; this brings him back from Beachmont as far as the station, and gives us a number to use to balance the trip No. 46; then we find the distance Broadway station to Chelsea square and back, and find what per cent it is of a full round trip, which is 21.6 per cent; this we enter as an extra trip, but it figures with the rest of the Beachmont trips where it belongs. The trips are transferred to our records and footed at the close of the fifteenth and of the last day of each month and the mileage computed. We do not consider it is of enough advantage to compute the mileage more frequently than twice a month to warrant the expense of doing so.

From blank C the trips run on the tracks of the Boston Elevated Railway Company are transferred to our record, Form D, and at the end of the month a report is rendered them. In making this record we only enter the trip numbers of inward trips as it saves half the labor. We also use this record to keep account of the trips run by one division on power furnished by another division. This same system is used in keeping the trips and mileage of the Beverly & Danvers Street Railway, the accounts of which are kept in this office. This road has but one route, but uses the tracks of the Lynn & Boston Railroad Company at both ends. Some trips stop short, however, of the regular termini and we use letters instead of figures to distinguish the trips. We have found the system is perfectly satisfactory on both roads, and believe it is so simple and inexpensive that any road that is not satisfied with its present methods could well afford to try it. It entirely relieves the foremen from making any report of the trips except of chartered cars.

Checking the registers from start to finish enables us to be sure all trips have been reported. The work required of the conductor is so simple that we can insist upon its being done properly. If we required a conductor who finished his run at midnight, after putting in eight hours on his car, to stay and compute his own mileage, we should expect it would take us longer to correct his errors than to do the work ourselves, besides as stated before we do not see any great advantage in having the mileage daily.

OF THE LYNN & BOSTON RAILROAD.

facing pages of the Record Book.

If any readers of this have any suggestions to offer, looking to an improvement of our system, we should be pleased to have them made through the medium of the Review.

REBUILT STATION OF UNION TRACTION COMPANY.

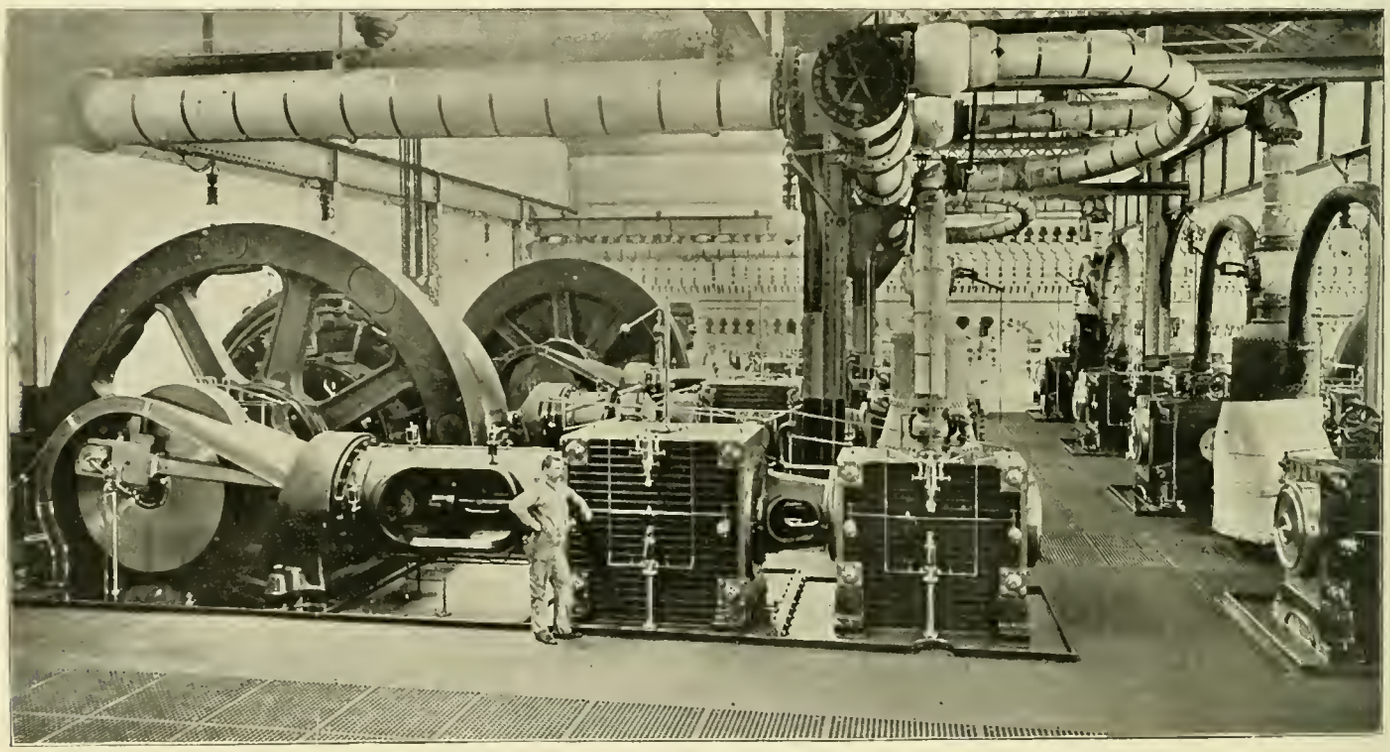
The power station of the Union Traction Company of Philadelphia, located at 13th and Mount Vernon streets, was partially destroyed by fire on March 3, 1897, and the work of reconstruction has been only lately completed. The accompanying illustration is a view of the engine-room as it now is.

The four units consist of compound non-condensing engines, built by Robert Wetherill & Co. of Chester, direct connected to 1,500-k. w. Westinghouse generators. The cylinders are 26 and 40 by 48 in.; the engines take steam at 150 lbs. and run at 80 r. p. m. The engines are not set on foundation capstones as is usually the case, and a large sole-plate forms the base of each engine. The gravity oiling system is used, and the sole-plates serve to collect the waste oil, which is filtered for re-use.

Three of the engines were considerably damaged by the fire and had to be rebuilt; the fourth one was but little injured. Just previous to the fire it had been decided to replace the four generators in the old station, which were of 1,100 k. w. capacity with new 1,500-k. w. machines. The change made necessary new engine shafts, of which but one had been delivered at the time of the fire.

The new shafts were made by the Bethlehem Iron Company of fluid pressed open-hearth steel, and forged in a 5,000-ton hydraulic press. The tensile strength of the material was 85,000 lbs. per sq. in. and the elastic limit 35,000 lbs.; the extension in ½-in. specimens 2 in. long was 25 per cent. Two of these shafts are 20 ft. 5¼ in. long and two 21 ft. 5¼ in.

The boiler-room equipment comprises 19 Babcock & Wilcox boilers of 375 h. p. each. Hoppes open exhaust heaters and Snow steam pumps are installed. The exhaust steam not utilized in heating the feed is carried to a stack connected with the basement of the station, and its high velocity creates a strong draught, thus ventilating the building.



ENGINE ROOM OF REBUILT STATION OF UNION TRACTION COMPANY, PHILADELPHIA.

The Cleveland 4 cent fare case is still pending in the United States court.

EAST SIDE ROAD, KANSAS CITY, TO BUILD.

The East Side Electric Railway Company of Kansas City, Mo., has decided to build four miles of track as soon as possible; it will commence operating the road with 12 cars, and is in the market for materials and equipments. W. O. Hands, who has been appointed manager of the company, advises us that the motive power to be adopted will probably be electricity, although compressed air has been under consideration.

Mr. Hands has been identified with street railway work for over 10 years and has had an experience which well fits him for the position of manager of a company that is building its lines. From 1887 to 1890 he was with the Brush Company at Cleveland and afterwards with the Short Electrical Company. He supervised or assisted in the installation of the roads at Muskegon, Mich.; Rochester, N. Y.; Baltimore and Washington. Mr. Hands has served as superintendent and electrician of the Braddock (Pa.) and Beaver Falls roads; in 1894 he went to Kansas City to become purchasing agent and superintendent of the Northeast Electric Railway Company.

FIFTY-YEAR FRANCHISES.

The town board of Cicero, a suburb of Chicago, met on December 19, and after a session lasting until 1:30 o'clock the next morning passed four ordinances granting 50-year franchises to four of the Yerkes street railways, the Cicero & Proviso, the Cicero & Harlem, the Ogden and the Suburban. The minority of the board attempted to break a quorum by withdrawing, but one member who had not been present because he was suffering from an accident, left his bed when the case was presented to him and attended the meeting. His presence completed the quorum and the ordinances were promptly passed by an unanimous vote. Residents in the districts served by these roads largely gain in the longer ride now given for one fare.

The Carnegie Steel Company has purchased an additional tract of land near Pittsburg, and will erect there a plant for building steel freight cars. A forge for steel car axles will be part of the equipment.

THE NORTHWESTERN ELEVATED, CHICAGO.

Work on the Northwestern Elevated Railroad of Chicago is to be pushed as rapidly as possible, and the prospect is that the northern division of the city by next October will be furnished with an admirable transportation system. It is proposed to provide for express trains which will carry passengers from Wilson avenue to the Union Loop, a distance of six miles, in 18 minutes.

The company was prevented from negotiating a loan early in the year by reason of the war. In November last the matter was again taken up and on December 24 arrangements were closed by which Blair & Co. of New York, Chicago stockholders, and the Illinois Trust & Savings Bank lend $4,500,000 on promissory notes of the company. The notes are secured by the deposit of $5,000,000 of first mortgage 5 per cent gold bonds, and the entire capital stock of the company, $5,000,000, with the Illinois Trust & Savings Bank as trustee.

The company has elected a new board of directors as follows: C. L. Blair and W. W. Miller of New York, and E. L. Brewster, Clarence Buckingham, Bryan Lathrop, D. H. Londerback and John C. Welling of Chicago.

The road was originally organized to operate from Congress street on the south and extending northwest to the city limits. Four branches were provided for, the first commencing at a point on the main line north of Monroe street and running west to a point not more than 100 ft. west of Halsted street, and continuing with two branches, one running northwest, the other north to the city limits. The second branch was to commence at the main line between North avenue and Chicago avenue and extending west to a point between Western and Ashland avenues, thence north to the city limits. The third branch to run from a point on the main line between North avenue and Diversey street north or northwest to the city limits. The fourth branch was to commence at the main line between North avenue and Belmont avenue and extend west to the city limits. One distinctive feature will be a four-track line north of Chicago avenue for 5.52 miles which will accommodate express trains. Plans are contemplated for building inclines by which surface cars of the cross lines may pass to the elevated tracks and be attached to the regular elevated trains.

A power-house of 7,000 h. p. capacity is now building on the corner of Southport and Fullerton avenues. There will be one 1,000-h. p. and three 2,000-h. p. horizontal cross compound Allis engines direct connected to Siemens & Halske generators. The boiler room will contain sixteen 400-h. p. Babcock & Wilcox water tube boilers. The stack will be 16 ft. in diameter and 204 ft. above the street level.

FINE INCREASE IN TOLEDO BUSINESS.

The past three months have shown a most gratifying increase in both the gross and net earnings of the Toledo Traction Company. Operating schedules have been rearranged in a manner at once improving the service and reducing expenses, and with other changes have combined to make the present showing one of the best in the country. Toledo is largely a manufacturing city, and is working hard to secure more industries, hence the city is growing rapidly. The company will at once install an additional 500 h. p. of engines and generators, and General Manager McLean expects even this will be insufficient within a year, if the present rate of increase is maintained.

KINETIC MOTOR NOT RUNNING IN DETROIT.

We have had several inquiries as to the operation of the kinetic motor supposed to be running in Detroit, and find it is not in operation there at the present time. In fact the trial which was made on the Detroit & River St. Clair Railway was anything but satisfactory, and the motor was taken off after two days and a steam locomotive has been used since in its place. The Dodge kinetic motor system was not tried on the Detroit & Mt. Clemens line, as currently reported.

FALK CAST-WELDING ON THE THIRD AVENUE RAILROAD, NEW YORK.

On December 27 the first cast-welded joints on the Third Avenue cable line, New York, were made by the Falk Manufacturing Company and the work of welding is now under way. The joints on this line are made without interrupting the operation of cable trains, which run during the night on a three minute headway and, to quote the foreman in charge of the welding, "Come like shots from a Gatling gun," making the work a matter of more than ordinary difficulty. The track on Third avenue is laid with 7 in. Trilby rails on yokes 5 ft. between centers, and in order to make the joints without interrupting traffic a special mold and clamp was devised by the Falk Company. The clamp is made long enough to reach from

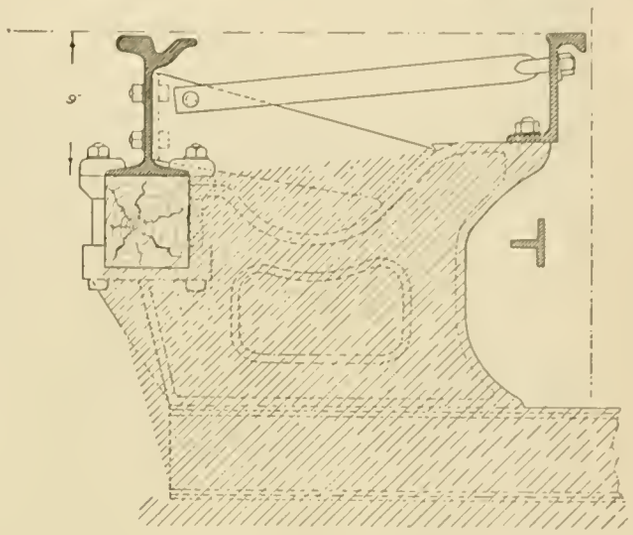


FIG. 1.—CROSS SECTION.

yoke to yoke, thus taking the weight of the car off of the joint itself, and is provided with tapered risers at the ends so that the car can run over it without difficulty.

Superintendent Robertson, who is giving his personal attention to the construction of the road, has carefully inspected the welding and has been well pleased to find that the running of the cars during the progress of the work has not in the least depressed the joint, which it had been feared might result from the incessant operation of loaded cars during the continuance of the work.

All of the new work of the Third Avenue Railroad Company, except that on Third avenue, where the present yokes are being utilized, will be laid with 9-in. Trilby rail, with yokes 5 ft. between cen-

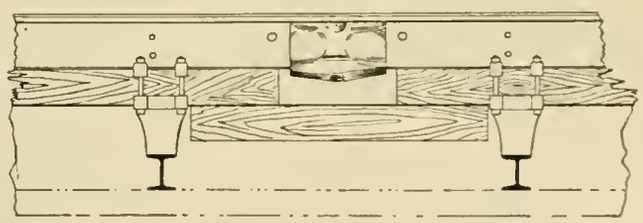

FIG. 2. SIDE ELEVATION.

ters, and the joints will be welded by the Falk process. In order to provide elasticity in the roadbed and consequently smoother running of the cars, Mr. Robertson has designed the construction, of which a cross-section is shown in Fig. 1 and a longitudinal view in Fig. 2. The rail is laid on yellow pine stringers resting on the yokes and supported upon concrete between yokes. The track construction for which the welding contract has been placed embraces about 70 miles of single track, and over 2,000 men are now at work.

An American company is now filling the order for the electrical equipment of the underground Paris terminal of the Orleans railroad. This road was described in the REVIEW for June last, page 400.

LETTER CARRIERS TO WALK IN MONTREAL.

Eighteen months ago President L. J. Forget, of the Montreal Street Railway Company, gave notice to the Canadian postmaster-general that the agreement for carrying the Montreal letter carriers for the lump sum of $200 per month would be terminated on December 31, 1898. The company kept an accurate record of the fares reprsented by the traveling of the letter carriers during both winter and summer months and found that they aggregated from $1,000 to $1,500 per month, and concluded that $200 per month was too little compensation for service worth $1,000 to $1,500.

The postmaster general is reported to have said that the department was indifferent as to whether the contract was terminated or not, as he thought the carriers rode too much anyway, and a satisfactory agreement was not reached. Beginning with the new year the carriers must pay fare or walk.

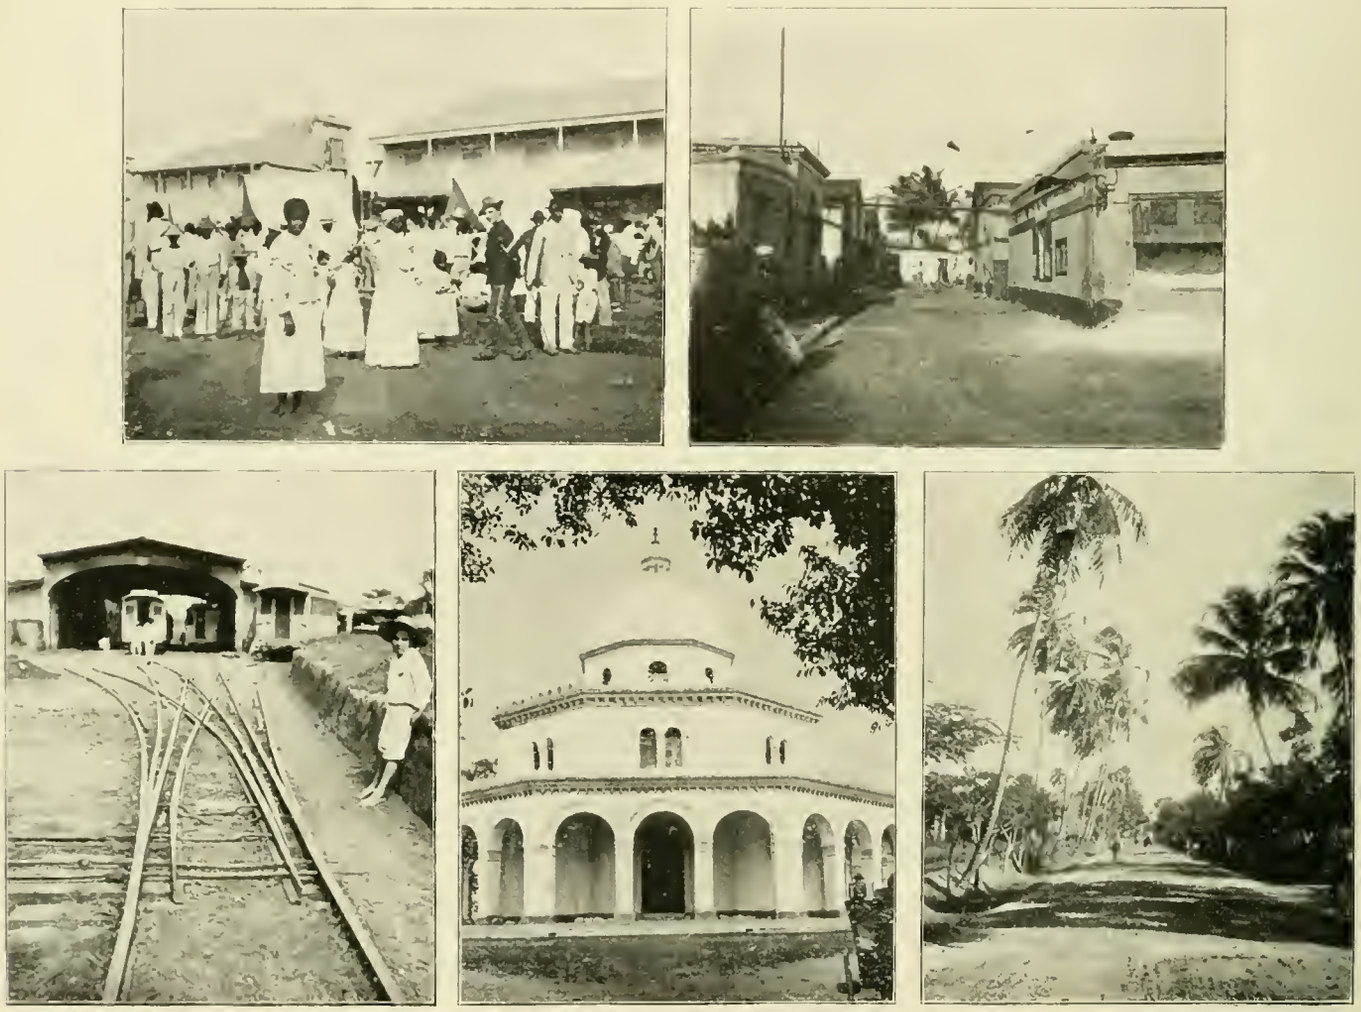
DAYTON, SPRINGFIELD & URBANA ROAD.

Fred Colburn, president of the Dayton, Springfield & Urbana Electric Railway Company, states that his road will be completed by June 1. There are about two miles of track laid and it is the intention to push the work as soon as the season permits. Mr. Appleyard, who has charge of the building, has purchased several cars, one of which has been delivered; it is one that was exhibited at the World's Fair in 1893.

The road when completed will be 42 miles in length, and one may go from Urbana to Cincinnati, over 100 miles, by electric cars. The steam railroads are making preparations to fight the new line.

TROLLEY ROAD IN PORTO RICO.

A syndicate formed by J. G. White, of New York, has purchased from the owners the San Juan & Rio Piedras Railroad in San Juan, Porto Rico, and the San Juan & Rio Piedras Railroad Company has been incorporated in New York, with a capital of $300,000, with Geo. H. Walbridge and H. H. Harrison among the incorporators. The new company will equip the San Juan road with electricity; at present the road is operated by steam and has a gage of 30 in.; it has 20 passenger cars, 20 freight cars and seven Baldwin locomotives. The new company has not yet decided in regard to cars, and possibly the passenger cars will be converted so that they can be used for electric service. The gage will be changed to 4ft. 8½in.



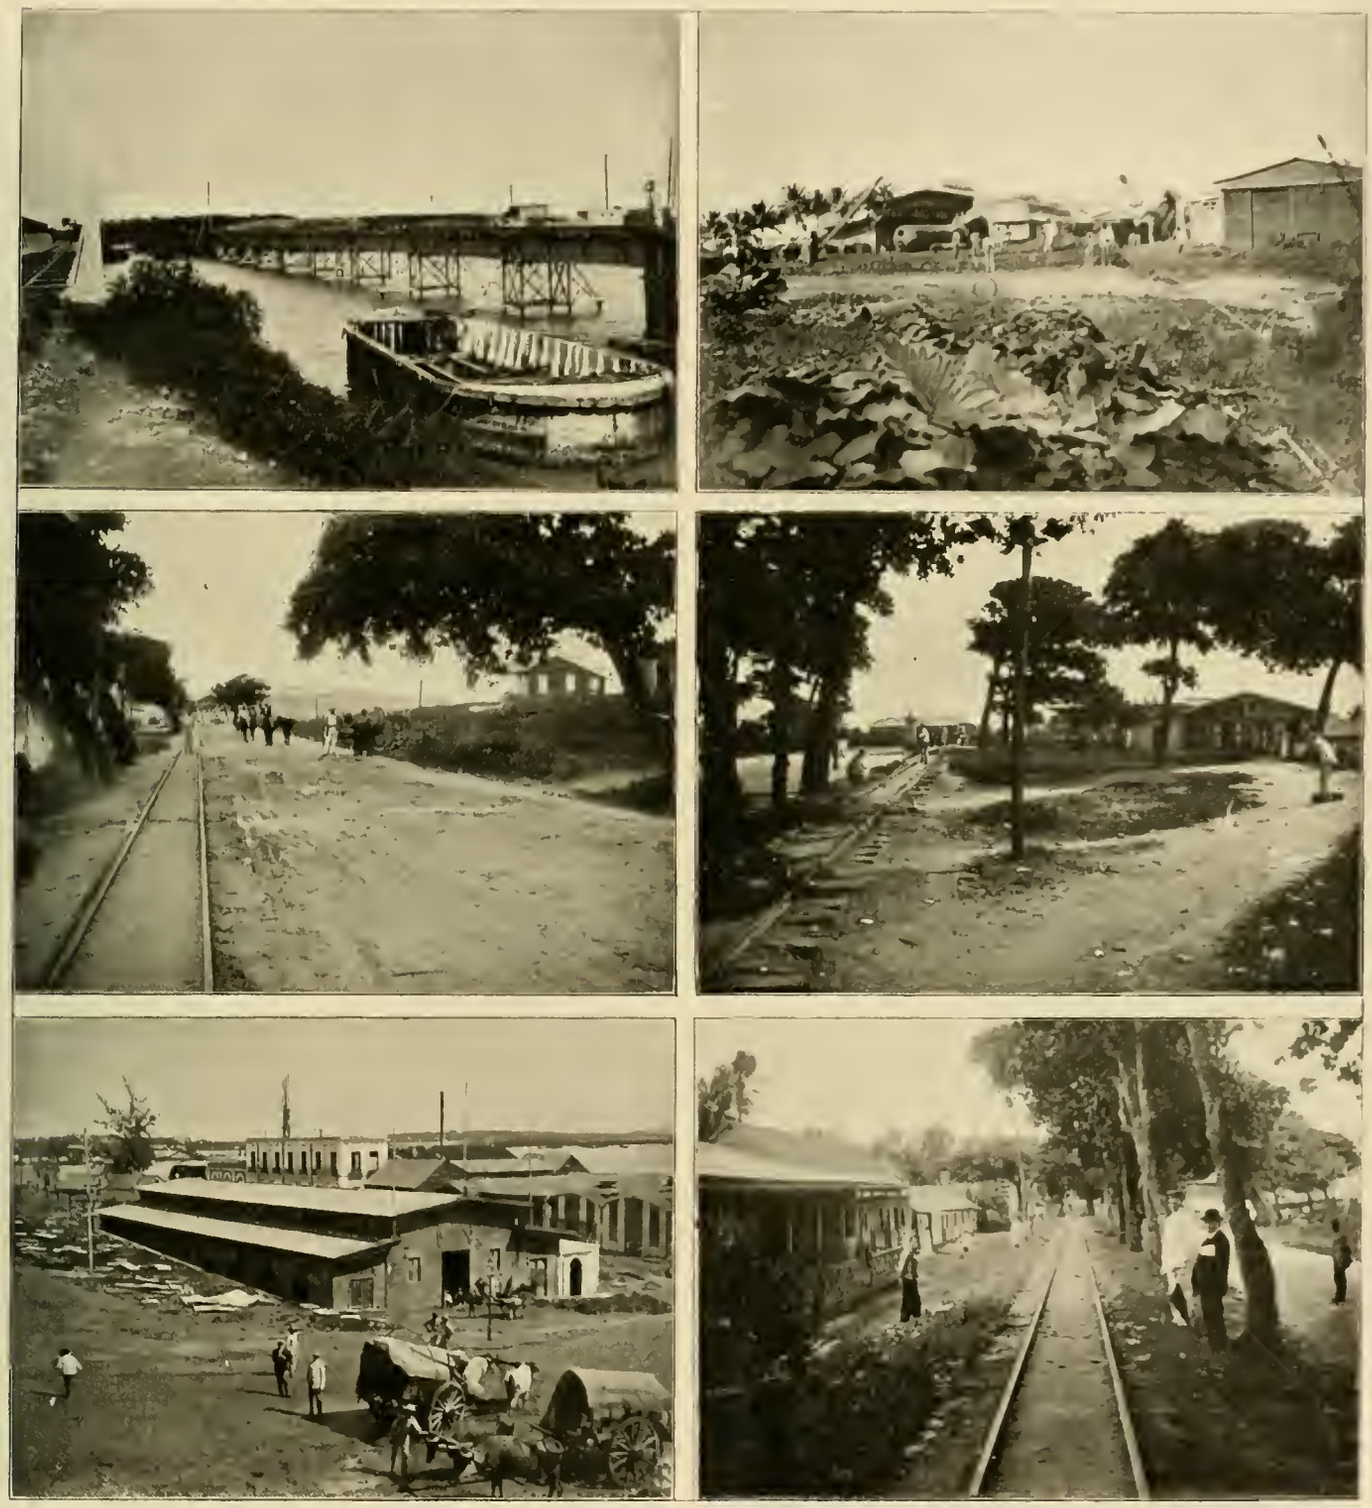
SCENES IN PORTO RICO.

The road at present is about seven miles long; it starts in the center of San Juan, and runs out through a beautiful country which has a population of about 20,000, consisting mostly of persons that live in the suburban villages and do business in San Juan.

San Juan has a population of 35,000 and is situated on an island about a mile and a half long; the road has its own bridge to the mainland. The city is paved, has sewers, and in February the city waterworks will be opened. It is said that the water is very pure and the works will be one of the most complete waterworks ever built. The new company, among other things, contemplates building an amusement park on the line where theatrical and band concerts will be given. Mr. Wilson, who has been with J. G. White & Co. for a number of years, is now in charge of the road and is operating it by steam. Without doubt the new company will also do an electric lighting business, and in building its power house will have it of sufficient capacity for that purpose.

Through the courtesy of Messrs. White & Co. we have received a number of photographs of scenes in San Juan and along the line of the road, some of which are here reproduced. Since the announcement of the purchase of this road, White & Co. have been flooded with letters and calls from people who wish to go to Porto Rico, but there are no positions in connection with the railway now open, nor is there any prospect that there will be.

Our fellow-citizens in San Juan are to be congratulated on the excellent system of street railway in store for them, for the long experience and high standing of J. G. White & Co. is a guarantee of the most satisfactory results possible.



SCENES IN PORTO RICO.

NEW MEMBERS OF THE ACCOUNTANTS' ASSOCIATION.

In addition to the Metropolitan Street Railway Company, of Kansas City, Mo., announced in our last issue as having joined the Street Railway Accountants' Association, Secretary Brockway advised us that the United Traction Company, of Philadelphia; the Syracuse Rapid Transit Company, of Syracuse, N. Y., and the Quebec, Montmorency & Charlevoix Railway, of Quebec, Can., joined the association on December 12, the information reaching us too late for that issue. This makes the membership 80.

PAINT SHOP WASTE.

BY J. L. JOHNSON.

It has been said that "willful waste makes woeful want." The old saying may not be strictly true in every particular, but in the main we think it is. As this has reference to paint shops of either street or steam railroads it certainly should receive careful consideration from the foreman of painters whoever he may be or under whatever management he may be employed. It should be understood that waste in this instance is not intended to be applied to what may be called legitimate loss. For instance, there may be a loss when a thread is cut on a bolt or a skim may form on paint that it is positively necessary to leave after it has been mixed. But the loss that can to any extent be avoided by care or thought on the part of the foreman is what we wish to define in this case as "paint shop waste."

Probably it will be good policy to mention a few instances to illustrate more plainly what is meant by waste. A very common practice in some shops is taking an excess of varnish out of the can, or more than can be used on the job which is to be varnished. This is a loss from any standpoint, as it can be only used afterward for inferior work, very often where a lower priced varnish would do equally as well. There can be no excuse offered for a repetition of this bad practice except carelessness or a direct indifference to all interests of the employer. When a painter varnishes one job he must know how much stuff it takes to do it; and he must consequently know just how much varnish it will take for any jobs of the same kind that he may have to do. What can be plainer?

Notwithstanding this it is not an uncommon thing to find a large can used for (and it is generally full) "slush" or "dump" varnish. This "slush" varnish is also used for every conceivable purpose to "use it up." And on almost every place where slush is used raw linseed oil would serve the purpose just as well were it not for the "using up" process. It is quite right and necessary to have a dump varnish can, but it should be kept strictly clean and a one gallon can is as large as should ever be needed in any ordinary street railway shop. Eight years of continuous service proves this to be the case in our shop, and during that time not once has the "slush" been used with the intent to use it up in order to keep it from accumulating. The varnish account is no small item in the shop expenses and care should be shown in the handling of it.

Now a word on mixing and matching colors. It is a recognized fact that all colors must be kept a uniform shade. This can easily be done by using any regular line of colors and weighing out the regular proportions, or by having all colors ground in bulk form. We have adopted the latter plan and find it a great saving in time. It also insures absolute uniformity of shade. Without this plan it requires extreme care, and much valuable time is taken from the foreman painter, as it is understood that he alone should mix all colors except where the shop is so large that his time will not allow it.

A few words may be allowed as to the matching of colors on cars that have been shoped to be touched up and revarnished. This is a part of the trade where a skilled workman must be employed, and even then he must be an expert on colors to be a success. It is supposed that this is the case, and that a fully competent man is employed, as unless it is so, it can be easily seen that a very great waste is made in every attempt at matching color. Still, in how many cases do we find matched color dried and useless, having stood long after the car for which it was matched was turned out of the shop as finished. This should not be so. Again, why should it be thought so necessary to always start with fresh color in matching? Why not use up color that has been matched for a car that has gone by changing the shade to suit instead of "dumping it," as the saying is, and making fresh? If used as promptly as possible these colors will not have become fatty and much valuable time and material can be saved as compared with the "mix it fresh" process. These examples might be multiplied indifinitely, but we think these should be enough to encourage thoughtful men in trying to save the materials and time that are entrusted to their care. The foreman is entirely and essentially the party who is to be censured for any or all waste that occurs in the shop; even if the shop is so large that a foreman can not do his own mixing, it is his duty to know not only how all paints are mixed but just how much is mixed for each job which is to be done. The loss of paint is only nominal until it has been taken from the keg and mixed and there can be no reasonable excuse for paint mixed in excess of what is needed to do the job. Loss of stuff wasted is as great from a financial standpoint as if it were stolen, and aside from the sentiment it is the same thing. A man may mean well but a lack of thought may entail a loss of many dollars in the course of a year.

Probably the most disastrous waste that can be found in a paint shop is a foreman who is incapable from a practical standpoint. It is in this case that the most costly colors are lavishly wasted. It will be found that an inexperienced person will use the most expensive colors to produce shades and then be compelled to kill their brilliancy by dumping part and waste more stuff to cover the first blunder; a waste of time and waste of material. The writer well remembers a case of this kind in which the dump kegs got so large that they were becoming a "give away," so the paint shop "kid" was told to dig a hole in the ground and over 40 gallons of expensive colors were dumped and the earth never gave up her dead. If a foreman be fully competent his employers have the benefit of what he knows, but if incompetent they have the full benefit of what he does not know in a ten-fold ratio. Alas! that all should be hidden so effectually in most cases from the eyes of those who foot the bill. We cannot conclude this without remembering the old song:

"Waste not, want not, is a maxim I would teach;
Let your watchword be dispatch and practice what you preach.
Never let your chances like sunbeams pass you by,
You'll never miss the water till the well runs dry."

CLEVELAND CIVIL ENGINEERS' CLUB.

W. H. Searles, secretary, advises us that at the regular December meeting of the Civil Engineers' club of Cleveland Edwin L. Thurston, associate member of the club, read an instructive paper on "The Nature and History of Patent Rights." He defined the origin and limitation of the rights enjoyed by a holder of letters patent, showing them to be only such as the statute confers and nothing by natural right or common law. The only right secured by a patent to the patentee is the right to exclude or prevent others from exercising their natural right to make out of their own materials the particular invention which the patent covers. Frequently the patentee of an improvement is excluded from the use of his own invention by some prior patent covering the thing improved.

Two theories were discussed as to the nature of a patent right, the one regarding it as a monopoly, the other as a contract between the inventor and the government representing the public. The latter view has been generally accepted by the courts and by congress in this country. As a contract its language should be liberally construed so as to give the inventor as complete protection as may be. Considered as a monopoly, a patent is such in form only. It is not an illegal or oppressive monopoly. It deprives no one of any right previously enjoyed, because a patented invention must be new. The author described the progress of patent law since the reign of James I of England in 1623 to the present time. The first patent statute in America went into effect April 10, 1790, and was entitled "An act to promote the progress of useful arts." The first patent granted was dated July 31, 1790, and was issued to Samuel Hopkins for making pot and pearl ashes. This act was replaced by another on February 21, 1793. Other acts were passed in 1819 and 1832; but in 1836 all preceding acts were repealed and the present system was inaugurated. The new act created the patent office, with a commissioner of patents. It provided for the registration of patents, thus affording security to the patentee's title. It also provided for an examination to be made by the commissioner as to the novelty of an invention and for the establishment of a library of scientific books. This library now contains nearly 60,000 volumes. In 1870 the term of a patent was changed from 14 to 17 years. A new law which went into effect January 1, 1898, provides for the length of time an invention may be known to the public before the inventor loses the right to claim a patent. This law also relates to the effect of a foreign patent upon a United States patent. More than 15 bills are now under consideration by the two patent committees of Congress.

An interesting discussion followed, after which the meeting adjourned for conversation and lunch.

BOYCOTTING CIRCULARS.

The supreme court of Michigan on November 16, 1898, rendered a decision in the case of Beck and others against the Railway Teamsters' Protection Union and others, of Detroit, familiarly known as the "boycott case." The firm of Beck & Sons was engaged in the milling business, and in the fall of 1897 became involved in a controversy with the teamsters' union because it refused to sign the latter's scale. The firm ceased to use its own teams for a time but later the men it had formerly employed left the union of their own accord and returned to work for the Becks.

The union then interfered with them on the street, hooting and throwing missiles. It also intimidated customers on their way to the mill, and distributed boycotting circulars to the firm's customers and others. Beck & Sons at this point obtained from the Wayne circuit court an injunction restraining the union from further interfering with its employes or business. This decree sanctioned, however, the distribution of the boycott circulars to customers and the public generally, except in front of the mill premises, and any form of boycott to the firm or its customers, without the actual use of violence, and also sanctioned threats to injure and ruin the firm's business, when unaccompanied by violence or threats of violence. From this portion of the decree an appeal was taken.

The supreme court in considering the threats made by the union says that the law abhors subterfuges and that threats in language are not the only threats recognized by law. Covert and unspoken threats may be just as effective as spoken threats. Courts have held that the display of banners in front of one's premises warning workmen to keep away is part of a scheme unlawfully entered into.

So when the Detroit union distributed, on the streets and in stores, circulars advising the public to boycott Beck & Sons, the court declares they intended to convey to the latter's customers that they would be treated in a like manner unless they ceased trading with the Becks.

"The distance that this was done from the mill of the complainants," says the court, "does not detract from its character and harmfulness. It was just as effective and as wrong when 1,000 ft. from the mill as when done 10 ft. from it. The act itself, not the distance, determines the character."

After saying that the circular was false in stating that the Becks had violated their agreement or had discharged union men, and in conveying the impression that they were not paying living wages or treating their teamsters fairly, the opinion continues:

"It would be idle to argue that these circulars were not intended as a menace, intimidation and coercion. They were so used and were a standing menace to everybody who wished to work for or trade with the complainants. They constituted a part of an unlawful scheme and their circulation should have been enjoined."

The court furthermore holds that to picket the Becks' premises in order to intercept their teamsters or persons going there to trade is unlawful. "It is an act of intimidation and an unwarrantable interference with the right of free trade. The highways and public streets must be free to all for the purposes of trade, commerce and labor. The law protects the buyer, the seller, the merchant, the manufacturer and the laborer in his right to walk the streets unmolested. It is no respector of persons. And it makes no difference in effect whether the picketing is done ten or a thousand feet away. It will not do to say that these pickets are thrown out for the purpose of peaceable arguments and persuasion. They are intended to intimidate and coerce."

As to that portion of the decree of the lower court which permits "boycotting by peaceful means," it is said: "If these defendants had threatened complainants' teamsters that, unless they ceased to work for them and joined the union, they had the power and would use it to induce all merchants not to sell them any goods by which they might support themselves and families, and had carried out this threat by issuing boycotting circulars and notifying merchants personally and by committees that they must cease to sell goods to these men, there would have been no act or threat of violence, but would the boycott or conspiracy have been lawful?

"May these powerful organizations thus trample with impunity upon the right of every citizen to buy and sell his goods or labor as he chooses? This is not a question of competition, but rather an attempt to stifle competition. It is a question of the right to exist.

"If there be no redress from such wrongs, then the government is impotent indeed. But such a combination is a criminal conspiracy at the common law, and in some states, in order to remove all doubt, is made so by statute."

The opinion concludes: "The decree must be modified so as to enjoin picketing, the distribution of the boycotting circulars, and all acts of intimidation and coercion."

TROLLEY LINES APPRECIATED IN PHILADELPHIA.

Even the best citizens and business men in our large cities do not always know what is to their own interests. Instances without number might be cited where trolley lines into desirable residence districts have been bitterly opposed by the property owners in the vicinity. After the service has been regularly established and the growling citizen reluctantly steps aboard the electric car he has to admit that it is superior to anything that preceded it. After a time it would be recognized as a calamity to any community to lose such transportation facilities.

The "Philadelphia Telegraph" makes the following comments, which not only are true of Germantown but many another large district or suburb of our cities: "The advent and development of the trolley system, after four years of successful test, has demonstrated to Germantown residents that 'the overhead trolley system, with its unsightly poles and wires,' was in reality a blessing in disguise. Germantown has been for many years peculiar in its obstinate adherence to established customs and for its opposition to innovations, no matter what ulterior benefit might accrue from their introduction.

"The opposition was so strong that a committee of citizens of recognized intelligence and ability was organized for the express purpose of fighting the scheme to the bitter end. Literature was widely circulated, wherein it was asserted that the trolleys would not only be a daily menace to the lives of men, women and children along the routes, but it was pointed out that a great depreciation in property values in the neighborhood of the street car lines would follow, as the dangers resulting from the overhead wires and the electrical current would deter people from occupying or renting houses on streets along which the trolley cars would pass.

"The fallacy of this argument, although its supporters included men of deep learning in business and scientific lines, is easily shown in the wonderful advance in property values during the past eight years. The total value of property in Germantown in 1890 was $31,373,625, and in 1894 it increased to $37,998,781; in 1896 it was $40,118,830; in 1897, it was $44,490,970, and for the present year it will easily reach $50,000,000.

"A study of these figures shows that the advance in values since 1894, when the trolleys began running, exceeds in great proportion the increase before their introduction. Another advantage shared by Germantown with other suburbs is that of increased mail facilities. Before the days of trolley postal cars the railroads carried all postal matter intended for this suburb. The mail matter was conveyed in wagons to the stations and there were often long intermissions between trains. Now the railway postoffice makes the trip between the main postoffice and the Germantown branch in less than three-quarters of an hour, resulting in returns both in the quantity of mail delivered and received greatly in excess of former years.

"The inhabitants of the little borough along the old Germantown roads have long pursued the solitary tenor of their way and been content to follow rigidly the footsteps of their forefathers, but the clanging of the trolley bell and the hurry and bustle of the swiftly moving car have awakened them to a realization of their ability and the possibilities of home development. The last few years have been productive of great progress in Germantown real estate, and the residents do not hesitate to give the credit for the revolution to the one-time abused, but now eagerly welcomed, trolley car."

It is announced that the fare between Lorain and Elyria, O., on the electric road has been raised from 5 to 10 cents.

VIADUCT CONSTRUCTION IN CHICAGO.

The most complicated network of tracks in the world is probably along the Chicago river for some distance on either side of 16th street, in Chicago. The track elevation department of the city collected statistics regarding the traffic at this point. During the 18 hours between 6 a. m. and midnight 743 trains, with 3,952 cars, passed across Clark street; also 827 street cars, containing 16,540 passengers; 2,232 wagons, trucks, etc. The enormous movement at this point made it one of exceptional

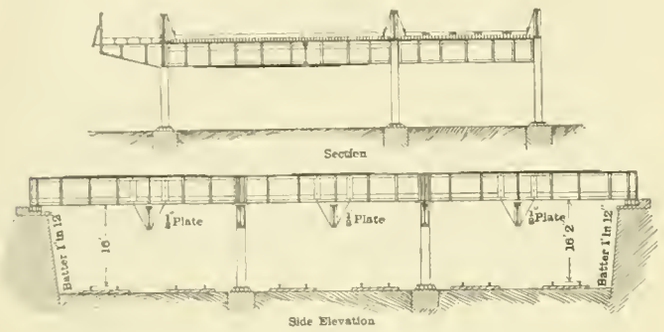


FIG. 1. SIDE VIEW AND SECTION OF CLARK STREET VIADUCT.

danger. Elaborate plans were made for elevating and depressing the railroad tracks, and a viaduct was designed for the car lines and traffic on Clark street.

The grade on Clark street was raised to pass over the depressed railroad tracks and lowered beneath the elevated tracks of the St. Charles Air Line. This latter elevation necessitated the raising of the structure of the South Side Elevated Railroad Company, 2½ squares east of Clark street. On Clark street a 4½ per cent grade begins about 15th street and extends to the viaduct over an open cut through which six railroad tracks pass. Beyond the viaduct the roadway descends at a grade of 5 per cent and passes under the St. Charles Air Line bridge, a clearance of 13½ ft. being left for the electric cars.

FIG. 2. VIEW OF VIADUCT.

In Fig. 1 is a side view of the structure and a cross section of the viaduct, showing the relative space given to the roadway, car tracks and walk for pedestrians. The structure is of steel and is 80 ft. wide. On the west side, separated from the roadway by a concrete wall, is the right of way of the street car company, 26 ft. wide. In the center is a 42-ft. roadway and on the east side is a 12-ft. sidewalk.

The street car tracks are laid with a grooved girder rail with granite paving between, but on the approaches to the viaduct broken stone is filled in between the tracks to prevent the right of way being used for teaming purposes.

About two years ago the Chicago City Railway Company paid $85,000 into the city treasury, after securing a franchise on Clark street, with the understanding that this sum should go towards building a viaduct at 16th street. The city ordinance providing for the elevation of the tracks was passed May 17, 1898, and work was commenced April 24 of this year. For six months the Clark street line has been closed and the Wentworth avenue, Wallace, Halsted and Clark street cars were switched east on 22nd street to the Wabash avenue and State street cable lines. Street cars began to use the viaduct November 20, 1898.

POWER TRANSMISSION AND DISTRIBUTION FOR RAILWAY WORK.

A valuable paper was read by Ernst J. Berg before the American Institute of Electrical Engineers dealing mathematically with some of the troublesome problems which arise in alternating current transmission and in converting the same to a direct current for the trolley circuit. Some practical suggestions are here given from the paper without taking up the formulæ and their derivations

When electric power was first applied to railway work, the distances of transmission were comparatively short, so that one generating station usually located in the center of distribution was sufficient to furnish all power at a reasonable loss.

As the plants were extended it was soon evident that even disregarding the question of efficiency, the distances were very limited for commercial and practical reasons, and boosters connected in series with the line so as to raise the voltage proportional to the load were introduced. By their use it was possible to cover considerable distance and yet keep the potential up without too excessive an amount of copper. Since, however, any booster system must be very inefficient, such installations are not very common, and their field of usefulness limited to cases where considerable power is taken and at the end of a long line for a short time only. The next step towards extension was the introduction of power stations located in various places in the network, but the complication and inefficiency of such an arrangement was apparent, and the possibility of transmitting the power by alternating currents was brought out.

The first suggestion was to generate alternating current power in one station and transmit it at a reasonably high voltage to various sub-stations placed where the steam stations would have been located under former conditions, and there convert it to direct current by means of synchronous motors driving direct current generators. This method of transmitting and converting electrical power was applied in a few cases but was soon superseded by the rotary converters which not only gave a simpler means of converting alternating current to direct current, but which are more efficient and permit of perfect automatic potential control. Thus in 1894 large and representative converter systems were installed.

Since, with the introduction of long distance transmission the generators were placed far away from the converters and connected to them by lines of considerable resistance and self-induction, it was apparent that potential control could hardly be effected in the power station, at least a control of sufficient sensitiveness to follow the greatly fluctuating loads in a railway circuit, the more so as the voltage does not vary in the same proportion as the load.

To illustrate the variation in voltage at the receiving end of a line of considerable resistance and reactance as a function of the phase relation in the current, in Fig. 1 is plotted a curve giving as abscissæ the power factor of the load, that is cos W and as ordinates the voltage at the receiving end. The line current is the same in all cases, the generator voltage is constant and assumed as unity, the resistance is 10 per cent and reactance 40 per cent. The upper part of the curve gives the voltage with leading current, the lower with lagging current.

It is readily seen from this diagram how impossible it would be to control the potential at the generating station under these conditions, as, for instance, with a load of 90 per cent power factor the voltage at the receiving end would be 69 per cent of the generator voltage with lagging current, and the same as at the generator with leading current. Thus, if the generator should be controlled by the amount of current taken, it is evident that no in-

dications whatever would be made by the current itself, since it is the same under these two conditions.

But even if a wattmeter were in the circuit at the power station, this would not help matters, since under the conditions referred to the watts, that is the power, is the same, and yet the voltage so widely different.

In Fig. 2 this is demonstrated in a slightly different way. It is assumed that the voltage impressed upon the converter shall be constant at all loads, and shows how the generator voltage has to be varied in order to keep this constant at rated output with different power factors, and consequently at a variable line current. It is equally evident from this curve how unfeasible voltage control from the generating station would be.

It was therefore necessary to develop some means by which the potential could be controlled, not at the generator station, as is done in direct current railway circuits, but in the converter station. This means of regulating the potential was found in changing the phase relation of the current taken by the converter by means of a change of field excitation, raising or lowering the impressed alternating voltage, and consequently the direct current voltage by means of this current passing through lines of considerable self-induction, or through special reactive coils inserted in the circuit.

In the following I shall endeavor to explain this method of control, and discuss its effects on the operation in general.

In a synchronous converter system we have to distinguish between three e. m. f's.; the impressed e. m. f., that is, the e. m. f. at the collector rings of the rotary converter; the counter e. m. f., which is the e. m. f. induced in the rotary converter by the armature revolving in the magnetic field, and consequently proportional to the field excitation; and the e. m. f. of impedance or the e. m. f. consumed by impedance, which is that caused by the current flowing through the reactance and resistance of the converter.

The first mentioned e. m. f., that is the impressed e. m. f., is entirely dependent upon the generator voltage; the counter

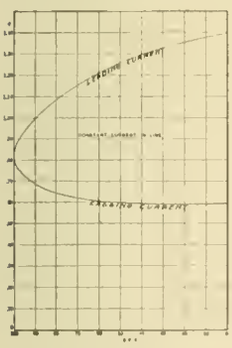

FIG. 1.

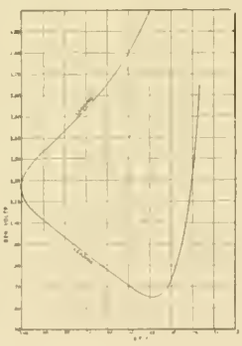

FIG. 2.

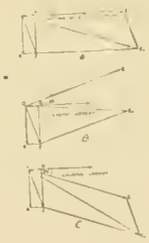

FIG. 3.

e. m. f. is entirely dependent upon the field excitation of the converter, and is constant regardless of the load on a machine, and the e. m. f. consumed by the impedance changes with the load and is proportional to the current.

To explain the phase relations between these e. m. f.'s let us for the sake of simplicity consider the converter running light or doing no work. Since the work done by a synchronous converter rotary is the product of the current taken by the rotary and the projection of the counter e. m. f. on this current at no load the current must be in quadrature that is, at right angles to the counter e. m. f. Since, furthermore, the input of a rotary converter is expressed by the product of the impressed e. m. f. and the projection of the current on the impressed e. m. f. under the assumption that no energy is consumed, the current is also in quadrature or at right angles to the impressed e. m. f. Consequently the impressed e. m. f. and the counter e. m. f. must be in phase and in opposition to each other. Let, then, the field excitation of the converter be reduced, so that the counter e. m. f. is less than the impressed. Since only three e. m. f.'s are acting in the system and their sum must always be zero, that is, the impressed e. m. f. must at any time be equal to the counter e. m. f., plus the e. m. f. consumed by impedance or neglecting the resistance, the e. m. f. consumed by the reactance. The counter e. m. f. is assumed to be less than the impressed, therefore, the e. m. f. consumed by reactance must be in phase with the counter e. m. f. and add itself thereto. But since the current is always 90° ahead of the e. m. f. of self-induction it must be 90° behind the impressed e. m. f. and consequently be lagging.

If, on the contrary, the field excitation of the converter is increased so that its counter e. m. f. is higher than the impressed, it is evident that the e. m. f. consumed by reactance must be in phase with the impressed e. m. f. and add itself thereto. Consequently since the current is 90° ahead of the e. m. f. of self-induction it must be also ahead of the impressed e. m. f., in other words, the current is leading. By a similar discussion it is readily seen that the same argument is true, if the converter is loaded. That is, in this case the wattless lagging or leading current due to the difference between counter e. m. f. and impressed e. m. f., merely adds itself in his proper phase relation to the energy current representing the load.

It is thus seen how by means of converter, leading or lagging currents are caused to flow in the lines. It is readily shown how the voltage at the receiving end of the system can be changed by causing a leading or lagging current to flow over a line with some self-induction.

Graphically this is done in Fig. 3. Let $O\ I$ denote the current which is assumed to be in phase with the e. m. f. in diagram A. The e. m. f. consumed by resistance $O\ R$ is in phase with this current and the e. m. f. consumed by reactance $O\ X$ is 90° ahead of the current. Thus, the e. m. f. consumed by the impedance of the system is represented by $O\ Z$ and is the resultant of $O\ R$ and $O\ X$. The generator voltage is the resultant of this e. m. f. $O\ Z$ and the e. m. f. at the receiving end is thus represented by $O\ E_0$, which is larger than $O\ E$ and larger than $O\ E + O\ R$.

In diagram B, Fig. 3, is assumed the same current flowing over the same line, but the current is made to lead by a certain angle. It is readily seen in this diagram that the e. m. f. which has to be generated is less than the e. m. f. desired at the receiving end, and of course much less than that in the first mentioned case, where the current was in phase with the voltage at the receiving end.

In diagram C Fig. 3, is shown the same condition with lagging current, and demonstrated plainly how the generator e. m. f. is still higher than the generator voltage for non-inductive load.

Usually it is required that the converter voltage shall remain constant or increase with the load, when the generator voltage or excitation is kept constant. If each converter is operated from its own generator, it is preferable to leave the generator field excitation constant and thereby use the generator reactance for phase control and avoid any necessity of regulation in the generating station. If, however, many converters are operated from one generator, or if all generators in the power station are operated in multiple, it is preferable to keep the generator terminal voltage constant, and control the converter voltage by outside reactances in a low reactance transmission, or by the line reactance in a highly inductive transmission.

Since a converter can be made to take leading or lagging current by changing its field excitation and thus its counter e. m. f., such an installation gives the most favorable opportunity to study the fundamental principles of alternating current.

It may perhaps seem as if it would be rather a delicate operation to accomplish this potential control in commercial circuits where available instruments, etc., would prohibit the determination of leading or lagging currents necessary for the control with any degree of accuracy, yet the problem is perfectly simple and resolves itself to adjusting the shunt excitation for a given running light current which is predetermined by calculation, and afterwards to adjust the series field so that the converter takes minimum current, that is, runs non-inductively at the desired load. It will then follow that the potential control for all intermediate loads is perfect, at least within very close limits.

To obtain the maximum possible output with a given line impedance, the converter should run non-inductively at higher outputs as the generator voltage increases, so that for instance, if the system has 10 per cent energy loss and 40 per cent re-

actance and the generator voltage is kept 12½ per cent above the converter voltage, the maximum output is 2.12 times rated output and the converter should run non-inductively at ¾ of rated load. If the generator voltage were 18 per cent higher than the converter voltage, the output would have been 2¼ times the rated, and the converter would run non-inductive at full load and finally, if the generator voltage were 30 per cent higher than the converter voltage the maximum output would be 2.55 times the normal output but the non-inductive load would have been 1½ times full load. In other words the converter should run with lagging current up to 50 per cent overload.

In commercial installations, however, where there is always a limit to the generator voltage, which limit is caused by saturation of the machine, or outside conditions which do not permit of excessive voltage in the power station, the output of a converter is by no means unlimited, and thus some care has to be taken, to get the proper reactance, since with a given difference in generator and converter potential, the output changes as we change the reactance and resistance.

In practice the shunt field is so adjusted that the converter takes the required lagging current running light, and the series field is made to increase the excitation so as to give the required field strength at non-inductive load. Since, however, the series excitation is proportional to the load, it is evident that without hand adjustment, it would be theoretically impossible to accomplish perfect phase control; or rather, it would be impossible to have constant voltage at the rotary converter with constant voltage at the generator. The difference, however, is exceedingly small, the series field being slightly too strong at light loads and too weak at overload, in other words the voltage will be slightly increased at the converter up to non-inductive load and will drop slightly at overloads

Before closing the paper it might be well to discuss the conditions which govern the amount of reactance, etc., in the machines. As stated in the beginning of the paper, in plants where one converter is operated from one generator it is convenient, to use the generator reactance for phase control. Since, however, as seen, it requires considerable self-induction to do this at high power factors, it means a generator of high armature reaction and self-induction, in other words a generator with rather limited output with constant field excitation. This is not objectionable, since by leading or lagging currents the output can really be made as high as desired, even if the armature reaction is high. Yet when considering that it is often desirable to start the rotaries from the generator and therefore its voltage may be reduced greatly at the starting moment when the converter necessarily takes a large lagging current, it may not always be the best policy to use the generator reactance alone for phase control.

Often, however, converters are started from the direct current side and sometimes by auxiliary motors. Under these conditions the generator might conveniently be made with very high armature reaction.

In plants where several converters are operated from one generator, or from a number of generators in parallel, control by generator reactance is not to be recommended, since it involves the change of series field adjustments with the change of generator capacity. The generators may be made of any armature reaction since several of them are used in parallel in starting, yet it must of course be borne in mind even then, that if the armature reaction is too high, the large current taken in starting a converter from the alternating current side, may cause the voltage to drop so far as to seriously disturb the system in general.

Regarding converters themselves, it is obvious from the preceding discussion that they must be of composite type, that is, they must have shunt and series excitation

Shunt wound converters do not permit of automatic phase control, but at constant adjustment of the field will always run at the same wattless current at all loads, so that, for instance, if the field is adjusted for non-inductive load at one load, the converter will run non-inductively at all loads, and therefore the drop in voltage at full load will correspond to the energy loss in the system, and the converter voltage will be higher at lighter loads than at heavier loads, therefore will vary as the load varies, and phase control is thus feasible only by hand regulation, that is, in systems where the load varies only slowly as in lighting circuits.

Reaction converters take lagging currents at all loads and thus are in general objectionable, the more so as they do not allow any automatic potential control

DECORATED CARS IN AUSTIN, TEX.

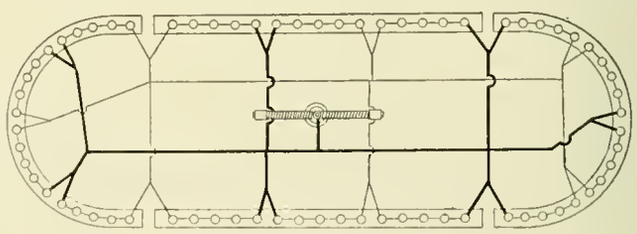
During the past summer a plan of decorating four of the cars of the Austin Rapid Transit Railway Company was devised by Frank E. Scovill, superintendent. The cars were prepared to order for a lawn party and it was considered good policy to so design the decorations that they could be easily removed and replaced for another like occasion.

The diagram of wiring for exterior illumination is here given.

DECORATED CARS, AUSTIN.

the heavy lines indicating the trolley circuit and the lighter ones, the ground wire. The incandescent lamps were fixed to four strips, two of which are semi-circular, and the connections are made for five lamps in series. There were 250 lamps in red, white and blue used in the illumination. A star and crescent of lamps adorned the front dash. The bunting was easily attached by tieing with twine and tacking it to the wood work where it would not show.

The first party was given by Dr. Morse, clerk of the supreme



EXTERIOR LIGHTING CIRCUIT.

court of Texas, in honor of his daughter and 200 guests were invited. An orchestra was stationed in the front end of the first motor car. Two motor cars and two trailers accommodated the party. After a trip over the company's lines the party enjoyed dancing and other amusements. This train of decorated cars has proven to be a very attractive feature and brought considerable revenue to the company.

It is reported that the Italian Mendonial Railroad Company has decided to construct an electric railway between Mandela and Sublaco, in the province of Rome, and it proposed to utilize the water power of the Anniera River for the production of the motive power.

FIGHTING SNOW.

The street railways of Denver are favorably situated with reference to fighting snow, for, as a rule, the winters are exceedingly mild with few cold days. Occasionally there comes a storm which requires a snow equipment. The blizzard in November, which swept from the Rocky Mountains eastward to the Atlantic, was more severe in Denver than in Chicago and other cities in the central states. There was one storm last winter during which 18 inches of snow fell.

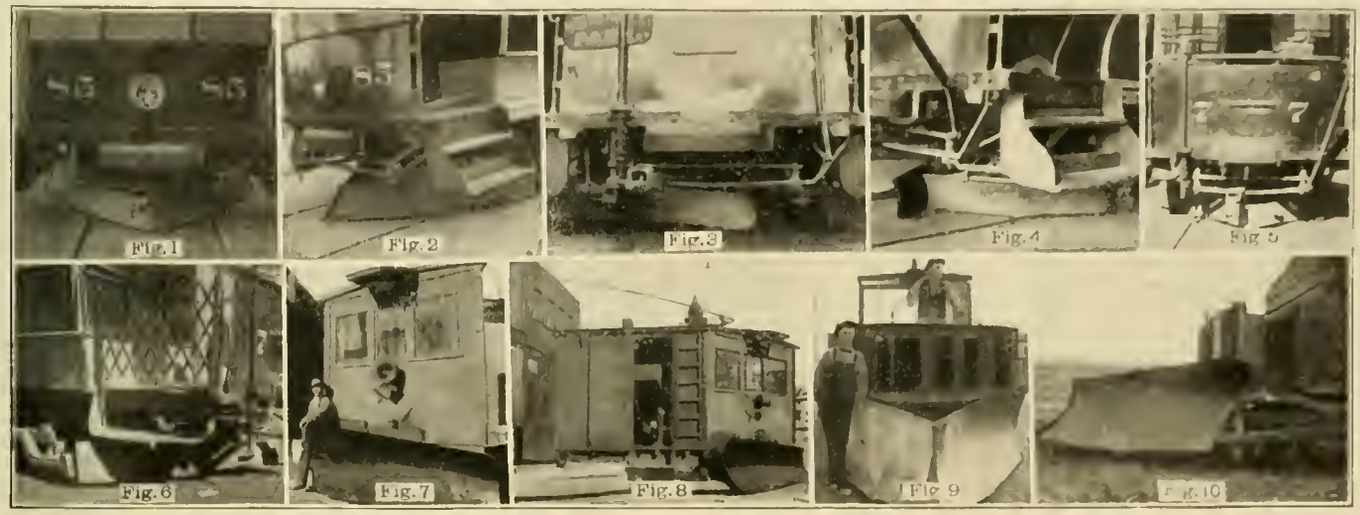
The Denver Consolidated Tramway Company has three distinct types of plows which are mounted on car trucks. Superintendent C. K. Durbin states that each of these plows has done good service. The type shown in Fig. 1 and Fig. 2 is especially suited for the heaviest snows that come to Denver. The plow shears are raised and lowered by means of a lever on the platform, as shown in Fig. 2. The plows, shown in Figs. 3, 4 and 5, are somewhat different in construction. The wings of these are so arranged with springs that they will turn under in case any obstruction is encountered, such as a paving block or high plank.

In Fig. 6 may be seen another style of plow which has done excellent work, handling six inches of snow without difficulty. The great objection to the V-shaped plow is that it piles up snow between the tracks which has to be removed by a plow similar to the one shown in Figs. 7 and 8. The company has six plows of this kind of its own design and construction. The plow, shown in Figs. 9 and 10, is used on the suburban lines and in high drifts. With this equipment the Consolidated Company is well prepared to successfully cope with any storm which may come.

The obstacles to be overcome in Montreal in the winter are much greater than in many cities in the United States. The snow equipment of the Montreal Park & Island Railway Company is very complete and intended for clearing the tracks of snow drifts of any depth. In Fig. 11 may be seen a small plow which is pushed by a sweeper, clearing the track on the "Mountain" line of the company. Fig. 12 is from a photograph of the sweeper and plow as they are returning after cleaning the track on the Outremont branch. Mount Royal Park is in the background. The work is evidently very thoroughly done, as the rails show clean and free from snow.

The view represented in Fig. 13 speaks volumes for the effective work of this equipment. At this point the track was covered by snow drifts 7 ft. deep. The plow and sweeper has cut a road through these piles of snow and cleaned the rails.

For the past four years the Gallatin Light, Power & Railway Company, of Bozeman, Montana, has been able to keep its cars running all winter long without delay. The appliances for keeping the tracks clear of snow were designed by W. W. Livingston, electrician of the company. The plow shears are made of ½ by 5 in. steel and No. 18 sheet steel. Two of these are suspended at the end of the car truck by 1½ in. bolts. These extend through the point of the heavy iron on the plow to the V-shaped irons fastened to the guard board irons, and throw the points of the plows well forward and dropping the bottom of the plow at the center to within 3 in. of the rails. To the sills of the platforms are angle irons from which elbows extend to a handle on each platform. When the handles are released the plows drop of their own weight.



SNOW PLOWS AND SCRAPERS—DENVER CONSOLIDATED TRAMWAY COMPANY.

SNOW PLOW AND SWEEPER—MONTREAL PARK & ISLAND RAILWAY COMPANY.

SHEARS ATTACHED TO TRUCK—BOZEMAN, MONT.

For cleaning the snow farther away from the sides of the track a plank, 18 in. wide and 3 ft. long, shod with iron, is suspended from the truck in an upright position, the outer end being held by a stout chain. One car only is fitted with these plows and it has always kept the tracks clear, even when the snow was 2½ ft. on a level and no thaws for weeks at a time.

Fig. 14 shows a car and with plows running into snow 10 in. deep at a speed of 12 miles an hour. In Fig. 15 the picture was taken on the second trip. Here the track is higher than the adjoining surface and a speed of 20 miles an hour can be attained.

One of the cars of the Milwaukee, Racine & Kenosha Electric Railway Company is represented in Fig. 16 after a blizzard. These cars pass through long stretches of sparsely settled country and have many heavy snow drifts with which to contend. Fig. 17 is

Three motors are used, two for propulsion of the car and one for driving the brooms. Those employed for driving the plow are usually of the heaviest description, while a 30 h. p. motor is sufficient for the brooms. This motor is set diagonally in the cab so that a straight lead is obtained for the sprocket chains. In the matter of chains a great improvement has been made. The Brill Company has introduced solid forgings to take the place of the malleable iron chains which have been heretofore employed. The brooms are raised and lowered by powerful levers within the cab, and are hung on radial guides so that the chains are always taut and do not slip on the sprocket wheels. They are always under perfect control and are readily adjusted for wear. They are easily taken down and taken apart for the replacement of the rattan when worn out. Sweepers are arranged to run in either direction and are fitted with two headlights or one shifting

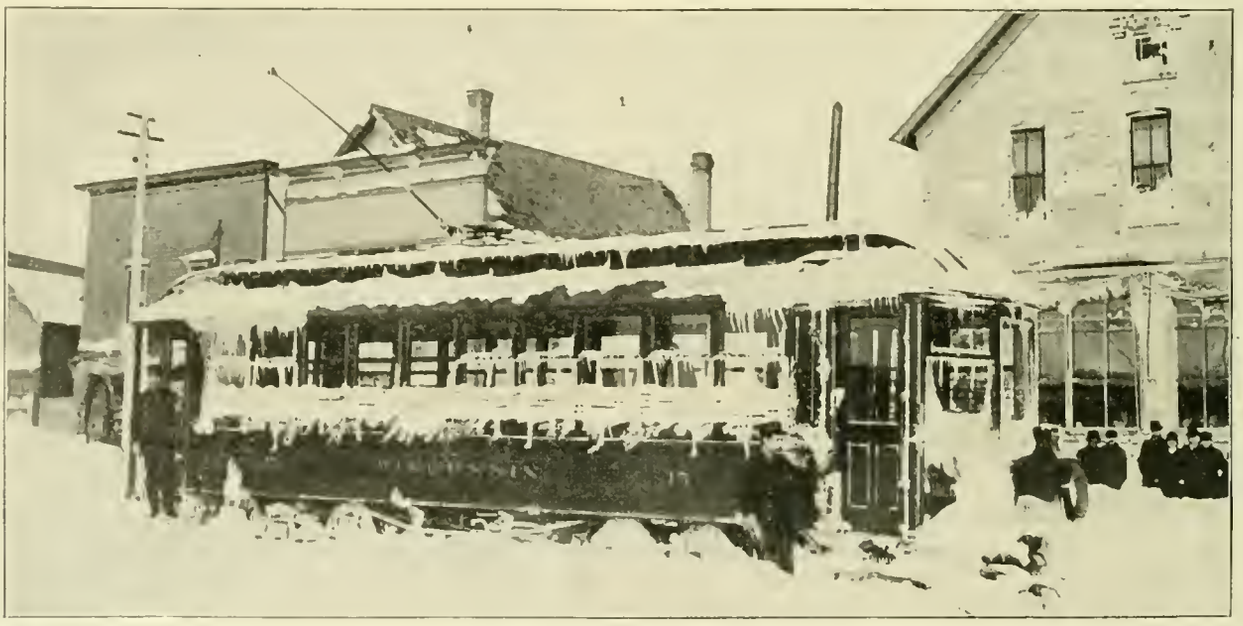


FIG. 16.—MILWAUKEE, RACINE & KENOSHA CAR AFTER A BLIZZARD.

from a photograph of a well-equipped sweeper in service on the lines of the Cincinnati, Newport & Covington Railway Company.

The Brill snow sweepers are unusually effective on account of several improvements of design and details. These improvements have been made in order to overcome the defects which have heretofore made the operation of snow sweepers both troublesome and uncertain. The standard form has a length of 21 ft. with a width of 6 ft. 10 ins. The height is varied to suit conditions when necessary.

headlight for this purpose. Two roof gongs are fitted on the sweeper, and a 6 ft. wheel base is generally adopted. There are two sliding doors in the cab, one on each side. There are two sand boxes, and it is a common plan to fit four sand spouts, one for each wheel, thus giving ample adhesion when it is needed. Both sand boxes are worked from either end of the car. Sweepers are intended for use over paved streets, but are not recommended for unpaved or macadamized street, because the sweeper is liable to pick up stones and throw them with great force.

Aprons are fitted over the brooms to obviate the throwing of snow, etc., as much as possible. Mould boards at the sides clear away the snow which is beyond the reach of the brooms.

For the successful operation of sweepers, they should be started as soon as a storm begins, and be kept at work continuously until it ceases. When a lines does not operate at night it is too expensive to keep a line in operation for a sweeper alone, hence the best practice combines the plow with the sweeper. The Brill plows are designed for operation in deep snow and can easily attack and clear away the accumulation of a night.

For suburban use and upon unpaved streets the plow alone is always recommended. In our southern cities, where there is but

FIG. 17.—SWEEPER—CINCINNATI, NEWPORT & COVINGTON RAILWAY.

small use for a snow plow, the Littell track scraper is often applied to cars, which are then enabled to run in snows which would stall a car or at least render operation extremely wasteful. These scrapers act as small plows and can handle either wet or dry snow of considerable depth.

The snow plow illustrated in Fig. 18 is intended to be to the electric railways what the great rotary snow plows used in the northwest are to the steam railroads. Snow 10 ft. deep will not stop it and it will go through 3 ft. of snow about as fast as a car will follow behind it. It was one of eight recently built by the Peckham

FIG. 18.—PECKHAM ROTARY PLOW.

Company and this one is now in service on the Chicago & Milwaukee Railway which passes through some narrow cuts and suffers from drifting snow. The plow weighs 15 tons and is equipped with three 50-h. p. motors, two for traction and one for propelling the fans. It has a double equipment and can be run either way, having four controllers. At each end of the shaft passing through the car is a fan with four blades of $\frac{3}{8}$-in. sheet steel and a wheel with buckets on the periphery. The fan blades of this plow are 5 ft. 6 in. across. The steel hood about the fan, which are made as wide as the largest car on the line, come within 3 in. of the track. The snow beneath the fan is taken care of by the track scrapers and ice diggers. The snow is cut by the blades and deposited in the buckets which throw it against a deflector door near the top. The bucket wheel going at full speed will throw the snow 125 ft. away from the plow but by arranging the deflector it can be deposited beside the track. The blades of the fan are so turned that they tend to draw the plow into the snow and it is claimed that this plow takes at least 50 per cent less power to do the work than any other type.

STEEL TIES.

There are a number of street railway systems on which the traffic is sufficiently heavy to permit the management to practice economy by using the "best" of everything, even if the first cost is higher, and doubtless some of these fortunate ones have looked upon the steel tie as perhaps being desirable.

The subject of metal ties has been much discussed by the civil engineers of steam railroads and to their experiments we owe the greater part of our knowledge of the subject. There are practically no metal ties in use in the steam railroads of the United States, which have over 10 per cent of the total number of ties laid; in a few instances American roads have laid short and isolated stretches of track with metal ties for trial or for special purposes.

Such was the track laid by the New York Central in 1895, from 106th to 110th street. The ties used were of pressed steel, trough shaped in cross section and bent longitudinally so that only the rail seats were above the ballast, which covered the tie in the middle and at both ends. These ties weighed about 100 lbs. and cost $2.50 each

The disadvantages of steel ties are that they are quickly corroded in a soil impregnated with saline matter; the cost of tamping in soft soils is greater than with wood ties; the ballast tends to work out from under the tie; in case of derailment the steel ties are usually so strained as to be worthless. The advantages are the longer life, and the fact that they are impervious to the attacks of insects

Metal ties have been extensively used in India, and in 1895 the "Indian Engineer" thus compares the economy of cast iron, steel and wood ties. The cast iron ties are two bowl-shaped castings joined by a rod; they cost 55 per cent more than wood ties and have a life of 30 years. The steel ties referred to were of trough section; they cost 30 per cent more than wood ties and have a life of 15 years. The life of the wood ties is taken at $7\frac{1}{2}$ years. At the end of 30 years the total cost (interest included) is estimated to be in the following ratio: Cast iron, 100; steel, 212; wood, 225

If metal ties are preferable any place they would be in India, both because wood is scarce and because it is there subject to the ravages of insects, which quickly destroy it. But even there many of the railroad engineers are of the belief that it would be better to use wood if it is possible to get it. On the Sindh Sagar District of the Northwestern Railway of India, having some 300 miles of track, it was decided in 1893 that renewals of ties should in the future be made with wood. A test showed that in four years steel ties on this road lost 61 lbs. in weight, the original weight being 148 lbs

After an experience of five years on the Belgian State Railroads, steel ties were pronounced unsatisfactory and wood substituted, but this result it is claimed by the advocates of steel ties was because of too light structure and poor rail fastenings. On the other hand the saving by the use of steel ties on the Austrian railroads is placed at about 14 per cent, and at an International Congress in St. Petersburg in 1893, the average results on 17 lines of railway in Europe showed a gain of 30 per cent in the maintenance of steel ties as compared with wood.

Steel ties are much used in Switzerland; in 1894 the percentage of steel ties used on five roads was given at from 60 to 18 per cent, the larger roads having the greater proportion of steel ties.

In Mexico steel ties are used to some extent, the number imported being placed in 1894 at 50,000 annually.

Some foreign street railways have used steel ties in the construction of their track; among these are the street railway systems of Aix-la-Chapelle and Budapest. In the United States very little has been done with steel ties in street railway track construction, the situation being about the same as on the steam railroads.

Probably the most extensive experiment was that of the Citizens' Street Railway Company, of Detroit, which in 1895 adopted steel ties for its new track. The ties in this case were of channel section, 7 in. wide, with flanges 1½ in. deep, and were 7 ft. long. They were spaced 5 ft. between centers, and as the rails and ties were bedded in concrete it is evident that the ties were merely substitutes for rods to keep the gage; they were neither close enough together nor stiff enough to properly support the rails.

The Cincinnati Street Railway Company laid some steel ties in 1895, which are still in service, and have given no trouble. While the steel ties require less excavation and less concrete to properly bed them it is a question as to whether they will last longer than oak, as oak laid in cement concrete seems to be "cured" to some extent and decays less rapidly than when laid in macadam. Bert L. Baldwin, mechanical engineer for the company, states that when some of these steel ties were uncovered after one year it was found that many of them were somewhat rusted. The hot tar coating which was given them when laid had failed to entirely prevent corrosion.

In 1893 the Los Angeles Consolidated Electric Railway Company conceived the idea of utilizing old T-rails for cross ties when the track was relaid with girder rails. The old rails, cut to suitable lengths, were laid head down, with two short sections of Z-bar riveted to each for rail chairs to which the track rails were bolted. At the joints two of these ties were used, one under the end of each rail. The ties were tamped with rich concrete

All of this work has since been torn out and replaced by the ordinary wood tie construction, as it was found that the joints went down just as much as with wood and that it was practically impossible to make any track repairs without tearing up the T-rail tie and cement in which it was bedded.

Steel ties have been laid as an experiment by other street railways in this country, but so far as we know they have not been adopted as standard on any of the large systems. The Rochester (N. Y.) Railway has adopted steel ties in its new work as described in the REVIEW for November, using old rails for this purpose for the most part. The Boston Elevated, in its sub-way track work, used preserved wood ties in preference to metal, and in general the same views obtain in street railway as in steam road practice in this country.

CARE AND CONSTRUCTION OF COMMUTATORS.

In an article in the "Electrical Review," of London, F. J. A. Matthews gives some notes on commutator design which are instructive.

Considering that many makes of direct current dynamos and motors can now be bought with an efficiency of from 85 to 94 per cent, and that by the expenditure of so many more pounds a higher degree of efficiency can easily be obtained, designers have now only two problems to consider, first, to cheapen the cost of production, and, secondly, to improve the general running and life of dynamos. It is of the very greatest importance that the machine, when set to work, should run with the minimum of attention and absolutely no sparking.

The causes of sparking may be classified as follows:

1. Faults inherent to the dynamo design.
2. Faults due to bad setting of the brushes.
3. Causes entirely outside the machine.
4. Faulty construction of the commutator.
5. Bad connections.
6. Commutator too small.

In the present article we are more concerned with the three latter causes, and so may briefly dismiss the first three.

1. These faults are, broadly speaking, two-fold:

(a) Unsymmetrical winding; (b) too weak a field, and each denotes lack of experience and bad designing.

2. These faults are again two-fold: (a) brushes not being diametrically opposite, and not on the neutral plane; in either case this is more a matter for the dynamo attendant, although the designer should contrive to secure such a degree of fixity of lead, that the lead of the brushes does not require to be altered with every slight fluctuation in the load; (b) the brushes not bearing on sufficient width of the commutator, the brushes should be set to cover one and a half sections, plus one and a half pieces of mica. Referring to Fig. 1, where the brush covers one section only, the coil c, just coming under the brush, is carrying current in a right-hand direction; but when it reaches the position of the coil, b, it will have to carry current in a left-hand direction, as it will have passed from the y series into the x series of coils; therefore, while short-circuited under the

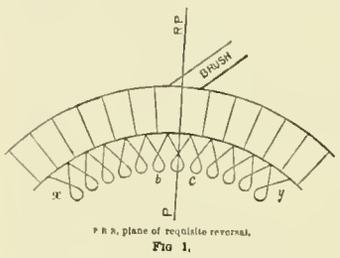

Fig 1.

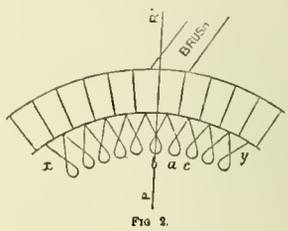

Fig 2.

brush, the current must first die away, and in order to obtain sparkless commutation, a reverse current of the same strength as that carried by the x series of coils must be generated in it. Take the case of a commutator built up with 60 sections, and running at 1,200 r. p. m., the time each section is under the brush is 1-1200 part of a second, and we know that, in accordance with Lenz's laws, there will be a force opposing the dying away of the current, and then a force opposing the generating of a current in the opposite direction, in addition to which the coil must be exactly in the plane of requisite reversal; the time for all these forces to act is very short. It is not impossible to get sparkless commutation with a brush covering only one section. The condition for sparkless commutation in such a case is, that the plane of requisite reversal must be exactly through the center of the coil, and the slightest variation in the load will have a tendency to shift this plane and thus cause sparking. In Fig. 2 the brush is shown covering one and a half sections; here two coils are short-circuited in place of one, as before, with the result that the total time under the brush is very considerably longer; the plane of requisite reversal will now lie through the center of coil c, so that the current in any coil coming up under the brush will have time to die away,

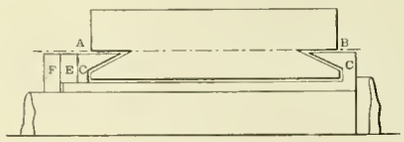

Fig 3

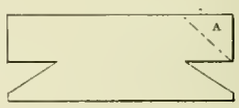

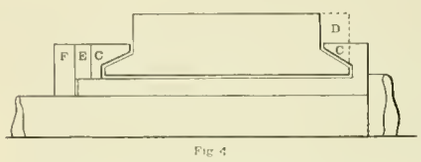

Fig 4

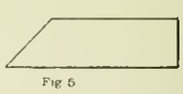

Fig 5

and even a slight reverse short circuit current may be generated in the coil before arriving at the plane of requisite reversal. Should, now, this plane vary owing to a fluctuation in the load, the sparking will in no case be as heavy as it would with a similar fluctuation were the brushes covering one section only.

3. These faults are caused either by (a) vibration of the dynamo, (b) bad joint on the belt causing the brushes to be continually lifted up and down, (c) leakage on the outer circuit. They have, in reality, nothing to do with the design, but attention should be paid to these points by whoever puts down the dynamo.

Having glanced thus briefly at these preceding causes of

sparking which are not due to the design and construction of the commutator itself, we will now deal more fully with faults which can, and ought to, be guarded against when the commutator is either designed or in process of being built.

4. The conditions for a sound commutator are, that it shall be absolutely rigid, evenly balanced, truly turned axially with the shaft, and that the metal shall be homogeneous. Another condition is, that each segment shall be thoroughly insulated from its neighbors and from the sleeve.

Absolute rigidity can only be attained by the exercise of the utmost care, not only in the design, but also in the building up of the commutator, for in all commutators the method of holding various segments together is very far removed from being a sound mechanical construction. This is caused by the fundamental condition that the segments may not be directly held by metal, whilst at the same time they are acted upon by various strong forces, such as centrifugal force due to rotation, friction due to the brushes, and expansion due to the rise of temperature in the commutator during a run. Except in commutators of large size, there are practically only two ways of holding the segments together, represented in Figs. 3 and 4. Various makers differ slightly from these two methods, but they are only variations of the same principle. Each of these two methods has its advantages and its disadvantages. For the type shown in Fig. 3 there can be claimed that less length is required on the shaft for nuts and rings, with a consequent saving in length of the sleeve and bed plate, and also that with rolled copper bars the sections can be cut for connecting lugs from the inductors before the commutator ends are turned up. On the other hand, the life of the commutator is short, for as soon as it has worn down to A B, the brushes will rest on the rings, C C; while with the type shown in Fig. 4 the great advantage is the longer life of the commutator, which can now be worn down to the very bottom; the disadvantages being, first, the longer length required on the shaft, and secondly, and more important, the greater amount of time in building up the commutator when made of hard rolled copper bars, as the various segments have first of all to be put together, and the dotted part, D, Fig. 4, must be turned off, and the whole taken in pieces again before the commutator lugs can be attached, the time of this building up and undoing being saved if the type of Fig. 3 be adopted. Each manufacturer must decide for himself which of these methods is the best, as neither of them has any real advantage as regards the solidity of the commutator; what is of real importance is that the rings, C C, should well cover the V's of the segments so as to secure a good grip.

In a commutator with bars 1½ in. deep, 6 in. long, 8 in. external and 5 in. internal diameters, running at 1,200 r. p. m., the centrifugal force tending to throw the bars outwards is equal to 2,700 lbs., or with 60 sections in the commutator to 45 lbs. per section. Between the collar, C, and the V of the sections some insulating material must be placed, and even today many of the smaller makers use for this purpose fibre washers, one of the very worst materials possible, as not only is it hygroscopic with consequent varying degrees of hardness and rigidity, but it also, under the action of heat, rapidly deteriorates in other ways, and it will be readily seen that if it once only slightly looses its hold the high centrifugal force will cause some of the sections to rise, and the result will be disastrous to the commutator, rapid wearing away and oscillation of the brushes, and development of flats owing to the sharp edges and unevenness of the risen bars. The only substances that up to the present have proved of any serviceable nature for these washers are either pressed mica or micanite. Another fault which may arise, and in many cases has done so, with the use of fibre washers, is for the outer ring to loosen its hold, and the friction of the brushes causes the commutator bars to become inclined at an angle, instead of being parallel with the shaft, with the result that the outer brushes have a forward lead in comparison with the inner brushes; this is a case which the writer has observed in more than one machine which he has been called in to inspect after some months of use. Even employing mica or micanite washers, it is of the highest importance, in order to prevent subsequent slip, to see that the nuts are well tightened up; this can only be done by having the commutator heated after the first tightening up, and upon allowing to cool, again screwing the nuts up in the lathe; further, the nut, E (Fig. 3), securing the commutator to the sleeve, should either be in duplicate, or should slightly overhang the sleeve, so that the nut F, securing the sleeve to the shaft, may act as a check nut.

Another point of vital importance is to see that the commutator segments, washers, sleeve, etc., are entirely free from all dirt, turnings, borings, or filings, as the presence of these in the commutator will cause rings of fire running round the commutator, and although in all probability this dust will soon burn out, and give no further trouble, yet in building such a delicate piece of mechanism as a dynamo, a good manager will leave nothing, that is avoidable by the exercise of a little close attention, to chance.

5. In order to prevent the formation of flats, owing to some bars wearing away faster than others, it is necessary to secure the same degree of hardness in all the bars, by using a perfectly homogeneous metal; but copper being a metal that varies so greatly in the melting pot, the use of cast segments must be abandoned, and hard rolled copper substituted. The worst of this is, that either the bars must be made to the top of the lugs and then turned down along the blade—which would make a thoroughly sound piece of work, but is too costly for any manufacturer to seriously entertain the idea of—or else lugs must be let in. The usual method is to make a saw cut at an angle of 45 degrees and then let in a copper strip lug, as shown in Fig. 5; when this is done, it is most important that the connection at A should be thoroughly sound, as it is owing to bad contacts that a vast amount of heating arises in electrical work. The only method which recommends itself to the writer is to have a saw cut through the center of the bar and solder, or preferably braze, the lug in, and then to drill and rivet it.

6. Above all, the commutator should not be too small for its work; it is frequently stated in dynamo specifications, "no part of the machine to rise more than 70 degrees F. above the surrounding atmosphere at the end of six hours' run with full load;" this, as regards the commutator, is far too high. Take the case of the commutator referred to above; if this rises 70 degrees F. it would tend to lengthen .0005 in., and if the insulating ring is not thoroughly rigid it would give, and upon cooling the commutator would be slack, and the troubles enumerated before would rise upon the next run. If the insulating washers are absolutely rigid, then they and the sleeve, nuts and end rings, C C (Fig. 3), would have to withstand a stress of something like a ton to the sq. in., and the consequences might be very serious, for while the whole might stand firmly together, still the danger, with innumerable successive runs, would be very great, of either the sleeve giving way and breaking, or else of the bars buckling in the center, when we should have the old sequence of events, rapid wearing away of the brushes, owing to the sharp edges and the development of flats. Here, again, the good designer will leave nothing to chance, but will do away with all fear of danger by making a commutator of such ample section that the heating effects shall not cause any such rise in temperature. Even with a considerably less rise there will always be a strain on the sleeve, and hence is seen the necessity of making this of gun-metal of ample section.

As we saw at the first, a commutator is a most unmechanical construction, judged from an ordinary engineer's point of view; yet with careful designing and supervision during construction, and in the hands of an attentive dynamo tender, there is no reason why this, which has always been the weak part of direct current machines, should not thoroughly retrieve its character, which a little time ago it was fast losing.

A plan has been submitted to the Italian government asking for the right of way to construct an electric railway over the Great St. Bernard, a total distance of 43 miles. According to report the scheme is being promoted by an English company recently incorporated under the name of the Great St. Bernard Concessionary Company. It is proposed to adopt a third rail on the rack system, as used on the Mont Cenis line. The cost of the construction and equipment of the railway is estimated at $3,000,000. J. B. Fell, engineer, Turin, Italy.

A PEACE PROPOSITION IN DETROIT.

On December 12, J. C. Hutchins, vice-president of the Detroit Citizens' Street Railway and of the Detroit Electric Railway, made a proposition to the Detroit council involving the following provisions:

A new franchise covering all lines to run 30 years.

The abolition of the eight-for-a-quarter tickets save between the hours of 5:30 and 7 a. m. and 5 and 6:30 p. m.

Six-for-a-quarter tickets with universal transfers for continuous rides.

In lieu of present paving regulations the company to pave between the tracks.

The Detroit Electric Railway to pay 2 per cent of its gross earnings to the city as do now the Citizens' and the Detroit, Fort Wayne & Belle Isle.

Lines within the city limits, operated under original township grants, to be considered extensions of the system.

Sundry extensions of lines to be built.

In case of the widening of a street to lay double tracks the company to bear the expense.

In presenting the ordinance Mr. Hutchins said:

"I will try to be brief. It has been asked in behalf of the city that we shall submit a proposition extending further advantages to the public in street railway matters. I feel the weight of some responsibility in now endeavoring to comply. Your wishes are met in the form of a draft of an ordinance. This draft has been carefully prepared and is in legal form. In it we burn all bridges behind us. It wipes out all indefinite and perpetual rights, and fixes one definite date upon which all franchises shall expire; cancels all authority to charge a straight 5-cent fare, as in other American cities; requires universal transfers where no transfers are now required; extends the hours for workingmen's tickets and compels the giving of transfers on such tickets; it provides for the expenditure of many thousands of dollars in new extensions. It requires the Detroit Electric Railway to pay 2 per cent of its gross earnings into the city treasury, as the other companies do, and while righting a wrong under which that company now labors, requires it to assume the same heavy burdens for street paving as are borne by the other companies.

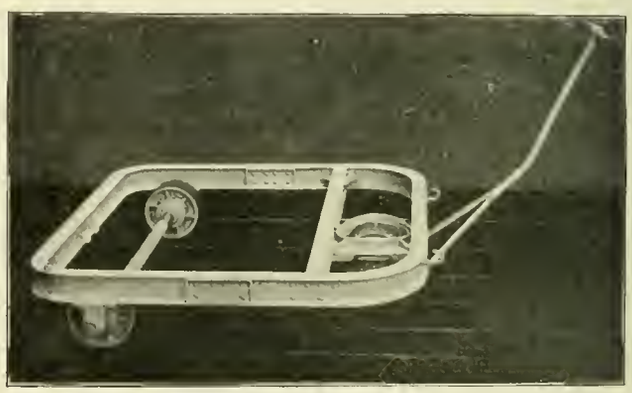
"It makes all tickets and all transfers good on all lines in Detroit. The rates of fare are 25 per cent or 30 per cent below those in effect in any other American city. No other railway management in the world would probably consider such a proposition. We may be able to live under it. I spoke at the commencement of responsibility. Three or four years ago it was largely on my advice that my associates in and out of Detroit were induced to stake their fortunes on Detroit. That advice was predicated on my unswerving belief that in this American city we could count on ultimate fair play. If this ordinance is adopted, it will be on my advice that it may be accepted. Four years ago the bicycle cloud was no larger than a man's hand. Today there is a cloud of more than 50,000 bicycles in this city. No man may foretell what the evolution of city transportation may be. The risk is ours. We may be making a great mistake in proposing to surrender terms which would protect the property under all changing conditions; but we are moved by a desire that the people of this day and generation may have every advantage and facility that now seem possible. The people 20 years hence will be able to take care of themselves.

"There is a phase of this matter to which I wish specially to allude. The records show that no measure introduced in the common council antagonistic to the interests I represent has ever failed of passage by a practically unanimous vote, and none of any other tenor has ever been introduced. The people are doubtless willing that right shall prevail, but have been led to believe that their interests may suffer through the dishonesty of their own servants. It is said that some of these very servants are dishonest in a mercenary sense, and that others are dishonest in the sense that they would annoy us for political advantage. I attack no man's integrity, but trust that all may now be honest. We shall do nothing that is not open and above board. Not one dollar shall be paid to any man, either directly or indirectly, in any way to influence his action in this connection. This matter shall be put upon an altogether higher plane. I have simply complied with the city's wishes in submitting this proposition.

"The common council may be in doubt as to the proper course to pursue. If advice is needed, why not ask it of a high commission composed, if you please, of the governor of Michigan, of the mayor of Detroit, of members of the faculty of our great university, of members of the Michigan supreme court, of members of the circuit court bench, and of the leaders in our great commercial, industrial, labor and religious organizations? or, if you please, submit the whole matter to a vote of the people. If the people of Detroit desire an adjustment along these lines, we shall bow to their will, though the sacrifice seems great on our part. I confess I am sorry this matter is up at this time. If you think best, drop it and let us wait. It now becomes your duty to determine what is best to be done. My duty is discharged. Your responsibility begins. And now, gentlemen, I hand you the proposition and beg leave to retire."

HAND TRUCK FOR BUENOS AYRES SLAUGHTER HOUSES.

In the Review for October, 1898, page 745, was described the method by which meat is handled in the city of Buenos Ayres between the slaughter houses and the markets and the cars furnished by the Brill Company for that purpose. At that time we alluded to the trucks upon which the meat boxes were handled on arrival at destination. The accompanying illustration shows one of these trucks. They are mounted practically upon three wheels although the forward wheel is doubled to facilitate turning. This forward



HAND TRUCK FOR BUENOS AYRES.

wheel is set in a turn table carried in ball bearings and the whole truck can be turned in its own length. While it is intended that these trucks should be handled by hand, a large portion of the work done with them is performed by means of mules and the trucks themselves are arranged so they can be hauled in trains. The handle of one truck is made of sufficient length to drop into the hooks at the rear end of the truck in front of it. The handles of the forward truck can be turned up against the meat box or can be unshipped and then attached to two hooks seen in front of the trucks. The construction is exceedingly simple and at the same time of the greatest strength. Roller bearings for each journal reduces the friction to a minimum.

There is a small truck that might be used to advantage at repair shops, depots and other places where heavy weights are to be moved and where the roads do not have overhead trolleys for the purpose. The trucks illustrated are made of 6,000 lbs. capacity but they can be built for any desired load from 1,000 lbs. up.

The Altoona & Logan Valley Electric Railway Company of Altoona, Pa., has built an addition to its power-house and installed two new 300-h. p. Heine boilers.

The engineer of the proposed elevated freight road for Detroit has prepared drawings showing the construction. It is to be a double-track structure with the posts set along the curb at intervals of 30 feet.

NOTES ON AUSTRALIA.

BY FRANK X. CICOTT.

Australia is 2,400 miles long from east to west and 1,971 miles wide, and is divided into five colonies, New South Wales, Victoria, Queensland, Western Australia and South Australia. The island of Tasmania, which lies just south of Victoria, might also be included when speaking of Australia generally. The population is 5,000,000, about the same as metropolitan London, or 20 per cent less than the state of New York. The governments of the several

PANORAMA OF SYDNEY HARBOR.

colonies of Australia are as distinct from each other as is that of the Dominion of Canada from South Africa, although all are British possessions. Both free trade and protective tariff systems exist. New South Wales has free trade and its next neighbor, Victoria, a high tariff which discriminates against New South Wales as a commercial rival. There is a duty of about $15 per head on live stock crossing the Victorian border, but there is no tariff on cattle entering from any other colony. This state of affairs will doubtless be ended before long by the formation of an Australian federation, which will include Tasmania; this is now being formulated.

Sheep-farming is the pre-eminent industry of Australia, which is of great importance as a wool-producing country. There are in the aggregate about 90,000,000 sheep in Australia. The gold coinage (sovereigns) of the Melbourne mint is about $23,000,000 and of the Sydney mint about $14,000,000 per annum. These mints are under the jurisdiction of the Royal Mint of London. A third Australia mint is now nearing completion at Perth in Western Australia.

Sydney, the largest city and seat of government of New South Wales, was founded January 26, 1788. Port Jackson, the harbor, which is claimed to be one of the most picturesque as well as one

KING STREET, SYDNEY, N. S. W.

of the most secure ports of the world, has many beautiful suburban towns in the numerous indentations of the bay, which has the general outline of a human hand. The railways and tramways of the colony are owned by the government, and the latter are under the management of P. Bedford Elwell, electrical engineer, and Gustav Fischer, chief assistant engineer for tramways. Both of these gentlemen are members of the Institute of Civil Engineers, and Mr. Elwell is a member of the Institute of Electrical Engineers also. The cable and steam tramways are now undergoing a transformation for electric traction. Nearly all of the equipment has been contracted for in the United States; it includes steel rails, Allis cross-compound condensing engines and Peckham standard cantilever trucks. The commissioner, W. M. Fehon, has awarded the contract for cars to Henry Hudson of Sydney, and they are all to be equipped with the Standard air brake. The trolley hangers are of the writer's design. The trolley wire is ordered from John A. Roebling's Sons Company. The feeder cables are being laid underground, and a novel point in the system is the laying of two submarine cables in the bottom of the harbor to carry the power for the north shore lines. These cables have a cross-section of 500,000 c. m. each and are insulated and armored. At the cable crossing the distance is about 1,500 ft. and the water nine fathoms deep. The introduction of electric traction in Sydney and environments will have a tendency to encourage smaller towns in New South Wales to do likewise. Being under the same administration of the railway commissioners as Sydney, these towns will certainly follow Sydney and its suburbs have a population of about 500,000.

COLLINS STREET, MELBOURNE.

Melbourne (Victoria) has also a population as large as Sydney; both cities claim to be the metropolis of Australia, and the census of 1900 will decide the question. However, to visit either one or both of these beautiful cities an American will soon discover that the advance agent of progression has already established an alliance between America and Australia. The characteristics of the people are democratic to a degree; the streets are similar; the Equitable Life and the Mutual Life Insurance Companies of New York have erected large office buildings here which are a credit to American architecture. Even the school children sided with us during the Spanish-American war.

One cannot but admire the liberal way in which the Australians improve property and spend money upon public works, such as legislative buildings, town halls, postoffices and botanical gardens.

The Melbourne Tramway & Omnibus Company, Ltd., of which F. B. Clapp is chairman and general manager, operates about 44 miles of cable and three miles of horse lines. It is contemplated that suburban extensions will be made soon and electricity will be employed. The merits of the construction and favorable results of this cable system have been the subject of many articles published in America and Europe. However, the possibilities for the installation of electric traction in other places in the colony of Victoria is fast approaching; in Ballarat with a population of 45,326, Bendi-

go with 42,380, Geelong with 24,575, and in other smaller towns, the favorable conditions would justify the construction.

The population of Brisbane in the colony of Queensland, is about 130,000. This is one of the most prosperous colonies in Australia; the broad plains afford the richest pasturage. Live stock, tropical fruit and sugar cane are the leading products in this section. The colony has 460,000 horses, 6,500,000 cattle and 20,000,000 sheep.

Brisbane has a modern municipal tramway operated by the overhead trolley system, recently constructed by Mr. Badger, formerly connected with the General Electric Company of Schenectady. Mr. Badger has been retained at Brisbane as general manager, and the tramway is proving profitable. The equipment is nearly all of American manufacture.

From Western Australia, street and steam railway sleepers and piles for bridges and harbor work are largely exported to India and Europe for construction purposes. These jarrah forests cover immense tracks of land in Western Australia; this wood is extraordinarily durable and as it resists both the teredos and white sand ants it is admirably suited for the purposes mentioned. This colony is a great timber country; sandal wood is found and also the karri, which tree attains a height of 300 ft. and is considered to be equal to the jarrah for many purposes.

There are four flourishing towns in this colony, Fremantle with a population of 13,000, Perth with 16,000, Coolgardie with 15,500, and Southern Cross with 15,000. At Coolgardie and vicinity there are rich gold mines. As mentioned a mint has been recently built at Perth to coin the local production of bullion. The rich resources, the permanency of the institutions and rapid growth of these towns will have a tendency to invite electricity for traction purposes.

AN AUSTRALIAN CHIEF.

Adelaide, the capital of South Australia, has a population of 102,000. The municipal conditions are modern; here are broad straight streets, well paved, and planted with beautiful trees; electric lights, public buildings of fine architectural appearance and botanical and zoological gardens of 124 acres within the city limits. The local press is demanding electricity to supersede the present horse tramways. The city authorities are about to arrange the legal preliminaries to make the change. Adelaide is an ideal city in which to operate an electric tramway economically; the gradients are easy, the people are a riding community and the climate is delightful. There is no doubt but that the change of the present tramways will be electrically installed within the period of a few months.

Hobart, Tasmania, is where a penal settlement was established by the British in 1803; transportation of criminals was abolished in 1853, and the name changed from Van Diemen's Land to Tasmania after Captain Tasman.

HOBART FROM THE BAY.
Mt. Wellington, 4,464 ft.

Tasmania is a very productive colony; coal, wool, copper, tin and apples are exported direct to England, via both Cape Horn and the Suez canal.

The first electric tramway constructed in Australasia was installed in Hobart by Messrs. Siemens Brothers & Co., Ltd., electrical engineers of London, in 1891 for an English company. The system gives most satisfactory results, both electrically and commercially.

The prospects for an electric tramway in Launceston, Tasmania, are encouraging; there is water power of great capacity already installed for lighting and power purposes.

There is a rapidly growing field in Australasia for business in electrical appliances, and there are many enterprises under way that will be carried out in the near future.

TO READ AND PONDER.

The following aphorisms conclude the rules and regulations to be observed by the motormen and conductors operating the cars of Lindell Railway Company, of St. Louis:

Politeness is the expression of social virtues.
An honest endeavor is worth ten promises.
Constant occupation prevents temptation.
Good examples are very convincing teachers.
Silence sometimes speaks more than words.
Quarrels require two; both are to blame.
Write injuries in dust, kindness in marble.
Unskilled workmen will blame their tools.
Ease and honor are seldom companions.
Labor well directed will achieve all things.
It is not how much we do, but how well.
He that knows not when to be silent, knows not when to speak.
Better be alone than in bad company.
Trifles often lead to serious results.
A little neglect may breed great mischief.
Many value character less than reputation.
To excel in art you must excel in patience.
Odd moments are the gold dust of life.
He who conquers self is the greatest victor.
Form plans with care, to execute with vigor.
Yield always to reason, but never to passion.
Whatever is worth doing is worth doing well.

The Cambridge (Mass.) board of health has secured its first conviction under an anti-spitting ordinance. An attorney named Zarrelli was fined $1 and costs.

ROTARY CONVERTERS.

Read by Prof. Silvanus P. Thompson before the Institute of Electrical Engineers, England.

So much interest is concentrated at the present time upon the transmission and distribution of electric energy for motive and locomotive power, as well as for lighting, that attention may profitably be directed to a class of machines which hitherto have been little discussed—namely, rotary converters.

In general a rotary converter may be described as a machine having something in common both with a dynamo and with a motor so far as its structure goes, and of which the function performed by its rotation is to transform the electric energy which is imparted to it in one form into an output of electric energy of some other form. Of such converters there are many varieties, subserving many different uses. For example, one sort of rotary converter will change continuous currents at one voltage into continuous currents at a different voltage. Another will change two-phase alternating current into three-phase alternating current. Another will change three-phase alternating current into continuous current. Yet another will change an alternating current of a certain frequency into an alternating current of a different frequency.

In the following table of the principal conversions which may thus be accomplished, C stands for continuous current, A_1 for alternate current of single-phase, A_2 for two-phase, A_3 for three-phase:

TABLE I.

1. C to C at higher or lower voltage.	7. C to A_3, or A_3 to C.
2. A_1 to A_1 " "	8. A_1 to A_2, or A_2 to A_1.
3. A_2 to A_2 " "	9. A_1 to A_3, or A_3 to A_1.
4. A_3 to A_3 " "	10. A_2 to A_3, or A_3 to A_2.
5. C to A_1, or A_1 to C.	11. A_1 to A_1 of different phase.
6. C to A_2, or A_2 to C.	12. A_1 to A_1 of different frequency.

Any one of these conversions might be accomplished by selecting an appropriate motor to receive and be driven by the primary current, and coupling it to a generator to give out a secondary current of the species desired. It will be noted that of these conversions No. 2 is the ordinary alternate-current transformation, and is better accomplished by ordinary stationary transformers; as also are Nos. 3 and 4. By a suitable combination of stationary transformers No. 10 can also be effected, whilst Nos. 8 and 9 may be more or less satisfactorily effected by the use of auxiliary choking coils and condensers. But all of them may, and all the others must, be effected by means of rotatory apparatus. From the above list there have been omitted several possible cases of conversion, as, for example, that of a current supplied at fixed voltage but of varying amperage, to a current of fixed amperage but delivered at varying voltage.

It is not proposed here to deal, save incidentally, with the continuous-current transformer (No. 1), nor with phase transformers (Nos. 8, 9, 10 and 11); nor with frequency transformers (No. 12); nor with any stationary kind of transformer. This paper will be directed to the machines devoted to the purpose of converting continuous currents into alternating currents of one, two, or three phases, or vice versa. The importance which such machines have now assumed in the electrical industry arises from several causes. Long-distance transmission, with its corollary of the employment of high voltages, has demanded for this service alternating currents. The development of the electric tramway with continuous-current motors has called for methods of feeding at distant points. For this service rotary converters are required. Also for charging accumulators in cases where the public supply is an alternating one, and for factory driving with three-phase motors in cases where the public supply is one with continuous currents, rotary converters are wanted. All these cases might, of course, be met by the use of coupled machines, motor and generator. An early example of this method was afforded by the lighting station at Cassel, where the high voltage alternating transmission was effected by the use of synchronous single-phase alternators, and the town distribution by continuous current dynamos coupled to the shaft of the synchronous motors. Even now, in the case of a three-phase transmission and a continuous-current distribution, some engineers recommend the use of a group converter, consisting of a non-synchronous three phase motor coupled to a continuous current dynamo. But in all such cases the efficiency of the group is necessarily lower than that of either of its component parts. If a motor having, say, a 90 per cent efficiency is coupled to a dynamo, also of 90 per cent efficiency, the efficiency of the group cannot possibly exceed 81 per cent.

Two other solutions to the general problem are possible. One is to wind the revolving armature with two sets of windings—one to receive the primary current and revolve as a motor, the other to generate the secondary current. As only one field magnet and one pair of bearings are required, there is an obvious economy of material, though no great saving in efficiency. Another solution—not, it is true, of universal application, but having the advantage of effecting a considerable increase of efficiency as well as an economy in material—is to wind the armature with but one set of windings, furnished at one end with a commutator, and at the other with appropriate contact rings, the same winding serving both to receive the incoming primary current and to generate the secondary current. It is this specialized type of machine which is the main subject of the present discussion, and which is called par excellence a rotary converter.

At this point it may be convenient to drop the adjective "rotary," and speak simply of converters, leaving the term "transformer" to denote the stationary apparatus.

Converters of a simple kind have been known for many years. Ever since 1885 there has been one at the Technical College, Finsbury, consisting of a bipolar Gramme machine with the ordinary commutator, with the addition of two insulated contact rings at the other end of the armature, these rings being connected to two points on the winding at opposite ends of a diameter. It, therefore, belongs to the species C A_1 (No. 5). The addition of three contact rings connected to three symmetrical points on the winding would constitute a machine of the species C A_3 (No. 7).

It may be convenient here to point out the relation between the number of contact rings (called for brevity slip rings) that are applied in any alternate current generator, and the uses to which such generator may be put with respect to the phasal relations of the currents that may be drawn from it. For brevity these are enumerated in the following table. The figures in the second column relate to the angles between the points on the winding at which the slip rings are connected for the simple case of a bipolar machine.

TABLE II.

No. of slip-rings.	Angle.	Possible service.
2	180°	Single phase.
3	120°	3 single-phase in ternature = "three-phase."
4	90°	2 single-phase in quadrature = "two-phase," or 4 single-phase in successive quadrature = "four-phase."
5	72°	5 single-phase in quinature = "five-phase."
6	60°	3 single-phase in ternature = three-phase with separate leads, or 6 single-phase in successive sexature = "six-phase," or 2 three-phase in sexature.
7	51⅔°	7 single-phase in septature = "seven-phase."
8	45°	4 single-phase in successive octature = "four-phase" with separate leads, or 8 single-phase in successive octature = "eight-phase," or 2 two-phase in octature.
9	40°	3 three-phase in nonature, or 9 single-phase in successive nonature = "nine-phase."

The general principles of conversion from polyphase to continuous currents, or vice versa, are well known. The relation between the respective voltages on the alternating current side and the continuous current side have long ago been investigated, and expressions for their values in the several instances that may arise have been given for those cases in which it is assumed (a) that the alternating currents are simple sine functions of the time, and (b) that the magnetic flux is distributed as a sine function in space with respect to the periphery of the armature. Calculations for the voltages of two-phase and three-phase converters were given by Prof. Ayrton in the "Journal of the Institution of Electrical Engineers," vol. xxii., p. 340, in a discussion on April 27, 1893. For the purpose of studying such machines they may be considered either as used to convert continuous currents into alternating, or

as converting alternating into continuous. The latter function is of more frequent occurrence in practice; the former is rather more easy to follow out in thought. Taking, then, the instance of the converters as used to change continuous currents into alternating, and applying Prof. Ayrton's results to the several cases, we obtain the following numerical values. If we take the continuous currents as being supplied at a constant pressure of 100 volts, the voltmeter readings at the alternate current side will be as follows:

TABLE III.

No. of slip-rings	Angle between connections to rings.	Nature of service generated.	Voltage ratio.	Voltage (virtual volts).
2	180°	Single-phase ...	$\frac{1}{\sqrt{2}}$	70·71
3	120°	Three-phase ...	$\frac{1}{2}\frac{\sqrt{3}}{\sqrt{2}}$	61·23
4	90°	As two-phase..	$\frac{1}{\sqrt{2}}$	70·71
4	90°	As four-phase	$\frac{1}{2}$	50·00
6	60°	As three-phase	$\frac{1}{2}\frac{\sqrt{3}}{\sqrt{2}}$	61·23
6	60°	As six-phase ...	$\frac{1}{2\sqrt{2}}$	35·35

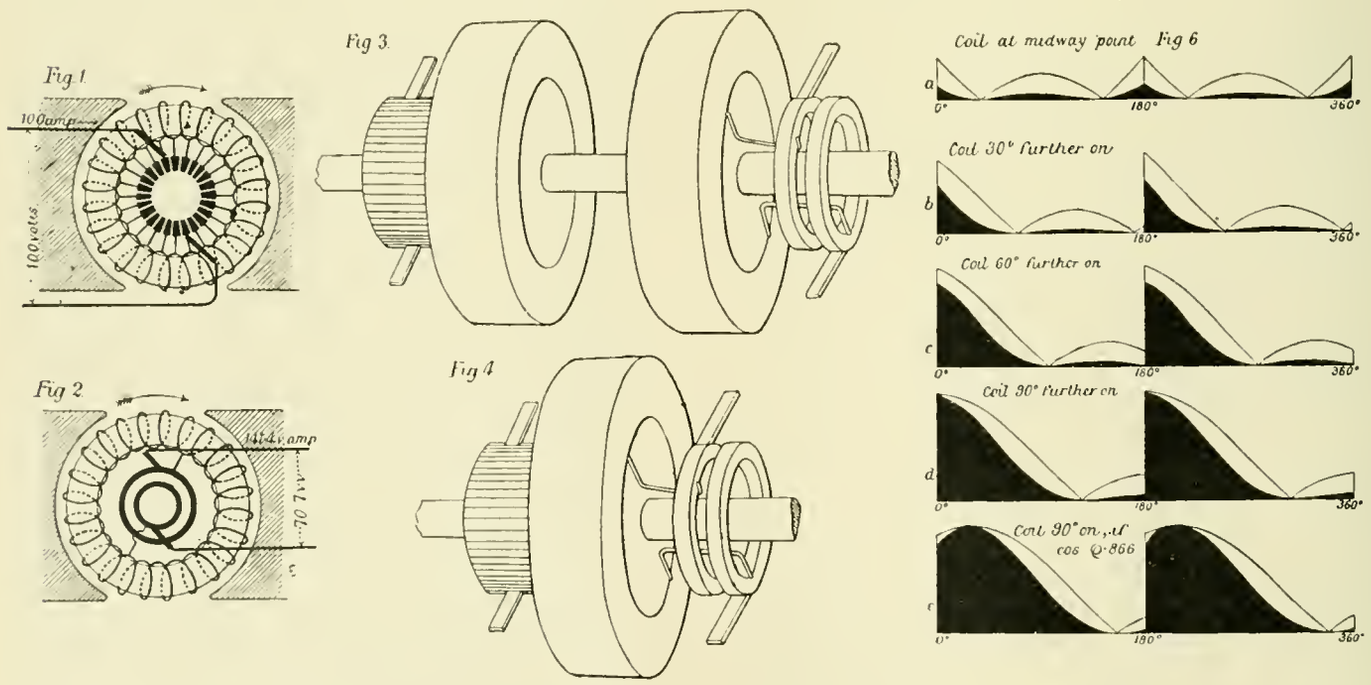
A very complete discussion of the voltage relations, with formulae applicable to the cases of open-coil windings as well as of closed-coil windings, was given by Herr R. M. Friese in the "Elektrotechnische Zeitschrift" of February 15, 1894. Throughout the series of articles he assumes the sine values of the distribution of the magnetic flux around the periphery of the armature. More recently Mr. Steinmetz has reconsidered the same problem in the same journal in articles which appeared on March 3 and 10, 1898. From these theoretical considerations it is easy to write down not only the voltages in the several cases, but also to calculate the corresponding relative values of the working currents in the armature and in the line wires. Similar calculations, down to a certain point, have to be made by every designer of polyphase motors. If we assume the above values for the voltages, and proceed to calculate the corresponding currents for an output of 10 k. w., we find the values of the currents generated to be as follows, the circuits being supposed non-inductive. Maximum as well as virtual values are given. Columns 4 and 5 refer to currents in the armatures, and columns 6 and 7 to currents in the lines. Star groupings are out of the question here, as they cannot be applied in armatures of converters. The only two-phase case that is possible is really a four-phase.

TABLE IV.

No. of slip-rings.	Angle between connections to rings.	Nature of service.	Armature current.		Line current.	
			Virtual.	Maximum.	Virtual.	Maximum.
2	180°	Single-phase	70·7	100·0	141·4	200·0
3	120°	Three-phase	54·5	77·0	94·3	133·3
4	90°	Two-phase [4 wires]	50·0	70·7	70·7	100·0
6	60°	Six-phase	47·2	66·7	47·2	66·7

If the circuits are inductive, there will be a lag of phase in the currents, and wattless currents as well as working currents. For an equal output of power the numbers in columns 4 to 7 of the above table will need to be increased by dividing them by the cosine of the angle of lag.

Let us return to the problems presented by a converter, in which an armature, furnished with slip rings at one end and a commutator at the other, is wound with but one set of windings, receiving current as a motor and delivering it as a generator. The question for consideration is how the current in the act of being transformed from alternating to continuous, or vice versa, flows through the windings of the armature. This is a matter that has not hitherto been considered in detail in any publication. Consider the general case of a revolving armature which is at the same time being traversed by continuous currents to drive it as motor, and by alternating currents which it is putting forth as generator. It is self-evident that the currents which it receives as motor must be flowing in general against e. m. f.'s induced internally by its rotation, while the currents which it gives out as generator must be flowing with those e. m. f.'s. Further, since at every instant (under steady conditions of operation) the value of the continuous current is (by hypothesis) unvarying, whilst the instantaneous value of the alternating current is continually changing, it is clear that at some instants the motor current must be in excess of the generating current, whilst at other instants the reverse must be the case. Whilst the average speed of rotation remains uniform it is certain that dur-



ing each period, or revolution, there will at times be a positive acceleration, and at other times a negative acceleration. Further, it is clear that if there are any irreversible sources of loss of energy, such as friction, hysteresis, or eddy-currents, the motor current must, on the whole, be greater than would otherwise be requisite, the power supplied at the motor side being greater than the output of power at the generator side, the difference being equal to the sum of the various items of power wasted in the machine.

To make this clear, as well as to exhibit the way in which the circulation of current in the windings is effected, it is well to take some concrete case. All cannot follow an analytical argument; and therefore, though the analytical treatment has many advantages, I have deliberately preferred, for the purposes of the present paper, to avoid formulae (though they have been used in its preparation), and instead, to exhibit the arguments numerically by taking specific cases that are readily followed.

Let us consider a 10-k. w. bipolar ring armature, having at its periphery 96 conductors, connected symmetrically down to a 48-part commutator, running at 1200 r. p. m., or 20 revolutions p. s. There will be two turns of the winding between each commutator bar and the bar next adjacent. (Or the armature might be wound as a lap-wound drum, with two conductors to constitute each element of the winding.) That it may run as a 100-volt continuous current machine the magnetic flux through the armature core must be 5,208,333 lines, or a little over five megalines. Fig. 1 will serve to represent diagramatically this armature when receiving 100 amperes at 100 volts, and running as a motor. The flow of current in the armature winding will, of course, be 50 amperes in each half of the ring.

Now, suppose a precisely similar armature to be revolving in a precisely similar field, but let its windings be connected at two diametrically opposite points to two slip rings on the axis (Fig. 2). If driven by power it will generate an alternating current. As the maximum voltage between the points that are connected to the slip rings will be 100 volts, and the virtual volts (as measured by a voltmeter) between the rings will be 70.7 ($=100 \div 1.414$), if the power applied in turning this armature (Fig. 2) be 10 k. w., and if the circuit is non-inductive, the output in virtual amperes will be $10{,}000 \div 70.7 = 141.4$. If the resistance of each of the armatures is negligibly small, and if there are no frictional or other losses, the power given out by the armature which serves as a motor will just suffice to drive the armature which serves as generator. Accordingly, let us suppose them both mounted upon the same shaft, as in Fig. 3, and placed so that each lies in a similar and equal bipolar magnetic field. We have here the well-known combination of a motor dynamo. In every actual case there are, of course, losses (a) by friction, hysteresis, and eddy currents; (b) by heating of the resistance in the armatures. The former have to be paid for by an increase in the motor current. Suppose them in the present case to amount to 4 per cent for each armature, then 108 amperes, instead of 100, must flow in from the supply circuit. The heat losses manifest themselves electrically by a fall of potential at the terminals of the generator, and by a fall of speed in the motor if the primary voltage is not raised. Let the primary voltage be supposed to be raised the requisite small percentage to keep up the speed and to maintain the secondary voltage at 70.7 on the generator side; the output of the generator will then be 10 k. w., the input at the motor 10 k. w. plus the number of watts required to make up all the various items of lost power. Though the armatures are of equal resistance, and are respectively receiving and giving out (approximately) equal amounts of electric energy, the armature of the alternate current side (whether used as generator or motor) will heat more than that of the continuous current side; for it carries 1.414 times as large a current, and the ohmic heat will be proportional to the square of this, or twice that produced in the continuous current armature by the 100 amperes of working current. In each armature the heat will be developed equally in all the separate coils around the ring. As the armatures are alike, and as the similarly placed windings in each are passing through identical magnetic fields, there is no reason why one winding should not answer for both purposes. Fig. 4 shows the case in which this change has been made. One armature only is used; it is connected at one end to the commutator, at the other to the two slip rings, and the machine now becomes a simple rotary converter. The total hysteresis and eddy-current losses will obviously be now one half of their former amount. The total heating due to resistance will be also reduced, because now the single winding has to carry only the differences of the two currents—a point presently to be considered—and the ohmic losses will be less. The waste of power, in fact, is approximately halved. How far this economy of losses can be carried depends on the number of phases of the alternating current. But there is another consideration involved—the question of armature reactions and sparkless collection of current. In the combined pair of machines called a motor-dynamo the brushes on the continuous current side must be set, exact as in any continuous current machine, with a lead, negative or positive, according as whether it is operating as motor or dynamo. In the rotary converter no lead in either sense need be given to the brushes; for the armature reactions of the motor part being, in general, opposed by those in the dynamo part, they cancel one another to a large extent. This property, which is common to all those motor-generators in which there is used, whether with one winding or two, a common core in a common field, was pointed out by the author in 1888, when giving the theory of continuous current transformers.

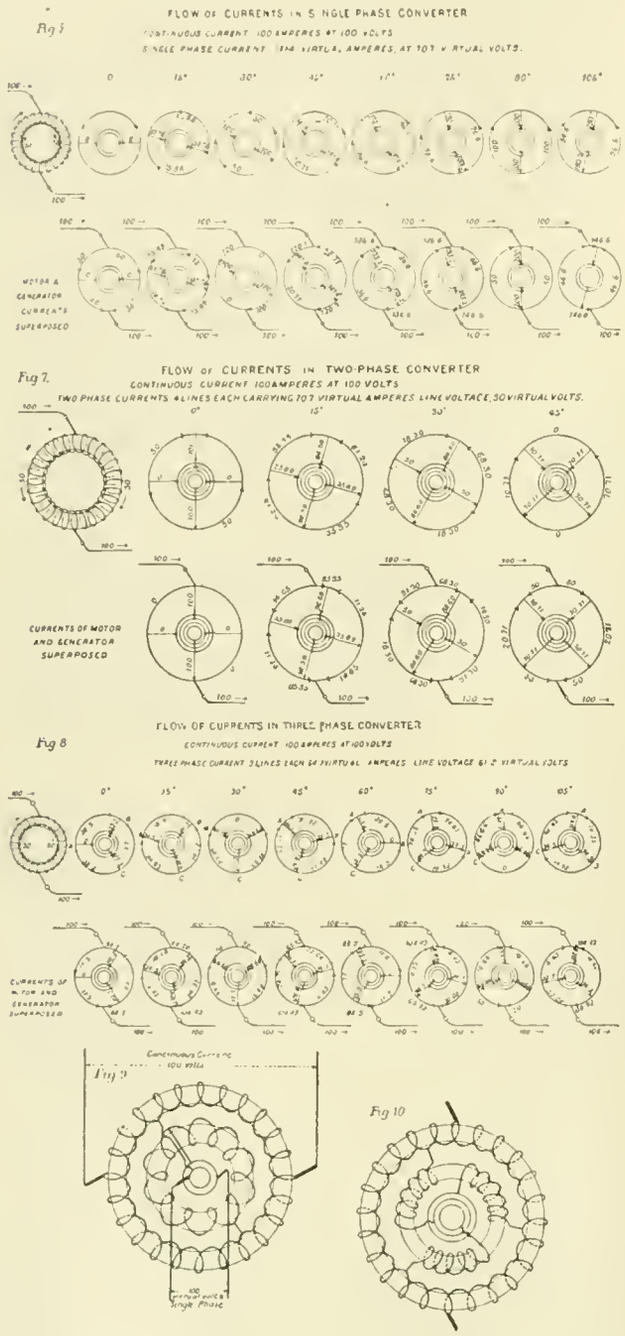
The relations between speed and field are peculiar. In the case of those grouped machines, or motor-dynamos (Fig. 3) in which each armature revolves in its own field, the conditions differ from those of the converter (Fig. 4), where there is only one field. If in either case the continuous current side is the primary (i. e., motor) side, the speed of revolution will depend on the field magnet, the weakening of which will increase the speed. The frequency of the secondary or alternating current will in that case also vary. But the ratio of the primary and secondary voltages will be independent of speed if the speeds are alike, or if only one common field is used. The secondary voltage cannot be varied, while the primary voltage is kept constant, unless separate fields and separate windings are employed, as in Fig. 3.

If, on the other hand, the alternating current side is used as primary, then the machine, whether motor-dynamo or converter, runs as a synchronous motor with a fixed speed. In that case the voltage ratio remains also nearly a constant, even though the excitation of the field is increased or diminished, owing to the peculiar phase relations which take place, as is known, in the currents of synchronous motors when under-excited or over-excited. This question, and the expediency of exciting in series or in shunt from the continuous current side, or of running without excitation, has been discussed by E. J. Berg, in the "American Electrician," for February, 1897.

Returning to the question how the current in the armature of the converter gets through the windings, it will be found that a simple means of answering it is afforded by the principle of the superposition of instantaneous values of currents. Still taking as a concrete case the 10-k. w. converter of Fig. 3, we may calculate out the instantaneous values of the currents in its windings at different epochs in its period of rotation. If we do this for the motor currents and for the generator currents separately, and then superpose them, we shall obtain a number of instantaneous values for the combined armature as converter. This has been done in the series of drawings in Fig. 5. If the continuous current acts as motor taking 100 amperes, there will be 50 amperes flowing in each half of the winding at every instant—qua motor—in a direction opposing the e. m. f. in the winding. This is shown in the first diagram in the upper row of Fig. 5. As single-phase generator the armature is working, as already described, with a virtual voltage of 70.7 volts, and an output (supposing the power-factor = 1) of 141.4 virtual amperes. The maximum current will be $141.4 \times 1.414 = 200$ amperes: and this will be attained at the instant when the two conductors which lead down the winding to the slip rings are turned to the position of 90° to the axis joining the middles of the pole-faces. The eight diagrams which follow in the top row of Fig. 5 exhibit the successive values of the currents flowing in the armature in positions differing successively by 15°. By supposing these eight diagrams successively superposed upon the motor diagram which precedes them, we obtain the eight diagrams of the lower row, which exhibit the currents actually flowing in the different parts at the particular times when the armature has the position shown.

Examination of these diagrams shows several interesting points. At the instant when the alternating current is reversing, and has

zero value (at position 0°), the armature is operating simply as a motor with 50 amperes in each half of the winding, and is being accelerated. At the 90° position, when the alternating current is at its maximum (200 amperes), the armature is operating wholly as a generator, and with an equal current of 50 amperes in each half of the winding, and the acceleration is negative. The armature is thus adding 100 amperes to the 100 amperes coming in from the primary mains. Nothing has here been allowed for the extra power needed to make up for the frictional and other losses. Suppose that an additional 4 amperes were needed for this, making 104 amperes as the motor current; in position 0° the two downward currents would be 52 each instead of 50, increasing the positive acceleration;



in position 90° the upward currents would be 48 instead of 50, decreasing the negative acceleration. The output current at that instant would still be 200, being made up of 104 incoming plus 96 generated in the windings.

On further examining these diagrams it will be seen that the currents in the armature windings consist of a set of four currents, each in position 0° being 50 amperes. But as the armature turns these change. They increase in the two arcs that are shortening as the points where the slip-ring connectors approach toward the positions occupied by the commutating brushes. But in the two other arcs that are lengthening, the currents first decrease to zero, then increase again to 50. Further, the individual coils in different parts of the ring winding have very different currents to carry. A coil that is midway along the winding between the two connectors has to carry never more than 50 amperes. Four times in each revolution it carries 50, and four times it carries 0 amperes, with values intermediate in intermediate positions. (This will obviously set up four armature reactions in each period.) But a coil that is situated next to either of the two connectors has to carry a current which, when it is closed to the brush position, rises to a maximum of 150 amperes, and changes abruptly to 50 in passing the brush; rising thus gradually twice to 150, or else rising twice abruptly from 50 to 150, and being zero twice in one revolution. The necessary consequence of this is that the coils which are close to the slip-ring connectors are much more heated than those which lie midway along the periphery beween the connectors. The distribution of the heating is here quite different from that which would obtain in either armature of the motor-dynamo machine (Fig. 3). This unequally distributed heating effect is in total somewhat greater than that in the same armature if used purely as a continuous motor or generator, but is less than the total heating effect (if equal power) is used purely as single phase generator or motor; the ratios of the heating being as 1 : 1.366 : 2 in the three cases. Or, if we consider the output of an armature to be limited by equal heating effects, the several outputs which would give equal total heating in the same armature would be: As continuous current generator or motor only, 100 k. w.; as single-phase generator or motor only, 50; as single-phase converter, 85 k. w. Fig. 6 exhibits this unequal heating effect in the case of a single-phase converter. The first line represents graphically by the outline diagram the varying current (irrespective of direction) which a coil midway between the connectors will carry in one revolution; and the outline curve of the darkened area within it is drawn with ordinates squared so as to be proportional to the heating effect at different instants. The total area blackened represents the total heating effect in that coil. The second line represents similarly the current and heating for a coil 30° farther towards the connector. The third line represents current and heating for a coil 60° farther; whilst the fourth line represents similarly the current and heating in a coil that is next to the connector. The relative heatings in these four coils are about in the proportions 10, 21, 50, 86. The curves in the fifth line depict the case of one of the coils next to a connector when there is, in consequence of self-induction in the circuit, a lag of 30° in the phase of the current. The result of such phase-difference is an increase of heating for the whole armature, but an extra increase for those coils which are near the connectors.

We may now pause to consider what differences will be made in the preceding considerations if the distribution of the magnetic flux around the periphery of the armature does not follow a sine law. It will be noticed that when any arc of the winding (and this applies to two-phase and three-phase cases) lying between two slip-ring connectors is acting as generator, it produces its greatest e. m. f. when its mid-point is passing the mid-point of any pole. Hence, if the poles are narrowed so as to concentrate the field, even though the average e. m. f. for continuous current purposes remains unchanged, the root mean square value of the e. m. f. will be increased, and the curve of induced e. m. f.'s will be more peaked than a sine curve. If the machine is being used to convert continuous current into alternating, the effect will be to raise the relative alternating voltage and lower the relative alternating current, and on a non-inductive circuit the current also will have a more peaked curve. If the machine is being used to convert alternating into continuous currents the converse result takes place, the relative value of the alternating voltage being lowered. An eight-pole conconverter at the Technical College, Finsbury, constructed in 1891 by the Allgemeine Elektricitats, of Berlin, has a curve of induction which is remarkably close to a sine curve, and its relative voltage ready referred to, gives the following tabular comparison for three for continuous and three-phase currents is practically identical with the theoretical value. Herr Friese, in the article already referred to, gives a tabular comparison (see Table V.) for three machines with ring armatures constructed by Messrs. Schuckert.

M. Hanappe has published a careful analysis of a Schuckert converter, capable of yielding alternating currents in one, two, three, four, or six phases, and suitable for laboratory experiments.

If the machine is being used to convert a single-phase current into a continuous one, the form of the impressed voltage curve, and the distribution of the flux around the periphery, are of even greater importance. The current delivered, though certainly continuous, will not be uniform, but will have a periodic fluctuation superimposed upon it by departures from the sine law. Armature reactions will, as we have seen above, impose fluctuations of a frequency double that of the primary current. Indeed, in any case the single-phase converter is a less satisfactory apparatus from several points of view than the two-phase or the three-phase converter. It has more considerable variations of armature reaction, a greater and more unequal heating, and requires a more accurate setting of the commutator brushes than the polyphase converters. Moreover, it is not self-starting from the alternate current side. Notwithstanding these disadvantages, single-phase converters are in satisfactory use—for example, several constructed by the Elektrizitats-Aktiengesellschaft (Schuckert & Co.) are in operation on the city circuit at Cologne.

TABLE V.

Nature of service.	Voltages as measured — Machine No. 1.	Machine No. 2.	Machine No. 3.	Voltage calculated.
Continuous current	100	100	100	(100)
Single-phase	71·0	71·8	—	70·7
Three-phase	61·3	62·0	61·8	61·2
Two-phase	71·0	71·8	—	70·7
Four-phase	49·8	50·7	—	50·0
Six-phase	35·0	35·8	—	35·4

A single-phase converter when standing still can act partly as a mere stationary transformer. When running at a certain speed in a field with a given number of poles it will act as a converter, converting into continuous current those currents only which come to it with a frequency corresponding to the frequency of the movement of revolving conductors past the poles. Any alternating currents or components of alternating current of any other frequency that may be superposed can affect the continuous-current output at the other side by producing superposed fluctuations.

Passing on then to the case of the two-phase converter, we may at once apply the same principle of superposition of instantaneous currents to study the flow of current through the windings. Fig. 7, which gives the corresponding series of diagrams, requires no further explanation. The generator action during one-eighth of a revolution is illustrated by the four figures on the right of the upper line. The superposed action is exhibited in the lower line. Inductive reactions and energy losses are, as before, supposed to be absent. In position 0° the converter is acting neither as motor nor as generator, the current at that instant simply running through from the commutator to the slip-rings. In the position 15° it is observed that the currents in the armature windings consist of six sets. Two short portions are carrying a motor current of 85.35 amperes each; two others of somewhat longer arc are carrying a motor current of 14.65 amperes; whilst two quadrantal parts are delivering generator currents of 11.24 amperes. On the whole, in this position the armature is acting as motor, increasing the acceleration. In the next position, at 30° the motor action has decreased. In the position at 45° the action is chiefly generator, the current in that part of the field which is strongest being at its maximum and flowing with the e. m. f. It will again be noted that the currents in those coils of the armature which lie close to any of the four connectors will be more heated than those midway along the intervening quadrants; the maximum current for the former being 100, for the latter 50. The inequality of the heating is much less, however, than in the single-phase armature. Also armature reactions are more nearly balanced throughout, and there is much less tendency to impart a periodic fluctuation to the continuous current. Such machines will be self-starting, and will give little trouble from sparking at the commutator.

Fig. 8 exhibits the flow of currents in the armature of a three-phase converter. Comparison of the successive positions will bring out several points. The current in any one of the three lines is at its maximum (on a non-inductive circuit, when generator, or when, as motor, the field has normal excitation) when the connector for that line is just passing a commutator brush; and its maximum is 1·1·3 times the continuous current. In certain positions of symmetry—for example, in position 30°—the motor and generator actions resulting from the flow are bilaterally similar. In other positions—for example, in position 0°—one side (the left here) is acting wholly as motor, the other side partly as generator and partly as motor. A coil which lies midway between two connecter ends will carry a current that has a maximum of 27 in one part of its revolution, and another maximum of 50 in another part of its revolution; there being two of each of these maxima in one revolution. A coil situated close to a connector has 133.3 as its maximum twice in each revolution, with an abrupt change to or from 16.66 just as it passes the brush. The inequality of heating of coils is less in a three-phase converter than in a single-phase, but it is greater than in a two-phase converter. The inequality of heating in the case of two-phase converters has recently been examined analytically by Messrs. Woodbridge and Child in recent numbers of the "Electrical World" (January 1 and February 12, 1898). Their paper, which is one of great skill, concludes with the interesting deduction that, assuming a power factor of unity, if such a converter is driven mechanically so as to be generating both a continuous and a two-phase current at the same time, the heating of the armature will be less than would be the case if with same output it were used as either a continuous-current generator alone or a two-phase generator alone.

Amongst Continental firms Messrs. Alioth, of Basle, have been prominent in the application of rotary converters, which they designate as "commutatrices." R. B. Ritter, one of their engineers, has kindly furnished many particulars of these machines and of their application. Articles by him on this subject have appeared in "L'Industrie Electrique" for 1896. He points out that in the application of these machines to charge accumulators from an alternating current supply, means are necessary for changing the voltage as between charge and discharge. There are several ways of meeting this need—by the use of choking coils, or of auto-transformers of variable ratio in the alternating side of the circuit, or by throwing in or out of circuit of a supplementary armature. The solution preferred by M. Ritter is the latter, a small auxiliary continuous current machine in series with the continuous current side being either mounted on the same shaft or driven by a pulley from it. The desired variations of voltage can be obtained by varying the excitation of the separate field magnet provided for this auxiliary machine.

A large 100-k. w. two-phase converter, constructed by Messrs. Alioth for Geneva, is described in the "Electrician" of January 8, 1897, with sectional drawings. This is a 14-pole ring armature machine, having an armature 1 meter in diameter, running at 385 r.p. m. As it is designed to supply continuous currents to a three-wire distribution, it is wound with two independent converter windings, each capable of supplying 450 amperes at 110 volts; and is furnished with four slip-rings, and with a commutator at each end. It has an efficiency of 90 per cent.

The problem of changing into convenient simple ratios the awkward percentage numbers which subsist between the voltages at the two sides of a converter has engaged the attention of several engineers. Mr. Heldt has described an ingenious method of obtaining any desired ratio by the device of including on the alternating current side additional windings between the slip-rings and the points where these rings are connected up to the armature winding proper. Fig. 9 illustrates the case of a single-phase converter. Here auxiliary windings (in two parallel circuits) are joined in so as to bring up the 70.7 volts on the alternating side to 100 volts, so as to make the voltages alike at both sides of the machine. To adapt this suggestion to the case of a three-phase converter, three sets of auxiliary windings must be intercalated between the three slip rings and the points of connection to the ring winding; these auxiliary windings being chosen, as to number and position, so as to add the desired supplementary voltage. It will be seen that this is equivalent to using a mixed star and delta winding; the delta part being that which alone constitutes the true converter winding. It is uniformly distributed around the core, and is symmetrically connected to the commutator.

(To be continued.)

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

In the REVIEW for October last was a brief description of the chimney of the Omaha & Grant Smelter, at Denver, Col., the highest chimney in America. This chimney is 352 ft. 7 in. from the stone table at the ground to the cap at the top; it is 33 ft. square at the base, with a 16-ft. flue. This chimney must now take second place, yielding the first to the stack of the power house of the Metropolitan Street Railway Company of New York.

The Metropolitan chimney has recently been completed and is 353 ft. high. At the base it is 55 ft. square; 80 ft. from the ground it is 38 ft. 10 in. in diameter and at the base of the neck 26 ft. 10 in. The flue is of the uniform diameter of 22 ft. The cap is of cast iron in 40 segments. On the outer edge of the cap are erected 10 lighting rods which are connected with two rods carried down the north and south sides of the chimney.

There were 3,400,000 brick used in the construction. The estimated weight is 8,540 tons. The foundations rest on 1,300 wooden piles driven to an average depth of 37 ft.

* * *

In discussing mechanical draft and its advantages an engineer recently made the following estimates as to what might be saved in a plant that with chimney draft would require 1,600 nominal boiler horse-power:

By omission of chimney and damper regulation, ...	$5,800
By reducing the boilers necessary from 8 to 7,.....	4,125
By saving in space occupied by chimney, ...	990
By saving in space occupied by boiler omitted, ...	960
Total	$11,875

This would make a reduction in the fixed charges of $831 or $890 per annum, according as the aggregate of interest, taxes and insurance is taken at 7 or 7½ per cent per annum.

Doubtless there are many plants so situated that this estimate of the saving effected by induced draft would be considered high. If the cost of land is low, $1,950 is too much to credit to the space that would be occupied by an extra boiler and a chimney. And for various reasons it might not be desirable to reduce the number of boilers, which reduces the estimated saving of the induced draft to the first item only, $5,800. This is $406 per annum at 7 per cent and $435 at 7½ per cent.

The Cincinnati Street Railway Company has recently made some important changes in its Depot street power station, and one of them has been the substitution of natural for induced draft, as it was found that the coal required to drive the fan engines for the latter system would pay for the chimney in a short time. The new stack is of steel, 175 ft. high, with a 12-ft. flue.

The company has installed a new 26 and 42 by 42-in. McIntosh & Seymour non-condensing engine, which is directly connected to an 850-k. w., 12-pole G. E. generator. The engine is similar to one which has been in service several years driving an 800-k. w. generator.

* * *

INGENIOUS PATCH FOR A LEAKY TUBE.

Charles J. Mason of Brooklyn, N. Y., described in a recent number of "Home Study" the method employed by him to make tight a leaky boiler tube. The boiler was rated at 250 h. p. and carried a working pressure of about 90 lbs. per sq. in. The leak was at the back end in a tube in the fifth row from the bottom, marked A in Fig. 1. The tube was 4 in. in diameter, and the leak proved to be due to a hole about as large as a needle point near the sectional box in which the tube ends were expanded. As it was not wished to condemn the tube for this small leak, a section 6 in. long was cut from an old tube and split in two lengthwise. The two pieces were bent slightly to conform to the curvature of the inside of the tubs and the edges filed to a taper of ⅜ in. to the foot. After smearing the tube with a thick paste made of red lead and boiled linseed oil,

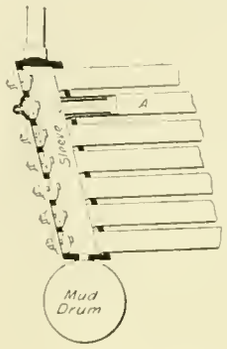


FIG. 1.

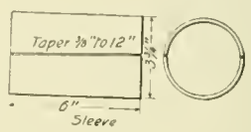

FIG. 2.

FIG. 3.

the lower tapered piece was put in place and the upper one driven home with a hand hammer. The boiler proved tight when tested under 150 lbs. hydraulic pressure and has remained tight ever since.

* * *

SOME COOLING TOWER DATA.

At the last meeting of the American Society of Mechanical Engineers, J. H. Vail presented a paper in which he described a cooling tower and condenser installation made under his direction. The power plant was an electric light station equipped with 27 boilers, 48 in. in diameter, 20 ft. long, with 22 5-in. tubes. These boilers were set in pairs to furnaces having grates 8 ft. 6 in. by 5 ft.; the odd boiler was set to a single furnace. The engine capacity and the station load already taxed the boilers to the limit of their capacity. The author made tests which showed the boilers to be each able to make 4,281 lbs. of steam per hour from a feed water temperature of 206.5° F. and at a steam pressure of 97.4 lbs.

After making tests it was recommended that one 18½ by 30 in. Buckeye simple engine be transformed into a 14½ and 25 by 30 in. tandem compound condensing engine; that an additional 750-h. p. tandem compound condensing engine be installed; that a cooling tower and the necessary condensing apparatus be installed, and that no change be made in the boilers save to raise the working pressure.

After investigation the Barnard type of cooling tower was selected as desirable to best meet the conditions existing at this plant, which were, minimum floor space and minimum weight, and a considerable elevation above floor level of engine room.

The cooling tower is of the twin type, having two chambers, with a pair of fans supplying a strong draft of air to each chamber. The interior dimensions are 12 ft. 3 in. by 18 ft. by 29 ft. 6 in. high. The shell of the tower is of steel, 3-16 and ¼ in. plates, reinforced with angle and channel irons.

The hot water from the condenser discharge is delivered through a 10-in. wrought-iron pipe, extending the whole length of each chamber, slotted on top and perforated at the bottom, giving equal distribution to a series of 96 distributing pipes extending across the tower, each pipe being slotted and perforated, thus insuring a very uniform distribution of water.

Means are provided for cleaning these pipes, which is found necessary in cold weather, when the cylinder oil from the exhaust

COST OF POWER FOR ELECTRIC RAILWAYS.

steam is liable to clog the pipes and interfere with uniform and free distribution of the water.

The hot water falls from the distributing pipes over 42 galvanized wire mats, made of No. 19 steel wire, woven to No. 5 mesh. Each mat is 12 ft. by 15 ft. 6 in., affording a total of 8,064 sq. ft. of cooling surface. Each mat is suspended by galvanized iron hooks and is easily removed for cleaning or repairs. In actual service it is found that the water is uniformly distributed.

The circulation of air is furnished by two pairs of 8-ft. diameter fans, each pair of fans being mounted right and left on a 2 15-16-in. shaft, and the four fans being capable of delivering 360,000 cu. ft. of air per minute when driven at a speed of 150 r. p. m. The air entering the tower chambers at the lower section is deflected vertically from each fan, thus avoiding cross currents, and affording a uniform blast through and between the mats.

The rated capacity of each section of this cooling tower is to cool the circulating water needed to condense 12,500 lbs. of exhaust steam, from an initial temperature of 132° F. to 80° F. when the atmospheric temperature does not exceed 75° F., nor the humidity 85 per cent.

The circulating water is handled by a Blake vertical twin air pump and jet condenser.

In an equipment of this kind it is important to have facilities for driving the fans at variable speeds; this requisite flexibility has been obtained by using a small vertical engine without a governor direct connected to the shaft of each pair of fans.

From the log book the following data as to the performance of the tower were given:

	1898. Jan. 31.	Feb.	June 29	July.	Aug 26	Nov 4.
Time	9 P M	8 P.M.	8 P M	8 P M	8 P M	5 35
Temperature atmosphere	30	36	78	96°	85	59
" condenser discharge to cooling tower	110°	110	120°	130°	118°	129°
Temperature condenser suction returned from tower to tank	65°	84°	81°	93°	88°	92°
Degrees of heat extracted through tower	45°	26	36°	37°	30°	37°
Speed of fans at tower, R. P. M.	36	0	145	162	150	148
Vacuum at condenser	25¼	26	25	24¾	25¼	25
Strokes of condenser pump	30	30	37	44	43	28
Lbs. boiler pressure	110	110	120	120	120	112
Temperature boiler feed	212°	212°	210°	211°	213°	213°

The Buckeye engine when converted showed the following output:

Revolutions, 137; steam pressure, 113 lbs.; mean effective pressure, 50.16 lbs.; vacuum per gage, 26 in.; h. p. developed in high pressure cylinder, 163.42; h. p. developed in low-pressure cylinder, 168.48—total, 331.9 h. p., and of this 90.52 h. p. was below atmospheric line. The work was divided almost equally between the high-pressure and low-pressure cylinders; all cards showed similar results.

The usual work required from the cooling tower and condenser varies from 7 to 17 hours per day. A notable record was made on August 2, 1898, when the run was from 7 a. m. till 12 midnight, and from the daily records, the following data are extracted:

	Maximum	Minimum.
Temperature atmosphere	103	83
Temperature, condenser discharge to tower	128	106°
Temperature, condenser suction	98°	91°
Degrees of heat extracted, through tower	32	21
Speed of fans, r. p. m.	160	140
Vacuum at condenser	26	20
Strokes of condenser pump	50	38
Pounds boiler pressure	121	100
Temperature, boiler feed	212°	200
Engine, h. p. developed	900	400

A continuous heavy load was carried during the entire 17 hours' run. This was not a test record, but simply daily service.

Indicator diagrams, November 5, 1898, from the 20 and 36x42 tandem compound condensing Corliss engine, gave the following:

Engine revolutions	120 p. m.
Steam pressure	112 lbs.
Vacuum at condenser	25 in.
Work done in high-pressure cylinder	311.8 h. p.
And in low-pressure cylinder	31.5 h. p.
	643.3 h. p.
Work done in low-pressure cylinder below atmospheric line	185.1 h. p.

Simultaneously with the engine, the pump and fan engines were indicated. The cards showed:

Work done by the pump	13.75 h. p.
Work done by the fan engines	13.5 h. p.
Total external work	27.25 h.p.

which if deducted from the work done below atmospheric line in low-pressure cylinder 185.1 h. p. leaves a net gain of 157.85 h. p. from the use of the condenser and cooling tower.

It will be noticed from the previous data that the feed water shows a temperature above 200° F. There are two feed-water heaters in connection with the condensing plant. First, an intermediate tubular heater in the line of exhaust between low-pressure cylinders and condenser. Second, an auxiliary feed-water heater was also attached, receiving the exhaust from the condenser and boiler feed pumps, and any other auxiliaries.

The feed water is first heated in a tank that receives the exhaust from the general line of high-pressure engines. The feed water then passes through the intermediate heater, and thence through the auxiliary heater, and reaches the boiler at a temperature of upwards 200° F.

The condensing plant has increased the station capacity about 1,000 h. p. with the aid of a condensing system, using the same water in continuous circulation, while the boiler plant, previously stated to be fully loaded, supplies steam for this additional work with boilers to spare.

SCHLICHT PROCESS OF COMBUSTION.

In a paper recently read before the Franklin Institute, Paul J. Schlicht described the method which he has invented for supplying air to furnaces by drawing it down the chimney. A brief mention of the advantages claimed for this process was made in the REVIEW for April, 1898, page 222. Mr. Schlicht said in part: "The invention is based upon the fact, which I have discovered, that if a current of air is properly introduced into a chimney or flue through which hot products of combustion are escaping, the air current will flow in a direction contrary thereto, and, becoming heated in its contact therewith, will reach the sphere of combustion in a condition highly favorable to the union of its oxygen with all the combustible elements of the fuel.

"In stoves, house furnaces and other slow combustion apparatus, all of the air for combustion is supplied on the top of the bed of fuel. In industrial furnaces the desired rate of combustion determines the quantity of air to be admitted below the bed of fuel in addition to air supply on top.

"In some instances the best results are obtained by closing, or nearly closing, the ash pit door. In other instances, when a high rate of combustion is necessary, the resistance offered by the bed of fuel and the air pressure downward through the chimney or flue so reduces the air pressure ordinarily exerted through the open ash pit doors that no appreciably large air supply is furnished upward through the bed of fuel, but it is given a double air supply most favorable to high efficiencies.

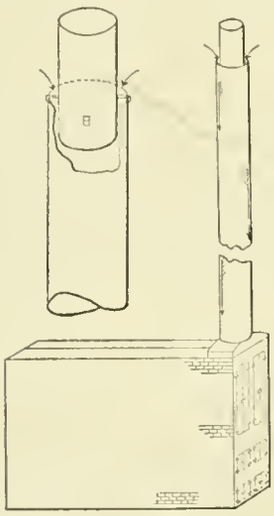

FIG. 1.

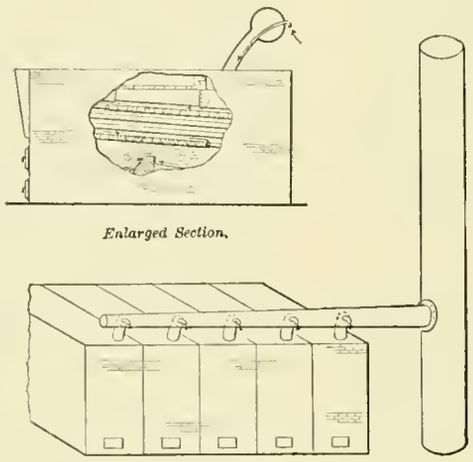

FIG. 2.

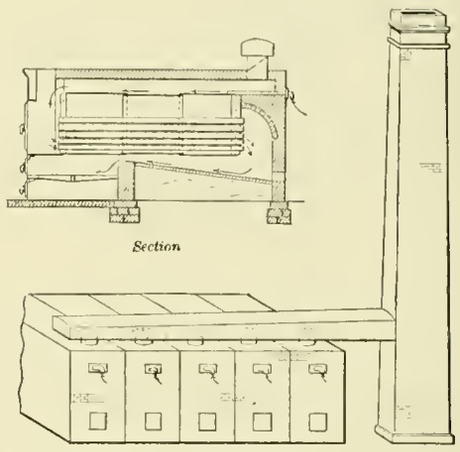

FIG. 3.

"In the ordinary process, combustion is most active over the grate bars, but its uniformity is constantly interfered with by the varying thickness of the bed of fuel and the gradual accumulation of ashes. In stoves and house-furnaces the losses from the escape of carbon-monoxide and other combustible gases up the chimney, in very large quantities, is the result of feeding the air for combustion upward under the grate bars, and through the bed of fuel. In industrial furnaces this upward draft generally results in the feeding of an excessive air supply, the losses due to which are known to those who have made a special study of the subject, and are now beginning to receive the attention they deserve by engineers generally. I will not refer to the breaking up of carbon-dioxide, about which much might be said.

"I believe that the most common sources of waste in industrial furnaces when the fuel is high in fixed carbon, are those due to excessive air supply and to the non-transmission of a portion of the heat of the gases through the boiler plates, the rate of flow of the gases being more rapid than the rate of transmission through such plates. I effectually prevent such wastes in plants favorable to the proper application of my invention, besides bringing back waste heat to the combustion chamber. When the fuel is high in volatile matter, the additional gains by my system are very large. I have realized gains as high as 40 per cent in well-designed plants burning such fuels. This latter gain was made at a plant where evaporative tests of two weeks' duration were confirmed by months of subsequent use of the system.

"In industrial furnaces, where the draft has been insufficient to economically burn the smaller sizes of anthracite coals, I have realized large gains with my process in the burning of these cheaper fuels, burning them either alone or mixed with soft coal. I am well aware that with high chimneys and forced draft this can be done successfully, but I maintain that it can, in most cases, be done on a smaller investment and with a less deterioration of the boiler-plant and greater economy by my system. Another great source of gain that has been realized with my process of combustion is the less frequent cleaning of boiler-furnace fires. At one large plant which had been run with the closest regard to economy, the services of two men were easily dispensed with.

"One of the boiler-plants of the Barber Asphalt Paving Company, of Long Island City (See Fig. 1) typifies the conditions most favorable to the application of my invention at the top of the chimney of industrial boiler furnaces. Here the combustion products enter the chimney immediately after leaving the sphere of useful work, and its height and diameter are properly proportioned to the grate surface and to the quantity of coal burned per sq. ft. of grate. If there were a separate chimney to each furnace, the results would be even more favorable, as the current of the combustion products from one boiler interferes somewhat with the current of combustion products from the other. If a less quantity of coal be burned per sq. ft. of grate in one furnace than in the other, the quantity of air flowing into the combustion chamber will be proportionate to the combustion taking place therein. For example, if twice the amount of coal is being burned in one furnace than in the other, approximately twice the quantity of air will automatically flow to the combustion chamber of that furnace.

"These two boilers are return tubular. For a part of the day the plant is run below and for the other portion, far beyond its rated capacity. It is while burning the largest amount of coal per sq. ft. of grate surface that the largest economy is effected. Evaporative tests with these boilers show the following results with "Sonman" bituminous coal:

	Without Schlicht Process.	With Schlicht Process.
Pounds water from and at 212° per pound	10.79	12.96 and 12.68
Horse-power developed	166	188 and 172

"A test made to determine the efficiency of process with reference to time required to melt 250,000 lbs. of crude asphalt showed: without Schlicht process, 20 hours; with Schlicht process, 17 hours, and requiring a consumption of 8¾ per cent less coal. The amount of work done at this plant was greatly in excess of that done in previous evaporative tests. There are also Babcock & Wilcox's boilers at this plant, the equipment of which is at top of chimney.

"Evaporative tests were made at a brewery where this process

is in use, and showed variations with the rate of combustion. My compensation for the application of the process was determined by the lower cost for coal of each barrel of beer. From returns made by the brewing company, the cost of coal per barrel of beer up to June 1, 1898, for the previous year was $0.0695, while previous to installation of the invention the cost of coal per barrel of beer was $0.0855. This difference represents a saving of $0.016 per barrel of beer. In these calculations the price of coal was made the same for both years, although the market price was less for the last year.

"About this time the German Patent Office, doubting the statement in my application for a patent that I could cause air to flow down a chimney in contact with products of combustion escaping therefrom, requested me to furnish affidavits of reliable experts in corroboration of this fact. Accompanied by Professor Greenleaf, formerly of Columbia College, and John J. Powers, I secured evidence of this fact in a very simple manner. Pieces of tissue paper were strung upon a string with a piece of wood fastened at its lower end. The string was let down the chimney close to its side and the papers strung upon it were drawn down in the manner that pieces of paper on a kite string are carried to the kite, known to boys as telegraphing to the kite.

Fig. 2 shows the application of the device to the boiler plant of Fleischman & Co. at Blissville, Long Island, and Fig. 3 to the plant of the New York Quinine & Chemical Works. At the former plant the evaporation was increased from 11.08 to 12.19 lbs. of water from and at 212° per lb. of coal.

THIRD AVENUE, NEW YORK, CONTRACT.

It is announced that the contract for equipping the underground conduit system of the Third Avenue Railroad, of New York, was let December 15, to the Westinghouse Electric & Manufacturing Company. The Westinghouse Company is to furnish the power-house equipment as well as the motors and controllers. The plans call for a power-house, to be located at 216th street, with a capacity of 64,000 h. p. It is understood that of the electrical apparatus one-half will be made in Pittsburg and the other half at the works of the Walker company in Cleveland. The engines are to be built in Pittsburg. This is a $5,000,000 contract and the Westinghouse Company has our heartiest congratulation on securing it. The Third Avenue Railroad will have no reason for regret as "the name of Westinghouse is a guarantee."

The breaking of a shaft in the power house of the Chippewa Electric Railway Company, Eau Claire, Wis., on December 16, caused a delay on that line and also on the Eau Claire-Chippewa Falls interurban.

A heavy overload caused an armature in the power house of the South Bend (Ind.) Electric Company, to burn out on December 14. A new Westinghouse machine recently ordered was in the freight yard, so that only a short delay ensued.

STREET RAILWAYS IN ATCHISON, KANSAS.

The Atchison Railway, Light & Power Company furnishes gas and electricity for lighting, transportation and power purposes in that city. In addition the company will put in a steam heating plant this coming year to utilize the exhaust steam. The corporation is a progressive one and lets no opportunity slip to enlarge its field of usefulness.

The company has been operating its cars for a little more than four years, the first car having been started on Thanksgiving day, 1894. From this time on Atchison has been a wide-awake, progressive city. While the electric line was talked about for years, it was really built and equipped in a very short time; the work was practically done in six weeks. The power house had been constructed and the boilers set in position nearly a year before. Then came the panic, and it was not until October 14, 1894, that Messrs. Waggener and Hetherington, local capitalists, decided to back the enterprise with their own money, and ordered J. A. Bendure, then superintendent of construction, to proceed in all possible haste with the work. They were incredulous when he said he would have the work completed by Thanksgiving, but he did. The haste was due to certain contracts for electric lighting conditional upon the completion and operation of six miles of electric railway by December, 1. From October 14 to November 29 all the material and the cars were purchased, the track laid, the engines and dynamos placed in position and the overhead wiring completed, to say nothing of the work done on the lighting plant, which was to be operated in connection with the railway.

FIG. 1. POWER STATION AND CAR BARN AT ATCHISON, KAS. FIG. 2.

FIG. 3. ENGINE ROOM.

At the start the enterprise was pretty much of a speculation, for then Atchison had a population no greater than 15,000, and there

was sharp competition in the lighting business with an older company. Rates were cut to such an extent that there were no profits left and then a consolidation was effected. Low rates prevailed even after the combination and as a consequence there are more than 16,000 incandescent lamps in use in the city. The plants of the two companies were combined. The exterior views of the new power-house and car barn are shown in Figs. 1 and 2. The company operates 16 cars, eight of which are trailers, on 8½ miles of

FIG. 4. PIT IN CAR BARN.

track. Two of the motor cars are 10-bench open cars, 27 ft. long; two are 18-ft. closed cars with vestibules, and four are 16-ft. closed vestibuled cars. Each car is equipped with two 25-h. p. motors, the closed cars having steel motors, made by the Johnson Company, with series-parallel steel controllers. These motors have been in service for four years without a single one having burnt out, which in part is due to the excellent system of inspection and shop practice of the general manager, J. A. Bendure. Electric heaters, made by the Consolidated Car Heating Company, keep the cars comfortable in winter.

The traffic not being especially heavy, 45-lb. rails in 30-ft. lengths are used. They are laid on 5x7 in. by 7 ft. oak ties spaced 2 ft. between centers. On the different lines of the company there are nine grades, the maximum being 10 per cent; 18 curves, with radii

FIG. 5. MACHINE SHOP.

ranging from 80 to 90 ft., and five switches. No. 0 trolley wire has been strung and is reinforced by one mile of No. 0000 and half mile of No. 00 feeders. The poles are spaced at intervals of 100 to 125 ft., 500 of them being cedar poles, 7-in. tops, for side suspension, and 30 are iron poles.

The power station occupies a site 90x100 ft. and contains electrical machinery for supplying current to the street railways, arc and incandescent lamps and for motor power. There are two generators for street railway purposes, one of 100 k. w. and the other of 200 k. w. capacity, and one 90-k. w. dynamo is run for commercial power. The three arc light machines are capable of lighting 225 lamps.

FIG. 6. WHEEL PRESS.

The four incandescent machines have a combined capacity of 385 k. w. On the left in Fig. 3 may be seen one of the engines driving several lighting machines, and on the right is an engine driving several railway generators.

The boiler plant consists of two 80-h. p. and four 125-h. p. Freeman boilers furnishing steam at 100 lbs. pressure. The feed water passes through Hoppes and Excelsior feed water heaters before being pumped into the boilers. The engines comprise one 100-h. p. Ball automatic speed engine, one 300-h. p. Hamilton Corliss, one 300 and one 350-h. p. Sioux City Corliss.

The car barns and shops are combined in one brick building 130 ft. long, the shop occupying a space 40x40 ft. The facilities for repairs and construction work are unusually good for so small a road. All the frogs and switches are made in the shops, the Bryant cold metal saw, made by the Q & C Company, being used for this purpose. A Shafer wheel press of 125 tons capacity, a McCabe double lathe, with 24 and 40-in. clutch, and a Barnes 30-in. back geared drill press are the other large tools in the shop. A Buffalo forge furnishes air for the blacksmith shop. The next three illustrations are views of the repair shop in the car barn. In Fig. 4 is shown a motor car truck over the pit for repairs. The armature

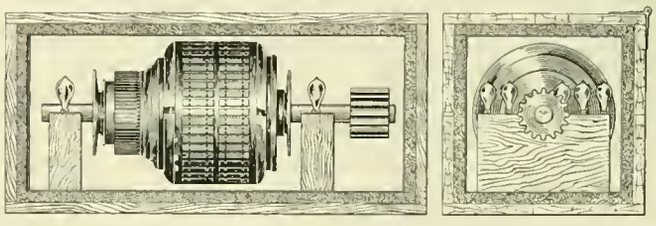

FIG. 7.—ARMATURE BAKING OVEN.

from one of the motors is being lifted from the case. The machine tools and wheel press are illustrated in Figs. 5 and 6.

General Superintendent Bendure has constructed an armature baking oven which is simple and inexpensive in construction, but serves the purpose very well. The end and side views of the interior of the oven give a good idea of its construction. The oven consists of a box in which one of the car motors was shipped, lined

with tin and about 1 in. thickness of asbestos between the wood and tin. The box is 17 in. wide, 17 in. deep and 3 ft. 3 in. long inside.

The armature rests on two end bearings. On each of the wooden blocks is a five-lamp circuit, and these furnish the heat for drying. After the armature is in place the oven is closed so that it is practically air tight and all the incandescent lamps are turned on. When the interior of the box is thoroughly heated one circuit is cut out, the other being sufficient to dry the armature. The oven does its work quickly and at small expense.

It is generally conceded that Atchison has an unusually good street railway system for so small a city. The Atchison Railway, Light & Power Company has not only given an impetus to the growth of the town, but has paid out for labor, so far this year, the sum of $28,951.26, and has employed an average of 72 persons. The company uses 250 cars of coal annually. Another item of interest is that the company has 100,000 lbs. of copper wire in the streets of Atchison, all of which cost at least 14 cents a pound.

The Atchison Railway, Light & Power Company has a capital stock of $300,000. Its officers are J. P. Pomeroy, president; W. P. Waggener, vice president; C. S. Hetherington, treasurer; J. A. Bendure, superintendent; J. P. Brown, George Storch and B. P. Waggener, directors.

THE RELATION OF THE STREET RAILWAY TO THE PUBLIC.

BY JAMES F. LARDNER.

The following is extracted from a paper on "Transportation in Cities," read before the Contemporary Club by Mr. Lardner, secretary, treasurer and general manager of the Tri-City Railway Company of Davenport, Ia. The first portion of the paper was devoted to a brief history of street railways, then followed the discussion of the relation to the public, and the concluding portion was upon the municipalization of street railways.

In considering the wonderful and rapid growth of the street railway since its first introduction to the public, let us examine into it in the light of its relation to the public. The great successes achieved by the promoters and owners of street railway enterprises, and the immense amounts of capital invested in these properties, have attracted the attention of the public to them at this time, when they have reached what might be termed the acme of their success in meeting the demand of the people for rapid transit. Much of the private capital invested in street railways has yielded fair returns, some of it large returns; but many millions have been entirely lost to the investors, in costly experiments in endeavoring to arrive at the solution of the problem of rapid transit. The time is now at hand when the original franchises of the street railway companies in America are beginning to expire, and considerable discussion is indulged in as to the conditions under which renewals of franchises shall be granted. There are many and varied shades of opinion on this question. It must be borne in mind, in considering this matter, that the street car is no more of an intruder on a public street, and has no less legal right to use a street than a wagon or private carriage; and should not, on account of any wear or detriment it may cause the public streets, be subject to any special taxation any more than these vehicles; for the fact presents itself that, instead of wearing out paving or roadway, by the constant tramp of horses over a given surface, as in the case of the horse car, the modern car actually preserves the street from wear and tear, by transporting a large percentage of the population over its steel rails, that would otherwise be necessitated to make use of the public highways to transport themselves about, and subject such highways to consequent wear and tear.

There seems to be a grave popular misapprehension also, as to the value of street railway franchises, and the extent of street railway profits, that is not warranted by the facts. There is a general impression in some quarters that street railway corporations are receiving from municipalities exclusive rights and privileges of enormous value, for which they pay absolutely no money consideration; that in exchange for these rights they are rendering a very inadequate and unsatisfactory public service, and that their profits are consequently inordinately large, as compared with returns on other investments; and that, by a vicious system of financiering, and still more vicious method of bookkeeping, they have managed to keep their enormous profits concealed from the public. The facts do not seem to bear out these ideas. A careful investigation will show that the real value of public franchises is greatly exaggerated, and that the equivalent of money value is paid for the franchises in the shape of tax on capital stock, paving and maintenance of streets, licenses for cars, transportation of city employes and other direct expenses, in addition to regular taxes levied on real and personal property; and, as will be seen hereafter, a careful investigation does not disclose that profits on street railway investments in general are as great as they are generally supposed to be.

It is contended by some that in addition to the present requirements, in the shape of direct and indirect taxation mentioned above, there should be exacted a reduction in carrying charges, and a 3-cent fare is urged on the ground of the reduction in price of labor and all other products and commodities, with which street car fare should be made to keep in step. There are others still who urge that the profits of the street railway companies, which are so generally supposed to be fabulous, should be divided with the municipality, either in the shape of a fixed charge or a percentage of receipts or profits. There are others again who argue that the tracks and roadbed, conduits and overhead lines, should belong to the municipality, and should be leased to the railway companies, so as to put the streets, and everything in connection with or appertaining to them, under the absolute control and ownership of the city. And there are still others who go to the limit and assert that we should, in imitation of some experiments that have been made with indifferent success in Europe, secure for the municipality not only the control and ownership of all street railways, but that the municipality shall operate the street railways as well. There is a great deal to be said on all these different ideas, but let us briefly run over them in the order of their standing.

Much has been said and written in support of the statement that, "Everything has been cheapened in price, but street car fares alone remain the same." By a careful analysis of the following facts I will endeavor to show that this statement is not correct, in the light that more than twice as much accommodation and benefit is given for the 5-cent fare than formerly, and hence street car fares have actually been cheapened by more than 50 per cent. That which constitutes a ride in a street car today is certainly of twice the value as the ride of ten years ago, and the cost of operating railway companies twice as much as under the old methods and system. We have only to recall the bob-tailed horse car that dragged along wearily, badly lighted and heated, if heated at all; the rough and rocky roadway, and the short distances traversed for a 5-cent fare. Is not the public receiving more for 5 cents in the service of today than formerly, when we consider the increased facilities in the shape of extended lines, rapid transit, large and comfortable cars, well lighted and heated, more frequent service and improved roadway, and the long haul in the large cities where systems of transfer have been in operation? (Here the author quoted at some length from the data published in the REVIEW for February, 1897, showing the 5-cent street car ride of 1896, average for 28 cities, was over 3 1-3 times the 5-cent ride of 1886.)

It cannot be denied that the price of a street car ride has been reduced by giving more for the money, when above facts are taken into consideration. There can be no other reason alleged, therefore, for a reduction in fares, unless it can be shown that the profits of street railways are far beyond a reasonable interest on money invested. In connection with this matter we must bear in mind the enormous amount of capital expended in the last 10 years in changing over the method of operation from horse to electric power, and the accompanying necessary changes in roadbed and rolling stock; the building of large power houses; the substitution of newer and improved motors, as they were introduced from time to time, (one road I know of having changed five times in eight years); the general extension of railway systems in America to meet the demands of the public, and the consequent building up of the suburbs, which before were inaccessible, and the immense wealth added thereby to the entire city, as well as to separate individuals, who actually profited by street railway enterprise. The investment in experiment and experience in the power stations, motors, roadbed and extensions ought, in all fairness, to be entitled to a profit in view of the developments that resulted. In order to form

an idea as to the possibility of a reduction in street car fares, I secured statistics, showing the cost of hauling each passenger, including interest on bonded indebtedness, on 17 of the principal street railways of the United States.

From this table we learn that the average total cost of carrying each passenger on 17 different roads is about 3.8 cents for each person carried.

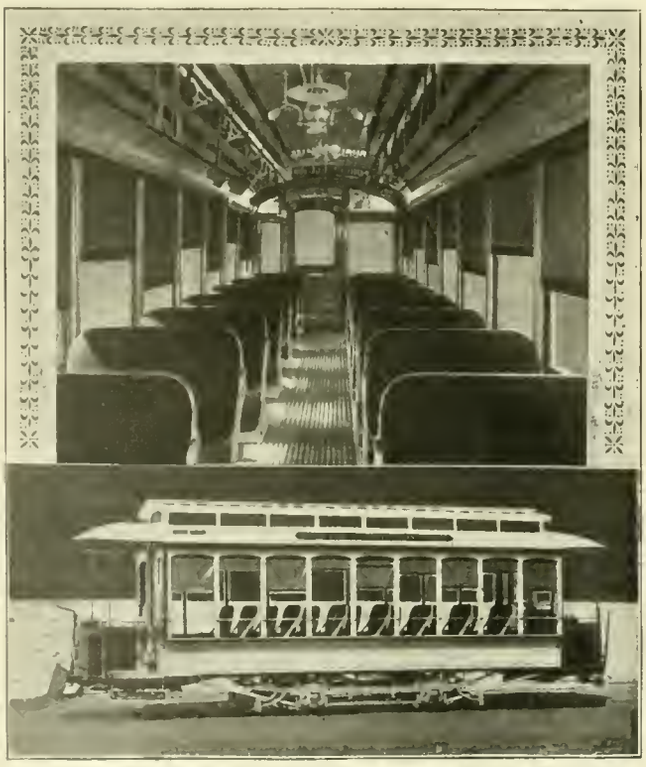
These 17 railways are among the most profitable railways in the country, and the average cost of carrying passengers is, perhaps lower, on account of the volume of business done than on most other railway systems in the country.

When we deduct from the 1.2 cents per passenger remaining, the amount required to make extensions and improvements, and the amount set aside for depreciation of property, it does not, I think, leave an excessive amount for distribution among the stockholders for interest on money invested.

From this we can easily see that the adoption of the 3-cent fare is absolutely out of the question, unless it is intended that the street railway corporations shall absolutely pay more for the privilege of hauling the public than this privilege earns; as the cost of carrying each passenger is considerably more than 3 cents, and from the above figures it is hard to see how the American public can expect to reduce the 5-cent fare and allow a fair profit to the companies operating street railways. No comparison can be made between rates of fare or carrying charges in Europe with those in this country, on account of the entirely different conditions existing here.

CAR FOR CONSOLIDATED, BALTIMORE.

The Consolidated Railway Company of Baltimore has recently purchased a large number of combination cars of the pattern shown in the accompanying illustrations. They were built by the J. G. Brill Company and are intended to give all the advantages of both open and closed cars. They have cross seats with aisles in the center and the seats are so low that when the upper panels and sash are removed, they are practically as open as any cars with side entrances, and since they are provided with longitudinal panels upon



BRILL CAR FOR CONSOLIDATED, BALTIMORE.

the sides, they possess nearly as much strength as an ordinary box car. The upper view shows the interior of the car with the sash in place, that is as the car appears for winter service; below is a view of the exterior with the sash removed for summer use.

The design is one which has given great satisfaction and is extensively used. These cars have bodies 22 ft. 11 in. long, 7 ft. wide at the sills and 7 ft. 10 in. wide at the belt rail. The length over the dasher is 30 ft. 11 in., the platforms being 4 ft. each. They were mounted on trucks furnished by the company and the under sides of the sills stand 28¼ in. from the rail: with a 12 in. riser this gives a step about 16 in. from the head of rail. The gauge of the road is 5 ft. 4½ in. The wheel base is 7 ft. and the wheels are 33 in. in diameter. There are two No. 49 Westinghouse motors used. The weight of the car complete is 18,470 lbs.; the truck without motors weighed a little more than 5,000 lbs.

There are 16 "walkover" seats 34½ in. long; at the ends of the car there are two 19 in. seats. This gives a seating capacity for 34 persons. The seats are upholstered with dark maroon plush similar to that employed on first-class steam railroads. The ceiling is of three-ply birch veneer neatly decorated; the interior finish of the cars is of cherry with cherry hand poles. The height of the car at the center inside is 8 ft. 2 in. and the height over the trolley board is 11 ft. 7 in. All the glass is set in cast rubber and held in position by moldings screwed on from the outside. The dasher is closed on one side and open on the right hand side as the car goes forward. The outside platform knee is strengthened by an angle iron bent to the shape of the knee. The trolley board extends the full length of the body. The fittings throughout are of solid bronze. There is one center lamp with sockets for three electric lights and a beveled plate glass mirror is placed at each end of the car. The buffers are of malleable iron of the company's own pattern, and the cards are fitted with the Baltimore Consolidated Railway Company's fender. Electric push buttons are provided on each post, the dry batteries for operating the platform bells being placed underneath one of the seats.

The window guards, which are a very necessary feature in a car of this type, are of ⅞ in. pipe arranged along both sides of the car. The panels and sash for closing the sides of the car are of cherry finished in the natural color of the wood; as the cars are painted a very light cream color this produces an exceedingly fine effect and the cars are among the handsomest that we have seen. It should be noticed that the doors of these cars are placed at diagonally opposite corners. When the first of this lot of cars reached Baltimore, they were very favorably commented upon by the local newspapers and apparently gave great satisfaction.

LITIGATION IN ATLANTA, GA.

The Atlanta Railway Company not long since secured franchises for a number of streets in Atlanta, including a portion of Mitchell street leading to a new viaduct. Mitchell street is already occupied by tracks of the Atlanta Consolidated Railway Company and as the Atlanta Railway Company had served notice that it would institute condemnation proceedings against the Mitchell street tracks, the Old Colony Trust Company, as trustee for some $2,000,000 of the Consolidated bonds, filed a bill in the United States circuit court praying for an injunction.

The Atlanta Railway in its answer to the bill alleges that the Old Colony Trust Company has no interest in the condemnation proceedings which authorizes it to sue, and further that the existence of the Atlanta Consolidated Railway Company is illegal, the consolidation having been effected in violation of state statutes on the subject.

COLLISION AT WORCESTER, MASS.

December 21, a collision occurred on the Worcester & Suburban Street Railway, Leicester division, that resulted in the death of two persons and the slight injury of a number of others. One car passed the switch where it should have waited to meet the car coming in the opposite direction and the two cars met at the foot of a descending grade. One car was telescoped while the other was but little injured. A fog hung over the valley, otherwise the two cars would have been in view of each other and the collision been avoided. Prior to a month before the accident a different switch had been the passing point, and the motorman at fault doubtless had the old turnout in mind when running past the proper one.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

Sufficient Designation of Company.

Sprigfield Consolidated Railway Company v. Hoeffner (Ill.), 51 N. E. Rep., 884. Oct. 24, 1898.

One of the defenses sought to be made in this case was that the party suing the street railway company for personal injuries was not shown by the testimony to have been riding upon one of its cars. This contention was based upon the fact that the plaintiff in the lower court spoke of the company as the "Consolidated Street Railway Company," and her brother-in-law spoke of it as the "Springfield Consolidated Railway," whereas its real name was the "Springfield Consolidated Railway Company." But technical accuracy as to the proof of the name of a corporation, the supreme court of Illinois holds, is not required. It says that it was a question of fact whether or not the plaintiff was a passenger upon a car of the defendant, which question was expressly submitted to the jury.

No Recovery for Breaking of Trolley Pole While Being Replaced.

Broderick v. St. Paul City Railway Company (Minn.), 77 N. W. Rep., 28. November 10, 1898.

As a general rule, a servant cannot recover damages for an injury caused by the very defect which he was employed to repair. This rule the supreme court of Minnesota applies here to a case wherein an employe, who had been engaged in helping replace certain wooden trolley poles with iron ones, and while on a ladder resting against one of the wooden poles where he had gone to fasten a block and tackle to be used in raising one of the iron poles, sustained personal injuries by reason of the wooden pole breaking off on account of its rotten condition, throwing him to the ground. The court thinks that this is a case where the servant was injured by reason of the very defect which he was employed to repair. It required no superior skill to inspect the pole and discover the defect. The employe was as well able to discover the danger, and protect himself from it, as was the foreman or the company to discover it, and protect him from it. So says the court, which adds that, in its opinion, the old wooden pole was not, as was contended, an instrumentality furnished by the master for the purpose of raising the iron pole, and of such a character that the master was liable for failure to repair that instrumentality. And for these reasons it holds that the employe was not entitled to recover damages.

No Special Consent or Authority Necessary to Construct Connecting Curve.

Kunz v. Brooklyn Heights Railroad Company (N. Y.), 54 N. Y. Supp., 187. February, 1898.

That two companies have the right to connect their tracks by a curve by agreement, Judge W. M. Smith, sitting at a special term of the supreme court of New York, Kings county, says in this just reported case, is not open to serious question, and he considers it the same where the curve is to be erected by a third company under a contract with the other two companies, a part of the consideration for which is the right for the third company to operate its cars at times over the curve and the operation of the tracks of the two companies whose tracks are thereby connected.

As the judge looks at it, if the tracks of the two companies were lawfully constructed, the curve is a necessary incident thereto, and no further consent or authority is necessary for its construction.

And the constitutional provision that "no law shall authorize the construction or operation of a street railroad except upon the condition that consents of the owners of one-half in value of the property bounded on, and the consent also of the local authorities having the control of that portion of a street or highway upon which it is proposed to construct or operate such railroad, be first obtained," which is substantially re-enacted in section 91 of the railroad law, he does not consider makes necessary new consents in the case of traffic contracts, so long as section 78 of the railroad law, a re-enactment of an enactment of 1839, makes it lawful for any railroad corporation to contract with any other railroad corporation for the use of their respective roads, and thereafter to use the same in such manner as may be prescribed by said contract

Duty Owed Person Attempting to Get on Car in Wrong Way or at Wrong Place.

Kelly v. Consolidated Traction Company (N. J.), 41 Atl. Rep., 686 November 7, 1898.

It cannot be that a carrier owes an intending passenger no duty merely because that passenger is attempting to enter the vehicle in a wrong way or at a wrong place. Such an entrance need not be anticipated; but, if seen, proper care must be exercised for the safety of the passenger, and the more precarious the situation, the greater should be the care. So says the supreme court of New Jersey.

In this case a boy 12 years of age was about to take passage on an open electric street car, having a bar across the side next to an adjoining track. Under the conductor's eye he stepped upon the foot-board at the barred side, and before he was fairly on the car was started on the conductor's signal, and the boy thrown down and injured.

Under the circumstances the court holds that the questions of the conductor's negligence and of contributory negligence in the boy were for the jury, and that a nonsuit was wrong.

It declares that it cannot say, as matter of law, that the attempt to enter an electric street car at a place where it may be seen, because of barrier or other conditions that entrance is not invited, must necessarily be negligent, even though the car is held for passengers and the attempt to enter is under the conductor's eye. It is not a reasonable anticipation that under such conditions the car will suddenly be started by the conductor's order. If in this particular case the foot-board was on edge, the boy's position on it, the court further insists, called loudly for care in the starting of the car.

In Favor of Same Crossing Rights for Electric as Steam Railways.

Stewart v. Wisconsin Central Company (U. S. C. C.), 89 Fed. Rep., 617. September 30 1898.

Here the Chippewa Valley & Electric Railway Company petitioned for an order authorizing it to construct its electric railway across the track of the Chippewa Falls & Western Railway Company, operated apparently by the receivers of the Wisconsin Central Company, which desired order the United States circuit court grants.

It was conceded at the argument that the court, having possession through its receivers of the steam railway in question, could in its discretion exercise the rights of an owner of the property, and grant to the Electric Railway Company the right to cross upon proper conditions, so that the court states that it had no need to stop to consider the interesting legal question whether the petitioner had statutory power to procure by condemnation the right to cross tracks of a railway.

While it is unquestionably true that the crossing of one railway by another at grade is necessarily accompanied with great danger to the public, to life and to property, and that crossings, at least in populous communities, should be required by law to be above or below grade, the court points out that such has not yet become the established policy of the state of Wisconsin. Nor does the court (Judges Jenkins and Bunn) perceive why that policy should be adopted with respect to electric railways when not applied to steam railways, for in the latter case the danger is much greater than in the former. The electric car can be much more speedily brought to

a stop than can cars propelled by steam; and, the court declares, that it can see no reason for enforcing so stringent a rule with respect to cars propelled by electricity, when the authorities of the state do not deem it necessary to apply it to cars propelled by steam.

Electric Railways not "Electric Power Lines."

McDermott v. Warren, Brookfield & Spencer Street Railway Company (Mass.), 51 N. E. Rep., 972. November 28, 1898.

By an amendment made in 1884, section 4 of chapter 109 of the Public Statutes of Massachusetts, which prior thereto related only to "companies for the transmission of intelligence by electricity," was extended so that its provisions allowing the assessment of damages by the selectmen in certain cases were also applied to "electric light and electric power lines." This, it was contended in this case, would take in electric street railways. But the supreme judicial court of Massachusetts holds that the legislature did not intend by the amendment of 1884 to abridge the rights of street railway companies or to affect them in any way. It says that it seems rather that companies for the production and sale of electric power or of electric light were intended to be brought within the provisions of the statute amended.

While electric railways use electric power, the court insists, they are not properly called electric power companies. Their use of power is only in their own business of maintaining and operating railways for the transportation of passengers or freight. In the same way they use electric light for the illumination of their cars, but they are not for either of these reasons electric power companies or electric light companies. They are not in the business of manufacturing or furnishing electric power or electric light for others.

For these reasons the court holds that the action of the selectmen in assessing damages, on the plaintiff's petition, against the defendant corporation, for the construction of an electric railway in the usual manner along and upon the highway opposite the plaintiff's land, was without warrant in law, and that their award was void.

Not Always Duty to Stop Car on Approaching Frightened Horse.

Terre Haute Electric Railway Company v. Yant (Ind.), 51 N. E. Rep., 732. November 2, 1898.

Upon examination of the many decisions in which railway companies have been held liable for damages occasioned by frightening horses, the appellate court of Indiana says that it will appear that the liability was held to attach on the ground of negligence when the fright has been caused by the running of the train or car in an unusual, unnecessary or improper manner, or when those in charge, seeing the injured party in imminent peril, have acted in a manner attributable only to a wanton disregard for the safety of those in peril.

Averments that a car was being run at a high rate of speed and making a great noise, and that it was run carelessly and negligently, it does not consider averments of facts showing negligence.

This will help to explain why it reverses a judgment for damages obtained in this case, on the ground that the complaint was fatally defective. It says in its criticism of the complaint that it did not appear from the averments therein that the injured party would have been able, because of the gentleness of the horse, or from any other reason ,to have controlled it, and prevented the injury, had the car been stopped before its near approach, nor that the motorman had reason to apprehend the accident that occurred. Neither did they show that he manifested a wanton disregard for the safety of the injured party, nor that he had reason to believe that such party, who was in the position which he believed the best to manage his horse, would not be able to do so.

To hold the complaint in this case sufficient, the court continues, would be to declare it to be the duty of a motorman operating a car in a lawful manner to at once stop or slacken its speed at the sight of a frightened horse on the public highway adjacent to the track, although held by his owner in a manner from which it might fairly be supposed he would be able to control him. To so hold, the court believes, would be error.

Limitations Attaching to Power to Construct a Street Railroad.

South & North Alabama Railroad Company v. Highland Avenue & Belt Railroad Company (Ala.), 24 So. Rep., 114. Decided June 16; rehearing denied November 5, 1898.

The Elyton Land Company, from and through which the Belt Railroad Company claimed to have acquired certain rights, was originally a land corporation, and had no power, prior to the act of the legislature, adopted in 1885, enlarging its powers and franchises, to construct or operate a railroad of any kind. By this act it was given the power "to build, own and operate street railroads, and use thereon cars propelled by horse, steam or other motive powers; . . . but no street railroads shall be constructed on the streets of the city of Birmingham without the consent and authority of the city council." No other powers with respect to street railroads or railroads of any kind were conferred by the act, and no express power was given to construct such railroad except upon the public streets or highways, or to condemn the property of other railroads or of individuals.

After making these explanations, the supreme court of Alabama says that the term "street railroad" is applied to "a railway passenger carrier whose road lies along and upon the streets of a city, town or village."

From this power given to a land corporation (which previously had no power to construct a railroad of any kind) to construct a street railroad, the court holds no authority can be derived to construct a freight belt railroad in and around the city, for the sole purpose of transferring freight cars to and from factories and other railroads.

If the Elyton Land Company had any power of condemnation at all, continues the court, it was certainly such only as was incident to street railroad companies, and only as to such lands as were necessary for a right of way and structures necessary and incident to its business.

Indeed, the court declares, it may be doubted whether a street railroad company, having no express power to construct its railroad elsewhere than on the public streets and highways, has any authority to either condemn or receive, for a right of way or other purposes, property not located on such public streets or highways, since its charter does not contemplate the necessity or use of such property.

The right of way of the South & North Alabama Railroad Company, upon which the Elyton Land Company contracted for the right to build its track, the court further insists, was not a public street or highway in this sense, it being a broad avenue running through the city, the property of the railroad company, donated to it by the Elyton Land Company for railroad purposes, when it founded and laid out the city.

But it cannot be doubted, says the court in concluding its discussion on this point, that this corporation had no authority to take or receive, either by condemnation or by grant, property for the use of a freight belt railroad which it had no power to construct or operate.

However, the court recognizes it as a principle of universal application that if a corporation has acquired the title and possession of real property, its right to hold it cannot be questioned by a private citizen, this question being one between the corporation and the government, the state alone having the power to question the right in a direct proceeding for this purpose. Still it says that if it is necessary for the corporation to seek the aid of a court of equity to perfect its title, an interested individual may contest its claim, and the court will, in case it has no right to hold property of the particular kind in controversy, refuse a decree in its favor.

Riding on Running Board of Trolley Car.

Hassen v. Nassau Electric Railroad Company (N. Y.), 53 N. Y. Supp., 1069. November 1, 1898.

An open trolley car, with seats running across and a running board upon the side, had from 70 to 90 passengers, all of the seats being filled, and people standing in the space between the seats and also upon the running board. A man got on it. He could have occupied some of the still unoccupied space within the car between

the seats, but remained upon the running board. While riding in this position, and when the car was running at about six or eight miles an hour, it gave a sudden violent jerk, causing him to break his hold with the left hand upon the stanchion of the car, swinging his body outward, in which position his head was brought into contact with a trolley pole, inflicting injuries, to recover damages for which he sued the electric railroad company.

The company contended that the man was guilty of negligence as matter of law; that if he could, with slight inconvenience to himself, have procured standing room between the seats of the car, he was bound so to do; and that, as it was conceded that there was such space, the man must be deemed to have voluntarily remained in a place of danger, which defeated his right to recover damages.

But conceding that a person would be chargeable with contributory negligence, in the ordinary operation of a car, if he stood upon a running board when he might obtain a safe place within the body of the car, the second appellate division of the supreme court of New York declares that, under the circumstances of this case, it does not think that such proposition may be affirmed as matter of law.

The court says that it is well known that the space between these seats, when the latter are occupied, is quite narrow. With small people upon a seat, the space left might be occupied, with more or less inconvenience. With large people it may become a matter of extreme difficulty to stand in the space, and with some an impossibility. In all cases it is a place of discomfort, and disagreeable both to the person standing and to those sitting.

Nor does the court stop with this generalization. It goes on to say that the cars running from Coney Island to Brooklyn, on one of which this man was injured, at most times are crowded within and without in all available space. The company expects that this will be so; and if it does not invite, it makes little effort, if any, to prevent such condition, and collects and receives fares from those sitting and those standing, indifferent as to the place where the passenger secures his foothold.

Under such circumstances, the court says that it thinks the question of contributory negligence becomes one of fact to be determined by the jury, having regard to particular conditions.

The trial court charged the jury in accordance with this view of the law, and, upon the evidence, the appellate division thinks the submission was proper.

Besides this, the court holds that the company was properly found guilty of negligence upon the testimony. It says that such finding was warranted by the evidence with regard to the sudden and violent starting of the car, which was shown to have disturbed the equilibrium of other passengers as well as of this particular one. It says that the company had accepted him for carriage. It collected his fare, and knew the place he occupied upon the car. It was bound to know that the application of motive power in such manner as to cause the car to give a violent jerk was extremely hazardous, in view of the position of many of the passengers upon the car, and might result in injury. The jury were therefore authorized to say that it was a negligent act, it holds. And judgment against the company is, upon these considerations, affirmed.

Street Railway Cannot be Double Tracked Under Guise of Building Switches.

Willis v. Erie City Passenger Railway Company (Pa.), 41 Atl. Rep., 307. October 17, 1898.

This was a suit brought by certain township road commissioners to restrain the extension of a street railway side-track along a highway, and they obtained a permanent injunction. Among the findings of fact was one stating that the road commissioners had duly passed a resolution granting to said company and its lessees the right of extending the street railway in question along the highway, provided that the railway should be constructed south of the center of the road, except at points where crossovers, switches, and turnouts were required, the poles to be set as near to the south fence as practicable, almost all of the owners of abutting property having previously granted the right to occupy and extend the line of railway, and the necessary turnouts, and to operate the same through and along said highway.

As a conclusion of law it was held that by virtue of the consent given by the road commissioners and landowners, and by the fact that the railway had been constructed in said highway, that the defendants had the right to maintain and operate a single track street passenger railway, with such switches or turnouts as are necessary for the proper operation of single track street railway, but that the defendants had no right to construct a double-track railway in said highway.

It was further adjudged that the location of switches prior to the commencement of the suit, did not, under the facts of the case, exhaust the power to build necessary turnouts, or to relocate the same permanently, so as to equalize the distance, etc., and that, while ordinarily the length of switches, etc., might be a matter in the discretion of the railway company, yet where, as in this case, the defendants, under the guise of building switches, were manifestly attempting to double-track their railway or at least a large portion of it, it then became the duty of the court to find from the evidence the number of switches and of what length were necessary turnouts to which the defendants were entitled.

The supreme court of Pennsylvania states that the case was tried with such painstaking care and ability that little, if anything, would be profitably added to the opinion embodying the findings of fact, conclusions of law, etc., of the court below, and affirms its decree, dismissing the appeal.

"Any Railroad" Held to Include Street Railways.

Bammel v. Kirby (Tex. Civ. App.), 47 S. W. Rep., 392. June 23, 1898.

A general demurrer was sustained to the petition, and the suit was dismissed, in this case, in the district court, on the ground that the Texas statutes give no cause of action against the receiver of a street railway for the death of a person caused by the negligence of his servants.

Whether or not this ruling was correct, the court of civil appeals of Texas says, depends upon the construction to be given that portion of article 3017 of the Revised Statutes of Texas of 1895, which gives rights of action as follows: "When the death of any person is caused by the negligence or carelessness of the proprietor, owner, charterer, hirer of any railroad, steamboat, stage coach, or other vehicle for the conveyance of goods or passengers, or by the unfitness, negligence or carelessness of their servants or agents; when the death of any person is caused by the negligence or carelessness of the receiver or receivers or other person or persons in charge or control of any railroad, their servants or agents, and the liabilities of receivers shall extend to cases in which the death may be caused by reason of the bad or unsafe condition of the railroad or machinery or other reason or cause by which an action may be brought for damages on account of injuries, the same as if said railroad were being operated by the railroad company."

The court says that it believes that it has not been questioned in the state that street railroads themselves, when operating their roads, are liable under this statute for damages for deaths caused by the negligence of their servants. If they are generally liable, their liability is created by the inclusion of them within the words "any railroad" used in the first clause of said article 3017. And if that language embraces street railroads, the court holds, it must necessarily follow that the same language in the second clause, with reference to the receiver of "any railroad," must also include receivers of street railways, because it is impossible to hold that the words are used in different senses in the two relations.

And so the court holds that the language "any railroad," in the statute under consideration, includes street railroads, and therefore gives an action against receivers of such roads for the death of a person caused by the negligence of their servants, and that the action of the district court in dismissing the suit against the receiver was erroneous.

A rehearing was denied.

But this case should not be passed by without it being further noted that the court suggested that it might be urged that liability would attach to a street railway company as the owner of "vehicles for the conveyance of passengers," thus spoiling the above argument. But the court thinks that it is hardly to be supposed that the legislature, if intending to make them liable at

all, would express its intention by referring to them as the owners of vehicles, while at the same time declaring generally the liability of railroads. The words "other vehicles," it says, follow naturally after "stage coach," and include such instruments of conveyance as are not embraced in the preceding language. They might include street cars, but the court says that it thinks the more natural construction of the statute is to hold that those operating street railways are included among the owners of "any railroad."

Legal Propriety of Making Due Allowances for Temporary Breakdowns.

Illinois Trust & Savings Bank v. Ottumwa Electric Railway (U. S. C. C.), 89 Fed. Rep., 235. September 8, 1898.

This action was brought to foreclose a trust deed. A third party filed a petition of intervention for the purpose of establishing a preferential claim, over the trust deed, for money he had furnished the defendant company, which was engaged in operating an electric railway system, in operating an electric lighting plant, and in operating a steam heating plant.

One point that the United States circuit court makes, in this connection, is that the payment of an installment of interest on bonds under the trust deed in question, though it possibly prevented a foreclosure of the trust deed at that time, did not make or keep the railway a "going concern," because such foreclosure would doubtless then, as has now, been attended with others providing for operation of the railway enterprises meanwhile.

But all of the rest of the money the intervener furnished, beyond a certain sum that was diverted from use in making additions to the plant was applied on the payment of interest, was expended in building a new power house, and providing additional engine, boiler, etc., facilities. The court is convinced that this was an imperative necessity at the time. But objection was urged that the expenditure was unnecessarily large, and that a smaller one might have been sufficient. The answer of the court is that, while it may be true, under the evidence as applied to past facts, that a smaller expenditure might have sufficed, yet we must not forget that what are now to us known facts then lay wholly in the future. There was the necessity of making proper allowances for temporary breakdowns in machinery, boilers, etc., and the necessity of some provision to meet same.

The railway could not shut down for repairs, like a private corporation operating a sawmill or a factory, continues the court. What would justify this shutting down in the sawmill or factory might fall far short of justifying it in the railway. Its public and private lighting, the operation of its street railway lines, and the furnishing of its heating facilities, demanded whatever precautions were reasonably necessary as to reserve ability to supply the same or provide for accidents reasonably to be anticipated.

In conclusion, the court rules against the allowance as a preferential claim of the amount applied to payment of interest, but it allows as a preferential claim the amount furnished the railway and applied to erection of building and procuring machinery, etc., for power supply.

Doing Some Freight and Express Business Does Not Alter Nature of Railway.

Cedar Rapids & M. C. Railway Company v. City of Cedar Rapids (Ia.), 76 N. W. Rep., 728. Oct. 20, 1898.

Here is a case where a railway company that was assessed as a street railway company contended that it was a "railway corporation," within the meaning of Section 1317 of the Iowa Code of 1873, which provides that, "On the first Monday of March in each year, the executive council shall assess all the property of each railway corporation in this state, excepting lands, lots, and other real estate belonging thereto not used in the operation of any railway."

The railway owned and operated by the company extended from a point within the limits of Cedar Rapids, through the incorporated town of Kenwood, and over certain unincorporated territory, into the incorporated city of Marion. It also owned and operated in connection therewith certain other lines or branches entirely within the limits of the city of Cedar Rapids. These tracks were laid upon and at the grade of the streets of these municipalities, and upon and at the grade of the public highway connecting said cities, over the unincorporated territory, including certain county bridges in said highway.

Originally, the line to Marion started at what was then the boundary street of Cedar Rapids, and was operated by steam engines, under chapter 32, Acts 18th General Assembly, authorizing any street railway company extending its lines beyond the limits of the city to build and operate its road over and along any portion of a highway of a width of 100 feet or more. Later, the tracks within the city of Cedar Rapids and that to Marion were operated together; electricity, applied by the overhead or trolley system, being used as the motive power, one or more of the steam engines formerly used being kept in a motor house near a certain creek, for use in case of deep snows or other emergency rendering their use desirable. Cars were operated on these tracks mainly for the carriage of passengers in the manner practiced by street railways, but the company had four cars which it used in carrying freight between said cities, and it also carried such express matter as was offered at either end of the line or at any point between.

Conceding that the company is a "railway corporation," in the broadest signification of that term, the supreme court of Iowa says that the fact that the line between Cedar Rapids and Marion was laid and operated along the highway as authorized by the act stated, relating exclusively to street railway, seems to it conclusive that the company is a street railway corporation, and not a railway corporation, within the meaning of said section 1317, Code 1873. The fact that the company's street railway was authorized to be extended and laid and operated along a highway, it says, precludes the conclusion that it was intended to be other than a street railway.

Moreover, while ordinarily it is true that a distinctive and essential feature of a street railway in relation to other railroads is that it is exclusively for the transportation of passengers, and not for goods, the supreme court declares that surely the mere fact that this company carried goods and express matter did not take it out of the class of railways where the statute under which it was built and operated put it.

Thus it is, that the court holds that this company is not a "railway corporation," as contemplated in said section 1317, but a street railway, and is therefore subject to assessment by the local assessors.

All Care and Vigilance That Human Foresight May Suggest Must be Exercised.

Keegan v. Third Avenue Railroad Company (N. Y.), 54 N. Y. Supp., 391. November 11, 1898.

The injuries for which damages were awarded in this case were sustained by a passenger who was sitting on the side, near the rear, of an open car on a cable road, and were caused by a collision with a heavy wagon that the driver was attempting to get out of the way of another car that had come up behind it on the other track.

First of all, the first appellate division of the supreme court of New York says, that the gripman was not absolved from blame for not observing this attempt and slackening his speed, because the wagon struck the car, instead of the car's striking the wagon. A defendant company has often been held liable, although its own car was the one struck in the collision.

But the main question of law presented upon this appeal was as to the correctness of the trial judge's charge to the effect that, while the company was not to be considered as an insurer of its passengers' safety against all possible injury, yet it was bound to use a high degree of skill and vigilance to guard against accidents from which its passengers might suffer injuries, and that it had not fulfilled this duty unless it had used the utmost care and diligence which human skill and foresight would suggest. And this was subsequently accentuated by his specifically charging further that the responsibility of a common carrier of passengers is such as to require a high degree of care for their safety, and the discharge of this duty requires of such a carrier the exercise of all the care and vigilance that human foresight may suggest to secure the safety of its passengers, and that if it was possible by exercising of great care and vigilance, all that human foresight might suggest, for the gripman

to have avoided the collision and consequent injury to the plaintiff, and he failed to use such care and vigilance, then he was negligent, and the railroad was responsible for the consequence to the plaintiff.

This charge, the court holds, was correct, and in accordance with what it understands to be the settled rule of law in the state applicable to the facts here presented to the jury. Nor does it agree with the contention that the rule in question is not applicable to street cars drawn by horses or propelled by a cable.

Referring to the case of Stierle v. Union Railway Company, reported on page 568 of the STREET RAILWAY REVIEW for August, and commented on in a decision reported on page 741 of the STREET RAILWAY REVIEW for October, 1898, the court says that what it understands to have been decided in that case was simply that the general rule to which it has adverted was not applicable to its particular facts, that case presenting no situation of danger and calling for no special exercise of extreme vigilance.

Every act of the driver of a car, however simple and ordinary, continues the court, calls for reasonable care. Where, however, there is nothing whatever in the surroundings to evoke the slightest sense of danger, the decree of care required is simply that which is commensurate to the existing conditions. A rule which called upon every driver or motorman, at all times and under all circumstances, to keep himself keyed up to the highest pitch of vigilance, would be senseless. He should never, it is true, be heedless or forgetful of his duty. He should, in fact, at all times be watchful and prepared for emergencies. When, however, the law imposes upon him a still higher degree of care—namely, the exercise of all the vigilance that human foresight can suggest—it naturally refers to conditions calling for that extreme degree of vigilance. It is not so unreasonable, for example, as to demand constantly strained eyes from the lookout over a perfectly clear horizon.

Finally, the court directs attention to the fact that in the general charge the trial judge explicitly confined the propositions quoted to the particular situation "immediately prior to the happening of the accident," and spoke of the gripman's duty commencing when the driver of the wagon began to swing it across the track the gripman was on. Judgment for plaintiff affirmed.

Not Necessarily Negligence for Woman to Prepare to Alight Before Cars Stop.

Springfield Consolidated Railway Company v. Hoeffner (Ill.), 51 N. E. Rep., 884. October 24, 1898.

The supreme court of Illinois recalls here that it has held that it is not negligence in itself for a passenger to board or alight from a street car operated by horse power while it is in motion; that it is not negligence in itself for a passenger to board or alight from a street car propelled by electricity while it is in motion; and also that it is not negligence in itself for a passenger to get on or off a moving street car, whose motive power is a cable. In all such cases of getting on or off street cars while they are in motion, whether such cars are propelled by horse power, electricity or cable, continues the court, the question whether or not the passenger has used due care for his safety, or whether or not he has been guilty of contributory negligence, is a question of fact to be submitted to the jury, and to be determined by them from the circumstances surrounding the case.

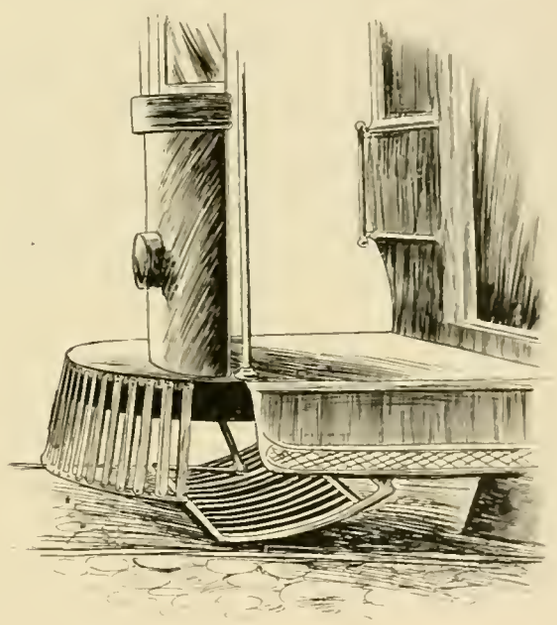
In this instance it was a woman who, according to one expression of the court, might be deemed to have attempted the feat of alighting from a moving electric street car, and the court says that it was for the jury to determine whether,in making such an attempt on her part, she was exercising due care for her own safety. But, it seems from the evidence, that this was more of a case where the woman notified the conductor of the street crossing at which she wanted to alight, and as the speed of the car was slackened at that point, prepared to alight when the car should stop on the other side of the crossing. She stood with one foot on the car and the other on the foot-board, and was holding on to the brass arm of the seat. While she was in this position, and while it seemed that the car was about to stop and she was about to alight, the car, without stopping, started forward with a sudden and violent jerk, breaking her hold and throwing her upon her back, so as to cause the injuries complained of, the most serious of which was to her spine. The trial judge told the jury that they must believe from all the evidence that the company ran its car to the corner of the intersecting street in question and was then and there in the act of slacking up or stopping said car, and that the woman passenger was then and there exercising all due care and caution for her own safety, and that, while so exercising said care and caution, she was preparing to alight from said car when it should come to a stop, and that such act or acts by her of preparing to alight at the time, under all the circumstances, and in the manner shown by the evidence, were not negligence or carelessness on her part.

This instruction, the supreme court holds, stated the law with substantial correctness. It says, furthermore, that street car companies are obliged to stop a reasonable time to allow passengers to get on or off the car, and the question of what is a reasonable time is in every case a question for the jury. If the manager of a car sees, or ought, in the exercise of reasonable care, to see, that a passenger is in the act of getting on or off the car, it is negligence on the part of the company if he starts the car suddenly.

The supreme court also points out that the jury were required in this case to find that the passenger gave to the conductor reasonable notice of her desire to get off, which left the jury to determine whether the notice was reasonable or not. Judgment for the woman affirmed.

A NEW FENDER.

The fender illustrated is now being tried on a Western road but has not yet passed the experimental stage. When anything is struck by the guard, fastened to the bumper by means of a pivoted lever, the fender beneath the platform is forced down against the



track, and is supposed to scoop up the fallen person. As now constructed the guard in front of the bumper extends down too close to the track and serious injury is liable to be done a person before the fender proper comes into play.

EXCLUSIVE UNIFORM HOUSE.

An extensive establishment has recently been opened in Chicago, at 192 and 194 Market street, for the exclusive manufacture of uniforms. While uniforms of every description will be made and also carried in stock, particular attention will be given to conductors' and motormen's garments. The concern is composed of men who have had extensive experience in uniforming, and the firm name is James H. Hirsch & Co. The manager is H. H. Crocker, also an experienced uniform maker, who has furnished some of the largest steam roads running out of Chicago. Samples and prices will be sent on application. Special attention will be given to street railways in cities of 50,000 or less.

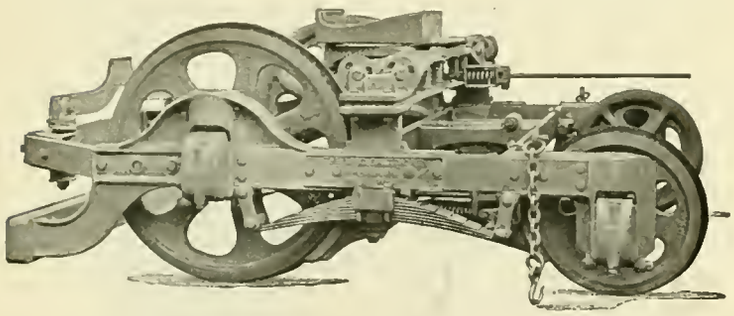
LORD BALTIMORE MAXIMUM TRACTION TRUCK.

The accompanying illustration shows the maximum traction truck made by the Baltimore Car Wheel Company of Baltimore, Md., and like the other well-known trucks made by the company it is called the Lord Baltimore. The design conforms to that of the Lord Baltimore single and center-bearing trucks.

The pedestals are of steel and form part of the side frames; they are provided with housings to receive graduated coil springs, which rest on the axle boxes and carry the entire weight, thoroughly cushioning all. The car body and load ride upon four half-elliptic springs, two to each truck, suspended from below the side frames by links and connected by posts to the truck bolsters. The posts are held in place between and guided by the bars forming part of side frames and connecting the pedestals.

They are of bolster construction, to which bolster pivotal centers, located at or near the centers of driving axles, are fastened; the weight of the entire structure is so proportioned that 66 per cent rests upon the driving wheels and is applied to the wheels through the bolsters and distributed upon the centers of the bolsters and self-oiling roller side bearings which revolve upon steel thimbles. These roller side bearings, upon which car body chafe plates bear, are placed directly above centers of half-elliptic body springs. The axle boxes are of the most improved dust and oil tight pattern and provided with either felt or waste feed as may be desired.

The driver end cross frames are bolted directly to the main pedestals and are of such form that they will never be outside of track



LORD BALTIMORE MAXIMUM TRACTION TRUCK.

line in curving; the only function they perform is to carry bars supporting the motors upon outer ends, the motors being placed outside of the drivers. These end cross frames form stiff end ties for the side frames, which are also securely braced diagonally between the wheels. The frames, taken as a whole, are as securely built as the best locomotive trucks and have all the advantages of stiffness and stability claimed for center bearing trucks of the most approved design.

The brakes are applied between wheels and so constructed with proportioned levers that 70 per cent of the braking power is applied to the drivers, they are operated by levers acting from the pivotal points of trucks, avoiding the use of objectionable quadrants in applying brakes upon curves; all the working parts of the brake mechanism have large bearings provided with oil holes, work upon steel thimbles, are placed at center lines of trucks, and not liable to receive mud or dust thrown up by the wheels. The brakes are extremely powerful and this power is equalized between the trucks by interposing springs in such a manner that it will be divided equally between the trucks and each wheel will receive its proper proportion of the braking power.

These trucks are thoroughly and carefully built in every particular, the construction is such that there are no shearing stresses upon the bolts. All parts are of steel and malleable iron, no cast iron being used except for wheels and brakeshoes.

The Employes' Mutual Benefit Association of the Rapid Transit Railway Company of Syracuse, N. Y., was organized last month. Applicants for membership must be between the ages of 21 and 45; the initiation fee is $1 and the monthly dues 50 cents. Death benefits of $150 and sick benefits of $1 per day, with a maximum of $90 in any one year.

PERJURY IN NEW YORK DAMAGE SUITS.

It is stated by Louis Julian, of the claim department of the Metropolitan Street Railway Company of New York, that about a year ago he was informed of a conspiracy to commit wholesale perjury in suits for damages pending in the supreme court against this company and other corporations. A general investigation was made and a number of confessions secured after which the matter was laid before the district attorney. In December last an indictment was secured against five persons alleged to be concerned in the conspiracy. Charles Gallaher, an adjuster, and William Rapp, a janitor, were arrested, and on December 28 Michael P. O'Connor, a lawyer, gave himself up and was admitted to bail.

O'Connor was the ringleader and one of his schemes was to educate young children, tell them what to testify to and place them on the witness stand. In order to thoroughly drill them he had in his office models of cars and rails, wagons and trucks, which were used for the purposes of illustration.

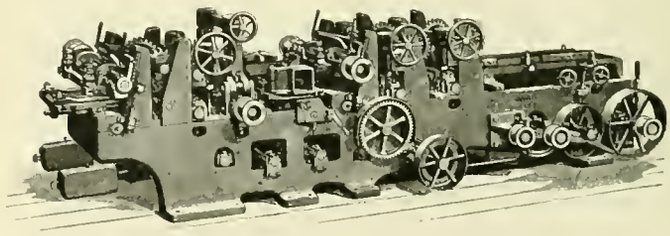
The confessions on which the indictments were based showed the existence of an organized band of swindlers, whose business it was to commit perjury and furnish perjured testimony against street railway companies in this and other cities and any and all corporations and private individuals against whom damage suits might be brought. The Third Avenue Railroad Company, the Casualty Company and other business concerns and reputable lawyers have assisted the Metropolitan Street Railway Company in the pursuit of these inquiries.

Another source of revenue of this band was to furnish straw bondsmen. Most of the men used by O'Connor as witnesses to swear his cases through the courts had been used by him and others as bondsmen.

The affidavits on file show that perjured testimony is cheap in New York. One witness, who was put through a course of study so that he might know the story by heart when he appeared in court, is said to have got $10 to commit perjury. Another got $5. They did not always remember the stories when on the witness stand, and one man who was in Oklahoma when the accident to which he testified occurred aroused the suspicion of Justice Freedman by the manner of telling his story.

FAY & CO.'S NEW FLOORING MACHINE.

J. A. Fay & Co. of West Front street, Cincinnati, have had a corps of expert mechanics and draftsmen at work for over a year designing and perfecting new and improved wood-working machinery, and one of these machines which has just been placed on the market is shown in the accompanying illustration. It is known as the No. 17 new six-roll, triple-cylinder, "Lightning" flooring machine, and combines a number of important improvements not be-



J. A. FAY & CO.'S NO. 17 "LIGHTNING" FLOORING MACHINE.

fore assembled in one machine. The framing is massive and all parts are well braced; by a system of interchangeable parts and adhering to exact standard sizes the highest degree of perfection has been reached.

There are three cylinders made of solid steel forgings, with four faces slotted to receive two or four knives, and chip-breaking lips for cross-grained lumber; all three are provided with long self-oiling bearings. The matching works are heavy; the bearings are adjustable horizontally and vertically, and rigidly locked by means of a lever conveniently located outside the frame. Stock as narrow as 1½ in. may be matched on this machine. The feed works comprise six 8-in. rolls driven by a train of powerful gearing. There are

three speeds of feed, 30, 45 and 60 ft. per minute; the feed is under instant and positive control of the operator by means of a lever engaging a friction ring. The various pressure bars are adjustable to and from the cut.

New and improved belt tightening apparatus for both cylinder and side head belts, which is quickly adjustable while the machine is running, permits the use of endless belts that run smoothly and do not have to be cut to take up the stretch.

PRIZES FOR CARE OF CARS.

The Birmingham (Ala.) Railway & Electric Company has recently added 11 new cars to its equipment. They were built by the St. Louis Car Company, and are 42 ft. long with 20 cross seats. They are divided into two compartments accommodating white and colored passengers. The cars are finished in green, white and gold.

Having made this addition to the equipment General Manager J. B. McClary thought the time had arrived to put in operation a plan for keeping the cars in the best possible condition and at the same time ascertaining which of the men have the interests of the company at heart. Accordingly street records are to be kept and awards made on July 1 and December 31 of each year.

Conductors of electric trains and motormen of fare box cars who have kept the neatest cars will be awarded $10.

Those who have habitually kept dirty cars will be discharged.

All motormen who have not cost the company anything for damages or break-downs will be awarded $20.

All who have not cost over $5 for collisions or break-downs will get $5.

All who have cost over $5 and under $25 will get nothing.

All who have cost over $25 will be discharged unless they can prove themselves innocent of carelessness.

DENVER STREET RAILWAYS IN 1898.

The Denver Consolidated Tramway Company during 1898 expended over $150,000 in improvements and expects to spend an equal amount in 1899. The tracks from Lawrence and 15th streets to the terminus of the Colfax avenue line have been relaid with 60-ft., 72-lb. rails on creosoted ties. General Superintendent Durbin gives the cost, including paving between the rails, as $27,000 per mile of single track. The company's shops are at present busy rebuilding cars, making combination cars by joining open and closed cars as described in the REVIEW for November.

What is known as the Montclair line, running to that suburb, has been acquired by the company, bringing its mileage up to 110 miles. This addition makes the longest 5-cent ride offered by the company 13½ miles.

A new transfer station is under construction and is to be completed by February 1. A contract was recently let for 104 new 35 h. p. motors and the improvement of the equipment is to be continued.

During the first 10 months of 1898, 18,000,000 passengers were carried, an increase of 5 per cent over the same period in 1897.

No change of importance has been made in the lines of the Denver City Railroad Company. An ordinance was recently passed by the council, after very extensive discussion, granting the company the right to change the motive power of its cable lines to electricity, but this was vetoed by the mayor and failed on its second passage.

A RAILWAY LOOP AT NIAGARA.

A new suspension bridge which is now building at Lewiston, N. Y., will be the connecting link in a loop including the lines of the Niagara Falls Park & River Railway and the Gorge Route. A continuous trip can then be made on the trolley cars along the gorge on the American side, crossing the new bridge to Canada, returning on the Canadian bank and recrossing the river on the bridge at Niagara Falls. The bridge will be completed in time for the opening of the season and will enable visitors and tourists to make a most delightful circuit on the electric cars. The location of the bridge is on the site of the old suspension bridge which was built in 1850 just above the village of Lewiston and destroyed by a storm in February, 1864. The structure will be 1,040 ft. between towers and have a clear passageway of 25 ft., affording ample space for a railway track and a roadway for teams on either side.

NEW YORK APPROACH TO NEW SUSPENSION BRIDGE AT LEWISTON, N. Y.

The cables are those removed from the old upper suspension bridge at Niagara, recently replaced by a steel arch. The metal in the bridge weighs about 800 tons, 200 tons of which is in the cables. The height of the bridge above the water will be 65 ft. On both sides of the river long approaches have been constructed so that the trolley cars may have an easy run on and off the bridge, the approach on the New York side being 800 ft. long. Double tracks will be laid on them to increase the facilities for handling the cars. The two illustrations are views of the New York approach. The face wall, which has been built to prevent the shale disintegrating and falling on the tracks, is 800 ft. long and 19 ft. high at the highest point.

A. N. Sicard, secretary of the Ft. Smith (Ark.) Street Railway Company, announced that construction work would begin by January 1. The line is to be six miles long.

The Helena (Mont.) Power & Light Company reports its receipts for the fiscal year ending November 30, 1898, at $36,147, and its expenditures at $37,008, of which $3,200 went for improvements.

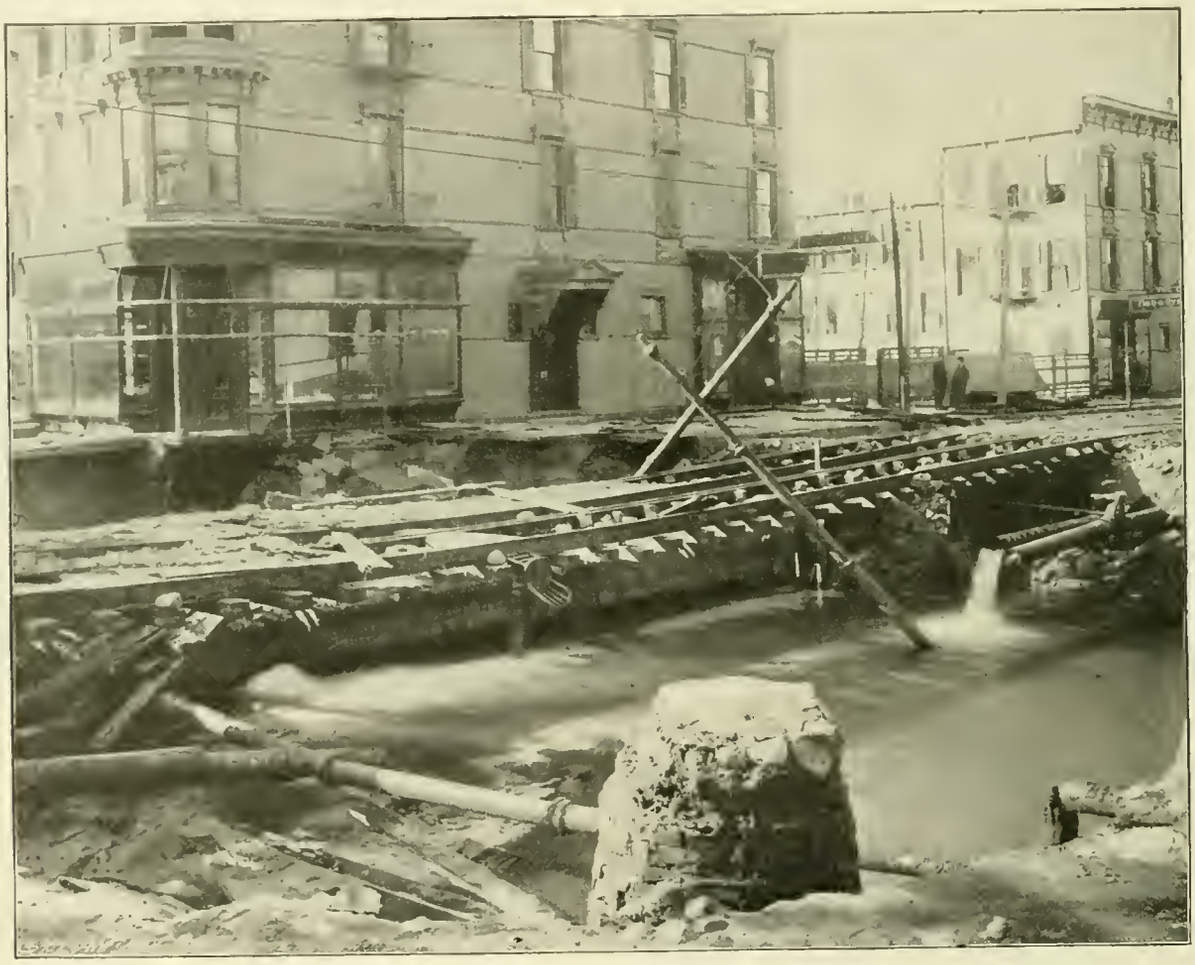
BURSTING OF A WATER MAIN IN BROOKLYN, N. Y.

The accompanying illustration, for which we are indebted to the "Scientific American," shows the corner of Central avenue and Covert street in Brooklyn as washed out by the breaking of a 48-in. cast iron water pipe on December 11. The pipe was laid about eight years ago and extended from the Ridgewood reservoir to the Prospect Hill pumping station.

The soil about the point of the break is sandy, and the street was undermined before the effect of the break showed on the surface. When the street caved in the gas mains were broken. The foundations of many of the buildings in the neighborhood were undermined, making them unsafe.

As near as could be ascertained the break occurred about 5 a. m. As soon as it was discovered firemen were detailed to render assistance. When they arrived the street car tracks on Central avenue were submerged and the poles down, as shown in the illustration. Adjacent basements were flooded to the depth of 6 ft. The supply was cut off at the reservoir as soon as possible, but the water in the pipe still caused trouble. After several hours the water receded, and it was found that the hole at the street crossing was 100 ft. in diameter and 20 ft. deep. The sewer in Central avenue was also badly damaged.

The break in the pipe was near the bottom and was 3 ft. long by 12 or 13 in. wide. It is stated that the break was due to structural weakness in the casting. The loss of water is estimated at 4,000,000 gallons.



BREAK IN A 48-IN. WATER MAIN IN BROOKLYN, N. Y.

Richard Croker, in a recent interview, announced that the underground rapid transit scheme would be put through during the administration of the present mayor of New York. The tunnel is to be wide enough for four tracks.

STREET RAILWAY ASSOCIATION OF VIRGINIA.

The organization of the Street Railway & Electric Association of Virginia was announced in the December REVIEW. A copy of the constitution has been sent us by E. A. Williams, president of the Richmond Traction Company and vice-president of the association. Active members of the association comprise street railway companies or lessees, or individual owners of street railways, electric light and power companies, and associate members include manufacturers and dealers in street railway and electric supplies, and engineers and contractors engaged in electric railway construction. The meetings are to be held on the third Tuesday in May each year. A membership fee of $10 is charged and the yearly dues are $10. The first meeting of the association gave promise of a useful and prosperous future.

PROSPERITY AT BUTTE, MONT.

The year just passed has been a very good one for the Butte (Mont.) Consolidated Railway Company, the increase in business being in excess of 20 per cent when compared with 1897. This increase was largely due to extensions and improvements in the system. When the present manager, J. R. Wharton, took charge of the system, in 1891, the business was easily handled by nine cars; at the present time there are 24 passenger and nine freight cars in use.

This company handles a great deal of ore, transporting it from the mines to the smelters, but during the year ending October 1, 1898, the number of passengers carried was 1,615,000. About 5¾ miles of new track have been laid, the most important of the additions being a line to the Parrot smelter.

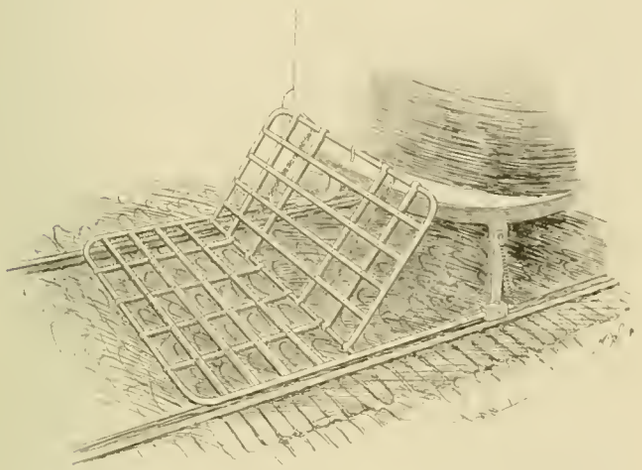
In the REVIEW for March, 1898, page 171, was published an illustration showing an electric locomotive with a train of ore cars on the Butte line.

SAFETY DEVICES ON CHICAGO CARS.

The fender which was adopted for the North and West Chicago cable cars was described in the REVIEW for October, page 771. Another fender has been designed by V. T. Lynch, master mechanic of the North Chicago Street Railroad Company, for applying to the electric cars. The frame of the fender is of ¾ in. pipe, and in this frame are wooden slats 3 in. square held lengthwise by four steel bands each 1 in. wide and 1 16 in. thick. The wooden strips are rounded on the top corners and are held in place by 3-16-in. bolts.

The characteristic feature of the fender is in its suspension. On either side of the platform is bolted a knee made of angle iron ½ by 3 in. In each knee there are three bolt holes so that the fender may be suspended at different heights from the track, or to provide for cars whose platforms are not at the same heights as the standard. A curved link is held in the knee by an iron dowel and is loose riveted to the extension of the frame of the fender, as may be seen in the cut. Between the fender frame and the knee is a spring 1½ in. in diameter and 7 in. long having a tension of 7 lbs. to the inch. A dowel in the curved link holds the frame in place.

The portion of the fender covering the bumper is joined to the cradle beneath and in front of the bumper. This portion is held in place by two clips and a loose bolt in the bumper. The fender is normally 5 to 6 in. above the rails. When the fender strikes anything in front the link work of the suspension throws the fender down close to the tracks. Beneath the frame and on



FENDER FOR NORTH CHICAGO ELECTRIC CARS.

each side is a U-shaped piece of pipe fastened at the ends and riveted to the frame. These prevent the fender striking the ground and hold it an inch or more from the rails. The spring suspension cushions the blow which may be struck by the fender. The fender can be folded up and changed from one car to another in five minutes.

The outer frame is about 30 in. in front of the bumper and is 6 ft. across. All the work is done in the repair shops and by turning them out in large numbers the cost is small. By the last of this month 400 fenders will have been finished and put on the cars of the North Chicago Street Railroad Company. The West Chicago Street Railroad Company has adopted the same type of fender for its motor cars.

The cars have also been fitted with another safety device which is simple and effective in accomplishing its purpose. Beneath the car body and in front of the wheels a V-shaped wooden fender is carried by the truck. On this fender and immediately in front of each wheel is bolted a clip of ¼ by 4 in. steel which holds a piece of 2-in. four-ply hose about 12 in. long. When the car is loaded the hose just touches the rails. Should the hand or foot of a fallen person be in front of any wheel of the car and in danger of being crushed this piece of hose will push it off the track.

A large percentage of serious and fatal accidents on the cable trains is to passengers who, in jumping on or off the cars while in motion, either slip or lose their hold in some way and are caught by the trail cars. J. M. Roach, general manager of the North Chicago Street Railroad Company, has patented a guard which effectually prevents such accidents. Its principal feature is a row of five coil springs connecting the cars at the dash. These springs are 36 in.

SPRING GUARD BETWEEN CARS.

long and 1¾ in. in outside diameter and made of No. 5 wire. At each end of the coil is a hook made of ⅜ in. iron, with a loop on the inner end about which the spring is tightly coiled. On each side of the dash of each car is a ⅜ by 2 in. steel strip in which five holes are drilled. This is held at the bottom by a piece of steel ⅜ by 2 by 6 in. which is bolted to the sill under the platform, and at the top there is a clip of ⅛ by 1 in. iron which is bolted to the dash by 5-16-in. bolts. The strip is free to move so that the springs are drawn out straight when the cars are rounding curves. All parts of the guard except the springs were made in the repair shop. Not an accident of this class has happened since these guards have been put in place.

A NEW ORLEANS FOLDER.

The New Orleans City & Lake Railroad Company has distributed a 12-page folder which is very useful to one visiting or touring the city. The folder has not only been published entirely at the company's expense, but it has been advertised by placards, 10½ by 13½ in. printed in red and black ink, a reproduction of which is shown in the cut. In the folder is a map of New Orleans and vicinity showing the 64 miles of track operated by the company. A brief directory of the railroad stations, hotels, churches, etc., is given and also a condensed description of the parks, pleasure resorts, monuments, places of amusement and points of historic interest. The folder is pocket size, and is not only very attractive, but is full of information concerning "New Orleans, What to See and How to See It."

WORK ON BOSTON ELEVATED.

Most of the material for the Boston Elevated structure has been contracted for, and the contracts for the rolling stock and equipment are soon to be placed. The exact construction for the stations has not been determined upon. The route is shown on the map of the Boston lines, published in the REVIEW for August, 1898. At the corner of Harrison and Beach streets it is proposed to erect an eight-story building, through the second floor of which the trains will pass. At Dudley street and the Sullivan square loops the stations are to be three-story buildings. Elevated cars will have two routes, one over the elevated structure and one through the subway. The third rail system will be used and some nice problems are involved in making the connections at the inclines to the subway. The cars it is proposed to use are to be 45 ft. in length, with entrances at each end and at the center. They are to comfortably seat 48 persons and this means accommodation for at least 100 in rush hours.

THE CINCINNATI AND HAMILTON INTERURBAN.

One of the best recent examples of quick and thorough work in building electric railways is that of the interurban between Hamilton, O., and Cincinnati, connecting with the Cincinnati Street Railway lines. In March, 1898, F. J. J. Sloat, then superintendent of the Akron, Bedford & Cleveland Railroad Company, went to Hamilton to look over the proposed route of the Cincinnati & Hamilton Electric Street Railway Company. In November of the same year the cars were running on schedule time from Hamilton to College Hill. The entire construction and equipment of the road indicate that it has been in the hands of experienced men. Only first-class material and the best of equipment have been used.

The line is 15 miles in length and extends from Hamilton through Symmes and Mt. Healthy, making connection at College Hill with the lines of the Cincinnati Street Railway Company. At the Hamilton terminus it joins with the Miami Valley Electric Railway, thus a continuous trip can be made from Dayton to the heart of Cincinnati on electric cars. The power station is located five miles south of Hamilton. The water for the boilers is pumped from two 60-ft. wells and stored in a large cistern. The power house occupies a site 49 by 143 ft. and is built of brick with a slate roof and cement floors. The engines are 600-h. p. Hamilton-Corliss, built by the Hooven, Owens & Rentschler Company, of Hamilton. The cylinders 24 by 48 in. and the speed of 88 r. p. m. The fly-wheel is 20 ft. in diameter and weighs 27 tons. The engines are belted to two 400-k. w. Westinghouse generators running at 425 r. p. m. and giving an output of 600 amperes at 650 volts. At times an overload reaching 1,000 amperes is carried by one unit. There are four 250-h. p. Stirling watertube boilers. The fuel consists of a mixture of nut and slack coal. The feed pumps were made by Laidlaw, Dunn & Gordon Company. A Hoppes purifier and Berryman hot water heaters are employed. The pumps occupy a separate room, 13 by 27 ft.

VIEWS IN THE POWER STATION OF THE CINCINNATI & HAMILTON ELECTRIC STREET RAILWAY.

FIRE AT ST. LOUIS.

A fire, the origin of which is doubtful, broke out in the Lami street power station of the St. Louis (Mo.) Railroad Company between 3 and 4 a. m. on December 29. The building is of brick with a slate roof. The slate is laid on wood and underneath is a false roof of wood. The fire broke out between the roof and false roof of the boiler room, and quickly burned out all the wood, the slates falling into the boiler room.

The Broadway cable line was stopped when the fire was discovered, but cars were again running at 6:30 a. m. The coal handling and stoking machinery was deranged and hand labor was needed in the boiler room until repairs could be made. The damage was estimated at $10,000, covered by insurance.

The building was erected in 1890, and is a two-story brick structure, valued with the equipment at $200,000. General Manager McCulloch considers it fortunate that the loss was so little.

Eight 42-ft. cars, made by G. C. Kuhlman & Co., of Cleveland, are now running. The cars are mounted on Peckham No. 14 double trucks and equipped with four 50-h. p. motors. The controllers are G. E. No. P 8. The cars are fitted both with hand brakes and with G. E. electric brakes. The electric heaters were furnished by the Consolidated Car Heating Company and the fare registers by the New Haven Car Register Company. Each car has a smoking compartment and at the end of each seat provision is made for a card table such as are used in steam passenger coaches.

The system by which the car schedule is regulated is worthy of mention. At each switch is a telephone booth and at intervals of 1,000 ft. along the entire line are plug-in boxes to which a portable telephone box may be attached. Each car carries a portable telephone so that if any accident should happen between switches the conductor has only to go with his instrument to the nearest plug-in box to be in communication with the office and shop. In this manner all the cars are directed from the office. A speed of from 40 to 45 miles an hour is attained along the greater part of the route.

The trolley wire consists of two No. 0000 copper wires and in this way all overhead frogs and switches are avoided. There are three No. 000000 feeders 22 miles in length south of the power station and two of the same size four miles in length north of the station. Cedar poles 35 ft. long with 15-in. butts and 6-in. tops are spaced at intervals of 90 ft. and the trolley wire is suspended from Christy brackets.

TERMINAL STATION AT COLLEGE HILL.

POWER HOUSE AND CAR BARN.

TRACK AND LINE WORK.

The main line is laid with 70-lb. T-rails and in the towns 73-lb. T-rails and 83-lb. girder rails. For 13 miles of track rails 30 ft. in length are laid and for the remaining two miles 60-ft. rails are used. Oak ties of standard size, 6 by 8 in. by 8 ft. are spaced 2 ft. between centers. Crown bonds of the Washburn & Moen Manufacturing Company are used. All special track work was made by the Johnson Company. There are some 35-ft. curves in Hamilton but very few on the main line. The maximum grade is 8 per cent.

The car barns are located five miles from Hamilton and occupy a site 55 by 153 ft. The structure is of brick with a patent paper roof. The shops are 41 ft. by 69 ft.

The officers of the company are as follows: President, Will Christy, Akron, O.; vice-president, D. Kimberly, Cleveland, treasurer, F. T. Pomeroy, Cleveland; secretary, C. E. Hoover, Hamilton, and general manager, F. J. J. Sloat, Hamilton. General Manager Sloat, who is a large stockholder also, has long been prominent in interurban work in northern Ohio.

F. T. Pomeroy, treasurer of the company and also a member of the executive committee, took an active part in projecting and constructing the railway. Mr. Pomeroy is general manager and treasurer of the Cleveland, Berea, Elyria & Oberlin Electric Railway Company, one of the most successful interurban roads in the country. He has made the building and operating of interurban railways a study and is an enthusiastic advocate of them, having been one of the projectors and builders of the Cleveland & Berea line, which was constructed in 1894. The Cleveland & Elyria and the Elyria & Oberlin lines followed in quick succession the building of the Cleveland & Berea road. From the date of the completion of the Cleveland & Berea line, in 1894, to the present time he has been actively interested in interurban railway business and has been very successful in this line of work.

F. T. POMEROY.

A PROPOSED CHICAGO CONSOLIDATION.

A highly desirable consolidation of a number of companies, now having nominally separate existence, but in fact operated in connection with the larger Yerkes companies of Chicago, was recommended by Mr. Yerkes at the annual meeting of the North Chicago Electric Railway Company. There are nine of these companies: North Chicago Electric Railway, Cicero & Proviso Street Railway, Chicago North Shore Street Railway, Chicago Electric Transit, North Side Electric Street Railway, Evanston Electric Railway, Chicago & Jefferson Urban Transit, Ogden Street Railroad and Suburban Railroad. The aggregate capital is $13,900,000, and the bonds $8,061,000. These nine companies have over 260 miles of track.

December 26, a car of the Euclid avenue line in Cleveland ran into the rear end of a Cleveland, Painesville & Eastern car because of a failure of the brakes to work properly. The passengers in the Euclid avenue car were badly shaken up, and the motorman seriously, but not fatally, injured.

TERMINAL STATION OF THE CALUMET RAILWAY.

The great problem for the managers of suburban roads is to stimulate traffic and offer inducements which will attract patronage. The manager of the large city railway turns his attention to providing accommodation for enormous traffic, and schedules must be arranged for a large movement of cars at certain intervals in the day. As a rule the cars of suburban roads are not so burdened with passengers and the ingenuity of the manager must be exercised to stimulate travel. The Calumet Electric Street Railway Company has 90 miles of track and all of this is in the suburban districts in the southern part of Chicago. About 70 per cent of the patronage on its lines is what is known as through traffic, i. e., passengers use the Calumet lines to reach the South Side Elevated and the Chicago City lines to go to the business districts.

There are three suburban systems in the southern part of the city, the Calumet, the South Chicago City and the Chicago Traction (the storage battery road), and the Chicago City runs as far south as 79th street. One northern terminal of the suburban lines is at 63d street and South Park avenue, connection being made with the Alley L. At 63d and Stony Island avenue is the other northern terminal of the Calumet and South Chicago City lines, and connection is made at this point with the Alley L and the Chicago City lines. Three of the Calumet lines center at this point, the Pullman, the Robey and the Grand Crossing, and during each day of 18 hours there are from 250 cars in winter to 350 in summer brought to this terminal. There is sharp competition in this portion of the city, for besides the electric lines, the Illinois Central Railroad gives an excellent service with its local and express suburban trains, but higher rates are charged than on the electric cars.

FIG. 1—CALUMET TERMINAL STATION.

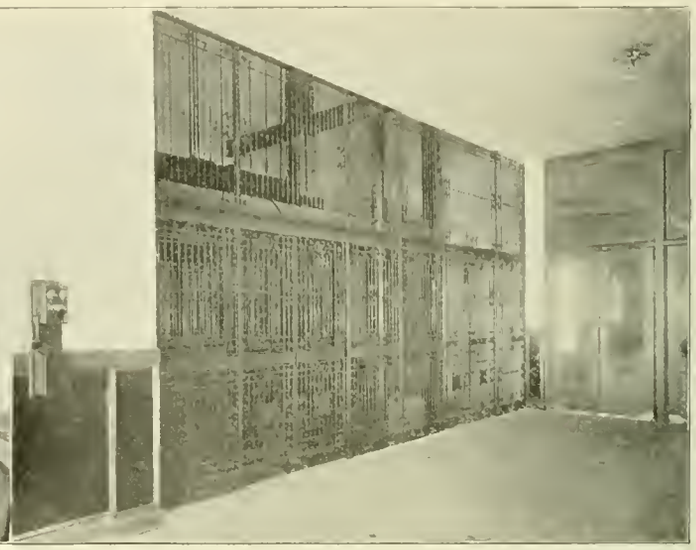


FIG. 3—ELEVATORS IN WAITING ROOM.

Where the Alley L crosses the elevated tracks of the Illinois Central at 63d street it was necessary to raise the structure to 30 ft above the street grade, and this makes a station of unusual height at Stony Island avenue. H. M. Sloan, general manager of the Calumet Electric Street Railway Company, decided that a terminal station at 63d street would be a great convenience to the patrons of his road and would induce a corresponding increase in traffic. Plans were carefully made for a station and it is now nearing completion.

The desired terminal being across the street from the site of the

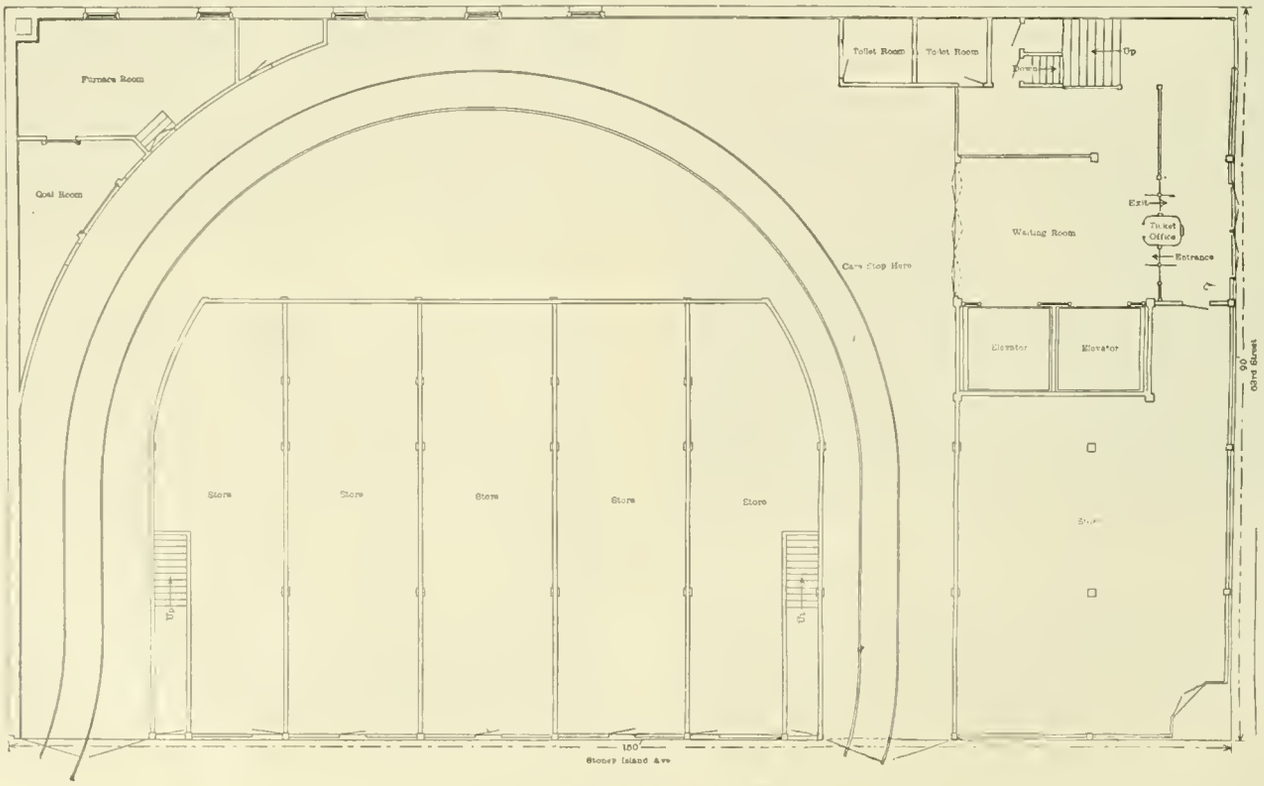

FIG. 2—FIRST FLOOR PLAN.

World's Fair, the locality is filled with large buildings, and to get to the station it was necessary to purchase a three-story brick building with a frontage of 90 ft. on 63d street and 150 ft. on Stony Island avenue, a general view of which is given in Fig. 1. On the ground floor a passageway was cut through the building and a loop constructed, as may be seen in the first floor plan, Fig. 2. The loop is entirely under cover and occupies the space shown up to the second floor. All cars stop and discharge passengers in front of the swinging doors leading into the large waiting room. This is a handsome, commodious apartment, a view of the interior being shown in Fig. 3. The trolley above the loop, instead of being fastened to the trough on the ceiling by hangers, was suspended by span wires, which effectually prevents the noise of the running trolley from being transmitted to other parts of the building.

In the waiting room are the entrances to the two elevators which run to the third floor. These are the largest passenger elevators in Chicago, each one having a capacity for 55 persons and capable of lifting 7,000 lbs. In Fig. 4 is given the plan of the third floor showing the arrangement of the stairways, elevator entrances and halls leading to the station platform of the Alley L. The arduous climb up the stairs to the elevated station is thus avoided.

The elevators were installed by the Crane Company, of Chicago, and are very complete in every detail. In the basement is a large steel tank half filled with water and the rest with air, which acts as a cushion in running the elevators. The hydraulic piston cases are sunk 30 ft. into the ground. The two pumps are worked by 10 and 20-h. p. motors, the smaller being in reserve. Current for the motors is taken through a switchboard from the Calumet trolley wire and connection is also made with the feeder system of the Alley L for cases of emergency. A rotary transformer reduces the voltage from 500 to 110 for lighting the building. The heating plant will occupy a triangular space in the southwest corner of the ground floor, as shown.

The building is being remodeled, attractive storerooms occupying the ground floor on the Stony Island avenue front, and the second and third floors largely devoted to flats or apartments. On the second floor has been constructed a small but well appointed theater with a seating capacity of 500. Aside from letting it for theatrical performances the company will rent it for lodges, dances, banquets and entertainments of various kinds. The arrangement of the theater, stage, banquet room overlooking the hall, the kitchen, dressing rooms, lavatories, etc., may be seen from the plan of the third floor. The entire building has been modernized and now it is one of the most valuable terminal stations in the possession of any electric railway company. Although the investment is large, there is every indication that it will be very profitable, and the largely increased traffic will justify General Manager Sloan's course in providing such facilities.

ELECTRIC RAILWAYS IN GREAT BRITAIN.

In a special report which was made last month by James Boyle, United States consul at Liverpool, some interesting information is given concerning the street railway situation in England. The following extracts are taken from it.

"Heretofore the cities of Great Britain have been among the most backward of any cities of the world in the matter of street railroads. A great change is taking place, however. Undertakings are in progress in the principal cities of the kingdom for the establishment of the most improved systems. Attention is here drawn to this newly awakened spirit of enterprise, so general on the part of British municipalities, in the hope that American contractors and manufacturers may secure some of the work of supplying the plants. The recommendation is made that American firms who manufacture and deal in street railway and electrical appliances put themselves in communication with the municipal authorities here. This can be done by addressing the city engineer. As nearly every city and town of importance in Great Britain has such work under progress or in contemplation, it is unnecessary to give a list, and those interested can hardly go astray by addressing the city engineer of any large city in England or Scotland; and the same suggestion holds good, to a limited extent, for Irish and Welsh municipalities. The further suggestion is made that American contractors and manufacturers who desire to bid for such work should have an agent, say in London, who could keep them informed of the undertakings determined upon, so that bids could be promptly made.

"There is a general belief, both in the United States and England, that contracts for these public undertakings must be advertised for in the newspapers and must be let to the lowest bidder. I learn, however, from official sources that this is not necessarily so. It is not the case so far as Liverpool is concerned, and I understand that it is not so as regards most of the cities. These great municipal enterprises are undertaken by authority of act of Parliament. First, certain powers are granted by general acts. Then specific authority to meet local conditions is obtained in one of two ways, viz., (1) either by special local act passed by Parliament, or (2) by provisional order of the Government Board of Trade, which subsequently has its permissive authority or grant of power confirmed by act of Parliament, a number of such grants being 'omnibused' in

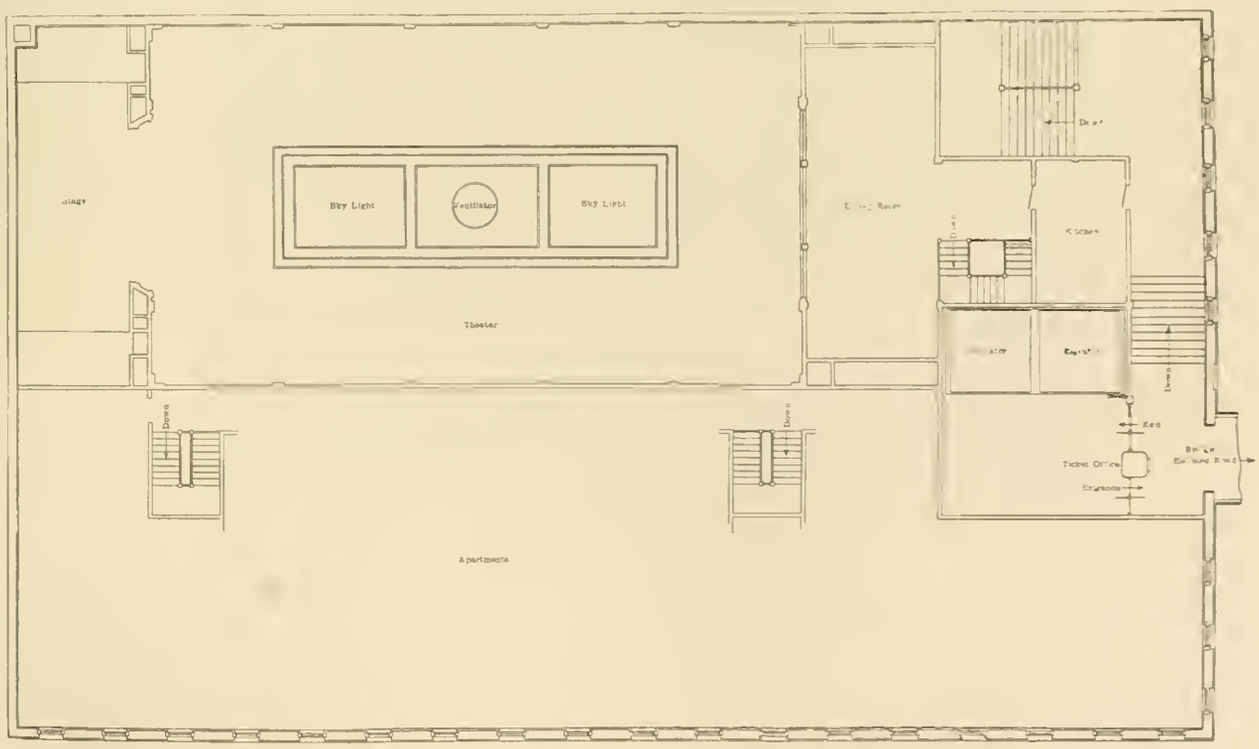

FIG. 4—THIRD FLOOR PLAN.

one act. The general public understanding has been that in the parliamentary acts there is a proviso necessitating advertising in the newspapers and the awarding of the contracts to the lowest bidder. On inquiry I learn that these details are left to the municipal authorities. After the plans and specifications are drawn up, the rule is for the council committee, through the city engineer, to write to concerns inviting bids. On application, the engineer will supply forms, plans and specifications.

"Within the last two years there has been a widespread agitation in Great Britain against the awarding of public contracts to foreign concerns. This sentiment has been particularly aroused by the bringing over of workmen from the United States to perform public contracts. Were it not for the fact that, for the last 18 months, labor generally has been plentiful here, with fair wages, this opposition would probably have made itself even more manifest. Certain industries, particularly those relating to iron and steel, are very busy in Great Britain now, as there is an accumulation of orders which had to be postponed because of the recent engineers' strike.

"The result was that the British manufacturers were placed at a great disadvantage when it came to making bids for these public contracts, and this applied both to prices and the time in which the work could be turned out. Some municipalities issued advertisements for tenders and gave the contracts to the lowest bidders, even though they were foreign concerns, and a number of American contractors and manufacturers reaped the advantage.

"I have inquired with particularity from those in authority whether, in the extension of the electric street railroad system, foreign competition will be invited and accepted if the bids are the lowest and the best. I am informed that, owing to the protests of their constituents, the city council of Liverpool will not go abroad for any more of the work where it can possibly be done in England, and this will include the furnishing of rails, electric plant and cars. It is better that American contractors and manufacturers should understand the situation as it really exists, and yet I believe it is worth their while to make an attempt to secure some of the work, not only in Liverpool, but in other British municipalities. Within the next few years there will be a great many million dollars spent by the municipalities in street railroad and electric light improvements. 'King's Manual of Electrical Undertakings' gives the aggregate capital of the electrical companies in Great Britain and Ireland for 1898 as $426,426,120. In Liverpool alone, from $5,000,000 to $7,000,000 will be spent for steel rails, electrical plant and cars within the next two or three years. The length of the contemplated street railway extensions is about 100 miles.

"The directors of the Metropolitan and Metropolitan District Railway Companies of London have decided to undertake, at their joint cost, a series of experiments prior to the introduction of electric traction on the Inner Circle underground lines. For this purpose it is proposed to lay down between Earl's court and High street, Kensington, an electric installation adequate for the hauling of a train which shall be fully as heavy as those now running at the busiest times of the day on the Metropolitan railway. This section of the company's line has been chosen for two special reasons: First, because the ordinary service thereon is not so frequent as that on other sections; and, in the second place, because it contains some steep gradients—as sharp as 2½ per cent—which will enable the new electrical system to be tested under the severest conditions that would be experienced in regular working.

"Each company has agreed to put down the sum of $50,000 to defray the cost of experiments, and these will be carried on without any interruption of the present steam locomotive traffic for eight or ten months—a period sufficiently long to demonstrate the practicability of the principle thereafter to be introduced generally on the lines of the Metropolitan and Metropolitan District railways. The contract for the experimental work has been let, and it will be executed forthwith, under the direction of Sir John Wolfe Barry, the consulting engineer to the Metropolitan Company, with whom is associated Mr. W. H. Preece, the engineer-in-chief and electrician to the general post office. Owing to the enormous volume of traffic, the undertaking will probably be the largest enterprise of any kind in the world in which electricity is the motive power.

"The extraordinary awakening in England in the use of electricity extends in a still further direction than that here outlined. There is a scheme under way for connecting Liverpool with the manufacturing towns within a radius of 17 miles, by light suburban electric street railroads, which in the daytime will carry passengers and at night will carry freight. Electric light and power will also be supplied to the towns. There will be a huge generating station at St. Helens. The company has a capital of $5,000,000."

In connection with this report it is of interest to give a partial list of electric railway schemes which will be presented for the approval of Parliament during the session of 1899. The information is taken from "Lightning," of London. Summary of applications for session 1899:

	Loc. Author.	Companies.	Total.
Tramway Provisional Orders	14	9	23
Tramway Bills	28	13	41
Electric Railway Bills	—	9	9
Light Railway (Electric) Provisional Orders	4	28	32
	46	59	105

Statistics regarding the following applications are given.

PENNSYLVANIA CAR WHEEL COMPANY.

The Pennsylvania Car Wheel Company, although a comparatively new concern, has already made giant strides and has established a most enviable reputation for its product. Starting in the early part of 1898, it has been compelled to make two large additions to the works in order to keep pace with the growing demand for its wheels, and it is now melting iron at the rate of 30,000 tons per annum and expects to largely increase this during the present year.

The accompanying illustration, Fig. 1, shows a view of the company's works at 499 to 539 Preble avenue, Pittsburg. In Fig. 2 is shown a view of the interior of the main foundry. The company has a complete equipment, and is prepared to meet the requirements of every kind of service; the sizes vary from 14-in. wheels for turntables to 36-in. wheels for snow-plows and street sprinklers, and 42-in. coach wheels.

FIG. 1.—WORKS OF PENNSYLVANIA CAR WHEEL COMPANY.

The wheels are all made from specially selected grades of metal and are properly annealed and carefully tested—in fact, the testing of both the material and wheels after being finished is most thorough. The raw material is carefully inspected and only the higher grades of charcoal iron with a percentage of selected old wheels are used in the mixtures. The metal is tested frequently; at stated intervals during the melt, test bars are poured from which to ascertain the transverse strength, and test pieces made from which to ascertain the hardness and wearing quality of the metal and to determine the depth of chill. All the wheels are carefully annealed; this process requires a number of days, depending on the weight and diameter of wheels, and every individual wheel is thoroughly tested and examined by competent inspectors before shipment can be made. The testing and inspecting are so carefully done that it is almost impossible for an imperfect or defective wheel to be sent from the foundry.

The company guarantees its standard quality of wheel to meet all the requirements of ordinary service either for steam or electric cars; but for specially severe service, such as heavy grades, and consequent severe application of brakes, or for unusually high speed, it strongly recommends its "Duquesne extra quality." The "Duquesne" wheels are made under exactly the same thorough system of tests and inspection as the standard wheels, but owing to the use of more expensive metals in the mixtures they have greater strength and increased wearing quality, giving a corresponding increase in mileage. These wheels are recommended for absolute safety. This company's wheels have been adopted by a number of roads and are largely used under cars of 100,000 lbs. capacity, which require a wheel that will stand severe service.

The quality of wheels furnished electric railways is shown in a letter the company received recently from E. W. Davis, superintendent of the Versailles Traction Company, McKeesport, Pa., in which he says: "I am returning two pairs of wheels on axles. One axle was bent in a wreck which we had a few days ago and has on it the wheels you recently sold us. As I can find no damage to the wheels, please have the axle straightened and replace the same wheels on it, and return it as soon as possible. The wheels were subjected to very severe stresses and the result speaks well for your product."

FIG. 2. INTERIOR OF MAIN FOUNDRY.

The officers of the Pennsylvania Car Wheel Company are all men of wide business experience. Joshua W. Rhodes, of J. W. Rhodes & Co., of Pittsburg, is president, and his all-around business ability

and enterprise have had not a little to do with the remarkable success achieved. W. L. Elkins, the vice-president, is one of the celebrated Elkins family of Widener & Elkins fame, and has been largely instrumental in securing the very considerable street car business which the company is doing. The burden of actual management rests on the shoulders of Charles V. Slocum, secretary and treasurer, who is equipped for the arduous duties by 20 years' experience in a similar position. J. D. Rhodes looks after the sales in the western part of the territory. The eastern section is taken care of by John Howard Yardley, with headquarters in the Girard building, Philadelphia. Mr. Yardley is one of the best known men in the railway business, having in the last few years developed a large trade with both steam and electric railways. Connected and interested with the company are C. L. Magee, state senator from the Pittsburg district and proprietor of the "Pittsburg Times;" W. B. Rhodes, general manager of the Pennsylvania Tube Works, and J. D. Callery, president of the United Traction Company, of Pittsburg. The company will be pleased to submit designs of wheels for any special service, and any inquiries addressed either to Pittsburg or Philadelphia will receive prompt attention.

REPORT OF BOSTON ELEVATED.

Under date of December 19, 1898, President William A. Gaston presented to the stockholders of the Boston Elevated Railway the first annual written report of the company, covering the operations of the fiscal year ending September 30, 1898. We extract the following from the report:

The company was chartered by special act of the Massachusetts legislature in 1894 and organized immediately thereafter. The property of the West End Street Railway Company was leased December 9, 1897, for 24 years, 8 months and 9 days from October 1, 1897. The lease was approved by the Railroad Commissioners on December 15, 1897.

For the year ending September 30, 1898, the business was as follows:

Gross earnings from operation		$9,179,096.35
Operating expenses		6,566,584.16
Net earnings from leased lines		2,612,512.19
Subway rental	$ 106,134.35	
Interest on debt of and dividends on stock of lessor companies	1,655,730.00	
Taxes on West End Company	435,860.44	
Total payments under lease		2,197,724.79
		414,787.40
Add interest on special deposits		78,156.59
		492,943.99
Taxes		166,366.83
		326,577.16
Interest to holders of Boston Elevated Railway Company, 2¼ per cent on amount paid in		112,500.00
Surplus for year		214,077.16

Compared with the business done by the company's lessors in the year October 1, 1896, to September 30, 1897, the business done the past year on the leased roads shows a satisfactory and substantial increase, and this in spite of unfavorable weather and disappointing financial conditions. The company has maintained the leased property fully up to the solid and excellent condition in which it took it. With a view of increasing the business and of meeting and satisfying reasonable public demand, the company has built new track, established new lines, and enlarged the general equipment to the extent necessary to accomplish that result. The cost of these improvements and additions are charged to the West End Street Railway Company under provisions of the lease. Among some of the more important track work finished or in process of completion, may be mentioned the new line from Waverley to Mount Auburn, the extension of the track on Blue Hill avenue to Walk Hill street, and the double tracking of Main and Salem streets, Medford, from the Somerville line to the Malden line; 13.21 miles of old tram or T-rail track have been relaid with the best 9-in. girder rail; 128 open and 140 box cars have been purchased, with all their necessary adjuncts and electrical equipment, 57 cars taking the place of 57 cars burned in the fire that occurred December 24, 1897, in which the Everett car-house was completely destroyed, the loss, however, being covered by insurance; 13 additional snow-plows have been bought, five having been destroyed by fire. The company has purchased on Dorchester avenue, Dorchester, a lot of land, and built a large, fine, commodious car-house, with opportunity for the storage of 60 cars, and has built at Everett another new car-house, of a capacity of 60 cars, to take the place of the one destroyed by fire. The total number of miles of new track laid and equipped with all necessary electrical apparatus, including new track in subway, has been 16.44.

In connection with the business of the leased line, a few words of interest may perhaps be said concerning one of the largest and most important public works that has been recently experimented, the Boston subway. Up to September 3, 1898, the portion of the subway south of Park street was operated by this company, although previous thereto, while the public work was still uncompleted, it had equipped the remainder of the subway with the very best road-bed, track and electrical apparatus known. On September 3, 1898, the completed subway was open to the public, and since that date has been operated under the contract made and entered into by the city of Boston and the West End Street Railway Company, which contract has been assumed by the Elevated Company. Up to the end of the fiscal year which this report covers, and since that time, the company has been endeavoring to make the subway a success and a pleasure to the public, and endeavoring to make the largest and most advantageous use of that leased property. In this, it has had the assistance of the Transit Commissioners, who have made many valuable suggestions as to the operation of the subway and as to the conduct of the business therein. Whether any means can be devised which will increase the present carrying capacity of the subway is a problem upon which the operating department has given, and is giving, the best thought in its power; and the officers feel confident that, if any solution to that problem is possible, it will be made.

While the fiscal year ended on September 30, it may be of interest to learn of the use of the subway for the month of October, 1898 as at the end of the fiscal year the largest use of the subway had not taken place.

Average daily number of cars running through subway in October, 1898, was		3,518
Total number of subway checks sold October, 1898:—		
At Boylston Street	138,523	
At Mason Street	171,726	
At Park Street	818,708	
At Scollay Square	485,941	
At Brattle Square	136,032	
At Adams Square	85,698	
At Haymarket Square	161,851	
		1,998,479
Average number of subway checks sold per day in whole subway in October		64,467
Free transfers in October, 1898, in subway		749,687
Average number of free subway transfers given per day in October		24,183
Total free transfers issued in October, 1898		3,622,279
Average number of free transfers given per day in October		116,847

VOLUME OF BUSINESS FOR YEAR.

Total revenue passengers carried during year	181,321,295
Increase over business of lessor's previous year	8,766,782
Or an increase of about 5.1 per cent.	
Total free transfer passengers carried during year	28,239,880
An increase over business of lessor's previous year of	4,462,154
Or an increase of about 18.8 per cent.	

The present free transfer facilities now in effect point to an enormous increase of free transfer passengers in the present fiscal year.

Under the provisions of law, no work could be begun on the elevated structure until the plans thereof had been approved by the mayor of Boston as to architectural appearance and obstruction to

and safety of the structure, as to the convenience and comfort of the public, and as to certain other particulars. The plans were approved by the mayor on April 29, 1898. The plans were approved by the Railroad Commissioners, after several long public hearings, on July 11, 1898. Since that time the company has been busily engaged with a large force of men, making the surveys and examinations of the streets and adjacent properties necessary to make contracts and specifications for the erection of the elevated structure. In anticipation of a favorable decision on the plans, some necessary work was done on the new Charlestown bridge prior to July, 1898, in connection with the building of that bridge by the Transit Commission, so that it was able on September 27, 1898, to make a contract with the Carnegie Steel Company, Limited, to erect the section of the structure upon that bridge, completion of the work to be prior to January 1, 1899.

Within a short time it is expected to have under contract a large proportion of the structure upon the route upon which the company has been authorized to build by the Boston city government. Foundations to receive the structure will be begun at the opening of the spring of 1899. Much of the structure will be completed by the following fall. The plans for the terminal stations at Roxbury and Charlestown have been completed, and a large part of the land required for the same has been taken by eminent domain or purchased.

The traffic statistics for the year are as follows:

Round trips run by electric passenger cars	3,088,473
Round trips run by horse passenger cars	52,588
Round trips run by U. S. mail cars	15,363
Total	3,156,424
Revenue car-miles, electric passenger	31,933,624
Revenue car-miles, horse passenger	275,526
Revenue car-miles, U. S. mail	170,295
Total	32,379,445
Revenue passengers on electric cars	180,178,908
Revenue passengers on horse cars	1,142,387
Free transfer passengers on electric cars	28,239,880
Passenger receipts, electric cars	$8,911,080.94
Passenger receipts, horse cars	56,506.62
Receipts, U. S. mail cars	20,097.31
Average receipts per revenue passenger	4.945 cents.
Average receipts per total passenger	4.270 cents.

The company operated a total of 316.05 miles of track on September 30, 1898, of which over 306 miles are equipped on the overhead trolley system.

The company owns 274 horse cars, 2, 566 electric cars (passenger), 13 mail cars, 437 horses, 3,370 electric motors, 78 horse snow plows, 158 electric snow plows, 419 snow sleds, and 501 miscellaneous vehicles.

NOTES FROM COLUMBUS, OHIO.

The street railway companies of Columbus, O., have been furnishing their patrons with weather reports during the past six weeks and the service has proved to be very popular. The United States weather bureau furnishes neat cards, with forecast printed on them, each morning, and one of these is placed in each car by the conductor.

Columbus has no public parks suitable for picnics, and the street railway companies are fortunate in each having a park of its own. All of them are beautiful and are well patronized by the public. Last year was the most successful one in the history of the roads and largely because of the parks.

One of the roads recently settled a claim against it for $162.50 arising out of an accident at its park casino. There was a small rent in a piece of carpet in which a lady caught her toe, and in falling sprained a finger.

The Columbus Central Railway Company runs a freight car which is proving very popular and is more lucrative than any passenger car on its lines.

NEW PUBLICATIONS.

The address of Charles Wallace Hunt, as president of the American Society of Mechanical Engineers, delivered at the meeting of the society in November last, has been reprinted in pamphlet form. A short extract of this address was published in the REVIEW for December, 1898.

"Graphite," Vol. 1, No. 1, appeared in December. It is a four page monthly issued by the Joseph Dixon Crucible Company in the interest of its graphite products. The first number is filled with interesting information, and we may expect to find in this publication the cream of the writings on this subject.

The "Wisconsin Engineer" for January is a number very creditable to the technical department of the University of Wisconsin. Many valuable contributions on electrical, mechanical and civil engineering subjects were made by the professors and alumni of the school. The introductory article is on "Technical Education at the University of Wisconsin."

The 20th annual number of "The Tradesman," published at Chattanooga, Tenn., is a volume, including advertisements, of 248 pages. There are over 100 pages of reading matter, principally descriptive of the industries and resources of the south, and the book will be valuable for reference. There are a large number of signed articles by able writers and every business man will find something in it to interest him. There are numerous handsome illustrations and the typography is above reproach.

Our New York contemporary, "Locomotive Engineering," which had its offices on the 15th floor of the Home Life Insurance building, suffered severely when that building was burned out on December 5. Only the contents of the safe escaped destruction, and the papers and books in it were badly scorched. The loss included the office furniture, reference library, books kept for sale, copy for the January issue and the mailing list. Notwithstanding that the fire left the paper without cuts or copy, the January issue appeared on time with a complete new dress, and it appears that the difficulties encountered by Mr. Sinclair only served as a tonic. The whole number is fully up to the high standard of previous issues.

The National Association of Manufacturers, which has its general offices at 48-51 The Bourse, Philadelphia, has just prepared its "American Trade Index," a volume of over 300 pages, forming a descriptive and classified membership directory of the National Association of Manufacturers of the United States, arranged for the convenience of foreign buyers. The first 125 pages is an alphabetical list of American firms and companies doing an export business, with a brief statement of the line of goods made by them. The second part, of 130 pages, is an index of products, names of makers being given under each. Part III is a list of the registered cable addresses of members of the association, and Part IV comprises a number of displayed announcements. The index is a handsome volume strongly bound in cloth.

The first edition of 5,000 copies, in the English language, is to be distributed free to the principal merchants in English-speaking countries. A second edition, in the Spanish language, is now in preparation. The work is done without cost to the firms indexed. As the index is intended for foreign circulation, a charge of $3 per copy is made to those desiring the book in the United States.

CONDUIT CARS BLOCKED BY RAIN.

It is reported from New York that the cars on the Sixth avenue conduit electric line were compelled to stop at 11:15 p. m. January 6, the blockade continuing until morning. The blockade was at first only between 23rd and 59th streets, but within a short time the entire line was involved. A heavy rain commenced on the night of January 5 and continued for so long a time that the drainage system proved inadequate to keep the water level in the conduit below the level of the conductory rails. When installed the drainage system was thought to be ample.

THE LATEST IN AIR BRAKES.

Supply is Carried in Reservoirs—No Charging on the Car—300 Stops With One Supply.

For more than a year past the G. P. Magann Air Brake Company has conducted exhaustive experiments at Detroit on a new type of air brake, the purpose being to avoid the use of electric or axle-driven compressors, and provide a brake cylinder that would act more sensitively in instantaneous release of brakes, and eliminating noise and vibration. Through the hands of the company's inventor these results have been attained. Widely departing from present methods of air brake application, stored air is used confined in res-

CAR WITH MAGANN AIR BRAKE.

ervoirs fixed to the car and filled by a half minute charge from a stationary steam or electric driven air compressor in the power station, or on the line at sufficient pressure to allow a car an average of 300 stops to be made. By this system the care and expense incident to air brake machinery is reduced to a minimum, for there is very little mechanism on the car. The broad claims of the company for its storage air system are supported by an examination of the working of the brake on the Detroit & Pontiac Railway, which has had 12 cars thus equipped and in successful operation for the past eight months.

The system is extremely simple, the air being first compressed at the power station to 225 lbs. per sq. in. by means of a reciprocating air pump located in the engine room, and driven directly by steam. From the compressor the air is conducted to a large stor-

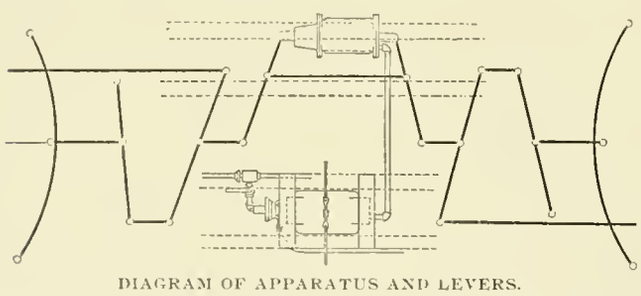

DIAGRAM OF APPARATUS AND LEVERS.

age reservoir, thence through underground pipes to convenient points along the track in front of the station, and to the car barn when near by. Connection to the cars is by means of automatic adjustable couplings quite similar to the air brake train connection on steam roads. Each passenger car carries two storage tanks made of riveted sheet steel tested to double the ordinary storage pressure of 225 lbs. Each cylinder has a capacity of 36 cu. ft. The time required for making connection, charging and breaking connection is less than 30 seconds, and on the D. & P. line all this is done while the conductor is filing his trip report. The storage tanks on the car are piped through a reducing valve to a small auxiliary reservoir which carries 40 lbs. pressure. The usual connections are then made to the brake or jam cylinder through a 3-way controlling valve on the platform. The jam cylinder is of the differential type, air being admitted on both sides of the piston, which moves in two cylinders of different sizes. To stop the car the large sized cylinder is exhausted, allowing the air pressure in the smaller cylinder to force the brake on. To release, the air is admitted to the large side, forcing the brake off and making a positive release. This also allows the motorman to put on only the requisite braking pressure, any undue pressure being immediately relieved by air cushioning in the large cylinder. With car reservoirs stored to original pressure of 200 lbs. a large double truck interurban car on the Pontiac line ran six hours and 20 minutes, or a total of 96 miles, in a hilly country and made 228 stops. When the car was then brought into the car house there was still enough pressure to handle the car with ease, the gage showing 40 lbs. Where a greater or less number of stops than 300 are desired, it is regulated by the initial pressure carried. The system will meet its first and large introduction on interurban and elevated lines, but it is highly probable that city surface lines will be able to adopt it with equal success in large cities, where headways are short, or on very long lines, where it is desirable to have the charging stations either scattered or increased, to avoid bunching cars at a few points, compressors can easily be installed wherever desired; in basements for instance, and operated by current from the trolley wire. The rapidly increasing uses to which compressed air may be put around a power station will also make the presence of a compressor in a station useful in many ways. The Pontiac officials report no repairs or delays in the operation of the brake, and their requirements are severe, the running time of the 30 miles being 90 minutes, while over a portion of the route a speed of fully 50 miles an hour is attained.

The general offices of the company are at 47 Campau building, Detroit, and F. D. Ray, well known to street railway men, has assumed position of general manager. Mr. Ray has had a long and wide experience in matters electrical, and as manager of electric lines, and is fully qualified to determine just the requirements for any kind of service.

CAST-WELD PATENT DECISION.

In the case of the Falk Manufacturing Company vs. the Missouri Railroad Company, of St. Louis, and the American Improved Rail Joint Company, of Chicago, which has been pending since July, 1897, an opinion was filed on January 10 by Judges Adams and Sanborn of the United States circuit court at St. Louis. In this opinion the court finds that while the Falk Company's patent sued upon (No. 545,040) has five claims, yet each of them might be said to be practically based upon the following steps, viz.: 1. Cleaning the abutting rails for a short distance from the ends. 2. Heating such cleaned rail ends. 3. Adjusting a mold around such rail ends. 4. Pouring molten metal into the molds.

After commenting upon the result obtained, in the way of securing what are known as continuous rails, the court says: "In our opinion, without entering into any detailed analysis of the evidence bearing on the state of the art, consisting generally of publications, technical works, mechanical operations, individual experiences, common knowledge, and divers patents—all of which have been carefully considered—the efforts of the patentee, as disclosed by this patent, belong to the domain of mechanical skill and not to the domain of invention."

The opinion then calls attention to the fact that "the proof shows and common knowledge confirms" that every step in the process is something that was known in the general art of casting and founding "long before the application for the patent in suit was made."

Answering the argument that the patent should be sustained notwithstanding all that was known of cast-welding in other arts the court says: "It is an old and familiar method applied to a condition which is brought about by the needs of the recent changes and improvements in street railway propulsion." It is then pointed out that such improvements are the heavy electric cars, and heavy rails, such rails being "required to be so sunk into the ground and fortified by retaining walls of stone or cement so that only the upper surface of the head and running flange are exposed." These conditions the court observes are not of the creation of Mr. Falk, and he "is not entitled to a monopoly of the supposed invention because the well known old process of his patent fell into a use

made available by the adaptation of new conditions to new needs, with which the patentee had no concern."

After thus disposing of the Falk patent in general terms the court considers specifically some of the English patents put in evidence by the defense. It says: "Again, in our opinion the complainant's patent is clearly anticipated by other patents pleaded by the defendants in their answer. The Norris English patent of 1851 shows the rail sections united so as to form a continuous rail; shows also a divided mold adapted to be placed around the abutting ends of two rail sections; shows also the process of pouring in the molten metal so as to surround the ends of the rail sections."

This Norris patent (which was issued in 1851) is then quoted from at length, and as to the point raised by the complainant that it was silent on the points of preliminary heating and cleaning, the court says: "We agree with counsel for defendant that these steps were so well known to the founder's art, both in practice and prior patents, long before the Norris patent, as to be necessarily read into it."

The patent of 1831 to George Stephenson, the eminent English engineer, was also quoted to show that at that early day everything set forth in the Falk patent in the way of doing cast-welding was well known.

The opinion concludes: "It seems to us that any practical mechanic familiar with the founder's business cannot read these two English patents, to say nothing of several others in the case almost equally suggestive, without seeing the applicability of the process there taught, to any and all the uses contemplated by complainant's patent. We therefore hold that complainant's invention was anticipated at least by the Norris and Stephenson patents above alluded to. It results that the complainant's bill must be dismissed."

WRECK ON THE ALLEY "L," CHICAGO.

A read end collision occurred on the South Side Elevated Railroad, Chicago, about 7 p. m. on January 13, in which four persons were seriously injured. The two trains met at Monroe avenue, one square west of the Madison avenue station, on the heavy up grade leading to the bridge over the Illinois Central at 63rd street. The rear of the train struck was at Monroe avenue and 63rd streets. The two cars were telescoped, the motor car being driven into the other for a distance of 10 ft. or more. As stated four persons were seriously injured; the motorman was not hurt.

Who or what is to blame for the accident is not known at this writing, but one lesson to be drawn from it is that elevated cars should have steel platforms and vestibuled ends.

At the municipal election held in Ottawa, Canada, January 2, the question of whether street cars should run on Sundays was voted upon; there was a large majority in favor of Sunday cars.

The Worthington, Clintonville & Columbus (O.) Street Railway Company, December 31, elected officers as follows: George H. Worthington, president; F. D. Simons, vice-president; T. A. Simons, secretary and treasurer; R. M. Weaver, auditor.

The Westerville & Worthington Street Railway Company, of Delaware, O., is at work securing grants for a right of way between Delaware and Flint, preparatory to asking the county commissioners for a franchise. The company promises to complete the line by July, 1900, if the franchises and consents are secured.

The first trip of a 5,000-gallon street sprinkling car recently put in service by the San Diego (Cal.) Electric Railway Company, was witnessed by a party comprising the mayor, city council and other guests. We understand that the company is willing to take the city contract for sprinkling the streets in which its tracks are laid.

The passenger earnings of the Brooklyn Rapid Transit Company's system for December, 1898, were $472,500, an increase of 10 per cent over December, 1897, and 14.3 per cent over December, 1896. For the year 1898 the total passenger earnings were $5,847,568, an increase of 12.8 per cent over 1897 and 15.4 per cent over 1896.

A franchise for an interurban road between Mattoon and Charleston, the county seat of Coles county, Illinois, is being sought by W. H. Patterson, president of the Bloomington City Railway Company. There will be a mile of track in Charleston, 2½ miles in Mattoon and 10 miles between the two towns. Charleston has a population of 7,000, which will soon be increased on account of the recent completion of a normal school for 1,000 students. The shops of the Big Four and the Peoria, Decatur & Evansville Railroads are located at Mattoon, which is a city of 11,000 inhabitants. Prospects are very good for franchises being granted for this line, and in such a case Mr. Patterson will be in the market for 500 h. p. of engines and generators and eight to ten cars.

The Rock River Valley Electric Railway Co., which wishes to build between Rockford and Oregon, Ill., is seeking to place $50,000 of its bonds in Rockford.

The Tama & Toledo (Ia.) Electric Railway & Light Company has been reorganized with W. C. Walters, president; H. A. Shanklin, secretary and treasurer, and Wm. McDaniel, superintendent.

The East Liverpool (O.) Railway Company refused to reinstate a discharged motorman and dispense with the services of one of the officers of the company at the demand of the local motormen's union, and a strike resulted.

A Monongahela electric car left the track and went over a 25-ft. embankment near Duquesne, Pa., on January 9. The stove was upset and several passengers burned. Four passengers and the conductor were injured, but all will recover.

It is announced that a decree has been entered in the case of the city of Lincoln, Neb., against the receiver of the Lincoln Street Railway Company, making the city's claims for paving taxes some $80,000, a first lien on the system, taking precedence of two mortgages.

H. C. Scott and S. W. Fordyce of St. Louis are making oil experiments at Waco, Tex., with a view to sinking wells and developing oil fields. Mr. Scott is president and general manager of the Citizens' Railway Company of Waco, and both are large stockholders in the Waco Gas Company.

The town of Gray's Lake, Ill., has granted a 50-year franchise to the Chicago & Fox Lake Electric Railway Company for a free right of way through the village. It is the intention to start the road at Lake Bluff and build it to the Fox Lake district. Cars will be operating by July 1 according to the plans of the promoters.

Among the 4,500 uniformed employes of the Boston Elevated Railway Company there are three men, Christopher Brady, Benjamin F. Jacobs and John Byrnes who are entitled to wear eight service stripes, indicating that they have been with the road for over 40 years. Six men wear seven and 22 wear six stripes. About 1,500 are entitled to one stripe.

The new board of directors of the Zanesville (O.) Electric Railway Company was elected as follows: T. Robinson and John M. Graham, of Boston, Wm. B. Cosgrave and Charles W. Foote, Zanesville, and Wm. Cristy, Akron. The board selected the following officers of the company: Thomas T. Robinson, president; John M. Graham, vice-president; W. B. Cosgrave, treasurer, and Charles W. Foote, secretary and general manager. Frank A. Durban will act as chief counsel for the company.

David Young was chosen president of the North Hudson County Railway, of Hoboken, N. J., on January 5, which is taken to indicate that stockholders of the North Jersey Street Railway Company, of which Mr. Young is vice-president and general manager, have acquired control of the former company. One of Mr. Young's first orders was to connect the wires of the two companies, and North Hudson electric cars at once began running to the Jersey City ferry terminal over the North Jersey tracks, where only horse cars of the North Hudson Company have been allowed heretofore.

NEW DOUBLE TRUCK CARS.

We present herewith illustrations of two very handsome cars built by J. M. Jones' Sons, of West Troy, N. Y., which cannot fail to be of interest to our readers as showing the latest types of double truck cars built by a firm having a most enviable reputation for excellent work.

The closed vestibule car for interurban service has a length over all of 39 ft. 6 in.; the length of the body is 30 ft. 6 in., and the width over the windows 8 ft. The bottom framing is extra heavy, with inside steel plates; there are inside and outside iron trusses. The car is equipped with spring buffers and air brakes. The car is wired for two trolleys. The vestibules are the Jones standard round and bent type; drop sash are in both the body and the vestibules. The vestibules have folding doors and double steps are placed at each end of the car. The car is divided into two compartments, one of which is for smokers.

The view of the interior of this car shows the partition separating the smoking compartment from the other part of the car; plate glass is used in this partition. The door in the end, to the left, is the regular entrance for this end of the car, and the entrance to the smoking compartment is at the platform, at the side of the regular entrance. The passageway from the entrance to the main passenger compartment is along one side of the car, as shown in the illustration, and by this arrangement there is no need for persons entering or leaving the car to pass through the smoking room, as would be the case were the partition separating the two parts simply a transverse one. The entrance at the opposite end of the car is at one side of the center, the two main entrances being at diagonally opposite corners.

JONES CLOSED INTERURBAN CAR.

The interior of the car is beautiful, being natural cherry throughout, with decorated ceiling. There are upholstered "walkover" seats for 28 persons in the large compartment and longitudinal rattan seats for 12 persons in the smoker. The cars are wired for 25 lamps. The windows have spring roller curtains. There are adjustable ventilators; push buttons are placed at each seat.

This car is one of a number built for the Stillwater & Mechanicville Street Railway Company, of Stillwater, N. Y., and Jones' Sons are now building 10 cars for the Albany Railway, which are the same in all respects save that there are no vestibules and plate glass is used throughout.

The second illustration shows one of the Jones standard 15-bench open cars built for the Commonwealth Avenue Street Railway

JONES 15-BENCH OPEN CAR.

Company, of Boston. This car is 41 ft. 3½ in. long over all; the length of the body over the panels is 32 ft. 9½ in. The width at the bottom is 7 ft. 3 in.; over the seats 7 ft. 9 in.; over all, with steps folded, 8 ft. 1½ in.; over all, with steps down, 9 ft. ¾ in. The distance from center to center of trucks is 25 ft. This car has seats for 90 persons. The seats are placed 2 ft. 6 in. from center to center, except at the ends, where the distance is 3 ft. 9 in., to give sufficient room between the facing seats. There are folding steps and guard bars on each side. At the sides are spring roller curtains; at the ends there are drop sash. The car has iron plate sills. It is wired for double trolleys. The interior finish is in maple and ash, and solid bronze trimmings are used throughout.

NEW ELECTRIC ROAD IN KANSAS CITY.

The work of changing the Brooklyn Avenue Railway, Kansas City, Mo., from a cable to an electric line is to be commenced at an early date. A number of changes will be made in the grade and the roadbed reconstructed. The company has applied for franchises which will enable it to make much needed extensions and reach a better paying territory.

The plans for the substitution of electricity and the rebuilding of the line have been prepared for some time, but the letting of contracts was delayed on account of the litigation concerning the Julian law providing for the sale of franchises to the highest bidder. The supreme court finally decided that this law has no application to Kansas City.

The present officers of the company are: John Lucas, president; James Blair, of New York, vice-president; W. H. Lucas, general manager.

GENERAL ELECTRIC RAILWAY LITIGATION.

As noted in the Review for November, 1898, when the General Electric Railway, of Chicago, began the construction of its tracks in Plymouth place it was stopped by injunction issued on the petition of the Chicago & Western Indiana Railroad Company. Later the injunction was dissolved and the bill dismissed, and the Chicago & Western Indiana carried the case to the appellate court, which a few days since reversed the ruling of the lower court, and held that the Chicago & Western Indiana Railroad, by virtue of its right of way across the street, could sue in equity to restrain the injury to its property which would be inflicted were the crossing permitted. The case will of course be carried to the supreme court.

FOREIGN FACTS.

Hastings has decided by a large majority of its voters that the city should be provided with electric traction. A committee has been appointed to inspect the various tramway systems in English cities.

In the latter part of November the Compagnie Generale Parisienne de Tramways put in operation its Bastille-Charenton line. This has a total length of 4⅜ miles, partly conduit and partly overhead trolley.

The experimental trolley line in Glasgow has given satisfaction, and instead of equipping the Govanhill route, connecting the line to Coplawhill for operation by the conduit system, as was intended, the council directed that a trolley line be built.

The accident at Bradford of an electric car slipping down hill and causing a loss of life has turned the attention of the tramway committee of Sheffield to investigate the question of safety brakes, for there are steep grades and sharp curves on the Walkley line.

The council of Newcastle is hesitating as to the system of tramway traction to be adopted in that city, for there are some steep grades. A committee is now visiting the cable roads in Edinburgh and Brixton, and the electric lines of Middlesbrough, Leeds and other cities.

In the construction of the cable tramways of Edinburgh some difficulties have arisen; among others, narrow streets on the Edinburgh and Portobello suburban line prove to be a hindrance. It was considered in the council that a trolley line might be desirable along this route.

The results from the Dingle experimental trolley line in Liverpool have been gratifying. On the first day the cars carried 20,000 passengers and on the succeeding 23 days 265,000 were carried. The increase in traffic has been 170 per cent since the horse cars have been replaced by the electric.

The conduit system of Blackpool, which has been in service for 12 or 13 years, is now being converted to a trolley line. This change was brought about by investigating the power consumption. Under favorable conditions not less than 45 per cent of the current leaked into the ground. This caused a yearly loss of $11,000, which in two years will pay for the cost of the necessary changes.

Japan is to have a second electric street railway system connecting the seaport of Oita with the town of Beppu, on the island of Kyushu. The construction is now in progress and much of the equipment has been ordered. The Brill Company has shipped 10 car trucks; McIntosh & Seymour one 160-h. p. high speed engine; the General Electric Company one six-pole 160-k. w. generator and 20 25-h. p. car motors.

Sometime since a laborer on one of the motor cars of the Dublin United Tramways Company jumped from the car while in motion, and in falling was run over and killed by the trailer. Although the jury found that no blame was to be attached to the company or its employes for the accident, objection was raised to the use of trailers. The company has consented to discontinue the trail cars except on special occasions when traffic is excessive.

The development of water powers in Switzerland, particularly those on the Rhine, promise to bring a great boom to the industries in the country. Electric railways are being planned and built between cities and villages, and in some cases these lines connect towns of insignificant population. Not far from Aarau, power stations are being erected to give an output of 16,000 h. p. An electric railway is now being constructed between Aarau, a city of 7,000 population, and Frich, a village of 1,000 inhabitants.

The United States consul at Lourenco Marquez, or as better known, Delagoa Bay, in Portuguese Free State of East Africa, reports that the government has given a 50 year concession to a Belgian syndicate to build and operate an electric railway. Surveys are made for four miles of tracy with overhead trolley. The frdanchise provides that work must begin by July of this year. He further reports that the council of Durban, Natal, is seeking reports of electric railway systems in the United States and Europe with the intention of planning a system for that city, which has a population of over 25,000.

Carlisle, England, has been given power by an act of Parliament to build a system of electric railways. The mayor and council have been investigating the different methods of traction and are very favorably disposed toward the trolley as operated in Dover. The American manufacturers who furnished the apparatus at the latter place will do well to foster this impression by plans and estimates.

The power station for the Sheffield tramways, which has been building since last July, is nearing completion. The first installation will be three 300-h. p. E. P. Allis engines direct connected to 225-k. w. generators.

Further investigation into the transportation needs of Porto Rico leaves no doubt but that electric railways are best suited to the needs of the island. The few railroad lines that are now in operation charge exorbitant rates, over 5 cents per mile for passengers and even higher rates for freight. There are a great number of streams of considerable magnitude which rise in the mountains and make a rapid descent into the sea. These streams provide abundant water power at all times during the year. The island is so small and symmetrical that current could be rtansmitted to all parts when these water powers are developed. In every way the trolley lines would be best fitted to meet the needs of the island, and it is only a qustion of a short time when they will be constructed.

The Dusseldorf & Crefeld Light Electric Railway has been completed and opened for traffic. This interurban line is about 20 miles in length and connects Dusseldorf, a city of 150,000 population, with Crefeld, a city of 110,000, in one of the Rhenish provinces of Germany. For 11 miles between the cities the company owns its right-of-way. The overhead trolley wire is employed throughout the entire length; this together with the other portions of the electrical work was constructed by Siemens & Halske Company. The interurban cars are each equipped with two 35-h. p. motors, and the cars used for local traffic with two 20-h. p. motors. This line comes in competition with the state steam road, and it is necessary to maintain a speed of 26 miles an hour to meet the schedule of the steam road. The construction of the power station and roadbed was commenced in July, 1897, and the rails were laid early in 1898. The electric railway crosses the Rhine on a steel bridge 555 ft. long, which has just been completed at a cost of over $1,000,000.

The history of electric railway projects in Italy was recently given in a well written paper by an electrical engineer named Minarini. The first trolley road in Italy was opened for traffic in Florence in September, 1890, and was a little less than five miles long. In 1892 1½ miles or road were put in operation in Genoa, and in the following year a trolley line was constructed in Milan. The electric railways in Rome were put in service on September 19, 1895, and have grown to be 10 miles in length, but will soon be enlarged to 25 miles. In the same year two systems of railways were built in Turin, one of which uses a mixed system of trolley and storage battery, and the other the trolley and conduit, overhead wires being forbidden in the business districts. Each of these systems is being extended and interurban connections constructed. These lines will be 62 miles long when completed. Suburban lines are now building about Florence under a 50-year franchise. There will be 33 miles of track. Concessions have been granted for 42 miles of electric railways about Genoa and on the Riviera, the franchises extending for 40, 55 and 90 years. It appears from this that the railway companies receive more liberal concessions in Italian cities than elsewhere on the continent, and as a consequence there is great activity although the industrial conditions are not as favorable as in other countries.

REPORT OF THE YERKES ROADS, CHICAGO.

The annual meetings of the North Chicago Street Railroad, the West Chicago Street Railroad, and the Lake Street Elevated Railroad Companies were held on January 10, and the following extracts are taken from the reports submitted for the consideration of the stockholders:

NORTH CHICAGO.

	1897.	1898.
Capital	$6,600,000.00	$7,920,000.00
Passenger receipts	2,818,398.90	2,921,425.10
Other sources	93,153.51	93,897.91
Total	$2,911,552.41	$3,015,323.01
Operating expenses	1,319,926.63	1,390,680.93
Net earnings	$1,591,625.78	$1,624,642.08
Charges, including railway rental, taxes, insurance and interest	636,462.73	543,665.24
Net on stock	$ 955,163.05	$1,080,976.84
Regular dividends paid	791,943.00	870,957.00
Balance	$ 163,220.05	$ 210,019.84
Percentage earned on stock	14.47	13.65
Percentage Operating expenses	46.83	47.60
Passengers carried	56,354,147	58,422,071
Transfers	.....	19,972,589
Total passengers	.....	78,394,660
Miles run	10,644,270	10,916,737
Passengers per mile	5 30-100	5 35-100
Receipts per car-mile, cents	26.5	26.8
Total cars run	677	767
RECEIPTS.		
Cable lines	$1,141,248.78	$1,448,652.50
Electric lines	1,375,638.57	1,456,907.75
Horse lines	20,911.55	15,864.85
PERCENTAGE OF OPERATING EXPENSES.		
Cable lines	47.67	48.00
Electric lines	44.92	46.90
Horse lines	115.26	76.36
COST PER CAR-MILE, CENTS—		
Cable	13.4	13.5
Electric	11.4	11.9
Horse	20.6	25.9

In his report President Yerkes said: "During the last year we have not added any miles to our trackage and have made few improvements, except in the office building, which has been enlarged. There have also been some cars added to our complement. This has been owing to the fact that the management did not feel warranted in spending money for that purpose at the present time. The road, buildings and rolling stock are in first class condition, as has always been the case, it being a matter of pride with our company to have the North Chicago Street Railroad in the best condition possible.

"There are many improvements which could be made to facilitate the carrying of passengers if the city would acquiesce in our suggestions, such as giving us the right to run continuous trolley cars over the cable tracks and places where it is necessary. We are in hopes that they will in time understand the matter more fully and consent to our making these improvements.

"The general business of the country is good and when that condition exists, street railways always partake of their share of the prosperity."

The directors, Messrs. Yerkes, Winston, Lamb, Furbeck and Moore, were unanimously re-elected. During the counting of the ballots Mr. Yerkes made the following statement to the stockholders:

"Recently there has been considerable talk about the crowding of cars. Strange as it may seem, the newspapers have given circulation to the criticisms against the company, but have failed to give our reply. In answer to the complaints by the city and to the communication of Mr. McGann we sent out a reply, although the charge was made that we neglected to do so. That reply, in which we gave the reasons for the crowding of the cars, was not given circulation by the newspapers. In that reply we show that if the city were willing to give the public the same facilities this company provides there would be no crowding.

"The case presented is just like this: On the one hand the city finds fault with the facilities afforded the public, while on the other hand the city authorities are not willing to extend the means to make these advantages possible. I suggested in that reply the extension of the electric lines on Clark and also on State street, so as to permit of continuous connection with the limits. Various other recommendations are made to do away with the crowding, and we could have given more reasons, but we thought those sufficient for the purpose. Nevertheless, I hope the city authorities will soon realize the need of these things and grant them. This road offers more to its passengers for 5 cents than any other line in the world, and the generosity of the roads in Chicago to their patrons is a matter of world-wide knowledge."

WEST CHICAGO.

The president's report contained the following statements: "The total receipts from passengers and all other sources were $4,031,903, which is an increase over the year previous of $131,983. The total operating expenses were $2,017,946, being an increase of $88,282 The total profit from operating was $2,013,957, an increase of $43,703. From that are to be deducted the fixed charges, which include interest, taxes and rentals of leased roads, of $1,198,000, leaving $815,956 as profit for the 12 months. From this amount there were dividends paid amounting to $791,340, leaving a balance to the credit of income account of $24,616. There were carried on all the lines, including full fares and transfers, 111,916,319 passengers, showing that the receipts a passenger carried were 3.55 cents.

"The business of the company is increasing, more particularly in the last few months. The competition of the elevated roads is being felt less than at any time in the past. From evidences which we have in regard to the increase of travel, both on the surface and the elevated roads, it would appear that the West Side is keeping well up to the measure of progress that is being made on the other two sides of the city, and it is a matter of regret that the increased demand cannot be met by the street railroad companies owing to insufficient legislation, as business generally is extremely prosperous, and it looks as if we might expect a considerable increase in our receipts for the coming year."

Mr. Yerkes also said: "The addition of capital to the company has not resulted in an increase of our earnings. That is to say, the dividend that we receive on our stock has not been increased by the fact we are running cable and electric cars. We are not making as much money on the amount invested today as we did when we ran horse cars. The reason is that we did not carry the people so far—did not give them so much for their money."

In answer to a question by a stockholder the portion of transfers actually issued which could be demanded by the public as a right was given as 6 per cent. The total number of transfers on the West Side lines was 31,000,000, reducing the receipts per passenger to 3.55 cents.

LAKE STREET ELEVATED.

The report of President Louderback contained the following statement:

	1898.	1897.	Increase
Gross business from passengers	$618,326	$561,370	$56,955
Advertising, etc.	15,077	18,589	*3,512
Totals	$633,403	$579,960	$53,442
Operating expenses	324,947	329,124	*4,177
Extraordinary expense	.....	31,880	.....
Net earnings	$308,456	$218,956	$80,500
Fixed charges, including taxes, interest on floating debt, and loop rental	335,147	291,798	43,349
Deficit	$ 26,691	$ 72,842	*$46,151

*Decrease.

Average passengers a day for 1897, 30,766; for 1898, 33,948.

The operating expense per cent of earnings was 51.27 for 1898,

as against 56.75 for 1897. Having regard to which the following may be of interest:

	1897.	1898.
Loop rental	$15,707	$61,953
Maintenance of track	7,104	9,534
Maintenance of cars and motors	26,552	27,511
Totals	$49,363	$99,000

The entire rolling stock has been painted and given a thorough overhauling during the last two years, and the property of the company has been well maintained throughout.

By a recent ordinance passed by the town board of Cicero, the Lake Street Elevated is to be extended 1,000 ft. west where an incline will be built to the street surface, and necessary surface lines built, so that by April 15, 1899, the company's cars can be run to the west line of Cicero.

BROOKLYN MAIL CARS.

The street railway companies in Brooklyn were among the first to carry mail for the government. After a contract had been awarded to the Brooklyn Heights Railroad Company several special mail cars were built. They had 32 ft. bodies and were divided into two compartments; one for the mail and the other half was closed, with seats on either side of a center aisle for passengers. This arrangement proved unsatisfactory, for patrons had an aversion to this type of car and would wait for one of the regular passenger cars. In many cases these cars were mistaken for mail cars exclusively, and at other times when a car would be behind time with the mail it would have to stop to take on passengers.

President Rossiter decided that the best service would be rendered by cars used for mail exclusively and turned the problem over to D. S. Moffatt, superintendent of the Brooklyn Heights shops The new mail cars were reconstructed from old passenger cars as shown in Fig. 1. They were 16-ft. cars and had been in service for 10 years or more. On each side of the car a part of a panel was cut out and a door put in to receive and discharge the mail sacks. The front door of the old car was removed and a panel put in with one small window. The window on each side of the front door was replaced by a panel bearing the insignia of the government. At the rear end the doors were taken out and a swing door built in. Fig 2 shows the completed mail car as reconstructed. The car is painted white with gold lettering. As may be noticed the car is mounted on a Peckham truck. The trucks so used were among the first put in service under the electric cars in Brooklyn and are now practically as good as new.

Fig. 3 gives an interior view of the front or working end of the car and shows a rack for holding mail sacks, sorting table and pigeon-holes for letters. At the other end of the car there is provision for a wash basin, water cooler, locker and room for chairs. The car is finished in ash throughout and is lighted by three clusters of three lamps each, suspended from the roof of the monitor, and four separate incandescent lamps. The motorman and conductor will have the uniform of the United States postal service. The old combination mail cars are being changed into passenger cars, the side doors have been taken out and paneled, and the mail compartment is furnished the same as the other compartment with seats and an aisle extending the length of the car.

FIG. 3 INTERIOR OF BROOKLYN MAIL CAR.

STREET RAILWAY FRANCHISE IN HAVANA.

After considerable legal difficulty the title to the Urban Ferro Carril lines, of Havana, has been secured by an American syndicate headed by G. B. M. Harvey, the price paid being $1,472,000. Others interested in the deal include H. P. Whitney, F. S. Pearson, Senator James Smith, of New Jersey, Hanson Brothers, of Montreal, J. W. Todd, of London, and the Banque Internacionale, of Paris. Plans are now formed for equipping the lines for electric traction, and F. S. Pearson, chief engineer of the Metropolitan Traction Company, will go to Havana to take charge of the construction work. Percival Farquhar, who was successful in negotiating the deal, will be the manager.

On the Meriden (Conn.) Electric Railroad only one passenger was injured out of nearly 1,500,000 that were carried during the year.

FIG. 1—OLD PASSENGER CAR RECONSTRUCTED FOR A MAIL CAR IN BROOKLYN. FIG. 2.

COAL WAGONS FOR BOILER ROOMS.

Two very convenient forms of wagons are here illustrated for conveying the fuel from the coal pile or bins to the boiler furnaces, and they are designed especially with the view of easy running and convenience in shoveling the coal. The wagon shown in Fig. 1 is made to carry from 1,200 to 2,000 lbs. of coal. The wheels are 19 in. in diameter with wrought iron spokes, and the wagon has a wrought iron fifth wheel, 14 in. in diameter. The wheels are all provided with ball or roller bearings, as may be designated. The underwork is of wrought iron, and the body of the car is made of 3-16 and ¼-in. hard finished steel fastened on the corners with 2-in. angle iron, reinforced around the top edge with a flat bar. The door is hung on hinges, making it convenient to shovel the coal from the wagon into the firebox. All rivets are countersunk on the inside so as to offer no obstruction when removing the coal.

The car shown in Fig. 2 has heavy plate cast iron wheels and the car body is nearer the ground. On account of the radial trucks the cars can be turned in a very small space. The standard capacities are 1,000 lbs., 1,500 lbs. and 2,000 lbs., although they are also made in smaller sizes. These wagons have been used with success in many of the large stations in New York city and Philadelphia. They are made by the Atlas Bolt & Screw Company, of Cleveland, O.

FIG. 1 COAL WAGONS, ATLAS BOLT & SCREW COMPANY, CLEVELAND.—FIG. 2.

CANADIAN NOTES.

The Quebec-Montmorency & Charlevoix Railway Company will apply at the next session of Parliament to change its name to the Quebec Railway Light & Power Company; to ratify and confirm the purchase of the property and franchise of the Quebec District Railway Company and the issue of bonds and stocks made to pay for the purchase of the road; and to authorize the building of a line of railway in the counties of Levis, Bellechasse, Dorchester, Beauce and Lotbiniere; to ratify the purchase of the property and capital stock of the Montmorency Electric Power Company, and for other purposes.

The Sherbrooke Street Railway has been purchased by Frank Thompson & Co., bankers and financial agents of Sherbrooke. They have also acquired the Brompton Falls water power which will enable them to extend the line and increase the number of cars, which could not be done with the present water power. This railroad was opened about a year ago, and the earnings have been very satisfactory, exceeding the expectations of the company. There are now six miles of road in operation, and it is now probable that the line will be extended to North Hatley and other outside points.

The Cataract Power Company has asked Engineer Hillman to survey two direct lines from Hamilton, Ont., to Guelph and Berlin for a fast electric railway service. The proposed lines will run from a point on James street in Hamilton to and along Burlington Heights, thence over the old canal, and will follow in some respects the original radial railway survey to the top of the Flamboro escarpment, and be as straight as possible. Once over the hill the road will fork, one line leading direct to Guelph, through Millgrove Freelton, Aberfoyle, etc., and the other through several villages to Galt, Waterloo and Berlin. No bonuses will be asked for and the most direct lines that can be laid down will be used.

The St. Catharines & Niagara Central Railway has again changed its application to Parliament for permission to change its name to the Niagara Falls, St. Catharines & Toronto Railway Company and to extend its line to Port Dalhousie on Lake Ontario and to the city of Hamilton. The negotiations for its purchase by an American syndicate and converting it into an electric road commenced some time ago. The government inspector on account of the condition of the road prohibited traffic upon it and the bondholders disposed of it to Mr. Neelon of St. Catharines for $35,000 subject to prior liens of $15,000. Ten per cent of the money was paid into court and the time for the payment of the balance extended. This expires next week and a further extension will be asked and in all probability conceded, to allow time for the consummation of the present deal and the amending of its present act which will enable it to make connections at Port Dalhousie with all lines of steamboats to Toronto and all points down the St. Lawrence and at Hamilton with the T. H. & B. and C. P. R. and a number of projected radial lines. The purchasers are Messrs. S. B. Colon, treasurer, of New York, J. A. Powers of Albany, Hon. C. D. Haines of New York and others.

AN EXCLUSIVELY STREET RAILWAY SUPPLY HOUSE.

The firm of McGill & Pomeroy, which is the only exclusively street railway supply house in Chicago, has made every preparation for meeting the heavy demand for such goods that will undoubtedly come as soon as the weather permits the many companies now contemplating building to commence operations. The firm has taken the whole of the store at 317 Dearborn street, Chicago, of which it formerly occupied only a portion, and has ample storage space for carrying a complete line in stock, so that shipments can be promptly made.

A full line of street railway supplies of every description is carried in the Chicago stock. The firm handles the Ohio Brass Company's line material, Cutter Electric & Manufacturing Company's I-T-E circuit breakers, the Bradford Belting Company's "Monarch" insulating paint, and other such standard products.

Both Mr. McGill and Mr. Pomeroy have demonstrated their ability in the railway supply business and we predict continued success for them during 1899. E. R. Mason, who "before the war" was with the Mason Electric Equipment Company, of St. Louis, is now with this firm. Mr. Mason served on the U. S. S. Cincinnati.

THE CHICAGO PLANT OF THE GRIFFIN WHEEL COMPANY.

Chicago can boast of having the largest car-wheel works in the world, that of the Griffin Wheel Company, located at Sacramento avenue and the Chicago & Northwestern Railway. The plant covers over 15 acres of ground and a general idea of the extent of the works can be gleaned from Fig. 1. This is the view presented looking towards the east as one enters from Sacramento avenue. The distance from the extreme left to right is 1,050 ft. In the right-hand corner is shown the company's new office building completed some six months ago. The office is 48 by 62 ft., of red pressed brick with stone trimmings, two stories high and of fire-proof construction. On the first floor are the offices of the local manager, storekeeper, timekeeper and shipping clerk; while on the second floor are the offices of the managers, second vice-president, secretary, consulting engineer and general bookkeepers.

FIG. 1 GRIFFIN WHEEL WORKS, CHICAGO.

The foundry as originally built in 1891 had a capacity of 750 wheels per day. Additions have been built within the past four years until now the daily output is 1,060 wheels per day; this output has been maintained for the past 12 months, and plans are now being perfected to increase this to 1,500 wheels per day.

The main foundry is 400 by 320 ft. directly back of which and connecting therewith is the charging and cupola building which measures 60 by 200 ft. In this building are located three cupolas with a melting capacity of 300 tons daily. All material is handled by elevators from the lower floors and yard to the charging room. The molding room contains 43 floors; all ladles, etc., are moved about by means of overhead tracks, while all the cranes are fitted with penumatic hoists for the handling of molds and wheels.

The annealing pits are located at the west end of the main foundry and take up a space 360 ft. in width. Wheels after being cast are placed in these annealing pits for a specified time and are then taken to the cleaning and shipping room, shown in Fig. 2. Directly south of the cleaning room is located the storage platform for new wheels, Fig. 3. This platform is capable of holding 10,000 wheels; additional storage platforms are located to the west. The yards contain 2½ miles of side track, with direct connections to the Chicago & Northwestern Railway and the Chicago, Milwaukee & St. Paul Railway. The machine shop is 75 by 140 ft., and is equipped with all modern appliances for boring and pressing wheels on axles, improved lathes for turning and key-seating electric motor axles. Adjoining the machine shop is a complete pattern shop, where all wheel patterns are made not only for the Chicago plant, but also the branch plants of the company. The pattern room and laboratory are located in a fire-proof building 36 by 60 ft. directly to the west of the machine shop.

In addition to the above buildings are the engine and boiler house 75 by 60 ft., the core room, where all cores are made; two large sand sheds, coke sheds, carpenter shop, etc. Surrounding the foundry to the north, east and south are extensive storage yards for pig iron, old wheels, etc. In the southeast corner of the grounds is a large pond, furnishing water to the steam plant and affording ample fire protection. A thorough system of water pipes encircles the works and at intervals are located hose houses fitted with Prescott automatic reels. Extensive improvements have been made in all departments during the past year, a great many new tools of special design have been purchased, and every preparation has been made to anticipate the increased business for 1899.

FIG. 2—SHIPPING ROOM.

FIG. 3—STORAGE PLATFORM FOR 10,000 WHEELS.

The Chicago plant is at present casting about 200 wheels per day for electric motor and street railway service. Aside from the Chicago plant, the Griffin Wheel Company owns and operates car wheel foundries at Detroit, St. Paul, Denver and Tacoma.

TOLEDO UNION DISBANDS.

The union of the employes of the Toledo Traction Company has been disbanded and the property of the local association was turned over to W. D. Mahon, president of the Amalgamated Association of Street Railway Employes of America, of which it was a branch. The local union was organized on August 13, 1895.

PERSONAL.

Max Berg, of the Ohio Brass Company, called on the REVIEW on his recent trip to Chicago.

George A. Paul, superintendent of the Southwest Missouri Electric Railway, Webb City, Mo., has resigned.

G. J. Nitsche, who for nine years has been electrician of the City Electric Railway, Decatur, Ill., resigned January 1.

Charles J. Mayer, of Mayer & Englund, Philadelphia, was a REVIEW caller when in Chicago just before the new year.

Albion E. Lang, president of the Toledo Traction Company, was a caller on the REVIEW when in Chicago on Christmas week.

James Partridge, of the Partridge Carbon Company, Sandusky, O., was among the REVIEW callers shortly after the first of the year.

Forbes Holton and W. J. Kenney have been chosen president and secretary respectively of the Charleston-Mattoon (Ill.) Street Railway Company.

Maj. Clay Stacker, who has been superintendent of the Electric Street Railway Company, of Clarksville (Tenn.), since 1896, resigned on January 1.

M. D. Thatcher, president, and the other officers of the Pueblo (Col.) Electric Street Railway Company were re-elected at the annual meeting in December.

President Frank H. Dewey and the other officers of the Consolidated Street Railway Company of Worcester, Mass., were re-elected at the annual meeting in December.

James V. Thompson, who has for 41 years been foreman of the Gilpin County (Col.) Tramway, has resigned, and William S. Wells of Denver has been appointed to succeed him.

Charles A. Wilson, superintendent of the Prospect Heights & Glen Oak Railway Company, Peoria, Ill., was on Christmas presented with a handsome oak chair by the employes.

T. H. Anderson has been elected general manager of the Somerset Traction Company, of Skowhegan, Me. Heretofore the president, Gen. R. B. Shepherd, has held the title of general manager also.

J. C. DeLong, who has been the successful manager of the Sedalia (Mo.) Electric Railway, Light & Power Company since last May, when the present owners acquired the property, has resigned. He was succeeded temporarily by Robert Hamner.

Francis E. Drake has been appointed director of machinery and electricity for the United States commission at the Paris Exposition. Mr. Drake is well known to street railway and electrical men, having been with the Walker Company for several years.

George Barclay, electrician of the Uniontown (Pa.) Electric Railway Company, recently met with a distressing accident. His thumb was caught between the belt and a fly-wheel in the power station and he was thrown to the floor with such force that his leg was broken.

S. G. Coleman, superintendent of the lighting department of the Milwaukee Electric Railway & Light Company, has resigned. This department was in sole charge of Mr. Coleman and it was built up under his direction. O. M. Rau, chief electrician, will fill the vacancy at least for the present.

Edmund Furthmann, who has been attorney for the North Chicago Street Railroad Company for 11 years, resigned on January 1. Mr. Furthmann was assistant prosecuting attorney under the late Julius S. Grinnell, and was retained by the company on leaving that office when Mr. Grinnell was placed on the bench.

Prof. and Mrs. Sidney H. Short of Cleveland sailed for Liverpool on December 13, and will make an extended trip in Europe, returning in April. Prof. Short has seldom taken vacations, and while he is making this trip for recreation he will doubtless address some of the scientific societies which have invited him to deliver papers on subjects connected with electric railways.

Charles Sheldon has resigned the position of general manager and treasurer of the Consolidated Car-Heating Company, of Albany, N. Y., to become manager of the Chihuahua & Pacific Railroad, with headquarters at Chihuahua, Mexico. Frederick W. Kelley, who has been Mr. Sheldon's assistant, has been appointed general manager and treasurer of the Consolidated Car-Heating Company.

In December the Boston Elevated Railway Company made some changes in its department officers; John H. Studley, superintendent of division 6, has been transferred to the legal department, and succeeded by R. T. Laffin, formerly superintendent of employment; Joseph Dee, superintendent of division 7, was transferred to the department of maintenance of way, and succeeded by H. A. Pasho, heretofore superintendent of division 9.

J. L. Willcutt, secretary of the Market Street Railway Company, San Francisco, had a very narrow escape from death recently while crossing on the ferry-boat Bay City. Just as the boat was entering the dock the walking beam of the engine broke, and portions of the beam and the loose connecting rod struck among the passengers to their consternation. Fortunately none were injured, though Mr. Willcutt and several others had very narrow escapes.

Franklin E. Huntress has been chosen to represent the seventh Middlesex district in the Massachusetts house of Representatives for a third term, the first time a representative has secured a second re-election in that city. Mr. Huntress has been active in politics since his graduation at Harvard in 1889 and equally active in business. He is known in street railway circles from having introduced the Neal electric headlight, which is used by the West End, of Boston, the Metropolitan, of New York, and numerous other roads throughout the country.

With an entire change of ownership in the Quincy, Ill., lines comes the customary change in management, and C. C. Rush of Joliet succeeds E. K. Stone, Jr. Mr. Stone has long been identified with the operation of the Quincy property, of which his late father was also for many years manager. Mr. Stone has made an enviable record, and the local papers speak in highest terms of his work. While he has not yet fully decided as to the future, we feel sure he will not remain long out of the service, and if he concludes to go into other business, it certainly will not be for the lack of opportunities to remain in street railway work.

W. J. Clark, who for years has been manager of the railway department of the General Electric Company, has been appointed manager of the company's foreign department, with headquarters in New York. Mr. Clark thoroughly understands the details of the foreign electrical business and has an extensive acquaintance abroad, which specially fits him to make as great a success in his new department as he did in the old one.

N. C. Draper resigned as electrical superintendent and master mechanic of the Central Railway Company, of Peoria, Ill., on December 27, and on January 1 became general manager of the Joliet (Ill.) Railway Company. Mr. Draper will be remembered by many street railway men as having been with the General Electric Company as constructing engineer, when he built and operated the City Electric Railway, of Decatur, Ill.; the Ottumwa (Ia.) Electric Railway, and roads at Revere and Plymouth, Mass. He has also been at various times connected with the railways at Brockton, Mass.; Newton, Mass.; Providence, R. I., and the West End, of Boston.

OBITUARY.

Dr. Wellington Adams of St. Louis, well known as an electrician and inventor, died of pneumonia on December 20.

Col. I. G. Randle, well known in Texas as a capitalist and street railway promoter, was shot and killed at Dallas on December 19 by H. P. Erwin, of Forney, Tex.

Frederick Culver Whitmore, assistant engineer of the underground and third-rail department of the General Electric Company, died December 7 of typhoid fever at the residence of his parents in Hartford, Conn. Mr. Whitmore was 27 years of age.

William C. Crane, for many years connected with the New Albany (Ind.) Street Railway Company as treasurer before the Kentucky & Indiana Bridge Company secured the property, died at his home in New Albany on January 11, at the age of 73.

Michael J. Burns, who was until a few years ago superintendent of the Citizens' Street Railroad of Indianapolis, died December 20 from the effects of a surgical operation. Mr. Burns was prominent in local politics and was school commissioner at the time of his death.

E. K. Stone, Sr., formerly and for many years general manager of the Quincy Horse Railway & Carrying Company, died November 25, 1898, at his residence in Quincy. He attended the Boston convention with his son, E. K. Stone, Jr., and had a wide acquaintance with those in early street railway work.

R. T. McDonald, president of the Ft. Wayne Electric Corporation, died at Dallas, Tex., on December 24, after a short illness. Mr. McDonald was born in Allegheny City, June 24, 1849, and was of Scotch extraction. When a small boy his family moved to Indiana and he has long been identified with many enterprises in Ft. Wayne. He became interested in manufacturing electrical supplies in 1880, and was not only connected with the Ft. Wayne Electric Corporation and the Ft. Wayne Lamp Company, but was interested in lighting and railway companies in St. Louis, New Orleans, Dallas Indianapolis and New York.

Charles F. Orthwein, one of the leading financiers of St. Louis and associated with Corwin H. Spencer in the purchase of the National Railway Company's street railway lines, died at his home on December 28. Mr. Orthwein was a native of Stuttgart, Germany and came to this country over 40 years ago; he was 60 years of age. The firm of Charles F. Orthwein & Sons is widely known in the west.

FIRE AT ROCHESTER.

At 8 o'clock on the morning of January 1, fire was discovered in one of the buildings of the Rochester Railway used for storing cars, and was quickly communicated to other buildings. Many of the men were at the barns and were able to get out all but 20 of the cars. One corner of the building occupied by the machine shop and tool room was somewhat burned, but the greatest damage here was from water. General Manager Nicholl estimated the total loss at $45,000 to $50,000, covered by insurance. Fourteen cars were destroyed, but the service was not seriously interfered with on that account. The origin of the fire is unknown.

The Des Moines (Ia.) City Railway Company contemplates making a number of improvements at Crocker Woods Park which will add to the attractions of that resort. The theatre is to be enlarged, chutes erected and bath houses and diving platforms built.

What is said to be the shortest street railway in existence has been operated for about a year by the Metropolitan Street Railway of Kansas City, Mo.; it is two blocks long and serves to connect two of the company's main lines. The equipment comprises one car, and the trip from one end to the other takes about one minute.

ECHOES FROM THE TRADE

The executive office of the Electrical Exhibition Company is now located at Madison Square Garden, New York, where the electrical show is to be held May next.

The 1899 calendar of the American Electrical Works, of Providence, R. I., bears a handsome steel engraving of S. F. B. Morse, surrounded by the company's name.

The Weber Railway Joint Manufacturing Company, of New York, formerly located in the Cotton Exchange building, has moved its offices to rooms 1813-1816 Empire building, 71 Broadway.

The Okonite Company, of New York, is sending out an extremely pretty calendar, lithographed in colors, which will prove an ornament to any library or office, and the attractions of which are well qualified to more than last the year.

The Van Dorn & Dutton Company, of Cleveland, O., has remembered its friends and customers with a wall calendar for 1899, which also briefly tells of the trucks, gears, pinions, armature lifts track cleaners, etc., made by the company.

L. A. Chase & Co., of Boston, on January 1 became selling agents for the Pawtucket Brass Company, of Pawtucket, R. I. Chase & Co. are well-known supplymen, and are now in a position to figure on all kinds of overhead material.

Mayer & Englund, 10 South 10th street, Philadelphia, have leased the entire five floors of the building they are in, and will use the basement and first floor for store rooms. The rapid increase in their business has made more space absolutely necessary.

The catalog of the Jeffrey Manufacturing Company, of Columbus, O., entitled "Circular No. 15, Jeffrey Electric Locomotive," is a very handsomely illustrated pamphlet of 40 pages, which gives data on the mining and yard switching electric locomotives built by this company.

The R. D. Nuttall Company has distributed a neat calendar to the trade. One of the standard pinions is illustrated and the inscription, "The Gear Cutters," is encircled by a gear rim. This calls attention to the conspicuous position of the company as successful manufacturers of street railway gears and pinions.

Gustave Suckow, manager of the Vose Spring Company, of New York, reports the business of the company as exceptionally good. Mr. Suckow has been 23 years in the spring business, and he states that while December is as a rule the lightest month of the year, December last was the business month of 1898.

Edward Daniell, superintendent, informs us that the Menominee Electric Light & Power Company, Menominee, Mich., contemplates the purchase of one 300-h. p. engine, one 100-k. w. 500-volt generator, 60 ft. of 5½ in. shafting, with sundry clutches, couplings and pillow blocks, and 11 clutch pulleys of various sizes.

The Link-Belt Machinery Company, of Chicago, has published a new edition of its Catalog No. 24, which is entitled "Modern Methods," and is an exposition of modern methods of handling raw and manufactured products and of transmitting power. It is a profusely illustrated book of 300 pages which covers the subject well.

John B. Wallace, general manager of the Wallace Electric Company, 1506 Marquette building, Chicago, January 9 filed a petition in voluntary bankruptcy, declaring his debts to be over $236,000. No assets are mentioned. This company did a large business and was the western representative of a number of large eastern concerns.

Wendell & McDuffie, of New York, have just sold the Metropolitan Street Railway, of New York, 12 Taunton snow plows. The Metropolitan people had been making most of their plows themselves, and thought their type of plow sufficient for all emergencies. The recent severe storm, however, demonstrated the necessity of something better, hence the order for Taunton plows.

The Whitney Car Wheel Works, of Philadelphia, have resumed the manufacture of chilled wheels at 901 Montgomery avenue. James S. Whitney is manager; Asa W. Whitney, superintendent, and H. F. Hannis, treasurer. The firm has on hand all its old patterns, chills, drawings and the records of orders filled in the last 52 years, and will be prepared to duplicate old orders or fill new ones.

The Bates Machine Company, of Joliet, Ill., has recently placed on the market a new wire nail machine which has more than double the capacity of the other nail machines best known to the trade. On 10d. common nails, for instance, the new Bates machine has an output of from 37 to 40 kegs per 10 hours, as against 14 to 16 kegs for other machines. This extraordinary increase in production is due to the peculiar construction of the machine and its great strength.

The Standard Underground Cable Company, of Pittsburg, has sent to its friends a neat foot-rule and wire gage as a Christmas souvenir. We all remember the company's No. XV Pocket Handbook, received about a year since, which has been of constant use for reference, and the rule promises to be equally useful. The company will be pleased to give gratis the benefit of its 16 years of successful experience to those who contemplate any cable or wire installation.

The Lombard Water Wheel Governor Company reports that the demand for its governors is constantly on the increase. During last month orders were received for upwards of 20 governors to regulate 41 water wheels, which will develop 15,750 h. p.. More than half of this machinery will be used in electric stations—principally in power-transmission plants—and electric railway stations, the balance being in textile and other manufacturing plants driven by water power.

The Chisholm & Moore Manufacturing Company, of Cleveland, O., formerly the Moore Manufacturing Company, of Milwaukee has recently published an 8-page illustrated circular descriptive of its anti-friction differential chain pulley blocks, traveling cranes, trolleys and door-hangers. The differential block of this company was illustrated in the REVIEW for November, 1898, page 846. The company has moved into a new building of its own and is prepared to promptly fill all orders.

The most pretentious calendar we have seen is that of the Falk Manufacturing Company, Milwaukee. It is 20 by 28 in. and intended to hang upon the wall or rest on a library bookcase or easel. It contains a set of six superb photogravure reproductions of masterpieces and a page of text describing the pictures. The name of the company occupies a very modest position at the bottom of the sheets, and the calendar is suitable to adorn the library as well as office. The idea is carried out in a manner at once highly artistic and attractive.

The Creaghead Engineering Company, of Cincinnati, has recently furnished the brackets and line material for the Gadsden & Attalia Union Railway Company, of Gadsden, Ala., which has been changed from steam to electric. The company has also furnished the line material for extensions built by the Knoxville Traction Company, the Birmingham (Ala.) Railway & Electric Company and the Chattanooga Rapid Transit Company. It now has on hand a contract for the line work of the Dayton, Springfield & Urbana Electric Railway.

We are gratified to be able to announce that the "Turner" water tube boilers as made by the Turner Engineering Company, of Bucyrus, O., is meeting with a prompt acceptance on the part of some very critical and extensive steam users. These boilers, which were described in the REVIEW for August, 1898, page 576, are made in various sizes from 100 to 500 h. p. and are being installed in various parts of the country. Among the contracts on hand are two 100-h. p. boilers for the Standard Snuff Company, Nashville, Tenn.; two 500-h. p. for the Midland Steel Company, Muncie, Ind.; three 225 h. p. boilers, piping and stack for the Indianapolis (Ind.) Ice & Cold Storage Company.

The sweeper department of the McGuire Manufacturing Company of Chicago closed the year with the shops working day and night. Among the roads ordering sweepers late in 1898 were: Metropolitan, New York; Buffalo Railway; Citizens, Oshkosh, Wis.; Monongahela, Pittsburg; St. Joseph & Benton Harbor, St. Joseph, Mich; Chicago Electric Traction; Milwaukee Electric Railway & Light Company; Meadville Traction, Meadville, Pa.; Ashtabula Rapid Transit, Ashtabula, O.; Rockford Traction Company, Rockford, Ill.; St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo.; South Bend Street Railway and Indiana Electric Railway, South Bend, Ind.

The Babcock & Wilcox Company has taken from Westinghouse Church, Kerr & Co. the largest stationary boiler order that has ever been placed. The boilers are for the power plant which the Westinghouse Electric Company has contracted to build for the Third Avenue Railroad Company, New York, at 218th street and Harlem river, and which is to be constructed by Westinghouse, Church Kerr & Co. The order covers 60 Babcock & Wilcox forged steel type boilers of 520 h. p. each, or an aggregate of 31,200 h. p. The boilers are to be capable of carrying 200 lbs. steam pressure. They will supply steam for compound condensing engines of 64,000 nominal horse power in the aggregate.

The J. A. Fay & Egan Company, of Cincinnati, O., under date of December 15, announces that as it is exclusively a maker of woodworking machinery, it has decided to discontinue acting as selling agent for other products. The Chicago branch store of the company has been sold to the firm of Manning, Maxwell & Moore, of New York, and they will be the exclusive agents in the Chicago territory for J. A. Fay & Co. and the Egan Company. The sale is to date from November 1, 1898, and settlements on all business previous to that date should be made with the Fay & Egan Company; after that date with Manning, Maxwell & Moore. The company bespeaks for its new agents the same consideration that has been shown to it.

The Clonbrock Steam Boiler Works, of Brooklyn, N. Y., has recently won an infringement suit against the Columbian Steam Boiler Works, with which were connected former employes of the Clonbrock Works. The Columbian boiler was practically identical with the Climax in construction and the defense was lack of novelty; to support this contention the Rogers & Black and the Hazleton "Porcupine" boilers were cited as anticipatory inventions. The court carefully considered these and other inventions, and the opinion is an interesting discussion of boilers of these general types. The court holds that the Climax boiler was clearly infringed. The Climax boiler comprises a vertical shell surrounded by tiers of looped tubes set obliquely, and the whole set over an annular grate and surrounded by a cylindrical casing. It has given excellent results in practice.

The Q & C Company, of Chicago, has just issued its first catalog on pneumatic tools, which is a pamphlet of 46 pages, uniform in style with the other well-known catalogs of the company. The company announces that it has purchased the entire business and good-will of the Ridgely & Johnson Tool Company, Springfield, Ill., and added a pneumatic tool department to its list of special machinery and railway appliances. When purchasing the business of the Ridgely & Johnson Tool Company, a thorough comparison of the various tools on the market was made, and in presenting this subject the Q & C Company deems it perfectly safe to claim that it has a most complete line of pneumatic tools. The list embraces

the lightest of tools for chipping and calking, as well as hammers powerful enough to drive 1¼-in. rivets, or to do any work usually done with an eight or ten-pound sledge. The great characteristic of these tools, and the main claim for their superiority, is simplicity. They are valveless, have but few parts, and no skill or experience is required to keep them at work—points which will be appreciated by all users of pneumatic tools. All tools of each size are perfectly interchangeable, so that any part of one tool will fit another of the same size.

The Westinghouse Electric & Manufacturing Company has closed a contract for 101 large car motors and 125 controllers for the Hanover (Germany) Street Railway Company. The contract was got in the face of fierce German competition.

The Peckham Truck Company has just received an order from the Third Avenue Railroad Company, of New York, for 100 sets of No. 14 B short wheel base double trucks, and 60 No. 14 D 2 maximum traction trucks. These are to be used on the cars on the conduit lines which are now being reconstructed from cable lines.

Theo. A. H. Weinz, sole agent of the Warrenton Woolen Company, and R. M. Bickerstaff, who looks after the western business of the company, were recent callers at the Review office. These mills make a specialty of uniform cloths, and with constant efforts to improve a long and honorable record for high grade materials, are receiving a constantly increasing patronage. Particular attention is given to the requirements of street railway companies.

Elmer P. Morris, 15 Courtlandt street, New York, reports an excellent business with prospects for the coming year better than at any time since the introduction of the trolley. There is a great demand for iron poles and brackets, in fact the factory of which Mr. Morris is the representative, is working day and night on orders. Contracts for trolley wire were larger during the past 30 days than any month in 1898. Assembled commutators, made from drop forged copper, have been in great demand. On February 1 Mr. Morris will open a branch office in Philadelphia in the Betze building.

The Western Electrical Supply Company, of St. Louis, has of late put on the market a number of railway specialties which have the approval of street railway managers. The company's railway business has grown to such an extent that the facilities have had to be greatly increased. It is now in a most favorable position to care for its patronage in a most satisfactory manner. In St. Louis the company carries a very large and well assorted stock of electric railway supplies of every description, and the many specialties which are now offered are worthy of investigation. A neat and complete catalog, devoted exclusively to railway supplies, has recently been published. A copy of this may be had by writing a line to the company. Additions have been made even since this publication, which is an indication that the company is keeping up with the needs of street railways and is receiving an increasing patronage.

The Michigan Electric Company, of Detroit, has had its place of business at No. 101 Woodward avenue, which was completely burned out September 24, 1898, entirely rebuilt, and has utilized the opportunity to have the building arranged in every particular in the manner best suited to the needs of the business, and has just opened with a complete new stock, fittings, etc., a place which the company claims is the handsomest and best arranged electric house in the country. Their first floor is the electric supply store; second floor, general offices; third floor, jobbing stock room, and fourth floor, shop for electric repairs, etc. The company reports a very satisfactory business for 1898, as ever since the fire, it has done almost its usual amount of business and now with new quarters perfectly arranged, a large and varied stock, and a demand more brisk than at any previous time, it counts on making 1899 a year whose business will excel by far that of any previous year.

The Pennsylvania Car Wheel Company reports an interesting incident in connection with the use of car wheels developed on one of the lines of a large street railway company, as follows: It filled an order for 48 wheels, each 33 in. in diameter, and these were placed in service on axles, while on the opposite end of each axle was the wheel of another manufacturer 33¼ in. in diameter, or ¾ in. larger in circumference than the Pennsylvania wheel. These wheels being pressed rigidly on the axle the larger wheel went ¾ in. each revolution farther than the other, dragging it this difference which aggregated 480 in. in a mile. Many of the cars were making 150 miles a day, so that the smaller wheels were dragged 6,000 ft. per day. The remarkable feature of it is that 80 per cent of these wheels are still in service, having in that time made 18,000 miles, each wheel being dragged over 136 miles. Naturally the master mechanic of the company does not care to have his name published as permitting such a practice. However, these results speak well for the wheels of the Pennsylvania Car Wheel Company.

SALE OF THE METROPOLITAN ELEVATED, CHICAGO.

According to the order of the United States court of the northern district of Illinois, the Metropolitan West Side Elevated Railroad Company was sold in Chicago on January 4. The sale was advertised by the master-in-chancery and an upset price of $6,000,000 put on the property. There was but one bid, that of F. T. Olcott, of New York, chairman of the reorganization committee. It is expected that a reorganization will be effected in the next 30 or 60 days. The improvements which are now in progress will be completed and no change is anticipated in operating officials.

CONSOLIDATION IN BROOKLYN.

There are persistent rumors that the Brooklyn Rapid Transit Company, of Brooklyn, N. Y., through Roswell P. Flower, Anthony N. Brady and others of its stockholders and their friends, has acquired control of the stock of the Nassau Electric Railroad, and that the two systems will be consolidated as soon as the necessary papers can be prepared. The deal is said to include both the elevated roads of Brooklyn, and thus would consolidate the Brooklyn Heights, Nassau and DeKalb avenue surface lines and the Brooklyn and the Kings County elevated roads.

The project of an electric road from Lexington to Richmond, Ky., is growing in favor and probably construction will be begun in a short time. The originators of the project are Dr. David Bennett and W. J. Loughbridge.

A new time card has been arranged for the Tri-City Railway Company of Davenport, Ia., by which the service commences earlier in the morning and is continued later at night than formerly. More men have been put on so that the maximum time on duty is reduced to 11½ hours.

John C. Wegner of Milwaukee last month applied to the Kenosha (Wis.) city council for a franchise for an electric railway. Mr. Wegner also wishes to secure the right of way for a road from Kenosha to Waukegan, which connecting with the Milwaukee, Racine & Kenosha and the Chicago & Milwaukee would give an electric line from Chicago to Milwaukee.

At the regular meeting of the Chicago Electrical Association on December 16 the annual election of officers was held with the following result: President, Thomas G. Grier; vice-president, J. M. Hollister; treasurer, Harold Almert; secretary, Cloyd Marshall; directors, F. S. Hickok, E. W. Jewell and Hayward Cochrane. The address of the secretary is 1310 Monon building.

At the annual meeting of the Albany, Helderburg & Schoharie Electric Railway Company, December 21, officers were chosen as follows: President, H. W. Burgett; vice president, B. M. Secor; secretary, W. H. Irwin; treasurer, Charles E. Bibben. The Albany Construction Company, of which W. H. Schermerhorn of Brooklyn is president, has been incorporated to do the construction work, which will be commenced as soon as the weather permits. The company is now ready to let contracts for materials.

H. H. WINDSOR, Editor. F. S. KENFIELD, Business Manager.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 9. FEBRUARY 15, 1899. NO. 2.

We note that "many prominent men have joined the Municipal Ownership League of Illinois," which has for its object the acquisition of street railway properties by municipalities. If the majority of the Chicago council is as corrupt as these "reformers" would have us believe, it would appear that the League is extremely anxious to jump from the frying pan into the fire.

One would scarcely look to Italy for an expression of broad gaged policy among European nations. And yet the Italians are by no means slow, and are granting franchises for electric railways for terms of forty to ninety years. The natural result of this liberal policy has been a marked activity in electric railway construction, entirely out of proportion,—from industrial conditions,—to other continental cities.

At last the Keeley motor fraud has been laid bare. The one solitary feature of his work worthy of mention was the ability of the man to continuously humbug so many people through so long a term of years; and even this cannot be too severely condemned, for it was a deliberate lie without a single redeeming feature. And yet little sympathy can be found for his victims, who thought to get something out of nothing. In the street railway field during the past twenty years there have been many Keeley motors, nor is it probable we are entirely done with them yet. More money has been spent in trying to perfect more such appliances than Keeley ever saw: but it must be said for some of them, their promoters honestly believed in what they had.

The diagrams on the supplement accompanying this issue will be appreciated by street railway men in the operating departments. We have seen similar diagrams in the private note books of electricians, but these have never before been arranged in such a compact and convenient form. All the circuits and connections for each notch of three of the principal types of controllers are graphically shown. They have been developed from car wiring drawings and the paths of the current through the controller contacts, rheostats, motor armatures and fields are indicated as the controller handle is moved and the changes occur in the series and parallel connections. Diagrams can tell a long story in a concise and lucid manner, and so it is in this instance.

In England many cities and towns have undertaken to own and operate their own electric lighting plants and a smaller number to own and operate street railways, and now the authorities seeking permission for similar undertakings apparently wish to enter the electrical supply field. No less than 70 recent notices from local authorities which are going to apply for power to supply electricity ask for permission "to manufacture, purchase, hire, sell, and let meters, lamps, accumulators, dynamos, fittings, plant, machinery, and other matters or things required for the purposes of the order, and to acquire, work, and use patent rights for the producing, storing, controlling, distributing, measuring and using, or otherwise relating to the supply of electricity." The English electrical papers are doing a good work at the present time in calling the attention of the public to the seriousness of thus authorizing municipalities to undertake manufacturing schemes on the credit of the taxpayers.

The extent to which street railways are utilized for transporting United States mails is not so great at the present time as was predicted a few years ago when this service was commenced, but the efficiency of this service shows a remarkable increase. On another page is a statement compiled from the reports for the last three years of the superintendent of the railway mail service of the United States. From this it appears that in 1897 1 street railway mail car with 3.1 clerks made 10.4 trips per day, running 49,086 miles per year, and carried 17,996 pieces of mail and 17.2 closed pouches per day; in 1898, 1 car with 2.8 clerks made 9.7 trips per day, running 43,617 miles per year, and carried 47,227 pieces of mail and 24.3 closed pouches per day. The total miles of cable and electric mail routes having no clerks and handling closed pouches only was 798 in 1897 and 1,304 in 1898; the mileage per annum was slightly less but the number of pouches per day was 40 per cent greater in 1898.

Our friends the daily papers have struck a new lead on us, and as might be supposed in these days of germs, it is what they christen the street car bacilli. The street car family of germs, moreover, is a large and vigorous family including everything from chilblains to consumption. Some of the learned medical men of the east have already found a remedy, if indeed they did not make the remedy first and discover the germs afterwards. All we have to do is to inoculate our cars with the biniodide of mercury, and then fumigate with formaldehyde gas. Managers who really desire to do the work thoroughly will also use a 7,000-volt current on such germs as have survived the two previous treatments. It might also be well to request the passage of an ordinance requiring each passenger on paying his fare to make affidavit he has no germs concealed about his person. All this, with the thorough though old fashioned method still in use of scrubbing with soap and water, should keep the street car what it has always been—a pretty safe place to be in.

A correspondent of one of our English exchanges writes commenting upon the relative danger of German and American competition to British makers. He claims that the Germans maintain low prices because they pay small salaries to their managers and engineers as well as low wages to workmen; it is believed that the salaries of engineers and managers must eventually be increased which will make the cost of manufacture nearer what it is in Great Britain. American competition is regarded with more alarm; he says American makers are now exporting to Germany, machine tools and bicycles in large quantities and are entering the market for iron and steel pipes, fittings, steel rails, bridges, etc., and asks: How can they do it with their high wages and expenses for freight and duty? He further states that he was informed by American firms operating branch factories in Germany which were equipped with the best machine tools and under the direction of their best engineers, but

employing only German labor, that they could not turn out work as cheaply as in their American works.

The reason may be that the American is the best workman, and the best is the cheapest even if the first cost is higher.

The "Electrical Engineer," of London, takes the REVIEW to task for some comments appearing in the December, 1898, issue regarding the comparative safety of trolley circuits of 500 volts and arc lighting circuits of high potential. Had the article in the REVIEW been read with care the criticisms would have been unnecessary, for the statement was not made that lighting circuits of 5,000 volts were carried overhead in American cities. However, it is needless to add that where arc lamps are connected in a circuit there must be some exposure. In the case of the railway electrician who was killed, he was working with the arc lamp and accidentally came in contact with it. The fact that he was not killed at once by such a high voltage is evidence that he would have suffered little danger in coming in contact with a 500-volt trolley circuit, which was the point in our editorial. The expression of thankfulness that England is blessed with Board of Trade regulations, forbidding the nefarious practices of the United States, is amusing, especially in view of the fact that many of the needless and oppressive regulations of the Board of Trade, particularly regarding electric railway construction, have stood as a barrier to progress.

Last month we remarked on the probable scarcity of machinery and construction material for early spring delivery on account of the unusually large amount of new work in sight. During the month copper has strongly advanced, and insulated feeders are likely to go still higher on account of the rise in rubber. Rails are becoming scarce at any price for April and May delivery, and the mills are already talking July and August delivery to inquiring buyers. The car builders are not overbooked now, but another month will undoubtedly see them all full. With a demand equal to or in excess of possible supply buyers will be forced to bid against each other for time delivery, and this will raise prices. The supply houses in all the smaller materials and specialties are doing a land office business, and buyers are already beginning to seek the sellers as they have not done in several years.

New enterprises are being announced every day, and while many of them are the hopes of people who know nothing about electric railways, and are ten years in advance of a paying business, some are legitimate and commendable undertakings which will make good propositions as operating roads. Money is cheap and abundant, and investors are paying more to get into the same deals they turned down less than six months ago, just as was then predicted in these columns.

Roads already built are doing a good business with fine prospects for the largest summer riding ever experienced.

Pleasure resort roads are improving their parks and installing additional mechanical and amusement features. Altogether these are busy days in the street railway field.

The Twin City Rapid Transit Company, of Minneapolis and St. Paul, has begun the substitution of large double-truck cars for the two-car trains, motor and trailer, on its city lines, and has adopted the type of car used on its two interurban lines as the standard. The reasons for this are the economy in operation effected by reducing the item for car service employes, the decrease in accidents which it is expected will result by abolishing trail cars as far as possible, and the preference of passengers for the larger and more comfortable cars.

As brought out in the paper before the Boston convention by Richard McCulloch the use of trailers increases the number of accidents for two reasons; first, because the trailer is another car; and second, the opening between motor and trail car is sometimes a dangerous one for a passenger boarding or alighting from the car. The means of effecting a reduction of the number of accidents to passengers boarding or alighting from cars have been given much attention by the officials of this road, and the radical remedy adopted of at all times restricting the entrance to one end only of the car and protecting that entrance by gates which are open only when the car is at a full stop, has proved an effectual one as shown by statistics published on another page.

The experience of street railway companies in general has been that the use of double truck cars, solely by reason of being larger and easier riding, has created traffic, and this is a good reason for recognizing the preference of passengers in choosing rolling stock.

On the Twin City lines it is found that one of the large cars requires more power than a two-car train, but that the increase of this item is more than balanced by the saving of having only two instead of three men to operate each unit.

In October, 1897, Isaac B. Brown, the secretary of the bureau of railways of the department of internal affairs of the state of Pennsylvania, caused a count to be made of the number of persons passing a given point in the city of Harrisburg in street cars and on bicycles during two days. The figures were published in the Pennsylvania report for 1897, and excited considerable interest as showing that 67.7 per cent of the persons counted were on wheels.

On November 1 and 2, 1898, similar observations were made at the same point and in the report for 1898 these figures for the two years are compared. It is stated that the conditions for riding were about the same in the two years; there was no particular inducement on account of the inclemency of the weather to ride in the cars, and the condition of the streets was such as to make the riding of wheels entirely satisfactory. In 1897 the number in cars was 1,962 or 32.3 per cent of the total; on wheels 4,116 or 67.7 per cent. In 1898 the number in cars was 2,370 or 40.7 per cent; on wheels, 3,449 or 59.3 per cent.

These figures confirm the impression we received last summer that pleasure bicycle riding is on the wane. The number of riders in the Chicago parks was markedly less, so far as a casual observer could judge, than in 1897, and was rather surprising when the rapid and continuous increase in the number of bicycles during previous years was recalled. Two years ago most people were of the opinion that the bicycle had come to stay and that its use would continue to increase as it had for some years. Now it is realized that the high water mark of pleasure riding was probably reached in 1897. The ownership of a bicycle, like the possession of other property, entails care, and more people now think that the care overbalances the pleasure to be got from it.

The bicycle riding of the coming season we think will be for the greater part by those who would otherwise walk, and the loss in fares to street railway companies will be much less.

At a recent dinner of the Chicago Trade Press Association, the largest and most influential organization of its kind in the world, addresses were made by Arthur Woodcock, of the Paris Exposition commission; John W. Ela, of Chicago, and other speakers upon the development of the foreign trade of the United States, in which they strongly urged the necessity of reform in the consular service, and the desirability of having a government department of commerce. The state department has, at the request of this association, secured data from foreign countries as to the governmental departments dealing with commerce, which will soon be published in the consular reports. We have received advance sheets and heartily recommend that our readers and particularly our advertisers secure the report and peruse it carefully.

The remarkable expansion of the foreign trade of the United States within the last two or three years has made a greater number of the American manufacturers and dealers acquainted with the methods pursued by other nations in promoting foreign commerce and in conducting the consular service, and made them more keenly appreciate the shortcomings of our own government in these respects. Consuls are properly business agents pure and simple, charged with assisting their countrymen in conducting business transactions and in collecting statistics on commerce and industries which will be of value in informing home manufacturers and promoting the export trade. The United States consuls are in the majority of instances appointed on the recommendations of ward bosses and county central committeemen; they have neither the ability nor the desire to promote the commercial interests of their country and look to making what they can during a short term of office. The consular reports, which are really good, are not the work of the consuls, but of their clerks, who are generally natives

of the country to which the consul is appointed and hold over from one administration to the next.

No business man would choose his business agents as the United States chooses its consuls and expect satisfactory results. Knowing the conditions, and feeling the results more sharply each year as our export trade grows larger, our exporters should endeavor to secure a remedy. Our congressmen and senators pay greater heed to the business men and manufacturers among their constituents than to any other class, because it is from them the campaign funds must come. Let everyone who has suffered from the viciousness of our consular system make a personal appeal to his representative in congress and the evil will stand a better chance of being soon remedied.

There is a bill now pending in congress which should receive the strong and active support of manufacturers; it provides for an Executive Department of Industries and Commerce. Every nation making any pretensions to civilization, save only our own, has either one or two departments of its government whose scope is industries and commerce. At the present time the work of gathering statistics on commerce properly belonging to such a department, is being carried on by four independent corps under the secretary of state, the secretary of the treasury, the secretary of agriculture, and the commissioner of labor, and notwithstanding these four sets of statistics on the same subjects, it is said that there are none of any practical value.

The electric railway is widening its field, and as each spring time brings its list of projected trolley roads it becomes more and more certain that the electric motor is a competitor of the steam locomotive for traction purposes. During the coming year the prospects are favorable for building more interurban lines than are now in existence, and these frequently parallel or compete with steam railroads. Wherever there are contiguous cities of considerable size there is sure to be a plan for connecting them by a trolley line. Practical railway men who have built roads and are officers of street railway companies are quietly looking over every field and are planning interurban lines which will be quickly constructed and soon become paying properties, and for this reason the new electric railway construction is on a healthy basis.

The return of prosperous times is not the only cause of trolley lines extending in every direction. By experience it has been shown that a trolley line can be constructed, maintained and operated at less cost than a steam line. Steam railroad engineers have been very reluctant to acknowledge that the locomotive could be replaced by the electric motor with greater economy. For elevated railway service they argued that the cost of maintaining the electrical equipment would equal the maintenance of the locomotives, and whatever saving there might be from energy being generated in a central station would be lost in transmission. Whatever may be said pro or con on the subject, the financial report of the South Side Elevated Railway Company, of Chicago, for the past year is the strongest argument which can be set forth in favor of the electric motor. Under practically the same conditions of traffic and operation the percentage of operating expenses to receipts was reduced from 84.7 in January, 1898, when steam locomotives were in service, to 55 per cent in December, 1898, when electricity was the tractive power. Such a record as that cannot be answered by any theoretical arguments against the electric motor. This demonstrates that for heavy, and frequent passenger service over comparatively short distances, the motor has a great advantage over the locomotive.

A case in which the conditions were diametrically opposite is that of the interurban line near Wilkesbarre, Pa., which is described elsewhere in this issue. One terminus of the line is at a town of about 3,000 inhabitants and the other at a popular pleasure resort, the line passing through several villages, the largest of which has only 500 population. At the other terminus connection is made with the street railway system of Wilkesbarre, a city of about 40,000. This line, 12 miles in length, was operated for some time as a steam road, but was a losing venture. Progressive street railway men came in possession of the property and equipped it for electric traction. One item alone is sufficient to set forth the relative merits of steam and electricity. During the past month of steam operation the coal bill for the two locomotives was just five times the cost of coal for the power station during the first month of motor car operation; furthermore, a better and more frequent service was rendered. This line is also an excellent example of the various advantages of high voltage transmission. The power station could be located at one terminus of the 12 mile road, which effected a very great saving in the fuel bill; no feeders were necessary, and the combined cross section of the three alternating current transmission wires is less than a No. 1 wire, making an enormous saving in copper. The transmission is at 8,000 volts, and the drop or loss on the lines is less than on many short city trolley circuits.

The alternating current has successfully passed through service tests and has greatly augmented the possible length of electric interurbans. Between the two extremes described above there are other railway conditions which can be met better by the trolley than by the locomotive. While we are not sanguine enough to say that the best days of the locomotive are over, it is our firm conviction that the greater development in the future will be in the line of electric railway engineering.

CONFISCATION OF PROPERTY.

Under the above caption the Cincinnati "Enquirer" comments on the demand made by some unreasonable citizens of that place for further and impossible performances on the part of the road. The tenor of the article is so unlike the usual newspaper attitude we copy it, as follows:

The Cincinnati Street Railway Company has spent about $12,000,000 in rebuilding its entire lines and in making extensions. A large share of these $12,000,000 went directly into the streets on which the company's tracks were laid. In numerous instances the streets were relaid from curb to curb either with granite or asphalt, thus contributing millions of value to the city, and in no way enhancing the value of the company's property. Extravagant as was this cost the company had to bear it. Moreover, this company has been loaded down with tax burdens, such as the 5 per cent on gross receipts and the $4 per lineal foot on each car, as no other street-car system in the world is loaded. To insist now on its again tearing up the streets and rebuilding its lines by putting its trolley wires under ground, and so spending another $12,000,000, would practically insist on the property being confiscated. If the company were compelled to spend that sum now it would have to issue bonds, and to pay interest on those bonds would leave no money for dividends, which would destroy the value of the stock, and that would be confiscation. But this is not all, and is not the worst of it. Should the company have this burden forced upon it, its enormously increased fixed charges that would follow as a result, it is claimed, would make cutting down the wages of every one of its employes inevitable. It could not pay the wages it now pays, for it would not have the earnings above its fixed charges with which to pay them. Do the people of Cincinnati want this kind of result? Did any city in the world ever profit by the cutting of the wages of its laborers or by the bankruptcy of its most prosperous corporation?

AN ECHO OF THE LONDON, ONT., STRIKE.

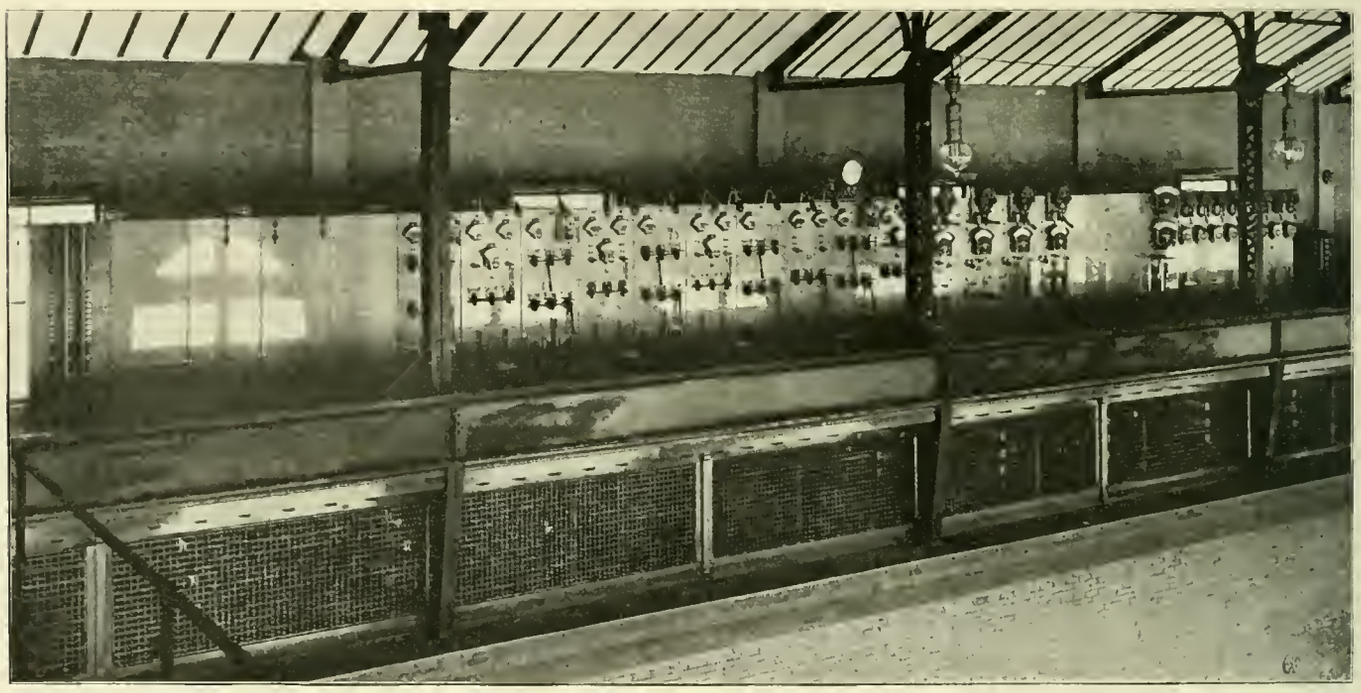
The city of London, Ont., is likely to pay dearly for its passive assistance to the striking employes of the London Street Railway Company. Writs of summons against the corporation of the city have been prepared at the instance of the railway company in a suit for damages arising from the recent strike. The chief grievance of the company was the action of the city council in denouncing the company at one of its meetings and upholding the prospective strikers. The claim is made on the grounds of "inciting riots, causing damage to the plaintiffs and for neglect and breach of duty." The suit is for $20,000 damages.

On January 19, a cable oiler was severely burned as the result of an explosion in a cable pit of the Presidio & Ferries Railroad, San Francisco. He had entered the pit, which is 25 ft. by 50 ft., to oil the pulleys and on striking a match to light a gas jet as usual, the explosion followed. It was found on investigation that the cable had been rubbing against a gas pipe and had cut it about half off.

Power House and Shops of Twin City Rapid Transit Company.

Description of the Water Power Plant at St. Anthony's Falls — Method of Distributing Current — Changes Effected in Old Stations — Description of the General Shops of the Company and of the New Car Shops — Standard Double Truck Car for City Use — How Accidents Have Been Reduced by Gates and Fenders.

The Twin City Rapid Transit Company was chartered in June, 1891, under the laws of New Jersey, but the three companies which it controls, the Minneapolis Street Railway Company, the St. Paul City Railway Company, and the Minneapolis, Lyndale & Minnetonka Railway Company, are much older. The men who are now managing this company were interested in the street railways of the Twin Cities before the motive power was electricity and were pioneers in electrical working. Thomas Lowry, the president, was among the first to recognize the future of electricity in the street railway field, and though he had decided upon a cable system and purchased large quantities of material, did not hesitate to change his plans and use the newer power. C. G. Goodrich, the vice-president, has been connected with this system for over 20 years, and W. J. Hield, the general manager, for nearly 12 years. Both have been untiring in their efforts to develop the business, and the success achieved crowns the work. The auditor of the company, John F. Calderwood, is well known to the street railway men of the country through his connection with the Street Railway Accountants' Association, of which he is president, and as a member of its committee on a standard system of accounts.



VIEW OF SWITCHBOARD.

At the present time the company operates about 240 miles of track. Since acquiring the St. Paul & Suburban road it has all the street railways in and connecting the two cities and their suburbs. The various lines are shown in the map of the system published herewith. The equipment comprises about 1,000 cars, of which over 600 are motor cars. The great majority of the cars are run in one direction only, Y's being provided at all terminals, and hence have but one controller. The exceptions are cars put on intermediate sections of lines where there is a heavy local traffic during portions of the day; on these lines cross-overs are provided and the cars are run back and forth without turning.

Double truck cars are favored because they are more popular with patrons and cheaper to operate under the conditions which obtain, and, it is believed, are also cheaper to maintain. The large cars are heavier and require more power, but the capacity is greater and the increased cost of power is more than compensated by the saving in trainmen's wages. A single large car will replace a small car and trailer, dispensing with the need of one conductor. This reduction of one-third in the item of wages, about 40 per cent of the operating expense, permits a comparatively large increase in the item of power, which is only about 15 per cent of the total. Also by substituting one car for a two-car train the number of safety gates is reduced. As fast as possible the old cars will be superseded by new ones of the standard type.

One year ago the power used by the company was generated at three separate stations, two of which, known as Nos. 1 and 2, were in Minneapolis and one, No. 3, in St. Paul. The aggregate power of the engines then in use was 10,500 h. p. The plant of the St. Anthony Falls Water Power Company was first put in partial operation January 1, 1898, and was in full operation by February 19, 1898, since which time the old No. 1 power station has been run but 11½ hours, and No. 2 has been abandoned. It was not intended to entirely supplant No. 3 station by the water power plant, and this station still carries a portion of the regular St. Paul service.

The power station of the St. Anthony Falls Water Power Company is located on the north side of the Mississippi river, at the end of the company's dam, which is commonly called the lower dam. This company owns all of the St. Anthony's Falls water rights, and years ago built the upper dam and leased power to the various mills located on both sides of the river at this point. The fall at the upper dam is 48 ft., and when the lower dam was built its height was limited by the necessity of not interfering with the water power of the mills above. At the lower dam the available head varies from 16 ft. to 21 ft., depending on the stage of the river; the average available acting head is 19 ft. The location of the plant is shown in the accompanying map.

As seen from this map the building is a part of the dam; it has foundations of cut granite and walls of hollow tiling, with sandstone

trimmings. The building from outside to outside is about 250 ft. long by 100 ft. wide. The northern portion, constituting the wheel pits, has walls extending 20 ft. above the flood level (which is the same for the wheel pits as for the generator room); this portion is 44 ft. wide, inside measurement. The generator room is about 48 ft. wide at the floor, but the north wall of this room is built over the wheel pits so that a gallery 12 ft. wide is formed at one side. In this gallery are placed the switchboard and transformers. The office of the electrical engineer of the Twin City Company, Edward P. Burch, is also located near the front end of the gallery. From the floor of the generator room to the top of the side walls is 34 ft.; to the ridge of the roof, 45 ft. The roof is of slate, supported on steel trusses. A 40,000-lb. crane, built by Pawling & Harnischfeger, of Milwaukee, travels the entire length of the building.

The dam, as shown in the map, extends in a northeasterly direction, almost parallel to the 10th avenue bridge, for a distance of 400 ft., and then turns at an angle and runs parallel to the northern shore for 544 ft.; at the southern end is a log sluice and near the power house are two bear trap waste gates. The dam is built of cut lime stone laid in concrete cement. To protect the shore a retaining wall, also of granite, was built from the east end of the station to a point opposite the angle in the dam.

The so-called bear trap gates consist of two aprons pivoted at their lower edges and inclined toward each other. One, the lower or down-stream apron, is shorter than the other, which is the gate proper, and has rollers along its upper edge against which the upper apron rests. To raise the gate water is admitted to the space between the two aprons, through a by-pass under the up-stream apron, and forces the two gates up. To lower the gates the upper by-pass is closed and a by-pass connecting the space between the aprons with the water below the dam. As the water flows out from under the aprons they fall, and when completely open the two lie flat, one over the other. The gates at the south end of the dam are three vertical gates operated by screws with ball-bearing nuts. These are operated by a small water wheel.

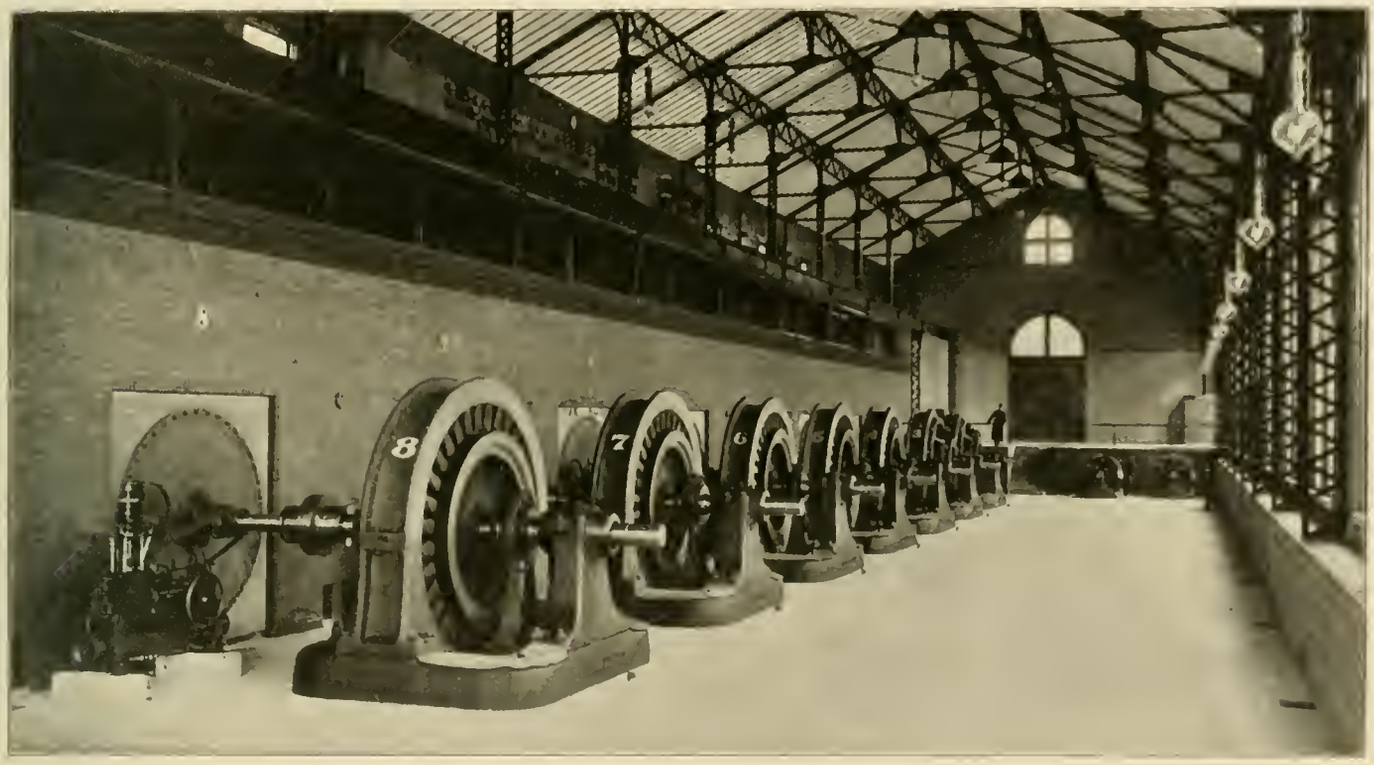
There is also a wing dam extending from the power house side of the bear traps down below the abutment of the Minneapolis Western Railway bridge, which crosses just east of the power house. This wing dam serves to keep the tail-race clear and protect the power house.

In the main wheel chamber are 14 pairs of 42-in. horizontal water wheels, made by the Stilwell Bierce & Smith-Vaile Company; they are of the Victor type. Under the head available these wheels are guaranteed to develop 250 h. p. each. They are mounted in pairs and two pairs coupled, making four 42-in. wheels driving each of the seven generators now installed. At the east end of the power house, in a smaller wheel chamber, are two sets of wheels made by the S. Morgan Smith Water Wheel Company.

The governors were made by the Lombard Water Wheel Governor Company, and seven of them are now installed.

The machines installed now comprise five 700 k. w. three-phase General Electric alternators, with 32 poles, running at 130 r. p. m., giving a frequency of about 35; two 700-k. w. G. E. 8 pole direct current generators, wound for 575 volts at no load and 600 volts at full load; and two 100 k. w. six pole exciters running at 280 r. p. m., giving 575 volts at no load and 600 volts at full load.

The switchboard is of Vermont marble, with 28 panels, six of which are now blank for the machines not yet installed. The plant was built to contain ten 700 k. w. machines. A good idea of the size and extent of the switchboard may be had from the illustration. The station panel is fitted with one 750-volt illuminated dial Weston voltmeter and one 2,500-ampere, 600-volt Thomson recording wattmeter. The alternating current panels are each equipped with one 200-ampere, dead-beat, inclined coil ammeter, one 5,250-volt voltmeter, one generator rheostat, one high-voltage main switch with porcelain chamber, two single-pole field switches, one two-point phase lamp switch, two pilot lamps, one phase lamp, one potential plug, one 700-k. w. single-phase indicating wattmeter and three fuse blocks.



INTERIOR OF POWER HOUSE.

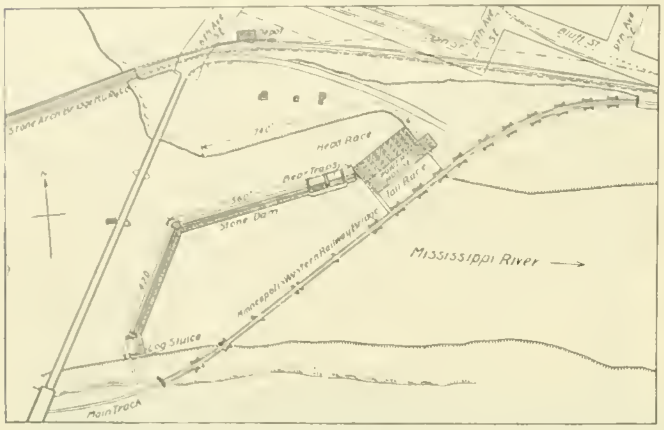
There are five alternating current feeder panels, each fitted with one 200-ampere, 3,500-volt three-phase Thomson recording wattmeter, three porcelain-chamber, high-voltage coupling switches, one pilot lamp, six busbars at the back, one single-phase indicating wattmeter of 700 k. w. capacity, and three fuse blocks.

The panels for the two continuous current generators are each equipped with one 1,200-2,000 circuit breaker, one 2,500-ampere illuminated-dial Weston ammeter, two single-pole, double-throw main switches, one two-way field switch, one potential plug, one pilot lamp, one resistance lamp and two busbars at the back.

The two exciter panels are next the generator panels and have

each one illuminated dial Weston voltmeter, one Weston ammeter of the round pattern, one rheostat, two single-pole, double-throw main switches, two single-pole field switches, one automatic circuit breaker and two busbars at the rear.

Each one of the railway feeder panels has mounted upon it two



MAP OF DAM.

300-500 ampere circuit breakers, two 200-ampere Weston ammeters of the round pattern, one pilot lamp, two single-pole main switches, and there are two busbars at the back.

One panel of the switchboard is designed for the purpose of taking care of static discharges. Two divisions are for the 3,500-volt circuits and the third for the 12,000-volt circuit, the latter having a greater number of discharge gaps and more graphite resistance; otherwise, it is the same as the other two. These are connected to

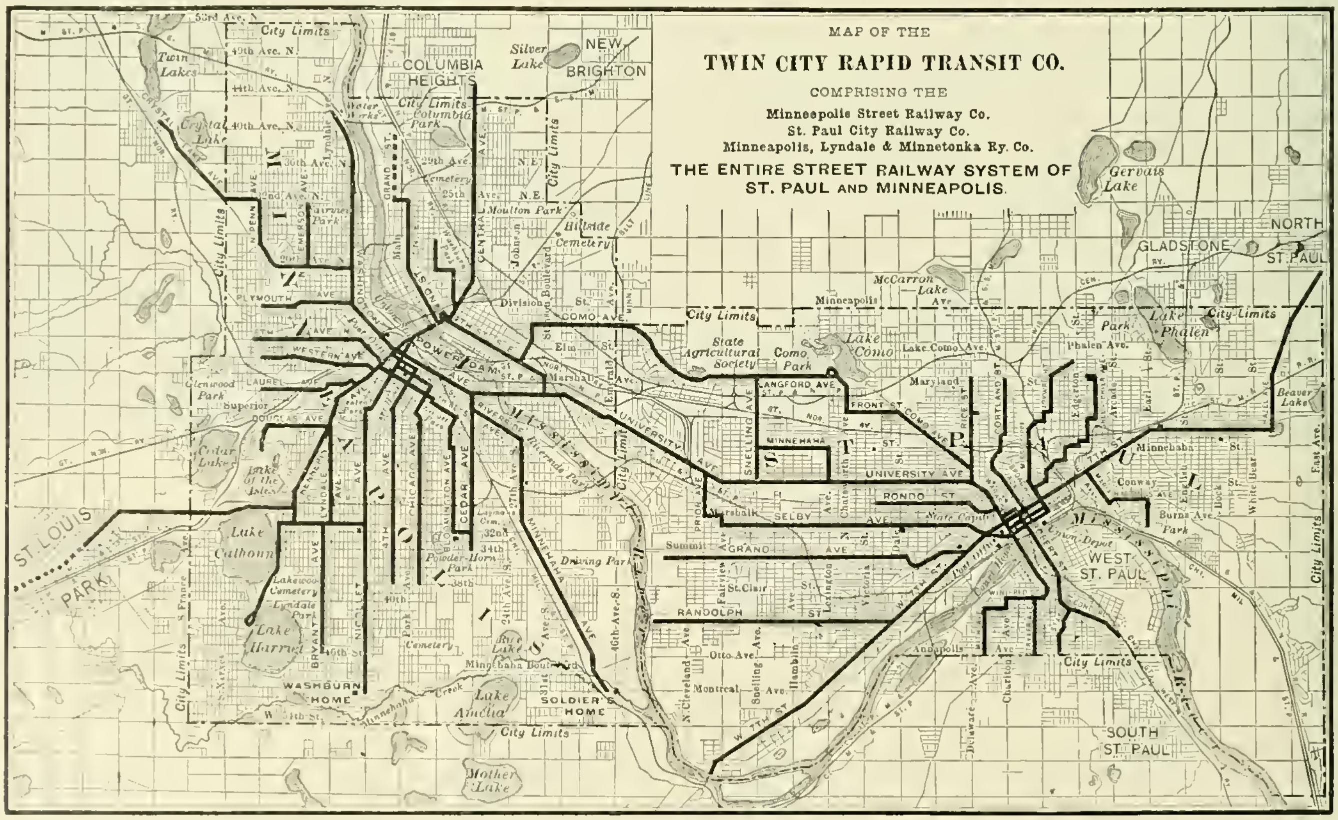
At the west end of the switchboard gallery are six G. E. static transformers of the standard air blast type. They are each of 223-k. w. capacity, and are used to raise the voltage of the generators from 3,450 to 12,000 volts for transmission to St. Paul.

EXTERIOR OF POWER HOUSE.

The building is heated by means of home-made electric heaters and lighted by 13 arc lamps.

The hydraulic work of this plant was in charge of William de la Barre, engineer of the St. Anthony Falls Water Power Company; and the electrical work in charge of Edward P. Burch, electrical engineer of the Twin City Company. Mr. Burch has been with the company for seven years.

The entire output of this plant is leased to the Twin City Rapid



the line through switches and can be opened at any time without interrupting the flow of current in the line. This is for the purpose of cleaning and adjusting the discharge gaps with safety. Surmounting the central panel of the switchboard, as a head piece, is a 12 in. dial. The switchboard, which is in a gallery above the generators, as a whole, is a very handsome piece of work.

Transit Company. Current is transmitted to the three stations of the company in the two cities.

Current is transmitted to station No. 1, which is in the business heart of Minneapolis, through two triple-conductor, paper insulated, lead covered cables, each equivalent to No. 000 B. & S. wire. The distance is 9,000 ft.; voltage, 3,450. In the station are six 215-

k. w. transformers of the General Electric A. B. type, transforming from 3,300 to 360 volts, and two 600-k. w., 8-pole rotary converters running at 520 r. p. m., and giving 580 volts up to full load.

This station formerly contained two triple-expansion Allis-Corliss engines, with cylinders 24, 40¾, and 56 by 60 in., one simple Allis-Corliss of 400 h. p. and one vertical engine of 400 h. p. The two smaller engines have been removed to make place for the converters and transformers. The triple-expansion engines each have flywheels 28 ft. in diameter and 73 in. face, which drive through jack shafts 16 Edison 175 k. w. and two Edison 80-k. w. generators. The old boilers, two Stirling boilers (2,875 sq. ft. of heating surface each) and five Babcock & Wilcox boilers (3,128 sq. ft. of heating surface each) are still in place, though regularly used only for heating the building.

The two triple-expansion engines are available as a reserve. During 1898, after February 19, they were run but 11½ hours, and that was during the severe snow storm of November last, when the water was somewhat low in the river and the demand for power was exceptionally heavy, because the use of snow plows had to be continued during the peak of the railway load.

No. 2 station is in Minneapolis, about 4½ miles from the water power plant, and current is transmitted to it at a voltage of 3,450 over one cable equivalent to a No. 0000 wire. No. 2 contains one 600-k. w. converter and three transformers. This station formerly contained ten 16 and 27 by 16 in. Westinghouse compound engines direct belted to m. p. 270-k. w. T.-H. generators, and seven Stirling boilers of 287 nominal h. p. each. The engines have been removed from this station, but the boilers remain in place and some of them are used for heating the building.

Current is taken to station No. 3, which is in St. Paul, a distance of about 10 miles, over one triple conductor cable of three No. 0 wires. Here are two converters and six transformers. No. 3 formerly contained three triple-expansion Allis-Corliss engines with cylinders 24, 40¾ and 56 by 48 in., and one 400-h. p. engine; the small engine has been discarded. As before stated, No. 3 still carries a part of the regular load.

The cables from the water power station to the three sub-stations are all laid underground in cement lined sheet iron pipe, there being about 100,000 ft. of this conduit laid. The pipe is 4¼ in. outside diameter and inside the cement lining measures 3 in.

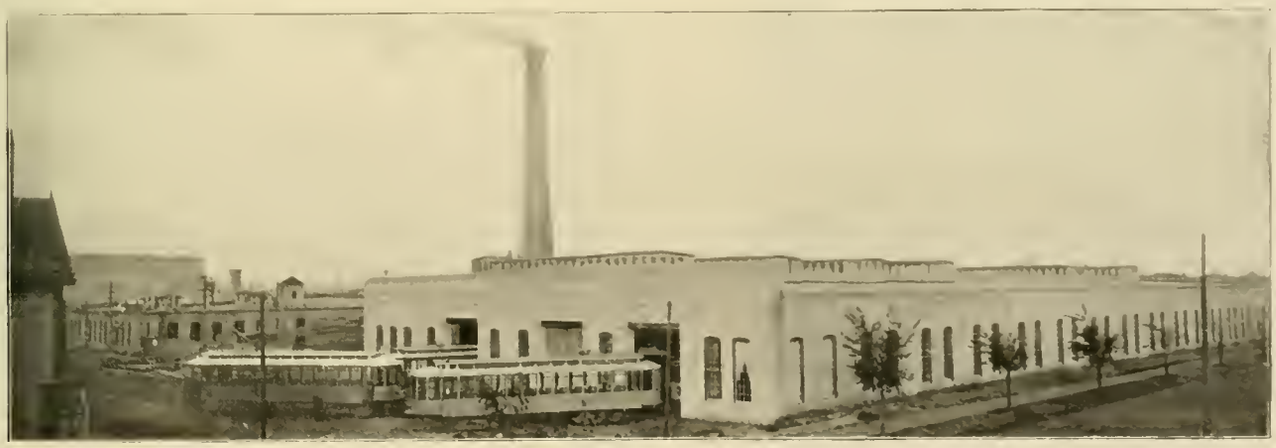
In both Minneapolis and St. Paul are extensive systems of underground low potential feeders which were installed in 1890, when the lines were converted to electricity. These have been supplemented by overhead feeders as extensions were built. The trolley wire is divided into sections of varying length, the length being such that the maximum load on the section is about 300 h. p.

The Twin City Company has recently acquired the St. Paul & Suburban road, which is a line extending from St. Paul to Wildwood, at White Bear Lake, 12 miles northeast. This line is to be extended eight miles farther to Stillwater, giving a 20-mile road. The power station of this road is known as the Wildwood station and is equipped with two Babcock & Wilcox boilers, two 100-h. p. Ideal engines and two m. p. 4 pole, 90-k. w., T.-H. generators. There is a heavy traffic between St. Paul and White Bear Lake, which is cared for by this station.

The Twin City Rapid Transit Company does a great deal of its own work, probably more than most other roads of the same size, and has extensive shops occupying an entire block in Minneapolis, bounded by West 31st and West 32nd streets and Nicollet and Blaisdell avenues, south. The ground plan of this plant is shown herewith.

THE LOWER DAM.

The building on the northwest corner of the lot is about 65 ft. by 95 ft., three stories high, and was built in 1890; it is occupied by the general storehouse and the offices of the purchasing agent and general store-keeper, A. M. Baldwin, Jr.; the engineer and roadmaster, David Curtin, and the master mechanic, W. M. Brown. The vice-president, Mr. Goodrich, and the general manager, Mr. Hield, keep in very close touch with the work at the shops, and usually spend a portion of each day there, as all requisitions of the purchasing agent and all requisitions on the general storehouse must be approved by the manager. Two rooms on the second floor have recently been fitted up as offices for Messrs. Goodrich and Hield, so that the records, plans, etc., which they wish to keep at this building can be more conveniently arranged.



EXTERIOR OF CAR SHOPS.

The heavy supplies are arranged in tiers of boxes and bins on the lower floor and the lighter supplies on the second floor. The third floor is used for storing patterns, of which the company has a complete line; the iron castings are about all that it has done outside, and for these it makes its own patterns.

The greater portion of the building joining the storehouse on the

south was built in 1884 and was the shop of the Minneapolis, Lyndale & Minnetonka Railway Company (a steam road), which was purchased by the Twin City Company. It is, of course, no longer operated by steam. Various additions have been made to the original building, and it now comprises the machine shop, 94 ft. x 110 ft.; the armature room, 52 ft. x 53 ft.; the brass foundry, about 27 ft. x 52 ft.; the blacksmith shop, 42 ft. x 52 ft., and the general repair shop of irregular shape.

All the repairs for the system are made here, as it is found cheaper to haul disabled cars and apparatus from St. Paul than to keep up the shops and storehouses that would be necessary to make repairs at the car houses. The machine shop regularly employs about 45 men. Its equipment comprises 10 lathes, 6-ft. to 16-ft. bed; 1 turret lathe, 2 power punches, 3 gear cutters, 1 planer, 1 key-seating machine, 2 shapers, 4 Brown & Sharp milling machines, 3 bolt cutters, 2 tapping machines, 2 speed lathes, 1 universal grinder, 5 emery wheel stands, 6 drill presses, 3 sensitive drills, 1 gear blank machine, 1 wheel boring machine, 1 hydraulic wheel press, 1 rail saw, a rail bender for special work, and a full line of tinsmith's tools. For hand work there are 20 vises.

The tool room occupies one corner of the shop, and in it are a milling machine, a lathe, and two grinders kept exclusively for toolmaking. There is a full line of reference and snap gages for close work. The system of checking out tools is combined with the system of checking the time. Each man has a shop number and a bundle of small checks, bearing the same number, on which to draw tools. When he goes to work he receives from the tool room a large check with his number and this is turned in at noon, drawn again in the afternoon, and returned at night.

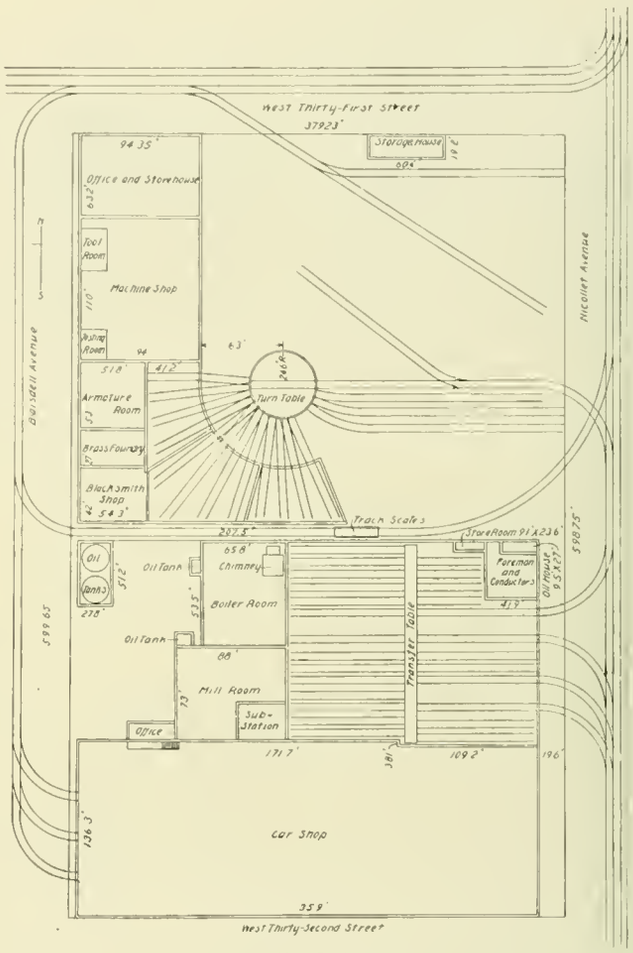
The gear and pinion work, turning trolley wheels, etc., furnish work for several machines. The pinions used on cars are of novel design. They are built up of 75 disks of No. 24 sheet steel, and five

VIEWS OF STANDARD CAR.

disks of raw-hide, punched out and assembled between two 1-in. brass disks. The assembled pinion is subjected to a pressure of 60 tons and five ½-in. steel rivets put through it. When riveted they are placed two at a time in a milling machine and the teeth cut, the steel blanks, being already formed, need only a light cut. One machine will mill 12 pinions in 10 hours. The pinions and the seats for them on the shaft are turned to a taper of ⅝ in. to 1 ft., which greatly facilitates their removal.

The cast wheels used are ground and the steel tired wheels turned down in this shop. The company had some trouble with cast wheels breaking under the heavy cars, and now very generally uses steel tired wheels for the motor axles, having about 400 such wheels; when the tire becomes worn thin the wheel is placed on the non-driven axle of the truck.

Throughout the shop the shafting has been carefully arranged so that portions of it may be cut out when the machines are not needed. The shop is driven by one of the discarded traction generators rewound for a motor.



PLAN OF SHOPS.

A great deal of rebuilding has been done in the machine shop and the W. P. 50 motors appear to have come in for their full share. As originally built, these motors had only one field coil containing 165 lbs. (about 165 turns) of No. 3 wire. This coil is replaced by one with 192 lbs. of wire in it, and the lower pole piece is chipped and planed so that a lower field containing 65 lbs. of No. 4 wire may be inserted. These lower field coils are known in the shop as "horse collars." The commutator in this type of motor has been placed outside the pole piece. The shaft is replaced by one 6 in. longer, made hollow at one end, and the leads from the armature carried through the center of the shaft. This arrangement removes the armature from all contact with the dust from the commutator.

In one corner of the machine shop is a small room fitted with the necessary prony brakes and instruments for testing motors. Fuse boxes and lightning arresters are also tested here.

In the armature shop about 13 men are employed, the company doing all its own repair work. One of the labor saving devices here is a shellac stirrer; the shellac is in a barrel mounted in bearings and belted to the line shaft, so that it is always stirred. To draw off shellac for use the belt is thrown off and the barrel stopped. In the armature room are motor cases and brakes for quickly testing armatures.

The brass foundry employs four men, who usually make three heats per day each. All the brass castings used are made here. The method of making pinions, which has been described, causes a

great deal of the brass turnings and borings to be mixed with steel, and a most ingenious machine for separating these turnings is used. The mixed metal is placed in a hopper, which discharges it into a cylinder having strong magnets on the interior. The iron and steel particles adhere, while the brass drops off as the cylinder turns. The steel is swept off by a stiff brush during the latter part of the revolution and falls into a separate box.

The blacksmith shop is equipped with eight forges, a steam hammer and a trip hammer. There are now 26 men employed, working in day and night shifts.

The general repair shop, which employs 31 men, is in what was the round house of the railroad. There are 12 pits, three of which are long enough to take two cars. One of the pits is fitted especially for dropping the wheels and axles from under cars. The screws moving the wheel platforms are driven from the line shaft. Outside is the turn-table, and several tracks for temporarily storing cars are laid in the yard. The scrap pile is also here.

South of the buildings already described is the old 31st street power station and car house of the company, built in 1889. The car house is still so used. It is, approximately, 280 ft. x 158 ft., and has 14 tracks. In one corner is a room for the foreman and car service employes.

The boiler room still has its equipment, seven Stirling boilers, but only enough of these are used to heat the shops. The engines and generators formerly in the room south of this have been removed and a small space in one corner partitioned off for the 600-h. p. converter and the three transformers, which constitute the equipment of sub-station No. 2, before mentioned. The rest of the old engine and dynamo room is now filled with wood-working machinery and called the mill room.

South of the car house is the new car shop, which was completed in April, 1898. This is a building of brick 359 ft. long, outside measurement; the north wall is formed by the old car house, so, while it is 136 ft. 4 in. wide at the west end, the offset in the old wall reduces it to 130 ft. at the east end. Windows 4 ft. wide x 10 ft. 4 in. high are spaced two to each 20 ft. of wall along the south side. At the ends are 14-ft. doors for the entrance and exit of cars, with windows where the wall spaces admit. There are six monitors in the roof, each 20 ft. x 52 ft., affording ample light.

The south wall of the new shop is 21 ft. 6 in. high; the east and west walls 25 ft. 6 in. The roof is 4-ply gravel supported on wooden trusses. The clear space under the trusses is 16 ft. Three rows of 7-in. round cast columns support the roof trusses. From the outside of the south wall to the centers of the first row of columns is 35 ft. 11 in., and the distance between rows 36 ft. The columns are spaced 20 ft. apart in the rows.

Walls have been erected in the exterior corner of the car shop and mill room buildings, forming a two-story building 14 ft. x 36 ft., inside measurement, which is marked office in the general plan. The lower floor is occupied by the stock room, where are kept the bolts, screws, etc., from the time they are drawn from the general storehouse until issued to the workmen. The upper floor is occupied by the master mechanic as his car shop office. The office is reached from the car shop by a flight of stairs, and from the gallery which extends along the side of the office the whole shop is in plain view. Windows in the east wall of the office give a similar view of the mill room, and the yard where lumber is stored may be seen from the exterior windows. The whole office is most conveniently arranged to enable a man to keep the shop under his eye.

The car shop is 11 tracks wide. The south side, three track, is set apart for the paint shop, and this portion has a cement floor with drains to the sewer, so that cars sent in for painting can be conveniently washed here. Throughout the rest of the building the floor is of wood. Arc lamps are provided for lighting, when necessary. Steam pipes are carried along the walls for heating, and in cold weather these radiators are supplemented by hot air from a Sturtevant plant.

The mill room is well equipped with machinery for wood-working, a great deal of which was made by the J. A. Fay & Egan Company, of Cincinnati. The mill room machinery includes 1 wood-worker, 1 molding machine, 2 rip saws, 1 shaper, 3 planers, 2 cut-off saws, 1 re-saw, 2 jointers, 1 mortising machine, 2 tenoning machines, 1 band saw, 1 Fay boring machine, 1 combination rip and cross-cut saw, emery grinders, and some smaller machines.

There are 74 men in the car shop, not including 13 painters. The capacity of the shop is eight cars per month. It was first opened in April, 1898, though not at that time completely finished. Last year 22 cars of the company's standard type were built and an order of 30 is now going through the shop.

MILL ROOM.

CAR SHOP.

The master mechanic, W. M. Brown, has been with the company for seven years, and has occupied his present position for over three years. He has had an extended experience in car building, and designed the company's standard car.

The foremen of the several shops are: Machine shop, E. Stoudt; repair shop, J. Reardon; blacksmith shop, O. Shoemaker; wood shop, W. H. Day.

The new cars, which are very fully shown in the accompanying illustrations, are regarded with considerable pride by the officers of the company, who feel that no road has any better cars. The greatest care is taken in the selection of material and in the construction, and the aim has been to build the best car possible.

These cars are designed for both summer and winter service; the window sills are but 27 in. from the floor and the two sashes may be slipped down into the side of the car, making practically an open car. The length, as shown in the floor plan, is 41 ft. 7 in., and at the front end is added a buffing timber (bent to conform to the car end) 9 in. thick at the center line of the car. This makes the total length 42 ft. 4 in. The weight of the body is 10 tons; with trucks and motors, 17 tons. The long sills are of Oregon fir, 4¾ in. by 6¾ in.; steel plates ⅝ in. by 5 in. are let into the side sills; the short sills are of oak. The ends of the car are rounded, and both are vestibuled. There is but one entrance, and that is protected by gates of the type described elsewhere. There are two steps, each 11½ in. high, to reach the platform; the steps are of the Stanwood type, made by the Q & C Company.

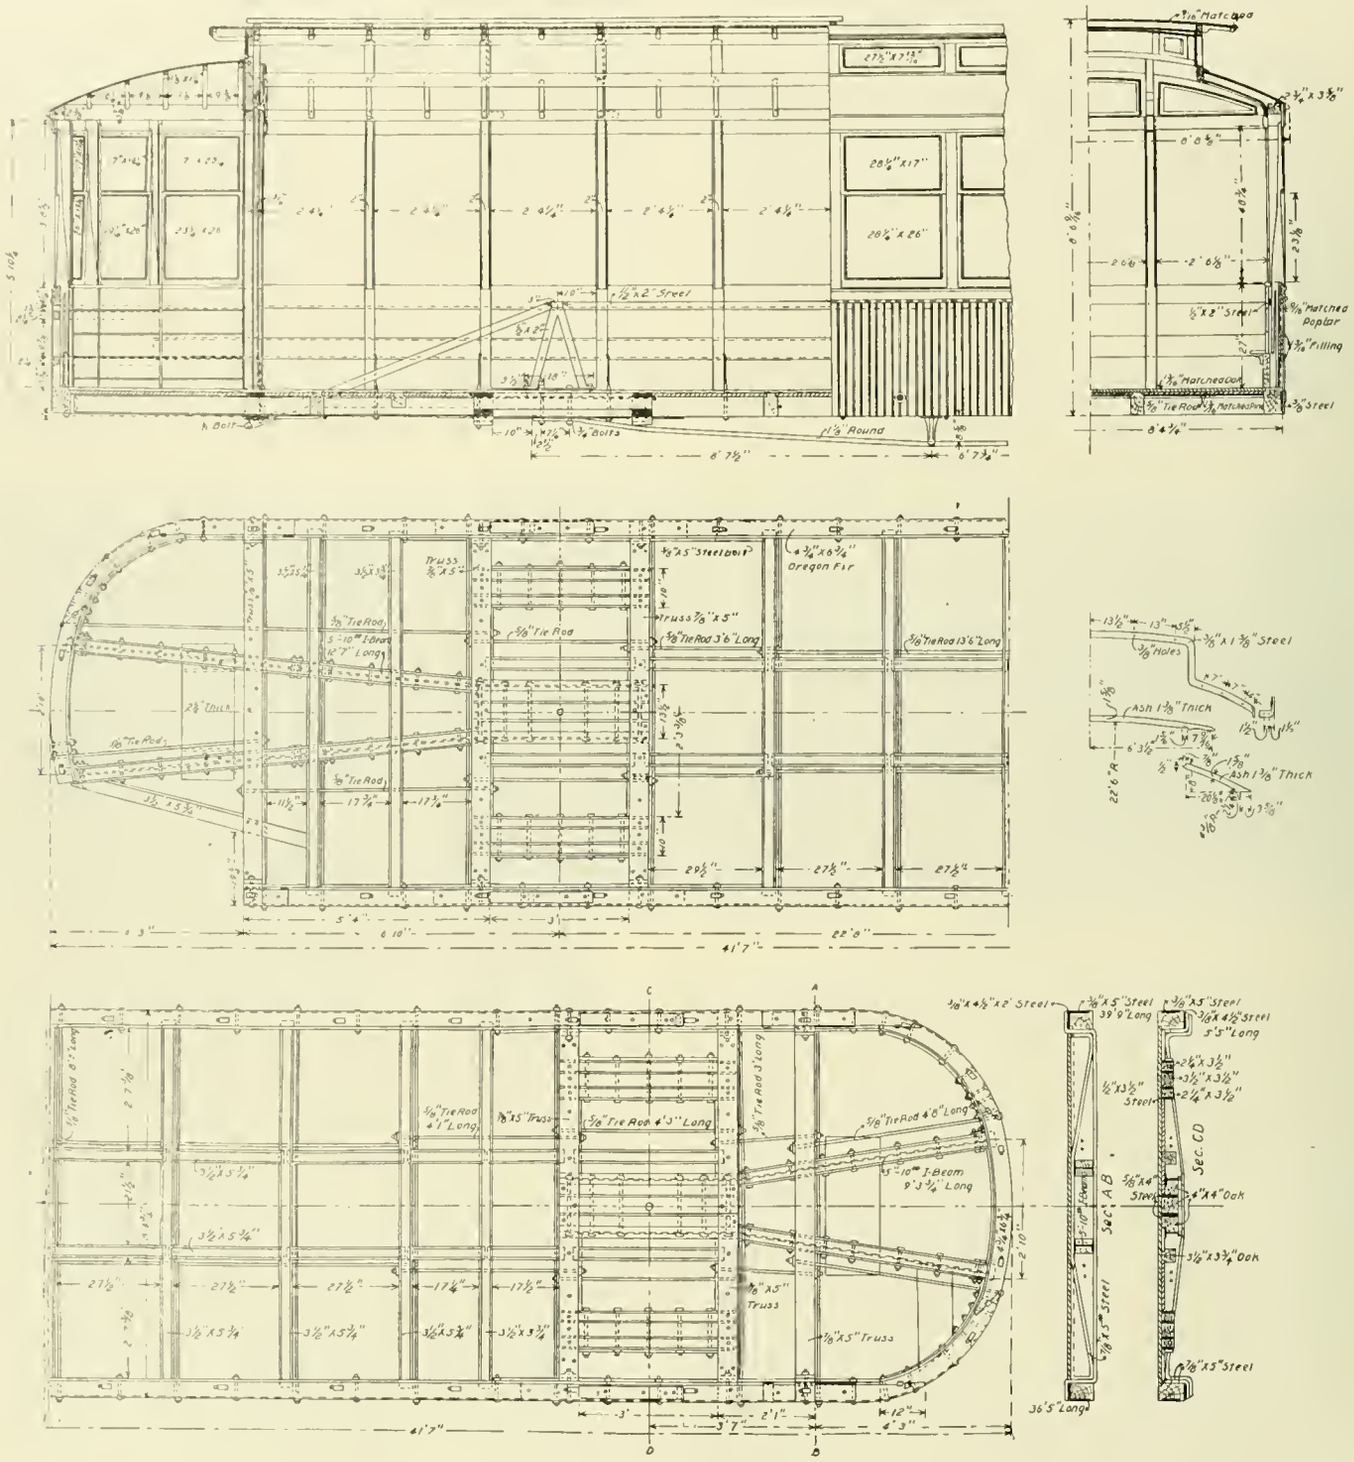
Over the trucks are two cross trusses (shown in the section CD) spaced 3 ft. 5 in. between centers. These are of ⅞ in. x 5-in. steel. Between these, to receive the center bearing, is a beam built up of

three pieces of oak 4 in. x 4 in., two steel bars 5/8 in. x 4 in., and portions of two 5 in. I beams (which support the vestibule ends). Over the side bearings are similar longitudinal pieces built up of three oak pieces and four steel bars 1/2 in. x 3 3/4 in. A third cross truss (shown in section AB) is placed under each end of the car body proper. From the innermost truss to the curved platform sill are two 5-in., 10-lb. I-beams; between the inner cross trusses the lower flanges of these I-beams are cut away to reduce the total height of the trusses. Oak filling pieces are placed on each side of the I-beams, as shown in section AB. In each side of the car is a steel truss of 1/2 in. x 2 in. steel, as shown in the longitudinal section, and the two side sills are further trussed with 1 1/8-in. rods.

The posts, water tables, and rafters are of southern white ash; the plates are of Oregon fir; the flooring is double, 13-16-in. matched oak on top of 13-16-in. matched pine; the roof is of poplar, covered with No. 6 canvas; the outside sheathing is of poplar, the inner sheathing of 1-in. white oak; the inner finish is of northern red birch, except the ceiling, which is quartered white oak. The details of the rafters are shown in the drawings, and also the details of steel rafters placed at four of the posts to give additional strength to the monitor roof.

This car seats 40 or 51 persons according as the heater is or is not in place. As an experiment one car was fitted with seats upholstered in leather, but the Hale & Kilburn rattan seats were decided upon as preferable, particularly for warm weather. The seat arms are brass, and were cast in the shop, as were also all the fittings.

The car is heated with the Baker hot water heater, and lighted by 20 electric lamps. Electric headlights of the company's own design are used.



SECTIONS AND FLOOR PLAN OF CAR.

The trucks to be used under these cars have not been decided upon; one of the new cars is now in use with Brill trucks.

Nearly all the cars of the company are equipped with safety gates, which were designed several years ago, and have proved so satisfactory in operation that Mr. Goodrich would sooner send out a car without motors than without gates. This last is literally true, as the only cars without gates are trailers, and these are to be superseded by the larger cars now building. The standard type of gate adopted, after mature deliberation and numerous experiments, was fully illustrated and described in the REVIEW for March, 1895, page 154. It is operated by the motorman, who opens the gate after having brought his car to a full stop, and closes the gate before again starting the car. The gates are placed at the extreme outer edge of the step and open outward. It might be thought that bringing the car to a full stop and opening the gate before permitting any passengers to alight would cause a considerable loss of time, but such is not the case; what time is lost by operating the gates is more than gained by the quicker stop and quicker start that can be made when the motorman absolutely knows that no one is attempting to leave or board the car while it is in motion.

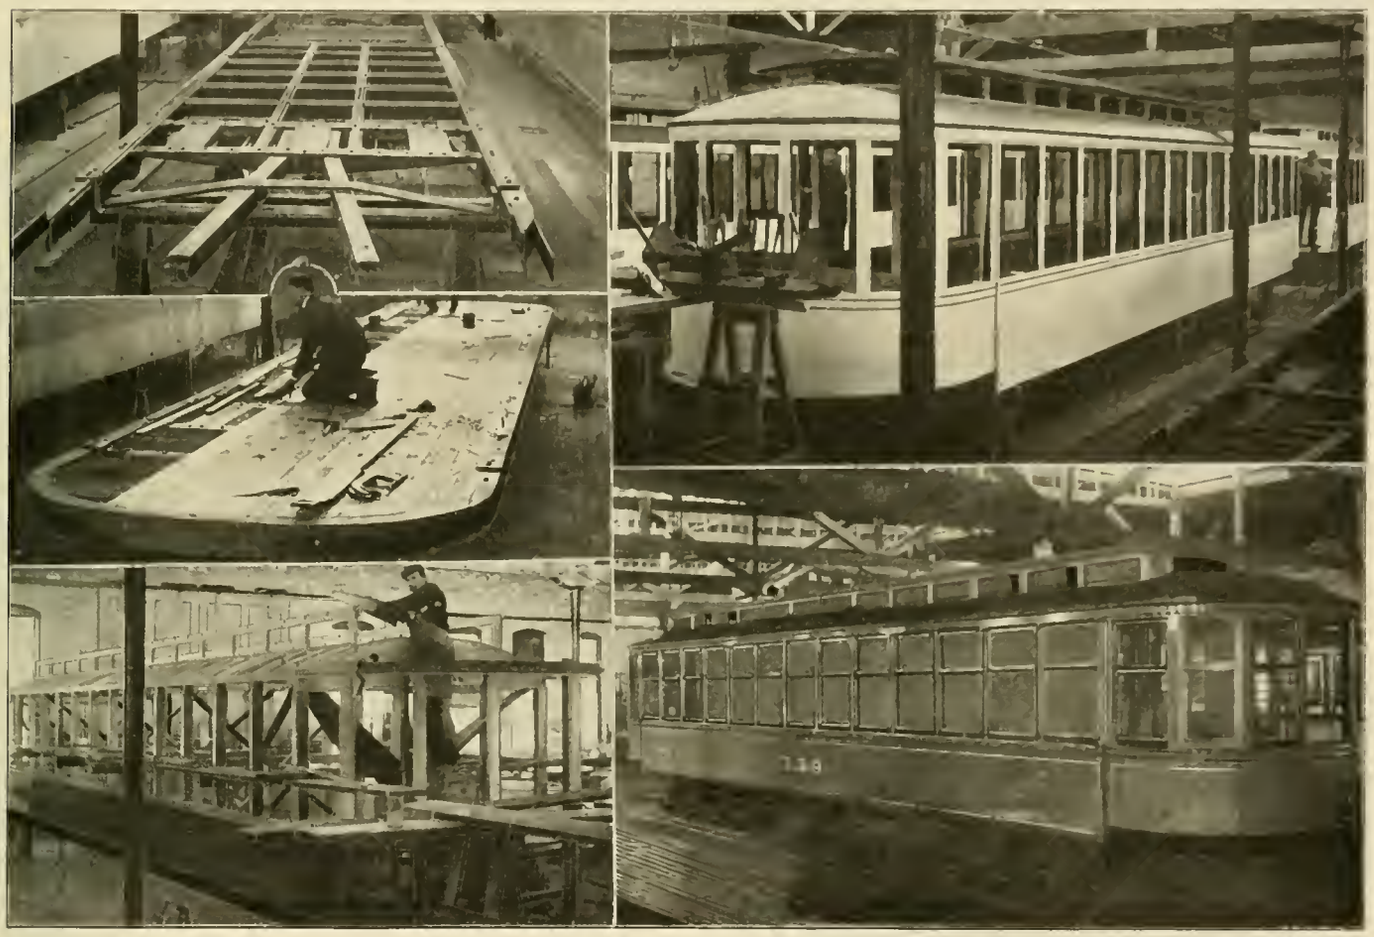
When the Twin City Company first began to operate by electricity it was insured in a casualty company which failed and left the Transit Company with damage claims aggregating $100,000 to settle. As a preliminary step to finding a means of preventing these accidents, Mr. Goodrich analyzed the causes of accidents, dividing them into 23 classes, and it was found that the most expensive and troublesome accidents were those caused by persons boarding or leaving cars when in motion. The adoption of safety gates followed.

How successful the remedy proved is shown by the following table, which gives the number of accidents on the Minneapolis division for the years 1898 and 1895, occurring from these causes. But few cars had gates in 1895. Some trail cars are without gates at the present time.

Cause.	1898	1895
1. Boarding moving cars.	32	83
2. Leaving moving cars.	55	141
3. Cars starting, alighting or boarding	23	14
4. Fell, alighting or boarding	35	71
5. Fell on or off car	8	36
6. Fell on curves	0	4
Total	153	349

In connection with these figures it must be remembered that in the four years the mileage and number of cars operated have increased nearly 100 per cent.

The other causes of accidents, as separated in the company's records, are: 7. Cars off track. 8. Collisions, cars. 9. Collisions, persons. 10. Collisions, vehicles. 11. Collisions, animals. 12. Cable slot injury. 13. Center pole injury. 14. Employes injured on duty. 15. Electric shock, persons. 16. Electric shock, animals. 17. Frightened horses. 18. Disturbances on cars. 19. Trouble on account of fare. 20. Ejections from car. 21. Miscellaneous. 21a. Gate injury. 21b. Bicycle accidents.



STAGES IN THE CONSTRUCTION OF THE CAR.

The Twin City Company was one of the first to experiment with the concrete beam track construction, and the construction adopted by it in streets paved with asphalt has been described in the REVIEW. In February, 1897, we published sections of the standard trench work of this company, showing 5-in. T-rails. There have been several miles of concrete beam track built since that time, but in the new work a deeper rail, 7-in., 80-lb. T, is used. This height of rail is preferred principally because it permits the use of a deeper toothing block.

When the street is to be newly paved throughout at the time this roadbed is put down, the method of procedure is as follows. The paving contractor lays down the concrete foundation over the entire street, leaving two or four trenches (as the case may be)

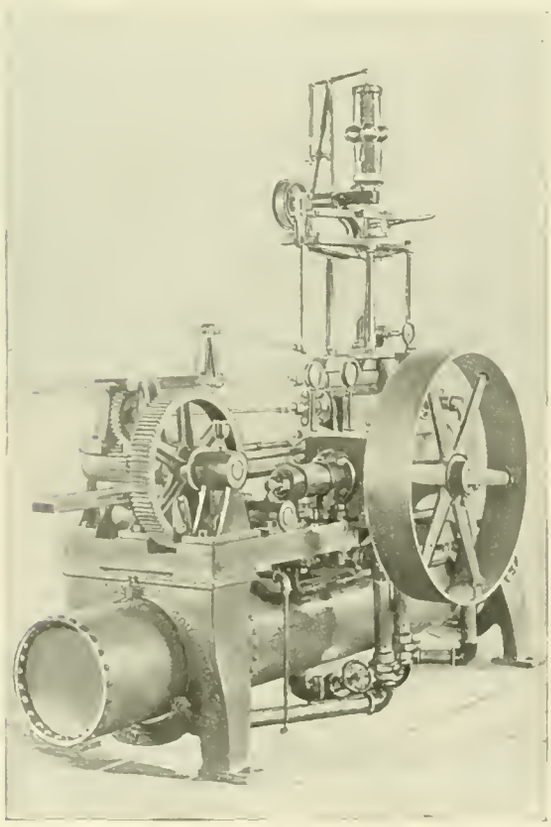
where the rails are to be; the paving foundation is usually of American cement concrete, 8 in. deep. The beams supporting the rails are of Portland cement concrete 15 in. wide x 8½ in. deep. In laying the rails they are levelled properly and supported temporarily on ties. Tie rods 2 in. x ⅜ in. are spaced 10 ft. apart to preserve the alignment. Then the concrete is put in place, and filled in about the base to within 2½ in. of the head, the ties being withdrawn as the work proceeds. A wooden form is laid against the inner edge of the rail when the concrete is tamped, to leave a space for the toothing blocks. The joints are cast-welded by the Falk process,

CONCRETE CONSTRUCTION IN PAVED AND UNPAVED STREETS.

and the welding gang keeps just ahead of the concrete gang in building the track.

The cost, exclusive of rails and joints (the railway paying the cost of paving from outer rail to outer rail), is about $3.10 per lineal foot of single track.

There are now about 15 miles of this construction in the two cities. About 60 miles of the company's track has cast-welded joints. The engineer and roadmaster who has charge of this work is David Curtin. One of the illustrations shows the process of construction in a street already paved with asphalt.



LOMBARD GOVERNOR, TYPE "B."

Another view of the water wheel governor, shown at the extreme left of the engraving of the interior of the power house on page 75, is given herewith. The other six governors in the station are not visible in that illustration, being concealed by the generators. As may be seen on page 75, the governor is directly geared to the gate stem coming out through the head of the water wheel case, and thus the governor positively connected to the water wheel gate through one pair of gears only. These governors are the type B made by the Lombard Water-Wheel Governor Company, and the regulation of the plant under street railway load variations is within 3 per cent. This type is the most improved form made by the Lombard Company, which builds eight distinct types of water wheel governors, adapted to the various requirements found in practice. The Lombard governors are now used to regulate about 80,000 h. p. of water wheels in this country, besides being used quite extensively abroad. The direct connection used here has also been adopted in a number of other large plants in this country, using the same type of governors, and has been found entirely satisfactory.

NEW COMPRESSED AIR COMPANY.

The Compressed Air Motor Company is the name of a new corporation organized in Chicago to promote the use of compressed air for street car service and to build and sell the motors. The officers are: W. J. Chalmers, president; H. G. Cooke, vice-president and manager; Alexander Soper, treasurer; and Charles W. Hinckley and W. R. Donaldson, directors. Mr. Cooke is already known in compressed air work, as also the engineer, Robert Hardie.

POWER PLANT OF THE THIRD AVENUE RAILROAD.

When the Third Avenue Railroad Company, of New York, decided to adopt electricity for a motive power on all its lines it was necessary to make provisions for one or more power stations of great capacity. Plans were made to construct one mammoth station on the Harlem river, between 216th and 218th streets, which was to supply current not only for the downtown districts, but also for lines far north into Westchester county. Alternating currents will be generated and transmitted at high potential to 30 or more sub-stations containing step-down transformers and rotary converters, and from these direct current will be fed into the trolley lines at suitable points throughout the city. The normal capacity of the station will be 64,000 h. p. but capable of carrying an overload of 50 per cent.

It was essential that a work of such magnitude be well done and by responsible firms, so the railroad company invited several of the largest electrical concerns to submit plans and bids for the entire undertaking. As mentioned last month the contract was awarded to the Westinghouse Electric & Manufacturing Company and Westinghouse, Church, Kerr & Co. drew the plans for the station.

The power house will be an imposing structure of brick and terra cotta, and its architectural effect will be gained by its color and huge proportions. It will be under two roofs, one arch covering the engine room and that over the two-story portion will cover the boilers. Alongside the river will be docks for unloading the coal boats, and coal handling machinery for conveying the fuel to a bin of 10,000 tons capacity. The coal after passing through automatic weighing machines is deposited into the hoppers and then into mechanical stokers. Machinery will convey the ashes out of the build-

ing and into boats at the docks. There will be four smoke stacks 200 ft. high and for purposes of forced draught there will be powerful exhaust fans.

In the engine room there will be 16 Westinghouse engines, each of a capacity of 4,000 h. p. with a maximum of 6,000 h. p. The generators are direct connected and excited from dynamos driven by independent engines. A switchboard 200 ft. in length will be arranged in a gallery above the machinery. With an ultimate capacity of 100,000 h. p. this station when completed will exceed that of any other in size, even Niagara not excepted, and will break the record for large stations recently made by the Metropolitan Street Railway Company.

STREET RAILWAY PARK AT OSHKOSH.

The lines of the Citizens' Traction Company cover the principal streets of Oshkosh, Wis., and extend south along the shores of Lake Winnebago to Electric Park, which is the property of the company. The company owns all the street railway lines in the city of Oshkosh, having 14 miles of track in the city and 2½ miles beyond the city limits. An interurban line is contemplated connecting Oshkosh, with a population of 32,000, with Appleton, population 12,000, and passing through Neenah and Menasha, population 13,000. Should a franchise be granted, which is expected, the line will be in operation by August 1, 1899.

During last summer Electric Park proved a great attraction. It is located on a high and beautiful site along the lake shore about 3½ miles from the city. The company has built a handsome casino, summer theater, arbors, swings, bath houses, etc. General Manager E. E. Downs made arrangements for music and special attractions which were liberally patronized this last season. One specialty was sending up hot air balloons with several dollars' worth of street car tickets attached, which were eagerly sought after by the visitors. The accompanying cut was reproduced from several photographs taken in the park and along the line last summer.

SCENES IN THE CITIZENS' STREET RAILWAY PARK, OSHKOSH, WIS.

ORLEANS TERMINAL, PARIS.

In the REVIEW for June, 1898, page 400, was described the preliminary plan of the Orleans Railroad of France for building an underground extension of 2½ miles in Paris to secure a more central terminal. At that time Messrs. Solacroup and Sabouret visited the United States to examine the electric railways of this country. Electric traction was decided upon because nearly two miles of the extension is in tunnels, which would be fouled by the use of steam engines.

The company had fully decided upon building a lighting station of 750-k. w. capacity and the power station is to be combined with that. The station being three miles from the Quai d'Orsay terminus high tension transmission with transformers and converters will be used. There are to be two sub-stations, one at each terminus of the extension, and each will have a storage battery of 1,100 ampere-hours capacity. There will be eight 8-wheel locomotives of a type similar to those used by the Hoboken Shore road.

METHODS FOR COLLECTING AND REGISTERING FARES ON INTERURBAN LINES.

BY F. H. FITCH.

The advent of the interurban electric railway has brought forward many interesting problems. Not of the least importance among these is that of the collection and registration of fares. This of course is one of the chief problems of any road. But on city lines the fare is one price to all whether the passenger rides one block or the full length of the line, and thus few complications arise, and the register at the end of the trip should indicate the number of cash passengers carried. On interurban lines, however, the fare ranges from 5 cents up to something less than one dollar, usually in multiples of five, and the problem of collection and registration is an entirely different proposition than that on city lines.

Interurban lines have grown by gradual expansion. At first they were extended a little way beyond the city limits to nearby suburbs, or built to connect two adjacent towns. In these instances, one extra fare was charged, or 10 cents for the entire trip. This was collected and in most cases where 10 cents is the maximum fare, is yet taken up by two separate collections, there being a designated point of general collection somewhere near the center of the line. When 10 cents is the maximum fare, this system of making two separate collections seems to be the most satisfactory. By this method the number of passengers carried cannot be ascertained, the register merely showing the number of 5-cent fares collected. This information is not however of vital importance, though desirable.

Interurban lines grew, and from five and six miles, with a maximum fare of 10 cents, they were extended until cities and towns, 30 and 40 miles apart, were united, and the fare accordingly increased to 10, 20 and 30 cents, and upward. As if by force of custom, street railways having from time immemorial collected 5-cent fares, or perchance not having thought out a one-collection system adequate to the occasion, some of the earlier interurban roads which extended their lines collected increased fares in installments of 5 cents each. One road in particular, for a time, made eight separate and distinct collections during the course of a single trip.

It is hardly to be wondered at that the passengers complained bitterly at having to be disturbed so frequently, and one regular passenger, on the line mentioned, even threatened to bring suit against the company to recover the value of a pair of trousers, the pockets of which had become frayed before their time, by reason of their wearer being compelled to "go down into his jeans" so frequently for change.

The problem then which presented itself was to invent a system by which the entire fare might be collected at one time, and yet:

(1) Permit an easy and reliable checking up of the conductor.

(2) Insure just returns to the company of moneys taken in.

(3) Identify passengers that their destinations might be readily seen, and the conductor be not confused as to who has paid and who has not paid their fare.

(4) Permit no perverting by either passenger or conductor of the methods used.

(5) Be handled with facility and rapidity.

(6) From which might be deduced all necessary information for statistics and accounts.

A great many, and perhaps the greater part of the interurban roads today, use the duplex ticket, the same as are used by the Pullman and Wagner sleeping car companies. The chief objection to these duplex tickets is that a dishonest conductor could punch the half of the ticket which he keeps, and which is turned into the company as a record of the amount he has received, differently from the half which he gives to the passenger. The other serious objection to duplex tickets is the time it requires to punch and detach them. There is one place upon an interurban line known to the writer, where the cars, on very frequent occasions, are loaded to the guards at a park, and in six minutes a transfer point is reached where many passengers are discharged, and it is essential that the collection be completed before reaching this point. In a place like this, duplex tickets could hardly be used.

Other forms of tickets are such as are used by the interurban lines running out of Cleveland, which have been described in a previous issue of the REVIEW, and a form designed by the writer for use upon the Southwest Missouri Electric Railway.

The essential principle of this last form and of the Cleveland form is the same, and is a ticket designed to be torn in two, one part to be given to the passenger to be retained by him for his identification throughout the trip, and the other part to be retained by the conductor and by him turned in to the office, from which portion the conductor's debit is determined, and either portion of the ticket to indicate the amount of fare paid, and the stations between which the passenger is traveling.

Fig. 1 shows the passenger's side of this ticket, and Fig. 2 the reverse or conductor's side. The bold figures, 1, 2, 3, 4, 5, 6, 7 and 8, indicate the number of 5-cent fares paid or collected. The abbreviated words, part of them in vertical position, are the names of the various stations where an additional fare is collected, or in other words, they are points of general collection. There are nine of them, or eight spaces between which 5 cents is charged. The full set of stations does not appear with the figures 5, 6, 7 and 8, for obviously, if eight 5-cent fares are paid, that being the maximum fare, there is only one station to which such fare would be collected, viz., the opposite terminus of the line. And likewise there are only eight stations to which five 5-cent fares would be collected, and accordingly with the figure 5, the ninth or middle station in this case is omitted, for even from the two terminals the fare to the middle station is only four 5-cent fares. On the conductor's side, these stations are still further abbreviated, being designated merely by letters. The letter on either margin of the passenger's side is a certain conductor's letter, no other conductor having tickets with that letter. Each conductor's tickets are numbered consecutively.

These tickets are put up in block form, two hundred to the block, and are detached by use of a rule, both the block of tickets and the

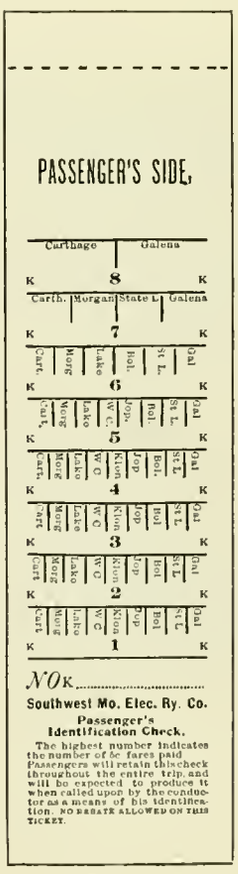


Fig. 1

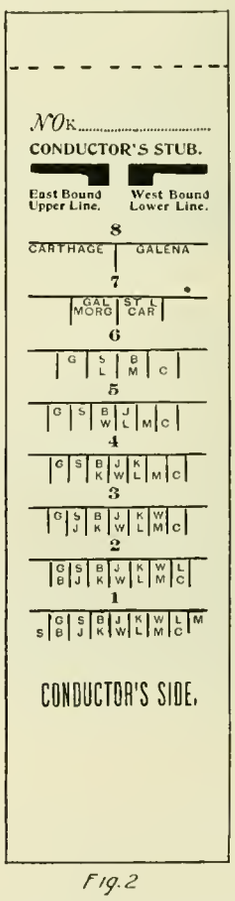

Fig. 2

rule being suspended about the conductor's neck by a small chain. The manner of holding the rule when in the act of tearing off the passenger's portion of the ticket is illustrated in Fig. 3.

Now to illustrate the use of the ticket: Suppose a passenger boards the car at Joplin, wishing to go to Carthage. The fare is

25 cents, as will be seen on the ticket. The conductor detaches the ticket as shown in Fig. 4, and gives the portion torn off to the passenger; if it is a male passenger, sticks it in his hat. The reverse side of the portion which he retains, which remains in the block, is shown in Fig. 5. The portion given to the passenger indicates first, by the bold figure, that he has paid 25 cents; second, that he has started at Joplin, and third, by the offset in the upper edge being

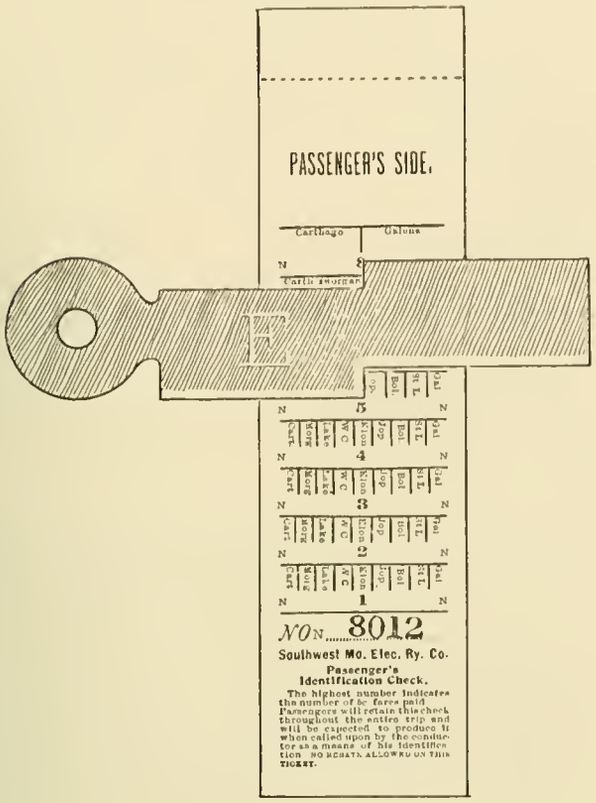

Fig. 3

on the left hand side, that he is east-bound. The reverse side of the conductor's portion gives the same information. The heavy black forms at the top are to show the direction. When the ticket is torn as in Fig. 5 the bottom edge is similar to the form on the left and indicates east-bound. When east-bound, to determine the point of starting, one refers to the upper line of letters, which in the illustration is J, which stands for Joplin.

As will be observed, the rule has two edges, one of which is used on east-bound trips and the other on west-bound trips. To illustrate a west-bound trip, suppose the passenger boards the car at Joplin to go to Galena. The fare is 15 cents, and the resulting tickets for passenger and conductor are shown in Fig. 6.

Should either the conductor or passenger attempt to alter his portion of the ticket by further mutilations, he would do so to his discomfiture. The conductor would be held responsible for more money and the passenger be entitled by his check to ride a less distance. Should the passenger tear off or cut off, say in Fig. 6, the abbreviated Joplin, he would then be entitled to ride by his check only three fares distance west from Klondike, the next station east of Joplin.

It may appear that the conductors would consume much time in finding the place at which the rule should be held to make the tear, and this as well as innumerable other objections were raised against the system by the conductors, who, by the way, always object to innovations. But the rapidity and skill with which they soon became accustomed to handle the tickets was really beyond all expectations, and the fact that all handled them with almost equal facility, showed that it was no extraordinary feat.

From an accounting standpoint, this ticket will show:

(1) The number of passengers carried.

(2) The number carried at the various rates and of course the average fare collected per passenger.

(3) The number of passengers traveling from any particular, or each station, and to what stations they go, if this is desirable.

No second hand checks can be worked on a conductor, because each conductor has his distinct appellation, and if by chance the forger should board the same conductor's car, at the same place, and going in the same direction, the conductor would have his serial number to fall back upon.

Last of all, and no doubt the most important requisite of a suitable ticket system is to get one by which dishonest conductors can be reliably detected. I say reliably, because a conductor should not be called upon to face so serious a charge as that of theft, unless there is absolutely no doubt of his guilt. It is rather a difficult proposition for any one to get on a car of an interurban line and ride for perhaps two hours, with passengers constantly getting on and off, and to report how many passengers should have paid 5 cents, how many should have paid 10 cents, how many 15 cents, etc. I claim that it cannot reliably be done. It was on account of the difficulty of inspection, where the fare was collected all at one time, that some roads did, for a long time, and that many yet collect their fares in installments of 5 cents each, so that their inspection is no more difficult than on city lines. By the ticket system which I have just described, an inspector need only report the maximum number of passengers between each section of the line. For instance between Stations A and B, there were so many passengers, being the maximum number; at B he begins his count anew, and reports that between B and C there were so many. Furthermore, it is not essential that the inspector should ride the full length of the line and this, by the way, is a weak point in inspection. Conductors grow suspicious of a frequent through traveler. If the inspector reports so many passengers between any two stations, the conductor's stubs can be referred to and these should show a like number of passengers.

Aside from the count, let the inspector take pains to observe that no passenger is slighted in the giving of checks. Should the conductor give a check for a less amount than he receives, the stub will

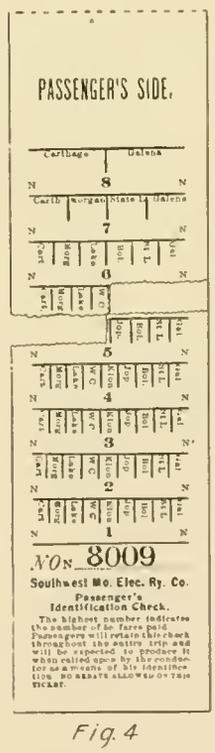

Fig. 4

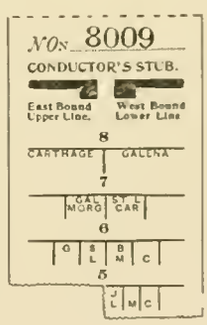

Fig. 5

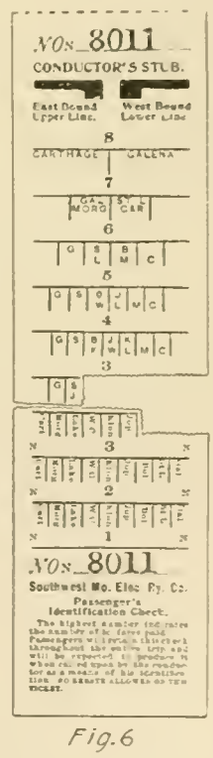

Fig. 6

not show that passenger as on the car over that section of the road; or if instead of giving the passenger a new current check he gives him a second hand one which he has picked off the floor or found in a seat, although it may fit all conditions, his stubs will not tally with the inspector's count.

In conclusion, I will say that while I do not claim for this system perfection, yet I believe it comes nearer than any other yet pro-

duced in complying with all the necessary requisites of accounting, rapid handling, non-perversion, identification, inspection and of just returns, for when properly torn the stub gives the company a credit with the conductor which cannot be effaced.

STREET RAILWAY MAIL SERVICE.

The following interesting statistics showing the growth of the street railway mail service in the United States are taken from the report of the general superintendent of the railway mail service for the fiscal year ending June 30, 1898, and compared with the similar statistics for 1896 and 1897, which were published in the REVIEW for December, 1897, page 808.

The remarkable feature of the table is the increased efficiency of the service; with but seven more routes, six more cars, and 10 more clerks than in 1897, the number of pieces of mail handled daily was over three times as many and the number of closed pouches handled per day was increased over 70 per cent.

The number of electric and cable lines handling only closed pouches was increased about 38 per cent, the miles of route over 60 per cent, and the number of pouches handled nearly 40 per cent.

STREET RAILWAY POSTAL CAR SERVICE.

	1896.	1897.	1898.
Number of routes	21	33	40
Miles of routes	198.58	303.68	379.47
Number of cars	45	65	71
Number of round trips with clerks per day	195 5-6	343	388
Annual miles of service with clerks	907,863	1,619,829	1,744,694
Estimated pieces of mail handled daily	505,481	593,860	1,889,092
Average number of closed pouches handled daily	398	568	971
Number of crews	60	87	98
Number of clerks appointed to lines	75	102	112

CLOSED POUCH SERVICE ON LINES HAVING NO POSTAL CLERKS.

	1896.	1897.	1898.
Number of routes	126	146	201
Miles of routes	726.84	798.24	1,304.43
Annual mileage	1,986,838	2,368,786	2,296,703
Pouches handled per day	1,924	2,485	3,440

PORTLAND & YARMOUTH (ME.) ROAD CHANGES HANDS.

At the annual meeting of the Portland (Me.) & Yarmouth Electric Railroad Company, on January 21, it transpired that local parties had secured control. Officers were elected as follows: President, Seth L. Larrabee; vice-president, F. C. Boyd, of the New Haven Car Register Company, New Haven; secretary and general manager, Louis B. Wheildon; treasurer, Henry P. Cox. The bonds of the company have all been placed in Portland.

It is the intention of the new management to thoroughly equip the road and develop a park to encourage summer traffic.

REPORT OF COLUMBUS (O.) STREET RAILWAY COMPANY.

The annual report of the Columbus (O.) Street Railway Company for the year 1898 has been published in pamphlet form and gives exactly the information that an investor in street railway securities wishes. The last year has been a very successful one from a financial standpoint, showing a surplus of $155,376, against $124,293 for 1897.

The company has 64.17 miles of (single) track laid with 45, 52, 70, 86 and 93-lb. Johnson girder and 60, 72 and 80-lb. 6-in. and 8-in. T-rail. In the power station are 10 Babcock & Wilcox boilers furnishing steam to three McIntosh & Seymour, and two Buckeye tandem compound condensing engines, aggregating 2,700 h. p.; there are two 500-k. w. direct connected and eight 75-k. w. belted generators. The car equipment comprises 119 motor trucks; 57 open motor cars, 28, 30 and 36 ft. over all; 20 open 7 and 8-bench trail cars; 87 closed motor cars and 14 trail cars; four electric sweepers, sand cars, etc. The cars were made by Brill, Brownell, Stephenson and Barney & Smith. Twenty-five of these cars were added during the year.

The earnings and expenses were:

Passengers	$680,172.53
Less operating expenses	327,691.94
Net earnings	352,480.59
Carrying U. S. Mail	410.16
Advertising in cars	3,000.00
Power sold	3,580.01
Other sources	1,869.65

Gain over 1897	31,083.13

During the year $10,874 was charged to roadway and track construction, of which $1,552 was for street improvement assessments, and $248 to park construction. There was charged to equipment $32,320 for new cars, $15,281 for motor equipment, and $252 for power house equipment.

The capital stock of the company is $3,000,000 and the funded debt $3,572,000.

The following tables show some interesting statistics:

Statistical.

The officers are: President, Robert E. Sheldon; vice-president, Edward K. Stewart and Clarence M. Clark; secretary and auditor, P. V. Burington; treasurer, Edward K. Stewart; general superintendent, Willis F. Kelly.

The Canton & Massillon (O.) Electric Railway Company is now building 1½ miles of new track; it will probably be completed by March 1.

A TRANSMISSION LINE TO LOS ANGELES.

The number of water power plants is constantly on the increase and where their distance from a city is moderate it is a great convenience and saving for a street railway company to receive current from a transmission line. The numerous trolley roads about Niagara, at Salt Lake City and Ogden, Utah, Sacramento, Cal., Minneapolis and elsewhere all take current from high voltage currents. The San Gabriel transmission, conducting current from Azusa to Los Angeles, Cal., 23 miles, is the latest to supply current to move electric cars. The peculiarity in this case is that the steam power station of the Los Angeles Railway Company is reinforced by the current from the transmission line and in turn assists in carrying the lighting and power loads at certain intervals.

Operations began on July 1 and within a month afterwards the rated capacity of the water power plant had been reached and the machinery and line carry an overload of 50 per cent at times. Although the water in the San Gabriel river has not been so low in 30 years a satisfactory service has been continued without interruptions. In a recent issue of the "Journal of Electricity" George P. Low has contributed a comprehensive account of the hydraulic and electrical features of the San Gabriel plant and it is to this we are indebted for the data and accompanying illustrations. The writer expresses the opinion that the Azusa-Los Angeles transmission is in some respects the most remarkable to be found on the Pacific coast, if not in America. Of all transmissions, the San Gabriel

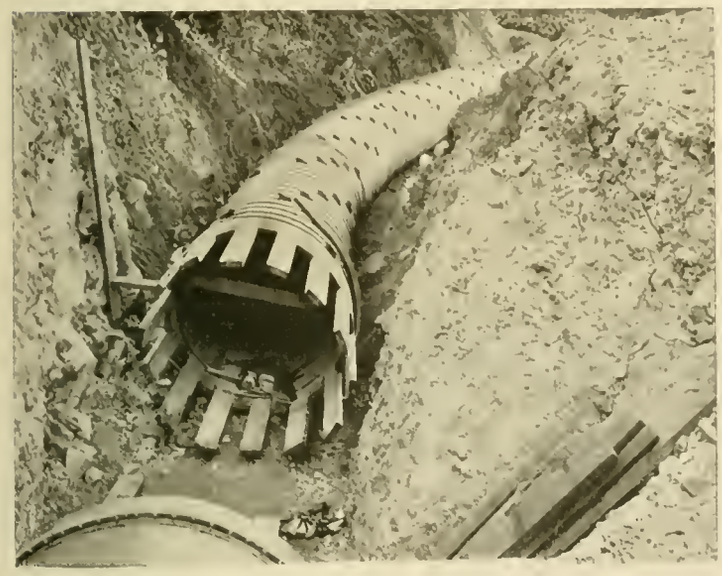

FIG. 1 WOODEN STAVE PIPE.

plant resembles the Hartford installation more than any other. Each is driven by water power, each has an auxiliary steam plant, and each delivers direct current, lighting and power service from rotary converters, but while the Hartford plant has a storage battery to equalize the load factor, the San Gabriel system gives or takes 500-volt direct current from the power circuits of the Los Angeles Railway Company, thus evening the load factor and affording a reserve of practically unlimited capacity. It is in the ingenuity of the combinations that result from the use of these three plants—water, steam and railway—that the remarkable novelty of the San Gabriel system, from an electrical engineering standpoint, exists.

The water system contains over 20,000 ft. of tunnels, nearly 9,000 ft. of wood pipe, and over 1,500 ft. of concrete culvert. No open ditching, in the ordinary sense of the term, is used, and the system has no fluming; the tunnels are lined on the sides and bottom with concrete varying from 4 in. up to 36 in. in thickness, according to the characteristics of the rock, and, except where firm rock is pierced, the tunnels are arched with masonry. The longest of the 38 tunnels in the waterway is 1,610 ft. In summer time a material part of the flow of the river is in the underflow that seeps through the sand and gravel beneath the river bed, and that this underflow should be thrown into the canal as well as the surface flow, a submerged dam is to be built across the bed of the river. About 75 ft. of the length of the dam will have an average height, or rather depth, of 50 ft., while the remaining 300 ft. of the dam will have an average depth of not more than 25 ft. The dam so constructed will be of concrete with an average thickness of perhaps 20 ft. at the base, tapering to a width of probably 6 ft. at the top; this top or crest, of course, being level with the surface of the gravel that forms the bed of the river.

All pipe, except the last short section leading down from the penstock to the power house, is 48-in. wooden stave pipe, Fig. 1,

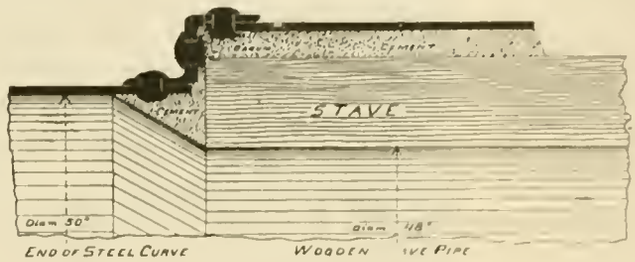

FIG. 2.

laid uniformly 10 ft. below hydraulic grade, and is buried in the side of the mountain. The pipe can be laid in curves, the radius of which depends upon the diameter of the pipe and the thickness of the staves. The sharpest of the curves of the San Gabriel pipe has a radius of 125 ft. Where sharper curvature could not be avoided, steel elbows were introduced of slightly larger diameter, having a riveted bell or socket to connect with the wooden pipe, the space between the pipe and bell being partly filled with oakum, driven in hard, the remainder being filled with clear Portland cement as shown in Fig. 2.

Fig. 3 gives an idea of the arrangement of the power house, from which it will be seen that it is composed of three apartments extending in the direction of its length. The apartment farthest from the mountain side contains nothing but the impulse water wheels with their gate valves, regulator hoods and housings, and the receiver. The center of the building, which forms the main portion, contains

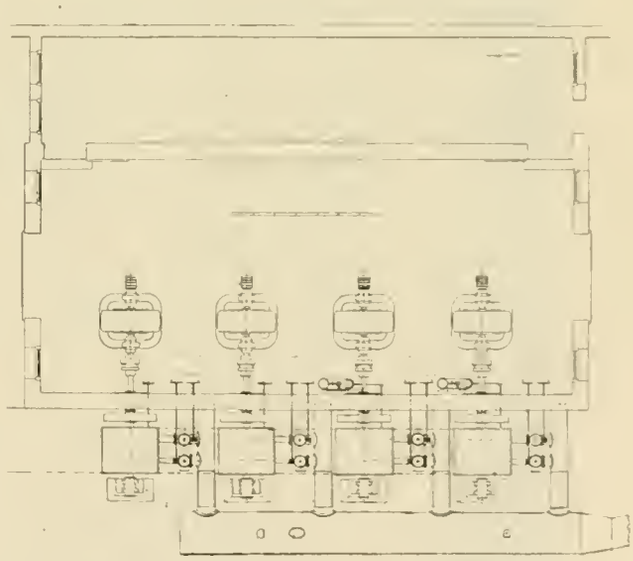

FIG. 3 DIAGRAM OF POWER HOUSE.

the generators, exciters, switchboards and water wheel governors, while the third apartment, constituting the transformer house, contains the step-up transformers, high tension switching devices, lightning arresters and choke coils, and from this room the line wires are carried out through a usual form of opening. A gable roof covers the whole power house, and in the center apartment, where the roof is highest, a traveling crane of sufficient capacity to handle any of the machinery, is installed. All walls of the power house, even the two inner ones dividing the building into compart-

ments, are of massive concrete work, and as the roof is of corrugated iron supported on iron trusses, the building is both substantial and thoroughly fire proof. Each water wheel shaft carries a three-ton fly wheel placed next to the wall, as may be seen in Fig. 4, and

FIG. 4—ARRANGEMENT OF FLY-WHEELS, RECEIVERS AND BUCKETS.

each set consists of two wheels, each supplied from an individual nozzle, and controlled by an independent gate valve. The water wheel governors were guaranteed to prevent a variation in speed of over 3 per cent with load fluctuations of 25 per cent.

A flexible connection between each water wheel and generator is obtained by means of two discs placed close together in parallel planes on the abutting ends of the generator and wheel shafts. Each of these discs has four pins projecting and a pin of each disc is connected to the corresponding pin of the opposite disc by means of oblong links of leather. This is an improvement over the old coupling of this type in that it uses the leather edgewise without cutting, rather than wrapped around flat as formerly. All of the electrical equipment of the entire plant is of Westinghouse manufacture, and in the Azusa station are installed four generators. These are of the revolving armature type with overhanging collector; their output is in two-phase current at a voltage of from 500 to 550, and their normal speed is 450 r. p. m. They are erected on concrete foundations, capped by wooden frames, and in order to insure accuracy of alignment and to make slight changes more easy, a sheet of boiler plate ¼ in. thick was placed on top of each wooden frame. This obviates the trouble in the erection of direct-connected machines from cutting into the wood while the alignment was being perfected. The bearings are of the usual self-oiling type with large oil reservoirs. The armatures are entirely bar wound and the coils

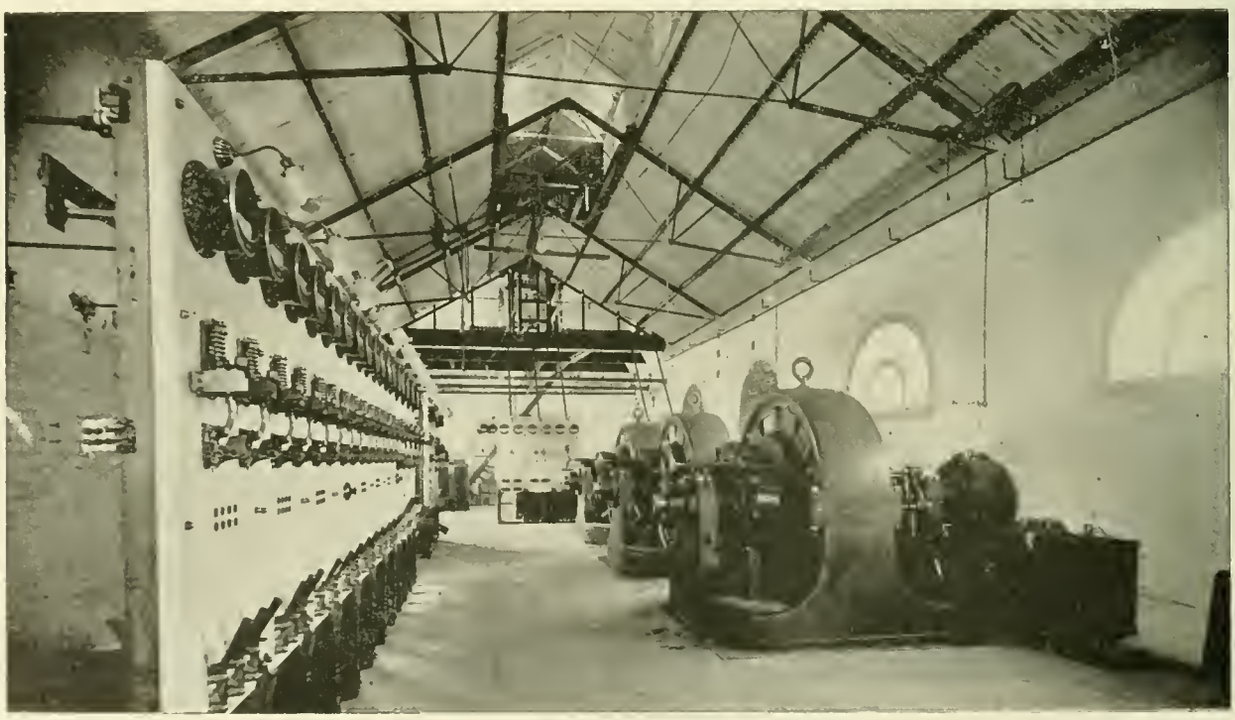

FIG. 5—INTERIOR OF LOS ANGELES SUB-STATION.

are held in place with fiber wedges so that no band wires are required. As a result the armatures remain perfectly reliable under most trying treatment. The exciters are of the four-pole type, having a capacity of 7½ k. w. each, which is sufficient for two generators, and delivering 125 volts at 1,300 r. p. m. All of the station wiring is placed in subways made of redwood boards and painted with P. & B. paint on all sides. The wiring is done with rubber covered wire on porcelain knobs, and all work is open for inspection and changes as the subways are covered entirely with removable boards. This presents no difficulty, as the cement floor of the building is made flush with the tops of these boards and thus the even floor is not interrupted. The paralleling of the two-phase equipments of the San Gabriel transmission is a process that is as reliable and satisfactory as is the paralleling of two direct current generators, despite the fact that water-driven generators are synchronized with a steam-driven one; or that rotaries or the railroad circuit are synchronized with each other or with either one or any combination of the preceding. All station transformers used by the

The Los Angeles sub-station is a one-story brick building with steel roof trusses, corrugated iron roofing and concrete floors; an interior view is reproduced in Fig. 5. The transformers are set in pairs in the room immediately under the high tension room, and each pair reduces the three-phase line current at 15,000 volts to two-phase current of the voltage required for its particular service. Each transformer is set on a separate wooden base and the floor is arranged with sub ways so that all of the low tension wiring is below the floor. The sub-station was installed so as to enable the operation of four varieties of electric service, viz. (1) a single-phase 2,400-volt lighting system for residence and outlying districts; (2) a 2,400 volt two phase power service for synchronous and induction motors; (3) a 500 volt direct current power service for direct current motors, elevators, etc., and (4) a 220-volt direct current three wire service for incandescent and constant potential arc lighting on either the 110 or 220 volt system. The 2,400-volt single-phase lighting circuits are, of course, merely one side or the other of the two-phase 2,400 volt power system, as the delivery of both

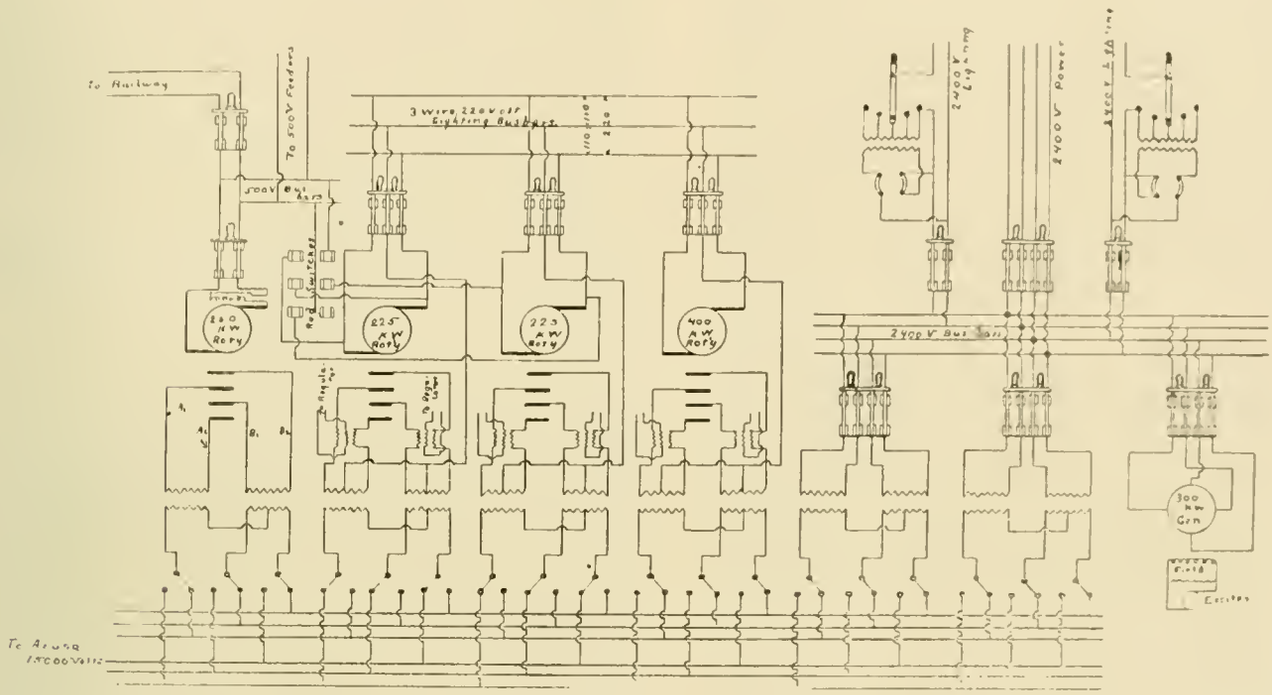

FIG. 6—DIAGRAM OF CIRCUITS.

San Gabriel Electric Company are of the self-cooling, or oil-insulated, air-cooled type, and except that different numbers of leads are taken out from the different styles of transformers as they may be adapted for rendering various characters of service.

The transmission proper is on the Scott system, that is, two-phase generation, three-phase transmission, and two-phase distribution. The four 250-k. w. step-up transformers at Azusa are, therefore, two-phase three-phase transformers, and step-down transformers at Los Angeles are three-phase two-phase transformers, but the last named deliver variable electromotive forces as required, while the former are wound at a fixed ratio, approximately taking 500 volts and delivering 16,500 volts to line. The noteworthy features of the line are that it is in two three-phase circuits, each consisting of three No. 5 hard drawn copper wires, supported on 5½-in. Locke glass insulators which are mounted on locust pins boiled in paraffine and then driven into cross arms previously painted with P. & B. paint. Each set of lines is spiralled—one-third turn at 7¾ miles from the Azusa end, and one-third turn at 7¾ miles from the sub-station. The two lines are spiralled in opposite directions. The line is twenty-three miles in length, the poles are round and placed about 125 ft. apart. The six wires are mounted on two cross arms, four wires being on the lower arm and two on the upper, the three wires of each circuit being placed at the corners of an equilateral triangle having 30-in. sides.

incandescent lighting and power from the same transformers are not attended with difficulty. The 500-volt power service was made necessary by the large number of 500-volt direct-current motors in use in Los Angeles prior to the installation of the San Gabriel plant, and the 220-volt three-wire system was preferred by the San Gabriel company's engineers to a low tension alternate current distribution because direct currents enable a more satisfactory operation of constant potential arc lamps, and, above all, their power factor is at all times 100 per cent, while against them can only be charged the fact that the efficiency of the rotary converter is slightly lower than the efficiency of the stationary transformers. The 500-volt power circuit is taken from a 250-k. w. compound wound rotary which is supplied with two-phase currents, at nominally 380 volts, from two 150-k. w. transformers. Four secondary leads, of 270, 400, 440 and 460 volts respectively, are brought out of these transformers so that any necessary voltage may be obtained on the direct-current side of the rotary. Direct current is taken off by 12 sets of carbon brushes, with two brushes on the arm of each set; the brush holders are of the swivel type; the armatures are bar wound; the cores have cooling air ducts, and there are four collector rings on the alternating current end, while overhanging as an extension of the main shaft is a 10-h. p. induction starting motor. Starting from the alternating current end is, therefore, a process of driving the rotary as a direct current generator by the starting motor and thereby exciting the

fields, which, in the 225-k. w. rotaries, are simply shunt wound. When the rotary is up to synchronism, the two-phase current may be thrown on and the rotary will always be of right polarity. This is a marked advantage over rotaries that are self-starting from the alternating-current end. While the San Gabriel rotaries may be started from either side, they are ordinarily started on the direct current side, that is, one from the other by means of a water rheostat, in fact, a start can be made from the direct current side of any rotary with much less fluctuation than from the alternating current end, since the starting current can be applied very slowly, giving the governors at the power station ample time to act.

No better way exists of conveying an understanding of the different combinations under which the electrical equipments of the plant have been worked during the trying season of drought just passed than by recalling the fact that the system may be resolved into five distinct portions, viz: (1) The Azusa station; (2) the Los Angeles auxiliary plant; (3) the practically unlimited power at 500 volts from the plant of the Los Angeles Railway Company; (4) the 500-volt rotary, and (5) the 250-volt rotaries. From the three first named sources of power, the four different characters of service, heretofore enumerated must be rendered. Last summer the Azusa plant was capable of delivering but about one-third of its capacity to the line, and when it is known that within a month after the plant was started it was called upon to carry a greater load than was believed it would be possible to secure within six months, it will be seen that it was necessary to take heroic action to meet the exigencies thrown upon the plant by reason of the shortage of water and the unlooked for increase in business. The auxiliary plant was therefore installed early in the summer in the belief that it would carry the 2,400-volt service, and that the Azusa plant could, with the assistance that it would receive from the auxiliary plant, carry the direct current lighting and power loads. It soon transpired, however, that these two plants were unable to carry the load, being short 250 k. w., practically all of which would have to be delivered to the three-wire mains at 220 volts. The only available source of power from which this 250 k. w. or more of energy could be drawn was from the Los Angeles railway plant and the reinforcing of the transmission line thereby through the operation of the 500-volt rotary from the direct current side. At all times the four classes of service have been delivered without interruption: First is the ordinary combination of running the entire plant from Azusa, in which the generators, as well as the 250-volt rotaries were run either singly or in multiple; second was the running of the entire system from the steam plant; third, the running of the entire system from the railway plant through the 500-volt rotary; fourth, the operation of any or all of these sources of power either singly or in multiple; fifth, the running of the 225-k. w. rotaries in multiple from the alternating current side, and in series on direct current sides, in which event one rotary delivers 220-volt service, and the two being in series operate the 500-volt power circuit; and sixth, the operation of the two 225-k. w. rotaries in series from the railway plant, one rotary operating one-half the three-wire system direct at 220 volts, and the other rotary operating at 220 volts in series with the other half of the three-wire load. These combinations can be effected by an arrangement of circuits as shown in Fig. 6.

It is evident that the plant is so arranged that it can be operated under several advantageous conditions; for instance, the first advantage was gained from the 500-volt rotary. The electrical end of the transmission plant was ready for operation before the water could be turned in and each day that could be saved on the installation was considered a great advantage. The railroad current at 500 volts was, therefore, run into the substation and the 500-volt rotary was used as a direct current alternating current rotary, giving alternating current which was used for getting the whole plant in operation. The other rotaries were started with this current; all the transformers were dried out and properly filled, etc.; all of the bearings were tested and put in proper condition for operation; all electrical connections completed, synchronizers adjusted and instruments tested, and everything was ready for operation, both at the substation and at the generation station, before the water was turned on. This saved about one week's time in starting the plant.

The conditions under which the plant is now operating are equally interesting. The entire day load is carried by the Azusa and auxiliary plants working in parallel; the San Gabriel Company has taken over the 500-volt power or commercial motor load of the Los Angeles Railway Company, on which is a direct current motor driving two Edison generators feeding into the underground mains of the Los Angeles Edison Company; during the peak of the load the 500-volt rotary takes current from the railway plant, stepping it up to 15,000 volts, at which electromotive force it is thrown in parallel with the Azusa and auxiliary plants, and, finally, the main generators of the Los Angeles Edison system are driven by steam and work in parallel with the motor-driven generators just referred to. During the peak of the load, therefore, five different stations are electrically tied together for the delivery of incandescent service, viz.: the Azusa water power plant, the auxiliary steam plant, the San Gabriel substation, the Los Angeles railway plant, and the Los Angeles Edison station. In other words, four stations, which are entirely dissimilar in that they deliver 15,000-volt three-phase current, 2,400-volt two-phase current, 500-volt direct-current, and 220-volt direct-current respectively, are all coupled together in parallel for the operation of two entirely different and independent systems of three-wire direct-current distribution.

All of the electrical equipment of the entire plant from the power house to the lighting and power services, was built and installed by the Westinghouse Electric & Manufacturing Company, with one or two minor exceptions, notably in the use of Weston instruments The copper for the transmission lines was furnished by the Washburn & Moen Manufacturing Company, that for the underground distribution by the John A. Roebling's Sons Company. Locke triple petticoat glass insulators are used throughout. The Paraffine Paint Company supplied the P. & B. paint used on the cross arms and in the underground work.

PURCHASE, INSPECTION AND DISTRIBUTION OF STREET RAILWAY MATERIAL AND SUPPLIES.

BY H. W. BROOKS.

Review of a paper and discussion presented at the meeting of the New York Railroad Club, October 20, 1898, with application to street railway practice.

When we stop to consider the enormous monetary value, together with the cost of purchasing, storing and distributing attached thereto, of material and supplies annually consumed by the railways of this country, we recognize the importance of giving this department of railroading very careful study, in order to effect economy in this enormous expenditure of money. Street railway managers are constantly striving to find some new way to reduce operating expenses, and so earn dividends for their roads or keep the deficit from piling up. They have tried some means and found them impracticable; they have tried others and found them successful. By giving careful, detailed study to the purchase and handling of supplies, and by putting the results of this study into practical operation, I believe every street railway manager can find another effective means of reducing operating expenses. Experience has taught superintendents, master mechanics and roadmasters to be economical in the use of material; but of what avail is this economy if the purchasing agent is extravagant in the price paid and method of purchasing? Buying is a difficult art. In business circles the failure of one concern and the success of another may often be traced to the buying, and in railroading the influence of a good buyer is felt in the prosperity of the company, although his skill is seldom fully appreciated.

What are the essentials of good buying? To know exactly what is wanted, i. e., the best article for the purpose, where to go to get it, and what price to pay are the principal points of good buying. No one knows all the points better than the manager, and consequently he should do the buying if his time will permit. If not, then it should be done directly under his supervision. On some roads this department is in charge of the secretary or other official, in connection with his other duties. Whoever does the buying should have a rare combination of qualities. He should be an able, honorable, broad-minded business man, possessed of sound judgment, and at the same time keen, shrewd, alert and energetic. He should be a man above suspicion, with no other business, especially with no pecuniary interest in railway supplies. He should have the ability to secure good prices for his road.

Quoting from Mr. Hodge's remarks; "The purchasing agent

should be something more than a mere price clerk and medium of communication between the chief engineer * * * and the dealer or manufacturer; he should, before he is competent to hold this responsible position, become familiar with the different classes of supplies used in all departments, the service required of them and the peculiar uses to which they are to be put. He should furthermore post himself as to the different kinds and qualities of railroad supplies on the market, with which object some study of the process of manufacture at the mills and factories is of great advantage, so that he may select his supplies with some judgment, and not make the selection depend solely on price—frequently a very expensive practice in the long run."

Also if the buyer would visit the shops and other places where material is used, so as to familiarize himself with the use and handling of material, he would learn why it is often more economical to pay a higher price for an article than to buy a cheaper substitute. Buying requires close watchfulness, and a careless, easy-going and indifferent man will never make a successful buyer. If a special purchasing agent is employed, the proper importance and salary should be attached to his position; and where the size of the road will warrant, it is recommended that a competent man, who shall devote his entire attention to buying, be employed. It is well to remember that a good buyer is worth a good salary, and a "cheap" man may be a most expensive one in the end. Whoever does the buying, whether the secretary, purchasing agent or employe, should be in close touch with all departments of the road, and should freely consult with the various officials.

Just how far the buyer's jurisdiction shall extend rests with each individual road. On some he is a mere order clerk, while on others he has considerable latitude, even dictating just what material his fellow officials shall use; but the latter is manifestly unjust to the other officials. As Mr. Hodges states, "The purchasing agent has no right to force a fellow official to use material which that official believes will not give satisfactory results in service, and as a matter of policy should not desire to do so, as he thereby relieves that official from all responsibility in case of any failure of the material to serve the purpose for which it was wanted; or in case of any accidents which can be traced to its use, the responsibility in these instances can very properly be placed on the buyer." It cannot be too emphatically stated that railway companies should first of all know distinctly and fully precisely what they need. Intelligent, experienced and well-trained railway men should know the best article for the purpose, and the authority to make requisitions on the buyer and storekeeper should only be given to such.

What quality shall be purchased? The rule to follow is to buy the right thing for the right place, or in other words, to make service, rather than price, the basis of selection. I think all managers are agreed on the ultimate economy of using only the best quality of material for its particular use. It is a very short-sighted policy to buy only the lowest priced goods, thinking thereby to reduce the cost of operating; and at the same time it is equally poor policy to buy material of too expensive quality, as to buy cheap material of inferior quality.

"A marked saving due to the longer service obtained from high-priced goods than cheap ones, is also readily shown in the case of supplies, such as shovels, scoops, lamp chimneys, lantern frames and globes, galvanized iron pails and cans, brooms, brushes and car washers made of genuine bristles instead of horse hair, etc. In these cases, as in others, I have satisfied myself that it is an economy to pay the difference in price in view of the longer life and better service obtained." Especially important is it to purchase only the best quality of electrical equipment of cars, which forms quite an item of the expense for maintenance, as nothing but the best grade can stand the very severe strain to which it is subjected. Dangerous material should never be bought. Its failure might result in loss of life or property, with consequent legal complications and heavy damages. Its final cost may be many hundred times the cost of safe material.

"The use of cheap shoddy so-called (wool waste), which has no elasticity and settles down in the box and fails to feed the oil up to the journal, causes hot boxes, and is soon thrown out by the inspector, whereas an elastic, long-fiber wove will far outlast the other and keep the bearings well lubricated. It frequently happens that the cost of making renewals is so much greater than that of the material used, that it is economy to pay twice as much for material which will last twice as long," and as an instance, the economy of long lived nes may be cited.

Now the scrap pile is an interesting thing and well worth watching. If you will only take the time to look into it, it will tell you a great deal. As Mr. Forney has well said: "There is one other matter that may be mentioned, which is the failures that occur on railroads. I think in an investigation of the sort of material that ought to be used, a great deal can be learned from the failures. One of the most instructive things to me, in traveling about the country among the railroads, has been to examine scrap heaps. I never have failed to be interested in them. They usually contain all sorts of material that has failed. You may take brass journal bearings. Suppose you get such bearings that do very bad service. As a usual thing they are dumped into the scrap-heap and melted up and buried perhaps. It seems to me it would be very instructive if you would take the bad metal and have that analyzed, and find out what is in it, and what the reason was that caused the failure of the bearing metal. It would be sure to shed some light on what the qualities are, or what a good bearing metal ought to have."

One of the most important questions that confront the buyer is that of price. Prices are often hard to determine. In New York city, for instance, you can buy goods for almost any price you are willing to pay. The buyer must keep himself constantly posted on the latest market prices and secure good prices for his road. By calling for competitive bids for definite qualities of articles, the lowest market price for material of any kind can be secured. The buyer should never pay "fancy prices" and should beware of exceptionally low priced goods, for exceptional cheapness often means adulterated or defective goods. If a purchasing agent thinks that by buying cheap supplies he is making a good showing, he is greatly mistaken, for while he may make a good showing temporarily, the ultimate showing will be very much against him. A favorable showing must be based ultimately on the actual service you get out of the goods.

The question of quantity, which is a serious one, was not touched upon in the paper presented to the club. The aim of all skillful buyers is to carry in stock only so much as is absolutely necessary to avoid delays in filling requisitions. Money locked up in idle material and supplies adds to the interest cost and cost of storing, and may be quite embarrassing to a road in financial straits. The greater portion of supplies should be bought at monthly intervals, but such staples as coal may be provided for in advance by contract. It is decidedly advantageous for the company to enter into contract with responsible houses for the delivery, at fixed prices, of certain things, in order to secure the lowest market prices and insure certain delivery.

"As I understand it," said Mr. Hodges, "the object of making a contract is to effect a saving, and in many cases a purchasing agent, by agreeing to purchase of a certain firm all of a certain class of material the road uses in 12 months, is able to get a better rate than he could by buying of different concerns at different times during that period. In other words, a manufacturer may feel that he can afford to agree to furnish that material at a lower price, if he knows that he can count on a certain amount being purchased during that time, than if he has to compete every few weeks with others for it, and that can be the only excuse for making a contract. Of course there is a certain risk attached to it, a risk on both sides. The dealer takes a risk, because the raw material which he uses in his factory, or the cost of labor, may go up during the year, and the purchasing agent runs the risk of having the price fall during the year. To a certain extent he is speculating on the rise and fall of prices during the coming twelve months. He simply takes his chances. So far as he can see he can at that particular time make a better arrangement as to price than if he buys for a few weeks' supply. So I think it is no reflection on the purchasing agent's judgment if during those 12 months prices may fluctuate so that he could possibly have bought elsewhere at a lower price. It does not seem to me that this contract principle would apply to every class of supplies, but in certain lines I think it a very good principle to follow, and I have followed it in a number of cases."

"There can be little doubt that the contract system tends to secure beneficial results in several ways," said another speaker. "The field is perfectly free and fair at a good letting, the material goes to the lowest bidder, and the contracts being let, the case is closed for a year and the defeated bidders have to hustle around to see how

they can beat the ruling prices at the next year's letting, while the railway has only to determine by inspection that it gets the material contracted for. One of the blessings of the contract system is that it lengthens the life of the purchasing agent, because when the contracts are let there is nothing in this line to do but to inspect the material; while if no contracts are let there are continual offers of 'better' material at much reduced prices during the whole year, and time which can be much better employed is spent in listening to the efforts of one set of men to undersell another set."

It is not good policy in the long run to purchase at one time large quantities of material ahead on some prospective rise in price, or in other words, to speculate in material. Railroad companies are not speculators, and if the buyer wants to speculate he had better go down on Wall street on his personal account. Then again large supplies result in the accumulation of articles that become "out of date" or shop-worn, and thus a dead loss to the company. Standardizing equipment and interchangeability of parts result in great saving in amount of stock necessary. Annually a large sum of money is squandered in the purchase of repair parts and supplies for electric railways, owing largely to the want of standards in their electrical apparatus. The distance of the railway from the market will also affect the amount of stock it is necessary to carry, those roads which are further away being obliged to carry a larger supply, bought at less frequent intervals and in larger amounts.

From whom shall we buy? Sometimes we are compelled, as a matter of policy, to buy from prominent stockholders or local politicians, and on steam roads, also from large shippers and industries located along the line, to foster their growth. In such cases higher prices may be paid than in the open market, but are more than offset by the indirect gain. But as a rule purchases are made in the open market, and a house furnishing a definite quality at the lowest price and giving prompt service should be selected. "The system of buying only of firms of long established reputation, because they can be trusted in the opinion of the buyer, does serious injustice to younger houses, equally honest and often turning out goods of equal quality. The purchasing agent should invite all respectable houses to compete for his business on a fair and impartial basis."

Of late there has been considerable discussion among railroad men as to the advisability of buying on specifications. While it is true they are scientific, the collection of the experience of other men and bringing it together for use in your own purchases, are of great value to railway systems making large purchases, at the same time they are not adapted to the average street railway, with the exception, perhaps, of machinery, rails and certain other construction material. Practical specifications are hard to get up, they are the work of experts, require too much expensive "red tape" for a small road, and demand minute tests of the material bought under them. Many a buyer has been tangled up in his own specifications. Buying from reliable houses, with the usual examination of articles bought by a competent man, has been found far more satisfactory.

How far shall railways carry on the business of manufacturing the supplies they consume? Although this practice has been successful in certain instances, as a rule it is not recommended, especially with the smaller roads. On this subject a man of ample experience remarked: "In going about the country and looking into railroad matters, the fact has been impressed upon my mind that the business of railroads is that of carrying freight and passengers, and although there are a great many very able railroad people who differ from me in this, it has always seemed to me that it was not desirable for railroad companies to go into the manufacturing business, and that if they confined their attention exclusively to the business for which they were chartered, which is the carrying of traffic, they would find that they had as much to do as it was possible for them to give attention to."

The proper inspection of material which has been bought is a thing that is often carelessly neglected. Too often material is ordered and that is the end of it; the buyer hears no more of it unless some one makes a kick. Many dealers knowing this, send an inferior quality, knowing it will be promptly accepted. Close inspection secures good quality, therefore an economical system of rigid inspection should be established, and whatever falls below the line should be promptly rejected. If dealers know to what close inspection their goods will be subjected by you, they will be very careful to send only first-class material.

Many of the larger steam roads have a testing department or a corps of mechanical engineers, chemists and inspectors attached to either the supply or motive power departments, and a thorough system of tests and inspection, but such a system is manifestly impossible for the average street railway, owing to its costliness. This work may be simplified to a great extent by being attended to by the heads of departments or by a competent man acting as buyer and inspector under the direction of the manager. It is always good policy for the buyer to also inspect his purchases, if his time will permit. The inspector should be a man of honesty and ability, one intimately acquainted with the quality of street railway supplies. In order to prevent the acceptance of inferior goods for those of better quality, and other frauds, the inspector must be a man of established character, experience, and not susceptible to flattery, favors or bribery. He should be a painstaking man, one that will inspect in detail, and not a sample from a car load. In every case the inspection should be fair and intelligent. Never try to cheat the dealer and never let him cheat you. Rails should be inspected at the mills before shipment, and if you are having cars built by the contract shop, you should have your man there to look after the work. Ties and lumber should be carefully inspected before going into the work or shop. But there are some supplies, such as paint and varnish, that seem incapable of immediate test, requiring months of service before the quality can be ascertained. Such articles can be purchased most safely from reliable houses, who have furnished you good articles in the past.

In the proper storage of material will be found another source of economy: Did you ever consider what money you lost by fire, deterioration and other results of improper storage? By a little forethought in properly locating the storehouse or storeroom near the principal shops, and in such a manner as to facilitate the easy handling of material, much time and money may be saved. By centralizing material at the most convenient point the following advantages may be obtained: Greater economy in storing and handling, necessitating fewer watchmen; better security from theft and destruction; greater ease in inventorying, and in being directly under the eye of the buyer, affording him a better knowledge of the condition and quantity of the supply on hand. The storehouse should be, if possible, a one-story building, substantially built, with ample fire protection. It should be equipped with appliances for handling heavy articles, as an elevator, overhead track and tackle, warehouse truck, etc. The storeroom should be light, dry, airy, clean and commodious. Every article should have a place, so that its location may be readily known, thus saving time and labor. Heavy articles, such as brake shoes, oil barrels, kegs or spikes, etc., bulky articles as bales of waste, oakum, bundles of brooms, etc., and articles most frequently used, should be located nearest the door. Such things as small hardware, stationery, and articles seldom used should be located farthest off. Racks should be built for bar and sheet iron. The various articles should be so arranged on the shelves and elsewhere that they may be readily seen.

In locating the power-house of a new road the engineer will, of course, make arrangement for the most economical handling of fuel, according to the particular conditions of the road in question, and therefore it will be impossible to state in a general way the most economical way to store and distribute coal, which forms a large part of the material used by an electric road.

In distributing material the idea is to handle it as few times and with as little cost as possible. On most of the medium sized roads the storehouse, power station, car barn and repair shops are located at one point, perhaps in one building, and therefore there is little expense attached to the distribution of material. But owing to consolidation of roads some systems find themselves with several power stations, car barns, storage yards, a machine shop and a car shop in different parts of the city. In such cases material can be distributed much cheaper by use of a freight car, with motor equipment, than by trucking. One large system, which I have in mind, is composed of cable, electric and horse lines, and buys its goods deliverable at dealers' warehouses, therefore it finds it more economical to carry on a trucking business, employing a number of trucks and delivery wagons.

Every manager realizes the importance of proper accounting, I hope, and unless material and supplies are properly accounted for, there will be a lot of operating accounts that are worse than useless, for they are misleading. The limits of this article will not permit

me to enter into detail on this subject, and I only wish to call the attention of managers to this subject, for the material accounting offers a great opportunity for intentional or unintentional errors in the construction and operating accounts.

In conclusion, I wish to emphasize the economy which may be effected by wise and judicious buying, storage and distribution of street railway material and supplies, and that the purchasing agent as well as the superintendent may be largely instrumental in earning dividends for the stockholders.

CABLE RAILWAYS OF EDINBURGH.

It has been a matter of surprise to street railway men to learn that in Edinburgh, Scotland, an extensive system of cable railways is being constructed and is now nearing completion. In this country the cable is being gradually and surely superseded by the electric cars. Even on trunk lines and routes of long and heavy grades the trolley car has proved its superiority.

In a paper on the "Conversion of Edinburgh, Leith and Portobello Horse Tramways' Systems into Cable Traction," W. N. Colam, consulting engineer, explains the reasons which influenced the adoption of cable traction for the most extensive system of tramways in the United Kingdom. It may be added that Mr. Colam has had wide experience in street railway affairs, having received his early training in that line in the United States. The illustrations are from the "Railway World" and the following extracts from the paper read before the Incorporated Association of Municipal and County Engineers.

In 1890 the cable system in Edinburgh was in its infancy, as the second line built had only been opened to the public in February of that year, and the first line in January, 1888. The information available at that time as to the operating costs was not reliable, because the lines had not been at work long enough to ascertain how far the working costs would be increased after the lines and machinery had been in use for some years. This can now be given without any dubiety from the regular balance sheets for the last ten and a half years up to the date when the corporation of Edinburgh bought the lines at a price which yielded a profit over the original cost of construction of about 30 per cent.

The conditions under which these lines have been compelled to operate cannot be considered conducive to the best financial results for either receipts or expenditure, for the following reasons: (1) The maximum speed was limited to six miles per hour when the system was inaugurated, mainly because it was something new, and has not since been raised because in the hilly district perhaps slow speed is not so noticeable. (2) No Sunday traffic on tramways has been permitted. (3) The routes are most exceptionally hilly. (4) The ends of the routes are not built over and lead nowhere in particular. (5) The engines are high-pressure, non-condensing, working at low pressure of steam. (6) There are no economizers for utilizing the gases nor feed water heaters. (7) The whole managerial department was in London which necessitated heavy traveling expenses.

Notwithstanding the unfair limitation in speed and other drawbacks, the results have been eminently satisfactory, as will be seen from the following statement (Table No. 1) made from a comparison of results in 1890 with the last year of the company's working in 1896.

TABLE I.

Year.	Motive Power.	Maintenance.	Total.	Car-Miles.	Passengers.
1890	$6,395	$11,095	$17,490	222,822	2,582,620
1896	5,940	13,550	19,450	376,725	3,715,989
Increase Per cent	.....	22.12	11.23	69.06	43.88
Decrease Per cent	7.74	.....	.....	.....	.....

Note.—The motive power includes wages, coals, oil tar, waste, water and engine room requirements. Maintenance is for road, cars and plant.

The reduction in cost of motive power has been due to improvements and a slight reduction in the price of coal, and the reason for no increase is that the loads up and down balanced on an average. These figures once more prove that cable haulage is able to enormously increase its car service, and so provide for the future without appreciable increase in its working expenses.

It will be observed from the returns that, whereas the number of passengers only increased 43.88 per cent, the car mileage increased 69.06 per cent. This is most important to note, because it points to a factor peculiar to cable haulage. It is directly in the interests of the management to improve the service of cars beyond even the requirements of the public, because, beyond the wages of the drivers and conductors, very little extra is incurred in placing each additional car on the line.

Even more satisfactory results than are shown in Table No. 1 were recorded on one of the cable lines during a week of greatly augmented traffic, and the author now presents these figures, believing them to show the most unique results for the conditions of operating which have ever been obtained in tramway practice in Great Britain. The ordinary weekly working expenses given in the table was arrived at by a division of the yearly certified accounts of 52 weeks, and the increased cost of operating was carefully checked during the week, and was mostly due to wages and gratuities given to the men and inspectors for close attention to their duties.

TABLE II.

Year 1893.	No. of Cars.	Mil'ge of Cars	Passengers.	Tons hauled per Mile.	Cost per Ton Mile in Cts.	Total Receipts.	Total Exp'nses
Show week, 24th to 29th July	47	3395	112,663	7.14	$1.50	$2,340	$375
Ordinary week. Average 4 w'ks	36	2514	27,541	5.75	2.22	570	335
Increase Per cent	31	35	309	24	..	311	12
Decrease Per cent	..	..	..	..	33	..	..

Table 2 shows that with the same fares a cable tramway was able to increase its receipts 311 per cent by a rise of working expenses of 12 per cent only.

That by quickening the service of cars by 1⅛ minutes, when the traffic would warrant it, the working expenses per car-mile run were reduced 1½ cents.

That the tons hauled per mile increased 24 per cent, and the cost of hauling a ton-mile was reduced 33 per cent. This is elasticity in the right direction, and the author is of opinion that local authorities and tramway companies too often make the mistake of not thoroughly arriving at sound conclusions as to the elasticity of a mode of traction in this direction when considering the initial cost of systems under scrutiny.

The last return of the company's workings showed that the cost per car-mile, including every charge possible, excepting depreciation and interest on capital, was 10.4 cents, notwithstanding the restriction on speed and the severe hills, etc. The receipts per car-mile had only been 20.26 cents, which was just about what the cost per car-mile run has been on the horse system of Edinburgh. The foregoing facts conclusively prove that the lines have been a great success financially, and the fact of the corporation of Edinburgh still favoring cable should be sufficient authority for the statement that mechanically they have met with public approval.

It may be of interest to give what the author believes to have been some of the reasons for adopting cable haulage in preference to other mechanical traction.

First of all, it must be stated that the original lines were self-contained and there was no inducement for extending the system for the preservation of continuity.

Secondly. The overhead system, which was the only other reported as being anything like a financial success was not entertained in Edinburgh because of its interference with the amenities of the city.

Thirdly. Because the contour of the city is peculiar in being exceptionally hilly, and where so many hills exist in a city, it is of paramount importance that the speed ascending hills shall not be less than that attainable on level portions of the routes.

Fourthly. The building limit of the city is more markedly defined than in most cities.

Fifthly. From the operating expenses of the cable systems in Birmingham, London and Edinburgh an approximate working cost per car-mile with the cable system could be determined, whereas by any other system which could be in any way considered, no such reliable information was available, particularly from experience of operating under British Board of Trade regulations. Further, it is within the author's knowledge that eminent electrical opinion has been given that Edinburgh is not a suitable place for electrical traction in any form.

The subsequent table gives the miles of lines within Edinburgh, Portobello and Leith reduced to single track of tramway.

TABLE III.

	Miles of Double Track.	Miles of Single Track.	Reduced to Miles of Single Track.
Edinburgh.....	19.004	.700	38.708
Portobello.....	2.110	...	4.220
Leith.....	2.165	.170	4.500
Total....	23.279	.870	47.428

Throughout the system there will exist nearly all conditions of tramway operating which are to be met with in ordinary practice. For instance, the grades are as high as 9 per cent, there are right angle branches, "S" junctions and compound triangular junctions to be worked. Single lines of track with passing places are not common, but at places are required. Cross traffic, where cables cross each other, have also to be dealt with. Bridges and cellars have already been crossed by the cable construction in Edinburgh, when clearances of 14 in. only from the surfaces of the roads have been available, and lastly, an arrangement for crossing a swing bridge in the Leith district has been designed.

Arrangements are made by which the traffic can be returned or (short circuited) through turn-outs when the management considers it will be advisable during parts of the day to provide an augmented service of cars short of the terminus of the route, and such provision is also made for isolating a cable section where a block may occur.

The general speed of cars throughout the Edinburgh district is to be eight miles per hour, but passing round important corners and over congested crossings, the drivers of cars will not be able to acquire a higher speed than four miles per hour, and they will be able to go as much slower than four miles as may be required.

Provision is being made to increase the maximum speeds when the Board of Trade may give permission. In the outlying district of Portobello, it is expected that the Board of Trade will raise no objection to nine miles.

The permanent way will be of interest. The track rails are of the usual type now common for tramways, and are 6½ in. deep, weighing 83 lbs. The joint adopted was designed with two objects in view:

Firstly. That the wheel in rolling along the tread of the rail shall not, in passing from one rail to the other, be left without a support, and thereby it is hoped that all chances of concussion due to break-joint will be abolished. Secondly. That by the arrangement of recessed nuts and flat cheese-headed bolts, the paving may be brought square up to the edges of the rails, and the author submits these two improvements are of very considerable importance.

The tests of 42 to 44 tons per sq. in. for tensile, 15 to 20 per cent on 8 in. for elongation, and 40 to 45 per cent contraction called for in the specification was objected to by British manufacturers, but the engineers are pleased to report that the effort was made, and the tests were fully obtained, with the result that extremely hard and yet tough rails have been laid in the system.

The slot rails weigh 48 lbs. per yard, and are made of a somewhat milder steel than the track rails, the tensile asked for being 39 tons to the sq. in., with 15 per cent elongation and a contraction of 30 per cent. The actual amount of metal appearing on the surface of the street in these slot rails is 1 3-16 in. Against these rails also it will be observed that the paving can be placed right up to the edge of the rail without any chipping, and on a square bed, which is important. The Barrow Haematite Steel Company carried out one contract for rails, and Dick, Kerr & Co. the other.

The points and crossings are all to be made of steel, and no facing points are used excepting when they cannot be avoided, such as at junctions.

Trailing points for track and slot rails will work by springs, but where facing points are required, the track points are connected underground to the slot points by levers in such a manner that, whichever way they are thrown over, there is a locking apparatus introduced to fix the slot correctly with the track points. The slot points are built up of cast and spring steel.

CABLE TRACK CONSTRUCTION, EDINBURGH.

The track points are made of cast steel, and track over slot and slot over track crossings are built up from the section of these rails, but the junctions of slot and slot are made of cast steel with renewable points.

The paving is granite, of two qualities as far as workmanship is concerned. Inside the track the blocks are 3 in. wide by 5 in. deep, and the average length is about 6 in. Outside the track the blocks are 6 in. deep by 3 in. wide. The better quality of blocks are axed on top as well as square on ends and sides. The hatch covers, which are used in the track for obtaining access to the pulleys, are filled with granite blocks specially dressed, and of the same size as other blocks, so that in ordinary conditions they are almost imperceptible on the road surface. In the road construction a great deal of wood has been used, and this has chiefly been of the hard Australian qualities. In some cases the wood has been laid from curb to curb, including inside the tramway track.

The standard distance between the tramway tracks is 4 ft., but where the streets are narrow, this has been reduced to 3 ft. At places where the streets are exceptionally wide, the tracks have been spread apart to give a distance between of 6 ft., and electric light posts have been erected in the center. The width of the slot is specified to be in no case more than ¾ in.

The terminal pits for diverting the cables at the terminal of each route are so constructed that, regardless of whether the route ends on an incline upwards or downwards, the cars will proceed to the extreme end of the journey by means of the cable, and no gravitation whatever will be resorted to. This is attained by passing the cable around two large vertically placed pulleys, one behind the other, and one slightly inclined. By this means, even in a heavy

snowstorm, a car could proceed through the snow to its terminus, and start out again without the tracks being cleared.

Where cables terminate in the middle of a route and meet other cables, the two cables are made to lap past each other by arrangement of large pulleys placed in a pit. At these places the cables are so arranged that the operation of releasing from one cable and taking the other is performed while the car is at a state of rest, and will not require more than 15 seconds to accomplish the change over. The operation is practically automatic.

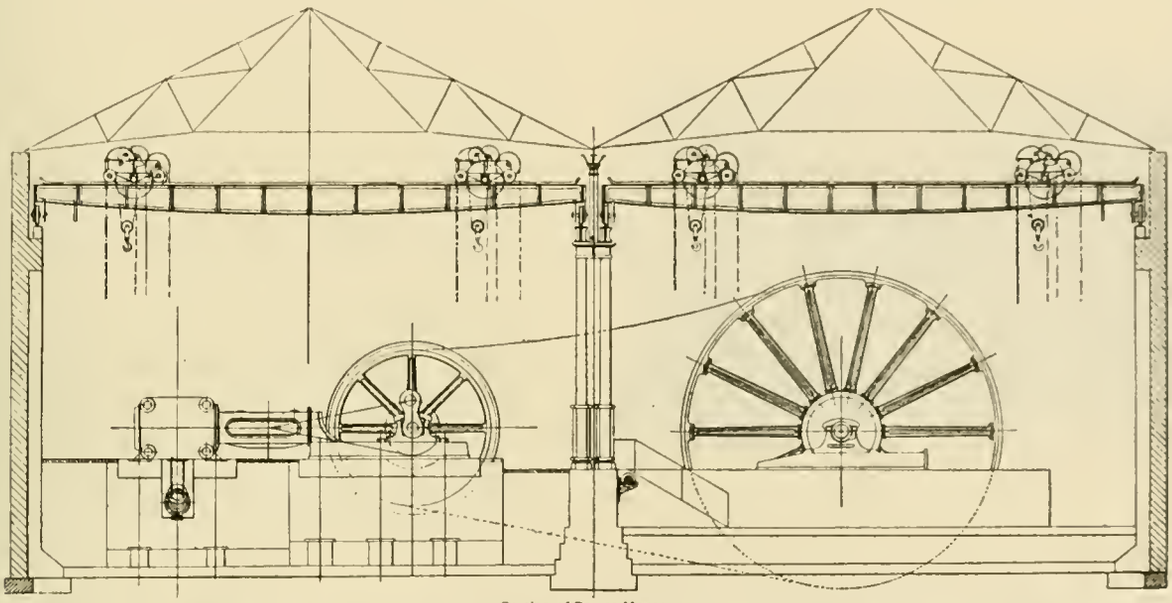
The reduced maximum speeds of cables for passing round important main corners in streets is obtained by the introduction of auxiliary cables, which are worked off the axles of large pulleys kept in motion by the main cable, and the main cables are thus saved from a great deal of hard work, and their lives, consequently, will be materially lengthened.

There seems to be an idea existing that cable tramway tracks are very serious innovations for streets, because they require a tube construction beyond an ordinary tramway track. The following information will confute any such erroneous impression.

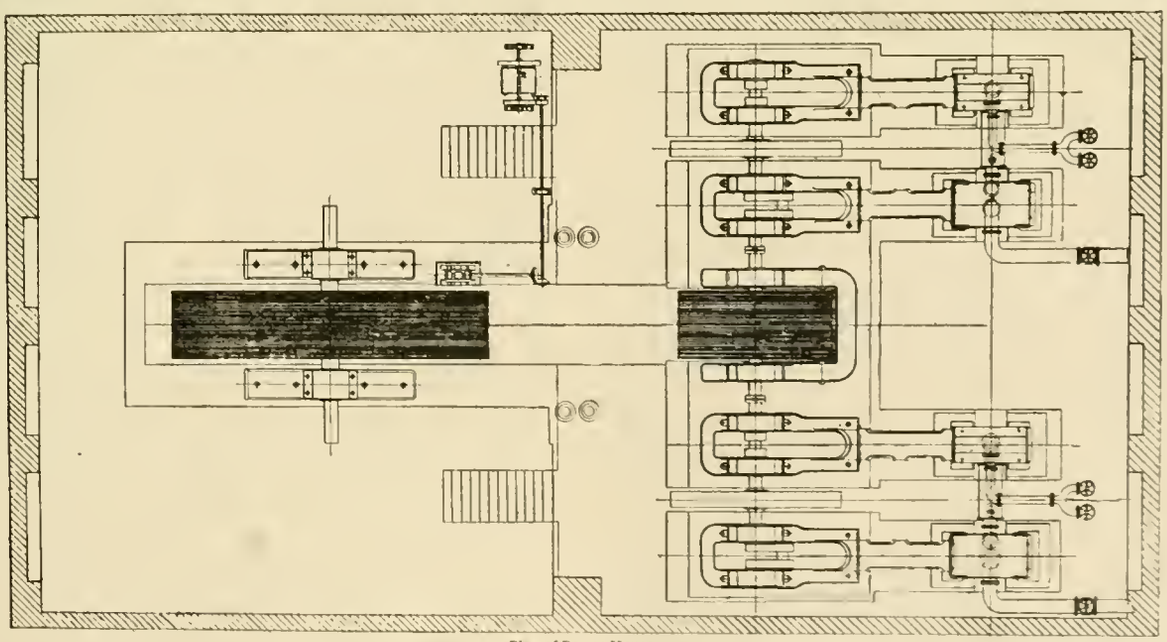
During the first 12 months of the contract there were laid in the streets of Edinburgh a trifle over 20 miles of cable track. The greatest speed attained was during six consecutive days, when an average of 220 yds. per day was attained on one section of new lines. It will be seen that the amount of finished work during 12 months averages a little more than 112 yds. per working day, which would be considered splendid work for an ordinary horse line, where the traffic is such as in Edinburgh, and where the tramway service has to be maintained. The contract for road and pit work was secured by Dick, Kerr & Co., Limited.

Station No. 1 is the main power-house and is located in the western district. The site is by no means an ideal one for the purpose, but by its adoption a miserable collection of houses has been removed, and a great public improvement effected. The principal materials used in the building are red stone and a fine quality of brick, the former being exclusively employed for the front elevations. The buildings include engine room, boiler room, chimney 180 ft. high, pump room, built-in water tanks to hold 40,000 gal., tension room, car sheds for 43 cars, cart sheds and stable for three horses, stores for road work, and underground stores for oils, etc., lavatories, offices, etc. The chief point for storing, painting and repairing cars is at No. 2 station, where the sheds are divided into sections, to isolate the cars in case of fire. Total accommodation for the storing of 225 cars is being provided.

The engines are horizontal compound non-condensing, with cylinders placed side by side on separate cranks set at right angles. There are three pairs of engines attached to the one line of main



Section of Power-House.



Plan of Power-House.

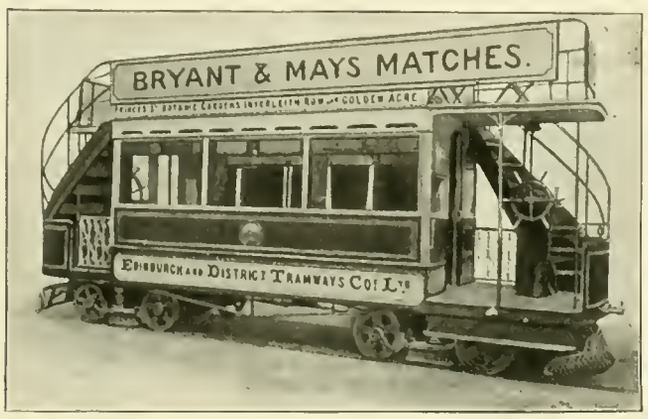
CABLE POWER STATIONS, EDINBURGH.

shafting. Each main shaft is divided into sections which can be connected by specially arranged couplings forged on the shaft ends. Two 14 ft. 6 in. diameter grooved pulleys are mounted in the line of shafting, so that any two of the three engines can be geared to work the two pulleys. These pulleys are made for carrying 32 ropes of 1 5-8 in. diameter, and they will revolve at 45 r. p. m. The power of the engines will be transmitted to the counter shaft through pulleys 30 ft. diameter. The high-pressure cylinders are 23 in., the low-pressure cylinders are 40 in. diameter. The stroke is 5 ft.

The engine room is provided with two cranes to lift 24 tons each. Dick, Kerr & Co., Limited, secured the contract for this portion of the work.

The boiler house is placed immediately behind and considerably lower than the engine room. All the pipes to and from the boilers and engines pass underneath the engine room floors without dipping, and do not appear at all in the engine room, also the low level of boilers should also reduce the chance of priming through siphoning.

The boilers are of the cylindrical marine type, 10 ft. 6 in. by 12 ft., with super-heater tubes on the top. The gases from the fire enter a back combustion chamber, from which they pass to the front of the boiler through tubes into the smoke box. They are returned over the top of the boiler, passing on their way around super-heater



CABLE CAR, EDINBURGH.

tubes into a second back chamber which directs the gases along the bottom of the boilers into the main flue.

Apparatus is provided for diverting the gases down the sides of the boilers, in case the super-heater tube should require attention when the boiler is under steam. The duty of these boilers is to evaporate not less than 9,000 lbs. of water per hour at a boiler pressure of 160 lbs. There are four such boilers designated to work up to a pressure ultimately of 160 lbs. These boilers will not be worked to anything like their full capacity, and a large reserve will always be kept in hand.

The main steam piping is welded steel, and all in duplicate. The feed pipes are in copper and are duplicated. The boilers are fitted with mechanical stokers, supplied with coal from an overhead bunker running the full length of the boiler house. Coal is taken up with ropes to the bunkers in receptacles resembling contractors' steel wagons, which are so adapted that they are suitable either for use on the body of a cart through the streets or to form the tipping body of a tramway coal truck which will travel on rails over the top of the coal bunker.

There are two heaters, arranged so that they may be used together or separately, and each is capable of passing 1,600 gal. of water per hour. The pumps are in duplicate, and are 8-in. double vertical type.

The arrangement of pipes from the pumps is such that any or all of the boilers may be fed with either hot or cold water.

At station No. 2 the arrangements of boilers and machinery is much the same as at No. 1, only the boiler house is not placed exactly in the same relative position to the engine house, but has the advantage of being at the side of a railroad, so that a siding has been made by which means coal can be lifted direct up into the bunkers instead of having to be brought in carts as at No. 1. At this station the repair shops are placed.

From No. 1 station there will be five cables driven, and the longest at present will be 24,000 ft., but these will all be capable of considerable extension. The longest cable in the system at present is 34,500 ft. Opposite each rope drive there will be an iron drum, with a spare cable for its respective route, ready at any moment to be run into the road. At the side of the engine room an engine and drum is provided for hauling out old cables, and it is estimated that the longest cable will be taken out, and a new one put in, within the space of one hour.

The grip apparatus to be placed on the cars is an important feature of the arrangements made for cabling the Edinburgh extensions. The old grip would not meet all the requirements of the new lines where some cables have to be taken in the gripper to the left, and others to the right, of the direction in which the car is proceeding. The new grip also has to be able to pass over crossing cables. The whole machinery is enclosed with a cast iron box standing on the platform of the car. The main improvements over the old grip consists of provision by which the driver of the car standing in the front of the car can operate the grip by his side or the one at the rear end of the car by a simple reversing of a lever. It is by this means that the driver can cross over the cable running at right angles to his path. He proceeds to a stopping point with the grip attached to his main cable, he then by the one process lets go that cable in the front, and takes it in the rear grip and proceeds over the crossing of the cable. The operation takes only a few seconds, and should be quite safe, because there is an automatic arrangement provided for stopping the car providing the driver should be forgetful or careless. Another improvement is, that the portion of the grip which works in the tube underground can be quickly detached from the car and dropped into the tube if anything should go wrong with it. There are 125 cars being built on the bogie principle. The bogies are very light in construction, being made of 5-16 in. pressed steel frames. The chief feature about them is that the wheels are on the axles outside the bearings, and that the wheel base is 3 ft. 9 in. and less than the gauge of 4 ft. 8½ in. This is contrary to customary practice, but the author has tried them very severely, and finds them to answer admirably. The cars are designed to seat 18 passengers inside and 28 outside, and the only noticeable departure from ordinary practice is that the insides of the cars will be domed after the manner of railroad coaches, instead of the type of roof common in tramway cars.

The whole of the work is from the designs of the author and your vice-president, Mr. Cooper, who are superintending the carrying out of the work with the assistance of their respective staffs.

MILEAGE MADE BY STREET CAR WHEELS.

Wheels for street cars for the most part are made with spokes, being similar in design to those used under horse cars, though they have been increased in both diameter and weight as electric traction has developed. From a 30-in. wheel, weighing 200 lbs. the increase has been to a 33-in. wheel weighing 350 lbs., or more. The advantage of the spoke section for cast-iron wheels is that for a given weight the metal can be massed and a deeper chill given the wearing surface; with plate wheels the web could not be made thicker than ½ in. or ⅝ in. and the use of a heavy chilling mixture would make it harder and more liable to crack in service

At the 1897 convention of the New York State Street Railway Association, F. D. Russell, of Rochester, presented a paper on "Street Car Wheels," discussing the subject with particular reference to whether they should be made heavier. The conclusions drawn by him from his experience as a manufacturer and from observation were that 335 lbs. is heavy enough for a 30-in. wheel, though they run from 325 to 350 lbs., and that for 33-in. wheels 380 to 400 lbs. is not too heavy

Electric service is severe upon car wheels because: (1) With groove rails and at jump crossings the load is carried on the flanges; (2) on motor trucks the wheels are drivers; (3) on curves with rigid wheel base the flange wear is great; (4) the higher speeds require more energy to be absorbed by the brakes, heating the tread and straining the spokes

MILEAGE OF STREET CAR WHEELS AND CAUSES OF FAILURE.

							Wheels taken out per cent for:

9	30	300	2¼	Mileage	40,000	120,000	.....	.....	50	40	8		

The above table exhibits some data concerning the life of wheels and the causes of their failures on nine street railways, all but one of which are extensive systems in large cities. The first five roads keep mileage records of individual wheels.

It is very noticeable in this table that the percentage of wheels removed for the same cause are widely different for different roads. To reduce the number of flat wheels some roads take drastic measures; we have in mind one that makes the motorman pay for them. No. 1 frequently discharges motormen for bringing flat wheels into the shop. No. 2 has scarcely any trouble from this cause, "flats" being very rare. No. 3 does not impose any fines for "flats." No. 4 fines the motorman for flat wheels, unless it is shown that he is not to blame. No. 5 imposes fines when carelessness is shown; it may be that the smaller proportion of flat wheels on No. 4 is because the burden of proof is on the motorman.

One manager writes: "We do not fine our motormen for flattening wheels, as, to our mind, it would be a very unjust proceeding. The motorman is given a car to operate through the public streets, and is required to avoid accidents as much as possible, and many times, to avoid an accident, it is impossible to avoid skidding the wheels. Theoretically it is all right to say that a man should not skid his wheels, and that he should be fined for so doing; but my experience is that practically it is wrong. The better way to do is to reason with the motorman, and educate him to using discretion and judgment to the best of his ability under the circumstances."

The point is made against regrinding wheels that the cost of shopping them is in most instances greater than is justified by the additional mileage which is got out of them. There is, of course, a limit of mileage after which it does not pay to regrind the wheels. This limit is placed at 20,000 by the manager of No. 9, whose wheels average 40,000 miles, and at 30,000 by the manager of No. 2, where the average life is 55,000 miles. A third says that it is not profitable to grind wheels if it is necessary to remove them, which is usually the case on his road, as the axles become sprung and it is necessary to straighten them, and in order to do that the wheels have to be removed from the axles and the axles put on the lathe.

Those who have had experience with steel-tired wheels agree that they are not as desirable as chilled wheels, as they wear no longer and cost more. The flanges wear rapidly on curves and flat spots are more frequent than with chilled.

An interim dividend of 3 per cent has been declared on the stock of the Cape Electric Tramways, Ltd., of Cape Town, South Africa.

THE CLEVELAND & EASTERN INTERURBAN.

Cleveland has a greater number and more mileage of interurban electric lines than any other city in the world. This being the most fertile field for experience in this line it is natural to turn to this city to determine if the interurban roads are as successful as was anticipated. The fact that every year for some time past new interurbans have been planned and built, or extensions made, is the best kind of testimony that interurban lines are in demand and are prosperous.

The latest interurban will be built from Cleveland to Chadron and Burton, a total length of 36 miles, which will be in operation by May or June. It is planned to extend the line to Andover, 70 miles, and ultimately to Meadville, Pa., 100 miles. The new corporation is called the Cleveland & Eastern Railroad Company and has offices at 710 New England Building, Cleveland. The officers, who are men of large business experience, are as follows: President, H. P. McIntosh, who is also president of the Canadian Copper Company and the Guardian Trust Company; vice-president, N. B. Sherwin, of the Sherwin & Williams Paint Company; secretary and treasurer, E. G. Tillottson, treasurer of the Cleveland Trust Company; attorneys, Baldwin & McGraw; chairman of the construction committee, H. Clark Ford; engineer, W. C. Jones, and consulting engineers, E. P. Roberts & Co.

Mr. Jones is now receiving bids for a 600-h. p. engine, boilers of 600-h. p. capacity, condensers, heaters, pumps and a steel self-supporting stack. The car equipment is to be purchased in the near future. The cars will have air brakes and four 50-h. p. motors which will give a speed of 45 miles an hour.

The Cleveland Electric Railway Company is installing a 2,400-k. w. generator made by the General Electric Company. It will be direct connected to an E. P. Allis corliss engine. The company has ordered 50 double truck open cars from the John Stephenson Company, and each one will have 14 benches and will seat 70 passengers. The cars will be mounted on Brill trucks and equipped with Westinghouse No. 49 motors.

At the annual meeting of the stockholders of the Cleveland City Railway Company all the officers were re-elected, including Senator M. A. Hanna as president of the company. Secretary J. B. Hanna reported that more passengers were carried and more car-miles run than during preceding year. A quarterly dividend of ¾ per cent was declared. There had been much street talk of consolidation, but this matter was not even discussed at the meeting.

ROTARY CONVERTERS.

Read by Prof. Silvanus P. Thompson, before the Institute of Electrical Engineers, England.

(Continued from page 33.)

Another solution of the problem, of more limited application, lies in so altering the distribution or concentration of the magnetic field at the poles as to change the irregular ratios into more regular ones. It was pointed out above that any concentration of the field will alter the conversion ratio. For example, the ratio in the case of the three-phase converter with sine distribution being 61.23 per cent., if the poles are narrowed a little, this may be raised to 66.6 per cent.; so that a machine which is a 300-volt machine on the continuous current side will be a 200-volt machine on the three-phase side. An example of this is afforded by a four-pole 55 k. w. converter constructed by the Oerlikon company, the description of which has been kindly furnished by Dr. Behn-Eschenburg. Drawings of this machine are given in Figs. 11 and 12. It was designed to receive continuous current at 300 volts, and to run at 600 r. p. m. Its armature is a two-circuit multipolar drum 20½ in. in diameter, 14 1-6 in. long, having 117 slots, and two conductors per slot. It has four sets of carbon brushes, set at zero lead. It runs quite sparklessly at all loads. As originally constructed the poles were furnished with pole-pieces (as shown) each of about 72° span, therefore having a breadth about 80 per cent of the pole-piece; the chord across the tips being 13 1-5 in. So shaped, the coefficient of conversion was found to be 57.7 per cent, as against the 61.23 per cent if sine distribution had been present. When supplied at 300 volts on the continuous current side, its open-circuit three-phase voltage was only 173 volts. The pole-tips were then cut away (as shown in Fig. 12), so that the arc of the pole-span was reduced to a little under 50°; the chord across the tips being now 9 in. and the pole-breadth being 54 per cent of the pole-pitch. This had the effect desired of bringing the conversion ratio up to 66.6, the open-circuit three-phase voltage being now 200. The ratio of conversion was constant within 2 per cent at all loads. Fig. 13 gives a plot of the performance of the machine under different excitations. It will be seen that the ratio of the ordinates is approximately that of 3 : 2. Two other points plotted show the demagnetizing reaction due to wattless currents. They affect, of course, the speed and heating of the machine, but practically have no influence upon its ratio of conversion when the excitation of the field magnets is normal. In its original shape, when operated as continuous-current motor at 300 volts, with an excitation of 2.1 amperes, without load on the three-phase side, it ran at about 470 r. p. m. When loaded so as to give out 153 amperes per phase on an inductionless circuit the speed fell, in consequence of reactions, to 440 r. p. m. At this speed the measurements were: continuous-current side, 295 volts, 153 amperes; on the three-phase side, 165 volts, 3 × 153 amperes. Then the output was changed to one of 235 amperes per phase of lagging current on a load of induction motors running light. The speed went up to 640 r. p. m. (showing a weakening of the field), and the instruments measured: continuous-current side, 298 volts, 32 amperes; on the three-phase side, 157 volts, 3 × 235 amperes. To keep the speed, and, therefore, the frequency, constant under such conditions, the (shunt) excitation would need to be adjusted in accordance with the load and its lag.

The pole-cores and yoke of this machine are of cast steel, each pole being wound with 3,200 turns of No. 14 copper wire; the total resistance of the shunt winding being 80 ohms. The armature resistance from brush to brush is 0.028 ohm. The machine runs sparklessly with zero lead of the brushes. It will also run as a synchronous motor delivering continuous current sparklessly, with or without excitation of the field magnet, and with brushes set at zero, or set with either a large forward or a large backward lead. With a large backward lead, running synchronously, without excitation, at 627 r. p. m., giving out 46 amperes at 100 volts, it took in three currents of 155 virtual amperes (largely wattless) at about 100 virtual volts at the three-phase side. The reactions in this curious case are exceedingly complicated.

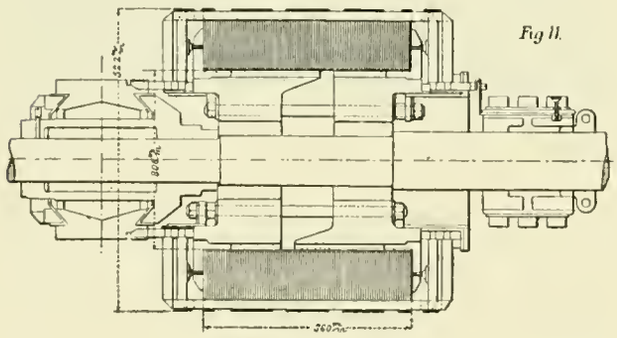

Fig 11.

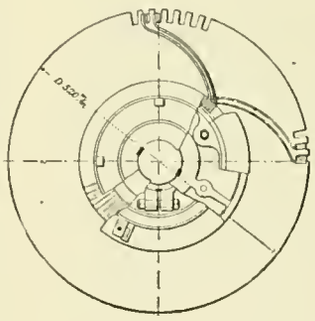

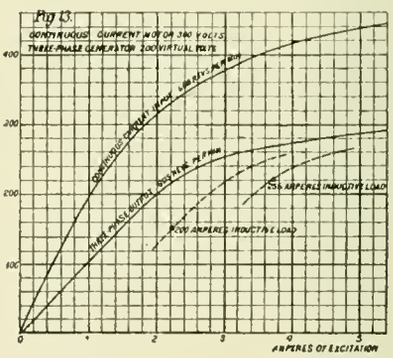

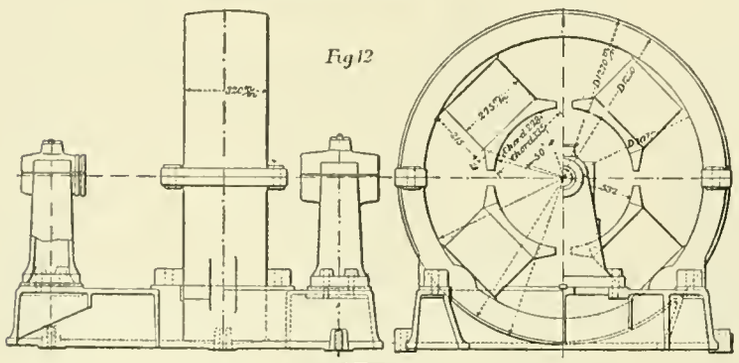

Fig 12

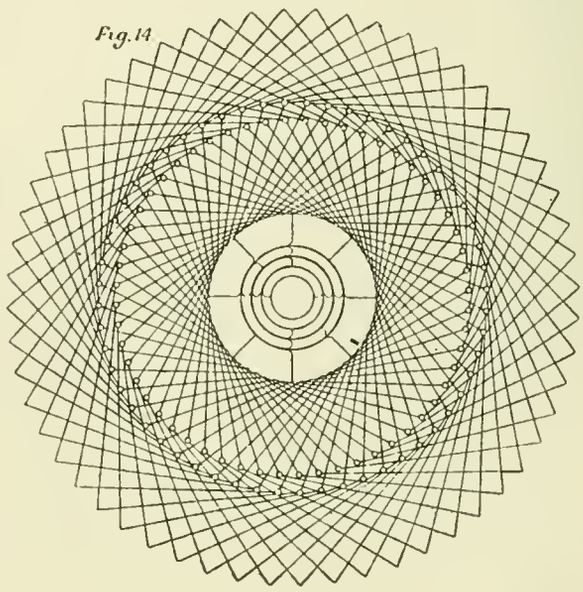

Fig. 14

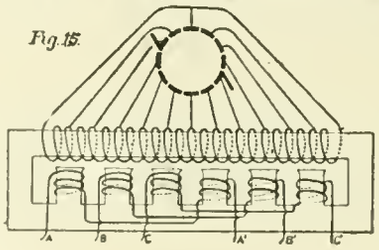

Fig. 15.

Quite recently Gisbert Kapp has re-examined the question of the influence on the conversion ratio, and on the efficiency of changes in the distribution of the flux. With the theoretical case of a sine-law distribution he compares analytically other cases, equally unreal in fact—namely, those of a distribution of supposed uniform density over a limited arc of polar span. From his calculations it may be deduced that the conversion ratio will be the same as the sine-law distribution if the poles are such that the breadth of their faces is about 70 per cent of the pole pitch. If the faces are broader, the voltage ratio for a single-phase machine will be lower than 70.7 per cent, and the ampere ratio higher than 141.4 per cent. If the pole-breadth is reduced to 2-3 of the pole-ditch, or to ½ the pole-ditch, the respective voltage percentages become as follows:

TABLE VI.

Voltage for	Sine Law.	Pole Ratio, ⅔	Pole Ratio, ½.
Continuous current ..	100	100	100
Single-phase ..	70.7	75	82
Two-phase	70.7	75	82
Three-phase	61.2	65	71
Four-phase	50.0	53	58
Six-phase	35.35	37	42

M. Routin has made another study of the effect of varying the pole-breadth in a mathematical paper, in which also he assumes the uniformity of the field beneath the poles.

In the Oerlikon converter (above described), the pole-breadth was only 55 per cent of the pitch, yet the voltage ratio was 66.6; showing that the field does not distribute itself uniformly, but is less concentrated, with fringing at the pole-tips.

Mr. Kapp has further treated the question of the limit of output for equal heating, for different pole-breadths, and for different angles of phase displacement in the currents. When the phase displacement is zero, the limiting output of a single-phase converter armature was (see above) 85 per cent of that when used as a continuous-current armature simply, if the sine law is assumed. For pole-breadths of 2-3 and ½ respectively, Kapp finds this increased to 88 to 95 per cent. This is equivalent to saying that if by concentration of field one makes the midway coils relatively more active, there will be for equal output less heating of the coils next to the connectors, and a less total heating. If there is a phase displacement such that cos ph = 0.8 (ph = 35°), the percentage output for sine-law distribution is 69, but with pole-breadths 2-3 and ½ respectively, this is raised to 73 and 80 per cent. But in practice the fringing of the field will reduce these latter values. For the more favorable cases of two-phase and three-phase converters, these percentages of output for equal heating of the armature are greatly raised. The three-phase converter, assuming sine distribution and no phase displacement, has a limiting output 134 per cent of that of the simple continuous-current armature. With pole-breadths of 2-3 and ½, the output rises to 138 and 144 per cent respectively; and if there is a phase dislocation such that cos ph = 0.8, to 117 and 126 respectively. For a two-phase converter the limiting output of 164 per cent, for the case of sine distribution and cos ph = 1, becomes 167 and 170 per cent respectively for pole-breadths of 2-3 and ½; whilst, when cos ph = 0.8, these numbers fall to 144 and 153 per cent respectively.

A four-pole 30-k. w. two-phase converter, constructed by Brown, Boveri & Co., has been described to me by M. B. Field, who designed it for that firm. The armature is wound according to the scheme shown in Fig. 14. It has four poles (two wound, two unwound), and runs at 1,200 r. p. m., giving a frequency of 40 periods per second. Its efficiency is about 90 per cent. The input being two currents, of 415 working amperes each, in quadrature at 40 volts, the output is 500 amperes at 60 volts. The armature is a cylindrical drum-wound, in 56 slots, with two conductors per slot, as a singly re-entrant double winding, being cross-connected at the slip rings to give four parallel circuits. At normal load, the excitation is such as to give a flux-density in armature core body of 7,800 lines per square centimetre, and in the teeth of 10,700 to 14,900. It runs (as exciter for some two-phase alternators) in parallel with some turbine-driven exciters and with a two-phase to continuous motor-generator. The ratio of conversion when running as two-phase motor did not alter greatly with the excitation, as the following figures show:

TABLE VII

Exciting current.	Virtual volts between slip-rings.	Volts at commutator.	Ratio of conversion percentage.
2	18·5	30·0	60·8
3	27·0	43·0	62·7
4	34·0	53·0	64·2
5	41·0	62·0	65·1
6	46·5	68·5	67·8
8	53·0	77·0	68·5
10	56·5	82·0	68·8
12	59·0	86·0	68·6
14	62·0	88·5	71·0

It is, however, in America that the converter has found its application on the larger scale, for the purpose of supplying continuous currents for tramway circuits, electric lighting systems, and electrolytic processes from distant power stations, whence the transmission is accomplished by polyphase currents at high voltage. These high voltage currents, when they reach the receiving end, are first passed through transformers to reduce the pressure to a suitable lower voltage, and are then passed through the converters.

* * * * * * * * * * * * *

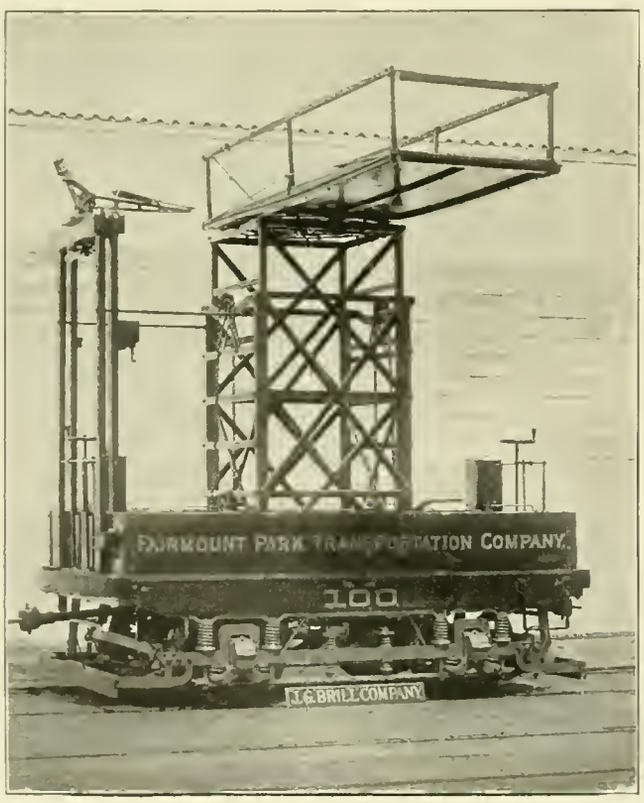
One difficulty which has been experienced when operating converters in their application on the large scale—a difficulty which could hardly have been foreseen from the working of small isolated machines—is a tendency for them, when grouped in parallel, to set up a see-sawing interference of slow period, probably in consequence of armature reactions, similar to those which in certain types of alternators trouble their parallel running. Another puzzling defect is a similar tendency to hunt, observable when two converters are arranged in series at the two ends of a long three-phase transmission line for the purpose of feeding continuous currents from one point to another. The cure for these troubles will probably be found in an analagous treatment to that adopted for securing good parallel running in alternators, namely, careful design so as to prevent armature reactions from unduly distorting the magnetic field. But the point demands further investigation.

Before quitting the subject of converters it is but right to refer to the existence of another class of rotating machines for effecting the same aim, and to which, for distinction, the name of "permutators" may be allotted. In this category are comprised those machines in which alternating currents (of one, two or three phases) are first transmitted through a stationary part of the apparatus (a species of transformer) where they create in a re-entrant sectional winding a series of alternating currents which differ from one another in phase by small successive phase-angles; these currents then being led off to a commutator and commutated section by section into a continuous current. To fix ideas, consider Fig. 15, which is adapted from a recent article by Dr. J. Sahulka in the "Zeitschrift fur Elektrotechnik." The lower part of the diagram represents the stationary transforming apparatus, having three pairs of projecting poles, wound with three circuits, A, A', B, B', and C, C', to which are brought the three-phase primary currents. The action of these three-phase currents is to produce traveling polarities along the row of poles, and induce electromotive forces in the coils wound around the portion of the core about the six-pole faces. This winding, it will be observed, is electrically the precise equivalent of a Gramme ring. In an ordinary Gramme dynamo the ring revolves between the two poles. Here, instead, the two polarities travel past the re-entrant winding. Under these circumstances, seeing that the commutator stands still, it is necessary that the brushes should be rotated synchronously in order that they may collect the continuous current. A development of permutating machines was made by Hutin and Leblanc, who turned the difficulties of revolving brushes by the following device: Upon the shaft of the synchronous motor is fixed the commutator and a series of slip-rings equal in number to the bars on the commutator, so that though the commutator revolves, each segment may still be in connection with its corresponding point on the stationary re-entrant winding. The brushes may then be fixed as in ordinary machines. The sole advantage of machines of this type seems to be that they can transform and convert the three-phase currents from

a high voltage without requiring the interposition of any other transformer. Their disadvantage in requiring many slip-rings is obvious. It is also very doubtful whether, under varying conditions of use, the sparking would not be excessive. Nevertheless, this type of converting machine is well deserving of the further attention of engineers. Probably there are cases where it is to be preferred to either the motor-dynamo group or the rotary converter proper. The motor-dynamo can transform the voltage as well as change the species of current. The converter can change the species of current, but only by adopting a fixed ratio of voltages.

TROLLEY TOWER CAR.

The trolley car, shown in the illustration, was built by the J. G. Brill Company for the Fairmount Park Transportation Company, Philadelphia. The road is peculiar in that there are no roadways along its route so that the usual trolley wagon was out of the question both for construction and repair work. The car body is mounted on a four-wheel No. 7 Brill truck with 33-in. wheels and two W. P. 50 motors. The wheel case is 6-ft. and the gage is 5 ft. $2\frac{1}{4}$ in. The body of the car is 12 ft. over the end sills and 6 ft. 10 in. wide. The sills are about 9 in. deep and are framed so as to give a strong support to the angle iron buffers. The sides are 18 in. high by $1\frac{3}{4}$ in. thick. They are strapped and made very solid. A short length in the centre of the side is made to drop. At one end there is a trolley stand on a separate frame which is braced from the tower. This stand carries four incandescent lights. In the same circuit there is a movable light with long leads, so that it can be used



TROLLEY TOWER CAR.

at the extreme end of the platform or at any other point about the car where a light may be needed. In each corner of the body there are tool boxes built in. The platform has a 9-ft. reach, and is placed in the middle of the car. The wide wheel base made this easily possible. The reach of the platform had to be great enough to cover the opposite track. There are brake wheels at both ends of the car, two controllers, two gongs, and the usual sand boxes are provided. The total weight complete is 15,000 lbs.

EXTENSIONS TO THE CITY AND SOUTH LONDON RAILWAY.

The underground railways of London have been brought to the attention of American readers lately by the large orders for electrical appliances placed in the United States. Although the cost of driving the tunnels is enormous the traffic in London is great enough to justify the expense. When compared with the surface lines the length of the tunnels is very short, with the further disadvantage that each short line is owned by a separate company. The pioneer of these railways is the City & South London Railway which was commenced 13 years ago.

Some important extensions are now in progress and they include the driving of a tunnel under the Thames river and constructing an underground station beneath a large church. A description of this work is given in the London "Electrical Review" from which

OLD AND NEW TUNNELS, LONDON.

the illustration and data are taken. The work of tunneling was commenced in October, 1886, and it was at the time and in this work that the feasibility and economy of the Greathead system of tunneling were demonstrated. In 1888 the hydraulic elevators were completed and in 1889 the contract for the electrical equipment was let. After four years had elapsed the road was at last opened in December, 1890.

The line consists of two iron lined tunnels which besides passing under the Thames, in some places go through water-bearing strata, compressed air in combination with the shields having been successfully used for this portion of the work. Grouting by compressed air was first employed on this line for the purpose of filling in the cavity left by the advance of the shield.

The rolling stock of the line consists of 17 locomotives and 54 cars, their peculiar design being shown by illustrations published in the REVIEW in September, 1893. In the first six months' operation 174,000 train-miles were run and 2,412,000 passengers were carried and in the half year preceding January 1, 1898, 230,000 train-miles were run and 3,337,861 passengers carried. During the latter period the operating expenses were 56.67 per cent of the gross receipts and a dividend of $1\frac{3}{4}$ per cent was declared. The system has never been particularly successful financially and the new work has been undertaken with the hopes that the traffic will be materially increased. One new station will be near the London Bridge terminus and connections will be made with the Northern & City Railroad and the Metropolitan, Central London and Waterloo & City underground railways. The line has heretofore been out of touch with other railway systems but with the extensions it will connect with a complicated network of railways. The most conspicuous feature from an engineering standpoint is the underpinning of St. Mary Woolnoth church, underneath which the shafts

for the elevators have been sunk. The company was granted power at one time to pull down the church but later the condition was imposed that the structure was to be left intact but the subsoil could be used for a station. The large oblong shaft is 24 by 73 ft. and divided into five bays, each of which contains an elevator. It is lined with a cast-iron casement for a depth of 52 ft., the remaining portion being brickwork in which are the entrances and exits to the elevators. The two station tunnels are each 21 ft. in diameter and lined with cast iron rings.

In underpinning the church the four main girders, designed to support the four groups of columns which carry the roof, were fixed in position, and small needle girders were then threaded through the bases of the columns. The south wall was pierced at intervals of about 5 ft. and strong needle girders fixed through the wall, one end resting on the solid stone on the outside, and the other tied down to one of the main girders supporting the columns. For the wall on the north side the same method could not be adopted, as the work could not be executed from the street. One main girder was therefore designed to carry the whole weight. Needle girders were fixed just below the church floor level, under cover of which the wall was cut away to allow of the girder being fixed. After the wall had been securely pinned up above the girder, suspended needles were put in one at a time, and the intervening masonry held up by cross steel joints placed on the top of the needles. Grouting under air pressure has been largely employed in the work, especially for filling up between the girders and the old masonry.

The power station which is located near one terminus has been in operation for eight or nine years and the machinery is of obsolete design, Siemens bi-polar dynamos being belt driven from Willans engines. The illustration shows the junction of the new tunnel with one of the old ones, the original line being to the left in the picture. The work at the junction was accomplished without at any time stopping the regular traffic.

WASHOUTS IN THE MIAMI VALLEY.

The six views here shown were taken after the flood on March 23, 1898, which was one of the most disastrous known in the Miami Valley and doing great damage to railroad and electric railway property. It represents one of the obstacles with which many interurbans have to contend. On account of these washouts the Cincinnati & Miami Valley Traction Company which owns 37 miles of track had to suspend operation for three days between Miamisburg and Hamilton and one day between Dayton and Miamisburg. There was also great damage between Middletown and Trenton and more than a mile of the roadbed between Overpeck and Hamilton was destroyed. It cost a large sum to put the roadbed in shape again and it was six weeks before the trestle was pulled back into place.

RESULT OF A FLOOD OF THE MIAMI RIVER.

The trestle was built in the Miami river between Franklin and Middletown and is 1,700 ft. long. The northern half which was not affected by the flood was anchored with stone but the lower half, which was lifted and thrown to one side, was not anchored. The reason for this was that the river bed is formed of shale rock and the piling instead of driving into it,dubbed up on end and just stood on the bottom of the river. The water coming up under the stringers floated it.

The pictures are from the following views: 1. The washout at Franklin dam. 2. The south end of the river trestle. 3. Another view of the south end of the trestle. 4. The center of the river trestle. 5. Building up the roadbed at Franklin dam, the break in the bank having been stopped with gunny sacks. 6. Looking south from the Franklin dam washout.

J. Walter Gillett, electrician of the Marinette (Wis.) Gas, Electric Light & Street Railway Company, has resigned and has accepted a position as superintendent of a large electrical concern in United States of Colombia, South America.

STOREROOM ACCOUNTS OF THE CALUMET RAILWAY.

There are few leaks in street railway management that can be so easily and effectually stopped as the loss of stock material, but if it does not receive proper attention the waste soon grows to considerable magnitude. Whenever a road is of sufficient size to have its own repair shop it becomes a manufacturing institution on a small scale and it would be well to copy factory methods. In the care of stock material there is great negligence with many roads. It is not uncommon to see stock kept under benches in the repair shop and in the car barn, open to everyone, and no one in particular responsible for its keeping; or, even worse, parts are left outside exposed to theft and to the weather. When J. J. Williams was appointed auditor of the Calumet Electric Street Railway Company of Chicago, he believed that the material saved by providing a place and a man to care for it would more than compensate for the cost.

The company owns about 90 miles of track and has 225 cars. It is a suburban road throughout its entire length and has quite a variety of equipment, some of which has been in service for several years. In consequence there is much repair work and a large stock has to be carried. The stores are kept in a separate building at the rear of the repair shop. On the first floor shelves are built up around the walls and subdivided into boxes. Every kind of article or material, no matter how bulky it may be, has a separate box and number. There are now 2,340 boxes and this number will shortly be increased to 2,500. The different oil cans and barrels are given a box number, as are also the racks holding iron for the blacksmith shop. All the scrap iron about the place is gathered, sorted and boxed. The heaviest material is kept in the basement, which is about on the ground level. The parts most frequently called for are kept close to the storeroom window, all arrangements being made with a view to quick delivery.

All material is delivered to the storeroom, together with the bills for the same after they have passed through the hands of the general manager and purchasing agent. The storekeeper counts or weighs everything and then makes the proper distribution. He then enters on his stock-book the number and size of each article with date of delivery. In the price-book is entered the cost of each article from the bill. A duplicate stock-book is kept by the clerk in the auditor's office, the records of which are made from the daily reports of the storekeeper. Nothing leaves the storeroom except on a stock requisition.

REQUISITION BLANK.

parisons are made. By this means if the storekeeper should change the requisition in any way it would at once be detected. If there was a desire to defraud the company a collusion between the storekeeper, the foreman and workman would be necessary.

The stock-book contains a page for each separate kind of material, and each page is divided across for four years of 12 months and the months are subdivided into 31 days. When the day's requisition comes in entries are made for all the stock consumed.

At the first of the month the amount or number of each article is given and beneath each day the number used is checked off. At the end of the month the number or amounts used are added together and substracted from the stock on hand at the first of the month. As a check on the accuracy of the accounts, each month the auditor orders some of the boxes to be inspected, choosing any number he may think of, but not in rotation, from month to month. At the end of the year an inventory is taken. That these accounts are carefully kept is demonstrated by the one for the last year. The inventory came within $3.10 of checking with the records made from the bills and requisitions.

It might seem a difficult task to keep records of the value of each article while the market prices are fluctuating more or less. This is simplified by the rule that every article must be valued on the requisition at the price paid for it. The present market value has nothing to do with the use of material from the storeroom. As an example of this: if 100 bolts were purchased for $1.50, and after 75 had been used another lot of 100 was received, the price of which had dropped to $1.00, the first 100 bolts are charged at 1½ cents apiece, and it makes no difference whether the last 25 of the 100 bolts are actually taken from the first or second lot. A complete record is kept of all the old material that is sent to the storeroom and a price set on each article. Piping and valves which have been put aside for the time being are placed in the storeroom and given a value. A price is fixed on the sorted scrap iron, and a charge is made against the foundry whenever any is used there.

PAGE FROM STOCK-BOOK, CALUMET RAILWAY.

When a workman has to use so many bolts, oil, etc., he goes to the foreman and gets a requisition which is made out in duplicate. He takes the slip to the stockkeeper, and at the delivery of the stock the workman signs the requisition in receipt for the material. The storekeeper places this on file and at 9 o'clock each morning he delivers to the auditor's office all the requisitions, with price and box number added to each, which were honored the previous day. The foremen send their duplicate requisitions to the office and com-

The complete system of accounts which has been introduced and developed by J. J Williams is almost identical with the standard system of accounting of the Accountants' Association. In the classification there are a few minor differences, but Mr. Williams intends changing these to conform with the standard. A feature which is of great value for reference is the special construction accounts. For any work which is in any way out of the ordinary, such as putting in machinery, new line or track work, paving or crossing work, new buildings, vestibuling cars, etc., General Manager Sloan issues an order which is known by its number. Copies of this numbered order are posted in the office, car barn,repair shop and one given to the timekeeper. The time, material from stockroom and material specially purchased for it are separately charged to the order, and in this way an itemized account is kept of the costs. Afterwards the amounts are transferred to under the headings of the regular classification. At the end of the month a statement is given to each head of a department showing the cost of labor and material, and in this way any leak or mismanagement is soon detected and attention called to it.

GENERAL MANAGER'S ORDER NO. 313.

In construction work at power house, charge to above general manager's order. Distribute labor and material as follows:

A. Excavations for stack.
B. Foundations for stack.
C. Stack proper.
D. Excavation for boiler foundation.
E. Foundation for boilers.
F. Boilers proper.
G. Furnaces.
H. Preparatory work.

The Cleveland City Railway is building a new car house at Rocky River; it is 85 ft. by 340 ft.

TOLEDO TRACTION COMPANY BAND.

Thos. H. McLean, general manager of the Toledo Traction Company, is one who believes not only in the desirability of improving his men in every way, but favors also frequent gatherings for social and literary purposes, and at these functions he is always one of the moving spirits. Not long ago he discovered that a large number of the men, like himself, are very fond of good music and that among the several hundred employes were quite a number of excellent musicians. When he proposed to organize a brass band to be composed exclusively of Traction men, the plan met with instant favor, and with a generous subscription of his own and the company the boys had no trouble in raising the balance of the thousand dollars necessary to buy the instruments. Though in existence but a few months the Traction Company Centennial Band has already become famed for its excellence, and is the pride of everyone from president down, and its services are in demand for parades as well as the special monthly concerts given exclusively for Traction employes and their families. The band includes 25 members and has chosen for its motto the admirable sentiment: "Life, Liberty and the Pursuit of Happiness." J. Collins, superintendent of the company, is president of the band and his portrait is shown in the lower right hand corner of the engraving. The band manager, whose portrait appears in the lower left, is A. A. Atkinson, contracting agent for the lighting department of the Traction Company. As noted in a recent issue of the REVIEW the band gave a most enjoyable and successful public entertainment on November 10, last.

TOLEDO TRACTION COMPANY CENTENNIAL BAND.

The Mahoning Valley Railway Company, of Youngstown, O., contemplates building about five miles of new track and making some radical changes in the power station arrangement. The plan is to discontinue the operation of three separate stations, now in use, and build a new station sufficiently large to furnish current for the entire system.

ANNUAL REPORT OF THE "ALLEY L."

At the annual meeting of the stockholders of the South Side Elevated Railroad Company, of Chicago, the officers and directors were re-elected. President Carter stated in his report that the road had been earning for the past six months 3½ per cent on its capital stock and although it had seemed best to expend the earnings so far for betterments, if expectations of business continue dividends can be declared in the near future. The average daily traffic for the year has been 51,771 passengers against 36,525 last year. When the motive power was changed it seemed that 120 cars would be sufficient to take care of the traffic, but now the entire equipment of 180 cars has been prepared for electric traction. During the past year storage batteries have been installed, the Union Loop station has been connected to the feeder system, an inspection shed has been built, the machine shops completed, the lighting station remodeled to suit the new conditions and a bridge built to connect the Stony Island avenue station with the terminal station of the Calumet Electric Street Railway Company. But one passenger was injured on the cars of the company during the past year and that one not seriously. A combination with the Chicago City Railway Company which was discussed during the year was prevented by legal objections. The following table gives the average traffic per day for each month of 1898, the percentage of increase over the corresponding months of 1897, earnings, operating expenses and the percentage of operating expenses to gross earnings. The reduction from 84.5 to 55 per cent in the ratio of expenses and earnings represents the comparative economy of steam locomotives and electric motor cars.

	Average daily traffic.	Pct. inc. over 1897.	Earnings.	Expenses.	Percent of earnings.
January	52,117	48	$82,927.22	$70,242.55	84.7
February	52,691	47	76,119.32	63,597.85	83.6
March	54,828	54	87,631.33	71,101.20	81.1
April	54,149	56	84,391.38	68,170.47	80.8
May	49,459	51	79,925.78	56,101.25	70.2
June	45,427	54	70,633.88	53,442.91	75.7
July	44,148	63	70,662.98	49,762.77	70.4
August	41,770	54	67,733.75	43,175.69	63.7
September	46,576	55	72,336.36	45,681.43	63.2
October	58,198	48	92,618.58	52,602.76	56.8
November	59,257	*09	92,372.14	52,923.58	57.3
December	62,735	*10	100,938.78	55,583.10	55.0
Totals	51,777	42	$978,291.50	$682,385.56	69.8

*Loop in use in November and December, 1897.

At Cleveland, recently, as two cars were passing, the trolley wheel of one fell and was carried through the vestibule and front partition of the other, breaking glass and slightly injuring two passengers.

SIGNAL SYSTEM OF THE LEHIGH VALLEY TRACTION COMPANY.

The Allentown & Lehigh Valley Traction Company has developed a very neat signal system. The steep grades, curves and single track requires a signal which will operate positively and hold the cars on switches until the track between switches is clear. This system is a manual one and this method has the advantage of making the conductor responsible for maintaining his right of way.

The system is operated as follows: A conductor before entering a section between switches pushes a switch rod which sets a signal at the turnout ahead, a magnet operating a red semaphore and incandescent lamps behind a red glass disk. This makes the signal visible both night and day. This semaphore stays set until he reaches the switch ahead; then the conductor opens the circuit which sets that track behind him to safety. If on reaching the switch he finds the semaphore is set to danger, he has to wait on switch until the car passes. Conductors only set semaphores ahead of them and release those behind; the car is controlled by the semaphores operated by the conductors of cars passing it at the

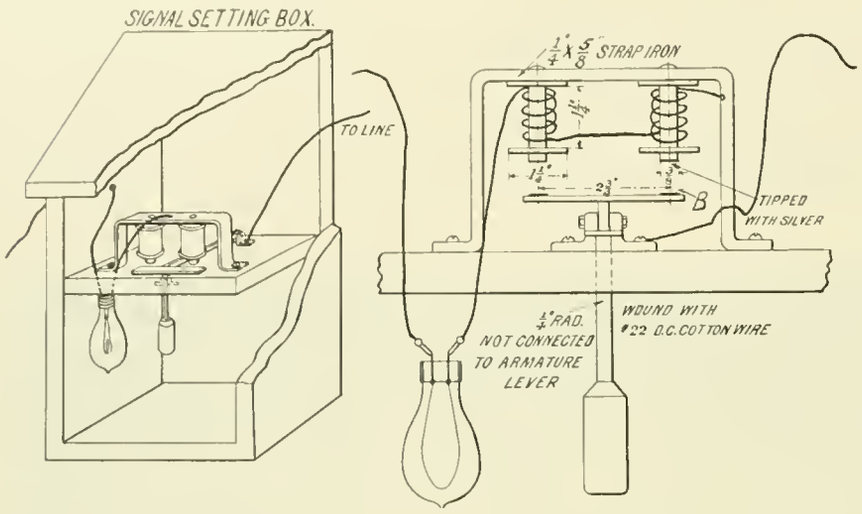

FIG. 1.

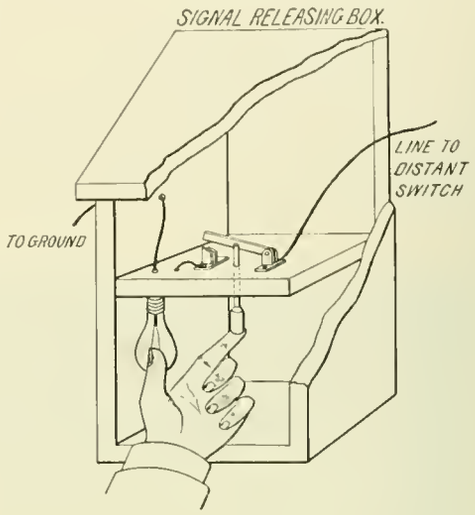

FIG. 3.

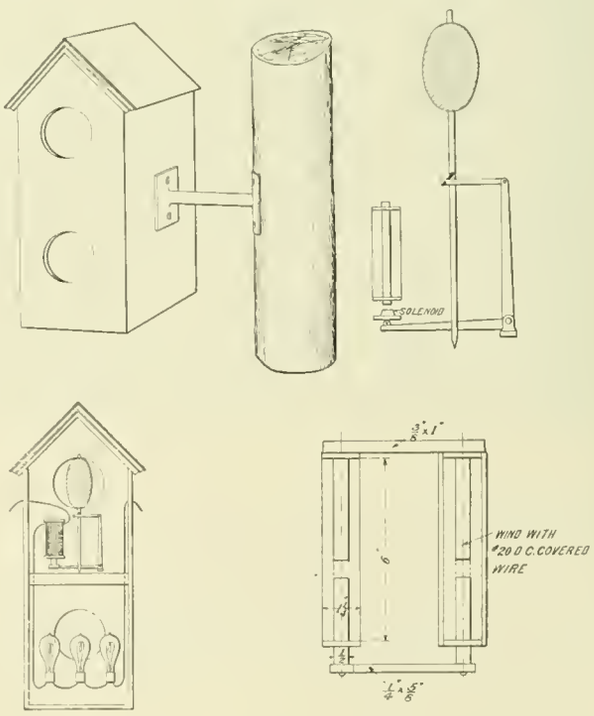

FIG. 2.

switches, and the signal systems for cars operating in opposite direction are entirely independent. In each signal box there is also a pilot lamp which is extinguished when the section of track is opened and illuminated when the section is closed; this gives the conductor knowledge that his signals have properly operated at the distant switch. As the first signal set gives the right of way there is no meeting between switches. The detailed description is given below and by it its construction is readily understood.

There are three separate operating parts, a signal setting box, a signal releasing box and the semaphore box.

The signal setting box is shown with details in Fig. 1. The magnets are 1¼in.x1¼in. winding space with fiber heads and ⅛ in. core; the end of the iron cores exposed to the armature are tipped with platinum or silver, and the armature, B, is also faced as these surfaces come together and complete the circuit and are held in contact by this current also passing through the magnets. The armature B normally rests out of the influence of its magnet. A rod entering from the bottom of the box shoves this armature up

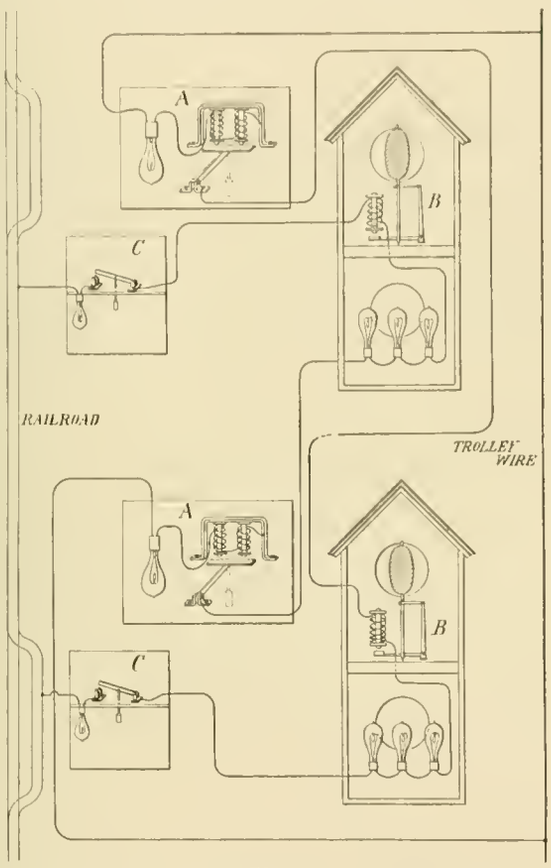

FIG. 4.

into contact with the ends of the magnet, and is held in this position until the circuit is broken.

The current from the trolley enters first through a lamp, then through the magnet winding to the frame. When the armature is up the current passes down the arm holding the armature and then through the signal line to the distant semaphore box.

The semaphore box contains a pair of solenoid magnets which set the semaphore disk and light the lamps. These lamps are arranged behind a red glass disk inserted in the semaphore box. The disk is set by means of a solenoid operating a bell crank and link, which turns the semaphore rod and displays the red disk. The dimensions and methods of general construction employed are shown in Fig. 2 The circuit first passes through three lamps, then through the solenoid and out to the signal releasing box. The construction of this box is shown in Fig. 3. and consists of a switch and a lamp in circuit with this switch. It is operated by pushing up the rod and when the rod is released the blade falls back into position, but it will not close the circuit now, for on opening the circuit, the magnet in the circuit making box dropped its armature and opened the current at the distant switch, which can now only be closed by the conductor on the car following. The diagram of connections is given in Fig. 4 Covered No. 10 iron wire can be used. Robert Doumblaser developed all the details, and Assistant Manager Walter says it greatly aids in the satisfactory operation of the road.

SHOP NOTES FROM PEORIA.

BY H. P. DAY.

The Central Railway Company, of Peoria, Ill., has a system of monthly inspection of all its car motors, and each one is thoroughly cleaned and everything tightened and worn-out parts replaced at the time of inspection.

It was found that the axle linings of the G. E. 800 motors were wearing out altogether on the collar. Instead of replacing the collar as a whole it was found better to have castings made in ring form and sweat them on under the old lining. This resulted in practically a new lining at a sixteenth of the cost, being about 15 cents. In the new linings the collar is made ¾ in. wider from the axle out, which gives more wearing surface where it is needed.

It was the custom to shrink the sleeves of the W. P. 30 and 50 motors on the shaft but it was found that 20 per cent of them failed. The heat in expanding the metal made the sleeves loose. Now they are put in the lathe and bored out 1-64 in. small for the shaft and forced on solid. The sleeves are made out of worn-out pinions so that they cost practically nothing.

Some trouble was experienced from the noise made by the F 30 motors and the old pinions were replaced by rawhide pinions which operate noiselessly and are much easier on the armatures. They have an average life of nine months. The armature linings have proved another source of noisy operation but this was stopped by set screws which were put in the caps, leaving no play.

In refilling burned-out 51 D rheostats, it is now the practice to renew only the first half instead of putting in all new filling. The motormen are given strict orders to use the first half only in starting the car. This reduces the cost one-half and gives the same results.

The diameter of small trolley wheels has been increased from 4 in. to 5 in. which makes the wheel last a third longer and does not wear out the bushing. Whereas the smaller wheels would wear out three bushings the larger ones requires only two before the trolley wheels are worn out.

Iron guards have been put on the roof headlights to prevent the trolley poles from breaking them. An air plant giving compressed air at 60 lbs. has been installed in the power station to be used in blowing out and cleaning armatures.

INCREASE IN TORONTO.

At the annual meeting of the Toronto Street Railway the directors reported net profits for the year 1898 of $404.738. Dividends aggregating $240,000 were paid and a mileage allowance of $64,000, leaving a surplus of $100.738.

The receipts from the operation of the Sunday car service have shown a steady and marked increase, the average receipts as compared with the period during which the service was in operation in 1897 showing an increase of $367.24 per Sunday.

Comparative statistics are as follows:

	1892	1897	1898
Gross earnings	$820,098	$1,077,612	$1,210,618
Operating expenses	590,333	525,801	578,857
Net earnings	229,765	551,811	631,761
Percentage of operating expenses to earnings	71.9	48.8	47.4
Transfers	5,592,708	8,169,022	9,287,239
Passengers	19,122,022	25,271,314	28,710,338

Last year the company built 30 new cars and now has 40 more under construction.

Walter Frohle, a child four years old, was last month awarded $23,000 damages for the loss of one leg, having been run over by a Brooklyn, N. Y., trolley car. This is one of the largest verdicts on record.

REORGANIZATION UNDER RAILROAD LAW IN ILLINOIS.

Charles L. Bonney, vice-president and general counsel of the Chicago General Railway, which is one of the four so-called independent street railways of Chicago, has prepared a bill which was introduced in the Illinois legislature by Representative Drew. The bill was accompanied by a petition from Mr. Bonney setting forth the conditions of the street railways in the state and the reasons in favor of the bill drafted by him.

The street railways of Illinois, aside from the large roads in Chicago, have been hampered in their development by reason of the fact that investors look askance at the bonds of a "horse and dummy" road, because so many questions affecting rights and liabilities of such companies have never been passed upon by the courts. In endeavoring to finance the Chicago General Railway Company Mr. Bonney had to meet this difficulty; he overcame by reorganizing his company under the general railroad law. Investors everywhere are familiar with the provisions of this law; the rights of companies organized under it have all been passed upon by the courts; and the securities of such companies have a standing that "horse and dummy" securities can never expect to attain.

This Mr. Bonney has demonstrated in his own case and the plan he proposes is to enable the companies outside of Chicago to give the same standing to their bonds. Statistics have been collected which show that the outside companies and the four independent Chicago companies have a total of 730 miles of track as against 685 miles for the special charter companies of Chicago.

Mr. Bonney has carefully examined the question and states that there is no difficulty in reorganizing under the railroad law, that no rights will be lost in so doing, and that the gain in financial standing will be of enormous advantage to these small roads, which need money to make necessary extensions and put them on a paying basis.

In conversation with a REVIEW representative Mr. Bonney said: "My bill has been designated by one newspaper as a Chinese puzzle; in fact it is largely based on and its language closely follows the constitution of Illinois. Briefly stated it is a bill relating to the use of streets by railways which will give all companies of this state good financial standing in the money markets of the country. Section 1 is based on section 4, article 11, of the constitution of 1870. Section 2 is based on clause 90 of section 62 of the city and village act. Section 3 defines a 'street railroad' and a 'railroad in a street' as being the same. Sections 4, 5, 6, 7, 8 and 9 are based on sections 9 to 14, inclusive, of article 11 of the constitution of 1870. Section 10 is designed to retain the proper police regulation of the vehicles operated under the control of the local authority, without interfering with the charter right of the company to continue its occupation. Section 11 is designed to fix the period for which corporations may remain in business without interfering with the right of the local authority to exercise proper police power. Section 12 repeals the entire horse and dummy law, and section 13 provides that horse and dummy companies may assign their property to companies organized under the general railroad law, as has been done by the West and South Towns Horse Railway Company. Such assignment has already been sustained by the courts.

"The railroad commission would have the same authority over street railways as over steam railroads. This plan would greatly facilitate the development of interurban lines in which direction the most promising prospects of electric roads lie."

A GENEROUS STREET RAILWAY OFFICIAL.

The Newport News, (Va.) Hampton & Old Point Railway Company sold its street railway property, including 14 miles of track and 32 cars, to the Newport News & Old Point Railway & Electric Company on October 26, 1898. On that date there was between $20,000 and $30,000 in the treasury of the old company which was not included in the purchase. This amount was the cash balance in the hands of the treasurer and was the property of the stockholders, and not money accumulated from fares turned in by the conductors and not rung up, as was stated in some of the newspapers.

F. W. Darling, president of the company, and his father and mother held two-thirds of the stock, and they proposed that the sum be divided among the employes in recognition of their faithful service. This did not meet the approval of the minority stockholders and the matter was dropped at the time. When Christmas came the Darlings decided to divide their portion of the accumulated profits of the defunct company, amounting to $16,000, among the men according to the time of service and position.

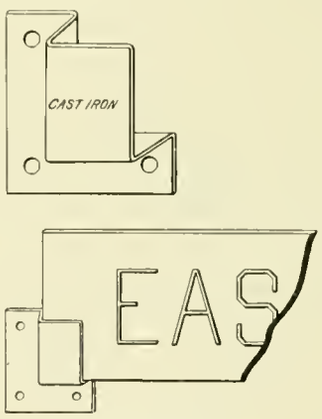
Christmas eve the employes received notice to report at the power station. There was some anxiety among the men to know what such an emergency call at that time meant until each was handed the following note:

> "In recognition of your faithful and efficient service while in the employ of the Newport News, Hampton & Old Point Railway Company, which we feel has added very materially to its success, we take pleasure in enclosing you a check for $———."

The cashier who had been with the company since its organization received $1,000, the engineer $712, two of the conductors $414 each, and the others sums ranging down to $100. The men, who had not the slightest intimation of such good fortune, were overjoyed and were unstinted in their praise of the generosity of the Darlings. It is needless to say that F. W. Darling, who is general manager of the new company, holds a warm place in the hearts of his men.

NOTES FROM EASTON TRANSIT COMPANY.

The Easton (Pa.) Transit Company has avoided any trouble from sleet on the trolley wire for the past year. Late in the fall trolley wire is greased, which prevents the water from adhering, and there has been no use for sleet cutting trolley wheels. The best method found for applying the grease is to drive the construction wagon under the trolley wire and have a man apply stiff lubricating grease that they used, by dipping his gloved hands into



SIGN BRACKET.

the grease and letting the trolley wire slip through his hands as the wagon is driven along. Two men with a team can cover about 10 miles of wire per day. This application lasts during the winter season and obviates sleet troubles.

The company has also changed its method of attaching destination signs, having found that the hook and eye allowed the sign to flap against the outside of the vestibule, injuring the paint, and being very noisy. A cleat, like shown in sketch, was cast so the wooden sign is slipped into it, and placed on the front of the dash. The sign can be slipped in place from the ground. They like this method much better.

The railroad employes in Missouri are vigorously opposing the bill now before the Missouri legislature providing for the reduction of railroad fares in that state from 3 cents to 2 cents per mile.

By standing at his post Motorman Nichol, of the Toledo Traction Company, prevented a serious collision with a Clover Leaf train on January 10. Because of slippery rails he was unable to stop his car until almost on the track; the front of the vestibule was carried away by the railroad train, Nichol escaping injury by a few inches.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

FACTS EXCUSING FROM LIABILITY FOR LOOSENED RAIL.

Kelly v. Metropolitan Street Railway Company (N. Y.), 54 N. Y. Supp., 173. November 10, 1898.

A judgment was obtained in this case for injuries caused by a loosened or upturned rail catching a wagon, causing the whiffletree to break, and precipitating the man driving in the wagon to the ground. According to the testimony introduced in his behalf, the end of one rail, where two rails had been joined, projected about six inches upward from the other, and one of the spikes had loosened.

On the other hand, it stood uncontradicted that about 10 minutes only before the accident a car passed safely over the alleged defective rail, that no imperfection was then observable, and that traffic in that street was quite heavy at that time of day. There was not a particle of evidence introduced to show that the defendant's road was either improperly laid, or constructed of poor material; nor was it shown that the then condition of the rail was caused by one of the company's cars, or was in any wise the result of its acts, nor yet that the company's method of inspecting its tracks was not the proper one. Proof was also absent of any previous defect, or of any circumstances from which, in the opinion of the court, it might be inferred that the company had reasonable grounds to apprehend danger because of either loose rails or spikes.

These undisputed facts, the appellate term of the supreme court of New York holds, showed an absence of negligence, and rebutted the presumption of knowledge which was implied from the existence of the defect; and so it reverses the judgment above mentioned, and orders a new trial.

SUDDEN AND UNUSUAL APPLICATION OF BRAKE IMPORTS NEGLIGENCE.

Bradley v. Second Avenue Railroad Company (N. Y.), 54 N. Y. Supp., 256. November 11, 1898.

This was an action brought to recover damages for the death of a passenger alleged to have been caused by the defendant company's negligence. At the time the accident occurred, this passenger was riding upon the front platform of the car, standing behind the driver on the right side, with his back against the window, and smoking a cigar. When the car reached the place of the accident, it was going on a slight downgrade, and gave a sudden jerk, and the passenger was thrown over the dashboard, under the wheels of the car, and killed.

Upon the part of the company, it was argued that it was a physical impossibility that the accident could have happened if the brake were suddenly put on and as quickly let go. But the first appellate division of the supreme court of New York holds that this was a consideration to be submitted to the jury. They were to judge as to whether there was a sufficient interval between the putting on of the brake and the release of it to throw the passenger over the dashboard. If there was upon the part of the company's driver this sudden and unusual application of the brake, by which the passenger was thrown over the dashboard of the car, the court continues, it was incumbent upon the company to excuse this extraordinary management of the car by showing the existence of some emergency which appeared to require such prompt and decisive action.

The court further declares that it could not be held that the mere fact that the passenger was standing upon the front platform was, as matter of law, conclusive evidence of contributory negligence. That, it says, depends upon the circumstances of each individual case, and it is a question for the jury to determine whether, from the evidence, any reasonable excuse has been offered. In this case, it appeared that it was the custom of the company to allow smoking upon the front platform, and that this passenger was smoking; and, the court adds, the jury had a right to consider all these circumstances, as well as the state of the weather and the condition of the streets, in determining the question as to whether the passenger had been guilty of contributory negligence.

Upon the whole case, the appellate division thinks that the dismissal of the complaint was error. And even if the trial court was of the opinion that one of the witnesses had amended his testimony to fit the opinion of the general term upon a previous appeal, it says that fact would not authorize the court in taking the case away from the jury. It was simply a fact to be considered by the jury in weighing his evidence.

NO DAMAGES ALLOWED FOR INJURY TO DRESS TORN ON DOOR LATCH OF CAR.

Atwood v. Metropolitan Street Railway Company (N. Y.), 54 N. Y. Supp., 138. November 10, 1898.

This was an action brought to recover damages for injury to a passenger's dress that was caught in the door latch of a car and cut or torn. She described the latch or catch as a sort of a hook, square looking, worn so that it was bright at the edges, and as sharp as a knife. Her sister testified that it was a well worn, very sharp catch.

On the other hand, the conductor who was in charge of the car at the time stated that it was a new car, and that the catch used upon it was of the same kind as that which was employed on the other cars operated by the company, and that there was nothing wrong about it. The superintendent of the road and the general repair man were also called as witnesses, and they also gave evidence tending to show that the catch in question was in good order, and that they knew of no better appliance for the purpose for which it was used than the one in question. Besides, there was evidence given showing that each car on the line carried an average of 500 or 600 passengers per day, and that no accident of the kind described here had happened before upon the road.

Assuming, without deciding, that, when the plaintiff closed her proofs, there was enough to make out a prima facie case in her favor, still, the appellate division of the supreme court of New York says, it was for the court, as the trior of the facts, upon a consideration of all the proofs, to determine what the condition of the catch was, and whether it was such as to have made it the duty of the company, in the exercise of proper care, to discover and repair the defect. It certainly cannot be said, declares the court, that the case was one in which no issue of fact arose, and that the company was guilty of negligence as a matter of law. And to this it adds that, in its opinion, in rendering judgment for the company, the trial justice had rightly found the facts in its favor, and that therefore the judgment should not be disturbed.

RIGHT TO RELY UPON STATEMENTS AS TO EARNINGS OF ROADS.

Old Colony Trust Company v. Dubuque Light & Traction Company (U. S. C. C.), 89 Fed. Rep., 794. October 28, 1898.

The foreclosure of a trust deed on what had been two distinct lines of street railway met with opposition in this case by parties who had practically owned one of the lines intervening and setting up that they had been induced to transfer that line and join in a consolidation scheme through alleged false statements of a heavy creditor of the company operating the other line, one of such statements being that the net earnings of this latter line, while in the hands of a receiver, had been sufficient to pay one year's interest, at 6 per cent, on $300,000.

But this was met by the argument that the statements referred to were of the nature of mere puffing, or trade talk, upon which the interveners were not entitled to rely as being anything more than a mere expression of opinion, and, further, that the interveners should not have relied thereon, but for their own protection should have made inquiry into the facts.

If the statements made had been with reference to the future earnings of the road, to the effect that they would be large enough

to pay a named interest, the construction sought to be put thereon, District Judge Shiras, of the United States circuit court, in Iowa, says, might have been admissible. Such, however, not being the case, the statement made having reference to the past, not to the future, and being a positive averment as to what the earnings of the line had been, and not made as the expression of a mere opinion or hope or belief, either as to the past or future, and having been made to impress upon the interveners a fact which, if true, must have been of persuasive force in inducing them to agree to a combination of the lines, it is held that responsibility therefor could not be evaded on the theory that the statement was merely idle puffing, not intended to be relied upon by the parties to whom it was made.

Nor is there considered to be any merit in the suggestion that the interveners had not the right to rely upon this statement of fact thus made to them, because they might, by inquiry on their own part, have ascertained what the actual fact was in this particular. The reason given for this is that had they undertaken to make inquiry about this matter, they would have been compelled to rely upon the statements of the parties in charge of the line, and it was not to be supposed that it would have been open to them to make a search through the books and papers in the company's office in order to ascertain the facts.

Likewise, it is held that reliance could be placed upon the statements of the creditor company as to improvements it intended making.

Finally, it is held that the interveners were entitled to rescind the contract and transfer in question, though it was stated to be the duty and within the power of the court to mold the final relief granted in such form as to meet the exigencies of the case, having due regard to the rights of all who might be affected by the decree, whether parties to the record or not, and that while granting a decree of rescission in favor of the interveners, the court might require them to take a judgment for the money value of their property, if it appeared that the property itself could not be returned without serious injury to other parties, who were not participants in the wrong whereby the interveners were induced to enter into the rescinded contract.

PRESUMPTION ARISING FROM BREAKING OF TROLLEY WIRES.

O'Flaherty v. Nassau Electric Railroad Company (N. Y.), 54 N. Y. Supp., 96. November 3, 1898.

A woman was passing along the street, as was lawfully her right, when a trolley wire broke, and she was thrown down twice. Whether her fall was occasioned by electrical shock, a question raised by the company endeavoring to show that she was not in the vicinity where the wire grounded, the second appellate division of the supreme court of New York says, was for the jury to determine, measurements and statements of witnesses as to particular places where the wire struck or remained upon the ground not being conclusive.

The falling of the trolley wire into the street, the court further holds, raised a presumption of negligence on the part of the company, and, in the absence of contributory negligence, created liability for the injuries sustained, whether the woman received the shock by coming into contact with the wire, or whether she occupied such a position as caused her body to form a circuit through which the electricity, flowing from the broken wire, or some part of it, passed, unless the company satisfactorily explained the conditions so as to overcome the presumption of negligence which thus arose. And while it is true that injuries arising from fright alone do not authorize a recovery of damages, yet, where there is physical injury accompanying fright, the court says that it furnishes basis for a recovery of damages, and that here the jury were authorized to find the existence of electrical shock and fright produced by it, the whole causing the woman's present condition.

But the company insisted that by its proof it successfully met the above stated presumption, and established by conclusive evidence that it was without fault. In this regard it contended that its evidence established that it used, in the construction of its trolley wire, and the supports for the same, such material as is commonly in use for such purpose, and the best which the market affords; and that its method of construction and supports was in accordance with the best plan which practical use has demonstrated to be proper. It also urged that, in addition to thus establishing the use of proper material and care in construction, it had a system of inspection under which its trolley wire and the supports were carefully examined at least once in every four days; and, in addition thereto, that the wire which broke, and the supports in connection therewith, were inspected the day before the wire broke, and found to be in perfect order.

Unfortunately, however, it seems that the system of inspection which the company claimed to have existed rested for its support upon the testimony of interested witnesses, charged with the duty of discharging this obligation. Under well-settled rule, therefore, the court says, this testimony was that of interested persons, who had, or might have, a motive for shielding themselves from blame, and that under these circumstances their credibility was involved, and became a question to be determined by the jury.

In addition to this, it was disclosed by the testimony that the company employed a device called the "breaker system," which, when properly constructed, and in proper working order, would throw the current off the wire the moment it came into contact with the ground. But, upon this testimony, the court says that the jury were authorized to find that the automatic device was either not properly adjusted, or was not in proper working order; for, had it operated properly, the current would have been immediately cut off, and thus none passed through the body; whereas it continued to escape for a period long enough to twice shock the person.

Under these circumstances, the court says, the jury were permitted to find that the condition of the wire and its appliances was not consistent with the testimony of the company, and therefrom to conclude that the company was guilty of negligence in not discharging its duty.

It follows, therefore, adds the court, that this contention of the company may not be sustained, and it affirms a judgment against the company.

SPECIAL RULES FOR GUIDANCE OF MOTORMEN NOT EVIDENCE AGAINST COMPANY.

Isaackson v. Duluth Street Railway Company (Minn.), 77 N. W. Rep., 433. December 20, 1898.

This was an action at law, brought to recover damages for personal injuries received on a street railway track, in a public street. Against the company's objection, the trial judge permitted the plaintiff to introduce in evidence a rule adopted by the company for its own protection, and the private direction and guidance of its motormen. That rule was as follows: "He must keep a sharp lookout to avoid running into pedestrians and vehicles, especially at cross streets. While the car is in motion, the responsibility for safe running rests with him. He will never allow any unauthorized person (the conductor is not an authorized person) to use the handles. He will be held responsible for any damage arising from negligence on his part." In the trial judge's ruling in this matter, the supreme court of Minnesota sees reversible error.

The supreme court says that this rule of the company's was evidently intended for the guidance of its own motormen and as a standard of duty to the company on the part of such motormen. Rules may be adopted by the company which impose a higher degree of care upon its employes than that imposed by the law itself. Such rules are meritorious in this: that the stricter the rules are against negligence or willful misconduct, they tend to make the employe diligent and careful in his management of the car, and thus lessen the dangers which result in personal injuries to passengers or persons on the track of a railway company.

Moreover, there was not the slightest evidence here to show that the plaintiff knew or relied upon the rule in question. Neither was there any evidence showing or tending to show how long this rule had been in existence, or of any custom based upon it, and, in the absence of knowledge of such custom, the court takes the ground that the plaintiff could not have been influenced by it in his conduct at the time of the injury.

The rule itself, continues the supreme court, required a higher degree of care on the part of the motorman than the law imposed upon the company itself. The plaintiff sued for the violation of duty imposed by law, not for the violation of a special rule about which he knew nothing. It was the duty of the company through

its employes to use ordinary care so as not to injure persons lawfully on its track, but the rule requiring the motorman to keep a sharp lookout to avoid running into pedestrians and vehicles might well have been understood by the jury as requiring an extraordinary degree of care in such case, which is not the law. It is only a reasonable degree of care and vigilance of the street car motoneer in watching for persons upon the car track in a public highway that is required.

In still further explanation, the supreme court says that the duty of a street car company requires it to exercise the greatest care and foresight while operating its road as respects its passengers, but the rule is not so strict as to persons upon its right of way, though in a public street. It is only guilty of negligence, in respect to this class of persons, when it has not used ordinary care, which, of course, embraces reasonable attention and caution upon the part of the employe operating or controlling the car on its track. Of course, it might be liable for wanton injury inflicted upon a pedestrian under certain circumstances. So, too, it is the duty of the traveler on a car track in a public street to use ordinary care in looking out for an approaching car, and avoid injury, as the latter has the right of way.

A new trial granted.

CAR BARNS AND SWITCHES IN RESIDENCE DISTRICTS NOT CONSIDERED NUISANCES.

Romer v. St. Paul City Railway Company (Minn.), 77 N. W. Rep., 825. January 6, 1899.

This was an action for damages against the defendant company for so maintaining and operating one of its street car barns, and switching the cars in and out of it, as to constitute a nuisance, whereby the rental value of the plaintiff's real estate was impaired. At the close of the evidence, the trial court directed a verdict for the company, and the plaintiff appealed from an order denying his motion for a new trial. Now the supreme court of Minnesota affirms that order.

The supreme court says that the defendant company has for some years maintained and operated by public authority a street car system, the motive power of which is electricity, in the city of St. Paul. As a necessary incident to such operation, it has maintained this car barn in a residence district, for the purpose of storing a part of its cars when not in use on the streets. The barn fronts on Ramsey street, with its sides abutting on Thompson and Smith avenues respectively. It is not authorized to operate its system on these avenues, but it has, without any negligence in the premises, laid tracks and curves thereon, over which it runs, from early in the morning until late at night, its cars to and from the barn. Such operation of its cars over such tracks and curves causes loud and disagreeable noises, whereby the rest and comfort of the plaintiff are disturbed, and the rental value of his real estate abutting on the street and avenues is materially reduced.

The court could find in the city ordinances granting to the company the right to operate its street car system no express grant to maintain the curves and switches in the avenues in question for the purpose of taking its cars in and out of the barn, but it holds that the right to do so was given by necessary implication. It says that it would be a very narrow and technical construction of these ordinances to hold that the company was authorized to lay switches and curves for the purpose of getting its cars in and out of its barns only on the streets on which it was expressly authorized to operate its street railway system. And the court maintains that where, as in this case, its barn fronts on a street upon which it is authorized to and does operate its street railway system, and it is reasonably necessary to take its cars in and out of the barn from the streets on each side of the barn, it has the right, by virtue of the ordinances, to do so, although it has no right to operate its electric lines thereon.

In this connection, it may be of importance to note that the court says that while it is true that all public grants, unlike private ones, are construed strictly and favorably for the grantor, the public, it is equally true that where a grant is made for the benefit of the grantee, and also for the express accommodation and benefit of the public, everything which is reasonably proper and necessary (not simply convenient) to effect the essential objects of the grant passes by necessary implication, otherwise the purpose of the grant would be seriously impaired, if not wholly defeated. And the court recognizes that it is practically impossible for a street railway company to operate its street railway system without car barns in which to place its cars when not in use, for it would be intolerable to permit them to stand upon the streets, and that the only practical way to get the cars in and out of its barns is by the use of the usual motive power, and the use of tracks and curves on the streets adjacent to the barns. Hence, its decision that the defendant company was authorized to lay and operate the tracks and curves on the avenues, as above stated.

This still left the question of whether the loud and disagreeable noises occasioned by the running of the company's cars in and out of its barns over the curves and switches on the streets at the place and at the hours in question, although authorized by the city ordinances, constituted an actionable nuisance, as to the plaintiff. The answer to this question—there being no negligence in the case—depended, the court says, on whether the location of the car barn was a reasonable and proper one, and whether the use of the streets at the times and in the manner they were used by the company in running its cars over the curves and switches, whereby the noises complained of were produced, was one of the reasonable uses or purposes for which the streets were acquired.

The plaintiff cited and relied on a class of cases to the effect that, where a party is carrying on a lawful business on his own land without negligence, yet if it is a business which is attended with loud and disagreeable noises, or produces noisome smells or noxious vapors, whereby the property and comfort of those dwelling in the neighborhood are materially injured and disturbed, the business is a nuisance per se, that is to say, in itself. Such cases, however, the court insists, are not particularly in point; for this is not the case of carrying on an offensive trade or business on one's own premises which may be carried on at places removed from the occupied parts of a city, or beyond its limits.

The court also maintains that there is a radical difference between an ordinary commercial railway, operated by steam, and a surface street railway, operated by electricity, as to the selection of its roundhouses and machine shops by the one, and its car barns by the other. In each case the selection must be made with reference to the rights of the property owners in the neighborhood; also, those of the railway company and of the public. The rights and conveniences of property owners cannot alone be considered, for one living in a city must necessarily submit to the annoyances which are incidental to urban life, and individual comfort must in many cases yield to the public good.

Now, the only ground for claiming in this case that the location of the car barn was an improper one was that it was in the residence portion of the city. But, the court points out, the exclusive business of the company is the carrying of passengers within the limits of the city and in its streets. Its lines traverse the streets of the residence portion of the city. Its business is there. It takes on and discharges passengers in all parts of the city. It must have its car barn so located that it can promptly get its cars upon its lines for the purpose of enabling the people of the city to seasonably get from their homes to their respective places of business or labor. It cannot locate its barns outside of the city, because it is only authorized to build and operate its lines within the city limits and upon its streets; and, if it had the authority to do otherwise, it would be impracticable and detrimental to public interests to do so. Again, if it locates its barns at points where there are at present no dwelling houses, it is only a matter of time when some property owner will be disturbed by the loud and disagreeable noises necessarily occasioned by taking its cars in and out of the barns. The rights of such an owner are the same as those of the plaintiff.

The barn in question is only one of five barns located and used by the defendant company for the same purpose in different parts of the city, and the court holds that, upon the undisputed evidence, its location is not an improper or unreasonable one.

The question, whether the maintenance and use by the company of the switches and curves in question were a proper street use, the court says is settled adversely to the plaintiff by previous decisions. Such maintenance and use are a necessary incident to the operation of its street car system, which derives its business from the streets, is intended for the convenience of the travel therein, and is in aid of the identical use for which the streets were acquired; hence the maintenance and operation of these switches and curves are a proper street use, and not an additional burden thereon.

The discomfort and injury sustained by the plaintiff from the

loud and disagreeable noises produced by taking the cars of the company in and out of its barn over the switches and curves at the place and at the times in question, continues the court, are the same, except in a greater degree, as are sustained by property owners at the street corners where its cars are operated over curves.

And so it holds that the acts of the defendant company complained of do not constitute a private nuisance for which the plaintiff is entitled to recover damages.

THE MILCREEK VALLEY STREET RAILROAD.

The Millcreek Valley Street Railroad Company owns one of the suburban lines running northward from Cincinnati, and operates eight miles of double track, one terminus being at the Zoological Garden in Cincinnati and the other at Lockland, in Hamilton county. The line passes through the villages of St. Bernard, Elmwood Place, Carthage, Hartwell, Maplewood, Wyoming to Lockland. Plans have been completed and will be carried out this spring for extending the lines through Reading and Glendale to Hamilton, and the company will serve a territory containing over 60,000 inhabitants without counting Cincinnati or Hamilton. In addition to the foregoing it is intended to rebuild the tracks, put in complete overhead construction and build a new power station of 3,000-h. p. capacity.

The car here illustrated is the standard type and is one of 18 operated by the company. Each car is 26 ft. over all with 18 ft. body,

MILCREEK VALLEY CAR.

side seats, upholstered in plush and heated with H. W. Johns panel heaters. The cars are painted a dark green, the standard coach color of the New York, New Haven & Hartford Railroad Company, and lettered in gold and aluminum. The trucks are the Peckham No. 7 D, the Cincinnati type of heavy truck fitted with the Kilgour safety brakes. The cars can be operated either by a single or double trolley, to conform with the overhead work in Cincinnati. Each car is equipped with two Johnson No. 22 motors and is run at a speed of 12 miles an hour in the city but this may be increased to 30 miles in the less populous districts. They go up the 9 per cent grade on Vine street at nine miles per hour.

At the Zoological Garden the cars are received by the employes of the Cincinnati Street Railway Company and run to Fountain square in the heart of the business district. They are returned to the Zoological Garden and there taken charge of by the regular crew; a continuous service is thereby given between the heart of the city and the villages up the valley. The Millcreek Valley Street Railroad Company is composed of Cincinnati capitalists and the operating department is in strong hands, W. G. Wagenhals being general manager and R. Powers superintendent.

The American Trust Savings Bank, of Chicago, for the bondholders of the City Electric Railway Company, Decatur, Ill., made application for the appointment of a receiver, January 13.

EVERETT PRESIDENT OF CLEVELAND ELECTRIC.

At the annual meeting of the Cleveland Electric Railway, commonly called the Big Consolidated Company, on January 19, the active campaign for control of the company waged by the Everett and the Andrews factions culminated in the former electing a majority of the board of directors. Officers were chosen as follows: President, H. A. Everett; vice-president, C. L. Pack; secretary, R. A. Harman; treasurer, E. W. Moore. Mr. Harman is the only officer re-elected.

Mr. Everett urged Mr. Andrews, the retiring president, to take the chairmanship of the board of directors which has been vacant since Tom L. Johnson left it, but he declined. It is stated that J. J. Stanley was requested to continue as manager, and H. J. Davies to continue as assistant secretary, but both declined to do so.

Mr. Everett was president of the company for one year after the consolidation was effected in 1893, after which his friends lost control of the organization. The new management is pledged to economy and the first act of the board was to reduce the salaries of the higher officials; the president's salary was cut from $10,000 to $5,000.

The Akron, Bedford & Cleveland and the Cleveland, Painesville & Eastern offices where Mr. Everett as president of the former company made his headquarters are now in charge of C. W. Wason, president of the latter. F. S. Borton, secretary of these two companies, succeeds H. J. Davies as assistant, or active, secretary of the Cleveland Electric.

PERMANENT INTERNATIONAL TRAMWAY UNION.

We have received from F. Nonnenberg, of Brussels, secretary-general of the Permanent International Tramway Union, the official report of the 10th annual convention held at Geneva in August last. Accompanying the report was a list of the questions to be discussed at the next convention to be held in Paris in 1900, which we translate below.

1. How have urban rates of fares been changed in the last five years? Why were changes made? What are the results as affecting receipts, expenses and profits? Give total figures and figures per car-mile. Do you consider your present rates reasonable?

2. What have been the consequences of electric traction upon the operation of transformed lines, as affecting traffic, expense of operating and net profits? Give total figures and figures per car-mile. State nature of your electric lines as to profile and also special circumstances influencing results, such as duration of concession, etc.

3. What are the advantages and disadvantages of narrow and standard gages, particularly in view of the use of powerful motors?

4. What is the arrangement and equipment of your power station? (There is enclosed a list of questions covering the station, equipment and operation in great detail.)

5. What is the best system of distributing current in extensive systems using electricity—continuous, alternating, polyphase?

6. Have you used the Falk joint? For how long? On what length and what type of roadbed have you these joints? On what technical considerations did you adopt it? What is the cost, giving items of cost in detail? What proportion of the joints break? Why do they break? Do the number of failures vary with the season? After what time do they occur? What is the maximum length of rail you have been able to cast-weld without making special expansion joints? Do you use electrical bonds with the Falk joints? What else can you say on this joint?

7. What progress has been made concerning accumulators, as to construction, increase of capacity, decrease of weight, duration, cost of maintenance, practical and economical application on tramways?

8. Give your experience as to the best means of heating cars. Give cost of installation, operation and maintenance of the various systems you have employed.

9. What are the advantages and disadvantages of operating branch lines as compared with the main lines?

STREET RAILWAYS OF PENNSYLVANIA.

From the report of Isaac B. Brown, superintendent of the bureau of railways of the department of internal affairs of the state of Pennsylvania we abstract the following statistics concerning the street railways of that state.

There are 94 corporations operating their own and other lines, with capital stock outstanding of $100,900,335; in addition there is outstanding capital stock of lessor companies amounting to $56,027,922. The bonded indebtedness of operating companies is $32,440,850, and the current liabilities amount to $14,229,491. The total funded and unfunded debts of non operating companies is $40,810,690. The grand total of capital stock, funded and floating debts is $244,418,288.

The total of assets of the Pennsylvania street railways is given at $247,328,522, which it is stated is not accurate because even the officials reporting in many instances have not the data necessary to a correct valuation of the assets.

The total income from operation was $19,745,706, an increase of $866,057 over that for the fiscal year ending June 30, 1897. Over one-half of the total income is received by the Union Traction Company, Philadelphia, and this company together with the four companies in Allegheny county (Pittsburg) have about 75 per cent of the total gross receipts.

This increase in the receipts is indicative of the improved business situation. In the matter of bicycle competition the situation is also improved; in the report for the previous year were some data as to the number of persons passing a given point in Harrisburg on street cars and on bicycles, and similar records were taken for two days in November, 1898, which are compared with those of the previous year. The report says:

"Last year the number of persons passing a given point was 6,078. This year the number was 5,819. Last year the number in cars was 1,962, and on wheels 4,116; this year the number in cars was 2,370, and on wheels was 3,449. Last year the percentage on wheels was 67.7 and in cars 32.3; this year the percentage was 59.3 on wheels and 40.7 in cars."

A further observation was made as to the time when bicycles were most used. "Of the 5,819 persons passing, 1,470 passed between the hours of 12 noon and 2 p. m., of which 1,028 were on wheels and 442 in cars. The figures show very clearly that the clerk and the laborer in going to and from their work use the wheel quite generally. They also show that there is no particular increase in the number of passengers carried by the cars during the hours named, which is proof that the large increase in favor of the wheel is due to the fact that business people are adopting that method of transportation from one point of the city to another. The figures referring to the use of the wheel during other hours of the day indicate that fewer persons are using the wheel as a source of pleasure."

The total operating expenses were $9,486,573, approximately 50 per cent of the gross receipts. Taxes were $1,211,135; interest, $2,250,797; rentals, $6,087,871; other expenses, $256,367; dividends, $804,169. This is a total of $20,096,912.

The total mileage of Pennsylvania street railways is reported at 1,422.84, and the aggregate length of tracks at 1,708.32 miles. There are 6,616 cars and 12,680 employes who receive $6,542,840. The total number of passengers carried was 432,779,314.

During the year 15 passengers were killed and 506 injured. Of employes 11 were killed and 86 injured. Of other persons 80 were killed and 409 injured. Total killed, 106; injured, 1,101.

Lessor companies received $7,227,347 for track rentals and from other sources; they paid $4,636,489 in dividends and $2,433,934 in other disbursements.

TRANSFERS IN ATLANTA.

The Atlanta (Ga.) Consolidated Street Railway Company on January 19 decided to adopt a transfer system as an experiment for six months in order to determine whether such a system is practicable in Atlanta. The city council will be asked to pass ordinances preventing abuses.

The East Liverpool (O.) Street Railway was tied up for several days in January because of a strike.

NEW ELECTRIC STREET RAILWAY, NORWICH, ENGLAND.

The very ancient city of Norwich beloved of "Ye Virgin Queen" dating back almost beyond the range of history, has been drowsing beneath the shadow of the old cathedral for centuries, with nothing but civil wars and now and then a fire to give passing excitement. Though in paving and sanitary matters improvements have been made in modern times, and electric lights installed, there has been no real alteration in the city, the principal pride of which is its antiquity. However, the trolley has at last made its appearance, and those who are foresighted are preparing to take advantage of the great changes which must result from adapting so modern a means of transportation.

The new transporting agent is the New General Traction Company. The offices are at 35 Parliament street, London; J. E. Winslow is chief engineer and A. E. Hopkins managing director. The

NORWICH CATHEDRAL.

company is not a Norwich association, but is designed for the purpose of attending to the wants of the whole country. The Norwich enterprise is called the Norwich Electric Tramways Company, and the engineer in charge is A. N. Bannister, but the work is controlled and done by the New General Traction Company. At present about 15 miles of track is laid and some of the narrow streets have had to be widened, while two new streets are being cut through the oldest part of the city. The cars will doubtless soon be running. The poles had not appeared a few weeks ago, but they will be the last things to be put up.

The track gage is 3 ft. 6 in. The rails are 65-lb. girder, with a 1-in. groove; they are laid on steel cross-ties or "sleepers." The sleepers weigh about 40 lbs. each and are placed at distances of 10 ft. apart. There is a steel tie-rod between each cross-tie; these latter are made by the Askham Engineering Company, of Sheffield, England; the rails come from Belgium.

The Falk cast-welded joints are used throughout; this work is being done by the agents, R. W. Blackwell & Co., 39 Victoria street, Westminster. The rails will rest on 6 in. of concrete, in which the stamped, or rolled, steel cross-ties are bedded. In this concrete foundation will also be laid Doulton stoneware conduits

for the feeders. The rails will be cross bonded every 200 ft. The line will be single-track nearly everywhere in the city, with turnouts, except in the very narrow streets.

One of the features of the track construction at switches and turn-outs is shown in the accompanying sketch, furnished by Mr. Bannister. The switch points are of cast steel, and when worn may be taken out and replaced without disturbing the rest of the track. Electrical connection is provided by placing an angle 3 x 3 x 5/8 in. under the movable piece and cast-welding it to the rails which it connects.

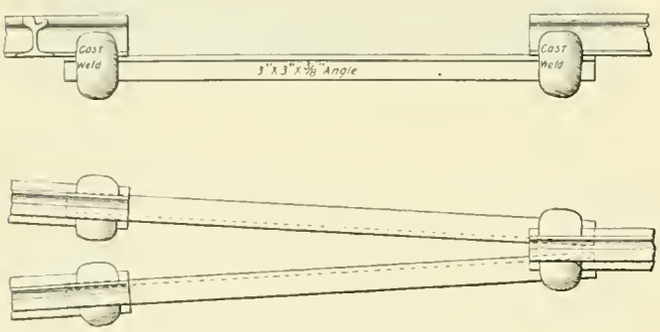
The electrical equipment will be furnished by the Westinghouse Company. In the power station there will be four 150-k. w. West-

PARLOR OF "MAYDE'S HEAD INN."

inghouse direct current generators, coupled to 300-h. p. engines built by Browett & Lindley, of Manchester, England. The engines are compound, condensing, with two independent Worthington compound jet-condensers, each capable of handling three engines. Steam will be supplied by four 300-h. p. Babcock & Wilcox boilers.

The poles, supplied by R. W. Blackwell & Co., are made by Morris Tasker, New York. The trolley wire, No. 0 B. & S. gage, is from Washburn & Moen. The wire will be carried on brackets, span wires on poles, and spans on rosettes.

Fifty cars, made by the Brush Electric Company, of Loughboro, are ready for delivery; these are double-decked, with open tops, and have a total seating capacity of 70. The cars are 29 ft. 6 in. long,



CONNECTION AT SWITCHES.

over all, and 6 ft. wide, outside measurement. A car shed is built to hold 60 cars and a repair shop for six cars. With the line nearly complete, something over $500,000 have been spent, which seems quite a small sum considering that compensations have had to be paid for widening and making streets, though the city has taken its share of this. The very important department for purchasing property has been under the active management of S. Mealing Mills, a local estate agent, who, though raised in the old cathedral city, would be able, for business acumen, to hold his own anywhere.

The fares will be determined by the company, but the run will, doubtless, be divided into sections for each of which one penny, (two cents) will be charged. There will, however, be workmen's fares of two cents for the whole distance, morning and evening; this is one of the conditions invariably attached to concessions for any kind of city or suburban transportation, whether light railway or steam roads, in the United Kingdom.

The Board of Trade speed-limit is eight miles an hour, and as the public desire for rapid locomotion grows by what it feeds upon this maximum will certainly have to be made wherever it is possible to do so. The speed cannot be high in the very heart of the museum of antiquities, past the cathedral; the "Mayde's Head Inn," that has stood since the year 1287, and has never at any time been anything else but an inn; past the castle, that was, in Norman days, a stronghold many times besieged, later a prison and now a museum; but once outside in what is now country, but will presently be broad streets and a new city, full speed can be maintained and the rapid transportation is expected to produce a building boom all along the line.

EARNINGS OF BROOKLYN ROADS.

The earnings by months of the Brooklyn Rapid Transit Company's system and of the Nassau Electric Railroad, of Brooklyn, N. Y., are shown for 11 months, the years 1897 and 1898, in the following table:

BROOKLYN RAPID TRANSIT.

	1897.	1898.	Gain.	Per cent. of gain.
January	$392,285	$414,809	$22,524	5 75
February	360,128	385,967	25,839	7.10
March	407,760	466,387	58,627	14.50
April	437,356	491,802	53,988	12.35
May	488,059	528,347	40,288	8.25
June	495,006	580,039	85,038	17.17
July	489,463	572,116	82,653	16.90
August	477,400	563,257	85,857	18.00
September	460,837	534,941	74,104	16.11
October	443,923	509,629	65,703	12.57
November	417,818	446,501	28,683	6.87
Total	$4,870,035	$5,493,795	623,304	12.81

NASSAU ELECTRIC.

	1897.	1898.	Gain.	Per cent of gain.
January	$109,623	$135,438	$25,815	23.68

Total	$1,760,118	$1,999,858	$240,459	13.05

PUBLIC OWNERSHIP A FAILURE.

On January 19, the St. Joseph & Benton Harbor Railway & Light Company, of St. Joseph, Mich., was awarded the contract for lighting and heating the court house and jail in that city for three years for $3,900. The county paid over $6,000 for the years 1896, 1897 and 1898. The reason for this difference is that for the last three years the county has been experimenting with public ownership of lighting plants. In 1895, the building committee of the county board refused to give the railway company the contract, and for the last three years the president, W. Worth Bean, has been showing the loss resulting from the public ownership scheme, using the supervisor's own figures. The difference was $2,100 or 54 per cent against the public plant, and the majority of the board has at last seen light. This time Mr. Bean got the contract.

PROPOSED CANADIAN ASSOCIATION.

There has been some agitation among Canadian street railway men over the question of organizing an association, the purpose of such being to discuss topics relating to street railway management and secure desired improvements. Such an organization would correspond to one of our state associations rather than the American Association. In order to ascertain whether or not the movement was a popular and far reaching one the REVIEW addressed inquiries to the managers of the Canadian street railway companies. The replies given below indicate that while the matter is being discussed and is strongly favored by some, yet other officials believe that the street railway companies of Canada are too few and widely separated to form a successful association, and as for the consideration of subjects on the operation of electric railways, this need is fully met in the American Street Railway Association, of which many of the Canadian companies are members.

"In reply to yours, with reference to a Canadian Street Railway Association, I have heard but little about it. Personally, I would be very much pleased to see such an organization, similar to the American one, established in Canada, but fear that our territory is rather large, and, as yet, the number of railways so limited that I am in doubt if it could be made successful."—A. J. Nelles, secretary and manager of the Hamilton, Grimsby & Beamsville Electric Railway Company.

"About a year ago there was quite a strong feeling in favor of a Provincial Street Railway Association for Ontario, but, like all such movements, it fell flat for the want of some one to take the time to complete the organization. At the present time there is talk of united action on the part of all street railway companies, telephone and electric light companies in Ontario. No doubt an association of the different street railway companies, along the line of your state associations, would be most desirable, but until such time as the different companies become educated to the advantages of such an association, it will never become a fact."—C. E. A. Carr, manager of the Montreal Park & Island Railway Company.

"I have heard nothing of the agitation in favor of the organization of a Canadian Street Railway Association. It seems to me that the American Street Railway Association fills the bill."—T. Ahearn, vice-president and managing director of the Ottawa Electric Railway Company.

"In reply to your letter with reference to the formation of a Canadian Street Railway Association, I beg to say that I have not heard of any agitation here in respect to the formation of such an organization, and I have some doubts as to whether an institution of the kind is required or would be a success."—E. H. Keating, manager of the Toronto Railway Company.

"In reference to a Canadian Association, I have heard the matter discussed, but I have always felt that there are not enough of us near together to make such an association a success."—J. B. Griffith, secretary, treasurer and manager of the Hamilton Street Railway Company.

"Replying to your inquiry, I have not as yet heard of any agitation in favor of the organization of a Canadian Street Railway Association, and do not at present see any necessity for the formation of one."—Edward A. Evans, general manager and chief engineer of the Quebec, Montmorency & Charlevoix Railway.

"Replying to your inquiry regarding a Canadian Street Railway Association, would say that I am, personally, very much in favor of the formation of one; in fact, I have discussed the matter with several managers. I do not think there should be much difficulty in the formation of an association for Canada on the lines you speak of."—Mark B. Thomas, manager of the Hamilton & Dundas Street Railway Company.

"Replying to your favor regarding the agitation in favor of the organization of a Canadian Street Railway Association, would say, that our company has only been in existence a short time, and, personally, I am not aware that there has been any movement in favor of the organization referred to by you. I am not in a position to say whether such an association is desirable, and would have to hear from some of the older street railway companies before I could give an intelligent opinion."—J. H. Still, president of the St. Thomas Street Railway Company.

"I have not been able to hear of any actual proposition for the organization of a Canadian Street Railway Association, but I certainly think it would be desirable."—W. B. Close, manager of the Toronto Suburban Street Railway Company.

CAR FOR THROUGH TRAFFIC ON THE MAHONING VALLEY INTERURBAN.

For a year past the Mahoning Valley Railway Company has been running a special car for through traffic between Youngstown, Girard, Niles and Warren, O. It is the fast "train" of the road and makes but few stops, all other cars giving it the right of way. As may be noted from the illustration the car is a large and handsome

MAHONING VALLEY CAR.

one. It is 36 ft. in length and fitted with McGuire maximum traction trucks. Each truck carries a 50-h. p. high speed Westinghouse 38 B motor. The speed between towns is 35 miles an hour. A. A. Anderson, general manager of the company, states that the car has made a good record from an operating and financial standpoint showing that there is a demand for such service on interurban roads.

COALS TO NEWCASTLE.

The Filer & Stowell Company, of Milwaukee, which has very large engine works in that city, and makes a specialty of heavy duty Corliss engines, has recently placed an order which causes more than ordinary interest. It is that of a cross-compound condensing engine for the Union Railroad Company, of Providence, R. I. In view of the fact that Providence is the native heath of the Corliss engine, this causes the question asked by foreign makers who have recently had to meet American competition: How can they do it with the high freight rates they have to meet?

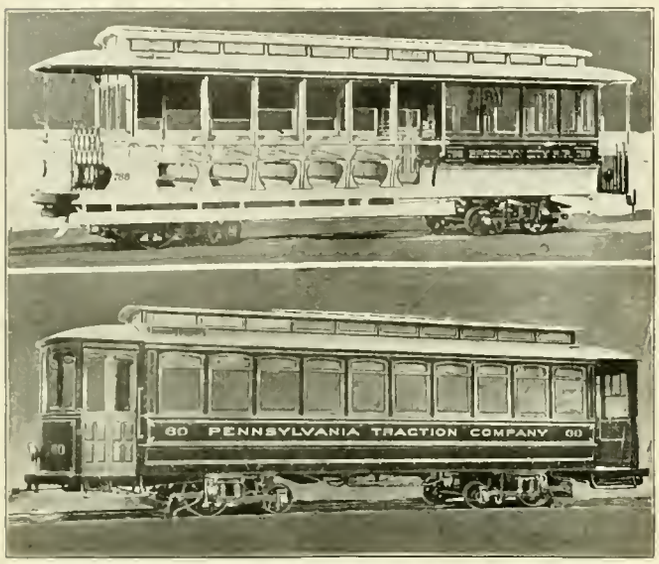
The engine for Providence is to drive a 1,200-k. w. generator, with capacity for an overload of 50 per cent. As stated, it is cross-compound condensing. The cylinders are 28 in. and 54 in. by 48 in. stroke. The armature is on the engine shaft, which is 26 in. in diameter. The fly-wheel is to be 18 ft. in diameter and weigh 100,000 lbs.

Other recent sales of the Filer & Stowell Company are: A cross-compound with cylinders 24 in. and 44 in. by 48 in. to the Edison Electric Light & Power Company, Erie, Pa.; a simple engine 22 in. by 48 in. to the Menominee (Mich.) Electric Light Railway & Power Company; a cross-compound, with cylinders 32 in. and 64 in. by 54 in., to the Armour Elevator Company, Chicago.

The company is now building for Armour & Co., for their central power station at the Stockyards, Chicago, two cross-compound engines, with cylinders 23 in. and 46 in. by 48 in., to be direct connected to 1,000-k. w. generators.

CARS AND LOCOMOTIVE RECENTLY BUILT BY THE BRILL COMPANY.

The Brooklyn City Railway Company has just put in operation a new car of the California type which, from its large size and arrangement of details and the fact that it is of a decided improvement over anything of this class which has been used in the east, is of considerable interest. It is similar in general appearance to the large cars recently put in service by the Metropolitan, of New York, but has a lower platform and no side steps on the closed portion. Considerable objection has been made to the high platform of the New York cars, and the new Metropolitan cars will have a low rear



BROOKLYN CITY AND PENNSYLVANIA TRACTION CARS.

platform, such as here shown. The step is 13¾ in. from the rail with a 13-in. riser.

The length of the car over the corner posts is 36 ft., the length over the buffers being 44 ft. It is 6 ft. 6 in. wide at the sills and 7 ft. 2 in. at the post. On the front or open end of the car the platform is 3 ft. 8 in. Ample strength is secured for the side sills by plating them with iron. The closed section is 11 ft. 2 in. over the end panels, and has two double doors. The open section has seven cross seats, two of which, those against the forward bulkhead, have stationary backs. Along the open portion there are the usual folding steps at the sides. These steps are 18½ in. from the ground, with a 13 in. riser. The height in this case from the head of the rail to the under side of the sill is 28 in. Brill maximum traction trucks with a 4-ft. wheel base are used under the car. The wheels are respectively 30 in. and 20 in. in diameter. There are two W. P.-50 motors.

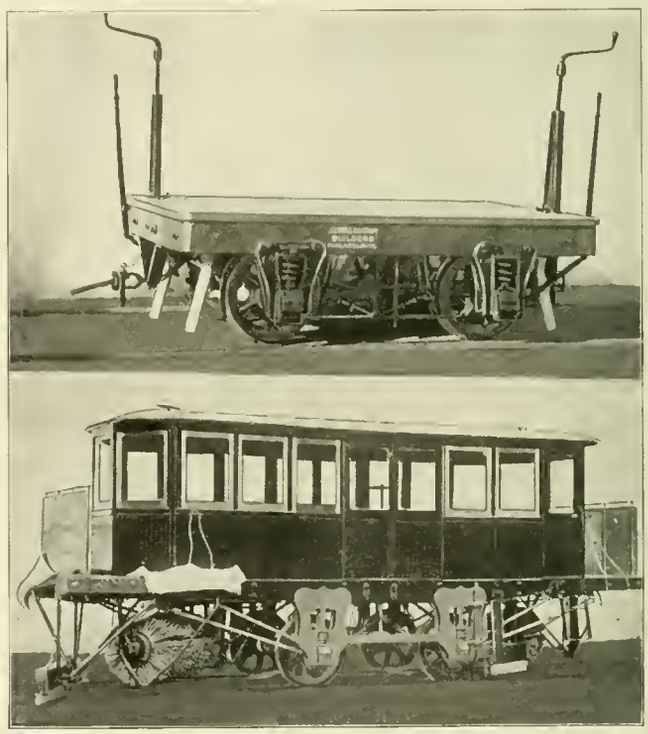
The ends of the car are provided with angle-iron buffers, and gates are used on one side of the rear platform, with a Brill folding gate on the opposite side. The seats in the closed compartment are longitudinal and covered with spring rattan, seating 14 passengers; the open portion accommodates 35; making a total of 49 seats. The closed compartment is finished in cherry throughout, with three-ply quartered oak ceilings. Cherry and ash are used for the finish in the open section.

Push-buttons are placed on each post, to signal the conductor. There are two 12-in. Dedenda gongs with disappearing buttons, and there are two sandboxes. The headlights are in the dasher. The trolley board extends the whole length of the car. The grab-handles of the posts are of ash set in solid bronze sockets. The seats in the open part of the car are fitted with a Brill round-corner seat end panels.

The weight of the car without motors is 17,200 lbs. The trucks weigh 3,250 lbs. each. The California car, with the modifications which are going on in its design and construction since its introduction in the east, is rapidly coming into favor wherever a large traffic has to be accommodated.

The Pennsylvania Traction Company, of Lancaster, Pa., is one of the largest suburban roads in the State outside of the Philadelphia interurban lines, and the practice of the company is especially interesting because it has tried many different kinds of cars with a view to finding out which will accommodate the heavy traffic to the best advantage. The car is 28 ft. long, 38 ft. 8 in. over all. It has curved sides and is 7 ft. 5 in. wide at sill and 8 ft. wide at the posts. The platforms are 4 ft. 6 in. long and the height to the sill from the head of rail is 30 in. The step is 17 in. from the head of the rail and has a 12-in. riser to the platform. Each end of the car is provided with a stationary round end vestibule with doors folding against the vestibule. This is a complete enclosure and there is no entrance to the car until it has stopped. These vestibules give perfect protection to both motormen and conductors while at the same time it adds greatly to the comfort of the passengers. The car is mounted on Eureka maximum traction trucks. The wheel base is 4 ft. and the wheels are 33 in. and 20 in. in diameter. There are two Westinghouse No. 38 motors. The gage is 5 ft. 2½ in. The car is furnished with 20 reversible back seats covered with spring rattan. This gives a seating capacity for 40 persons. The inside finish is of cherry with bird's eye maple headlighting; the trimmings are of bronze throughout. There are two electric headlights and two Brill sandboxes. The buffers are of the Brill angle iron type. The weight of the car without motors is 20,500 lbs. The trucks weigh 4,500 lbs. each.

The electric locomotive illustrated was recently built for the Deadwood & Delaware Smelting Company. It is powerful, although it measures but 8 ft. in length and is only 5 ft. 3 in. wide.



ELECTRIC LOCOMOTIVE—MONTREAL SWEEPER.

It stands 2 ft. 3 in. to the floor and is furnished with a W. P. No. 5 motor with two K 10 controllers. The wheel base is 4 ft. and the gage of the track 36 in. Its small size and compactness made it possible to use a light pedestal gear arranged to take the motors. Four Brill sandboxes are placed within the frame to give an equal and complete distribution of sand when it is necessary. The convenience of a machine of this kind is hardly to be estimated by those who have had no experience with them. It is intended for use within a mine and on the surface as well. A third rail transmission of power is to be employed and the General Electric Company put on the necessary electrical equipment. Electricity is available in a large percentage of all manufacturing establishments and railway tracks are equally commended. A small expense for overhead wires or for third rail conductors makes a machine of this kind possible and its convenience is much greater than a pair of horses, while the economy is in favor of the electric machine which when not in use is not "eating his head off."

The sweeper illustrated in the accompanying engraving is of unusual interest as illustrating a form of construction specially adapted to the needs of the Montreal Street Railway Company, and may be taken as a type of those necessary in cities where the winters are of extreme severity and the snow fall very heavy. The body is 21 ft. long and the width over all is 6 ft. 10 in. At each end of the body there is an 18-in. platform which is used to carry salt, tools and miscellaneous materials necessary for attacking snow and which need to be easily accessible. There are No. 12 Westinghouse motors for driving sweeper; the brooms are operated by Westinghouse No. 3 motors. It will be observed that both of the brooms are hung on radial guides so that they rise and fall with the motor shaft as the center thus preserving the sprocket chains at constant tension. The sills extend 6 in. outside the dasher so as to carry the shear outside of the front broom; this takes the snow from between the tracks; when down this shear extends 2 ft. 8 in. outside the inner rail. The distance between the rails being 4 ft. enables the whole space to be cleaned in this manner; this peculiarity was specified by the company. There are four doors to the cab. In the center on the further side of the engraving is a swinging door 4 ft. 2 in wide; the door on the near side is of the same width, but is blind, being screwed in place. At diagonally opposite corners of the cab there are two doors each 20 in. wide. The screw brake which is seen between the wheels comes up in front of one of the doors and is made with a toggle joint connected with a nut so as to give immense pressure on the wheels. The hand wheel is 16 in. in diameter. The driving axles are 4 in. in diameter; those for the brooms 3 in. Double braces are used from the pedestals on each side and the whole floor of the sweeper is framed in the strongest and most solid manner. The sprocket chains are forgings of special patterns and have given great satisfaction on account of their strength and durability.

CHICAGO, HARVARD & GENEVA LAKE RAILWAY.

This is one of the most promising interurbans that will be built this year. It forms a short cut to the lake, effecting a saving of from two to six hours time each way. The line starts from Harvard, Ill., where two lines of the C. & N. W. Ry. cross, and follows the public highway and over private right of way to Geneva lake, Wisconsin, a distance of 12 miles. This lake has long been one of the most noted in the west, and is visited by thousands. Its spring fed waters are remarkably clear and cold, and in places 300 ft. deep. With the exception of the mountains it is conceded to rival the Swiss lake from which it takes its name. Here the merchant princes of the west have laid out extensive summer palaces, and thousands of less pretentious structures which help form the chain around its shores swell the value of the improvements to upwards of $10,000,000, and this sum is rapidly increasing each year.

The company's franchises cover a term of 50 years and permit the transportation of passengers, baggage, express, mail and all kinds of freight. What the latter item means is suggested in the one million pounds of butter made annually in a single district on the line where over 5,000 cows are milked and some 400 car loads of cattle shipped each year. Farm lands are worth $100 per acre and this richest dairy country in the United States is very thickly settled. The Yerkes telescope, the largest in the world, is within walking distance of the lake terminus of the line, and from this point also the steamers leave for all points on the lake which is about 10 miles long. The remarkable purity of the air and the hundreds of springs which abound everywhere combine to make Geneva lake at once a pleasant ground for the masses and a favorite resort for persons seeking health. In the territory now for the first time made easily accessible to the lake are the thousands engaged in industrial work in such manufacturing cities as Belvidere, Rockford, Janesville, Beloit, etc. While the summer season will furnish easily 100,000 excursionists, there is a good paying business the year around.

The road will be laid with 60-ft. 60-lb. T-rail and constructed and equipped in the best possible manner, the contract for all the work having been let to the Continental Construction Company, of Boston. Work on the power house has already begun. The initial equipment will be 400 h. p. of engines and boilers, with room left for as much more. The rolling stock will include both 40-ft. combination cars and 28-ft. motor and trail cars. The freight equipment will provide for heavy service. There are three towns and villages along the line, which at present have no rail transportation facilities whatever. A rate of 3 cents per mile is allowed, but a 25-cent fare will probably be made for the 12 mile ride. The line will do a paying business from the start, as it is what residents along the route have been trying to secure for years.

FURTHER CONSOLIDATION IN BALTIMORE.

January 26 the board of directors of the Baltimore Consolidated decided to recommend to the stockholders that they sell their holdings to the syndicate represented by Alexander Brown at $37.50 per share; the stockholders are offered cash or securities of the properties it is proposed to combine. Messrs. Perin and Jenkins, who control a majority of the stock of the Consolidated, will go into the syndicate.

The plans of the Brown syndicate look to the consolidation of the Baltimore City Passenger Railway, the Baltimore Consolidated Railway (itself a consolidation of the Baltimore Traction and the City & Suburban Companies effected in 1897), the Baltimore & Northern, and the Baltimore, Middle River & Sparrow's Point Companies. The track of these companies aggregate 270 miles.

The capital stock of the consolidated lines will be less than the sum of the present capital stock of the separate companies in order to make a saving in the taxes imposed.

The management of the properties will be in the hands of a board of directors consisting of seven members. It is considered that a small number of directors can work to better advantage than a large number. Interest centers in the composition of this board, whose members will have under their control the entire street railway mileage of Baltimore. It has been settled that four of the seven members will be Alexander Brown, Henry A. Parr and George R. Webb, who compose the Brown syndicate, and Nelson Perin, who will have large interests in the combination. The entrance of Mr. Perin in the directory is also with the understanding that he will be the president of the corporation. It is also understood that George C. Jenkins will be a member of the board.

PAY FARE AND THEN SUE TO RECOVER.

January 13, an interesting case brought against the Detroit Citizens' Street Railway Company was decided in the lower court at Detroit. Wm. G. Schroeder had been given a transfer which was improperly punched, and the conductor of the second car ejected him because he refused to pay his fare. The court held that the passenger should have paid his fare the second time and then have sued the company to recover the 5 cents; however, he instructed the jury to bring in a verdict for nominal damages (6 cents) because of the assault committed on the passenger in ejecting him.

TROLLEY FOR MANCHESTER, ENGLAND.

Estimates made by Mr. Higginbottom, mechanical engineer, and chairman of the committee on street traction for Manchester, England, show in favor of the overhead trolley system, as compared with underground conduit, as follows:

1. The first capital cost per mile of track was £2.135, against £11,491 for the conduit system; or, for the 67 miles required in Manchester, £144,000 against £773,897.

2. The working cost per car mile was ½d. more for the conduit system, or £14,000 per year.

3. Difficulties of construction of the conduit system in the narrow and congested Manchester streets.

Beverly, Mass., proposes to pay the car fare of its councilmen who live in the suburbs and have to use steam or electric cars to attend council meetings.

Two cars on the Citizens' Electric Railway, of Mansfield, O., met in a head-end collision on January 16. Both motormen were slightly injured; there were no passengers on either car. One of the motormen left his regular passing point without orders and failed to keep a look-out.

TRAIN RESISTANCE FORMULAS.

In the "Street Railway Journal" for February is an editorial on a new general formula for train resistance which is extremely interesting. The opening sentences are as follows:

"The alchemists of old sought diligently for the philosopher's stone, the inventors of a later age for perpetual motion, and engineers of the nineteenth century have been almost as eager to obtain a general formula which shall reconcile all existing data and experiments upon train resistance. The first two objects of effort are now known to be unattainable,and the third has until now baffled the best minds in the railroad profession. Only a month ago 'Locomotive Engineering,' which for years past has devoted special attention to this subject, said editorially: 'We do not believe that it is possible to devise a formula that will show an approximation of the resistance due to different kinds of trains at different speeds when train tons are the basis of calculation.'

"A general formula which appears to be applicable to passenger trains of all weights, running at all speeds up to the highest limits so far reached, has been lately worked out, however, by John Lundie as a result of a long series of tests of trains in actual service, and is here given to the engineering public for the first time."

Mr. Lundie's formula is as follows:

$$R = 4 + S\,[0.2 + 14 \div (35 + T)]$$

where

T = the weight of the transportation unit in tons (2,000 lbs.).

R = resistance in pounds per ton.

S = speed in miles per hour.

This formula gives a family of straight lines, all passing through the point which corresponds to a train resistance of 4 lbs. per ton for a speed of zero. The lines corresponding to the train weights of 100 tons, 200 tons, 500 tons, 1,000 tons, and infinity are shown solid in the diagram.

The editorial proceeds:

"The test of any formula lies in its application. Gaged by this test, Mr. Lundie's formula unifies in a remarkably close manner nearly all recently published experiments, together with other formulae of more limited application, as will be seen by an inspection of the accompanying table. The Stroudley, Sinclair and Dudley tests of train resistance scheduled in this table were brought together by A. M. Wellington in the 'Engineering News' in 1892, and referred to as intrinsically worthy of confidence on account of the careful manner in which they were made. To these we have added further experiments made on the Philadelphia & Reading Railroad in 1889, and on the Central Railroad of New Jersey in 1892, so that a fairly complete range of train weights from 200 to 400 tons, and of train speeds from 40 to 70 miles per hour is given in the table. The Lundie formula checks up all these tests very closely, though in all but one case the results obtained by its use are slightly higher than the observed results. In this connection it may be noted that Mr. Lundie obtained his speed figures by positive methods, having found that speed recorders for variable speeds are not sufficiently accurate owing to the inertia of the moving parts.

"These tests are all for heavy railroad passenger trains, upon which Mr. Lundie himself has made no experiments. For trains of from 20 to 100 tons, and for speeds of from five to thirty miles per hour, the Lundie formula is accurate, inasmuch as it is obtained directly from 150 or more observations made by Mr. Lundie in Chicago, as before stated. For lighter units still, the formula agrees with the results of private tests made by several of the great electric companies, and checks very well indeed the Clark formula,

$$R = S^2 \div 171 + 7.16,$$

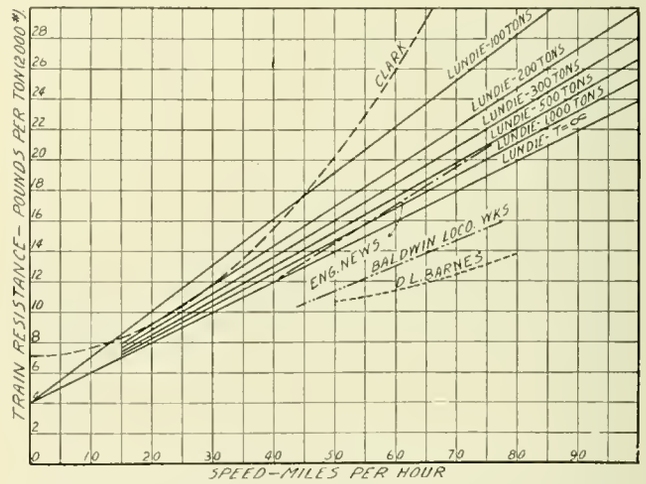
bearing in mind that the latter is generally admitted by engineers to be from one to two pounds too high.

"Now it need scarcely be pointed out that when a formula of this general kind, deduced on mathematical principles from a large series of experiments within a comparatively narrow range of action, is found to be equally applicable over a much wider range, a strong presumption in favor of the soundness of its underlying principle is established. It seems practically certain, therefore, that the Lundie formula is thus applicable to the whole range of passenger train traction on straight, level, exposed track in a calm atmosphere. It cannot, however, be said to be applicable to street cars running on gritty or dirty rails, and, in fact, it is unfortunately too probable that no formula whatever can be devised for street railway work for which a large factor of safety would not have to be allowed in practice to provide for great differences in condition of track."

The table referred to is not reproduced here, but the results shown in it will be apparent from the inspection of the diagram, where a number of formulas for train resistance are plotted. The Engineering News formula was developed after considering the Stroudley, Sinclair and Dudley tests, and it is seen to give results one or two pounds below the Lundie formulas for 200-ton and 300-ton trains. The Engineering News formula is admitted to be too low for speeds below 40 miles per hour and hence the line in the diagram is not shown for lower speeds.

For speeds below 40 miles per hour the "Journal" compares the Lundie and the Clark formulas and finds them in close agreement. Had the Clark formula been correctly stated the agreement would have been found even closer than it was. It is not stated whence the Clark formula was taken, but it appears to have come, with alterations, from the "Engineering News" of June 9, 1892, page 585. The "Engineering News" correctly gives the Clark formula for pounds per long ton as $R = S^2 \div 171 + 8$, and incorrectly gives it for pounds per short ton (2,000 lbs.) as $R = S^2 \div 181.5 + 7.16$. The "Journal" takes part of each of these and gets $R = S^2 \div 171 + 7.16$. The correct Clark formula for pounds per short ton of total train weight is $R = S^2 \div 191.5 + 7.14$.

The later formulas for train resistance were devised because it was found that locomotives were hauling trains which would be impossible were Clark's formula correct; hence it was discarded and formulas made which accorded more nearly with observed facts. A



few years ago the Baldwin Locomotive Works discovered that the formula used in designing engines was incorrect, giving too high values for R. What followed is thus stated by S. M. Vauclain, superintendent of the Baldwin Locomotive Works, in the proceedings of the St. Louis Railway Club, November 11, 1898: "Engine 1027 (a Vauclain compound on the Atlantic City Railroad) exceeded our guarantee about 10 per cent, and Engine 839 on the Milwaukee road exceeded the guarantee by four cars, hauling 13 cars, the train with locomotive and tender weighing 1,200,000 lbs., in the specified time. We immediately proceeded to make an accurate test of Engine 1027. * * * * * Our first effort was to determine the resistance of modern passenger trains at high speeds, and found it as shown [Mr. Vauclain presented a chart showing various formulas plotted; from his chart the Baldwin and Barnes lines of our diagram were taken.—Ed.]; you can compare the curve of Clark's, Engineering News' and Barnes' with ours. We devoted several days to this, taking about three diagrams per mile and from this collection produced the curve, from which all our high speed estimates are made.

"You will notice that the resistance set forth by Clark is considerably in excess of that of the Engineering News, whereas the Engineering News is slightly in excess of ours. Mr. Barnes' card is for 50 miles [and over] per hour. The last two lines are close enough to indicate that Barnes was correct in his determination. The differences in the atmospheric influences of the two days would be sufficient to make the differences in the two lines. The line given by the Engineering News, however, is a perfectly safe one for any designer to follow in calculating the horse power necessary for a locomotive to do a certain prescribed work."

The Engineering News formula is R = 0.24 S + 2.

The Baldwin Locomotive Works formula is R = S ÷ 6 + 3.

The two trains referred to by Mr. Vanclain weighed 322 tons on the Atlantic City, and 600 tons on the Milwaukee road. As the Baldwin formula has been found to be sufficiently accurate and conservative for them to base guarantees of performance on it, it is certainly entitled to great respect. It is granted that the Lundie formula for T = 300 tons is "safe," being 4.6 lbs. (40 per cent) higher than Baldwin's practice at 50 miles per hour, and 6.5 lbs. (42 per cent) higher at 75 miles per hour; by the same token Clark is a still safer guide, for he is nearly 80 per cent higher at a speed of 50 miles.

The formula devised by Mr. Lundie is said to be accurate for trains of from 20 to 100 tons, and for speeds of from five to thirty miles, because obtained directly from experiments. The claims for it should stop here. And even if such were the case it would be highly desirable that more complete data be given, in order that those who are expected to use the formula may judge of the weight to be given it. Details as to the length of run, the methods of taking the velocity, etc., would be very welcome.

A priori, the weight and speed are not the only elements determining the total train resistance. David L. Barnes, in an editorial in the "Railroad Gazette," March 18, 1892, pointed out that for a train on level track an approximate formula in its simplest form would, at least, have as many elements as the following: the friction of the journals, wheels, flanges, etc.; the friction of the air on the side of the train; the pressure per square foot of the air on the front of the train; the area of the front of the train; the weight of the train; the length of the train.

Many of the engineers who have proposed train resistance formulas, have considered the speed the most important element, and neglected all the others; Clark thought that the speed entered in the second power,and made the mistake of not fixing limits to the application of his formula; the three other formulas shown in dotted lines on the diagram were devised on the assumption that the speed enters as the first power only, but they are all confined to narrow limits as to that variable, their authors recognizing that undoubtedly other elements entered which might change the character of the line outside the known limits.

In 1898 S. T. Dodd presented a paper before the Civil Engineers' Club, of Cleveland, (Street Railway Review, December, 1898) which contained some data on train resistance of interurban cars running on T-rails over a straight and level track at uniform speed. The trains weighed from 20 tons to 95 tons, and the speed was from 25 to 50 miles per hour. When the Lundie formula is applied to these data it gives results differing from the observed resistance by from .15 lb. to 8 lbs.

We do not know whether it is Mr. Lundie or the editor of the "Journal" that makes the claim of universal application to passenger service for the Lundie formula, but in either case it is the height of assurance to say that a formula good for passenger trains of 20 to 100 tons at speeds from five to thirty miles per hour, is equally good for passenger trains of all weights at all speeds. The "Journal" states that the Lundie formula is not applicable to street cars on gritty or dirty rails, nor to heavy freight service on steam roads. We have shown that it does not accord with late results obtained with heavy passenger trains at high speeds, and a comparison with Mr. Dodd's tests leads to the inference that Mr. Lundie's results are perhaps not entirely conclusive even for the train weights and speeds investigated.

THE POPULARITY OF THE TROLLEY IN THE BRITISH ISLES.

The trolley must be seen to be appreciated, and its conveniences, experienced in daily life, make staunch friends of all its patrons. This is substantiated by the testimonials below which certainly come from conservative sources. In nearly every English city where mechanical traction has been adopted there was much discussion as to the motive power, and delegations or committees were sent on junkets to other cities in the British Isles and on the continent to inspect traction systems. They all reached the same conclusion, viz., for the particular needs of their own city the trolley filled all the requirements better than any other mode of traction. In spite of this unanimity of opinion each municipal corporation goes through the same painful operations, probably for the sake of retaining the appearance, at least, of British conservatism.

It was proposed to introduce the trolley at Ealing, but objections were raised on the grounds of danger and that property adjacent to the street railway lines would be depreciated, and the following communication was sent to the municipal authorities of the cities having electric railway systems: "Impressions created here that the introduction of overhead trolley electric tramways depreciates the value of property and lowers the character of districts through which the cars run. It is also suggested that the electric lines are more dangerous, and, on scientific, sanitary and economic grounds, afford no greater advantage to a community than horse tramways. Kindly wire opinion on these points, based upon your experience."

The replies are given below, most of them being telegrams, which explain their brevity and force.

Bristol: "Absolutely mistaken impression. Has distinctly improved our district; no longer void buildings and houses. Better class houses than before, as result of over two years' working. Residents unanimously favor overhead electric traction."

Kingswood: "Electric tramways have proved the greatest boon to our district, which had no tramways, horse or otherwise, before. Ratable values improving, and district becoming popular for residence of people engaged in city."

Coventry: "Your telegram just received. Impression quite mistaken; streets through which tramways run among the most progressive in the city. Two years' experience very satisfactory on scores of safety, health and efficiency."

Douglas, Isle of Man: "Continental experience shows property not depreciated, nor character of neighborhood lowered. My opinion electric tramways superior on sanitary, scientific and economic grounds, and possess greater advantages in many ways."

Dover: "Tramways. No justification, from our experience, for impression named. Electric cables no source of danger; great economy over all other traction, especially horses. Send critics here. All local opponents converted."

Dublin: "Overhead trolley traction has increased value of property along line Dublin to Dalkey. Not more dangerous than horse traction; only one accident within nearly two years. More advantages to public on scientific, sanitary and economical grounds."

Guernsey: "System established. Harbor and coast line, no streets, answers admirably; does not depreciate property or lower character of district. More economical than horse traction. Has proved free from danger."

Hartlepool: "Do not think electric tramways depreciate value of property, or lower character of district in this town; is better than horse or steam. Generally appreciated by community."

Kingstown, Dublin: "Value of property along line of tramways here much appreciated, not depreciated, in value, and electric traction, so far as I can ascertain, is not more dangerous than horse traction, while on sanitary grounds it is more advantageous."

Wednesbury: "No depreciation of property followed overhead system here; not one accident has happened since introduction five years ago. On sanitary and economic grounds much preferable to horse or steam traction."

Walsall: "Trams overhead trolley system has been most satisfactory here. No depreciation of property. One accident only. Safer than steam. Have been great advantage to community and are much appreciated. Cleaner, quicker, and better than horse or steam."

Leeds: "Dear Sir.—I have taken the first opportunity of speaking with the chairman of the tramways sub-committee on the question raised by you, and he instructs me to say that, to his knowledge, the overhead trolley electric tramways do not depreciate the value of the property or lower the character of the districts through which the cars run. Our accidents with the electric line are not more serious or frequent than those of horse or steam tramways, and there are greater advantages to a community by electric traction than by horse tramways. The former are highly appreciated here and the system is most successful."

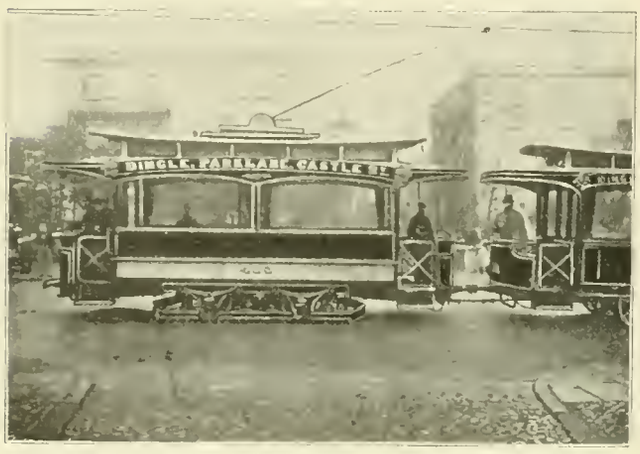
At the annual meeting of the stockholders of the United Traction Company, of Reading, Pa., President John A. Rigg presented the following figures: Receipts from all sources, $430,955; operating expenses, $260,318; gross earnings, $170,637; fixed charges, $166,517. The car-mileage for the year was 1,115,198 and 4,655,028 passengers were carried. The equipment of the company comprises 2,875 h. p. in engines, 2,242 h. p. in generators, 70 car equipments, 47 closed cars, 35 open cars, three trailers, one snow plow and three sweepers.

THE INTRODUCTION OF THE TROLLEY IN LIVERPOOL.

The experimental trolley line of the Liverpool Corporation Electric Tramways has been opened for traffic, and upon its success depends the final acceptation of the overhead electric system for all the surface railways in the great English seaport. Although the line is but 2½ miles long, 30 cars have been provided for the heavy traffic anticipated. Until September, 1897, the tramways in the city were owned by the Liverpool Tramways & Omnibus Company, the track and right of way being leased from the corporation, but at that date the complete system was purchased by the city for $2,757,000. A committee was appointed to devise plans to improve the service and investigations were made both in America and on the Continent. Expert reports were received from Bramwell & Harris and F. S. Pearson, of New York, and the late Dr. John Hopkinson was the consulting engineer for the corporation.

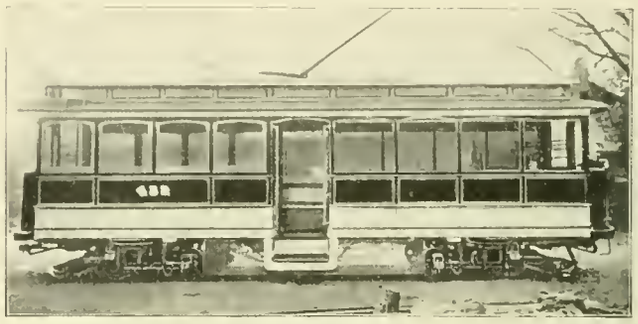
Although little was said publicly about the matter, the committee was confronted at the outset with the opposition to foreign competition, yet several of the most active of the promoters of the improvement were in favor of a free field and no favor. The first success of the opponents of foreign competition was in the defeat of the proposition to employ an American street railway expert. Bids were obtained for steel rails from a number of firms in England, the United States and Germany. It was discovered that the English bids ranged from $2.43 to $7.29 per ton more than the American and German bids. It was claimed that the American and German bids did not fill the conditions exactly as to height and shape of the rails, so the contract for the rails was awarded to a London concern. There was no stipulation as to material, but the understanding was that English rails should be supplied. It turned out, however, that the English company sublet the contract to a German firm, and all the rails which have been laid on the experimental line, just completed, are marked "Made in Germany." The excuse given by the London firm was that, owing to the accumulation of orders on hand, it could not meet the contract in time with English rails. The track was laid with 100-lb. rails on a concrete foundation. The rails were connected with Chicago bonds, but in the new track construction the Falk cast-welded rail joints will be tried.

The overhead construction is mainly span wire suspension, although at some points center poles are used. The side poles are placed at intervals of 120 ft., but in many cases the span wires are attached to rosettes fixed to the walls of buildings adjoining the line. The diagram shows the plan of suspension at one of the principal corners. Two types of poles are employed, one being of single section and the other built up in two sections. The weight of the first type is 950 lbs. and of the second 1,300 lbs. The poles are painted gray, which makes them less noticeable than any other color. The poles are of ornamental design and some of them carry a lantern for a gaslight. The trolley wire is about No. 000 and is hard drawn copper wire of circular section. The trolley wires are divided into sections of a half mile long and reinforced by feeder cables of 400,000 c. m. which are carried in iron troughs. There is an absence of guard wires, which is usual in English cities, but wherever telegraph or telephone wires cross, a strip of wood is attached to the upper side of the wire and effectually guards it.



GERMAN CAR.

Liverpool has tried the experiment of combining the power station of tramways with the lighting station, although separate engines and generators are operated for supplying current for the tramway lines. In the interior view of the engine room the first



BRILL CAR.

three units are for tramway service. The same boiler plant is used for both the tramway and lighting engines. Three compound non-condensing triple-crank Williams engines of 300-h. p. capacity are direct connected to two-pole shunt-wound 550-volt Siemens generators. The normal speed is 350 r. p. m. Working in parallel with the dynamos is a large battery of storage batteries; it is unusually powerful, and could give 1,000 amperes for five minutes, if necessary.

The battery is erected on the floor of a spacious room adjoining the engine room. It consists of 246 cells, manufactured by the Electrical Power Storage Company, each cell containing 21 plates, the battery being rated at a maximum discharge of 480 amperes at 550 volts for one hour.

The switchboard is simpler than one usually finds in a tramway station. An automatic circuit breaker protects the feeder circuits, and a similar device is employed to protect the battery, and the dynamos are supplied with fuses. There are the usual recording instruments, and a special panel is provided to carry out the specified tests of the Board of Trade. An interesting feature is the employment of a booster, one side of which boosts up the feeder current, the other side being employed to prevent fall of pressure in the return circuits. The plant feeds into the line at two points, one near the power house and the other near the end of the line. The new units which are building will be of 1,500 h. p. each. The engines will be of the vertical compound Willans type, and are so designed that they can easily be converted into triple expansion engines. At the Dingle terminus are located the car barns, capable of housing 50 cars. A small repair shop is being equipped, and inspection pits and facilities for handling motor trucks have been arranged.

The type of car to be adopted is another matter for experiment to determine. The committee found that no English firm could build the cars in suitable time, and at first purchased one American and one German car and later 14 cars of each type were ordered. The two types of cars are shown in the illustrations, and it is not difficult to determine the superiority of the American design and workmanship. The Brill car was described in the November, 1898, Review. Each car is fitted with Brill maximum traction trucks and two 35-h. p. Walker motors and series-parallel controllers. The American apparatus was supplied through Dick, Kerr & Co.

The German cars are of two kinds: the "Altona" type and the "Ringbahn" type, as used on the Hamburg tramways bearing these names. Both types of cars are carried on rigid trucks, and are equipped with two 20-h. p. Schuckert motors together with Schuckert series-parallel controllers. There are, in addition, 15 German trailers. Each of the American cars is capable of carrying 40 passengers, while the German motor cars have a capacity of only 20 passengers and the trailers 18. One car is fitted with a Standard air brake, the air pump being connected to one of the axles and the pump automatically cut-out when the pressure in the

air reservoir reaches the maximum pressure. This brake actuates the same brake blocks on the car as the hand brakes, and is found to work very satisfactorily. Electric emergency brakes are fitted to all the cars. The trolleys are of the pivotal type commonly used on American cars. The trailers are used for smoking cars and a reduced fare is charged for transit in them.

POWER STATION.

With a fair trial of the trolley in Liverpool it is needless to say the advocates of gas and oil motors, cable and conduit lines will cease their denunciations of the overhead electric system. The equipment of the other lines for electric traction will doubtless proceed with all the celerity possible with the slow moving municipal authorities.

ELECTRIC CANAL TRACTION IN FRANCE.

The accompanying illustration from "La Nature" shows the scheme for electric canal traction employed since last September near Bethune, in the north of France. It has proved so successful that the method is to be adopted on a length of 50 miles of the canal

ELECTRIC CANAL TRACTION IN FRANCE.

between Bethune and Cambria. The boats are drawn by a three-wheeled electric locomotive operating on the tow-path, and taking alternating current from overhead wires. This machine makes a speed of 1.8 miles per hour drawing boats loaded with 200 tons, about twice the speed made with horse traction.

It is stated that the minority stockholders of the Nassau Electric Railroad will endeavor to prevent the consolidation of that company with the Brooklyn Rapid Transit Company, contesting the matter in the courts.

THE STREET RAILWAY AS A PUBLIC INSTITUTION AND ITS RELATIONS TO THE PUBLIC.

Extracts from an address before the Political Economy Club, University of Chicago, by H. H. Windsor.

Instead of being the extremely simple problem the riding public supposes, a street railway and its operation is a difficult one and complex, and, moreover, presents a radically different aspect as viewed from the several standpoints. While capable of still further division, we may classify under four general heads the cardinal points of the manager's compass; these are: What the public wants; what the employes want; what the city wants, and what stockholders want. Each of these four have claims, and to harmonize these naturally somewhat conflicting interests is the chief end of the operating man; and I may assure you, those who have never stood under the equatorial heat and intensity of service have any conception of the undertaking. Schools have vacations, banks close Sundays and holidays, there are times when the office cat sits enthroned alone in its glory in the daily newspaper office; but there is never a day in the year, or an hour in any day or night, when the heart-beats of street railway operation entirely cease. On a city system cars are always running somewhere.

The riding public everywhere has for years looked upon street railway operation as a decidedly easy matter, and one which almost any person could assume on a moment's notice, and conduct with numerous improvements. The running of the same cars over the same tracks day after day certainly does appear not only easy, but even a monotonous undertaking; and it is this familiarity growing out of the visible portion of the service, and an entire ignorance of the intricacies absolutely necessary to systematic method, which mislead people in a judgment which is not meant to be unfair.

As a matter of fact, there is nothing in the rest of the world in the line of city transportation which can be compared with the street railway systems of the United States. All they have on the Continent has been either made here or copied from this country, and we lead the world in street railways to an extent even greater than in our steam railroads.

This misconception on the part of the public is not so surprising when we remember that the public bases its opinions on what is published in the daily papers, and that in the inevitable haste necessary to daily journalism there is no time to corroborate either facts or figures.

Moreover, the daily press naturally takes advantage of what appears to be popular with the masses, and as it seems to be popular to criticise, condemn and harass a corporation because it is a corporation, it naturally follows that a street railway, not only of necessity a corporation, but also on account of it being a quasi-public one, becomes the notable object and mark for these thrusts. The fact that it occupies public streets with its tracks, and operates its cars along these streets, is taken to be a confiscation of rights private and public; still, every owner of a vehicle, from a peddler's cart to the four-in-hand, uses these same streets for private convenience or gain, giving in return practically nothing for the privilege. And yet the street car is the people's conveyance—the poor man's carriage, without which he would walk to his work or remain at home, when otherwise he may with his family reach the parks and other breathing places. One of its cars, accommodating 30 to 50 riders, occupies no more room on the street than the carriage of the well to do. It does not effect any wear whatever of the pavement, as does the horse-drawn vehicle, and it, moreover, is required, in many cities, to lay and keep in repair from 16 to 18 ft. of paving on the streets occupied by its tracks. The streets are dedicated to public travel, yet no other method of conveyance begins to approach to a fraction of the carrying accommodation rendered by the street car service. On certain streets, moreover, omnibuses and carettes perform a service as common carriers, furnishing accommodations so inferior in point of time and comfort as not to be in comparison; and yet who thinks to criticise these in their appointments, or to limit what possibilities they do possess with restrictions such as are constantly thrown upon a railway? The explanation appears to be in the fact that none of these companies are large enough to attract attention, and it is not expected of them to furnish accommodations at unreasonable hours, nor during any hour of the day when

such operation is attended with a loss. There are very few of what are known as the night cars, running from 1 to 5 a. m. in any city, that have ever paid expenses. The undesirable nature of the work forces the company to pay a full day's wage for the four hour's labor, and yet no one denies the necessity for the service, and I concede it is proper that every company should maintain as good a night service as conditions will permit; but they receive no credit for the same, nor does any one ever seem to think but what it is highly profitable.

Another distinction is in the price charged for service at unseasonable hours. In the early hours of the morning cabs and carriages are allowed a greater rate of compensation than during business hours, and the public takes no exception to the rule, and looks upon the extra charge as fair and just. The street car fare, however, must be no more, although the service is furnished at more than double the cost of day service.

This is but one, and a very inconsiderable, feature of the many services the company performs. The street car makes values as does no other agency. Put a line on a street where a few scattered stores are found and speedily it becomes a business thoroughfare. Take it away and the result is immediate. An illustration in Chicago is Madison street, from Jefferson across the river east to 5th avenue. I remember well when this was the great artery through which the west side daily turned its vast population into the business district. Then the street and Madison street bridge was one moving stream of humanity, day and night; and rents were at a figure high even for those days. What it is to-day, with travel all diverted through the tunnel, is best evidenced by a stroll along those blocks, forsaken by the crowd and with wholesale houses where once were popular retail stores.

Now let us look at this from another side. Have you ever considered the return to the city and state in increased revenue from taxation growing out of values thus enhanced? A farm of the richest land, under climate conditions most highly favored, and capable of producing the choicest fruits and grains, is of practically no value if far removed from shipping opportunities. The rich fruit lands of California had little value until the railroads opened her doors and let out the delightful products of vine and tree. Land which was worth $5 an acre then, sells for $300 and $400 now. Not an electric line passing through a country district, and bringing the farmer into hourly touch with the outside world, but enhances the value, and selling value, too, of the adjoining farms from $5 to $10, and in many cases much more per acre. We think of steam roads as pioneers, and so many of them have been; but with the exception of the Union and Central Pacific, made possible only by governmental aid, the steam roads do not begin to be the pioneers the streets railways have been. The former wait until the population has reached a point, or the natural resources a development which is believed to insure a paying, or, at least, self-supporting business. On the other hand, hundreds of miles of street railways have been laid in the face of certain loss the first few years, and in some cases with the full expectation that no profit need be looked for during a long period. Some have received their reward sooner than expected; many others have not.

One practical illustration of this is close at hand in the line of transportation within a few hundred feet of where we are to-day. This entire territory, nearly a mile wide and two miles long, had lain dormant for 15 years. Once it had a future, but the panic in the early '70s killed its prospects. During all this time values had steadily declined through 10 years, and then remained stationary for five more. How much longer this condition would have lasted no one can say. However, at the time the Cottage Grove line was cabled from 39th street to 72nd street, and east on 55th street to Lake avenue, the spot where we are to-day, while scarcely a howling wilderness, presented a very different aspect. It was all practically farm land, used for pasture, where horses grazed and the lowing of kine were heard; rabbits bounded from bush to bush, and Mother Earth had not yet opened her arms to gas and sewer and water mains. At that time, in going from 55th street to 67th street, I counted exactly 11 houses, which were all there were in sight. In fact, the cemetery to the south presented more signs of activity than all else combined. Take all transportation out of this territory to-day and what would properties be worth, even with the present expensive improvements?

No sooner was this line built than people began to leave the crowded districts north of 31st street, and to erect dwellings hereabouts and for a mile east. At first the buildings were near the tracks; then, as the territory gradually filled up, farther back, until it is as you see it this afternoon. These lines were built under a 99-year franchise; they would not have been laid at the time they were under a 20-year grant. The element of chance was too great. It seems a perfectly safe proposition to-day, but who could assure the growth which did result? Many of the best-posted men in the city shook their heads and pronounced the venture a crazy undertaking which would bankrupt the company.

Would it have been wiser to have waited 10 years, when annexation could have offered only a 20-year lease? Who would have been benefited? Not you nor I to-day—not any of the men and women who had held land at prices from $10 to $35 per foot for over 15 years, unable to sell a lot at any price, but who, in a hundred days, found ready sale at prices ranging from $40 to $100 per front foot. Would the thousands of days' work which were required in the 10 years following to build houses and stores, lay sidewalks, and water and gas mains, build sewers and streets, have been more welcome to those laborers later on? Would those who have had the most delightful portion of the city in which to live and educate their children been better off to have waited a decade? It is practically the same land to-day that it has doubtless been for hundreds of years, remaining unimproved save for a few board fences until transportation came and breathed into it the breath of life.

Why is the entire business life of the country, the money market, and values of every kind put in jeopardy every four years? It is all expressed in the one word, uncertainty. And the larger the interest the greater the caution necessary and the anxiety felt. A battleship cannot turn on the radius of its keel; a fishing smack can put about in smaller space and in shallow water. The larger the interest the farther it must look ahead. When the night is foggy the ocean liner proceeds under slow speed and with caution. If it were foggy all the trip across from New York to Liverpool there would be no six-day records to break.

The street railway of our large cities is a gigantic institution; it cannot revolutionize in a day or a year. To do its best for all concerned, public, employes, stockholders, it is absolutely essential that its course be plainly marked out a long way in advance. But it cannot proceed with a progressive policy, however desirable, and pull up suddenly in a moment. Such a course means disaster just as much as when a ship strikes a rock.

But, you say, we argue for long-time franchises, with fixed fares of correspondingly long periods, and admitting that five-cent fares are just now, will not four cents or three cents or even less be possible in 10, 20 or 30 years? Under the old horse car regime, were not the prevailing rates of fare five cents, and are they any less now? Hence, why tie ourselves up for a long period, only to cause us regret later on? The point is well taken, I concede; but what are the facts now and what is the record? Let us see. The broad claim is made that while economies in production, resulting from labor-saving machinery and competition, have reduced the selling price of all commodities of necessity and luxury during the past decade, street car fares alone of all the rest remain the same. Sugar, petroleum, flour, shoes, iron, books, jewelry, newspapers have bent to the downward trend of prices, but the car fare is a Gibraltar. But is it true? What is the history of car fares the country over, and here in Chicago?

During the horse car regime, which dates from the first car in 1831 to 1885, when electricity came into practical use, there were frequently 10 separate, and some of them competitive, companies in a single city. The longest haul in those days rarely exceeded four or, at the most, five miles, while the majority were probably three miles or less. The service was slow, infrequent and performed with cars dimly lighted and but little better than a shelter. There was no interchange of passengers, and to go three or four miles often necessitated the payment of a second or even a third fare. With the advent of electricity came many comforts, and the ability to use larger and heavier cars than was possible to haul with animal power.

The ability with electricity to supply several roads from one power station brought about consolidations. Without a single exception the public was the direct gainer by this merger system. It became possible to give transfers where formerly two fares were required. On parallel lines, where competition was running empty cars (for I have visited cities where the supply of cars on parallel lines one block apart was two and three times in excess of the possible de-

mands), in such cases the unnecessary cars were removed, and either placed on new lines or held in reserve for emergency. The expense thus saved became available for improvements in numerous ways, but which before were unwarranted. In these consolidations the new company, or the old one absorbing the others, voluntarily surrendered its rights to extra fares. This has been the history for more than ten years. Not only this, but extensions were made in every city, greatly increasing the length of the haul, but without any increase in the fare. This has been continued until in almost all, if not every one, of our larger cities the five-cent fare carries the rider two, three and four times as far as for the amount paid 10 years ago. In other words, on the basis of the ride sold for five cents only a decade ago, the pasenger would to-day be paying 15 or 20 cents.

On the line nearest us to-day, the company voluntarily reduced its rate from 10 to five cents, and the ride is 10 miles. The same is true of many other cities, and I desire to emphasize this fact—not a theory, but a simple fact of easy confirmation—that the street railways have steadily pursued a liberal, a progressive policy; not only have kept pace with the times, but have of their own accord made frequent and valuable concessions of their legal rights, and this, too, in the absence of any moral or legal obligation whatsoever. At the time these concessions were made the public did not even consider it fair to ask these concessions; and yet I am confident that not one of all the companies throughout the country which did this, would have ever dared to accept a franchise and build under it, calling for these concessions at the date they were actually put in force, or even at any date. They could not look into the future and know it would even be a possibility. It does seem to me that it is the lack of information as to what has been the record, the actual history, of the attitude and doings of street railways which lead so many intelligent people to insist on the stringent and unfavorable terms which they do in their treatment of street railways.

A liberal policy pays everywhere, if it is only in the conduct of a peanut stand; give well-baked nuts and good measure. The street railway has demonstrated in a large degree its broad-gaged, progressive, liberal policy. Then accord to it the same kind of treatment and it is my firmest conviction of convictions, after the closest observation for 16 years, that in no other way can the people get so much for so little, so large a measure of return for what they give, as they have and do and will from a liberal treatment of city lines of transportation.

The liberality cannot all be on one side, for in exactly the proportion you burden and restrict a street railway, in just that proportion do you limit its range of usefulness. Does the company ask what you are pleased to term certain privileges and concessions in exchange for certain concessions or performances on its part? If so, it is because the company has been actually forced to use in barter that which, under a liberal and just treatment from the city, it would gladly have done voluntarily. And what, too, are these same "concessions" the company seeks? Investigation will, with scarcely an exception the country over, find them to be that which will go to improve the service and add value to property in which the company has no share.

If the North Side road in Chicago would run its cars through a tunnel it must pay a large sum, build a bridge, and keep the tunnel in repair. The repairs, I grant you, are fair; but why, when it removes several thousand cars from other bridges, thus leaving more room for any who desire to use them, should it pay for getting out of the way? But the tunnel cost public money and is for the public, and we would take it for a car track. Yes, it was built from public funds,and for the public. But did you ever walk or drive through the La Salle street tunnel before the cable cars entered some years ago? I have driven through it several times. It was absolutely deserted; dark, damp, uncanny for the pedestrian, a favorite place for thugs and hold-ups, and so steep that loaded teams kept out. With the exception of that memorable night when the city was in flames, there has rarely in a day passed through so many persons as have gone through every daylight hour since the car tracks made it for the first time of any practical value.

Would it be any improvement to stop the cars across the river and let the tired thousands walk over the bridges and through tunnels to get a car? The public now get daily use of that tunnel; they never did before, and yet it was built for the people.

What a street railway asks it asks for the good of the public and the city, more than for itself, and if you have never studied that assertion, and will do so, you will be surprised. Does the street railway constantly ask for more and new grants? You should congratulate yourself that transportation is being conducted along progressive lines. When a street railway stops expanding you may be sure of one of two things—either that the city has ceased growing, or the public good demands a new manager for that road.

Did time permit I would like to trace for you the evolution and revolution of the street railway. It is as interesting as a romance. It is a story of patient, persevering, ceaseless endeavor toward something better. A few know of the trials and lives and millions of treasure which have gone into the striving; the world has never heard of these. Success only is crowned. I would have told you of the cars of 50 years ago, small wages and long hours. I should like to picture the great social change in the life of the farmer and his family which the trolley has wrought in four years; of the brightness and happiness poured into the life of drudgery of the poor by music and entertainment and parks, now provided free by hundreds of street railways; of reading-rooms and libraries and social clubs, and free baths and benefit associations for employes.

There are so many phases to a subject seeming to possess but few we must pass them by, but I cannot close without a word for the social and moral benefits which it has brought to those whom we are accustomed to term the laboring classes. Why the man who carries a dinner pail is any more entitled to be called a laboring man than you or I, is something I could never comprehend. But what has the railway done for the man with the dinner pail?

When cities were young in point of size in this country, their boundaries were limited by the distance a man could walk in, say, 30 minutes, from place of business or labor to his home. At first this radius from the city's center was about a mile and a half. When the horse car appeared it increased this radius to about double in the direction of the car route. Now the electric car makes it possible to ride 12 miles in the time formerly consumed in walking two.

For 50 years walking and horse cars were practically the only means of travel between work and living place. In those days also the hours of labor were longer, thus placing an additional burden on a greater distance between the two. Thus it happened that our cities were badly congested, becoming more and more so each year. To accommodate this steadily increasing army of laborers tenement-houses, with all their misery, discomfort, unsanitary and immoral conditions, grew rank within our cities. If an epidemic broke out it raged most fiercely here; if a criminal was in hiding he was sought here. Children grew up literally in the gutter, a product of the slums. But how help it? Away out somewhere there was green grass and pure air, but both might as well be across the sea, for all the good they were to these unfortunates. Population extended but little, if any, beyond the end of the track, and there was a positive line where buildings ceased and farms began, in some places as marked as if a wall had been thrown about the city. It was only the more favored class, with time to command, who could live out any distance.

With the advent of mechanical power lines were immediately extended in all directions, as one reaches out his hands for food and air. For the first time it became possible to cover a distance from four to six or even 10 miles in the time previously required to walk one or two. Then followed an exodus as remarkable as that commanded by Moses, and the trolley car led the people out literally to the promised land. A little house on a little lot sometimes, but it was at least a home where the children had a chance to grow up strong physically, mentally and morally. It is the modern system of transportation which has made possible the phenomenal growth of American cities during the past decade, and if this growth had otherwise been possible, consider the home life and condition of the poor, forced up into the air because expansion could go no other way.

No one pays his fare so uncomplainingly as the working man. Could he be heard you would hear him say: "Instead of lower fares, give me longer lines." And when you are inclined to judge harshly of the street railway, don't forget its service to these hundreds of thousands, and the gladdened hearts of the father and mother and the little children, to whom existence has been changed to living by their good friend—The Trolley.

The Consolidated Traction Company, Jersey City, N. J., is now defending a personal injury suit brought by a girl who tripped on an advertising sign fastened to the car steps.

In the Power House

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

HIGH-SPEED TANGENT-SPOKE FLY-WHEEL.

In discussing the paper on "Mechanical Features of Electric Traction," read before the Institution of Mechanical Engineers (England) in 1898 by Philip Dawson, the subject of fly-wheels was considered by Archibald Sharp, who presented a design of his own. Mr. Sharp's discussion and the accompanying drawings are taken from the published proceedings of the Institution.

Mr. Sharp said a good deal had been heard about fly-wheel accidents in America; but in this country (England) they were not unknown, for within the last two years there had occurred three accidents to large fly-wheels, one of them involving great destruction of property, in Glasgow, in Barrow, and a few months ago in Lancashire. The fortunate circumstance that no lives had been lost had proved unfortunate for arriving at the causes of the accidents, inasmuch as the fact of their occurrence was consequently known to a limited extent only. When a fly-wheel is in motion, the rim tends to expand under the action of centrifugal force; and the stresses on the rim depend greatly on the method in which it is constrained by the mode of its construction. In a freely rotating rim with a circumferential speed of 100 ft. per second, which is above the safe limit, the circumferential tension produced in the rim is only 0.47 ton per sq. in. of its transverse section. This is probably the low figure which the author (Mr. Dawson) had in mind when stating in his paper that fly-wheels were running with factors of safety varying from 17 to 18; such a margin he thought must be erroneous. In a large fly-wheel with six or eight arms the stresses on the rim are due principally to the bending induced by the constraint of the arms. The bending moment on the rim of a fly-wheel is proportional to the centrifugal force per foot length of rim, and also roughly to the square of the distance between the outer ends of two consecutive arms. The tensile stress due to bending is probably always much greater than that due directly to the hoop tension: so that, in a fly-wheel running with a rim speed of 200 ft. per second, the hoop tension just before bursting might be 1½ tons per sq. in., while the maximum tension due to bending might be somewhere about 7½ tons per sq. in.; consequently on the section of the rim just in line with an arm there might be a maximum tensile stress of 9 tons per sq. in., and a maximum compressive stress of 6 tons per sq. in. Such conditions of stress are quite unsuitable for cast-iron; in fact they are nearly what would occur in a Hodgkinson cast-iron beam turned upside down. A plate fly-wheel is no doubt a good design for a large size, on account of the rim, receiving practically continuous support; and in this respect it is in the same position as a solid disk fly wheel of small diameter; but its cost must militate against its wide adoption.

A fly-wheel designed by Mr. Sharp is shown in Fig. 1; it has been tried with a fair amount of success, and is not of such an expensive construction. It has three distinct features. In the first place it has numerous spokes, so that the unsupported length of rim is small. The wheel illustrated has 24 spokes: so that, comparing it with a six-arm fly-wheel of the same diameter, the stresses due to bending in the rim would be only one-sixteenth—or according to Professor Unwin's exact formula only about one-fourteenth—of those in the rim of the six-arm fly-wheel. The second feature is that the nuts at the ends of the spokes were all screwed up tight in building the wheel, whereby an initial tension is put upon each spoke, and an initial circumferential compression upon the rim. The initial compression put upon the rim should be made great enough to exceed the direct tension due to centrifugal force when the wheel is running. The third feature is that the spokes being slender must be made tangential to the hub and oblique to the rim, otherwise the wheel would not have circumferential rigidity. A direct-spoke bicycle-wheel would be an utterly unsuitable construction for a fly wheel. A subsidiary feature of detail is the method of fastening the spokes to the hub. This is done by frictional grip alone. The spokes are made in pairs, and the middle of each pair is wrapped half round the hub, lying in a spiral groove, as shown in Fig. 1. The sides of the groove are inclined at a small angle, as shown, so that any desired amount of wedging action can be obtained. In the actual running of a fly-wheel so constructed of 10 ft. diameter there had not been the slightest cause of doubt that this mode of connecting the rim to the hub was sufficient. The fly-wheel had been designed for a gas engine to run at 180 r. p. m. with a circumferential speed of 94 ft. per second. In default of exact measurement of the tension applied the endeavor was made to tighten up the spokes to an initial tension of 4 tons per sq. in., which would produce an initial compression on the rim of about one-third of a ton per sq. in: so that, when the wheel was running with a rim speed of 100 ft. per second, the average circumferential stress on the rim would be nearly zero, while the stresses on the spokes would be increased to 4½ tons per sq. in., and the stresses due to the bending of the rim would be only ½ ton per sq. in. for compression and tension. An experiment had been made for comparing the efficacy of this 10-ft. fly-wheel with that of an ordinary fly-wheel of 5½ ft. diameter on the same shaft. The records of the experiment are given by the Moscrop diagrams shown in Figs. 2 and 3. The height of

the pencil drawing the diagram corresponded with the actual speed of the crank shaft at the instant, so that the amplitude or width of the band drawn by the oscillations of the pencil up and down was proportional to the variations of speed from point to point during the revolutions of the wheel at an average speed of 150 r. p. m. with no load on the engine. The broader band in Fig. 2 pertained to the working of the gas engine under the ordinary conditions with two heavy cast-iron fly-wheels, each 5½ ft. diameter and 1,670 lbs. weight. In the second half of the experiment at the same average speed and with no load on, represented by the narrower diagram, Fig. 3, one of the ordinary cast-iron fly-wheels was taken off, and

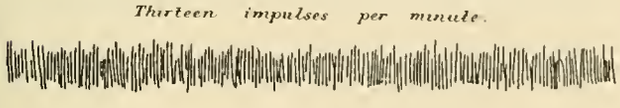
Thirteen impulses per minute.



the tangent-spoke fly-wheel of 10 ft. diameter and 2,900 lbs. weight was put on in its place, the total weight of the fly-wheels being now 4,570 lbs. against 3,340 lbs. previously, whereby the speed variation was considerably reduced, as seen in Fig. 3. Approximately the speed variations in the two cases were inversely proportional to the moments of inertia of the fly-wheel rims. These two diagrams, Figs. 2 and 3, show the effect of mere weight in a fly-wheel, as distinct from its efficacy or controlling power. The latter is proportional to its weight and to the square of the rim velocity: so that it is to the advantage of the steadiness of the engine to have the rim running at as high a speed as possible. With a heavy fly-wheel the pressure on the bearings, and therefore the total resistance of the engine, is increased, as is illustrated by the fact that the heavier fly-wheels in action, Fig. 3, 13 impulses per minute were required to drive the engine at no load, whereas with the lighter fly-wheels in Fig. 2 only 11 impulses per minute were required.

The power-house of the Dublin (Ireland) Tramway Power Company was fireproofed with tile made by the Pittsburg Terra Cotta Lumber Company of Pittsburg, Pa., and we understand that the purchaser is greatly pleased with the work.

BERTHIER METHOD OF COAL CALORIMETRY.

When a boiler test is made, one of the things to be determined is the efficiency. There are two methods of defining and calculating efficiency: 1. The efficiency of the boiler, which is the ratio of the heat absorbed per pound of combustible to the heating value of one pound of combustible. 2. The efficiency of the boiler and grate, which is the ratio of the heat absorbed per pound of coal to the heating value of one pound of coal. The first of these is recommended as the standard of comparison for all tests; the second is needed when comparing different furnaces, grates, fuels or methods of firing.

To determine the heating value of the coal, recourse is had to various forms of calorimeters. The Berthier method of coal calorimetry was treated in a paper recently read by Charles V. Kerr before the Western Society of Engineers, Chicago, from which the following abstract is taken:

The Berthier method consists in heating a quantity of coal with litharge (Pb O), the air being excluded, and M. Berthier in his "Treatise on Assays," published in 1833, thus describes the method:

"Mix intimately 1 part by weight of the substance, in the finest state of division, with at least 20, but not more than 40, parts of litharge. Charcoal, coke or coal may be readily pulverized; but in the case of wood the sawdust produced by a fine saw or rasp must be employed. The mixture is put into a close-grained conical clay crucible, and covered with 20 or 30 times its weight of pure litharge. The crucible, which should not be more than half full, is covered and then heated gradually until the litharge is melted and evolution of gas has ceased. At first the mixture softens and froths. When the fusion is complete, the crucible should be heated more strongly for about ten minutes, so that the reduced lead may thoroughly subside and collect into one button at the bottom. Care must be taken to prevent the reduction of any of the litharge by the gases of the furnace. The crucible, while hot, should be taken out of the fire and left to cool; when cold, it is broken, and the button of lead detached, cleaned and weighed. The accuracy of the result should be tested by repetition."

In using litharge in clay crucibles a bright red heat should be avoided, because the liquid litharge combines with silica at a high temperature, forms a fusible silicate of lead, and soon perforates the crucible. This property occasions the use of litharge in the manufacture of glass and in glazing earthenware. The purpose of covering the mixture of fuel and litharge in the crucible with a quantity of pure litharge is not only to prevent access of air to the fuel, but also to prevent the escape unoxidized of the more volatile portions of the fuel. And this covering of pure litharge must likewise be protected from the furnace gases. A yellow flame like that of a gas jet would reduce the litharge to lead in the oxidation of the incandescent carbon of the flame; while the blue flame of a Bunsen burner would have no such effect.

The Berthier method is based on Welter's law, which is: "The quantities of heat emitted by combustible substances are proportional to the amounts of oxygen required for their complete combustion."

Thus 1 lb. of carbon requires 2 2-3 lbs. of oxygen for its complete combustion and gives out 14,600 B. T. U. The chemical equation is—

$$C + O_2 = C\,O_2$$
$$12 + 32 = 44$$

When we divide the O_2 by the C we get $32 \div 12 = 2\ 2\text{-}3$, and the heat per pound of oxygen is $14{,}600 \div 2\ 2\text{-}3 = 5{,}475$ B. T. U.

If the oxygen is furnished by litharge the equation is

$$C + 2\,Pb\,O = C\,O_2 + 2\,Pb$$
$$12 + 2\,(206.9 + 16) = 44 + 413.8$$

Dividing the 2 Pb by the C we get $413.8 \div 12 = 34.48$, and the heat per pound of lead reduced will be $14{,}600 \div 34.48 = 423.4$ B. T. U., or Heat = 423.4 (Lead ÷ Fuel).

But Welter's law does not hold true for hydrogen compared with carbon. When hydrogen is burned with oxygen 7,830 B. T. U. per pound of oxygen required are evolved; with carbon the figure was 5,475. This wide divergence has caused the method to be discredited, but Mr. Kerr makes the point that the methods of coal calorimetry correct in theory, on account of experimental errors, give more widely varying and erroneous results than the Berthier method which is defective in theory but freer from errors in practice.

If hydrogen be burned with litharge we get

$$Pb\,O + H_2 = H_2\,O + Pb$$
$$222.9 + 2.02 = 18.02 + 206.9$$

The lead reduced per unit weight of hydrogen is $206.9 \div 2.02 = 102.42$. The ratio of lead reduced per unit weight of hydrogen to that per unit weight of carbon is $102.42 : 34.48 = 2.97$. If Welter's law were true for hydrogen, the heating power of hydrogen would be $2.97 \times 14{,}600 = 43{,}362$ B. T. U. per lb., but this is 18,638 B. T. U. less than its true heating value, which is 62,000 B. T. U. Thus if a fuel containing 2 per cent of hydrogen be judged by the formula, Heating value = 423.4 (Lead reduced ÷ Fuel burned) or V = 423.4 L ÷ F, the heating value will be too low by 2 per cent of 18,638 or 373 B. T. U. Dividing this figure by 34.48 we get 10.8 which must be added to the constant in the formula for V making it V = 434 L ÷ F for fuel with 2 per cent hydrogen such as coke, charcoal or anthracite.

For fuel containing an average of 5 per cent hydrogen the formula becomes V = 450 L ÷ F for bituminous coal, lignite and wood. The percentage of hydrogen in the fuels named is so nearly constant that these last two formulas are probably correct within 1.5 per cent.

When fuel is burned in the ordinary boiler furnace a large excess of air is usually present and the products of combustion are sent into the chimney at a high temperature. It may be of interest, therefore, to consider here the heat actually available in what is at present called good practice. Assume 18 lbs. of air at 32° F., and normal pressure, an excess of about 50 per cent, to be required for the combustion of each pound of fuel, and that the products of combustion together with the excess of oxygen and nitrogen to enter the chimney at a temperature of 400° F. Then the loss of heat to the carbon burned will be about 1,600 heat units, the total carried away by the carbonic acid gas, the oxygen and the nitrogen. Hydrogen will lose almost 15,000 heat units, more than half of which is due to the latent heat carried away in the aqueous vapor or steam. The available heat will be for carbon 14,600 — 1,600 = 13,000 B. T. U. and for hydrogen 62,000 — 15,000 = 47,000 B. T. U. The excess available in hydrogen over that required by Welter's law is $47{,}000 - 13{,}000 \times 2.97 = 8{,}390$. The formulas then become

V = 377 L ÷ F for pure carbon.
V = 382 L ÷ F for fuel with 2 per cent hydrogen.
V = 389 L ÷ F for fuel with 5 per cent hydrogen.

and in this form give at once what a given fuel should do when burned under a boiler in good condition.

Determinations of the heating values of different fuels made by this method showed much more harmonious results than tests made of the same fuels with an oxygen calorimeter, and the author believes this method accurate and reliable. The cost of the crucible and the litharge used in a determination is only 6½ cents.

The annual report of John Overn, chief of the Bureau of Engines and Boilers, in Philadelphia, states that of 3,579 boilers under the supervision of the bureau, 625 are temporarily out of use because electric power has been substituted for steam in these plants. In 1898, 306 new boilers (112 horizontal tubular, 9 compound tubular, 115 vertical tubular, 9 locomotive, 46 sectional, 17 patent) were installed. No boiler explosions occurred during the year; there were two serious accidents to boiler steam piping.

ANNUAL REPORT OF THE STORAGE BATTERY ROAD.

The annual report of the Chicago Electric Traction Company for 1898 has been prepared by General Manager E. R. Gilbert, and the following figures have been extracted from it. During the past year the company has been reorganized and put on a substantial basis. The traffic for the 12 months past has increased 53 per cent over that of the preceding year. On an average 10 cars have been in constant operation, and a total of 609,767 car-miles run, the operating expenses being 8.72 cents per car-mile. The average cost of running a car per day was $14.61.

Perhaps the most interesting data in the report are regarding the batteries and their work. The total battery expense was .758 cent per car-mile. The batteries for the past year averaged 23,233.6 car-miles before being dismantled, the best making a run of 27,174 miles. Experience has shown that one set of negative plates will outlast three sets of positives. The latest positive plates have an increased surface without additional weight, so that they will last about 50 per cent longer than the old ones.

There are in the power station two 250-h. p. Willans triple expansion engines connected through quill shafting to four 250-k. w. generators. For a complete description see the Review for February, 1898. From the report of the power station expenses they are divided: Fuel, 58.5 per cent; wages, 34; repairs, 4; supplies, 2.7; and water, .7 per cent. During the year 4,741 tons of coal were consumed, and the station output was 1,227,228 k. w.-hours, making a coal consumption of 7.726 lbs. per k. w.-hour; cost of coal per k. w.-hour .557 cent, and a total cost per k. w.-hour of .977 cent. In the summer months when a larger number of cars are running and the track and other conditions are more favorable to the operation of the batteries a better showing is made. Last July 61,288 car-miles were run; the output of the station was 104,552 k. w.-hours; coal consumption, 6.77 lbs. per k. w.-hour; cost of coal per k. w.-hour .479 cent, and total expenses per k. w.-hour, .835 cent.

The result of this year's operation have been so satisfactory that some extensions are to be built this spring, including a line from Blue Island to Harvey; in all 6½ miles of new track. A new car barn for 50 cars will be constructed and additional rolling stock purchased.

MILWAUKEE IMPROVEMENTS.

In 1898, the Milwaukee Electric Railway & Electric Company spent nearly $500,000 in extensions and improvements. Among the extensions are the 16-mile Waukesha line, the Whitefish Bay line, displacing the old steam line, and the substitution of electricity on the Wauwatose dummy line. The new power house on River street also called for a large investment. Vice-President Payne states that the principal work of 1899 will be the building of an extension to Calvary cemetery through a portion of the Soldiers' Home and west to connect with the Waukesha line.

The Cleveland City Railway is installing a new engine (marine type) direct coupled to a 1,200-k. w. Walker generator.

The executive committee of the board of directors of the Manhattan Elevated, of New York, has given President Gould full authority to raise funds for the electrical equipment of the road.

In view of the presence of smallpox in Rochester, N. Y., the board of health has ordered that the employes of the Rochester Railway Company be vaccinated at once.

A head-end collision occurred on the line of the Citizens' Rapid Transit Company, of Nashville, Tenn., on January 10, in which one of the motormen was killed and the other injured. There was a dense fog and a misunderstanding as to the proper passing point.

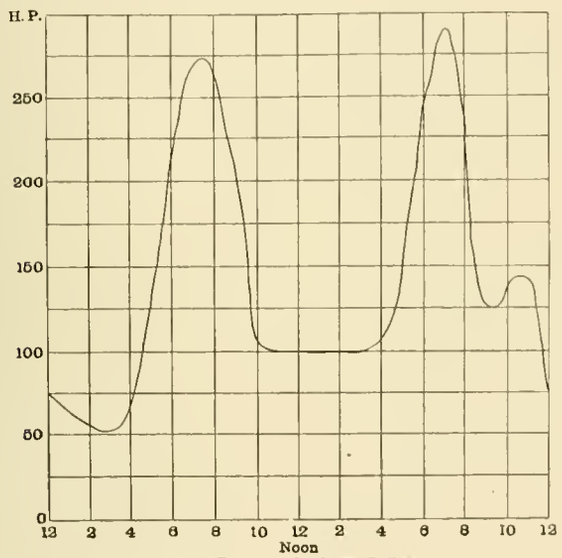
January 25, a freight train on the Puyallup line of the Tacoma (Wash.) Traction Company left the track on a curve at the foot of a steep grade and plunged into a deep gulch. The motorman and conductor both jumped and landed in soft mud, escaping without injury.

Designing Boilers for a Small Street Railway Plant.

BY WILLIAM KENT, M. E.

PART I.

In entering upon the studies preliminary to the design of the steam boilers for a small or medium sized electrical street railway power plant, the engineer must take into consideration some peculiar features of the service required from the boilers which differ more or less from those which govern the design of boilers for other purposes, such as a factory. Such features are: the extreme variations of the load upon the engines from hour to hour, and the consequent variation in the quantity of steam to be furnished; the prime necessity of having the boiler plant constantly in condition to furnish the maximum amount of steam required during the hours of heaviest load; the absence of holidays or slack seasons during which general repairs or alterations may be made; and the considerable uncertainty that exists before the plant is put in operation concerning the actual amount of power that may be required and the probable additions that may be needed as the road is extended or as traffic increases. The first considerations, therefore, in the design of the boiler plant are certainty of operation under the severest load, and capacity for furnishing the maximum amount of steam that may be needed under the most adverse conditions, such



Load Diagram of a Street Railway.

as a combination of heaviest load, bad weather, poor coal, and a portion of the boiler plant being laid off for cleaning or repairs.

To meet these requirements it is necessary not only to have the boilers of sufficient capacity to meet the greatest demand for steam, but also to have enough boilers to allow one of them to be laid off without curtailing the steam supply below the maximum quantity that may at any time be required by the engines. In even the smallest sized plant it is advisable to have not less than three boilers, any two of which are able to run the plant at the time of heaviest loading. In larger plants, four, five or more boilers may be installed, and arranged that any one of them may be laid off at any time for cleaning or repairs without interfering with the operation of the others.

Assuming that our boiler plant is to contain one boiler more than is sufficient to generate the steam required under the conditions of maximum load, the poorest coal being supplied that is ever expected to be used at the station, and the weather the most unfavorable as regards the draft and the amount of moisture in the air and in the coal, we proceed to consider the number, size, proportions and style of the boilers to be selected.

The boiler plant is usually one of the last of the divisions of the complete power plant that are to be designed. Before designing it we must know the maximum quantity of steam that will be needed. The electrical engineer of the railway company will furnish data as to the electrical horse-power that will be required from the dynamos, and he will hand to the steam engineer a diagram something like the one shown in the accompanying cut, giving the heaviest loads expected on the dynamos during 24 hours. From these data the steam engines will be selected or designed, involving a long study of the relative advantages and disadvantages of horizontal and vertical, of simple and compound, of condensing and non-condensing engines, of their size and of their probable steam consumption at different loads. The two "peaks" of the load diagram will be carefully considered, and the question will be decided whether these peaks are to be taken care of by storage batteries, by overloading the engines or dynamos, or by the use of a separate engine and dynamo to be operated during three or four hours of the day when the load is heaviest.

The steam engine questions being decided a careful calculation is then made of the probable steam consumption per hour during the single hour or fraction of an hour of maximum load, having due consideration for the fact that an overloaded engine may be very wasteful of steam. How wasteful will depend on the type of engine. Not until this question is settled is it time to prepare the design of the boiler plant.

The boilers, after one of them is reserved for cleaning or repairs, must be capable of furnishing sufficient steam to the engines during the time of the peak of the load, even when the coal is poor and the weather bad, and the engine not in its best condition as to steam-tightness and valve adjustment; and to this consideration every other one, such as first cost of boilers, or economy of coal, must be made secondary.

The maximum number of pounds of steam per hour now being given, and the pressure of steam required by the engines and the probable feed water temperature being known, we have the data with which to begin figuring on the boilers. By referring to a table of the properties of steam, or to a table of "factors of evaporation," we may reduce this given number of pounds to the equivalent number of pounds per hour evaporated "from and at 212° F." Multiplying the figure so obtained by 965.7 gives the number of heat units per hour to be furnished by the boilers, or dividing it by 34½ gives the number of "boiler horse power." A slight allowance, say 1 per cent, may be added to cover loss of heat due to radiation from the steam pipes.

(Definitions.—A heat unit or British thermal unit; B, T, U, is the quantity of heat required to raise the temperature of 1 lb. of cold water 1° F. A boiler horse power is the evaporation of 34½ lbs. of water from and at 212° or its equivalent. It is equal to 33.317 heat units per hour. When used as a rating of the capacity of a boiler in the market, the term is thus defined by the Boiler Test Committee of the American Society of Mechanical Engineers—code of 1898,—"A boiler rated at any stated capacity should develop that capacity when using the best coal ordinarily sold in the market where the boiler is located, when fired by an ordinary fireman, without forcing the fires, while exhibiting good economy; and further, the boiler should develop at least one-third more than the stated capacity when using the same fuel and operated by the same fireman, the full draft being employed and the fires being crowded; the available draft at the boiler, unless otherwise understood, being not less than ½-in. water column.")

Having the figure of the equivalent evaporation from and at 212° in pounds per hour as the amount of work to be done by the boilers during the time of the peak of the load, we now consider how this capacity is to be obtained. The first essential in a boiler of a given capacity is its capacity to burn coal. No matter what its type or proportions, or the extent of its heating surface, it will not develop the required power unless it can burn enough coal. This qualification strictly does not belong to the boiler itself, but chiefly to the furnace under the boiler, and largely to the chimney, to the area of flues or gas passages through or beyond the boiler, and to the quality of the coal. We must therefore proportion the furnace before we proportion the boiler, and to do this we must first find

out how many pounds of coal are to be burned per hour during the time of maximum steam demand. This is rather a complex question, for it involves many variable elements, such as the quality of the coal, the kind of furnace, the rate of driving of the boiler, and the skill of the fireman.

The number of pounds of coal required per hour will be equal to the quotient obtained by dividing the equivalent evaporation from and at 212° per hour, in pounds, by the number of pounds of water that may be evaporated from and at 212° by one pound of coal. This latter number will vary anywhere from 12, when the best grade of semi-bituminous coal, low in ash, is used, in a furnace adapted to burn all the volatile part of the coal, with a boiler so proportioned as to be capable of absorbing 75 per cent of the heat generated in the furnace, and with skillful firing, down to five pounds or less, with a poor grade of western bituminous coal, high in moisture, ash and sulphur, burned in an ordinary furnace directly under the boiler, with no provision for burning the volatile matter or preventing smoke, with a boiler having insufficient heating surface, and therefore overdriven, and with unskillful firing. With lignite, or lignitic coal, from Utah, a figure as low as 3.70 lbs. has been obtained. (Trans. A. S. M. E. Vol. IV, p. 263.) The writer once obtained as low as 5.09 lbs. from a poor quality of Illinois coal, with expert firing, with the boiler driven 16 per cent below its rating, but with both the furnace and the grate bars unsuited to the coal. (Trans. A. S. M. E. Vol. IV, p. 267.)

To be continued.

THE TRAMWAYS OF LAUSANNE, SWITZERLAND.

The electric tramways of Lausanne are noteworthy not only for the steep grades on all the branches but also for the gas engine installation at the central power station. The Lausanne Electric Tramway Company was organized June, 1895, and secured a 50-year concession from the municipal, cantonal and federal authorities. Work was commenced in March, 1896, and 8.4 miles of tramway were completed in five months. It may be of interest to note that Lausanne is a city of about 35,000 population and is situated on the northern shore of Lake Geneva. The steep slopes, intersected by deep ravines, presented many difficulties for constructing and operating an electric tramway. The map of the tramway system and the data are taken from a contribution by C. Du Riche Preller in "Engineering." As may be seen from the plan the tramway lines comprise an inner circle in the upper or central part of the town with a number of suburban branches radiating out from it.

The altitude of the roadbed varies from 1,246 to 1,900 ft. But 3 per cent of its length is level, the rest having an average grade of 3.5 per cent, and on one line there is a 11.3 per cent grade. Furthermore 36 per cent of the entire length consists of curves with radii from 28 to 330 ft. The girder rails are 4½ in. deep and weigh 60 lbs. to the yard. They are laid on iron sleepers 6 ft. long, weighing 46 lbs. each. The trolley wire is suspended from span wire and brackets, the poles being spaced at intervals of 115 ft.

The power house is situated practically in the center of the system and beside it are the car barn and repair shop. The car barn has accommodation for 16 cars, but it will be increased to shelter 50 cars when proposed extensions are completed. All the cars return to the barn at night. The power house comprises the engine room, 50 by 66 ft., for four sets of gas engines and generators, a gas generating room, 40 by 50 ft., two storage battery rooms and the offices of the company. The three sets of Crossley gas engines are direct connected to six-pole Thury generators by Raffard friction couplings. Each unit consists of two twin gas engines, each developing 75 h. p. at 160 r. p. m. and provided with an 8-ft. fly-wheel weighing 6.5 tons. The gas is ignited from porcelain lamps which are kept incandescent by a burner fed from the gas plant. A mixture of French coal with Belgian anthracite, costing about $6.70 a ton, is used giving a h. p.-hour with 1.3 lbs.; this is a cost of 1 cent per car-mile.

The storage battery consists of 300 elements and has a capacity of 700 ampere-hours, or a discharge rate of 23 amperes at 500 volts for three hours. It works in parallel with the generators and the line, and compensates for the great fluctuations in load resulting from steep grades and is used in case of accident to any of the station machinery.

The rolling stock comprises 21 four-wheel motor cars and one trailer. Each motor car carries 32 passengers and is 23 ft. 4 in. over all and weighs 6.7 tons. A car is fitted with two 20-h. p. four-pole Thury motors, having a single reduction of 1 to 9. The motors always run in parallel, the speed being regulated by resistances placed on the roof of the car. This arrangement has proved satisfactory as the speed can be varied within wide limits. The controller consists of a flat contact box mounted one on each platform, the handle being moved left or right; the sections marked by incisions in the edge of the box. For starting, the handle is moved from the zero point to the left and a movement to the right applies the electric brake.

The cars are heated by two radiators in series absorbing five amperes, and are lighted by six 16-c. p. incandescent lamps. The trolley is a steel tube weighing 22 lbs. Instead of a trolley wheel there is a sliding shoe filled with alloy which wears very rapidly, and is refilled at frequent intervals. When going down grade the motors are thrown in parallel and act as generators independent of the trolley circuit, and the resistance is so designed that the speed does not exceed 5 miles an hour on steep grades. The car is fitted with a screw brake rigging which applies two brake shoes to each wheel. The third brake is for emergency purposes and consists of two steel blocks whose lower surfaces are toothed. Each block is movable in a frame fixed to the car body between the two axles, and when in a state of rest compresses a pair of spiral springs, having the force of a ton to each block. By raising a handle on the platform and thereby releasing the lever which keeps the springs compressed they at once force the blocks downwards so that the serrated surfaces scrape along wood planks placed outside the rails. This brake is very effective although there has been few occasions to use it.

Some interesting figures are given regarding the cost of construction and operation. The cost per mile is based on seven miles, the turn-outs and double sections not being included in that length.

	Total.	Per Mile.
Administration.	$	$
Engineering and general charges	15,840	2,260
Track.		
Rails, sleepers and fastenings	43,400	8,800
Switches, crossings and turntables	5,200	
Excavation, packing and ballast	8,000	
Laying	5,000	
Electrical Equipment.		
Overhead line	22,000	4,400
Underground feeders and return	8,800	
Repair Shop and Sheds.		
Repair shop and car-sheds	11,660	1,900
Waiting rooms and huts	1,540	
Rolling Stock.		
21 motor cars, including equipment	74,400	10,840
One trailer	600	
Three trucks	900	
Tools, Furniture and Sundries.		
Tools for repair shop and sheds	3,000	745
" maintenance of line	1,400	
Furniture for offices and station	880	
Total	202,620	28,945
Power Station.		
Land and surveys	6,600	15,680
Earthworks and walling	7,480	
Building	33,440	
Gas, generating plant and motors	29,260	
Dynamos, storage batteries and switchboard	33,000	
Total	312,400	44,625

The cost of the power station and plant, comprising three units of 150 h. p. each, and a storage battery equal to a further unit of 150 h. p. works out as follows:

			Per H. P.
	H. P.	$	$
Three sets of gas plant and gas motors	450	29,260	65.0
Three sets of dynamos and accessories	450	20,000	44.4
One set of storage and reserve battery	150	13,000	86.6
	600	62,260	103.7
Land, works and building	...	47,520	79.2
		109,780	182.9

The annual operating expenses are divided as shown by the table

		Total.	Per Car-Mile Cents	Per Cent.
	$	$		
Administration and general charges		2,978	.82	7.0
Maintenance of Line and Buildings.				
Wages	2,553	4,521	1.26	10.4
Work	1,968			
Traffic.				
Wages of station masters, inspectors and guards	9,246	10,020	2.82	23.4
Sundries	774			
Traction.				
Wages of motormen and car cleaners	8,020	14,591	4.08	33.8
Maintenance and repairs of rolling stock, lighting and heating of car-shed	6,571			
Sundries.				
Rates, taxes, insurance, &c.		1,965	0.52	4.6
		34,075	9.50	79.2
Power Station.				
Wages	2,461	8,914	2.50	20.8
Maintenance and repairs of machinery and storage battery	2,000			
Fuel, oil and water	4,452			
		42,989	12.00	100.0

The car service varies from intervals of five minutes in the city to 30 minutes on some of the suburban lines, and the fares are differential, depending on the length of the grades. The maximum fare allowed is 4.6 cents for the first mile and 1.5 cents for each succeeding mile with an increase in the latter amount of 50 per cent on grades from 4 to 7 per cent and 100 per cent on grades above 7 per cent. During 1897 there were carried 2,180,430 passengers, and 341,338 car-miles run. The income in 1897 was $55,700 which increased to $76,000 in 1898. The cars each ran on an average of 50 miles per day, and the traffic was about equal to 50 passengers per head of population, which is approximately 44,000 in the city and

MAP OF LAUSANNE TRAMWAYS.

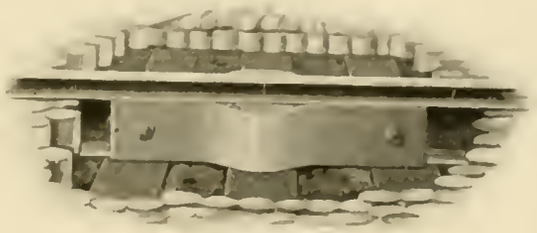
suburbs. The employes are divided as follows: Management, 6; inspectors, 8; motormen, 28; ticket collectors, 25; repair shop and barn, 13; power station, 8; line, 11; total, 99. The wages of the motormen and conductors average 66.5 cents per day of 11 hours.

The average power consumption in summer is about 170 k. w., which in the winter is increased by 2 k. w. per car for heating, making a total of 210 k. w. During the hours of light traffic one unit and the storage battery will carry the load and as the current demand increases another set is thrown in. A dividend of 4.64 per cent was paid in 1897 to the stockholders.

A company of which G. T. Dinwiddie is president; J. W. Morrison, vice-president; James McClamroch, secretary, and D. A. Coulter, treasurer, has been formed at Frankfort, Ind., to build an electric railway.

A NEW CAST-WELD JOINT.

Inasmuch as cast weld joints for street rails are so widely used, the new method of cast welding which has been brought out by the Milwaukee Rail joint & Welding Company, of Milwaukee, Wis., will not fail to interest street railway men. The illustrations show a side view and a section of the joint. It differs from other cast-weld joints in form and in the materials, as it consists of both cast iron and steel. The joint extends along the sides of the rail about 15 in. and projects at the sides opposite the joint, but not below the rails. When making the joints a space about 2 ft. square is cleared about the rail ends and the rail ends cleaned by means of a sand blast; steel strips bowed out to form a cavity around the joint are placed on each side and riveted to the rails; then the rail ends are



THE MILWAUKEE RAIL JOINT.

heated and molten iron poured between the rails and the steel strips.

An important advantage of this method is the small amount of excavation necessary in preparing the track for welding; the roadbed is not disturbed and paving removed is quickly replaced.

In 1897 the company cast-welded the joints on about half a mile of the Milwaukee Electric Railway & Light Company's track; in 1898 10,000 joints on the same road were welded by this method, including a suburban line from South Milwaukee to Milwaukee, a distance of eight miles of exposed track. In welding the South Milwaukee line expansion joints were made from 500 to 1,000 ft. apart, but the company states that subsequent work on other exposed lines shows such joints to be unnecessary; if the joints are

SECTION OF JOINT.

properly made they will hold as well on exposed as upon embedded tracks.

Tests made to determine the electrical conductivity of these joints showed it to be from 118 to 120 per cent of that of the rail. The Milwaukee Railway states that the cost of preparing the track for welding is only one-third as much as when the other processes with molds are used. On the work done in 1897 no joints have broken; in the 10,000 welded in 1898 the breakage has been less than one-half of one per cent.

That the Milwaukee Electric Railway & Light Company is well satisfied with this work is shown by the fact that the Milwaukee Rail-joint & Welding Company has a contract to make 20,000 more joints on this system during 1899; this will complete the work on the Milwaukee road, 15,000 joints having been cast by another company in 1896 and 7.

The Rail-joint Company has its own patents covering this joint, and states that roads using the joint need not fear infringement suits; the outlook for the coming season is very encouraging.

1899 Convention of the American Street Railway Association.

October 17 20 the Time—Executive Committee Meet in Chicago, Lay Out the Program and Decide on Place for Meeting.

The executive committee of the American Street Railway Association met in Chicago February 6 and 7 and decided to hold the next convention in this city on October 17, 18, 19 and 20. Tattersall's, the building selected by the local committee, was accepted as the place for meeting and exhibits.

The following members of the executive committee were present: C. S. Sergeant, Boston, president; Walton H. Holmes, Kansas City, vice-president; T. C. Penington, Chicago, secretary and treasurer; and Albion E. Lang, Toledo; George E. Yuille, Chicago; Frank G. Jones, Memphis; John I. Beggs, Milwaukee, and Ira A. McCormack, New York.

The subjects for reports are as follows:

"The Modern Street Railway Shop:—Its Design, Machinery and Shop Practice."

"Maintenance of Car Equipment."

"Train Service and Its Practical Application."

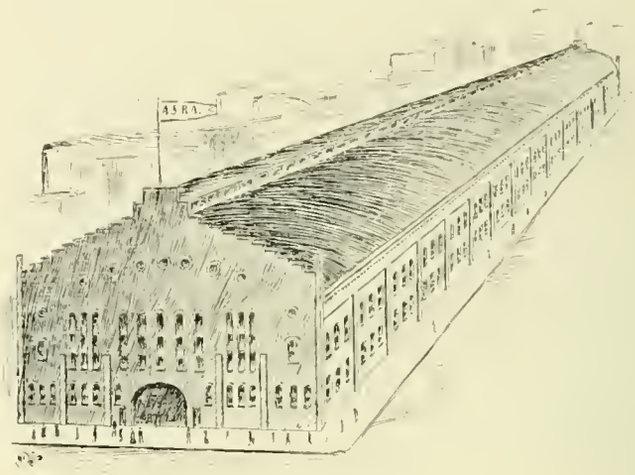
"Investments in Street Railways:—How Can They be Made Secure and Remunerative?"

"Construction and Maintenance of Street Railway Tracks."

It was the unanimous expression of the committee that it was far better to assign a fewer number of reports than has been the custom for many years, and use the time in a very thorough and detailed discussion of the paper. The committee will urge delegates to come prepared to speak on the several questions, and bring data and figures.

The executive committe discussed at some length the matter of excursions and entertainments, the general feeling being based on the expressed wishes of a large number of members of the association that hereafter more time be devoted to the practical work of the convention and less to side trips and sight seeing. While this decision is greatly disappointing to the local committee, which asked for four half days for this purpose, and while it is with many regrets to all our local members that the rule should be first applied to Chicago, the REVIEW feels that it is a move in the right direction, and is on record for two years past in favor of more work and less play. The Association has grown and expanded in its work to such an extent that twice the time is required which was ample ten years ago. Our visiting friends will not be without entertainment, however, and everything will be done in genuine Chicago style, and excursions will be made to various points of greatest interest.

One radical change will be inaugurated which cannot be too highly commended, and which will be alike pleasing and satisfactory to delegates and supply men. For several years past the length of program and multitude of excursions has left practically no time for an examination of the exhibits, and members have been obliged to absent themselves from the meetings or get what chance they could early in the morning or late at night. Several managers of very large roads last year deliberately cut the sessions for an entire day to examine the exhibits, saying they could read the papers and the discussions in the reports, but could not afford to miss the instructive display. On the other hand, it was very discouraging to an exhibitor to go to several hundred or thousand dollars expense

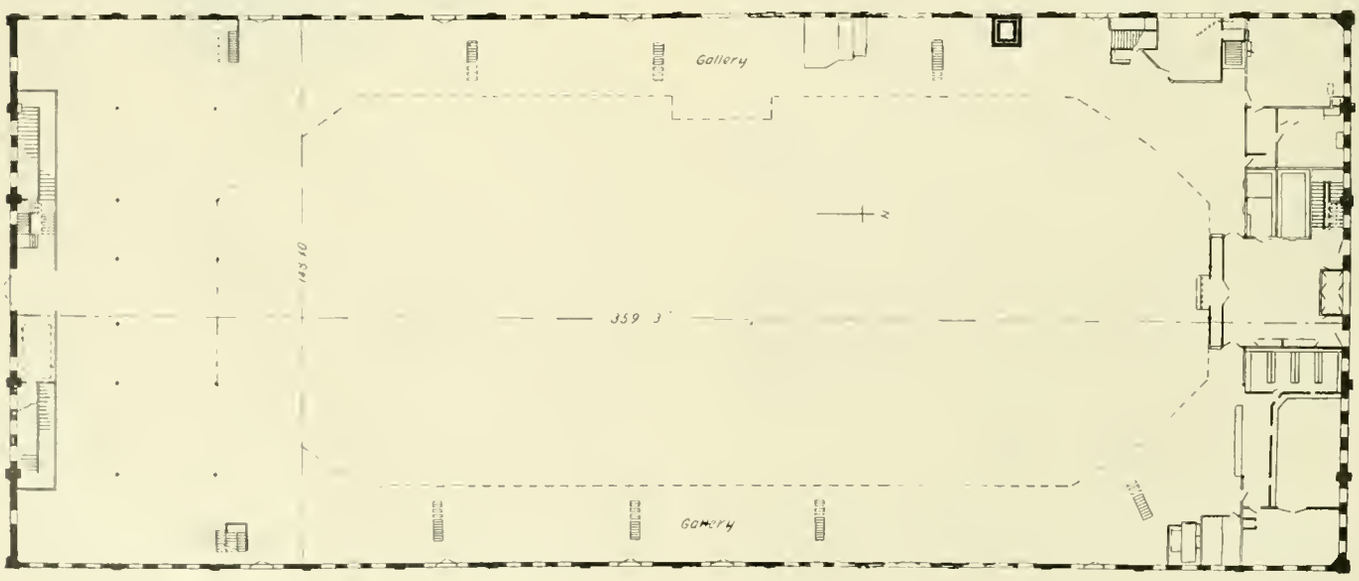


TATTERSALL'S.

in providing a fine display and have it receive only a hurried inspection.

This year one entire day will be devoted to this feature. It will be Friday, the last day, and the installation of new officers and the banquet will occur that evening.

Everyone will be interested in the meeting place. For this the largest suitable building in the city has been engaged. It is on the South Side, reached by three lines of cars from the hotels in ten minutes. Exhibits will all be on one floor, which has a space of over 50,000 square feet, unbroken by posts, as the roof is very high and carried on steel arches. The floor is laid directly on the ground and will support any desired weight. Switch tracks lead to the



FLOOR PLAN OF THE CONVENTION HALL.

side doors, which are ample to admit the largest cars and machinery. Pleasant session rooms for both associations and parlors for the ladies are in the same building. There is an abundance of light day and night and good heat. Tattersall's will afford the largest single-floor space ever had for exhibits.

Secretary Pennington will issue the floor plan and spaces in a few weeks and allot spaces. The price remains the same as last year, 10 cents per square foot. The executive committee were entertained Monday evening by the officers of the city companies. The dinner was given at the Union Club, and most delightfully presided over by J. M. Roach, vice-president of both the West and North Chicago systems, to whom the credit is due for the perfect arrangements of the evening. The guests were all seated at one round table which was elaborately decorated. The menu left nothing to be desired. Those present were: C. S. Sergeant, president American Street Railway Association and vice-president of the Boston Elevated Railway, also A. L. Plimpton and H. F. Grant of the same company; W. H. Holmes, manager of the Metropolitan of Kansas City; Ira A. McCormack, general superintendent Brooklyn Heights Railroad; John I. Beggs, general manager Milwaukee Electric Railway & Light Company; A. E. Long, president Toledo Traction Company; F. G. Jones, vice-president Memphis Street Railway; W. W. Bean, president St. Joseph & Benton Harbor Railway; George E. Yuille, second vice-president, and F. L. Fuller, general superintendent, West Chicago Street Railroad; George O. Nagle, superintendent, and Frank R. Greene, secretary, Chicago City Railway; T. A. Henderson, superintendent, and J. R. Chapman, chief electrician North Chicago Street Railroad; W. Warmsley, superintendent South Chicago City Railway; H. M. Sloan, general manager Calumet Electric Railway; T. C. Pennington, treasurer Chicago City Railway; T. C. Crossman, New York; and H. H. Windsor, editor STREET RAILWAY REVIEW.

After the dinner the entire party attended the theatre and later were entertained at a supper at the Grand Pacific hotel. The following day the guests were taken in Mr. Yerkes' private car and, after calling on Mr. Yerkes, inspected several of the West Side power plants. Returning, lunch was served in the car. The executive committee are highly pleased with the work already done by the local committee and the plans submitted for the future, and express the confident expectation that the convention of '99 will exceed in attendance and importance any yet held, and the Chicago street railway people do not intend to disappoint them.

The local work of the convention will be done promptly and effectively, and within two weeks all arrangements possible to make at this time will have been completed. On the evening of February 10 a largely attended meeting was held at the Auditorium, at which Mr. Yuille presided, in the absence of Mr. Roach, who was ill, and the following committees of workers were appointed.

Members of committees report to their chairmen; the local executive board is composed of the chairmen of the several committees.

GENERAL COMMITTEE.

Chairman, M. K. Bowen, president, Chicago City Ry.
Secretary and Treasurer, Geo. E. Yuille, 2nd vice-president, West Chicago St. R. R.
J. M. Roach, V. P. and G. M. North & West Chicago St. Railroad Co.
Geo. C. Nagle, Supt., Chicago City Railway Co.
H. M. Sloan, Gen'l Mgr., Calumet Electric St. Ry. Co.
H. H. Windsor, Editor STREET RAILWAY REVIEW.
F. L. Fuller, Gen'l Supt., West Chicago St. R. R. Co.
Jas. R. Chapman, Gen'l Mgr., Electrical Dept., North & West Chicago Street Railroad Companies.

ENTERTAINMENT COMMITTEE.

J. M. Roach, Chairman, V. P. and Gen'l Mgr., N. & W. C. St. R. R. Co.
T. M. Henderson, Supt., N. C. St. R. R. Co.
A. S. Littlefield, Railroad Contractor.
Geo. C. Bailey, Jno. A. Roebling's Sons Co., Chicago.
Harry Keegan, Ass't Supt., N. C. St. R. R. Co.
Frank R. Green, Sec'y Chicago City Railway Co.
Geo. A. Yuille, 2nd Vice-President, W. C. St. R. R. Co.

EXHIBIT COMMITTEE.

Jas. R. Chapman, Chairman, Gen'l Mgr., Electrical Dept., North & West Chicago St. R. R. Companies.
C. E. Moore, M. M., Chicago City Ry. Co.
Jno. Miller, M. M., North Chicago St. R. R. Co.
F. T. C. Brydges, M. M., West Chicago St. R. R. Co.
A. C. Heidelberg, Ass't Supt., Chicago City Ry. Co.
Geo. W. Knox, Chief Electrician, Chicago City Ry. Co.
W. F. Carr, Supt., Electric and Track Dept., W. C. St. R. R. Co.
W. A. Harding, M. M., Calumet Electric St. Ry. Co.
N. C. Noe, Engineer, General Electric Co.

TRANSPORTATION COMMITTEE.

F. L. Fuller, Chairman, Gen'l Supt., W. C. St. R. R. Co.
W. Worth Bean, Pres. & Gen'l Mgr., St. Joseph & Benton Harbor Electric Ry. & Light Co., St. Joseph, Mich.
Wm. Walmsley, Supt., South Chicago City Ry. Co.
Wm. J. Cooke, McGuire Manufacturing Co.
T. D. Miles, with W. C. St. R. R. Co.
J. M. Atkinson, of J. M. Atkinson & Co., of Chicago.
Jno. O'Keefe, with Chicago City Railway Co.

PUBLICITY AND INFORMATION.

H. H. Windsor, Chairman, Editor STREET RAILWAY REVIEW.
C. S. McMahan, Western Mgr., St. Railway Journal.
D. B. Dean, Terre Haute Car Mfg. Co., Terre Haute, Ind.
J. A. Hanna, Peckham Truck Co., Chicago.
C. J. Riley, Chief Engineer, Chicago City Ry.
Jno. O'Keefe, Chicago City Railway Co.

HALLS AND HOTELS.

Geo. O. Nagle, Chairman, Supt., Chicago City Railway Co.
A. S. Littlefield, Railroad Contractor.
T. M. Henderson, Supt., N. C. St. R. R. Co.
Maurice Coster, Westinghouse Electric & Mfg. Co.
T. C. Pennington, Treas., Chicago City Railway Co.

BANQUET COMMITTEE.

M. K. Bowen, Chairman, Pres. Chicago City Railway Co.
D. G. Hamilton, Chicago City Railway Co.
M. B. Starring, Ass't Gen. Counsel Chicago City Railway Co.
B. E. Sunny, General Electric Co.
H. H. Windsor, Editor STREET RAILWAY REVIEW.
C. S. McMahon, Western Mgr. Street Railway Journal.
Geo. C. Bailey, Jno. A. Roebling's Sons Co., Chicago.

LADIES' COMMITTEE.

H. M. Sloan, Chairman, Gen'l Mgr., Calumet Electric St. Ry. Co.
Theo. P. Bailey, General Electric Co.
Joseph Leiter, Chicago City Railway Co.
Frank R. Green, Sec'y, Chicago City Railway Co.
F. L. Fuller, Gen'l Supt., W. C. St. R. R. Co.
M. K. Bowen, Pres., Chicago City Railway Co.
C. K. Knickerbocker, Griffin Wheel Co., Chicago.
L. S. Owsley, Sec'y and Treas., N. C. St. R. R. Co.
J. Chas. Moore, Sec'y and Treas., N. C. St. R. R. Co.

FINANCE COMMITTEE.

Geo. A. Yuille, Chairman, 2nd V. P., W. C. St. R. R. Co.
C. R. Pennington, with Chicago City Railway Co.
J. Chas. Moore, Sec'y and Treas., N. C. St. R. R. Co.
W. S. Bell, Ass't Sec'y and Treas., W. C. St. R. R. Co.
H. B. White, Sec'y and Treas., Calumet Electric St. Ry. Co.

The chairman of the General Committee will shortly call a meeting of the General Committee, at which time the duties of the several committees will be outlined, and this information will be transmitted to the members of the several committees by their respective chairmen.

MR. WISE'S VISIT TO CUBA.

Clift Wise, the well-known railway and paving contractor, of Chicago, has recently returned from an extended trip to Cuba, where he visited all parts of the island. Mr. Wise states that concessions for all street railway and similar enterprises which offer any promise of being profitable have already been taken; but that there are most excellent opportunities for men with some capital, say from $5,000 up, to make money in agriculture. While nearly all the plantations have been devastated, and the owners are not in a position financially to put them under cultivation again, they will not sell them; but there is money to be made by leasing plantations and cultivating them. Havana and the other cities are filled with disappointed Americans who went to Cuba in the hopes of securing lucrative positions at once; they have found that it is no place for a man without capital.

Mr. Wise took a large number of photographs while on the island, and has mounted them in a souvenir album which is very interesting.

TO HARNESS NIAGARA WHIRLPOOL.

An effort is about to be made by New York and Buffalo capitalists to harness the Niagara Whirlpool Rapids. Surveys have been made and plans are now ready to put the scheme into operation. John Brinkerbine, of the Franklin Institute, Philadelphia, is the superintending engineer. His plan is to build a raceway inside the gorge road to the power house, which will be situated around the bend of the whirlpool. It is expected that 35,000 h. p. can be generated.

The Union Railroad Company, of Mount Vernon, N. Y., on the night of Jan. 31, laid a mile of track in North Pelham, to connect its belt line around the cities of Mount Vernon and New Rochelle. A decision of the supreme court rendered that day was to the effect that both the Union Company and the New York, Westchester & Connecticut Traction Company had rights in the street. By its diligence in taking possession of the route the Union Company has probably excluded the other.

MERRY-GO-ROUNDS FOR PLEASURE RESORTS

From the experience of street railway managers the most profitable attraction at a summer resort is a merry-go-round, and these, when well managed, will pay for themselves in a short time. The foremost manufacturer of steam riding galleries is the Armitage-Herschell Company, of North Tonawanda, N. Y. The latest and most attractive of these machines is the "Mountain-Valley Railway," which has, in addition to a rotary motion, the undulatory movement of the switchback. Every detail of this railway is elaborately decorated. With the machine is a fine organ, an electric light plant and double engine. It has eight handsome chariots, each seating 12 passengers. For large pleasure resorts this should be a great attraction and a source of large revenue.

The standard machine of the company is 40 ft. in diameter and carries 24 horses and four chariots, holding in all 56 persons. All parts are numbered and easily attached, so that the machine can be readily set up or dismantled and transported from place to place.

The portable engine and boiler are mounted on wheels and weigh about 2,000 lbs. Another type is similar to the last, but has three horses abreast instead of two, there being 36 in all. Each three horses are rocked by two eccentrics, the outside and inside rocking opposite to the middle horse. The total seating capacity is 60, and the machine is considerably larger than the standard outfit. It can be loaded into one furniture car for shipment. This gallery is equipped with an electric light plant, double engine, plate glass center and an organ playing 16 of the latest popular airs.

It should also be stated that the company manufactures electric motors, and in any place where current is available the engine and boiler can be replaced by a motor. The Standard multipolar motor is shunt wound, and is of high efficiency and the best workmanship. All the armature coils are machine wound, baked after dipping in an insulating compound, taped and painted and then laid in mica troughs. These coils are symmetrical and interchangeable, giving a uniform distribution which contributes much towards sparkless commutation. The field coils are also carefully wound and insulated. These motors are made from 1 to 50 k. w. capacity. Compound wound generators of the same type are also made.

Letters have been sent the company stating that in one day the receipts from one of its galleries amounted to $300, another telling of $5,000 being taken in during the month, and another customer took in nearly $13,000 in four months.

SPEED IN FRONT OF SCHOOLHOUSE.

Judge Sutherland, of Rochester, N. Y., has made a ruling on a question relating to negligence that has never before been passed upon by the courts. The case was that of Charles Summers against the Rochester Railway Company. The question was whether a street railway company is guilty of negligence in not running its cars slowly by a schoolhouse, around which young children are in the habit of congregating. Judge Sutherland decided in the affirmative, and held that the contention as to speed of the car in the case on trial was a question of fact for the jury. The action was brought by the father of a six-year-old boy to recover doctor's fees and other expenses caused in caring for the injuries of the child who was run over in front of a schoolhouse in Rochester last September. After deliberating for a few minutes, the jury brought in a verdict in favor of the plaintiff, fixing the damages at $400. A $20,000 damage action brought by the injured lad through his guardian ad litem, to recover for his personal injuries, is now pending.

ST. LOUIS CONSOLIDATION.

It has been announced that C. H. Spencer, representing the purchasers of the Hamilton lines, of St. Louis, has given a Baltimore syndicate, consisting of J. H. Hambleton, C. R. Spence, W. H. Witheridge and others, an option on the Hamilton lines and on the Southern Electric.

Brown Brothers, of New York, have purchased the Missouri and the Lindell properties, and it was announced February 11 that the same firm had made all arrangements for the purchase of the Scullin properties, the Union Depot Railroad, the Grand Avenue Railway, and the Jefferson Avenue Railroad. The first payment of $30 per share has been made to the stockholders. The price agreed upon was $130 a share, making a total of $5,200,000. It is expected that there will be a large outlay for improving and increasing the roads and equipment.

Washington G. Benedict, a prominent street railway operator and real estate man of Boston, died at his home on January 25.

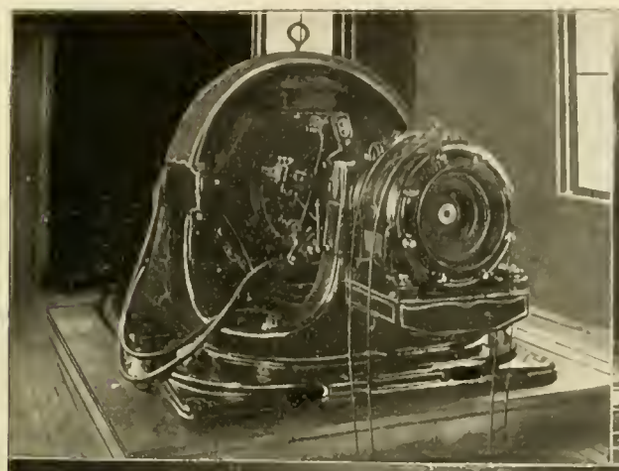
The report of the York (Pa.) Street Railway Company shows receipts for 1898 to be $58,262 as against $52,764 for 1897. The total number of car-miles run was 239,987, the average receipts per car-mile being 14.6 cents.

The Wilkesbarre Interurban Railway.

The interurban line extending from Luzerne, Pa., through Dallas to Harvey's Lake is notable for three features, viz.: Its tortuous roadway with many heavy grades through the mountains; its power station machinery and alternating current transmission lines, and its success both from a financial and operating standpoint where a steam road failed. At Luzerne, which is four miles northwest of Wilkesbarre, connection is made with a line of the Wilkesbarre & Wyoming Valley Traction Company. From this point a steam road was first constructed running 12 miles in a northwesterly direction to Harvey's Lake, which is a great pleasure resort. The steam line was a failure and last year the company was reorganized with John Graham, general manager of the Wilkesbarre & Wyoming Valley Traction Company, at its head. Immediately after the purchase plans were set on foot to equip the line for electric traction. This work was delegated to James Fagen, who for seven years has been the electrical engineer of the Traction Company. The original plan was to build a power station midway on the line, but this was abandoned for a site at Luzerne and alternating currents for transmission.

As may be seen from the various illustrations the route is through a mountainous country, the track being on a curve or grade along its entire length; in fact, the only piece of straight track is south of Harvey's Lake for a distance of 1,600 ft. as shown in the map. Commencing at Luzerne the line goes up into the mountains, passing through several settlements, the largest of which is Dallas, a town of 500 inhabitants. Harvey's Lake is about 1,000 ft. above the sea level and is the largest lake in Pennsylvania, being 12 miles around. At the lake the company has laid out a park and picnic grounds, and built a large summer hotel. On the first eight miles of the line there is a rise of 797 ft., then it drops to an elevation of 301 ft.; the highest altitude being 1,400 ft. above sea level. The average grade along the route is 2.6 per cent. In addition to the lake park there is another picnic ground in the mountains about four miles from Luzerne. In stringing the wire a locomotive was used, and rapid and effective work was done in this way.

There is but one power station and that is on the bank of a small creek at Luzerne at the terminus of the Wilkesbarre road. The power house is a brick building 50 ft. by 80 ft. with a steel truss roof covered with slate. A brick wall separates the boiler from the engine room. Across the creek on a high bank is a coal breaker, and the coal company has contracted with the railway company to build a chute so that the coal can be delivered into the boiler room. The coal is taken from the mouth of the mine and passed into the breaker, where it is properly sorted. A portion of the coal best adapted to use in the furnaces is diverted into the chute and into the railway power station right in front of the furnace door. There are few electric railway companies that are so favored with such facilities for handling and using fuel as this. In the boiler room there are three 200-h. p. horizontal tubular boilers 72 in. diameter by 20 ft. long, made by the Harrisburg Foundry & Machine Works, of Harrisburg, Pa. The stack is set on a brick base outside the building, and is of steel 5 ft. in diameter and 90 ft. high, made by the same company as the boilers. The feed water heaters were made by the Stilwell-Bierce & Smith-Vaile Company. The two



ROTARY CONVERTER IN SUB-STATION.

CAR HOUSE.
POWER STATION AND COAL CHUTE.

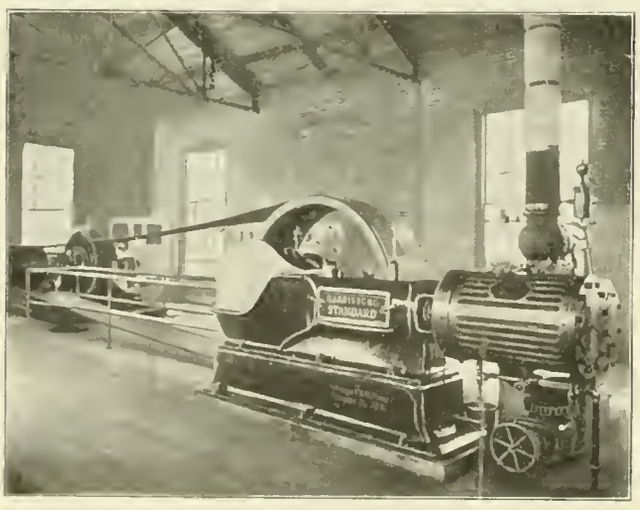
feed pumps were furnished by the same company and are connected so as to take water from either the creek or the city mains.

The two engines are the standard type of the Harrisburg Foundry & Machine Works and are of 300 h. p. capacity each. They are self-oiling and single expansion with a cylinder diameter of 18 in.

STRINGING THE TROLLEY LINE.

and 19-in. stroke, speed 225 r. p. m. The generators are connected with the engines by 27-in. belts. This style of engine has been long and favorably known in electric lighting work and in many of the smaller street railway power houses; in fact it was one of the pioneers in electric stations. These engines may be belted or direct connected to the generators, and the speed regulation by the well-known Ide shaft governor is very close.

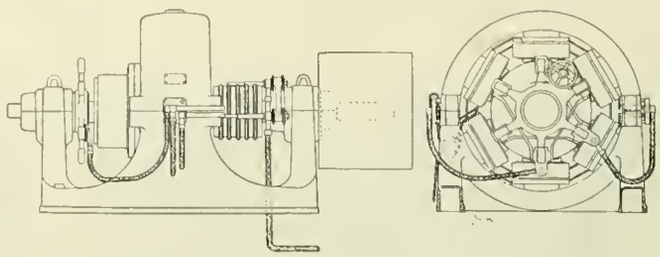
The two Westinghouse generators each have a capacity of 200 k. w. This type of machine has a commutator for delivering direct current at 550 volts at one end of the armature, and at the other there are collector rings from which is taken a two-phase alternating current of 3,600 alternations; the speed of the generator is 600



HARRISBURG STANDARD ENGINE.

r. p. m. The proportions and connections of the machines may be seen in the cut. The direct current is fed into the trolley line sections contiguous to the power station and the alternating two-phase current at 400 volts is raised and changed to an 8,000-volt three-phase current for transmission. The transformers are in a small brick building outside the power house.

After leaving the transformers the current passes to the transmission line consisting of three No. 6 copper wire. The lines are carried on double petticoated glass insulators which are on the same poles supporting the Creaghead trolley arm brackets, as may be seen in some of the illustrations of the track. It was thought that these glass insulators would not stand a potential of 8,000 volts, but so far there has been no trouble with them. The transformer station is located about eight miles up in the mountains. The voltage is here reduced through two Westinghouse static transformers to 400 volts, and the circuits from the transformers are connected through the switchboard to the alternating current end of a rotary converter shown on page 131. This converter is practically the same machine as the generator with the addition of a starting motor on the end of the shaft. The motor is of the Tesla rotating field type



ALTERNATING-DIRECT CURRENT GENERATOR.

and its function is to get the armature of the converter up to speed or in synchronism with the generator. The direct current is fed into the trolley wire, no feed wire being necessary. The trolley wire is No. 0000 round section. The diagram of the circuits of the power station, transmission lines and sub-station is shown below. For each generator and converter there are a direct ammeter, a direct current voltmeter, an alternating current voltmeter and ammeter, all Weston instruments.

Two of the switchboard panels, which are all of white marble, are

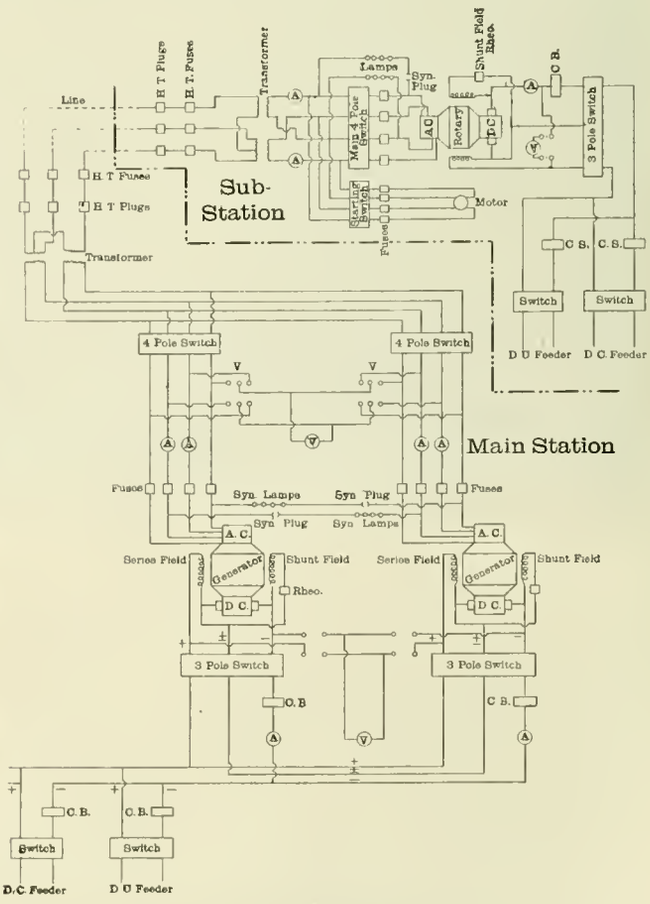


DIAGRAM OF CIRCUITS.

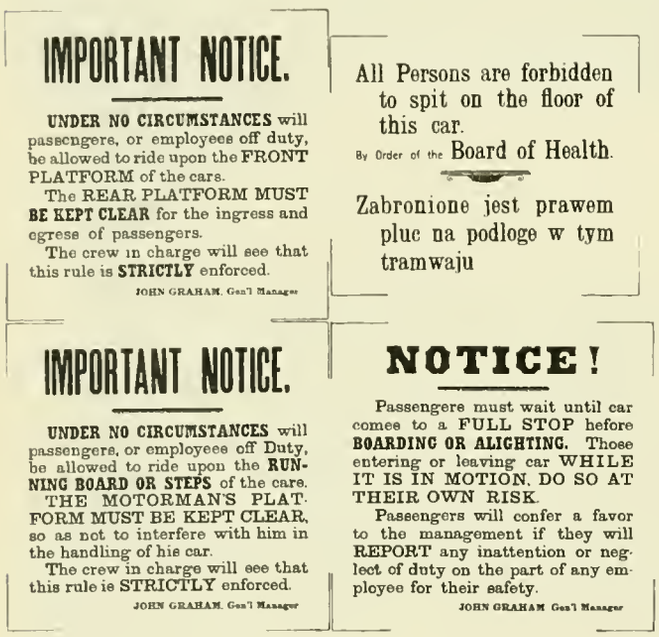
for direct current, two for alternating current and two for feeder connections.

The rolling stock comprises two closed passenger, one closed combination car, five open motor and three open trail cars. The

SCENES ON THE WILKESBARRE, DALLAS & HARVEY'S LAKE RAILWAY.

general appearance of the closed cars may be noted from one of the pictures on the preceding page. The car is 38 ft. over all and is equipped with four 35-h. p. General Electric 1,000 motors, and G. E. electric brakes. The controllers are General Electric B 6 type. Jackson & Sharp double trucks are used under all the cars. The cars have cross seats, are heated with Johns' electric heaters, and New Haven registers are used for recording fares. The signs placed in the cars are reproduced below. The car barn is a large wooden structure, an exterior view being shown on page 131.

The track is single with turn-outs, standard gage, laid with 60-ft. 60-lb. Johnson rails, from the works of the Lorain Steel Company. Horseshoe bonds, made by J. M. Atkinson & Co., form the electrical connections in the return circuit. All the overhead material was supplied by the H. W. Johns Manufacturing Company. Moulded mica round top hangers with heavy galvanized iron shells and ¾ in. steel studs were used to hold the No. 0000 trolley wire. There being a large number of curves on the line about the same number of pull-overs were employed as hangers and these were the standard "giant" type with ¾-in. bolts. The ears for both hangers and pull-overs are extra heavy and made of phosphor bronze. The eye-bolts, cross-arm braces and all iron parts with the exception of the bracket arms are galvanized. A number of the "Philadelphia" section insulators and splicing sleeves were used and made extra heavy on account of the large trolley wire. The company also supplied



SIGNS POSTED IN CARS.

the asbestos fire-felt sectional covering for the steam pipes in the power station.

The officers of the Wilkesbarre, Dallas & Harvey's Lake Railway Company are: John A. Schmitt, president; Theo. S. Barber, secretary; John Graham, treasurer and general manager; Thomas Wright, chief engineer, and James Fagan, electrical engineer. Mr. Fagan, to whom the credit of perfecting the electrical plans for the road is due, was born in Rahway, N. J., in 1857. At the age of 19 he worked in the shops of Thomas Edison at Menlo Park, being engaged chiefly in telephone work. In 1877 Mr. Fagan was employed in the Western Union shops in New York and remained there until three years later when he went to the city of Mexico to take charge of telephone work there. One year was spent at this work and another as consulting engineer for a large importing house. In 1882 he returned to the United States and was engaged with the Excelsior Electric Company. He was general manager and electrician of the lighting station in Harrisburg, Pa. Since commencing electric railway work in Wilkesbarre in 1892, 65 miles of railway have been built under his direction.

That the plans for the interurban have been carried out successfully is shown in the cost of power for the road; it also shows the advantage of electricity over steam for traction purposes under these conditions. The month before the cars were operated by electricity the two locomotives used $250 worth of coal and the coal consumption under electric traction conditions was $50 for the same time. That tells a long story in favor of the trolley.

TO BUILD IN PORTO RICO.

Hon. E. P. Shaw, treasurer of Massachusetts, and his two sons, J. F. Shaw and E. P. Shaw, Jr., who are interested in a number of electric railways in Massachusetts, together with other Boston capitalists, have applied for articles of incorporation under the laws of Massachusetts for the International Construction & Power Company. The company intends to operate in Porto Rico.

In a recent interview Mr. Shaw is quoted as follows:

"My term as treasurer of the Commonwealth expires with the present year, as the law provides that a man can hold the office for but five years. I am now making preparations for future fields of labor.

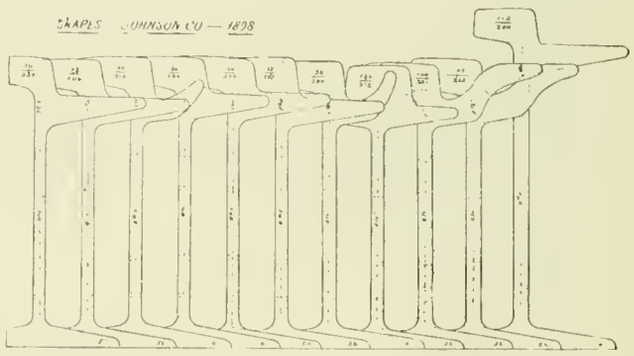
"It is my belief that the next three years or so will be a period of marked prosperity, and this belief has in a measure, I might say, some weight with respect to our present undertaking.

"What may be the outcome of our negotiations for the construction of electrical railways in Porto Rico I cannot say, but it must be remembered that the incorporation of the company is not being sought simply with the view of obtaining work in that island. There are many advantages in carrying out large contracts as a corporation rather than as a copartnership. This fact has appealed to us strongly.

"Some time ago the firm of J. F. Shaw & Co. attempted to secure a contract in Jamaica, but failed, although $8,000 was spent in studying the situation there."

A CONVENIENT CATALOG.

The American Rail Joint & Manufacturing Company, of Cleveland, O., has just issued a new catalog; it has been sent to all the street railways in the United States, and will certainly prove a most convenient reference book. The first 50 pages show sections of the different joints made by the company; then follow 18 pages in which are assembled miniature sections of all the rails rolled in the United



States, save those made by one company which failed to furnish its data in time. On each section are marked the weight, section number, height and width of lower flange. It has required a great deal of labor to make this compilation, but the company will without doubt achieve its just reward. Extra copies will gladly be sent on application. The cut is a reproduction of one of the six pages, showing the Johnson Company's sections.

In six months the N. Y., N. H. & H. third rail electric line has carried 34,421 passengers between Bristol and Hartford.

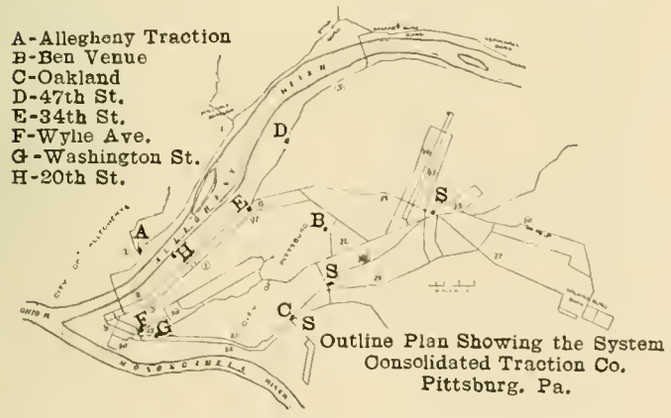
A San Francisco police justice has decided that a street railway passenger may give his transfer to whom he pleases, and refused to enforce a city ordinance punishing the offense. Whether the company concerned will endeavor to prosecute this case further is not now known. The contract of the company is to carry the passenger, and if to accomplish the object in view it gives a transfer ticket, it appears clear that the passenger cannot transfer his rights under the contract to some one else.

New Power Station, Shops and Pleasure Resort of the Consolidated Traction Company, Pittsburg.

The Consolidated Traction Company, of Pittsburg, was chartered in 1895 for the purpose of acquiring, by lease or purchase, the Central Traction Company, the Pittsburg Traction Company, the Duquesne Traction Company, the Fort Pitt Traction Company, the Allegheny Traction Company and the Citizens' Traction Company. The present mileage of the Consolidated is 120 miles. After the consolidation was effected the new company had seven power houses, of which four were cable and three electric. The relative location of these various plants is shown in the accompanying map, which is reproduced from the "Proceedings of the Engineers' Society of Western Pennsylvania."

Several of the stations were so situated as not to be convenient for coal and water supply. This is especially true of the cable stations, since they were necessarily located on the streets on which the cables run, and about midway of the line. The electric power houses were somewhat better located in regard to coal supply, but the 47th street and the Allegheny Traction stations were too far from the center of the system, and the Ben Venue station had no good water supply and only one coal supply. Thus it became evident that for the best efficiency, both in getting the power station in the center of the system and securing the best sources of coal and water supply there was a demand for a new station sufficiently large to carry the whole load, and suitably placed for coal and water supply. The location of the new power house at 20th street and the Allegheny river was chosen because of the natural advantages in securing coal and water, and also because it is not far from the center of the system. The property on which the building is located is 177 ft. deep and about 360 ft. from the harbor line. As the Pennsylvania Railroad has a 30-ft. right of way across the property, the length of the building was limited to 265 ft. The Baltimore & Ohio also has a line running down to the river end of the building, so that the coal supply can be furnished by either of these railroads or from the Allegheny river itself, and an unlimited supply of good water is at hand.

The capacity of the station was determined by extensive tests made on various lines by a testing car and checked by observations on one of the main lines. This was found to be about 6,000 k. w. The plant is designed to have one machine to furnish 1,000 k. w., so at present six machines are required. Provision is also made for the addition of two more units of the same capacity, which will be put



Outline Plan Showing the System Consolidated Traction Co. Pittsburg, Pa.

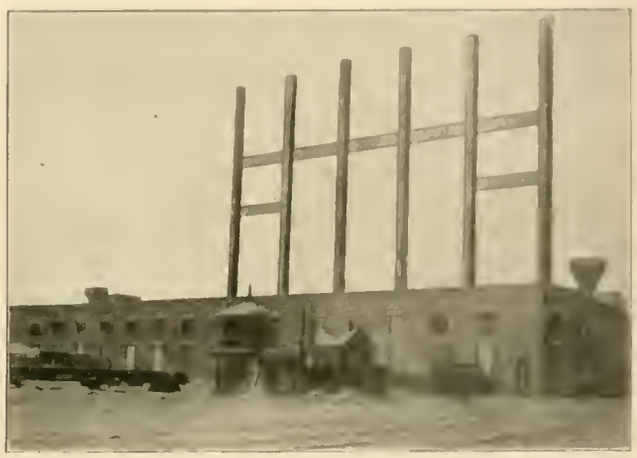
in as soon as needed, and ultimately, with little building expense, the capacity can be doubled, making a total of 12,000 k. w. The capacities of the old electric stations were as follows:

Allegheny Traction, three units	900 k. w.
Ben Venue, four units	1,875 k. w.
Oakland, one unit	800 k. w.
47th street, three units	300 k. w.
Total	3,875 k. w.

The three cable stations aggregated 3,250 h. p., making the grand total of the station capacity of about 8,450 h. p.

The new station has the same capacity as all the old ones, and its operating expenses are less than one-half (about 45 per cent) that of the old ones.

The work of excavating for the foundations was begun September 1, 1897, the total excavation being about 35,000 cu. yds. The floor level of the station was fixed at 1 ft. above the high water mark of 1884, in order that floods might not interfere with the operation of the plant. The intake pipe must be always under water in order not to lose the vacuum; accordingly, it was laid in a trench 13 ft. below the normal river level and over 40 ft. below the surface level. The trench for the intake pipe was over 300 ft. long, extending nearly to the center of the river; the pipe itself is 60 in. in diameter, and is surrounded with concrete to make it permanent and give a good foundation for the machinery above it.



EXTERIOR OF POWER STATION.

The basement walls and all foundations are of American Portland cement concrete, mixed with sand and gravel in proportions varying from 1, 3 and 8 to 1, 2 and 5; the concrete was mixed very wet. Three cement mixers were erected; they were of the worm type, and each was found capable of turning out as much as 500 cu. yds. per day of 20 hours. The cost of materials per cu. yd. for the proportions mentioned was $2.36 and $3.32 respectively; the cost of mixing, delivered by wheelbarrows 150 ft., tamping, etc., was 53 cents per cu. yd.

The engine room is 54 ft. 10 in. wide, 261 ft. long, and 32 ft. 6 in. from the floor to the roof. The basement walls are of concrete, 16 ft. high and 3 ft. thick. The exterior of the station is of Pompeian brick with sandstone trimmings; the interior of the engine room is of Pompeian brick, with wainscoting of enameled brick and slate cap; the floor is a mosaic floor of "granito;" the woodwork is quartered oak. The interior of the boiler room is of red brick; the roof is of cinder concrete, stiffened with iron bars, with felt and crushed slag imbedded in pitch on the outer surface. This is the Roebling construction, system B, type 1.

The steel frame work of the building was furnished by Jones & Laughlin, and the most interesting feature of this is a coal bin of 1,200 tons capacity over the boiler room. The floor of this bin is carried on 12-in. I-beams, 24 in. between centers; the sides are made of plate girders 10 ft. deep and 19 ft. apart.

The boiler room is at the east of the engine room; it is double, that is, provision is made for two lines of boilers. The length of the boiler room is 261 ft.; the width of the side which is to be used for the present boiler room is 38 ft. 9½ in.; the passage way is 10 ft. 3 in.; the other side is at present used for coal storage, and will contain about 2,000 tons. There are six batteries of two boilers each. The boilers are Babcock & Wilcox water tube, of special design, being shorter and higher than the usual make, and having three 36-in. drums 20 ft. long and 18 sections of 1¾-in. tubes. The heating surface of each is 4,000 sq. ft.

The boilers are fitted with down-draft furnaces, having a grate surface of 60 sq. ft., and are guaranteed to give 10 per cent greater efficiency than the ordinary grate, and to burn 40 lbs. of coal per sq.

ft. of grate surface per hour, consuming 92 per cent of the smoke. The boilers have been tested by hydraulic pressure to stand 300 lbs.; the normal pressure, however, is but 125 lbs. Each battery of boilers has an unlined iron stack 66 in. in diameter, and rising 147 ft. above the grate bars, giving a draft of from 1 to 1½ in. of water. Three Worthington duplex direct acting feed water pumps, capable of lifting 240 gallons of water per minute to the elevation of 20 ft., delivering it against a pressure of 160 lbs., furnish water for the boilers. Water may be taken either from the city mains through a meter or from the hot well. After passing through the pump on its way to the boilers the water passes through a small heater which is heated by the exhaust steam from the pumps. The feed piping is entirely of brass and in duplicate at front and rear of boilers; the steam piping is of cast steel. All boilers connect into one main steam line 20 in. in diameter, and all engines connect or tap into this main line. The large steam main is provided with two copper expansion loops.

The coal used in this plant is known as the 3-in. to 4-in. run of mine. It is brought to the plant by rail, and dumped directly into a hopper at the river end of the boiler room. This hopper is provided with a screen which prevents lumps of coal from passing through. From the hopper it passes through an automatic weighing device to a Mead conveyer, and is then carried to the coal bin and dumped where desired. The coal bin is located directly over the central passage way of boiler room, extending the whole length of the building, and has a capacity of 1,200 tons. In addition to this coal bin the east half of the boiler room is used for coal storage, as stated, and has a capacity of 2,000 tons. The coal is delivered to the furnaces by chutes. The coal conveyer passes from the coal bin down to and back through a tunnel beneath the floor of the boiler room to the coal tower; chutes from the furnaces lead into this tunnel, so that the ashes may be carried out by the conveyer when it is not used in carrying coal, or coal may be carried from the coal storage room to the bin in the same manner.

There are now in the engine room eight engine foundations, six of which are occupied by 30-in. and 54-in. by 48-in. cross-compound condensing Corliss engines, built by the Pennsylvania Iron Works Company, of Philadelphia. The distance between the center lines of the cylinders is 20 ft. 6 in. The shaft is 19 ft. 9 in. long and 24 in. in diameter; the fly-wheel is 20 ft in diameter, 18-in. face and weighs 50 tons. Each engine has its own air pump driven from the main shaft. Jet condensers are used. Oil is supplied to the engines under pressure, the tank and pump being located in the basement. The intake pipe, which was previously mentioned, is provided with strainers and will be protected by a crib. The overflow is 36 in. in diameter and placed 3 ft. 6 in. below the basement floor.

At the river end of the engine room in the basement is a well or cistern into which all drainage of the station and tunnel flows. The water is then pumped from the cistern into the overflow pipe by a pulsometer.

The generators are direct connected Westinghouse 800-k. w. machines; they are compound wound for 500 volts at no load, and 550 volts at full load, and are guaranteed to carry 50 per cent overload continuously for an hour or more and 75 per cent momentarily. The engine room has an electric traveling crane, made by Pawling & Harnischfeger, of Milwaukee, which travels the whole length of the engine room, and has a capacity of 90,000 lbs. at 5 ft. per minute; the maximum lift is about 40 ft.

The three-wire system of distribution is used; that is, part of the trolley wires are positive and part of them negative, the rails forming the neutral conductor. If—and in practice it is always the case—the positive and negative loads are not equal, the difference in the current will return to the power house through the rails. This system has been tried a number of times in other places and been abandoned in each instance; the result in Pittsburg will be awaited with great interest. The difference in potential between positive and negative wires is 1,100 volts.

The switchboard is located on the west side of the building. The power system adopted caused a radical change from the ordinary type of switchboard to be made. It is built from the basement floor up to 9½ ft. above the engine room floor, and consists of three vaults with a slate platform covering the top vault; each vault is 48 ft. long, 9 ft. 5 in. wide and about 8 ft. high. On the slate platform are located stands for the electrical instruments. Each generator has a stand provided with an ammeter, voltmeter connections, wheel for regulating the potential, two air valves, one controlling the switch and the other the circuit breaker, and a signal lamp which shows when the circuit breaker is out. Each feeder stand has a similar equipment, with the exception of rheostat and voltmeter connections. There are also a voltmeter stand and an ammeter stand carrying three ammeters. There is also one lighting stand which controls all the lights in the building. The interesting feature of this last stand is that the lights may be thrown on any machine, even though power circuits are all cut out. All indicating and recording instruments are of the Western make. In the upper vault are placed two wattmeters, one on the negative bus-bar and one on the positive bus-bar. Immediately below the floor of the upper vault are placed the bus-bars, in the same horizontal plane, insulated by porcelain and supported by iron I-beams, and below these on the ceiling of the middle vault are placed the switches. These switches are not of the ordinary kind, but act back and forth with slide contact. The circuit breakers are placed on the east wall of this vault and make a pressure contact instead of the usual contact. In the lowest vault are the outgoing feeder cables which connect directly to the lead cables, the neutral cables and the cables from the generators to the switchboard. As was intimated above, there are devices for regulating the circuit breakers and switches. As soon as a circuit breaker is cut out a signal lamp is lighted, and the attendant can at once throw the circuit breaker back by the pneumatic device. The switches may be thrown upon either the positive or negative bus-bar.

When it is desired to keep the switch on the positive bus-bar, there is an interlocking device to keep from throwing it on the negative bus-bar and vice versa. The arrangement is such also that it is impossible to throw the circuit breaker in while this switch is closed. The feeder cables are half positive and half negative. A neutral connection is made from the rails to the neutral bus-bar.

Leading from the power house to the intersection of Penn avenue, and a portion to Liberty street, the current is carried underground through lead-covered cables of 1,000,000 c. m. cross section each. This distance is about 1,000 ft.; for 400 ft. the cables pass through a tunnel 7 ft. 4 in. high and 5 ft. wide made of concrete; the remaining distance they run through conduits. The reason for constructing the tunnel is that the new freight yards of the Pennsylvania road under which the cables had to pass, necessitated such a construction, so that the cables could be inspected if there was any trouble. At the intersection of Penn avenue and 20th street are four cable towers, and one block further south, at Liberty and 20th, are two more towers where the undergound cables connect with the overhead cables, which are 500,000 c. m. each. The length of the overhead cables is about 110 miles. The rails are connected to the neutral bus-bar of the power house by old girder rails, well bonded, 30 being placed in multiple. These rails run directly beneath the tunnel and are imbedded in the cement.

Three storage batteries are used to regulate the current at distant points from the power house; two of these batteries have a capacity of 500 ampere-hours each, and the third a capacity of 1,000 ampere-hours. The large battery is ventilated by air shafts; the other two have no special device other than windows for ventilation. Each battery has 250 cells and is adjusted so as to discharge when the voltage drops below 500 volts. Each battery is about four miles from power station. The locations of the batteries are indicated in the outline plan of the system by the letter "S."

The company has recently erected a large terminal station and extensive repair shops and car barns. These are known as the Frankstown shops and barns, and are located at point 16 on the map. The buildings are of red brick with steel frame-work, and the roofing of matched sheeting covered with tin. The shop building is 576 ft. by 135 ft.; the machine and blacksmith shops take up 216 ft. of this building. All the machines are belted to countershafts, which are driven by a 50-h. p. Westinghouse motor. A 10-ton crane, with a span of 44 ft. 4 in. and capable of lifting pieces 36 ft. from the floor, is provided for conveying heavy work from one machine to another.

One of the most used machines in the shop is the wheel press, by means of which the wheels may be driven on the axles without removing the gears. There are two Bryan car dismantlers, diagrams of which are shown. The process of removing parts from a car is as follows: The car is run upon the dismantling carriage and the truck and car body disconnected. The carriage, which is mounted on four wheels, drops into the pit with the truck, wheels and motors, the car body being supported at four points by sta-

tionary jacks. After the carriage settles to the bottom of the pit it is run out to a side or "L" pit, from "a" to "b" in the diagram, so that the wheels and motors are accessible to the crane; by this means a car can be dismantled in a very few minutes.

The carpenter shop occupies 180 ft. of the building next to the machine shop, and is equipped with the wood-working machinery made by J. A. Fay & Co. for car building and repairing. A 50-

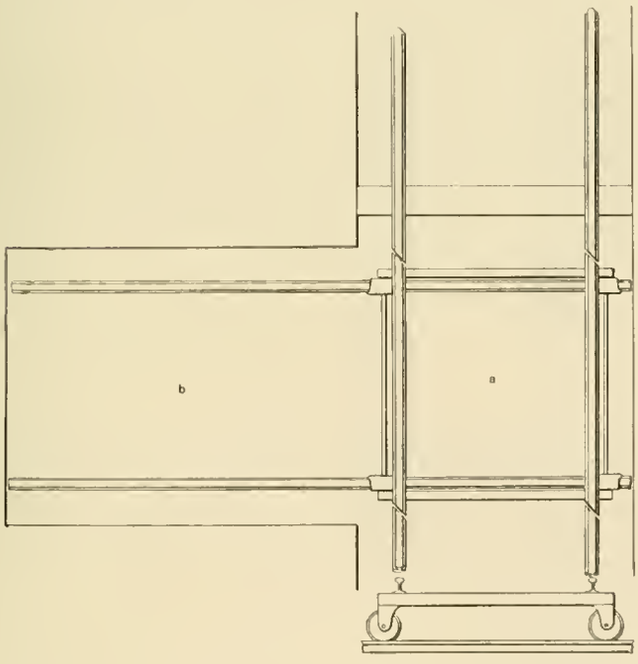
e. Lockers, barnmen.
H. Heating plant.

h. p. Westinghouse motor furnishes power for this machinery. The paint shop is of the same size, and these two, with the machine shop, are under one roof. On both sides of the tracks in the paint shops there are stationary posts with swing arms for platform supports for holding up the car bodies while the painters are working with them. The J. G. Brill Car Company inaugurated this system many years ago. The oil and paint storehouse is in a small building, 20 by 45 ft., and is isolated from the other buildings. This is



divided into three compartments for oil, paint and waste. As may be noted from the plan, there are transfer tables in each of the three above-named shops which greatly facilitate the work.

The storage barn is an immense building, 346 ft. long and 135 ft. wide, with an enormous car capacity. Here either the summer or winter equipment is kept when not in use. At the opposite end of the line of buildings is the operating barn, 218 ft. long. This is heated by the hot-air system of the Buffalo Forge Company. There are two heaters with engines and the requisite piping. Along the east side of the building are the operating offices of the company, the receiver's and the superintendent's, and a locker room containing 500 lockers and tables for the convenience of the conductors in making their reports. On this side is also a locker for the barn employes and a lavatory. The steam for heating the other buildings comes from an isolated steam plant, Weddell return tubular boilers, equipped with Murphy stokers, being used.

In the yard there is a supply house for coal, sand and salt. This building is 24 by 72 ft., with a capacity for six carloads of coal and six carloads of salt. The coal, salt and sand house for daily use adjoins the operating barn. The coal is used for heating the cars in winter. A lumber shed, 46 by 150 ft., for storing and seasoning timber, is separated from the other buildings. The operating yard, 382 ft. in length, intervenes between the machine shop and the operating barn. Each shop has a separate store room, small but complete, and these are arranged to be very convenient. The track outlay may be noted from the plan. It was carefully designed for the greatest convenience in running the cars about the yards, barns and shops. The company is now putting in 120 new equipments of General Electric 57 50-h. p. motors and electric brakes.

The Consolidated Traction Company realizes the importance of having first-class places of public amusement and recreation to

EXTERIOR DUQUESNE GARDENS.

stimulate street railway traffic. The demand for such a resort, it finds, is as great in the winter as in the summer season. Last year it had a hall at Schenley Park for amusements both in winter and summer, having a large skating rink for winter sport. This hall was burned last summer, and instead of constructing a new building, one of the car barns, which is located near the park, was fitted up for winter amusements, which it is expected will be used for concerts, etc., in the summer. The company was able to use this barn, as it was not needed after the Frankstown barns were built. The barn is one of the best buildings owned by the company, and especially adapted for a large skating rink or any other affair requiring large floor space. This resort is known as Duquesne Gardens, and is owned and operated by an independent company, char-

tered for $300,000, and has its own manager. The building is of brick with sandstone trimmings, and is 480 ft. long by 150 ft. wide.

The charms of the place do not fully appear until one enters the building and sees the splendid lay-out, and becomes acquainted with the perfect method of management. The main attraction at the present time is the ice floor, which is 272 ft. long, 90 ft. wide, covered with ice 8 in. thick. To freeze the ice and keep it in good condition is a complete ice-making plant located at the east end of the basement. The plant was put in by the Case Refrigerator

MAIN HALL—DUQUESNE GARDENS.

Company, of Buffalo, N. Y. The ammonia compressors, of which there are two, are driven by Westinghouse motors. These motors were used as generators in one of the street railway stations and are rated at 200 k. w. each. The plan of freezing the water is to have pipes running back and forth through the water, through which pipes brine is driven by a Dean duplex steam pump. There are 26 miles of this pipe in the floor. The brine enters the pipes at a temperature of 15° and returns to the cooling tank at 22°. A much lower temperature can be secured, but it is found that the

LADIES' PARLOR.

above temperature produces a tougher ice than can be produced by a colder brine.

At the east end of the building is a large stage where concerts are held each night. Back of this stage are 16 dressing rooms. The front part of the building is arranged for the accommodation of the people before they go on the ice. Here are check rooms for skates, coat rooms, ladies' parlor, ladies' private parlor, ladies' cloak room and toilet room, men's smoking room and toilet room, superintendent's office and clerk office. There are also two skate counters, where 2,600 pairs of skates are kept for men, women and children. It is the plan of the company to furnish all patrons with a pair of skates free, the patrons having only to pay a small entrance fee. There is also a large soda fountain, said to be the finest in the land; it cost $6,000, and is brilliantly illuminated by 255 incandescent lamps. The building itself is illuminated by 4,000 incandescent lamps and 40 arc lamps. The Traction Company furnishes the light from its 20th street power house. A large auxiliary storage battery is placed in the basement and used to keep

SODA FOUNTAIN.

the voltage constant. The battery is adjusted to feed into the light circuits when the voltage of the line drops below 500 volts. The large ice floor is surrounded by one row of boxes, back of which are three rows of opera chairs, and back of this is a promenade 8 ft. wide. There are seats for 3,800 people, beside the bench around the ice floor in front of the boxes for the convenience of the skaters. The management is very strict in keeping down any appearance of rowdyism. No drinks stronger than soda water are allowed in the building. The garden has proved very popular with the best class of people, being patronized by men, women and children, there being 4,100 people in attendance on the first night. The maximum number on the ice at one time was 2,200. The accompanying illustrations show the exterior of the building, the main hall, the soda fountain and the ladies' parlor.

ANNUAL REPORT OF CHICAGO CITY RAILWAY.

At the annual meeting of the stockholders of the Chicago City Railway Company, Joseph Leiter, second vice-president, was chosen first vice-president, and D. G. Hamilton was elected second vice-president. President Bowen and the other directors and officers were re-elected. The capital stock was increased $2,000,000. The report of operation for the year ending December 31, 1898, was as follows:

	1897.	1898.	Increase.
Gross earnings	$4,816,516	$4,832,806	$16,290
Operating expenses and taxes	2,908,982	2,926,490	17,508
Net earnings	$1,907,534	$1,906,316	$1,218*
Interest	207,877	207,877	——
Dividends	1,440,000	1,440,000	——
Depreciation, etc	50,000	90,000	$40,000
Per cent operating expenses	60.84	60.97	.13
Passengers carried, cable	41,444,646	38,482,628	2,962,018*

THE NIAGARA ICE BRIDGE.

The electric roads in and about Niagara Falls have had their incomes materially increased during the past month by travel to view the scenery in the gorge, which, so far as the ice bridge is concerned, has surpassed any previous formation. The Niagara ice bridges, or jams, close to the falls, where the river is very wide and the water at least 200 ft. deep, have a wonderful formation. Sunday afternoon, January 22, while people were crossing the river on the ice bridge, the jam started to move down the gorge toward the whirlpool rapids. Fully 100 people were on the ice, and at its first trembling they made for the shore. All but three succeeded in easily making their escape. One of the three, a young man, watched his chances and as he was being swept down stream leaped from the ice to the main span of the steel arch about 50 ft. out from the abutments of the New York side, a feat that was made possible by the piling of the ice up against the abutments and on the arch fully 80 ft. high. The other two persons on the moving ice, a man and a woman, ran across the current-caught mass toward the Canadian shore. Time and again the woman fell, but each time her companion helped her up, cheered by the crowds of sightseers. Finally they reached the shore, having been carried fully 1,000 ft. on the ice.

This sudden movement of the ice bridge was caused by high water and an immense flow of ice over the falls. It resulted in the formation of the greatest ice bridge ever known at Niagara. It stretched from the foot of the falls down the gorge fully a mile, a solid mountain-like mass. From the tracks of the Gorge Road the view of the ice bridge with the falls as a background is especially fine. Great crowds of visitors came to the Falls, and of this travel the electric roads have their share.

NIAGARA ICE BRIDGES IN 1899.

Niagara has this year inaugurated a winter festival, one of the main attractions of which is an ice palace. This palace is located on the riverway immediately opposite Prospect Park, within a few hundred feet of the stopping place of the cars of the Gorge road and the Buffalo & Niagara Falls line. It is but a short distance from the New York end of the upper steel arch, over which the cars of the Niagara Falls Park & River Railway run, the cars of this line stopping in full view of the palace. The palace has a frontage of about 120 ft. on the riverway and a depth of 50 ft. In the rear within an ice wall a skating rink has been built. On the Canadian side of the river close to the end of the steel arch a toboggan slide has been erected and travel between the palace and slide has been brisk, thus increasing the revenue of the electric car on the bridge and the bridge company.

For the first time in the history of the Niagara region the ice bridge has proved dangerous. The abutments of the new steel arch bridge are located close to the water's edge, but it was thought they were sufficiently high to be out of the way of any ice jam. On the New York side the ice crowded up into the steel work of the main span so that some of the girders were bent, the height of it being 80 ft. or more. Back of it, stretching up to the Horseshoe Fall was a mass of ice, pressed on by the 15,000,000 cu. ft. of water falling over the precipice every minute, making a force which nothing that man has ever built could withstand. The danger to the bridge was recognized and men were quickly put to work blasting the ice away from the abutments. They worked night and day and succeeded in getting the abutments released from the pressure temporarily. Again the ice jammed about the abutments and again it was blasted away, and this process will be repeated when necessary until the ice goes out. Should a sudden thaw come accompanied by a high wind across Lake Erie to drive the water into the upper river, raising it in the gorge and driving the ice down in a mass, great damage might result.

CANADIAN NOTES.

The Halifax Tramway Company is increasing its capacity, both track and equipment. Two box cars, two open cars, two box trailers and one snow sweeper have been recently ordered. The company has purchased adjoining property and erected an additional brick shed for cars 60 by 100 ft., in the basement of which are the stables; the offices have been enlarged by a new brick addition, and in the station much new machinery has been installed.

The Montreal Street Railway Company has declared a dividend of 2½ per cent for the quarter ended December 31. The total earnings for 1898 were $1,526,457, as against $1,397,383 for 1897.

Application has been made to parliament for an act to amend and consolidate the acts relating to the company; to authorize the increase from time to time of its capital stock to such extent as may be necessary for the purpose of its business; to ratify and confirm divers contracts entered into by it with different municipal corporations and railway companies; to authorize the extension of its line to any point within a radius of 10 miles from Montreal, and the operation of such lines, and for other purposes.

The directors have decided to concentrate its shops at the Hochelaga (a suburb) works. In the spring a brass foundry and an iron foundry will be built. The company will make all its own castings, including car wheels, in the future. The company will also make cars for the other Canadian roads controlled by it.

A trolley line to St. Lambert will be operated as soon as the new Victoria bridge, over the St. Lawrence, is completed—about May 1.

The Ottawa (Ont.) Electric Railway Company will apply for authority to extend its lines to various points in the townships of Nepean and Gloucester, and for permission to run cars on Sunday.

The directors of the London (Ont.) Street Railway Company were re-elected at the annual meeting; the board chose H. A. Everett, president, for another year. T. H. Smallman succeeded E. W. Moore as vice-president.

Work on the bridge that is to span the Niagara river gorge, between Lewiston, N. Y., and Queenston, Ont., to which we referred on page 47 of our last issue, has been suspended owing to the dangerous condition of the cliffs on both sides of the river. Nothing further will be done on the bridge until the weather makes the conditions better. There is no possibility of having the bridge ready for use until some time next spring. The retaining walls on both sides of the river have been finished, and the pier work is practically complete. As soon as work is resumed the superstructure will be put in place.

A project is on foot to build an electric railway between Westville, N. S., via New Glasgow, and Stellarton.

G. Whitaker, of Toronto, has been appointed assistant superintendent of the London Electric Street Railway.

The Nepigon Electric Railway Company has applied to parliament for power to run a line from Nepigon Station, on the Canadian Pacific Railway, to Lake Nepigon.

The Board of Trade, of Parry Sound, Ont., has recommended the construction of an electric railway to connect Parry Sound and Depot Harbor. The cost of the road is estimated at $25,000.

The Toronto Street Railway proposes to extend the system to Whitby and Oshawa, and Manager E. H. Keating has prepared a report on the advisability of building branches to Lake Simcoe and Oakville.

The largest driving pulley in the Ottawa Electric Railway power station burst a few days ago, and badly wrecked the interior of the station. The wheel was of iron, and weighed nearly four tons. No one was killed.

John Rowley, superintendent of the Montreal Belt Line Electric Railway Company, has been appointed manager of the Boul de l'Isle Hotel, which has recently been taken over by the Montreal Belt Line Railway Company.

The Mont de l'Isle Electric Railway (Que.), a suburban line, is to be utilized for carrying 500 carloads of ice from the Ottawa river into the city. This is only a beginning of the freight movement on electric lines in this part of Canada, but it will rapidly develop to great proportions.

George E. Kidd, of Ottawa, acting for a syndicate, will apply for a charter incorporating a company to construct an electric railway from Ottawa, Ont., to Meach's lake, with branches to Graham's bay, Aylmer and Hull, Que. As soon as the charter is issued work will be commenced on the construction of the same. The capital stock of the company is $500,000.

The Montreal Incline Electric Railway's fourteenth annual report showed a good cash balance on the right side. The statement showed that a quarter of a million passengers had been carried during the past year. The new board elected are Wm. Mann, President; F. B. McNamee, Vice-President; and directors, Murdock McKenzie, Fayette Brown and James Williamson.

The Niagara Falls & Lewiston Electric Railroad, better known as the Gorge Road, has changed hands, Capt. John M. Brinker and R. W. Jones having parted with their controlling interest in the company, but both remain large stockholders. The interest they sold was represented by bonds. The purchasers are stated to be New York parties, no names being mentioned as yet. Joseph R. Megrue, of New York, formerly manager of the Detroit & Lima Northern line, has been appointed manager, and has taken charge of the affairs of the road.

The St. Catharines & Niagara Central Railway has been purchased by an American syndicate, and is soon to be equipped for electric traction; power will be generated at some points on the Welland canals. The road now extends from St. Catharines to Niagara Falls, where it connects with the Buffalo and the Lockport electric lines. W. Caryl Ely, it is stated, has enlisted capital to extend his Lockport road to Rochester, 56 miles. It is proposed to extend the Canadian line 3 miles from St. Catharines to Port Dalhousie to connect with steamers for Toronto, and 12 miles to Beamsville to connect with the Hamilton, Grimsby & Beamsville. From Hamilton a line will be built 18 miles to Oakville, connecting there with an extension of the Toronto system.

The Metropolitan Elevated, Chicago, proposes to build an extension into the towns of Cicero, Proviso and Leyden.

HALF FARES.

The Milwaukee Electric Railway & Light Company has subscribed $3,500 to the Milwaukee Carnival Association.

February 3, a car became unmanageable and was derailed at the foot of the Leverington grade, in Philadelphia, making the third accident at that point within a year.

Some of the students of the San Francisco institutions affiliated with the University of California are in trouble for hazing a street car.

The Canton & Massillon (O.) Electric Railway Company has decided to require all its employes to give bonds from one of the surety companies.

The longest power transmission system in the world, that from Santa Ana river to Los Angeles, Cal., a distance of 80 miles, was completed January 26.

Elgin, Ill., has ordered certain of its streets to be paved with brick and directed the street railway company to remove its T-rails and substitute a tram rail.

The Springfield (Mass.) Street Railway Company has had the bridge over the Connecticut river, which is occupied by it, examined by experts, who found it perfectly safe.

The Cleveland Electric Railway has put on a large double truck car for trial, and President Everett states that such a type will probably be adopted eventually on all lines of the company.

January earnings of the Brooklyn Rapid Transit Company's system were $452,347; this is an increase of 14.2 per cent over January, 1898, and an increase of 20.2 per cent over January, 1897.

The cable line on San Pablo avenue, San Francisco, is to be superseded by an electric line; several car-loads of rails are on the ground and the work of rebuilding is proceeding rapidly.

The statement that the controlling interest of the Brooklyn Rapid Transit system is seeking to acquire the Long Island Railroad system and the two Brooklyn elevated roads, is strongly denied by all parties concerned.

The electric railway from Cairo, Egypt, to the Pyramids, which has been noticed in the daily papers of late, is the line, a description of which was given in the REVIEW for May, 1897, page 317.

January 29, two cars in Cleveland collided in a fog; no one was injured, and the cars would have been but little damaged had the shock not overturned the stoves in both cars, which caught fire and were badly wrecked before the fire department reached the scene.

The Lexington, Mass., authorities have granted the Lexington & Boston Street Railway franchises for a road in that town. This company proposes to connect Lexington and Waltham, also build a line completing the electric connection between Lowell and Boston.

The newly organized French Westinghouse Company has received the contract for the electrical equipment of the Paris Metropolitan Railway. This is one of the largest orders recently placed for a European road; the work will probably be done at the company's works at Havre, formerly the Heilmann locomotive works.

The annual meeting of the National Electric Light Association will be held in New York, May 23 to 25, inclusive, with headquarters in the Murray Hill Hotel. At this time the Electrical Ex-

hibition Company will have an exhibition in Madison Square Garden under auspices of the association and in connection with the meeting.

The Massena Street Railway Company of Massena, St. Lawrence county, N. Y., has been incorporated; capital, $100,000. Directors, Thomas H. Gillespie, H. A. Johnson, E. M. Statthers, Howard Hasbrough, Edward M. Nolan, Thomas D. Harris, Williard A. Esselstyne, James R. Jones of New York and Robert Swan of Massena.

S. R. Smith, superintendent of the Black River Traction Company, of Watertown, N. Y., was presented by the employes of the company with a silver mounted umbrella, and a handsomely engrossed testimonial bearing the signatures of his men. Mr. Smith responded in a felicitous manner to the employes when these tokens of respect and esteem were presented to him.

The Pacific Electric Railway Company has been incorporated for 50 years, with a capital of $1,000,000, to operate electric railways in Los Angeles, San Bernardino, Riverside and Ventura counties, California. The subscribers to stock are: I. W. Hellman, $96,500; Charles Seyler, James W. Hellman, F. M. Nickell, W. C. Patterson, Frank P. Flint and Frank A. Gibson, $500 each. The board of directors consists of all the stockholders except I. W. Hellman.

Assemblyman Hall has introduced a bill in the New York legislature which provides for reduced fares for children on railroads in cities of the first class. Each railroad company is compelled to issue coupon tickets for a round trip, which shall be furnished to the principals or head teachers of the public schools, who shall sell them to the pupils. The tickets, however, shall be good only between the hours of 8 and 9 o'clock in the morning, 12 noon and 1 o'clock in the afternoon, and 3 and 4 in the afternoon.

The Braddock & Homestead, the Homestead & Highlands, and the Braddock & Duquesne electric roads, near Pittsburg, Pa., have been merged into the Monongahela Street Railway Company. The new company has been operating for several months, though the new concern may be said to be as yet in its formative stage, since numerous improvements and extensions are contemplated. The company now operates 17 miles of double track. The car barn and operating office are at Rankin, Pa.; the general offices at 512 Smithfield street, Pittsburg.

A new time card has been arranged by Wm. Walmsley, superintendent of the South Chicago City Railway Company, giving the time the cars leave the terminals and pass transfer points. It is in the form of an eight-page folder, and is very conveniently arranged for the patrons of the cars. Under the name of each line the hours are printed in heavy-faced type, and in the space to the right the minutes are given so that the schedule of each car is readily determined. On one page is a map showing all the lines of the South Chicago and the Hammond, Whiting & East Chicago Electric Railway Companies.

There has been an unusually protracted spell of severe weather in Chicago during the latter part of last month and the first of this, which has been very trying to the street railway employes. In order to make the men more comfortable while at work on cold and windy days, Superintendent Geo. O. Nagle, of the Chicago City Railway Company, had sandwiches and coffee served to the motormen and gripmen. Bricks were also provided, which were heated in the car stoves, and placed so the grip and motormen could stand on them while on duty. The train crews greatly appreciated these attentions, for they added much to their comfort.

J. M. Shank, president of the Lebanon (Pa.) & Annville and the Lebanon & Myerstown Street Railway Companies, withdrew from the management of both companies on account of the press of other business interests. S. P. Light was elected president of both companies, H. H. Light, secretary, Frank H. Reinoshl, treasurer, and Charles H. Smith, superintendent. S. P. Light has long been known to street railway men as secretary of the Pennsylvania Street Railway Association. Superintendent Smith was complimented by the directors for his efficient management. A semi-annual dividend of 2 per cent was declared.

The horse car line in Niagara Falls, Ont., has sent a communication to the town council asking that it be allowed to change from horse to electric power on the present line and to build a branch down Bender avenue to Mowat gate of Queen Victoria Niagara Falls Free Park, and up Clifton Hill to Center street. Here the route would change, and instead of following Victoria avenue, as at present, it would continue out Center street to Ellen street and on to Ferry street. A line would also be built out to Lundy's Lane, and the right of way would be asked to Victoria and Culp streets, making a loop line to Falls View.

Several weeks ago A. M. Hall, of Buffalo, was appointed receiver of the electric road built by Rochester and Buffalo capital between the villages of Lima and Honeoye Falls, N. Y., and since that time he has been endeavoring to wind up the affairs of the concern. The capital of the company is $40,000. It was the company's intention to supply the two villages with electric light from the power house, which was built midway between the two places. The engines in the power house proved defective and an effort was made to operate them by gas, but this was an utter failure. The receiver found that to continue the road would necessitate $15,000, which has not been forthcoming. A motion was recently made before Justice Werner, in Buffalo, that the injunction order be modified so that the unpaid employes of the company could bring action against the stockholders to recover what is due them, as individual liabilities against the defendants. The motion was opposed and decision was reserved. At the same time the attorney for the receiver made application for leave to borrow $12,500, with which to continue the operation of the road. Decision was also reserved on this motion.

The Creaghead Engineering Company, of Cincinnati, have just taken the contract for all the overhead work for the new Dayton & Xenia Traction Company's 17 miles of track connecting these two cities. Creaghead flexible brackets and line material will be furnished.

W. F. Kelly, general superintendent of the Columbus (O.) Street Railway Company, has just ordered a new 1,200-h. p. cross-compound Wheelock engine, direct connected to a G. E. 850-k. w. generator. This road is now engaged in 15 miles of new rails. Lorain Steel Company's rails are used; they will be cast-welded.

The Consolidated Car Fender Company, of Providence, R. I., in a most unique announcement recently mailed, states that it has only one customer standing first in its esteem and encloses a likeness of that one. Our readers who have not yet received this card should write for one, and discover who the favored individual is.

The B. F. Sturtevant Company, of Boston, has recently issued a number of interesting circulars and pamphlets relating to induced draft for power plants. "Bulletin G" illustrates a generating set in which engine and dynamos are entirely enclosed, which is a design very desirable for use where machinery cannot be protected from dust. "Draft Without a Chimney" tells why the Sturtevant Company abandoned its tall chimney and substituted mechanical draft. A second and larger edition of the lecture on "Mechanical Draft," delivered at Sibley College, Cornell University, by Walter B. Snow, engineer for the Sturtevant Company, has been published by the company. The company makes generators and direct-connected sets for all purposes, as well as its well-known draft and ventilating and heating apparatus.

One of the cars of the Milwaukee, Racine & Kenosha Electric Railway Company was held up by two highwaymen at 8 p. m. February 4 in Racine. There were no passengers when the men boarded the car and when the conductor came to the back platform to attend to the trolley rope as the car rounded a curve a revolver was pushed in his face and $23 taken from him. The car crews have since been armed for such emergencies in the future.

Geo. C. Ewing, for many years connected with the electrical supply business in Boston, is now representing Elmer P. Morris in New York and vicinity. Mr. Ewing has just returned from Porto Rico where he was a member of the engineering staff of General Griffin.

George Pratt has opened a Philadelphia branch office for Elmer P. Morris, of New York.

The Globe Metal Company, of Fullerton, Pa., has appointed Elmer P. Morris, of New York, general eastern agent for the well known "Semi-steel" brake shoe.

The Johnstown Passenger Railway Company has ordered 16 new summer cars, which will be equipped with Johnson steel motors. This company will build a new car-barn 150 ft. x 50 ft. in the spring. It will be a modern building having solid brick walls and covered with a steel roof.

H. B. Westcott was on February 1 appointed general manager of the Cortland (N. Y.) & Homer Traction and Electric Companies.

The Cahall Sales Department, of Pittsburg, has found it necessary, owing to the very rapid increase in price of raw materials entering into boiler construction, to advance the prices of all boilers of its manufacture 20 per cent, to take effect March 1. It has delayed making this advance as long as possible, as it was hoped to get through the season without any advance, but materials have arisen so rapidly in price and continue advancing so sharply that it was obliged to take this step in order to come out even.

WRECK ON THE CINCINNATI & MIAMI VALLEY.

On the night of January 12, an interurban car on the Cincinnati & Miami Valley Traction Company was struck by a train on the Cleveland, Cincinnati, Chicago & St. Louis Railroad, at Dwyer Station, six miles south of Dayton, O. The Big Four train was the New York and Buffalo Fast Express due in Dayton at 11 p. m.

The rear truck of the electric car had become derailed at the crossing by reason, it is stated, of the conductor having allowed the

FIG. 1.

derail to open before both trucks were past the switch. After several ineffectual attempts to get the truck back on the track, they heard the approaching train and started down the track with a lantern to give the engineer warning. They did not get far enough from the crossing to stop the train in time to prevent a wreck; when stopped the last coach was just over the crossing. The electric car weighed 20 tons, and had the engine struck one of the trucks instead of the center of the car the wreck might have been disastrous for the train; as it was, the pilot of the locomotive was broken off and the extension front caved in. The electric car was

FIG. 2.

struck full in the center and the body thrown to one side of the track into the position shown dotted in Fig. 3.

Fig. 1 is from a photograph of the exterior and Fig. 2 from a

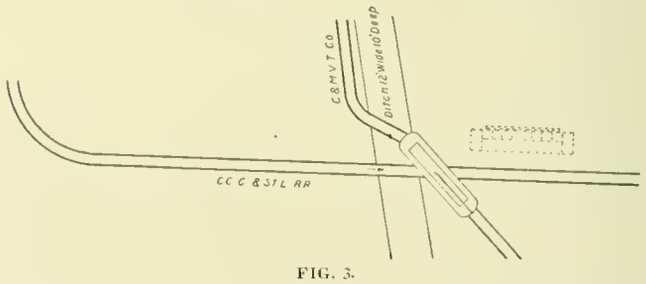

FIG. 3.

photograph of the interior of the electric car after the wreck. The passengers were warned in time to leave the car, and none of them was injured.

CLEVELAND ROADS CO-OPERATE.

The Cleveland Electric Railway Company and the Cleveland City Railway Company, locally known as the "Big Consolidated" and the "Little Consolidated," have agreed that the tickets bought of either street railway company shall be accepted on any car of either company. This led to the reports that the companies have been consolidated, but at present there is only a working agreement although a combination may be effected in the future. Transfer tickets are not interchangeable. It has been arranged that the power for the west side of the city will be supplied from the power stations of the Little Consolidated and the stations of the Big Consolidated will furnish current for all the east side lines. A number of loops are to be constructed so that more cars can be put in service and a new line is to be built on Euclid avenue.

It is quite probable that Fresno, Cal., will have a new electric street railway system, consolidating the present horse lines and extending out so as to give service to the vineyards.

General Manager J. B. McClary, of the Birmingham (Ala.) Railway & Electric Company, advises us that the company's East Lake Pavilion theater will open on May 29. The season continues for 14 weeks, closing September 3, and by arrangement with the Southern Amusement Syndicate, operating attractions for 11 southern parks, a new play will be put on each week.

PERSONAL.

Edward Rhomberg, secretary and treasurer of the Dubuque (Ia.) Street Railway Company, and Miss Mame Simones, of Dubuque, were married on January 9.

John Dolph, of New York, representing the Sterling Varnish Company, of Pittsburg, was in Chicago for a few days last month and while here called on the REVIEW.

C. S. Bidwell, formerly superintendent of the Trumbull Electric Railroad Company, of Warren, O., has been chosen superintendent of the Miami Valley Railway Company, of Piqua.

D. Mazenet, whom W. J. Clark succeeded as general manager of the foreign department of the General Electric Company, is now managing director of the Mexican General Electric Company.

W. S. Wright, general manager of the Wheeling (W. Va.) & Elm Grove Railroad, was recently presented with a jeweled watch-charm and cuff-links as a testimonial from the employes of their esteem.

L. D. Nelson, traveling salesman for the Sterling Supply & Manufacturing Company, of New York, called on the REVIEW a few days ago. He reports that the business in his line is all that could be desired.

F. P. Mooney, for several years superintendent of the Corning & Homer Traction and Corning & Homer Electric Companies, of Cortland, N. Y., has resigned. His successor has not been appointed at this writing.

Charles G. Burton, who has been with the Central Electric Company, for five years, is to be associated with E. B. Kittle, western manager of the Sprague Electric Company. Mr. Burton has been engaged in the electrical field for 15 years.

A. Johnson, formerly with the Joliet (Ill.) Railway Company, has gone to Quincy, Ill., to become electrician for his old superintendent, C. E. Rush, who was recently appointed superintendent of the Quincy Horse Railway & Carrying Company.

The management of the Canton & Massillon (O.) Electric Railway Company has undergone some changes. Second Vice-President H. C. Fogle is now manager, with Lawrence O'Toole as assistant. T. R. Catlin, for some years superintendent, has resigned.

Capt. Frank S. De Ronde, who served during the war with the Second New Jersey Volunteers, and later was ill with typhoid fever, is again fulfilling his duties as general manager of the sales department of the Standard Paint Company, and was a caller on the REVIEW when in Chicago on business last month.

W. B. Brockway, for some years assistant secretary of the Toledo, Bowling Green & Fremont Railway Company, Toledo, O., was at the last meeting of the company promoted, with the title of secretary and auditor. This is a well deserved recognition of Mr. Brockway's services and we extend our congratulations. Mr. Brockway has been secretary of the Street Railway Accountants' Association since its organization.

At the municipal election held in Port Arthur, Ont., in January, W. P. Cooke, chairman of the Town of Port Arthur Electric Railway & Light, was chosen electric railway and light commissioner for a term of three years. Mr. Cooke defeated the successful candidate for mayor, who was also a candidate for commissioner, by an overwhelming majority.

William J. Fransioli, general manager of the Manhattan Elevated Railway Company, of New York, resigned on January 17 to take an executive position with the American Air Power Company, in which Richard Croker and Joseph Leiter are heavily interested. Mr. Fransioli has been with the Manhattan road for 18 years, and was appointed manager in December, 1896. Alfred Skitt, lately chosen vice-president, will succeed as manager.

January 20, the annual meeting of the Provident Society of the London (Eng.) United Tramways Company's employes was made the occasion of presenting an illuminated address to J. Clifton Robinson upon the celebration of his silver wedding. Mrs. Robinson was presented with a diamond brooch. The address was in behalf of the officers and employes of the following companies, of which Mr. Robinson is managing director: London United Tramways Company, the Middlesborough, Stockton & Thornby Electric Tramways, Bristol Electric Tramways, the Reading Tramways, the Corris Railway.

ELECTIONS.

The St. Charles Street Railroad Company, of New Orleans, chose directors who will elect Albert G. Phelps president to succeed Alden McLellan.

Murray A. Verner succeeds B. F. Miles as president of the Mahoning Valley Railway, Youngstown, O. B. F. Miles, the old president, is still a director.

Spencer C. Gilbert and W. L. Gorgas have been chosen president and secretary, respectively, of the Harrisburg & Mechanicsburg (Pa.) Electric Railway Company.

F. M. Stearns has been chosen president of the Cleveland & Chagrin Falls Electric Railroad, succeeding V. A. Taylor, who has disposed of his holdings in the company.

The Chester (Pa.) Traction Company has chosen C. M. Clark president and C. Ford Stevens secretary. George B. Lindsay, formerly president, is a member of the board.

The Laconia (N. H.) Street Railway has chosen new officers as follows: President, A. L. Pierce; treasurer, C. T. Foster; clerk of corporation, Edmund Little; superintendent, L. S. Pierce.

Sharon (Pa.) street railway stockholders have chosen the following officers: President, E. A. Wheeler; vice-president, Simon Perkins; secretary, John H. Dynes, Cleveland; treasurer, Charles Hall.

At a meeting of the directors of a company proposing to build an electric road from Indianapolis to Logansport, Ind., officers were chosen as follows: President, George W. Mariott; vice-president, M. A. Jordan, Logansport; secretary, J. L. Light.

The Tuscarawas Railroad, connecting New Philadelphia and Uhrichsville, O., has been purchased by Cleveland parties, and David King, president and general manager of the Tuscarawas Electric Company, will succeed Mrs. Dr. Fletcher Douthitt as superintendent.

The stockholders of the Zanesville (O.) Electric Railway Company, reorganized, chose a new board of directors which organized by electing officers as follows: Thomas T. Robinson, president; John M. Graham, vice-president; W. B. Cosgrave, treasurer; Charles W. Foote, secretary and general manager.

The stockholders of the Bethel & Rochester (Vt.) Electric Railway have organized, and will place orders for material for use as soon as the ground opens for spring work. The officers are E. H. Edgerton, Rochester, corporation clerk; R. H. Tupper, Rochester, treasurer. J. R. Tupper was authorized to place contracts.

S. P. Light has been chosen to succeed J. M. Shenk as president and general manager of the Lebanon (Pa.) & Annville and Lebanon & Myerstown Street Railways. Mr. Light has for several years been vice-president of these companies, and he is well known also through his connection with the Pennsylvania Street Railway Association, of which he is secretary, and whose success is largely due to his efforts.

FOREIGN FACTS.

The proposed tramway line from Raiganj to Lahire, in the Dinajpur district, has been surveyed.

The Wrexham Tramways Company is planning to lengthen its lines from Wrexham to Johnstown and adopt the trolley system.

Last month the Prince's Park route of the Liverpool Tramways was opened for traffic and a dozen new American cars put in service.

The corporation of Southampton has agreed to adopt the overhead system for the tramways and build double track wherever possible.

The town council of Paisley proposes to acquire the tramways in that city, extend them and make connections with the street railway system of Glasgow.

The route for a proposed electric interurban between Blackpool and Morecambe has been surveyed. This will tap a rich agricultural country in North Lancashire.

The town council of Reigate has purchased a site for a power station and has applied for a permit to construct an electric tramway between the city and Redhill Junction.

The American engineers, Messrs. Cook and Childs, of J. G. White & Co., of New York, have taken charge of the work of building the tramway system of Perth, Western Australia.

A 40-year concession has been granted the Helois Company, of Ehrenfeld, Cologne, Germany, to construct a system of trolley tramways in Spezzia, Pertusola and San Bartolomeo, Italy.

The contract for constructing an electric railway between Pekin and Matschiapu to be in operation this spring, has been secured by the agents of Siemens & Halske Company, of Berlin.

A company in Milan, Italy, is planning to build an electric line between Palsana-Sopra and Revello, a distance of 10 miles. A tramway is also projected between Biella and Graglia.

A public adjudication of tenders will take place next month for the construction and working of new tramways. Particulars may be obtained from the Prefecture de Vienne, Poitiers, France.

The George street electric tramway, in Sydney, Australia, is now in operation, and it is anticipated that at an early date the work of altering all the steam tramways for electric traction will begin.

At Brussels the Compagnie Generale des Tramways Electricques has been organized with a capital of $2,000,000 to acquire the Madrid Eastern Tramways and the street railways of Barcelona and Soria.

The United States consul at Moscow states that the town corporation of Riga, Russia, has obtained from the Minister of the Interior the permission to negotiate a loan of $800,000 to construct a street railway system in that city.

The District Board, Patna, proposes a tramway line from Baktiarpur to Behar. The estimates and plans have been submitted to the Government of India for sanction. The undertaking is in the hands of Messrs. Martin & Co., Calcutta.

The Great Northern & Strand Railway Company proposes to equip the two tunnels from Wood Green station to King's Cross station, and from the latter station to the Strand, for electric traction. The capital authorized is $12,000,000.

It is reported that the branch line of the Canadian Pacific Railway from Aylmer to Hull has been purchased by the Hull Electric Railway Company for $100,000. The line is 7½ miles long, and has been leased to the latter company for the past two years, at a rental of $5,000 per annum.

The route for the circular railway at the Paris Exhibition has now been decided on. It will be a single line railway, running in a complete circle, the train starting from the left-hand side of the Esplanade des Invalides, and returning thereto, after a course of two miles. The traction will be by electric power.

A group of capitalists of Antwerp propose to provide a complete system of electric tramways. The syndicate has arranged with all the existing tramway companies to apply for one general concession for the whole of the lines. The same group is applying for a concession for a new line from the docks to the Gare du Sud, Antwerp.

The tramway system of Kingston, Jamaica, will be supplied with current from a waterfall about 20 miles distant from the city. Satisfactory progress is being made with the work. The enterprise, involving an expenditure of about $1,000,000, is backed by Canadian capitalists.

Motor omnibuses are to be introduced into Brussels. The route chosen is the difficult road from the Bourse to Ixelles by the Montagne de la Cour, which entails so much suffering on horses. The Tramway Company is making experiments with the new vehicles in the Bois de la Cambre, and the results obtained are apparently quite satisfactory.

Manchester proposes providing workshops for making its own cars, instead of buying the cars in Germany, America or elsewhere. The committee, however, intends to buy the first supply of tramcars, after which it proposes to build its own cars and do its own repairs, as there would not be time to build the first supply, for they had to be ready by the 27th April, 1901.

Consul Erdman writes from Breslau, January 9, 1899: I wish to inform our manufacturers of and dealers in street car rails, electric motors, wire and electric supplies that the street car company, of this city, which has been using horsepower, has been granted the privilege by the city authorities to employ electric motive power at the expiration of its present charter, which will be in 1902.

The electric tramways of Dundee, Scotland, are to be operated by the city, and in order to supply the current for traction purposes and the increased demand for lighting the power station is to be enlarged. About $75,000 is to be spent in improvements. The intention is to order four boilers 38 ft. by 8 ft., one economizer of 400 tubes, two engines of 450 h. p. each, and one engine and dynamo of 700 h. p.

The Blackpool & Fleetwood Tramway Company possesses a valuable property, as is indicated by the report at the end of its first six months' operation. A dividend of eight per cent is to be paid for the half year, and a considerable sum is carried forward. An issue of $150,000 additional capital stock was sanctioned to purchase rolling stock, the present equipment being entirely inadequate to handle the summer traffic.

Egypt is awakening to the advantages of the trolley, and the patronage to the lines already constructed in Cairo is on the increase, as is evident from an order for 14 additional trolley car equipments placed with the Westinghouse Electric & Manufacturing Company. It is now proposed to connect Alexandria and Cairo by an electric interurban, but this proposition is not likely to be fulfilled, as the cities are 75 or 80 miles apart.

Work will soon begin on a trolley line connecting Heidelberg Germany, with Nusslock, a small place eight miles south of the city, and an effort will also be made to extend the line farther to Wieslock. Current will be supplied from Heidelberg and Wieslock, and the villages between these two cities will be lighted from the trolley current. A freight car will be attached to each train to

carry baskets, produce, etc. The rate of fare will be 1 1-3 cents per mile.

The mileage of electric railways is increasing more rapidly in Germany than any other European country, as shown by the statistics for the past year. There are now in all 1,260 miles of track, with 5,318 cars in operation, which require power station machinery of 38,451 k. w. capacity. The trolley system is in general use, although there are two short lines of conduit in Berlin and Dresden, and mixed systems, combining the trolley and storage battery, in Hanover, Berlin, Hagen and Dresden.

The sub-committee, of the Dewsbury town council, reported that it had considered various schemes for electric tramways, and unanimously recommended as the best a route commencing at the borough boundary in Huddersfield Road, near to the Ravensthorpe Station of the Lancashire and Yorkshire Railway, thence passing along Huddersfield Road, Webster Hill, Old Westgate, Wellington Road, Halifax Road, and Birkdale Road, to the western end of Green Lane. The estimated cost was $98,900.

Special report prepared by the railway, tramways and electric lighting committee, of Dudley, recommended that it be an executive committee for carrying out the necessary work of constructing and equipping the generating station, and for the supply of energy; and further, that application be forthwith made to the local government board for sanction by the council of a loan of $37,500 on account of the expenses to be incurred in the construction of the generating station and work connected therewith.

The corporation of Glasgow has accepted the recommendation of the tramway committee to adopt the trolley system for all the street railways of the city. The electric conduit was discussed at some length, but it was decided that climatic influences were not suited to its successful operation, and the fact that a number of the routes crossed bridges presented serious obstacles to the conduit construction. It is intended to have all the tramways operated by electricity before the municipal exposition in 1901.

Another Alpine electric railway is in contemplation, which will start at Landeck and extend through the Vintschgau valley, by Reschenscheideck, Meran, Trafoi and Bormio, to Milan, Italy. It will be known as the Vintschgau Railway, and will be a competitor to the famous St. Gothard Railway. A tunnel 8,000 yds. in length will have to be cut through the mountains. Water powers are so abundant through this region that electric operation will be the most economic. This line will be the shortest route from Germany to Italy.

OBITUARY.

Milan C. Bullock, president of the M. C. Bullock Manufacturing Company, whose death occurred in Chicago January 12, has long been known as one of the leading manufacturers of mining machinery and engines for electrical installations. Mr. Bullock was a native of New York state, and was 61 years old at the time of his death. He was an experienced machinist and came to Chicago in 1875 and started his factory. He was also one of the pioneers in the electric lighting industry in Chicago.

It is announced that there is a good prospect for building an electric road from Port Huron, Mich., to Lexington, and ultimately to Bay City. E. L. Brennan, of Toledo, and Charles Montague and Fred S. Wheat, of Cairo, are interested.

The Omaha (Neb.) Street Railway Company in 1898 had the largest year's business in its history: this was due to the immense exposition traffic. Numerous improvements have been made during the year; a 1,200-h. p. unit and the necessary boilers were added to the power house and a new stack built; a new car house 124 by 380 ft. was built; 40 open and 20 closed cars were added to the equipment

ECHOES FROM THE TRADE

We have inquiry for address of companies having 10 or 12 second-hand open cars for sale. Letter addressed to Editor Street Railway Review will be handed party.

The Chase Construction Company, general contractor, making a specialty of electric railways and stations, has removed from 1113 to 1321 Majestic building, Detroit, Mich.

Hackett, Carhart & Co., of 422 Broadway, New York, who are very extensive clothing manufacturers, are making a specialty of uniforms for street railway employes, and invite correspondence.

Bion J. Arnold, consulting electrical engineer, of Chicago, made a personal exhibit of mechanical and electrical designs at the Trans-Mississippi Exposition, which was awarded a gold medal and diploma.

The Leschen-Macomber-White Company, of Chicago, which makes a specialty of wire, wire rope and cordage, and contracts for mine, quarry and railroad supplies, has sent a handsome desk calendar to its friends and customers.

Stone & Webster, of Boston, have placed an order with Wendell & McDuffie, of New York, the New York and New England agents of the American Rail Joint Company, for boltless joints sufficient for several miles of track.

The United States circuit court of appeals for Massachusetts has held, in the case of the Thomson-Houston Company against the Athol & Orange Street Railway Company, that the Walker motor is not an infringement of the patent held by E. W. Rice, Jr.

"The Westinghouse Standard Engine" is the title of a 60-page pamphlet published by the Westinghouse Machine Company descriptive of its "Standard" engine which has been on the market for 18 years. It is a very handsome piece of work typographically.

E. G. Long, vice-president of the Peckham Truck Company, sailed for Europe on February 3, where he will thoroughly inspect the street railways. The Peckham Company has a very large foreign trade, and Mr. Long is manager of the foreign sales department.

We have had numerous requests for the address of Paul and Henry Hirsch, formerly doing business as "bankers" and street railway bond brokers, with offices in Chicago and on Wall street. Any of our readers who can furnish the information will confer a favor in so doing.

The West End Traction Company, of Pittsburg, has added 15 new cars made by the Laclede Car Company, of St. Louis; they are mounted on Lord Baltimore trucks and equipped with Westinghouse No. 58 B motors. Ten cars for summer use have also been ordered from the Laclede Company.

Arthur W. Field, 53 State street, Boston, who is sole New England agent for the Peckham Truck Company, the American Car Company, Ruggles' rotary snow plows and Price's friction brakes, and also sales agent for a line of standard street railway supplies, has recently sent to the trade an attractive calendar.

The Falk Manufacturing Company advises us that it will immediately appeal the patent case, which was decided against it in January, to the United States court of appeals, and will also bring suits against the infringers of other patents owned by the company. The Falk Company feels assured of its ultimate success in this litigation.

"Modern Engineering Practice" is the title of a circular issued by the Famous Filter Company, of St. Louis, Mo., which is a practical up-to-date treatise on reliable, perfect and economical lubrication. These three adjectives describe the three important objects to keep in view in successful engineering. The pamphlet will be sent free to any address.

William E. Cooke, who represents the London syndicate controlling the tramways of Perth, Western Australia, is now in Perth converting the system to an electric one. Mr. Cooke states that Perth is an excellent street railway city because of the rough topography and large area of the city, the hot climate and the poor roads.

J. A. Fay & Co., of Cincinnati, O., have just sent us a large illustrated poster, printed in two colors, which shows over 100 of the company's new woodworking machines. The company's line of machines includes everything for working wood and the poster is most convenient for reference. They will be sent free on application; mention the Review.

The Columbia Incandescent Lamp Company, of St. Louis, at its annual election chose officers as follows: W. O. Garrison, president; A. C. Garrison, vice-president and treasurer; George P. Rex, acting secretary. A. C. Garrison will have the general management of the business, and Mr. Rex, formerly representing the company in Chicago, will now be in St. Louis.

The Simplex Electrical Company, Sidney and Franklin streets, Cambridgeport, Mass., which is sole manufacturer under the patents of the American Electric Heating Corporation, has sent out through its heating department a pamphlet entitled "Electric Heating," which will prove a revelation to those who have not followed the subject closely. The Chicago office of the company is 1173 Monadnock building.

The Hazard Manufacturing Company, of Wilkesbarre, Pa., has its copper wire plant in running order and reports that the business in this line is very gratifying. The reputation made by this company in its bare steel wire and cables makes it easy to place its copper products. Insulating machinery is now being installed and the company will be ready to fill orders for paper, rubber and fiber insulated wire about March 1.

The Ajax Metal Company, Philadelphia, states that it has had its trolley wheels tested in competitive trials, and that they have shown longer life and much more satisfactory service than those of the other makers. The company recently secured an order for 20,000 wheels, at a better figure than was offered by competing makers, and the order was given because it was thought that the Ajax wheels had showed 75 per cent better results.

The Jeffrey Manufacturing Company, of Columbus, O., which has recently taken up the manufacture of standard elevator buckets and spiral conveyors, reports a very flattering trade. Its facilities are such as enables it to supply high grade material at prices which secure for it a large trade for this class of machinery. Any one requiring material in this line will do well to secure The Jeffrey Company's latest catalog and prices, which will be cheerfully sent upon application.

The "Calendar of Masterpieces" for 1899, with the story of the pictures by Prof. H. Ward Rhodes, of the Museum of Fine Arts, Washington University, is one of the most pleasing things the new year has brought. The six photogravures are reproduced from the celebrated paintings "Neighbors," "Adagio," "Phoebe," "The Dancing Lesson," "Marianna," and "Consolation in Sorrow." The calendar was sent to the friends and patrons of the J. G. Brill Company, and it represents one of the highest types of fine art in advertising.

The American Vitrified Conduit Company, of New York, of which C. J. Field is general manager, has been awarded the contract for the entire electrical conduit system of the city of Baltimore, involving several million feet of the company's vitrified tile multiple duct conduits. The multiple conduits have from two to 16 ducts. The contract was awarded January 25, by the board of awards of the city, upon the recommendation of the chief engineer of the electrical commission, Charles E. Phelps, Jr., who carefully considered all the bids made.

H. A. Dorner has been appointed sales agent for the A. & M. (Allen & Morrison) brake shoe in the states from Indiana to Maine. The A. & M. brake shoe was developed, after a series of experiments extending over several years, by Messrs. Morrison and Allen, superintendent and master mechanic, respectively, of the South Side Elevated, Chicago, who were seeking a brake shoe that would prove perfectly satisfactory on their road. When placed on the market it proved a decided success by reason of its high frictional and slow wearing qualities.

The New Process Raw Hide Company, of Syracuse, N. Y., lost its entire factory and stock by fire on December 19, and immediately made every effort to get a new plant in operation by February 1. When the fire occurred the factory was running overtime on orders, its raw-hide pinions being in great demand. The new works are located at 305-309 North State street, Syracuse, the business office remaining at 348 West Washington street. We congratulate the company upon the fact of being again in shape to supply its products to the trade.

A. O. Schoonmaker, importer of India mica, 158 William street, New York, and 1563 Monadnock building, Chicago, reports that business in the mica line is exceedingly good. Mica is an absolute necessity to the electric trade and the furnishing of mica commutator segments is a business in itself. Mr. Schoonmaker carries stamped solid sheet mica segments for all the standard types of motors, and mica rings, in stock, and will cut and build up any pattern desired. Samples and quotations will be furnished by him or by his agents: Reger & Atwater, San Francisco; Hayes & Arthur, Cleveland; Central Union Brass Company, St. Louis.

The Metropolitan Street Railway Company, of Toronto, is building a long line to Lake Simcoe, and has placed a large order for Westinghouse apparatus. In the new power station at Bond Lake will be placed two three-phase 400-h. p. alternating-direct current generators, with transformers for raising the voltage to 16,500. Transformers and rotary converters will be installed in sub-stations about 14 miles from the power house. The car equipment provides for freight and passengers, the motors on the passenger cars being 50 h. p. each. A 45-ton Baldwin-Westinghouse electric locomotive will provide motive power for the freight traffic.

The Cleveland & Eastern Railroad Company is now in the market for power station machinery and car equipment. For the power station a 600-h. p. engine, boilers of 600-h. p. capacity, condensers, heaters, pumps and a steel self-supporting stack will soon be purchased. The new cars, for which bids are asked, are to be equipped with air brakes and four 50-h. p. motors to give a speed of 45 miles an hour. The road, extending from Cleveland to Chadron and Burton, 36 miles, will be in operation by May or June. Extensions will ultimately be made to Andover, 70 miles, and later to Meadville, Pa., 100 miles. W. C. Jones, 710 New England Building, Cleveland, is the engineer of the company.

The Frank Ridlon Company, of Boston, announces, under date of February 1, 1898, that Charles N. Wood has become a stockholder in the company and been elected a director and vice-president. The New England agencies Mr. Wood has controlled for so many years, viz., the R. D. Nuttall Company, the International Register Company, the Van Wagoner & Williams Hardware Company, the Bradford Belting Company, the Monarch Stove & Manufacturing Company, the American Electric Heating Corporation, Wilson, Thomson & Co. The Ridlon Company will establish under Mr. Wood's management a strictly street railway supply house. Mr. Wood will for the present continue at 31 State street, but the business is soon to be consolidated in one office.

Louis Duncan and M. K. Eyre, consulting engineers, under date of February 1, announce that they have formed a partnership under the style of Duncan & Eyre, with offices at 1514-15 Empire building, 71 Broadway, New York.

The Bates Machine Company, of Joliet, Ill., is a very extensive manufacturer of general machinery and heavy wire machinery; Corliss engines and feed-water heaters are among its specialties. In the field of wire machinery this company claims to be the pioneer, and it has built up its trade by trying to anticipate the demands of the times, and being at all times prepared to furnish the most durable, most economical and most perfect machinery that is on the market. It is prepared to furnish a complete outfit of all that is necessary for a wire mill and give the best of everything. The company has recently issued a new catalog illustrating its specialties. The Cookson feed-water heater made by this company was illustrated and described in the REVIEW for October, 1898, page 770.

The New York Switch & Crossing Company has made extensive additions to its Hoboken works during the past year and is able to turn out its special work with greater rapidity than ever. A large number of new special tools have been installed. The company reports an excellent business in both street and steam railway fields. Much special work has been supplied to the Union Railway Company, of New York; the Brooklyn Heights Railroad Company, of Brooklyn; the Hartford Street Railway, of Hartford, Conn.; the Consolidated Traction Company and North Hudson County Railway, of Jersey City and Hoboken; the J. P. McDonald Company, and the United States Government railways in the Brooklyn Navy-Yard and at Indian Head. Considerable special work, mostly for T rail, has been exported also.

The P. & B. electrical compound, of the Standard Paint Company, continues to be recognized as a standard article, and is specified by electricians of electric railway and light companies both in the United States and abroad. The business done by the Standard Paint Company in this and in its armature and field coil varnishes during 1898 was in excess of any previous year, in spite of the up-set conditions due to the Spanish war and other causes. The company's branch factory at Hamburg, Germany, has been busy ever since it was opened early in 1898; its product includes P. & B. preservative and roof paints; P. & B. building, sheathing and insulating papers and ruberoid roofing. The orders for the company's insulating tape have been very heavy for several months past, both for domestic and foreign consumption.

Willard A. Smith, of Chicago, who was chief of the transportation department of the Columbian Exposition in 1893, has been appointed director of the department of civil engineering and transportation by the commissioner-general for the United States to the Paris Exposition of 1900. Mr. Smith wishes to enter into correspondence with intending exhibitors at the earliest possible date, and such should address him care of the Chicago offices of the commissioner, Auditorium building. The limitations of space are such that only exhibits of the most desirable character can be provided for. This department covers (as at the World's Columbian Exhibition of 1893) railways, vessels and vehicles, and everything relating to the subject of transportation and civil engineering. It is hoped that the well-known pre-eminence of the United States in this department, among the nations of the world, will be so well illustrated at Paris that it will be a just subject of patriotic pride. From a purely commercial point of view its influence on the world's markets can hardly be overestimated.

Edward Wilhelmj, conductor of a North Chicago electric car, while his car was waiting at a railroad crossing, saw a 6-year old child fall in front of the approaching train, then 20 ft. distant; he promptly seized the child and jumped upon the pilot of the engine. When the train was stopped both were found to be uninjured.

Negotiations are pending between the projectors and Westinghouse, Church, Kerr & Co., for the building of an electric road from Lansing to Ann Arbor, Mich. C. E. Mapes and Dr. R. J. Shanks, of Lansing; Thomas Barkett, of Dexter, and others are interested. O. A. Stranahan, of Chicago, is the company's financial agent.

NEWS NOTES.

AKRON, O.—The Akron, Bedford & Cleveland Electric Railway has secured the right of way for the proposed eight-mile branch from a point above Cuyahoga Falls to Hudson. This work is to be completed by May 1. J. F. Sloat, superintendent.

ALTON, ILL.—Articles of incorporation have been filed with the secretary of state by the Alton & East Alton Railway & Power Company, with a capital of $100,000, to construct new lines for the Alton Railway & Illuminating Company. The incorporators are: O. S. Stowell, G. M. Ryrie and Henry S. Baker. J. F. Porter, president.

ANN ARBOR, MICH.—Westinghouse, Church, Kerr & Company have the contract for building and equipping the Lansing & Ann Arbor Electric Railway. The road will run from Lansing to Mason, thence to Dexter, and from Dexter to Ann Arbor. C. E. Mapes and Dr. R. J. Shanks, of Lansing, may be addressed.

ATLANTA, GA.—The Atlanta Consolidated Street Railway has petitioned for the right of way to build an extension along the east side of the East Point road to Oakland City.

ATLANTIC CITY, N. J.—The Atlantic City Trolley Company which proposes to build an electric railroad from South Carolina avenue to the Inlet has declined the franchise offered by the city because of too many requirements for street improvements.

BALTIMORE, MD.—The Baltimore Consolidated Railway Company has completed a survey along the Frederick turnpike from Elliott City to St. John's college, a distance of about six miles, for a proposed single track extension.

BELFAST, ME.—James Mitchell, a railroad contractor and promoter of Bangor, Me., is to build a five-mile electric railroad this spring between this city and Northport.

BLOOMINGTON, ILL.—The Bloomington & Normal Railway Company, incorporated in June, 1898, will build three miles of extension, that will require the building of two iron bridges with stone abutments. Eight open and 16 closed motor cars and three trailer cars will also be wanted. A. E. De Mange, president and purchasing agent.

BRADFORD, PA.—At the annual meeting of the Bradford Street Railway Company held on January 9, the directors authorized the purchase of 225 trolley poles, 13,000 ties and 10 miles of steel rails, to be used in extending the Congress street branch to Lews Run. Work will be begun as soon as the frost is out of the ground.

BRIDGETON, N. J.—The Bridgeton & Melville Traction Company; operating 18 miles of railroad, is preparing to build an extension from Fairton to Cedarville in the spring. C. H. Kuhn, president.

CHAGRIN FALLS, O.—J. R. Curtis, of Cleveland, O., has been awarded the contract for track laying on the Chagrin Falls & Eastern Electric Railway. Jay E. Latimer has the contract for overhead work. The proposed route is from South Newbury to Garretville, via Burton, Troy and Hiram, a distance of 26 miles. R. S. Hubbard, president, Cleveland, O.

CHICAGO, ILL.—The limit of time for the completion of the Northwestern Elevated Railroad has been extended by the city council from January to December 31, 1899.

CINCINNATI, O.—The Hamilton & Eaton Electric Railway Company has applied to the county commissioners for a right of way through about 12 miles of the turnpike roads in this county.

COLUMBUS, O.—The Westerville & Worthington Street Railway Company has secured the right of way between Delaware and Flint, a distance of about 15 miles. It is proposed to complete the road by July 1, 1900.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 9. MARCH 15, 1899. NO. 3.

The Toronto, Ontario, city council is considering the passage of a bill delegating to the city engineer power to determine what "is a comfortable load" and that no car shall be operated which is "not approved by the engineer." The engineer is also to arrange such a time table "as he considers proper."

If these powers are conferred, and the city engineer is not the "whole thing," he will be sufficiently near to it for all practical purposes.

The action of the supreme court of New York in allowing the Brooklyn Heights Railroad Company an allowance of $500 against the plaintiff in an unsuccessful damage suit is greatly to be commended and if the practice is followed in similar cases it cannot fail to greatly decrease this class of litigation. The greater number of personal injury suits against street railways are brought at the instance of unscrupulous attorneys who know that their clients have no case, but trust to arousing the prejudices or sympathies of juries or frightening the company into a settlement.

The representative of West Toronto, Ont., in the legislature proposes to introduce, or has already done so, a bill providing that passengers who are unable to secure seats in the street cars shall pay only half-fare. It is not proposed to limit the number of persons who may ride on a car, and the street railway companies will not be permitted to run by persons who wish to take a car, or to exclude them because the car is crowded. The author of the bill says: "Because a car happens to be crowded is no reason why a passenger should be excluded from it, as the passenger would be perhaps seriously inconvenienced if he waited for a car which contained room for him to sit down."

This is certainly a one-sided arrangement as the only effect of it would be to reduce the receipts of the company. We all know that people on this side of the Atlantic will not accept the European plan of rigidly limiting the capacity of public conveyances, because they are not willing to wait for one with plenty of room. This being true why should the impatient man get transportation at one-half the rate paid by one with more time to spend in waiting?

It is a solon of the Nutmeg State, evidently from the rural districts, who has conceived and is now trying to secure the passage of a bill for more light in darkest Connecticut. He proposes to solve the problem by an act which shall make it incumbent on all interurban lines to burn 100-c. p. incandescents every 400 feet, or a 1,200-c. p. arc light every 1,000 feet along the highways on which are laid electric railway tracks.

When one takes into consideration the hour at which most of the dwellers along these country lines retire, there would seem about as much need for such lights in the daytime as at night.

The ministers of Baltimore are trying to preach vestibules into the street cars of that city. This effort on their part to save the bodies as well as the souls of men is probably put forth in a spirit of kindness, although there does not seem any call for the extravagant and unbecoming language some of them used from their pulpits. But it would not seem to us that, with any attempt whatever on the part of the men to dress for outdoor work, that there is any need for vestibules in that latitude. There were undoubtedly several days during the extremely unusual weather of early February, when any outdoor labor was unpleasant, and even attended with more or less suffering; but for the few such days once in 10 or 15 years, there are months when the absence of the vestibule would conduce to health.

Chicago can claim to have been about as cold during the transcontinental storm as any of the large cities east of the Mississippi, and it was here accompanied by an intensely high wind. One day at an hour when the thermometer was 22° below zero, a stranger in the city—not a street railway man either—had occasion to use a cable car. As he came from a portion of the country where cold is unknown, his heart went out to the figure bundled up in a fur coat and gloves on the grip car, and expressed his sympathy. A hearty laugh was the response, and the gripman remarked he was the warmest man on the train, as he not only was accustomed to being out every day, but dressed for it. The investigation was continued to three other cable trains, with the same result. Not one had a frosted ear or hand; but had taken the precaution to dress properly. It is a well known fact in the employment division of each of the large roads in Chicago, that men who have occupied responsible positions in stores, at good salaries, beg for a position on the front platform as an almost certain road to recovered health. The writer has personally known cases where the pale-faced applicant had in less than a year brought his weight up to 180 lbs. and his strength and appetite in proportion. Hence the good brothers of Baltimore who, probably in good faith, have tackled a text not taught in their seminary, would do well to investigate a little on their own account before plunging into the sensational utterances they have voiced. In most cities the health of the men is anything but improved by closed vestibules.

When the plan of a subway in Boston for the use of street cars was first proposed the street railway officials advanced the argument that while a subway would greatly relieve the streets in the congested business area, the diversion of the street cars from the streets to the subway would surely result in the lowering of rents and the depreciation of real estate on the streets formerly used by the street railways. The merchants and property owners along the streets in question expected that they would become pleasure thoroughfares, and looked upon the arguments of the street railways as being prompted merely by self-interest.

The subway was built and the tracks of the West End Company in Tremont street removed. The unexpected result (unexpected by the merchants interested) was that the streets thus relieved of railway traffic were eagerly seized upon for all sorts of heavy teaming and they are now monopolized by trucks. Further, many of the people who formerly walked through Tremont street, now take cars through the subway and prefer to do their shopping at points more convenient to the subway stations. The loss to the retail stores on

Tremont street has been so serious that those firms have petitioned the legislative committee on street railways, and the committee has undertaken an inquiry. President Gaston, of the Boston Elevated, states that the company is willing to go to the expense of replacing its tracks in Tremont street in order to accommodate the merchants there.

The dissatisfaction caused by the subway so effectually relieving the congested streets of possible purchasers, has resulted in the plan of Mayor Quincy for another subway, to connect the Boston & Albany and the Northern stations, being received with remonstrances instead of the approval which greeted the plan for the present subway.

While not writing in any spirit of "I told you so," we cannot forbear allusion to the fact that it forcibly illustrates the difference in the value of the views of the city officials though perfectly honest in their belief, and those of the street railway officials. The former were based on theories which seemed good and sound; those of the railway men on fundamental principles arrived at as a result of years of careful study and observation of the transportation business. One diagnosis was that of the layman: the other that of the practitioner. The whole matter illustrates what would be the rule under a management by a municipality, and that the competent street railway manager does better for the individual than he with his pet plans would do for himself.

There are now pending in the legislature of Illinois eight, and possibly more, bills, any one of which, if it became a law, would greatly decrease the incomes of railroad and telegraph companies doing business in this state. These corporations being engaged in business which public policy will not permit to be suspended they must reduce expenses or operate at a loss when their incomes are cut down. Operation at a loss has but one end, a receivership and the eventful wiping-out of a portion or all of the capital stock; inasmuch as the management of a corporation represents the stockholders it will not run the business at a loss until all other remedies have failed. When the expenses must be reduced, and the various items going to make up the total are examined, it is soon discovered that the largest single item, and the only flexible one, is labor. On railroads the operating expenses are probably about 60 per cent of the gross receipts, and labor constitutes from 40 per cent to 60 per cent of the total operating expenses; that is, from 25 to 35 per cent of the gross earnings goes to pay for labor. Therefore, when earnings are reduced say 5 per cent through hostile legislation, the immediate result is that the employes will suffer a reduction in their wages of from 15 to 20 per cent.

These facts are, of course, known and appreciated by every one connected with the management of railways, but are often overlooked by others. This inevitable effect of hostile legislation has resulted in the organization of the "Railway and Telegraph Employes' Political League of Illinois." Next year it is proposed to have a national organization on the same lines. The objects of this organization is the protection of the interests of its members by political but non-partisan action.

On February 24, a mass meeting of railway and telegraph men in Chicago was addressed by Chauncey M. Depew, who in the course of an eloquent address pointed out the reasons for forming such a league and the power which it could exert. The steam railroad employes of the United States number about 800,000, and acting in concert have the balance of political power in their own hands. The total vote for president of the United States in 1896 was only 13,500,000.

The street railways of Connecticut employ about five men per mile of track, and if the same proportion holds everywhere the street railway employes of the United States number 86,000, a great political force. At the present time most of the organizations of street railway employes other than the benevolent and social associations are for the purpose of fighting the employers, and their management is in the hands of professional agitators who mislead the men they should advise, and try to blind them to that old, old truth of political economy—the identity of interest of labor and capital. Instead of attacking the cause of the disease, reduction of the earnings of corporations, they seek to treat the symptom, reduction of wages of employes. The symptom they seek to cure by means of a strike, which exhausts both the men and the company, and leaves the latter less able to grant the demands upon it than before.

We commend to our readers the consideration of the objects of this political league and also its methods. The leading men in it have learned in the school of experience that labor cannot better itself by strikes, and to guard against this association being made the tool of professional agitators such as have controlled other organizations of railroad men and led them to their ruin, its constitution provides that all officers and directors shall be what the name of the league implies—railroad employes, and not ex-employes.

One of the most important matters which affect interurban roads, and some of them to a very serious extent, is that of carrying freight. The question is already a live issue in some states and will have to be met and decided in all states within the next five years.

The steam roads, naturally, are on the defensive, as they look ahead a little way and see hundreds of trolley interurbans competing for the business they now monopolize. While they cannot altogether be blamed for assuming the antagonistic attitude they now occupy, we believe and have repeatedly expressed our belief that they are making a mistake. Transportation begets freight and creates business, and while in some cases the interurban will seek to divide the existing business between the two given points, at other places it will give more than it takes. The steam roads must soon awake to the fact that they cannot long bar the progress of country electrics, either by injunction where they seek to cross the steam tracks, or in the courts on the question of right to carry freight as well as passengers. There is no good reason why an electric road occupying streets and highways should any more be debarred from hauling freight over its rails than a company organized to do a general teaming business, which hauls the same identical merchandise over the same route in wagons whose wheels rest directly on the pavement or ground.

* * *

The movement of cars drawn by steam locomotives over streets is obviously an entirely different proposition, for to operate with any degree of economy the latter must handle many cars in a single train. The electric system permits of economical operation with a very few cars in a train, or even only one or two. These electric trains being short do not obstruct cross streets in passing, and can be brought to a standstill promptly. The chief objection to the occupation of a street or highway by a steam railroad has always been the danger to animal-drawn vehicles on account of the noise and escaping smoke and steam. The extermination of the steam dummy for street car work is a striking proof of this. In many cities operating street railway companies are allowed to use any practical motive power except such as is propelled directly by steam.

The movement of farm products and other merchandise upon our interurban roads will very soon be as great a convenience and necessity to the district served as is the transportation of passengers.

* * *

The steam roads lay great stress, and not without some reason, upon the condition that they are obliged to buy a right of way upon which to build and operate, where the electric railway is given free lease for a term of years. But there are two sides to this. In the first place the steam road requires as a prime condition the ability to move its trains very rapidly. Just imagine for a moment a steam trunk line between Chicago and New York laid all the way upon streets and highways. Where would be our Empire State expresses and fast freight lines, and how many through passengers or tons of freight would it move? The steam road train can only stop at intervals of several miles, while its fast expresses frequently make but four or five stops in as many hundred miles, and these partly for fuel and water. The electrics, on the other hand, adapt their operation to the convenience of everyone, and stop at every block if desired.

In the second place, the right of way, while paid for and owned by the steam road has frequently been partly or wholly paid for by the people. The Government has made liberal land grants, and properly, to encourage and assist the enterprise. As the country grew older, towns and counties voted a cash bonus and "bonded the town" to help on the good work. Even where a second and competitive steam road desired to invade an attractive territory, the people had frequently to bond themselves a second time in order to get relief by competition from rates which were excessive because a monopoly prevailed.

In the country electric line the citizens of the towns thus connected and served receive a much more frequent service, with stops at almost any point and lower fares than steam roads. The interurban line in no way lessens the original use and purpose of the highway, and makes of it a convenience never before possible.

There can be but one result in the end, and that permitting trolley roads to carry all kinds of freight. It may be found best to move certain classes of freight at night, but this only in cities of considerable size.

VIADUCT AT CLEVELAND DAMAGED BY FLOOD.

The Willson avenue viaduct over the Kingsbury Run valley, Cleveland, was partially destroyed by a washout, January 13, and from the half-tone illustration a good idea can be obtained of the extent and character of the damage. The viaduct was built on the top of an old embankment, 40 ft. high and 70 ft. wide at the crest, which was made in 1872 to extend Willson avenue across the valley. The viaduct was constructed by the New York, Chicago & St. Louis Railroad Company in accordance with an agreement made with the city for the privilege of building tracks across this and other streets. This agreement was made in April, 1882, but it was not until 1895 that it was enforced. The city built the approach at the north end and the railroad company built the south approach and the bridge.

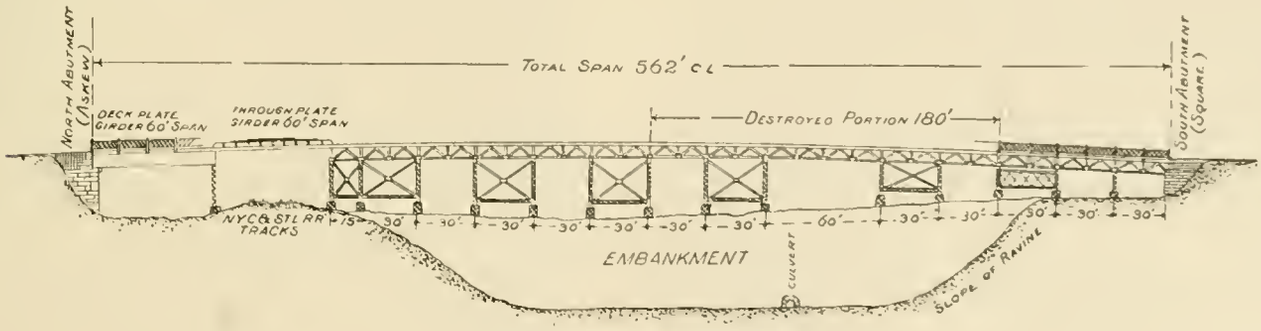
The metal portion of the bridge was 562½ ft. long, and carried a 45-ft. roadway and two 7½-ft. sidewalks. Its approaches were earth embankments 230 ft. and 345 ft. long respectively. A cross section of the valley with a profile of the bridge is given. The street railway crossing the bridge was the Willson avenue line, operated by the Cleveland Electric Railway Company. It is a cross-town line connecting with both the Big Consolidated and the Little Consolidated systems, and transfers from both companies are accepted on the Willson avenue line.

Through the embankment there was a culvert 9 ft. in diameter and 200 ft. long to carry the stream, which with its tributaries drains a valley several miles in length. The embankment consists almost entirely of sand, and the foundation of the piers upon which the structure rested were not carried to any considerable depth into the embankment. A heavy rainfall increased the flow of water through the run, and this together with the breaking of an 8-in. water pipe in the embankment caused it to give way, and the four pedestals of the 60 ft. span to sink, but the adjacent spans held up the structure for 10 hours afterwards, then it gradually settled and broke apart, leaving a gap of 180 ft., as shown in the cut. James T. Pardee, bridge engineer, of Cleveland, informs us that the city has let a contract for a temporary wooden trestle leading around the broken portion of the viaduct, to accommodate street cars and other traffic until the structure is permanently repaired by the railroad company.

CONSOLIDATION AT LEBANON, PA.

The Lebanon & Annville and the Lebanon & Myerstown Street Railway Companies have been consolidated and plans are on foot for the improvement and extension of the combined lines. John A. Rigg, president of the United Traction Company, of Reading, is associated with the new company, and is represented in the board of directors by his son, Dr. Walter A. Rigg. The Annville line will be extended westward to Palmyra and the Myerstown line eastward to Womelsdorf, connecting there with the Reading & Womelsdorf system. This will form a continuous interurban electric railway 37 miles in length. A new power station will be constructed in the spring. The officers of the new company are: S. P. Light, president; H. H. Light, secretary, and F. H. Reinoehl, treasurer.

WILLSON AVENUE VIADUCT, CLEVELAND.



GENERAL DIMENSIONS OF VIADUCT.

It is reported that on the night of February 17, current from the trolley line of the Cleveland, Berea, Elyria & Oberlin Railway was utilized in breaking open the vaults of the Oberlin Bank Company, at Oberlin, O.

Legal Victory for the Aurora & Geneva Railway.

The Illinois Supreme Court Holds that an Interurban Electric Railway may Leave the Highway and Condemn a Right of Way through Private Property when it is "Expedient" or "Reasonably Convenient to Do So"—The Conclusion of a Hard Fought Contest.

Probably no case recently passed upon by the courts is of deeper interest to those connected with interurban electric railways, than is that of the Aurora & Geneva Railway Company against Jennie D. Harvey and others upon which the supreme court of Illinois passed last month. The opinion was filed on February 17, 1899, and we give it in full; it contains a detailed statement of the facts and circumstances and a full history of the previous litigation. The affidavits quoted will be clear after an examination of the diagram of the routes in controversy. The court said:

This is an appeal from the decision of the circuit court of Kane County in a proceeding under the act in regard to horse and dummy railroads of this state, instituted by appellant, (the Aurora & Geneva Railway Company) against appellees, Jennie D. Harvey, et al., to condemn the real estate described in its petition. The parties interested in this appeal have been before this court at a former term, (see Harvey v. Aurora & Geneva Railway Company, 174 Ill. 295), and as two of the disputed questions now presented grow out of the construction and effect to be given to our opinion rendered in that case, it will be proper to briefly restate the facts and proceedings then before us:

"The Aurora & Geneva Railway Company, appellant, was organized under the general incorporation law of the state, entitled 'An act concerning corporations,' approved April 18, 1872. In the application to become incorporated the purposes for which the corporation was organized are stated as follows: 'The object for which it is formed is to build, construct, maintain and operate street railways, horse and dummy railroads and tramways in the county of Kane, in the state of Illinois, to be operated by electricity or by any other motive power excepting steam, for the purpose of carrying passengers, express matter, mail and baggage; also for the purpose of generating and supplying others with electricity, in any form, for power, heat, light and for any other purpose.'

"The certificate of organization bears date July 29, 1896, and the purpose of the corporation was to construct a street railroad from Aurora to Geneva, the county seat of Kane county. Soon after the organization of the company, it constructed an electric street railway over certain public streets in Aurora and along the public highway from Aurora to Batavia, which was about two-thirds of the distance from Aurora to Geneva. On the eighth day of September, 1896, appellant petitioned the board of supervisors of Kane county to grant to it, and to its successors and assigns, for the period of twenty years, the right to lay down, construct, maintain and operate during said time its railway and tracks, with necessary sidings, appurtenances, poles, wires and other equipments, for the purpose of operating its railway and carrying out the purposes of its incorporation in, upon and along that part of the public highway in the townships of Batavia and Geneva, in said Kane county, Illinois, which runs along the westerly bank of Fox river, extending from a point on said highway connecting with Batavia avenue, at the northerly city limits of the city of Batavia, to the southerly city limits of the city of Geneva. The board of supervisors, after due consideration, granted the prayer of the petition. From the northern limits of the city of Batavia the railway company proceeded to construct its street railway along the highway, the use of which was thus granted to it by the supervisors of Kane county for the distance of about one-quarter of a mile, to a point less than one thousand feet south of where the right of way of the Chicago & Northwestern Railway Company crosses the said highway. At this point the managers of the road determined to deflect from the highway, pass under the Northwestern Railway and construct the road over private property from the point indicated to near the terminus of the road, a distance of one mile. Under this arrangement the managers undertook to leave the highway altogether and run over private property along the banks of Fox river, which lies at a distance east of Batavia avenue varying from eight hundred to fifteen hundred feet.

"The railway company, not being able to procure land for right of way from the owners, filed a petition in the district court of Kane county to condemn a strip fifty feet in width and about a mile and a half in length over private property, claiming the right to do so, under 'An act in regard to horse and dummy railroads' (Rev. Stat. Chap. 66), and the Eminent Domain Act. (Rev. Stat. Chap. 47.) Appellees, land owners, appeared, and entered a motion, supported by affidavits to dismiss the petition filed against them. The motion was predicated on the ground that unlimited power was not conferred on railway companies incorporated under the general incorporation act as horse or dummy railroads, but that the power of condemnation which is given by the Horse and Dummy Act is purely ancillary and incidental to the proper purposes of a street railway. Thus it was contended that the power given to condemn might properly be exercised by a street railway when it became necessary to take private property in order to render the use of the highway practicable and efficient,—when, for example, power houses, switches or turn-outs demanded such use, or when some practically insurmountable obstacle necessitated a slight deflection from and return to such highway,—but that it could not be exercised for the purpose of enabling a street railway to cease to be a street railway; that it could not, in other words, be exercised to enable the road to leave the highway over which it had the privilege of going between two points a mile and a quarter apart, and to make for that mile and a quarter an exclusive right of way for itself over the private estates of individuals. On the other hand, the petitioning railway company asserted that right, and claimed that power was given to it by the Horse and Dummy Act to select its route over private property and condemn the lands so selected. The court denied the motion to dismiss the petition."

Appellees excepted, and prepared a bill of exceptions containing the motion and affidavits in its support, which was signed and sealed by the court. Cross-petitions were then filed by appellees, and on a hearing before the court and a jury damages were awarded for the lands taken, and appellees sued out the writ of error upon the hearing of which the opinion above referred to was rendered. The question then presented for our decision was whether this appellant (then defendant in error) had the right, by virtue of the provisions of the act in regard to horse and dummy railroads to exercise the same right of eminent domain as is permitted to railroad companies organized under the Railroad Act. In the following language we held that the right of eminent domain conferred by the Horse and Dummy Act is a limited and not a general right, as was contended by petitioner:

"It is clear that section 2 of the act of 1874 confers power upon a street or horse and dummy railroad company to take private property, but the power is a limited one, as is apparent from the language of the section. It declares: 'When it is necessary for the construction, maintenance or operation of such road, or the necessary sidings, side tracks or appurtenances to take or damage private property, the same may be done.' Giving this language a strict construction, which, under the uniform decisions of this court, must be done, can it be said that defendant in error was at liberty, in the construction of its road, whenever it saw proper to leave the highway upon which it was authorized by the board of supervisors of Kane county to construct its road, and take private property against the will of the owner? We think not. If, in the construction of the road in the highway, difficulties or obstructions were encountered which rendered it impracticable to construct the road in the highway, a necessity might arise, within the meaning of the law, which would authorize the company to leave the highway and go upon private property until the difficulty encountered was overcome, when a return could be made to the highway; or if sufficient land could not be had in the street for side-tracks, turn-outs or stations, and the same were necessary for a successful operation of the road, under the statute the company would have the right to resort to private property. The power conferred by section 2 of the act is not general. It is limited to a case where it becomes necessary to resort to private property, and that necessity must be shown in the peti-

tion to condemn. What is said in 119 N. Y. supra, applies here: 'Section 13 of the act of 1850 allows any corporation organized thereunder to obtain by condemnation such land as is "required for the purpose of its incorporation." The power is not general or unlimited. The company cannot condemn what it pleases, but only such and so much land as the proper execution of its corporate purposes shall require and render necessary.' Here no reason whatever was shown by the petitioner for leaving the highway nor was any evidence introduced on the hearing of the motion to dismiss, showing a necessity for leaving the highway and resorting to private property."

Whether, under this construction of the statute and the facts of the case as they might appear, the company would be entitled to condemn the property taken was there neither considered nor decided. The opinion concluded in these words: "For the error indicated the judgment will be reversed and the cause remanded." The remaining order issued from the clerk's office contained the language, "further proceedings in conformity with this opinion."

The original petition for condemnation alleged, in general terms, that for the construction and maintenance of its railroad it would be necessary for the petitioner to enter upon and appropriate the private property therein described, following substantially the form usually adopted by railroads in condemnation proceedings. Upon the re-instatement of the cause in the circuit court after its reversal and remandment by this court, appellant asked and obtained leave to file amendments to its petition, setting out the facts which it claims constitute the necessity for taking the private property in question. Appellees moved to dismiss the petition as amended averring that by the opinion and mandate of this court filed in the cause the circuit court was required to dismiss the petition, and that by the opinion and mandate the petitioner was precluded from amending its petition and the court from receiving any amendment thereto, and averring further that the facts alleged did not show any necessity for the proposed condemnation. In support of their motion and contention they filed eighteen affidavits from civil engineers and others. In opposition thereto appellant filed affidavits by twenty-seven civil engineers and several others to the effect that the proposed route necessitating the condemnation is the only safe, feasible and practicable one. These affidavits are all the evidence offered by either party on the hearing and determination of the motion to dismiss, and thereupon the court ordered that the petition be dismissed at the petitioner's cost. From that order the appellant now prosecutes this appeal.

Mr. Justice Wilkin delivered the opinion of the court:

This appeal presents three questions: First, were amendments to the petition properly allowed on the reinstatement of the cause after reversal and remandment by this court; second, what interpretation is to be given to the word "necessary," in the Horse and Dummy Railroad Act; and third, has such necessity been shown as will warrant the condemnation of the property in question.

First:—It is strenuously insisted on behalf of appellees that the circuit court erred in permitting appellant to amend its petition on the re-instatement of the case after its reversal and remandment by this court. The rule is well settled that when a decree is reversed and the cause is remanded without specific directions the judgment of the court below is entirely abrogated and the cause then stands in the court below precisely as if no trial had occurred, and the lower court has the same power over the record as it had before its judgment or decree was rendered, and may permit amendments to the pleadings and the introduction of further evidence, so long as the same are not inconsistent with the principles announced in the court of review, and do not introduce grounds that did not exist at the hearing in the court below. (Palmer v. Woods, 149 Ill. 146; Chickering v. Failes, 29 id. 294; Perry v. Burton 126 id. 599; Cable v. Ellis, 120 id. 136; Rush v. Rush, 170 id. 628.) And further, it is well understood that when a cause is reversed and remanded with direction to proceed in conformity to the opinion then filed, and it appears from the opinion that the grounds of reversal are of a character to be obviated by subsequent amendment of the pleadings or the introduction of additional evidence, it is the duty of the trial court to permit the cause to be redocketed and then to permit amendments to be made and evidence to be introduced on the hearing, just as though it was then being heard for the first time. (Washburn & Moen Manf. Co. v. Wire Fence Co., 119 Ill. 30; West v. Douglas, 145 id. 164.) In the opinion heretofore filed the only point in fact decided is, that the petition for condemnation should have stated facts showing the necessity for appropriating the lands in question. This defect was easily cured by amendment, and the circuit court committed no error in allowing the amendment. In fact, it was the duty of that court to permit the amendment and to admit evidence in proof of the facts alleged in the amended petition. It is only when the merits of the controversy and the ultimate rights of the parties are decided in a court of review that a reversal and remandment will deprive the court below of the right to allow amendments to the pleadings and hear other evidence and the authorities cited by counsel for appellees go no farther than this.

Second:—Counsel for appellees contend that the "necessity" required by the statute in relation to horse and dummy railroads, means an "absolute necessity,"—a necessity so great that in the case at bar, if it is physically possible for appellant to construct and maintain its railroad upon the highway there is no right to condemn. We do not think such a strict interpretation should be placed upon the language of the statute. In the former opinion herein referred to we said: "If, in the construction of the road in the highway, difficulties or obstructions were encountered which rendered it *impracticable* to construct the road in the highway, a *necessity* might arise, within the meaning of the law, which would authorize the company to leave the highway and go upon private property." And again: "In the construction of the road, if a necessity existed for making a deflection from the highway in order to avoid a heavy grade which would prevent a successful operation of the road, defendant in error would no doubt have the right to take and condemn private property to obviate the difficulty." The safety, comfort and convenience of the traveling public require protection, and the policy of the state must be to compel railroad companies to so build their roads as to conserve the safety of its citizens to as high a degree as is reasonably attainable in view of the character and exigencies of that mode of transportation. In the construction of the statutes relating to the taking of private property the word "necessary" should be construed to mean "expedient," "reasonably convenient," or "useful to the public," and cannot be limited to an absolute physical necessity. This, we think, was certainly the intention of the legislature when the act was passed. The view here expressed seems to be well supported by the authorities. Hays v. Briggs, 3 Pitts. 504; Comrs. of Parks v. Moesta, 51 N. W. Rep. 903; Pettingill v. Porter, 8 Allen 1; Coates v. Mayor of New York, 7 Cow. 585.

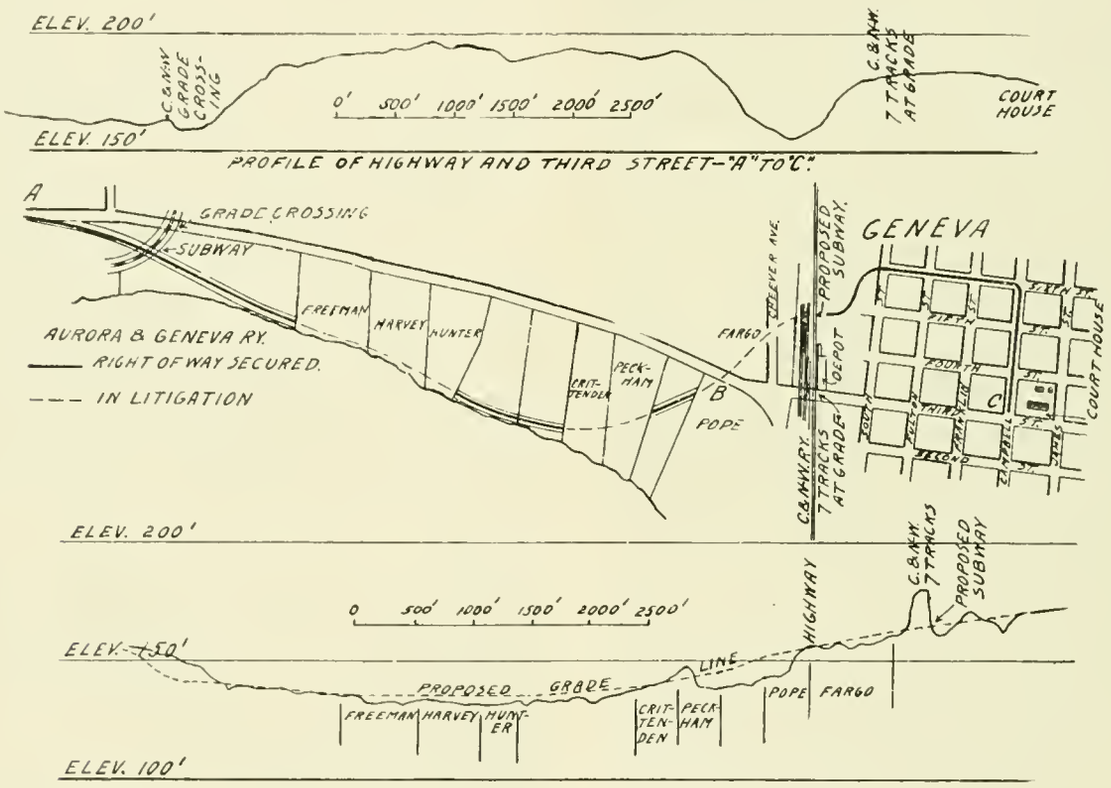
Third:—Keeping in mind the character of the necessity which must be shown to warrant the condemnation of private property by a corporation of this character, has any such necessity been shown to exist here? The evidence adduced on the hearing of the motion to dismiss the petition in the form of affidavits is very voluminous. The following facts are, we think, clearly proved by the petitioner and substantially admitted by appellees:

The Aurora branch of the Chicago & Northwestern Railway crosses the public highway onto private ground at an acute angle on a four per cent curve, and on a grade of 68 to 70 feet to the mile; that the elevation of the outer rail over the inner one, measured in the line of the highway, is five inches; that the railway company runs trains over and across this public highway at a high rate of speed at intervals of not to exceed 30 minutes from six o'clock in the morning until late at night, on each and every day; that from a point on the south side of said crossing it is extremely difficult to see a train coming from the north until it is practically crossing the public highway; that immediately north of this branch crossing of the Chicago & Northwestern, and between it and the main tracks of that company in Geneva, is a hill that rises to the height of 40 feet above the level of appellant's road; that commencing a few feet north of the branch crossing of the Northwestern Railway the hill rises at a gradient of four feet to the hundred feet for a distance of between eight hundred and twelve hundred feet, and then, after a number of sharp undulations, reaches the crest of the hill and then descends the same at a grade of five per cent to the hundred feet for a distance varying from eight hundred to a thousand feet; that the foot of the hill is in a hollow made by a ravine which crosses the public highway at this point and extends to the left of the highway in a northwesterly direction for a long distance, and the Chicago & Northwestern main tracks cross this low depression, made by the ravine, a distance several hundred feet west of the highway in question; that to the right of the highway, at the foot of the hill, the

ravine extends in a southeasterly direction to Fox river; that this depression is only a few hundred feet in width, and the public highway begins to rise at gradients of five or six per cent until it reaches the center of the main tracks or yards of the Chicago & Northwestern railway at this point,—a distance of probably eight hundred feet from the point where appellant in its proposed route crosses the public highway from Fargo' ground onto the premises of appellee Pope; that over the five per cent, eight hundred or one thousand foot grade, on the hill above mentioned, there is heavy foliage, and that at certain seasons of the year the dropping of leaves upon the track would seriously interfere with the operation of a car on the same and would render it dangerous to passengers riding on such car; that this grade upon this part of the hill is made even more dangerous by the character of the macadam, which under the traffic becomes a fine powder, and when moistened by the rain becomes an oily paste on the rails, which would greatly increase the difficulty of controlling the car; that there are seven main and side tracks of the Chicago & Northwestern Railway that cross the public highway at the top of the second elevation, which is reached by a grade of from five to six per cent from the low depression of ground last above mentioned; that the yards of the Chicago & Northwestern railway are over and across the public highway at this last mentioned point, and that freight and passenger trains pass and repass this public highway over said tracks at intervals of every ten or fifteen minutes on each and every day, and that at this point there is much making and unmaking of trains crossing the highway; that the yards of the company are unusually wide, and for the electric road to cross them it would have to cross practically the center of the yards over the highway at this point, and would have to cross these seven railroad tracks with the conditions of making and unmaking of trains and passing and repassing of freight and passenger trains at frequent intervals, as above indicated; that the route proposed by appellant in its amended petition avoids the crossing of the Aurora branch of the Chicago & Northwestern Railway by a subway already constructed by appellant; that it avoids the obstacles and dangers of ascending and descending the hill above mentioned between the Aurora branch and the main tracks of the Northwestern, by skirting around the foot of the hill next to Fox river on almost a perfect level, and, on reaching the public highway, following the ravine up from Fox river; that it extends to the left of the highway and follows the low land made by the ravine over Fargo's property, and escapes the dangers of the grade crossing on the seven main tracks of the Chicago & Northwestern railway by a subway, which appellant proposes to construct at the west extremity of the passenger depot of the Chicago & Northwestern, and then, by easy grades, connects with its Geneva end of the road already constructed to the court house.

In support of their motion to dismiss, appellees filed affidavits of twelve persons, experts in the location, construction and operation of electric railroads such as the appellant is building, only four of whom, however, were familiar with the premises described in the petition. Of these four, the affidavit of William P. Harvey, one of the appellees, his wife being the real party interested, will be quoted at length, as being at least as favorable to the contention of appellees as any of their witnesses. It is as follows:

"I, William P. Harvey, of Geneva, Kane county, Illinois, being duly sworn, on my oath say that I am by profession a civil engineer and was actively engaged in work as such from the year 1886 until the year 1895, and during the last five years of that period my work was in the construction and operation of electric railroads. I have



PLAN AND PROFILES OF HIGHWAY AND OF PROPOSED ROUTE.

made a survey of Batavia avenue at and near the point where the right of way of the Aurora branch of the Chicago & Northwestern Railway Company crosses it, a little north of the point where the proposed route of the petitioner in this proceeding coming northward would leave said highway; and I have also surveyed said Batavia avenue at and near the point within the city limits of Geneva where the proposed route of the petitioner herein would emerge from private grounds and cross said highway. I have also carefully examined without the necessity of a formal survey, the said avenue between the two points at which I made formal surveys as aforesaid. The construction of the petitioner's line in the highway, and crossing the Aurora branch of the Chicago & Northwestern Railway aforesaid at grade and up the hill immediately to the north of that crossing, would involve a gradient to be surmounted of not to exceed three and one-half feet in a hundred, or what is known to engineers as a three and one-half per cent gradient. If it should be considered necessary or desirable to go under the track of the Chicago & Northwestern Railway, this could be done without leaving the highway and without exceeding a four per cent gradient of a total length of about one thousand feet. If it should be found necessary, for any unforeseen reason, to leave the highway for the purpose of going under the track of the Chicago & Northwestern Rail-

way, it would be possible for the line of said petitioner to follow its present contemplated route from where it leaves the highway to the northeast side of the Chicago & Northwestern Railway right of way, from which point it would be possible to return to the said highway, intersecting the east line of the same at a point about three hundred and ten feet north of the center of the Chicago & Northwestern track and continuing on up the before mentioned hill, without exceeding a three and one-half per cent gradient of a total length of about twelve hundred feet. My survey at this point was specially intended to determine what such gradients would be. The construction of the petitioner's line along the highway between the southern city limits of Geneva and the northern end of said highway, which end is at the fork of the roads just south of the main right of way of the Chicago & Northwestern Railway Company, would involve the surmounting of a gradient not greater than five and one-half per cent and about one thousand feet in length, as the highway is at present graded, which percentage, with a little alteration of the road, could be easily reduced to five per cent. This I determined also by actual survey. The highway in the space between the two surveys made by me as aforesaid has none but trifling undulations, none of which would present the difficulty of a grade as great as either of these concerning which I have specially commented in this affidavit."

The other three engineers who examined the premises make substantially the same statements, except that they estimate some of the grades a little higher. The remaining eight affiants on behalf of the appellees confine their statements to the question of the safety and practicability of steep grades, and state that grades of four, five, six seven and even as high as eight per cent are not objectionable and constitute no serious obstacles to the successful operation of an electric railroad, and are not such serious elements of danger as to be worthy of consideration. On the question of grade crossings of electric and steam railways, five of the twelve witnesses concur in the statement that such crossings are always undesirable and ought to be avoided if possible. Two or three witnesses also say, in a general way, that such crossings can be made safe by a system of interlocking switches.

In opposition to the motion to dismiss the petition, appellant filed affidavits of twenty-seven civil and electrical engineers who have had varying experiences extending from seven to forty years,—all men of experience in the location, construction and operation of electric railroads. As in the case with the affidavits offered by appellee they can neither be set out nor specifically noticed within the reasonable scope of an opinion, nor would any good purpose be served by attempting to do so. That of William A. Lynch, whose connection with electric railroads appears to have commenced with their introduction and continued to the present, and who seems to be disinterested and impartial, covers all the questions involved in this branch of the case. After stating his experience with electric railroads he says:

"My attention was first called to the electric railway between Aurora and Geneva three or four years since, and I made an examination of the line, not only between those points, but between Geneva and Elgin, with a view to becoming interested financially in the enterprise, but as nothing was done at the time I did not become interested in the road and have no present interest in it. In going over the line I followed the highway between the points named and made such lateral examinations of the country as suggested themselves to me as I passed along the highway. My attention has been invited to the location of this railway lately, and I have made a somewhat careful examination, so far as seems to be involved in this controversy, at the city of Geneva and extending my observation thence south, first along the highway and then along the line of the company's proposed location over private property. I have also examined the plan and profiles in this case as prepared by the company's engineer. These plans show the plan of the country, with profiles showing the present surface lines both upon the highway and upon the company's location over private property.

"The first question involved in the location is, naturally, the proper exit from Geneva southward. I understand the important point to be reached in Geneva is the court house, and I find that the company has already located and constructed its line beginning at the court house, running on Campbell avenue to Sixth street and thence on Sixth street to South street. Taking this line as the fixed position in Geneva I endeavored to ascertain the most suitable exit from the city to the south. After doing that I somewhat widened my inquiry without having in mind the fixed position in Geneva by tention was called to two suggested lines of outlet, which are the the railway as actually constructed and in that connection my atonly two lines that it seemed possible could be considered other than the company's proposed line of exit. Of these two lines proposed the first is upon Third street, which involves crossing over the tracks of the Chicago & Northwestern Railway very close to its depot at Geneva, and, in fact, involves the crossing of its yards, which are occupied by the main tracks and the side tracks, necessarily much used for switching, making up of trains, station service, etc. There are, as I remember, seven tracks at this street crossing. This line would involve a grade crossing over these tracks. No one who notes the frequent and almost constant use of these tracks can fail to see that a crossing of an electric railway over them would be highly dangerous. As against any other line which could be obtained at any reasonable increase of cost, I have no hesitation in saying that this grade crossing is highly inadmissible, and in my opinion there is no manner in which that crossing could be rendered safe and practicable.

"My attention has been called to affidavits in this case on behalf of the property owners, and noted statements therein that an electric railway crossing at this point could be made safe by the employment of devices, among others, interlocking switches. I am familiar with all forms of interlocking devices in use upon steam and electric railways,—at least I have examined a great many,—and I can say that I do not know of any interlocking device that could be employed at this point that would make this a safe and practicable grade crossing. I know that interlocking devices are used at steam railroad crossings, and can be so constructed and operated as to very much diminish the dangers attendant at such crossings,—in fact, practically prevent them. They can be so constructed at steam crossings as to render it physically impossible for two trains on different railroads to reach or to occupy the crossing at the same time. But that is not the case with any interlocking device in use where electric railways cross steam roads. At such crossings the practice is to lock the electric road against the crossing and to give the steam road the right of way, so to speak. At this crossing it will be seen that it would be impossible to construct interlocking switches which would prevent the engines and trains of the Chicago & Northwestern Railway from reaching and occupying this crossing at the same time with an electric car. I do not mean that it would be physically, but that it would be practically impossible. The introduction of interlocking switches at this point would deprive the railway of the use of its yards, and would cause no end of inconvenience and annoyance in the use of its passenger and freight station. It would be possible to put in interlocking devices so that the electric car would not reach the crossing unless and until some one had gone upon the steam railway or across it, which is the common method, and there operate a device which would permit the electric car to pass upon or over the crossing. This plan has frequently been used so as to insure a man going from the electric car upon and across the steam railroad, being a precaution that the operators of the car are obliged to take in order to get across, and in a very considerable degree lessens the danger at such crossings, but it cannot be said that this would render the crossing absolutely safe. On the contrary there are elements of danger in connection with the crossing of electric cars over steam railroads which even this precaution does not lessen. It is a well known fact that the operation of electric cars requires the transmission of current from some central station, and it is equally well known that the interruption of this current is of frequent occurrence, and takes place constantly from any one of a thousand causes which cannot be wholly prevented, and absolutely without warning notice to those operating the car. It is absolutely instantaneous, and when it takes place the operators of the car are absolutely without power to propel it. This fact introduces or constitutes an element of great danger, and as a steam road always claims and exercises, and must claim and exercise the right of way over a crossing, and does not assume and cannot assume to guard itself or the electric railroad against a danger of this character, the electric car is subject to this danger. This danger of the interruption of the current is increased by a number of tracks, and from the time that is taken in going over the crossing of so many tracks from the first track to the last track.

"There is another danger of some considerable moment which exists from the fact that the crossings of electric railways with steam railroads are apt to be and are somewhat rough,—that is, the car experiences a considerable shaking up, no matter how well constructed; and it is a matter of common observation that in cases where electric cars pass along rough track the trolley is more apt to get off the wire than where the track is smooth, and hence we frequently see that at railroad crossings trolleys do leave the wire, thereby depriving the car of its means of propulsion. This can be prevented, or at least mitigated, by extra care at these points, but the danger cannot be entirely avoided.

"After considering the whole matter of this crossing I desire to express the opinion that I consider it a very unsafe one, and the road should not be constructed thereon if other possible line can be obtained.

"The other means of exit called to my attention by way of First street, under the tracks of the Chicago & Northwestern Railway and thence by Bridge street to the highway leading south of the city. If I understand the situation correctly, this is the only exit from the city to the south available for public travel, except Third street across the seven tracks of the Northwestern, to which I have above referred, making this one of the most important highways, inasmuch as it provides the only route from the city south for the general public. To place an electric railway in this street through this subway under the Northwestern tracks would be to impose a burden upon the traveling public and upon the citizens of Geneva which should not be permitted if there is any possible way to avoid it. This under crossing is not a straight one. On the contrary, a pretty sharp curve occurs in the highway just at that point, and extends to the south where the street swings around into the public highway. The abutments at the subway cut off the view both ways,—that is, the view of a person traveling on the road going south and approaching the subway would be cut off as against an electric car approaching the subway from the south, and vice versa. I would regard the construction of an electric railway along First street, through the subway and along Bridge street as a very serious burden upon the traveling public along the street.

"Leaving the whole question of the exit of the railway from Geneva, I am of the opinion that the location selected by the company is the only proper one and the only feasible and practicable one, having in view the successful operation of the railway, and especially having in view the rights of the traveling public either upon the cars of the company or upon the street.

"There is another railroad crossing a short distance south of Geneva where the highway passes over what is known as the Aurora branch of the Chicago & Northwestern. It is a single track road, which I observed to be in constant use by trains. This crossing is especially dangerous because of the fact that trains approaching the crossing from the west round a sharp curve which cuts off the view, and a person standing at the crossing or near it cannot see approaching trains from that direction. I observed at that point there is a heavy grade upon the steam road, which would be an additional element of danger. While I do not consider this crossing nearly so dangerous as the one in Geneva, I consider it highly objectionable, and if any other way is possible I would say that it ought to be selected, even though it should involve considerable extra cost to the railway. In fact, I may say that while grade crossings are used and are obliged to be used in cities and to some extent in the country, past experience shows that the dangers attendant upon such crossings should be avoided wherever it is possible to do so. In cities ordinarily it is not possible and the danger must be met as well as can be by the employment of care in the use of such crossings; yet we know that it is impossible to expect the employment of care always and under all circumstances, and whatever may be said theoretically about such crossings, we know that practically they are very dangerous.

"Looking over so much of this location beginning at Geneva and going southward, as seems to be involved in this present inquiry, I do not wish to be understood as saying that the grade crossing of the seven tracks at Geneva and the grade crossing of the Aurora branch of the Northwestern alone necessitates the deflection of the location from the highway, but coming now to that portion of the highway lying between those two points the questions involved in the location are very plain. The location in the highway involves the use of a grade of five feet to the hundred, or thereabouts, for some seven hundred feet, and if the grade crossing were to be avoided, and the Bridge street line is also to be avoided, as in my opinion they should be, it further involves the introduction of a curve, with a radius of from one hundred and twenty-five feet to one hundred and fifty feet, just at the foot of this grade. After going over the highway and looking into the matter carefully, I am of the opinion that the only feasible and practicable route between these two points is the one selected by the company. Grades of five per cent are in frequent use upon electric railways. I am operating a railway with heavier grades than that, but their use is very dangerous, especially under certain conditions of the track, generally dependent upon the state of the weather. A grade of that kind, in and of itself, is a very objectionable part of an electric railway. No system of brakes has yet been introduced which will absolutely prevent a car from sliding upon such a grade. While this sliding often happens without causing injury, yet it is liable to result in serious injury, and frequently does so. But with the introduction of a sharp curve at the bottom of such a grade the danger is greatly increased. If a car should get beyond control on such a grade, (as might often happen and does often happen, owing to the failure of the brakes to act, or, in acting their failure to hold the car, and owing to the failure of the current and inability to reverse the car, or, even if all should work properly the car, under certain conditions, might easily and often does slide) it would leave the track at the curve. The surface of the ground at this point is broken by a ravine and the sliding of a car down that grade and its leaving the curve would doubtless precipitate it into the ravine and cause serious damage. It seems to me that the location of this grade, with a curve at the foot, under the conditions existing at this point, makes that location inadmissible.

"I have examined the two proposed locations,—the one proposed by the railway company over private grounds, avoiding the two railway crossings, and the other along the highway,—and looking at the question, considering the effect upon the owners of private property, and also with reference to the convenience and safety of the public using the highway, and the convenience and safety of the public using the electric railway, I have come to the conclusion that the line proposed by the railway over private property is the only proper and practicable location from these different points of view. The gradients are excellent. No sharp curves are involved. It will be entirely safe and free from avoidable danger."

The statements made by this witness are fully and repeatedly corroborated in the affidavits of the other twenty-six witnesses for appellant, half of whom, at least, have made actual inspection of the premises and the others have familiarized themselves with the location by the examination of the map and profile in evidence, the correctness of which is not disputed. On the question of excessive gradients and grade crossings of electric and steam railroads the witnesses on behalf of appellant are unanimous in their condemnation of both when they can possibly be avoided, and the evidence as to the dangerous character of grade crossings is corroborated by five of the witnesses for appellees. The evidence of expert witnesses is always more or less argumentative,—perhaps more so when, as in this case, it is given in the form of ex parte affidavits; but from the facts stated and the opinions given by all the witnesses it is impossible to escape the conclusion that by the clear preponderance of the evidence such a necessity for the condemnation of private property by street car companies as is contemplated by the statute has been established by the petitioner in this case.

The point is made by counsel for appellees that even if a necessity for the departure from the highway has been shown, it does not appear that a return thereto cannot be made, and thereby the condemnation of at least a part of the land in question be avoided. With the legal ground of the proposition we fully agree. That is to say, if under our construction of the statute a necessity for departing from public streets or roads arises in the construction of street railways, a return to the public highway must be made as soon as the same can be practicably done. The facts in this case, however, show that a return to the highway was impracticable, and we are unable to agree with counsel in the contention that the evidence fails to show that a return to the public highway, after leaving it could not reasonably be made.

We are of the opinion that under the evidence in this case the petitioner below, appellant here, established its right, under the law, to condemn the property sought to be taken, as described in its petition and that the circuit court erred in its judgment denying it that relief. That judgment will accordingly be reversed and the cause

will again be remanded, with directions to proceed in conformity with the views herein expressed.

Reversed and remanded.

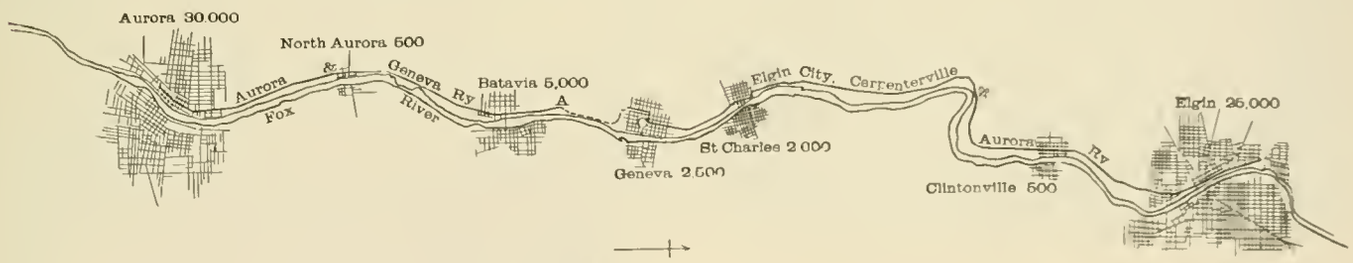
Mr. Justice Magruder: I dissent from this opinion in toto—both the reasoning of the opinion and the conclusion reached by it.

The success which has finally crowned the efforts of the Aurora & Geneva Railway Company in its endeavor to condemn a right of way through private property in order to enter Geneva by a safe and practicable route, is greatly due to the perseverance and energy of D. A. Belden, general manager of the company. From an examination of the map of the portion of the right of way in dispute it is easily seen that it was good business policy for the company to engage in a long and expensive legal contest. The work necessary in preparing the case has fallen largely upon Mr. Belden and he as well as his road deserves the thanks of all the many street railway men whose own projects will be greatly aided by this important decision.

D. A. BELDEN.

Mr. Belden entered the employ of the Aurora Street Railway Company in 1891 as assistant secretary and treasurer; a year later he was appointed manager and on the organization of the Aurora & Geneva Railway Company became manager of it also. In the latter capacity Mr. Belden secured the necessary franchises and right of way, and built the road; no part of the work was let. The numerous extensions of the Aurora Street Railway made since 1891 have been in his charge.

The sketch showing the towns, with their respective populations, in the Fox river valley will make clear the importance of the short section of the Aurora & Geneva line which has been in litigation. This road which is owned by the same parties as is the Aurora line, and really a branch of the latter, runs from Aurora through North Aurora and Batavia to the point A and in Geneva to the court house, marked C on the map. At the point C it connects with the Elgin City, Carpentersville & Aurora Railway running through St. Charles and Clintonville to Elgin. The portion of the road which is uncompleted because of this litigation is indicated by the dotted line beginning at A.



INTERURBAN LINES IN THE FOX RIVER VALLEY.

ELECTRIC BOARD FOR BUFFALO.

A bill has been introduced in the New York legislature providing for a Buffalo Board of Electricity Commissioners, to regulate the wiring in that city and prevent the employment of incompetent men in such work. One member is to be a practical wireman of at least six years' experience, one a member of the Board of Fire Underwriters, and the third an electrical engineer of good repute.

A motorman in Providence, R. I., was arrested last month for running his car faster than six miles per hour, the limit by ordinance; in taking a switch the conductor was thrown from the car and injured which was the reason for the question of speed (if it really was too high) being raised.

ALUMINUM VS. COPPER FOR ELECTRICAL CONDUCTORS.

The production of copper in the United States during the past year amounted to 546,367,000 lbs., valued at $64,000,000. This output exceeded that of any other year, and the value of the product was greater than that of any other metal except iron. With such great mines as those in the upper peninsula in Michigan, from which the pure lake copper is taken in its native state, those in the Anaconda district of Montana and those in Arizona, it is hard to realize that there could be any scarcity. The Lake Superior mines produced 158,233,000 lbs. of copper last year, but it requires much time, money and labor to develop them, and the output of this district cannot respond quickly to any enhanced demand. The Arizona district has doubled its output in three years, and during 1899 will likely produce 75,000 tons of copper. About two-thirds of the copper supply of the world comes from the United States.

Yet this enormous production is inadequate to the demand occasioned by an increase in all lines of electric industry during the past year, so that copper quotations have steadily increased. The European demand has for some time past been extraordinary, and with an expanding consumption in the United States, this condition has been brought about. The stock, particularly in Europe, has been slowly decreasing, and the price has risen 30 per cent in the last three months. Recently copper was sold as high as $365 a ton in England and Scotland, and in New York copper is quoted at 17 cents per lb.; compared with 11 cents a year ago, this is an increase of over 50 per cent. Apparently this advance is only partly due to speculation and largely to a very great consumption at home and abroad, much in excess of the production.

It is a serious problem to users of copper to know if there is any means of relief from such a rising market. The street railway companies are among the largest purchasers, for copper is employed in nearly every part of their equipments. The rise of 50 per cent has enormously increased the cost of trolley wire, feeders, bonds and affects motors, generators and fittings in the power station and on the cars. There is but one metal which can be economically substituted for copper for conducting electric currents, and that is aluminum. With the present price of copper, aluminum seems to have a decided advantage as far as cost is concerned, except, perhaps, where the wire has to be covered with insulation.

Copper has a specific gravity of 8.93 and a tensile strength of 16,500 lbs. per sq. in. when pure, but for commercial work it has a purity of about 98 per cent, and in the form of hard drawn copper wire has a tensile strength of 65,000 lbs. Aluminum has a specific gravity of 2.68, a tensile strength of 26,000 lbs. in pure soft wire and 40,000 lbs. per sq. in. in the form of hard drawn wire. According to the above copper is 3.332 times as heavy as aluminum, volume for volume. A series of careful experiments, made by E. F. Northrup, upon the relative conductivity of the two metals showed aluminum to have 61.5 per cent of the conductivity of copper. To compare the costs of the two metals we may use the expression $gCp \div GcP = 1$, where g, c and p are specific gravity, conductivity and price, respectively of copper, and G, C and P for aluminum. Substituting the values given above we get $(8.93 \times 61.5 \times 17) \div (2.68 \times 100 \times P) = 1$. From this the cost of aluminum of equal conducting power would be 34.83 cents per lb. to correspond with copper at 17 cents. The Pittsburg Reduction Company has stated that it will sell rods, bars, plates and wire drawn not less than No. 12 B & S in large special orders for electrical conductors at 29 cents per lb., and guarantee the conductivity higher than that given above. This is equivalent to copper at 14.14 cents per lb.

Properly drawn aluminum wire is as tough, and will stand bending as severely without breaking, as soft copper wire. On account of having but 48 per cent of the weight and 60 per cent greater cross section than copper wire, longer spans can be constructed between poles and insulators. The following table gives the comparative area, diameter and gages of equivalent copper and aluminum wires:

Sizes of Copper Wire.			Sizes of Aluminum Wire Having Equal Electrical Conductivity		
B & S Gauge	Size Each Number Diameter Inches.	Area Square Inches.	Area Square Inches.	Size Each Number Diameter Inches	Nearest B & S Gauge.

One of the chief drawbacks to the use of aluminum is the difficulty of soldering or brazing, which is on account of the high heat conductivity and the surface of the metal cannot be cleaned with ordinary soldering salts. There is a thin film of oxide over the surface which prevents the solder from amalgamating with the aluminum, but this can be removed by scraping or by a solution composed of one part hydrofluoric acid, 10 parts nitric acid and 50 parts water. Soldering is a much more difficult and slow operation than with copper, but the facility with which it can be done depends very much on the skill of the workman. At best the soldered joints are not strong and are subject to electrolysis.

Several forms of mechanical joints have been successful; perhaps the most satisfactory form consists of thin aluminum sheets being wrapped and twisted about the joint, which can be left smooth on the outside when desired and can be made stronger than the body of the conductor. Another method of making joints is to roll a thin aluminum sheet about 6 in. wide into two cylinders from opposite edges of the sheet and the ends of the wires are joined by inserting them in the cylinders from opposite ends, and both the wire and sheet twisted with pliers until a firm joint is secured which is strong and impervious to air and water.

In reference to the general use of aluminum for electrical conductors, A. E. Hunt, president of the Pittsburg Reduction Company, the largest manufacturers in the world, writes:

"Aluminum has been used very largely for electrical conductors for some time past. The Pittsburg Reduction Company has had 10,000 h. p. of electrical current transmitted over an aluminum line for the last two years. The Niagara Falls Hydraulic Power & Manufacturing Company has a considerable amount of this material about its plant at the lower works of the Pittsburg Reduction Company. We have furnished some 80 miles of aluminum wire for electrical conductors at Snoqualmie Falls, for the transmission of power from the falls to Seattle and Tacoma. We have furnished the Standard Electric Company, of California, with a considerable amount of wire for electrical conductors; also the Pennsylvania Railroad Company with some aluminum wire, and have very satisfactory reports regarding it from the superintendent of telegraph.

"The following is a copy of a letter received some time ago from D. H. Fitch, manager of the telephone exchange, Cazenovia:

"'In regard to the further use of aluminum wire, I shall have need of a little for special work this spring. All thus far has served its purpose splendidly. I was a little apprehensive of the last, on account of being so soft, but it has stood the storms thus far without the least impairment. The last wire put up had about 450 ft. spans. The long span (nearly 600 ft.) has now stood through two winters and is in perfect condition—just where I put it—and has not stretched or sagged. I have an inquiry from Canada, which I herewith enclose. I have said to him that my use of aluminum is most satisfactory, and if I had this exchange to build today, I would use aluminum wholly for line work.'

"We have furnished the Bell Telephone Company with aluminum conductors for foreign business; also have furnished considerable aluminum for conductors in Japan and other foreign countries.

"We are not recommending aluminum for electrical conductors where it is necessary that the material should be soldered, but we are now arranging for suitable joints which will entirely avoid the use of solder to give satisfactory lines.

"We are now putting in two 14-in. and four 10-in. mills, with two continuous drawing benches, so as to draw aluminum wire as cheaply as copper wire is drawn, and we shall have as large facilities as any mill in the country for doing this work.

"We intend in the future to be in the market with aluminum wire as against copper, although there are many places where we will not compete with copper where insulated covering and soldering are necessary, as in switchboard work.

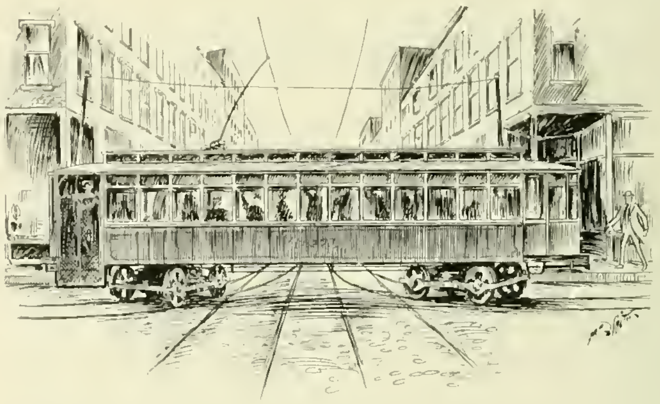
"We do not mean to claim that aluminum is to replace copper by any means, but what we maintain is that a large amount of work can be done with aluminum as well as copper, and this we shall endeavor to secure. We can furnish aluminum at a price to make it cheaper than copper, for many purposes. It is our intention to later on push for the street railway business."

SHALL MOTORMEN BE EXAMINED BY THE STATE.

A bill providing for the compulsory examination of all street railway motormen now pending in the Michigan legislature is severely criticised by managers on the ground that it requires that the motorman have a knowledge of the apparatus he uses which is entirely unnecessary and may (because a little knowledge is dangerous) prove a real disadvantage to the company. As one manager put it, the experienced motorman knows about as much of the inside workings of his motor as does the business man about his watch, and has about the same need of such knowledge. Companies do not give men charge of cars until they are competent to handle them.

THIS CAR WAS FOR EXPANSION.

A rather unusual incident in street railroading is reported from a western city. The corner of A and B streets is a junction point, and interurban cars leave B street at this corner, turning to the left into



A street. On February 15 the switch point slipped after the forward truck had safely taken the curve to the left, and when the rear truck reached it the switch was set for the right hand curve with the result that the car soon reached the position shown in the accompanying sketch. Of course no damage was done and after a few minutes' delay the car was sent on its way.

OWNER OF WAGON PAYS FOR COLLISION.

Some time ago a car of the Atlanta (Ga.) Railway Company was run into by a team and wagon, and one of the horses struck an employe of the company who was on the front platform, though not on duty at the time. The employe was severely injured and sued the owners of the wagon for damages sustained. The case was tried last month and the injured man given a verdict for $250. This is an unusual result from a collision in which a street car plays a part.

Pleasure Resorts in 1899.

Plans of Street Railways for the Entertainment of Patrons During the Coming Season—New Features in the Way of Attractions—Amusement Circuits—Vapor Launches for Lakes.

At all the meetings and conventions of street railway operating officers since last summer there have been discussions as to the advisability of providing amusements of various kinds. The advice in nearly all instances was that very expensive attractions should be avoided. Companies which introduced grand opera and other high class music, and elaborate special exhibitions found them expensive experiments. Vaudeville performances, to which a small charge is made, are by all odds the best paying entertainments at the theaters. Band concerts, generally given by a local brass band, with a liberal share of purely popular airs on the programs, also draw a large patronage. The late war furnished many ideas for marine and

CELERON PARK—JAMESTOWN STREET RAILWAY, JAMESTOWN, N. Y.

pyrotechnic displays which drew enormous crowds to many parks, and these will doubtless be even more popular this coming summer. One novelty of this year will be golf links which may be a drawing card in some localities which have the golf craze. A number of companies find that zoological gardens on a small scale are popular and deservingly so.

The summer resorts are generally being improved for this coming season and many new ones laid out at great expense. A large number of street railways having fine parks are publishing pamphlets and booklets handsomely illustrated with half tone views in the parks and along the routes. These are distributed throughout the city and adjoining territory. They are placed in racks or handed out in the railroad stations and hotels so that the attention of strangers in the city will be called to this means of recreation; also mailed to clubs, orders, societies, Sunday schools and other church organizations which generally give annual picnics. By this means pleasure travel is increased to a marked degree. The street railway companies are performing a service in the various cities where they maintain parks which is of incalculable value and this good work is being appreciated. In some of the larger cities the street railway resorts rival the municipal parks in area and beauty, and in many of the cities of secondary importance the companies have provided the only breathing spots and pleasure grounds.

JAMESTOWN, N. Y.

Jamestown is admirably situated for summer attractions, being at the outlet of Chautauqua Lake, and it is but natural that the Jamestown Street Railway Company should have one of the finest parks in New York. Celeron park includes a zoological garden with bear pits and a monkey house, a gravity railway, bowling alleys, a Moorish palace, shooting galleries, a miniature railway with 12 coaches, a water toboggan the end of which is shown in one of the views, the Phoenix wheel which was modeled after the Ferris wheel and exhibited at the Atlanta Exposition, and a cycle boat which affords a unique way of enjoying the lake. There are tables and seats for picnic parties, swings and sand piles for the children. In the afternoons and evenings open air band concerts are given free of charge and on special occasions there are fireworks and balloon ascensions. The auditorium and convention hall is an enormous building having a seating capacity of 8,500; in summer dances are given in the building and in the winter it becomes a skating rink. The Celeron theater is a handsome building holding 2,000 people. During this season the attractions will be the Tommy Shearer Repertory Company, Barlow Minstrels, Waite's Comic Opera Company, "The Spooners" and high class vaudeville. The company will erect several new buildings for concessions and will build quarters for the water animals. General Manager Maltby states that all the attractions were very successful last year.

ASHLAND, KY.

The special exhibitions at Clyffeside park which is owned and managed by the Ashland & Catlettsburg Street Railway Company have been described and illustrated in the REVIEW. There are swings, trapeze, croquet, see-saws, facilities for boating and vaudeville for the pleasure of the patrons. The company has found the park a profitable investment. The refreshment privileges are rented and an entrance fee of 10 cents is charged visitors who are not pas-

sengers. Picnics and conventions are found to be very desirable and this coming season there will be an encampment of the State College cadets in the park. President Ringo says that the company expects to build a casino this season.

BIRMINGHAM, ALA.

One of the most progressive companies in the pleasure resort business is the Birmingham Railway & Electric Company. General Manager J. B. McClary writes: "We have been running parks and park attractions several years with great success. The STREET RAILWAY REVIEW is the cause of this, having drummed this idea into street railway manager's heads for several years. We acted on your suggestion and won." Boating, bathing, fishing, merry-go-rounds, side shows and band concerts on Sunday draw large crowds. Everything is under the management of the company and no admission is charged. Last season theatrical performances drew crowded houses every night when the weather was good, and for such entertainments a fee of 10 cents is charged. A contract has been signed for vaudeville, drama, specialties and other attractions of the "roof garden" nature for 14 weeks of the season beginning May 29 and extending to September 3, with the Southern Amusement Syndicate. The agreement is in part as follows, the syndicate being the party of the first part and the street railway company the second party:

"Said party of the second part agrees to furnish for theatrical attractions or companies of the Southern Amusement Syndicate for the above time the.....lighted, heated, cleansed and licensed; attaches to work front theater and stage, usual orchestra and advertising in daily papers, tickets and ticket sellers, bill posters and distributers, currents for all electrical effects; to furnish the resources of the theater in scenery, set stuff, furniture and appointments and imperishable property, and to furnish transportation to and from theater to members of companies; employes of theater to assist in carrying scenery and baggage to and from stage door and to the stage and dressing rooms, and deliver same outside of the stage door immediately after the last performance of each company.

"Said party of the first part agrees to furnish full acting companies to faithfully perform at the above theater from time to time, for the above stated periods, and will not allow said company to appear previously at any other place of amusement in said city during the continuation of this contract, furnishing entire stage entertainment, and to conform to rules and regulations governing said place of amusement.

"For the faithful observance and fulfillment, by said party of the first part, of each and all of the above conditions, the said party of the second part agrees to pay him, or his representatives, the sum resulting from the following terms: The receipts from all ticket sales, cash collections at the door, and....per cent of all excess fares, for the six days of each week.

"Prices of admission to be fixed by party of the first part.

"It is further agreed, that for the mutual interests of parties of the first part and second part, and the honest and faithful fulfillment of this contract, that party of the first part shall furnish good and legitimate attractions for the amusement of the public, and the party of the second part will furnish such transportation facilities as the public may demand for the comfortable transportation of passengers to and from said place of amusement."

This contract is altered to suit conditions and in this case the company pays salaries and does not work on the percentage plan.

DULUTH, MINN.

The Duluth Street Railway Company rents its park together with all the concessions, and admission is free to everyone, no distinction being made between passengers and others except when theatrical entertainments are given. The park is finely situated on a bluff, access to which is gained by an inclined railway. No decision has yet been reached for the line of attractions this season.

SENECA FALLS, N. Y.

The Geneva, Waterloo, Seneca Falls & Cayuga Lake Traction Company manages Cayuga Lake park but has rented the cafe, refreshment and merry-go-round privileges, the latter on the percentage plan. No admission either to the park or entertainments is charged to passengers, but other visitors pay, and some revenue is derived from bicycle riders by a charge for checking wheels and 10 cents admission to the entertainments. Passengers are given tickets to the theater. The vaudeville performances are conducted on a stage on the lake about 50 ft. from the shore, the pavilion being the only place from which a good view can be obtained. The attractions last year were quite profitable and the prospects for this season are very favorable, a number of picnics and conventions having already been booked. There are good facilities for bathing, fishing and boating and for the latter the company owns and rents 25 row boats.

MT. VERNON, O.

Mt. Vernon is a prosperous Ohio city located in the Kokosing valley, 45 miles northeast of Columbus. By a ride of 2½ miles on the park cars of the Mt. Vernon Street Railway Company a passenger arrives at the entrance of Lake Hiawatha Park. The resort covers a track of 50 acres which is naturally very beautiful but it has been made more attractive by landscape gardening, the arrangement of artistic floral designs, broad lawns, terraces, and fine walks and roadways. The rustic architecture of the improvements such as bridges, seats and shelters of various kinds is very artistic. Lake Hiawatha, which gives the park its name, is a pretty sheet of water fed by springs and wells from which the water is pumped by electric power. The outlet to the lake is by the falls of Minnehaha partially shown in the illustration. There is a boat house on the lake shore and a large number of row boats which are rented by the company. A bath house having 20 apartments is nearby and spring boards, swings, water toboggan and marine trolley are provided for the enjoyment of a swim or plunge in the lake. Besides the summer sports there is fine skating on the lake in winter. The company encircles the lake with arc lamps and provides band music during the skating season and large crowds are attracted to enjoy the healthful exercise.

A baseball diamond, tennis courts, croquet grounds and a half-mile bicycle track have been laid out and three bowling alleys built for the pleasure of athletically inclined visitors and not infrequently contests in these sports are held. Besides a merry-go-round there is a pony livery to cater to the tastes of the children. The building, together with a number of little ones about to take a ride, is shown in the illustration. Another view is of a little rustic shelter and the Dairy Kitchen where ice cream, soda water, cigars, candy and dainty lunches are served. The company has built an auditorium, 80 by 100 ft., with a seating capacity of 3,000. A stage with suitable scenery is also provided, so that all kinds of theatrical and musical entertainments, conventions and large meetings of all kinds can be held.

The park "Zoo" is one of the notable features. The bears are confined in a combined pit and cage built of iron and stone. The deer are in a two-acre wire enclosure with a log barn for winter-quarters; there is a prairie dog village, a den of foxes, beavers, several coons, coyotes, alligators, monkeys, badgers, wild cats, mountain lions, minks, gophers, golden eagles, owls and ground hogs on exhibition.

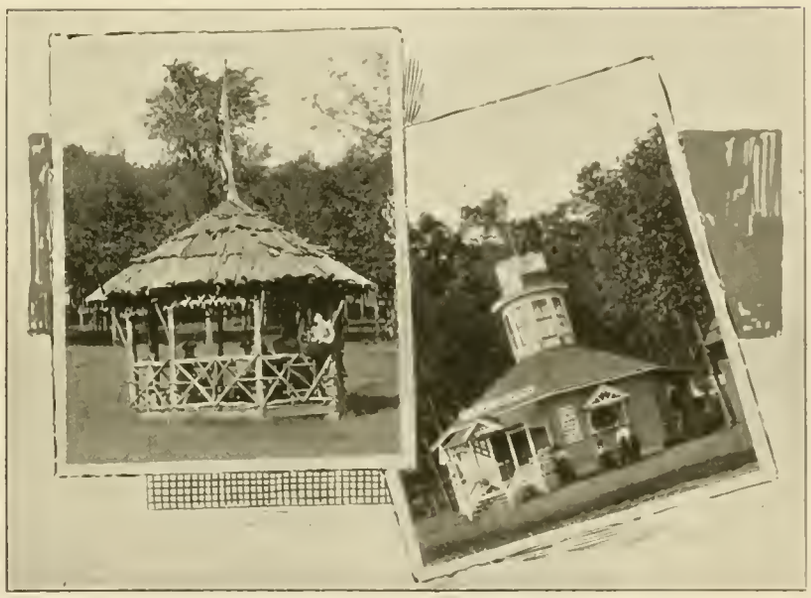
One feature which is rather unusual in a street railway park is the summer cottage. There are a number of them, each bearing an Indian name as Mackinac, Cheyenne, Kaw, Minnehaha, etc., and overlooking Lake Hiawatha. These cottages are finished in hard wood, the floors covered with Japanese mattings, and furnished ready for occupancy except bedding, linen and towels. A cottage may be rented for $6.50 a week or $20 a month. Adjoining the cottages is a dining hall where meals can be purchased for 25 cents or board at $4.50 per week. There are telephone and telegraph connections at the park, two free mail deliveries to the cottagers daily, and the park has its own complete system of water works and electric lighting. No intoxicating liquors are sold or permitted to be brought upon the grounds and the boat house and all places of amusement are closed on Sunday. In event of rain the buildings in the park will shelter 10,000 people, or the entire population of Mt. Vernon.

The park is owned and managed by the company. For four seasons theatrical entertainments, principally vaudeville, have been given and an entrance fee of 5 cents is charged. Secretary D. K. Bird states that the results have been satisfactory, and that many picnics from out of town come to the park.

KANKAKEE, ILL.

The Kankakee Electric Railway Company rents a park in which it has built a theater, boat and bath houses and a pavilion for

THE CASCADE—MT. VERNON STREET RAILWAY PARK.



PAVILION. DAIRY KITCHEN.

THE PONY LIVERY—MT. VERNON STREET RAILWAY PARK.

dancing. During the summer dramatic productions are given by a stock company six nights in the week. An admission of 10 cents is charged to all but no bicycles are allowed on the grounds. Picnics and conventions are profitable and the company solicits this patronage.

DETROIT, MICH.

In Detroit there are no street railway park attractions. The Detroit Electric Railway Company formerly maintained the Boulevard park, but this was abandoned two years ago and since then no effort has been made to stimulate traffic by this means. Thousands, however, use the cars to reach Belle Isle, the city park on an island in the Detroit river.

SEDALIA, MO.

The Sedalia Electric & Railway Company owns and manages its park and has already built a theater, shoot-the-chutes, boat and bath houses and will erect two pavilions this year. Large crowds attended the performances last year. An entrance fee of 5 cents is charged to others than passengers.

SHEBOYGAN, WIS.

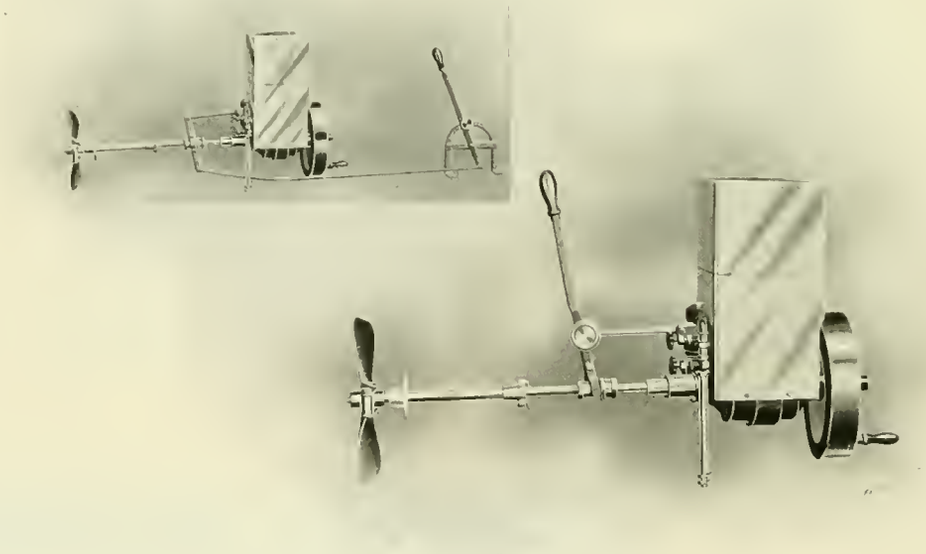
The Sheboygan Light, Power & Railway Company owns and manages its park which is free to its patrons, but 5 cents admission is charged to others. There is every facility for boating, bathing and fishing, a large pavilion for dancing and picnic parties; a fine summer hotel is also on the grounds. Entertainments are given in the theater three nights a week for 14 weeks during the summer as well as band concerts on certain occasions. For four years the company has maintained a menagerie in connection with the park and it is liberally patronized and no special effort is made to secure picnics and other large gatherings.

FT. WAYNE, IND.

The Ft. Wayne Consolidated Railway Company owns and manages Robinson Park, letting only the refreshment and boating privileges. The park is free to passengers, 10 cents being charged to others. The park has facilities for boating and bathing, merry-go-rounds, a theater and other popular attractions; all the buildings have been constructed by the company. Vaudeville shows proved very successful last year. For this season the new attractions will be a bicycle track and a zoological garden.

PITTSBURG, PA.

The Monongahela Traction Company has purchased a 150-acre tract on the west bank of the Monongahela river opposite Braddock, Pa., and will improve it as a first class summer resort. It is alongside one of the company's lines from Homestead to McKeesport, and is 12 miles from Pittsburg, five from McKeesport, and two from Homestead and Duquesne. A summer theater is to be built, a dancing pavilion 72 by 100 ft. encircled by a 20-ft. promenade, a club house bowling alleys, a band stand and a large dining hall with kitchen. A baseball diamond, tennis courts, a bicycle track and perhaps a race track will be laid out for summer sports. Excavations will be made for a lake 500 by 600 ft. which will be fed by large springs on the grounds. The outlet will be by a waterfall into the river. On top of the hill two observatories are to be constructed overlooking the river 1,200 ft. below. A contract has already been closed for a brass band to furnish music for the entire season from May 30 to September 30. The work is being rushed with vigor so that it may be opened on Decoration day. It will be known as Kennywood Park.



TRUSCOTT MOTORS AND PROPELLERS.

the result has been very satisfactory. The new feature for this year will be a golf link.

NEW HAVEN, CONN.

The Winchester Avenue Railroad Company has found by experience that the best plan is to lease the entire park with concessions to one party, the company only retaining the right to exercise control of the character and conduct of the place and amusements, also the privilege of presenting vaudeville and theatrical entertainments. All the buildings and improvements were built by the company. No entrance fee is charged to anyone, but wheelmen are compelled to check their wheels before entering the grounds, at two large stands accommodating 700 bicycles; the charge for checking is 5 cents. The chief attractions are band concerts every afternoon and evening, the electric fountain and fireworks at least once a week. As this is the only resort of its kind in a city of 100,000 inhabitants

OTTAWA, CANADA.

After comparing the results of managing its own resort in 1897 and leasing it in 1898, the Ottawa Electric Company will manage its park this coming season with the exception of the refreshment rooms in the auditorium, which will be rented. Admission to the park is free to all, but seats in the auditorium during vaudeville entertainments are 10, 15 and 25 cents. Swings and merry-go-rounds add to the attractions of the grounds, especially for picnics, which were found particularly profitable last year.

HOLYOKE, MASS.

The Holyoke Street Railway Company owns and manages the celebrated "Mountain Park" which covers 400 acres. In addition

to the beautiful scenery, shady nooks and pleasure grounds there are look-out towers, the deer park, open air stage, merry-go-round and gravity railway all of which were constructed by the company. Good vaudeville performances will be given for 14 weeks beginning with June 15. The charge is 5 cents for a seat to such attractions and last year the results from such attractions were very satisfactory. The company employs a manager for the park whose duty it is to book desirable attractions and entertainments. Picnics and conventions at the park have not proved particularly advantageous to the company. The restaurant privileges only are rented. Admission to the park is free to all, but a charge of 5 cents is made for checking wheels.

TRUSCOTT VAPOR LAUNCH.

Some bright young man observed that all cities are located on or near a body of water; the same individual, had he been making observations today, would have noted that street railway parks are similarly situated. Boating either by launch or row boat is one of the great attractions for any resort, but the majority of pleasure seekers do not care for the vigorous exercise of rowing. Where a light draught, mechanically propelled and easily handled boat can be secured it proves a great drawing card. One of the illustrations shows a boat which is admirably suited for such work. It is 40 ft. long, 9 ft. beam and draws only 28 in. of water when loaded to its capacity. There were 36 passengers crowded to one side of the boat to get a place in the picture. This same boat has carried 70 persons at a speed of nine miles an hour with an equipment of 8 h. p. of machinery. This type of launch can be procured from a row boat size 16 ft. in length to a 60-ft. cruising yacht. Considering the kind and popularity of the service and the capacity for carrying passengers they are not expensive. The Columbus Street Railway Company has had a 20-ft. launch of this kind in Olentangy park and was so well pleased with the results that it ordered in addition a 30-ft. vapor launch which is called the "Wyandotte."

The boat can be finished in any style with any kind of power, but the builder, the Truscott Boat Manufacturing Company, of St. Joseph, Mich., has developed a vapor motor or engine which experience has taught is best adapted to the work. Another illustration shows the motor, propeller wheel and shaft with reversing gear. The motor sets far back in the stern of the boat and is easily controlled; in fact, by reversing the motor the boat can be stopped within its length. In the bow of the boat is a tank of gasoline which is carried through a brass tube in vapor form to the motor. It requires about one pint of gasoline per h. p.-hour, and the tank is of sufficient size to run the boat about 400 miles. The exhaust which escapes under the after deck is muffled. Water is circulated about the cylinder and cylinder heads for cooling purposes. An aluminum jacket completely covers the motor and it is impossible to catch clothing or throw oil or grease. The motor is the acme of simplicity, absolutely safe and requires no licensed pilot or engineer to operate it. There is nothing about it which can easily get out of order and so simple a child can operate it.

WORKING AGREEMENT IN MILWAUKEE.

The Milwaukee, Racine & Kenosha Electric Railway Company has always operated its cars over the tracks of the Milwaukee Electric Railway & Light Company from South Milwaukee to the city hall terminus, and its employes were under the jurisdiction of the latter company when in the city limits. This arrangement has been unsatisfactory in some respects, and a new agreement was made, taking effect March 1, under which the Milwaukee Company has responsible control of the operation of the entire interurban line, though the ownership of that line is not changed. It is the intention to have a terminal superintendent of the Milwaukee Company at Racine, as it has for the Waukesha line.

This agreement with the Milwaukee, Racine & Kenosha is another step in the establishment of an electric railway system that will connect with Milwaukee the cities of Oconomowoc, Fond du Lac, Oshkosh, Neenah, Appleton, Kaukauna, De Pere, Green Bay, to the west and north, and Kenosha, and eventually Chicago at the south.

CHICAGO CONSOLIDATED TRACTION COMPANY.

The Chicago Consolidated Traction Company has been incorporated with a capital of $15,000,000, for the purpose of effecting the consolidation of the outlying Yerkes roads in Chicago, as recommended in Mr. Yerkes' annual report. There are nine companies which it is proposed to consolidate. They are as follows: North Chicago Electric Railway, Cicero & Proviso Street Railway, Chicago North Shore Street Railway, Chicago Electric Transit, North Side Electric Street Railway, Evanston Electric Railway, Chicago & Jefferson Urban Transit, Ogden Street Railroad and Suburban Railroad. The aggregate capital is $13,900,000, and the bonds $8,061,000. These companies have over 260 miles of track.

At the annual meeting of the Citizens' Passenger Railway, one of the Norristown, Pa., street railway properties operated by the Schuylkill Valley Traction Company, a dividend of 3 per cent was declared on the stock. This action was something of a surprise, as the stock has recently sold as low as $8 per $50-share.

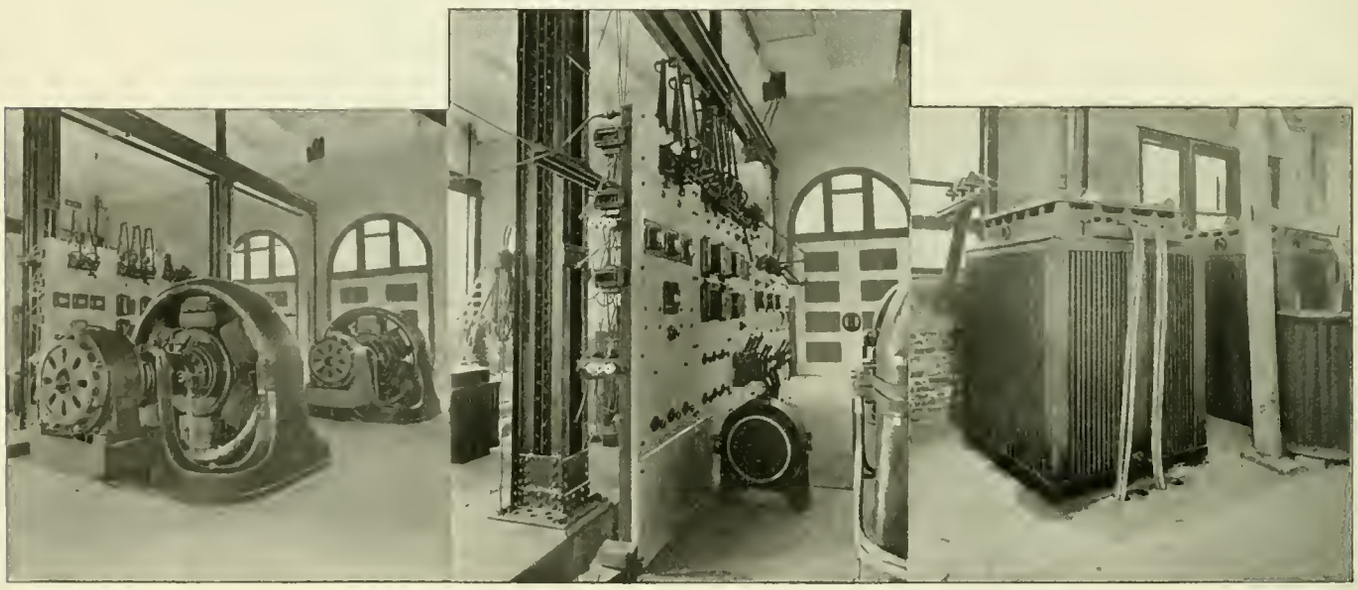
NEW TRANSFORMER STATION AT TONAWANDA.

The recently organized Tonawanda (N. Y.) Cataract Power Company has completed its new transformer station on Robinson street, in North Tonawanda, and current is now supplied from the apparatus there installed. This company was organized for the purpose of acting as distributing agent for Niagara power in the town of Wheatfield, and the city of North Tonawanda, Niagara County, and in the town of Tonawanda and village of Tonawanda, Erie County. The erection and operation of this station has made it possible to operate the Buffalo & Niagara Falls and the Buffalo & Lockport electric roads entirely by electric power generated at Niagara Falls, for it forms a new source of supply that will allow the Buffalo & Niagara Falls road to dispense with its power house in Tonawanda. Current from this new transformer station operates the cars of the Buffalo & Niagara Falls road from the car barns to the Buffalo city line, and also on the Buffalo & Lockport road to a point at or near Pendleton Center. The Buffalo & Lockport line also receives a supply of current from the sub-station in Lockport; the Buffalo & Niagara Falls line is also supplied current from the rotaries in the central station of the Niagara Falls Power Company at Niagara Falls. While running in Buffalo the cars of both roads, it will be recalled, are operated over the tracks of the Buffalo Railway Company, and therefore the supply of current there is furnished from the Niagara street station of the Buffalo Railway Company.

This new transformer station of the Tonawanda Cataract Power Company is another substantial addition that has been added to the buildings of Western New York as a result of the Niagara power development and its transmission throughout Erie and Niagara Counties. The building is of brick and iron. There is nothing temporary about it, but in every part it bears the stamp of the men who by their work in the development and application of Niagara power, show that they are building for years to come. The structure is about 60 ft. by 80 ft. at the foundation, and is a story and half high. The transformer room is undivided. The floor is of granolithic pavement.

The apparatus so far installed consists of two 500-h. p. rotary converters, four 500-h. p. static transformers, switchboard, etc.; it is all of Westinghouse make. The building stands close to the Buffalo-Niagara power transmission line, which is tapped for the station's service. The alternating current enters the building on the east side, passing through high tension circuit breakers on the second floor at a voltage of 11,000 and three phase, and then down to the static transformers, where it is reduced to 375 volts, at which it is fed to the rotary converters. These converters have small motors on one end for use in starting.

The present installation is given space in the east half of the transformer room, and space has been provided for two more rotary converters. The west half of the building is to be devoted to a lighting station. The switchboard is of white marble and has eight panels, with the necessary apparatus for controlling the various currents. From this station power is to be supplied throughout the field above referred to for commercial purposes, and thus it will place North Tonawanda and Tonawanda in close touch with the current from the big generators at Niagara Falls. The industrial conditions in and about the Tonawandas are very flattering, and there is no doubt that very soon a large amount of Niagara energy will be used there.



CONVERTERS. SWITCHBOARD. TRANSFORMERS.

SALT ON ASPHALT PAVEMENTS.

Replying to an inquiry as to the effect of salt on asphalt paved streets, "Municipal Engineering" for February says that the bad effects from sprinkling salt on asphalt pavements in winter arise not so much from the salt directly as from the water produced by the melting of snow and ice, which would find little opportunity to drain off if grades were light. It is further said that the injurious effect of the salt water, which has a temperature very near zero as long as there is snow or ice to melt, upon horses' feet, should prevent the use of salt as described. This last is not a well settled point. Some years ago the manager of a large horse railway system stated at a meeting of the A. S. R. A. that he stood his horses in a salt bath when they suffered from sore feet.

NEW ELECTRIC RAILWAY MAP.

All our readers who attended the Boston convention of the A. S. R. A. will remember the excellent "Street Railway Guide to Massachusetts," published by Robert H. Derrah, and will be pleased to learn that Mr. Derrah has recently published a map of Massachusetts, Connecticut and Rhode Island, showing all the existing and projected street railway lines as well as the steam railroads in these three states. Like Mr. Derrah's former work, this has been carefully prepared. To those who have not kept in close touch with the electric railway development in New England, this map is a revelation. The roads now operating in these three states aggregate 2,157 miles in length, and in 1898 some 90,000,000 car-miles were run; the number of passengers carried was over 400,000,000.

The aldermen of West Superior, Wis., have refused to pass an ordinance providing that no member of the council shall make use of a street railway pass.

THE GLASGOW ELECTRIC TRAMWAY.

While the municipal tramways of Glasgow are widely known, to bring them and other municipal undertakings to universal notice, the city is to hold an international exposition in 1901. The attention which has been attracted by this tramway system is rather out of proportion to its importance or magnitude, for the facilities for rapid transit have at no time equaled those of any American city which approaches Glasgow in population and commercial importance.

It may be of interest to trace briefly the history of the tramways in the Scottish metropolis. In May, 1871, the Glasgow Tramways & Omnibus Company made an agreement with the corporation to lease the tracks for a period of 23 years, ending June 30, 1894. The first line was opened August 19, 1872, and by the end of the year nine miles of track were in use; other lines were authorized and constructed until the total length of single track became 73 miles. In 1891 the council resolved to operate the tramways when the lease of the company expired in 1894. An amicable agreement between the company and municipality could not be reached regarding the sale of the tramway plant, and so the corporation had to secure a new equipment throughout. This was the opportunity for Glasgow to make a record and adopt electric traction. The unqualified success of the trolley had been demonstrated in many cities of America, but instead of this the corporation purchased over 3,000 horses and 240 new cars, which were as obsolete as stage coaches for city transit.

The first year of municipal ownership ended May 31, 1895, and the financial results were gratifying. A committee was appointed later in the same year to investigate mechanical traction, and it went to Brussels, Hanover, Hamburg, Berlin, Dresden, Budapest, Vienna, Milan, Genoa and Paris. The report was that "the overhead system of electric traction is the best we have seen, and can be made quite applicable to any part of the city." Again a committee visited the cities on the Continent, and Coventry and Bristol, in England, and the previous report was corroborated: "The overhead system is the simplest, cheapest to construct and operate, most accessible for maintenance and repairs, and on the whole the most efficient system of mechanical traction which has yet been demonstrated by practical working." Even this was not conclusive for the hard headed Scotsmen, and John Young, general manager, and William Clark, engineer of the tramways, were sent to America. An exhaustive report in favor of the trolley was submitted, and at last the council, in May, 1897, decided to equip the suburban line from Mitchell street to Springburn for overhead traction. In November, 1897, a contract was closed with the Westinghouse Electric & Manufacturing Company for the entire electrical equipment.

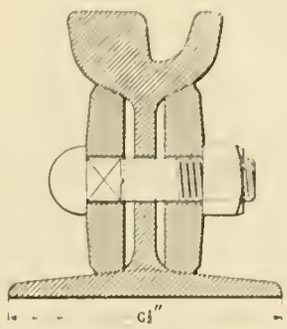


FIG. 1.

The length of the route is 2½ miles, double track the entire distance. The route is for the most part winding and hilly, the steepest grade being 5 per cent and the sharpest curve having a radius of 37 ft. 6 in. The roadbed was designed to meet the condition of

FIG. 2—ROUTE IN BUSINESS DISTRICT.

FIG. 3—ROUTE IN SUBURBS.

FIG. 4—OPENING DAY.

FIG. 5—AMERICAN CAR.

heavy traffic and is of the most substantial construction. The roadway was excavated to a depth of 13 in. and Portland cement 6 in. thick was laid, and upon this the rails were placed; between the rails and for 18 in. on either side the roadway is paved with granite blocks.

tervals of 7 ft. 6 in. steel tie-bars $\frac{3}{8}$ in. by 2 in. are employed. Drain rails are laid at intervals. The rails are connected by No. 0000 B. & S. copper bonds 2 ft. $4\frac{1}{2}$ in. long, and in addition are cross-bonded at intervals of 135 ft.

The span wire suspension, which is generally employed on the

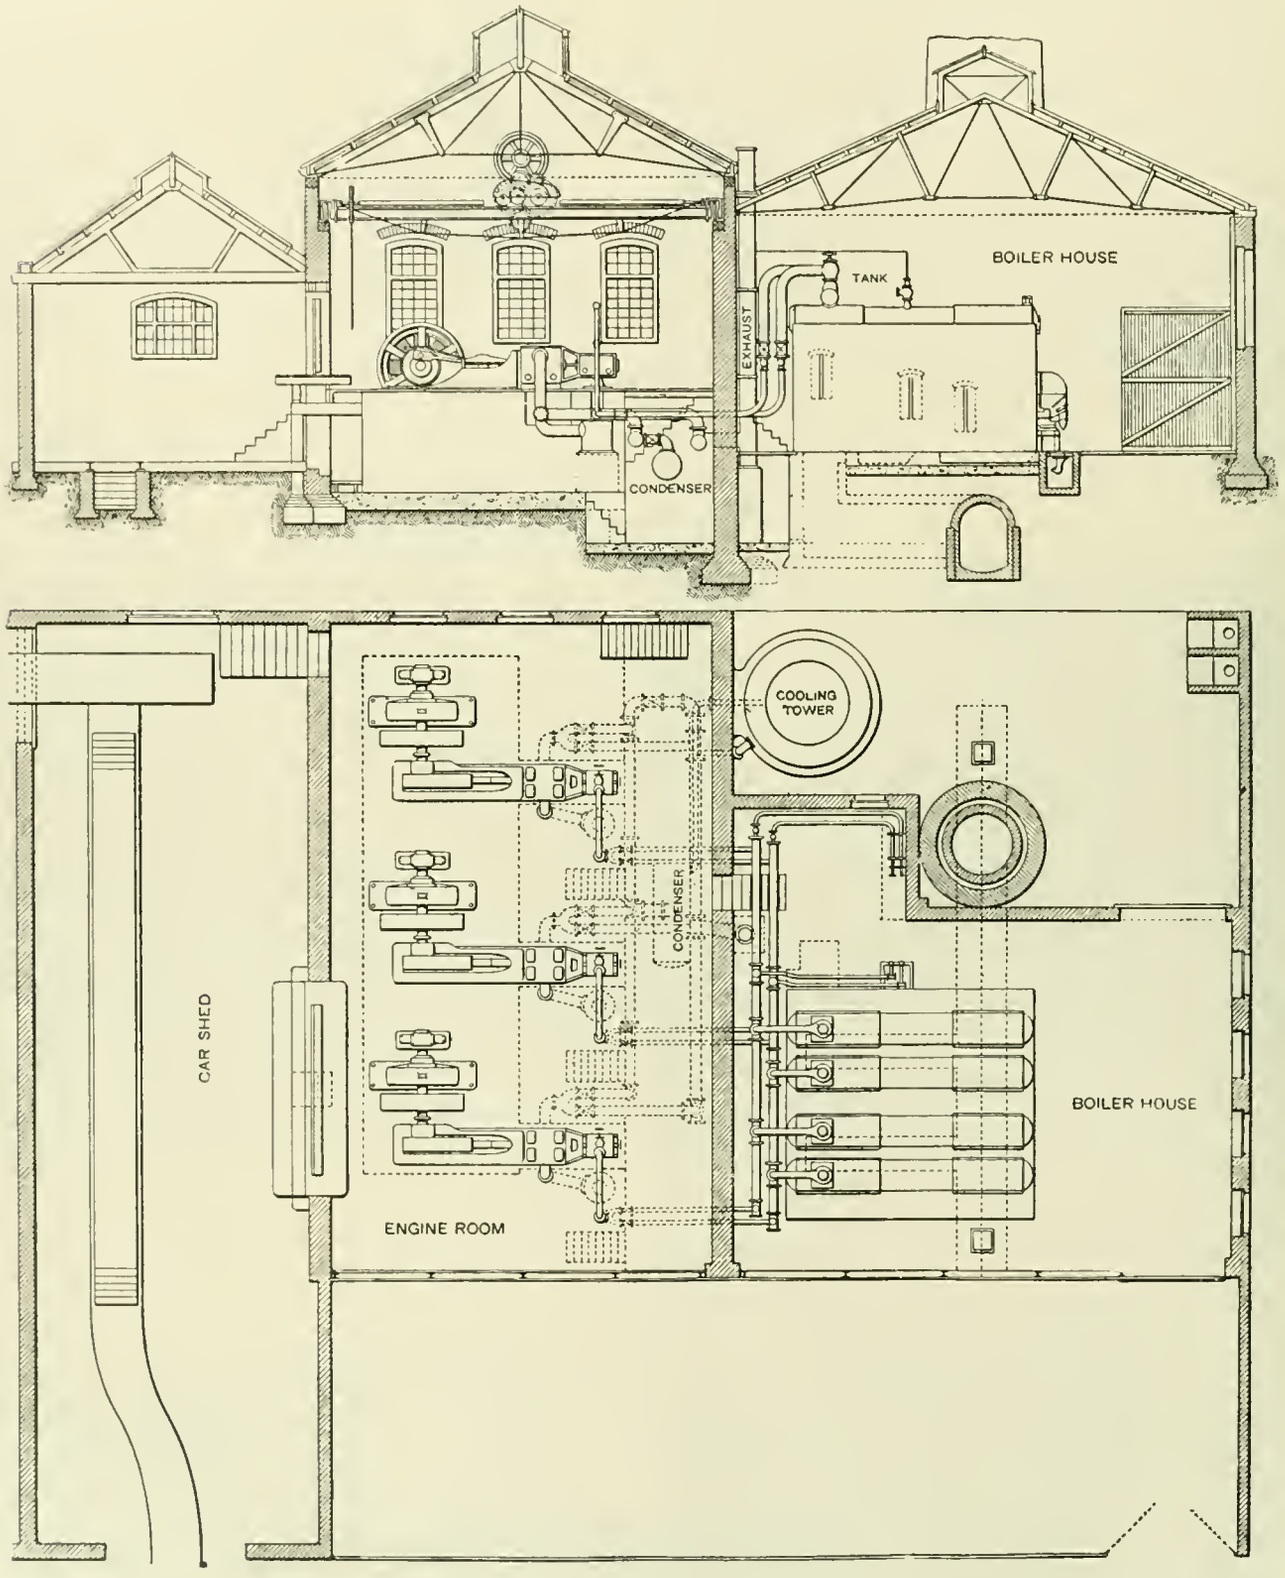

FIG. 7- PLAN AND SECTION OF POWER STATION.

Fig. 1 shows the shape of the 100-lb. girder rail which was laid. Its depth is $6\frac{3}{8}$ in., the width of head $1\frac{7}{8}$ in., on roll $3\frac{3}{4}$ in. over all, and the base is $6\frac{1}{2}$ in. wide. The rails are in 45 and 60-ft. lengths, and are held together by steel fish-plates weighing 48 lbs. per pair. They are 24 in. long and provided with six 1-in. bolt-holes. At in-

Glasgow line, is a great novelty in the British isles, but seems to meet with general approval. By reference to the first group of pictures an idea can be formed of the line and track construction. Fig. 2 is from a view along one of the main thoroughfares of the city, and shows the span wire suspension with guard wires above the trolley

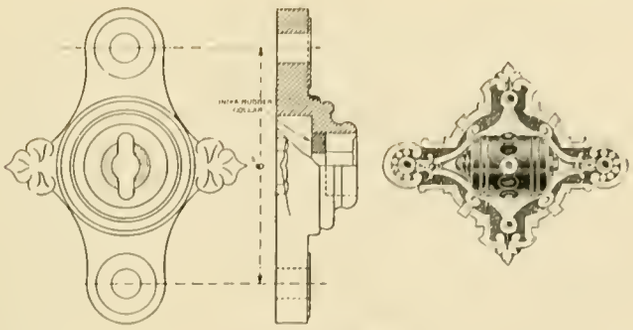

FIG. 6—ROSETTES.

wires. The type of center-pole construction is indicated in Fig. 3. The inspection cars, with municipal and tramway officials and other distinguished Scotch gentlemen, are shown in Fig. 4. The smooth and even paving along the road-bed may be noted from Fig. 5.

guard wires are of No. 6 iron wire and are supported by separate span wires about 6 in. above the trolley. To conform with the Board of Trade regulations, the trolley wire is divided into half mile sections, a cast iron section box containing feeder switches, telephone and lightning arresters being placed at each division. The feeders are placed underground and are about 625,000 c. m. section.

The power station is situated a half mile from the northern or Springburn terminus of the line. The power house is a brick building, one of the end walls being only temporary, and sheathed with corrugated iron so that extension can be added at any time. A plan and section of the station is shown in Fig. 7. The boiler room is 33 by 46 ft. and contains two 250 h. p. Babcock & Wilcox water tube boilers (Fig. 8). They have a heating surface of 2,530 sq. ft. and a grate area of 51 sq. ft. All the steam piping is in duplicate and is carried under the engine room floor. A smoke stack 100 ft. high has been built, and is of ample capacity for the present equipment and any additions to be made in the near future. The two steam feed pumps are the horizontal duplex type.

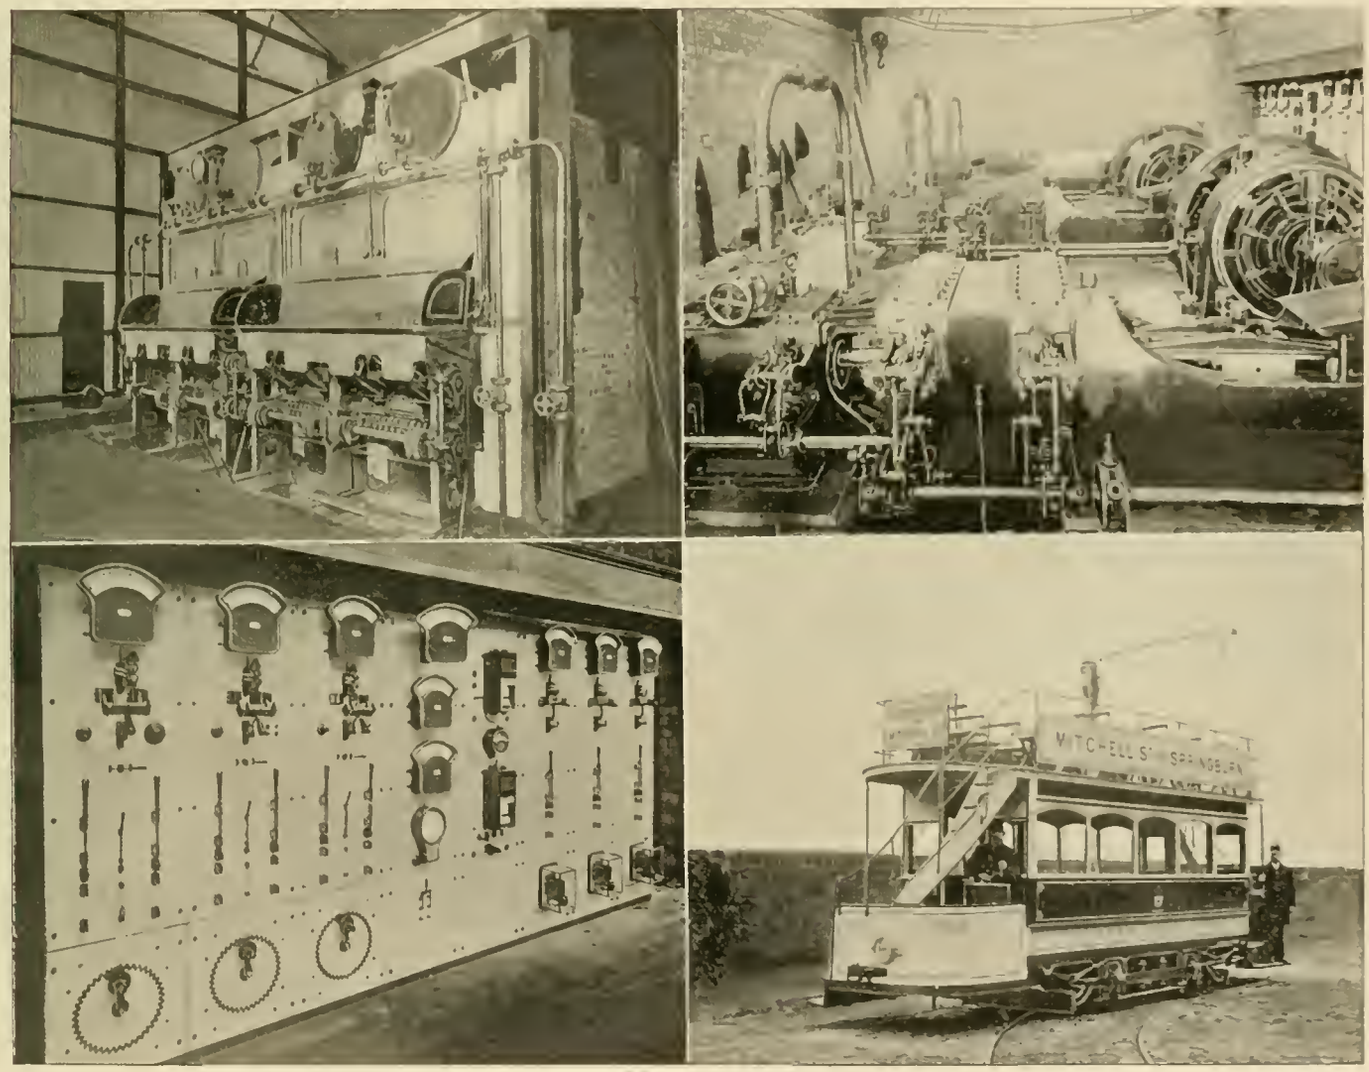

FIG. 8—BOILER ROOM.
FIG. 10—SWITCHBOARD.

FIG. 9—ENGINE ROOM.
FIG. 11 DOUBLE DECK CAR.

Ornamental iron poles, 31 ft. long and planted 6 ft. 6 in. deep, are spaced at intervals of 120 ft. They are of extra heavy mild steel pipe, divided into three sections. A rake of 8 in. is allowed for the strain on the span wires. At certain points along the route the side poles are displaced by ornamental rosettes (Fig. 6), attached by four bolts, but insulated from the buildings.

The trolley wire is double, and consists of No. 00 B. & S. gage, with an ultimate tensile strength of 6,000 lbs. and a conductivity of 98 per cent. The trolley ears are 18 in. long and are soldered. The

The engine room (Fig. 9) is 36 ft. by 61 ft. and contains three large units. McIntosh & Seymour horizontal compound engines are direct connected to Westinghouse generators and develop 300 h. p. at 200 r. p. m. The high pressure cylinder is 11 in. in diameter, the low pressure 22 in. and the stroke is 2 ft. A fly-wheel governor gives very close speed regulation. To the exhaust pipe are fitted two Blake-Knowles automatic relief valves. The exhaust steam passes into a Worthington condenser, which has water circulating around it and is then conducted to the cooling tower. The

tower is 12 ft. in diameter and 31 ft. high and filled with vitrified fireclay pipes. An air draught is produced by a 7-ft. fan driven by a 10-h. p. Brotherhood steam engine. The current of air passing up through the tower comes in contact with the warm water descending from the distributer at the top and cools it. The water supply for the boilers and condensers comes from the city mains.

The Westinghouse generators are the eight-pole railway type, with a circular yoke carrying inwardly projecting pole pieces of laminated soft steel. The field castings are divided vertically and

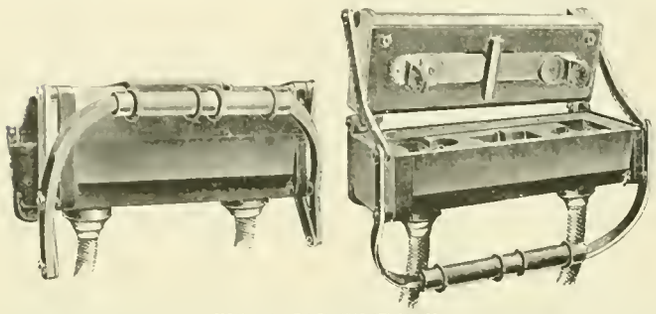

FIG. 12 CAR FUSE BOX.

set upon ways on an independent bed plate. This vertical division of the fields affords every facility for inspection and removal of field or armature coils without dismantling any part of the engine. These generators are over-compounded, so that the voltage increases about 10 per cent from no load to full load, the speed being constant. The shunt and series coils are separately wound and easily removable. The series coils are composed of forged conductors of rectangular section. The armature core consists of punched discs of annealed steel with cast steel end pieces and held together with bolts. The armature coils are carried in slots, and are made from bars of drawn copper forged into shape, and insulated by mica and fuller board. The generators have an efficiency of 94 per cent and are guaranteed to run on an overload of 50 per cent for half an hour.

The switchboard (Fig. 10) is also of the Westinghouse standard railway pattern, and consists of marble panels built into a frame-

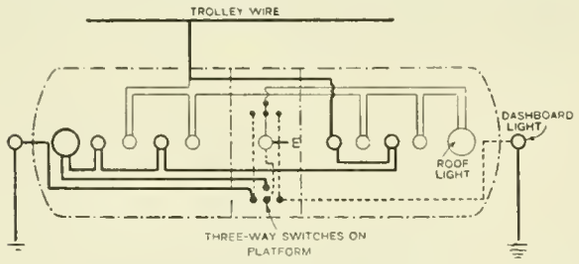

FIG. 13—CAR LIGHTING CIRCUITS.

work in one of the walls of the building. It has eight panels, three of which are for feeders, three for the generators, and the two in the center are for the Board of Trade and main recording instruments. At the back of the board the busbars are so arranged that any addition can be made without alteration of the present connections. There is no woodwork or combustible material in contact with the board, the instruments being mounted on marble slabs in a frame of angle iron.

The present equipment of rolling stock consists of 25 cars, 21 of which are the single-deck American type, four being provided with outside seats and Brill single trucks, as shown in Fig. 11; of these four two are American cars and two of English make. The majority of the cars are 33 ft. 6 in. in length, with central entrances and double trucks. One of the two compartments is reserved for smokers. The cars are 7 ft. 9½ in. in height inside and are ventilated by a monitor roof with side windows. There is seating capacity for 50 passengers. The double trucks have a 4-ft. wheel base and 30-in. wheels. The car equipment was supplied by the Westinghouse Company, the motors, two to a car, being each of 35-h. p. capacity.

The car fuse box is shown open and closed in Fig. 12. The fuse is a copper wire and is connected in the circuit when the lid of the box is closed. When the fuse is blown the lid of the box is opened and can readily be replaced. There is a special arrangement of circuits for lighting the cars, as shown in the diagram, Fig. 13. This provides for two circuits for the lamps of each car, there being two three-way switches so connected that the head-light can be put in either circuit, depending upon the direction of the car. The switches are worked from one handle and are locked so that the same lamp cannot be put on both circuits at the same time.

The cars run on a headway of 2½ minutes and an average rate of seven miles an hour, which will doubtless be considerably increased when the possibilities of rapid transit are better known. The fare for a single trip is 3 cents and there are four 1-cent section fares.

CONSOLIDATION OF BUFFALO AND OTHER LINES.

An important consolidation has been effected of the electric railroads in the vicinity of Buffalo and Niagara Falls. All the railways of the city of Buffalo, the lines connecting that city with Niagara Falls and Lockport, the electric road of Niagara Falls and the Niagara Falls Park & River Railway, on the Canadian side at Niagara, all fall into the possession of a syndicate capitalized at $25,000,000. While there is yet much believed to be back of the plans of the syndicate, it is known that it is proposed to retire all the stock bought with an issue of new bonds, while there will also be a new issue of preferred and common stock.

The companies to be consolidated are the Buffalo Railway Company, the Buffalo Traction Company, the Buffalo, Bellevue & Lancaster Railway Company, the Buffalo & Niagara Falls Electric Railway Company, the Buffalo & Lockport Railway Company, the Niagara Falls & Suspension Bridge Railway Company, and the Niagara Falls Park & River Railway Company. But in addition to these electric roads the new syndicate become the possessors of two of the great Niagara bridges, one of them the fine new upper steel arch, owned by the Niagara Falls & Clifton Suspension Bridge Company, and the other the proposed new suspension bridge now in course of erection across the Niagara gorge at Lewiston. These bridges will afford crossings for a belt line about the gorge, while the possession of the Buffalo & Niagara Falls road gives trackage facilities from Buffalo to the falls on the New York side. As the Niagara Falls Park & River Railway now controls a franchise for a line from Fort Erie to Chippewa on the Canadian side, it will be seen that the new company has all the rights for a belt line skirting the Niagara River on both shores from Lake Erie to Lake Ontario. Much of the stock of the several railway companies was bought below par, but it is understood that the stockholders of the Buffalo Railway Company will receive par. Also that about 75 cents was paid for stock of the Buffalo & Niagara Falls road, and about 50 cents for the Buffalo & Lockport road.

The amounts involved in the purchase of the various interests are about as follows:

Buffalo Railway	$15,215,000.00
Buffalo Traction	3,858,000.00
Buffalo & Niagara Falls Railway	2,250,000.00
Buffalo & Lockport Railway	1,500,000.00
N. F. Park & River Railway	1,000,000.00
Lewiston & Queenstown Heights Bridge	285,000.00
Total	$24,108,000.00

The statement above given is exclusive of the property of the Niagara & Clifton Bridge Company's property.

Further announcements as to the ultimate scope and purpose of the consolidation may be expected to follow soon. The bonds of the Niagara Falls & Clifton Bridge Company are out to the extent of about $400,000, and are understood to be equally divided between Canadian and United States capitalists.

TO BUILD STREET RAILWAYS IN JAPAN.

Dr. W. Delano Eastlake, in an interview recently published in a Seattle, Wash., paper, states that he and his brother, Dr. F. Warrington Eastlake, who is now in Japan, had succeeded in interesting American capitalists in a project for building electric railways in Japan. The syndicate, it is said, will invest $40,000,000 in Japan, but the business will be conducted through Japanese companies.

SPECIAL CAR FOR BALTIMORE.

We present herewith engravings showing the interior of the special directors' car recently built by the American Car Company, of St. Louis, for the Baltimore City Passenger Railway Company, of Baltimore, Md., which is undoubtedly one of the most elaborate street railway cars ever built.

The body is of the swell and concave panel type; it is 30 ft. over corner posts with 5-ft. platforms, and is mounted upon high speed double motor trucks. The smoking compartment is 10 ft. in length and the ladies' parlor 20 ft. The doors leading to either compartment from the platforms are of the twin automatic type. The eight side windows are double sashed and glazed with beveled crystal polished plate; two windows at the center have large observation lights. Between linings on the inside the car is 8 ft. wide in the clear.

The wood for the interior finish is a finely figured East Indian mahogany, known to the trade as Padouk, and was specially imported by Uptegrove & Co., of New York, for this car. It is solid throughout, and a few beaded mouldings and delicate carvings stand out, clear cut, in bold relief on the smooth polished surface, accentuating the rich amber and vermilion tints natural to this species of wood.

AMERICAN CAR COMPANY'S CAR FOR BALTIMORE CITY PASSENGER RAILWAY.

The interior lines of architecture are plain, modest and neatly elaborated into the colonial and empire style. The upper deck being very broad is recessed into a secondary dome, from which the opalescent center electroliers depend; these latter surrounded and bordered by a large number of lamps with translucent globes incased in bronze gilt husks.

The curtains are of green, silk-faced, pantasote mounted on spring rollers with Acme holding devices. The over-hangings, portieres and upholstery are of a luxuriant texture in soft green tints harmonizing nicely with the Royal Wilton floor rugs. The Reed furniture of fantastic designs is stained and tinted to match the general color scheme. The cheval mirrors, set in massive frames, at the farther end of the ladies' parlor are useful and ornamental adjuncts that add greatly to the interior effects.

Every convenience conducive to comfort and luxury has been admirably placed and planned. The appointments include adjustable tables for games and refreshments. A folding lavatory and ice cooler as also a cosy buffet closet, find place in the smoker's den. The refrigerator, supply chests and tables are carried beneath the car body, being suspended between the trucks.

Twelve electric Gold car heaters are planted in the side walls and a regulating switch, turned to any one of three points, provides a varying degree of radiant heat. A system of electric call bells is arranged to conveniently summon either porter or conductor, and the latter signals to his motorman by touching a push button. The other motor car accessories are of the latest and best types in use and were specially manufactured for this car.

The hardware trimmings, coat and hat hooks, and parcel racks are gold bronze. The electric headlights are 14 in. copper silvered reflectors incased in solid bronze frames.

The platform gates are solid gold bronze of the grille folding type and the dashers are capped with bronze and ornamental scroll designs. The exterior decorations of this car are in entire harmony with its interior furnishings. The color is a rich olive, the striping and ornaments gold; the lettering is trim and neat. The car is named "Maryland."

PROPOSED TRANS-ILLINOIS ELECTRIC LINE.

The Wabash & Mississippi Construction Company, of Salem, Ill., has been incorporated to build an electric railway from Vincennes, Ind., to East St. Louis, Ill., a distance of about 150 miles. The officers of the Construction Company are: D. D. Haynie, president; C. H. Neff, vice-president and secretary; W. C. Irwin, treasurer; A. N. Rooks, superintendent of construction and right of way.

Mr. Rooks states that the road will follow the old State road and be almost parallel with the Baltimore & Ohio Southwestern Railroad, passing through the many towns and cities, such as Olney, Clay City, Flora, Carlyle, Trenton and Lebanon. There are many reasons for believing that the road will be a paying investment and a great accommodation to the people. There is not very much grading to do, since the line will be built on the old Vincennes dirt road; over 100 miles are now ready for the rails. In low lands the road will require some grading, but on the whole this will amount to very little. The bridges will have to be strengthened and kept in repair.

ACCOUNTANTS' BLANKS AND FORMS.

The secretary of the Street Railway Accountants' Association of America, W. B. Brockway, Toledo, O., announces that the progress already made with the collection of blanks and forms is extremely satisfactory, and that it is hoped to complete it within 30 days. All members of the Association who have not already sent copies of the forms used by them to the secretary as requested in his circular letter of November 15, 1898, are urged to do so within this time. This department of the Association's work gives promise of becoming a very important one, and it is hoped that prompt attention will be given to these requests. The collection is also to include samples of tickets and transfers, for which a later call has been issued.

The collection is, of course, for the exclusive use of members of the Association.

THE DAYTON & WESTERN INTERURBAN.

The interurban line of the Dayton & Western Traction Company, extending 25 miles westward from Dayton, O., through the fertile sections of Montgomery and Preble counties, and connecting the city with the towns of New Lebanon, Johnsville, West Alexandria and Eaton, is a fine type of the latest interurban practice. Although as a rule there is less difficulty in securing franchises for interurban than city systems, yet this company had the unusual experience of being received with "open arms" at every point. There was no direct railroad connection between these cities, and to go from one to another involved a roundabout trip of 20 to 30 miles out of the way. There was not a single injunction to contend with in building the line. Such a peaceful and welcome beginning was a happy augury for the future, which is already in a fair way to be fulfilled.

FIG. 1. FIG. 2. FIG. 3.

Furthermore, the road follows a section line and is almost as straight as an arrow, having no sharp curves. There are five grades on the line, the maximum of which is 4 per cent, being 2,000 ft. long. Fig. 1 is from a view of the reverse curve and grade going east from the bridge at West Alexandria. The road penetrates a rich farming country, as may be seen from Figs. 2 and 3. The latter was taken looking towards the Dayton Soldiers' Home on the right. This is the largest of the national homes for disabled volunteer soldiers of the civil war. Thousands of visitors and friends of the old soldiers come each year to go through the beautiful grounds or to see some of the 5,000 inmates.

There are several streams to cross along the route and at each point a steel bridge has been constructed. In one instance a steel bridge was built at the side of an old covered bridge on the highway, shown in Fig. 4. Another bridge along the line may be seen in Fig. 5. The rolling stock consists of six cars made by G. C. Kuhlman Company, of Cleveland, and is of two types—the double-truck passenger car shown in Fig. 4, and the combination car, Fig. 5. The passenger car is 42 ft. long and has a seating capacity of 50. The motor equipment consists of two G. E. 57, 50-h. p. motors, and the controllers are G. E. 23. The motors are suspended on Peckham double trucks. Johns' electric heaters keep the cars warm in winter. The New Haven car register is used for recording fares. One fitting, which is rather unusual in electric cars, is the arrangement of package baskets along the inside as in steam railroad coaches. Portable telephones are carried on each car and these may be plugged in at intervals of 1,000 ft. along the line, insuring communication with the offices and power station in case of accident or change in schedule. Along part of the route the speed is as high as 45 miles an hour, and the average speed outside of Dayton, including stops, is 25 miles per hour.

The power house is located at West Alexandria, 17.3 miles from Main street in Dayton and six miles from Eaton, the western terminus. It is a brick structure (Fig. 6) of plain but substantial design, and having a composite roof of asphaltum. The boiler room (Fig. 7) is 47 ft. 6 in. by 53 ft. 6 in. inside dimensions, and 23 ft. 8 in. high. The engine room (Fig. 8) occupies the same floor space, but is 28 ft. 6 in. high, and in addition has a recess 27 ft. long, 6 ft. 3 in. deep and 15 ft. high for the switchboard. The advantage of this construction is that it gives the same span for the roof trusses, thus making the building symmetrical, and the recess enables the switchboard, busbars and cables to be placed out of all danger from the chains of the traveling crane, or from anything falling from above.

The water supply is obtained from two wells 16 in. in diameter driven at the foot of the bank upon which the power station is built. The water comes to the surface in these wells, but is 28 ft. below the level of the engine room floor, and the suction valves 36 ft. below the same level. In order to be sure of a suction at all times a pit, 10 ft. 3 in. by 30 ft. inside, and 19 ft. deep, was dug beneath the engine room near the boiler room partition. In this the two condensers, the service pump and the make-up pump are placed, and the two feed pumps and the heater are in the boiler room. These auxiliaries consist of two Wheeler surface condensers, each rated to condense 8,000 lbs. per hour with the water at 70° F.; one 6 by 4 by 6 in. duplex outside packed plunger pump for service use; one 3½ by 2 by 3 in. duplex piston pump for make-up water; and two 6 by 4 by 6 in. duplex piston pumps for boiler feed, all furnished by Stil-

FIG. 4.

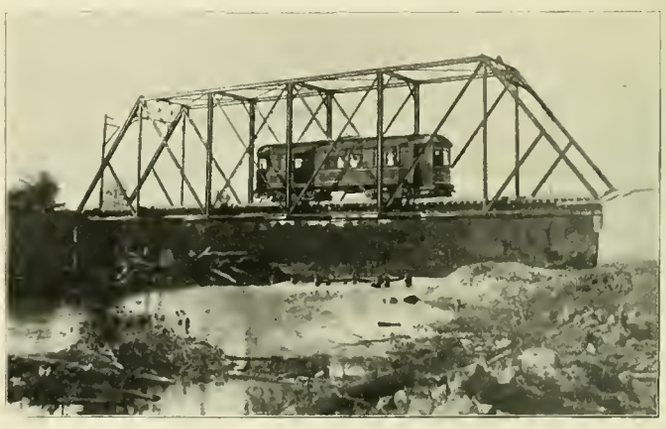

FIG. 5.

well-Bierce Company. There are three 250-h. p. boilers of the B. & W. type made by the Aultman & Taylor Company, of Mansfield. Fig. 10 is a view on top of the boilers, showing the headers and bends.

There are two 400 h. p. Buckeye engines running at 150 r. p. m. having cylinder dimensions 15¼ and 28½ by 30 in., each with a flywheel 11 ft. 6 in. in diameter. All the live steam pipes are drained by the Holly system, and Cochrane live steam separators are above each engine cylinder, and the Bundy steam trap takes the oil and water from the Cochrane exhaust separators. Direct connected to each engine is a Siemens & Halske generator, and belted to the line shaft as shown in the foreground of Fig. 8 is a 75-k. w. booster. A view of the switchboard, showing the two generators, the station and four feeder panels, is given in Fig. 11.

On account of the great length of line east of the power station it was necessary to make some provision to keep up the voltage near that terminus, and E. P. Roberts & Co., consulting engineers of the company, planned the booster installation. The trolley line has a circuit breaker and switch on a pole (see Fig. 2) 9 1-3 miles from the station, and the booster feeds from there to the Dayton city limits, a distance of 5.95 miles. The switch at the trolley break is open continuously, but can be closed and help the direct feed, or if it is necessary to shut down the booster the whole line can be operated by direct feed. This portion of the line contains the heaviest grades on the road, there being about four miles of uneven roadway, the grades ranging from 2 to 4 per cent. When four cars are running between the power station and Dayton, the car running on this part, fed by the booster, receives current at from 500 to 600 volts, while on the portion fed direct from the generators the voltage is from 450 to 575, the voltage on the booster end, averaging about 550, only running to 600 momentarily when the current is shut off.

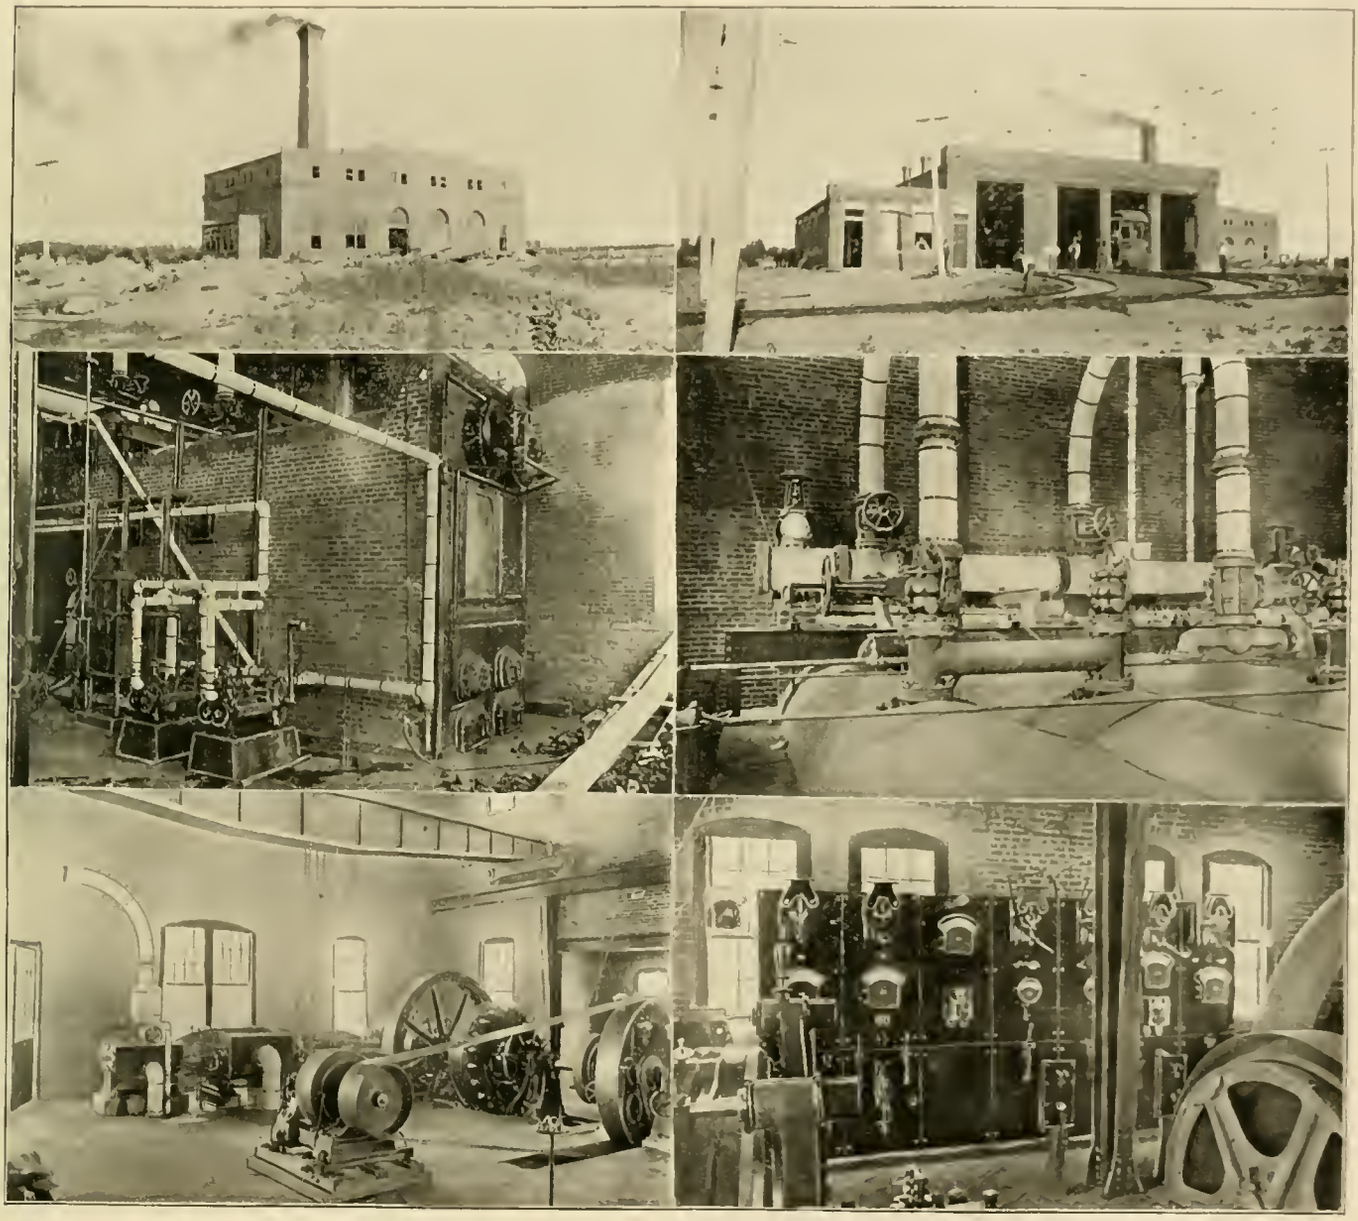

FIG. 6—POWER HOUSE.
FIG. 7 BOILER ROOM.
FIG. 8 ENGINE ROOM.

FIG. 9—CAR BARNS AND OFFICES.
FIG. 10 TOPS OF BOILERS.
FIG. 11—SWITCHBOARD.

The booster raises the voltage about one volt per ampere of current taken.

Two figure 8 No. 00 trolley wires are strung along the entire length of the line, doing away with all overhead switches, and the feeders are of 300,000 c. m. bare copper wire. Cedar poles, with 10-in. butts and 6-in. tops and 35 to 40 ft. long, are set at intervals of 100 ft. The bracket construction is clearly shown in Figs. 2 and 3, and the poles having two cross-arms and carrying two feeders. The entire length of track is 25½ miles, and is laid with 70-lb. T-rails, 60 ft. long, from the works of the Lorain Steel Company. These are laid on oak ties 5 by 7 in. by 7½ ft., spaced 2 ft. between

centers. All the switches and frogs were supplied by the Cleveland Frog & Crossing Company. Washburn & Moen horse-shoe bonds form the electrical connection between the rails.

A general view of the car barn and offices of the company is shown in Fig. 9, covering a space 61 by 100 ft. Three of the tracks in the barn are for car storage and the fourth is for repair work. The office occupies a portion of the building 20 by 55 ft., and contains the superintendent's and general offices, the treasurer's room and the storage room.

The officers of the Dayton & Western Traction Company are Dr. J. E. Lours, president; J. E. Feight, secretary and superintendent; and Oscar Sheppard, treasurer. The capital stock of the company is $400,000. The splendid construction and the fine equipment of the road indicates that the management is in the hands of able men. Its operation thus far leaves no doubt as to its success.

Since the above was written there has been a transfer of stock of the company to a syndicate of Dayton capitalists—J. H. Winters, V. Winters, C. B. Clegg and D. B. Corwin, all street railway men. J. H. Winters is the new president and V. Winters general manager.

COLLISION BETWEEN STREET CAR AND SALVAGE WAGON.

Judge Toney, in the Jefferson (Ky.) circuit court, on Feb. 7, directed the jury to find for the defendant in the case of Flynn against the Louisville Railway Company, and his instructions will prove of general interest, as they discuss the right of way of fire trucks, etc., a question that has arisen rather frequently of late.

Flynn was the driver for the Salvage Corps, and was injured in a collision between his wagon and an electric car.

The court said:

The defendant, on the close of the plaintiff's testimony, moved the court for a peremptory instruction to the jury to find for it on the ground of contributory negligence by the plaintiff. The effect of this motion is to admit the truth of all of the competent evidence adduced to the plaintiff, and all just inferences which can properly be drawn therefrom. This motion is quite analogous to a demurrer to a pleading. It may be conceded for the purposes of this motion that the defendant's motorman in charge of the electric street car, in running its car at the place and time of the collision, was guilty of negligence in going at the rate of speed shown by the evidence. It was the duty of the motorman to slow up the electric street car as it approached the intersection of Third street and Jefferson street so as to be able to check and halt it, if necessary to prevent collisions with passing vehicles, and to prevent crushing pedestrians at that crowded intersection of those two thoroughfares of the city; and it was equally his duty to keep a vigilant lookout to prevent such actions as he approached such intersections.

It may be admitted, I say, that the defendant's motorman failed in both these duties, and was therefore guilty of such negligence as would render the defendant company liable in damages to any one, not in like fault, injured through such negligence. The plaintiff was in charge of the salvage wagon that collided with the said street car at the west crossing of Third street, at said intersection from which he was thrown and injured. The undisputed evidence is that the said wagon was being driven at the rate of from ten to fifteen miles per hour at said intersection. The horses were in a run going out to a fire on Third and Breckinridge streets. The driver and motorman came in sight of each other at the same time. The driver of the wagon could not check up his horses to prevent the collision; the motorman could not check up his street car in time to prevent the collision. They were both too near to the intersection, and were too near to each other when each discovered the other, to prevent collision at the rate of speed at which both were going.

The twelfth section of the charter of the Salvage Company, to which the wagon and horses belonged, and whose agents the plaintiff and driver were, gave it the right of way along the streets of the city; but this right of way through the streets did not authorize or justify the Salvage Company, or its agents in charge of its teams, in approaching and crossing such intersections as Third and Jefferson streets, where street cars were liable to be passing at any moment in close proximity to its path, and where pedestrians were passing to and fro, to drive at such a reckless rate of speed as to make it physically impossible to check up its teams to prevent crushing into vehicles, or colliding with street cars that might suddenly come upon its path at said intersection in ignorance of their approach and proximity.

As was said by Hooker, judge, in Garrity v. The Detroit Citizens' Street Railway Company, 70 Northwestern Reporter, page 1019, in a case on all fours with the case at bar in many of its salient features: "It is manifest that a fire truck" (that was a case where the collision was between an electric street car and a carriage or truck of the fire department, in which the fireman was thrown from his truck by the collision and killed, and his widow sued the street car company for damages), "approaching a street upon which is a street railway, is liable to find cars in any degree of proximity to its pathway either with or without fault of motorman, so close indeed that to stop would be impossible. A collision involves danger to life and limb to those upon the car as well as those upon the truck; and while the exigency of fire may well require dispatch, it is not so essential as to justify taking unnecessary chances of collision dangerous to life. Furthermore, collisions do not conduce to dispatch, but cause delay, and the public service is advanced by avoiding them; so we think that both the prevention of life and expedition in getting to the fire require caution in approaching streets where cars are likely to be encountered as an abstract provision; then we think that the approach to a street car line which must be crossed, without having the horses under such control as to permit of stopping, is negligence; and the proof shows that the driver was culpably negligent in approaching this street. Had the car been a little nearer, or responded as quickly to the efforts to stop it, the pole of the truck would have crushed into it, and the consequences of such an accident are frightful to contemplate."

How applicable, how apropos to the facts of this case as established by the plaintiff's own witnesses, is the language of the learned judge of the supreme court of Michigan just quoted. Had the driver of the wagon in this case had his horses under control as he approached the intersection of Third and Jefferson streets so as to have been able to stop them, as was his duty, can any one say that this collision would have occurred? The proof shows that his team was not under his control, and he was close to the intersection and first saw the defendant's electric car. If the car had been at such a distance from the intersection, when the driver of the wagon first saw it approaching, as to justify an ordinarily prudent man in attempting to drive a wagon like the one on which the plaintiff was across the street in front of it, the fact that the driver was going at too great a rate of speed would not impair or have his right of recovery for injuries resulting from such a collision weakened, because it could not be said that the negligence of the driver contributed to the accident in such a state of case. This is the deflection of the case at bar from the Michigan case.

In the case at bar it is established by the plaintiff's evidence that the street car, at the first moment the driver of the wagon discovered it, was too near to the intersection to be stopped in time to avoid the collision, although the proof is that the motorman at once, on discovering the salvage wagon on approaching said intersection, did all in his power to check his car and prevent the collision. The motorman and the driver of the wagon owed certain duties to each other and the public. They were both under legal obligation—a legal duty in approaching the intersection of Third and Jefferson streets, two crowded thoroughfares of the city, and to adopt and move at such a rate of speed as would enable each and both of them respectively to keep their street car and wagon under their control.

The negligence of one cannot neutralize the negligence of the other, and a collision and consequent personal injuries, the joint result of the negligence of both, cannot support an action by either. It is right that the salvage company of a fire department should have the right of way through and along the streets and thoroughfares of the city, and it is the duty of every vehicle, street car and pedestrian to use every effort to get out of their way and to God-speed them on their perilous mission in defense of life and property against destruction by fire; but the rights and lives of people traveling on street cars are as much entitled to protection as is property which is in danger of being destroyed by fire; and the brave men who drive the salvage wagon and fire trucks through the streets of the city are bound in law, are legally bound, when approaching the intersection of crowded thoroughfares traversed by street cars

and pedestrians, to keep their teams under such control as to make it profitable for them by the exercise of diligence to avoid collisions and calamities such as the proof in this case discloses.

Suppose the motorman had been injured by the collision, or the pole or tongue of the wagon had crushed through the sides of the street car and injured or killed several passengers on board the same, and they had sued the Salvage Company for damages, alleging that the said injuries had been caused by the reckless driving or rather negligence, and the proof in support of said action had been the same as that now before the court, in the absence of a plea of contributory negligence in such an action, can any one doubt their right of recovery?

I think the plaintiff in this action has the burden of proof. He is the laboring oar—he must make out this case. Concede that he has shown negligence on the part of the motorman in charge of the defendant's street car, by the same witnesses and the same evidence he has established negligence on the part of his driver which is unprofitable to him, as he was in control of and directing the driver, which negligence on the said driver's part contributed to the production of the collision, and without which negligence the collision would not have happened. In such a case the plaintiff cannot recover unless it be affirmatively shown by the evidence that notwithstanding the plaintiff's contributory negligence, the defendant's motorman discovered, or by the exercise of reasonable care on his part could have observed the plaintiff's imperilled or dangerous situation in time by the exercise of reasonable care to have avoided the collision.

The evidence introduced by the plaintiff clearly and overwhelmingly established that the motorman did not discover the approach of the wagon until it was too late and impossible to avoid the collision, and that it was a physical impossibility, at the gait at which the wagon was moving and the direction in which the street car was moving, for the motorman to have discovered the wagon and driver until it was too late to prevent the collision. Under this state of facts there is no reason to submit this case to the jury and request them to wander through fields of conjecture and guesswork as to what might or might not have been done under other and different circumstances by the motorman or by the driver.

I have considered this motion upon the assumption (and which is only on assumption) that the motorman was guilty of negligence; conceding that he was, the plaintiff's own proof shows that the plaintiff's wagon was being driven at a reckless rate of speed and under circumstances that clearly establish contributory negligence, which is a bar to this action. For the foregoing reasons the defendant's motion for a peremptory instruction to find for defendant is sustained.

THE FEBRUARY STORM.

Street railway lines in the eastern and New England states had to contend last month with the second severe snow storm of the winter. The blizzard struck on February 13, and the heavy fall of snow, high winds and intense cold combined to stop nearly all steam and street railway traffic east of the Allegheny mountains as far south as Virginia and Maryland. The storm last November coming so early found many street railways with their snow plows and sweepers in repair shops and unprepared for immediate use; last month the plows and sweepers were put in service as soon as snow began falling, but the high winds carried the snow back on the tracks and in nearly every place rendered futile the attempts to keep lines open.

In New York the conduit lines stopped running cars about 5 o'clock on the afternoon of the 13th; the horse car lines soon followed; the cable lines kept running with only occasional blockades. On the electric lines snow prevented the wheels from getting a grip on the rails, and in some places the snow drifting into the conduit through the slot made further trouble.

The ferry boats and steamships were almost as effectually blocked as the street railways, and traffic on the Brooklyn bridge on the morning of the 14th was the heaviest since trolley cars began to run over it. The bridge cars were not interrupted and no accidents to persons were reported.

The underground trolley lines continued to be badly crippled during the 14th, and until late that night cars on the 2nd and 4th avenue lines did not attempt to run below Astor place, which is about two miles from the Battery, though north of Astor place regular trips were made. Eighth avenue was cleared between 14th and 16th streets on the morning of the 14th.

Most of the horse car lines ran cars on the 14th but at long and irregular intervals, and on several lines there were four and six horses to each car. The cable lines were open, but the cars were frequently delayed by trucks and wagons which used the cable tracks because that was the only portion of the street cleared for traffic. The elevated trains ran on schedule time on the 14th.

In Brooklyn many of the surface lines were fairly well opened for traffic during the 14th; the service to Flushing was not resumed until late on the 15th. Transportation to Coney Island was abandoned and no attempt made to open a route till the 15th when a large force of men was put at work.

Traffic in Jersey City and Hoboken was conducted under great difficulties and many of the lines were abandoned on the afternoon of the 13th.

Throughout New England the snow storm of February 13 blocked nearly all the steam and trolley lines. At Hartford the street railways found it easier to clear their tracks than after the storm in November; all lines were running by the night of the 15th.

At Boston the lines of the Boston Elevated were kept open by extraordinary efforts. In recognition of this work the executive committee of the board of directors sent a letter to C. S. Sergeant, second vice-president, and other officers and employes in the bureau of surface lines which was concluded as follows:

"You all deserve and receive high praise for your unprecedented success in keeping open all the lines and in running the cars, thereby enabling the company to serve the public at a time when its service was especially appreciated."

The Palmer & Monson Street Railway, of Palmer, Mass., was able to keep all but one of its lines open all the time during the storm; the exception was the line to Bondsville which was blocked for half a day. The superintendent of the company, C. D. Shepard, worked with the snow plow almost continuously for 48 hours, and persisted in his efforts to keep the lines open though the other officials of the company thought the task hopeless and advised him to cease the attempt. When thrown from the track the snow was banked up several feet deep on both sides so that teams could with difficulty break through. That the public is sometimes ungrateful is shown by the fact that in this instance complaint was made that the snow was not promptly removed from the streets, and notwithstanding the Palmer road was open for traffic when nearly all others in that part of the country were effectually blocked.

In Washington the roads were compelled to stop running cars as in other eastern cities. When the officials after the most strenuous efforts succeeded in partly opening the lines again and were congratulating themselves on the result a sleet storm came and interfered with traffic almost as badly as the snow had done. By a liberal use of sand the cars were run over the icy rails, but not on schedule time. On the afternoon of February 16 the rain became warmer, melting the snow which had previously fallen, and the tracks were deluged with slush and water. In many places the water was above the car steps.

In Philadelphia the Union Traction Company had great difficulty in opening up its 450 miles of track. Snow plows were followed by sweepers, but the snow was so tightly frozen that the sweepers were of but little use. The sweepers were often blocked and had to be dug out with picks and shovels. The greatest difficulty was the cars which became blocked during the storm and had to be abandoned; when a plow reached such a blocked car it could not proceed until the car was dug out by hand. The men on the plows worked during Monday and Tuesday and got but little rest until Tuesday night; that night other men were put on the plows, but on Wednesday, the 15th, the experienced men returned to duty ready for another 48 hours' fight.

Wednesday about 20 of the most important lines were open, and the following day forces were put at work on the suburban and interurban lines. More than a thousand extra men and 500 carts were at work on the 14th and this force was increased where possible and kept at work till the lines were cleared. The loss to the company by reason of the storm is estimated at $50,000. The Fox Chase line was still closed beyond Franklinville on the 15th.

The Pennsylvania Traction Company, of Lancaster, Pa., which operates a number of interurban lines, some 63 miles of track in all, was forced to abandon all but its city lines and the one to Columbia; these were kept open by constant use of snow plows. On the

Millersville road the car was replaced by a large sleigh. On the Lititz line both cars were snowed in.

Several other roads in Pennsylvania had cars snowed in and in some instances at points so remote from dwellings that passengers prepared to spend the night in the car.

The cost of this storm to the Chester (Pa.) Traction Company, which has 20 miles of track, was very nearly $4,000, about one-half of which was for labor in cleaning the tracks.

In Baltimore all street cars were forced to stop running on the afternoon of February 13, after the men had been fighting hard all day to keep the lines open. The heavy fall of snow and the high wind made it impossible to keep the cars running, as the way cleared by a snow plow would be quickly filled again. At one point a broken water main resulted in a sheet of ice 18 in. deep forming across the entire street and effectually blocked car traffic. Other routes were blocked by the armatures in the sweeper motors burning out, leaving the sweepers stranded.

During the fight to keep the lines open both the Consolidated and the City Passenger managements saw to it that the men were given food and warm coffee at frequent intervals.

PROPOSED ELECTRIC RAILROAD LAW FOR NEW HAMPSHIRE.

There is now pending in the New Hampshire legislature a bill providing for building electric railways in country highways by consent of the towns (townships).

Section 1 provides that the general corporation law shall be amended by removing the restriction against electric railways, and that any five or more persons may organize a railway company. Section 7 contains the repealing and emergency clauses. The other sections are as follows:

Sec. 2. Before any such corporation shall construct such electric railroad, it shall present a petition in writing to the selectmen of the town, or to the mayor and aldermen of the city, through which said railroad is intended to be built, asking for a location for the same in the public highways or streets of said town or city.

Sec. 3. Upon receiving said petition the selectmen of the town or the mayor and aldermen of the city shall give notice by publication in some newspaper published in the vicinity, of a time and place of hearing upon said petition, said notice to be published once each week for three successive weeks, the last publication to be ten days, at least, before the day of hearing, at which hearing all parties may be heard on said petition.

Sec. 4. If at said hearing it shall appear that the public good requires it, the selectmen of the town and mayor and aldermen of the city shall grant a location for the same in the public highways, which location shall be filed in the office of the clerk of the town or city through which said road is located, and also in the office of the secretary of state.

Sec. 5. After said location has been granted and filed as aforesaid, said corporation may construct and operate such railroad in accordance with, and subject to, all the laws now existing relating to the building and operating of electric railroads.

Sec. 6. The location given by the selectmen of towns and mayor and aldermen of cities shall be conclusive upon the question of public necessity.

LITIGATION OVER QUINCY (ILL.) ROAD.

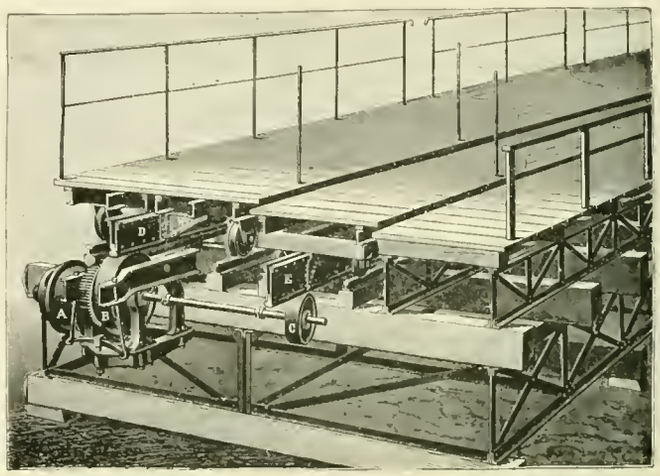
There is now pending, and soon to be heard, in the United States circuit court for the southern district of Illinois an interesting street railway case. The complainant is the Quincy Horse Railway & Carrying Company and the defendant the J. C. Hubinger Company, an Iowa corporation (Mr. Hubinger is president of the Keokuk Electric Street Railway & Power Company also).

The parties have agreed on a statement of facts which will greatly facilitate the trial of the case. The old company has expended $399,000 for construction, equipment, etc.; it has paid dividends each year varying from 1 to 7½ per cent, the average being 5.4 per cent; the new company on April 7, 1898, was granted a franchise for an electric line in Quincy, and given the use of some streets already occupied by the old one and of other streets in which the old company wishes to build extensions; the building of a new line will deprive the old company of gains and profits.

TWO-SPEED TRAVELING PLATFORM FOR PARIS.

One of the transportation features of the Paris Exposition in 1900 is to be a two speed electric-driven traveling platform connecting the Esplanade des Invalides and the Champ de Mars. The plan of M. de Mocomble was accepted and request made that preliminary trials be made early in this year. These trials have recently been made and the accompanying illustration from "La Nature" shows the arrangement of the apparatus.

There are three platforms, one stationary and two which travel; the latter are made in sections and jointed for turning curves. The



TWO-SPEED TRAVELING PLATFORM.

slower moving platform travels at the rate of 2.4 miles per hour, and the other at double this speed. While there are tracks and wheels to guide the platforms, the greater part of the weight is on the rails D ad E, placed under the center of the two platforms. These rails are carried on pulleys such as B and C, placed at intervals. The two pulleys are of different diameter and on the same shaft which is geared to three-phase electric motors, A; the movement is solely due to adhesion and the fixed connection between B and C secures the proper relative speeds of the two moving platforms.

OPENING OF A NEW MICHIGAN INTERURBAN.

February 14 the Detroit, Plymouth & Northville Railway was opened for traffic. This line runs from Wayne, Mich., a station 18 miles west of Detroit on the Detroit, Ypsilanti & Ann Arbor Railway, about 12 miles north through Plymouth to Northville. By an agreement with the Ann Arbor road a 30 cent rate to Plymouth and a 35 cent rate to Northville from Detroit is made. The equipment consists of four 30-ft. interurban cars. The power house is at Plymouth. The officers of the road are C. W. Casgiani, president; H. P. Wickham, secretary; J. A. Russell, treasurer.

The district opened up is not now given good transportation facilities by the steam railroads, which now run but four trains per day each way from Plymouth, and three trains from Northville to Detroit. The new line will give hourly service from 6 a. m. until 11 p. m., and half-hourly service will be installed if business shall warrant it.

COLD WEATHER STOPS TRAFFIC.

February 9, the Sandwich, Windsor & Amherstburg Railway, of Ontario, was tied up by the breaking of trolley wires caused by the contraction due to the unusually low temperature. The wires broke in many different places, and just at the time when the cars were heavily loaded with workmen on their way to the factories. Passengers were obliged to leave the cars and walk to their destinations. After several hours the breaks were repaired and traffic resumed.

MANUFACTURING FOR EXPORT.

From an address read before the Chicago Trade Press Association by John K. Allen, Editor "Domestic Engineering."

Let us take it for granted that a manufacturer in any line is desirous of increasing his export trade, and consider for a moment what he should do in order to build a good foundation for this new departure in his business. In the first place, I cannot speak too strongly of the importance of manufacturing goods which the foreigner needs and with which he is familiar. Too many manufacturers in the United States have attempted to force the goods which they manufacture for consumption here into current use abroad with disastrous results, and, finding their goods left on their hands in foreign countries, have decided that it is foolish to attempt to build up an export business. Had the manufacturer studied the markets a little in advance and discovered the lines of goods which were actually being used in those markets, and had he conformed his manufactures to the type of goods already in use, I have no doubt that the results would have been quite different.

In some goods, of course, it is quite possible to introduce into a foreign market exactly the things which are used in the United States. This is true under my observation with certain novelties, and with certain types of goods, such as radiators. Even in this class of goods, however, special patterns have to be made in many cases. I therefore advocate most strongly a study of the markets previous to beginning a foreign business. It is almost certain that, taking any English article in the production of which machinery plays an important part, the American manufacturer can reproduce the articles already in use in the English market at a much lower price and still make a good profit. As an illustration of this, let me cite the instance of a well-known manufacturer of his line of goods in the United Kingdom, who had large and excellently planned works in Scotland, with water transportation to London, say 250 miles, who found it more profitable to close his factory, send his patterns to the United States, and have his goods made in Detroit, and delivered to him in London than to produce his own goods in his own works in Scotland, and ship them by water to his London warehouse. This illustration proves the positive side of my statement, and it can be proved on the negative side by citing one or two other illustrations.

The firm whose business I am somewhat familiar with, purchased very largely of a certain kind of goods in the United States, their purchases being divided among four houses, all of whom manufactured a standard line of goods, which could be sold in the English market without trouble. A fifth house desired some of the trade and received a large order. These goods were not discovered to be below the standard in weight until they reached their destination in London, when it was found that they were not so heavy as the goods which were consumed in the English market, nor as heavy as the goods which had been received from the other four American manufacturers, and the result is that these goods are lying in the London warehouse, without being of any benefit to anybody, and the fifth house, which made these goods not up to the standard weight, is very much dissatisfied with their experience in the export trade. Had their goods been up to the standard there would have been no trouble whatever in their increasing their business very largely.

In another case, a firm manufacturing water closet seats took the liberty of changing the specifications slightly, and instead of having a hinge on the side of the seat placed it upon the top, thinking it really made no difference. The result is that they have about six or seven hundred dollars' worth of goods in the London warehouse which will not be paid for, and which are of no good to anyone whatever simply because they do not conform to the English pattern. I could cite a number of instances on both sides to demonstrate the correctness of this position, but these two are, I think, quite sufficient.

I have often been asked by friends of mine as to what line of goods could be successfully introduced into the English market. In response to this, I think it worth the while for any manufacturer who has goods that contain a very large element of machine labor, and a small element of human labor, to investigate the foreign markets, and the same remarks will apply to the manufacturer who has goods which contain a small proportion of raw material in comparison to the amount of labor.

It is much better for the manufacturer of American goods to form a connection with some reputable foreign house already engaged in introducing a similar line of goods than it is to endeavor to handle the market himself.

Secondly, it is almost necessary, in my judgment, that stocks of goods should be carried in foreign centers, as, so far as I have been able to observe, buying stock for future delivery is not satisfactory to the foreign buyer. The delays in transmission are so various and so exasperating that in many cases orders have been cancelled and goods left upon the agent's hands in Great Britain, because the transportation lines were too crowded to take care of them properly.

Thirdly, the manufacturer should select a thoroughly reliable house, financially, and make it purchase goods outright rather than attempt to handle credits from this side of the water.

Fourthly, goods should not be placed in foreign markets upon consignment unless one is positively acquainted with the character of the firm with which he is doing business.

Fifthly, one cannot be too careful in packing and shipping. For heavy goods one must use a great deal of crating or very heavy boxing in order to place goods in a satisfactory condition. Bear in mind that in some foreign markets the timber which is used in crating and packing is often sold at a profit. This is true in England, so that one need not be sparing of timber in packing.

Sixthly, the quality of original samples must be kept up to the standard. The foreign buyer is shown a sample very carefully polished, very beautiful to look upon, packed in cotton and carried around by traveling salesmen who are able to show it off to the very best advantage. He gives an order based upon the appearance of this sample. The goods come to him ordinarily packed, with brown paper around them, and, if of metal, they may have been exposed to the action of the salt air in transit, and be pretty badly rusted, with a result that when they arrive at their destination they no longer compare with the sample which was shown to the buyer. The result is cancellation of the order. A case came under my observation recently where a line of goods, thoroughly up to the sample, were packed one in a box, the wood from which the boxes were made not being thoroughly dry. There was enough moisture left in the box to rust the machines, so they were not salable when they reached the other side. Lastly, if possible, secure American salesmen for American goods. Patriotism goes a long way, and pride in country often assists skill in selling.

It is attention to such details as these which will permit the American manufacturer to build up a thoroughly satisfactory and constantly increasing export business.

REORGANIZATION OF THE BROOKLYN ELEVATED.

One of the final steps in the reorganization of the Brooklyn Elevated Railroad Company was the appointment on February 16 of J. Edward Swanstrom as referee to take the accounts of Frederick Uhlmann, receiver and president of the company. Mr. Uhlmann has devoted his entire time to the work, attending to the duties of treasurer as well as those of the two above named offices. The receipts have been $3,935,149, and disbursements, $3,699,455, and the actual operating expenses from March 25, 1897, have been $2,254,400.

CAN STREET CARS CARRY FREIGHT?

A suit brought by Aaron De Grauw, of Jamaica, N. Y., against the Long Island Electric Railroad Company, the Brooklyn Heights Railroad Company, the Brooklyn, Queens County & Suburban Railroad Company and the National Express Company, to determine the rights of an electric railway company to carry freight and express matter, is now pending in the supreme court of New York. The railway and express companies have entered into an agreement to run cars for carrying such matter, and this action is brought to restrain the defendants from running trolley express cars along Washington street in Jamaica, on which the plaintiff is an abutting property owner.

W. E. BAKER GOES TO NEW YORK.

W. E. Baker, who has been general superintendent of the Metropolitan West Side Railroad Company, of Chicago, since its origin has resigned to accept the position of general superintendent and chief electrical engineer of the Manhattan Railway Company, of New York. This signifies beyond a doubt that the electrical equipment of the Manhattan elevated will proceed, and under Mr. Baker's skillful guidance it will become as fine an example of a model elevated railway in electrical equipment, train service and management as the Metropolitan is today. The selection is a wise one, for a more experienced man in electric elevated construction and operation could not be found.

Mr. Baker was born in Springfield, Mass., in 1856, and was graduated from the engineering school of Lafayette College in 1877, and later found employment on the civil engineering staffs of the St. Paul & Pacific, the Northern Pacific and the Canadian Pacific rail-

W. E. BAKER.

roads. After doing pioneer surveying work for two years in the Rocky Mountains he was engaged as resident engineer in steam road building for the International & Great Northern in Texas. In 1883 on a trip to St. Paul Mr. Baker met Miss Griffin from New York who was visiting Governor Merriam, and she afterwards became his wife.

In 1888 he went to Boston and associated himself with the Thomson-Houston Co. and here gained his first electrical experience. The West End Street Railway was the first large railway system to be equipped for electric traction, and Mr. Baker had ample opportunity to demonstrate his ability as superintendent of the surface roads in Boston. After finishing his work there the General Electric Company secured his services for a time. The Intramural Railway of the World's Fair was constructed and operated under his supervision and it was demonstrated in service that the third-rail system was practical for elevated railways. The many innovations in this system, including the largest generators and motors ever built at that time, were carefully worked out by Mr. Baker. Little need be said about his connection with the Metropolitan West Side Elevated Railroad Company for its unequaled excellence in every department is largely due to Mr. Baker's efforts. Mr. Baker goes to New York to take entire charge of the installation of the electrical equipment and to assist and advise Alfred Skitt, vice-president and general manager of the Manhattan Railway Company.

On the evening of March 6 a farewell dinner was tendered Mr. Baker by a number of friends, at the Union League club. While Mr. Baker's removal to New York is a positive loss to the electrical fraternity of Chicago, he carries with him the warmest regard and best wishes of all.

During the latter part of February the cable roads of St. Louis experienced some difficulty in running because of the cable slots contracting. The trouble was due to the sudden freezing of the material between the paving blocks forcing the slot rails together. The trouble is one inevitably incident to all conduit construction.

DOUBLE-TRACK ELECTRIC RAILWAY FROM BUTTE TO CENTERVILLE, MONTANA.

From a paper by Francis W. Blackford read before the Montana Society of Engineers and published in the Journal of the Association of Engineering Societies.

The city of Butte and the town of Centerville, one of its suburbs, were connected, in the year 1897, by a cable passenger railway, which did service until about a year ago, when plans were made to substitute therefor electric traction and to make the necessary changes in the alignment and grades.

The cable was run in an almost direct line between the two places. It overcame an elevation of 390 ft. between Park street, Butte, and Center street, Centerville, a distance of 0.9 mile, and had grades as steep as 14 per cent.

The plan of the new enterprise was to construct a double-track electric railway, if possible, upon grades not exceeding 5 per cent,

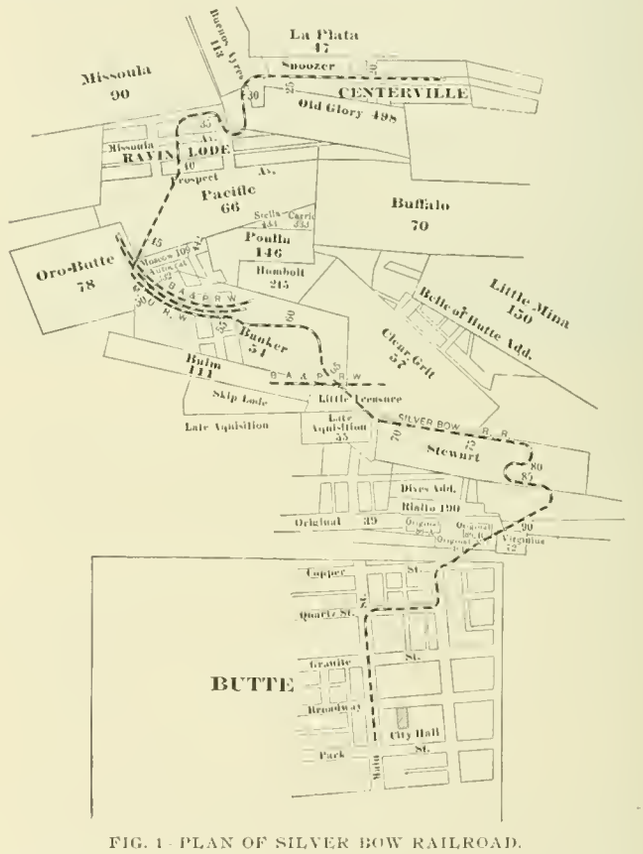


FIG. 1 - PLAN OF SILVER BOW RAILROAD.

and located so as to accommodate the greatest number of people residing in the several settlements lying between the two places.

In pursuance of this plan a number of lines were run in the summer of 1897 by W. H. Harrison, C. E., under the general direction of the writer, and the possibilities were pretty well understood before the final location was begun. In these preliminary location lines complete circles of radii to suit the conditions were used in development, and many interesting engineering features were introduced to overcome the elevation and avoid expensive or objectionable places. It was, however, found to be impracticable to adhere to a grade of 5 per cent, and in the final location grades of 6 and 7½ per cent were introduced in places, with rates varying from level up to these, as shown by the profile, Fig. 2.

As the location progressed it was found that the right of way was the paramount question, and of greater importance than the physical difficulties to be overcome. While farm and town or city property has a pretty well-established value, easily determined by testimony before a commission, the determination of the value of a piece of undeveloped mining property is a very different and a very difficult matter. The owner of such property can often prove the value of his surface ground, for use in the development of the mine, to be so great in a single instance as to practically kill such an en-

terprise; and the only thing to do in such cases is to avoid the property, or at least that part of it which is likely to be used for developing the mine.

The company's charter gave power to condemn land for a right of way, but, for the reasons stated, it was thought best to locate the line upon ground which could be purchased at reasonable prices; and the location was so made, the right of way therefore becoming one of the controlling features of the location.

The crossings of the three steam railroads were made overhead upon steel spans or plate girders, the other crossings, four in number, were wooden bent trestles. While the latter contain no unusual features, the plans were prepared especially for this work. They were planned to carry "Jumbo" cars of 15 tons weight, with a load of 180 persons, or a total weight of 30 tons. The elevation of the track on curves was computed for a speed of 12 miles per hour, and on the bridges was obtained by means of a false cap.

The curves vary in radius from 64 to 143 ft., with transition curves at the ends increasing to 1' every 10 ft. upon the lighter curves and to 1' every 5 ft. upon the heavier ones.

No compensation of grade on curves was made because the power supplied to the cars was ample to enable them to ascend much steeper grades, the objection to the heavy grades being the difficulty in safely descending them. Upon this line, which overcomes an elevation of 416 ft., and has 13¼ miles of almost continuous grade, the safe descent is the special feature of its operation.

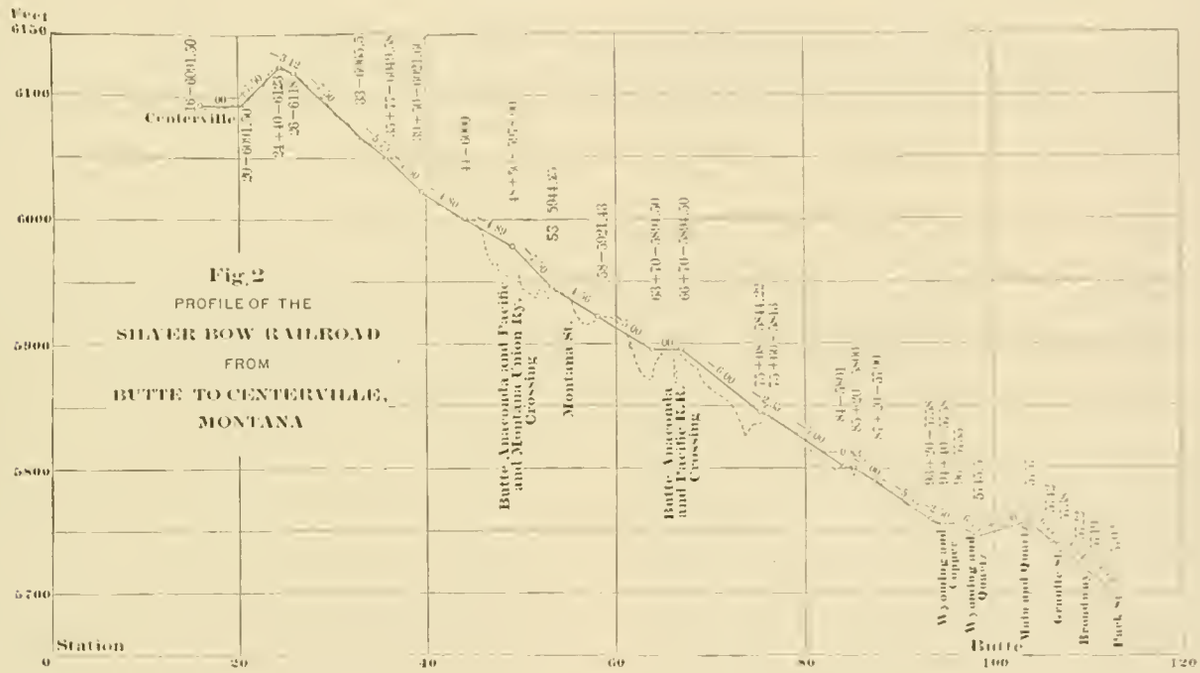

Fig. 2
PROFILE OF THE
SILVER BOW RAILROAD
FROM
BUTTE TO CENTERVILLE, MONTANA

Except on the paved streets of Butte, the road is laid throughout with 52-lb. second-hand steel rail that had been in use on the Oregon Short Line Railway. The rail was but little worn, and it makes an excellent track.

The rails are bonded with the Atkinson horseshoe bond, No. 0000 cross-bonded every 600 ft.

The power is transmitted by the usual overhead wire, supported by cedar poles on each side. The feed wire, however, does not follow the meanderings of the road, but runs straight up the hill and feeds at the crossings and at the end of the line.

The line is equipped with 16-ft. single truck cars, with 30-in. wheels and two 35-h. p. G. E. 1,000 motors on each car.

In addition to the usual chain brake, the cars have the General Electric electric brake, the latter being used as an emergency brake only. They also have the G. E. K-10 controller.

The trip from the corner of Park and Main streets, Butte, to the corner of Center and Main streets, Centerville, a distance of 13¼ miles, is made with ease in 15 minutes, each car making two round trips per hour.

The line has been in successful operation since August 7, 1898, and no accidents or runaways have occurred. In only one instance has the emergency brake been applied.

LAND DAMAGE SUITS IN CHICAGO.

It is stated that the owners of property abutting on the streets occupied by the Union Elevated Railway, of Chicago, have pooled their interests and have secured William G. Peckham, of New York, who won many land damage suits against the Manhattan Elevated, and other eminent counsel to prosecute the suit of the Chicago Office Building Company against the Lake Street Elevated Railroad Company set for March 1. The case will be important as a precedent. The damages alleged are the hampering of free ingress and egress, cutting off light and air, the creation of noise, dirt, and vibration and the casting of shadows.

BROOKLYN RAPID TRANSIT INCREASES CAPITAL.

The following statement of the action taken at a recent meeting of the stockholders of the Brooklyn Rapid Transit Company has been issued by Mr. Rossiter:

"The special meeting of the stockholders of the Brooklyn Rapid Transit Company called to consider the proposed increase of the capital stock of that company from $20,000,000 to $45,000,000 was held at the office of the company. All the stock was represented, and the vote was unanimous in favor of the increase.

"In addition the holders of 149,386 Central Trust Company's certificates of beneficial interest gave their consent to the proposed increase. No other business was transacted at the meeting."

Ex-Governor Flower is authority for the following statement: "The reason for increasing the capital stock was to enable the company to buy the stock, rights and franchises of the Nassau Electric Railroad Company. The negotiations for the purchase are now well under way, and I believe it will be effected within thirty days. After that the absorption of the Brooklyn Elevated Railroad Company may follow."

Rumors of negotiations for the purchase of the Bay Cities Consolidated Railway Company's property by the Saginaw (Mich.) Valley Traction Company are denied by S. L. Nelson, manager of the Bay City lines.

By an arrangement with the local authorities the plans for a new bridge over the Connecticut river at Hartford are to be modified so that the Hartford Street Railway Company may lay a double track over it. The cost of the bridge, which was not to exceed $500,000, will be increased about $75,000 because of the change and this will be borne by the railway.

THE MOORE TRUCK.

A motor truck has been developed in the shops of the Chicago City Railway Company, which presents a number of new and commendable features. About a year and a half ago a truck was constructed with wooden sills, and placed under an 1,800-gallon sprinkling car. Its operation was so satisfactory that it was continued in service and a record kept of its performance. Alterations and improvements were made from time to time, under the direction of C. E. Moore, master mechanic of the company. Designs were prepared for motor car trucks and a few of them placed in service. The result was so satisfactory that an order was given for 35. Later, Superintendent Nagle decided to put this style of truck under the 100 cars now being built by the Stephenson Company.

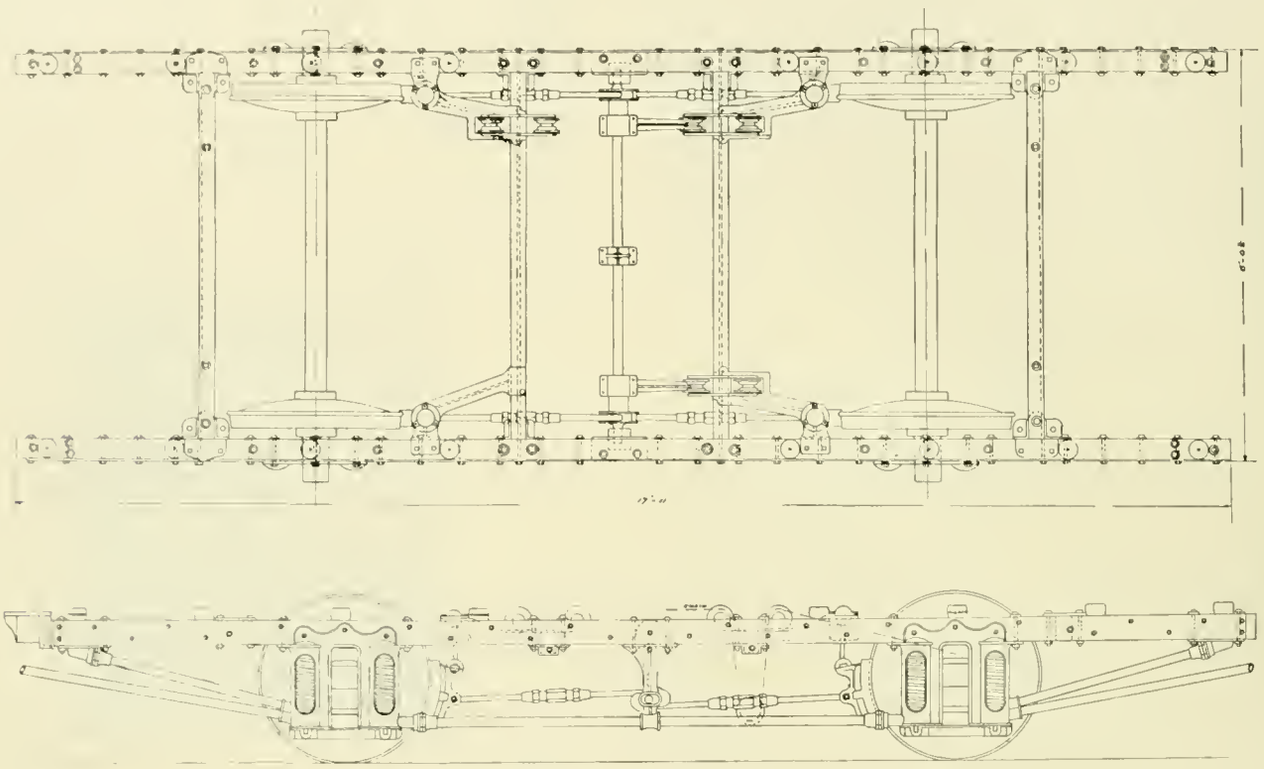

FIG. 1—PLAN AND ELEVATION OF THE MOORE TRUCK.

As may be seen from the side elevation and top view, Fig. 1, there are two longitudinal wood sills of yellow pine, 3½ by 4½ in. by 17 ft. 11 in. long, reinforced on the outside by ⅜-in. steel plates. The cross tie pieces and motor supports are of seasoned oak. Bolted to the sills are four pedestals, each holding two springs 4⅞ in. in diameter and 11 in. long. Two large pedestal bolts extending down through the springs hold the pedestal binder at the bottom in place. This is so arranged that by loosening the nuts the binders may be removed, the pedestal dismantled, and the wheels taken out without interfering with the car body, trusses or other parts. This is a great advantage when repairs are to be made or wheels removed.

The oil boxes are supported in pedestal jaws in such a manner as to allow a perfectly free lateral movement of 1¼ in. in each direction, providing a swing motion of 2½ in., which is brought into play in rounding curves. The journal brasses are cupped shape at the top, with small holes leading down through the brass to the inner or bearing surface. This cup is packed with a mixture of plumbago and tallow, which melts at an abnormal temperature and trickles down through holes, lubricating the bearing, effectually preventing hot boxes. The oil box cover is provided with a leather washer around its inner edges, and is held in place by a bolt in the center, making a dust-proof box, and also prevents oil from leaking or slushing out.

To each sill, midway between the wheels, is a center truss support, which also carries a tumbling shaft, being the only beam or bar connecting the brakes. The brake shoe hanger has an adjustable ball and socket joint attachment, both at the truck and brake head, permitting perfect freedom of movement. By means of a turnbuckle each shoe can be separately adjusted. An eccentric toggle at each end of the tumbling shaft forces the shoes against the wheels.

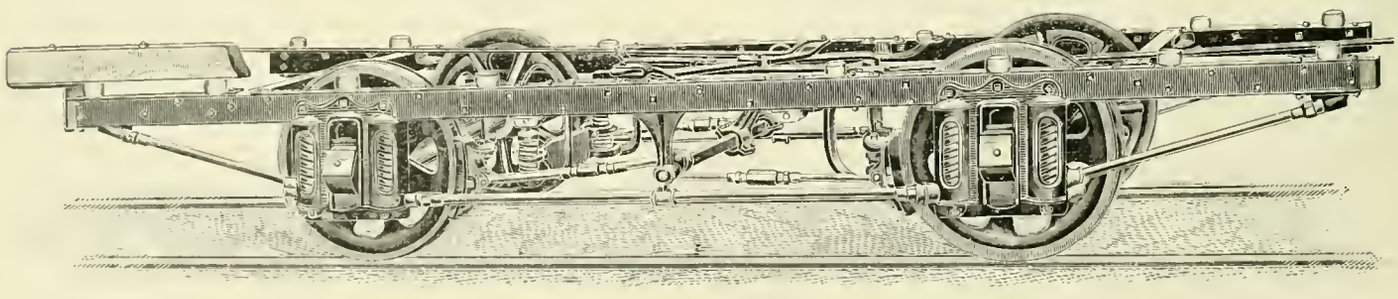

FIG. 2.

In each center truss support is an equalizing slot, 1⅝ in. x 3 in. long, which carries the tumbling shaft when the brakes are applied. This equalizing slot allows the tumbling shaft to adjust itself, thereby insuring a perfect equality of shoe pressure at the wheels. The brake shoes, on account of the ball and socket joint, adjust themselves under all conditions to the wheels, thereby insuring a uniform wear at all points of contact between shoes and wheels. The

shoes bearing near the center of the wheels, obviates the tendency to compress the springs when brakes are applied, as is the case where shoes are carried on the outside and near the track. The compression of springs in applying brakes, means more slack in the brake chains, consequently longer time in attaining the maximum braking power. The brake shoes are of cast iron, held in Christy heads, and can be easily removed at any time. The brake can be operated either by brake handles or friction disks.

The method of mounting the car body on the truck is shown at the right, in Fig. 2. Along each truck sill are eight cylindrical rubber insulators, $2^1/_4$ in. in height and $3^5/_8$ in. in diameter, with concave surfaces, top and bottom, held in place by wooden pins. The weight of the car body, compressing these insulators, forms a vacuum, which assist in holding the car body to the truck. By this means the truck sills support the car body along its entire length.

A socket padded with sheet rubber is slipped over the end of each sill. On the top of this socket is a serrated plate which fits into a corresponding plate on the sill of the car body. The socket is pushed into the proper position and held in place by a bolt extending down from the car body through a slot in the socket plate; the plates, and not the bolts, take the stress. There is no metallic contact between the track and car body, which largely accounts for the noiseless operation and the easy motion of the cars. The arrangement makes the changing of the trucks an easy matter. Four nuts have to be loosened, the sockets slipped back, the controller cables disconnected, the car body jacked up and the truck run out, which requires only a few minutes' work.

It will be noted that on account of the inside brake mechanism both ends of the truck are free from any parts which would interfere with fenders, life guards and track cleaning devices. With the exception of the oil box links and pedestal bolts, there are no forgings about the truck, strong and light malleable iron castings being employed. The swing motion in the pedestal jaws allows the use of a long wheel base and permits the truck to round sharp curves without undue stress on the truck or wear on wheel flanges.

The service tests of this truck under the cars of the Toledo Traction Company and the Sheboygan Light, Power & Railway Company, as well as the Chicago City Railway Company, prove it to be cheap, durable, noiseless and easy riding. Arrangements have been completed for its manufacture and sale by the Dorner Truck & Manufacturing Company, of Cleveland.

SAFEGUARDS IN EXPORT SHIPPING.

From an address before the Chicago Trade Press Association by F. B. Smith, of G. W. Sheldon & Co.

There is much to be done before the world-business can be intelligently and skillfully controlled by our manufacturers:

We must go after the business.

We must get the business.

We must hold the business.

To accomplish the first named requisite, our trade journals are doing a magnificent service, their circulation reaching the most remote known points where business is carried on. A second and similar help to the introduction of American goods abroad are the elegant catalogs issued by our large mail order houses. The establishment of trade expositions of raw and finished products in our midst, and at the principal capitals of other nations, will bring comparisons and inquiries, which cannot but result to the benefit of our commerce. The personal solicitation of orders by sample and by catalog is steadily going on, and in ever increasing amounts.

But after all is done, the business gained, the orders filled, there still remains the third requisite:

How are we to hold the business?

The representation has been good, the articles are satisfactory in themselves, but they must be quickly and cheaply transported to their destination, and here the shipping agent may contribute his link of the chain. Nothing can be more annoying to a waiting customer, nor to an eager and progressive manufacturer, than the delays and expenses due to errors in shipping and clearing goods. To the shipper for export, it may be said that a few simple precautions taken before his goods have gone forward, will result in a smooth delivery, whereas, these matters neglected, result in confusion, delay and loss, perhaps in a total suspension of orders from a given source.

In the main, the necessary requisite for a satisfactory export shipment should be the preparation of a duplicate invoice, setting forth the component material, size, and weight of each item detailed, and a manifest or skeleton description of the export, stating gross and net weights of each package, and its height, breadth and length, and marks, numbers, addresses and value. This document should accompany the duplicate invoice. It is not necessary in exports to many countries, but it is required by some, and is a most useful adjunct to an invoice, when handled by custom house officials abroad.

These documents should be handed to the forwarding agents at point of origin, with a request to secure a through rate to ultimate destination. This can usually be obtained at a lower rate than the sums of local, inland charges, and ocean freight would amount to, if a contract be made at time of shipment. If delivery be made by shipper at seaboard, or f. o. b. departing vessel, shipper and consignee share the reduced rate in proportion.

Goods for export should be plainly marked on cases or packages with full name and address of consignee, and these marks repeated in a letter of instructions to the forwarding agent, enclosing the invoice and manifest above referred to, stating clearly whether insurance is desired or not, particulars of collection of freight charges and giving instructions for disposal of the bills of lading.

As a matter of interest to most shippers for export, it may be stated that through bills of lading may be obtained from your forwarding agent at point of shipment, either for use as evidence of shipment to accompany invoice, or as negotiable documents to be exchanged for ship's bill of lading on arrival at the port. It is scarcely necessary to say that shipments for export should be invariably packed in strong cases well packed. If crated, crates should be so heavy as to prevent possibility of being shaken apart or broken by rough handling.

If these simple precautions are taken, the shipper may feel that nothing has been left undone on his part to insure his property a safe and speedy delivery to destination.

Rates of ocean freight are usually quoted by measurement, and in quoting rates, steamship lines reserve the privilege of applying a weight or measurement rate to the whole or any part of a given shipment. A rate of 20 shillings per ton weight, therefore, would mean 2,240 pounds for $4.80, or $22^1/_2$ cents per 100 pounds, while a rate of 20 shillings measurement may mean, if goods weigh 500 pounds to 40 cubic feet, 96 cents per 100 pounds, or, if weight be 1,000 pounds to 40 cubic feet, it would mean 48 cents per 100 pounds. To secure a through rate, therefore, shippers should always specify the weight and measurements of representative cases of their product, especially reporting any pieces of over two tons in weight, as rates on such heavy pieces are higher than for ordinary goods, and include charges for hoisting and for lighterage. Information regarding duties on shipments to foreign countries should be obtained from the resident consul of such country. It is true that a number of consular offices at Chicago are at present poorly informed as to the tariffs of their respective governments, but this condition will doubtless be remedied in the near future, as the need of information of this nature is persistently represented to the home offices of the various diplomatic representatives.

CAR BARN DESTROYED.

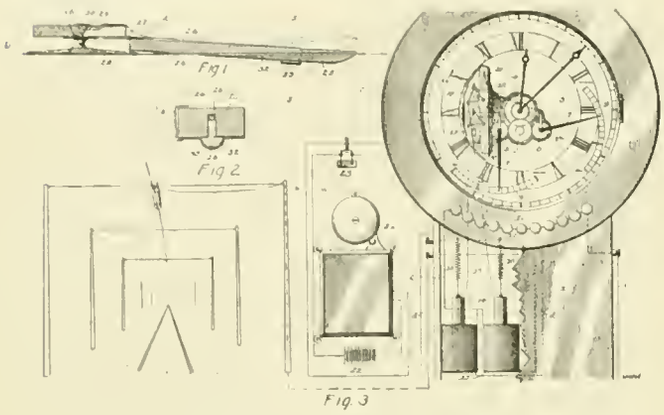
February 10, the car barn of the East Bridgewater (Mass.) & Brockton Street Railway Company, an iron roofed brick building 90 ft. by 50 ft., located a short distance from East Bridgewater, was destroyed by fire. A good fire had been built in the furnace to prevent water pipes freezing, but it is not thought that the fire caught from the furnace.

Five cars and one snow plow, together with a quantity of tools, belonging to this company were destroyed and also three cars belonging to the Brockton, Bridgewater & Taunton Street Railway Company, which were in the barn. The loss was estimated at over $23,000.

There is a city ordinance in East St. Louis compelling all street cars to be equipped with fenders, but the St. Louis, Belleville & Suburban Electric Railway Company has not yet complied with it. Superintendent Mayo and eight of the employes were served with summonses to appear for trial in a justice court for violating the law.

CAR TIMING SYSTEM FOR TROLLEY CARS.

The timing mechanism for trolley cars described below was patented last month by Henry Garrett after it had been in successful operation for several months. Although not suited to the short headway of cars on the large city lines, it is applicable to suburban and interurban routes. It is essentially an ordinary clock for automatically keeping check on the cars and indicating at the office



GARRETT CAR TIMING SYSTEM.

whether cars are on time in passing a particular point on the line, and, if not, to indicate how late they may be.

There is an indicating hand for each line, and while only two are shown in the figure any number of hands may be grouped around the gear, one for each branch line operated. At the extremity of each hand is a split hub having a frictional slip fitted on the spindle of the gear which is sufficiently tight so that the rotation of the gear will swing the hand in one direction, while at the same time permitting it to be swung back automatically. The latter movement of the oscillatory pointer is effected by the action of an electro-magnet. The bell circuit is open, but is closed by any abnormal movement of the pointer and the bell rings as a warning.

The electrical connections and the arrangement of the mechanism are shown in the diagram. At certain intervals along the line are trip-arms, Fig. 1, an enlarged cross section being shown in Fig. 2. The trolley wheel strikes the arm and brings the plate on it in contact with the trolley wire, which completes the circuit down the pole, to the office and through the clock solenoids, Fig. 3, to the ground, and the hand is swung back to the starting point. Should the car be late the hand will move on until it strikes a contact whose position has been predetermined, and the bell will ring.

When cars are operated on a schedule there is no difficulty in telling when any one is due at a given point, and all other cars on that line are at certain intervals ahead or behind. As long as the alarm gong does not ring there is assurance that there are no blockades, dead power, wires down or disabled cars. Should a car fail to pass a trip-arm and the allotted time is past, the bell will indicate that something is wrong and the attention of the emergency crew is needed.

ELECTRICAL EQUIPMENT AND DRAINAGE OF BOSTON SUBWAY.

In the Review for August, 1898, was published a brief illustrated description of the Boston Subway. This work was begun March 28, 1895, and completed, so far as the Transit Commission was concerned, on July 5, 1898. The fourth annual report of the Boston Transit Commission, for the year ending August 15, 1898, has been issued, and contains details of the work done during that year and a summary of all the work of the engineering department from the beginning. In appendices are given interesting data on the changes in pipes, sewers, conduits, etc., made because of the subway and of the equipment of the subway. From these appendices we extract the following:

There were 1,036 ft. of sewers of various sizes removed and 3,842 ft. built; 7,736 ft. of water pipes were removed and 9,105 ft. laid; 10,296 ft. of gas pipes were removed and 10,744 ft. laid; 31,800 ft. of lighting, telegraph and telephone conduits removed and 27,300 ft. laid. In addition numerous manholes, hydrants, junction boxes, etc., were removed and replaced.

The tunnel is 9,498 ft. long, and has 5.3 miles of track (measured as single track) laid with 85-lb. T-rail; the track rails are protected by 43-lb. guard rails. In equipping the overhead lines the following material was used:

Trough construction for trolley wire	23,625 ft.
Figure 8 trolley wire	23,362 "
No. 0 and No. 00 trolley wire at entrances and loops	7,055 "
Ground return, 500,000-c. m. cable, about	5,000 "
Ducts in conduit in subway alone	81,905 "
Barn hangers and insulating bolts	3,093
Insulating joints	17
Feeder switches	35
Manholes	63

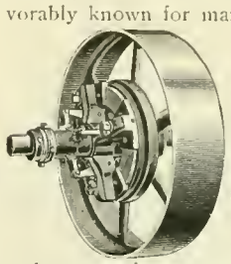
Four independent sources of light supply, in addition to the lights in the cars, are provided. At present there are installed in the entire length of the subway 1,235 incandescent lamps and 175 enclosed arcs.

The leakage into the subway, which nearly all comes through the small drains in the invert leading from hollows left in the side walls, was measured at the end of an unusually wet season, and found to be about 81 gallons per minute. This, together with the rain water entering from the open inclines, is collected in reservoirs and thence lifted from 12 to 18 ft. to the city sewers. There are four pump chambers equipped with motor-driven pumps, and the motors can be driven either from the circuit of the Boston Elevated Railway Company or from that of the Boston Electric Lighting Company.

The pumps are automatically operated. When the water rises to a certain level it raises a float that is connected by means of a chain with an automatic rheostat, that starts one motor direct connected to a vertical submerged centrifugal pump that removes the water, and when the water has fallen to a certain level the float descends and stops the motor. If it should happen that the first motor did not start, the water on rising a little higher would start the reserve motor, and if that should not work and the water continue to rise, an alarm bell at the center of distribution will ring and give warning that something is wrong. Duplicate pumps, each of 300 gallons per minute capacity, direct connected to 5-h. p. motors, are installed in each pump chamber.

FRICTION CLUTCHES.

The advantages of friction clutches for operating machinery in factories and repair shops is almost universally acknowledged. They are necessary where perfect control is desirable over the machinery in every part of the shops. The Frisbie clutch, which has been favorably known for many years, is now made by the Eastern Machinery Company, of New Haven, Conn. Thousands of these clutches are in use in every part of the country and under every condition of service. The simplicity of the design, as may be noted in the cut, and good workmanship have resulted in nearly all cases in long service. Letters have been received stating that clutches were in daily use for as long as 13 years with no repairs and apparently as good as new, and in one case a clutch was returned to the factory for repairs, the first time in 18 years of continuous use. The sizes range from 1.6 to 1,400 h. p. In some instances it is desirable to have a quill and hollow shaft connection between the engines and generators in the power station and for this purpose the clutch has been especially adapted. Many of the Frisbie clutches are now in use for driving generators in electric light and power plants.



The Cleveland Street Railway Employes' Association gave its annual masquerade ball on February 21; over a thousand persons were in attendance.

The gross earnings of the West Chicago Street Railroad Company for the week ending February 26, were $71,375, which is an increase of $5,347 over those for the corresponding week last year.

SOME DETAILS OF STREET RAILWAY CONSTRUCTION.

Read before the Illinois Society of Engineers by W. H. Rosencrans, City Engineer of South Bend, Ind.

The subject of street railway construction is a constantly broadening one, and, in my opinion, will soon overshadow in importance that of the steam railroad. I wish to speak of a few details of street railway construction, and in doing so will describe briefly the street railway systems and interurban railroad lines in and about South Bend, Ind. The city proper has at present about eight miles of street railroad, all of which was rebuilt in the summer of 1898.

Outside of the city there is a line running along the brow of the St. Joseph river bank, in a southeasterly direction to Mishawaka, a distance of four miles, its present terminus being in the center of the town. There is another line which leaves South Bend on the east and runs in a direct route to Mishawaka, on the north side of the river. Both roads follow the highway the entire distance, but are constructed on the sides of the road wherever it is possible to do so.

The same company has also acquired the Elkhart street railroad and the Goshen street railroad, and during November and December, 1898, connected these lines by a 10-mile interurban line along the Lake Shore & Michigan Southern Railroad right of way nearly the entire distance, on private right of way.

A line is located between Elkhart and Mishawaka, a distance of 10 miles, and will be constructed early this coming spring, together with many extensions to other towns in the vicinity of South Bend.

The city lines were constructed, with the exception of curves, entirely of T rails, weighing 70 lbs. to the lineal yard of the high girder rail form, furnished by the Johnson Steel Company, using section No. 70-264. All rail used was in 60-ft. lengths. The old lines of South Bend were first torn up and all old material removed. Then the street was excavated a sufficient depth below sub-grade to allow the placing of one foot of gravel below the base of ties, and excavated to a width of 8 ft. This sub-grade was rolled thoroughly with a 5-ton steam roller, having a compression of 500 lbs per sq. in. The track was then laid in the prepared trench, the rails, ties and splice bars having been previously distributed along the gutters. The gravel ballast was then distributed along the line and the lining and grading of the track was done in a most painstaking manner, using bar and pick tamps to give the finishing touches. The track was brought to exact line and grade. The spaces between the ties were then thoroughly tamped with hand tamps until

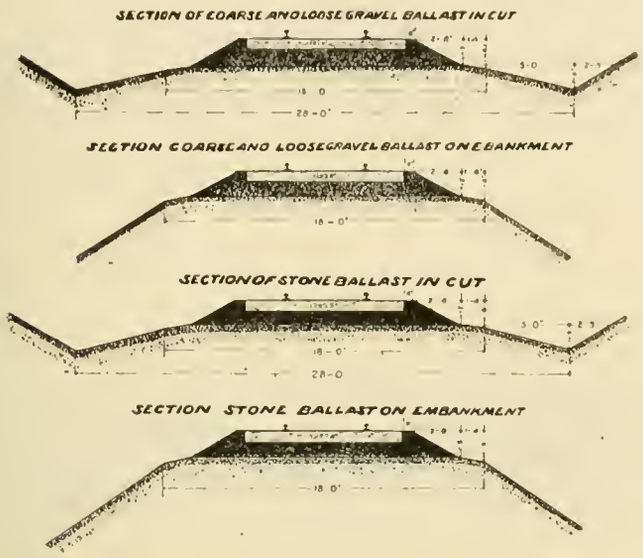


FIG. 1.

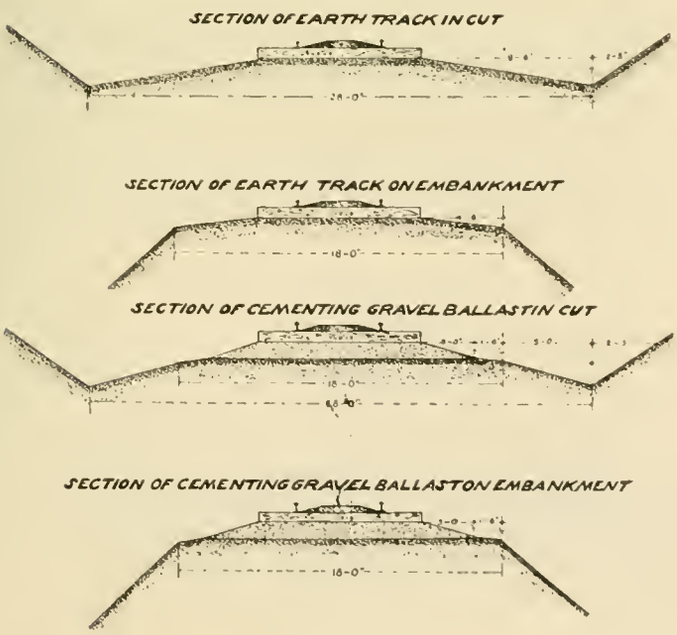

FIG. 2.

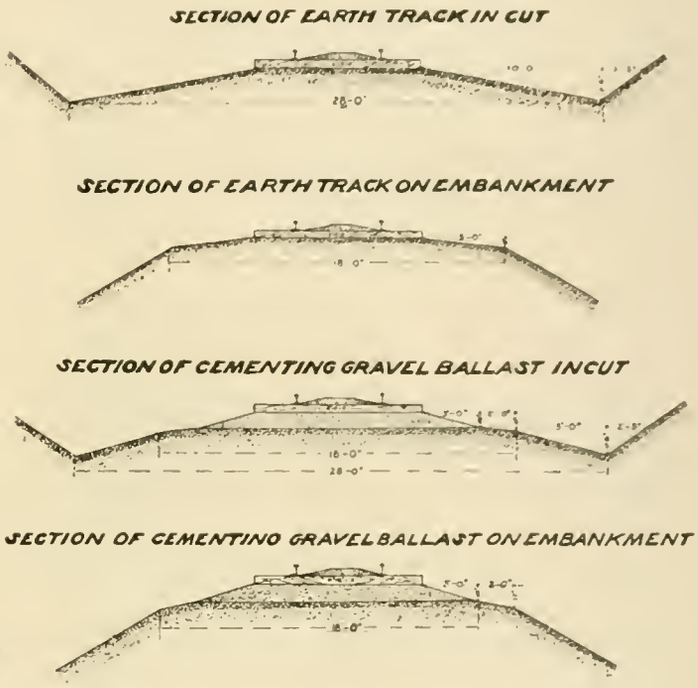

FIG. 3.

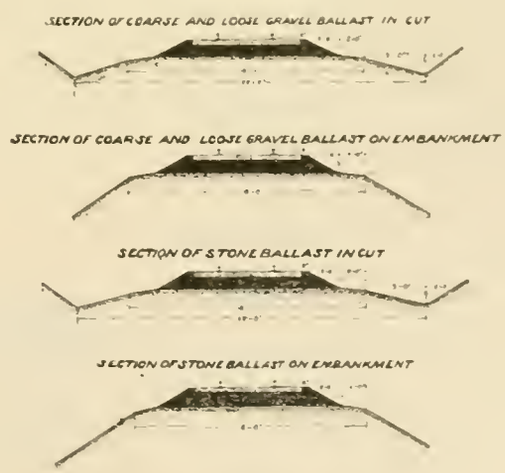

FIG. 4.

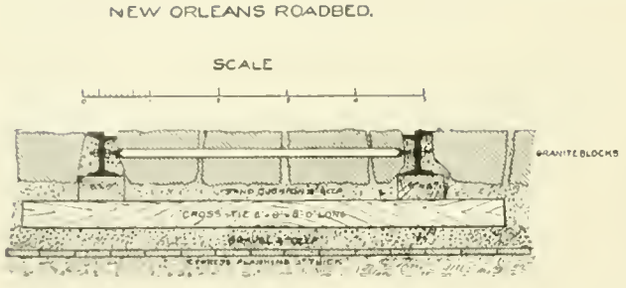

FIG. 5.

the gravel was brought to an even hard surface and at the level of the base of the ties. Great care was required in the construction and putting together of the joints. Splice bars 36 in. long were used, having drillings for three bolts in each rail. The splices were all sent to the shops of the company and all iron coatings, rust and scales removed. The ends of the rails were also thoroughly inspected, and while tightening the bolts the heads of the same were required to be tapped with a heavy hammer, as a safeguard to insure that all joints were tight.

On all the city lines the joints were double bonded, first inside the splices with short, many stranded, arched bonds, and outside with a single heavy copper rod running on the inside of the rail clear of the splice bars at both ends, and having about ½ in. of slack.

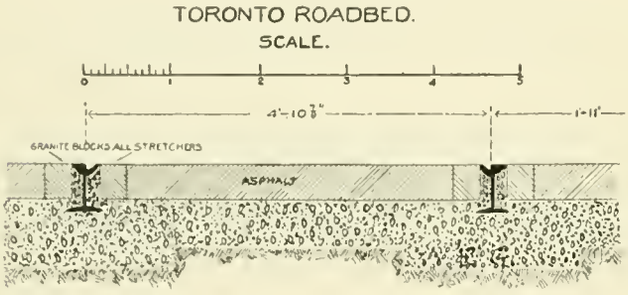

FIG. 6.

Tie rods were also used at intervals of 10 ft., drillings for them being made in the center of the web of the rail.

The street railway company is required to pave 3½ ft. on either side of the center line of its tracks, and also all space between double tracks, curves and switches. It was therefore decided to pave the space between the rails throughout the city, and repave in a permanent manner the entire strip which the street railway company was required to maintain.

The following plan was followed: Cement concrete was placed between the ties and to a height of one and one-half inches above them, on all brick paved streets, but care was observed to have no concrete laid on the ties. The space between the rails was paved with brick, laid at right angles to the track and having 1 in. crown in the center. A special form of brick was designed, a cut of which I herewith present, designed to fit beneath the head of the rail, and against the web, leaving a groove for the flange of the car wheel, which groove is curved or flared so as to allow a narrow-tired vehicle to slip out of the groove easily, if it should drop into it. These brick were made in such lengths that no chipping whatever was necessary, except at special work. On asphalt paved streets the paving was constructed with two lines of stretchers outside the rail and one row of headers of this special form of brick on the inner side. I have prepared a drawing showing this section, which I have made the standard shape for asphalt paved streets. In both the brick paved and the asphalt streets the space between the head of the rail and the base on the outer side of the rail was filled with cement grout, in order to bring it flush with the head of the rail and afford an even bearing for the paving surface.

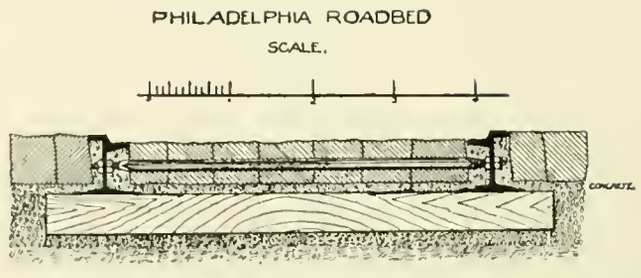

FIG. 7.

I have been able to prepare sections of street railway roadbeds, showing the methods of construction followed in a number of cities, which I believe represents the general practice in paved streets, which I wish here to present for your consideration.

In interurban street car lines the requirements become nearly the same as of a first-class steam road, and I have prepared sections of different classes of roadbed, which I think represent the best modern railroad practice. If 60-ft. lengths of rail are used, particular care should be observed to leave a proper allowance at joints for expansion. This is so important that I wish to quote from Ganot, who gives the co-efficient of expansion of steel due to a change of one degree F. as .000006.

The Pennsylvania Railroad Company made a series of tests to de-

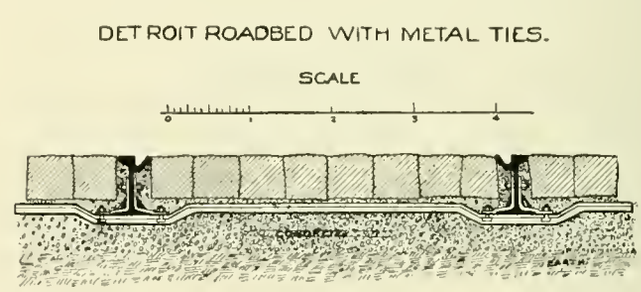

FIG. 8.

termine the rate of elongation of a steel rail, when subjected to a tensile stress within its elastic limit. The average was found to be .00006 in. per 1,000 lbs. per sq. in. Dividing this by the temperature co-efficient gives 114.6 lbs. as the stress per sq. in. in a rail, due to a change of 1° F., of 11,460 lbs. in a change of temperature of 100° F., which latter is equal to about one-fifth the elastic limit and one-ninth the ultimate strength of steel rail. However, it is probable that 5,000 lbs. represent the greatest stress due to change of temperature. This brings out a very vexatious question, that of the proper allowance for expansion when laying 60-ft. rails. I have obtained

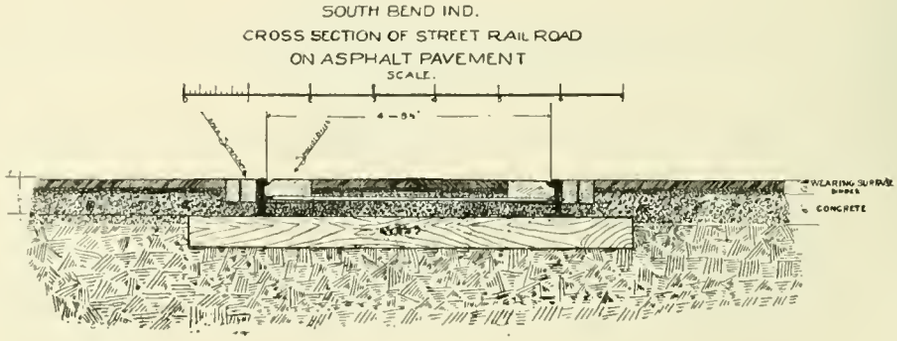

FIG. 9.

the best results by the use of a Fahrenheit thermometer when laying track, used as follows: At a temperature of 0 degrees a space of 5-16 in. was allowed, always using an iron shim. At 50°, 3-16 in. space, and in extreme summer heat, say 90° to 100° F., allow 1-16 in. space.

On the other hand, 60-ft. rails laid in paved or graveled streets and covered to their full depth may be laid closed joints; that is,

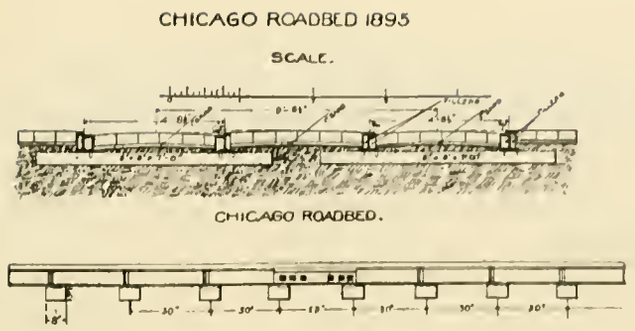

FIG. 10.

without any opening at the ends of the rails for expansion. Very good results are thus obtained, as we practically avoid the disagreeable pound due to passage of a wheel. "The worst enemy to good track is water, and the further it can be kept away from the track, or the sooner it can be diverted from it the better the track will be

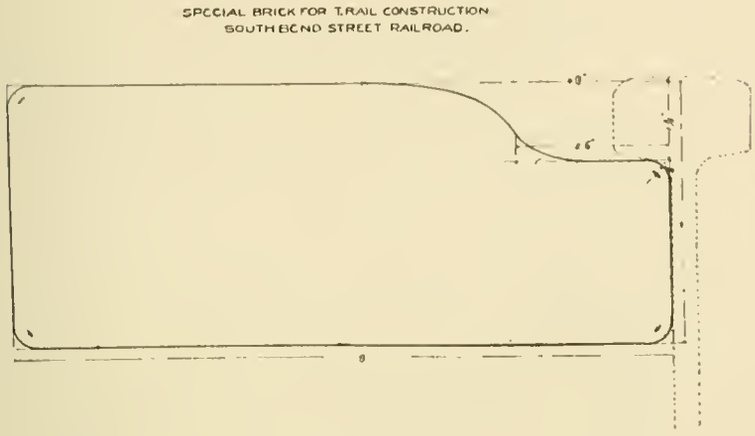

FIG. 11.

protected. Cold is damaging only by reason of the water which it freezes, therefore the first and most important provision for a good roadbed, and consequently good track, is drainage."

In the construction of the road and in its maintenance, this matter should receive the most careful attention of the engineer. I once had to clear a railroad wreck in a sand cut, thirty feet above the level of water in the adjacent creek, which was caused by water washing down a shallow depression which skirted the very crest of the sand hill, caving in the sand from the brow of the bank to a depth of five feet and clear across the track and cut, a distance of some 50 feet. The conditions were frozen ground followed by a

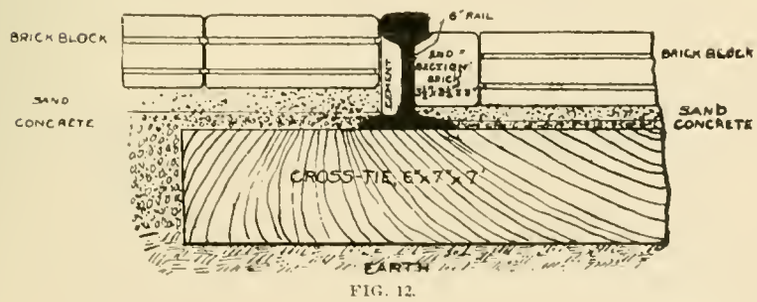

FIG. 12.

January thunder storm. This road had been operated 15 years, with no previous indication of trouble at this point.

In concluding I wish to say that street railway construction is yet in its infancy, and what is generally considered good engineering practice today may be looked on with as much circumspection in a few years as what was considered good street railroad construction ten years ago would be now considered.

The importance today of the interurban railroad is not questioned by the most skeptical. Six hundred miles of interurban railroad is a low estimate of the amount which will be built in Indiana alone during the year 1899.

With no limit to the field, and the brilliant promises of the electrical engineers in their special department, I believe we are entering an era of development more extended and far-reaching than any we have yet experienced, and one in which the engineer and the surveyor will play a most important part.

BILL TO LICENSE PUBLIC ACCOUNTANTS.

A bill for an act to regulate the profession of public accountants in the state of Illinois has been introduced at Springfield, whereby it is proposed to authorize the University of Illinois, at Champaign, to examine public accountants of this state and grant certificates to such as pass the examination, permitting them to designate themselves "certified public accountants." This bill is strongly indorsed by many prominent citizens of Illinois, and the public accountants of the state and their friends and clients are working to secure its passage. It is recognized that should this bill become a law, it would in time be very beneficial to the commerce of this state. A similar law has been in force in New York for two years, and has considerably benefited the legal, banking and business communities in the east. The proposed law for Illinois is not at all prohibitive; it only provides a body of recognized professional public accountants to choose from. It provides that the trustees of the University of Illinois may, at their discretion, waive the examination of any persons possessing the qualifications prescribed in the bill, and who shall have been continuously for more than five years before the passage of the bill practicing as public accountants, two years of which shall have been on their own account, in this state, and who shall apply in writing for such certificate within one year after the passage of the act.

A NOVELTY IN DAMAGE SUITS.

In the case of one Herman Schinauer against the Brooklyn Heights Railroad Company for $10,000 damages for personal injuries alleged to have been received in a trolley car accident the jury found for the defendant. It is the practice of the New York courts to grant the plaintiff an extra allowance of 5 per cent in event that he is successful, but it is unusual to grant a similar allowance to the defendant if the plaintiff fails. In this case, however, the court did grant the defendant an allowance of $500. Fortunately for the company the plaintiff is responsible and the company can collect the amount.

We trust that this precedent will be followed because if plaintiffs in the event of success are entitled to an extra allowance there would seem to be much better reason for the courts granting an extra allowance to defendants in case of their success, especially in view of the fact that much of the litigation of this nature is brought by attorneys who, knowing they have no case, expect to get money for themselves and their clients by appeals to the sympathies of juries or by frightening the railway company into settlement prior to suit.

PROPOSED FRANCHISE LAW IN CALIFORNIA.

A bill is pending in the California legislature providing for the sale of franchises by municipalities and the minimum compensation is fixed at 3 per cent of the gross receipts, but in the event that the franchise is for a branch line or extension of a street railway, the gross receipts are deemed to be the receipts from passengers getting on the cars on such branch lines or extensions. No governing body shall offer or advertise the renewal of any franchise until within one year of its expiration, unless previously surrendered by the operating company and accepted by the municipality. Should the bill pass the 3-per cent clause cannot fail to greatly delay the proposed construction of new roads, especially in the smaller cities.

Chester W. Chapin, receiver of the Consumers Electric Light & Street Railroad Company, of Tampa, Fla., has a large force at work restoring the dam which was destroyed by dynamite some months ago.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

In a paper recently presented before the Northeast Coast Institute of Engineers and Shipbuilders (England), T. Messenger described an effective method of strengthening copper steam pipes by placing on them a series of bands. The bands are made in halves with cottered connections. In one instance cited by the author, a 12-in. pipe carrying steam at 110 lbs., the bands had a section 2 in. by 3-10 in. and were spaced 6 in. from center to center. By arranging a special design of flanges and bands this mode of strengthening the pipes can be applied at branches. This plan is of advantage in localizing the rupture of the seam in brazed piping; with bands spaced as above, the seam opening cannot exceed 4 in. in length, whereas on a pipe without such reinforcement the seam would probably open along the entire section of pipe.

Commodore G. W. Melville, engineer-in-chief of the United States Navy, calls attention in his last annual report to the improvements made in the materials for marine machinery. He states that nickel-steel engine forgings have been brought to a high degree of perfection, and the only regret is that so few companies have undertaken to do this class of work, but the prospect is that in the near future several more steel companies will begin to make them.

Seamless drawn steel boiler tubes have been furnished during the year for all classes of our boilers of a degree of excellence undreamed of a few years ago, and in consequence the lap-welded tube makers have been compelled to correspondingly improve their product both in material and workmanship.

The securing of a suitable material for steam and feed pipes in the destroyers and torpedo boats became a vital question, owing to the fact that at the temperatures, corresponding to the high pressures carried, copper and brass, which have hitherto been employed, lose a large percentage of their strength. The difficulty has been overcome by the advent of seamless drawn-steel pipes, with wrought-steel flanges welded on which are now made with a degree of perfection which makes them absolutely safe.

When it was decided that the new battleships should be practically identical with the Alabama class and that no hull changes would be made, it became necessary to find a way to reduce the thickness of the shell plates for cylindrical boilers. The shell plates in the Alabama class had reached a thickness of 1 7-16 in. in material having a tensile strength of over 65,000 lbs., and elastic limit of over 35,000 lbs., and an elongation of 24 per cent in 8 in. for longitudinal specimens.

Experiments have been made on a higher carbon steel, oil tempered and annealed, which has a tensile strength of over 74,000 lbs., and elastic limit of over 40,000 lbs., and elongation of over 21 per cent, with a very satisfactory transverse cold bending test. Such material allowed a slight reduction in thickness from that used in battleships Nos. 7, 8 and 9, although the boilers were designed for the higher pressure called for in the new battleships.

Nickel steel bracing and rivets have been made and tested and found suitable for use with this high-grade compound boiler plate, easily reaching the requirements of the Bureau's specifications.

Experiments have also been made with nickel steel to fill the high-grade shell-plate requirements, which gave very satisfactory physical results, with a surface much better than that furnished for the boilers of the Chicago, but not as perfect as that of the high-grade steel just described.

IMPROVEMENT IN CAST IRON FLY-WHEEL DESIGN.

Some time since the writer, having occasion to design a fly-wheel to meet rather unusual conditions, investigated the question of fly-wheel design and considered some changes that might easily be made and what the benefits of such changes would be. There are a great many fly-wheels built by the makes of medium and low speed engines that are made in halves with the joints placed midway between the adjacent arms, and these wheels are often run at a higher rim speed than are the larger built-up wheels, which as now generally made have the joints in the rims at the ends of the arms. Many excellent papers have been written upon the subject of fly-wheel design, in which it is shown that the joint when placed midway between adjacent arms is in the worst possible position; as Professor Benjamin, in his recent paper before the A. S. M. E. stated it, to put a joint midway between adjacent arms is like putting a joint in the middle of a girder.

The radial centrifugal force acting uniformly round the rim like a fluid pressure tends to separate the rim, and the joints, no matter where placed, must resist this stress. The centrifugal force of the portion between the arms acts to load that portion as a beam and thus additional stresses are introduced. The point in this portion at which the joint is placed greatly affects the stress placed on the joint.

Considering the solid segment in Fig. 1, we have a beam fixed at both ends and uniformly loaded. The maximum bending moment under such conditions is WL ÷ 12, where W is the total uniformly distributed load and L the distance between supports. This maximum bending moment occurs at the two supports; midway between the supports the moment is WL ÷ 24. There are two points, about one-fifth way from each support, where the moment is zero, these being the points of contrary flexure.

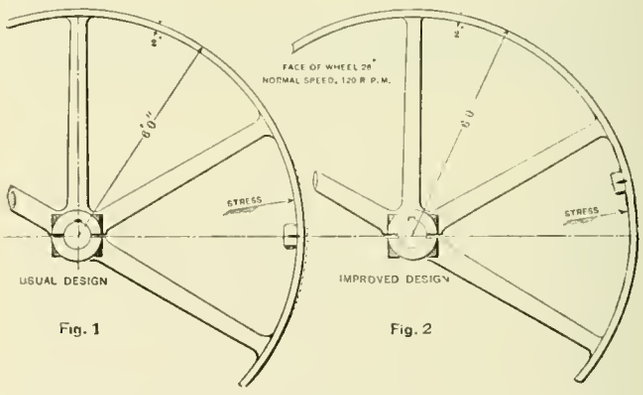

Fig. 1 Fig. 2

If we place midway between the arms a joint of the type shown (with inward projecting lugs to receive bolts) in the cut, we practically have two beams fixed at one end. The maximum bending moment in each of these beams, fixed at one end and uniformly loaded, would be WL ÷ 8, where W is the total load on both beams and L is the total length of both beams. This, it is seen, is 50 per cent greater than in the solid segment.

If the joint be placed, as shown in Fig. 2, about one-fifth from the end of the segment at the point of contrary flexure, the bending moment at that joint has to resist only the stress tending to separate the rim in halves. That this is true may be easily demonstrated by considering the longer portion of the segment as a beam fixed at one end and supported at the other by the shorter portion, and the shorter portion as carrying a concentrated load (the reaction at the end of the longer portion) in addition to its own uniformly distributed load; the result is the same as for the solid segment, i. e., the maximum bending moment is at the adjacent arms and is WL ÷ 12.

Changing the position as here suggested does not add in any way to the cost of manufacture, nor does it make the joint as strong as

*Miscellaneous .002. **Miscellaneous .006.

the solid rim, nor does it eliminate the stress the rim bolts are generally computed to stand, that of holding the two halves together; but as the joint lugs are usually made, placing them nearer the arms lessens the stress in the section of rim where the joint occurs, conduces largely to cause the wheel to revolve at a high velocity as a true circle (instead of as an ellipse, with the joint on the major axis), and reduces the stress in the bolts from the joint "giving" or "opening" slightly, as is so often the case.

The common practice of placing the bolts very near the inner edge of the joint lugs which often results in an enormous stretching action in the bolts, and in some cases which the writer has seen has undoubtedly been the cause of the difficulty experienced in keeping the rim bolts tight; not because the bolts were not of sufficient section to stand the ordinary pull, as generally computed (like the stress of a boiler shell), but the additional stress caused by the wheel rim springing out, as shown in Fig. 1, and there slightly opening the joint on the outside of the wheel, against the resistance offered by the bolt with the leverage of the short side of the lug, which, of course, resulted in stretching the bolts in the bottom of one or two threads; and subsequently upon stopping the wheel the bolts would be found looser than when the wheel was put in motion, or the bolts last set up tight; and in connection with this matter we must remember that the usual and accepted methods of calculating the section of rim bolt make no allowance for this springing and stretching action, which can be entirely avoided by placing the joint as shown in Fig. 2, in which case the only stress coming on the bolts from the joint is one of small shear if the joint is planned, but if the wheel is cast whole and afterwards split, even this shear is taken up by the roughness of the fractured surfaces on the inner and outer edges of the joint lug.

F. W. Salmon.

ENGINE AND BOILER TESTING.

Abstract of a paper read before the Engineers' Club, of Philadelphia, by Henry W. Spangler, and published in its "Proceedings" for January, 1898.

In these days of elaborate codes for the testing of engines and boilers we are apt to lose sight of the reasons for making such tests, and to attempt to fulfill certain requirements that are entirely foreign to the reasonable purposes for which such tests are made.

Generally, all such can be divided into two classes—first, the so-called scientific tests; and, secondly, commercial tests. The first of these are such as are carried out by so-called original investigators, whose facilities are generally of the best, but applied in many cases to impossible apparatus in a commercial sence. The objects of such tests are, nominally, to get at the real facts, on the basis of which greater advances in steam engineering are to be made. Unfortunately, the advance has seldom been made as the result of tests of this kind, and it is doubtful if scientific tests of the kind here referred to which will bear the sharpest scrutiny have been made by more than one investigator in a generation. By impossible apparatus, in a commercial sense, I mean that the self-imposed conditions are those which are very different from, and in many cases the direct opposite of, the conditions which actually prevail in apparatus intended for practical use. A concrete example will illustrate: In the proposed code for boiler testing now under revision by a committee of the A. S. M. E., a scientific test of the boiler may be commenced by hauling the fire.

Many of the so-called scientific engine tests have been made on engines designed to be used for many different purposes, and the numerous by-passes, pockets, etc., required to fulfill the various functions leave the results obtained always open to criticism.

The second class of tests stands in an entirely different position, and it is on the results of these tests, intelligently carried out, that practically all the engineering advance is made.

Commercial testing has for its object the determining of one of two things—first, whether the apparatus is doing the best that can be done by it; or, secondly, whether a certain guarantee has been fulfilled.

These two tests are usually made by different persons and in the sequence above given, as in these days of sharp competition the guarantees furnished by the maker require for the fulfillment that the apparatus should be in first-rate condition. The result is that, generally, the engineer or the maker is called on to make the first of these tests, while the engineer, who stands between the maker and the owner, is called on to make the second. Much the higher grade of engineering is required for the first. The duty of the engineer in the first instance is not only to determine the facts, but to so modify the regimen of the apparatus that as many as possible of the unfavorable conditions may be eliminated and the favorable conditions made still more so. The business of the engineer in the second case is to report on the facts only. It is evident that the character of the tests made will differ in the two cases. In the one case all the facts, or as many as possible, must be obtained, while in the other only such as pertain to the guarantee.

In making the first set of tests the data obtained must be correct, or the object of the test will not be attained; in making the second set of tests the data should be as honestly obtained as in the first. The position of the engineer is quite a different one in the two cases: in the first he must be honest with himself, and he has the confidence of his employer or client; while in the second case, if acting alone, he is liable to be looked on as the servant of the party who first suggested him, or, if acting with others, is very likely to be considered as a partisan. When the engineer finds that the latter is his position—as, I am sorry to say, some do—he is too likely to be a quibbler, straining every point that his employer may come out ahead; and one does not wonder that many so-called tests are looked on with suspicion. The position of the engineer in a case like the last is not at all an enviable one, and he must first know what is right and then do what he knows to be right.

The actual testing of boilers and engines is really a very simple matter. Direct methods of measuring the quantities to be dealt with are always to be chosen rather than indirect ones, and care should be taken to see that the apparatus in use is as nearly correct as can be obtained.

As tests of the second class above referred to are entirely covered by the first one, it is with that one alone that we will deal.

We will first take up a boiler which has been erected and is about to be tested. The maker wants to know whether it is in the best possible condition, and he wants to be able to tell this in the least possible time. There are usually two things required—first, that the boiler shall be able to do a certain maximum amount of work; and,

secondly, that under certain definite conditions—as, for instance, when evaporating some part, say 75 or 80 per cent, of the maximum amount—it will do so with a given economy—as, for instance, utilizing 65 or 70 per cent of the heat in the coal, and using a certain grade of coal. Unfortunately, it is not a very easy matter to state these conditions in such a way that they are entirely definite, and in many cases the results will vary with the meanings and limitations set to the terms of the contract.

For instance, if the contract says that 70 per cent of the heat in the coal is to be utilized, what does this mean? and how is it to be determined? Is the moisture in the coal to be determined during the test by actually drying a large quantity, or by the chemist's method, using a few grams? If by the first method, is it to be done by placing in the hottest part of the boiler room or over a slow fire? It is safe to say that any one of these methods will give a different result and a correspondingly different value to the amount of heat that must be utilized.

Again, is the evaporation of this water to be allowed for or not? How is the heat in the coal to be determined—by chemical analysis or by actual burning in a calorimeter? Is the heat to be counted down to the initial temperature of the coal, which is the value usually obtained from the ordinary formulae, or by the calorimeter, or only to the temperature of the steam? If by the first method, the lower the boiler pressure, the lower the actual efficiency; and if by the second, the greater.

It is clear that if the basis on which the efficiency is based is clearly stated, there can be no such questions arise; but, ordinarily, they are all open questions for the engineer to decide.

As what we are after are the exact facts, it is probable that they will be most nearly reached by methods that lie between those ordinarily in vogue. That is, the amount of moisture in the coal should be determined by the chemist's method—heating to something over 212° F.—but on much larger samples, and before they are crushed for chemical analysis.

The heat in the coal is probably most nearly exactly determined if the coal is burned. The constants in the formulae we have are not determined for the class of coals we use, and there is a considerable difference in opinion as to what the terms mean, anyway.

Knowing what we have to work with, the results obtainable in the actual boiler depend partly on the fireman. The latter factor is the one that makes the boiler tests unsatisfactory as compared with an engine test. Bad results may be obtained from a good fireman, but the reverse is seldom the case. It has not been possible until within a short time to measure the efficiency of the fireman as one of the factors in a boiler test, but it is believed that such data will soon be available. Assuming that a proper fireman has been selected to do the work, it is sufficient simply to know the quantity of coal and water fed to a boiler, together with the minor data usually taken, as we supply the boiler with many more pounds of air than we do of coal and water combined, and it is possible that a boiler is inefficient because of its air supply in more cases than most of us dream of. Ordinarily, we supply one pound of coal, say eight pounds of water, and twenty pounds of air; and it is as necessary to have a check on the air supplied as on the coal or water. It has not been possible to keep a very close watch on this until a method of continuously gaging the air was perfected, but it looks now as though such an apparatus is at hand.

The amount of air supplied increases the quantity of heat carried to the chimney for a given temperature; or, if the air supply can be reduced, allows a higher stack temperature with less loss, which would mean a greater capacity with the same economy, or the same capacity with greater economy.

To come down to details, the water should be weighed, and it is, perhaps, worth noting that, except for rough tests, the tank should never be allowed to fill to a certain mark, and the number of such tanks recorded. One of the most celebrated series of tests ever made is under the cloud of being worthless because of an incorrect tally of water tanks used on the test. The noting of the time at which anything is done is a good check on errors of this kind.

It is a wise plan to keep the time that water passes a definite mark in the lower tank, as this gives the rate at which the water is fed into the boiler, and allows a test to be started or stopped at any time.

Coal and ashes should, of course, be weighed, and when a number of boilers are being tested, it is worth while keeping separate accounts to locate any difficulty that may arise.

The only feasible way of determining the air supplied to a boiler is by the use of such apparatus as an econometer. The method of testing flue gases chemically is slow, and does not show the momentary changes taking place, and has always been found to be unsatisfactory.

This apparatus also enables us to determine the quantity of air in the flues at various points of their length, thus telling whether the air comes in at a proper place or not.

There are two other pieces of apparatus of value in testing boilers, but ordinarily their use is perfunctory; these are the stack thermometer and the draft gage. Generally, these readings are taken and set down and nothing further done with them. The thermometer should give the total pressure available for forcing air through the fire, and the draft gage the amount required to overcome the resistance of fire and passages, and to give the air velocity. There is not, necessarily, any relation between the quantities. With a stack 150 ft. high, and with an outside temperature of 60°, the pressure due to the height of the chimney would vary with the temperature. Thus, with an inside temperature of 600° the total pull of the chimney is .91, while with 400° it would be .71 in. of water. I mean that with this temperature in the stack, and with the grate entirely closed so that no air could get to the chimney, this would be the pressure shown by a draft gage. This pressure is actually used up in overcoming the grate, fire and flue friction, and in giving the air velocity. In a good boiler with a 150-ft. stack these quantities might have the values of 1 for the flue friction, 12 for the grate and fire friction, and 1 for the portion required to give the air its velocity. As the opening through the grate is increased, the draft-gage reading will fall, until, finally, if all the resistance to the entrance of the air to the bottom of the stack were removed, the draft gage would read substantially zero. A high reading, therefore, means practically that the resistance to the passage of air through the grate is high and nothing more.

The volume of air which a chimney will deliver will, therefore, not increase with the readings of the draft gage, but will increase with the temperature of the flue, and probably decrease with the increased reading of the draft gage, which differs from the ordinarily accepted ideas.

One other point worth remembering in boiler tests is the desirability of keeping conditions constant. It is surprising how nearly this can be accomplished with care on the part of the operator. One buys a boiler to deliver so much steam at a definite pressure. Ordinarily, this is understood to be the average an hour for, say 10 hours. For a single boiler this seems to be a mistake. For power purposes one does not want 3,500 lbs. of steam one hour and 2,500 lbs. the next from a 100-h. p. boiler, but 3,000 lbs. each hour; nor does one want a boiler which will blow off just after cleaning fires, and have the steam pressure drop from 100 lbs. to 60 lbs. while fires are being cleaned. To the user the latter condition is surely not satisfactory.

It is not a difficult matter, when testing more than one boiler, to keep the conditions substantially uniform. With a given steam pressure a steam pump can be made to deliver practically the same quantity of water each five or ten minutes. With a reducing valve, or by hand, the pressure on a boiler can be kept practically constant and the water level can be kept practically at the same point for the same condition of the fire.

There is one more detail of boiler testing that is worth speaking of, and that is the method of starting and stopping a test. The method of hauling fires at the beginning and end of a test is simply barbarous; and when one attempts to decide that there are so many pounds of combustible in the material hauled from the fire, he is, perhaps, unconsciously straining his judgment. Whenever one "judges," he guesses, and that is outside the province of the class of tests here spoken of. The other standard method is by judging the fire at the beginning and end of the test, and allowing the difference. In a capacity test the allowance makes little difference, but in an economy test the greater the allowance, the greater the economy.

There is a third method which has been practiced for many years which is fair to both boiler and prospective owner, and has been well thought of by some boiler-makers. It is much more tiring on the engineer conducting the test; but that he can charge for, if he pleases. The scheme is this: Suppose we have a 100-h. p. boiler to test for capacity, test to run from 8 a. m. to 6 p. m. The coal is such that the fires are to be cleaned twice in the test. Fire should be on the boiler 24 hours before the test begins. Beginning at 2 a. m., the

boiler should be fired at about its capacity. Roughly, 400 lbs. of coal should be burned each hour from 2 a. m. until 7 a. m. It is not necessary that any account should be taken of water, nor any other data for test purposes. All we want is heavy, dirty fires at 7 a. m. At 6.30 the water level is brought to the point at which it is to be carried, and is kept there, and all conditions brought to running conditions. At 7 begin cleaning fires. Put, say, 400 lbs. of coal on the floor and allow the fireman to use it to the best advantage. Note the time he begins using the next lot of coal. Say this is 8 a. m. This is the time at which the test really begins. At 5 p. m. clean fires again and weigh out 400 lbs. of coal, the same amount as in the morning. See that it is all used up by 6 p. m., when the test ends. The fire at the end of the test will then be as nearly in the same condition as at the beginning of the test as it is possible to make it, barring the fatigue of the fireman.

This seems more intricate than the standard methods, but neither the boiler nor the results can be jockeyed.

In this connection emphasis should be put on keeping the water level constant. This is particularly necessary at the beginning and end of the test, and unless the person making the test stands over the pump at this time, it is not likely to be done. We have all seen the water level kept below the mark, and at the end of the test the pump started as fast as it will go to bring the level to the right place; and we have all seen the feed-pump stopped at the beginning of the test, to bring the water down to right starting-point. The result is that at the beginning of the test the boiler had the least weight of water in it, and at the end the most, the difference being apparently evaporated, but in reality being in the boiler.

In engine testing very much the same character of tests are made. One is to determine whether certain results are obtained or not; the other to determine whether the economy of the engine can be improved—that is, to put the engine in its best shape. As in boiler testing, these tests are ordinarily made by different persons, and the second requires much the greater engineering skill.

We are all sufficiently familiar with indicator cards to know that all they give is the relation between the pressure in the cylinder and the volume swept through. The horse-power, the general conditions of the distribution of steam, can be determined, but the economy of the engine is still an unknown matter. It is absolutely impossible to tell how much steam is being used by the engine from the cards. The volume, or weight, actually in the cylinder in the shape of steam can be determined, but it is well known that there is a large amount of moisture in the shape of water actually passing through the cylinder, and this may be from 25 to 40 per cent of all the steam used, if the engine is known to be tight.

To determine the weight of steam used there is only one thing to be done if satisfactory results are desired, and that is to weigh the steam after it has passed through the engine and been condensed in a surface condenser. This credits the engine with all leaks between the engine and condenser; but this can not be avoided. It often happens that this is not practicable, and we must weigh the water fed to the boiler. As the steam line is generally much longer and much more complicated than the exhaust line, the error against the engine this time is much greater than the error in its favor when a condenser is used.

It is often suggested that the line leakage can be determined by shutting down the engine and noting the difference in water level in the boiler some time after the test is ended. One does not try this experiment very often, as, from what has been said on the question of water level in boilers, it is easily seen that for a long time after the plant has been shut down the water level is as likely to go up as to go down; and the going down, when it does occur, is as likely to be due to a cooling boiler as to leaks.

To analyze the heat losses in the engine with a view to improving the economy, recourse is had to Hirn's analysis, or to the entrophy-temperature diagram first put in practical form by S. A. Reeve; these methods were described by the author.

Another point often desired in engine testing is to determine the regularity of speed. In the use of some engines this is a matter of moment, while with others it is not. In specifications one finds such a clause as "the speed shall not vary over 3 per cent"; in others the same clause, but the additional words "from the rated speed." Both are clear, but the additional words double the possible variation. Of course, a continuous record would be desirable; but, generally, records of this class are qualitative rather than quantitative, and the calibration of the apparatus is not at all convenient, and, finally, the calibration comes down to some system of counting. Practically, we can conveniently count the number of turns and separate them into intervals as small as we please. The average for each such time-interval is usually taken for the speed during that interval. With a well-regulated engine, the variations in the speed taken in this way are not great, do not occur suddenly, and do not have a very great effect on the running of the plant. For lighting purposes especially, the variation in speed, due to sudden changes of load, is of more moment. Probably the best way to judge of the effects of such a change in speed is by the indicator. By opening a switch to throw off any desired proportion of the load and, at the same time, throwing in the indicator, a series of diagrams will be traced showing the rapidity with which the governor acts. Cards taken just before and just after such a change in load will locate on the varying card the initial and final conditions which, with a hunting governor, are not generally the greatest and least diagram drawn.

The net horse-power delivered by an engine is often desired. There is only one way of properly determining this, and that is by using a Prony brake. Up to, perhaps, 150 or 200 h. p. this can be satisfactorily managed; but for larger engines, and for engines directly connected to the apparatus driven, the thing usually done is to run the engine light and assume that this is always the work used up in friction. This is not always a safe course, however.

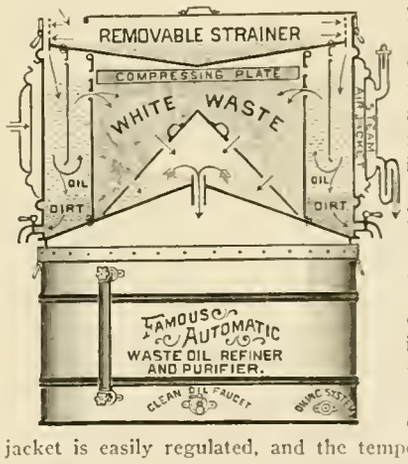
THE FAMOUS FILTER.

The accompanying illustration shows the construction and operation of the "Famous" oil filter which is made by Famous Filter Company of 314 North Main street, St. Louis. The one illustrated is the latest of the company's designs and is known as the "99" type. The waste oil to be purified is poured into the removable strainer which retains all of the coarser impurities; from this strainer it passes down through the settling and refining chamber, being kept away from the filtering material by the shield hanging in this chamber. The oil is heated by a steam jacket (using either live or exhaust steam); between the oil chamber and the steam jacket is an air jacket through which air circulates; by screwing bushings of different sizes into the air outlets at the top of the jacket the volume of air passing through the jacket is easily regulated, and the temperature of the oil thereby controlled, and limited to the maximum suitable to the grade of oil filtered. The oil being rendered fluid by thus heating it, dirt, water, and other impurities readily settle and are drawn off through the faucets near the bottom. After being thus settled the comparatively clean oil rises on the inner side of the deflecting shield and as shown by the arrows passes through the filtering chamber which is filled with compressed white waste. The bottom of the filtering chamber is a perforated cone covered with white waste.



It would be difficult to imagine a more perfectly arranged oil cleaning apparatus; the oil is first strained and settled, thus removing by far the greater portion of the impurities, and finally filtered by the capillary action of cotton waste.

On January 28, a 58-in. pulley of 38 in. face, mounted on a 6-in. shaft, in the power house of the Consolidated Electric Light Company, Birmingham, Ala., burst, bending the shaft and wrecking the line shaft foundation. Six generators, aggregating 920 k. w., were run from this shaft. Repairs could not be made in less than a week, and one result of the accident was that the Birmingham Railway & Electric Company, which rents power from the Light Company, was greatly inconvenienced.

Designing Boilers for a Small Street Railway Plant.

BY WILLIAM KENT, M. E.

PART II.

QUALITY OF COAL.

Of the several variable elements which enter into the problem of estimating the probable evaporation from and at 212° per pound of coal, which as above stated may range from 12 down to less than 5 pounds, the first to be considered is the quality of coal. We may consider all coal as containing three constituent substances, two of them being useless or worse than useless, viz., moisture and ash, and one useful, the combustible.

Moisture is of two kinds: 1st, surface moisture which may be derived from water in the mine or from rain, and which may be dried out by exposing the coal to an ordinarily dry atmosphere, and 2nd, inherent moisture, which exists in a lump of apparently dry coal and which may be entirely expelled from the lump by heating it to a temperature of 240° or upwards. The quantity of this inherent moisture varies from less than 1 per cent in anthracite to as much as 14 per cent in some Illinois coals. This moisture is contained in the coal as it is in wood, and if it is dried out by heating to a high temperature it will be absorbed again from the atmosphere upon long exposure.

The ash in marketable coal may also be of two kinds: 1st, that existing in the lumps of coal, and which may be found only by burning the coal, and 2nd, that which comes from seams of clay, slate, iron pyrites, etc., between the seams of coal or from the top or bottom of the coal seam. The quantity of this latter kind of ash depends largely upon the care with which the coal is prepared at the mine. Some of it may be removed by screening, jigging or washing.

The combustible portion of the coal may be divided into two subdivisions: 1st, volatile matter which may be driven off by heating the coal to a red heat, and 2nd, fixed carbon, which is burned away by air at a very high temperature. A lump of coal which has all the moisture and all the volatile matter driven off becomes coke, which contains the fixed carbon and the ash.

Finally, both the percentage of the volatile matter and its nature vary according to the geographical location of the coal mine. The quantity, expressed as a percentage of the total combustible (that is the coal after subtracting the moisture and ash) varies from 2 or 3 per cent in the hardest anthracites to over 50 per cent in some western coals and lignites. The quality of the volatile matter varies from being almost entirely a hydrocarbon, similar in composition to marsh gas, CH_4, containing 3 parts by weight of carbon to 1 of hydrogen, in those coals containing less than 25 per cent of volatile matter in the combustible, to a combination of hydrocarbon with oxygen, in coals containing larger percentages of volatile matter. Generally the relative proportion of oxygen increases with the increase of volatile matter, but it does not follow any fixed law, varying with the location of the mine.

Sulphur, in the form of iron pyrites, a very objectionable constituent of marketable coal, comes usually from thin seams of pyrites in the mine. Its quantity varies from less than 0.5 per cent in some anthracite and semi-bituminous coals to upwards of 4 per cent in some bituminous coals. It is found in the greatest quantity in the slack, or screenings, of soft coal, from which it may to some extent be removed by jigging. It is objectionable because it is the chief cause of the formation of clinkers on the grates, the iron left after the volatilization of the sulphur combining with the silica and alumina of the ash to form a fusible slag or glass which chokes the air supply and diminishes the coal-burning capacity of the furnace.

Coals are classified according to their general character into anthracite, semi-anthracite, semi-bituminous and bituminous coals. Anthracites are distinguished by containing less than 7½ per cent volatile matter in the combustible and by being low in moisture. The ash and sulphur vary in different mines, and with the sizes into which the coal is divided by screening. The dirt, slate and iron pyrites are screened and picked from the larger sizes, which are commonly used for domestic purposes and for locomotives and steamboats, and not for stationary boilers, for which they are usually too high priced. The smaller fragments of dirt, etc., are therefore found in the smaller sizes of coal, and usually the smaller the size of the coal the greater quantity of ash it contains.

The semi-anthracites are found in a limited district of Pennsylvania. They contain from 7½ to 12½ per cent of volatile matter, and since this volatile matter has a higher heating value per pound than fixed carbon, they are worth more per ton than the anthracites, provided they have the same ash moisture and sulphur, but these vary with different mines.

The semi-bituminous coals contain from 12½ to 25 per cent volatile matter in the combustible. They are mined over a large territory, chiefly east of the Allegheny mountains, from Pennsylvania to Virginia, and include the Clearfield, Broad Top, Somerset County and Cambria County coals in Pennsylvania, the Cumberland coals in Maryland, the New River coal in West Virginia and the Pocahontas coal in Virginia. These coals are all usually low in moisture, ash and sulphur, varying, however, in different mines and according to the care taken in mining and preparing for shipment. They are all characterized by high heating value per lb. of combustible, since the volatile matter is low in oxygen and has a heating value of much higher per lb. than the fixed carbon. These coals are by far the best steam coals in the United States, and rank with the best coals in Europe. They are very free burning, and those that are low in ash may be burned at rapid rates of combustion without clinkering the grates.

The bituminous coals, which contain from 25 to 50 per cent volatile matter, referred to total combustible, are of a great range of quality, depending upon the district in which they are mined, which covers most of the coal-bearing areas of the United States west of the Allegheny mountains. Generally speaking, the amount of volatile matter increases as we go westward and northward from the Alleghenies, and as the volatile matter increases so does the percentage of oxygen in that volatile matter, thus making it of lower heating value. To this rule, however, there are some exceptions, as of two coals containing the same percentage of volatile matter in the combustible, one may be higher in oxygen and therefore lower in heating value than the other. The percentage of inherent moisture also generally increases as we go westward, ranging from less than 2 per cent in some coals mined near Pittsburg to 12 per cent or 14 per cent in some coals in Illinois.

If we have an ultimate analysis of a coal we may calculate its heating value, within a probable limit of error of 2 per cent, by means of Dulong's formula, viz.: Heat units per lb. $= .01\ [14{,}600\ C + 62{,}000\ (H - O \div 8) + 4{,}000\ S]$ in which C, H, O and S are respectively the percentages of carbon, hydrogen, oxygen and sulphur in the coal.

If we have a proximate analysis, giving the moisture, volatile matter, fixed carbon and ash, we may calculate the probable heating value within a limit of error of not over 3 per cent, except as stated below, by reference to the following table:

APPROXIMATE HEATING VALUE OF THE COMBUSTIBLE PORTION OF COAL.

Composition		Heating Value per pound	Equivalent water evaporated from and at 212° per pound combustible
Fixed Carbon	Volatile Matter	Heat Units	
97	3	14,940	15.47
94	6	15,210	15.76
90	10	15,480	16.03
87	13	15,660	16.21
80	20	15,840	16.40
72	28	15,660	16.21
68	32	15,480	16.03
63	37	15,120	15.65
60	40	14,760	15.28
57	43	14,220	14.73
55	45	13,860	14.35
53	47	13,320	13.79
51	49	12,420	12.86

The figures in the last column are obtained from the figures of the preceding column by dividing by 965.7, the number of heat units equivalent to the evaporation of 1 lb. of water from and at 212°.

By "combustible" here is meant what remains after subtracting the moisture and ash. Thus if a coal contains .4 per cent moisture, 6 per cent ash, 72 per cent fixed carbon and 18 per cent volatile matter, the fixed carbon in the combustible is 72 ÷ 90 = .80 per cent, and the volatile matter 18 ÷ .90 = .20 per cent, and its approximate heating value is .90×15,840 = 14,256 heat units per lb.

The above table may be considered accurate within 1½ per cent for those coals containing over 72 per cent fixed carbon in the combustible, and within 3 per cent for coals containing from 72 per cent to 62 per cent, but below 62 per cent it is apt to have an error of 4 or 5 per cent, since of the coals containing over 38 per cent of volatile matter in the combustible, the quality of the volatile matter may vary greatly, being much higher in oxygen in some coals than in others.

It has been shown, however, by the recent researches of Professors Lord and Haas, of Columbus, O., that the highly bituminous coals of any given seam mined in one district have a remarkably uniform heating value per lb. of combustible, so that knowing the average heating value per lb. of combustible of the coal of any given seam and district and the percentage of moisture and ash in a given lot of such coal, we may calculate the heating value of that lot by multiplying the average heating value of the combustible by the percentage of combustible, that is 100 per cent minus the sum of the percentages of moisture and ash.

The heating value per lb. of combustible of coals of different districts may be taken approximately as follows:

	Heat Units per pound combustible	Equivalent evaporation from and at 212°
Anthracite, Pa.	14,900	15.42
Semi-anthracite, Loyalsock and Bernice, Pa.	15,500	16.05
Semi-bituminous, Broad Top, Clearfield, Cambria and Somerset, Pa.; Cumberland, Md., New River, W. Va., and Pocahontas, Va.	15,750	16.30
Bituminous, Connellsville, Pa.	15,300	15.84
Youghiogheny, Pa.	15,000	15.53
Pittsburg, Pa.	14,800	15.32
Upper Freeport Seam, Pa. and O.	14,800	15.32
Middle Kittanning Seam, Pa.	14,500	15.01
Thacker, W. Va.	15,200	15.74
Jackson Co., O.	14,600	15.11
Hocking Valley, O.	14,200	14.70
Big Muddy, Ill.	14,700	15.22
Streator, Ill.	14,300	14.80
Mt. Olive, Ill.	13,800	14.29
Lignites, Ia., Wyo., Utah, Ore.	11,000 to 12,900	11.39 to 13.35

The heating value of the coals may be found by multiplying the heat units per lb. combustible by the proportion of combustible in 1 lb. of coal, that is 100 per cent less the moisture and ash. The ash will vary from 4 or 5 per cent in a carefully prepared lot of semi-bituminous coal to 25 per cent or more in some lots of western bituminous slack coal. The fine sizes of anthracite will contain from 12 per cent of ash in washed coal or yard screenings to 25 per cent in culm or in poor lots of buckwheat and rice. The surface moisture in fine sizes of anthracite may be from 6 to 8 per cent in wet weather, the inherent moisture in lumps of anthracite being usually below 1 per cent, and that in semi-bituminous coal will vary usually between the same limits. In the bituminous coal the inherent moisture varies with the district, ranging from 1 to 2 per cent in Western Pennsylvania coals, 4 to 7 per cent in Ohio coals, and 7 to 14 per cent in different varieties of Illinois coals, the surface moisture varying from 0 in lump coal in dry weather to 6 or 8 per cent in fine slack in wet weather. The range of heating values of different coals mined east of the Mississippi is between that of a semi-bituminous coal containing say 4 per cent ash, 2 per cent moisture and 94 per cent combustible of 15,840 heat units, or .94×15,840=14,890 heat units, to that of a poor grade of Illinois slack containing say 25 per cent ash, 15 per cent moisture and 60 per cent combustible of 14,000 heat units, or .60×14,000=8,400 heat units per lb. of coal. The relative heating value of the two coals is in the ratio of 1 to 1.77, but this is not a fair measure of their commercial value for use in steam boilers. It may be easy to obtain in the steam as much as 75 per cent of the heating value of the better coal, in any well proportioned boiler, but it may not be easy to obtain more than 70 per cent of the heating value of the poorer coal. The relative commercial value of the poorer of the two coals will therefore be not greater than the ratio of .50×8,400 to .75×14,890 or 1 to 2.66, as compared with the better coal.

Published analyses of western bituminous coals are apt to be in error as regards the moisture, since it has only recently been discovered that the inherent moisture cannot be determined by heating the coal to 212°, as was formerly the custom of the chemists, and that a temperature of from 240° to 280° is required to drive out the moisture from a lump of coal.

Having determined the heating value of the coal which is intended to be used in the proposed boiler plant, the next thing to be considered is the percentage of that heating value which may be utilized by the boiler in making steam, or what is known as the "efficiency" of the boiler and the furnace. With anthracite of large size, such as egg coal, it is barely possible, with a slow rate of driving and with the most careful firing, to reach an efficiency of 80 per cent, but 75 per cent is rarely exceeded. With the smaller sizes 70 per cent is as much as can be expected, and this figure is greatly reduced with small sizes and with ordinary firing. With semi-bituminous coals 75 per cent is about the maximum that may be expected, and with bituminous coals it is not easy to obtain 70 per cent, on account of the difficulty of burning all the volatile matter, which difficulty increases with the percentages of volatile matter and of moisture. Perhaps 50 per cent is an average figure for the efficiency of a boiler provided with an ordinary furnace, using a poor grade of highly bituminous coal in everyday practice, and driven, as is usual, at an irregular rate. With careful and steady firing this may be increased to 55 per cent, and it is possible with well-designed fire-brick furnaces or mechanical stokers, with expert handling, to raise it to 65 per cent or even 70 per cent, when the boiler is not driven beyond its most economical rate.

RELATION OF ECONOMY TO RATE OF DRIVING.

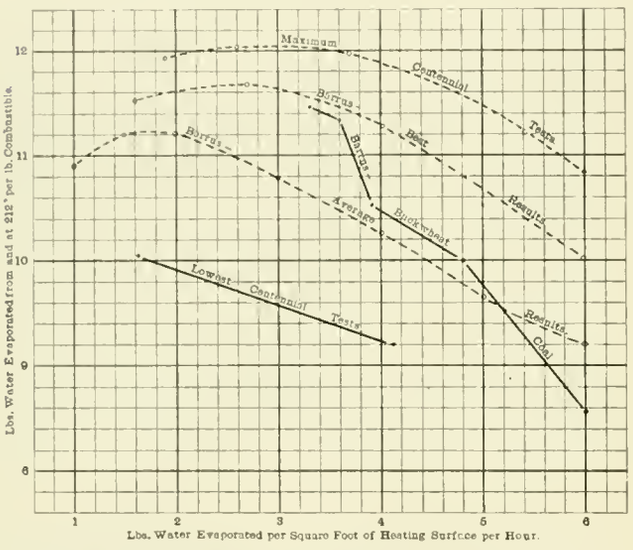
With a boiler properly designed and proportioned, and with a furnace adapted to burn coal to the best advantage, it is generally found that the highest economy of coal is obtained when the boiler is driven at a rate equivalent to the evaporation of 3 lbs. of water from and at 212° per hour per sq. ft. of heating surface. When driven at a slower rate than this the economy decreases on account of the loss by radiation becoming a greater percentage of the whole amount of heat generated in the furnace and to the difficulty of burning the coal properly with diminished draft. When driven at a higher rate the economy usually decreases on account of the increased temperature of the chimney gases, due to the extent of heating surface being insufficient to absorb the additional heat generated. Apparent exceptions to this rule, showing a higher economy at a rate of driving in excess of 3 lbs. evaporated per sq. ft. of heating surface per hour may be due either to more perfect burning of the volatile gases of the coal at high rates of combustion, or to such a design of the gas passages through the boiler that the gases are apt to be "short-circuited" at the slower rates of driving, their volume in transit to the chimney being insufficient to fill all the gas passages, and the gases choosing certain paths of least resistance.

The relation of economy to rate of driving with anthracite coal is well shown by the accompanying diagram. The upper line shows the highest results that were obtained at five different rates of driving, with five different boilers, in the tests made with good anthracite egg coal at the Centennial exhibition in 1876. These results have never been surpassed with anthracite coal, and they represent the very highest results that can be expected with any boiler with that kind of coal. They may be increased, measured in pounds of water per lb. of combustible, from 5 to 8 per cent with the best semi-bituminous coal, with furnaces especially adapted to burn the volatile matter and with expert firing.

The lowest line shows the results obtained by two boilers in the Centennial tests, using the same coal. The low figures are not easily explained, but may have been due to improper firing. The two lines marked "Barrus, Best Results," and "Barrus, Average Results," are plotted from figures given by Mr. George H. Barrus, in his book on "Boiler Tests," representing the figures obtained in many tests of different boilers with anthracite coal. The line marked "Barrus, Buckwheat Coal," is plotted from tests made with the Stirling water tube boilers at the mines of the Lehigh Coal Co.

Wilkesbarre, Pa. The lines on the diagram all show a falling off of economy with a rapid rate of driving. Comparing the points on the curve corresponding to 3 and 6 lbs. of water evaporated from and at 212 per sq. ft. of heating surface per hour, the maximum Centennial tests show a falling off of about 11 per cent, Barrus' best results about 14 per cent, Barrus' average results 15 per cent, and the buckwheat coal tests, 26 per cent. The lowest result is explained as being due to unskillful firing and to uneven adjustment of the air spaces in the grate bars. The temperature of the waste gases in this test was always above 800° F, and during part of the time flame issued out from the top of the stack.

Comparing the line joining the two lowest Centennial tests with the line of the maximum Centennial tests we find that at a rate of



RELATION OF ECONOMY TO RATE OF DRIVING—ANTHRACITE COAL.

2 lbs. per sq. ft. of heating surface per hour the former is 17 per cent below and at 4 lbs. 22 per cent below the latter, showing what a large difference of economy may occasionally be found between different boilers at the same rate of driving and using the same coal.

No similar series of curves representing the performance of different boilers with bituminous coal has yet been published, but there is every reason to believe that the same law of falling off of economy with rapid driving will be found to be true with bituminous as with anthracite coal, but with many apparent exceptions, as before stated, due to more perfect combustion of the coal at higher rates of combustion, and to the flues or other gas passages being proportioned better for fast than for slow driving.

It may be expected therefore that with any kind of coal the evaporation per pound of coal will be in the neighborhood of 15 per cent less with a rate of evaporation of 6 lbs. of water from and at 212° per sq. ft. of heating surface per hour than at a rate of 3 lbs., the rate for maximum economy.

(To be continued.)

It is announced that all-night street cars are to be run in Baltimore, which has heretofore been about the only large city in America without them.

The Barney & Smith Car Company has recovered a verdict of $21,731 against the Rapid Transit Railway Company, of Syracuse, and W. R. Kimball, vice-president, for cars bought while the road was in the hands of a reorganization committee.

The Altoona (Pa.) & Logan Valley Electric Railway Company is making a substantial addition to its power plant, and will install new G. E. 500-k. w. generator direct connected to a 750-h. p. Allis engine before the summer season opens. New shops are also contemplated.

STORAGE BATTERIES AND RAILWAY POWER STATIONS.

BY ROBERT M'A. LLOYD.

An abstract of a paper read before the American Institute of Electrical Engineers.

The average load on a railway power station for a given period is much less than the maximum load occurring during that period and much more than the minimum, but it is not generally understood that the maximum load for the same period is apt to be far below the capacity of the generating plant in operation. As an illustration of this fact I show in Fig. 1 some data on a typical railway plant when 35 cars were running. We have not discovered any railway plant where this is not true, and I believe that the data on most of the railway plants of this country will confirm my statement. The first explanation of this would be that such a surplus capacity is necessary for reserve to meet emergencies, but I do not find it to be a useful reserve, and shall refer particularly to Fig. 1, taking this station because, from the standpoint of the manager, engineers and attendants, it is dangerously overloaded and has no reserve. In fact, it was necessary to add to the capacity at once to make it safely operative.

I obtained these data on the day of heaviest travel in the whole year. It will be noticed that the highest point reached was within the capacity of the main station, and yet it was necessary to start up an auxiliary station. The central solid line shows the average load, and the upper and lower lines show the limits of the fluctuations occurring from moment to moment. The method pursued in getting these curves was to divide the day into half hours, and during the first five minutes of each half hour take the highest and lowest ammeter reading in each minute; these readings are plotted in the upper and lower curves; also to take ammeter readings every five seconds, and obtain the average of these readings as the point in the curve of averages. Another convenient method of obtaining the curve of averages is by wattmeter readings. Among some of the interesting features in this diagram may be noticed the fact that the nominal capacity of the generating apparatus was about 400 k. w. in excess of its maximum output occurring at about 8 o'clock in the evening, and that the average output at this time was about two-thirds of the maximum. The excess of nominal capacity was not so great at 7 o'clock in the morning, or two in the afternoon, when other high points occurred, but as it was known that the morning peak would be of short duration, the engineer decided to run through it without the auxiliary station, and in the afternoon the load increased more rapidly than was expected, and the auxiliary was not ready to go into operation on short notice, consequently obliging the main station to groan under a dangerous load for an hour or so.

It will doubtless occur to some that this station apparatus has been overrated, or that the engineer was incapable or over-cautious, but the fact remains that similar data are obtained in very many stations, and that in many cases the apparatus has been subjected to satisfactory tests before acceptance by the purchasers. It may be possible to build engines which regulate at all conditions of load and at the same time use steam satisfactorily at maximum load, but I do not find such engines commonly in use. Further than this there are many very good engines in use which cannot be safely operated at anything like maximum load if that load is liable to sudden variations. I realize that you may suggest all sorts of schemes for getting a better output from the plant illustrated by this curve, and you may wish to ask some questions about this apparatus, but experience convinces me that the men who are most likely to be consulted about such a station will recommend more generating plant, and the truth is that there are so many good salesmen pushing engines and dynamos that station managers frequently fail to get full duty from the machinery which they are operating already. It is not merely that the storage battery has been neglected, but any of us can see in railway power houses throughout the country, where the managers have been persuaded to increase their generating plant when attention to a few details such as steam piping would have brought their output up to requirements. Assuming, however, a station equipped with the best obtainable apparatus, and operated under the most advanced laws of station practice, in the absence of a storage battery, there would still be much more apparatus running than would appear necessary from the load diagrams.

The generator salesman says in reply to this proposition that his apparatus is cheap, and that it is good to have plenty of it, but one generally finds that where there is plenty of apparatus available, the engineer is tempted to keep too much of it running, and therefore running at low efficiency.

Of course railway power stations have individual characteristics, and it will not do to assume that they all need storage batteries, but there are certain features of railway power requirement, which are common to the problem everywhere, and which invite consideration for the storage battery.

In my endeavor to point out some of the uses for a storage battery I shall take as a typical station that shown in Fig. 1. It is located in a Pennsylvania town of 50,000 inhabitants. The railways radiate from the center of the town to distances of three to nine miles. There are six branches and the power station is located two miles out on the longest branch. It has railroad and water frontage. The small auxiliary power house is the result of a recent consolidation and is close to the main house. There are three distinct ways of using a storage battery with this power plant. Taking up the figure we find first the great fluctuation between night and day load; second by the fluctuations occurring from moment to moment. We shall call a battery of sufficient capacity to level off the night and day fluctuations "large;" a battery for levelling the hour to hour fluctuations "medium," and a battery to level the momentary fluctuations "small." It will be seen at a glance that the small battery will reduce the requirements of the generating plant to a capacity sufficient to meet the demands of the average load shown in curve A. The battery must be able to discharge at 650 amperes for momentary periods, but its capacity in ampere hours is unimportant. It will cost less than generating capacity for the same work, and a large part of the excess of capacity over requirements shown in the diagram will be saved. It will save some depreciation on the generating apparatus, and its own depreciation will not cost more than the depreciation of generating apparatus of similar capacity. It will have sufficient storage capacity to run a few night cars and lights when the engines are shut down. If located at a point nearer the center of feeder distribution than the location of the generating station, a saving in copper will be effected. Inasmuch as the investment will not be increased by including such a battery in this railway outfit all the saving in fuel due to a steadier load and the operation of less generating machinery will be clear gain to the credit of the battery.

Line B at 810 amperes shows the average load for 18 hours of the day and a " medium" battery to reduce the load to this straight line would have a capacity of 1,300 ampere hours. It will cost about twice as much as a "small" battery, but will not add enough to the cost of the installation to bring the investment up to the total now in generating apparatus alone and presumably necessary if no battery is used. This battery will have all the advantages of the small plant with wider limits of operation. The station circuit breakers may be set 650 amperes higher, and there will be greater convenience throughout the station in operating at a fixed load. There will be a marked effect on the efficiency of all departments of the station, and all the apparatus will yield a higher output in proportion to investment and cost of operation.

Line C at 650 amperes shows the average load for 24 hours, and a "large" battery capable of leveling off this load will have a capacity of 3,000 ampere hours. It will cost approximately twice as much as the " medium" battery, and will have all of its advantages. It will cost as much as the generating machinery displaced by it. It will add largely to the flexibility of the station. This battery could be discharged momentarily at 3,000 amperes, which will put the circuit-breaker limit of the station at about 3,600 amperes, instead of 2,300, with all the present apparatus. It may be discharged at 1,500 amperes for one hour, which will be sufficient to cover load peaks that would stall the 1,150-k. w. generating plant completely.

In cases of extreme necessity the entire system might be carried by this battery for several hours. The ability to carry sharp peaks is a distinct addition to the earning power of the system. Such peaks often signify the collection of fares, which would be lost if the system were not flexible, and some managers keep up enough station capacity to carry a few holiday crowds, while for 99 per cent of the whole year it is earning nothing. Other managers do not attempt to carry special crowds. The large battery will give the manager an opportunity to get all the money that can be made out of such business without feeling that he has made any investment for the purpose. Of course, the capacity of the system is limited also by the investment in copper, but in many cases the battery may be located so as to facilitate the distribution of power.

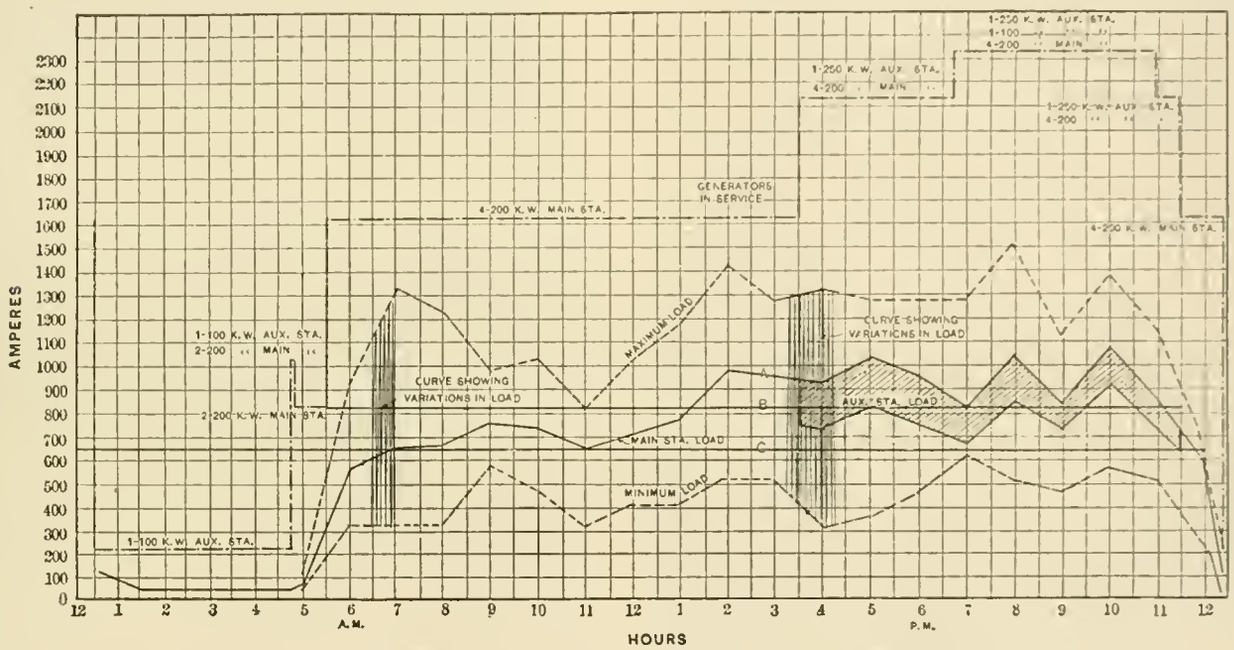


FIG. 1—CURVES SHOWING VARIATION OF LOAD ON RAILWAY POWER STATION.

There is no reason why a railway power station of this capacity, running night and day at a constant load, should not attain a fuel economy as high as that of the well-known Chestnut Hill pumping station, at Boston, which would be equivalent in electrical work to 557 watt-hours per pound of coal. Curve A, Fig. 1, shows for one day's work 7,800,000 watt-hours, which required at the above rate seven tons of coal, and, assuming that the battery would only have 75 per cent efficiency, and that 25 per cent of the entire day's work would go through the battery, one-half ton of coal would be added to this consumption, making 7½ tons of coal a day for this plant running with a large battery.

The battery efficiency in such service as this has been found in most cases much higher than 75 per cent, and in same cases over 90 per cent, so my estimate is clearly on the safe side.

On the day when these data were obtained 15 tons of coal was

burned, or twice as much as would be necessary with the battery outfit. The battery would therefore save, at $2 a ton, $5,474 per annum in coal alone.

The number of men in the station is now the same night and day, and there would certainly be no increase in the labor item, whereas it is probable that one man on each shift might be dispensed with if the plant were reduced by the battery, in which case there would be another saving of $1,200 per annum. The battery would also save water, oil, waste, etc., and there would be minor advantages, such as more constant potential on the line, less annoyance from circuit-breakers, no fear of sudden demands on the generating apparatus and the disagreeable possibilities incident thereto.

In the following table some figures are tabulated for the purpose of comparing four different layouts to meet the requirements of the railway system referred to in Fig. 1:

TABLE REFERRING TO FIG. 1.

	Lay out with	Cost of generating apparatus.	Cost of storage battery.	Total cost of station plant.	Cost of coal per day.	Cost of coal per annum	Saving in coal.	Sav. in coal and sav. in int., 5 p. c.
1	No battery..	$115,000	$.....	$115,000	$30	$10,950	$....	$....
2	Small bat'ry	60,000	20,000	80,000	25	9,125	1,825	3,575
3	Medium "	50,000	35,000	85,000	20	7,300	3,650	5,150
4	Large "	40,000	70,000	110,000	15	5,475	5,475	5,525

CONTINUATION OF TABLE

	Cost of real estate and buildings.	Repairs and depreciation.	Saving in labor per annum.	Saving in water, oil, waste, etc.	Total saving	Estimated addition to receipts.	Net advantage in operation
1	All the same.	All the same.	$.....	$.....	$.....	$	$
2			.....	100	3,675	.....	3,675
3			.....	200	5,350	1,000	6,350
4			1,200	300	7,025	5,000	12,025

I have assumed $100 per kilowatt as the cost of complete station apparatus without batteries. This figure might have seemed high a year ago, but in view of the rising prices of such material I think it is only conservative.

In regard to the "small" battery, there is no doubt of its advantages in many cases, but for new installation it is not always the most economical battery. It seems to me hardly worth while in laying out a new station to put in a battery for the purpose of reducing the railway-power curve to the characteristics of electric light practice, when by going a few steps further it may be refined to a practice comparable with marine engineering.

It might appear at first thought that a battery of sufficient capacity to insure a full load for the generating units at all times would save as much fuel as a battery large enough to level off the 24-hour service, but it is very difficult to follow the power requirements from hour to hour in such a way as to make ideal use of a battery, whereas, with a "large" battery, it would be possible for the ordinary station engineer to adjust his load so as to operate all of his apparatus to the best advantage all the time.

I have carefully analyzed the figures in R. W. Conant's very interesting paper, before the A. S. R. A., and am compelled to differ from him at some points, and refer to them in order to meet in advance any criticism of my paper which may be based on his tables. In the first place, he assumes that his standard station can be worked all the year round with a load factor of 33 1-3 per cent, which is entirely too high; 20 per cent, or 25 per cent, would be more normal. I suspect that Mr. Conant's load factors have been obtained by indicator cards, instead of wattmeters. In Mr. Conant's table none of the stations shows a better figure for coal than three pounds per kilowatt-hour, while his standard station is put down for 2.2 pounds, without any intimation of the process for attaining such a good result. The question as to how the cost of repairs and depreciation of the entire plant would be affected by a large battery is particularly debatable ground. Mr. Conant allows 2 per cent for depreciation beyond the normal running repairs. He estimates the entire plant, including buildings, to last 50 years. His statement that the machinery now being installed will last much has nothing to back it up except faith in the promises of the builders.

I propose to allow 10 per cent per annum for repairs and depreciation on the entire station apparatus, including batteries. I have not seen any boilers that are likely to last 50 years, and there is plenty of evidence that all the best engines and boilers in this class of service today will go to pieces in a life of from 10 to 20 years. The particularly hard usage to which most of them are subject is not only steadily wearing them out, but producing a state of constant danger and not infrequent accidents. I am sure this is becoming well understood among railway men, and some of the best man-

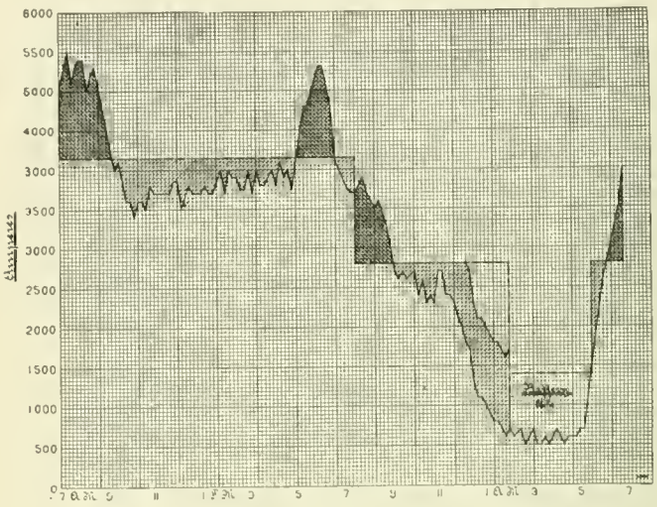

FIG. 2 BATTERY REGULATION ON BUFFALO RAILWAY.

agers are writing off to depreciation 10 per cent per annum. Moreover, who can say that improvements will not be made in the next 10 years, as in the past, and that engines and boilers may not be out of date before they are used up?

It is, of course, well known that whatever the rate of depreciation may be without batteries, it will be lowered by giving the generating apparatus a constant load; my belief is, therefore, that the storage battery will not increase the rate of depreciation for the entire plant. If it can be shown that interest and depreciation for a plant of given load dimensions are practically equal, with or without a large battery, it is evident that the great saving in fuel alone will determine the superiority of the battery system.

I have so far considered the battery only at the central generating station, so that all the advantages due to locating it at proper points in the distribution system are additional arguments in its favor. In

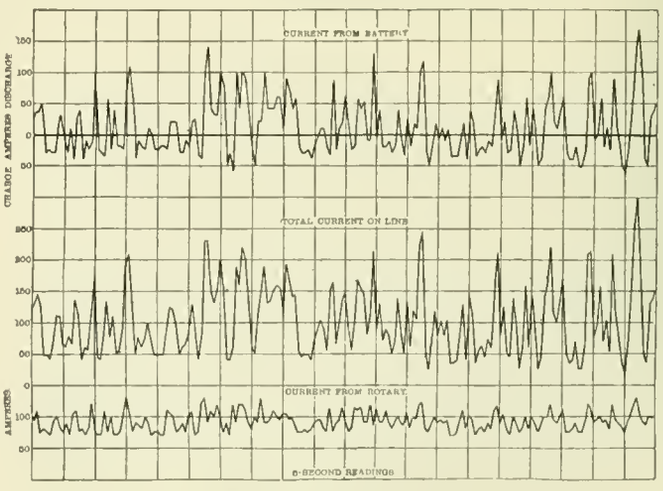

FIG. 3—BARRE-MONTPELIER TRACTION COMPANY.

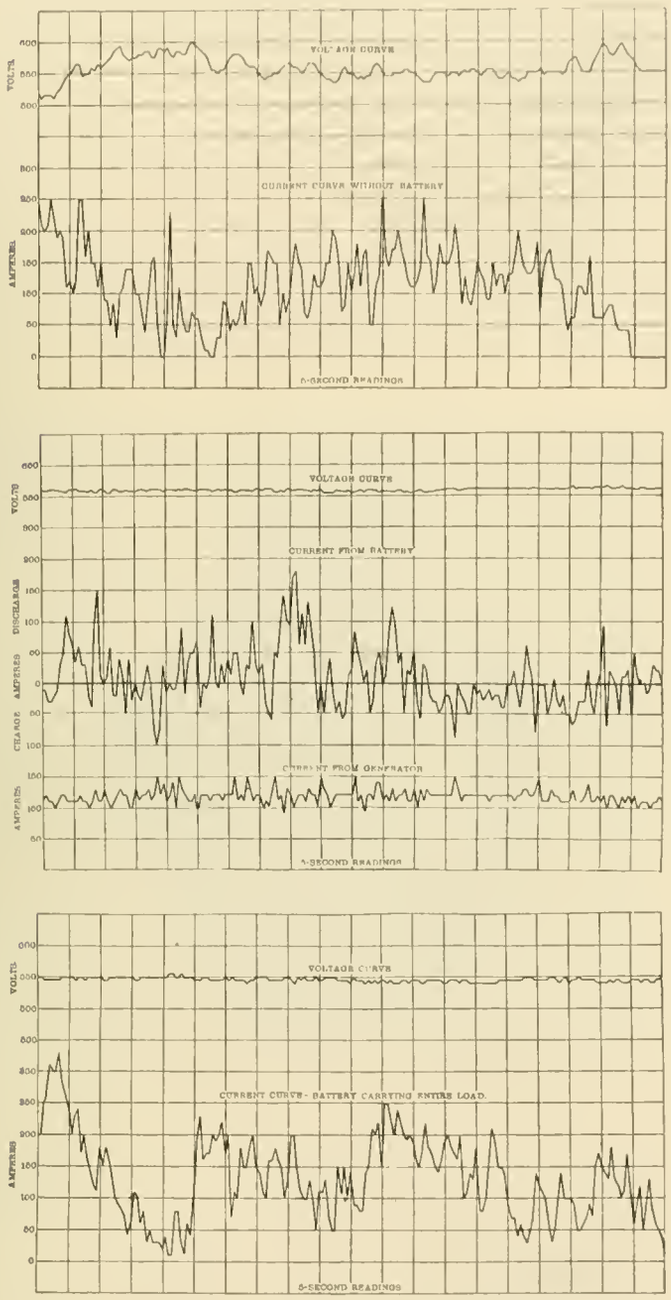
many cases the saving in copper may be greater than the sum invested in the battery, and the flexibility of the system improved in places where it would not pay to install sufficient copper to meet the irregular demands of travel.

The reserve qualities of the storage battery are unique. It might be supposed that a mere reservoir which is quickly drained would be of little value compared to a lot of extra generating apparatus standing idle, but experience is demonstrating every day, in exist-

ing plants, that the reserve which is needed most is the reserve which is not only ready for emergencies, but actually alive to any demand without the direction of a human mind.

Most of what has been said of the storage battery, as applied to the power station illustrated by the curves in Fig. 1, is true of its application to railway power stations in general. The use of water power introduces a factor in the problem more variable than fuel,



FIGS. 4, 5 and 6—WOONSOCKET ELECTRIC MACHINE AND POWER COMPANY.

and I shall not attempt the discussion of it. Alternating currents lend themselves readily to the development of storage battery applications on account of the mutually helpful combination of battery and rotary at sub-stations. Up to the present time, each of the large batteries installed for railway work has been obliged to meet different conditions and requirements, but they are all serving their respective purposes well, and showing many different fields of usefulness.

Most of us feel that the electric railway and electric lighting interests are destined to get into closer relations, and the generating station of the future may be required to furnish all the electricity used within large areas for every purpose.

Coming, finally, to a problem which has been the subject of some newspaper discussion of late, I trust you will pardon me for treating of work with which I have no connection. Electricity has so many advantages over any other medium for transmission and storage of energy that I assume its use to be firmly established, and cannot conceive of any lasting rivalry by the other contestants now in the same fields. Further than this, without saying anything for or against monopolies, I believe that all the energy supplied by means of electric currents to consumers of every nature in the Greater New York should radiate from two or three central stations, and that these should be electrically tied together. The sub-stations would naturally consist of rotaries and storage batteries. It may not be possible to lay out each sub-station so that the rotaries would run at a constant load for 24 hours a day, but it seems to me quite probable that such an arrangement would eventually be reached, and this would, of course, give the generating stations a constant load.

At the present time the load curves of the electric railways are very uncertain, and peaks are likely to occur at almost any time of day, while the addition of the peak due to electric lighting in the early evening would not add in large proportion to the railway peak, but electric lighting is capable of more general application, and it is possible that within a few years the distribution in the borough of Manhattan may reach from three to five hundred thousand kilowatts at the highest part of the lighting curve, which will probably be as great as the railway load when the elevated railway and the underground rapid transit are included. These peaks will often occur at the same time of day, and so there is no possibility of improving the load factor of either system by splicing the two together. It follows, therefore, that what is true of the relation of a storage battery to the economy of the generating station for power or light separately will be true of the resultant of their combination.

The railway and light people recognize the importance of leveling up some portions of their load curves, but I estimate that the greatest saving is to be obtained by operating for a constant load 24 hours per day. However high would be the economy of such large stations, I am sure it would be higher with large batteries than without. Certainly the economy of the Boston pumping station as to fuel consumption should be surpassed. It must not be assumed that a high load factor for the system is an advantage. It is all right for the generating plant and for the copper feeders, but the kilowatt-hours that bring in the most money may spoil the looks of the load diagrams and kill the load factor. What is required to earn dividends is a profitable load factor outside of the stations, whether high or low, and the highest possible load factor at the dynamo terminals. The large storage battery meets these two requirements perfectly. A load factor of 100 per cent may be maintained at the dynamo and current may be sold to the consumer regardless of the time of day.

With a million kilowatts in view for the borough of Manhattan, it would be necessary to generate an approximately constant force of 300,000 k. w. A million kilowatts in station plant, without the battery factor, would cost $100,000,000.

The same capacity, including the proportion of battery now deemed advantageous by some of the engineers in touch with these problems, would be divided as to cost into $70,000,000 of generating plant and $30,000,000 of battery plant. Finally, the same capacity, if divided in the proportions which seem to me most productive for the investment, would cost $30,000,000 in generating plant and $70,000,000 in battery. This is quite a large battery plant, and as there would be more than two parts battery to one part generator, I am fearful of the jealousy which such a reversal of engineering practice would create.

In conclusion, I wish to state that nothing in this paper should be regarded as emanating, officially or unofficially, from the company with which I am connected. The accompanying diagrams, Figs. 3 to 6, inclusive, show railway power curves, with and without batteries. If they do not indicate attainment of perfect results by the battery, it is not because perfect regulation is impossible, but because the engineer is well pleased with what he has, and does not strive for greater refinement. Fig. 2 shows the application of storage batteries to a large railway installation, in which part of the power is generated at a waterfall. It shows what may be done by what I have called a "medium" battery.

The Southbridge (Mass.) & Sturbridge Street Railway Company is attaching vestibules to its cars.

A "SLOW FEED" CONTROLLER HANDLE.

There are hundreds of devices on the market to save fuel and labor in the power station, and street railway managers eagerly accept any scheme to reduce the coal bill, but nearly every one has as yet overlooked the consumer, i. e., the controller. W. G. Wagenhals, general manager of the Millcreek Valley Street Railway Company, of Cincinnati, has been among those who have been seeking for some means of compelling the motormen to handle their con-

FIG. 1.—WAGENHALS CONTROLLER HANDLE.

trollers properly. After a careful study of the subject for the past ten years he has invented a handle which serves the purpose admirably.

The average motorman will feed the current into his motors in such a manner as to cause heating, breaking down the insulation of the windings and making the deterioration of street railway apparatus a constant nightmare to the manager. The motors not only suffer, but the generators as well. The ordinary series-parallel con-

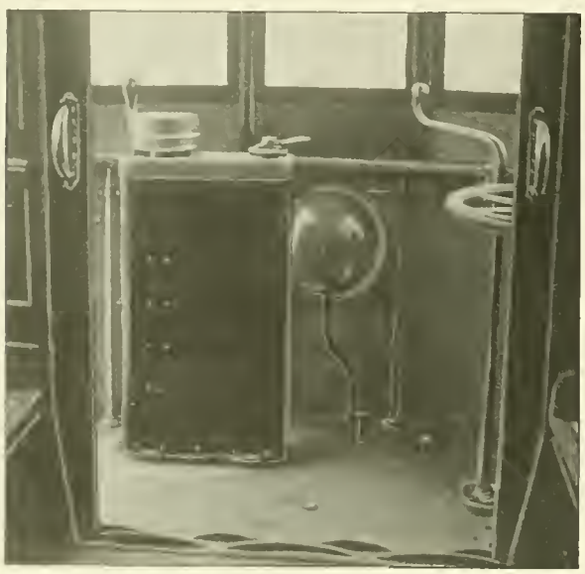


FIG. 2.—CONTROLLER WITH SLOW FEED HANDLE.

troller has nine points, and the average motorman will cover these in from four to six seconds. At this rate something must suffer, and it is the motors. With this device it is in the hands of the manager to regulate the number of seconds in which the motorman shall feed his controller to the last notch, 8, 10 or 20 seconds, just as he wishes to set it, and when once set it can not be tampered with.

The construction of the handle is such that all wearing surfaces can be taken up and the clutch which regulates the feed and its pawl are made of case hardened steel. There is no possibility of any of the mechanism interfering with the shutting off of the controller; any number of notches can be left open for free use as with the ordinary handle. The first and second notches have been so arranged on the controllers of the Millcreek Valley cars. In using the handle the motorman presses a button on top of handle with his thumb and when the clutch clears the notch he passes over the same before he can pass to next notch. The clutch drops automatically so that he must repeat the operation in order to pass over the next notch. A simple mechanism controls the time from one notch to the next. The whole device is composed of a few parts, with nothing that is liable to get out of order.

Another feature which will be advantageous, and that is, no alteration is necessary to adapt it to the use of a controller. The old handle is lifted off the post and the new handle put on, and this has the same movement as the ordinary one, with the exception of the button on the handle.

With handles of this kind in use on a road, instead of the fluctuating current consumption so noticeable in street railway work, there is a steady even load. Tests have been made which show that with the ordinary arrangement of the controller handle as high as 250 amperes would flow in the motor circuits, whereas with the

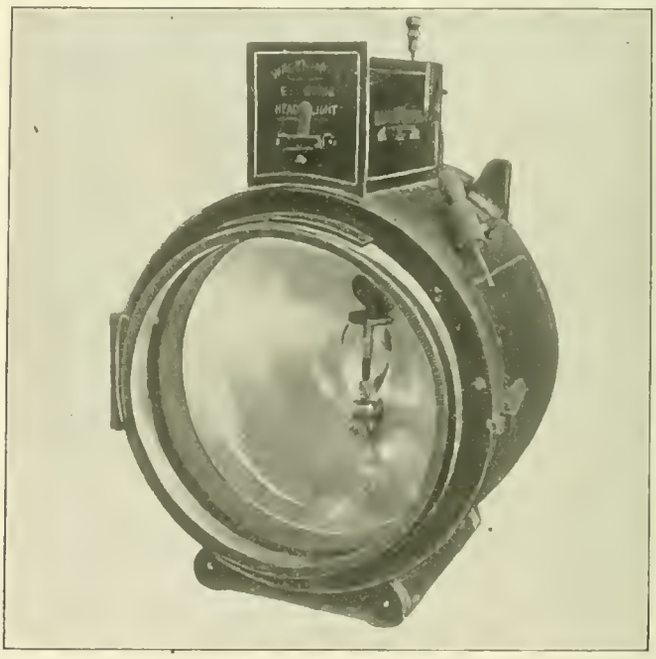

FIG. 3.—WAGENHALS HEADLIGHT.

"slow feed" handle no more than 125 amperes could be used. This would indicate that nearly double the number of cars could be operated from the same sized station on account of the even consumption of current. Fig. 1 shows the controller handle before it is placed on the controller, and Fig. 2 shows it in position.

Mr. Wagenhals has also designed an electric headlight which is especially adaptable for suburban and interurban cars on account of its great brilliancy. It consists of an enclosed arc light in a parabolic reflector. The connections to the car circuit are readily made at the dash. The appearance of the headlight may be noted from Fig. 3.

The Wagenhals Manufacturing Company has been organized in Cincinnati to place these specialties on the market. The company is under the direction of Mr. Wagenhals, but he does not propose to leave his present position, and will turn over the active business management to his associates.

John L. Williams & Sons, of Richmond, and Mittendorf, Oliver & Co., of Baltimore, have purchased control of the Piedmont Traction Company and the Virginia Electric Company, which own the street railway at Petersburg, Va., and will at once proceed to rebuild and give Petersburg a modern electric railway system.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

$15,941.25 FOR A CHILD'S LEG.

Kalfur v. Broadway Ferry & Metropolitan Avenue Railroad Company (N. Y.), 54 N. Y. Supp. 503. November 22, 1898.

Not being prepared to say that a verdict of $15,941.25 was excessive compensation for the loss, pain and suffering which had to be endured by a boy who was so negligently injured when 18 months old that his leg had to be amputated above the knee, the second appellate division of the supreme court of New York affirms a judgment for that amount, entered in behalf of the plaintiff in this case, notwithstanding the trial judge evinced the feeling that it was too much, and seemed afraid to exercise his discretion to reduce the amount. Goodrich, P. J., dissents.

DENIES DECIDING THAT DERAILMENT OF CAR DOES NOT INDICATE NEGLIGENCE.

Stevenson v. Second Avenue Railroad Company (N. Y.), 54 N. Y. Supp. 815. December 9, 1898.

The first appellate division of the supreme court of New York takes up here the suggestion that, contrary to other decisions, it had held, in Hastings v. Railroad Company, 7 App. Div. 312, 40 N. Y. Supp. 93, that the mere derailment of a street car is not sufficient proof, prima facie, of negligence; and it declares that it did not so decide. What was there said in regard to the derailment of a street car, it explains, had reference to the claim made by counsel that the ruling in Edgerton v. Railroad Company, 39 N. Y. 227, was applicable, namely, that proof that a car left the track is prima facie evidence of negligence. Its criticism in the Hastings case, it says, was as to the pertinency of the Edgerton case as a controlling authority, and what followed was merely to illustrate why the rule as to railroads operated by steam should not in every case, and as a matter of law, be applied to a street car leaving the track.

AS TO WITNESSES TALKING WITH COUNSEL AND BEING PROMISED PAY FOR LOST TIME.

North Chicago Street Railroad Company v. Anderson (Ill.), 52 N. E. Rep. 21. October 24, 1898. Rehearing denied December 9, 1898.

The supreme court of Illinois holds that, the trial judge being asked to instruct the jury that "the fact that a witness has been promised pay for time lost while attending the trial of this case does not in any wise tend to impeach his credibility as a witness," it was not prejudicial for the judge to modify this by an addition advising the jury that they might consider the fact that the witness had been promised pay, together with all the other facts in evidence, in determining the weight of the testimony of the witness. It thinks that this is a matter to be treated much as it would be proper to treat the fact that a witness had talked with an attorney representing one of the parties in the case. It says that it is perfectly proper for counsel to interview witnesses, but it also holds that such fact may be shown and considered by the jury, together with all the other facts in evidence in determining the weight of the testimony of such witness.

LIABILITY FOR MOTORMAN'S INVITATION TO LEAVE CAR BY FRONT DOOR.

Sowash v. Consolidated Traction Company (Pa.), 41 Atl. Rep. 743. November 14 1898.

Two separate actions were brought against the traction company, the plaintiffs being husband and wife. These two cases were consolidated into one, and tried at the same time and before the same jury. There was evidence that the motorman opened the front door of the car, and invited Mrs. Sowash to leave the car from the front platform. She testified that she followed his direction, and descended to the ground from the steps of the front platform. That ground was broken, and the night was dark, and Mrs. Sowash testified that, within a very few steps, she caught her foot in some way, and fell to the ground, and sustained her injuries.

As there was no proof of any contributory negligence on her part, the supreme court of Pennsylvania says that if the jury believed her story, she was entitled to recover damages, and her husband also. The case, it holds, must necessarily have been submitted to the jury, and could not have been taken from them without error. So it affirms judgments for the plaintiffs.

BOARDING OF CARS AT PLACES OF OBSTRUCTION.

Dean v. Third Avenue Railroad Company (N. Y.), 54 N. Y. Supp. 490. November 22, 1898.

The second appellate division of the supreme court of New York suggests that it would hardly do to hold that the persons operating street cars in our great cities are not under some obligation to anticipate that intending passengers may get on board, or attempt to get on board, when the cars are stopped by reason of temporary obstructions, or for any other cause, at places where stops are not ordinarily made.

This was brought out by the contention of counsel that, recognizing the rule that a street railway company must give an intending passenger a reasonable time to board a car, this applies only to regular stopping places or crossings, and to cases in which the employes of the company have actual notice that there is an intending passenger who is attempting to board the car.

The trial judge had instructed the jury, in substance, that liability might be imputed to the defendant if the conductor, in the exercise of reasonable care, ought to have seen whether or not any one was about to get on the car while it was temporarily stopped by reason of the obstruction in front of it, and not have let it start too soon for the person, which view the appellate division seems to adopt, when it not only refuses the company a new trial but makes the intimation above set forth.

PROPERTY RIGHTS IN RIGHTS OF WAY.

Birmingham Traction Company v. Birmingham Railway & Electric Company (Ala.), 24 So. Rep. 368. August 15, 1898.

The supreme court of Alabama holds that a [street] railroad corporation, in possession of and owning a right of way, has such property rights and interests that the crossing of it by another [street] railroad corporation is the taking of property, within the meaning of the state constitution and laws, which require just compensation to be paid "before such taking" to the owner, and it insists that the payment of the money before the taking is a condition precedent.

The court further holds that whenever any person, corporation, or authority, vested with the power of eminent domain, undertakes to exercise such power, by appropriating private property to its own use or benefit, with first compliyng with the constitution, a court of equity has jurisdiction to enjoin such undertaking, until compensation has been first paid to the owner, his title or interest being admitted or clear, and that without regard to the solvency or insolvency of the party or corporation proposing to exercise such authority.

Moreover, the court holds that the refusal of a [street] railroad company whose right of way it is wanted to cross to consent to any proposition, or agree to any amount, does not authorize another street railroad company to proceed across its right of way without condemnation proceedings and payment of compensation.

SUFFICIENT CONSENT TO SUSTAIN RIGHT OF COMMON TRACKAGE.

Staten Island Midland Railroad Company v. Staten Island Electric Railroad Company (N. Y.), 54 N. Y. Supp. 598. November 22, 1898.

Assuming that the control which the board of supervisors exercised over county roads made its consent necessary to the operation

of a railroad upon a county road within a village, the second appellate division of the supreme court of New York holds that the action of the board in question in adopting a resolution granting a franchise to the defendant upon conditions providing for common trackage in favor of a connecting company situated like the plaintiff, and the subsequent action of the board in granting to the plaintiff authority to construct its railroad to the very head of the street where were the tracks of the defendant on which the plaintiff desired to exercise the right of common trackage, must be regarded as constituting a consent that the plaintiff should operate its line over said street.

Moreover, upon the ground that if the defendant could give its consent afterwards, it could give its consent in advance of the construction of its own line, authorizing another company to operate its railroad in a certain street over the same tracks, and that being what it deems that the defendant did by entering into a certain contract and stipulations with the municipal authorities, the court holds that the conditions in such contract would not be void but would be available to the plaintiff or any other corporation coming within the terms of the contract.

ADMISSIBILITY OF EVIDENCE AS TENDING TO SHOW RIGHT TO RIDE ON TRANSFER.

Woods v. Buffalo Railway Company (N. Y.), 54 N. Y. Supp. 735. December 9, 1898.

In an action brought to recover damages for a personal injury alleged to have been inflicted in the ejection of the plaintiff from a car for refusal to pay his fare, where the conductor maintained that the transfer offered had expired, the fourth appellate division of the supreme court of New York holds that it would undoubtedly have been competent to prove that the plaintiff told the conductor at the time that he took the first passing car after receiving his transfer; and if a witness had been produced who knew that fact, it would have been competent for him to testify that he told the conductor that the plaintiff took the first passing car after receiving his transfer. This, it says, would have been competent, as tending to show that the plaintiff was acting within his right, and for the purpose of showing that the defendant's agent had notice that the plaintiff claimed to be acting within his right. But this, the court holds, falls far short of rendering it competent for the plaintiff to testify that an unknown person standing by told the conductor that the plaintiff took the first passing car, which related to a past transaction. This, it maintains, would not be a statement of a third person characterizing an act occurring at the time, but a statement of an alleged past act, and the defendant would not waive its objection to this incompetent evidence by showing that no such statement was made by a man sitting or standing near the plaintiff. Moreover, it holds that the evidence would be wholly incompetent as mere hearsay.

MUST LOOK CAREFULLY AND NOT CARELESSLY FOR CARS.

Jewett v. Paterson Railway Company (N. J.), 41 Atl. Rep. 707. November 4, 1898.

The court of errors and appeals of New Jersey thus summarizes this case: The plaintiff, at a little after 9 o'clock on a dark night, was approaching on foot a trolley road having a single track, which he intended to cross. His line of approach was northwesterly, and diagonal to the track. When he had somewhat more than 50 feet to walk before crossing the track, he saw a car somewhat more than 250 feet south of the place of crossing. He testified that, when from four to six feet distant from the track, he turned his head, looked for the car south along the track 75 or 100 feet, and did not see it; that he was then going diagonally across; that, the first thing he knew, the car was on him, and knocked him down; and that he was about the middle of the track when he was struck. The track to the south was straight for more than 250 feet, and the view of it was unobstructed.

The court holds that facts within the knowledge and observation of the plaintiff, who must be assumed to have moved at the rate of an ordinary walk, made it probable that the car, coming from a quarter towards which his back was partly turned, would be dangerously near to him before he got across the track; that it was therefore his duty to look for the car before he attempted to cross; that the car, moving at any rate of speed that was attributable to it under the evidence, must have been so near to the plaintiff, when he looked for it before going on the track, that if he had not looked carelessly, he would have seen it, and have been warned of imminent danger; that his failure to receive warning was therefore due to his own negligence; and that a nonsuit was properly granted.

TOO VAGUE AN ACT TO REGULATE GRANTING OF FRANCHISES.

State v. West Side Street Railway Company (Mo.), 47 S. W. Rep. 959. November 16, 1898.

The supreme court of Missouri says that the attempt at legislation manifested in the Missouri act of April 9, 1895, wherein the method of granting franchises of many different kinds was sought to be regulated by one general provision, is so indefinite and uncertain, by reason of the effort to regulate the disposition of a great number of franchises by one general rule, that it must hold it incapable of practical operation and enforcement, and, consequently, void.

This act declared that the privilege of constructing railroads, street railways, electric light plants, gas works, waterworks, telegraph and telephone lines and extensions thereof, "above, across, along, beneath or through any highway, road, avenue, alley, park, square, street or other public land" must be sold at public auction to the responsible party who would give the largest percentage yearly of the gross receipts derived from such use and occupation.

It will be seen, at a glance, says the court, that it is utterly impossible to give this act any reasonable or sensible construction as applied to railroads. There cannot be any competition, in the very nature of the case, for the privilege of constructing and operating that part of a continuous line of railroad located within the limits of the highway or streets, as distinct from the entire road, which may extend over many miles. And much of what is to be said about railroads, the court considers, applies with equal force to "extensions" of street railways, etc. The privilege of making an extension can only be conferred upon the owner of that which is to be extended. If granted to any one else, it must necessarily be an independent enterprise.

Then, too, the court says, an extension of a street railway gives an increased distance over which people may be carried for a single fare, and the act, as in case of railroads, gives no rule by which to determine the amount of the gross receipts to be credited to the new portion of the line.

The court further finds an insuperable obstacle in the way of any attempt to enforce this act, even as against a new street railway, in that it seemed to contemplate that the bid should be a percentage only of the receipts derived from the use and occupation of the public property, but failed to state how and by whom the proper proportion of the gross earnings that should be attributed to such use and occupation should be determined.

Again, the percentage was to be increased in "each period of five years" "to correspond with the increase in the value of the land thus occupied and used," and the court criticises the act for giving no intimation by whom or in what manner this increase was to be settled and determined, adding that there was painful obscurity, too, as to what was meant by the "increase in the value of the land thus occupied and used," so that it declares that it could not be stated what meaning should be ascribed to this part of the act.

Thus does the court show that the provisions of this act were so obscure as to make it impossible to ascertain and declare their proper meaning.

Flooded streets in Chester, Pa., have caused the Chester Traction Company to lose at least $1,000 by the burning out of motors.

The city council of Nashville, Tenn., is engaged in a discussion with the Nashville Street Railway and the Nashville & Suburban Railway Companies as to whether two or three tracks shall be laid over the Broad street viaduct, recently built. The former company permitted the latter to use its tracks when the city decided to use the viaduct, and has found by experience that the joint use of the tracks causes inconvenience and delay.

C. S. KNIGHT BECOMES MANAGER OF SIEMENS-HALSKE.

C. S. Knight, one of the best known men in the electrical fraternity, has been elected vice-president and general manager of the Siemens-Halske Company, of America, and has entered upon his new duties in the general offices in the Monadnock building, Chicago.

The appointment of Mr. Knight is the inauguration of a new and vigorous business policy on the part of his company, which, while it has been doing a quite extensive business, and steadily making itself felt in the quality of its products, has not endeavored to secure business to any great extent outside of certain lines. As our readers may know, the company has the use in America of all the data, patents and patterns owned by the parent company in Berlin, which has the most extensive electrical works in the world, and which also stands at the head in the quality of its products. It is one of the cardinal principles of the home company never to allow a piece of apparatus to go on to the market until it has been tested in private to an extent which warrants the makers to absolutely guarantee what it will do. Hence the name Siemens-Halske has long since become a synonym for the best.

C. S. KNIGHT.

With extensive manufacturing facilities in Chicago which enable the production of its machinery to great advantage, and a corps of highly experienced men both in its administrative and mechanical departments, it will now become one of the leading factors in the production of electrical apparatus. Many of its present installations are of national renown, and with the record of the past, and present facilities, it will from now on take a front rank. The sales department has been reorganized, and includes some of the strongest men in the country. Certainly no better selection could have been made for general manager.

Mr. Knight was born at Columbus, Ohio, and passed his early life there; he entered the service of what are now the Pennsylvania lines west of Pittsburg in 1860, and continued in the transportation department of the railroad until 1881. After this he was for five years engaged in the gas business at Ft. Wayne, Ind.; at the end of that period Mr. Knight became interested in the Ft. Wayne Electric Company. When this company was thrown into the hands of a receiver in June, 1894, and the Ft. Wayne Electrical Corporation organized for the purpose of operating the business under contract with the receiver, Mr. Knight was chosen a director of the new concern. This connection continued until February 1, of this year, when he resigned the vice-presidency of the corporation. He is a broad gaged, progressive man, with a very wide acquaintance in the electrical and street railway field, and has hosts of friends, all of whom will wish him a full measure of success in his new work.

THE ALLEN LAW REPEALED.

The Illinois legislature on March 2 passed an act repealing the Allen law, and this was approved by the governor on March 7. The repealing act restores the horse and dummy law of 1874, with slight modifications to include electric and cable power, thus limiting the terms of franchises to 20 years. The Allen law was not the vicious measure its traducers claimed it to be, and the action of the republican legislature was doubtless taken at the instance of the leaders of that party in Chicago, who feared that their opponents would seek to make the non repeal of the Allen law an issue in the coming city election.

The Allen law, while permitting a 50 year grant, placed no limit on the amount which the city could demand for new franchises. One feature only of the law remains, and while even this is somewhat in doubt, we believe it will be found to be still in force, though the supreme court may have to pass on the question. It is the section in regard to consents, and reads as follows:

"The city council or board of trustees shall have no power to grant the use of or the right to lay down any railroad tracks in any street of the city to any steam, dummy, electric, cable, horse or other railroad company, whether the same shall be incorporated under any general or special law of the state now or hereafter in force, except upon the petition of the owners of the land representing more than one-half of the frontage of the street, or so much thereof as is sought to be used for railroad purposes, and when the street or part thereof sought to be used shall be more than one mile in extent, no petition of land owners shall be valid unless the same shall be signed by the owners of the land representing more than one-half of the frontage of each mile, and of the fraction of a mile, if any, in excess of the whole miles, measuring from the initial point named in such petition, of such street, or of the part thereof sought to be used for railroad purposes."

VIRGINIA STATE ASSOCIATION.

The Virginia Street Railway and Electric Association, which was organized last December, has already got down to work, and Secretary Woodson, of Lynchburg, has made the assignments for papers to be read at the first annual meeting which is set for May 16, 1899, at Richmond. There are nine members to date, which is an excellent start. The papers and assignments are:

"Care of Car Equipment and Their Repairs," E. J. Willis, general manager, Richmond Traction Company.

"Park Attractions and Amusements," E. R. Williams, president Richmond Traction Company.

"Track Bonding," R. D. Apperson, general manager, City Street Car Company, Staunton.

"Methods of Improving the Electric Lighting Business," H. P. Woodson, secretary, Lynchburg & Rivermont Street Railway, Lynchburg.

"Road Bed and Its Maintenance," D. W. Flickwin, receiver, Roanoke Street Railway.

The indications are for a good meeting.

The new officers of the Virginia Street Railway & Electrical Association are as follows: President, R. D. Apperson, general manager of the City Street Car Company, of Staunton; vice-president, E. Randolph Williams, president of the Richmond Traction Company; secretary and treasurer, H. P. Woodson, president of the Lynchburg & Rivermost Street Railway Company. The executive committee consists of the officers named above and R. L. Williams, of Norfolk, and D. W. Flickwir, Roanoke.

VESTIBULES IN NEW YORK.

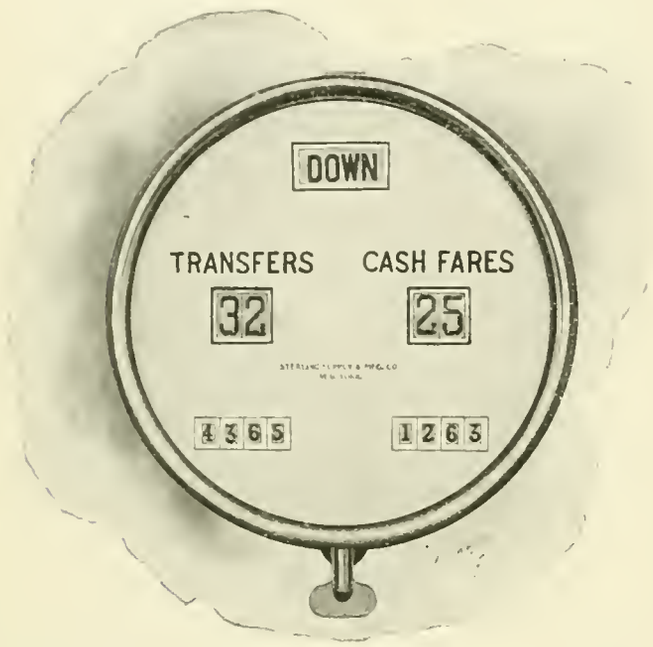
The street railway employes of Binghamton, N. Y., are seeking to have the railroad law of the state amended so as to require all street cars (except trailers) to be equipped with vestibules between November 1 and May 1. The penalty suggested is $25 per day per car. Up to the present time they have not succeeded in securing the introduction of their bill in the legislature

The Fitchburg (Mass.) & Leominster Street Railway Association gave its third annual concert and ball in Fitchburg on February 8.

THE STERLING DOUBLE REGISTER.

In buying fare registers many purchasers consider quality first and the price second, but some see no difference in registers and the initial cost alone governs their selection. The latter soon learn that a cheap register is dear at any price and that the first cost is greatly augmented by the cost of maintenance.

The Sterling Supply & Manufacturing Company owns several of the oldest as well as many of the latest patents on fare registers and there is no necessity for any intricate mechanism to avoid other patent claims. The Sterling register is notable for its simple and scientific construction. The accompanying illustration shows the latest model of the Sterling double register which has the following salient features: It is strictly a double register; two distinct registers in one case. It is operated through a train of gears and not entirely by springs. The gear connection between the trip and totalizer wheels is positive, no cams or dogs being employed. Every working part is a carefully tested steel casting and all parts are interchangeable. The indicators are very plain and easily read from a distance. The inner mechanism is complete and simple and the outer finish and appearance is durable and handsome. The parts are all carefully made of the very best material and is the result of mechanical ingenuity and skill.



STERLING DOUBLE REGISTER.

FALK COMPANY ABSORBS WESTERN GEAR.

The Falk Company, Milwaukee, has dropped the word "manufacturing" from its corporate name, and has secured the plant and business of the Western Gear Company, of that city. All the officers and skilled employes identified with the Gear Company are now transferred to the Falk, which will continue the manufacture of gears and pinions on a larger scale than before. It will also engage in the manufacture of steel castings by the open hearth process and is now erecting its foundry for that purpose. The new works will also afford enlarged facilities for the special work in switches, frogs and crossings. The company will also contract for the construction of electric railways, and of course give a large share of attention to the Falk cast-welded joint. With its greatly increased facilities and the same strong administration the Falk Company cannot fail to continue to grow and become each year a stronger factor in its special lines.

Congressman Charles L. Henry, of Anderson, Ind., president and general manager of the Anderson Electric Street Railway Company, has filed a petition with the commissioners of Marion county for a right of way over Pendleton pike for an electric line from Anderson to Indianapolis.

NEW COMPANY AT INDIANAPOLIS.

A syndicate headed by Hugh J. McGowan, of Kansas City, has purchased the stock of the Citizens' Street Railroad Company, of Indianapolis, and also acquired the interests of the City Railway Company, and will consolidate these companies, concerning the rights of which there has been so much litigation and legislation, into the Indianapolis Street Railroad Company.

The details of the organization and the agreement which will be made with the city have not yet been completed, but it is announced that H. P. Wasson, of Indianapolis, will be president of the company, and H. P. Wasson, Dr. Henry Jameson, Harold B. Hibben, Hugh J. McGowan, of Kansas City, and Randall Morgan, of Philadelphia, directors.

As a result of this sale by the old company the argument of the street railway case now pending in the United States Supreme Court was postponed.

RHODE ISLAND STREET RAILWAY LAW.

June 15, 1898, the Rhode Island legislature passed an act providing for a tax on street railways, the provisions of which are in substance as follows:

Section 1. Street railway companies accepting the provisions of the act are to pay a state tax determined as follows: If the annual dividend on the capital stock outstanding is 8 per cent or less, the tax shall be 1 per cent of the gross earnings. If the dividend is in excess of 8 per cent on the capital stock the tax shall be equal to such excess, but in no case is the tax to be less than 1 per cent of the gross receipts. This tax is in lieu of all other state taxes of every kind, but the act does not affect the taxing power of municipalities, nor any obligations of the municipalities or street railways now existing by virtue of agreements.

Section 2. Companies accepting the provisions of this act shall have the right to operate all the lines operated at the time of the acceptance of the act or acquired later, provided that "every street railway company accepting the provisions of this act shall, so long as it continues to enjoy the rights, privileges and franchises aforesaid, continue to pay to the several cities and towns, notwithstanding the expiration of any existing contracts or agreements, such sums as are now or may be required thereunder until new contracts or agreements shall be made, and such sums, not less, however, than those paid at the expiration of such existing contracts or agreements, as may thereafter be agreed upon from time to time."

Section 3. City and town councils may order the revocation of location and the right to use any portion of a street provided the company interested shall be given a right in another street as nearly similar in public convenience as possible; orders of revocation must be passed upon by the railroad commissioner and from his decision an appeal lies to the appellate division of the supreme court which finally determines all matters of law and fact involved.

Section 4. Companies may increase their capital stock to meet the cost of extensions and new equipment upon the approval of the railroad commissioner.

Section 5. This section deals with the methods of computing the tax.

Section 6. Companies leasing their roads to companies who pay the tax are exempt.

Section 7. This act applies to companies which accept its provisions in writing, and when so accepted it shall constitute a contract which shall not be altered or amended without the consent of both parties. Existing companies accepting this act shall do so on or before October 1, 1898.

Five companies which do the bulk of the street railway business in the state have accepted the act. By a careful reading of the words quoted in section 2 it is seen that so long as the ruling in the Dartmouth College case is law, the five companies cannot have their burdens increased save by their own consent.

The first meeting of the board of directors of the Charleston (S. C.) Consolidated Railway, Gas & Electric Company was held February 21. This company has acquired the property of the Charleston City Railway, the Charleston & Seashore Railroad, and the gas and electric light companies of the city. The consolidation was arranged through the Guaranty Trust Company, of Baltimore.

STEAM SWITCH-BACK MERRY-GO-ROUND.

It is the constant dropping of the nickels which keeps 50,000 street cars going in this country. The 5-cent pieces become dollars with remarkable rapidity, and in no wise is this more clearly shown than in the operation of a merry-go-round in a well appointed street railway park. The steam switch-back merry-go-round herewith illustrated was patented and is made by Norman & Evans, of Lockport, N. Y. These machines are enormously profitable when properly managed. As much as $562 has been taken in during one day's

NORMAN & EVANS MERRY-GO-ROUND.

operation, and at a summer resort one earned $2,850 above all expenses in two weeks.

This merry-go-round has an undulatory rotary motion and carries eight cars, designed to represent Venetian gondolas. Each car will carry 12 passengers, making a total seating capacity for 96. The decorations are highly artistic, and in the center is a military band organ which can be made to play continuously whether the machine is in motion or not. The entire merry-go-round can be packed for transportation on a single flat car and can be erected at its destination in a few hours.

IMPROVEMENTS AT LYNCHBURG, VA.

The Lynchburg & Rivermont Street Railway Company is making an important extension of one and one-half miles to its line and is building terminal station and pavilion. This combination pavilion and station building will be in the public park and the new extension will connect it with the main line.

The company owns also a 30-acre park at Rivermont, which is beautifully located on the highest point of land within 10 miles of the city, and well wooded with oak. This park has proved a favorite spot for the inhabitants of Lynchburg in the summer season, and will grow in favor as the company is able to improve the place. The greatest attractions, however, and always will be, are those features furnished by nature. Beside being covered with oak trees it is on a bluff at the foot of which runs the James river. To the north and west can be seen ranges of the Blue mountains.

The Lynchburg Electric Railway Company has contracted for material to rebuild its road and also about a mile of new track. The new company expects to make the property of the old Lynchburg Electric Company the best in the state. The Virginia Paving Company has the contract for rebuilding the track and overhead work under the supervision of the New England Engineering Company. The Pennsylvania Steel Company will furnish the rails and Jackson & Sharp will furnish 12 new cars, mounted on Peckham trucks.

The company has secured the West Lynchburg Hotel and 65 acres of wooded land adjoining to be used for an amusement ground or park. When the grounds are improved the place will be one of the prettiest places in central Virginia.

The company has two power stations, a small water plant which furnishes power for the incandescent and arc lights and a steam plant to furnish power for street railway and commercial power for electric fans, printing presses, carriage factories, machine shops, etc. The demand for electric power is growing rapidly.

REQUIREMENTS FOR BROOKLYN HEIGHTS EMPLOYES.

The Brooklyn Heights Railroad Company, of Brooklyn, N. Y., has found men of more than average height and weight are required for motormen on its large and heavy cars, and has accordingly fixed its minimum requirements as to height of motormen at 5 ft. 8 in., and the weight at from 160 lbs. to 200 lbs.

The physical examination insisted upon is for the test of eyesight, hearing, lung and heart troubles, etc.—in short, what would be required of every man, wherever employed in a position of responsibility.

The requirements and regulations enforced when selecting employes are merely a recapitulation of the foregoing. The endeavor is, so far as is possible, to pick applicants for the position of conductor from among men who have had some experience in handling money and accounts, who are alert, courteous, cool in emergencies, and of unfailing good temper; motormen are selected from among drivers, laborers of the better class, ex-steam railroad men, and men, generally, who are quick, possessed of keen judgment, and responsive to the wants of the company.

ILLUMINATING TORCHES.

The accompanying illustration shows the No. 6 illuminating torch for gasoline which is made by Chas. G. Smith, 350-352 Pearl street, New York, who is perhaps better known to the trade as "Smith of New York." This is a particularly reliable piece of apparatus and can always be depended upon to be in working order; the advantages of the gasoline torch over that using kerosene is its greater

cleanliness and ease of operation. Needless to say it is a safe torch. The one shown is of 5,000 candle power. The gasoline is carried in a tank made of heavy galvanized iron of any capacity desired; the tanks are designed to withstand a pressure of 200 lbs. per sq. in. The small pump shown at the side of the tank is used to provide the necessary working pressure, which is only 40 lbs.

The torches are particularly adapted for extraordinary park illuminations, and for use when construction work is in progress at night or in tunnel.

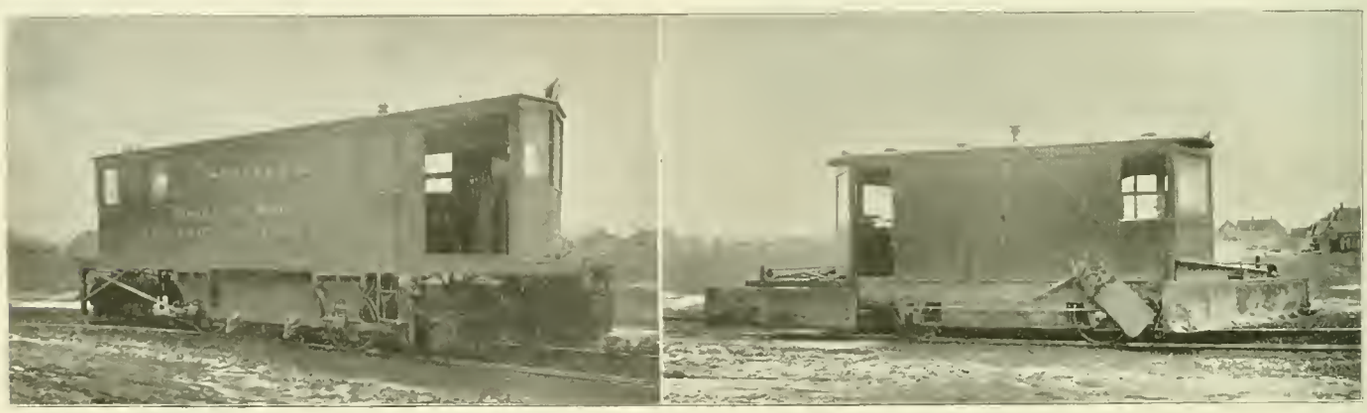
The newly reorganized Saginaw (Mich.) Valley Traction Company has recently moved its offices into a new suite of rooms, on East Genesee street, Saginaw.

A bill is pending in New Jersey to permit city councils to impose license fees of from $25 to $50 per car on the street railways operating in their respective jurisdictions.

REMOVING SNOW ON CHICAGO SUBURBAN LINES.

Fighting snow on some of the Chicago suburban roads is serious matter at times, for many of the lines pass through strips of prairie country where the snow drifts on to the track, often forming great banks through which the plows have to cut, and furthermore, it is hard to keep the tracks clear on account of the long headway of the cars. Almost all of the 35 miles of track of the Chicago Electric Traction Company is laid through the sparsely settled suburban districts. General Manager Gilbert finds that a heavy sweeper is the most satisfactory means of contending with light snows or to keep the tracks clear during a storm. For this purpose the McGuire Manufacturing Company built a specially designed sweeper.

The sweeper, shown to the left in the illustration, is the largest the company ever made, and is perhaps the largest in operation. It is 32 ft. in length and weighs complete, with equipment, 46,000 lbs. There are three 50-h. p. Walker motors, two of which are mounted on the car axles and furnish the motive power; the third is mounted on a shaft which runs lengthwise of the car body and drives the brushes through bevel gears and vertical shafting. There are two clutches on this shaft so that the brushes at either end may be driven. The brushes are mounted on adjustable bearings which can be moved vertically by a chain and hand wheel. A crew of three men work the sweeper satisfactorily. Snow-falls up to 7 in. deep



SWEEPER AND PLOW—CHICAGO ELECTRIC TRACTION COMPANY.

are taken care of by this machine. The sweeper can be operated from either end, there being a controller and hand wheel front and back, and a third controller near one end connected to the motor actuating the brushes. Three sets of standard car storage batteries are carried by the sweeper.

The other illustration shows a Brill snow plow which has been in operation for the past year and a half. This plow is 32 ft. long from tip to tip and weighs 40,000 lbs. Two 50-h. p. Walker motors furnish the motive power and three sets of car batteries furnish the current. Each plow share is mounted on three standards and can be raised or lowered by a chain and hand wheel. The wing used for pushing the snow out from the side of the tracks is shown plainly in the half-tone. This plow has successfully cleared the tracks of the heaviest drifts. Last year there was one 7 ft. deep and 500 ft. long which was quickly and easily removed.

The large home made snow plow of the Calumet Electric Railway Company, described and illustrated in the REVIEW for March, 1897, has accomplished some unusually heavy work. On one of the outer lines a snow drift 16 ft. high accumulated over both tracks. The plow succeeded in clearing one track and then by means of the side wings about a foot on top of the drift over the other track was removed. It passed back and forth cutting into the drift each time one or two feet until the second track was uncovered. General Manager Sloan considered this plow a success and ordered two others of similar design built under the direction of W. A. Harding, master mechanic. The body is 8 ft. 6 in. across and 12 ft. long and the frame is of rigid cross construction to prevent tipping. Each share, 9 ft. in length, is set at an angle of 55° and consists of five segments with spring suspension to prevent them from being damaged when striking a rigid obstruction. There is no truck, the axle boxes being attached to the sills of the car body. Two W. P. 50 motors, one on each axle, supply the motive power. Every part of the plow is made very heavy and to add additional weight about a ton of iron ballast is placed in each corner.

PRACTICE VS. LABORATORY TESTS ON LIGHTNING ARRESTERS.

Due consideration should be given laboratory tests and the results derived therefrom, but often practical operation has varied widely from what was expected from experiments previously conducted. It is the practice that makes perfect. In no industry has this proven so true as in the electrical, and the extreme perfection of electrical machinery is due largely to the correction of defects developed in practice. To no piece of apparatus does this apply with more force than to the lightning arrester. For a long time it was looked upon as a luxury and a nonessential, but experience has taught that they are absolutely necessary for the protection of the expensive electrical machinery.

Lightning arresters have to deal with the forces of nature and therefore in principle must be in accord with natural laws. If for the protection of the dynamo or motor, a piece of wood properly treated, or if a piece of iron and carbon work in unison with nature, accept the one which successfully does the work regardless of theoretical considerations. Arguments have been made against lightning arresters with moving parts, but practice has shown many of these fallacious. The Garton arrester comprises moving parts, but it is so simple and the parts so arranged that all the difficulties anticipated in a device of this character are entirely obviated. The most convincing proof that moving parts are not always objectionable is in the success of the Garton arrester under the most trying conditions.

Every operation of this arrester cleans the contacts and discharge points, thereby keeping the conductivity at a maximum and the resistance at a minimum. The arrester is so quick in its action that discharges in rapid succession are taken care of with the greatest ease. After a discharge the Garton arrester increases the resistance in the circuit and chokes and disrupts the current flow. This operation is done so quickly that a sensitive plate is incapable of detecting any motion, as may be seen in the illustrations from photographs in the catalog.

The Garton-Daniels Electric Company, of Keokuk, Ia., has issued a new catalog, No. 22, setting forth the merits of the Garton arrester and presenting some valuable information regarding protection from lightning. This catalog is very complete and handsomely illustrated and may be had for the asking.

The Marion county (Ind.) commissioners have been petitioned by P. H. Fitzgerald, Sterling Holt, J. C. Tarkington and Joseph Elliott for a franchise for an electric line to connect Indianapolis with Martinsville via Maywood, Valley Mills, West Newton, Friendswood and Mooresville.

CAST STEEL IN TRUCK FRAMES.

In the REVIEW for December, 1898, page 916, was illustrated the McGuire No. 35 truck, which, with the exception of the journal boxes, is made of steel—cast or rolled. The McGuire Company has recently issued a circular relating to the use of cast steel in truck manufacture, from which we take the following:

"Since it has become a fact that cast steel can be made to equal rolled steel and that it is susceptible of being worked in a forge in the same manner as the ordinary bar steel, and since the old difficulty with cast steel—that of blow holes and shrinkage cracks—has been entirely overcome, we have adopted this metal in double and single trucks. The advantage is easily comprehended, the minimizing of parts being greater than by any other method. It simplifies, strengthens, adds life, and absolutely avoids any cost of maintenance as far as the frames of the trucks are concerned.

" The steam railroads of the country, after half a century of experience, are getting away from the composite truck with all possible speed.

"A side of our No. 35 truck was placed on two supports—one on each pedestal opening, and a pressure of 55 tons placed in the middle, with a deflection of ⅛ in. with no permanent set; at 63 tons the deflection was ¼ in. and the permanent set ⅛ in. At 70 tons, a permanent set of 1¼ in. without sign of fracture, was noted, and the tensile member parted at 72 tons, making a total of 288,000 lbs. for one truck, or a total of 576,000 lbs. per car, giving a safety factor for the truck side of 14.4, assuming the load to be 40,000 lbs.; the bolster and transom are equally as safe. All the important pieces in the truck are given physical test of three times the actual load before being used. Side frames 1¾ in. by 4 in. are welded every day in the shops of the company, with the same facility and results that could possibly be obtained from the very best rolled steel."

The company has orders from the following companies: Northwestern Elevated Railroad Company, Chicago (entire new equipment), Colorado Springs Rapid Transit Company, Danville Gas, Electric Light & Street Railway Company, Syracuse Rapid Transit Company, St. Joseph & Benton Harbor Electric Railway, South Bend Street Railway Company, Peoria & Prospect Heights Railway Company, Benton Power & Traction Company, and the Monongahela Street Railway Company, which goes to show that cast steel is fast coming into general use and will command the attention of railway people generally.

SPOKANE'S MAYOR FAVORS FREIGHT.

Spokane, Wash., as all who have ever visited that thriving city know, is destined to become a large manufacturing center on account of its location and nature's ready made water power. Already desirable industries have located there and others will not be slow to favorably consider a city where there is such evidence of extending a broad gage policy.

In his annual address to the Chamber of Commerce, Mayor Olmsted defined his policy in the following:

"There are industries which are prepared to come here when the question of cheap transportation from the factories to the railroad depots is settled to their liking.

"Personally I see no reason why freight should not be hauled over the suburban streets, if it will help to build up the town. I do not think any one would be disturbed by having this done between the hours of 1 o'clock at night and 6 o'clock in the morning. Provided, of course, that this traffic was carried by electricity. I should be opposed to steam engines on the city streets on account of the smoke, the noise and the tendency to frighten horses.

"While in Seattle I have noticed the freight cars being loaded at all hours of the day and in a good part of the city, too. In San Francisco they run the mail cars over the street railway, and I don't see that freight cars would be any different. Everything of this kind helps to attract manufacturing men, and the more facilities that are offered will lead to the location of factories here."

The right by which freight is now hauled over Front street from the C. & C. Mill to the railroad was granted by a franchise given the Spokane Street Railway Company March 6, 1894, and it gives them the privilege of hauling cereals and the products of cereals along and over certain streets.

It is expressly provided that the cars used shall not exceed in length 24 feet and shall be of light construction, similar to the electric cars used on suburban travel, and shall be equipped with electric motors similar to those used on cars with a maximum carrying capacity of ten tons; and the speed at which the cars are to run shall not exceed five miles per hour, and all street passenger cars and the fire department apparatus shall have the right of way over the freight cars.

The president of the city council and a number of the aldermen expressed themselves as heartily in favor of the plan.

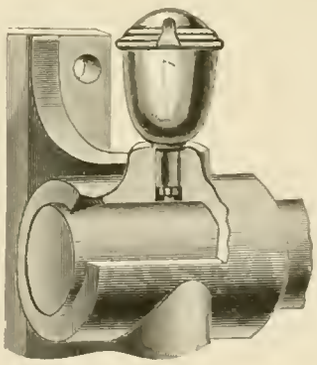
GRINDING FLAT WHEELS.

The flat wheel question is one of the most serious and annoying features which the railway manager has to meet and much time and money has been devoted to it. The Wheel Truing Brake Shoe Company has apparently solved the problem. This company makes a shoe which is interchangeable with the shoe whose place it is to take while doing its work, and is like it in every respect, except that it contains pockets filled with a grinding material. When a wheel becomes flattened the regular brake shoe is removed and the wheel truing brake shoe is put on in its place. The car is then run as usual, and every time the motorman applies his brake the wheel is being ground down. Of course the shoe grinds only when the brake is applied, and as that is but a short time and at intervals it takes some little time to complete the truing process, especially if the flat is a bad one. Usually a days run will true up a wheel.

The shoe being a part of a true circle must of necessity make the wheel perfectly round. The shoe can be put on and taken off as easily and quickly as the ordinary shoe, which means a great saving of time; it can also be used in the barns when the car is out of service.

THE ALBANY LUBRICATORS.

The regular style of spindle compound cup here illustrated is made by the Albany Lubricating Compound Company, Adam Cook's Sons, proprietors, 313 West street, New York. As may be seen from the section, a hole is bored through both the cup and brass of sufficient size to allow the outside tube of the cup passage to the shaft, but only the inside spindle rests on the shaft, the outer tube being about ¼ in. above. The inside spindle is removed and the cup filled with the compound. It is only necessary to replace the spindle with a few churning motions and the cup is ready for use. These cups require a minimum of attention, one charge of lubricating compound lasting from one to four months.

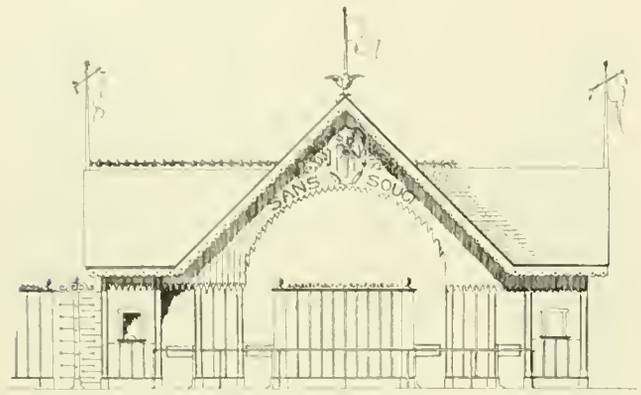


When the Albany compound is used in the cups no drip pan is required, for it is self acting and runs only when the shaft is in motion. This compound is especially desirable for dynamos, motors, heavy cable machinery and other and fully illustrating the cups and compounds, has been published four regular grades, depending upon the temperature and the speed of the machinery. An interesting booklet, giving much information and fully illustrating the cups and compounds has been published by Adam Cook's Sons.

At the annual meeting of the Hamilton & Dundas (Ont.) Street Railway a 5 per cent dividend was declared on the outstanding stock; the surplus, after meeting fixed charges and dividends, was $2,671 for the year 1898.

SANS SOUCI PARK, CHICAGO.

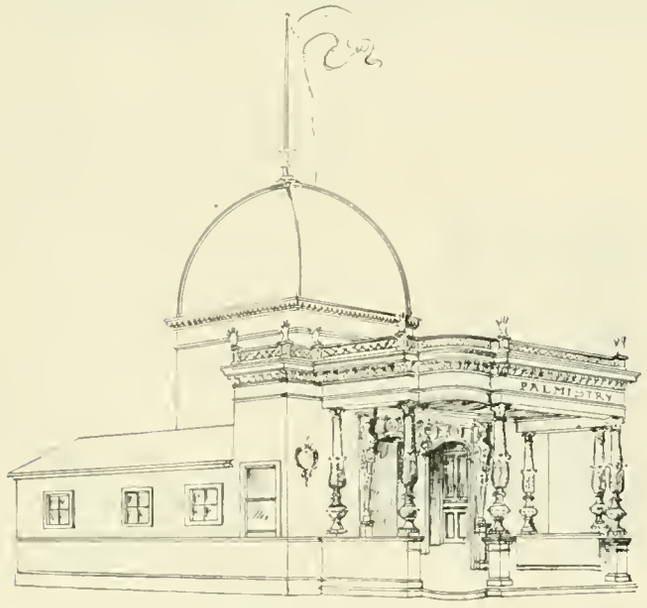
Chicago has a magnificent system of parks and boulevards on the north, west and south sides of the city. In the parks are zoological and botanical gardens, immense pleasure grounds, lakes for boating and fields for all kinds of summer sports. These parks have excellent street railway facilities and the cars are liberally patronized by those seeking fresh air and recreation in the summer. The bounty of the municipality has made it unnecessary for the



ENTRANCE TO THE PARK.

street railway companies to maintain large pleasure resorts. From the standpoint of popular amusements there is but one deficiency in the municipal parks and that is the pleasure seekers like excitement and exhilaration as well as rest; they wish to see summer vaudeville, shoot the chutes, ride on the merry-go-round and have a chance to spend some money on frivolous amusements. To meet such demand the Chicago companies encouraged private enterprise along these lines, such as the Ferris Wheel park on the north side, and spectacular, pantomime and pyrotechnic displays in other parts of the city.

The most elaborate and permanent undertaking of this kind is the new Sans Souci park on the south side. It has an ideal loca-



TEMPLE OF PALMISTRY.

tion, being right at the west entrance of the famous Midway, and on the southern boundary of Washington park. It occupies 10 acres between Langley and Cottage Grove avenues and 60th and 61st streets. The Cottage Grove cable line passes along its east boundary, and on the south is the 61st street electric line of the Chicago City Railway Company. Cable trains and electric cars will pass the park every two or three minutes at busy periods, so that there will be ample facilities for transporting large crowds.

Last summer W. H. Carter, who has been connected with the Chicago City Railway Company since 1892, saw the need of such an amusement resort and began investigations. He secured a 10-year lease on the tract of ground and with the encouragement and assistance of the railway company commenced the improvements. The work of building began late last fall and has proceeded as the weather permitted through the winter. The pavilion, cafe and theater, combined in one large building, 145x180 ft., was designed and erected under the supervision of Robert Hotchkin, architect. It consists of two substantial brick wings, one for the stage and accompanying compartments, and the other for the cafe and refreshment rooms. The two are connected by an iron trussed roof. The theater will have a seating capacity of about 1,000. Extending around the entire building on the first and second floors are 20-ft. verandas, and outside the building will be a finely paved terrace. There will be 350 tables and 2,500 chairs and refreshments of every kind will here be served. For protection on windy or rainy days heavy canvas curtains will be hung on the veranda posts and these can be let down and fastened when desired.

The band stand is a neat structure adjoining the pavilion, as may be seen in the illustration. A band of 30 pieces has been engaged to play afternoons and evenings for the entire summer. Just west of the band stand and within view of the pavilion verandas will be a hippodrome track and arena where outdoor exhibitions will be

JAPANESE THEATER AND TEA GARDEN.

given, such as trained horses and aerial acts, with a change of program each week.

It is the policy of the management to let as many concessions for new and high class attractions as possible. Chief among these is the Japanese tea garden which will be under the auspices of the Japanese Central Tea Association, and will be similar to the garden at the Omaha Exposition, but on a larger scale. This association is supported by the government of Japan, and in reality represents the agricultural department of that country in promoting foreign trade in teas. There will be two handsome buildings with a garden about them laid out and decorated in characteristic Oriental fashion. In the Japanese theater there will be given dancing exhibitions, musical entertainments and Japanese dramas. The two illustrations show features of the entertainments; to the left are the Geishas or dancing girls, and the view on the right is from a photograph of the "gonin-bayashi," or band of five musicians playing on instruments peculiar to the Japanese. Such exhibitions will not only be of interest, but will have an educational value as well. There will be several jinrikishas in the garden, and the pleasant sensation of riding in one of these easy going conveyances may be had for a small fee.

The Temple of Palmistry is a very artistic building, decorated in staff which will attract many who are eager for a vision of the future. The Temple of Illusions will contain a series of popular and mystifying exhibitions. An arcade, 48x120 ft., has been built especially for minor concessions, and will be divided into compartments 12 ft. wide and running the width of the building, for shooting and photograph galleries, phonograph stalls and the like. A large shed, 100x250 ft., has been constructed on the north side of the park to shelter carriages and bicycles, all being cared for free of charge.

The main entrance to the park will be on Cottage Grove avenue, and at this point a fine gateway is building. C. E. Lund, landscape engineer, has spent much time and labor in laying out and beautifying the grounds. A large number of elm, ash, hard maple, linden, white birch, Norway maple and Carolina poplars have been planted. Some of these trees are 12 in. in diameter and 40 ft. high, and were hauled for a distance of 25 miles on wagons. Shrubs,

SANS SOUCI PARK—THEATER AND BAND STAND.

flowers and vines have been selected so that there will be blooming plants from June to late in the fall.

A concession has been granted for a Venetian gondola, which is an improved type of merry-go-round, and this will be located near the Japanese theater. A small zoo will be maintained, including birds, monkeys and other small animals. An artificial lake is on the north side, and here will be black African geese, white ducks and other water fowl. A crew of log rollers has been engaged to give exhibitions on the lake. These men will show how logs are handled in the water, and among other things will have spirited contests, trying to throw each other into the water by rolling the logs.

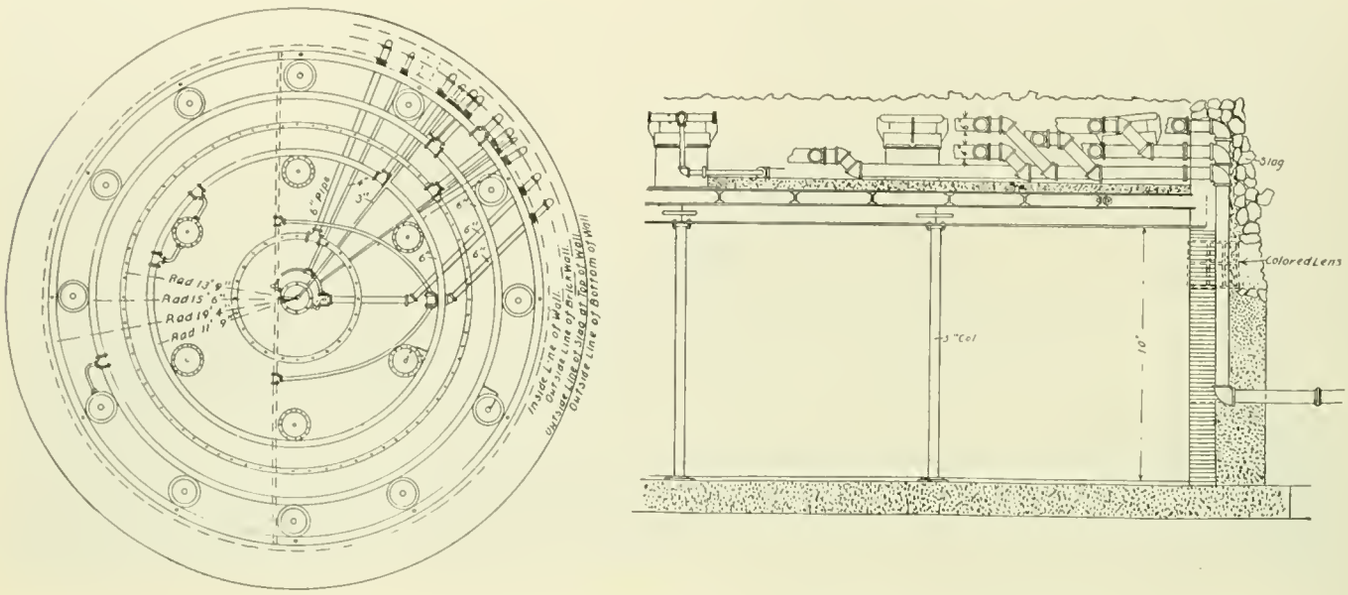
The electric fountain has received more careful consideration in its design and construction than any other feature of the park, and the outcome is one of the largest and finest fountains in the country. The design is the joint effort of C. E. Moore, master mechanic, and C. J. Reilly, superintendent of motive power of the Chicago City Railway Company, and the pipe fitting and machine work was all done in the repair shops of the company. The fountain will be 50 ft. in outside diameter and will have walls 3 ft. thick. The arrangement of the water pipes and the 19 light wells is plainly shown in the plan and enlarged section of the fountain. The water is pumped out of the lake, which is at present supplied from the city mains, but eventually it will come from two 6-in. artesian wells. The power house and operating station is on the north shore of the lake. Two railway motors drive Quimby pumps, supplying 300,000 gals. of water per hour, or running at full capacity the fountain jets will emit 5,000 gals. of water per minute. The current for these motors is to be taken from the trolley circuit.

Each of the light-wells is 2 ft. in diameter and 2 ft. high, and beneath is an equipment of nine colored sashes. These are moved by a motor in the chamber beneath the fountain which drives 19

THE GEISHAS DANCING GIRLS AND JAPANESE MUSICIANS.

shafts connected to the colored sashes by a pinion and rack. Underneath each light-well is an arc light with reflector giving 10,000 c. p. In the power station there will be a keyboard with push buttons to open and close the various circuits, and in this way the combinations can be changed with great rapidity. Already 25 different and distinct displays have been planned. Two men only are required to attend to the fountain mechanism when in operation.

The park being so easily accessible to all the populous districts in the southern part of the city it was deemed necessary to charge an entrance fee to draw the best class of patrons. In the afternoons the admissions will be 10 cents and at night 15, children free. Reserve seats to the theater entertainments will be 10 and 15 cents. The arrangements for an evening's entertainment will be a concert by the band, a short exhibition of the electric fountain, the theatrical performance and another concert and fountain display. The park will be opened May 20. The improvements on the park have cost not less than $85,000; the theater, $25,000; the fountain, $25,000; the other buildings and ground improvements make up the balance.



SANS SOUCI PARK—TOP VIEW AND ENLARGED SECTION OF ELECTRIC FOUNTAIN.

W. H. CARTER.

W. H. Carter is the proprietor and manager of the park, and J. B. Sturtevant is the superintendent. Mr. Carter is a street railway man of long experience. He was born in Union county, Ohio, and moved with his family at an early age to a Kansas farm. In 1885 he became associated in railway work with M. K. Bowen, then superintendent of the Kansas City Cable Railway Company. When Mr. Bowen received a call to Chicago in 1892 Mr. Carter came with him and became one of the division superintendents of the Chicago City Railway Company. Mr. Carter is, therefore, closely in touch with street railway work, and thoroughly understands the requirements of his new undertaking.

ST. LOUIS CABLE MAY GO.

The new owners of the Broadway cable line in St. Louis are considering changing the motive power to electricity, but nothing definite has been decided as yet. It will be an expensive change to make in any event. Capt. Robert McCulloch states that the practicability of using the present cable conduit in connection with an underground trolley system will be considered. The Broadway line is the longest and oldest single line in the city; there are 20 miles of track without a sharp curve.

The city council of Atlanta, Ga., has passed an ordinance providing suitable penalties for the misuse of transfer tickets which are to be issued by the street railway companies of that city.

CONSOLIDATION AT PORTLAND, ME.

The Portland Railroad Company, of Portland, Me., has leased the property of the Portland & Cape Elizabeth Railway Company for a term of 999 years from March 1, 1899. The former company, which was organized in 1863, owned and operated 28.9 miles of track, equipped with 73 motor and 38 trail cars. The latter company was chartered in March, 1895, and in November of that year acquired the property and franchises of the Cape Elizabeth Railway Company, and has at the present time 15.72 miles of track and 34 motor and 6 trail cars; in addition to this the company owns the Cape Cottage park property on which is erected the large casino illustrated in the REVIEW for May, 1898, page 327, which is one of the finest pieces of shore property in New England. The Portland Railroad will make additions to its central power station and operate both systems from the one station.

H. R. McLeod, general manager of the Portland & Cape Elizabeth Railway Company, has been identified with the Cape property since May, 1895, having had the entire supervision of the construction of the system and its operation.

ADDITIONS TO ACCOUNTANTS' ASSOCIATION.

Secretary Brockway reports a steadily growing interest in the Accountants' Association. Members are already beginning to appreciate the value of being able to secure information needed out of the archives which the association is building up. During the month of February new members were added as follows:

Vicksburg Street Railway, Vicksburg, Miss.
North Chicago Street Railroad, Chicago.
Savannah, Thunderbolt & Isle of Hope Railway, Savannah, Ga.
San Diego Street Railway, San Diego, Cal.
Duluth Street Railway, Duluth, Minn.
Glasgow Corporation Trams, Glasgow, Scotland.

FAVORS TROLLEY FUNERALS.

Dr. C. Herbert Richardson, of Baltimore, recently presented a paper before a meeting of Methodist Episcopal clergymen in which he suggested the advantages of trolley funeral trains, and, while not urging the adoption of their use, recommended the plan to the consideration of the public. Trolley funeral cars have proved so popular in many cities that there appears to be no reason for not using them in Baltimore.

The Columbus (O.) Street Railway Company has donated $1,000 to the Board of Trade to be used in entertaining visitors.

THE BALTIMORE CONSOLIDATION.

The incorporation on March 5 of the United Railways & Electric Company, of Baltimore, marks the final step in the consolidation of the street railway systems of Baltimore. The companies absorbed are the Baltimore City Passenger Railway, the Baltimore Central Passenger Railway and the Baltimore Consolidated Railway; the three companies include a number of subsidiary lines and companies which became merged with them by former consolidations, and among these are the Baltimore, Gardensville & Belair; Baltimore, Catonsville & Ellicott's Mills; Maryland Traction, Baltimore & Curtis Bay, Gwynn's Falls, Shore Line, Pimlico & Pikesville; Walbrook, Gwynn Oak & Powhatan, and Baltimore & Northern Companies. The Baltimore, Middle River & Sparrow's Point Railway is controlled through the ownership of the stock and bonds.

The new company is capitalized at $38,000,000, of which $14,000,000 is 4 per cent cumulative preferred stock and $24,000,000 common

W. A. HOUSE.

stock. Bonds to the extent of $38,000,000 have been authorized; $15,550,000 of the bonds will be retained in the treasury to meet outstanding obligations of the old roads, and $4,450,000 to pay for acquisitions and improvements.

The officers of the United Railways & Electric Company are:

President, Nelson Perin, formerly president of the City & Suburban Railway Company and the Baltimore Consolidated Railway Company.

Vice-President, Col. Walter S. Franklin, formerly president of the Baltimore City Passenger Railway Company.

General Manager, William A. House, formerly president and general manager of the Baltimore Traction Company, and vice-president and general manager of the Baltimore Consolidated Railway Company.

Treasurer, Briggs C. Keek, formerly cashier of the City & Suburban Railway Company and of the Baltimore Consolidated Railway Company.

Secretary, H. C. McJilton, formerly secretary of the Consolidated Railway Company.

Directors, E. L. Bartlett, Alexander Brown, Col. W. S. Franklin, W. P. Harvey, George C. Jenkins, Seymour Mandelbaum, Harry A. Parr, Nelson Perin and George R. Webb.

W. A. House, general manager of the consolidated street railway system of Baltimore, has been closely identified with the street railway interests of that city for 20 years, in which time he has risen, solely by reason of his capacity, energy and perseverance, from a subordinate position to that which he now occupies.

In 1879 Mr. House started at the foot of the ladder with the Peoples' Passenger Railway Company, when his chief work was to empty the fare boxes in cars; he worked for five years, Sunday and holidays, without the loss of a day from any cause, and at the end of that period collapsed completely as the result of overwork. This faithfulness brought its reward when the company was reorganized, and Mr. House was appointed secretary and general superintendent. In 1889 the Baltimore Traction Company secured two other lines, and Mr. House was made manager of the new system; other roads were added to the system of the Traction Company, and in 1892 a great impetus was given to the business by the adoption of electricity as a motive power.

Throughout the period of improvement and extension that followed the change from horses Mr. House proved a diligent, alert and indefatigable officer, and in 1895 was chosen vice-president; during 1896 he served as president, President Brown having resigned. In 1897 the Traction Company was consolidated with City & Suburban Railway Company as the Baltimore Consolidated Railway Company, of which Mr. House was chosen vice president and general manager, and now upon the further consolidation of the street railways of Baltimore, he retains the position of manager with vastly increased interests intrusted to his care.

All of his career and successful work have brought out in bold relief the fact that he is possessed of the three primary qualities essential to a progressive executive officer. These qualities are honesty, method or system, and persistent industry. The diligent application of those three qualities is what has placed Mr. House in the list of Baltimore's leading and most reliable railroad men.

THE SITUATION IN ST. LOUIS.

The street railways of St. Louis are now for the most part in the control of three syndicates: The Spencer syndicate has the Southern Electric Railway and the four lines, the Cass Avenue & Fair Grounds, the Citizens, the St. Louis Railroad and the Jefferson Avenue, which were formerly owned by the National Railway Company, of Chicago; these aggregate 88 miles of track. The Turner syndicate controls the lines of which C. H. Turner is president, the St. Louis & Kirkwood, the St. Louis & Meramec River, and the St. Louis & Suburban, which together comprise 57 miles of track. Brown Brothers, of New York, control the Lindell, the Missouri, the Union Depot, and the Midland Street Railway lines, in the aggregate 201 miles. A rumor to the effect that the People's Railroad, 9½ miles, which was sold by the receiver, F. B. Brownell, to August Gehner, on February 19, would be consolidated with the Spencer lines is denied.

Jilson J. Coleman has been appointed general manager of the Brown syndicate lines; three years ago Mr. Coleman was obliged to leave the Allentown, Pa., road because of ill health, but was afterwards with the Nassau lines in Brooklyn, and last was eastern representative of the St. Louis Car Company. We feel sure that all of Mr. Coleman's friends will be glad to learn of his return to street railway work, for which his experience so well fits him.

DAMAGES FOR USE OF TRACKS.

Last November a franchise was granted the Atlanta Railway Company, on Mitchell street, Atlanta, Ga., but from Broad to Madison avenue this street was occupied by the tracks of the Atlanta Consolidated Street Railway Company. Condemnation proceedings were instituted, but were delayed by injunctions of the federal and state courts. The case was referred to three assessors, who recently decided that the Atlanta Railway Company should pay the Consolidated Company $2,951.65 damages, itemized as follows: For right of way and property condemned, $1,556.75; for use of poles and span wires, $50; for consequential damage caused by interference at switches and elsewhere, $1,344.90. It was decided that the only safe way was to suspend the trolley wires of both companies from the same span wire. The Atlanta Railway Company is required to pay one-half the future expense of taxes, assessments for street improvements, repairs and renewals of the property condemned.

SOUTHWESTERN CONVENTION.

The Southwestern Gas, Electric & Street Railway Association will hold its annual convention in the city of Austin, Texas, on April 19, 20 and 21. This association was formed last year at Laredo, out of the three conventions indicated in the present name, and includes a considerable number of members from Mexico. The Austin meeting promises to be a strong one, and to the local attractions of an electrical nature will be added the well known Austin welcome and hospitality.

EAST CAPITOL STREET, WASHINGTON, D. C.

SEVERE SNOW STORM AT WASHINGTON, D. C.

Through the courtesy of George B. Coleman, general manager of the Metropolitan Railroad Company, of Washington, D. C., we have received a number of photographs taken along the lines of that company shortly after the very heavy snow storms that occurred in the first half of February.

On Sunday, February 5, 1899, there was four inches of snow on the ground. It continued to snow up to and including Saturday. There were twenty-four inches of snow on the ground on the morning of the 11th. Metropolitan cars had been operated on the regular schedule during all this time, the management having successfully met and coped with all difficulties. On Saturday, the 11th, it began to snow, and in addition the wind rose until it was blowing at the rate of forty miles an hour. This storm turned into a regular blizzard, blocking all the roads in this section of the country—both steam and street railroad lines. From Monday morning until three o'clock Tuesday eleven inches of snow fell, making thirty-five inches of snow. The storm was such as had never been known in that section of the country before. In many places on the lines the drifts were twelve feet deep, and nowhere less than three feet. It was a physical impossibility to keep the tracks clean, as no set of men could have withstood the cold, snow and wind.

During the storm Mr. Coleman made his plans for opening up the next day. Having secured nearly one thousand men they were started at both ends of the lines, and in the middle, dividing in the middle and working towards each end. In this way eleven miles of double track—24 ft. wide—were cleared by nine o'clock Tuesday night. When the sweepers were run out and the track cleared for operation the next morning, it was found upon starting that the slot was entirely filled from end to end. This was a problem that had never been anticipated, and the officers did not know just what the result would be. However, operations were begun with a dead

SCENES ON THE METROPOLITAN LINES, WASHINGTON, D. C.

plow in front, attached to the sweeper, the leads from the motor which operated the brooms being carried back to the plows of the next car. This train was made up of three motor cars and one sweeper.

In many places along the line the slot was found to have been closed with solid ice. Whenever this was the case gasoline was sprinkled along the slot and then it was burned out, so as not to injure the plow in any way. Apparently the snow in the slot had no appreciable effect as the cars were running the next morning. The company did not lose a single motor during the entire month.

The clearing of such a tremendous quantity of snow from the tracks, and the operation of cars so quickly, was commented upon by the papers of the city in a manner most favorable to the company, and it was, in fact, a great achievement.

Two of the engravings show views in front of the office of the Metropolitan Railroad Company on East Capitol street, between 14th and 15th streets—one before and the other after the tracks were cleared. In the group No. 1 is a view taken at the corner of First and East Capitol streets, looking west; No. 2 shows a sweeper and train of motor cars leaving the car house; No. 3 is a view on East Capitol street, between 1st and 2d streets; No. 4 shows East Capitol street, looking east, on February 14, 1899; No. 5 shows the start from the car house at 14th and East Capitol streets on the morning of February 14 (the plow in front of the sweeper is 4 ft. high); No. 6 is a view of 1st street just north of East Capitol, looking north.

GUSTAVE SUCKOW.

There is doubtless no one who is better known to the street railway managers and purchasing agents of the country than is Gustave Suckow, the genial general manager of the Vose Spring Company, of 25 Murray street, New York. Mr. Suckow grew up with this company, commencing with it when 13 years old, and has been with it for over 22 years. A considerable portion of this time he represented the company on the road, and has been general manager for several years.

The Vose springs have been on the market for many years and are well known among the trade for their quality and durability; the name "Vose" stamps them as being the best. Mr. Suckow has received many testimonial letters from customers which show the high repute which the goods hold. Though the company is an old one, it keeps abreast of the times and does not let its products deteriorate from the high standard set by the late Col. Richard Vose, whose rule of action was: Good quality and good workmanship will hold the trade. Many of the ideas embodied in the Vose springs as made at present are the result of the experience of Mr. Suckow.

GUSTAVE SUCKOW.

Among the company's products are the rubber center yoke springs which claim the distinction of being the only ones that will live in the journal boxes of electric cars, the Vose patent rubber and iron core springs, the Vose elliptic springs, coil and elliptic springs for all the standard electric trucks, trolley springs and bush holder springs, rubber springs, washers and cushions, rubber blocks for elliptic springs, etc.; a complete list would include any and all kind of springs. Mr. Suckow will gladly correspond with anyone who finds his cars not running satisfactorily.

There is a bill in the Missouri legislature providing for vestibules on street cars during the winter months, under a penalty of from $5 to $50 for each violation.

The Buffalo & Niagara Falls Electric Railway has subscribed $7,500 and the Lockport Electric Railway $2,500 to the fund for the Pan-American Exposition.

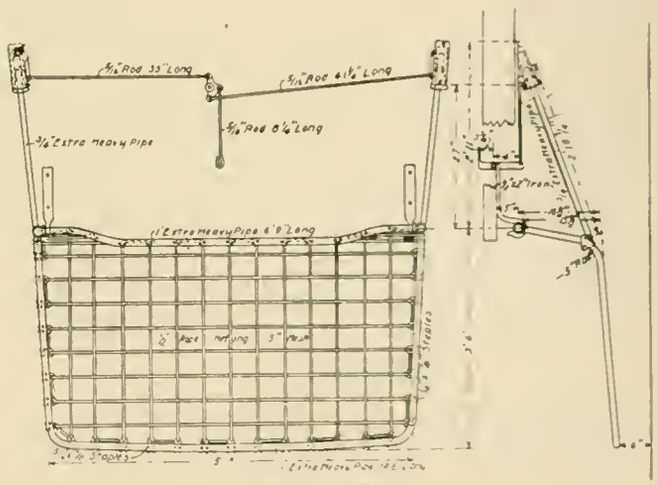
CONSOLIDATION IN DENVER.

The Denver City Tramway Company was incorporated March 3 and effects the consolidation of the Denver City Railroad, which now has 5 miles of horse railway, 11 miles of electric, and 30 miles of cable railway, and the Denver Consolidated Tramway which has 100 miles of electric road. C. K. Durbin, general superintendent of the latter road, advises us that if the permission of the city authorities is obtained the new company will spend half a million dollars in improvements during the next year, putting from 500 to 1,000 men at work at once. The improvements contemplated comprise a central power station located on the Platte river between 15th and 19th streets, the change of the present cable lines to electric, and the rebuilding of the Broadway line.

The capital of the new company is $5,000,000 and its officers are: President, Rodney Curtis; vice-president, William N. Byers; secretary, W. G. Evans; treasurer, G. E. Ross-Lewin. All of these held similar positions with the Denver Consolidated Tramway Company. No changes will be made in the other officers or employes of either of the old companies.

THE TWIN CITY FENDER.

As noted in our February, 1899, issue the Twin City Rapid Transit Company, of Minneapolis and St. Paul, by means of safety gates and fenders has been able to greatly reduce the number of accidents involving personal injuries. The gates were fully shown in that issue, and we herewith illustrate one type of the fenders, with which nearly all the company's cars are equipped. The drawing shows the type first adopted and the slight modifications since made will be mentioned later. The frame is made of extra heavy 1-in. piping and fittings bent as shown in the diagram; staples of ¼-in. round iron are spaced 5 in., center to center, and ½-in. rope run



TWIN CITY FENDER.

through them to make a netting. The frame is hung from hooks and held in its normal position by two struts of ¾-in. extra heavy pipe, one at each side. One end of the strut is fastened to the fender frame and the other rests in a cast iron pocket bolted to the car sill; in each pocket is a dog which when pulled out (by means of the mechanism shown in the cut) when the motorman presses the tripping lever with his foot, permits the strut to go to the bottom of the pocket and the fender to fall to the rail. Normally the front edge of the fender is carried 6 in. from the rail on level track. The newer fenders are made 2 ft. 10 in., instead of 3 ft. 6 in., long, and the front corners are bent to a larger radius so that they do not project so much as that shown. Wire is substituted for rope, and run through holes in the pike frame instead of through staples.

These fenders are made by the company in its own shop, after its own designs and at small expense.

The Monongahela Connecting Railway Company, of Pittsburg, has been authorized by the city council to build an overhead bridge on Second avenue, near Bates street, in order to do away with a grade crossing.

PERSONAL.

Charles S. Butts has accepted a position with the Toledo Traction Company.

It is announced that Tom L. Johnson is going to London and will endeavor to build an electric line in that city.

Samuel Oliver, of Rapid City, S. D., has purchased the plant and franchises of the Sturgis Electric Light & Railway Company.

George B. Hendricks, superintendent of the Fort Worth (Tex.) Street Railway Company, resigned March 1, after eight years of service.

Col. G. W. Parker, has been elected president of the Springfield (Mo.) Traction Company, to succeed his son, C. M. Parker, who recently resigned.

John M. Blatt resigned as superintendent of the Milwaukee, Racine & Kenosha Electric Railway Company on March 1, and will return to Cleveland.

Edwin Warner has been chosen secretary and treasurer of the Birmingham (Ala.) Railway & Electric Company, and has taken charge of his new work.

E. L. Simonton, electrician of the Lincoln (Ill.) Electric Street Railway, who has acted as superintendent since the appointment of a receiver, has resigned .

I. S. Tivoli, who has been general manager of the tramways of Alexandria, Egypt, has resigned and is now engaged in the commission business in that city.

Charles Alderman has resigned as city engineer of Eau Claire, Wis., to undertake construction work for a Boston syndicate now building an electric railway in Ohio.

John Kerwin, superintendent of construction of the Brunswick Traction Company, New Brunswick, N. J., has returned from a two months' visit to England and Ireland.

Mr. Bradley, formerly with the Hull (Que.) Electric Railway, has been appointed superintendent of the Cornwall (Que.) Electric Street Railway, and assumed his duties.

Ira A. McCormack, general superintendent of the Brooklyn Heights Railroad, while working on one of the sweepers during the storm last month had one leg badly frozen.

H. G. Fleming, for six years general manager of the Little Rock (Ark.) Traction & Electric Company, has resigned, and is succeeded by Walter A. Badger, formerly of Boston.

P. J. Callahan has been promoted from chief dispatcher of the United Traction Company, Pittsburg, to the superintendency; he is succeeded by John Lowrie, formerly division dispatcher.

John Murphy, general manager of the United Traction Company, of Pittsburg, was, March 1, appointed general manager of the Allegheny County Light Company; he will fill both positions.

T. G. Janney, chief engineer of the electric line between Chester, Pa., and Wilmington, resigned March 1, to become superintendent of the Bed Rock Dredging Company, Boise Basin, Idaho.

Edwin W. Decker, superintendent of the Portland (Me.) & Yarmouth Electric Railway since June last, resigned on March 1. General Manager L. B. Wheilden will act as superintendent also.

Oscar R. Lewis, assistant superintendent of the Pawtucket (R. I.) Street Railway Company, was married to Miss Alice M. Wood, daughter of George B. Wood, of Leominster, Mass., on February 22, 1899.

H. H. Archer, formerly superintendent of the Wilmington (Del.) City Railway Company, has accepted a position with an English syndicate as manager of an electric railway in the Island of Trinidad in the British West Indies.

George B. M. Harvey, who figured in the purchase of the Havana street railways, and who is interested in various other electric railway investments, has purchased the "North American Review." This is not Mr. Harvey's first venture in journalism, for he was a correspondent, reporter and editor at an early age, and in 1893 became editor-in-chief of the "New York World."

S. W. Jamison, treasurer and general manager of the Roanoke (Va.) Street Railway Company, has resigned. George C. McCahan, secretary, has been appointed superintendent, the office of manager having been abolished.

John Clifford has been promoted to superintendent of the Wilkesbarre (Pa.) & Wyoming Valley Traction Company, succeeding John C. Meixwell, resigned. Edward Irvin, of Kingston, succeeds Mr. Clifford as assistant superintendent.

W. D. Sargent, president and general manager of the American Brake Shoe Company, and vice-president and general manager of the Sargent Company, was married on February 14 to Miss May Partridge, daughter of the well-known capitalist of this city.

The engagement of Henry Nott Ransom, of Albany, to Miss Alice Gillet, daughter of Mr. and Mrs. Elmsie Gillet, of New York City, has been announced. Mr. Ransom has represented the Consolidated Car Heating Company for several years past, and is very favorably known by his large acquaintance.

C. C. Rush, who recently resigned as superintendent of the Joliet (Ill.) Railway Company to accept a similar position in Quincy, Ill., has been reappointed superintendent at Joliet, and will manage the two systems, making his headquarters at Joliet. N. C. Draper, who was temporarily manager of the Joliet road, will remove to Chicago.

W. S. Dimmock, general superintendent of the Omaha & Council Bluffs Railway & Bridge Company, when returning home on February 16 was startled by the whistle of a bullet close to his head; no report of a firearm was heard, and the police believe that a boy with an air gun did the shooting.

W. J. Johnston, founder and for 25 years publisher of the "Electrical World," celebrated the quarter-centennial issue by retiring from active electrical journalism. Mr. Johnston had built up in the "World" the foremost publication in its field, in the world, and should he desire to rest now on well-earned laurels we wish him long life to enjoy the fruits of deserved success.

Albert von Hoffman, inventor of the Falk cast-welded joint, has started on a trip to Mexico, where he will visit all the larger cities and will probably extend the tour to include the large cities of South America. In case he finds the opening favorable he may decide to locate in the City of Mexico, and in that event will represent a line of American street railway supplies. Mr. Hoffman speaks a number of languages and is at home in almost any part of the world.

E. K. Stone, who for several years past has been prominently known as manager of the lines at Quincy, Ill., has been greatly annoyed on account of the blunder of several publications which announced his death, when they should have stated it to be that of his father. The initials of Mr. Stone, Sr., were the same, and the elder

Stone many years ago occupied the position to which the son succeeded. The Mr. Stone who is so well known from his constant attendance at conventions, is we are glad to state just as active as ever.

H. M. Brinckerhoff, electrical engineer of the Metropolitan West Side Elevated Railway Company, of Chicago, has been appointed superintendent of motive power and way. He takes up the work which hitherto has been performed by W. E. Baker, who resigned as general superintendent, and has gone to New York to supervise the electrical equipment of the Manhattan Elevated Railway. Mr. Brinckerhoff had charge of the electrical construction work of the Metropolitan Elevated and has been with the company ever since. He is thoroughly conversant with every detail of the work, and is fully capable of managing the operating department of this fine property.

ELECTIONS.

At the annual meeting of the Beaver Valley Traction Company, Beaver Falls, Pa., held on Feb. 6th, 1899, Hartford P. Brown was chosen secretary and general manager, J. M. Buchanan president, M. C. Simpson vice-president and S. P. Stone treasurer. The newly elected directors are: Jno. M. Buchanan, R. S. Kennedy, A. M. Jolly, J. P. Stone, Hartford P. Brown, W. C. Simpson and T. P. Simpson.

The first meeting of the reorganized Fox River Electric Railway Company was held at Green Bay, Wis., on February 19, and officers elected as follows: President, H. S. Eldred; vice-president, A. M. Marphy; secretary, B. L. Parker; treasurer, Mitchell Joannes; board of directors, H. S. Eldred, A. M. Murphy, C. E. Vroman, J. H. Elmore and Mitchell Joannes. It was decided to retain the services of C. F. Goodrich as superintendent of the road when the company assumes full control.

The annual meetings of the Milwaukee (Wis.) Electric Railway & Light Company and the Milwaukee Heat, Light & Traction Company were held on February 20 and directors for the two companies elected as follows: Of the Railway Company, Henry C. Payne, Milwaukee, and C. W. Wetmore and George R. Sheldon, of New York, the other directors of the company holding over; of the Heat, Light & Traction Company, for one year, William Nelson Cromwell, C. W. Wetmore and C. A. Spofford, New York; for two years, Charles F. Pfister, Milwaukee, and George R. Sheldon and Arnold Marcus, New York; for three years, Henry C. Payne and F. G. Bigelow, Milwaukee, and Silas W. Burt, New York.

The Peoria (Ill.) & Pekin Traction Company has elected the following officers: President, T. J. Miller; vice-president, W. T. Trumbull, Salem, Mass.; secretary, L. E. Meyers, Chicago; treasurer, P. S. Saltonstall, Boston.

The stockholders of the New York & Philadelphia Traction Company met in Trenton last month and chose for directors: Gottfried Krueger, Edward H. Radel, Andrew Radel, J. Blair MacAfee and Henry Schnellbacker. Officers were elected as follows: President, Gottfried Krueger; vice-president, J. B. MacAfee; secretary and treasurer, E. H. Radel. The offices of the company were removed from Trenton to New Brunswick.

The Lexington (Ky.) Railway Company, a consolidation of former Lexington railway companies, at its annual meeting last month chose the following officers: President, C. J. Bronston; vice-president, W. J. Loughridge; secretary, J. C. Rogers; treasurer, R. P. Stoll; directors, the officers and C. H. Stoll, J. T. Shelby and J. R. Allen.

The Union Street Railway Company, recently in charge of Homer Loring and G. B. Morley as receivers, and the Inter-Urban Railway, of Saginaw, Mich., have been reorganized and consolidated, the receivership of the former company having been closed. The new company is the Saginaw Valley Traction Company, and its officers are: President, Homer Loring; treasurer, Frank D. Ewen; secretary, Charles S. Smith; superintendent, Lloyd M. Richardson; chief engineer, Henry E. Warren.

OBITUARY.

Frederic Candee Weir, president and general manager of the Weir Frog Company, Cincinnati, died on Wednesday, March 1.

Joseph Ebbsmith, who has been connected with the Birmingham Tramways Company and other English tramway enterprises, died last month at Monte, Grand Canary, at the age of 50 years.

John H. Callahan, secretary of the United Traction Company, of Pittsburg, died at his home on February 13, of peritonitis. Mr. Callahan was secretary of the Second Avenue Company before its consolidation with the United.

NEW PUBLICATIONS.

The "Electrical World" and "Electrical Engineer" consolidated under the joint title and are now issued weekly as one publication, to be known as "Electrical World and Electrical Engineer," under the editorship of T. Commerford Martin and W. D. Weaver, and the business management of James M. Wakeman, until recently of the "American Machinist," and A. C. Shaw.

The fourth annual report of the Boston Transit Commission dealing with the work on the Boston Subway to August 15, 1898, has been published. Like the former reports of this Commission, the present one contains much valuable information concerning this great undertaking and will be read with interest by the engineering profession. The Commission consists of George G. Crocker, Charles H. Dalton, Thomas J. Gargan, George F. Swain and Horace G. Allen. Howard A. Carson is chief engineer and B. Leighton Beal, secretary.

State Library Bulletin No. 10, of the Legislature Division, giving a summary and index of the legislation in the several states during 1898, and as far as possible complete to January, 1899, has been issued by the University of the State of New York. This bulletin digests and organizes the enormous annual output of state legislation so as to render available with a minimum of labor the most recent experience of other states. Besides a detailed summary, it contains a concise resume of the most important and distinctive laws and indicates the general trend of legislation by reference to laws of previous years. The bulletin is sent postpaid for 25 cents a copy or $1 a volume of five numbers. Checks or money orders should be made payable to University of the State of New York, and orders for the bulletin addressed Treasurer of the University.

UNIFORM CAPS.

Hohenadel Brothers, of 211-213 East Madison street, Chicago, are very extensive makers of regulation uniform caps, which have been found unequaled in style, excellence of workmanship, and durability both of color and material. The firm's long experience in this special line has served to make it thoroughly conversant with the requirements of the trade, and its product has given satisfaction wherever it has been tried. Caps are made of any material that may be desired and in every variety of shape, and the durability is guaranteed.

The illustration shows a conductor's cap made over a wire frame and covered with black or blue gros grain silk and serge or any color of cloth desired; embroidered letters, monograms, wreaths, etc., are added as desired. Hohenadel Brothers will be glad to quote prices and submit samples to those desiring them.

The council of Princeton, Ill., has held a number of informal meetings to consider the draft of a franchise which it is proposed to give the Princeton, Spring Valley & La Salle Railway Company now being promoted.

CONVENTION ANNOUNCEMENTS.

President Sergeant and Secretary Penington issued the following letter under date of March 10:

The American Street Railway Association will hold its eighteenth annual convention at Tattersalls, State and 16th streets, Chicago, Ill., on Tuesday, October 17, 1899, continuing in session four days.

The exhibits and displays of the supplymen are so important a part of our conventions, that the executive committee, in making arrangements for the meeting, has been as mindful of our wide-awake allies and as zealous in providing for their convenience and accommodation as for any other feature of the gathering.

We have held an executive session at Chicago, and give you in this circular the substance of the arrangements we have made in your interests.

The Exposition will be held in Tattersalls, the largest exposition hall in the city. We will have an abundance of floor space with all the light, heat and power required.

Every applicant is assured that he will get all the space desired as our resources in this direction are unlimited.

The convention will be held on the second floor of the exhibit hall, all stairways leading up from the inside, thus insuring the attention of all delegates and visitors to the exhibits.

The income from the sale of space will go to the American Street Railway Association. The executive committee of the Association has fixed the price at 10 cents per square foot, and ruled that no space of less than 100 sq. ft. will be assigned, but applicants may have as many multiples of this quantity as they wish, all in one body. Payment for space should be made to T. C. Penington, secretary and treasurer of the American Street Railway Association, 2020 State street, Chicago, Ill. Application for space should be made to Jas. R. Chapman, 444 North Clark street, Chicago, chairman committee on exhibits. Please state in your application for space the shape desired, number of feet wide and long, and the committee on exhibits will comply with your request if possible. Cars, sweepers and plows will be placed outside of the building on the street.

It is earnestly requested that all exhibits shall be in place and all work finished by Monday evening, October 16th, which is the evening prior to the opening of the convention. The local committee has rented the building from October 10th to 24th, so you can ship your goods early and will have ample time to remove them. Watchmen will be in charge of the building so that exhibits will be safe.

All goods should be marked to yourselves, Tattersalls, Chicago, care of H. W. Smith, successor to Anderson Transfer Company, 1618 State street, sending him bill of lading or advice that you have shipped goods in his care, giving particulars in regard to shipment and it will be delivered to your space in the exhibition hall. Ship all goods early to insure delivery in time and prepay charges. We hope to have you with us with an extensive display.

All articles intended for the exhibition shall be delivered at the building by the agent or owner, and at his expense, but the local committee has made arrangements with H. W. Smith (successor to Anderson Transfer Company) to haul and deliver all shipments to and from the building at low rates if directed in his care.

Articles will be placed on your space in the hall if you mark the number of space on your boxes. The number of your space will be mailed you in ample time for shipment.

All electrical connections for power and extra lights must be made at the expense of the exhibitor.

We expect a large exhibit and perhaps it would be in the interest of the exhibitors to make arrangements to have the building open in the evening, as it is well lighted, and the electrical companies expect to make a large display.

Space must be applied for by September 1. Assignments will be made as promptly as possible after that date and exhibitors notified of their location. Exhibits of like character will be grouped together and space will be assigned in the order of application.

The committee on exhibits will make contracts with carpenters, electrical workers and laborers at regular prices, so the exhibitors will not be overcharged for lumber, labor, etc.

Friday, the 20th, has been set apart by the executive committee for the examination of exhibits. No session of the Association will be held on that day and no entertainments of any kind will be given by the local committee, so all delegates will have ample time to call upon you and see what you have to show them.

The headquarters of the Association will be at the Auditorium Annex. All our hotels are within a radius of one-half mile and within ten minutes ride of the hall. They include Auditorium, Victoria, Leland, Great Northern, Wellington, Grand Pacific, Tremont and Sherman.

The executive committee advises all who desire rooms to apply at once, as they will be assigned in the order in which applications are received.

The executive committee found our Chicago friends so enthusiastic as to the coming meeting, and so hospitable in their greeting, that success is assured, the location being central and accessible; and the inquiries and information already received being so encouraging an unusually large attendance seems guaranteed.

The annual dinner will be held at the Auditorium, Friday, October 20th, at seven o'clock p. m. Tickets will be sold at the actual cost to the Association.

The railroads will sell tickets on the certificate plan. Be sure and leave your certificate with the clerk the first day of the convention, when you register; it will be signed, vised and ready for you on Thursday, October 19, 1899.

Please make your arrangements and applications as above noted as promptly as possible.

THE SALT QUESTION.

William Cummings, superintendent of the South Bend (Ind.) Street Railway Company, was last month fined for salting the tracks of the company in violation of a city ordinance. The case is to be appealed, and we shall perhaps get the views of the higher court as to whether such ordinances as these are reasonable.

The Memphis (Tenn.) Street Railway Company contemplates building a large car barn at an early date.

The city council of Louisville, Ky., has passed an ordinance ordering the street cars of that city to be equipped with vestibules.

Allentown, Pa., has passed a vestibule ordinance; the penalty for failing to equip cars as directed is a fine of $10 per day per car.

A company is reported to be securing consents to the building of an electric line from Canal Dover to Cadiz, O., to be continued later to Martin's Ferry, thus giving an all-electric route from Cleveland to Wheeling, W. Va.

A peculiar accident occurred at Miner's Mills, Pa., on February 7; an electric car had stopped at a railroad crossing to wait on a passing coal train, but the rails were so slippery that the car slid down and was struck by the train and thrown to one side. No one was seriously injured.

Dixon S. Carter, of Mayfield, Ky., is organizing a syndicate to build an electric road some 90 miles in length and will be pleased to receive catalogs of cars, motors, power house machinery, roadbed and line material, etc. The company contemplates doing a freight as well as a passenger business.

The proposed extension of the Cleveland & Chagrin Falls Electric Railroad from its present terminus in Chagrin Falls east to Warren will be built by the Chagrin Falls & Eastern Railroad. Work will be begun in time to have cars in operation by May 1. The cost of building, including cars, is estimated at $300,000. R. L. Palmer, general manager.

Work has begun on the foundations of the power house of the Northwestern Elevated Railroad Company, Chicago. The site is on Fullerton avenue, just east of Southport avenue and is about 3,000 ft. west of the elevated structure. The building is to be 112 ft. on Fullerton avenue by 255 ft. deep and will be 50 ft. high. The exterior is to be of brick and iron; the roof is to be of concrete. The plans call for a stack 15 ft. in diameter and 205 ft. high. The equipment is to comprise one 1,000-h. p. and three 2,000-h. p. direct connected units and 12 400-h. p. boilers. Coal will be supplied over a switch from the Evanston division of the Chicago, Milwaukee & St. Paul. The cost including equipment is estimated at $400,000.

FOREIGN FACTS.

It is proposed to construct an electric railway line between Parry Sound, Ont., and Depot Harbor.

The tramways committee of Newcastle recommends the adoption of the trolley system for the city tramways.

The British Electric Traction Company is expecting to lay a single track electric railway from Ardrossan to Saltcoats.

The British Electric Traction Company will soon construct an electric tramway between Kewhurst and St. Leonards, Bexhill.

Both the town council and the British Electric Traction Company have prepared plans for an electric tramway between Coatbridge and Airdrie.

The consolidation of all the tramways in Brussels seems likely and if this is accomplished important improvements and extensions will be made.

The Thomson-Houston Company has secured the contract to build 1¼ miles of electric tramway between Kalamata, Greece, and its sea port.

The Light Railways Commissioners have authorized a light railway in the county of Sutherland, England, between Forsinard, Melvich and Port Skerra.

The corporation of Riga, Russia, in conjunction with the Ministry of Interior proposes to build a system of electric tramways which will cost about $800,000.

In a Parliamentary paper the statement is made that there are 163 tramway undertakings in the United Kingdom representing a capital outlay of $61,200,000.

The annual report of the Halifax, Nova Scotia, Electric Tramway Company shows a gross income of $197,000 and a net profit of $54,784, which is a substantial increase over the preceding year.

A survey is in progress between Southport and Morecambe for an interurban electric tramway from Knott End, Fleetwood, to Morecambe. The route will be within view of the sea all the way.

The horse tramways of Ipswich, England, will soon be equipped for electric traction either by the company now owning the tramways or by the municipal authorities. Ipswich is a city of 60,000 inhabitants.

The city council of Aberdeen has sent a deputation to Glasgow and other cities to inspect the electric tramway systems, and it is reported that the committee is very favorably impressed with the trolley system.

The tramways committee of Liverpool has been empowered to ask bids for 20 motor cars to be delivered by June 1. The traffic is increasing so rapidly that even more cars will have to be purchased in the near future.

The electric tramways committee of Manchester, England, has unanimously agreed that in comparison between the relative merits of the trolley and the electric conduit systems the trolley is best suited to the needs of the city, and the question is now settled.

The engineer of Huddersfield has prepared plans for substituting electricity for steam as a motive power on two of the municipal tramway lines. It is expected that the work will begin at once and that it is the beginning of a change for the whole system.

The corporation of Doncaster has ordered the preliminary work done in preparing plans for an electric tramway 7½ miles in length. This will afford rapid transit to the residences of Balby, Hexthrope, Bentley and Wheatley with the city. The estimated cost is $350,000.

The town council of Glasgow has resolved to equip all the tramways in the city with the trolley. John Young, general manager, has submitted plans for this work and bids are asked on the equipment. The work to be immediately undertaken is estimated to cost over $270,000.

The Madras Tramway Company has made a contract with the British Electric Traction Company for the provision of the necessary funds to complete electrical equipment of all the lines. The total number of passengers carried during the past year numbered 3,643,000, a substantial increase over last year.

The capital stock of the Smith's Falls, Rideau & Southern Railway Company, amounting to $75,000 has been subscribed and work of construction will soon begin. An electric railway is to be built in the town of Smith's Falls to carry passengers and transport freight from the various mills and factories to the Canadian Pacific Railway. A line will also run to the Rideau Lakes.

After inspecting several electric tramway systems in Great Britain the tramways committee of Aberdeen unanimously recommends that the trolley system be adopted and that the Woodside line be equipped for electric traction at once. It is intended to call for bids for rails, bonds, wire, power station machinery and eight motor cars immediately. The estimated expenditures are to be $166,000.

The Giovi railroad tunnel near Genoa, Italy, is to be equipped for electric traction. It was only a few months ago that an accident occurred on account of the engineer and fireman being overcome by gases from a preceding train. The new electric power station will be capable of supplying current for 2,500 cars per day.

The Hamilton, Chedoke & Ancaster Electric Street Railway Company has applied for powers to increase its capital stock from $100,000 to $300,000, and to build a line to Brantford. The following are the officers: President, J. M. Clark; vice-president, M. Ryan; other directors, J. R. Lowell, R. J. Brodie, A. Patterson; secretary-treasurer, R. A. Bennett.

A new system of guard wires is to be adopted for the electric tramway lines in Leeds, for the grounded iron wires have been found inadequate for the protection of the telephone and telegraph wires. It is now proposed to place a wood strip between and above the trolley wires at such a height as to prevent any falling wires coming in contact with them.

In Buenos Ayres the same results have been experienced with suburban electric railways as in the United States. The La Capital Tramways line extends 10 miles out of the city and this territory has developed with great rapidity. Suburban residences have been built along the line as far out as the village of Flores, rapid transit being the sole cause of this growth.

The Dunedin City & Suburban Tramway Company, of Dunedin, New Zealand, has decided to equip the tramway lines for electric traction. D. R. Eunson is manager of the company and is also general manager of the Mornington tramway which is a cable road. Additional power is needed for the cable operation and the company contemplates purchasing a vertical engine.

In a paper read before the Birmingham Association of Engineers it was stated that the trolley lines of Leeds cost 7.1 cents per car-mile for operation and this was increased to 17.2 cents per car-mile when repairs, interest and depreciation were added. Manager J. Young, of the Glasgow corporation tramways, says that the operating expenses of the electric cars on the Springburn line is 13 cents per car-mile which is increased to 17.24 cents per car-mile by interest and sinking-fund.

Among the tramway projects in the British Isles may be mentioned the following: It is proposed to construct an electric line from Cruden Bay hotel to Cruden Bay station in Aberdeen. A provisional order has been granted to build electric tramways in Barking. Plans for electric tramways for Bath are maturing. The

proposed electric lines in Darlington are estimated to cost $750,000. A tramway line is to be built in Newcastle-under-Lyne from George street to London road. Rapid progress is being made in the construction and equipment of the electric tramways of St. Helens. Walsall proposes to purchase and equip the tramway lines for electric traction.

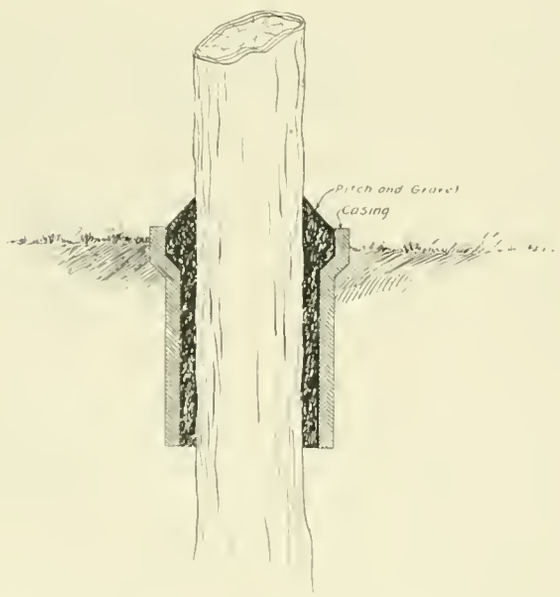
The Paris, Lyons & Mediterranean Railway Company is about to construct an electric railway from Saint Gervais-les-Bains to Chamonix, at the foot of Mount Blanc for carrying both passengers and freight. A third rail will be used for a conductor and a rack will be employed for the steep grades. The current will be supplied from a water power station at Chedde on the River Arve. The line is to be meter gage and 12½ miles long.

U. S. Consul Smith, of Moscow, sends this information:

"All contractors who are desirous of bidding for the construction of electric railroads in this city should make application to the city council not later than April 12. The sum of 750 rubles ($375) must accompany each application. The council will give all parties presenting applications the terms and conditions of the concessions, with all necessary drawings and statistics as to the working of the tramways in Moscow for the past five years, profits of the different localities, list of lines existing, and approximate prices for making out the estimates. For foreign bidders, there will be issued copies of the contracts printed in foreign languages, which will be sent on demand to all electrical companies. Copies will be sold to all applicants desiring particulars of the contract to be issued. The date of presenting the final tenders will be October 1, 1899."

TO PRESERVE WOOD POLES.

The accompanying illustration shows a method of protecting wooden poles at the surface of the ground from decay. A terra cotta casing, 24 in. long and from 2 to 3 in. larger in diameter than the pole, is placed so that it projects above the ground line about 2 in. In setting new poles a solid casing can be used, but for poles already planted a two-part casing is designed with beveled grooves, which



make a good joint. The space between the pole and casing is filled in with asphalt or common roofing pitch and clean gravel, forming a solid water and air tight casing about the pole where it needs protection. Gravel and pitch are the best materials to use, for many poles have season cracks in them and these will be filled with the hot pitch, which will prevent dampness from penetrating the pole. The designer, H. L. Dubois, claims that the life of poles so protected will be doubled.

A bill introduced in the New Jersey legislature provides that 10 hours shall constitute a day's work for street railway employes.

A FAST SUBURBAN CAR.

The Brockton Street Railway Company, of Brockton, Massachusetts, has recently purchased from the J. G. Brill Company a number of cars intended for very fast, heavy suburban service. While they are not of unusual length, having only 25-ft. bodies, they are provided with two 50-h. p. motors, which gives them a power and speed not commonly found on cars of the class. In many respects these cars resemble those recently purchased from the same builders by the Mansfield & Eastern Railway, yet the larger size of the motors make the car much more powerful, enabling it if necessary to haul a trailer and in winter to cope with snow.

These cars are mounted on No. 27 G trucks and weigh complete 20,000 lbs. The wheels are 33 in. in diameter and the wheel base is 4 ft. The long half-elliptics, the spring links and the journal springs combined, make these cars ride very easily. The length of the body over the end panels is 25 ft. 4 in., and over the buffers 36 ft. 5 in. The width is 7 ft. 5 in. at the sills and 8 ft. at the posts. The platforms are 4 ft. 6 in. in length. The vestibules, entirely enclosing the platform, have round ends and folding doors; the lower portion

FAST SUBURBAN CAR.

of each vestibule is sheathed in steel. The buffers are of the Brill angle iron pattern. Two sand boxes are provided.

From the underside of the sills to the rails is 31 in.; the platforms are dropped so that the step with a 13-in. riser is 16½ in. from the rail. The cars seat 36 persons and are fitted with plush covered, spring upholstered, walkover seats. The interior finish is quartered oak.

The cars are fitted with Littell track scrapers whose value has been well demonstrated during the past winter. Cars are frequently stalled by a light snow falling in upon the rails after the passage of a plow or sweeper, and trifling drifts sometimes render them unable to move when they have ample power to remove the snow in front of them if the wheels could only be kept in contact with the rails. This can be accomplished by the use of a scraper and the Littell scraper, owing to its great strength and simplicity of mechanism, overcomes the objections which have ordinarily been urged against scrapers. In the early hours of a snow storm its work is nearly equal to that of a plow and it has peculiar advantages for clearing the track possessed by no other piece of apparatus. It will be seen from the engraving that when not in use it is entirely out of the way of obstructions which might possibly injure it, but it can be dropped instantaneously by the mere touch of the toe against the controlling lever.

Dick, Kerr & Co. have received an order for 70 motor cars from the corporation of Bolton, which is the largest order of the kind so far placed by any municipality in Great Britain. This includes the car bodies, trucks, motors, controllers and air brakes with axle-driven compressor.

In a suit against the Market Street Railway Company, of San Francisco, the court ruled that an owner of the company's bonds and stock was disqualified as a juror.

The Big Consolidated road, of Cleveland, has inaugurated a new schedule giving increased service; 15 new cars have recently been put on by reason of the changes.

HALF FARES.

Frank May, Sr., is the president of the reorganized Fredonia & Dunkirk (N. Y.) Street Railway Company.

The Indiana Electric Railway, of Goshen, Ind., intends to complete its line between South Bend and Elkhart during the coming summer.

It is announced that the Pennsylvania & Ohio Railway Company, of Ashtabula, O., will soon commence work between Painesville and Conneaut.

It is stated that responsible parties have agreed to provide money for an electric railway at Mankato, Minn., provided $15,000 be subscribed by local men.

Michael C. Galvin, conductor, and Thomas Hiney, motorman, who were in charge of one of the cars in the collision at Worcester, Mass., on December 21 last, have been indicted for manslaughter.

Published statements that George N. Stone, of Cincinnati, was to become manager of the Cincinnati Street Railway Company, Mr. Kilgour retaining the presidency, are positively denied by Mr. Stone.

The two street railways and the Hercules Ice Company, of Lexington, Ky., have been consolidated under the name of the Lexington Railway Company; the capital stock of the new company is $800,000.

It is stated that the Whitney-Widener-Elkins syndicate has acquired control of the Electric Storage Battery Company, of Philadelphia, with which the syndicate has recently made some large contracts.

The Los Angeles (Cal.) Railway Company in February made a trust deed to the Union Trust Company, of San Francisco, to secure bonds for $5,000,000. The deed carried revenue stamps aggregating $2,500.

In a suit against the Toledo Traction Company, the plaintiff, who had been given a transfer wrongly punched, was awarded 11 cents damages, 10 cents being for extra fares he was compelled to pay; he had sued for $300.

The Bay Cities Consolidated Railway Company, of Bay City, Mich., has ordered six new double motor equipments which it is expected will be put in service May 1. Numerous improvements will be made during the coming season.

The question of street car service is being agitated in Mankato, Minn., and some local capitalists seem inclined to support the project. It is proposed to combine the railway and electric light undertakings and have one power station for both.

On February 16, Joseph R. Megrue, of New York City, was appointed temporary receiver of the Niagara Falls & Lewiston Railroad Company, commonly known as the Gorge road. The application was made by a majority of the stockholders.

The Sherbrooke, Canada, Street Railway Company has been purchased by F. Thompson & Co., of that city. They have acquired the Brompton falls water power and will increase the number of cars now in operation and build a line to North Hatley.

The street railways of Cleveland report an increase of gross earnings for January as compared with January, 1898. The increase was 3.4 per cent for the Big Consolidated, 45.3 per cent for the Lorain & Cleveland, and 12.5 for the Cleveland, Painesville & Eastern.

The operation of the Frederick City & Middletown (Md.) electric line has resulted in a marked increase in the population of Middletown. Many new houses have been built, but notwithstanding this many families desiring to locate there cannot secure houses.

During the cold weather last month the Toledo Traction Company made arrangements for giving its conductors and motormen warm lunches, with hot coffee served at more frequent intervals, a piece of "paternalism" which was greatly appreciated by the men.

The Winnipeg Electric Street Railway Company has been notified by the city council to build a line on Sherbrooke street from Portage avenue to Notre Dame avenue to be commenced by May 15, and also the cars of the company must be equipped with fenders.

February 11, a car on the McKeesport, Wilmerding & Duquesne Railway jumped the track just as it left the viaduct over the Baltimore & Ohio Railroad, and was wrecked by striking a neighboring building. Of over 60 passengers in the car only one was seriously injured.

The postmasters of Moline, Davenport and Rock Island have been discussing a plan for a trolley mail car service with General Manager Lardner, of the Tri-City Railway Company. If the approval of the department can be secured two mail cars will be put in service.

March 13 the Cook County (Ill.) Commissioners granted the Northern Electric Railway Company a 20-year franchise that will carry the projected line to Elgin as far as River Grove. Franchises will be asked for other towns between River Grove and Elgin, but the company has not given out what the route will be.

The Wheeling Railway Company took advantage of the very cold weather in February to lay a power cable on the bed of the Ohio river from the power station in Wheeling, W. Va., to West Wheeling, O. A channel was cut in the ice across the river and the cable lowered through it. The small station furnishing current to the Ohio division can now be abandoned.

On the evening of March 9, a south-bound electric car with 40 passengers on board, narrowly escaped running into the Chicago river, near Division street. The draw in the bridge was open, and before the car stopped the forward wheels were over the edge of the abutment. Four passengers were slightly injured in the panic that followed the accident; the motorman jumped into the river.

An interesting and unusual shut-down is reported from Kokomo, Ind. On March 11, an engineer formerly in the employ of the street railway entered the power house armed with a shotgun and opened fire on the employes, one of whom was wounded. When alone he shut down the engines and held possession for over an hour, until the sheriff and posse captured him; he is insane.

The Massena Electric Street Railway Company of Massena, St. Lawrence county, N. Y., has been incorporated; capital $100,000. Directors, Thomas H. Gillespie, H. A. Johnson, E. M. Stathers, Howard Hasbrouck, Edward M. Nolan, Thomas D. Harris, Willard A. Esselstyne, James R. Jones of New York and Robert Swan of Massena.

The Manistee (Mich.), Filer City & Eastlake Railway Company, of which G. A. Hart is president, is building three miles of road and constructing a park on the shore of Lake Michigan, where a theater and a number of cottages will be built. Eight new cars will be purchased, making 30 in all. A new engine room, 70 ft. by 70 ft., has been built, and a 750-h. p. cross-compound Corliss engine installed. When completed this road will comprise 14 miles of track, connecting all the villages around Manistee.

It is reported that the Great Northern Railroad is seriously considering electric traction for hauling its trains from Leavenworth, Wash., to Skykomish, Wash., a distance of 65 miles. The company is now building a tunnel 13,228 ft. long, located between these points, in which the problem of ventilation would be difficult of solution were steam locomotives used. If electricity is decided upon a 65-mile section will be so equipped, power being generated at a waterfall in the Tumwater canon.

March 1, the safe in the office of the Jacksonville (Fla.) Street Railway Company was opened and $400 stolen.

The Seattle & Tacoma (Wash.) Electric Railroad Company has applied for franchises for a line to connect these cities.

The Brooklyn Avenue Railway Company, of Kansas City, Mo., has been granted franchise in streets connecting its 10th avenue and Northwest branches.

New schedules on the Everett lines of Cleveland have increased the speed of night cars to 17 miles per hour, a change regarded with great approval by patrons.

The Metropolitan Street Railway, of Kansas City, Mo., has been authorized to build a steel viaduct and to run its union depot cars through the elevated road tunnel.

A suit has been begun to prevent the officers and stockholders of the City Railway Company, Fort Worth, Tex., from selling or otherwise disposing of that property.

The preliminary survey for an electric road from Cincinnati through Madisonville, Loveland, Foster and Kings Mills to Lebanon, O., was completed on February 21.

The Brunswick Traction Company, of New Brunswick, N. J., has ordered six large open cars for April delivery and 10 closed cars, for use on the branch lines to Somerville and Plainfield.

February 23, the first train was run over the extension of the Bergen County (N. J.) Traction Company's line from Fort Lee to the Hackensack river. The line was opened for traffic on March 1.

The Brooklyn (N. Y.) & Brighton Beach Railroad, now operated under a lease by the Kings County Elevated, will be sold March 21, and it is stated that the Brooklyn Rapid Transit Company will endeavor to secure the property.

At a recent meeting held in Chicago the directors of the Rock River Electric Railway Company, of Rockford, Ill., decided upon beginning the work of construction as soon as the weather permits. E. M. Hopkins is president of the company.

Press reports state that Senor Castanada, who purchased the Havana Tramways, and four of the directors of the company have been indicted for fraud connected with the transfer of the property; it is claimed that Castanada was the lowest bidder.

The Chicago city council has granted a 15-year franchise to the Northern Electric Railway Company, for a line between the 27th ward and the town of Cicero. This company is controlled by Ohio parties and contemplates extensions to Aurora and Elgin.

At the annual meeting of the Louisville (Ky.) Railway Company, held on February 15, President T. J. Minary submitted his report showing gross receipts of $1,297,394, and expenses including operation, taxes, interest and dividend on preferred stock, of $1,273,181.

A Chicago attorney recently sued the Chicago City Railway to recover the 5-cent fare paid, because he was carried one block past his destination; the court held that the evidence did not show a breach of contract on the part of the company and he failed to recover.

Joseph L. Lovett, of Emilie, Pa., writes us that he has secured the franchise and right of way to build a trolley line between Trenton, N. J., to Philadelphia, Pa., a distance of 12 miles. It is intended to have this road built in the spring.

The property of the People's Railway Company, St. Louis, which has been in the hands of F. B. Brownell, receiver, was sold on February 19, to August Gehner for $500,000. The company has 9½ miles of cable track and was capitalized at $1,000,000 and bonded for $1,000,000.

A disagreement has arisen among the directors of the Syracuse (N. Y.) Rapid Transit Company as to the desirability of purchasing the stock of the Syracuse & East Side Street Railway Company, and the minority of the board secured a temporary injunction restraining the purchase.

The Chicago Electric Traction Company has let contracts for the line from Blue Island to Harvey, a distance of about eight miles. Work will be pushed in the spring. The company recently acquired the two miles of horse car road in Harvey and will change this to conform with its other lines.

On February 17, about 7 o'clock in the evening, 800 ft. of live trolley wire was cut from the overhead line of the Belleville (Ill.) Electric Railway Company. The theft occurred in the town of Winstanley Park and this is not the first time that the company has suffered from such depredations here.

The Peoria (Ill.) & Pekin Traction Company has ordered 1,200 tons of rails and promises to have a portion of its line in operation by July 1, and the whole completed by October. The contract for the bridge over the Illinois river has been let to the Schultz Bridge & Iron Works, of Pittsburg; this bridge is 1,004 ft. long and will cost $125,000.

We are advised by W. H. Davis, general manager of the Quakertown (Pa.) Traction Company, that an extension of the line will be made to Doylestown via Perkasie, Benjamin, Silverdale, Blooming Glen, Dublin and Fountainsville, a distance of 20 miles. All the rights of way have been secured and it is hoped to have the line running to Perkasie by May 1.

The passenger earnings of the Brooklyn Rapid Transit Company's system for February, 1899, were $370,544 as against $369,420 in February, 1898, and $343,853 in February, 1897. For the eight months ending February 28, 1899, the increase was 12.8 per cent of the same period of the previous year, and 17 per cent over the eight months ending February, 1897.

The project of extending the Evansville (Ind.), Suburban & Newburgh Railroad to Rockport, Ind., is now being agitated. The plan has been considered several times in the last few years, but the proposal of an Ohio company to build an electric line through this territory has again aroused the Evansville, Suburban & Newburgh Company to action; this is a dummy road.

The Southwest Missouri Electric Railway Company has put in service two cars which maintain a fast schedule between Carthage and Joplin, a distance of over 18 miles. The time to make the trip has been shortened by these two cars from one hour and a half to 55 minutes. There are four stops, at Carthage, Carterville, Webb City and Joplin, besides four railroad crossings where the cars have to stop and be flagged before proceeding. The first through car leaves Carthage at 8 a. m. and each hour and a half thereafter until 11 p. m. These cars are equipped with two 50-h. p. motors and are capable of running 40 miles an hour. It is stated that this fast service is drawing heavily upon the patronage of the competing steam road.

W. F. Sadler, Jr., informs us that the Trenton, Lawrenceville & Princeton Railroad Company has been incorporated at Trenton, N. J., capitalized at $200,000, with the following directors: James L. Branson, president, and Henry C. Parry, vice-president, of Langhorne, Pa.; W. F. Sadler, Jr., A. Crozer Reeves and Wallace Buckman, of Trenton, N. J., and Ed. C. Williamson, of Morrisville, Pa. The company purposes to build an electric line, 10 miles in length, work to commence as soon as the weather permits. Bids are wanted for all construction work as well as for equipment. The profile for grading can be seen at the company's offices, 25 and 26 Forst-Richey building, Trenton, and specifications for work will be mailed upon application. Address all communications to Wm. C. Parry, general manager, Langhorne, Pa.

BLIZZARD IN EASTERN PENNSYLVANIA.

The two views here shown were taken on the Easton, Palmer & Bethlehem Street Railway, at Butztown, Pa. This section of country has little or no snow during an average winter, but this winter has been an exceptionally long and hard one, and on two occasions has been visited by blizzards. The electric railways have not been suitably equipped for fighting such snow storms and have had much to contend with during the past three months, but by constant diligence and hard work the lines have been kept open for traffic with few and brief interruptions. These conditions have been particularly hard on interurban lines passing through open country. The pictures prove that Superintendent Chas. H. Cox, of the Easton, Palmer & Bethlehem Street Railway Company, succeeded in operating his cars even with the snow drifts piled as high as the car roofs.

SCENES AT BUTZTOWN, PA.

STREET RAILWAYS OF WASHINGTON CITY.

From the annual reports of the street railways operating in the District of Columbia we extract the following data as to their operation during 1898:

The gross passenger earnings of the Capital Traction Company were $932,170, and the total gross earnings $933,177. Operating expenses were $537,991 and dividends, interest and taxes, $411,107; the surplus for the year was $44,079. During the early part of the year, that is, until a few weeks after the opening of the underground system, the receipts of this company were small, and the fact that so good a showing has been made is cause for congratulation. The expense of installing the electrical underground system was larger than was estimated by the company, owing to the final decision to put the system on the Seventh street line. The total cost of the improvement was $1,296,291.78. Bonds for $1,000,000 were authorized. The insurance on the burned out power-house was $250,000. It was, therefore, necessary to apply $37,000 of the receipts of the road to the construction account. The bonds have not been actually issued; they bear 5 per cent on their face and have been given as collateral on which loans have been placed at about 4 per cent.

The Metropolitan Railroad Company's receipts from passengers were $822,430, and the total gross earnings $836,819. The operating expenses, including improvements, were $471,358; taxes were, $38,565; interest on bonded debt, $143,691; dividends, $74,920. Deducting the amount spent in improvements, $46,776; the operating expenses were 51 per cent of the gross receipts. The number of passengers carried was 18,995,264.

The Columbia Railway Company is controlled by the same stockholders who control the Metropolitan. Its passenger receipts were $170,021; and the gross earnings, $171,397. Operating expenses were $76,180, which is 44.4 per cent of the gross receipts. Taxes were $7,386; interest, $30,000; dividends, $24,000. The amount expended for real estate and improvements was $24,921. This road has 5.6 miles of track.

The gross receipts of the Washington & Great Falls Electric Railway Company for the year were $47,764. Operating expenses were $22,713; expended for construction and equipment, $8,072; for right of way and real estate, $576. The excess of earnings over expenditures is $8,695, which is a better showing than made by any of the other suburban roads of Washington. This road is 7 miles long and carried 998,854 passengers.

The City & Suburban Railway Company (a consolidation of the Eckington & Soldiers' Home Railway Company and the Maryland & Washington Railway Company) has 31 miles of track, and the earnings of the property for the year were $82,551, and the total deficit, $58,621. The Anacostia & Potomac River Railway Company earned $32,743; it barely paid operating expenses. The Georgetown & Tenalleytown Railway Company earned $24,225; the total deficit was $3,966. The Brightwood Railway Company earned $55,935; its operating expenses were $47,565. The Capital Railway earned $18,609; the total deficit was $23,895. These roads are now controlled by a syndicate, whose principal members are O. T. Crosby, F. C. Stevens and C. A. Lieb. The Senate committee on the District of Columbia has favorably reported a bill permitting the consolidation of these syndicate roads and also the Washington, Woodside & Forest Glen Railway & Power Company, under the name of the Washington City Railway Company.

February 4 the directors of the Anacostia & Potomac River Railway Company voted to increase its capital stock from $100,000 to $2,000,000. This sum is to be devoted to installing the electric conduit system and acquiring the other syndicate properties.

The Capital Traction Company has made application for permission to reconstruct its U street line (the Chevy Chase line) and install the conduit system as used on the company's main line.

The District commissioners and the committees of congress are considering the advisability of requiring all street railway companies in the District to equip their cars with air brakes.

BUFFALO, HAMBURG & AURORA RAILWAY.

Work on the new interurban connecting the above named cities has already commenced and will be pushed to completion as rapidly as possible. The line will serve a large population and has fine prospects. U. L. Upson is secretary and general manager. Construction will be done by the Continental Construction Company, of Boston.

ECHOES FROM THE TRADE

The Star Brass Works, Kalamazoo, Mich., report the best of prospects for the coming season.

It is stated that the new Indianapolis street railway will order 100 new cars as soon as the contract with the city is closed.

The Central Traction Company, of Sioux City, Ia., has arranged for a $30,000 bond issue, the proceeds of which will go for buying new equipment and improvements.

The contract for constructing the elevated structure of the Boston Elevated Railway Company along Washington street and Main street, in Charlestown, has been awarded the Pencoyd Iron Works. The requirements state that the work must be completed by October 1 of this year.

The Chase Construction Company has removed its offices from 1113 to suite 1321 and 1322 Majestic building, Detroit. This change was due to the expanding business of the company in contracting for the building and equipping of electric railways and power stations of all kinds.

Harold P. Brown is about to introduce a new tie plate plastic rail bond especially for rebonding rails already in service and for steam roads adopting electric traction. The conductivity of this bond will equal that of the rail; it will last as long as the rail, and lengthens the life of the rail.

The Van Dorn & Dutton Company, of Cleveland, has just received an order for 22 trucks of the latest "99 B" type from the Cleveland Electric Railway Company. Business has never been so good with the company as it is at present and every department of the works is running up to its capacity.

The Miller-Knoblock Company, of South Bend, Ind., reports that it is receiving so many orders from all parts of the country that it must soon enlarge its plant or begin to decline orders. A. W. Morrell, general manager of the company, states that he had a large stock of copper bought when lower prices prevailed, and feels quite pleased because of this fact.

The Monarch Stove & Manufacturing Company, of Mansfield, O., suffered from a disastrous fire at its works on the night of February 9. The company immediately set about repairing the damage and we are gratified to be able to announce that its capacity will soon be larger than ever. The Monarch track cleaner, one of the company's specialties, is in great demand.

A new catalog has been published by the C. W. Hunt Company, of New York, illustrating types of hoisting engines and coal handling machinery made by the company. An account is given of the "noiseless conveyor," which is especially applicable for moving coal and ashes in large stations located in the cities. The motive power may be either steam or electricity.

After a careful investigation of the relative merits of the different sand boxes on the market, the Third Avenue Railroad Company, of New York, awarded the contract of equipping 160 new cars to E. F. DeWitt & Co., of Lansingburg, N. Y. Of this number 100 will be fitted with four boxes and 60 cars, each of which are built up from two of the cars now in operation, will be equipped with two boxes.

The abnormal increase in the market price of all metals, including all iron products, has compelled the Cahall Sales Department, of Pittsburg, to announce that there would be a 20 per cent increase in the price of boilers made by the company, this change taking place on March 1. Most of the iron works have orders booked so far ahead that it is difficult for the boiler makers to secure raw material even at the greatly augmented cost.

The branch factory of the Standard Paint Company in Hamburg, Germany, has been kept busy with foreign orders since it was opened last year. This factory makes insulating tape, armature and field coil varnish, rubberoid, roof paints, building sheathing and insulating papers. The P. & B. insulating tape and compounds has been in equal demand in this country, so that the company's business in 1898 was far in excess of that of any preceding year.

The Western Electric Company, of Chicago and New York, has just issued its illustrated catalog and price list of fan motors for 1899. Illustrations and complete descriptions of desk, bracket, ceiling and column mountings are given. The company makes both direct and alternating current motors; the greatest care has been exercised in their design, and they represent the highest stage of the art, both mechanically and electrically. The company has agencies in London, Antwerp and Paris.

The E. P. Allis Company, Milwaukee, has several notable railway contracts in hand: the South Side Elevated, Chicago, two 2,400-h. p. engines; the Metropolitan West Side Elevated, Chicago, two 2,400-h. p.; the Northwestern Elevated, Chicago, entire engine contract; the Toledo Traction Company, one vertical 1,500-h. p.; Consolidated, Grand Rapids, one 1,200-h. p., and the Cleveland Electric Railway, one 3,500-h. p. vertical. All the horizontal engines are cross compound condensing types. The five orders aggregate 15,800 horse power.

The Ajax Metal Company, of Philadelphia, advises us that it has placed on the market a metal that may be used in place of "Imported Tin" and sold at a much lower price. The new metal is known to the trade as "U. S. Tin," and its use, instead of imported tin in composition metals, results in sounder castings, more homogeneous in structure, richer in color, of greater tensile strength, and a better wearing metal in every way. U. S. tin can be used in the same proportions as the imported tin. The Ajax Metal Company will send to responsible parties small lots of U. S. tin on approval, and if satisfactory will make contracts covering a given time for their wants. This company over 18 years ago began marketing its "Ajax Tin," the sales of which metal have since reached millions of pounds per annum; its success with this metal led to its placing the new U. S. tin on the market. Correspondence is solicited.

The Western Electrical Supply Company, of St. Louis, Mo., has recently sent out to all parties having a copy of its Street Railway Catalog, No. 16, several insert pages calling attention to the many new lines which have been added to this department, or rather for which it has taken the general southwestern agency. This company represents many of the most prominent manufacturers in the country on a general line of street railway specialties, and is prepared to furnish factory prices on any article that is used in the construction and maintenance of a street railway, and it reports many large sales in this line since the season has opened, and anticipates a general increase not only in the railway, but throughout all the several departments the coming season. Parties anticipating the installation of an electric railway or making any improvements on their present system, will find it to their interest to communicate with the Western Electrical Supply Company on this subject.

We give herewith two out of a number of very flattering letters recently sent to the J. G. Brill Company, by whose courtesy we have received copies, and they will doubtless interest our readers. J. W. McFarland, superintendent of the Chattanooga (Tenn.) Electric Railway Company, writes: "Relative to your famous 21 E truck for four wheels, beg to say that we have been operating 10 of them all summer, and they have given the best of satisfaction. We

have ordered 10 more. I consider them the smoothest riding trucks and best truck on the market."

A letter from J. H. Wilson, manager of the Mobile (Ala.) Light & Railway Company, emphasizes most strongly the advantages of the metal seat end panels. The cars which he mentions as having gone to pieces after three years' use were built by a company which boasts of the best workmanship and prides itself on turning out the best wood work that can be done. It was unfortunately handicapped by the necessity of using wood instead of metal panels at the posts, with the result as told below: "What would be the cost of the 32 malleable seat end panels? We have only the two cars that need them, having two of the —— Company's cars that have absolutely got in worse condition after using three seasons than some second-hand horse cars, of your make, which we bought four years ago from West End Company, are in, although the West End Company had used them for 10 or 12 years. We use them as motor cars."

The Garton-Daniels Electric Company, of Keokuk, Ia., has just appointed Mayer & Englund, No. 10 South 10th street, Philadelphia, its representatives in the middle states territory for its line of railway lightning arresters.

The Allen & Morrison Brake Shoe & Manufacturing Company have just moved into much larger and convenient offices in the Fisher building, Chicago; the change became necessary by reason of rapidly increasing business. The new suite is number 604. The officers of the company are: F. R. Spear, president; A. J. Allen, vice-president, and F. D. Freeman, secretary and treasurer.

The "99 Famous" waste oil refiner and purifier, which is the latest improved type of this apparatus built by the Famous Filter Company, of St. Louis, is in use in the U. S. navy. Among other users are the Imperial Electric Light, Heat & Power Company, the Hamilton-Brown Shoe Company, the Regina Mills, the Wellman Dwyer Tobacco Company, the P. B. Mathiason Manufacturing Company, all of St. Louis, and the Bells Asbestos Company, of Johannesburg, South Africa.

The Central Electric Company, of Chicago, finds its present office rooms inadequate, and is about to make extensive changes in order to accommodate its increased office force. It states that, regardless of whether March comes in as a lion and goes out as a lamb, or the reverse, if its spring trade is any indication of later conditions, the season of 1899 will be a record breaker.

A. O. Schoonmaker ,of 158 William street, New York, the importer of mica and the maker of stamped mica segments and washers, has appointed the Electric Railway & Manufacturing Supply Company, of 548 Mission street, San Francisco, to represent him in the Pacific states. Mr. Schoonmaker furnishes mica in any form desired and segments and washers built up and gaged to any thickness.

The American Electrical Works always takes advantage of a holiday to send to the trade some attractive souvenir. February 22 of this year a steel engraving of the mansion house at Mount Vernon, the home of Washington, was chosen as most appropriate. It was accompanied by a circular giving the principal data concerning this historic building. Mr. Phillips is to be congratulated on the excellent choice he makes of souvenirs.

Babcock & Wilcox, Limited, of London, have organized the Deutsche Babcock & Wilcox Dampskesselwerke Gesellschaft, in Berlin, with a capital of $500,000, to establish works in Germany for the manufacture of Babcock & Wilcox boilers. A large portion of the capital will be employed in the expenditure for modern tools and machinery for the undertaking. Babcock & Wilcox, London, are large shareholders in the German company.

The Crouse-Hinds Electric Company, of Syracuse, has sent to the trade a handsome folder entitled "Official Endorsements." It contains over two dozen fac-simile letters from superintendents and general managers of street railway companies in all parts of the country testifying to the excellence of the Syracuse headlight. These letters are exact duplicates of the originals even to the color of the paper, and they form a most impressive testimonial.

L. C. Weir has been elected president and general manager of the Weir Frog Company to succeed Frederick Candee Weir, deceased. The company intends to increase its facilities for manufacturing and to continue its improvements as heretofore.

Eugene Munsell & Co., of New York and Chicago, report a very gratifying demand for their India and amber "Mica," of which they make a specialty for electrical insulation. Some very large orders have been received at both their Chicago and New York addresses.

The American Impulse Wheel Company, of New York, reports some very large electrical transmission work in hand and most valuable results from all its installations. The company is getting a large home and export trade, and the prospects for the coming season are most excellent.

The property of the Detroit Motor Works was sold under foreclosure proceedings on February 27, to the Union Trust Company for $49,500. The Detroit Motor Works were organized in 1892 by William C. Maybury, Ellwood T. Hance, F. A. Blades, W. H. Ellis, T. B. Rayl, Chas. W. Casgrain and executors of the will of J. Huff Jones.

The Ajax Metal Company, of Philadelphia, announces that it will send on approval any number of trolley wheels, up to 100, and meet competitors' figures on the first lot. This drastic measure is taken in order to prove to managers that the company means business and can afford to place sample wheels at a loss, because a trial show that they are better than others; when a trial is made the business of that road is secured.

Meysenburg & Badt, Monadnock block, Chicago, have just published a very complete catalog illustrating and describing the standard Weston electrical instruments. Meysenburg & Badt are western agents for the Weston Electrical Instrument Company, and in addition represent Harold P. Brown, A. L. Ide & Sons, the Helios Electric Company, Hugo Reisinger, the K. & W. Company, the Western Electric Company and the Ward-Leonard Electric Company.

The W. R. Garton Company, of Chicago, has been appointed central western agents for the Electric Equipment Company and also western agents of C. S. Knowles, of Boston. The company is the selling agent in this territory of the Partridge Carbon Company, Billings & Spencer Company, the Garton-Daniels Electric Company, the Miller-Knoblock Company and many others. A complete stock of railway supplies, including tape, insulated wire, trolley wheels, bushings, incandescent lamps and insulating material, is carried subject to hurry orders. "Armalac" and "enamelac," insulating compounds made by the Massachusetts Chemical Company, are held in stock.

Electrical engineers who are not already familiar with the value of "Micanite" as an insulator for commutator segments and rings, will do well to write the Mica Insulator Company, of New York and Chicago, regarding the same. It makes a specialty of furnishing segments for any style or type of machine, and has manufactured some segments recently as large as 30½ in. by 4 in. The company's sheet insulation manual and data book, giving break-down tests of its insulations and samples of goods, will prove very useful to builders of electrical machinery. A large stock of "Micanite" plates, cloth, tubes, paper, and "Empire" and "M. I. C. Compound" insulations is carried at New York and Chicago, also at the sales agencies in Cincinnati, St. Louis, San Francisco and Cleveland. The company reports a heavy business here and in Europe.

A. N. Tally, Jr., M. D., writing in the "United States Health Reports," says, in part:

"Millions of bacilli are found on one coin or piece of money or paper bill, though it may be in almost constant use and circulation. How much more have the bacilli which breed in the out-of-the-way nooks and corners and crevices of our household furniture a chance to multiply and attach themselves by myriads to the clothing or body of those coming in contact with them!

"To prevent this in as great a degree as possible 'Pantasote,' the famous furniture covering, has been devised and put on the market, a water-proof, grease-proof and stain-proof product, durable, inexpensive, and elegant. 'Pantasote' is a thoroughly meritorious article.

"From numerous inquiries received regarding 'Pantasote,' manufactured and for sale by the Pantasote Company, of No. 29 Broadway, New York City, we have had the matter referred to our experts for their investigation, and their complete reports are now filed, unanimously approved by our medical staff. Upon mature consideration of these reports as approved, we cordially extend to 'Pantasote,' the unqualified editorial and official indorsement of 'The United States Health Reports.'"

The Taylor Electric Truck Company, Troy, N. Y., is mailing a very attractive and handsomely illustrated catalog of the various single and double trucks manufactured by that concern. Details are given in a way that not only interests the reader but fully explains the points of merit in the Taylor truck.

McGill & Pomeroy, 317 Dearborn street, Chicago, the only exclusively street railway supply house in the west, have added to the lines of goods heretofore carried by taking the western agency for the Forest City Electric Company and also the agency for J. M. Atkinson & Co. McGill & Pomeroy report a continually increasing business, and we extend our congratulations upon their success.

The Western Electric Company carries the only stock of interior conduits in Chicago. As is well known the standard rubber-covered wires can be placed in these conduits without violating the Underwriters' rules.

The United States circuit court has authorized John C. McNulta, receiver of the National Bank of Illinois and of the Calumet Electric Street Railway Company, of Chicago, to dispose of the Calumet property, which is the principal asset of the bank, at his discretion.

George E. Pratt, Philadelphia representative of the Forsyth Brothers Company, of Chicago, and Elmer P. Morris, of New York, reports that last month was a good one and that during the first half of March he received orders for over 1,000 journal bearings and 13 miles of trolley and feed wire, besides car trimmings, trolley wheels, brake shoes, and smaller supplies. He has recently taken an order for 300 open car curtains with the new Forsyth adjustable fixture. The prospects are all for a large business.

GRAPHITE FOR CONTROLLERS.

C. D. Shepard, superintendent of the Palmer & Monson Street Railway Company, of Palmer, Mass., discusses the subject of controller lubrication as follows:

A lubricant of some sort must be used on the cylinders of controllers on all electric cars. Every electrician having charge of electric cars knows or has experienced the trouble pertaining to the use of any kind of grease or oil, by reason of dust sticking to the cylinder contacts, thereby cutting the cylinder and making poor contact, which causes the controllers to arc, thus destroying the life of the cylinder and fingers, also making it necessary to look over the controllers at least once a week and sometimes oftener. By the use of Dixon's No. 635 graphite this trouble can be remedied. Pure graphite being of high conductivity, and at the same time the best solid lubricant known, it has been demonstrated by practical experience that it is the only lubricant which dust will not stick to, and which will not interfere as a lubricant with making a sure contact between cylinder and fingers, giving a smooth surface on cylinder, allowing controller to be turned easily and smoothly, requiring attention only once a month.

To use this lubricant, clean the contact surface of the cylinder thoroughly with waste which has been dampened with a little kerosene oil, to remove all dust and dirt; then apply the graphite by rubbing smoothly and evenly over the surface of cylinder contacts, it not being necessary to apply any graphite on the fingers. All rough spots on fingers caused by arcing should be removed by file or sandpaper; all cuts or scratches which have been made by grit will become filled by the graphite, thus giving a smooth and even contact between cylinder and fingers.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. IX. APRIL 15, 1899. NO. 4.

The superintendent of a Massachusetts road which was obliged to vestibule its cars, requires motormen to keep the front window down, in order that there may be no danger of accidents resulting from snow or moisture dimming the glass. The motormen have concluded they preferred to run without any vestibules.

Now that Marconi has demonstrated his ability to telegraph some 32 miles without wires, it remains for some still more ambitious discoverer to find a way of transmitting a railway current in the same manner. This, with the cars which substitutes ball bearing for wheels, and a millenium conscience for the passenger who beats his way, would make the operation of street railways one continual round of pleasure.

The daily papers have been printing sensational accounts of the sudden death of a conductor on a Connecticut road just as he was in the act of ringing up a fare, and attempt to draw the conclusion that the man rang up the fare by accident and the shock was too much for him. There was a time years ago when the manager might have suffered a stroke of something at the sight of one of his men registering a fare, but in the present case we are prepared to accept the report of the doctor that the man died from natural causes.

The press dispatches chronicle the attempt in Zurich, on April 2d, to operate a street car with liquid air, and add that if successful the new power will be adopted in general service on the city lines. Liquid air is certainly capable of the most wonderful accomplishments in the laboratory, and to what extent it may be utilized for the practical every day purposes of power has not yet been demonstrated. It may not be an evidence of wisdom in these days to pronounce in advance upon almost any theory however seemingly impossible; at the same time we are old fashioned enough to believe that liquid air will have considerable history to its account before it freezes out the trolley.

The municipal campaign in Chicago which resulted in the re election of Mr. Harrison as mayor was conducted largely on street railway lines. The worst charge that the mayor could bring against his Republican opponent, Mr. Carter, was that Mr. Yerkes advocated his candidacy rather than Mr. Harrison's. Mr. Carter in return paraded his "street railway record," showing how many times he had voted against franchises in the council. Mr. Altgeld accused both the Democratic and Republican candidates of favoring 20-year extensions of existing franchises and therefore robbing the present generation of Chicago of its natural rights, first among which he apparently placed the municipal ownership of street railways. In any event, the street railway interests of Chicago were to be made to suffer as much as possible, and the election went that way.

Rails are getting scarcer every day and the mills will not now take orders for delivery short of three or four months, at any price. With standard sections of T-rail at $25 to $27 per ton, and the other advances in construction materials of all kinds, the situation is not an encouraging one for proposed new lines. In fact we are already beginning to hear of several companies which had fully expected to build this spring, but which have decided to go over until next year. These were established roads, with plenty of money, but did not feel the extensions were sufficiently important to warrant building now.

Last month 714 men employed by the Citizens' Street Railroad Co., of Indianapolis, presented a petition to the city authorities asking that petitions advocating 3-cent fares be ignored, pointing out that they, the company's employes, would be the greatest sufferers from any unreasonable action which reduces the receipts of the company. The fact thus stated by the Indianapolis men is destined, we believe, to result in the organization of employes' associations, which by concerted action will be able to impress upon municipal legislators that the 3-cent fare propaganda is unpopular among a considerable class of men who have votes. And certainly each of these men has one or two friends who also have votes.

During the month past the last cable car was withdrawn from service in Baltimore, and now all the lines in the city are worked by the trolley system. While the cable system was the most economical of operation at the time it was constructed, the trolley has steadily forced its way until the day came when the company was obliged to abandon its expensive plants, and build others. It does not seem possible that as radical changes as the trolley wrought can ever occur again: yet, who can guarantee they will not?

Fitts is the appropriate name of a Chicago woman who is heading a self appointed delegation of other strong-minded females who are to do great things. Three years ago she started out to have the city of Milwaukee buy the street railway lines of that city, but her efforts being unappreciated she enlarged her scope by moving to Chicago. She is now industriously engaged in circulating cards bearing an appeal to the men to "Stand up in street cars and give the women seats;" because "You can vote for municipal ownership and stop this thing—they cannot." We believe Mrs. Fitts would find a great work among the Filipinos.

The recent high price of copper has made that metal particularly desirable, and the depredations of the copper thieves in all parts of the country have been unusually annoying during the past two months. While the country lines have generally suffered the most, city lines have not entirely escaped. From all parts of the country come reports of losses from trolley wires and rail bonds being taken. On one interurban line we inspected recently there was scarcely a bond left in an entire mile of track over which we walked. The line was far removed from any dwellings, and it was an easy matter for the two thieves to pass along the track after the last car

was off the line, and while one ripped the bonds off with tools, the other propelled the wheelbarrow. With copper at upwards of 16 cents a pound, a night's haul of five or six hundred pounds is worth something. With the difficulty of protecting the miles of interurban lines by night watchmen, it may be necessary for the various state associations to secure suitable legislation which shall impose unusually severe penalties for depredations of this kind, which cost a great deal more than is represented by the market value of raw copper. Then it would pay to make a determined effort to catch and convict a few offenders in each state, which ought to have a discouraging effect upon the others.

When a number of bills providing for the vestibuling of street cars were introduced in the New York Assembly and referred to the Committee on Railroads, the Albany Railway submitted an elaborate argument against their passage, which will be found given in full on another page. The line of reasoning is briefly as follows:

The law requires the company to exercise great care in choosing competent car operators, and that the employes shall exercise the utmost vigilance in the performance of their duties. To be vigilant they must use their eyes and ears, and often by a warning cry may apprise pedestrians of danger. A vestibule restricts the range of vision and prevents the car operator from hearing and from giving vocal warnings, and is therefore dangerous.

The experience of electric railways has been that in cold weather the glass portion of a vestibule cannot be kept free from fog, and that at night the motorman cannot see unless the front windows of the car proper are covered by a curtain. The conductor who occupies the rear platform is similarly handicapped by a vestibule. Also, by partially concealing the movements of both motorman and conductor the vestibules render more difficult the task of the companies' inspectors to detect careless and reckless employes.

The reason given by the advocates of the bills in question is sympathy for the car operators, and this sympathy for a small class overlooks the whole general public which may be endangered by the effort to protect car operators from wind and storm. Further, the sympathy in question is misplaced, as during the thirty-six years that the Albany Railway has operated street cars there is no record that any employe contracted any disease while operating either horse or electric cars that caused or hastened his death.

Some extracts from a report by the Committee on Railroads to the Board of Aldermen of New York City unfavorable to a fender ordinance are also given in connection with the protest of the Albany Railway.

The announcement of the death of Mr. Menard K. Bowen, president of the Chicago City Railway, was as great a surprise to his friends throughout the country as it was to the people of Chicago. An exceedingly severe and unyielding attack of appendicitis baffled the skill of the best surgeons in the city, the illness lasting only 48 hours. His success had been phenomenally rapid, having risen by steady promotions until he was the youngest president in the country in charge of interests as extensive, and in his sudden death a future of unusual promise has been cut short. Chicago and the entire street railway fraternity have suffered a great loss.

Detroit is nearer to municipal ownership than any city in this country has ever been, and if the plans of Governor Pingree continue to meet with success and with the same rapidity of action, Detroit will be in possession of the local lines of transportation before the next issue of this publication. As may be surmised, a study of the situation reveals a clearly defined political move, which more than bears out our prediction that municipal ownership in this country cannot be divorced from politics. That important matters have been pushed to final action with less deliberation than is generally given some little cross roads project, need occasion no surprise. At present Mr. Pingree controls the commission, of which he is the chief member. Some of the solid business men and institutions of the city deplore this railroading of the plan through without consulting the citizens, but that does not appear to count for much, and it is doubtful if their attempt to gain time in court will be of much avail.

Our special correspondent in Detroit reports the status of affairs elsewhere in this issue, and the full text of the McLeod bill will also be found.

The various plans which have been suggested during the past 10 years for a solution of the rapid transit problem in New York City, have covered the entire range and included a large number of impracticable schemes. Those which were based upon the construction, or the construction and operation by the municipality have failed to command the confidence of the people, who hesitated to commit so large an undertaking to the chances which attend political manipulation. For the first time a thoroughly responsible and business proposition is offered. It is that of the Metropolitan Street Railway Co., which proposes to construct a tunnel at its own expense and operate it in connection with its surface system. As every street railway man knows, if undertaken by Mr. Vreeland the enterprise will be carried out to prompt and satisfactory completion, and in a manner creditable to both parties. The work is expected to require three years, and it seems probable that the proposition will be accepted.

The announcement made April 3d that the Manhattan Elevated and the Third Avenue (surface) systems had effected a traffic agreement will scarcely have any distracting effect on the underground plans. The arrangement which is intended to force the long haul riders on to the elevated and make the locals use the surface line amounts to little more than a shifting of the present passengers, and as both lines are carrying to practically full capacity, will not increase facilities to any great extent. Nor will it be easy to drive the short distance passengers off the route they have taken for years.

It is now the fashion to talk of the enormously valuable privilege which is granted when a street railway is given a license to operate in the streets of a city, and to demand that the company be made to pay for this benefit. Whenever application is made for a street railway franchise in a city of such size that a passenger traffic of some magnitude is assured, the demands as to what the company shall pay the city in the way of special taxes, or a division of profits become exorbitant beyond all reason.

It is urged that the company ought to pay the city a large percentage of its gross receipts and to pave, clean, and light the streets or considerable portions of them in return for the privilege of using the streets.

These demands are based first on the assumption that as the city owns the streets it should receive a rental for the use of them. This proposition appears quite reasonable to many who would stand aghast at a plan on the part of the city to erect a toll gate at every street crossing. In principle the two schemes are identical and result in taxing the traveling public for the benefit of the whole public. The effect of a toll gate is apparent to every one, and consequently there are no projects for thus increasing the city's revenue; but when the same tax on traveling is filtered through a street railway it emerges in a disguise that succeeds in blinding many to the fact that it is a tax levied on the men who ride for the benefit of those who do not.

When the compensation demanded is formulated as an arrangement by which a street railway company shall pave, clean, or light the streets it is again a tax on the traveling public for the general good, but the advocacy of this proposition involves an admission that the city is not fulfilling its duties in his regard, in a satisfactory manner. We do not doubt but that were the care of the streets confided to a private corporation the work would be better done, but municipal government must be indeed a monumental failure if rank injustice must be done and men who are too poor to ride except on street cars, be taxed to maintain the streets in fit condition for the carriages of their better-to-do neighbors, because the street railway company can do the work in a more satisfactory manner than does the city.

When the streets are paved it is not the city nor the general public which foots the bill, but the owners of property fronting upon the street. If any one is to be paid why not these property owners, instead of the city?

Some new interurban cars have been put in service on the interurban line between Anderson and Elwood, Ind.

The Big Consolidated, of Cleveland, has recently ordered 50 new open cars so that it will not need to operate any closed cars during the summer season.

THE STREET RAILWAY AND THE DAILY PRESS.

One of the most exasperating things with which the manager has to contend is the attitude of the daily press. We are anxious to make particular exception in what follows, for such fair minded editors of daily papers as endeavor to be impartial, and while censuring the company or its manager, if cause is really given, on the other hand are equally ready to extend a word of commendation when the manager or company is entitled to it. We are satisfied, however, from a careful watch of events for many years, that of late where the glad hand is extended once, there are twenty times where censure is passed unjustly.

* * *

When the banks make unusually large clearings, or break all previous records in the amount of deposits, the papers immediately go into a state of expansion and hold it up in big type as an evidence of the growing prosperity and importance of their city. When an opposite state of affairs exist they say nothing. When the list of building permits for the week fills a quarter of a column it is deemed necessary to shout the glad tidings in three or four columns of details giving minute particulars of each structure and rejoicing in the solid growth of the best town in the state. When building is at low ebb you would never find it out if you read the paper, ads and all; and when some little manufacturing industry is looking for the location with the largest bonus, the same paper pounds away day after day trying to whip into line public spirited citizens to secure the "prize." But when the street railway is trying to enlarge and benefit a thousand where the little factory helps ten, that is all at once a different proposition and must be fought tooth and nail.

* * *

This would seem to indicate that the railway and its management, instead of being the good fellows which the bankers, and the architects and the man with the bench and the handful of tools are, do not know how to win the good graces of his highness the editor, nor how to command a position among the other business men of the city which entitles them to equal consideration. And yet nothing could be really farther from the truth. With very rare exceptions a stranger might go to every editor in the city, and his personal expression regarding the social position and business ability of the railway manager would be highly complimentary. Then why is it he thinks and says one thing, and prints another?

* * *

Success and popularity multiply themselves rapidly, and in the same manner and probably for the same reason there has grown up throughout the country an attitude of the press which is either hostile or unfair, or both, toward street railways. A few of the leading journals in different parts of the land with personal axes to grind and whose editorial policies are on the market at a price, piqued at their inability to hold companies up, turn about to teach them a lesson. So they flash a broadside on every possible occasion. In the smaller cities the newspaper satellites of the great dailies take their cue and so it becomes the popular thing to look upon a street railway as a natural target at which to aim all kinds of shot at every possible opportunity. And thus the thing spreads and seems to have become a custom and sort of unwritten law.

* * *

What we object to is the eminent unfairness of it all. The columns of the daily press are supposed to be open to the great reading public. Any man with a grievance of a public nature may here raise his voice in protest. The department "Vox Populi" is always in good working order. It does not seem to occur to the editor ever to investigate the standing or responsibility of the writer, who has a "kick to put up." He must sign his name to be sure, as an evidence of good faith and all that, but if his name appears in the city directory that is sufficient, and even this precaution is not always taken. He may be the most worthless loafer in the ward, one who could never make a success at anything honest or honorable, but this does not act as any barrier to his sending in by mail and securing the free publication in a prominent manner of criticisms, which are the essence of unfairness and statements regarding the business methods of a company into whose office he has never even entered. An analysis of the "protests" and "demands" and "kicks" which go to make up the contributions in question would rarely ever disclose the name of a business man in good standing, or one whose opinion in personal conversation would ever be listened to for one minute. Yet they readily secure valuable space in which to air their views, the publication of which tickles the vanity of the writer and in the mind of the publisher conveys the idea to the public that his paper is the people's bible.

* * *

It is much easier to pull down than to build up, to tear than to mend; to harm the reputation of an individual or concern than to repair it. The work of even the most skillful surgeon leaves some scar. If irresponsible persons who carried an account in even a dime savings bank were allowed in print constantly to question the doings of our oldest and best banks, it would inevitably do them harm even though it did not cause a run on the institution. Just so with the leading dry goods merchant, or grocer, or butcher. Because one chances to fall on a slippery sidewalk or is accidently served with an over corned piece of meat, is no good reason for rushing into print and venting one's spite and damaging another's business. A fly in the coffee might occur even in Delmonico's.

* * *

What we regard as unfair is the thoughtless printing of communications without first verifying them or at least seeking the other side, for there are two sides even to "Constant Reader's" plaintive wail that he dropped his nickel on the floor and the conductor made him pay just the same. A denial can never reach all who read the indictment, and why, moreover, should one be put continually to the necessity of proving his innocence. In this connection by no means the least unfair feature is that while "our columns are always open to the public," when the street railway wants to reply, being a corporation and not a public, it must pay handsomely for the "privilege," and then like as not have its statement garbled out of all shape.

* * *

But much more inexcusable than this is the editorial policy which "has it in" for a road, because in such instance the attack is premeditated and intentionally falsified. It is not by any means difficult to make the most sacred things ludicrous, or to convict a perfectly innocent person out of his own mouth; though no high minded person would do either. Hence it requires neither special aptitude or ability to prove a very plausible case against a street railway on almost any question, especially when the attorney for the defense is not allowed to be heard.

* * *

At the present time in a city of 100,000 the papers are indulging in a combined attack upon the street railway of that place. The road and equipment are in excellent condition, and operation of the system certainly a credit to the city and the management. If we were invited to criticise it we could say nothing worse than that in our judgment the manager is running more and better cars than the business of the road warrants. One paper has been particularly severe, having interests of its own to further at the expense of the railway. The editor urged the manager to contribute an article over his own name setting forth his side. He somewhat reluctantly consented to do so, and the article was printed. But in its editorial columns the same editor after apologizing for printing the contribution which was done as a great favor to the company, etc., in permitting the presentation to the public of the manager's views, etc., he proceeded to tear the article into ribbons and place such a false construction upon it, and to misinterpret what was said in such a manner that the latter end of the manager was worse than the first, and it will be many, many moons before he will allow himself to be flayed alive again in that manner.

* * *

As a general proposition, therefore, we are warranted in assuming that we cannot expect from the daily papers the same fair, unbiased consideration which is accorded to the average business man whom the paper must treat considerately if it expects to continue his advertising. The street railway has no occasion to spend thousands each year in advertising, and however politic it may be to subsidize the papers it is neither right nor is it business. If there is educational and missionary work to do through the press as there is frequently and legitimately, the company should pay for it, and does so generously. But this paying of money to chain the dogs, when one is not a tresspasser, but in the full possession of moral and legal rights supposed to be guaranteed by that document respectfully termed "our glorious constitution," is a transaction

which galls an honest man. The public do not dream of this, and the company has no means of telling them—and even if it could and did, the story would have to be repeated many times—so long has been their education otherwise.

* * *

Is there anything then which can be done to ameliorate our unfortunate condition? We would not fight Filipinos with poisoned arrows for that is savagery, but we would use the same medium to defend and protect our rights that are now employed to attack them. In other words as the printing press is used against us, let us turn to it for assistance. It is not necessary to put in an expensive printing plant, or any plant at all. A small monthly sheet can be issued at a very reasonable figure; when occasion demands, it can appear as a weekly. Let it be devoted to local interests; to the announcement of all the notices the company desires to address to its patrons. Let its spirit be dignified but earnest and very much alive. Pursue a patient course of education in which the good work the company is doing is set forth, not in any boastful manner, but in the same tenor the daily paper treats other local institutions it desires to commend.

Recount the improvements made for bettering the plant and service; arouse a feeling of pride in a worthy local undertaking. The public as a whole is neither unreasonable nor unmerciful, and we should not be surprised, considering its one-sided education, that it thinks exactly as it does. The passenger who grumbles at what seems a poor service during a snow storm, for instance, would be indulgent and even sympathetic if he had a detailed account of the efforts made to keep the lines open, and astonished at the amount of money spent in doing it.

When the local papers "roast" the road, make a dignified reply, but avoid any direct mention whatever of that attack which occasioned it, take all the replies and answers you please, but not as in response to any individual or article.

* * *

The expense as suggested will be much smaller than most of our readers imagine. The circulation must of course be free, and the distribution made on the cars. A suitable rack near the door with a "take one" or a bundle suspended by one corner will find more ready readers than would be supposed. If the little sheet is bright and spicy and contains some general reading matter of good quality in addition to local news outside company matters, it will soon find its way into the hearts and homes of the people. Sixteen pages or more, 6 x 9 in., stitched in pamphlet form would be handy to put in the pocket, or a more pretentious size, say 12 x 18 in., printed in four pages, is good. But above all come out good and strong for your own town. Talk its good qualities all the time. Make the most of its every advantage, and convince the people that you have its best interests at heart—as you ought to have, and undoubtedly do.

* * *

"But I don't know the first thing about making a newspaper," you remark doubtfully. Very likely, and perhaps you could not wind an armature yourself and do it well, but there are others who can. There are good newspaper men in every city whom you can get to do the work on the side, and who will simply need to be advised as to questions of policy and such facts and figures as you wish emphasized. This expense will not be great, nor will the printing bill, and with "a guaranteed circulation" as large as the daily papers combined, if you wish, the time will not be long before local merchants will want to advertise in your columns, and the sheet will at least be self sustaining. The other papers may frown on this new client for advertising patronage, but they are entitled to no consideration; they alone are responsible for it.

* * *

To such publishers as may read the above and feel we have unjustly arraigned the daily press we would repeat the assertion made at the outset. We have only grateful thanks and appreciation for such journals as are fair minded and are willing to give both sides equal consideration. We do not include such in our recommendation to the company to do some printing on its own account. But there are cities where there seems absolutely no other alternative, and as the poisoning process has been of long duration, the evil cannot be corrected in one month or two. It takes longer to unlearn a prejudice than to create it, but conscientious, patient, dignified, manly statements of facts will eventually make their impress on the public mind.

THE ACCOUNTANTS' ASSOCIATION.

President Calderwood and Secretary Brockway, of the Street Railway Accountants' Association of America, under date of Mar. 20, 1899, issued the following announcement:

"It is our privilege to announce that arrangements have been made as follows for the Third Annual Convention of this association.

"Agreeable to our by-laws the meeting will be held simultaneously with that of the American Street Railway Association at Tattersall's corner State and 16th Sts., Chicago, October 17th, 18th, 19th and 20th.

"An exceptionally strong program has been provided, as papers upon these important subjects will be read:

" 'Car Mileage.'

" 'Blanks and Forms.'

" 'Materials and Supplies Accounts.'

" 'What Does the General Manager Want to Know from the Accounting Department?'

"These papers will be the results of studies rather than the experience of the author.

" 'The headquarters will be at the Auditorium Hotel (across the street from the Auditorium Annex), where rates have been provided; European plan $2 to $4 per day, American plan $5 per day. Rooms should be secured at once.

"The railroad rates will probably be the same as heretofore—one and one-third fare for the round trip.

"Those interested are urged to at once make their arrangements for attending the convention and tasting the pleasures of Chicago hospitality.

"Further announcements will be made about Aug. 15, 1899."

These preliminary arrangements were made at a special meeting of the executive committee of the association held in Chicago, at which Mr. Calderwood, Mr. Brockway and Mr. Mackay, of the Milwaukee Electric Railway & Light Co., were present. While here they were entertained at dinner at the Union League Club by Mr. F. R. Greene, secretary of the Chicago City Railway Co.

That the Department of Blanks and Forms, the exhibit of which will be an important feature of the coming convention, has already become of value to members is evidenced by the following letter recently received by Mr. Brockway:

"I am sending you today by express the blanks loaned to this company by the department of blanks, and I desire to say I am most gratified, as I found among the blanks sent me precisely the ideas for which I had need."

STREET CAR BUILDERS COMBINING.

Considerable progress has been made in the effort to consolidate the street car building interests into one organization, though the matter has been worked very quietly. It is intended also to take in the principal truck builders. The plan is to capitalize at $18,000,000. Under this arrangement there would be a saving in freights where western builders are now shipping to the eastern market and vice versa, but unless prices should be raised materially it would seem unlikely that this and such other economies in selling and administration as can be effected would offset the extra amount of interest required under the new stock issue. It is no secret that cars have been selling on very close margins, and in some instances the competition has even been so severe that contracts were taken with the expectation of a loss. Of course such a course could not be continued indefinitely, and it is a question in some instances as to which party suffered the most, the builder who tried to bid too low, or the company which has to use and keep the cheap cars in repair.

It would not seem likely, however, that prices could be abnormally advanced, for in such case the larger roads, which are the heavy buyers, would return to the practice of building their own cars, as they did so generally 15 years ago. The small roads could not do so advantageously and would have to pay the price. The builders are certainly entitled to a fair profit, which few of them have enjoyed during the past three years.

Last month the Saginaw Valley Traction Co., Saginaw, Mich., opened a reading room for the use of its employes.

THE NEW BUFFALO CONSOLIDATION.

The International Traction Co. is the name adopted by the $15,000,000 syndicate that has purchased the electric roads of Buffalo, Niagara Falls and Lockport and other roads in that vicinity. This company is organized under the laws of New Jersey. Benjamin Franklin has been elected president, and Charles McVeagh secretary and treasurer. It is the belief that these officers are only temporary and that in the course of time Hon. W. Caryl Ely will become president of the company, in fact, all signs point to this.

The merging of the various companies now controlled by the syndicate under the new organization is gradually going on. In all, 16 companies are concerned, with a total of about 318 miles of track. It is the belief of the men who have invested in the new deal that the various lines can be operated by the new organization with much greater economy than has been the experience of the several companies that formerly operated them, and that in this way a great saving will be effected.

One of the first steps taken by the new syndicate was to reorganize the Buffalo Railway Co., which was done at a meeting in the office of J. P. Morgan & Co., in New York, when an election of officers took place with this result: President, W. Caryl Ely; vice-president, Daniel S. Lamont; general manager, Burt Van Horn;

W. CARYL ELY.

BURT VAN HORN.

secretary and treasurer, Richard F. Rankine; directors, Charles H. Coster, T. De Witt Cuyler Daniel S. Lamont, Francis Lynde Stetson, William B. Rankine, W. Caryl Ely, Burt Van Horn, Henry M. Watson, Cornelius C. Cuyler, Robert L. Fryer, John N. Scatcherd, George Urban, jr., Daniel O'Day; executive committee, W. Caryl Ely, Daniel S. Lamont, Francis Lynde Stetson, Charles H. Coster, William B. Rankine, Burt Van Horn.

The financial strength of the new syndicate is apparent from a review of the names of some of the men. Charles H. Coster is of J. P. Morgan & Co., of New York. T. De Witt Cuyler comes from Philadelphia. Daniel S. Lamont was secretary of war under President Cleveland. Francis Lynde Stetson is vice-president of the Niagara Falls Power Co., and William B. Rankine is secretary of the same company. Cornelius C. Cuyler is of the firm of Cuyler, Morgan & Co., of New York. W. Caryl Ely is making a reputation as a great electric road financier, and is a man of wealth and ability; to him is given all credit for putting the big deal through successfully. Richard F. Rankine, who is secretary and treasurer of the company, is a brother of William B. Rankine. His assistant will be J. S. Beacher, who held a position under the old company.

The Niagara Falls & Suspension Bridge Railway Co. and the Whirlpool & Northern Railroad Co., of Niagara Falls, were reorganized under the new syndicate on March 27th. The directors elected were W. Caryl Ely, Charles H. Coster, T. De Witt Cuyler, Francis Lynde Stetson, William B. Rankine, Daniel S. Lamont, Burt Van Horn, Charles A. Sweet, Charles B. Hill, and Alexander J. Porter. The officers are: President, W. Caryl Ely; vice-president, William B. Rankine; general manager, Burt Van Horn; secretary and treasurer, Richard F. Rankine. An executive committee consisting of Messrs. Ely, W. B. Rankine, Van Horn, Coster and Lamont was appointed.

The company proposes to spend half a million in improvements during the coming summer and will make changes in the schedule and service wherever they will be for the advantage or convenience of passengers.

Mr. Ely was born at Middlefield, Otsego County, N. Y., on Feb. 25, 1856. He received his preliminary education at the Cooperstown Union School and other institutions, was graduated from Cornell University and then read law at East Worcester, where he was admitted to the bar in 1882. He served in the Board of Supervisors of Otsego County, and in 1883, 1884 and 1885 was elected to the Assembly.

In 1885 Mr. Ely removed to Niagara Falls, where he commenced a career in business and law which has been exceptionally brilliant. The firm of Ely, Dudley & Cohn has probably the most extensive practice of any law firm in Niagara County, but it is as a business man that he is best known in Buffalo.

Mr. Ely was one of the five original promoters of the original Niagara Falls Power Co., and it was largely due to his indomitable energy and business capacity that that concern was placed on the road to success. He was also the principal promoter of the Buffalo & Niagara Falls Railway Co., and carried that enterprise to a successful accomplishment. It was through his efforts that the sixteenth annual meeting of the A. S. R. A. was held at Niagara Falls, and all of those attending can bear witness to the successful manner in which the plan was carried out.

SOUTHWESTERN MEETING POSTPONED.

Because of the smallpox epidemic at Laredo, Tex., which would detain many members of the Southwestern Gas, Electric & Street Railway Association in quarantine and prevent them from attending the annual convention at Austin on April 19th to 21st, the meeting has been postponed for one month, and will be held May 17th, 18th, and 19th.

The members of this association are those who formerly constituted three separate associations interested in gas, electric lighting, and street railway enterprises, and have always taken the greatest interest in their work, so that a successful meeting is assured.

The following papers have been prepared for presentation at the convention. The list is a good one, both of subjects and of authors:

"The Item of Depreciation."—W. E. Hamilton, Shreveport, La.
"Meters."—W. E. Holmes, Austin, Tex.
"Transformers."—Harry L. Monroe, Dallas, Tex.
"The Amount and Extent of Legitimate Investment in Electric Lighting Plants of Certain Capacities."—F. Fries, San Antonio, Tex.
"Summer Amusements for Street Railway Companies."—T. H. Stewart, Waco, Tex.
"Art and Science of Selling Gas."—Thos. D. Miller, Dallas, Tex.
"A Model Plant Under Model Management; What Both Would Be Like."—J. F. Strickland, Waxahachie, Tex.
"Alternators."—E. Dysterud, Monterey, Mex.
"The Attitude of a Corporation to the Public."—W. R. Weiss, San Antonio, Tex.
"Means for Encouraging the Diversified Use of Electric Current."—C. L. Wakefield, Dallas, Tex.
"Electric Lighting and Application of Electricity to Various Purposes in Mexico."—By a Mexican Delegate.
"Arc Lamps."—May Levy, Galveston, Tex.
"Fare Boxes v. Conductors."—F. E. Scovill, Austin, Tex.
"Transfers."—(To be assigned.)
"Gas for Fuel."—(To be assigned.)

The Bellaire, Bridgeport & Martin's Ferry Street Ry., of Bridgeport, O., is now a part of the Wheeling (W. Va.) Railway Co.'s system.

The lower court has decided that the Rapid Railway Co., of Detroit, is possessed of a franchise to build across Hamtramck Township and dissolved the temporary injunction issued on the application of the township authorities.

The Mahoning Valley Ry. and the Trumbull Electric R. R., which connect Youngstown and Warren, O., have arranged so that the time between the two cities is to be 57 instead of 70 minutes.

Detroit and Municipal Ownership.

From Our Special Correspondent.

At last the great 10-year street railway controversy in this city is nearing its end. Only one more step is necessary to be taken and the municipality of Detroit will have acquired control of all the street car properties in this city on a basis perfectly satisfactory to the owners.

It only remains for the courts to say that Detroit has a right to give "municipal ownership" a trial and the final step will be taken.

Detroit has been a central figure in the street railway world for the past decade, but during the past two years little has been done or attemptted by the city officials, but Governor Pingree and his political supporters did not entirely abandon the idea of still making a great political issue out of the one topic that had carried them to offices and victory so many times.

So, almost a year ago Governor Pingree opened negotiations with Messrs. T. L. Johnson and R. T. Wilson, who controlled the various street railway properties of Detroit, relative to the same being transferred to a city commission and so operated. These negotiations were strictly private, and the citizens of Detroit, and its officials, are as yet in darkness as to what has been done.

Governor Pingree has stated, however, that he has an option from Mr. Johnson on the three street railway systems of this city.

When the Michigan Legislature met at Lansing in January Representative McLeod, from this city, who has been a conductor on the local street car lines for many years, introduced by title a bill designated as H. B. 1011, called "An act to authorize the city of Detroit to construct, acquire, maintain and operate street railways and to construct extensions thereof."

"Some labor crank movement," was about all the consideration this bill received at the start, and the friends of the governor never even intimated that they were in the least interested in what is now known as the McLeod bill.

A few days later came the McLeod bill in full and so little was thought of its importance or probable support that the local papers failed to even give mention of its introduction.

This McLeod bill, now destined to become noted in street railway circles over the entire world, is composed of a dozen short sections and in all contains about fifteen hundred words.

First, it provides that the city council of Detroit shall at any time during the next 20 years be empowered to appoint three persons to be known as the Detroit Street Railway Commission, the regular term of office of the commissioners being six years.

As the present mayor of Detroit is very much anti-Pingree, special provision was made that the first commission should be appointed by the council without the consent of the mayor; but all future commissions should be appointed by the mayor and only receive the approval of the council.

Under section five of the McLeod bill the commission is given immense authority to expend unlimited sums of money and incur unlimited liabilities without the approval of the city council or any direct representatives of the people. This section reads as follows:

"The said commission may in their discretion and upon such terms and conditions as they may deem advisable for the interests of said city acquire, by deed, lease or other satisfactory conveyance from the company or companies owning the same in said city, any street railway or railways existing at the time of the passage of this act and lying wholly within or partly within and partly without said city, operated by the same company or companies, together with the property, rights, privileges, etc., owned and used in connection with or pertaining to said railways, including right to routes belonging to such company or companies upon which a railway shall not be in operation, and may operate and maintain said street railways so acquired, for the carriage of passengers and freight for hire."

That section is really the McLeod bill, the incidental features providing that the liability of the obligations incurred by said commission shall only cover the street railway property so acquired and under no circumstances shall its bonds be considered a part of the indebtedness of the city. While the city treasurer shall be the custodian of the funds of the commission, under no circumstances shall the monies received become a part of the general funds of the city. The commission has full power to fix the rates of fare to be charged, the extreme limit to be six tickets for a quarter, with such transfers as they may designate. The only privileges given the mayor and the city council is that of examining the books of the commission once in three months.

GOV. HAZEN S. PINGREE.

ELLIOTT G. STEVENSON.

CARL E. SCHMIDT.

DETROIT STREET RAILWAY COMMISSION.

Any cause of action for personal injury shall be against the commission and not the city, and shall be started within one year of the alleged injury; written notice of the alleged injury must be given within 30 days thereafter.

The commission is positively prohibited from extending the life of any franchise of any of the existing street railway companies.

These are the salient features of the McLeod bill under which it is more than probable that Detroit will buy the property of four street railway companies and operate them for a few years at least.

Detroit citizens did not realize that the bill had any real support until about the middle of March, when the Pingree party in the Legislature began to have a good word to say about the bill. Governor Pingree even hinted one day that the bill would do no harm. Next it received commendatory notice from members who were with the street railway in most of their requests.

One morning the citizens of Detroit awoke to the fact that they were about to be plunged untold millions of dollars into debt without having a word to say on the subject; that if the plans of Governor Pingree were successful he would have control of the entire street railway system of Detroit and millions of dollars annually to expend in the building up of his political machine.

A special meeting of the city council was held and a request made that the bill be so amended that the commission, before making a final purchase, would have to submit the matter to a vote of the people. A mass meeting was called by the mayor and thousands attended to protest, asking that at least the council should have the final approval of any purchase contract and long protests were sent to the members of the Legislature.

Nevertheless, on March 23d the bill went through both branches of the Legislature and received the signature of the governor in the face of all protests.

With the passage of the McLeod bill leading members of the city council predicted that it would be years before sufficient votes could be secured to make the necessary appointments. A majority of the members of that body stated positively that under no circumstances would they vote to name the commissioners unless the act was so amended as to allow the council to give final approval to any purchase contemplated.

But the friends of Governor Pingree did not waste many days in getting down to business. The argument was made that the properties were now under option, so that it was important that immediate action should be taken. In the face of the opposition of the mayor and the president of the council, the Chamber of Commerce and the Merchants' and Manufacturers' Association, as well as of the leading property owners of Detroit, the council, by a vote of 21 to 11 on April 1st, named Hazen S. Pingree, Elliott G. Stevenson and Carl E. Schmidt as the members of the Detroit Street Railway Commission.

On April 3d the commissioners held their first meeting, elected Governor Pingree as president and notified Mr. T. L. Johnson, president of the various street railway companies, that they were ready to open negotiations as provided by the McLeod bill.

When the commission was four days old it selected experts to assist in arriving at the values of the profits it hoped to acquire. Prof. M. A. Bemis, of Kansas City, a student of political economy, will be consulted regarding the value of the various franchises held by the street railway companies. Prof. M. E. Cooley, of the University of Michigan, will appraise the value of the machinery and mechanical equipment, and Gilbert Wilkes, electrical engineer, of the overhead system. Mr. W. J. Spicer, ex-manager of the Grand Trunk Ry., will appraise the tracks of the companies. Local business men were chosen to fix the values of the real estate and buildings included in the street railway properties. All of these appraisers are under instructions to be prepared to make their final reports before May 1st.

In the meantime the street railway people are paving the way to simplify matters in making the proposed transfer. In the first place the Metropolitan Railway Co. has been organized for the purpose of consolidating all of the street car property in one company. Mr. S. B. Clarke, a New York attorney, representing the interests of Mr. R. T. Wilson, is here looking after this consolidation. Under date of April 5th the Metropolitan Railway Co. notified the Detroit Railway Commission that they were ready to negotiate, as follows:

"The Metropolitan Railway Co. have the honor to say that we are in a position to enter into negotiations with you and are willing to do so on the following basis:

"Provision to be made for the acquisition of the Metropolitan Co. of the properties of the Detroit Citizens' Street Railway Co., of Detroit, the Detroit Suburban Railway Co., the Detroit, Fort Wayne & Belle Isle Ry. and the Detroit Electric Ry.

"The Metropolitan Railway Co. is to issue a series of new bonds, the aggregate amount, character and security of which is to be agreed on.

"The city to acquire the properties from the Metropolitan Railway Co., subject to the new mortgage, on terms to be agreed on."

Experts are to have access to all of the books of the various companies, that the earning powers of the properties may be ascertained. This information is not to be made public unless the final purchase is consummated.

But this rapid progress in negotiating does not mean by any means that Detroit is "municipal ownership" mad. On the contrary, nine business out of ten are opposed to the proposed undertaking and every possible legal effort will be made to prevent the commission from carrying into effect any of the provisions of the McLeod bill.

The Good Government League, composed of the leading public-spirited men of Detroit, has raised by subscription $1,000 to employ legal talent and carry on the fight in the courts. The papers are already prepared for the starting of quo warranto proceedings within the next few days, and by this process it is calculated that the general constitutionality of the McLeod bill can be tested in the lower courts and also a foundation made by which the Supreme Court of the state will have to pass on the right of the Legislature to create a commission to form part of the municipal government without the local officials having the right to pass upon its acts.

Mr. J. G. Gates, a leading attorney and large property holder in Detroit, is one of the most active in endeavoring to prevent the proposed transfer of the street car properties to the city commission. "No municipal government can operate an institution of this kind as profitably as private individuals," he argues. "The power vested in the commission is too great to be placed in the hands of three men. Officers and employes would be selected, not for their efficiency, but for their political influence. I do not believe civil service would protect the efficient employes when it came near election time and aldermanic candidates had to look after the faithful in their wards."

"It would be the greatest mistake the city of Detroit ever made," was the concise statement of George H. Barbour, president of the Michigan Stove Co. "Today we have a street railway system equal to any city of the size in the world. What will it be after the politicians have made the appointments for a few years?"

Mr. Seligman Schloss, retired banker and for many years one of the managing directors in the Detroit, Fort Wayne & Belle Isle Street Ry., sees all kinds of trouble ahead in case municipal ownership is thrust upon the city. "Motormen who are political pets will not be noted for their sobriety and accidents will be frequent," was his prophesy before a party of bankers in discussing the matter. "The superintendents and bosses would have to hold a political pull and to exercise that they would have to give places to ward heelers. In 10 years the property would be a wreck."

Mr. George H. Russell, president of the American Bankers' Association and president of the States Savings Bank, of Detroit, one of the leading financial institutions of Michigan, is very positive in his opposition to the commisson buying or acquiring the street railway properties of this city. "It is against all public as well as business policy, and in the end will be an injury to the city," said the banker. "A commission cannot look after the welfare of its patrons like the manager for owners looking all the time after increasing the value of the property, and I trust it will not come about for the sake of Detroit."

The leading merchants of Detroit, like Mr. J. L. Hudson and Mr. W. H. Elliott, are aiding in the legal fight against the commission; the Chamber of Commerce, Merchants' and Manufacturers' Club and the leading newspapers are also on the anti-ownership side, so that if it is among the legal or argumentive possibilities, the final step in municipal ownership will not be taken in Detroit.

The street railway world will be interested in knowing what the street railway properties in Detroit consist of.

In the first place, there are 191 miles of track, nearly all of which has been relaid with girder grooved rails during the past five years. On some of the leading lines 90-lb. rails were used, steel ties underlaid with 14 in. of concrete and afterwards welded by electricity. The overhead equipment, with all the feed wires, at present price of copper, are said to be worth almost a million dollars.

Three power houses are owned by the street car companies of Detroit, one of 1,200 h. p., one 4,00 h. p. and one of 6,000 h. p., the machinery in which is estimated to have cost $800,000.

According to the tax rolls of Detroit, some twenty pieces of real estate are owned by the three companies, occupied by car barns, repair shops, abandoned horse car barns, power houses and a five-story office building. The valuation of this realty, with the building improvements thereon, will not fall much short of a million and a half.

According to the local street railway officials they have in service more than 700 motor cars and there are the thousand and one things necessary for the operation of a street railway system.

In the way of franchises, the first will expire in about six years and the franchise rights on two-thirds of the trackage has a life of 17 years, while the 60 odd miles of the Detroit Ry.—the 3-cent line—has 26 years yet to run.

Of course, the leading question here with all classes of people is, what will be the price of this property?

While Mr. Johnson and the street car people have not a word to

say on that subject, yet it is an undoubted fact that Governor Pingree knows, approximately, what the properties can be secured for, and from a source thoroughly reliable it can be stated that the figure is near $12,000,000. the same to be provided for by 30-year 4 per cent bonds.

A very important feature of the negotiations is the outstanding indebtedness—bonds—of the various companies, which is as follows:

Detroit Citizens' Street Ry. to New York Security & Trust Co., $7,000,000, due July 1st, 1905, interest rate 5 per cent.

Detroit, Fort Wayne & Belle Isle Ry. to New York Security & Trust Co., $1,200,000, due April 1, 1927, interest rate 6 per cent.

Detroit Electric Ry. to Cleveland Trust Co., $2,800,000, due July 1, 1916, interest rate 5 per cent.

An investigation in local financial circles indicates that at this time the market value of Detroit Eelectric Ry. bonds is 110; of the Detroit, Fort Wayne & Belle Isle 112, and of the Detroit Citizens' Street Railway 80 to 85. A large amount of the later bonds were never placed in the market and there are really none of them in commercial circles.

The stock of the three companies, aggregating something like $5,000,000, is all controlled by the Johnson-Wilson syndicate.

The handling of this vast amount of securities and stocks and turning the property they cover over to the commission, which has not one cent, is the part that the Metropolitan Railway Co. will play in the deal. This new company, organized for only $25,000, is able to command all of the enumerated stocks and bonds. Should the commission and the street railway owners come to terms, and provided the courts do not interfere, the Metropolitan Company will secure all of these outstanding obligations, issue a new series of bonds to the amount and at the rate of interest agreed upon, and then dispose of the Metropolitan stock to the commission. In case the commission failed to meet the interest charges on the liabilities of the Metropolitan Company, the ordinary foreclosure proceedings would naturally result.

This really tells of the progress made towards street car municipal ownership in Detroit. If the terms of sale can be agreed upon, which seems very possible, and should the courts not interefere by declaring the McLeod bill unconstitutional, it seems very possible that Detroit will try the experiment.

Members of the commission, in discussing some of their future plans, state positively that Mr. J. C. Hutchins will be retained in his present place of manager of all the properties, and also that Mr. A. B. du Pont, general superintendent, and other officials will be retained.

Something about the 10-year street car fight in Detroit may today be of general interest.

A decade ago Ifazen S. Pingree had never indulged in a political dream; had never aspired to an office nor did he care an iota about the operation of street railway systems. He had spent a quarter of a century in building up a shoe factory from the point where he was the only workman to a business now giving employment to 2,000 persons. Having always been a Republican, it was his yearly practice to give so much to the campaign fund at each election, but he took no interest in the naming of candidates. At that time the city of Detroit had been Democratic so long that it was almost impossible to secure a Republican candidate for mayor, and it was owing to the fact that Mr. Pingree had in the past been so liberal —also that he was out of the city at the time and unable to object to the scheme—that the Republican leaders nominated the shoe manufacturer.

It did not take Candidate Pingree long to get the political fever and he started in to putting up a campaign that continued night and day and resulted in his election.

At this time in politics street car matters were not considered and the then leading street railway owners of Detroit were among Pingree's warmest supporters. Before Mayor Pingree had occupied his official chair one year he became interested in street railway matters, but it was rapid transit that he started out to secure. Detroit had only one electric line, and during the few years to the present electrical system was constructed, probably not so much from the fighting carried on by the citizens as from the fact that the use of electricity was advancing so rapidly. Yet this has always played a prominent part in Pingree campaign literature. In the summer of '91 Mayor Pingree was looking after re-election, and it so happened that there was a big street car strike. The mayor lent his official assistance to the men, helped them secure their demands, and was rewarded with a re-election.

Starting on his second term Mayor Pingree began his bitter fight against all street car interests. The validity of certain franchises was attacked in the courts and in the legal battle that followed the city spent nearly $100,000 for attorneys and expenses. During this term 3-cent fares were first talked, and as the third campaign approached the question of lower fares first became a political issue. It was made a part of the platform and every aldermanic candidate in both parties talked in favor thereof.

This new council and the mayor endeavored to secure a compromise of seven tickets for a quarter from the new owners of the street railway system, the Johnson-Wilson syndicate. Unsuccessful in this, an opposition line was organized and a 3-cent franchise granted to Henry A. Everett, of Cleveland, Ohio, and Albert Pack, of Alfena, Mich.

When work on the new line started, Mayor Pingree got the governorship bee, but failed to secure the nomination. The 3-cent line was just completed in time to be a great benefit to the mayor in his fourth city campaign. The Detroit railway, to which he had pointed with so much pride as evidence of 3-cent prosperity, was amalgamated with the general electrical system, and before the fourth Pingree term was one year old the mayor had been promoted to the governorship.

Since that day the street car question has been but a pleasant dream of the past to the people of Detroit. The street car companies improved their property, and it was not until a month ago when the McLeod bill bobbed up in the Legislature, that the people knew that the old subject was to be resurrected.

What does Pingree want now? was the first question asked by the politicians.

"The second term for governor over and the political career of Pingree is ended," was the way they calculated. "He cannot be mayor again, but as president of the Street Railway Commission his power and patronage would be larger than that of mayor or governor, therefore he would continue to be a political power."

As to the other members of the commission. Elliott G. Stevenson is a young attorney with political ambitions; would like to represent in Congress the district in which the Street Railway Commission will employ 3,000 of the voters.

Carl E. Schmidt is a retired millionaire tanner, and has always been a warm supporter of Mayor Pingree. He will devote his entire time without recompense to the Detroit Street Railway Commission. Incidentally, it might be mentioned that Mr. Schmidt has had the mayoralty bee for a number of years, and is now being pushed for the Republican nomination of next fall.

Now the entire question is up to the courts, and there the business men of Detroit generally will exert their every influence and use every effort to have the McLeod bill declared null and void.

Mr. T. L. Johnson will not talk about municipal ownership, simply stating that he has street car properties to sell, and any opinions he might give would be misunderstood. Other officials of the Detroit street railway companies are equally non-committal.

Detroit, April 10, 1899.

THE M'LEOD BILL.

An act to authorize the city of Detroit to construct, acquire, maintain and operate street railways, and to construct extensions thereof.

The People of the State of Michigan enact:

Section 1. That the common council of the city of Detroit be and is hereby authorized and empowered to appoint by resolution at any time within the next 20 years, three persons, electors and freeholders of said city, who shall constitute a board of commissioners, to be known as the Detroit Street Railway Commission. One of said commissioners shall be appointed for the term of two years, one for a term of four years, and one for a term of six years. Their successors shall be persons of like qualifications, and shall be appointed by the common council on the nomination of the mayor of said city at the expiration of said term for the term of six years. Vacancies shall be filled by appointment by the mayor, and persons so appointed shall hold office for the unexpired term. All members of said commission shall hold their offices, respectively, until their successors are appointed and qualified. Any person otherwise eligi-

ble may be appointed as aforesaid, notwithstanding he may hold other office, excepting that of alderman.

Sec. 2. Said commissioners shall organize by the appointment of one of their number as president and one of their number as vice-president. They shall appoint a secretary, who shall keep a record of their proceedings. They shall fix his compensation and prescribe his duties.

Sec. 3. Before entering upon the duties of their office the said commissioners shall severally execute a bond to the city of Detroit, with one or more sureties, which shall be some responsible surety company or companies, in the penal sum of $250,000, and conditioned for the faithful performance of the duties of their office, which said bond shall be approved by the city comptroller and the corporation counsel of said city.

Sec. 4. The city treasurer shall be the treasurer of the moneys of said commission, and the same shall be credited to the said commission, and shall be disbursed by warrant drawn upon the controller of said city, signed by the president and countersigned by the secretary of said commission. Upon the presentation of such warrant it shall be the duty of the controller to draw his warrant upon the city treasurer for the amount and in favor of the person named in the warrant of the commission.

Sec. 5. The said commission may in their discretion and upon such terms and conditions as they may deem advisable for the interests of said city acquire, by deed, lease or other satisfactory conveyance from the company or companies owning the same to said city, any street railyway or railways existing at the time of the passage of this act and lying wholly within or partly within and partly without said city, operated by the same company or companies, together with the property, assets, rights, privileges, etc., owned and used in connection with or pertaining to said railways, including rights to routes belonging to such company or companies upon which a railway shall not be in operation, and may operate and maintain said street railways so acquired, for the carriage of passengers and freight for hire.

Sec. 6. Said commission may provide for the payment of rentals or other obligations and may provide for a sinking fund for the discharge of any liens upon any of the property acquired by them and may pledge the earnings and receipts of said railways for these purposes and may use the earnings in operating and maintaining the same, and may use any surplus of earnings in acquiring any bonds secured by lien upon the property so acquired, or may use such surplus in making needed extensions or betterments to said railways. Said commission shall have no power to incur any obligation on behalf of said city except such as shall be chargeable only upon the railways and property so acquired and the earnings and increments and extensions thereof.

Sec. 7. The said commission shall manage, maintain and operate any street railway so acquired or extended, and may purchase from the revenues thereof all lands, tracks, cars, motors, dynamos, machinery, equipment, tools and furniture necessary and useful therefor to be used in connection therewith, and may establish rates of fare for the carriage of passengers and freight, provided the rates of fare shall not exceed those now charged by the Detroit Citizens' Street Railway Co. In operating any railway so acquired, the commission may exercise such other general powers as are possessed or exercised by boards of directors of corporations organized under the laws of this state providing for incorporation of street railway companies.

Sec. 8. After acquiring any railway or railways pursuant to section five thereof, said commission shall have the power to enter into agreements with any street railway company having a line of street railway, for or in relation to the exchange of tickets and transfers, and for the carriage of passengers, use of tracks, or operation of cars, provided that such agreements shall not be inconsistent with or in violation of the terms of the conveyance or contract mentioned in section five thereof.

Sec. 9. The common council may examine the books, papers and accounts of said commission at any time, or cause the same to be done, and it shall be the duty of the city controller to make an examination of the books and vouchers of said commission every three months, and report the results of such examination to the common council. It shall be the duty of the commission to annually report to the common council, which report shall contain a complete and detailed statement of its receipts, and from what sources derived, and expenditures, and for what purposes made, and a detailed statement of the condition of the business and property under the management of said commission.

Sec. 10. Said commission may employ a director, and a manager, and such superintendents, attorneys, cashiers and other assistants and employes, and for such time and upon such terms and conditions and for such compensation as they may deem advisable. They may require security for the performance of the duties of any person so employed. They may make such rules and regulations relative to their meetings and proceedings, and for the government and conduct of their officers and employes, and for the regulation of the business as they may think best

Sec. 11. All causes of action relating to or arising out of the owning, operating or control of any street railway constructed or acquired by said commission shall be prosecuted by or against said commission by the name herein designated and said commission shall carry into effect, pay or discharge any order, decree or judgment, in any suit or proceeding to which it shall be a party, in like manner as if the same were prosecuted or defended by said city; provided, that no action for negligent injury arising out of the operation of said railways shall be maintained unless it be commenced within one year from the time when the injury was received, nor unless notice shall be given of such injury to the said commission, its secretary or attorney, of the time, place and circumstances of such injury and of the nature thereof.

Sec. 12. Nothing in this act shall be construed as granting any franchise to any of the existing street railway companies, or as extending the life of any existing franchise, or as implying any franchise rights in case of reversion of the property to the grantors or their successors; and said commission is hereby expressly prohibited from granting or extending the life of any franchise under any of the powers conferred upon it by this act.

This act is ordered to take immediate effect.

FENDERS IN CHICAGO.

Chicago, Apr. 1, 1899.

Editor "Review": Replying to your letter of March 21st, requesting information relative to the comparative number of accidents reported during the months of January and February, 1898 and 1899, will say that our records show a decrease of 60 per cent in collisions with pedestrians and 25 per cent in collisions with vehicles for January and February, 1899, against the same two months in last year. The statistics recently published in one of the daily papers were misleading inasmuch as this decrease was wholly attributed to the fact that certain companies in the city had in the interim equipped their cars with what is commonly known as "basket shaped fenders." The Chicago City Railway operated no cars during these two months in either year so equipped. The decrease in the number of accidents, therefore, must be attributed either to climatic conditions, more care on the part of pedestrians and drivers of vehicles or railway employes rather than to the use of mechanical safety devices. In January and February, 1898, a considerable snow fall was prevalent, while during the same months of 1899 the snow fall amounted to practically nothing. Experience has taught that accidents more than double in number when the ground is covered with snow and ice, and I would therefore attribute the decrease in accidents above stated to this condition more than to any other. From the fact that the "basket shaped fender" projects over three feet in front of the car, is it not reasonable to suppose that if our cars had been equipped with this style of fender a great many people might have been struck who were fortunate enough to avoid injury by being able to get out of the way of an approaching car simply by reason of the cars not being provided with extension fenders?

The nature of accidents varies so widely and operating conditions change so frequently it hardly seems reasonable that an intelligent comparison can be made and the results attributed to any particular cause. Yours truly,

G. O. NAGLE,
Superintendent Chicago City Ry.

Beginning with June 1st the Twin City Rapid Transit Co., Minneapolis, Minn., will increase the wages of conductors and motormen to the highest rate ever paid by the company. This will be 18 cents per hour. Good times and a prosperous year have induced this action.

Pleasure Resorts in 1899.

PARKS AND FREE ENTERTAINMENTS AS A MEANS OF STIMULATING STREET RAILWAY TRAFFIC.

By J. P. E. Clark, Manager, Binghamton Street Railroad Co., Binghamton, N.Y.

The question of whether pleasure resorts and special entertainments as a means of stimulating street railway traffic are profitable, is no longer asked, it having been decided in the affirmative by the street railroads of the many provincial cities who are studying to increase traffic as much as possible, and are not bothered by the problem that confronts a very few of the larger cities, whose great difficulty is to provide suitable and comfortable arrangements for the great number who desire to ride. The most difficult questions at the present time are:—How should the pleasure resorts be conducted? What style of entertainment should be furnished? and whether or not it is necessary to employ a practical man to take charge of the amusement department. My observations are the result of nine years' experience in catering to street railway patrons by means of public parks and special entertainments. In fact the company by whom I am employed—The Binghamton Railroad Co., Binghamton, N. Y.—is the pioneer in employing the means above mentioned for stimulating street railroad traffic.

It has been demonstrated beyond peradventure that the most essential and important feature in laying out and maintaining a pleasure resort as an adjunct of a street railway system is respectability. To attract large crowds and increase the popularity of the park, the presence in large numbers, of ladies and children is indispensable, therefore in establishing an out-door resort all features of an objectionable character should be eliminated, and only harmless and unobjectionable amusement and recreation provided. In selecting entertainments great care should be exercised to avoid engaging any act which approaches vulgarity, or is the least objectionable, as it is an easy matter to overthrow an entire season's hard work in establishing the reputation of a pleasure resort by a single week's performance.

PAVILIONS.

ROSS PARK, BINGHAMTON, N. Y.

It goes without saying that the character and style of entertainment to be furnished is governed entirely by the surroundings and environments of the resort at which the entertainment is to be presented. For instance, where the entertainment is presented out of doors upon a large platform erected for the purpose and the people, are not provided with regular seating facilities, what are known as "dumb acts" in the vaudeville profession can be presented in the most satisfactory manner. By "dumb acts" is meant those which appeal entirely to the eye, such as aerial, acrobatic, sensational novelties, Japanese, Arabs, and other acts of this description. In employing acts of this kind the performance can be witnessed by those scattered throughout the woods or upon the hill sides, as it is not necessary to be in close proximity to the stage.

Where the pleasure resort is provided with a pavilion or hall a performance of a more diversified character can be successfully arranged as singing and talking acts can be introduced, which interspersed with other features present a more varied and oft times more satisfying bill. But as heretofore stated, the program must be arranged with the greatest care, and the various acts selected with an idea of pleasing, and not affronting, either by dress, action, or word, the most fastidious.

The price to be paid by the railroad company or park management for the special entertainments provided, is governed entirely by the size of the city, the number of cars operated, facilities for reaching the pleasure resort, and whether or not an admission fee is charged, and upon circumstances in general. Our experience has taught us that a very pleasing and diversified program, running (including a ten-minute intermission) about two hours, can be provided for from $250 to $300 per week, but in order to arrange a satisfactory program, embracing seven or eight distinct acts and occupying the length of time above specified, and keep within the price mentioned, the person selecting or organizing the entertainment must necessarily be conversant with the business and know something about amusement matters. The amount to be expended for an entertainment is simply a question of good business judgment on the part of the person in charge.

Numerous combinations for park entertainments have been formed by the various vaudeville agents and amusement managers throughout the country. In many instances, where street railway managers are inexperienced in the amusement business and do not possess a general knowledge of the many hundred available vaudeville acts, the combination managers are perhaps their most reliable means of procuring a satisfactory park entertainment; but where the street railway manager is thoroughly posted and experienced, a cheaper and much more satisfactory program can be arranged by engaging the individual performers and making up his own program, thereby securing a much better and more diversified entertainment, and particularly adapted to the resort where it is presented. This, however, is an unsafe plan to attempt unless the party arranging the entertainment is competent to discern the good from the bad.

To make pleasure resorts profitable it is absolutely necessary to

make them attractive. A park or resort, even those possessing the greatest natural beauty and advantages, will soon drop into disfavor, and eventually out of sight, unless a carefully studied plan is devised for making them attractive, animated and respectable. There are innumerable features that can be added such as "carrousals," "scenic railways," "mazes," "bowling alleys," "shooting galleries," and many other smaller and less expensive features. The number and character of these special features should be governed entirely by the size of the city, location of the resort and general requirements. The fundamental principle in the operation and maintenance of any pleasure resort is to keep within bounds in the matter of expense, and to make the resort in itself self-sustaining (as far as possible) or even profitable.

The many pavilions and stands that must necessarily be provided for the sale of refreshments, popcorn, soft drinks, etc., can in themselves be made an attractive and special feature of any resort. This can best be accomplished by providing buildings of pretty and fancy designs, even though inexpensive, and employing attendants that are courteous, neat in appearance, and uniformed in keeping with the resort and its environments.

In a great many instances a portion of all the amusement and refreshment privileges can be sub-let to advantage, but this is always an unsafe policy unless an iron-clad contract is entered into whereby the virtual control, manner of conducting and operating of the several stands and places of amusement is in the hands of the railroad company, who, morally, has to stand sponsor for the resort, and its several features.

A tendency toward general improvement is always anticipated by the general public which is subserved by the respective resorts, therefore managers must be on the alert for new features, and where they are added it is always well to secure as much publicity of the improvement (even though it is slight) as possible. Keep your resort well before the people. Commence advertising early in the spring. Have your local newspapers mention the contemplated improvements; the number of people that visited the resort the season previous, and the immense popularity it attained. The saying that "Nothing succeeds like success" applies very closely to parks and pleasure resorts.

The question of whether admission should be charged or not is governed entirely by circumstances. Where the haul is short and a great many people can be quickly and easily transported and the park or resort is not provided with seating arrangements, it is in my opinion generally advantageous to make admission to the resort and the entertainment absolutely free, and particularly if you control and have charge of the various privileges, as oft times the extra revenue secured at the various stands from the largely increased crowd (due to the fact that no admission is charged) more than offsets the money that might be received from admission fees, to say nothing of the largely increased street railway receipts derived from a free entertainment.

THE CASINO, FROM THE RIVER.

Whether or not other than passengers should be admitted free is a proposition that is also largely governed by local conditions and circumstances. If you have numerous attractions and stands that you desire patronized it is not always well to drive people away therefrom because they did not pay 5 cents car fare. "A half a loaf is better than no bread" applies as well to street railway business as any other, and there is one fact that should never be lost sight of in conducting a park or pleasure resort, that is a crowd always follows a crowd. An immense concourse of people is the best single attraction you can have.

BALLOON RACE, CASINO.

The underlying and most important benefits to be considered in the establishing of a pleasure resort is how you can best and most effectively increase the street railway traffic, and if you control the various privileges, how you can secure the largest throng of people.

In a great many cases where arrangements will admit, a free admission to the park and a small charge for a seat proves a source of sufficient revenue to pay for the special attraction provided and this plan does not serve to drive patrons away from the resort itself. This, in my opinion, has proved the most satisfactory and advtantageous plan.

If possible, make special and careful arrangements for the care of excursions, picnic parties, conventions, etc. Provide free of expense, tables, dishes, cooking facilities and other necessary accommodations; these can be provided at a nominal expense, and while it requires care and attention to look after this department, it will, if properly conducted, yield the most satisfactory and gratifying returns.

Daily concerts—by either a band or orchestra—are the most potent, permanent attraction that can be secured. The most advantageous and economical way to arrange this feature is to hire the men outright for the season. Twelve musicians that can double in brass and orchestra make a convenient and adequate number for all ordinary purposes. They should be engaged with the understanding that they are to respond whenever and to whatever they are called upon to perform. In addition to the daily concerts they can be used for advertising, street parades, dancing, furnishing music for the entertainments, and in many other ways.

Fireworks make a cheap and standard attraction. The most economical and satisfactory way to arrange the display is to buy the material in bulk and educate someone in your employ to manufacture the set pieces and arrange and fire off the display. In this manner fully 50 per cent can be saved from the price charged for regularly prepared exhibitions.

A zoo is always an important attraction and almost indispensable feature of any park or resort. The more pretentious and complete it is the better it serves its purpose; but if unable to provide a very extensive affair of this kind, there is no excuse why the more com-

mon animals, such as bears, monkeys, birds, etc., should not be provided. They always prove a source of interest and enjoyment to all visitors, and particularly children. A proper place should be provided for caring for these animals, and their cages and surroundings should always be kept neat and clean.

Street railroads have unsurpassed facilities for advertising their summer resorts and special entertainments, and this is a branch of

ADVERTISING IN BINGHAMTON, N. Y.

the business that requires careful attention. A free entertainment properly advertised cannot fail to attract a crowd. The most effective of the many means offered is a car covered with immense banners with the band inside. This perambulator can be put out for two or three hours in the mornings so as not to interfere with the regular duties of the musicians. This advertising medium never fails to attract universal attention.

Pleasure resorts should always be located near a body of water if possible. Nothing adds more to the beauty and pleasure of an out-door resort than a pretty lake or river, offering many additional attractions, such as boating, bathing, and innumerable entertainments that cannot be arranged or provided without water facilities.

Under no circumstances should liquor be sold at parks or pleasure resorts operated in conjunction with street railways. The liquor traffic should be kept entirely aloof and apart from resorts of this kind, primarily for the reason that no park or pleasure resort can succeed without the unrestricted patronage of ladies and children, or without the good moral endorsement of the community, wherein it is located, neither of which can be attained when liquor is sold. A resort where liquor is dispensed must be established and arranged upon an entirely different basis, and cater to an entirely different element.

Keep your resort clean, wholesome, attractive and respectable! Select your entertainments with care and good judgment! Keep within bounds as to expense, or in other words "Cut your garment according to the cloth;" by so doing, and keeping a close watch upon the turn of affairs, I state emphatically and unreservedly that a pleasure resort operated in conjunction with a street railway will prove a profitable investment and a benefit to its projector, and the public at large of the community in which it is located.

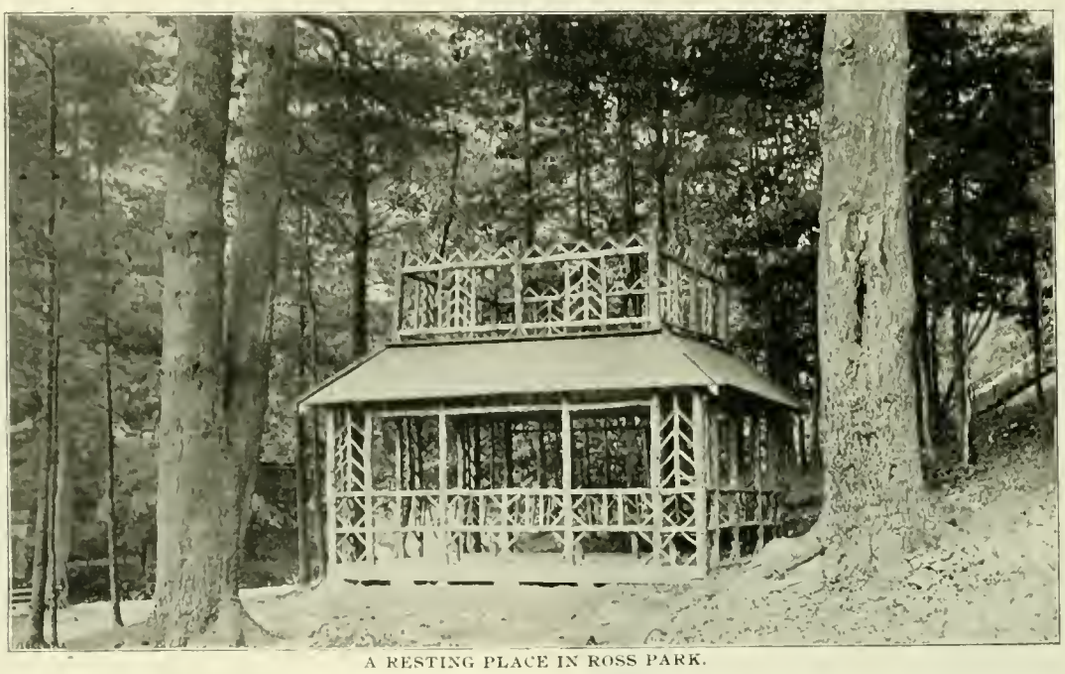
BINGHAMTON, N. Y.

The Binghamton Street Railroad Co. will open Ross Park and the Casino grounds on Decoration Day. At the Casino more electric lights will be placed about the grounds giving brilliant illumination. The band concerts beginning June 1 will be a regular feature, as it was last year. Athletic sports will receive more encouragement; the track, base ball field, tennis courts and golf links will be kept in fine condition. The cafe in the Casino will be enlarged and first-class meals served at all times.

Ross Park last year was a Mecca for excursion parties from many cities in New York and Pennsylvania. From Decoration Day until the season closed, October 1st, hardly a day passed without an excursion of some kind coming to the city to enjoy the beauties of the park. The seating facilities in front of the platform, where the entertainments are given are not sufficient, and it is intended to make a natural grand stand on the hill facing the dancing hall. Rustic seats will be arranged on the shaded hill side for the comfort of the spectators.

ALLENTOWN, PA.

The Allentown & Lehigh Valley Traction Co. operates its own park and does not rent any part of it. No admission is charged to passengers or others, but bicyclists must leave their wheels outside the park at the check rooms. The theater has six dressing rooms and a stage, the entire front of which is simply an open shell with a roof covering almost to the front of the stage. The dressing rooms are in the rear, and of course entirely closed. The performances are given in the open air entirely, no building or enclosure being necessary. The ground lies naturally in an upward slope, upon which are built benches giving capacity for about three thousand persons. A charge of 10 cents is made for 450 reserved seats directly in front of the stage. The theatrical attractions this year will be on the variety order, such as vaudeville, specialties and minstrel shows, these being very much the same as they have been during the past five years.



A RESTING PLACE IN ROSS PARK.

Mr. A. F. Walter, secretary and treasurer of the company, says:

"Our experience with these attractions has been satisfactory, considering the fact that they seem to have become incident and necessary to street railway operations. We believe that picnics and conventions are more profitable, however, than theatrical attractions, if they can be got, the experience we have had in this line leading us to believe this. We expect to make an extraordinary effort during the coming season to get more picnics and conventions than during the past two or three years. Our company owns an elephant which has not been at the park for the past few years, but which we expect to place there again this year. This is a great attraction for young children. We also have quite a number of animal cages and in some of these we expect to have a few animals. One or two cages at least will contain 12 or 15 monkeys. The monkey cage at our park has always proved to be a center of attraction."

AT A BAND CONCERT—WILLOW GROVE PARK.

PHILADELPHIA.

In Willow Grove Park, Philadelphia has the most highly improved street railway resort in the country, upon which $500,000 has been spent by the Union Traction Company. It lies in the beautiful Chelden Hills about 13 miles from the center of the city and includes three large groves which easily shelter 25,000 pleasure seekers. Thousands of trees, flowers, tropical plants and shrubbery of every variety have been planted in the park. The company has built a scenic railway which is said to be the longest in the country, a carrousel, a Moorish maze, a bicycle swing, shoot the-chutes, a theatre, a fine casino and the artistic music pavilion shown in the illustration. Each season one of the finest bands in the country is engaged together with choruses and special artists to furnish high class music. This season Damrosch and his New York Symphony orchestra and Band Rosa of 55 pieces will render musical programs.

The electric fountain was constructed at a cost of $100,000 and surpasses even the famous electric fountain at the World's Fair. It measures 44 ft. across the base, has two basins, one 5 ft. and the other 8 ft. above the lake. It contains 38 nozzles, varying from ⅝ to 1½ in. in diameter, and 867 ⅛ and ¼-in. jets emitting in all 1,500 gallons of water per minute, and arranged to throw vertical and inclined columns and sprays in large and small circles, by which a large number of beautiful combinations can be made and these are especially impressive when illuminated by powerful electric lights. The operation of the fountain is conducted from a room on shore which is connected with another directly beneath the fountain by a tunnel, two men only being required for the work. The lake in which the fountain is situated covers an area of 10 acres and affords fine boating facilities.

WATCHING A BICYCLE RACE—WILLOW GROVE PARK.

The Willow Grove park bicycle track and athletic field have a national reputation and large athletic meets and contests are often held here. An electric theater with phonographs and kinetoscope entertainments is a great attraction. There was one huge weeping willow tree in the park which was decorated in a most unique manner by hanging 250 incandescent lamps in its branches. The crowds at the park are often very large, numbering at times as high as 50,000, and it is natural that there would be some petty accidents and sudden sickness. To provide for such emergencies there is a doctor at the superintendent's lodge who can be reached by telephone from any part of the grounds.

ELECTRIC FOUNTAIN, WILLOW GROVE PARK.

No intoxicating liquor is sold and its use is absolutely prohibited on the grounds. A detachment of 25 policemen keep perfect order, as it is the object of the company to cater to the best class of people. Special effort is made to secure the annual picnics and gatherings of churches, Sunday schools and societies, and last season over 500 church organizations held their picnics in the park.

LYNCHBURG, VA.

The Lynchburg & Rivermost Street Railway Co. is developing and improving Rivermost Park, which is an undulating tract of 30 acres of primeval forest growth upon an elevated plateau with a magnificent view of the Blue Ridge Mountains 20 miles distant. The natural beauty of the park has been enhanced by laying out walks and lawns and planting trees and shrubbery in suitable places. The company owns the park and rents the amusement and refreshment concessions. Admission to the park is free to all, including bicyclists, but it is divided into two sections, one for white and the other for colored people, and no passage is allowed between them. There are two pavilions, one for each section, and the automoatic swings owned by the company can be used by all visitors. A switchback railway is owned and operated by a private party, who charges 5 cents a ride, and sells eight tickets for 25 cents. The privilege of giving theatrical performances is leased for the season. Picnic parties are encouraged, and there is a large patronage from the same.

H. P. Woodson, president of the company, states: "An extension is being built which will put our cars into City Park, owned by the municipality. It is undergoing improvement under the hand of an experienced florist and park superintendent and it is now one of the prettiest in this section of the state. The city has given permission to the company to erect a neat and attractive pavilion in the heart of the park, and we expect by May 1st to have our cars running into the park. As soon as the extension is completed we will have a park at each end of the road, and the route between them lies through the heart of the city and over an elevated route beyond to the terminus at Rivermost Park. This route is perhaps the most picturesque in the state, with a magnificent view of the Blue Ridge Mountains, and the short spurs reaching within 10 miles of the city. In warm weather a delightful breeze sets in about 7 oclock in the evening and lasts until midnight, making trolley rides most delightful. Concerts, musicales and other entertainments will be provided at Rivermost Park during the season from 8 to 10:30 p. m. The distance from park to park is about four miles and the fare is 5 cents."

TOLEDO, O.

The Toledo Traction Co. manages its own park but rents such concessions as selling popcorn, peanuts, confectionary and operating the merry-go-round and scenic railway. There are two theatrical performances daily, usually high class vaudeville, and band concerts afternoon and evening. The electric fountain and the zoological garden are great attractions, as is also the boating. Picnics and conventions are sought after and prove profitable. The round trip to the park costs 15 cents, including the admission, for which others than passengers are charged 10 cents. Bicycles are checked free on payment of admission.

DAVENPORT, ROCK ISLAND AND MOLINE.

The park about Black Hawk's Watch Tower, maintained by the Tri-City Railway Co. is one of the most attractive in the Central States. The famous Black Hawk Inn, overlooking the Rock River valley and the beautiful scenery thereabouts, have been described and illustrated in previous issues of the "Review." Besides the natural attractions many facilities for entertainment have been provided by the railway company such as bowling alleys, dancing pavilion, rifle range, museum, carrousal, merry-go-rounds, swings and electric fountain. The theater is a neat little outdoor play house, the stage, wings and property rooms absorbing the whole structure, and the audience occupies seats arranged up the hill. Vaudeville, comic opera and dramatic entertainments are given. Nearby, balloon ascensions are made and trapeze and slack-wire acts amuse the crowds.

THE CHUTES FROM THEIR HEAD WATCH TOWER.

The chutes are a never-failing attraction, being the most popular feature of the park. The toboggans are built like boats and slide

down a greased track several hundred feet long and at the foot rush splashing into the river. At the bottom of the chute the speed approaches a mile a minute and yet there is perfect safety, for no accident has occurred to the thousands who have enjoyed the sport. All the concessions are rented to one party. Admission is free to all, but bicycle riders must leave their wheels in the check room and pay 10 cents for their keeping. All buildings and improvements were carried out by the railway company.

BALTIMORE, MD.

The Baltimore Consolidated Railway Co. owns and operates Gwynn Oak Park, which is located seven miles northwest of the city at Gwynn Falls. It covers 76 acres, wooded with ancient and stately oaks. Sunday schools, church parties and all kinds of pic-

BAND STAND, GWYNN OAK PARK, BALTIMORE.

nics are especially solicited and tables and benches are placed through the woods for their convenience. No intoxicating liquors are allowed on the grounds, and the best police regulations are observed. The restaurant, dining pavilion, and the other buildings clustered about them are entirely new and of ample size for the shelter of the largest multitude in case of storms. The dancing pavilion, the interior of which is shown, is the largest and finest in the state. A string orchestra will furnish music from 10 a. m. to 11 p. m., and sacred concerts will be given on Sunday. There are tennis courts and base ball grounds for athletic games, also the lake with bath houses give opportunity for boating and bathing. The merry-go-round, photograph and shooting galleries furnish much amusement. Ballon ascensions, rope walking, high diving, music, specialties, circuses, etc., are free to the patrons of the park.

GRAND RAPIDS, MICH.

The Consolidated Street Railway Co., of Grand Rapids, rents the park privileges such as the restaurant, ice cream, soda water, cigars, peanuts, popcorn, fruit, candy, etc., but retains supervision over all. It is the purpose of the management to fill the grounds, 16 acres, with merry-go-rounds, switchbacks, gypsy camps and like attractions which are respectable. Near the park is a fine bathing beach. Two large steamers make the round of Reed's Lake all day and are liberally patronized. Picnics and conventions are desired, and if they cannot be located at the resort the company assists in getting them to the city. Admission is free to all, including bicyclists. A check room is provided, which may be used at a charge of 5 cents.

In reference to the management of the park Pres. G. S. Johnson says: "We devote a good deal of time and much attention to our summer resort, because we find the better it is conducted the larger the traffic is, and the better the class of entertainments given, the more popular it becomes. Each year we have been enlarging the scope of the entertainments. This year there will be a variety of entertainments and attractions, and they will all be high grade. We confine ourselves to no special features, and embody in our programs everything which promises to draw. For instance, we have Barlow Brothers' Minstrels and comic opera troupes of from 18 to 25 singers. We have various troupes of trained animals, wild and domestic, also some of the very best grade of vaudeville attractions, gymnastic and athletic performances. In fact, the range of the attractions extends over nearly the whole field of amusements. Of course we endeavor to limit the expenditures so that they will not exceed the receipts to any great extent.

"The admission to the pavilion, which will easily accommodate from six to seven thousand people, is free, and the arrangement of the building is such that the stage performances can be seen from and part of it. We have about six hundred reserve seats, for which we charge 10 cents each for every performance. This affords those who desire to be absolutely comfortable during the whole performance the opportunity to be so, and yet it does not prevent those who do not care for the seats from seeing what is going on. We find this arrangement very satisfactory, and the seats sell readily for the better class of performances. For the poorest or medium grades, they do not sell so rapidly. We find this reserve seat arrangement a considerable help financially, as the money so gathered goes some way toward paying the salaries of the performers.

"We have a band, which is a fixed feature of the place, a contract being made with them for an engagement from the begining to the close of the season. This band is made up from 15 to 20 pieces, and is so arranged that it can be converted from an orchestra to a brass band or vice versa, as occasion requires. If we find we have a stage performance which is not up to the standard, we strengthen it and fill up what is lacking with the band, it, at such times, giving concerts, which are attractive to people in this vicinity."

ELGIN, ILL.

The Elgin City, Carpentersville & Aurora Railway Co. is favorably situated with reference to parks, for there are a number along its lines which it does not have to maintain. The city of Elgin owns a fine park of 80 acres, with two lakes for boating, and a zoological garden, including bear pits, deer, foxes and other wild animals. This is at the terminus of one of the company's lines. An electric fountain is operated by the company and weekly concerts are given by the Elgin band. Besides this one, Front Park is on the Dundee

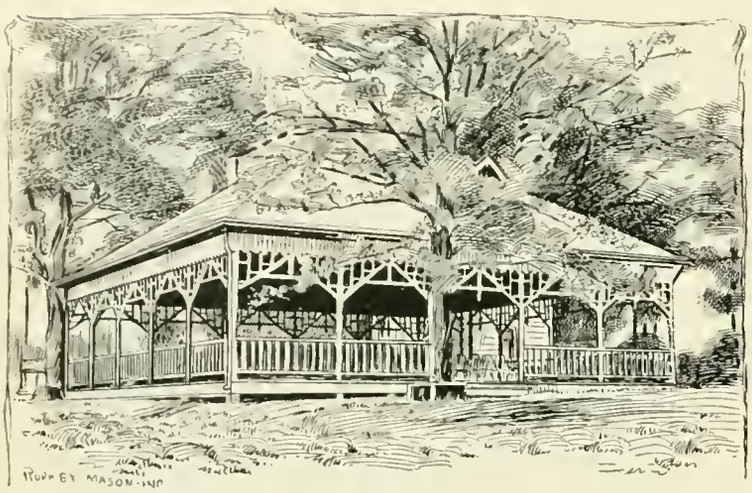
DANCING PAVILION, GWYNN OAK PARK, BALTIMORE.

line, Five Islands Park on the Geneva line and connection is made with St. Charles Park.

INDIANAPOLIS, IND.

Fairview Park, owned by the Citizens' Street Railroad Co., of Indianapolis, is a tract of 260 acres beautifully situated on an elevation overlooking the White River valley. The refreshment building shown in the illustration was built by the company. The concessions for the refreshments, pony track, bowling alleys, merry-

go-round, boating, photograph and shooting galleries are all let. Band concerts are given through the summer. Admission to the park is free to all. The "Open Air Mission" is a charitable work encouraged by the company. The poor and sick children in the city are conveyed to the park each morning through the summer



FAIRVIEW PARK, INDIANAPOLIS.

on a special car, leaving the city at 8 a. m. and returning in the evening.

CLEVELAND, O.

The last four views are of the Avon Beach Park of the Lorain & Cleveland Railway Co. The station at the park is a large brick building sufficient to accommodate big crowds. The pavilion is a commodious and well lighted frame building. The bathing beach and pulpit in the woods constitute the other views.

ATCHINSON, KAN.

The Atchinson Railway, Light & Power Co. manages its own park and rents only the refreshment privileges. A charge of 10 cents is made to those who are not passengers and bicyclists are not encouraged. A base ball diamond is enclosed within the park and the usual admission is charged to the ball games. There are also boating facilities. A summer theater has been built with stage and scenery and a seating capacity of 600. The floor is used for dancing purposes a portion of the time. One or two good opera companies have been engaged for one week each, but these have proved unprofitable, heretofore. A first-class orchestra will furnish music for this summer. It has been found that picnic parties draw the greatest numbers to the park at least expense to the company. As economically as the park can be managed, it has been found that it cost 42 per cent of all fares collected for expenses, including attractions.

HOT SPRINGS, ARK.

The Hot Springs Street Railroad Co. owns and manages its own park, renting only the refreshment stands. It is equipped for all kinds of athletic and aquatic sports, there being facilities for boating, fishing, bathing, baptizing; there are base ball and foot ball grounds, bicycle track, bowling alleys and a ring for boxing contests. There are dancing floors and a merry-go-round, and in fact opportunity for all kinds of amusements in season. Minstrel and vaudeville entertainments are given in the theater and pyrotechnic displays always draw large crowds. The company solicits and gets many school picnics and conventions. Gen. Mgr. C. G. Convers states that the results last year were good, for the park is operated to stimulate travel, but care is exercised to keep expenses down to a reasonable figure.

HARRISBURG, PA.

There was recently a conference at Harrisburg, Pa., attended by managers of electric railway companies of Altoona, Allentown, Reading, Williamsport, Lancaster, York and Carlisle for the purpose of forming a circuit to arrange with theatrical managers for the park entertainments. By this means lower rates can be secured, each attraction will stay one week at each park and a better class of entertainments can be secured.

The Bay City (Mich.) council has requested the street railway companies to employ only residents.

AVON BEACH PARK—LORAIN & CLEVELAND RAILWAY CO.

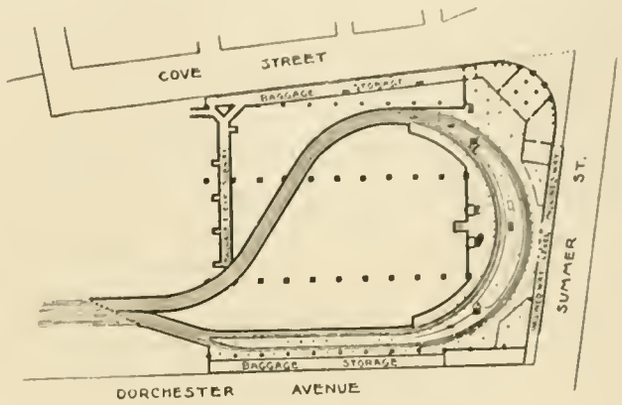
SOUTHERN TERMINAL STATION, BOSTON.

The Southern Terminal Station in Boston, which was opened to traffic January 1, 1899, is the largest terminal passenger station ever built and it is of interest to electric railway men because of the arrangements made by the steam railroads for competing with electric street railways by adopting electricity as the motive power on suburban lines. A union station for handling the traffic of the Boston & Albany, the New England, the Boston & Providence, and the New York, New Haven & Hartford Railroads, was strongly advocated by Mayor Josiah Quincy at the commencement of his first term in 1896. When he broached the plan to the officials of the railroads interested they readily acquiesced and on June 9, 1896, a bill chartering the Boston Terminal Company, and providing for the erection of a union station, was approved by the governor. The four railroad companies mentioned constitute the Boston Terminal Company, and they handle approximately 25,000,000 passengers per annum, this number being about one half the total for Boston. The population within 50 miles of Boston is 2,302,000, which is greater than that within the same distance of any other American city save New York.

The main building extends 792 ft. along Atlantic avenue, and 672 ft. along Summer street; the central curved portion is 228 ft. long. As seen from Federal street the central station is a five-story building; the first story is used for station purposes and the others for offices, conductors' and trainmen's rooms and the offices of the Boston Terminal Company occupy the second floor, the Boston & Albany the third, and the New York, New Haven & Hartford the fourth and fifth floors.

The five-story building has a total frontage of 875 ft., and on Summer street, Atlantic avenue and Dorchester avenue are two-story buildings 234 ft., 356 ft. and 725 ft. long, respectively, making the total frontage on the three sides 2,190 ft.

the station at one side of the steam tracks and at a grade about 17 ft. beneath them, and, as they enter, they spread, so that there is a large platform between the tracks. This central platform lies immediately below the midway on the main floor, and is connected with it and the main waiting room by stairs. It is designed to be the loading



PLAN OF SUBURBAN TERMINAL.

platform, and is the right platform for all trains. The unloading is designed to be done on the outside platforms. The total platform area on this floor is large enough to allow the assembling of about 25,000 people at one time. It is to be raised about 4 ft. above the tracks, so that the height of the stairway is to be 13 ft., while there is an 8-ft. rise in passing to Summer street by the inclined way, which will have a gradient of not more than 6 ft. in 100. So long as only one of the two loop tracks is needed, therefore, all climbing

NEW SOUTHERN TERMINAL STATION, BOSTON.

The new and important features of this station are the separation of the local and through traffic, the arrangement of these two classes on different floors, the use of loops instead of stubs for the local traffic, and the use of some other motive power than steam for the local traffic.

The trainshed is 570 ft. wide by 602 ft. long, with 28 tracks; including the headhouse the area covered is 13 acres. The tracks are 5 ft. above the street level and are reached without steps, the approaches being inclined grades of 3 and 5 per cent. The suburban traffic is to be handled on a lower level. Two loops were deemed equivalent to the 28 stub tracks in the main shed. The loops enter of stairs will be avoided. The radius of the outer track is 262 ft., and the inner, 242 ft.

This station was built with the idea of eventually substituting some other motive power for steam in handling the local traffic. While the Terminal Company does not state that electricity has been decided upon, it admits that it is at present the most probable.

The Atlanta Consolidated Railway Co. has just put in service a very handsome car which was built in the company's shops. Six other cars similar to this one are near completion and 20 more are under headway.

OPERATING EXPENSES OF CONNECTICUT ROADS IN 1898.

The Railroad Commissioners of Connecticut, in their annual report for 1898, give street railway statistics for nine months only, that is, from October 1, 1897, to June 30, 1898. This change in the fiscal year was made in order to make the fiscal year for the street railways the same as for the steam roads. The fact that the returns given do not include the months of July, August and September, when traffic is heaviest, renders the figures less valuable for the purpose of making comparisons with previous years.

There are now 31 street railways reporting to the Commissioners, two new ones having been added during the period covered by the report. One of these is the Manufacturers' Railroad Company, of New Haven, which has 1.36 miles of track and handles freight cars only.

The increase in mileage was 25.71 miles; of this 25.00 miles was increase of main track. The total trackage June 30, 1898, was 411.41 miles, including 24.40 miles of sidings.

The total capital stock issued was $10,451,000, an increase of $680,600; the stock per mile, excluding sidings, is $27,004.50. The bonds aggregate $10,022,800, an increase of $930,000; the bonded indebtedness per mile is $25,897.97. The floating indebtedness is $758,828.04, a decrease of $312,593; per mile it is $1,960.74.

The total cost of construction was reported as $17,519,534, or $42,584.53 per mile, excluding sidings; and the total cost of equipment as $2,286,706.56, or $5,908.63 per mile. These figures are stated to be only approximate, and to include the cost of electric lighting plants in a number of instances.

For the nine months the gross earnings were $2,018,985.98, being $5,253.55 per mile operated, $.1945 per car-mile run, and $.0514 per passenger carried. Operating expenses were $1,312,561.37, being 65 per cent of the gross earnings, $3,391.53 per mile operated, $.1271 per car-mile run, and $.0334 per passenger carried.

Dividends were declared by 10 operating companies of $180,276.40 on $3,777,500 of capital stock.

Taxes to the amount of $161,164.36, which is about 8 per cent of the gross earnings and 22.7 per cent of the net earnings, were paid. Of this, $133.053 went to the state.

The car-miles run in the state (three small roads not reporting) were $10,323,464. The passengers carried were 39,272,306, being 3.8 per car-mile.

The number of employes is 1,978, or about five persons per mile of road.

In the nine months 138 persons were injured, of whom 10 were killed

Data as to equipment and itemized statements of expenses in cents per car-mile are given below for the roads which gave the necessary data in their reports. Track is measured as single track, exclusive of switches and sidings.

The Manufacturers' Railroad Company, of New Haven, owns one 30-ton electric locomotive and 1.364 miles of track, hauling freight cars only; its gross receipts were $4,106.56; operating expenses, $2,780.38.

BRIDGEPORT TRACTION COMPANY.

Track, 52.60 miles; closed cars, 53; open cars, 51; equipped with motors, 66; cars equipped with fenders, 65; snow plows, 7; car-miles run, 1,454,638; passengers, 4,108,260; passengers per car-mile, 2.824; round trips, 220,680; employes, 200; fare, 5, 10 and 15 cents; operating expenses, 51.6 per cent of earnings.

ST. LOUIS WORLD'S FAIR.

It is proposed to hold a World's Fair in St. Louis in 1903 to celebrate the Louisiana Purchase Centennial, and arrangements are progressing for the organization of a stock company with a capital of $5,000,000; the city of St. Louis proposes to raise $5,000,000 on an issue of bonds and the National Government will be asked for a loan of $5,000,000 and the state of Missouri for a loan of $2,500,000 more.

The electrical industries are taking an active part in the enterprise, and at a recent meeting of their representatives in St. Louis E. J. Spencer, 24 Laclede Building, of the Safety Insulated Wire & Cable Co., was appointed chairman of the committee to solicit subscriptions to the stock of the exposition company. This stock of a par value of $10 per share is offered for popular subscriptions; the first payment of subscriptions to stock is to be 5 per cent; no subsequent call for payment on stock is to exceed 20 per cent of the amount subscribed; and no two calls are to be made in any single period of six months. All subscriptions are conditioned on the aggregate of at least $5,000,000; and except for the first payment of 5 per cent, or such portion thereof as may be necessary for preliminary expenses, no further calls on subscribers will be made until the aggregate subscriptions are at least $5,000,000.

NO COMPETING LINES AT QUINCY, ILL.

Last fall the city council of Quincy, Ill., granted a franchise to the J. C. Hubinger Co., of Keokuk, Ia., to construct a street railway system in that city. The Quincy Horse Railway & Carrying Co. secured a temporary injunction, and recently the United States Circuit Court has made the injunction perpetual. The judge held that the present company has an exslusive right to the streets of Quincy, and no one can interfere with these rights until after the expiration of the 50-year franchise granted by the Legislature, and that has still 15 years to run.

STEEL IN CAR REPAIRING.

BY W. H. GLENN.

The majority of the street railways of this country which have been electrically equipped, bought their original rolling stock for this equipment some six or seven years ago; consequently, most of them find just now that their cars and motors must either be repaired or renewed. And just which one of these to do is a question that is today puzzling many a manager. If he buys new cars, they must, of course, be charged to expense accounts, because they take the place of worn-out ones. This would run his operating expenses up in an alarming manner.

On the other hand, while it would not cost so much to repair the old cars, yet he would not get the service from them that he would get from the new ones. Naturally, then, he is loath to repair. But if he could hit on some scheme by which he could repair his old cars, and get from them one-half the service that he could from new ones, and at a cost of only one-fifth, or, at most, one-fourth, of the cost of the new ones, then the problem would to some extent be solved.

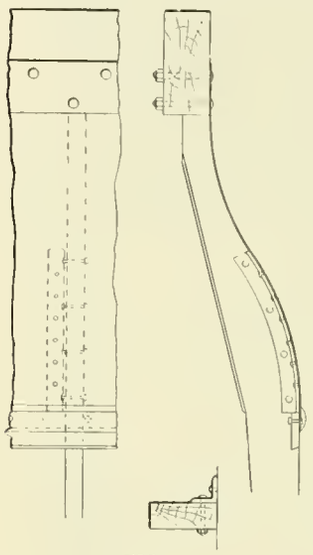

FIG. 1.

The introduction of steel into building construction, and its universal approval and adoption by the most expert architects and builders, has for some time past had the manufacturers of street cars experimenting along this same line, with a view to lightening and at the same time strengthening their cars; but so far as the writer's knowledge goes, it has not been adopted to any extent. The managers, in many instances, discouraged the use of steel, stating in proof of their position that it would be too likely to short circuit the current and cause no end of trouble. There was a time when there might have been some virtue in this idea; but the almost absolute control under which the current has lately been brought, due to more perfect methods of insulation, has rendered the use of steel available for street car purposes, especially in repair work. No one will deny that the tensile strength of a given weight of steel is much greater than that of the same weight of wood; and its durability is, of course, beyond question. Then, too, smaller cross sections can be used, retaining the same strength. This is a very important item, as will be explained later. There are many places, however, where it is impossible to use steel.

Let us take an ordinary box car which has been running for seven or eight years, and has the side sills and framing all decayed and the panels all stove in; it presents a very dilapidated appearance and it hardly seems worth while to attempt to repair it. By close examination we find that most of the timbers above the lower rail of the windows are in fair shape, with the exception of the roof. We must confine our repairs, then, to the lower portion of the car, for if the corner posts and window posts are held securely, the upper portion of the car will give little trouble.

The first thing, then, is to take the old framing from the bottom of the car and make a new one. If all the corners of the framing are lined with ⅛ or 3-16 steel for about 18 in. on each side of the corner, it will very materially strengthen the framing. This done, any corner or window posts that have decayed or been broken must be replaced, and the car is ready to be let down on the framing. When this has been completed the panels are ready to be put on. This is where the most important substitution of steel for wood comes in. Instead of using two pieces of poplar and bending them, one for the convex panel and one for the concave, we will take a solid sheet of steel as long as the car, about .135 in. thick and wide enough to make both panels, which is ordinarily 36 in. This sheet is bent to conform to the curve of the window posts; that is, the upper portion is convex and the lower concave. This process of bending will be found to be somewhat difficult at first, but if forms are made over

which the sheet can be bent it will soon be an easy matter. By all means bend the sheet before it is bolted to the car. Some may advise drilling it and letting each bolt, as it is put in, draw the sheet to conform to the proper curve, but sheets thus applied are always under stress and will very soon buckle.

We now take a piece of 1½-in. angle iron about 16 in. long and bend it also to conform to the upper curve of the window post (see Fig. 1). Placing the upper end of this angle iron about on a line with the lower edge of the window rail, we bolt one leg to the window post, using a ⅜-in. carriage bolt; the other leg is bored for ⅜-in. rivets. The sheet is bored so as to be riveted to this leg. It is countersunk on the outside, so that when the rivets are put through, with the heads on the inside (see Fig. 1), and the riveting done, with a little filing this sheet will be left perfectly smooth and ready for the painter. Of course these sheets could be bolted directly to the window posts, but these posts varying in thickness up and down would require a different length bolt for each hole. Then, too, the panel, all covered with bolt heads, would not present so neat an appearance. When the side panels are up, the end panels (that is, the ones on either side of the door) must be cut and put on. This is an easy matter, as there is no bending to be done. Where this end panel meets the side panel on the corner post, it would, of course, look rough; but we take a piece of 1½-in. angle iron, bend it to conform to the curve of the corner post and put it on over the joint. This makes a strong and at the same time a neat job.

The ideal car on which to put this steel panel would be one with straight sides; that is, no concave or convex panels. Then we could have one solid sheet starting at the side of door on one end of the car, curving round the corner post, extending the entire length of the car and around to the door. We would thus avoid the necessity of bending (except at the corners), and have all the panels, including the ends, in only two pieces.

The panels up, the next point to claim our consideration is the platform. Just here it is well to note that the street railways are enlarging their platforms. This is as it should be, for there are always a number of passengers who like to ride outside either to smoke or for any other reason, and a company will lose nothing by enlarging its platforms and taking care of this class of passengers. Let them ride where they please, so long as nothing is thereby endangered; for in so doing the passengers are humored, and the more they are humored the more they will ride, and the more they will ride the better able the company will be to drive away that awful "wolf"—fixed charges.

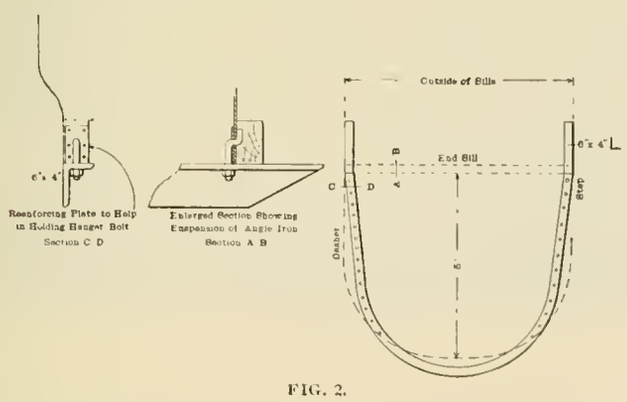

FIG. 2.

To make the platform, we take a piece of 4 in. x 6 in. angle iron, with the 6 in. leg vertical, and bend it as shown in Fig. 2. Of course the length of this platform may be regulated to suit the occasion; but a 5-ft. platform will prove very commodious and convenient. The ends of the angle iron should extend back under the sills for at least 24 in. The method of holding this angle is shown in the section of Fig. 2. The angle iron is drilled so as to allow the flooring (which should be at least 1¼ in. thick) to be bolted directly to it. This avoids the numerous timbers usually underneath a platform, and which are so much in the way of the wires and cables.

The dashers should be made of steel .065 in. thick and 36 in. wide, and bent, as shown by the dotted line in Fig. 2. It will be noticed that this dasher commences at the end of the side panel on the right of the car and extends around to the step on the opposite side. The dasher on the other end is arranged so as to throw the step on the diagonally opposite corner. In this way the step on the rear platform is always away from the paralleling track, and should anyone desire to get off from the front platform (the step of which is toward the paralleling track), the motorman is so close by that he can easily watch him and regulate the movements of the car accordingly. This obviates the necessity of gates, unless it is desired to close the front step, in which case it would require only two gates to the car.

These dashers are fastened to the floor by means of pieces of 1½-in. angle iron about 2 in. long and spaced about 12 in. apart. One leg

FIG. 3.

of this angle is bolted to the floor and the other either bolted or riveted to the dasher. For a dasher rail, take a piece of 1½-in. angle iron the length of the dasher, bend it to the same curve and rivet it to the top of the dasher.

The hoods are made so as to conform to the curves of the platforms.

When the necessary repairs are made on the roofs, the cars are ready for the painter.

Fig. 3 shows a car that has been repaired in the manner outlined above, and although it has not been in service long enough to tell just exactly what it will do, still it is safe to say that it is good for at least three years longer. This identical car was examined three years ago and reported worthless. It stood in the barn for two years and was then ordered to be burned; but when the work of repairing cars with steel sheets, etc., was begun, the car was saved, and at the present day it is one of the best on the line. The steel sheet not only serves the purpose of a panel, but braces almost the entire car.

This is merely a general statement of the method, the details of which can be easily worked out, and may be the means of converting some almost worthless cars into serviceable ones.

TENNESSEE STREET RAILWAY ASSOCIATION.

Since the organization of the Tennessee Street Railway Association in January last several meetings have been held in Nashville for the discussion of matters of general interest to the members, and the next meeting will probably be at Memphis. The object of this association is to render more intimate the business and social relations of the members and at present the questions under consideration are the practicability of organizing an inspection service so that some reputable and responsible agency may keep one or two men in the state, and satisfactory arrangements for a circuit of park and amusement attractions.

The membership includes the street railways of Knoxville, Nashville, Chattanooga and Memphis. The officers are: President, C. C. Howell, vice-president and general manager Knoxville Traction Co.; vice-president, E. J. Jones, vice-president and general manager Memphis Street Railway Co.; secretary and treasurer, E. G. Connette, general manager Nashville Street Railway.

NEW TAX BILL IN ONTARIO.

The government party in the Ontario Provincial Legislature has proposed a bill taxing railroads, telegraph, telephone, express and similar companies, banks, insurance companies, etc., which it is stated will probably be passed. So far as it affects street railways its provisions are as follows:

Every street railway company in any city and every company operating or owning a railway in a city any portion of which is operated by electricity, shall pay $20 for each mile of track when there are not more than 20 miles of such track in the city; $35 per mile when there are more than 20 and less than 30 miles of track· $45 per mile when there are between 30 and 50 miles; $60 per mile when the total exceeds 50 miles. The mileage is to be measured as single track.

The companies shall continue to be assessable and taxable for municipal purposes as heretofore.

CIVIL ENGINEERS' CLUB, CLEVELAND.

The annual meeting of the Civil Engineers' Club of Cleveland was held March 14th and the following officers chosen: President, Col. Jared A. Smith, U. S. A.; vice-president, Prof. John W. Langley; secretary, Arthur A. Skeels; treasurer, John N. Coffin; librarian, William E. Reed.

The membership of the club has slightly decreased, but its financial condition is excellent. W. H. Searles was the secretary of the club last year.

SILVER BOW RAILROAD.

In the "Review" for March, page 176, was published an abstract of a paper by Francis W. Blackford, engineer of the Butte Consolidated Railway Company, in which he described the Silver Bow Railroad, a double-track electric line between Butte and Centerville, Mont. The distance between the termini of the road is about 4,750 ft., but because of the difference of 390 ft. in elevation to be overcome, and the necessity of not crossing valuable mining property, the line is over twice as long and abounds in curves.

By the courtesy of J. R. Wharton, receiver of the Butte Consolidated, we have received photographs taken at different points along the line, and these are reproduced herewith. No. 1 shows a 5 per cent grade near station 80 (see St. Ry. Rev., Mar. 1899, page 177, for profile). No. 2 is the crossing over steam railroad tracks. No. 3 is a view of a 7½ per cent grade near station 35. No. 4 shows the 5 per cent grade near station 85.

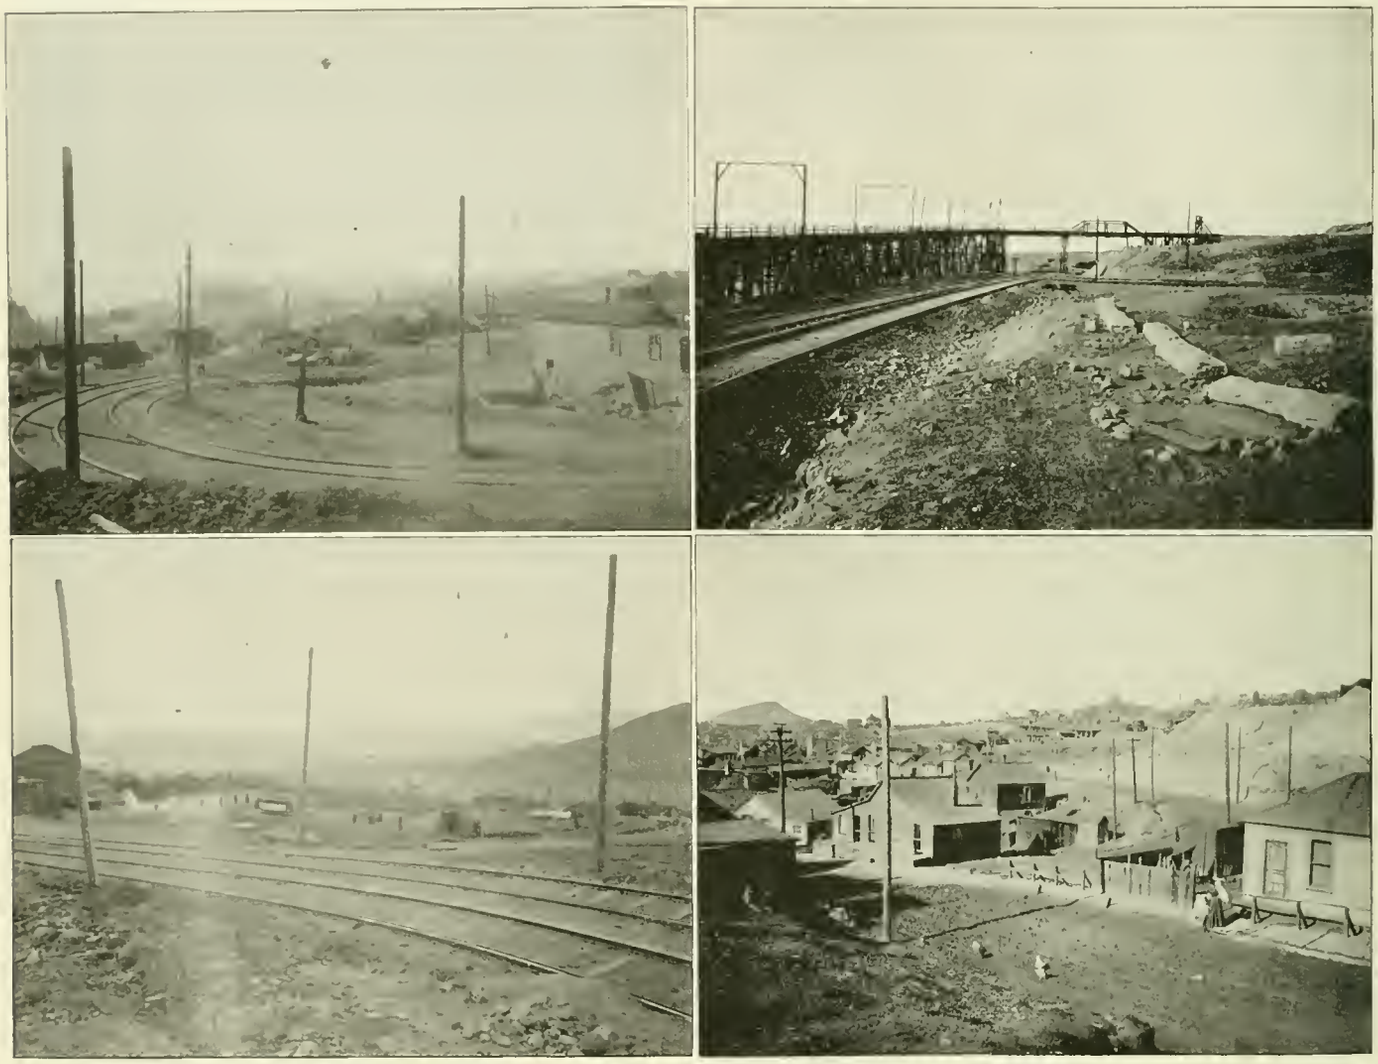

FIG. 1. FIG. 3. SCENES ON THE SILVER BOW RAILROAD. FIG. 2. FIG. 4.

Fig. 5 shows a section and elevation of the trestle conctruction for the approaches to the railroad crossings. Fig. 7 shows in detail the mannar of elevating the outer rail on curves; the elevations were calculated for a speed of 12 miles per hour.

The Silver Bow road was built by the Silver Bow Railroad Company, of which W. A. Clark is president; W. L. Hoge, vice-president, and J. R. Wharton, manager. The road is leased to the Butte Consolidated Railway Company.

The city council of Superior, Wis., has passed an ordinance prohibiting the street railway company granting to any alderman or city official free transportatilon under a penalty of from $5 to $25.

SHOP FLOORS.

Abstract of a report to the Association of Railway Superintendents of Bridges and Buildings.

Assuming the soil to be firm and well drained, excavate the ground to an even surface 8 in. below the grade of the desired floor. Tamp well with heavy rammers to secure a firm foundation, then fill in with good, clean sand or gravel to within 3½ in. of the grade, making a crown of about 2 in. between pits for drainage; wet this down well, tamp with rammers, and trim off with a straight edge, taking care to get good even surface brick on edge, close to each other and breaking joints so the tops come one-half above grade. After laying, roll the bricks with a 2,000 or 3,000-lb. roller, cover the surface with 1 in. of fine sand and broom it well into cracks, or fill the cracks with cement grout. A concrete foundation is recommended by some, but except in cases where the natural ground is not firm, or where the floor is to be subject to extremely heavy loads, it is not considered necessary.

For blacksmith shops or foundaries the natural earth frequently forms a very suitable as well as substantial floor. In localities where the soil is too soft in its natural state, the addition of cinders or clay will solve the problem cheaply and satisfactorily.

In machine shops the conditions are different, and here we find the recommendations almost as varied as are those for round house floors. A brick floor in a machine shop answers many of the requirements, but there is good evidence in support of the objection that men cannot stand all day on such a floor or upon a surface of concrete or asphalt without feeling the bad effects of cold upon the feet. This difficulty is overcome to a large extent by the use of slatted floor racks or platforms at the machines where operatives stand. When machines are set upon a brick floor there should be special provisions made for foundation. But this can hardly be urged as an objection, as it is necessarily the case with heavy machines under almost any circumstances.

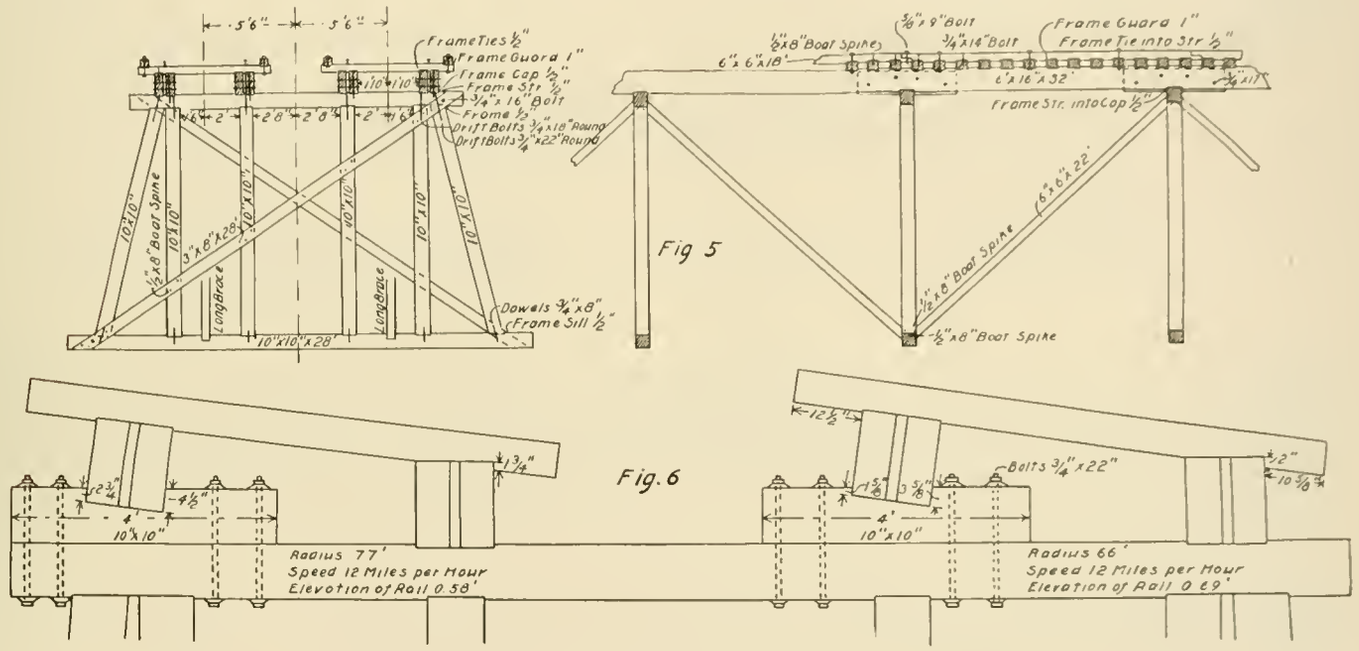
A bedded plank floor has recently been laid in an extensive shop plant of the Boston & Maine road. The earth is well compacted and brought to the proper surface and a bed of coal tar concrete put down in three courses. This bed is 4 in. thick when finished. The specifications are that the stones of the lower course shall not be less than 1 in. in diameter, and those of the second course not more than 1 in. in diameter. Stones of each course to be well covered with tar before laying and thoroughly rolled afterward. The finishing course to be composed of good, clean, sharp sand, well dried, then heated hot and mixed with pitch and tar and brought to a true level to fit a straight edge. Roller to weight not less than 700 lb. on a length not exceeding 22 in. On this finished surface of the foundation there is spread a coating ¼ in. thick of the best roofing pitch, put on hot, into which the lower course of plank is laid before it cools. Care must be taken to have the plank thoroughly bedded in the pitch, and, after laying, the joints must be filled with pitch. If vacant places occur under plank they should be bored and filled. The finishing flooring is laid across the lower and thoroughly nailed.

For the lower course 2½ in. spruce plank is used, and for the upper 1½-in. spruce plank. It is also noted that the lumber for lower course should be fairly seasoned, and that of the upper course well seasoned before using. The cost of such a floor is given at 18 cents per sq. ft., using spruce lumber.

For paint shops and car shops brick floor has been found very satisfactory. The committee believes that a brick floor, generally speaking, is the most economical, durable and satisfactory floor for shops as well as for round houses.

FORMS FOR STANDARD SYSTEM OF ACCOUNTS.

In the Review for April, 1898, page 232, were reproduced a number of forms used by the Twin City Rapid Transit Company, of Minneapolis and St. Paul, which were designed by J. F. Calderwood, auditor of the company, in conformity with the recommendations of the American Street Railway Accountants' Association. By the courtesy of Mr. Calderwood we have received some new blanks designed by him to conform to the later recommendations of the Association, and in the arrangement of several statements on the same sheet to give greater convenience.



SILVER BOW RAILROAD—TRESTLE AND ELEVATION OF RAIL ON CURVES.

The comparative statement of pay rolls is on a separate sheet 10 in. by 14 in. In the reproduction this form is superposed on a portion of the rear side of Form 455.

Three of these forms are shown, reduced on the succeeding pages, 244 and 245. Form 454 is on a sheet 21 in. by 15⅜ in. On one side is the comparative statement of operating expenses, and the statement of mileage, passengers, cars, transfers, etc., which constituted a portion of the Form 447 published last year. On the opposite side of the sheet are the comparative statement of earnings and expenses (both operating and fixed), the general balance sheet, and a statement of earnings and mileage by divisions; these were formerly on different sheets.

Form 455 is on a sheet 25 in. by 17 in. On one side are the comparative statement of the mechanical department and a summary of storehouse statement. In the former are provided spaces for each of the 54 accounts, as on the general expense blank, though many of the items may not be used in the mechanical department. On the opposite side are a statement of vouchers and a comparative statement of mechanical department pay rolls.

THE GORGE ROAD IN WINTER.

During the winter season the Niagara Falls & Lewiston R. R., better known as the Gorge road, has but little traffic, and when the cars are operated at all in winter only the outer of the two tracks is used. Considerable debris from the cliff falls onto these tracks

THE GORGE ROAD IN WINTER.

at all seasons of the year, but there is much more of it in winter; naturally the greater portion falls upon the inner track, and with a heavy fall of snow its removal presents added difficulties.

In the spring a great deal of repair work is always necessary to put the roadbed in proper shape for the tourist season when the

THE GORGE ROAD IN WINTER.

traffic is very heavy. During the past winter the road has not been operated and is now in the hands of a receiver. The accompanying illustrations lent us by the Railway Age show how the summer road appears in winter.

FROM THE WAGE-EARNER'S STANDPOINT.

On March 15th a committee of the street railway employes of Indianapolis waited upon the municipal authorities and presented a petition signed by 714 men employed by the street railway company, which was as follows:

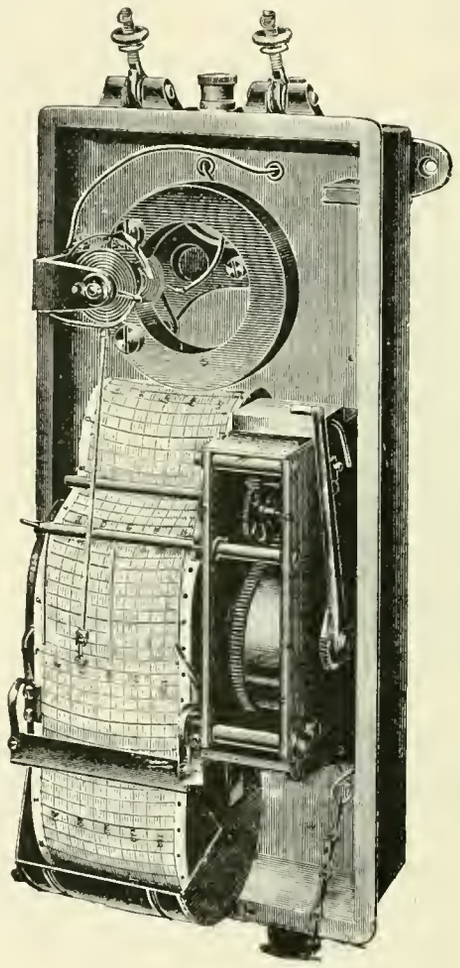
"As employes of the Citizens' Street Railroad Co. whose interests are vital in the scale of fares to be determined upon, we humbly ask your honorable body to ignore any and all petitions advocating the adoption of 3-cent fares, as we feel that we would be the sufferers thereby in having to submit to a cut in wages in order to enable the company to properly conduct its business.

"We therefore trust you will view this matter from our standpoint and have our interests at heart when considering this important question."

A truer statement of the case could not be made.

A RECORDING VOLTMETER.

The illustration represents a recording voltmeter which is made by Elliott Brothers, of London. The electrical mechanism consists of a small sphere of soft iron between the poles of a permanent magnet and a ring of insulated copper wire. At the end of the long aluminum arm or pointer is a pen formed for holding aniline ink. The recording mechanism comprises an eight-day clock and friction rollers for holding the plotted paper. The clock is wound by the lever shown to the right in the cut and drives by friction a drum



RECORDING VOLTMETER.

against which the paper is pressed by a spring. Teeth on the rim of the drum pass into holes perforated in the margin of the paper and prevent it from slipping. The clock gears can be proportioned to feed the paper 1 in., 3 in., 6 in. or even more per hour. The paper after passing under the pen is coiled in a drum at the bottom, from which it can easily be removed. The coils of fresh paper can be put in position with equal facility. Both voltmeters and ammeters can be fitted with this recording mechanism where a continuous record is desired.

The Toledo Traction Company Centennial Band has placed an order for new uniforms.

The Winnipeg (Manitoba) Electric Street Railway Co. has offered to install new 500-volt electric motors in place of the motors already in the factories and stores in that city. The proposition was accepted.

The Newport News (Va.) & Old Point Railway & Electric Co., which now comprises the Hampton & Old Point Railway Co. and the Chesapeake Light & Power Co., is making extensive improvements. A new power house is being designed and five miles of new track are under construction. Alexander Brown, of Baltimore, has control of the new company, and his superintendent, H. H. Carr, is getting the road in readiness for the heavy summer traffic.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

COMPETENT EVIDENCE OF INCOMPETENCY OF EMPLOYE.

Morrow v. St. Paul City Railway Company (Minn.), 77 N. W. Rep. 303. December 7, 1898.

Among other things, it was contended in this case, on the third appeal therein, that a certain gripman was incompetent because he did not have sufficient presence of mind in an emergency, and that he was not of sufficient judgment, and did not have sufficient strength and acuteness of intellect to be competent for the work of a gripman. On these questions, the supreme court of Minnesota holds that evidence of certain acts done in another part of the man's work was admissible. For example, the man was employed a part of the time as motorman on an electric line, being changed back and forth from the occupation of such motorman to that of gripman on a cable line. On one occasion, while acting as motorman, his car was stalled by reason of there being ice on the rails, which insulated the car wheels, and prevented the electric current from passing off from the wheels to the rails. He did not know that he could start his car by breaking the scale of ice on the rails, so as to make a connection for the current, and was not able to move his car. The trial judge charged the jury that they might consider these facts, with many others, in determining whether or not the man was competent as a gripman. In this the supreme court holds there was no error. It says that it may be conceded that, if the question of competency was merely as to the man's skill in the science of running a grip car, this part of the charge would be erroneous, but that as tending to show that he did not have sufficient judgment and presence of mind to be competent as a gripman the evidence was admissible. In more general terms, the court holds that evidence of certain acts done in one part of his work by an employe is competent as tending to show that he did not have sufficient judgment and presence of mind to be competent for the other part of the work in which he was employed.

MEN AT WORK ON TRACK ARE ENTITLED TO WARNING OF APPROACH OF CAR.

Lewis v. Binghamton Railroad Company (N. Y.), 54 N. Y. Supp. 452. November 16, 1898.

Men at work for a city contractor paving a street, who have to go upon a track laid in the street to do some of their work, the third appellate division of the supreme court of New York holds, have a right to expect a warning of an approaching car; something more than the mere noise which the running of the car itself will make.

Here a workman was stooping down and pouring hot tar into the cracks between the paving stones along the sides of the rails, when he was struck by a car, the approach of which the jury found had not been announced by the ringing of the bell, and for this reason, the court holds, negligence was established against the defendant. It says that inasmuch as the man was rightfully at work on the track, he could not be charged with negligence for being there. The only precautions he could take while there were to listen and look, and, of course, withdraw in ample time when he knew the car was approaching.

Negligence not being charged against the motorman for not stopping the car soon enough, but for not giving a reasonable warning of its approach, the court does not consider that the fact that the plaintiff had been in the habit of waiting, after he knew that the car was approaching, until it was very close upon him, and then quickly getting out of the way, had any controlling effect upon the question presented. Former delays on the plaintiff's part in getting out of the way of the car, it holds, did not warrant or invite any omission on the motorman's part to give, upon this occasion, the usual and ample warnings of its approach.

Whether the plaintiff was negligent in not keeping a better lookout for the car, after he began emptying his bucket, the court holds was properly left to the jury, which decided that he was not, under the circumstances. And the court adds that the measure of his duty in this respect was quite different from that of a pedestrian.

VALIDITY OF ORDINANCE REQUIRING WATERING OF TRACKS.

State v. Canal & Claiborne Railroad Company (La.), 24 So. Rep. 265. June 21, 1898. Rehearing denied December 5, 1898.

The supreme court of Louisiana holds that an ordinance of the city council of the city of New Orleans which requires corporations operating street electric cars within the limits of the city, upon tracks laid down in the public streets thereof, to water their tracks so as to effectually lay the dust within their tracks, is a legal exercise of the police power of the city, because such an ordinance tends to promote the comfort and convenience of passengers, and the health and comfort of the inhabitants of the city.

Neither does the court consider the ordinance indefinite nor unreasonable.

This decision becomes more significant when it is recalled that this court held a previous ordinance too indefinite and unreasonable, which made it unlawful for a corporation "to operate any electric, trolley or other cars or trains on the streets of the city without first providing, in some reasonable manner, for sprinkling of the streets through which their cars run," that is to say, from curb to curb.

Two defects in the last-mentioned ordinance are particularly recalled: First, that it singled out the street car companies, simply because they exercised a franchise upon certain streets of the city, and imposed upon them, solely and alone, the bearing of a public burden which should have been discharged by the city, or shared by the general public, namely, the sprinkling of the streets from curb to curb; and, secondly, that the provision that the companies should provide "in some reasonable manner for the sprinkling of the streets" was too indefinite and indefinable as to time, manner, amount and extent.

Speaking of the new ordinance, which it holds valid, the court says that it is obvious that the duty imposed is specific; that is, "to water their tracks." It does not require the street car companies to "sprinkle the streets," nor to sprinkle their tracks; but to "water" them. Water them where, and to what extent? "So as to effectually keep the dust laid on same." To water that part of the streets which is occupied and used by their tracks, and immediately covered by their franchises, it insists, is an altogether different thing from sprinkling the streets from curb to curb, and to a very great extent, at least, relieves the ordinance of the onerous and oppressive feature that was properly attributed to the former ordinance,—the imposition upon private individuals and corporations of a public burden.

MOTORMAN'S FIRST DUTY IS TO SEE THAT TRACK IS CLEAR.

White v. Albany Railway (N. Y.), 54 N. Y. Supp. 445. November 16, 1898.

A judgment recovered in this case for the death of a boy alleged to have been killed by the negligence of the defendant, is reversed by the third appellate division of the supreme court of New York, and a new trial granted. According to the statements of both the motorman and the conductor, the boy darted suddenly onto the track, just ahead of the car. The motorman testified that when he first saw him he was running along diagonally by the car, and as quick "as a shot," "like the snapping of a finger," he ran over the rail; that he instantly let down the fender and applied the brakes, but the boy was too near the car to be saved. Under such circumstances, the court holds, negligence could not justly be charged against the motorman.

Nor does the court consider that the motorman was negligent in not seeing the boy before he got upon the track. Undoubtedly, it says, it was the duty of the motorman to use all the means in his power to prevent the car from striking the boy, and to begin the use of such means as soon as the danger of hitting him became apparent. But he could not justly be charged with negligence in not stopping or beginning to stop the car until it became reasonably apparent to him that the boy was in peril unless he did so. Such is the measure of responsibility it applied to the motorman in considering this case. The motorman's attention, it maintains, is required first

to the track, to see that it is clear, and to the cross walks where people are expected to pass over the track or get aboard the car.

In this case they were just about entering a switch where a down car might be passed, and a cross walk was about 124 feet ahead of them; also, a railroad crossing at grade, where the car must come to a full stop. All these demanded the attention of the motorman, and the court holds that they were points on the track which it was his first duty to watch, so that if, until he was close upon him, he omitted to notice the boy on the street, and to apprehend that he was about to cross the track and so incur a peril, it surely ought not, under the rule above stated, to be charged as a negligent omission against him.

Moreover, the court says that two seconds is a short time to comprehend a situation of danger and avoid it, and that an inference that the motorman was negligent in not stopping the car and saving the boy in that space of time should not prevail.

POWER OF MUNICIPALITIES TO MAKE CONTRACTS WITH NEW COMPANIES.

City Railway Company v. Citizens' Street Railroad Company (Ind.), 52 N. E. Rep. 157. December 16, 1898.

The supreme court of Indiana holds, in this case, with which readers of the Street Railway Review are already more or less acquainted, and concerning which a statement of facts was made in the January number, on page 9: That the right of the Citizens' Company to exercise its franchise upon the streets of the city of Indianapolis will expire on January 18, 1901, by limitation of its contract; and also that the agreement entered into by the city and the City Railway Company April 24, 1893, was and is a valid contract "in praesenti" between the parties thereto; and that said City Railway Company, under said contract, had a right to enter at once upon the construction of what is known as the "North and South Line," and, on consent given by the city, upon any other unoccupied streets and parts of streets not in use by the Citizens' Company or necessary for the reasonable and safe operation of its lines; and that, on like consent given by the city, said City Railway Company may, upon the expiration of the term of the Citizens' Company, and the vacation of the streets by said company, enter upon and occupy such vacated streets for the construction and operation of its lines.

First of all, granting that the Citizens' Company has the right to use the streets occupied by it, and which it may hereafter lawfully occupy, until January 18, 1901, the supreme court maintains that, without additional legislation or consent given by the city of Indianapolis, the company cannot continue to exercise its franchise after that date.

It is true, says the court, that, by the statute of 1861, a street railroad company, when duly organized, is declared to be "a body politic and corporate in perpetuity;" but it also calls attention to the fact that the statute likewise declares that "nohing" in this act contained shall be so construed as to take away from the common councils of incorporated cities the exclusive powers now exercised over the streets, highways, alleys and bridges within the corporate limits of such cities," and that it further declares that, before constructing its railroad, any such company shall first obtain the consent of the common council. It may well be, therefore, that, subject to the right of the legislature to amend or repeal, retained in the act, the franchise of the company is perpetual. But the exercise of that franchise, the court holds, requires the consent of the common council as a condition precedent. And it would never do, it thinks, to admit that, by first agreeing to allow the company to enter upon its streets, and continue there for a definite term, the city thereby gave up forever that exclusive control over its streets which the same section of the act says shall never be impaired by any construction that may be given to the statute. As well contend that the landowner, by allowing a tenant to enter upon and cultivate his farm for a limited period, has thereby lost forever the right to reoccupy it himself, even after the time prescribed in the lease has expired. The very circumstance, too, that the statute provides for the consent of the city to the exercise of the franchise, the court holds, implies that the city may give or refuse such consent, according to its own discretion; and, if it gives consent, such consent may be with such limitations and conditions as the city may deem consistent with its own welfare and the welfare of its citizens.

It was not contended that in giving consent the city might not make all reasonable requirements as to location of rails, running of cars, kind of motive power, repair and improvement of streets occupied by tracks, amount of fare charged, and numerous other details, and the court thinks it inconceivable that the much more important consideration as to the length of time during which the company might occupy the streets should not also be in the control of the city. Moreover, it insists that it would hardly be consonant with common honesty, as practiced between man and man, for the company to seek for and enter into a contract, first for 30, and afterwards for 37, years, and then, when the right had been enjoyed for the time stipulated and agreed to, to turn around and claim that the contract was without a time limit; that the tenant for a term of years, being once in, had thereby become the owner of the fee simple. Besides, by its course, the court holds that the company, in conjunction with the city, put a practical construction upon the statute under which it claims corporate existence, which would be conclusive against it.

Taking up the question of the validity and scope of the contract made by the city, in 1893, with the City Railway Company, the court holds that, notwithstanding the Citizens' Company already had the city's permission to lay and operate its tracks in and along all the streets of the city, nevertheless the city had the right, at any time, to enter into a contract with another company to lay a street railroad upon any street or parts of streets not actually occupied by the tracks of the Citizens' Company or needed for the operation of its road, and that, consequently, the contract between the city and the City Railway Company was valid, in so far as it concerned streets and parts of streets not occupied by the Citizens' Company. Thenceforth, so long as both companies have the respective rights thus acquired, it seems that, in the court's view of it, as to unoccupied streets their rights will be equal. As to streets actually and legally occupied by either company, including, however, only so much of such streets as may be necessary for the proper operation of the cars, the rights of such occupying company are exclusive.

Moreover, whether the contract made by the city with the second company under such circumstances may be an advantageous one for the city and people or not, the court affirms that it is very plain, in any event, that the city had the right to enter into such contract, and that the same is legal and binding as between the city and such second company.

And the court insists that if the contract made by the city with the City Railway Company, in 1893, was in fact valid and binding, it could not be abrogated or annulled by any act of the legislature or of the city.

The court further holds that a city ordinance of 1865 giving a street railway company permission to lay and operate its tracks in and along all the streets of the city would not warrant it commencing the construction of a particular line nearly thirty years thereafter, without first having obtained the consent of the council to the location, survey, and construction proposed, where the statute under which the company was incorporated provided that such consent must be obtained before the construction of any line was commenced.

Finally, where one company forcibly takes possession of a street, without the required consent of the city, and against the protest of another company authorized to construct its line upon said street, the court maintains that the company thus seizing the street cannot be heard to object that the other company did not construct its line within the time limit fixed by its contract with the city.

ADHERES TO DOCTRINE TOUCHING CONTRIBUTORY NEGLIGENCE OF PARENTS.

Ploof v. Burlington Traction Company (Vt.), 41 Atl. Rep. 1017. July 21, 1898.

Much has been written for and against the doctrine of imputed negligence. Referring to Robinson v. Cone, 22 Vt. 213; 54 Am. Dec., 67, and note in which case it itself rendered the decision, the supreme court of Vermont says that the case has become a leading one against the doctrine of imputed negligence, and that its doctrine is quite generally followed by courts of last resort, and indorsed by eminent legal writers. Consequently, it is not surprising to find the court adding that it is content to abide by the decision in that case on the doctrine of imputed negligence.

In a suit in which a minor or his administrator seeks to recover damages in the right of the minor, or in the right of his estate, for

injuries inflicted upon such minor by the negligence of a party, the supreme court insists that it is difficult to find any satisfactory legal ground upon which such party can, in a court of justice, be heard to say: "True, I negligently inflicted a serious injury upon the child, but no legal obligation rests upon me to compensate the child for injuries inflicted by my negligence, because the parents of the child were negligent in the same transaction, and their negligence contributed to the happening of the accident occasioning such damages." It declares that it would be much easier to find good reasons for holding that such an injured child might recover jointly against his parent and the third person (or street railway company).

On the other hand, under a statute providing that when the death of a person is caused by a wrongful act such as would have warranted an action for damages in behalf of the person injured, if his death had not ensued, an action shall be brought in the name of his personal representative and damages shall be awarded "with reference to the pecuniary injuries resulting from such death, to the wife and next of kin," the supreme court holds that the negligence of such wife and next of kin, entering into and contributing to the accident causing such death will defeat their right to recover, it being manifest that the recovery under the statute, though in the name of the personal representative of the deceased, is not, in general acceptation, for the benefit of the estate of the deceased, but is for the benefit of those who may take by the terms of the statute. The court established a precedent for this in its late decision of Lindsay v. Railroad Co., 68 Vt. 556; 35 Atl. 513.

Thirdly, the court holds that where the most that the evidence tended to show was that the parents negligently permitted a boy 10 years of age, healthy, and of ordinary ability, to go unattended upon the street where the car ran, or that their negligence was a factor in bringing him to the place of the accident, but not a factor in the boy's attempting to cross the street in front of the moving car, and therefore not a factor entering into and contributing to the happening of the accident which caused his death, their negligence was at most a remote, and not a proximate, factor of the accident, and that such remote negligence would not defeat a right of recovery otherwise proven.

RIGHT TO LAY DOUBLE TRACKS ALONG NARROW STREETS.

Poole v. Falls Road Electric Railway Company (Md.), 41 Atl. Rep. 1069. December 20, 1898.

The question presented by this case was as to whether, if a double track street railway be built upon a street so narrow that the space left would not be sufficient to allow vehicles to pass or stand between the tracks and the curb lines, there would be such an invasion of the rights of an owner of abutting property as would warrant the court in interfering by the writ of injuction . The contention of the property owner seeking an injunction in this case, was that, even if it be conceded that the street had been dedicated and accepted, yet the laying of two tracks in such a narrow street would amount to a use of the street not embraced within the rights that passed by the dedication, because such a use would necessarily deprive the street of one of its most important attributes, and that, this being so, the complainant was entitled to an injunction, "as owner of the reversionary interest in the street bed, as well as of the fee in the adjoining lots," in order "to prevent the infringement of his constitutional right not to be deprived of his property without due process of law;" and also because the contemplated use would be an abuse of the street, and a "public nuisance, not sanctioned by the legislature."

The decision is in favor of the street railway company. To begin with, the court of appeals of Maryland says that it may be accepted as the established law in that state that, where the construction of a railroad is authorized by competent authority, and there is no invasion of, or physical interference with, the property of an abutting owner, there is no "taking" within the meaning of the constitution, and the remedy by injunction to prevent consequential injuries resulting therefrom cannot be invoked.

Upon the theory contended for, that the structure contemplated would subject the street to a new use, not included in any of the rights conferred by the dedication, the court says that the question would be, not whether there were or would be incidental or consequential damages growing out of the construction of the road, but whether there would be such a subjection or appropriation of the reversionary interest of the owner of the abutting property in the bed of the street as would amount to a constitutional "taking." By the dedication of property to the uses of a street the public acquires an easement of passing and repassing, with all such incidents as properly belong thereto; but all other rights in the soil remain in the owner. Any use not incident to such right of passage is a new one, an additional servitude, to which the street cannot be subjected, without first making proper compensation to the owner of the bed of the street. The laying of rails on a street and the running of cars thereon for the accommodation of persons desiring to use the street is not a new one, because it is only a new mode of using the street for the purposes for which it was originally taken.

The test, therefore, of what is a new use, continues the court, would seem to be found, not necessarily in the nature of the structure, nor in the number of the tracks, but in the use itself,—whether it is promotive of the objects and purposes for which the easement in the public was acquired.

The municipal authorities of the city of Baltimore have had committed to them the power to regulate the use of the streets, and that power is a trust of which they cannot divest themselves. The "primary use of the streets is not by any means that of furnishing tracks for street railways," and, therefore, further says the court, the municipal authorities cannot grant to railway companies such privileges as will obstruct the general public in the proper use of its highways, but must exercise the power vested in them; so that the beneficial enjoyment of the streets by the public in the ordinary and usual modes of passage thereon shall not be defeated or seriously impaired.

Here the street railway company, having obtained full legislative authority, proposed to lay two tracks in the bed of the street in question, with poles and wires to supply the electricity. The street was 40 feet wide, and in places there would not be room enough for vehicles to pass or stand in the space between the tracks and the line of the street. But, the court maintains, the street would not thereby be destroyed or seriously impaired for the ordinary uses of the public. Carriages, wagons, and other vehicles could always pass, unless the railway company blocked the street by permitting two of its cars, on different tracks, to remain stationary, and side by side; and this it would have no right to do for an unreasonable length of time.

Furthermore, the proof in this case showed that the weight of opinion among the property holders along the street was that advantages of better and quicker transit would outweigh any inconvenience that might result from the construction and operation of the road, and that the presence of the road with its two tracks would cause an increase in the value of the abutting property.

Under these circumstances, the court insists that it is difficult to understand how the construction of the two tracks, with necessary poles and wires, and the running upon them cars propelled by electricity, could be regarded as burdening the street with a new servitude. The rights of persons passing along it on foot, or with horses, or with vehicles would be the same as before. Cars could not be permitted to stand on the tracks in such manner as to prevent carriages and carts from passing. It would not be impossible for vehicles to be kept standing at the curb as long as might be reasonable for the purpose of unloading or loading their burdens or for discharging passengers. There might be some inconvenience at times, but not greater than often occurs in crowded thoroughfares.

And it must also be borne in mind, adds the court, that the relief asked for in this case could not be granted, whatever might be the incidental or consequential damages, unless the use proposed by the street railway company was a "new use," the imposition of which upon the street would amount to a "taking" of the complainant's reversionary interest in the bed of the street.

As to the other point raised by the complainant, the court deems it sufficient to say that it has more than held that the construction of the railroad, being authorized by competent authority, cannot be treated as a public nuisance.

CARE REQUIRED OF PERSONS USING TRACKS.

Johnson v. Brooklyn Heights Railroad Company (N. Y.), 54 N. Y. Supp. 547; Devine v. Brooklyn Heights Railroad Company, 54 N. Y. Supp. 626. November 22, 1898.

Johnson, the plaintiff in the first case, was a driver on a market wagon. He was driving upon the tracks of a street surface railway, operated by electricity. He was in a suburban community, where the cars were operated at a high rate of speed, and he was fa-

miliar with this fact. He was on the line of track where all of the cars must approach him from the rear, and he was passing down a grade where it was more difficult to stop a car than would have been the case on level ground, or where the grade was running the other way. Clearly, there could be nothing in this state of affairs, says the second appellant division of the supreme court of New York, from which a jury might reasonably infer that the plaintiff was free from contributory negligence, and, in the absence of direct evidence upon this point, it holds, there was nothing before the jury on which to find a verdict in favor of the plaintiff, and the motion of the defendant's counsel for a nonsuit should have been granted. Consequently, it reverses the judgment given the plaintiff for damages alleged to have been caused by a collision due to the defendant's negligence.

There are no presumptions in favor of the plaintiff, declares the court. The law imposes upon him the burden of proving, by a fair preponderance of evidence, not alone that the defendant has been guilty of negligence resulting in the injury, but that he (the plaintiff) has been free from negligence contributing to the accident; and, the court continues, where there is no evidence of the exercise of any degree of care on the part of the plaintiff, and when there are no circumstances from which such inference may be fairly drawn, there is clearly no question for the jury.

The fact that there was no room for the plaintiff to drive outside of the double tracks of the defendant, the court further insists, imposed upon the plaintiff, in common with the defendant, the duty of exercising a higher degree of care than would have been necessary under less dangerous circumstances. The danger was both known and obvious, and, while the defendant owed the plaintiff the duty of using reasonable care in the operation of its cars to prevent the collision, the plaintiff could not enter upon the tracks of the defendant, and rely wholly upon the defendant's servants seeing him in time to give warning. He was in a situation of danger. He was occupying the tracks of the defendant subject to the paramount right of the latter, to whom he owed the duty of using reasonable care, not only to avoid collisions, but to keep out of the way, and allow the cars to pass without unnecessarily impeding their progress; and, an accident happening to the plaintiff under these circumstances, the court holds, as before stated, he is bound to show affirmatively that he was exercising that reasonable care which the known and obvious dangers of his situation demanded.

Of something of the same character as this Johnson case, was the Devine case, which is cited with it at the heading of this article. Both cases were decided the same day, and by the same court, and to much the same effect.

But in the second, or Devine, case, wherein it was contended that the plaintiff had the right to assume that he would be given timely warning of the approach of the car by the motorman, it should be observed that the court says that, while it was the duty of the motorman to give timely warning, if he saw the wagon, or if he might, in the exercise of reasonable care, have seen the wagon, in time to have given such warning, he was not bound to do so under all circumstances; and it was for the jury to determine, under all the circumstances of the case, whether the motorman had discharged his duty, and whether the plaintiff had been free from contributory negligence.

Continuing, the court says that the defendant did not have the absolute right to the use of the tracks; the plaintiff might lawfully drive upon them; but the defendant did have the paramount right, and the plaintiff could not drive upon the tracks of the defendant, and impose upon it the absolute duty of giving timely warning of the approach of the car. The plaintiff was charged with the duty of exercising reasonable care, in using the tracks of the defendant, to guard against collision. He could not depend upon the motorman to give timely warning. He was bound to exercise that degree of care which reasonably prudent persons should or would have exercised under the same conditions; and, if he failed in this regard, he was not entitled to recover damages under the law. He could not enter upon the tracks of the defendant, and, closing his eyes to his surroundings, await the timely warning of the defendant's motorman.

If the night was dark, and the highway poorly lighted, so that the defendant's motorman, in the exercise of reasonable care, could not have seen the wagon of the plaintiff in time to prevent the accident, he was not bound, as a matter of law, the court holds, to give such warning.

On the other hand, if the plaintiff lawfully using the tracks of the defendant, subject to its paramount right, could, by the exercise of reasonable care, have discovered the approaching car in time to have left the track before the car reached him, the court insists that it was his duty to do so; and, in the absence of evidence tending to show such reasonable care, the jury would have been justified in finding that the plaintiff had not been free from contributory negligence, which is necessary to maintain an action for damages.

At the same time, the court does not wish to decide that, as a matter of law, it is negligence for a driver to fail to turn and look backward to discover the approach of a car from the rear. It holds that it is a question of fact for the jury whether, under the circumstances of the case, such precaution was necessary.

In other words, the court holds that the jury are to determine, as a question of fact, whether, under all the circumstances, the defendant was guilty of negligence in not giving timely warning; and that it is equally a question for the jury whether the plaintiff has been guilty of contributory negligence.

ALLEN ON THE REPEAL OF THE ALLEN LAW.

There is more truth than poetry, and, perhaps, elegance, in the following interview of Hon. C. A. Allen, author of the famous bill which bears his name. Mr. Allen remarked:

"I can only say what was long ago said, 'Let the heathen rage and the people imagine vain things.' The re-enactment of the old horse and dummy act is simply going back to the days of the single shovel plow and the reaping hook. Every man who has sense enough to draw his pay, if he is honest, will admit it. We have lots of brave men in the House who might smile at Satan's rage, but who could not face a frowning world—men who could look into a cannon's mouth on the field of battle, but who would cringe like miserable hound pups if commanded to do so by some newspaper without a revaluation clause or one run by a biscuit at a high rate of interest. The Allen law has adopted all over the state, and is giving splendid satisfaction. It is as legitimate as bread, and gives unlimited self-government to Sodom, otherwise known as Chicago, which has a mayor doing more business on less mental capital than any man in the world, who will drop out of sight so suddenly some day that it will require a search warrant to determine from what particular point he sloughed off. If old Ananias were living today he would belong to the newspaper trust and be running a newspaper on a school site or a dam site, as occasion might require, without a revaluation clause.

"The law as it now stands is wholly inadequate and will undoubtedly be revised and revampered after the municipal election in Chicago. It does not permit the operation of street railways under the Chicago River; the act says 'over,' and their operation could be enjoined at any time. The Hon. John P. McGoorty, Democratic minority leader, told the truth when he said: 'The Alling bill, if passed, will not provide permanent legislation on the street car franchise matter. It has no provision for the extension of the franchise of the existing street railway companies, and if passed the situation would be worse than it is now. The bill is simply a temporary makeshift to carry the question over until after the spring campaign, and although it is popularly stated now that, if passed, no further legislation would follow this session, the statement is clearly untrue.'

"When I stated on the floor of the House that the repeal of the Allen law and the re-enactment of the old horse and dummy act was the most infamous and cowardly act that ever disgraced a legislative body, and was done solely to influence the Chicago city election by both parties, I told a truth which will be admitted when the saintly members crawl out from under the ban of the devils now engaged in purifying the city of Chicago."

A working agreement between the Meriden Electric Railroad Co. and the Meriden, Southington & Compounce Tramway Co., of Meriden, Conn., has been effected whereby the latter will run its cars over the tracks of the former company.

The citizens of Zionsville, Ind., are very anxious that a franchise be granted to what is known as the Marott Co., to build an electric line over the Michigan road, and are using every endeavor to have the county commissioners reconsider their action in rejecting the company's petition.

A PROTEST AGAINST VESTIBULES.

Under date of Mar. 2, 1899, the Albany Railway, of Albany, N. Y., addressed to the Committee on Railroads of the Assembly, the following protest in the matter of the several bills then pending before the committee in relation to vestibuling or enclosing platforms of street railway cars:

The Albany Railway respectfully opposes the passage of any of the proposed measures providing for the vestibuling or inclosing platforms of its cars, for the following reasons:

I.

The Appellate Courts of the several states of the United States and the Supreme Court of the United States have laid down the law in relation to the care to be exercised by persons or corporations operating street railways. According to the several decisions, the operator of a street car, especially if it is impelled by cable or electric power, is bound to keep a constant watch for persons and vehicles on the street, and although he is not bound to anticipate that foot passengers will attempt to cross otherwise than at regular crossings, and he, therefore, need not maintain quite the same degree of vigilance, he is always held responsible for failing to see even persons crossing at other places if he would have seen them had he been in the exercise of ordinary care. (Sherman & Redfield on Negligence, Sec. 485c.)

1. This being the law, street railway managers are obliged to select able-bodied, competent operators of its cars.

The operator must be able-bodied, and physically able to promptly control all the appliances usually on cars for the purpose of starting and stopping them. His eyesight must be good, so that he may be able to see obstructions on the track, or at points along the line see those who are about to cross the track. His hearing must be good, so that he may be able to hear all signals given to him by the conductor and promptly obey them; and the warnings and signals of pedestrians or persons desiring to board cars. He must be able to speak, and preferably to speak the English language. His habits must be good.

No one known to habitually use intoxicating liquors can legally be employed as the operator of a car. (Railroad Law, Sec, 42, and Liquor Tax Law, Sec. 41. Penal Code, Sec. 420.)

II.

The law requiring the utmost vigilance on the part of those operating street railways is being constantly enforced by the courts in actions brought by persons suffering damages either to person or property. It would seem, therefore, unjust to require street railways, first, to take the greatest care in the selection of the operators of its cars and the greatest vigilance on their part, and then, second, to compel them to place such operator in such position that having ears he cannot hear, having eyes he cannot see, and having a tongue and voice he cannot use them. That is just what each one of the bills we are considering requires street railways to do. It requires the operator to be inclosed in a vestibule, so that his ability to see and hear and make himself heard is abridged.

1. As cars are now operated in Albany, the operator is in a position where he can be seen by all persons traveling on the street; where he himself can see all persons who are crossing, or attempting to cross, the track upon which he is driving his car; and he is in a position to hear warnings given to him by others; and is also in a position to give warning himself to those who may inadvertently place themselves in danger.

2. It is not saying too much to say that hundreds of persons have been saved from serious injury by reason of the ability of the operators of the cars of the Albany Railway to make themselves heard.

III.

The experience of electric railways and other railways using vestibules is that the vision of the operator is very much obscured, and the percentage of accidents happening by reason of this interference with vision is consequently larger.

1. It is impossible to keep the glass portion of the vestibule clear in cold, foggy or stormy weather. It is found at night that in order to enable the operator of the car to see at all, it is necessary to cover the front part or front windows of the car proper with a curtain. The effect of this, of course, is to prevent the passengers riding in the car from seeing the operator. For aught they know, he may have been taken with a fit and be lying senseless on the platform.

2. The hearing of the operator of a car while inclosed in a vestibule is very much impaired by reason of the resonating effect of the vestibule. All the noise made by motors and wheels on the track seem to be concentrated and intensified in the vestibule.

3. The conductor of the car, who occupies the rear part, is handicapped by the vestibule. If the trolley goes off, which is quite a common occurrence on all overhead trolley roads, it is necessary for him to get off the car to put the trolley on.

4. The present platforms enable persons to see the conductor or the driver, both from the inside of the car and from the outside of the car, during an impending accident. Many an operator of a car has been able to prove his great vigilance by aid of the testimony of persons standing on the sidewalks or sitting in the car which he was operating, when, if he had been inclosed in a vestibule, as these bills propose to inclose him, it would be impossible for him to do so.

5. The motion of his hands in throwing off power and putting on brakes is plainly visible. If he were inclosed in a vestibule, no one would be able to see whether he made any effort to stop the car or not.

6. The open platform enables inspectors of operation to readily see the position and condition of the operator.

IV.

Unless, therefore, the Legislature is prepared to relax the rule of law established by the courts, and give the operators of street railways the same right to operate their cars as is now enjoyed by steam railroads, they, the railways, should be permitted to manage the operation of their cars in such way as to secure the least possible damage to the persons and property of others.

V.

The reason given by the proponents of the several bills for their passage, namely, their sympathy for those engaged in operating cars, does not take into account the much larger number of persons interested in preserving their lives. For instance, the number of operators of cars employed by the Albany Railway does not exceed 150, while the population of the cities through which the cars of the Albany Railway are operated exceeds two hundred thousand. It is, therefore, a question whether it is better to conserve the health and comfort of 150 persons who may be exposed to wind and storm for a few days in each year, or to jeopardize the limbs and lives of thousands of people who have occasion to use the streets through which the cars run.

1. The Albany Railway and The Watervliet Turnpike & R. R. Co. have operated street railway cars in the city of Albany and vicinity since 1863. During that time there is no record that any operator of either a horse or an electric car contracted any disease while operating such cars which caused his death or hastened his death. The fact is that the drivers of cars are among the healthiest of the employes of a street railway.

2. The lives of persons run down by street railway cars are as precious to their fathers and mothers, or in the case of parents to their children, as the lives of the operators of street cars are to those who are related to them. With all the care which it is possible now to exercise, many annually lose their lives by reason of being struck or run over by street cars. It would seem, therefore, that any legislation which tends to increase the number who thus annually lose their lives should be restrained and withheld.

3. It is well known that pedestrians and drivers of vehicles on streets through which street railways are operated rely upon the vigilance of the operators of street cars to warn them of the approach of the car, and to stop the car if necessary to prevent a collision or accident.

4. A car with a human being in plain sight on an open platform seems less like an engine of destruction than a car with an inclosed platform, the operator of which is concealed from those using the streets as pedestrians or drivers of vehicles.

VI.

The fact that the operators of street cars—motormen and gripmen—want vestibules; or the fact that corporations owning railways do not want them, should not influence the decision of the question.

1. Many who advocate the vestibuling of cars do so simply from the standpoint of sympathy for the operator of the car. All other considerations are ignored or forgotten.

2. It is barely possible that some operators of cars may desire vestibules, forgetting for the moment how a vestibule would handicap them in the operation of their cars.

VII.

The question, therefore, whether any of the bills providing for the vestibuling of cars, or the modification of any of them, should be reported by your committee is respectfully submitted to you for consideration on all the facts which have been laid before you.

Respectfully submitted,

The Albany Railway,
By John W. McNamara,
General Manager.

In the same connection it is interesting to note the action of the Committee on Railroads of the Board of Aldermen of New York City. Oct. 4, 1898, an ordinance providing for vestibules on street cars was introduced and referred to the Committee on Railroads, which held public hearings, and on Jan. 24, 1899, reported unfavorably, no one having appeared at its hearings to advocate the measure.

While appreciating the humane purpose of the ordinance the committee felt that the proposed remedy was impracticable in New York City. Portions of the arguments of counsel representing the railway companies were approved and incorporated in the report. Some extracts from these are given below:

"Take a snow storm like we had last week and you would find it would be absolutely impossible for a motorman to run a car even a single block with glass up in front of him. He could not run his car even at a snail's pace without striking something. You must remember that a motorman has an awful lot to do. He has to attend to his brake. He has to start the car and stop it. He has to listen to the bell signals. He has to look out for parties on both sides of the street. He has to watch the track on the surface of the street in front of him. He has to look out for small objects on the track as well as large objects, such as trucks and carriages. He has to be alert every minute. He has to look out for the people standing on the sidewalks wanting to get on, and he has to listen for the conductor's bell for people wanting to get off. He has to look out at the corner of every street for people wishing to cross the streets. He could not possibly attend to all these things if he was inclosed in a glass case."

A letter from Mr. H. H. Littell, general manager of the Buffalo Railway Co., was quoted as follows: "We find the percentage of accidents very much greater where vestibules are used than we do where they are not. They obstruct the view of the motorman when he most needs the protection afforded by the vestibule, and he is compelled to throw open the front glass in order to see. We find that during rain, sleet and soft snow it adheres to the glass and prevents him from seeing. In such cases he is forced to open the vestibule and stand in a draft which results in severe colds and sickness."

The Municipal Record and Advertiser was quoted: "This one objection, on account of the greatly increased possibilities for serious accidents to the public in general, is sufficient to condemn the use of vestibules in climates that are subject to very cold and stormy weather. The benefit is only for the few employes of the road, but the danger is for the whole public at large. This danger has been considered by railroad men to be so great that many roads have refused to equip their cars with vestibules, even though the law demands it, and they are going to let the law take what steps it may, and then fight the question out in the courts."

In conclusion, the Committee said: "The importance of this subject and the desire to afford relief to the men at the front end of our cars prompted one of our members, Alderman John T. McCall, while recently at Springfield, Mass., and at Hartford, Conn., where vestibule cars are being operated, to inquire from railroad men whether they are beneficial and practicable. The responses were in the negative and the views expressed conformed absolutely to those hereinbefore quoted."

The Board discharged the Committee and placed the proposed ordinance on file.

MAINTENANCE AND REPAIRS OF ROLLING STOCK.

BY J. W. GREER, GENERAL MANAGER YOAKUM (TEX.) IMPROVEMENT COMPANY.

PART I.

The fact that this subject relates practically to the only department of street railroading which the manager is allowed to run without the advice and assistance of the law, should, if for no better reason, commend it to the careful consideration of every street railway man.

We pay a celebrated corporation counseller a fat fee for drawing up and putting through a franchise, which he modestly assures us gives us practically possession of the streets, and, acting upon this, we begin to build our road. We do not proceed far, however, before a big policeman arrests the whole gang and arbitrarily informs us that "it's against the law and you must have a permit before you can dig up the streets." We get the permit after considerable argument on both sides and find that it reads "tracks and switches to be located by the public improvement committee; grades and centers to be furnished by the city engineers; poles to be located and holes dug under the supervision of the committee on telegraphs, telephones and electric lights; all other work to be done under the supervision of the street and bridge commissioners."

We again consult the eminent counseller and find "that these simple matters in nowise interfere with the value of our franchise," but owing to a clause in the constitution vesting legislative bodies with the right to make "police regulations" for the sake of peace, we had better submit to these simple requirements. "Of course it is understood that if they try to interfere with our rights, why we'll fight 'em, sir; fight 'em to the last ditch, and through the Supreme Court, if need be, sir!"

About the time we get to working in the harness just mentioned along comes the artist who poses as city electrician and proceeds to sit down on the over-head scheme we have planned, gives us points on the best brands of insulated wire, poles, lightning arresters, etc.; brings the fire committee around to hear him talk, and intimates that "things must go his way or they don't go at all."

I remarked at the outset that the department to which his subject relates was free from the advice and assistance of the law. The needs qualifying to a certain extent; as we have all been forced to listen to the censure of the court on the subject of defective brakes after his honor and gentlemen of the jury have had the subject glibly explained to them by the ex-motorman who "could stop a car going 20 miles an hour in less than half its length provided the car had proper brakes," or, if he used the reverse lever, he could stop inside of three to five feet. Of course the funny story the superintendent tells about discharging the same ex because he was too lazy to stop the car at all, and allowed it to run off the end of the track, fails to go down with such early risers as the judge, the jury and the learned counsel for the plaintiff, so your company suffer accordingly. Its a sad world, Mr. Jones, a sad world, sir! However, its the best world the average street railway man has seen, or is likely to see, and the business with all its trials, troubles and tribulations has a peculiar fascination which impels those who enter it to continue in it (as the story papers say) "ever afterward."

Enough of ruminating, and now to the subject in hand, which we will begin by advising you to adopt as your motto (have it framed and conspicuously displayed in all your shops),

A STITCH IN TIME SAVES NINE.

In no business does this maxim apply with more force than in the maintenance and repairs of the rolling stock of a modern street railway. The expense of the mechanical department is usually about equally divided between labor and material supplied.

In order to keep the labor account at the minimum, it is better to pay a few men the highest possible wages, provided they understand their business, and do the work promptly and right, than to have a yard full of cheap labor to botch things and soldier when in their ignorance they have gone as far as they know how. It is well to mention just here that if the manager of a street railway is not himself a practical mechanic, the hardest labor problem he has to solve is in connection with the mechanical department, as all first-class mechanics are more or less cranky, and in the language of the

natives of this sunny clime, " the more better they air the wus crankier they gits." I speak knowingly, because I have trotted all the gaits of the mechanical department personally, from roustabout to master mechanic, and have many times seen the head of the mechanical department holding lordly sway over the impractical manager, who, if he had been able to personally direct that department, would have known what to do.

You may be able to impress the president and the board of directors, by means of a glossary of technical phrases, into the belief that you are thoroughly conversant with every detail of the construction and operation of street railways, but unless you are practically experienced don't try it on the intelligent mechanic; for he will at once measure you correctly, and will ever afterward feel a contempt for your knowledge and authority.

Nearly all the friction existing between heads of departments in street railroading emanates from the mechanical department. Lack of practical knowledge on the part of the president or general manager, causes him many times to listen to the tale of woe from the head of the mechanical department, because (as he reasons in his ignorance), a man who can keep the complex machinery in proper repair and the cars always looking spick and span must be right.

No man is fit to be master mechanic or head of any other department who does not thoroughly believe that except for his individual efforts, the whole road would stop and everything go to smash; but because you have men who take this interest in the road, don't lose your own head and conclude that his plan is necessarily best. Listen patiently to all he has to say in his zeal to help you, but after he is gone give the problem an equally careful study before unjustly reprimanding perhaps an equally good or better man. Nothing so takes the zeal and energy out of a faithful man as to be unjustly censured by his superior at the instigation of his inferior.

I am aware that there are managers (and apprently successful ones) who advocate and practice criticism all the time and with everybody on general principles, claiming that one should never be satisfied with anything, but keep everybody stirred up with the idea that they must do better or that better results must be obtained. Why do I say such managers are apparently successful? Because men ruled with a rod of iron or by fear, will do the outward things necessary to hold their place, while inwardly dissatisfied with the manager, the road and everything pertaining to it, and do not take that interest in their work they should.

The motorman and conductor may wear neat and clean uniforms, polish their shoes, and be at the sheds promptly on time, for the man who "always raises Cain," but the motorman will reverse his motors at an opportune time, burn out the armature with the brakes, or tear up the gears "to get even." The conductor will let the old lady drop off the steps and bring a damage suit, or run by passengers with his face earnestly looking out for them the other way, "to get even." The track man will spike out the rails, the wheels will cause an unavoidable spread, and he "gets even" by delaying the cars half an hour. The shop man loosens the brush-holder so it will jab into the commutator and tear it up, or puts a loose key into the gear wheel; it fails to mesh, and it goes to smash, and he "gets even," and so on ad infinitum.

If the board of directors at the annual meeting gives you a vote of thanks for your wise and successful management during the past year, you feel so good over it that if, on the quiet, they gently intimate that it might be as well to discontinue this, or make a change in that, you cheerfully and willingly make a trial of the suggestion. If, however, you never heard anything from the said board but a growl of discontent, what heart would you have to try to do the things they advised, knowing full well you could not please them in any event.

Some of us, after we have risen a few notches in the social scale or climbed a few rounds of the ladder of fame toward the goal of success, seem to imbibe the idea that there must have been some special mixture in the batch of clay we were made of, or that the material was ground finer, or something took place to make us a shade superior to our fellow man struggling at the point we began. Put ice to your head, or take something for your liver when you get in this fix, for 99 times out of 100 you will find it a case of swelled head or billiousness you are suffering with, instead of superiority.

In dealing with shop men, and all other employes, let your motto be, "exact justice to all and special favors to none." Be as profuse in your praise of faithful and efficient service as you are prompt to condemn the things that are wrong. Be sure you are right before you condemn anything. This will save visits from grievance committees, and the humiliation of correcting mistakes, which always cause a loss of prestige. If a manager exacts what is right of his men, investigates carefully and fully all complaints before passing judgment, promises nothing to them except what he invariably carries out, he gets the respect and willing obedience which makes true success. Without the personal interest and good will of the employes, all the scrupulous neatness, and military precision and outward appearances in the world will not give full measure to success.

Having now settled the labor question to the entire satisfaction of—the writer—we will next month take up the subject where we digressed.

To be continued.

NEW INDIANA LEGISLATION.

The Indiana Legislature at its last session, which ended March 6th, enacted a number of laws affecting street railways:

A law providing that between the 1st of November and the last of March of each winter, every street car shall be comfortably heated by electricity or otherwise. The penalty to which a failure to comply subjects the company and its agents, is a fine of from $25 to $100 per day.

A law providing for the consolidation of street railway companies whose roads form continuous lines. Special provision is made for interstate lines, and the act has an emergency clause.

An amendment to the general street railway law so that the city line in Fort Wayne must permit the use of its tracks by suburban companies.

An amendment to the act of 1891 providing that the Board of Public Works and the Common Council of Indianapolis, instead of the Aldermen and Council shall determine whether suburban railways entering the city may use the city company's tracks. A suburban company is given the right to use the city company's tracks from the time it files a petition for condemnation; the city company is required to furnish a loop for turning suburban cars at the city terminus; the suburban company may use the other's poles to string wires if the latter cannot furnish power over its own wires; the 10-mile limit formerly on suburban roads is removed. (This act is regarded as of doubtful validity.)

A new law authorizing the city of Indianapolis to contract with any street railway company organized since the census showing Indianapolis to have more than 100,000 inhabitants, for a surrender of existing franchises and the grant of a new one for a time not exceeding 34 years. The company's rights in the streets are to terminate at the end of 34 years and a franchise for not more than 30 years more shall then be sold to the highest bidder. The fare under this act shall not exceed 5 cents a single ride, and tickets shall be sold 6 for 25 cents and 25 for $1. Persistent violations of the provisions of the act will work a forfeiture.

ACCIDENT AT WATERTOWN, N. Y.

On March 20th a car of the Black River Traction Co., Watertown, N. Y., left the track and plunged down a 30-ft. embankment into the Black River. The conductor and motorman jumped, and were uninjured. There were three passengers in the car; one was not injured and two are reported more or less seriously hurt.

ELECTROLYSIS DAMAGE SUIT.

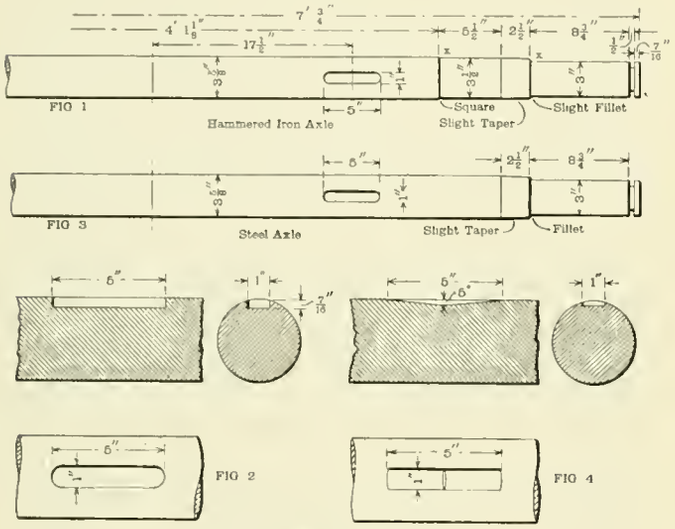
The city of Dayton, O., has sued the City Railway Co., of that city, to recover $45,000. that being the damages which it is alleged the city has suffered through having its watermains injured by electrolytic action, for which the City Railway Co. is responsible. The city's side of the case was probably well set forth in the article on "Electrolysis of Cast Iron Water Pipes at Dayton," which appeared in the "Review" for November, 1898, page 817; that article was written by Harold P. Brown, who made an electrical survey in behalf of the city. The railway company doubtless has matter to offer in defense, which will come out on the trial.

Mechanical Department.

SOME DATA ON AXLES.

A few weeks since we received a letter from a street railway company requesting information upon the subject of axles and the causes of their failure in service. The road in question found that the steel axles used by it broke either near the gear or near the collar very soon after they were put under the cars. Since that time we have made inquiries of a number of other roads as to their experience with axles, the substance of the replies received being given below.

The experience of road A in the matter of axles has been as follows: Hammered iron axles of the dimensions shown in Fig. 1 were put in service under single truck cars. The weights were as follows: Body 9,150 lbs.; truck, 4,000 lbs.; 2 motors, 4,910 lbs.; 2 axles, 500 lbs.; 4 wheels, 1,440 lbs.; total, 20,000 lbs. The first axle broke after six months and they continued to break, sometimes as many as nine axles (30 cars were in service) broke in one month, until all were gone. The axles broke at the square shoulder (x in Fig. 1) just inside the hub or at the fillet on the journal (x' in Fig. 1).



AXLES AND KEYWAYS.

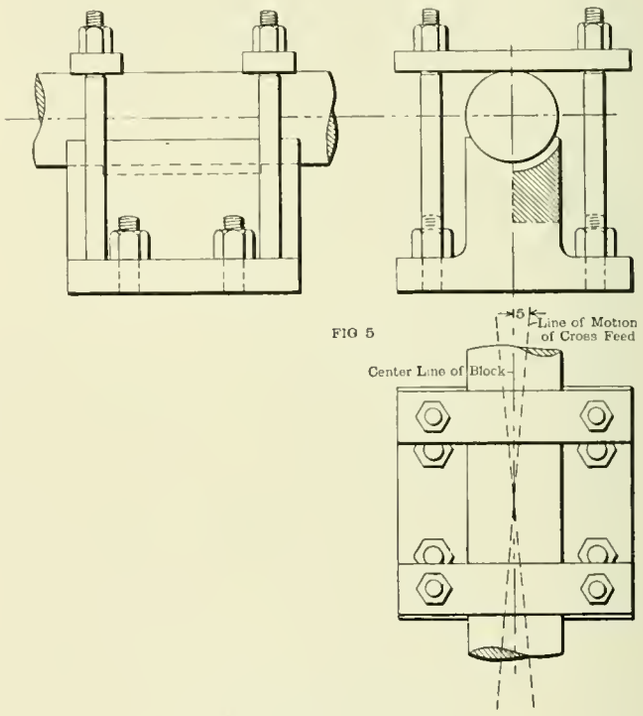
The iron axles breaking were replaced with cold drawn steel axles which were bought on the sole guarantee that they would prove better than the iron axles previously used. These steel axles when turned all over weighed 250 lbs. and had the dimensions shown in Fig. 3, differing from Fig. 1 only in having the wheel seat of the same diameter as the rest of the axle between the hubs. The key seat was of the same dimensions as in the old iron axles; and this is shown in Fig. 2. After about a year in service these steel axles began to break with the same rapidity as had the iron axles; in every instance the break started at one end of the keyseat. To remedy this it was decided to cut the keyseat only ¼ in. deep instead of 7-16 in.; before many of the axles had been so fitted, the master mechanic decided to adopt the key seat shown in Fig. 4, which is about .22 in. deep at the center of its length and tapers to nothing at the ends. Since adopting this keyway but three axles have broken and those failed by reason of the track spreading and letting the wheels drop between the rails; when the car reached a point where the track was in gage the binding of the wheels broke the axles. These three breaks occurred with successive cars at the same point and thus the cause of failure established beyond question. The break was not at the keyway. Many of the axles now used have been in service over three years.

The method of cutting the peculiar form of keyway shown in Fig. 4 is as follows: The tool rest on one of the lathes in the shop is removed and a cast iron block of the form shown in Fig. 5 placed on the cross feed, and the cross feed set at an angle of 5° with the line at right angles to the center line of the lathe bed. The head center is replaced by an end-cutting tool 1 in. in cutting diameter. An axle is placed in this block, held down by straps, and fed against the tool at the middle of the cut, the inclination of the block with the line of cross feed is changed from + 5° to — 5° and the cut continued.

The advantage claimed for the keyway of this form is that it places the weakest section of the axle in the center of the gear hub, which latter being set up tight serves to reinforce the weak place; if the top and bottom of the key are made parallel the weakened section of the axle extends beyond the gear hub.

This road, A, is now buying short piled, forged steel axles though no particular reason for the change is given. Of the axles now under cars 46 are cold drawn and 76 forged. The only specification is that the carbon shall not be above.15 per cent; no tests are made.

The wheels are bored to fit the axles, and not the wheelseats turned to fit the wheels as is the usual practice; in replacing wheels,



CLAMP FOR HOLDING AXLE.

the wheelseats are not turned off unless the surface is bad. Eight-bolt gears are used, and are bored .01 in. smaller than the axle.

The old equipment of the road in motors and trucks prevents the use of a larger axle, that shown in Fig. 3, without expensive changes. New cars recently ordered, however, have axles 4 in. in diameter between journals, with 3½-in. journals.

Road B uses the axle shown in Fig. 6 under all its cars, which are 20-ft. body closed cars seating 28 persons and 30-ft. open cars seating 50 persons. The weight of the car body empty is given at 8,000 lb., the truck at 3,700 lb., two motors at from 1,450 to 2,200 lb. each. The axles used are Jones & Laughlin's cold rolled steel and no specifications other than those as to dimensions are given. All axles are driven and the breakage during five years that steel axles have been in use is less than 3.5 per cent per year.

When the axles break the fracture is usually just outside the gear, but occasionally one breaks outside the wheel. The average mileage of axles (all driven) on this road is 80,000 miles; the axles are thrown out if the journals wear to 2¼ in. in diameter, which they sometimes do, and in such cases the axles are turned down to make armature shafts. With the present truck and motor equipment a 4-in. axle could be used without making expensive changes, but the 3¾-in. cold-rolled steel axles are considered satisfactory.

Road C uses the axle shown in Fig. 7 under single truck cars; its closed cars are 16 ft. cars seating 22 persons, the open cars are 27-ft. cars seating 45 persons. These axles are of crucible machinery steel, turned to size; there are no specifications as to chemical composition or tests. It is stated that this road has been using crucible machinery steel for axles for two years, and that prior to that cold rolled steel was used for five years; the reasons for using the machinery steel are that it has a high resistance to wear, is tough and not easily sprung. From this we infer that there was trouble experienced from the cold rolled axles springing when the keyways were cut. The keyways are ¾-in. wide and ½-in. deep, the length varying with the type of motor used. These are cut on a planer after drilling at the ends.

About 20 per cent of the axles break in service each year; two-thirds of the failures occur just inside the wheel hub, a few at the gear keyway and the others just outside the wheel.

The average mileage made is 70,000 miles; the permissible journal wear is 3-16 in. and a very few axles are thrown out because of wear. The road found that axles 3⅜ in. in diameter had a life of from 18 to 24 months, and increased the size to 3¾ in. which give over double the service. The diameter might be further increased ¼ in. with making changes in the equipment.

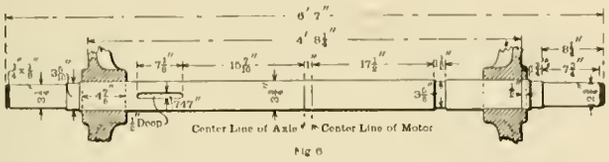


Fig 6

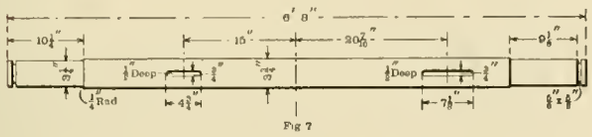

Fig 7

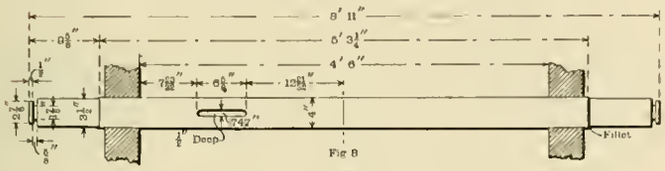

Fig 8

STREET RAILWAY AXLES.

Road D uses hammered steel axles, turned all over to the dimensions given in Fig. 8, not specifying for chemical compositon or tests. Three axles are used under box cars (18 ft. inside) seating 24 passengers, and open cars (29 ft. 6 in. over dashes) seating 45 persons. The location and dimensions of the keyseat vary with the type of motor, but for G. E. 58 motors are as shown in the drawing; special end mills are used in cutting the keyway.

This company formerly used 3⅜-in. and 3⅝-in. axles of cold rolled steel but found them too light, all breaking within three years; three years ago the 4-in. hammered steel axles were adopted, since which time only three have broken. When axles broke the fracture in nearly every case was at the end of the keyway just outside of the gear.

Road E, a 23-mile road with 10 motor cars reports that in 4 years and 5 months it had no broken axles.

Road F, which operates 180 miles of track and over 300 motor cars (18-ft., 20-ft. and 23-ft. bodies) uses 3¾-in. cold rolled steel axles with 3⅜-in. journals. The keyseat is 6⅝-in. long, ¾-in. wide and ½-in. deep and is cut by the maker of the axle. Steel axles have been under horse cars for 16 years and under electric cars for 6 years, and the percentage of broken axles is very low, ⅛ of 1 per cent. When an axle breaks the point of fracture is between the gear and the wheel. This company has recently increased the diameter of its axles from 3⅜ in. to 3¾ in. at small cost.

Road G, operating 31-ft. double truck cars which weigh 30,000 lb. each and carry maximum loads of 32,500 lb. each, uses 3¾-in rolled steel axles for motor-driven wheels and 3-in. or 3⅜-in. axles for non-driven wheels. The keyseats in motor driven axles are ¾ in. wide and ½ in. deep, being cut by drilling and planing in the usual manner. In nine years, with at least 100 axles always in service three driven axles have broken; two of these broke in the journal, and one at the axle collar inside the hub. No non driven axles have broken in service. The permissible journal wear is 9-16 in. with 2¾-in. journals and ⅝ in. with 3⅛ in. journals; most of the renewals are made because of journal wear.

The first equipment had 3⅜ in. axles, but the size was increased to 3¾ in. when making renewals because it was believed that the smaller axles had given poor results on other roads, a larger axle cannot be used because motor casings will not take them. This road is laid with light rails and the track is rough.

Road H reports that it uses 3¾-in. axles under 16-ft. body cars and has had but four axles break in seven years; it has 35 motor and 15 trail cars.

Road I has 52 motor and 16 trail cars which are single truck cars varying from 25 ft. to 29 ft. over the buffers, and seat from 35 to 40 passengers. Cold rolled steel axles 3⅜ in. to 3¾ in. in diameter are used, but all renewals are now made with 3¾-in. axles, which is the limit fixed by the motor bearings now in use. From 5 to 10 per cent of the axles break each year.

Road J operates about 150 motor cars and 50 trail cars; the motor cars, with double trucks, motors, etc., weigh 20,000 lb. and seat 32 persons. Hammered steel axles 4 in. in diameter are used and none have broken in the last five years.

Mr. A. B. du Pont, manager of the Detroit Citizens' Street Railway Co., in replying to our inqury says: "We purchased all our axles from the Johnson Co. in connection with the du Pont trucks, and although we use car bodies 22 ft. long and we have 10 and 12-bench open cars, we have not broken a single axle in four years. In regard to the axles that we had in use on other than du Pont trucks, we broke such a large percentage, that we scrapped the whole lot and replaced them with axles purchased from the Johnson Co. The cause of the breaking of these axles was that square shoulders had been turned on them just outside of the wheel line for the purpose of forcing on a dust collar for the journal boxes, and they would have broken whether the material in the axles had been good or bad. In replacing them we were careful to have spiral fillets left in at each place where there was a shoulder designed in the axle; since this was done, more than a year ago, we have not broken a single axle."

One of our corespondents is firmly convinced that the keyseat is the weak point of a street car axle; some forms of keyseat are worse than others, but all are bad. The question suggests itself to him: Is it necessary to use a key in securing the gear to the axle? He once put an axle in service, and severe service at that, without a key to hold the gear; it made 60,000 miles before going to the shop again and the absence of the key was not discovered until that time. We all know that wooden pulleys are not keyed to shafts, and perhaps it may some day be discovered that iron pulleys do not need keys.

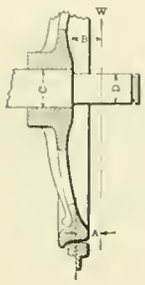
In 1891 a committee reported to the Master Mechanics' Association on iron and steel axles, and the master mechanic of one road stated that steel driving axles with keyways having square ends broke, while if the keyways were cut with a milling tool so as to leave a round corner at the end the axles did not break.

As a rule very little trouble is experienced with hammered steel or cold drawn steel axles; cold rolled axles usually spring out of line when the keyway is cut as cutting into one side relieves the initial tension of the metal. Some master mechanics prefer wrought iron because it is fibrous in structure, but as the fibrous structure is caused by the presence of impurities (slag, etc.) in the metal this does not seem to be a good argument. And it is every year becoming harder to secure a good quality of wrought iron because of the difficulty of keeping steel from becoming mixed with the scrap from which the iron is forged.

As many of the street car axles are reported to have broken just inside the hub, or in the journal, a table has been prepared to show

the relative strengths of the M. C. B. standard axles for freight cars of different capacities and a number of street car axles. In estimating the load per axle for the street cars, the figures for a crowded car have been taken, and perhaps that is as fair as to take the freight cars as loaded up to their full capacity. In general cars of either kind are not run fully loaded at all times. The dimensions indicated in the sketch were taken from drawings of the axles. As the strength of the axle varies as the cube of the diameter, the cube of the diameter divided by the moment to which it is subjected will give a measure of the strength; what is called in the table the "relative strength" is the quotient so found multiplied by 1,000.

It will be noted that the four street car axles, under the conditions assumed, are subjected to relatively heavier stresses than are the M. C. B. axles for freight cars.



Street cars make from from four to eight times the average daily mileage for freight cars on steam roads, though the speed is less, and there would seem to be no reason for making the axles at least relatively as strong as those used under freight cars.

The fact that with street cars a part of the weight of the motor is carried on the axle does not materially affect the moment to which the axle is subjected, but this weight being without spring support makes the effect of shocks more severe when passing a low joint or other irregularity in the track.

COMPARISON OF VARIOUS AXLES.

Axle.	W Lb.	A In.	B In.	C In.	D In.	Rel. str. at C.	Rel. str. of journal	
M. C. B. 40,000-lb.	8,000	10.	3.5	4.875	3.75	1.449	1.882	
M. C. B. 60,000-lb.	10,500	8.5	4.	5.5	4.25	1.866	1.829

1	8,000	3.875	4.25	4.	3.5	2.062	1.300	Few broken in in last 3 years.
2	8,000	4.56	4.56	3.75	3.25	1.429	.940	About 20 per cent break each year.
3	8,000	5.875	3.875	3.75	3.25	1.121	1.107	3½ per cent break each year.
4	8,000	4.69	4.375	3.625	3.	1.266	.771	

The general experience so far as we have been able to determine is that the great majority of steel axles that fail in street railway service break at a square corner or the fracture starts in the key. In some instances it has been found that the cracks started at tool marks in a fillet.

In discussing this subject before the American Society of Mechanical Engineers, (Trans. Vol. xvi.; p. 244), Mr. G. C. Henning said: "In a great number of axle fractures you will see that there is a central part of the axle which broke with a granular appearance, while between this part and the outer edge, there are a number of rings in which the metal is crushed more or less. Now, every axle is strained very much more in passing over a frog on a switch than by any of the reversed strains, oscillations, vibrations, or static loads. These are very small compared to the impact of the axle at the instant of crossing over a frog. Suppose the car is loaded to its maximum capacity, and a frog is struck when the roadbed is very hard, it may crack that axle on one or the other surface, according to how it is strained. If the wheel is inside as usual, then, of course, the fracture would be likely to occur on top. Now, that axle will run for a long while with that fracture in it. The next time that axle hits a frog it will break a little bit further. The next time it runs under a heavy load and strikes another bad place in the track it breaks still further. The journal section of the axle has by that time been very materially reduced, and careful inspection reveals these fractures; and when the fracture shows very plainly and opens the axle is taken out. But many of them are not found, because of carelessness during inspection. Then ultimately the axle will break with the central action of the material in perfect condition at the time of rupture; all the rest has been hammered during service, so that it is all polished. But the fracture does not occur uniformly. Some of these rings are wide and others are narrow. I have one axle in my office which has at least sixty such distinct rings, which shows that it broke on sixty different occasions. That is the way axles break. They do not break because they are weak. They do not break because the static loads are too great. They simply break because of the enormous impact in crossing over frogs, and they break very gradually."

Mr. E. D. Estrada in the same discussion submitted a sketch, Fig. 9, showing the end of a street railway axle broken on a Pittsburg road in the manner described by Mr. Henning. Tensile and chemical tests did not show anything which in Mr. Estrada's opinion would warrant adverse criticism of the material.

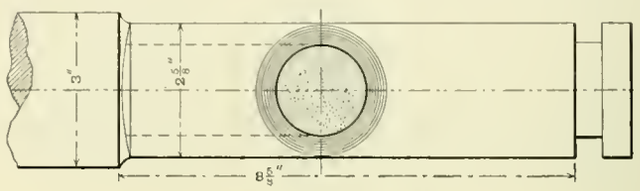

FIG. 9.—A BROKEN JOURNAL.

Most axles break in cold weather. They do not break because, as has some times been stated, the metal becomes weaker as the temperature decreases, but because the roadbed is frozen hard and is more unyielding, thus causing a severer shock. Experiments made by Prof. R. C. Carpenter (Trans. A. S. M. E., vol. xvii., p. 198), show that the tensile strength of iron and steel increases as the temperature falls between the limits of + 70° F. and — 60° F.

Professor Dewar found that at very low temperatures iron and steel became brittle, but the tensil strength was greatly increased. Thus iron which at + 59° F. had a resistance in tension of 34 tons per sq. in., at — 292° F., had a resistance of 62.7 tons; for a specimen of steel the figures were 35.4 tons and 60 tons respectively, for the two temperatures.

Another reason for some of the failures of axles in cold weather is that the track rails are forced together by the expansion of the paving, and the wheels are caught where the gage is tight, breaking the axles.

FOR TURNING TROLLEY WHEELS.

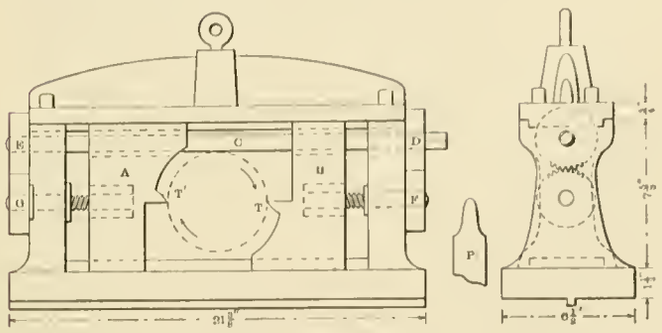
In the Review for May, 1897, was described a plan devised by C. E. Moore, master mechanic of the Chicago City Railway, whereby trolley wheels could be turned in four minutes; the work was done on a milling machine, a special cutter being used and the trolley wheels slowly revolved while under the cutter. This method was a great improvement of that formerly employed as four minutes sufficed for work that previously required 20 minutes.

Mr. Moore has recently designed and built a piece of apparatus which is an equally great improvement over the one previously described, and reduces the time required for turning a trolley wheel to one minute or less. This apparatus is shown in the accompanying sketch. It consists of a special tool holder which may be clamped to the bed of a lathe or milling machine (Mr. Moore uses it in connection with a milling machine). The frame has guides at the top and bottom in which the blocks A and B are free to move longitudinally; near the top of the frame is a ⅞-in. shaft C extending from end to end with a gear of 3 in. diameter at the pitch circle, keyed at each end; one end of this shaft is squared to receive a crank. The gears D and E mesh with similar gears F and G, each of which is keyed to and drives a ⅞-in. screw with six threads to the inch; F drives a right hand screw and G a left hand screw; the screws work in brass nuts which are fixed in the blocks A and B. On each block is fixed a tool, which is shown in plan at P. It is evident that on turning the crank on the end of C the two cutting tools will approach or recede from each other at the same speed.

The trolley wheel to be turned is mounted on the milling machine and rotated at a speed of about 45 r. p. m., and the tool holder fixed to the bed so that the trolley wheel occupies the position T T in the sketch. The two tools are at the extremities of a diameter and hence there is no chattering; they can be fed about as fast as a man

can turn the crank. As stated 60 wheels per hour can be turned by using this device.

When one of the cutting tools needs regrinding it is placed in a



TOOL HOLDER FOR TURNING TROLLEY WHEELS.

metal case or form, the end of which has the exact contour to be given the tool, and the case placed in contact with a stop on the grinding machine. By this means the tools may be quickly ground and always to the proper shape.

A 50-YEAR FRANCHISE IN INDIANA.

Mr. C. L. Henry, president of the Anderson Electric Street Railway Co., and Mr. G. F. McCulloch, secretary of the Citizens' Street Railway Co., of Muncie, have been devoting a great deal of time to an electric road which it is proposed to build between Muncie, Anderson and Middletown, Ind. The old state road through the towns of Yorktown, Daleville and Chesterfield has been selected for the route.

On application to the commissioners of Delaware County everything asked for except a perpetual franchise was granted; the commissioners wanted to make the term as short as they could, and cut the term down to 50 years.

INTERESTING, BUT NOT TRUE.

The highly colored account of an employe of the Metropolitan Street Railway Co., of New York, receiving a shock at 2,000 volts turns out to be a mistake; the highest voltage used on that system is 550. Some of the details of published accounts showa well developed imagination; for instance, the following: "The man's body was burned black from head to foot; every stitch of clothing was torn from him, and he fell senseless through a hole instantaneously burned in the floor by the terrific electrical power. The doctors who attended him say there is no case on record of a man withstanding a similar shock."

OWL CARS IN BALTIMORE.

About the middle of February the City Passenger Railway Co. began to operate all-night cars on one of its lines, and the Baltimore Consolidated Railway Co. put them on three lines. As the owl car was a new thing in Baltimore a careful account was kept of the receipts and expense of operating. The cars from 1 a. m. to 5 a. m. were run on a headway of one hour and it was found that the returns are away below the cost of operation.

There is now an ordinance before the council requiring all-night cars to be run, but President Perin states that the company's experiment will be continued for at least six months, regardless of the action the council may take.

PAVING IN CLEVELAND.

The general street railway law of Ohio requires street railway companies to pave the space between the rails of each track and 12 in. on each side. A special statute was enacted giving the city of Cleveland power to require that companies pave all of the space between double tracks, irrespective of the width, and attacked by the Cleveland Electric Railway Co., and a recent decision of the Supreme Court affirms the ruling of the lower court that the special act is unconstitutional.

THE DEVELOPMENT OF ELECTRIC TRAMWAYS IN THE UNITED KINGDOM.

From Our Own Correspondent.

The next twelve months will witness the completion of 200 miles of electric tramways in this country, which affords some evidence that we are making progress. Most of these lines, however, are experimental, especially those that are being carried out by municipal authorities. The most important among the tramway schemes are those which are being engineered by private enterprise, and in this respect the rise of the British Electric Traction Co. is one of the most remarkable features of the new phase of tramway work. The managers of this company quite early perceived that electric traction would not only improve the speed and decrease the working expenses upon existing tram lines, but would open up quite a new sphere of activity in creating new systems. As one travels about in the country and becomes acquainted with the methods of transportation between quite important towns, one is irresistibly reminded that ancient institutions in this country die slowly. Even in the great centers of industry there is a woeful lack of speedy communication between towns and villages, and in that hive of industry, the potteries district, it is impossible in many cases to travel direct from one town to another by railway, and frequently a journey of seven miles will take an hour. A similar state of things prevails in the manufacturing districts of Lancashire and Yorkshire. It is true that the train service between such places as Manchester, Liverpool, Bolton, and similar towns is very admirable, but connection between slightly less important towns is exceedingly bad.

It is in linking such districts together that the British Electric Traction Co. is about to carry on some useful work. A concrete example of what the company is doing is in the North Staffordshire towns already alluded to under the title of "the Potteries," which have been for some years badly served by a steam tramway—this line has been bought up by the British Electric Traction Co., and is being relaid and equipped for electrical working, and in addition quite new districts are being opened up and the total length of line will be close on forty miles. Then, again, in other parts of England, round the neighborhood of Newcastle, in the Lancashire districts, and between the busy parts of South Wales, this company is rapidly acquiring rights which will enable it to commence large systems of electric tramways. It is stated that the aggregate length of lines now owned by this company is over three hundred miles, and every foot of these will be operated electrically. Although the company is not yet operating more than a few miles, it is a significant fact as showing the faith of the public in this enterprise, that the company has for the past year's working shown a profit of over £2,000, which has been for the most part derived from premiums on shares.

Naturally the success of the British Electric Traction Co. is calling forth imitators, and there is no reason why many of them, with good management, should not prove financially successful. The question of municipal tramways has reached a most interesting and indeed a serious position. It is not unreasonable to suppose that municipalities and other local authorities, arguing from the success of their electric lighting schemes, should have assumed that they were equally well fitted to operate an electric tramway service. Opinion, however, is very much divided as to whether such a body can develop the real utility of an electric tramway, because, in the first place, the success of a tramway service depends upon carrying people from the center of the city to the suburban districts, and in most cases suburban districts are under a different local government from the center of the city. In many large towns, such as Glasgow, the difficulties in this direction are not insuperable, for the small local authorities in the outskirts of the city have neither the inclination nor the financial strength to operate any portion of a tramway system, and there is, under such circumstances, very little difficulty in inducing smaller local authorities to permit a large city authority to carry trams through the various districts.

While, of course, there is much to be urged against the control of tramways by local authorities, there is very little doubt that many of the largest schemes will be carried out by such bodies. A most interesting example of what can be done in this direction is Glasgow, where, many of your readers will remember, a short line has been recently equipped for the purpose of demonstrating the economical working of electricity for tramway propulsion. The suc-

cess of the line was soon demonstrated and the corporation has practically decided to carry out what is considered in this country an exceedingly large scheme of electric traction; it will comprise no less than six hundred cars and a power house probably having plant of seventeen or eighteen thousand horse-power. Mr. Parshall, who may be considered the leading authority on electric tramways in this country, has recently reported for the Glasgow corporation on the subject, and he recommends that the best method to meet the conditions obtaining in Glasgow is to adopt a three-phase high tension generating station with sub-stations, and he recommends this system for the reason that it will require less capital expenditure and that it is possible to obtain a site for a generating station which will give the advantages of good coal delivery, and where extensions may be easily provided for. He further considers that the three-phase system has the advantage of less working costs and repairs, and he states that it has been conclusively shown at Niagara, Dublin, Middlesborough and other places; that rotary converters require less attention than ordinary 500-volt railway generators, and that no skilled labor is required. The three-phase system, in his opinion, has greater flexibility and is better adapted to the requirements of future extensions. He further states: "In considering the transition from horse traction to electric traction the question of time is of great importance. The single generating station which I have recommended can be installed and put in working order more quickly than several stations. The loss through delay can be estimated upon the basis of your present working. The cost for horse traction is 3½d. per mile on a mileage of 9,000,000 per annum; taking the working cost for electric traction on the same basis as to maintenance, etc., the saving, assuming no increase in traffic, amounts to £112,000 per annum."

The Glasgow corporation is fully alive to the advantages that an electrical system will give, and there is very little doubt that it will adopt Mr. Parshall's scheme as it stands. The position of affairs at Glasgow has to some extent raised the question of combined stations. There is considerable leaning among engineers in this country towards power houses in which lighting and tramway plants are arranged together. To some extent this arises from the fact that many towns have already in existence a lighting plant, and it is assumed that it will give a more economical method of working if one staff of engineers is able to look after both sets of machinery.

Obviously, the system has its limitations, and there are not wanting very strong opinions on the disadvantages of combining lighting and tramway business. Mr. Parshall has reported most strongly against a joint supply, for the following reasons:

"1. On many days in the year the maximum load in lighting, and that in traction, occur at the same time, so that the same maximum total capacity in plant has to be provided, whether or not the supply is from a common station.

"2. Owing to the different nature of the loads, the capital cost for a given watt-hour production is three or four times as great for lighting as it is for traction; in other words, in traction apparatus it is worked at its greatest capacity three or four times as many hours in the year as is lighting apparatus, consequently it can be of a more substantial type with advantage.

"3. That machinery of a different type is commonly used for lighting, and the switching appliances are absolutely different. In the Glasgow lighting stations numerous small high-speed engines are in use; such engines are unsuited for the generation of current for your traction purposes. I have yet to find the engineer of extended experience in dealing with traction matters who would propose the use of high-speed engines for such loads as you have to consider in Glasgow for electric traction.

"4. The electrical arrangements for electric lighting are necessarily much more complicated and elaborate than is the case for electric traction. Electric lighting has to be carried on with reference to the delicacy of the human retina; in other words, the voltage at the point of consumption has to be regulated to a nicety. In electric traction the same conditions do not obtain, since uniform acceleration and speed of the car can be obtained to the satisfaction of the passenger within a much greater range of voltage.

"5. From a business point of view, the different conditions in electric supply are sufficiently shown by the difference in cost of energy between electric traction and electric lighting. The cost of energy for electric traction, owing to the better load factor, would not be more than 25 per cent of that for lighting. The present cost of electric lighting in Glasgow is 1.26d. per Board of Trade unit, which does not compare unfavorably with that of lighting for other cities. This figure is 4.8 times as high as would be expected in the traction service outlined. When you consider that in Edinburgh, according to published accounts, current is generated cheaper than in any other city in the United Kingdom, and this cost is 2.95 times that which I predict for your traction system, the difference in the nature of the load is apparent.

"6. It has been suggested that economy in staff will be gained in a joint station. This does not apply provided the tramway business is attended to as a business by itself. In the station which I have outlined this staff will, as I have said, be regularly employed during the sixteen hours of the day at practically full load, and during five more hours at one-third load, so that the staff would be fully occupied during the hours of working. Owing to the difference in the nature of load, a different class of attendants would be required for the two classes of work."

Mr. Parshall's opinion on this matter is shared by other prominent engineers, and some time ago Lord Kelvin and the late Dr. John Hopkinson, when considering the case of the Bristol Tramways & Carriage Co., strongly urged the inadvisability of combining lighting and power plants. The view, at any rate, taken by the Glasgow corporation on the subject is summed up in the phrase, "Whoever controls the power, controls the tramways." The chief objection in Glasgow is that the lighting arrangements are in the hands of one committee and the tramways controlled by another committee, consequently any arrangement of combined plants would confuse accounts to some extent, and having regard to the magnitude of the tramway system in Glasgow, probably the wisest course is to generate the electrical energy on quite a separate system. No doubt the decision of the Glasgow corporation will be followed by others, and it would not be surprising to find that the London County Council (which is now controlling some forty miles of lines) will adopt some such scheme as that suggested by Mr. Parshall for Glasgow. It is interesting to observe that the London County Council, which, before purchasing tramway systems, so persistently opposed electrical methods, has now appointed Professor Kennedy to prepare a report as to the best methods of electrically working the large tramway system of the South of London. The probability is that in many thoroughfares the conduit system will be adopted, while in the less important streets the overhead system will be used.

London, April 2, 1899.

A SCHEME TO DEFRAUD STREET RAILWAYS.

March 3d Henry D. Fowler, 20 years of age, and Ernest W. Wilson, 25 years of age, were arrested in Brooklyn on a charge of larceny, preferred by the Union Traction Co., of Philadelphia. They had been employed by this company, Fowler as a conductor, and Wilson as an inspector, and on February 8th Wilson stole a cash register, with which he and Fowler, who is his cousin, went to New York. Fowler secured a position with the Brooklyn Heights road and Wilson with the Dry Dock road, in New York. The scheme contemplated by these men was to use the stolen register during a part of the day, defrauding the company to the greatest extent that prudence permitted.

Upon discovery of the loss of its register the Union Traction Co. made an investigation, traced the theft to Wilson and secured his indictment. After their arrest in Brooklyn they were brought to Philadelphia and committed to prison March 11th. The register has not been recovered.

Wilson is said to have confessed that he is the man who stole the register and took it to the rooms occupied by him and Fowler. Fowler was charged with receiving stolen property, and pleaded guilty. March 20th Wilson was sentenced to four months' imprisonment; sentence was suspended as to Fowler.

Employes of the Marietta (O.) Electric Co. were given a 12 per cent increase in wages on March 10th, the notice coming as a welcome surprise.

The franchise granted to the Columbus (O.) & Buckeye Lake Street Railway Co. has been declared forfeited by the Franklin County commissioners.

TWIN CITY ROAD IN 1898.

The annual report of President Lowry to the stockholders of the Twin City Rapid Transit Co., of Minneapolis and St. Paul, under date of March 1, 1899, is as follows:

"The gross and net earnings of the property for the year ending Dec. 31, 1898, show a gratifying increase over the previous year; the gross being 8.29 per cent and the net 59 per cent.

"The physical condition of the property has been maintained to the highest possible degree and the expense thereof charged to the cost of operating. This cost of operating for 1898, including taxes, is 49.92 per cent of the gross earnings as compared with 53.18 per cent for 1897.

"During 1898, $825,000 of the 7 per cent preferred stock was issued, $750,000 of which was used to pay the "collateral notes" mentioned in our last report. The company has also issued for construction $90,000 of the consolidated 5 per cent bonds of the St. Paul City Railway Co., and under a provision of the Minneapolis Street Railway Co's. first mortgage, $20,000 of the 7 per cent bonds have been redeemed by the issue of a like amount of 5 per cent consolidated mortgage bonds.

"The Selby Ave. cable line in St. Paul has been changed to an electric line, with all new construction of concrete and 80-lb. 'T' rail with cast-welded joints. This has been made possible by the installation of a modern counter-weight system which overcomes the heavy grade of 15½ per cent, and it has been in successful operation since August, standing the severe tests of our low temperature and heavy snows.

"The company has likewise completed a new Interurban line between Minneapolis and St. Paul, via Como Park, St. Anthony Park, the State Fair grounds and the State Agricultural College.

"The company has constructed and fully equipped, during the past year, a new brick car shop 359 ft. long and 136 ft. wide, and has built and equipped 22 44-ft. electric cars.

"The water power plant, mentioned in our last report, to generate electric power has been in partial operation about a year.

"To avoid any possible delay in service the steam power plants were held in readiness for operation until all the electrical apparatus and transmission cables of the water power plant were in successful operation. This test consumed several months and the plant was only accepted by our company in December. This delay prevented the sale of surplus power and increased the expense of power plant operation."

Appended to this report was the statement of earning by months during 1898, as given in the following table:

EARNINGS IN 1898.

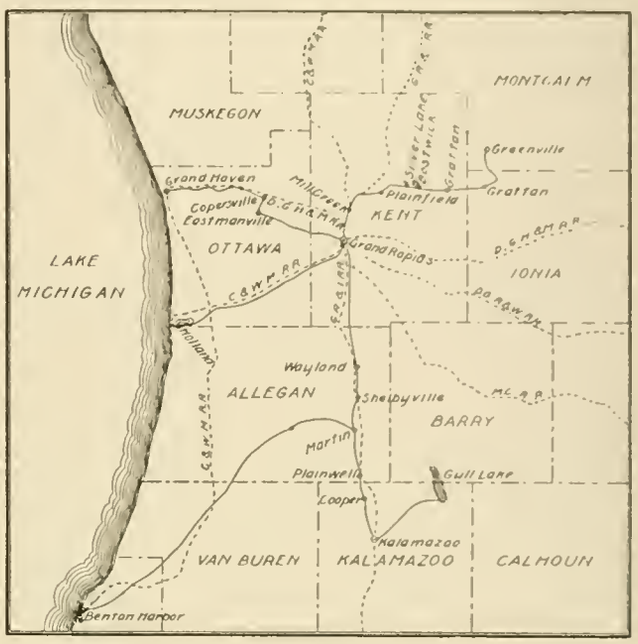
	Passenger Earnings	Miscellaneous Earnings.	Total Earnings.
January,	$163,722.50	$1,526.69	$165,249.19
February,	150,756.00	1,069.90	151,825.90
March,	168,848.15	1,496.44	170,344.59
April,	164,384.00	1,419 59	165,803.59
May,	178,816.05	1,490.49	180,306.54
June,	169,901 70	1,603.05	171,504.75
July,	194,762.35	1,754.02	196,516.37
August,	184,175.80	2,537.17	186,712 97
September,	206,708 35	1,473.68	208,182.03
October,	185,443.45	1,416.00	186,859.45
November,	176,067.00	1,555.05	177,622.05
December,	201,507.60	8,280.98	209,788 58
Total,	$2,145,092.95	$25,623.06	$2,170,716 01

The expenses are itemized as follows:

Maintenance of way and structure	$ 76,837.27
Maintenance of equipment	131,368.30
Operation of power plants	129,805.69
Car service	497,413.34
General expense	95,884.29
Legal expense	23,442.38
Injuries and damages	58,492.63
Insurance	6,148.24
Total operating expenses	$1,019,392.14
Net earnings from operation	$1,151,323.87
Interest on debt and dividends on 7 per cent preferred stock	$713,454.07
Taxes	64,214.11
Total interest charges, taxes and preferred stock dividend	$777,668.18
Surplus	$373,655.69

INTERURBAN ROADS ABOUT GRAND RAPIDS, MICH.

A glance at this map of southwestern Michigan will convince one that this is quite an active field for electric interurban railways. The different lines are in various stages of promotion, but the prospects are good for considerable construction work during the season. The longest road proposed from Grand Rapids is the one to Kalamazoo, following the Grand Rapids & Indiana R. R. most of the way. From Martin a spur will be built to Allegan, where connection will be made with the proposed line to Benton Harbor. The line southwest to Holland parallels the C. & W. M. R. R. The interurban to Grand Haven will pass through Lamont and Eastmanville and follow the D., G. H. & M. R. R. to Spring Lake and Grand Haven. The line to run in a northeasterly direction will follow the county roads and connect Mill Creek, Plainfield, Silver and Boswick Lakes, Grattan Center, Cook Corners and terminate at Greenville.



NEW ST. LOUIS COMPANY.

The Brown syndicate, of St. Louis, has organized the Central Traction Co., and Patrick Calhoun, Murray Carleton, H. S. Priest, George W. Hunter and J. J. Coleman have been chosen directors. The directors on March 13th elected officers as follows: President, Murray Carleton; secretary, John H. Blessing; general manager, J. J. Coleman.

CARS WITHOUT WHEELS.

Street cars without wheels are the latest novelty in vehicles. The cars run on ball bearings, and, being near the line instead of raised above it, are not subject to the same amount of resistance in the form of centrifugal force. Much greater speed is thus obtained, and the wear of the balls in carrying the car is much less than the wear of the wheel rims. The movement of the tramcar is easy and agreeable.—Chicago Journal.

The Chicago cars still continue to run on wheels, however.

In the Power House

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

What is said to be a very delicate, accurate, reliable and simple test for the presence of acids in lubricating oils is proposed by Dr. Wiederhold. Sub-oxide of copper, the red oxide, is placed in a white glass vessel and covered with the oil to be tested. If the oil contains a trace of acid, or any resinous acid from rosin, which may have been used to adulterate it, it will turn green. In the cold the reaction requires from 15 to 30 minutes, but a gentle heat hastens it. The chemical reaction is as follows: The free vegetable and animal acids separate the sub-oxide into oxide of copper and metallic copper; the former then combines with the acid to form greenish-blue salts that dissolve in the oil and give color to it. If but little acid is present the green color is faint, more acid makes the color deeper, and if rosin has been used the color is bluish. Oil which is not turned green by this treatment may be pronounced free from acid.

A LARGE CONCRETE CHIMNEY.

What is believed to be the only large concrete chimney in this country, or perhaps elsewhere, is the one built last year at the plant of the Pacific Coast Borax Co., Bayonne, N. J. The factory building of this company, which covers a ground space in excess of 50,000 sq. ft. and incloses a volume of nearly 2,000,000 sq. ft., is entirely of concrete and steel construction. The chimney is 150 ft. high and 10 ft. 4 in. external and 7 ft. internal diameter. It is erected inside the building and therefore the lower 70 ft. is fully protected from wind pressure. There are two concrete shells; the outer one is 5 in. thick, the inner one 7½ in.; for the first 20 ft. the inner shaft is lined with firebrick. Each shell of the stack is reinforced by ¾-in. steel rings placed 2 ft. apart vertically and by eight ¾-in. vertical bars of square steel twisted. After the concrete had set it was dressed by a pneumatic hammer to give it the appearance of rough pointed masonry; wooden strips were inserted in the molds so that the exterior face is pointed to represent coursed ashlar work.

AN AUTOMATIC LUBRICATING SYSTEM.

In building power stations, both large and small, those responsible for the design and those who have the bills to pay often put off until the very last thing consideration of the system of lubrication to be adopted, regarding it as an unimportant detail, whereas efficient lubrication is an absolute necessity in operating machinery, and economy is as desirable in a lubricating system as elsewhere about a plant.

Automatic lubrication is recognized as economical because it is saving of both oil and labor, and a number of automatic systems have been developed, one of the most successful of which is that controlled by the Siegrist Lubricator Co., of St. Louis. This system is in use in the power house of the Southern Electric Railway Co., of St. Louis, and also in that of the Missouri-Edison Co., which has the lighting for the city of St. Louis. Mr. Herbert A. Wagner, general superintendent of the Missouri-Edison Co., states that in the six months that this oiling system has been in use the company has effected a saving because of the oiling apparatus of over $150 per month in the cost of oil and $150 per month in wages paid. Four oilers formerly required; the work is now done by one.

At this station the lubricating system comprises automatically governed oil pumps, oil piping, automatic sight-feed cylinder lubricators and bearing oil cups, and the necessary tanks and filters. Four small duplex pumps are mounted on a polished iron table 2 x 4½ ft. in size; two pumps are for cylinder oil and two for engine oil, though only one of each is used at a time, the others constituting a reserve. There are three pressure gages, one for steam and one each for the two systems oiling piping.

Pressure in the engine oil piping is kept at from 60 to 80 lb., independent of the quantity of oil used, by means of a regulating valve in the oil discharge pipe, acting to control the steam admission to the pump.

At each bearing or part to be oiled is a Siegrist automatic sight feed pressure oil cup. The rate of speed of each oil cup can be regulated at will by a thumb screw provided for that purpose, but a diaphragm pressure valve (see Fig. 1) in each cup instantly closes

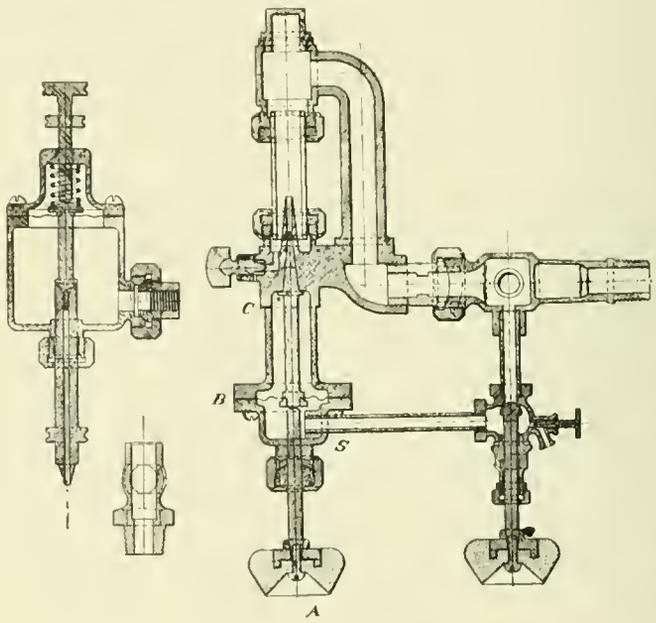

FIG. 1. FIG. 2.

the oil drip if the pressure in the system is lowered more than two or three pounds. One globe valve placed in the supply pipe for the oil system of each engine is therefore sufficient to start or stop all the oil cups on that engine. On closing this valve the flow of oil is stopped within a few seconds at every oil cup whether located at the highest or lowest points of the engines. This prevents any waste of oil after the engine is stopped.

For the cylinders Siegrist automatic lubricators are used. They have a sight feed, and the glass tube is 1 in. in diameter, giving but slight chance for oil to come in contact with the glass. A section of this is shown in Fig. 2; the diaphragm B has oil on one side and steam on the lower side, and if the oil pressure falls below that of the steam, the valve C is seated and the oil kept from backing down. The rate of feed is regulated by the screw A.

PURIFICATION OF WATER FOR STEAM BOILERS.

From a paper read before the Engineers' Society of Pennsylvania, by James Otis Handy.

The troubles which render boiler water purification necessary or desirable, are corrosion, scale formation, and foaming.

Corrosion is caused chiefly by acid waters from coal mines or coal washers, and is made evident by the appearance of red hydrate of iron in the boiler water. When the leaking of the boiler becomes so troublesome that repairs must be made, the tubes and sheets of the boiler are found to be covered with rust and pitted in

*Miscellaneous .002. **Price of Oil per Barrel.

a manner resembling worm-eaten wood. Many boilers in western Pennsylvania have been ruined by acid waters. The remedy lies in selecting a new supply, or in treating the water with lime or soda ash, or caustic soda as described later.

Corrosion may also be caused by organic acids contained in waters derived from peaty soils, or it may be due to the decomposition of magnesium chloride under the influence of heat in the boiler. In the latter case there is corrosion of the steam spaces and pipes as described later in this paper. The remedy for all tendency to corrosion is found in the maintenance of a slight excess of alkali in the waters at all times. Corrosion caused by the liberation of dissolved gases and by the air is not an important factor except in boilers which are cooled down every night.

The scale or incrustation forming in the tubes and sheets of the boilers may be hard or soft according as the water which is used contains only carbonate of lime, or both carbonate and sulphate of lime. The former deposits as a spongy coating which would not be adherent were it not for the crystallization of sulphate of lime between the particles of carbonate, thus forming a bond which is afterward made still stronger by the change of the $CaSO_4$, $2H_2O$ into anhydrite under the influence of the heated plates upon which the deposit has formed.

The rational remedy for scale formation is the removal of the lime compounds by treatment outside the boiler, or the addition of soda ash to decompose the sulphate of lime in the boiler. Scale allowed to accumulate means loss of fuel, injury to the heating surfaces, expense of cleaning, and danger of explosion.

The frothing or foaming of water in boilers may be due to one of several causes. Water free from suspended matter will foam if the alkali salts accumulate to 200 grains per gallon. Waters containing .75 grains of alkali and considerable sludge (precipitated carbonate of lime or magnesia) will also foam. Oily substances introduced into the boiler tend to produce foaming.

In any case the complete remedy is washing out, and the temporary relief is the blowing off of a part of the contents of the boiler and replacing it by fresh water.

The purification of water for use in steam boilers if intelligently carried out, pre-supposes, in the first place, a very intimate acquaintance with the properties and reactions of those substances which render natural water impure; and in the second place, a clear understanding of the conditions to which the boilers in which treated water is to be used are to be subjected.

The first requisite in any case is a correct analysis of the water, and this is by no means a simple matter. It is not sufficient to determine the total lime and total magnesia and base the proportion of purifying agents on these data alone. The amount of soluble lime, i. e., the lime as sulphate, chloride, and nitrate must be distinguished from the lime existing as carbonate. In the same way, the magnesia as sulphate, chloride, and nitrate must be distinguished from the magnesia in magnesium carbonate. It is not enough to evaporate a measured amount of water to dryness and to treat with hot water Some $CaSO_4$ may be left undissolved, and a small amount of $CaCO_3$, and a larger amount of $MgCO_3$ are sure to be dissolved along with the salts known to be freely soluble. In acid waters the free sulphuric acid and the sulphuric acid existing as sulphate of iron, and in peaty waters the organic acids, must be accurately determined, and this cannot be done unless the influence of acidity due to dissolved carbon di-oxide is eliminated, by thorough boiling.

In short the analyst must ascertain everything of import concerning a water which is to be purified, and having calculated the required charge of purifying agents, he should then make a laboratory trial of the efficiency of his formula.

The compounds existing in natural waters and influencing their value for steam making are:

Mud, organic matter, silica, oxides of iron and aluminum, carbonate of lime, carbonate of magnesium, sulphate of lime, sulphate of magnesium, chloride of lime, chloride of magnesium, nitrate of lime, nitrate of magnesium, carbonate of sodium, sulphate of sodium, chloride of sodium, nitrate of sodium, free sulphuric acid, sulphate of iron.

These may be classified imperfectly as follows:

Constituents forming sludge or soft scale: Mud, silica, oxides of iron and aluminum, $CaSO_3$ and $MgCO_3$.

Constituents forming hard scale: Sulphate of lime, hydrate of magnesia from decomposition of magnesium salts.

Constituents producing corrosion: Organic acids, and acids liberated by the decomposition of magnesium salts, notably the chloride, sulphuric acid and ferric sulphate.

Constituents causing foaming: Sulphates of magnesium and sodium, chlorides of lime and sodium, nitrates of lime, magnesium and sodium, certain organic matters and mud.

Upon entering the boiler, the water at a stationary plant has usually been heated by waste steam, so that a part of the dissolved gases have been expelled. In locomotive boilers, the water is not usually pre-heated. As the cold water enters the hot boiler, its dissolved gases are expelled by virtue of the temperature, although the condition of pressure existing in the boiler has some retarding effect on the liberation of the gas. Some corrosion of the metal by the escaping O and CO_2 is generally noticed near the point of entry. Following the expulsion of CO_2 precipitation of $CaCO_3$ and $MgCO_3$ occurs down to the point where they are held in solution by the water alone. After the first day's use of a newly filled boiler the deposition of CaCO, and MgO, will be at a constant rate dependent upon the rate of evaporation.

The $CaCO_3$ and $MgCO_3$ thus precipitated form at first a loose deposit or sludge, or a loosely adherent crust on the tubes and plates. Frequent blowing off removes most of this sludge, and washings out keep the boiler fairly clean and free from scale if no $CaSO_4$ is present. $MgCO_3$ is further decomposed into $Mg(OH)_2$ and CO_2. The hydrate, with $CaSO_4$, forms a hard porcelain-like incrustation. $CaSO_4$, lying as sludge in a boiler, may be acted on by $MgCl_2$, forming $Mg(OH)_2$ and $CaCl_2$ and CO_2, or by $MgSO_4$ forming $Mg(OH)_2$ and $CaSO_4$. The latter change should be guarded against very carefully. $Mg(OH)_2$ is usually found in boiler scales to the exclusion of $MgCO_3$.

$CaSO_4$ in boiler water is not completely deposited. Tilden and Shenstone's experiments have shown that the popular belief that $CaSO_4$, is practically insoluble at temperature above 212° F,, is not correct. At 473° F., higher than any ordinary steam boiler temperature, pure water can retain in solution 12.6 grains $CaSO_4$ per imperial gallon=18. parts per 100,000. Hence it is probable that $CaSO_4$ deposits even more regularly than the carbonates, with increasing density of the water. The solubility of $CaSO_4$ is increased by NaCl up to a certain point. Na_2SO_4 is said to have a similar effect and $CaCl_2$ the opposite influence. $MgCl_2$, at ordinary temperature, increases solubility, but at higher temperatures it diminishes it. A small amount of $CaSO_4$ seems to have the power of transforming a loosely adherent coating of $CaCO_3$ and $Mg(OH)_2$ into a more adherent scale, but an excess of $CaSO_4$ is necessary to make a really hard scale.

The reagents that have been proposed for the purification of water are: Hydrochloric acid, barium salts, magnesia, alkali oxalates, lime, carbonate of soda, caustic soda, phosphate of soda, fluorides.

Hydrochloric acid has been used for waters containing bicarbonates of lime and magnesia. If used to excess it causes much trouble and is not used in boilers.

Barium chloride has been suggested for waters containing calcium sulphate, but the reaction does not take place in the cold; and if magnesium sulphate is present magnesium chloride is formed which is objectionable because of its corrosive action.

Hydrate of barium precipitates both the bicarbonates and sulphates of lime and magnesia, but it is too costly.

Magnesium hydrate has been tried as a water purifier, but is very costly and the purification is incomplete.

The lime salts are all precipitated by oxalate of sodium. As a by-product of the reaction of sodium oxalate on the bicarbonate of lime, there results carbonate of soda, and this, if formed in sufficient amount, will theoretically precipitate the magnesia which the water contains. As a matter of fact, when used in the cold, sodium oxalate produces a precipitate which settles very slowly, and although the deposition is more rapid when the solution is heated, it is still necessary to filter in order to obtain a clear water. Sodium oxalate being expensive, the process is costly, and although it is possible to regenerate by heating the precipitated oxalate of lime with sodium carbonate, this method has not found general favor.

In 1840, Dr. Clark, of Aberdeen, patented his process for purifying water by the addition of lime. This process is especially useful for waters containing only carbonate of lime, sulphate of lime is not acted on by CaH_2O_2. Bicarbonate of magnesium is precipitated by CaH_2O_2, but the deposition of the $MgCO_3$ is very slow.

The reaction with magnesium sulphate has a very objectionable by-product, $CaSO_4$.

It is not possible to lower the $CaCO_3$ below 3.6 parts per 100,000, the solubility of $CaCO_3$ in pure water, and as a matter of fact, the result of the Clark process is usually not so good as this. At Bushey, in Herts, near London, the Clark process is used for purifying the town supply and the purified water has a hardness of 5 to 6 degrees, corresponding to 7 to 8.5 parts per 100,000.

Lime and soda ash are often used in conjunction and are capable of bringing about a nearly perfect softening of any water intended for boiler use. The amounts of carbonate of soda and lime which are used are to be varied according to the proportions of bicarbonate or temporary hardness and the sulphates and chlorides of lime and magnesia which constitute permanent hardness. The following rules have been formulated and are concisely given in "Water and Its Purification," S. Rideal, London, 1897.

Rule 1. For a water in which the temporary hardness exceeds the permanent, caustic soda must be added equivalent to the permanent hardness, and lime equivalent to the temporary hardness minus the permanent hardness.

Rule 2. For a water in which the permanent hardness, due to sulphate of lime, exceeds the temporary hardness, carbonate of soda must first be added in proportion to the permanent hardness, and then, if necessary, lime equivalent to the temporary hardness.

My own experiments have indicated that the process is not available for waters which contain only moderate amounts of carbonate and sulphate of lime.

Carbonate of soda may be used for purifying water and has proved its usefulness in railroad work. Unless the water is rich in calcium sulphate no precipitation takes place in the cold.

Caustic soda is capable of effecting a complete purification of water provided it contains enough carbonic acid in carbonates to form with the caustic soda sufficient carbonate of soda to precipitate the sulphate of lime. If the water is moderately hard, purification cannot be accomplished in the cold.

Sodium phosphate enters into reaction at once with all lime and magnesia compounds in natural waters.

The water purifiers adaptable for softening outside the boiler are:

Lime.—For bicarbonates; for soluble magnesia, if high; for acid waters of any degree of acidity.

Soda ash.—For waters containing $CaSO_4$ or $CaCl_2$ or $Ca(NO_3)_2$ in large proportion. Ordinary waters unaffected by soda ash in the cold.

Caustic soda.—For bicarbonates directly; for magnesia salts, if present in extraordinary proportion; for soluble lime if sufficient Na_2CO_3 is formed by the decomposition of the bicarbonates.

Tri-sodium phosphate.—For lime compounds. About 75 per cent is precipitated in the cold. Magnesium phosphate deposits with extreme slowness.

Sodium fluoride.—Unsuited for precipitations of lime and magnesia outside the boiler.

Bicarbonate of lime and to a less extent bicarbonate of magnesia, may be precipitated outside the boiler by lime or soda or tri-sodium phosphate; for sulphate of lime, and other soluble salts, if present in large proportion, use soda ash; if in smaller amount, only tri-sodium phosphate is available. From water containing both bicarbonate and sulphate of lime, the use of lime and soda ash removes indirectly nearly all of the soluble lime compounds. For acid waters, lime may be used, but soda ash or caustic soda are the best neutralizing agents.

For magnesia compounds in ordinary waters, no practically successful means of precipitation in the cold is known. In connection with removal of lime by the use of lime and soda ash, a small amount of magnesia is precipitated.

Those adaptable for softening water in the boiler are:

For bicarbonates.—No precipitant is needed. Heat accomplishes the work.

For soluble magnesia compounds.—No precipitant is needed. They are decomposed under boiler conditions, the magnesia being deposited as hydrate. This deposition is hastened by the presence of soda ash or caustic soda, and any acid liberated by decomposition of magnesia salts is at once taken up and rendered harmless.

For soluble lime salts.—Soda ash is cheap and effective. The sludge must, of course, be removed regularly. Sodium phosphate may be used. It forms light, bulky precipitates, whereas those formed by sodium carbonate are more dense. Sodium fluoride may be used, but the expense is two and a half times greater than that for soda ash, even when only one-fourth of the required amount is used, as suggested by its advocates.

Furthermore, there is no means of preventing sodium phosphate and sodium fluoride, when added to a water containing both bicarbonates and sulphates from doing useless work by precipitating the bicarbonates, and leaving the sulphates undecomposed.

The Consolidated Electric Light Co., of Birmingham, Ala., has placed an order for two 600-h. p. engines, and the necessary boiler equipment. They will be built in Birmingham and are to drive railway generators.

The work of building foundations for the elevated structure of the Boston Elevated Railway Co. is progressing rapidly, and the piers will be ready to receive the iron work as it arrives.

The Lake Street Elevated Railroad Co., Chicago, has appealed its case against William Zeigler and others to enjoin the foreclosure of a $6,500,000 mortgage, to the United States Circuit Court of Appeals.

The Leavenworth (Kan.) Electric Railroad Co. has increased 10 per cent the wages of all employes who have been in the company's service for five years or more; other employes receive an advance of 5 per cent.

The power transmission line between Stockton, Cal., and the Blue Lakes has been inspected and pronounced complete. The company is awaiting the arrival of the transformers from the East. The line is of aluminum wire.

Designing Boilers for a Small Street Railway Plant.

BY WILLIAM KENT, M. E.

PART III.

EXTENT OF HEATING SURFACE REQUIRED.

For factory boilers, or for any boilers that are to be driven at a uniform rate throughout the day, the boilers should be so proportioned that the rate of driving should not exceed 3 lbs. of water from and at 212° per sq. ft. of heating surface per hour; the extra cost of coal for driving at a more rapid rate usually being greater than the interest on the extra investment necessary to secure a sufficient extent of heating surface over and above that required for more rapid rates of driving.

With boilers for electric street railway service, however, the case is entirely different. The heavy load upon the boiler plant lasts for only about two hours out of the 24, and unless money is very cheap and coal very dear, it will usually pay to sacrifice 15 per cent of economy during those two hours rather than go to the expense necessary to proportion the boilers so that they will be driven at their most economical rate during those two hours. It is also to be considered that the extra boiler which is to be put in the plant so that any one boiler may at any time be laid off for cleaning or repairs may be used most of the time, since repairs and cleaning are not required often, so that all the boilers may be in service during the time of the peak of the load for a large proportion of the days in the year, and the excessive rate of driving during the time of the peak of the load may thus be diminished.

It will therefore not be bad designing if the extent of heating surface is proportioned so as to allow of the boilers, after one is laid off for cleaning or repairs, to be driven at a rate of 6 lbs. of water evaporated from and at 212° per sq. ft. of heating surface per hour during the time of the peak of the load, provided that no mistake has been made in estimating the quantity of steam needed during that time, due consideration being had to the fact that the engines are wasteful of steam when overloaded, as they are likely to be during that time, and provided also that sufficient coal burning capacity is provided in the furnaces, so that enough coal may be burned, including the 15 per cent wasted by rapid driving, to supply this steam, under the most unfavorable conditions of wet weather and of poor coal.

Assume that the steam engineer's estimates show that 600 indicated h. p. will be required to be furnished by the engines during the time of maximum load, that the engines are non-condensing, requiring 30 lbs. of steam per i. h. p. per hour at their economical load and 20 per cent more when overloaded so as to furnish the 600 i. h. p.; that the feed water is furnished from a heater at 200° F and that the steam pressure is 125 lbs., we then make a calculation as follows:

	600	I. H. P.
	30	Lbs. steam per I. H. P. per hour.
	18,000	Lbs. per hour.
Add	3,600	20 per cent for overloaded engines.
	21,600	Lbs. per hour.
Mult. by	1.057	Factor of evaporation for feed at 200° and steam of 125 lbs.
Product	22,831	Lbs. equivalent evaporation from and at 212° per hour.
Divide by.	6	Lbs. evap. per sq. ft. heating surface per hour.
Quotient	3,805	Sq. ft. heating surface.

This is the very smallest amount of heating surface that should be provided for the given conditions. It may be divided among two boilers of not less than 1,903 sq. ft. each, or three boilers of 1,268 sq. ft. each, and in either case an additional boiler of the same size must be provided so that one boiler may be laid off. The plant will therefore contain either three boilers of 1,903 sq. ft. each = 5,709 sq. ft., or four boilers of 1,268 sq. ft. each = 5,172 sq. ft. It may be found that the three larger boilers including setting, valves, piping, etc., will cost little if any more than the four smaller boilers with their setting, etc., and it may also be considered advisable to have the three larger boilers, with their greater total extent of heating surface, to provide against the contingency of an increased amount of steam being needed by the engines.

A plant of three boilers is a favorite arrangement for a new street railway plant, two of the boilers being set in one battery and the third singly, a space being left alongside of the third boiler for a fourth, completing two batteries, if ever it should be needed.

Now let us assume that the coal to be used is a rather low grade of Illinois coal, of a heating value of 14,300 heat units per lb. combustible, and that it may be expected to contain occasionally as high as 18 per cent ash and 12 per cent moisture. The heating value per lb. of coal will then be 14,300×.70=10,010 heat units. This divided by 965.7 gives 10.36 lbs. of water from and at 212° as the possible evaporation of the coal if it were completely burned and all the heat utilized by the boiler. But only a portion can be utilized, say 55 per cent, if the boiler is provided only with an ordinary setting, or say 65 per cent if it is set with a fire-brick oven, especially designed to burn the volatile gases, or if it is provided with a down-draft furnace or a mechanical stoker suitable for that grade of coal. The difference in economy between an efficiency of 55 per cent and one of 65 per cent is not 10 per cent, as some may suppose, but 10÷.65= 15.4 per cent.

We now make the following calculation:

	Plain furnace.	Special furnace.
Heating value of 1 lb. of coal, equivalent evaporation from and at 212°	10.36	10.36
Efficiency of boiler and furnace	.55	.65
Product, lbs. from and at 212°	5.698	6.734
Deduct 15 per cent for loss due to driving the boiler at 6 lbs. per sq. ft. of heating surface per hour, or double its most economical rate	.855	1.010
Lbs. water evaporated from and at 212°, per lb. coal	4.843	5.724
Divide these figures into the figure already found for total water from and at 212° per hour	22,831	22,831
Quotient, lbs. of coal per hour	4,714	3,989

The difference, 725 lbs., is 15.4 per cent of 4,714 lbs., which agrees with the economy of the more efficient furnace, as above stated, and checks the computation.

EXTENT OF GRATE SURFACE REQUIRED.

To calculate the extent of grate surface required we must know how many pounds of coal may be burned per sq. ft. of grate per hour. This will depend on the draft, on the kind of grate used, and on the nature of the coal as to free-burning quality and as to its clinkering on the grates and choking the air supply. We may assume that a chimney 150 ft. high is provided, which after making allowances for bends in the flues from the boiler to the chimney will under the most unfavorable conditions of weather give a draft of at least 0.5 in. of water column at the end of the boiler. The coal is free-burning, and will burn rapidly if supplied with enough air through the grate bars, but it clinkers badly. With ordinary grates we cannot count on burning it at a faster rate than 25 lbs. per sq. ft. of grate per hour, but with shaking grates well handled so as to keep the fire clear of clinker a rate of 35 lbs. may be expected. We now calculate the grate surface required as follows:

	Plain furnace.	Special furnace.
Coal to be burned per hour, lbs.	4,714	3,989
Plain grates, 25 lbs. per hour, sq. ft.	189	160
Shaking grates, 35 lbs. per hour, sq. ft.	135	114

With shaking grates and hard, steady firing, we may expect a loss through the grates of unburned coal amounting to about 2 per cent more than the loss through the plain grates, but as in a street railway plant this hard firing will last only about two hours a day we need make no change in our calculation on this account.

We thus have four different figures for the extent of grate surface required, according to whether we use ordinary or special furnaces

and ordinary or shaking grates. Dividing the heating surface already found, 3,805, by these figures we have for the ratio of heating to grate surface the following:

	Plain furnace		Special furnace	
	Plain grate	Shaking grate	Plain grate	Shaking grate
Sq. ft. of grate	189	135	160	114
Ratio heating to grate surface	20.1	28.2	23.8	33.3

These figures for the ratio of heating to grate surface are very much smaller than those provided in the common designs of modern boilers, especially those of the water-tube type. The ratio they give usually ranges from 35 to 50. The reason for this difference is that the data upon which the above calculations are based are very different from those upon which these boilers are designed. We have assumed a maximum rate of driving of 6 lbs. of water evaporated from and at 212° per sq. ft. of heating surface per hour, with an intentional sacrifice of economy in order to save first cost of installation. We have also assumed a low grade of coal that clinkers on the grate, and in the case of the plain furnace a low efficiency. In the design of the ordinary water tube boiler, especially for factory purposes, economy of coal is the first consideration. The heating surface is therefore made of such an extent that it does not require to be driven at a rate greater than 3 lbs. per sq. ft. per hour on an average, with a maximum of 4 or 4½ lbs. The boilers are by most builders rated in h. p., at the rate of 3 lbs. evaporation per sq. ft. of heating surface per hour, and when evaporation tests are made to prove guarantees a good quality of coal is usually obtained and the boilers are driven at not above 4 lbs. per sq. ft. of heating surface per hour.

Another reason for the high ratios of heating to grate surface in modern water tube boilers is that when designed with a view to economy of first cost and of ground space occupied they are made long, narrow and high, so as to pile a great amount of heating surface on a small ground area. A narrow boiler means a narrow grate surface, and as it is not easy for a fireman to handle with good results a grate over 7 ft. long, it means limited extent of grate surface. This is all right for good semi-bituminous coal or for Pittsburg or Hocking Valley bituminous, which are both free burning and low in ash. With these coals and strong draft, and a ratio of heating to grate surface of 45 or even 50 to 1 it is possible to drive the boiler to double its economical rate. For poor coals, however, whether anthracite or bituminous, such a ratio gives entirely too small a grate for rapid driving.

About three years ago in a series of tests made by the writer on a water tube boiler, with a very poor quality of Illinois coal, with an ordinary furnace and plain grate bars, and with a good draft, he found that only about 85 per cent of the capacity of the boiler could be developed even with the expert firing. The chief troubles were the clinkering of the grates and the excessive amount of moisture in the coal, which retarded the combustion. With the same boiler provided with a fire-brick arch setting, with shaking grates, and with Hocking Valley lump coal the boiler was driven to over 170 per cent of its rating, or over 5.1 lbs. of water evaporated from and at 212° per sq. ft. of heating surface per hour. Had it been possible to double the extent of grate surface when using the poor grade of coal it is quite likely that the capacity obtained could have been doubled.

Having made the calculation, as above shown, for the extent of grate surface required under the four assumed conditions, we must next consider which one of the four results should be adopted in the design. Unless coal is very cheap it will pay to go to any reasonable expense to provide the special furnace, either a fire-brick oven built in front of the boiler with arrangements for burning the smoky gases, or a down-draft furnace, or a mechanical stoker. With any of these devices a saving of 15 per cent in fuel should be expected when the coal is a highly volatile bituminous. Shaking grates are also desirable in a street railway plant using poor fuel, since they enable the grate to be kept free from clinker, and diminish greatly the grate surface and therefore the ground area required.

SPECIFICATIONS FOR BIDS.

Having fixed upon the extent of grate surface that is necessary to burn the coal under the most unfavorable conditions of weather, moisture, etc., for the heaviest load, adding, of course, the grate surface for the extra or reserve boiler, this should be entered in the specifications for bidders for boilers, and no bid should be considered which did not give the full extent called for. Many expensive mistakes have been made by purchasers of boilers who have accepted the guarantees of economy and capacity offered by builders, without reference to the extent of grate surface. After erection the boilers may be proved to have fulfilled the guarantees, on an expert test, with good coal, but afterwards they fail to develop the additional capacity required of them in emergencies, or even their rated capacity, when the coal is poorer than that used in the test. The remedy then usually is the costly one of obtaining additional boilers, and sometimes of building a new boiler house. The purchaser is fortunate if he can by a change in the style of furnace, or of grates, or by building a taller chimney, or by introducing forced draft, so increase the capacity of the boilers as to avoid the necessity of buying additional ones.

The extent of heating surface found by the calculation should also be entered in the specifications as the minimum to be bidden upon. Some bidders may not be able to furnish together with the specified extent of grate surface as small an extent of heating surface as that called for, since their designs are not adapted for such small ratios of heating to grate surface as those given above, but there is no objection to their furnishing as much more as they choose, and among bidders offering the same grate surface those offering the greater extent of heating surface should have the preference, other conditions being equal. Capacity for emergencies being obtained by extent of grate surface, economy of coal will be obtained by extent of heating surface above that needed to give an evaporation at the rate of 6 lbs. per sq. ft. of heating surface per hour.

BIDDERS' GUARANTEES.

Guarantees of economy and capacity may be inserted in specifications, but they should be considered secondary as compared with dimensions of grate and heating surface, and no attention should be paid to guarantees of unusual economy offered by any bidder who does not give any more heating surface than other bidders, unless that guarantee is based upon the offer of a special furnace or stoker, which may reasonably be expected to give better economy than a plain furnace when soft coal is used.

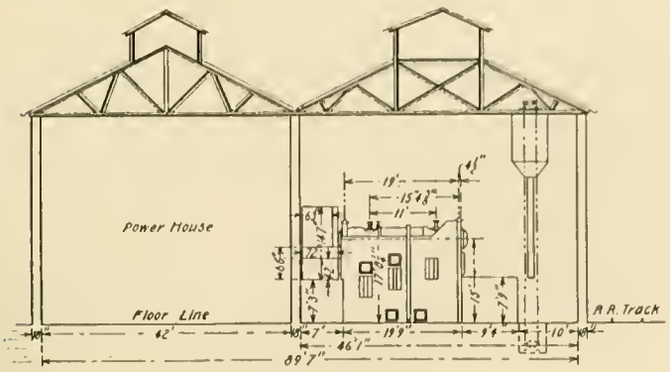
TYPE OF BOILER.

The calculations made as above described are applicable to any type of boiler. The selection of a type depends on other considerations than capacity or economy, for these depend upon proportions and not on type. These considerations are safety, durability, convenience or facility for cleaning and making repairs, ground space occupied, ability to furnish dry steam when overdriven, and last of all, cost. The writer's preference among the great variety of types now in the market, is the common form of water tube boiler, with horizontal steam and water drum and straight inclined tubes. The excellence of this form of boiler has now been proved by 30 years of experience in this and other countries, under all conditions of fuel, water and service. The foundation patents on this type having expired, and competition among builders being brisk, the old objection of high cost no longer holds.

ARRANGEMENT OF BOILERS.

The accompanying cuts show a good arrangement of water tube boilers, recently planned by the Babcock & Wilcox Company. Two boilers are set in a battery, with a division wall between them, so that either boiler can be run independent of the other. The complete plant may contain two or more such batteries, with a space of 3½ or 4 ft. between each battery and an equal space between the end wall of the boiler house and the first battery, to give ample room for blowing off the dust from the tubes, which is done by a steam nozzle inserted in the cleaning doors in the side walls. Each boiler contains 126 4-in. tubes 18 ft. long, set in 14 staggered vertical rows, nine tubes high, each vertical row being expanded into a header or manifold at each end. There are two horizontal steam and water drums in each boiler, 3 ft. diameter and 18 ft. long. The total heating surface of each boiler is about 2,700 feet, equivalent to 235 boiler h. p., at 11½ sq. ft. per h. p. The furnace is built in a fire-brick oven extending in front of the boiler, giving a large space for combustion of the gases of the fuel before they are allowed to touch the heating surface of the boiler. Provision is made for

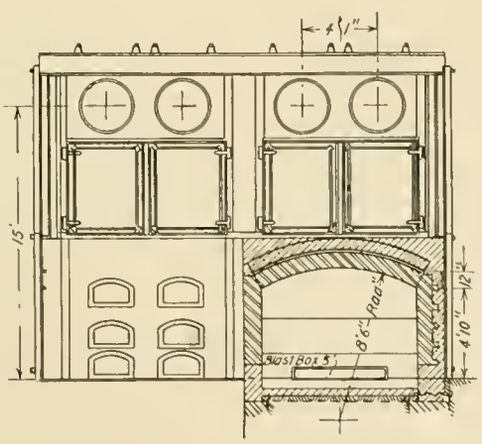
forced draft by a large flue built in the bridge wall with openings leading into the ashpit under each boiler. Part of the air may be admitted at the bridge wall, through the narrow vertical passage shown in the drawing. Coal is stored in bins located in the upper part of the boiler house, and is led down to the space in front of the furnace by vertical pipes. The position of the coal pipes and also



SECTION OF STATION.

of the coal conveyor for lifting the coal into the overhead bins is shown in one of the drawings. A large horizontal flue leading to the chimney is located immediately in the rear of the water and steam drums, into which each boiler discharges its flue gases. The space underneath this flue gives access to the rear end of the boilers and to their mud drums. The whole arrangement is an excellent one for a street railway plant. Ample room for coal storage is available above the oven furnace, so that the floor space usually required for storing coal is saved. The oven insures greater economy of fuel when soft coal is used than the ordinary furnace built under the tubes, and the arrangement for forced draft gives provision for driving the boilers far beyond their rated power in case of emergencies. Sufficient space is left in front of the boiler for the easy removal and replacement of a tube, and for removing the scale from the tubes by means of scrapers or other scaling appliances.

The writer would suggest one modification of this plan for use with very poor qualities of coal, high in ash and sulphur. It is that the space of 3 ft. 6 in. between adjoining pairs of furnaces, which is not needed for access to the cleaning doors, since the space between the boilers may be reached from the rear passage under the flue, be utilized for increasing the width of the furnaces. By this means each furnace may be increased in width from 8 ft. 6 in. to 10 ft. 8 in., leaving a 24-in. wall between each two adjoining furnaces. The grate surface may thus be increased 25 per cent, giving the furnace this much increased coal burning capacity, if the air supply be sufficiently increased to burn this additional quantity of coal. Since the capacity of a boiler using poor coal depends on the extent of grate surface, rather than upon the extent of heating surface, it is possible by this increase of the grate surface to increase the boiler capacity 25 per cent, and to make four boilers do the work of five set with the ordinary area of grate, thereby making a most important saving in the cost of boilers for a given plant. Such an increase of grate surface is, however, not recommended if good free burning coal, low in ash, is to be used, for in that case enough coal may be burned in the regular sizes of grate to develop much more than the rated capacity of the boilers, and too great an area of grate surface is apt to lead to boilers being driven far beyond their economical rate, thus causing a great waste of fuel.



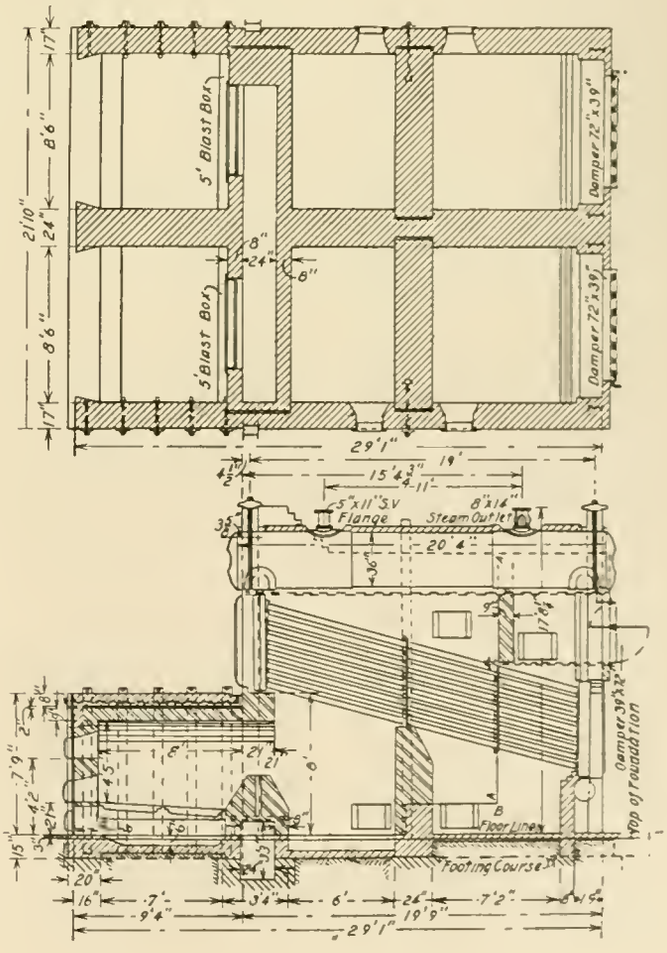
CHANGES IN DALLAS, TEX.

Mr. G. Van Ginkle, of Des Moines, Ia., for himself and Messrs. T. M. Earl and P. H. Bousquet, of the same place, has purchased the Dallas (Tex.) Consolidated Electric Street Ry. property for $900,000. The receipts of this road at this season of the year are reported as $350 per day, which will, it is expected, be increased at least $100 per day by reason of improvements which are soon to be made in the system. One of the lines, six miles long, which has been operated by animal traction, is to be equipped for the overhead electric system.

Dallas is now enjoying a rapid growth, and there is every reason to believe that the street railway company will receive its share of the prosperity. It is stated that there are now 500 residences and numerous business blocks in course of construction, and the predictions are that Dallas, now claiming 65,000, will have a population of 100,000 in five years from now.

The formal opening of the new electric line between Carlisle, Pa., and Wilmington took place on March 20th. Special cars filled with guests left Wilmington at 9.30 and made the round trip.

The Suburban Electric Railway Co. has been temporarily enjoined from laying double tracks on the turnpike near Belleville, Wis. The petition was brought by abutting property owners, who object to a second track, claiming that one is amply sufficient for the traffic.



BOILER SETTING.

The Relations of Municipalities and Their Street Railways.

Benefits of a Street Railway—Why it should not be Persecuted—The Liability for Paving from the Company's Point of View.

BY JOHN W. BOYLE, PRESIDENT OF THE UTICA BELT LINE STREET RAILROAD CO., UTICA, N. Y.

In all controversies there are two sides of the question. A persistent and reiterated presentation of one side, especially when this is in the nature of an arraignment of the other, with silence on the part of the other, is usually construed to mean that the other has nothing it can say in its own justification. This is not true in the present taxpayer-railroad controversy, and this is to present the question from the railroad point. I assume that a street railroad company is entitled to a point of view.

Throughout the press of the state of New York in those localities where a good railroad service is already in existence, the statement is being printed under conspicuous head lines, and the assertion is made, editorially, that the railroads are moving heaven and earth to shift their burdens on the taxpayers. In those localities which do not possess a good railroad service, and which are desirous of obtaining one, local bills are being introduced at Albany to relieve the railway from this same taxation, this being necessary in order to induce a company to invest its capital in a plant.

The fact that a railroad is built, and cannot be picked up and carried out of the city, if unjustly treated and taxed, renders it a peculiarly safe object of attack. The people know that even while they are endeavoring to slaughter the corporation, they will miss none of the conveniences and benefits of its service. A railroad cannot afford to retaliate by lowering the excellence of its accommodations. There is everything to gain and nothing to lose. The position taken by a portion of the public is not the loftiest one in the world, but it is exceedingly human.

The present agitation is over the liability of the street railroads for the cost of paving between its tracks and for 2 ft. outside. If this liability exists it is fixed by law. No law is infallible or immutable. It is entirely possible that two radically different opinions as to the justice of a statute, as well as to its interpretation, can exist and each be a perfectly honest one. The street railroads of this state, more especially those of cities below the first class, deny emphatically the "righteousness and justice" of the present law, as recently interpreted. They claim they should not be asked to pay for a pavement which is no benefit to them, which may be used by every vehicle in the city except the street cars, and which, if the railway plant could be swept from the streets of the city, the taxpayers would be obliged to pay for, and would simply be deprived of a convenience that no city can exist without.

Pavements are built only at the request of abutting property owners. They secure the pavement and pay for it for their individual convenience and benefit, and this proposition is so well recognized that the law compels them to pay two-thirds of the cost of the pavement and the city one-third, on the ground that the abutting property owner is the persons chiefly benefited. Does any one pretend that the pavement benefits the railroad companies? They use not one square foot of pavement. The street car is the only vehicle in the street which furnishes and keeps in repair at its own expense that portion of the street upon which its wheels revolve. It is the only vehicle which neither uses, wears out, nor litters the pavement. It is the only one which will furnish the public any kind of transportation for 5 cents. Every other common carrier furnishes his carriage or wagon and the taxpayers furnish the pavement for him to use, yet not another carrier will furnish transportation to those taxpayers for less than from five to twenty times the street car fare.

When a new pavement is to be laid a track, which is perfectly satisfactory to the company, and which has cost thousands of dollars to build, must be torn up, a new and expensive construction put in, entirely unnecessary except for the pavement, and when it is finally laid, it becomes a constant source of inconvenience and expense, whenever work is necessary upon the tracks. And the railroad company is expected to, and does, bear this increased expense for an improvement which is made for the benefit of every one in the city except itself.

Now it is proposed to compel the railroad companies to pay for about one-third of these pavements, which are a postive detriment to them, but have been laid at the solicitation of the property owners for the benefit of themselves and their property; and the attempt of the railroads to avoid this imposition is called "an astonishing scheme to further deliver the people into the hands of the railroad corporations."

The present law has been upon the statute books for 15 years. This fact is commented on in most of the attacks upon the railroads and the assertion is made that they obtained their franchises and were built under the present law, and having accepted these franchises and been built under this law, they are not justified in now asking its repeal or amendment. They are also accused of having evaded their "just" taxes all these years.

A discriminating selection of facts, is it not? But omits the important point that for more than 14 years of that time the decisions of the courts of this state, under this same law, exempted the railroads from liability for the cost of new pavements. It was under these decisions that more than two-thirds of the street railroads of the state were built, including the entire Belt Line system, and they can hardly be considered reprehensible in declining to pay taxes for which the courts had decided they were not liable. But these decisions, favorable to the railroads, were not acceptable to the taxpayers, and every effort was made to reverse this interpretation of the law. These efforts were considered entirely justifiable and nothing was heard of the "righteous and legal liability" of the taxpayers as fixed by those decisions. But when, after 14 years a decision against the railroads was finally obtained, and they in their turn sought relief from this decision, the press of the state comes down with an avalanche of vituperation upon the street railroad companies and declares their action an outrage on the taxpayers.

That this last interpretation of the law was by the court of appeals does not by any means establish the justice of the law itself. It simply establishes its meaning. It does, however, force the railroad companies to seek relief through legislation, instead of litigation. There is a prescribed routine for this, and it involves the presentation of the desired bill to the Legislature by some member of that body. But the members of the Legislature are being frantically warned that they are sent to Albany by the people, they are paid by the people, and are there to protect the people's rights. But the only people who have rights to be protected, who are entitled to frame the laws affecting street railroads are those who have not one dollar of interest in street railroad properties, and to whom their financial success or ruin is a matter of no concern. These are the people, and the protection of their rights means war upon the street railway corporations.

But what of the component parts of a corporation? Since when have men become outcasts from the people of their state, because they have united their capital and efforts for the prosecution of a business that one or two could not possibly conduct? And yet that is all there is to a corporation. Does a man who invests his money in a street railway property rather than a manufacturing business, therefore forfeit his right as a citizen to legislative representation and protection, and become a proscribed enemy of mankind, denied all right of relief or protest? It would seem so.

The representatives at Albany are paid by taxes, and of those taxes the street railroads pay their full and legal share in their respective districts. They are entitled to the same representation, protection in their business interests, and against oppressive legislation and courtesies from their representatives as any other taxpayer in the community. This is their right. How is it granted? It is almost worth the political life and reputation of any member of the Legislature if he dares to introduce a bill which remotely or directly is intended for the benefit of a surface railroad. He is at once branded as a scoundrel and corruptionist, and the tool of the railroad companies. It is strange that the promoter of any scheme to fasten a burden upon a railroad for the benefit of some one else

is never a tool. He may be a striker, but not a tool. If the recent decision of the court had been like those preceding it, in favor of railroads, how many bills would have been introduced at Albany this winter nullifying this law, and placing the burden on the railway corporations? But these would have been bills for the "relief of the people," not a "taxpayer's grab." Verily, it makes much difference whose ox is gored.

In fixing the duties and liabilities of street railroads very little argument is used. It is largely a matter of assertion. It is allowed to exist, therefore it should be compelled to pay for the privilege of existence. If one asks why, he is given invariably the following reasons: The railroads occupy the streets; they have possession of the streets; they injure the pavements; they have been donated a valuable franchise. Let us see. The company occupies the streets. Yes, as regards its cars, precisely as all other vehicles occupy them, except that in proportion to the number of persons carried, it occupies a much smaller portion of the street than do other vehicles. If the passengers carried by street cars were transported in any other known conveyance the streets would be considerably more occupied than at present, and very much more to the detriment of the pavement. Its tracks certainly occupy a portion of the street surface, and are something of an inconvenience, but they are an absolute necessity, if cars are to be run or anything like rapid transit given. Does any one pretend that the inconvenience of the track overbalances the convenience of the cars? That a city would be better off to remove from within its limits both tracks and cars? I think not. But if people are not to be compelled to walk or pay carriage hire, but are entitled to cheap transportation, some portion of the surface of the earth must be occupied to accomplish it. This is made necessary by the laws of gravitation, for which the railroad companies are not yet held responsible.

"They take possession of the streets," but when a person riding or walking disputes that question and collides with the car, he brings suit for damages. Nothing is now heard of the railroad having possession or exclusive use of that portion of the street. Judge and jury inform the company that if it was a possible thing for their motorman to stop his car, and give that person safe passage across the tracks in front of it, he was bound to do so. If he failed the company is liable for damages. If the company is exonerated it must not be because of any paramount right of the car in the street, but on precisely the same grounds that would relieve a truck driver from liability under the same conditions. Where, then, is the possession of the street?

"They injure the pavements." Not when the pavement is properly constructed. But when, under poor construction, defects appear in a pavement, it is a question of repairs, and no railroad company ever fought the law that placed upon them the liability for repairs on the portion of the street in question.

"The city has donated a valuable franchise." Has it donated it? When you part with one commodity and receive another in return, does either party to the transaction talk of donation? I maintain that the relations of municipalities and their street railways are entirely reciprocal; that when a city grants a franchise to a railroad company, that company, in the building its road, confers as great a benefit upon the city as the municipality has conferred upon the company in granting the railroad the privilege of existence and allowing its owners to invest their money and take the risks of the enterprise. The value of a franchise to a company is measured by its value to the public. These values correspond exactly. A street railway franchise is not worth a dollar unless the public patronizes the cars. The cars are patronized only by those to whom the accommodation is worth a nickel. No one ever rides under compulsion or for the benefit of the railroad, but solely for their own convenience, and when they decide that convenience is not worth their nickel they keep the nickel and walk. Every dollar in the company's coffers means a dollar's worth of accommodation to the people, and the value of that accommodation was passed upon by them before they entered a car. It is no answer to this to say that many ride from necessity, because the exigencies of their business demand it and pay the fare under protest. There are people who pay under protest for the food they eat and the clothes they wear; but when the food has been furnished them at the lowest market price, and the clothing for less than any other merchant of the city sells it, the protest carries little weight. If people ride from necessity, then the railroad becomes a necessity to the city, which is precisely what the railroad companies claim.

But those who are broad minded enough to admit the benefits of street railroads and their necessity to the existence of a city sometimes add that it is nevertheless an opportunity given the railroads to conduct a business and eventually reap profits, and that therefore they are indebted to the municipality for the chance and should be willing to pay for the favor.

If any other business enterprise proposes to establish itself in a new location subscriptions are circulated, money is donated, gifts of sites are made, and chambers of commerce fall over themselves in order to secure the plant in their city. Is there any one manufacturing business that contributes more to the prosperity of a city of fifty thousand population than does its railway plant? It would be a very extensive and well established business if it did. Is there any one manufacturing business that the city of Utica, for instance, could not dispense with for the next fifty years more easily than with its street railroads? If a modern Solomon forced a city to decide on the value of its respective business enterprises, by depriving it entirely of the less valuable, would the street railway be thrown out first? If a street railway were unattainable except by effort on the part of a city, would any municipality in the state leave a stone unturned to secure one? Yet all other business enterprises should be paid to come, but a street railroad should pay for the privilege of coming.

But it is said, in the case of Utica, that the Belt Line has a practical monopoly as a carrier. It is not likely to attract much competition with fares at 4 cents. The different lines of the city are under its control, but when the franchises for those lines were applied for did any other company signify a willingness to build them, or to bid on those valuable franchises? Did no one but the Belt Line company have sufficient foresight to see the need of a good and extended railway service, and should not its great future value have awakened competition? It is not so many years since the Belt Line railroad was in the hands of a receiver and on the market. Did the municipality or any of the taxpayers, who are now the "people," show any anxiety to obtain possession of this most valuable property, this Klondike on wheels? The opportunity was theirs, but they respectfully declined to take any chances. The men who had business interests already at stake were forced to take up their own burden, invest their own money, take their own risks, and accept as their daily portion more contumely, fault finding and annoyance than falls to the lot of any other citizen in the municipality, and when they have finally placed their property on a reasonably secure basis, they are told that for this great and valuable holding, for which they are indebted to the city of Utica, they shall submit to a burden which would be placed upon no other business enterprise within its limits. If this is done on the ground that they are better able to bear it than are some property owners, which proposition is sometimes gravely advanced, then every wealthy citizen owning horses and driving them and large business concerns, whose teams are constantly seen on the streets, should be asked to contribute to the paving assessment of their poorer neighbor, whose pavement they are using, and who does not himself drive over it once a year.

The Belt Line company does not claim to be a charitable institution, notwithstanding the good-natured sarcasm frequently leveled at it on this point. It has, however, just as much of this character as any other business enterprise in the city. They are all conducted on precisely the same basis. Merchants and manufacturers, professional men and wage earners, all prosecute their daily labors with a direct view to their individual benefit, and none of these gentlemen has a right to ask anything more or different of the railroad company.

The attitude of the press toward the street railways is perhaps excusable (if sometimes a little aggravating). It is a question of existence with them. As the railroads object to a law which means bankruptcy to them, so a newspaper should not be expected to adopt a policy which means bankruptcy for it, and the newspaper which boldly and openly championed the cause of the railroads would be doomed from the initial letter of its first editorial. The general trend of public opinion must be catered to. That the trend is not any too friendly to the railroads is shown by the demands made upon them when the enforcing of these demands means serious financial difficulty for most and bankruptcy for many.

It is shown in the fact that it is possible for a man to enter a street car, evade payment of his fare, lie to the conductor and boast of it afterward as a smart accomplishment. If the same man enters a store, slips an article in his pocket from the counter, and walks

off with it, he is a thief and a shoplifter. Yet there is no question but that the railroad is entitled to its nickel as justly as a merchant to his wares. This, fortunately for the railroads, is not a very common thing. The great majority of our patrons would no sooner attempt to beat their ride on a car than they would filch five cents from the pocket of a fellow passenger. But the fact that these things are done shows how confidently the beat and impostor relies upon the state of public sentiment.

It is this sentiment which is entirely responsible for the conditions out of which grows the present controversy. There is no law of right or justice which imposes upon a railway company or any other corporation the burden of paying for a thing which it does not use, does not want, which is no benefit to it, but a positive detriment; for the necessity of which it is in no way responsible, and which is built for the benefit of everybody in the city except the railway company.

NEW CHARLESTON (S. C.) COMPANY.

Mar. 1, 1899, the street railway and lighting interests of Charleston, S. C., were consolidated, and Charleston is now one of the few cities in the country where these public utilities are operated by one company. Four companies, the Charleston City Railway Co., the Charleston & Seashore Railway Co., the Charleston Edison Electric Light Co. and the Charleston Gas Light Co., were united under the title of the Charleston Consolidated Railway, Gas & Electric Light Co. All of the properties are considered good investments, and they were purchased by the Baltimore Trust & Guarantee Co.

The officers of the new company are: President, J. S. Lawrence, Charleston; vice-president, Francis K. Carey, Baltimore; secretary and treasurer, J. Banister Hall, Baltimore; general manager, W. S. Hill, jr.; superintendent of railway, T. W. Passailaique.

The Charleston City Ry. comprised the Charleston Street Ry.

SCENES ON THE CHARLESTON CONSOLIDATED RAILWAY AND AT THE ISLE OF PALMS.

There is only one law which does justify it, and it is the law under which the highwayman says to the traveler: "I am a larger man than you are. I am armed and you are not. You are here and can't get away. You have money and I want it. Give it up."

A proposed ordinance to elevate the railroad tracks crossing the Twin City interurban line at Washington Ave., Minneapolis, is meeting with strong opposition from the railroads.

The Canton & Massillon (O.) Electric Railway Co. has heretofore had a very stringent rule regarding tardiness of its employes; the man who was late was discharged. Recently a modification has man who was late was discharged. Recently a modification has second offense, 10 days; third offense, discharged.

and the Enterprise R. R., which were old horse car lines, one having been chartered in 1861, and the other in 1870. These two properties were purchased in the interest of the Charleston City in February, 1897, and the motive power changed to electricity. The company had 30 miles of track and operated 40 motor and 15 trail cars. The Charleston & Seashore has been in operation since August, 1898; this company had nine miles of single track with turnouts about one mile apart, running from Pleasant Point to the Isle of Palms along the shore of the bay the entire distance. Pleasant Point is across Cooper River from Charleston, and is reached by ferry boats; for this service the new company has secured two good boats each capable of carrying 1,600 people at one trip.

The seashore line and its beautiful resort on the Isle of Palms have been a great success from the first, the people of Charleston

having been very willing to avail themselves of this outing place. In the group of scenes on the Charleston Consolidated, No. 1 is what is known as the Cove Inlet trestle, on the seashore line; No. 2 shows the terminal pavilion, steeple chase carousal and Ferris wheel on the Isle of Palms; No. 3 is a view drawing the seine on the beach; No. 4 shows Fort Moultrie; No. 5 is the Charleston

ON THE ISLE OF PALMS.

ferry slip, the terminal building is not quite completed; No. 6 is a view on the pavilion veranda facing the sea at the Isle of Palms. The separate engraving shows the vegetation on the Isle.

We are indebted to Mr. W. S. Hill, jr., general manager of the company, for the photographs from which these illustrations were made.

NEW FRANCHISE AGREEMENT AT INDIANAPOLIS.

Press dispatches from Indianapolis state that the city council has granted the new street railway company a 34-year franchise. The conditions of the contract are: fare to be 5 cents and 25 tickets sold for $1 and a universal transfer given; the company to pave between the track and 18 in. outside; to expend $1,000,000 in improvements when necessary; to turn over its old Shelby St. barn for a market house; to pay the city $30,000 per year for 27 years, and $50,000 a year for 7 years.

IMPROVEMENTS AT ST. JOSEPH, MO.

The St. Joseph (Mo.) Railway, Light, Heat & Power Co. has purchased the material for extensive improvements and several miles of new track, and also ordered new equipment; some of the material is now delivered and the work will be rapidly pushed until completed. The company will build two extensions to its lines, one comprises three miles of double track and the other one mile of single track with turnouts and switches; three miles of double track will be rebuilt.

The power house equipment ordered includes one 1,200-h. p. engine to be direct connected to an 850-kw. General Electric railway generator and one 700-h.p. engine direct connected to a 700-h.p. Westinghouse alternating machine, and which may also be used to drive other smaller generators. In the boiler room a battery of Babcock & Wilcox boilers, 1,017 nominal h. p., equipped with Babcock & Wilcox stokers, are to be installed and a new steel stack erected.

The company has bought 12 large open motor cars and 12 11-bench trail cars, to be equipped with G. E. 1000 motors; and also ordered 10 20-ft. closed cars to be delivered Oct. 1.

All of the overhead railway lines are being rebuilt, and this work will be completed within 30 days. The copper for trolley and feeder lines was bought last May at the bottom price, the trolley wire costing 12¾ cents. General Manager Van Brunt is now selling the old trolley wire for 13 cents.

NEW JERSEY CONSOLIDATION.

It is stated that the North Jersey Street Railway Co., of Jersey City, which leases and operates the Newark & South Orange and the Consolidated Traction Co.' lines, aggregating 218 miles of track, is to lease the North Hudson County Ry. (52 miles) and if possible all the street railways in Essex, Hudson, Union, Somerset, Passaic and Bergen Counties. The principal men interested are said to be: P. A. B. Widener, William B. Elkins, Randolph Morgan and Thomas F. Dolan, of Philadelphia; William C. Whitney, J. D. Crimmins and Patrick H. Flynn, of New York city; former Senator Smith, B. M. Shanley, Leslie D. Ward, Elisha B. Gaddis, Gottfried Krueger, John F. Dryden, L. D. Howard Gilmour and David Young, of Newark; E. F. C. Young, of Jersey City; Garret A. Hobart and Augustus Barber, of Paterson, and John Kean, of Elizabeth.

AVALANCHE AT NIAGARA FALLS.

Early on the morning of March 31st there was a great avalanche of rock in the Niagara gorge. The mass fell from a point on the river bank close to the Buttery elevator and plunged 200 ft. straight down on the tracks of the Gorge road and the buildings of the elevator at the base of the cliff. It was the greatest fall of rock that has occurred from the Niagara banks in many years and the north end of the city was shaken as though by an earthquake. One immense boulder fell from the extreme top of the cliff full onto the Gorge road tracks, with the result as shown in the accompanying engraving. Between this rock and the base of the cliff is a mammoth pile of broken rock and shale that came down with the avalanche, the entire mass being piled many feet high.

There are numerous points along the cliffs where such falls of rock are expected during the spring and fall, but this was not one of them. An examination showed that another fall of rock was

GORGE ROAD AFTER THE AVALANCHE.

imminent, and proper precautions were taken to warn people away from the danger.

Had this fall occurred a few hours later loss of life might have resulted as the Buttery elevator is a favorite place from which to view the rapids. The building leading from the Gorge road depot to the foot of elevator was demolished; it had just been rebuilt, having been wrecked by the fall of an old elevator shaft during a high wind a few weeks ago. About 30 ft. of the lower end of the new elevator shaft was torn away.

DEATH OF M. K. BOWEN.

Menard Kenner Bowen, president of the Chicago City Railway Co., died suddenly at the Chicago Hospital on Sunday, April 9th. Mr. Bowen had been suffering for more than a year with stomach troubles which were thought to be of a catarrhal nature, but neither he nor others supposed the malady to be dangerous. He had been working unusually hard of late, and had planned to leave the city for a brief rest almost on the hour in which he died. He attended to business as usual on Friday, taking lunch at a down town club that evening. At 1 o'clock Saturday morning he became violently ill, and on the decision of a consultation of eminent physicians was taken at 5 o'clock to the hospital, which is one of the best equipped in the country, and immediately operated on for appendicitis. The operation disclosed an aggravated case of blood poisoning which made recovery extremely doubtful. The patient rallied, however,

M. K. BOWEN.

and some hope was entertained until 9 o'clock a m., at which hour a relapse occurred, under which he sank steadily until 10 p. m. when he died. At the bedside were his wife, his mother who was called from St. Louis, and his sister, Miss Annie Bowen, who arrived from Philadelphia four hours before. He had just purchased a residence into which he expected to move May 1st and was planning an extensive trip to Europe for next year.

Mr. Bowen was recognized as one of the brightest and most promising street railway men in the country, and although a young man, had learned the secret of turning off an immense amount of work in the shortest possible time, and had advanced far on a highly successful career. He was born in Jefferson Barracks, Mo., the army post on the Mississippi river, about 10 miles below St. Louis, in 1858. His father was Gen. John S. Bowen, a graduate of West Point, and his grandfather Pierre Menard,the famous lieutenant-governor of this state Mr. Bowen received his early education in the St. Louis university and later took a course in engineering at Washington university in the Mound city. At the age of 19 years he went into the service of the United States Government, being assistant engineer on a triangulation survey on the Mississippi river. A short time later he was made assistant engineer of the jetty work in the New Orleans harbor. In 1880 he became identified with a topographical survey from Fort Smith, Ark., through to California. In this work he was engaged eight years. His next step was to assume the duties of chief engineer and superintendent of construction of the Kansas City cable railway. Upon the completion of the cable line Mr. Bowen went to New York city as representative of the Short Electric Railway Co. He remained there a year and then came to Chicago as assistant superintendent of the City Ry., from which position he rapidly rose, until in January, 1898, he was made president and general manager. The entire conversion of the company's horse lines to electricity was made under his supervision. He was an excellent organizer, and had worked out a system of comparative records which was the admiration of all who were familiar with them. He was both approachable and friendly, and had won an extremely large circle of friends.

Mr. Bowen left two children, Allan, a boy of 12, and Marion, 4 years of age.

The funeral services were unusually impressive. Fully 1,200 people were present, and many of the best known millionaires in the city touched elbows with the humblest employes of the company. The remains were escorted from the residence to the train by a procession of 800 of the men, including delegations from each division and the shop and track departments. The Cottage Grove Employes band led the way, playing dirges. The floral tributes in number and beauty have rarely been equalled here, the special pieces alone more than filling four carriages. They were taken in the private car to Jackson. The honorary pall bearers were made up from the officers and directors of the road, as follows: S. W. Allerton, Joseph Leiter, George T. Smith, T. C. Pennington, W. B. Walker, D. G. Hamilton, F. R. Greene, G. O. Nagle; and the active pall bearers from heads of departments. As the great throng filed slowly past the casket while the band played the Dead March in Saul there was scarcely a dry eye in the whole assemblage. The voluntary demonstration on the part of the men was extremely touching, and a noble tribute on their part that while unsuccessful a few years ago in their labor matter, they had since come to love and respect the man who at that time defeated them. Each division and department sent a large floral piece. Nearly every street railway official in the city was present.

The interment was at Jackson, Tenn., the former home of Mrs. Bowen.

RAPID TRANSIT IN NEW YORK.

During the last three weeks the question of rapid transit for New York City has attracted a great deal of attention. On March 27th counsel representing the syndicate which controls the Metropolitan Street Railway Co., made a proposition to the Board of Rapid Transit Railroad Commissioners embodying the following points: A new company is to be formed to build an underground railway which is to be leased in perpetuity, or for a very long term, to the Metropolitan for 5 per cent on the cost of construction; fare on local trains to be 5 cents, with transfers to the Metropolitan surface system for 3 cents extra; fare on express trains (20 to 30 miles per hour), 10 cents; the company to pay the city 5 per cent of gross receipts, or so much of 5 per cent as shall remain after operating expenses and fixed charges shall be paid; exemption from taxation until tunnel road pays 5 per cent on the cost; the company to sublet space for wires, pipes, etc., to other companies; downtown sections of tunnel to be built within three years after proposition is accepted; remainder to be built as soon as first section begins to pay 5 per cent on cost; accounts of company to be subject to the inspection of the commissioners.

The Board on receipt of this communication, unanimously adopted a memorial to the Legislature asking for power to act in the premises.

Immediately after the Metropolitan letter became public a second offer was made by an "American-English syndicate" to build a tunnel to revert to the city after 99 years; fare to be 5 cents with free transfers to surface line (provided the surface companies would make transfer contracts, taking 2½ cents per passenger); the company to pay the city 8 per cent of the gross receipts, and 25 per cent of the rentals received for space for wires, etc.; the company to let local parties subscribe for 30 per cent of the stock.

April 3rd the Metropolis Contract Co. offered to build the tunnel road for $33,000,000 (the city to furnish the money); fare to be 5 cents; free transfers to surface lines, if the latter would make transfer agreements; the company to meet the interest charges and eventually pay the principal of the bonds, leaving the city with a tunnel that cost it nothing.

On the same day an agreement between the Third Avenue Railroad Co. and the Manhattan Elevated Railroad Co. was made public which offers rapid transit at a very early date. The substance of the arrangement is: Transfers to be given from one system to the other for an 8-cent fare; the immediate equipment of the elevated for electricity, and the inauguration of an express service. The transfer arrangement is to go into effect May 1st.

A bill is pending in the Michigan Legislature providing for air brakes on all street cars.

THE SYRACUSE SYSTEM OF PERSECUTION.

Syracuse is a big city, but the mayor thereof is bigger, or at least thinks he is, judging from the undignified and unjustifiable methods to which he has recently resorted to have things his own way. There was a matter of some unpaid paving for which one of the roads there expressed its readiness to settle the moment the correct amount chargeable to it was shown. Transfers were requested which the company put into effect. But the mayor was not satisfied with the transfers, and began to threaten. The company, unable to discern any end to his demands, did nothing. Then the edict went forth that no sand should be used on the tracks, and during the slippery weather the cars went skating past the crossings while passengers chased after them. He thought the speed was too high, and put out a big force of watchmen. He discovered some sort of sanitary order which he interpreted to suit himself and had inspectors riding, to order cars into the barn where the "spit signs" had been disregarded. Finally there came the big snow storm and an old ordinance was excavated which prohibited piles of snow on the street. The snow was deep and the ridges made by the plows were being levelled and removed as rapidly as possible, but still there were some. Then the mayor spends a lot of the city's money in shovelling the snow back on the tracks and arresting 17 of the plow men. It was Sunday, and as the company pulled its cars into the depots the people had a chance to walk. Then the people woke up and the mayor found out to his surprise that the citizens were sick of his foolishness, and thereupon they proceeded to take a hand in affairs, and now the company is getting some of its rights.

LITIGATION OVER PITTSBURG CONSOLIDATION.

Litigation following the consolidation of street railway lines in Pittsburg and Allegheny resulted in a decision, Mar. 27, 1899, by the Supreme Court of Pennsylvania, adverse to Drexel & Co. and Whitney & Stephenson, bankers of Pittsburg, the underwriting syndicate which undertook to float the preferred and common stock of the new corporation, known as the Consolidated Traction Co., of Pittsburg. The suit grew out of an agreement in which Drexel & Co. undertook to underwrite $150,000,000 of preferred shares held by William L. Elkins, P. A. B. Widener, George W. Elkins, William Flinn, Joshua Rhodes and M. K. McMullin. To enable this to be done the trolley magnates issued to the underwriting syndicate 150,000 shares of common stock, of which amount Drexel & Co. were to retain 77,000 shares as payment for their services. The financial disasters of the spring of 1896 rendered the scheme impracticable, Drexel & Co. failing to float the preferred stock at $50 a share. Messrs. Widener and Elkins and the other shareholders demanded the return of the 77,000 shares to the Consolidated company and filed a bill in equity for that purpose.

The bill was dismissed in the lower court, but was reinstated on appeal.

FALK COMPANY'S NEW SUPERINTENDENT.

Mr. Frank W. Carr has taken an interest in the Falk Co., of Milwaukee, and accepted the position of superintendent. Mr. Carr has been the chief engineer and superintendent of eletrical construction for the West Chicago Street Railroad Co. He is a thoroughly posted man in his business, having graduated from Amherst College and the Massachusetts Institute of Technology; later he was an instructor in the University of Minnesota. His work in Chicago is well known, but before he came here he had held some very responsible positions.

Mr. Carr will be general superintendent and chief engineer of the Falk Co., and have charge of all the construction work now under way and to be contracted for. The Falk Co. has just closed a contract for the entire construction and equipment of the new interurban line to be built between Neenah and Oshkosh, Wis. Of this new company, Mr. Geo. J. Kobuseh, of St. Louis, Mo., is president, and Mr. E. E. Downs, of Oshkosh, vice-president and general manager.

Another large order the company now has is the track construction for the Northeast Railway Co., of Kansas City.

MAURICE COSTER GOES TO PARIS.

Mr. Maurice Coster, for three years manager for the Westinghouse Electric & Manufacturing Co. at Chicago, has accepted the position of agent general of the Societe Industrielle d'Electricite Procedes Westinghouse, the French company newly formed to manufacture and sell Westinghouse electrical machinery and apparatus on the continent of Europe. After May 1st Mr. Coster's headquarters will be at No. 45 Rue de l'Arcade (Boulevard Hausmann), Paris. He left Chicago April 9th and sails on the 16th.

Probably no one in the entire electrical fraternity of Chicago has more or better friends than he, and when some thirty of them decided to tender him a farewell dinner at the Technical Club, it will be readily understood that it was something highly creditable. The banquet was under the personal direction of Mr. D. J. Gelder, the

MAURICE COSTER.

club manager, and arranged by a comn ittee consisting of Messrs. S. P. Wells, jr., John Allen, C. E. Billi , L. E. Ritter and C. H. Stranahan. The floral decorations were very elaborate, including a large piece in daffodils by Mr. John R. Wylie, who was unable to be present. Following the dinner, which was an unusually elaborate one, toasts of congratulation and good-will were responded to by each one present Mr. Wm. da La Barre, chief engineer of the St. Anthony Falls Water Power Co., Minneapolis, was one of the out of town guests who came to Chicago to attend.

Mr. Coster is strictly a self-made man. He came to this country from Holland when only 12 years of age, and landed in Boston an entire stranger. He worked his way through Stevens Institute of Technology, where he graduated with honors, and supplemented this with several years' practical study in some of the best machine shops in this country and Europe.

In 1886 he was married to Miss Edith Beckett, of Albany, and went to South America, where he managed a large sugar plantation and refinery. Here he made radical improvements in many of the mechanical processes in use there, but was obliged to leave after three years on account of his family's health. In 1888 he became associated with the Westinghouse company as an engineer in charge of construction and erection of plants, and in 1891 was transferred to the selling department, taking charge of the territory served by the home office. Upon the death of his wife in 1895, Mr. Coster was, at his own request, transferred to the Chicago office as manager, where he has had full charge of a large territory including 10 states. His success here in enlarging the business of his company is well known, while at the same time he has made an unusually large circle of friends to whom his departure is a matter of genuine regret. His experience is such that he is recognized as one of the foremost in his profession in this country, and with exceptional ability, and knowledge of several languages, and acquaintance with prominent engineers abroad, he is sure to make a notable record for both his company and himself in his new field of labor, to which he carries with him the hearty wishes of hundreds of friends. His three children will accompany him to Paris.

MURPHY THIRD RAIL SYSTEM AT MANHATTAN BEACH.

A spur of the Long Island Electric Ry. about 3,000 ft. long at Manhattan Beach has been equipped by the Safety Third Rail Co., of New York, for electric traction by the Murphy system. The current is taken from a third rail divided into sections of about 16 ft. in length, the sections being automatically excited as the car proceeds. The sections are about half a car or train length with collecting shoes or plows at each end of a car. The sectional third rails are so spaced that the car motors are taking current from one section before the circuit to the succeeding one is broken, giving a

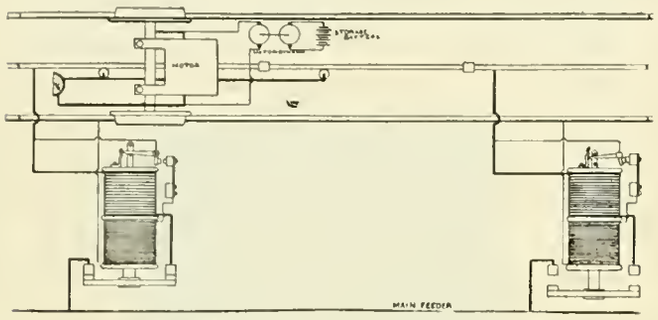


FIG. 1 CONNECTIONS FOR MURPHY SYSTEM.

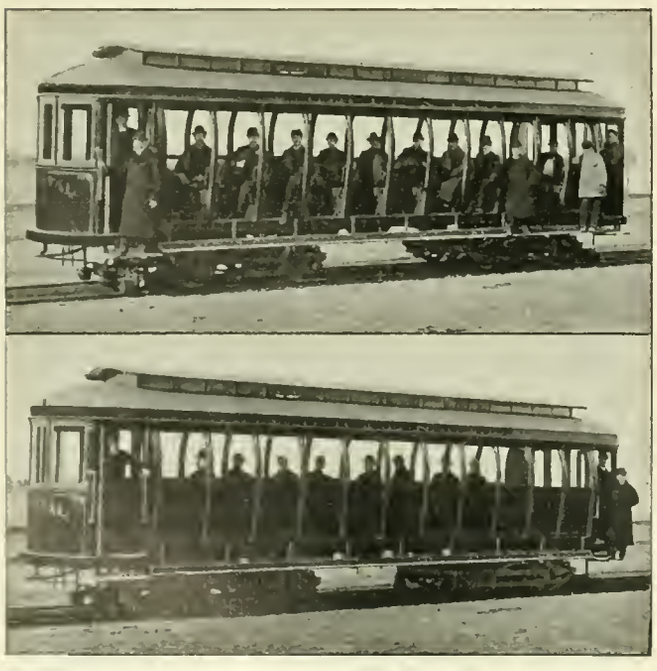
continuous current supply. The only live sections are the two immediately under the car, and each is insulated from adjoining sections by a block of granite. The bonded track rails constitute the return circuit.

Each car carries a storage battery of 10 cells which are employed when the car is starting to make connection between the feeders and the third rail section over which the car is approaching. To provide for charging these batteries a motor-generator is employed which reduces the line voltage to 20 for the battery. When starting this operation is reversed, the motor-generator taking the current from the battery at 20 volts and generating a 500-volt current to excite the electro-magnetic switch, and it also keeps the car lights going when the current from the power station is cut off. The current from the feeders is then admitted to the car motors which are of the same type and controlled in the same manner as those on trolley cars.

The switch cuts out the sections after the car passes, leaving them dead. The chief feature of the system lies in the construction of the



FIGS. 2 AND 3—DUPLEX CAR.

switch, and in the method taken of preventing arcs. It consists of a solenoid and plunger carrying at its lower extremity two carbon and copper contacts which when the current is flowing are pressed against two carbon disks. There are two circuits in the electromagnet, one of high resistance through which the current acts on the plunger first and the second circuit of large capacity carrying the current to the third rail section. After a car passes a section the circuit is broken at the two lower copper contacts, but no arcing

FIG. 4—SWITCHBOX.

ensues as the upper carbon contacts momentarily remain closed. When this is subsequently broken the motors are no longer taking current through this switch so there is no arc at the switch jaws and the switch opens by gravity.

When the car has been stopped the switch is open and there is no connection between the feeder and the car which can, therefore, receive no current. The motorman operates the controller and thereby connects the motor-generator to the third rail and the current passes through the fine wire of the switch and operates the plunger. The plunger rises completing the circuit between the feeder and the third rail section and then breaks the connection to the fine wire winding of the solenoid. The switch is held closed by the current passing through the heavy solenoid winding to the car motors, and the switch will remain closed so long as the car is taking current from the section to which the switch is connected. When the car leaves the section the switch opens by gravity and is ready for the next car. After the car is started there is no need of the motor-generator to supply current to operate the switches, for there are two sets of shoes on each car connected and spaced far enough apart to span from section to section. The forward shoe as it comes in contact with a section subjects it to the full line potential drawing its current from the preceding section. After starting the car the switches are operated by the current from the power station. The arrangement of the circuits is shown in the diagram, Fig. 1.

The installation at Manhattan Beach is operating satisfactorily, although it should be added there are few difficulties to overcome for there are no grades or crossings on the line which is on a private right of way. The convertible car now running on the line was built by the Duplex Car Co. and is shown both as a summer and a winter car in Figs. 2 and 3. The car is mounted on Peckham's double trucks. The arrangement of the switches in the boxes may be seen in Fig. 4, and in this case the boxes are attached to fences along the track. In commercial work it would be necessary to place them beneath the surface and they would be subjected to the trying effects of flooded tracks and moisture in the earth. The switches may be clustered at any convenient point. It is, of course, necessary to have a switch for each section and with sections 15 or 16 ft. long they become very numerous. If a car were running 50 miles an hour, a speed which is attained on some interurban roads, 280 of these switches would be in operation per minute. The main-

tenance of a great number of these switches, especially when installed beneath the surface would be a large and ever increasing source of expense. Furthermore there might be numerous forms of electro-magnetic switches which would serve the purpose as well as the one represented; the whole claim to originality seems to be based on the switch. The addition of a motor-generator and storage battery to the car equipment is also very objectionable. Where the third rail is in use on the surface this system might be employed to advantage at crossings and other points where it is not desirable

FIG. 5—THE HARMLESS TRACK.

to have a 500-volt conductor exposed. For use in city streets this system would be quite expensive to install and maintain and its reliability has yet to be demonstrated.

As announced in its prospectus the company is anxious to sell large blocks of stock and operating rights, and some of its methods savor strongly of a stock jobbing scheme. The recent column-and-a-half story which was handled by a news bureau and wired to a number of daily papers in different parts of the country, was a very clumsy attempt to disguise in the form of reading matter an advertisement to sell stock.

It would appear to us that the essence of the system is in the switches, and there are engineers in abundance who either question the validity of the patent on this switch, or express their belief that switches already on the market will work equally as well.

MAIL SERVICE IN KANSAS CITY.

The proposed establishment of a street railway mail service for Kansas City, Mo., has been much discussed of late and is warmly advocated. Supt. C. F. Holmes, of the Metropolitan Street Railway Co., says concerning the mail service: "For the benefit of the business interests of Kansas City the company is willing to meet the postal department more than half way in this matter, and we are willing to consider any proposition that may be made to us. But, be it understood, there is no postal regulation authorizing this street railway mail service and no appropriation to pay for its maintenance. The whole thing is conducted upon the 'star route' system, under sub-contracts, and is not officially recognized by the Government; but we can easily make arrangements with contractors which will expedite the mail service and will in no wise interfere with the regular passenger traffic of the Metropolitan company."

The New York Legislature failed to pass the bill providing that electric or cable cars in cities of over 50,000 inhabitants be equipped with fenders.

STREET CAR ACCIDENT DEFINED.

Should one undertake to define just what is included in the definition of the word "accident" as occurring in street railway work, he would find it to be a quite comprehensive term, to express which in satisfactory language is not the easiest undertaking.

Gen. Mgr. C. D. Wyman, of the New Orleans Traction Co., has found that the occasional posting in conductors' waiting rooms of special comments on important rules, is a most valuable adjunct to the rule book; and that, being prominent before the men, it provokes study and discussion, both of which greatly help to fix the matter plainly in the mind of employes. He has recently posted such a bulletin in all his depots, on the subject of accidents, and has kindly granted our request for a copy, which is reproduced below.

ACCIDENTS.

The term **Accident** includes injury to **persons** or **property, collisions, breakages** of all kinds to the **cars, ejections, personal trouble** in car between **employees** and **passengers,** or between **passengers,** and any event of any name or nature occuring upon a trip, wherein damages occur to **persons** or **their property,** to **car,** to **vehicles,** or wherein the possibility of damages may arise from any action of **employees** or **passengers** themselves, whether complained of or not.

Conductors are not permitted to use discretion as to reporting or not any occurence included in above statement, but must report promptly all matters coming within above list.

Reports must be **Truthful** and state **exact** facts, without **fear, favor** or **prejudice,** and no attempt must be made in a report to **shield** any employee, or to **conceal** any of the circumstances surrounding the occurrence reported. Reports must state **facts** which can be **sworn to in court** by the employee reporting or by the party or parties named as witnesses. **Inferences, opinions** and **suggestions** must be stated as such, and not as facts. Report must give:

1st. **Date of Accident and Exact time of day when it occurred.**

2nd. **Exact place of occurrence;** full name and address of party injured, or likely to have been injured, either in person, property or feelings; the owner of property damaged or doing damage to Company's property; if vehicle, name of driver, license number and year of issue.

3rd. **Nature of accident,** and cause of its occurrence. This cause must be carefully ascertained.

4th. **Full name and addresses** of all passengers, bystanders, and employees, as far as possible, whether they saw how the accident happened or not.

5th. **Distance where car stopped,** after the accident happened, from place on the street where accident occured, measurement to be made by stepping the distance from the front end of car to point of accident. This measurement should be witnessed by a bystander, or some one not connected with the Company.

6th. Statement of injuries or damages as well as any expressions of opinion from bystanders regarding the accident.

Above report must be filled out upon blank for that purpose, signed by the Conductor and Motorman, and left at the Station, after turning in the car.

In the event of personal injury, care must be taken to render all the necessary assistance and attention to person injured.

The most **trivial** and apparently **unimportant accident** or **occurrence** in or about the car, even where a person declines to give name, claims no injury, or seems to regard the whole matter as trifling, must be **reported** with as much care as though the damage or affair was of the utmost importance.

All accidents must be telephoned to General Office of Company as soon as possible, and especially in the event of a serious accident, the General Office must be notified **immediately** so that prompt aid may be furnished and investigation begun pending the full report.

It is expected that a report will be made of all accidents or injuries that may occur on the track, or within ten feet of same, whether the car was concerned in the accident or not.

Attention is specially called to questions arising between **Conductors** and **passengers,** as to the **payment** of fare, **character of money offered, change furnished, transfers** or other **complaints** leading to **disorderly,** or **boisterous** conduct, in each of which events Conductor must secure **positive proof** and **eye witnesses,** so as to be able to clearly substantiate the truthfulness of his report in court, particularly before any **ejection** or **arrest** is attempted, and full report of same must be promptly made in accordance with above rules. **No ejection** must be made without **first refunding fare.**

Conductors or other employees **MUST NOT TALK** about, or **GIVE ANY INFORMATION WHATEVER** concerning an accident to any person, other than the proper officer or person delegated with the authority of the Company to investigate the occurrence, and all questions asked of any employee of Company, except by person or persons above named, must be answered by directing the questioner to General Office for information.

Employees must not **visit** an **injured party,** or **family,** to make inquires or discuss accident without authority of Company.

The above rules must be **strictly observed,** and too much stress cannot be laid upon their importance. If any doubt as to their meaning in any respect exists in the minds of employees, they should consult, for their own protection and the Company's, their Station Foreman.

New Orleans, La., April, 1899.

C. D. WYMAN,
General Manager.

The bulletin is on heavy cardboard 17 x 24 in. and, as will be noticed, is printed in very plain type with the emphatic points in more prominent letters.

GALVESTON ROAD TO BE SOLD.

March 24th the court entered an order for the sale of the Galveston City R. R. on September 5th, and fixed the minimum price at $500,000. The bonded indebtedness of the company will approximate $1,200,000, and the floating debt amounts to $180,000. From investigations made by the court, the railway company has not been solvent in 10 years. The decree of foreclosure was strongly contested by attorneys representing local stockholders and New York creditors, but without avail.

EXCITING HOLD-UP AT CARBONDALE.

A gang of six professional burglars, masked, held up the power house and car barn night forces of the Carbondale (Pa.) Traction Co., at 1:15 a. m. Monday, March 27th. The plant is operated until 1:30 a. m., with an engineer and fireman in charge. The station is connected to the car house, where 10 or more of the car crews sleep each night. Between the two buildings is an office in charge of a watchman. The burglars expected to find the day's receipts in the office, but only secured the partial collections of a few late cars, amounting to about $75. The plan was then to rob the men up stairs. Two men men were stationed to guard the front, one the rear, while three entered the boiler room from the rear. They knocked the fireman insensible, and after beating and blindfolding the engineer used him as a shield as they entered the office. The watchman, attracted by the noise, fired until his ammunition was exhausted, receiving a bullet in his foot, but missing the intruders. Some dozen shots were exchanged here. Whenever one of the men upstairs would come to a window the outside guard delivered a volley. An attempt was made to force an entrance into the sleeping room, but was repulsed. The robbers then secured the cash box and fled.

Gen. Mgr. C. E. Flynn was at once notified, and after arranging for the company's surgeon for his injured men, telegraphed to all nearby towns to be on the lookout. It was surmised the gang had boarded a train on the D. & H. R. R., and Mr. Flynn headed a posse of his own men and ran out a special car and made a flying run some 10 miles, hoping to head off a freight train on which the bandits were supposed to be. Had they done so there would have been a lively battle, as both sides were well armed. The freight had just passed, however, but it was learned the gang were aboard. Mr. Flynn then wired to Summit, a little station with two or three houses 10 miles up the mountain. At this place resides a quiet, unassuming old man by the name of William Leech, who was formerly sheriff. The agent awoke him and when the train pulled in, Captain Leech, single handed, was there with a rifle. When the six desperadoes climbed out of a box car he remarked he wanted to converse with them, upon which the crowd began firing. Although only 75 ft. away he was not hit and returned the fire, killing one at the first shot, mortally wounding another at the second, and bringing down a third with the next shot. A fourth surrendered, and two escaped but were captured later in the day. They were all well dressed, and of genteel appearance. On their persons was found complete outfits for safe blowing, including wedges, glycerine, fulminating caps, fuses, etc., sufficient to wreck a large building. All were heavily armed.

The Sacramento (Cal.) Electric, Gas & Railway Co. has contracted with the Yuba Electric Power Co., which has its plant at Folsom, for the exclusive use of 5,000 h. p. This places 10,000 h. p. at the disposal of the Sacramento Co., which will rent to manufacturers and others

IMPROVEMENTS AT PETERSBURG, VA.

The Upper Appomattox Company, which owned the river for both power and water supply for several miles above Petersburg, the Piedmont Traction Company and the Virginia Traction Company, all of Petersburg, have been purchased by R. L. Williams & Co., of Richmond. An electric power plant, driven by water, will be built at once; also eight miles of street railway constructed. The power plant will have a capacity of 1,000 h. p. for present demands, to be increased to 2,000 if required. The new road is expected to be opened by June 1, 1899. Besides furnishing power for the electric railway, the plant will furnish light and power for the city. G. F. Haywood, of Baltimore, Md., constructing engineer.

EXHIBITS AT PARIS IN 1900.

Commissioner General Peck and John H. McGibbons, director of exploitation, of the United States Commission to the Paris Exposition of 1900, have issued the following announcement under date of Apr. 4, 1899:

All who desire to exhibit in the Paris Exposition of 1900 are requested to immediately notify the commission, if they have not already done so, in order that they may be considered in the allotment of space which will soon be made. While there are many applications on file in every line of industry, it is desirable that the American Sections be not only representative of this country but also represent the largest possible number of producers. Both our commercial interests and national pride demand that our works be entered in this most important International Exposition. It is estimated that fully 60,000,000 people from every part of the globe will attend, and it will be an opportunity to greatly increase our foreign trade and to demonstrate that the United States is supreme in the arts of peace.

The Chicago office of the Commission is in the Auditorium Building.

Joseph Leonard, Great Bend, Pa. Dark complexion; brown hair; blue eyes; age, 27; weight, 150 lbs.; height, 5 ft. 8 in.; wears No. 7 shoe.

John Cummings, Logansport, Ind. Sandy complexion; thin curly blonde hair; age, 26; height, 5 ft. 8 in.

William Zerby, Shenandoah, Pa. Sallow complexion; dark brown hair; dark blue eyes; age, 22; weight, 164 lbs.; height, 5 ft. 10 in.; wears No. 8 shoe.

VICTORY FOR SALT LAKE CITY ROAD.

The Salt Lake City Railroad Co. has won in the litigation with property owners which sought to prevent a certain extension of the company's lines. The abutting owners claimed that the company had forfeited its franchise in the street in question and that it had further agreed with the city not to build in this particular street. The Supreme Court, in passing on the question, held that the property owners were strangers to the city contract and could not complain of a violation of it, granting that there really was one; also that the company's franchise could be forfeited only by the state, which did not join as complainant.

The gross earnings of the Columbus (O.) Street Railway Co. for February showed an increase of $4,546, and the net earnings, $4,019.

PERSONAL.

MR. H. H. LITTELL, of Buffalo, is spending some time in California, and expects to return about the first of May.

MR. S. L. NELSON, general manager of the Springfield (O.) Railway Co., was a recent visitor to Chicago and this office.

MR. HORACE C. PEASE has been appointed purchasing agent for a branch of the Metropolitan Street Railway Co., New York.

MR. GEORGE B. HENDRICKS retired from the position of general manager of the Fort Worth (Tex.) Street Railway on April 1st.

MR. C. E. FLYNN, general manager of the Carbondale Traction Co., Carbondale, Pa., was a caller at the "Review" office when in the city recently.

MR. T. W. MEACHEM, president of the New Process Raw Hide Co., of Syracuse, N. Y., was a caller on the "Review" when in Chicago last month.

MR. HENRY SCHWITZGEBEL has been appointed purchasing agent of the Metropolitan Street Railway Co., of Kansas City, succeeding Mr. Satterlee.

MR. J. L. KARNES, claim agent for the Metropolitan Street Railway Co., Kansas City, Mo., was recently presented with a handsome Elks' badge by a number of friends.

MR. JAMES ROSTRON has resigned as chief engineer of the Chester (Pa.) Traction Co.'s power house to accept a similar position with the Sharpless Dyewood Extract Co.

MR WILLIAM A. SATTERLEE, who has been purchasing agent of the Metropolitan road, Kansas City, since 1890, succeeds Mr. Barratt as assistant general superintendent.

MR. L. F. KIRKER, late of the Central Traction Co., Pittsburg, has been appointed general manager of the Wheeling (W. Va.) Railway Co., and assumed his duties March 14th.

MR. KENNEDY ASHWORTH, of Pittsburg, has been appointed general manager of the Park & Falls Street Railway Co., of Youngstown, O., and entered on his duties March 20th.

MR. W. P. QUIGG, general manager of the City Railway Co., Fort Worth, Tex., has been appointed manager of the consolidated system resulting from the sale of that road to the Fort Worth Street Railway Co.

MR. WILLIAM P. GANNON, for several years secretary of the Syracuse (N. Y.) Rapid Transit Co., was on March 14th chosen president to succeed Charles R. Flint, of New York, who recently resigned the presidency.

MR. H. E. CHUBBUCK, who was formerly manager of the Pueblo (Colo.) Street Railway Co., and lately representative of the General Electric Co. at Salt Lake City, has been appointed general manager of the Quincy (Ill.) Consolidated Electric Co.

MR. HAROLD HARSON, lately chief clerk to Gen. Mgr. T. H. McLean, of the Toledo Traction Co., recently removed to Florida; before his departure he was presented with a number of handsome remembrances by his chief and other officials of the company.

MR. FREDERICK UHLMANN, president of the Brooklyn Elevated Railroad Co., has announced that he is not now eligible to any office in that company, as he has sold all of his stock, and consequently will not be interested in the new management of the road.

MR. J. D. PARKER, general manager and superintendent of the Sandusky (O.), Milan & Norwalk Electric Ry., recently tendered his resignation but it was not accepted, and he will continue in his position. Otto Sturtzinger has been appointed as his assistant.

MR J. W. MEAKER, JR., has resigned from his position with the Meaker Manufacturing Co., and will shortly open an office in Chicago, and handle street railway specialties. His experience and popularity and acquaintance in the street railway fraternity will insure him a good business from the start.

MR. GEORGE J. HURD, formerly of Toledo, on April 1st was appointed superintendent of the Janesville (Wis.) Street Railway Co., succeeding Mr. Fred O. Green, who resigned to accept a similar position under Mr. Mark Cummings, at Elkhart, Ind. Mr. Cummings was superintendent of the Janesville line until Oct. 1, 1898.

MR. H. A. REEVES, manager of the street railway department of the H. W. Johns Co.'s Chicago house, after a sickness of three months, has gone to southern California to recuperate. He is reported to be improving rapidly, and expects to be able to return home by May 1st. Mr. A. J. Anderson has ably managed that department in his absence.

MR. THOMAS BARRATT, assistant general superintendent of Metropolitan Street Railway Co., of Kansas City, Mo., has retired from active service. Mr. Barratt is now nearly 70 years of age and has been identified with the Holmes street railways for 27 years, having been in the employ of Mr. Nehemiah Holmes when he was operating horse car lines.

MR. JOHN M. ROACH, vice-president and general manager of the North and West Chicago Street Railroads, accompanied by his family, has been spending a month on his island 26 miles off the Florida coast. Mr. Roach purchased the entire island last year, and is improving it with buildings, walks and an artesian well 1,500 ft. deep. He has his own tarpon and other big fishing waters and is fast making an ideal winter home.

MAJ. RUSSELL B. HARRISON, provost marshall, Seventh Army Corps and Department of the Province of Havana, Camp Columbia, Havana, Cuba, is the present address of a well-known street railway official who was one of the first to enlist. He writes us that the regiments of the Seventh Army Corps are about to be mustered out and that he will shortly return and intends to again enter street railway work, and will be ready to consider a proposition about the middle of May.

MR. CLOYD MARSHALL who for the past two years has so acceptably filled the position of electrical editor of the "Review," resigns to enter business on his own account, and will engage in the manufacture of apparatus for the production of acetylene gas for residence and business houses. While we greatly regret to part with him, he carries into his new work the best wishes of all connected with this publication, as well as the large number of our readers who know Mr. Marshall personally. His company has already entered upon a fine business with excellent prospects for the future.

ELECTIONS.

MR. E. B. SMITH has been chosen president of the Easton (Pa.) Transit Co.

THE HOUSTON (TEX.) ELECTRIC STREET RAILWAY CO. has chosen officers as follows: President and treasurer, A. N. Parlin; vice-president and general manager, H. F. MacGregor; secretary, F. J. DeMerrett; auditor, J. W. Payne; superintendent, E. S. Ellis.

THE TACOMA (WASH.) RAILWAYS & POWER CO., organized to effect a consolidation of the street railway and power

companies of Tacoma, taking effect April 1st, chose the following officers: President, Gordon Abbott; vice-president, L. H. Hale; treasurer, R. T. Paine; secretary, J. N. Keeler.

THE NATIONAL TRACTION CO., which was recently chartered to build an electric railway from Columbus, O., to Indianapolis, Ind., has chosen the following officers: President, J. Q. A. Coover, of Spanker, O.; vice-president, O. P. Waymire, of Springfield; secretary, N. H. Albaugh, of Tadmor; treasurer, S. R. Fergus, of Phoneton. Additional directors are B. F. Weldy, I. F. Hutchins, C. H. Allen and M. C. Reynolds.

THE VIRGINIA ELECTRICAL RAILWAY & DEVELOPMENT CO., Richmond, Va., has chosen directors as follows: W. B. Oliver, H. Irvine Keyser and F. C. Todd, Baltimore, Md.; and Messrs. John L. Williams, James H. Dooley, S. W. Travers, E. L. Bemiss, Langhourne M. Williams, J. W. Rothert, W. M. Habliston and Joseph Bryan, Richmond, Va. Mr. E. L. Bemis was elected president.

THE MILWAUKEE, RACINE & KENOSHA ELECTRIC RAILWAY CO., which recently entered into working agreement with the Milwaukee Electric Railway & Light Co., has chosen officers as follows: President, Matthew Slush; vice-president, A. W. Bishop; general manager, John I. Beggs; treasurer, George O. Wheatcroft; secretary, H. C. Mackay. The last three are officers of the Milwaukee Electric Railway & Light Co.

OBITUARY.

MR. GEORGE Y. LORING, who was for many years superintendent of the Oakland (Cal.) Railway Co., died on March 29th at the age of 76.

MODERN STREET CAR BRAKES.

Now that the modern high-speed motor car has generally superseded the old-fashioned horse car, the demand for a more efficient braking apparatus is recognized by railway companies. The ordinary chain and spindle brake has often proved inadequate for the heavy electric cars of today, and while many braking devices have been invented and tried, but few have proved successful.

We illustrate herewith a simple and ingenious brake, which has been adopted by many roads, and, it is said, fully meets all requirements. It is called the "Sterling" safety brake.

The device is made up of a pinion shaft, socketed to the brake staff and geared to a double sprocket wheel, in the ratio of five to two. By this simple gearing device the motorman's power is multiplied and a quick, powerful and positive action is secured. The

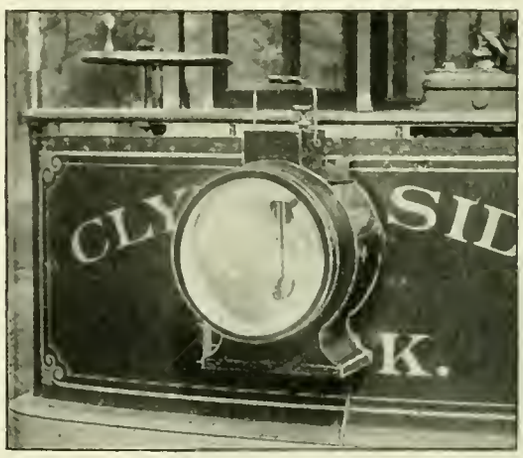
STERLING SAFETY BRAKE.

double sprocket wheel carries two continuous chains, which connect with the brake shoe rod. The double chain connection insures safety, as, in the event of one chain breaking, the other becomes operative instantly. The wear on the chain is equally distributed through the double sprocket wheel, thus avoiding the continual "grinding," wearing through and replacing of chain, common to the ordinary brake. This is quite an important item, as the old-fashioned chain on a spindle shaft wears out on an average in from 6 to 10 months and costs considerable for maintenance. The double sprocket wheel and gears are protected by housing. The pinions and gears are made of steel, the castings of the best gun metal and the chain is a special quality.

The device is extremely simple, having few parts, and none which are liable to get out of order. It is easy and inexpensive to apply and its cost is about one-sixth that of an ordinary power brake. It is in successful operation on hundreds of cars and has proved highly satisfactory in service.

AN ARC HEADLIGHT.

A detachable arc headlight for trolley cars has been invented by H. P. Wellman, and is here shown. The lamps have been in use for two years on the cars of the Ashland & Catlettsburg Street Railway Co., and have given perfect satisfaction. The lamp takes a current



WELLMAN ARC LIGHT.

of from 2½ to 3½ amperes and throws a brilliant light on the track for a distance of one to two thousand feet ahead of the car. The lamp is hand fed, but has an automatic arc starter. If the circuit breaker cuts off the supply of current or the trolley leaves the wire the arc is started automatically as soon as the circuit is closed. A slight turning of the hand wheel to feed the carbons every three or four hours is all the attention necessary. The arc enclosure is constructed in a novel way being particularly accessible for removing carbons or cleaning. It has a complete metallic circuit and can be lifted from its socket on the car dash and swung to the right or left lighting the country on either side of the track, as is sometimes desirable at pleasure resorts, or in case of accident of some kind, or if the car trucks are to be examined. Standard ½-in. carbons for enclosed arc lamps are used and the lamp is very economical in their consumption. The current is reduced through a german silver resistance substantially built of iron and porcelain and once installed it requires no further attention.

With this headlight there is no excuse for a motorman striking an obstruction on the track, as he can see as well by night as by day. This lamp has saved the Ashland & Catlettsburg Street Railway Co. from several serious accidents, notably one in which a wagon containing four occupants with horses rolled down an 8-ft. embankment onto the track within 350 ft. of an approaching electric car, running 20 miles an hour. The motorman at once saw obstruction on the track, and by quick application of the brakes stopped the car in time to avoid a most distressing accident, which would have been unavoidable with an ordinary headlight.

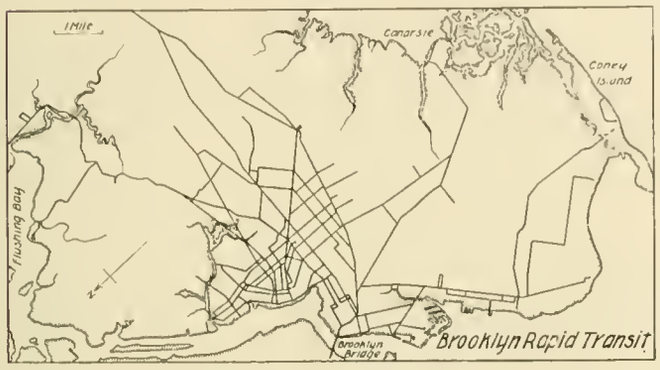
BROWN BROTHERS BUY ANOTHER ROAD.

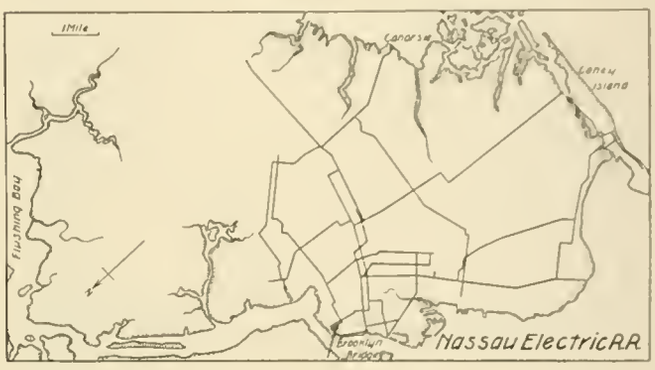
Mr. August Gehner, who purchased the property of the Peoples' Railway Co., of St. Louis, at receiver's sale announced on March 31st that arrangements for the sale of the road to the Brown Brothers syndicate had been completed, and that the transfer would take place as soon as the necessary papers could be prepared. The Peoples' Ry. has 9½ miles of cable road.

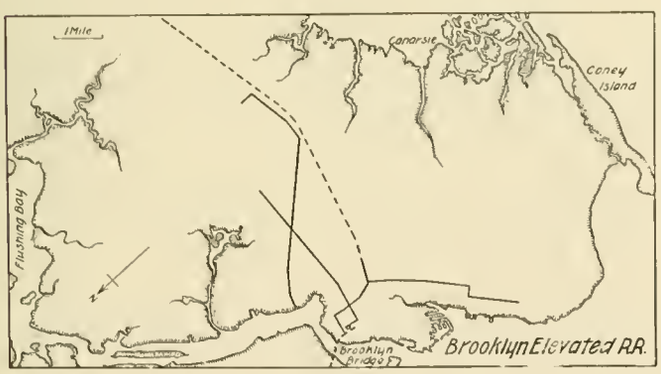
THE BROOKLYN RAPID TRANSIT CO.

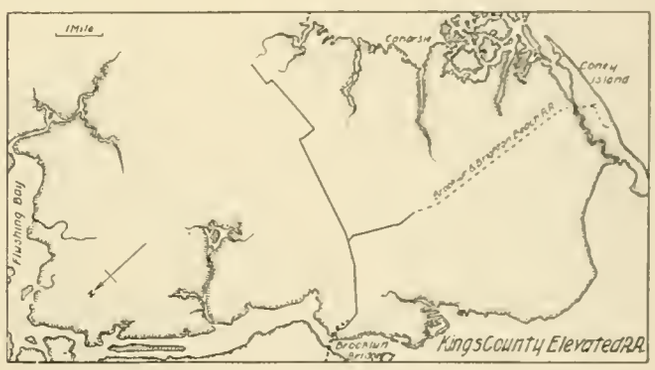
Clinton L. Rossiter, who now stands at the head of what is practically the urban transportation system of Brooklyn, is a man who has won his way rapidly and steadily to prominence and success, but withal in a quiet and unassuming manner; and while doing this he has found time to make warm friends out of his large circle of acquaintances. The same abilities and qualities which characterize the victorious general in the field, are those which we expect to find in one who undertakes to marshall the various transportation systems of a large city, and a strong hand and clear head carry out to success the immense financial undertaking of gigantic consolidations. Such, however, has been the record which Mr. Rossiter has been making, and now that he is bringing into one big family the great urban systems of Brooklyn, it is a pleasure to offer congratulations on the able manner in which the combination has been effected.

The Brooklyn Rapid Transit Co., which since its organization a little over three years ago has operated the largest street railway system of Brooklyn, has within a few months perfected arrangements by which it acquires nearly all of the important transportation lines on Long Island. The stockholders of this company secured control of the stock of the Nassau Eelectric R. R. a few weeks ago, and on March 25th purchased the Brooklyn Elevated; on March 21st the Brooklyn & Brighton R. R. and hotel property was bought, and it is reported that they have closed a bargain for the Kings County Elevated.









These four great systems are shown in their various ramifications by the accompanying maps, and the consituent companies are briefly as follows:

1. The Brooklyn Rapid Transit Co. was chartered in January, 1896, as successor to the Long Island Traction Co., whose property was sold under foreclosure proceedings in 1895. It controls through ownership of capital stock and bonds the following companies:

The Brooklyn Heights Railroad Co., which operates the Brooklyn City Railroad Co.'s lines (seven smaller roads have been at various times consolidated with the Brooklyn City) under a 999-year lease executed in 1893. The Brooklyn Heights owns 1.2 and the Brooklyn City 206.2 miles of track. The Brooklyn Heights operates 2,004 cars.

The Brooklyn, Queens County & Suburban Railroad Co. organized in 1894 as a consolidation of three other companies; it owns and operates by electricity 46 miles of track, and 309 cars.

The Sea Beach Railway Co., which owns and operates 14 miles of track by steam dummies.

The Sea View Railroad Co., which owns and operates 2.3 miles of elevated track by steam.

The total track operated by the Rapid Transit is 269.7 miles. The officers of the company are: President, Clinton L. Rossiter; vice-president, H. C. Du Val; secretary and treasurer, T. S. Williams; general superintendent, Ira A. McCormack. Mr Rossiter has also filled the positions of president and general manager of the Brooklyn Heights and the Brooklyn, Queens County & Suburban Cos.

2. The Nassau Electric Railroad Co. was chartered in 1893 and operated under franchises granted to the Kings County Electric Railway, the Coney Island, Fort Hamilton & Brooklyn Railroad and the Union Railroad Cos. In 1896 it leased of the Kings County Traction Co. for 969 years the property and franchises of the Atlantic Avenue Railroad Co., including the Brooklyn, Bath & West End Railroad Co. The company operated 132.24 miles of track with 926 motor cars.

3. The Brooklyn Elevated Railroad Co. was chartered in 1874. The Union Elevated Railroad Co. was consolidated with it in 1890, and in 1892 the Seaside & Brooklyn Bridge Elevated Railroad Co. leased to the Brooklyn Elevated all the various roads it was to construct. A receiver was appointed for the Brooklyn Elevated in 1897, and the reorganization has just recently been effected. This company operates 41.06 miles of track, 286 cars and 95 locomotives.

When the Brooklyn Elevated passed under the control of the court, its president, Frederick Uhlmann, was appointed receiver; the referee appointed to audit Mr. Uhlmann's accounts complimented him very highly upon the manner in which he had executed the trust, performing, with the help of his counsel, the duties usually performed by the president, secretary, treasurer and board of directors.

4. The Kings County Elevated Railway Co. was chartered in 1879, and its road opened in 1894. It owns 21.72 miles of elevated track and leases 6.67 miles of surface track from the Brooklyn & Brighton Beach R. R.; the company operates 155 cars.

The Brooklyn & Brighton Beach Railroad Co. owns 17.36 miles of road (measured as single track), connecting Atlantic avenue (Brooklyn) and Brighton Beach.

The mileage of the consolidated system of which Mr. Rossiter is the head is 475 miles, and this will doubtless be further increased at an early date by extensions where they are needed and by the acquisition of other desirable roads on Long Island. There are rumors that the control of the stock of the Long Island Railroad Co. will soon pass to the syndicate which controls the Rapid Transit.

The immediate result of the consolidation will be the equipment of the elevated lines for electric traction and the development of the elevated traffic. Mr. Rossiter states that Brooklyn is now to have real rapid transit. He says:

"We intend to make a feature of the elevated lines, and by electrically equipping them the running time will be materially reduced, in fact, it is intended to make the elevated lines so popular that the bulk of the travel will be on the overhead system. Instead of running cars every eight minutes in the rush hours and every ten or twenty minutes or half hour in the middle of the night, we will run cars on the elevated lines thoughout the entire day every two minutes.

"We can do this through the use of the electric system of motor power which will permit us to run one car trains when traffic is light at a very small cost as compared with the present steam system. If we can get the bulk of the travel on the elevated system, this will permit of the reduction in the number of cars operated on the street. I expect to take off at least one-third of the surface cars now operated and this will solve the vexatious problem of the congested state of traffic on Fulton St.

"Every effort will be made to induce people to ride on the elevated cars. The electric elevators will be put in at all the principal stations, so that the long climb upstairs, which has made the overhead system so objectionable, will be avoided. An express train service will be inaugurated, so that on holidays and in the summer time the cars which leave the Brooklyn Bridge at the Manhattan end will go direct to Coney Island without a stop. We will also inaugurate a liberal system of transfers between the elevated and trolley systems so that a passenger can ride the greater portion of his journey on the elevated line and complete it by way of the surface lines."

The Brooklyn Elevated is to be at once equipped with the third rail system; the electrical work on the Fifth Ave. Division is about half completed. Cars will be equipped with motors and shoes, and a part of them will have trolleys also in order that the Coney Island cars may run through. The steam road purchased by the Rapid Transit Co. is to be changed to the overhead trolley system. As soon as the company secures full control of the Kings County Elevated it is to be equipped for electricity.

The Atlantic Ave. line (shown dotted in Map 3) of the Long Island Railroad, which parallels the Kings County Elevated, and connects with the Brooklyn Elevated is to be joined to the latter road by an incline, which is now building, and it is stated that the Long Island R. R. will spend over a million dollars in equipping its lines with electricity.

TROLLEY WAR AT HOMESTEAD.

The borough of Homestead, near Pittsburg, has discovered a new source of income, that of fining the employes of the United Traction Co. and the Monongahela Traction Co., which engaged in a lively contest for the possession of McClure St., in Homestead. Formerly both companies used the tracks, but the United gave up its rights on condition that the Monongahela would enter into certain working agreements. This condition the former claimed was broken, and at 1 a. m. March 26th put a force of men to work cutting down the Monongahela wires in McClure St.; nine of these men were arrested. The company then hauled out a number of cars with horses, and so obstructed the track that no cars were run Sunday. At 10 a. m. the United Traction Co. put men at work to string wires; 21 of these were arrested and each fined $20 and costs.

General Manager Lardner, of the Tri-City Railway Co., Davenport, Ia., has ordered 12 new open cars, to be delivered May 1st.

GREENWOOD NO LONGER MANAGER OF PITTSBURG CONSOLIDATED.

Mr. G. F. Greenwood is no longer manager of the Pittsburg Consolidated, and his position has been taken by Mr. Charles Fitzgerald, who has been connected with the company ever since its purchase of the Citizens' Traction. Mr. Greenwood has not been entirely dropped from the company's rolls, having been given a position as consulting engineer, but will give most of his time to a bridge company of which he is also engineer. Mr. Greenwood's administration has not been a specially popular one from the standpoint of the public and employes, however competent he may be as an engineer.

Mr. Fitzgerald will bear the title of general superintendent, as the office of general manager will be abolished for the present. He is an experienced and successful operator, and came to Pittsburg from Philadelphia some 10 years ago.

CASHIER OF HOUSTON ROAD ROBBED.

Mr. E. M. Champion, cashier and assistant treasurer of the Houston Electric Ry., was sand bagged in broad daylight when leaving a bank with $3,000 of pay roll money and robbed of his money while unconscious. Upon being revived and learning that the money was gone, he tried to shoot himself through the head, but was saved by a friend, who struck the revolver and the ball missed. The company think highly of Mr. Champion and exonerate him from all blame in the matter.

AURORA, WHEATON & CHICAGO.

The Aurora, Wheaton & Chicago Railway Co. has been incorporated with a capital of $1,500,000, and will build electric lines from Aurora and Elgin into Chicago, which it is expected will be strong competitors for the steam roads.

The officers are: President, B. Mahler, of Cleveland, president of the Lorain & Cleveland Railway Co.; vice-president, L. J. Wolf, Chicago; treasurer, M. J. Mandelbaum, Cleveland, a banker and a director in several interurban electric roads; secretary, Edward Dickinson, assistant cashier of the Metropolitan National Bank of Chicago. Others interested are Henry Everett, of Cleveland, president of the Big Consolidated system of that city, and Will Christy, president of the Cincinnati & Hamilton.

These gentlemen have purchased the Northern Electric Ry., which has franchises from 47th St., Chicago, to River Grove, on the Desplaines River. This road has been run at a loss, but now it is the intention of the new company to put the roadbed in first-class condition and give it a northwestern terminus of some importance.

This same company will build two lines of electric railway, one from Aurora and one from Elgin, into Chicago. It has already acquired considerable of the right of way. Vice-President Wolf states that work will be begun during the summer and be pushed as rapidly as possible.

FATAL ACCIDENT AT WORCESTER, MASS.

A car on the Millbury division of the Worcester (Mass.) Suburban Street Railway Co. jumped the rails while crossing a bridge over the Blackstone River on the night of March 15th, and three persons were killed and one injured. A defective rail was the cause of the accident. After the car left the track it bumped over the wooden roadbed for more than fifty feet, when with a side lurch it shot diagonally, crashed through the iron railing of the bridge, and fell into the river about thirty-five feet below. The water was clear of ice and the car was almost entirely submerged, only the roof remaining in sight. The fall broke the car at about the middle and it was this fact that saved one life, that of a 60-year-old passenger. He managed to crawl up part way through this break and was thus saved from drowning. The others, the conductor and two motormen, one on duty and the other on his way home, were not only drowned but were horribly mangled.

It was with much difficulty that the passenger was rescued. He had been pinned in the break and remained with half of his body in the icy water for nearly an hour.

HALF FARES.

A strike of the Beaver Valley Traction Co.'s employes was begun last month, but amicably settled.

The common council of Erie, Pa., has passed an ordinance placing a tax of $25 per year on each street car.

The governor of Tennessee vetoed the bill granting street railway corporations power to conduct a lighting business.

April 1st the Punxsutawney (Pa.) Street Passenger Railway Co. began a 60-day experiment selling eight tickets for 25 cents.

The Oakland (Cal.) Consolidated Street Railway Co. will organize a ferry between San Francisco and Berkeley, Oakland and Alameda.

The Black River Traction Co., Watertown, N. Y., will probably erect another car barn if contemplated additions to its mileage are made.

W. O. Johnson, of Chicago, was on March 13th appointed receiver of the Freeport (Ill.) General Electric Co., operating the street railway.

"Motored" is the new word coined by a Cleveland paper when it wants to make a short cut in describing the collision of a motor car with a wagon.

The United Traction Co., Pittsburg, has received the contract to carry United States mail between Allegheny and Bellevue Station, a distance of five miles.

Mr. Henry Everett, of Cleveland, is understood to be negotiating for the Akron Street Railway & Illuminating Co., and to have made an offer of $1,250,000.

A bill has been reported in the New York Assembly requiring electric railways to equip their cars with fenders by January 1, 1900, with provisions for a fine of $50 per car after that time.

The Buffalo, Hamburg & Aurora Railway Co., which was mentioned in our last month's issue, is negotiating with the Niagara Falls power companies with a view to making a contract.

A bill has been introduced in the Missouri Legislature providing that no city council shall grant a street railway franchise except with consent of the owners of one-half of the abutting property.

The Comptroller of the Currency has ordered an assessment of 100 per cent on the stock of the insolvent National Bank of Illinois; the principal asset of the bank is the Calumet Electric Street Ry.

March 14th the motormen of the Keokuk (Ia.) Electric Railway Co. struck for shorter hours; two cars were kept running, being operated by employes of Mr. Hubinger, president of the company.

W. A. C. Ewan, of New York, proposes to organize a company capitalized at $1,000,000, to consolidate the street railways of Akron, O., and to be known as the Akron Consolidated Traction Company.

The Norfolk (Va.) Street Railroad Co. is now building an extension comprising 2½ miles of track. The company's summer cars have all been repainted and are ready for the opening of the season.

Perry Douds was on March 13th appointed receiver of the Mahoning Street Railway Co., of New Castle, Pa. The company was organized to build between New Castle and Mahoningtown, but never got farther than buying the ties.

The Toronto (Ont.) Street Railway Co. has been fined for running a car which did not have a vestibule for the protection of the conductor; the ordinance in question says that "motormen or others" perating the car shall be protected by vestibules, and the company has taken an appeal, claiming that the conductor does not operate the car.

Ann Arbor, Mich., seems destined to become a great center for electric interurbans. The Detroit, Ypsilanti & Ann Arbor Ry is finished; a contract for constructing an electric road to Lansing has been let; franchises for an interurban to Jackson have been secured, and the promoters for a road to Adrian have been encouraged and assisted by citizens in the towns interested. Should plans for all these roads be carried out Ann Arbor will present a scene of great activity this summer.

HAMILTON PRESIDENT CITY RAILWAY.

D. G. Hamilton, vice-president of the Chicago City Ry., has been elected president to fill the vacancy caused by the death of Mr. Bowen. Mr. Hamilton was, until recently, president of the National Railway Co., operating St. Louis lines.

THEFT OF COPPER.

The prevailing high prices of copper have made the overhead lines and bonds of electric railways very tempting to thieves and the companies are suffering in consequence. A case is reported from Chester, Pa., where the copper rail bonds were systematically removed from the tracks of the Chester Traction Co. in broad daylight. After the loss of the bonds had been discovered it was easy to find the man who took them, as he had been seen at work by many persons to a number of whom he hau said he was an employe of the company. Upon his arrest, he gave the name of Walter Lyons and admitted the theft; he was committed to jail in default of $500 bail.

NEW CHICAGO MANAGER FOR WESTINGHOUSE.

Mr. Arthur Hartwell has been chosen to succeed Mr. Maurice Coster in the management of the Chicago office of the Westinghouse Electric & Manufacturing Co. Mr. Hartwell is an Ohioan and for a number of years was interested in the gas business. About ten years ago he entered the service of the Westinghouse Co. and has been with it ever since. He was some time ago given the management of the Pittsburgh office, but has now been transferred to Chicago, where he fills a similar position. He is already favorably known to many in the electrical fraternity of Chicago, who welcome him as a valued addition to their numbers.

H. M. BRINCKERHOFF.

Mr. H. M. Brinckerhoff, who has been for several months superintendent of motive power and way of the Metropolitan Elevated Railway Co., Chicago, succeeded Mr. W. E. Baker in charge of the operating departments of the road, with the title of assistant general manager.

Mr. Brinckerhoff has had a wide experience in electric railway work. He graduated from the Steven Institute of Technology, taking the degree of mechanical engineer and then spent two years as a workman on line work, car equipping and repairs, power station operation, etc., with the West End road of Boston, and the Belt Line Street Ry., of Utica, N. Y. He was the assistant electrical engineer on the Columbian Intra-Mural Ry., during the Columbian Exposition, and assisted in planning, equipping and operating that line.

Mr. Brinckerhoff took the position of electrical engineer with the Metropolitan Elevated Railroad Co. and held it during the construction and afterwards until appointed superintendent of motive power and way last winter. His friends all wish him continued success in the management of his road.

New Work in 1899.

Electric Railway Extensions, New Buildings and Equipments, Recently Incorporated Electric Railway Companies, and Proposed Electric Railways.

ALABAMA.

HUNTSVILLE.—T. W. Pratt has applied to this city for an electric railway franchise, offering to have three miles of line in operation within sixty days.

BIRMINGHAM.—The Birmingham Traction Co., Alex. T. London, president, and Geo. H. Clarke, manager, will shortly buy ten new closed cars.

BIRMINGHAM.—The Bloomfield & Orchard Lake Railway Co. has a franchise to construct an electric railway to Orchard Lake.

BIRMINGHAM.—The Birmingham Railway & Electric Co. is now reconstructing the lines of its city division, requiring the laying of new cross-ties, new rails and new switches.

GADSDEN.—The Gadsden & Attalia Union Railway Co. has contracted with the Alabama Light & Power Co. to furnish the plant of the railway company with electricity and is changing the line into an electric system.

ARKANSAS.

FORT SMITH.—The Fort Smith Traction, Light & Power Co., Samuel M. Loud, president, and A. N. Sicard, secretary and treasurer, is now equipping its lines with electricity and expects to have them in operation by July 1st. The company is putting in two 100-kw. Westinghouse generators coupled to 150-h. p. Porter-Allen engines. It will operate about seven cars at first and will furnish the city with light.

PINE BLUFF.—Seven miles of electric railway will be built by the Pine Bluff Electric Light & Street Railway Co. This company was incorporated Dec. 6, 1898, with a capital of $300,000.

CALIFORNIA.

LOS ANGELES.—The contract for building the Alhambra Electric branch has been signed by the officers of the Los Angeles Terminal Ry. and the city of Alhambra. The conditions are that cars shall be running within five months.

FRESNO.—The Fresno Railway Co. was incorporated March 16, to build a standard gage electric railway in Fresno County, and carry freight as well as passengers. One branch of the line will run to Clovis and together with other branches the estimated length of the road is twenty miles. The company has a capital stock of $500,000, and the directors are: Alexander Gordon, W. M. Wyatt, W. H. McKenzie, C. W. Jones and S. N. Griffith.

KERN CITY.—The necessary funds for the proposed electric line between this city and Bakersfield are reported to have been secured. The estimated cost of the road is $60,000. H. F. Williams is interested.

LOS GATOS.—E. N. Davis has petitioned the town council for franchise for an electric line to San Jose.

OAKLAND.—The Oakland Railway Co. F. S. Douby, president, and M. M. Martin, superintendent, is substituting electricity for the cable on San Pablo avenue.

SAN FRANCISCO.—The Market Street Railway Co., H. E. Huntington, president, and E. P. Vining, manager, will at once build two new lines.

SANTA BARBARA.—The Santa Barbara Consolidated Electric Co., C. W. D. Miller, president and manager, will between June and Jan. 1, 1900, build five miles of new track and rebuild one mile. It will buy two new coast style combination cars and extend its power house.

PASADENA.—The Los Angeles & Pasadena Electric Railway Co., C. W. Smith, president, and W. H. Smith, manager, will on May 1st begin building two miles of new track and will rebuild two miles.

REDLANDS.—The Redlands Street Railway Co., Henry Fisher, president, and J. H. Fisher, manager, will build four miles of new track between the Hotel Casa Loma and Canon Crest Park, commencing in a few months, and will rebuild four miles of its old lines; two combination cars will be bought.

LOS ANGELES.—The Los Angeles Railway Co., H. E. Huntington, president, and F. W. Wood, manager, is building an extension of five miles to its main line. The company will buy ten new double truck 33-foot cars, and build a car barn of 111 cars capacity.

SAN FRANCISCO.—The San Francisco & San Mateo Railway Co., A. B. Spreckels, president, and W. Clayton, secretary and purchasing agent, will double track its line from San Francisco to Holy Cross cemetery, thirteen miles; work will be commenced May 15th and completed by October 1st. The company will buy thirty-five double truck cars, and may possibly build a new power house of 2,500 h. p. capacity.

LOS ANGELES.—According to report the $75,000 bonus asked for the construction of a trolley line from this city to Whittier has nearly all been subscribed. It is thought that work on the line will be commenced in two months.

LOS ANGELES.—It is said that the Los Angeles & Redondo Railway, an 18-mile steam road, is to be changed to electricity. L. T. Garnsey, president, Los Angeles. The subsidy of $9,000 asked by the Los Angeles Terminal Railway for building the Alhambra electric branch line has been secured from the city and the road is now an assured fact. T. E. Gibbon, vice president of the L. A. T. Railway, Los Angeles, may be addressed.

SAN DIEGO.—The San Diego Electric Ry. is contemplating double tracking the line on Logan and National avenues. The track on Logan avenue will be 2,100 feet long. J. A. Flint, general manager.

VISALIA.—The directors of the Visalia & Tulare dummy line, operating in Tulare County between the places named, are considering the advisability of changing it into a trolley road. The power is to be supplied by the Mt. Whitney Power Co. and new cars will be provided.

PASADENA.—Geo. D. Leighton has secured the right to build and operate an electric street railroad in specified streets in this city.

ALHAMBRA.—A proposition for approval has been submitted to the people of this place by the Terminal Railway Co., which proposes to extend its main line, as soon as electricity is installed, from South Pasadena to this city, a distance of three miles.

FRESNO.—S. N. Griffith is interested in a company to build an electric street railway in this city with branches to the extent of twenty miles. It is said that the estimated cost will be $350,000. The power will be furnished by the San Joaquin Electric Co.

COLORADO.

PUEBLO.—The Pueblo Traction & Electric Co. has been incorporated here with a capital of $500,000. The directors are John F. Vail, Charles E. Gast, John O. Albert, John S. Macbeth and Thomas H. Devine.

BOWLDER.—Application has been made by citizens of this place for permission to build a trolley line through the city.

FLORENCE.—Surveys have been made for the proposed electric line between here and Canon City, the road to be later extended to Soda Springs and the coal camps.

VICTOR.—The Gold Belt line, about eight miles in length, is to be equipped with electricity as soon as the electric plant now building at Goldfield is completed, according to report.

CONNECTICUT.

EAST LYME.—Application has been made for the incorporation of the East Lyme Street Railway Co., which proposes to build an electric railway through the village of Niantic to Crescent Beach, Black Point, Flanders and Oswegatchie. Ex-Representative Calkins of East Lyme and New London is counsel for the company.

MONTVILLE.—The Montville Railway Co. has petitioned the legislature for amendments to its charter to build a 13-mile road north and south to Norwich and New London, and use electricity for motive power. Solomon Lucas, representative.

HARTFORD.—The Hartford Street Railway Co., E. S. Goodrich, president, and N. McD. Crawford, will build three-quarters of a mile of new track in Hartford, commencing work in April.

WATERBURY.—The Waterbury Traction Co., D. S. Plume, president, and J. E. Sewell, general manager, has petitioned the city council for permission to lay tracks on the Watertown road within the limits of Waterbury, and if it is granted work will be begun at once.

NORWICH.—The Norwich Street Railway Co., Billings B. Learned, president, and W. L. Adams, superintendent, will build an extension of one-half mile.

NEW BRITAIN.—The Central Railway & Electric Co., A. M. Young, president, and E. H. Mather, manager, will build two and one-half miles of new track between Plainville and Southington, which is to be completed by July 1st.

NEW HAVEN.—It is reported that a consolidation is contemplated of all the street railroads in this city. Thomas M. Waller, James D. Dewell, Israel A. Kelsey, Harrison Wagner and W. B. Ferguson, representatives of different street railways in New Haven, have petitioned the General Assembly for an act of incorporation permitting them to form a new street railroad company and to build extensions to the present lines. The consolidation would embrace the New Haven Street, the New England Street, the Westchester Avenue, the West Shore and the Fairhaven & Westville Companies.

NORWALK.—The Norwalk Tramway Co. has completed plans for a new storage station and extensions of its systems to be made in the spring. W. R. Thompson, chief engineer, 40 South Main street, South Norwalk.

SOMERS.—A petition has been filed for a charter for an electric railway to be operated between this city and Enfield by the Enfield & Somers Electric Railway Co. George E. Kenney is interested.

HARTFORD.—A charter has been applied for by W. E. Goodwin of Elmwood and Fred C. Rockwell of Hartford, who wish to build an electric line from Hartford to New Britain.

CROMWELL.—F. W. Siebert, Edward W. Shedd and C. Siebert will apply for a charter to build an electric railway in this city.

BRANFORD.—The Branford Electric Railway Co. capitalized at $200,000 has been organized by the Branford Electric Co., to build a line to East Haven. A. M. Young, president.

DELAWARE.

WILMINGTON.—The New Castle & Delaware City Railway Co. has been incorporated with a capital of $100,000, for the purpose of building a line between the points named in the title. The incorporators are: Harry A. Richardson, president of the First National Bank of Dover; Peter J. Ford and Peter L. Cooper, Jr.

DISTRICT OF COLUMBIA.

WASHINGTON.—The Washington & University Railroad Co., F. C. Kennedy, president, and J. D. Croissant, manager, will build an extension four miles, beginning work this month. The company will buy four new cars and build a new car house.

WASHINGTON.—The Capital Traction Co., G. T. Dunlop, president, and D. S. Carl, superintendent, began rebuilding one and one-half miles of its line on April 1st.

FLORIDA.

JACKSONVILLE.—The Main Street Railway Co. has been granted a new charter by the city council, under which the company is authorized to build an extension of its present line. New stock will be issued to cover the cost of the improvement. S. B. Hubbard, president.

GEORGIA.

MACON.—The Macon Electric Light & Railway Co., T. J. Carling, president and manager, is rebuilding one mile of track, and is building a new power house of 1,000 h. p. for railway and lighting work.

ATLANTA.—The Atlanta Railway Co., M. F. Amorous, president, and F. M. Zimmerman, manager, will build eleven and one-half miles of new track between the present time and November, and rebuild twelve miles of old track. The company has recently bought fifteen new combination cars.

AUGUSTA.—The Augusta Railway & Electric Co., D. B. Dyer, president, and W. E. Moore, manager, is going to install three 400-kw. turbine-driven generators.

ATLANTA.—The Atlanta Consolidated Street Ry. has petitioned for the right of way to build an extension along the east side of the East Point road to Oakland City.

IDAHO.

WARDNER. — Articles incorporating the Wardner Kellogg Electric Railway Co. have been filed with the Secretary of State. The company is capitalized at $500,000 and purposes to build an electric railroad from Kellogg through Wardner through the Bunker Hill mine and from Kellogg to Government gulch. The directors are: Bartlett Pressley and Margaret Pressley of Kellogg; Lawrence O'Neill of Murray; B. Flaig of Wardner and William W. Woods of Wallace.

ILLINOIS.

KANKAKEE.—Plans are under way for changing the route of the Kankakee Electric Street Ry. in order to avoid a steep hill on Harrison avenue.

DANVILLE.—The Danville Gas, Electric Light & Street Railway Co. is figuring with contractors for the erection of a depot at the Soldiers' Home.

ROCKFORD.—The Rock River Electric Railway Co., E. M. Hopkins, president and manager, which has offices in Chicago, will commence work at once on twenty-eight miles of electric railway between Rockford and Oregon. A power house of 800 h. p. capacity and a car barn will be built and fourteen cars bought.

QUINCY.—The Quincy Horse Railway & Carrying Co. will build three miles of extensions to be completed by June 1. The company has bought twelve new Brill cars, and will build a new car house of twenty-eight cars capacity.

CHICAGO.—The Chicago City Railway Co. will rebuild eleven miles of track in Halsted street, the work to be completed by July 1. Some new work may be done if the necessary franchises are granted.

JOLIET.—The Joliet Railroad Co., W. F. Milliken, president, and C. C. Rush, superintendent, will build an extension of one mile of new track between Bush Park and Rockdale, and rebuild several miles.

PEORIA.—The Peoria & Pekin Terminal Railway Co., T. J. Miller, president, and L. E. Myers, manager, will build twelve miles of new track between these cities which it expects to have completed by July 1st. Ten 40-foot open cars will be bought, and a car barn, 100x200 feet, and a power house of 1,000 h. p. capacity built.

PRINCETON.—The Princeton, Spring Valley & LaSalle Railway Co. will build twenty-six miles of electric road between Princeton and LaSalle, commencing work as soon as possible; it will buy at least twenty cars.

ALTON.—The Alton & East Alton Railway & Power Co. and the Alton Railway & Illuminating Co., of both of which J. F. Porter is president, will build five miles of track between Alton and East Alton and Upper Alton, commencing work at once and opening the line by July 1st. Two miles of track will be rebuilt using 70-pound rails. Five new 30-foot cars will be purchased and a car barn, 80x125 feet, to hold twenty cars, is to be built.

ROCKFORD.—T. M. Ellis, general manager of the Rockford Railway, Light & Power Co., states that it will build two and one-half miles of new track in Rockford, using 50-pound rails, and increase the capacity of its power house by 250 kw. A line to Belvidere, twelve miles, will be surveyed and it is hoped that the right of way can be secured and construction begun during the present season.

BLOOMINGTON.—The Bloomington & Normal Railway Co., A. E. De Mange, president, and John Eddy, manager, will build five miles of extensions and rebuild three miles, commencing work May 1st. The company has just completed a new car house having a capacity of forty cars.

OTTAWA.—The LaSalle County R. R. to connect Streator, Ottawa and LaSalle will comprise when completed fifty-two miles of track. The affairs of the company are in charge of Naugle, Holcomb & Co., Chicago, who will begin work as soon as the weather permits. Some thirty-two miles of track will be entirely new construction and much of the remaining twenty miles will have to be rebuilt. It is the intention of the company to furnish power for the railway and also for lighting the three cities from a single power station. About twenty-five new cars will be bought.

GALESBURG.—The Electric Motor & Power Co., Fred Seacord, president and manager, is making an addition to its power plant in order to do a lighting business.

PEORIA.—The Central Railway Co. has petitioned the city council for permission to build two branch lines, one to start from its present tracks on Main and Boulevard streets and the other on Depot street. If the franchise is granted the work is to be completed in ninety days.

BELLEVILLE.—The Belleville Electric Railway Co. will extend its line one-half mile into the city limits, and replace one and a half miles of single track road with double track, the material for which has already been purchased. John A. Day, president and general manager.

MOLINE.—The Tri-City Street Railway Co. will lay new rails on the tracks of the blue line from First street to the city limits.

SYCAMORE.—The Lake Geneva, Sycamore & Southern Electric Ry. has petitioned the supervisors of DeKalb County for permission to build through that county. A 20-year franchise is asked for, with a single track road. The company was incorporated in December, 1897, with a capital stock of $155,000. George B. Morris and John B. Whalen are among those interested.

INDIANA.

HAGERSTOWN.—A franchise has been granted the Interurban Traction Co. permitting it to run an electric line through this place, the intention ultimately being to form connections with Indianapolis and Richmond.

TERRE HAUTE.—The Terre Haute Electric Railway Co., Joshua Jump, receiver, and M. F. Burke, manager, will rebuild two miles of track.

FRANKFORT.—The Clinton Traction Co., Geo. T. Dinwiddie, president, and J. W. Morrison, manager, will build ten miles of electric railway in Clinton county. It expects to begin work in four months and open the line next year.

GREENFIELD.—The Indianapolis & Greenfield Rapid Transit Co., John J. Cooper, president, will build a 25-mile line between Knightstown and Indianapolis, commencing work June 1st and completing it by October of this year. It will buy ten cars and build a car barn and power house.

AUBURN.—The Northeastern Indiana Street Railway Co., S. A. Powers, Angola, Ind., president, and W. E. Griswold, Auburn, manager, is arranging to build an electric line between Ft. Wayne and Orland, forty-five miles.

CAMBRIDGE CITY.—The Cambridge City Interurban Traction Co. will build twenty-five miles of lines to connect Cambridge City, East Germantown, Mt. Auburn, Dublin, Milton, Hagerstown and Economy; work is to be commenced in sixty days and the line is expected to be opened by September 1st. The company will buy twenty-five cars and build a car house and a power house of 900 h. p. capacity. Messrs. Kenney & Kepler, Cambridge City, are in charge of the plans.

RICHMOND.—The Richmond Traction Co., Elijah Kessler, manager, will build two miles of new track extending its line to the Fair Grounds.

MICHIGAN CITY.—The Lake Cities Electric Railway Co., I. I. Sipro, receiver, and F. H. Root, superintendent, will build an extension of two miles during the coming summer and make some additions to its power plant.

WABASH.—The Board of Commissioners have granted the right of way for a new interurban electric line through Kosciusko County. Two routes were asked for. One from Rochester to Kendallville, via Warsaw, Vawter Park, North Webster and Albion, and the other from Rochester to Akron, Sevastopol, Burket and Palestine. Right of way has been granted along the highways in both cases, the promoters being permitted to select the route.

WABASH.—It is announced that the sale has been effected of the Indiana Electric Co's. lines in Elkhart, connecting that city with Goshen and including the seven miles of track in Elkhart, the purchasers being Delworth & Kennedy, owners of the South Bend system. The new owners will build an electric street railway from South Bend to Goshen, a distance of thirteen miles, this fall.

ELWOOD.—The Elwood Electric Street Railway was sold January 2d to the Union Traction Co. This company has already completed the line from Anderson to Alexandria, and the council of this city will immediately grant the company the right of way into Elwood. Charles S. Henry, president.

INDIANAPOLIS.—Charles L. Harry, superintendent of the Kokomo Railway Co., has filed petitions with the commissioners in Tipton and Hamilton Counties, asking for the right of way and privileges of building an electric railroad extending from Tipton south through Atlanta, Arcadia and Cicero to this city. E. H. Shirk, president of the Tipton National Bank, is also interested in the proposed road.

ANDERSON.—N. N. Morse, representing Indianapolis capitalists, has petitioned the commissioners for a franchise to build an electric railway from Anderson to Ingalls, via Pendleton.

NEW CASTLE.—The commissioners of Henry County have granted a franchise to the New Castle Electric Railway Co. to build in this city. The franchise requires work to begin before October, 1899. The directors of the company are E. B. Phillips, P. Wisehart, Thad. Gordon, D. P. Jennings and T. B. Millikan.

RICHMOND.—A. C. Lindemuth of this city, as agent for W. A. Pickens of Indianapolis, Ind., has petitioned the council for a franchise to build a railway through this city, using either steam, electric or other motive power.

LEBANON.—The Board of Commissioners of Boone County has been petitioned by a traction company for an electric line connecting Indianapolis with Lebanon,, Logansport, Delphi, Frankfort and Lafayette. It is proposed to ultimately construct a line connecting Chicago with the Indiana gas belt.

INDIANAPOLIS.—The county commissioners have granted a 50-year franchise to D. P. Erwin, David M. Parry and D. M. Ransdell, to build an electric railway over the National Road via Bridgeport. The line is to be completed before September, 1901.

PORTVILLE.—Ellis C. Carpenter of Anderson, representing the Charles L. Henry Union Traction Co., has been granted a franchise for the use of the streets for the proposed new electric line. The right of way has now been secured in all the incorporated towns between Anderson and Indianapolis, and it is thought work will be commenced at once.

LOGANSPORT.—The Indianapolis & Logansport Traction Co. has been granted a 50-year franchise along the Michigan road to the north

county line; the proposed road will occupy the west side of the highway and is estimated to cost $1,000,000. Louis C. Walker, Indianapolis, is counsel for the company.

ROCHESTER.—A franchise has been granted by the commissioners of Fulton County for an electric railway from this city to Winona Lake. This will be an extension of the proposed road from Logansport to Rochester.

MEROM.—It is reported that A. D. Hayworth, of Washington, D. C., and others are interested in the construction of an electric railway from Terre Haute to Merom, a distance of thirty-two miles.

EVANSVILLE.—Henning & Henning of Dayton, O., are said to represent capitalists who contemplate the construction of a suburban line from Evansville to Rockport, Tell City and Cannelton. C. J. Murphy of the Business Men's Association may be addressed.

ALBANY.—Surveys for an electric line between this place and Pennville, passing through Dunkirk, have been completed, and work on the proposed line will begin at once.

WARSAW.—Surveys have been completed for the three-mile electric line between Warsaw and Winona, which Noah J. Clodfelter proposes to build and have in operation by June 1.

RICHMOND.—The Interurban Railway Co. was incorporated March 8th to build from this city to Cincinnati, O., via Scipio. Benj. Starr, president.

IOWA.

CEDAR RAPIDS.—A stock company has been organized and the city council has been petitioned for a 20-year franchise for a street railway in this city. The promoters of the scheme are G. W. Koontz, S. Bradley and C. S. Mercer.

OTTUMWA.—The Ottumwa Electric & Steam R. R. has been incorporated with a capital stock of $200,000 to build an electric street railroad in the city of Ottumwa and vicinity. The company is permitted to use either or both steam and electricity. The directors are: J. H. Merrill, William Daggett, J. B. Sax, J. W. Garner, Samuel Mahon and Calvin Manning, all of Ottumwa.

MISSOURI VALLEY.—A number of prominent citizens and capitalists of this city are preparing for the organization of a company for the building of an electric railway plant and line in Missouri Valley. Messrs. Edgecomb, Deur, Kellogg and Kramer are at the head of the project.

MUSCATINE.—H. W. Hutting has sold half interest in the Muscatine Electric R. R. to L. W. Prior. New extensions and improvements will be added.

KANSAS.

LEAVENWORTH.—The commissioners of Leavenworth County have granted a 50-year franchise to A. A. Fenn and others to construct an electric line connecting Kansas City and Leavenworth. Work is to begin by April 1 and to be completed by Jan. 1, 1900.

LEAVENWORTH.—The Leavenworth Electric Railroad Co., Newman Erb, president, and E. E. Coombs, manager, expects to build a new brick car barn to house thirty cars, and to buy four new open motor cars.

CHERRYVALE.—A franchise has been granted to C. J. Corbin to build an electric railway from Cherryvale to Corbin City, a new town, one mile distant.

KANSAS CITY.—A charter has been granted to the Kansas City & Leavenworth Railway Co. to construct, operate and equip a railway from Kansas City, through Lansing and other intervening stations, to Leavenworth, Kan. The capital stock of the company is $1,000,000. The directors are D. H. Kimberly, Chas. O. Everts, H. C. Ellison, all of Cleveland, O.

IOLA.—The Iola Rapid Transit & Electric Light Co., W. S. Hendricks, president, and A. W. Reck, manager, will build a line from Iola and La Harpe, between May and September. The company will buy five new cars.

KENTUCKY.

FORDSVILLE.—An electric tramway half a mile in length will soon be built by the Fordsville Block Coal Co. Address Ike C. Adair, secretary and treasurer.

COVINGTON.—The Cincinnati, Lawrenceburg & Aurora Electric Street Railroad Co. has applied to the county commissioners for a 50-year franchise and right of way to build and operate a single or double track electric street railroad from Anderson's Ferry to the Indiana state line.

PADUCAH.—The Paducah Street Railway Co. has filed a trust deed to the America Trust & Savings Co. for the sum of $400,000, to be used for the purpose of enabling the street car company to issue additional bonds for improvements.

CARROLLTON.—A company has been incorporated here, according to report, to build an electric line from Warsaw to Milton and from Carrollton to English Station. Myron O. Baxter, president.

LOUISIANA.

NEW ORLEANS.—The Orleans Railroad Co., E. Perrin, president, and V. L. Welloz, superintendent, will shortly add two new cars to the equipment.

NEW ORLEANS.—The New Orleans & Carrollton Railroad Co., J. K. Newman, president, and Geo. H. Davis, manager, will rebuild the St. Charles Ave. line, using 100-pound rails, and build an extension along Carrollton Ave. to Athletic Park.

MAINE.

LEWISTON.—The Lewiston, Brunswick & Bath Street Ry., A. H. Shaw, president, and A. F. Gerald, manager, expects to build a new car barn at Lewiston, 108x154 feet, and a power house, 50x90 feet, equipped with machinery of 1,000 h. p. capacity.

GOULDSBORO.—John G. Moore, J. Montgomery Sears and other well-known capitalists are considering the project of an electric railroad from Winter Harbor, through Gouldsboro and connecting with the Washington County Railroad, a distance of about ten miles; four miles of the proposed railway has already been surveyed.

SACO.—Isaac A. Walker & Son of Philadelphia have been given the contract for equipping and building the Saco River Electric Railroad. The line extends from Saco to Bonny Eagle and is about eleven miles in length.

BANGOR.—The Bangor, Hampton & Winterport Railway Co. is preparing plans to extend its line in the early spring to Winterport and to have it completed by July 1st. President, N. H. Mitchell, 29 Hammond street.

BELFAST.—James Mitchell, a railroad contractor and promoter of Bangor, Me., is to build a five-mile electric railroad this spring between this city and Northport.

BENTON FALLS.—The Benton Falls & Fairfield Ry., which was built principally for freight traffic, and now operating five miles of road, will build a new power station on the Sebasticook, about two miles above Benton Falls.

MARYLAND.

CUMBERLAND.—The Cumberland Electric Railway Co., Geo. L. Wellington, president, and W. M. Roberts, jr., superintendent, is now building an extension to its car barn.

CUMBERLAND.—A new franchise has been granted to the promoters of the Cumberland-Westernport Electric Ry., which requires them to begin work within 90 days, and to have the entire road completed and in operation within two years. E. F. Walker, president, Philadelphia, Pa.

ANNAPOLIS.—The Baltimore, Marley, Mountain Bar Electric Railway Co. has just been incorporated in this city with a capital of $50,000 in shares of $50, to construct an electric railway from this place to Baltimore City and Mountain Bar.

CUMBERLAND.—Surveys have been begun for the proposed electric railroad from this city to Westernport, a distance of 30 miles. Engineer, G. B. Howell, Philadelphia, Pa.

BALTIMORE.—The Baltimore Consolidated Railway Co. has made a survey along the Frederick turnpike from Elliott City to St. Johns college, a distance of about six miles, for a proposed single track extension.

MASSACHUSETTS.

DEDHAM.—Work is in progress on the Norfolk Western Street Ry., on High St. The proposed route is from Medfield to Dedham, via Westwood, nine miles. President, W. W. Mitchell, Medfield, Mass.; engineers, Hodges & Harrington, 60 State St., Boston.

TAUNTON.—The Taunton & Middleboro Street Railway Co. has been organized to build a street railway from the terminus of the East Taunton Street Railway in Taunton through Lakeville to the location of the New Bedford, Middleboro & Brockton Street Railway, a distance of 5½ miles. The directors are Fred C. Hinds, Newton; A. M. Bearse, Middleboro; A. P. Smith, New Bedford, and others.

FITCHBURG.—The Gardner, Westminster & Fitchburg Railway Co. has been granted a franchise to build a street railway to the town line of Westminster.

MEDFIELD.—Contracts will be let in a few days by the Norfolk Western Street Railway Co., for the proposed electric line between this city and Dedham, via Westwood, a distance of nine miles. Engineers, Hodges & Harrington, 60 State street, Boston.

BRAINTREE.—The selectmen of this place have granted a franchise to the Braintree & Weymouth Street Railway Co., to build on Meadow Road and French avenue.

NEEDHAM.—The railroad commissioners have authorized the Natick & Cochituate Street Railway Co. to extend its tracks to Needham. President, H. Harwood, Natick.

PITTSFIELD.—The Pittsfield Electric Street Railway Co. has been given permission by the aldermen to lay additional tracks on North and Wahcomah streets. Manager, P. C. Dolan.

QUINCY.—It is reported that the Quincy & Boston Street Railway Co. will soon build a car house, near Neponset bridge, on Robinson's wharf. The dimensions will be 93x23x144feet, and the cost, $15,000. B. J. Week, purchasing agent and superintendent, 4 Washington street, Quincy.

BRIDGEWATER.—The Brockton, Bridgewater & Taunton Street Railway Co. has petitioned the selectmen of Bridgewater for permission to lay a branch track from the main line to the power station. G. H. Campbell, president, Brockton, Mass.

WAITSFIELD.—This town has voted to issue $19,000 in bonds to aid in the construction of the proposed Mad River Valley Electric Ry. from Montpelier to Warren, via Middlesex, Moretown and Waitsfield, a distance of about 26 miles. F. C. Kennedy, president, Burlington, Vt.

GEORGETOWN.—The Georgetown, Rowley & Ipswich Street Railway Co. has been organized with a capital stock of $180,000, to build 18 miles of street railway. The incorporators are: C. E. Barns, 53 State street, Boston; Edmund B. Fuller, Haverhill, Mass., and others.

HINGHAM.—The selectmen of this city have been petitioned by the Hingham Street Railway Co. for an increased location for a double track from Broad Bridge to Hingham over North and Rockland streets to the Hull line. The plan also includes an extension in Hull to the beach.

LEXINGTON.—A franchise has been granted to the Lexington & Boston Street Railway Co. for a road in this city. It is understood that the company intends to extend its lines from Arlington Heights to Billerica, where connection can be made from the electric road to Lowell.

NORTHAMPTON.—The state railway commissioners have granted a charter to the Northampton & Amherst Street Railway Co., with a capital of $150,000. Among those interested are: F. S. Coolidge, Fitchburg, Mass.; E. F. Blodgett, Leominster; W. H. Gates, Hadley.

WINTHROP.—The selectmen have granted a franchise to the Winthrop & Boston Electric Railway Co.

LINWOOD.—The Linwood Street Railway Co. has been granted a franchise for an electric road between Linwood and Whitinsville. The road will connect at Whitinsville with the Worcester & Blackstone Valley Electric R. R., and will give a through line of 18 miles to Worcester.

EDGARTOWN.—The Edgartown Street Railway Co. has been organized with a capital stock of $30,000 to construct an electric road between here and Cottage City. Wm. H. Butle, of Boston, is interested.

WALTHAM.—The Waltham, Newton & Forest Hill Street Railway Co. has been organized with a capital stock of $200,000 to build a line 13 miles long between Waltham and Boston, via Newton. The directors are, Chas. F. Avery, Newton; Chas. H. Wilson, Brookline, and William M. Butler, of Boston.

WEBSTER.—The Webster & Dudley Street Railway Co., E. S. Hill, president, and John Flint, manager, will probably build some new track this season, but has not fully decided.

WHITINSVILLE.—The Worcester & Blackstone Valley Street Railway Co. has been granted a franchise by the selectmen to extend its line from Rockdale into Whitinsville.

WORCESTER.—The Worcester & Clinton Street Ry. will lease 8½ miles of new track between Clinton and Hudson, to be built at once by a company having the same officers as the Worcester & Clinton, and the new line is practically an extension of this company's interurban road. The Worcester & Clinton Ry. will buy two or three vestibuled cars and five or six open cars, and a new power house is to be built at West Berlin. A. S. Paton, of Leominster, is president, and J. W. Ogden, of Boylston Center, manager.

FRAMINGHAM.—The Framingham Union Street Railway Co. will add two open cars to its equipment.

PALMER.—The Palmer & Monson Street Railway Co., Chas. F. Grosvenor, president and manager, will probably build between Palmer and Monson Ware.

ROSTON.—The Martha's Vineyard Street Railway Co., J. H. Gilbert, president, and John A. Duggan, manager, will build nine miles of new track between Cottage City and Edgarton, commencing work about June 1st. The company will buy three or four cars and build a new car barn. The office of this company is at 60 State St., Boston.

GREENFIELD.—The Greenfield & Turners Falls Street Railway Co., Frank E. Lowe, president and manager, expects to build two miles of new track between Montague and Turners Falls. Work is to be commenced as soon as possible.

SPRINGFIELD.—The Springfield Street Railway Co., J. Olmsted, president, and A. E. Smith, manager, will petition for permission to extend the Belmont Ave. line one-half a mile from the present terminus of the West Springfield line.

MICHIGAN.

ADRIAN.—The Jackson & Adrian Electric Railway Co., H. C. Smith, president, and A. P. Southworth, manager, will build 40 miles of new track between Jackson and Adrian, commencing work May 1st. It will buy 12 cars and build a car barn and power house.

LANSING.—The Lansing, Dexter & Ann Arbor Electric Railway Co., C. A. Mapes, president, will build 61 miles of railway between Lansing and Ann Arbor.

OWASSO.—The Owasso & Corunna Electric Co., I. D. H. Ralph, president and manager, will build three miles of track as extensions to its city lines, beginning work as soon as possible. It will buy two new cars.

SAGINAW.—The Saginaw & Frankenmuth Electric Railway Co., which was organized last fall by capitalists of Saginaw, Mich., to build a 14-mile road from Saginaw to Frankenmuth vit Bridgeport, will commence work as soon as a franchise through Bridgeport can be secured.

MUSKEGON.—The Muskegon Street Railway Co., J. L. Crosby, president, and Fred W. Thompson, secretary, will rebuild two miles of track.

DETROIT.—The Grand Rapids & Kalamazoo Electric Railway Co. will build from 50 to 75 miles of new track between Grand Rapids and Kalamazoo and between Kalamazoo and Battle Creek, commencing work April 15th. From 20 to 30 new cars will be needed. W. W. Hannon is president and A. D. Prosser is secretary of the company.

LANSING.—It is rumored that an electric line will be constructed between Lansing and Grand Ledge and that the water power at the old mill at Delta Center will be used.

BAY CITY.—The Consolidated Street Railway Co. has been ordered to put in new crossings at points where the line crosses railway tracks, the present crossing having been declared defective by the railroad commissioner.

FLINT.—The Michigan Electric Railway Co., A. A. Talmage, president, and W. J. Schaefer, purchasing agent, announces that it will build 100 miles of electric railways near Flint; work is to be commenced by May and a portion of the line in operation by September of this year. Fifty cars, passenger and freight, will be bought; the plans contemplate four car barns and two or three power houses.

GRAND RAPIDS.—The Grand Rapids & Lake Michigan Railway Co., William J. Hess, president, and Robert Hanemann, manager, states that it will build 35 miles of new track between Grand Rapids, Holland and Macatawa Park, commencing work in May. The company will buy 25 new cars, 15 passenger and 10 freight.

DETROIT.—The Detroit, Mt. Clemens & Marine City Railway Co., capital $600,000, Chas. M. Swift, trustee, and the Detroit & Lake Orion Railway Co., John Winter, trustee, have filed articles of association with the secretary of state.

DETROIT.—The Detroit & Northwestern Railway Co. has been incorporated with a capital stock of $500,000 by Edward W. Voight, James A. Randall, Hoyt Post, Seymour Bovounell, Albert H. Wilkinson, James V. Oxtoby and W. F. Voight. The company proposes to build an electric street railway to the cities of Detroit and Pontiac, the villages of Farmington and Northville, in Wayne county, and also in Novi, Southfield, Bloomfield and Pontiac, in Oakland county. The entire road will be about 45 miles long.

MILFORD.—The village of Milford has granted Messrs. Park and Reynolds an electric road franchise through the village.

PETOSKEY.—Surveys are being made for an electric street railway from Cheboygan to this city.

YPSILANTI.—Captain E. P. Allen, of this city, has been granted a franchise by the town board of Saline for an extension of the proposed Ypsilanti & Saline Electric road toward Tecumseh.

LINDEN.—The Michigan Electric Railway Co., which proposes to construct an electric line through this city, connecting Fenton, Long Lake, Holly, Clarkson and Pontiac, has been granted a franchise by the city council. The route covers 87 miles, and the estimated cost of construction is $800,000. The road must be completed by September, 1900.

LANSING.—A corporation capitalized at $350,000 has recently been chartered in this city. It proposes to build a line of road from Freeport, Barry County, to Greenville, Montcalm County. The company will be known as the Grand Rapids, Belding & Saginaw Railway Co. William Alden Smith is interested.

BIRMINGHAM.—The Bloomfield township board has granted a franchise to a number of capitalists to build and operate an electric road from the village of Circle, a small town about two miles north of this place, to Orchard Lake. The road will be single track with necessary switches. George T. Hendrie, of Detroit, may be addressed.

VERNON.—The Vernon township board has granted a franchise to the Long Lake, Durand & Corunna Electric Railway Co. The company now has a clear right of way and expects to begin work next April.

DETROIT.—It is stated by the promoters of the proposed electric railway to Unionville that work will be commenced promptly.

DETROIT.—The Detroit & Pontiac Eilectric Railway Co. has increased its capital stock from $400,000 to $500,000 for the purpose of constructing a double track from Highland Park to Pontiac. The right of way has already been secured and the work of constructing the extra track will commence as soon as the weather permits. S. Hendrie, general manager.

GRAND HAVEN.—The common council has granted a franchise to Grand Rapids capitalists for an electric road from this city to Grand Rapids. The road is to be in operation in July. The power house will be located at Cooperville.

ANN ARBOR.—Westinghouse, Church, Kerr & Co. have the contract for building and equipping the Lansing & Ann Arbor Electric Ry. The road will run from Lansing to Mason, thence to Dexter, and from Dexter to Ann Arbor. C. E. Mapes and Dr. R. J. Shanks, of Lansing, may be addressed.

SUMMIT CITY.—Clark Cornwall, of Jackson, Mich., Arthur Woodard, Ann Arbor, and Walter Josly, of Ypsilanti, have been granted a franchise by the township board of Summit to construct an electric railway to Vandercook's Lake to Summit.

HUDSON.—The Clinton & Hudson Street Railway Co. has been granted a franchise by the selectmen to build and operate an electric railway through this town.

MINNESOTA.

ST. PAUL.—The Twin City Rapid Transit Co. is seeking a franchise in Stillwater for an extension to the recently acquired White Bear Lake line.

MINNEAPOLIS.—The Minneapolis & Champlain Suburban Railway Co. has filed articles of incorporation with a capital of $50,000. The incorporators are: Clifford D. Staples, president; Lorenzo L. C. Brooks, vice-president; F. D. Woodbury, secretary; Emory W. Hill, Collinwood Evans, Henry M. Morton, Anthony Chryst.

MISSOURI.

KANSAS CITY.—The Brooklyn Avenue Railway Co., J. H. Lucas, president, and W. H. Lucas, manager, commenced work April 1st on a three-mile extension to its Northeast and 10th St. line; the company will rebuild eight miles of track. A new car house for 70 cars will be built and 25 new combination cars bought.

KANSAS CITY.—The Kansas City Interurban Railway Co., with a capital of $300,000, has filed articles of incorporation. It proposes to convert the Waldo Park dummy line into an electric road. The organizers are Henry Pfeiffer, of Westport, H. G. Perk, B. H. Chapman and C. H. Mathews and C. H. Chapin, of Kansas City, Kas.

KANSAS CITY.—The East Side Electric Street Railway Co. has been given permission to take up the tracks of the defunct East Fifth street road and to begin work on its own line. J. J. Heim is interested in the new work.

KANSAS CITY.—It is reported that the Metropolitan Street Railway Co. has drawn plans and estimates for the changing of its cable lines into electricity. The change will involve 40 miles of cable track.

KANSAS CITY.—The Central Electric Railway Co., of this city, has been incorporated with a capital stock of $2,500,000 by P. B. Holmes, F. Hagerman and H. C. Page.

ST. LOUIS.—The Midland Terminal Railway Co. has been chartered with a capital of $75,000 to build an electric line, seven and one-half miles in length. The incorporators are: Valle Reyburn, J. P. Rodgers, L. E. Anderson, J. C. Kenny, J. B. Kruse, C. H. McMillan, Henry Vierling and G. W. Wilson.

ST. LOUIS.—The county commissioners have been petitioned by the St. Louis County Street Railway Co. for leave to substitute electricity for the present mule motive power. M. B. Greenfelder, president.

ST. LOUIS.—Surveys are being made for the proposed route of the electric line to Montesano, via Jefferson Barracks. J. D. Houseman, president.

SEDALIA.—Articles of incorporation have been filed by the Sedalia Electric & Railway Co., with a capital stock of $400,000. The directors are: C. H. Reeve, New York; J. C. DeDong, Brooklyn, and J. C. Van Riper, Wm. C. Evans and A. M. Trader, of Sedalia.

WEBB CITY.—The Southwestern Missouri Electric Ry., at present operated from Carthage to Galena, will soon build an additional three-mile line from Webb City to Oronogo.

FENTON.—The McCoy Construction Co. will begin at once the construction of the proposed Fenton & Southwestern Railway, from Fenton to Carondelet, St. Louis, a distance of 28 miles. Thomas F. Sneed, president.

NEVADA.—Quigley & Co. have petitioned the council for a franchise to build an electric street railway and also an electric light and gas plant. It is proposed to extend the line to

Eldorado Springs and other points within a radius of 20 miles. Estimated cost of the road is $100,000.

ST. LOUIS, MO. The Wellston, Creve Court, Lake & St. Charles R. R., J. B. C. Lucas, president, and J. D. Houseman, manager, is building 11 miles of new track between St. Louis and St. Charles and expects to have the line partly open in May. The company will buy 10 large new cars, put up a new barn with a capacity for 20 cars and a power house of 1,000 h. p. capacity.

KANSAS CITY, MO.—The Missouri Electric Railway Co., Henry Smith, president, and F. W. Sears, manager, will build 12 miles of new track. Work will be commenced July 1, 1899, and it is expected to open the line September 1, 1900.

MONTANA.

HELENA.—The Helena Power & Light Co., Henry M. Parchen, president, has made a proposition to the city with a view to building an electric line to East Helena.

BUTTE.—The Butte Consolidated Railway Co., W. A. Clark, president, and J. R. Wharton, manager, it building a 5-mile extension to its park line, which is to be completed May 15th. The company is now building a new car barn; 2½ miles of track will be built.

NEBRASKA.

OMAHA.—The East Omaha Street Railway Co., Dudley Smith, president, and Alfred B. De Long, manager, is contemplating improvements, but has not completed its plans as yet.

OMAHA.—The Omaha Street Railway Co. will rebuild from three to four miles of its lines, using 73-lb. rail. It has recently increased its equipment by 37 General Electric motors and 37 Peckham trucks, and fenders to equip all its cars.

NIOBRARA.—L. B. Rowe has applied to the council for a franchise to build an electric line in this city.

NEW HAMPSHIRE.

PELHAM CENTER.—A company in which W. H. Anderson, of Lowell, Mass., is interested has been organized to build an electric line between Lowell, Pelham and West Windham.

LACONIA.—The Laconia Street Railway Co., H. L. Pierce, president, and L. S. Pierce, manager, will build an extension of five miles, and expects to open it by June 15th. Four new cars have been added to the equipment and the car house has been enlarged. Heretofore the company has rented power, but it expects to build a power house of 500 h. p. capacity.

HAMPTON FALLS.—The railroad commissioners of New Hampshire have been petitioned by the Hampton & Amesbury Street Railway Co. for authority to issue $40,000 of capital stock in order to construct and equip a street railway in Hampton Falls and Seabrook, a distance of four miles.

BERLIN.—The Berlin & Gorham Electric Railway Co. has been chartered to construct an electric railway connecting the two towns named, a distance of about four miles. Carlos P. Day, president.

MANCHESTER.—The Manchester Street Ry. has been granted permission to extend its line to the village of Goffstown.

KEENE.—The act to increase the capital stock of the Keene Electric Railway Co. by $20,000 was approved March 7. The time for completing this road has been extended to March 31, 1902.

GILMANTON.—The Gilmanton & Barnstead Electric Railway Co. has been incorporated with a capital stock of $50,000 to build an electric line, about 10 miles long, between the places named. The incorporators are: Thomas Cogswell, Hiram A. Tuttle, Sherburne J. Winslow, George E. Kent, Charles E. Walker.

PORTSMOUTH.—The stockholders of the Portsmouth & Dover Railroad Co. have voted to authorize the Boston & Maine Railroad Co. to extend the Portsmouth Electric Street Ry. through Newcastle, Rye and Hampton and accept its proposition for the loan of money to complete the road until new stock could be issued to repay the loan.

NEW JERSEY.

HOBOKEN.—President Young, of the North Hudson County Railway Co., advises us that the company will build 21 new cars, 12 open and 12 closed.

BOUND BROOK.—The Lap Joint Railway Track Co., Charles K. Moore, president, will rebuild 10 miles of track, and build a new power house.

PLAINFIELD.—The Plainfield Street Railway Co., Thomas Nevins, president, and J. H. Almirall, manager, will build six miles of new track between Plainfield and Westfield, which is to be completed by June 1.

NEW BRUNSWICK.—The Brunswick Traction Co., which controls all the trolley lines in Middlesex County, and also lines in Somerset and Union Counties, has been merged with the New York and Philadelphia Traction Company, to be operated under the direction of the Brunswick Company. Judge Gottfried Krueger, of Newark; Andrew Radel, of Bridgeport, and E. H. Radel, of Brunswick, have purchased a controlling interest in the New York and Philadelphia Company.

TRENTON.—Surveys have been completed for the first five miles and contracts will be let at once for the proposed electric line of the Trenton, Lawrenceville & Princeton Railway Co. One steel bridge 110 ft. long will be required. Wm. P. Parry, general manager.

MILLVILLE.—The Millville Traction Co. is considering the advisability of extending its line to Vineland this spring. G. B. Langley, president.

PASSAIC.—According to report, the directors of the Saddle River Traction Co. have awarded the contract for the construction of the proposed electric railway from Passaic to Lodi. The line will be double track and be operated as an extension of the Paterson Railway. Colin R. Wise, engineer, Passaic Bank building.

PRINCETON.—The New England Railroad Construction Co., Worcester, Mass., has been awarded the contract for building the electric railway between Princeton and Trenton for the Princeton & Trenton Traction Company. The line will be about 12 miles in length and be equipped for handling both passengers and freight. E. E. Carpenter, general manager.

BRIDGETON.—The Bridgeton & Millville Traction Co. has decided to extend its line to Cedarville and Walter H. Bacon, treasurer of the company, will enter into contracts for the work.

HACKENSACK.—The Union Traction Co., operating eight miles of road between North Arlington and Carlstadt, was recently sold by Receiver William A. Johnson to William C. Giles, of the reorganization committee, for $20,000 above the indebtedness, which is $852,000. It is the purpose of the company to carry out the original plan of extending its tracks to this city.

WESTFIELD.—The Westfield & Elizabeth Street Railroad Co. has been granted a franchise to construct an electric street railway through the city of Rahway. A. A. Gaddis, president.

ELIZABETH.—The city council has been petitioned for a franchise to build a double track electric street railway through this town from Staten Island Sound to Westfield avenue, thence through Union township to the Cranford township line, where it will connect with the proposed road to Plainfield. Senator John Kean may be addressed.

SAYREVILLE.—The Sayreville Electric Light & Power Co. has petitioned the township committee for a franchise for a trolley line from Sayreville to South Amboy. The proposed line, which is five miles, follows the route surveyed by the Brunswick Traction Company.

BRIDGETON.—The Bridgeton & Melville Traction Co., operating 18 miles of railroad, is preparing to build an extension from Fairton to Cedarville in the spring. C. H. Kuhn, president.

HACKENSACK.—The purchasers of the Union Traction Co. have organized under the name of Newark & Hackensack Traction Company, with the following officers: G. W. McCormick, president; W. C. Giles, vice-president, and John H. Coon, treasurer, all of New York.

KEYPORT.—The Keyport & Mattawan Street Ry., now operating about four miles of horse railroad between the two cities named, is considering the advisability of changing the road into an electric line and extending it to Atlantic Highlands. A. M. Brown, manager.

NEW YORK.

BUFFALO.—Geo. P. Smith, general manager of the Tonawanda & Niagara Falls Electric Ry., has applied for a charter for a new line to the Falls.

BUFFALO.—The Buffalo & Depew Railway Co. expects to begin the construction of seven miles of double-track railway between Buffalo and Depew. W. B. Cutter, president; Geo. A. Ricker, chief engineer, 714 Ellicott Square.

BUFFALO.—Application has been made to the council by the Buffalo Traction Co. for permission to build a single track electric railway from Utica street to Rhode Island street, on Chenango street.

ROCHESTER, N. Y.—The Rochester & Sodus Bay Electric Ry. will probably be constructed and in operation before the close of the year, and when completed will make a direct route to the bay.

MT. VERNON.—The Westchester Electric Railroad Co. has filed notice of its intention to extend the lines in Pelham from the Mt. Vernon boundary line to the Boston turnpike and Pelham Manor.

ROCHESTER.—The Rochester Railway Co. petitioned the council for permission to rebuild its North Clinton street line. Double tracks will be substituted on the greater part of the line, and the road will be extended by a single track to the city limit. T. J. Nicholl, general manager.

ROME.—The Rome City Street Railway Co. will probably make some extensions and improvements, but has not yet fully decided upon its plans.

NEW YORK.—The Staten Island Electric Railroad Co., J. H. Swinarton, president, and J. H. Sims, manager, has recently ordered 25 Brill 9-bench open cars.

SEA CLIFFE, L. I.—The Nassau County Railway Co. was incorporated March 18 with a capital stock of $25,000, to construct and operate a street railroad from Sea Cliffe Station, of the Long Island Railroad, 1½ miles to the steamboat landing in the village of Sea Cliffe. The directors are William F. Brown, William L. O. Allan, Edward J. Boyle, G. A. Hamilton, W. J. Hawson, M. J. Keany, J. Hollis Gibson, L. E. Freeman and F. L. Hoyt.

BUFFALO.—The Buffalo, Hamburg & Aurora Railway Co., A. J. Benzing, president, and U. L. Upson, general manager, will build 21 miles of new track between these cities; work has been commenced and it is expected to open the line by Aug. 1, 1899. The company will buy 10 40-ft. cars. A car house 40x108 ft. and a power house, 48x120 ft., of 1,500 h. p. capacity will be built.

HORNELLSVILLE.—The Hornellsville Electric Railway Co., C. Adsit, president, and G. T. Rehn, manager, will rebuild three miles of track.

ELMIRA.—The Elmira & Corning Railway Co., H. B. Rhymer, president and manager, will build between these two places 18 miles. Twelve cars are to be bought and a car barn and power house built.

ELMIRA.—It is said that the contract for the Elmira & Seneca Lake Electric Ry. has been awarded to the American Engineering Co., of Bound Brook. The road will run from Watkins through Montour Falls to Horseheads, there connect with the Elmira & Horseheads Ry.

NEW PLATZ.—The New Platz & Wallkill Valley Railroad Co. will build a short extension, 1-5 mile, in Highland Landing, and will buy a few new cars. Edward Browne, receiver, and E. E. Hawkins, superintendent.

OGDENSBURG.—The Ogdensburg Street Railway Co., Henry A. Sage, president and manager, will build an extension of one mile to its King St. line and rebuild three miles.

SARATOGA SPRINGS.—The Saratoga Traction Co., P. A. Noyes, president, and R. E. Dunston, manager, is building five miles of track between Saratoga and Ballston Spa, and will rebuild two miles.

SARATOGA.—The Saratoga & Northern Electric Ry. has applied for permission to extend

its line to Glens Falls. R. E. Dunton is counsel for the company.

ELMIRA.—The Elmira & Horseheads Railway Co., C. G. Rasmus, president, and J. B. Cahoon, manager, will complete a 1½-mile extension by June 1st, and will rebuild one mile of track.

NYACK. The Nyack Traction Co., H. C. Howard, president, and E. F. Walker, manager, will build nine miles of track between Upper Nyack and Sparkill, to be opened July 1. Twelve 20-ft. cars will be bought, and a car barn 50x150 ft. and a power house 60x80 ft. built.

KINGSTON.—The Colonial City Traction Co., Chas. M. Preston, president, and C. G. Reed, superintendent, is to build an extension two miles of new track commencing in April, and completing it by June 1st. The company will buy six open and six closed cars.

LYONS.—Charles W. Field and Lucius L. Noyes, of the Clyde Electrical Co., have secured the right of way from Clyde, via Rose and North Rose, to Bonnie Castle, on Great Sodus Bay, for an electric road from Clyde, across the Rome, Watertown & Ogdensburg, at North Rose, to reach northern summer resorts on Lake Ontario.

UTICA.—The Utica Suburban Railway Co. has secured the right of way for an extension from Genesee street, Utica, to Capron, to connect with the Belt Line tracks in Upper New York Mills, via New Hartford.

GREENWICH.—The proposed extension of the Greenwich & Schuylerville Electric Ry., from Schuylerville to Stillwater, and from Schuylerville to Ft. Edwards, has been certified by the secretary of state. The road will connect at Stillwater with the Stillwater & Mechanicsville Street Railway and at Ft. Edwards it will connect with the Glens Falls, Sandy Hill & Ft. Edwards Street Railway. Joseph A. Powers, of Lansingburgh, is the promoter of the Greenwich & Schuylerville road.

PHILMONT.—Articles of incorporation have been filed by the Columbia Traction Co., of this place, with a capital stock of $100,000, of which amount $1,500 in paid in, to construct and operate a street railway in Philmont, Columbia County. Incorporators are: Franklin G. Simmons, William C. Allen and Ernest F. Foote, of Rutherford, N. J. Office, 332 Harrison avenue, Harrison, N. J.

SCHENECTADY.—The Schenectady Street Railway Co. has voted to issue $77,000 in bonds for contemplated improvements, to be made this spring. Theodore Stebbins, general manager.

PENN YAN.—A. T. Hubbell, of Baltimore, Md., is said to be promoter of an electric railway between this city and Geneva.

MASSENA.—The Massena Electric Street Railway Co. has been incorporated here with a capital of $100,000, to operate a street surface electric road from Massena Springs Station to the St. Lawrence river, a distance of eight miles. The directors are: Thomas H. Gillespie, R. A. Johnson, E. M. Stathers, Howard Hasbrouck, Edward M. Dolan, Thomas D. Harris, Willard A. Esselstyn and James H. Jones, of New York City, and Robert Swan, of Massena.

MINEOLA.—The Mineola, Hempstead & Freeport Traction Co. has been incorporated to build and operate an 11-mile railroad connecting this city with Freeport with other than steam locomotive power. The company has a capital of $125,000 and the directors are: William J. Newton, Benjamin F. Hamilton, Charles Hills, James A. MacElhinny, William L. Greeley, Frank Harrington, John D. Sweeney, all of New York City, and James A. Stiles, of Hempstead.

BABYLON, L. I.—Surveys have been made and the consent of the property owners secured for the New York and North Shore Railway from Babylon to Northport, a distance of 16 miles. According to report, the company has let the contract for grading the road from Sanford Ave. in Flushing to Jamaica, to T. J. McKenna, of Flushing.

GREENWICH.—The Greenwich & Schuylerville Electric Railway Co., which was chartered in 1895 to build an electric road between the two cities named, is about to begin work. Martin Schenck, president, Albany, N. Y.

MOUNT VERNON. Owing to the greatly increased traffic over the line, the railway between this city and Yonkers will be double tracked at once. The Union Traction Co. of New York is said to control the line.

WHITE PLAINS.—The Tarrytown, White Plains & Mamaroneck Railway Co. has been granted a franchise on the Boston Post Road by the highway commissioners of Mamaroneck for the proposed road through that place. H. T. Jennings is treasurer and counsel for the company.

NEW YORK.—The Fort Dearborn Extension Railway Co. has been incorporated at Albany with a capital stock of $10,000 to operate an electrical surface line from 172d to 185th street on 11th avenue. The directors are: M. G. Starrett, W. F. Plummer, John Lambdon, Andrew Loughlin, D. W. Patterson and Henry Hartwell, of New York; John Kerr and Charles E. Corby, of Brooklyn; and H. A. Himely, Far Rockaway (L. I.), N. Y.

UTICA.—The Utica Suburban Railway Co. has been granted the right to construct and operate an electric car line from Genesee street, near Richardson Place, across to Capron and on to the New York Mills.

OSWEGO.—Reports state that George B. Leonard and others are interested in the construction of a trolley line between Oswego and Syracuse.

HUDSON.—Charles Frisbee has secured the right of way for an electric railroad from Albany to this city. The new company is known as the Columbia & Rensselaer Railway & Lighting Co. The authorized capital is $2,000,000.

SARATOGA.—An extension of the Saratoga Traction Co. is reported soon to be made from the Geysers to Ballston Spa, about five miles. T. F. Hamilton, president.

GLENS FALLS.—It is reported that the Green sawmill on the canal between this city and Sandy Hill will be converted into a reserve power station for the Glens Falls, Sandy Hill & Ft. Edward Street Railroad. E. A. Clerk, chief engineer.

AUBURN.—The grading and masonry has been completed for the interurban trolley between this city and Skaneateles. The rails will be laid early in the spring. President, George B. Leonard, Syracuse.

ALBANY.—It is reported that work on the construction of the Greenbush & Nassau Electric Ry. will be resumed under new management. The proposed route in Greenbush is being surveyed.

ALBANY.—A certificate has been filed with the secretary of state by the New York, Westchester & Connecticut Traction Co., asking for the right of way for an extension of its line from Mount Vernon to White Plains and Bronxville.

AUBURN.—The Auburn Interurban Electric Railway Co. has filed a petition with the secretary of state for permission to build several extensions.

DUNKIRK.—The city council has granted the stock company headed by Daniel F. Toomey the right to build a trolley line to Hickoryhurst. The line must be finished by July 15.

ROME.—The Rome City Street Railway Co. will probably make improvements and extensions, but has not fully decided upon its plans.

NEW YORK.—The New York & North Shore Railway Co. has been given a permit by the board of railway commissioners to construct an electric road from Middle Village, Long Island, the terminus of the New York & Queens County Railroad, through Jamaica, Whitestone, College Point and Bay Side to Manhassett, Long Island.

POTTSDAM.—The citizens of this place have appointed Dr. F. L. Dewey, J. C. Cooke and C. R. Holmes a committee to consider plans for an electric railroad to Hannawa Falls.

MARION.—Surveys are being made for the proposed Wayne Central Railroad between this city and Palmyra, six miles. The company will be incorporated soon. Electric motive power will be used. Le Grand Brown, engineer, Rochester, N. Y.

WATERLOO.—It is understood that a project is on foot for an electric railroad to be constructed from this place to Bonnie Castle via Clyde and Rose. New York capitalists are interested in the project.

SYRACUSE. The Syracuse, Auburn & Western Street Railway is open for bids of 12 miles of complete railway equipment. Address 36 Nottingham building, Syracuse, N. Y.

SCHUYLERVILLE. According to report an electric railway will soon be built between this place and Greenwich. J. D. Powers, of Sandy Hill, N. Y., is interested.

SKANEATELES. The Auburn Interurban Railroad Co., which has been laying tracks in Genesee street, say that it is intended to grade the entire distance between the village and Auburn this fall, and the line will be completed next spring and probably extended to Syracuse.

PEEKSKILL. The Peekskill Traction Co. is about to build its 12-mile electric road, the contract being let to Sanderson & Porter, of New York. The company was incorporated last April. Hanford Smith, of Peekskill, is interested.

ALBANY.—The Albany, Helderberg & Schoharie Electric Railway Co., H. W. Burgett, president, and Chas. E. Bibber, 49 Federal St., Boston, purchasing agent, will build 44 miles of new track between Albany and Schoharie, commencing work May 1st. The company will buy 22 new cars (no freight) and build a car barn and two power houses.

NORTH CAROLINA.

ASHEVILLE.—The Intermontane Railroad Co., J. S. Adams, president, and J. S. Adams, jr., manager, will build an electric power house.

OHIO.

ALLIANCE.—The Alliance Street Railway Co., W. W. Hazzard, president, and W. J. Berry, manager, expects to build a new car barn.

ALLIANCE.—It is announced that the Canton & Alliance Electric Railway Co. is negotiating for the purchase of the Alliance St. Ry., four miles. The Canton & Alliance Co. has been authorized to build an electric line between this city and Canton and expect to have the line completed in six months. W. W. Hazzard, general manager.

AKRON.—The Akron Traction & Electric Railway Co. has been incorporated by Aaron Wagner, Frank A. Selberling, L. C. Miles, F. E. Smith and Ira M. Miller, to build an electric line to Blue Pond. The company has a capital stock of $100,000.

ASHTABULA.—The Pennsylvania & Ohio Railway Co., Thomas Fricker, president, will build 44 miles of new track between Painesville and Conneaut Harbor, beginning work as soon as the weather permits. The company will buy 44 double truck cars and build a car barn and a power house of 1,500 h. p.

BOURNEVILLE.—An electric line is proposed from Bourneville to Bainbridge, 19 miles. J. C. Gregg, of Bourneville, is our informant.

GALION.—The Galion-Bucyrus Electric Ry., 11 miles, of which D. A. Blakeslee, of New Haven, Conn., is the chief engineer, has contracted for the rails, cars and boilers and have settled on the site for the power house in this city.

CLEVELAND.—The Cleveland & Eastern Railway Co., H. P. McIntosh, president, and W. C. Jones, chief engineer, is building 36 miles of new track between Cleveland and Chardon, O., and an extension to Burton, O. It will also buy 12 new combination passenger cars and build a new car barn and a new power house.

CLEVELAND.—Work on the 1-mile extension which the Lorain & Cleveland Ry. proposes to build to North Amherst, will begin as soon as the weather permits. W. E. Davis, manager.

CLEVELAND.—The Cleveland City Railway Co., M. A. Hanna, president and Geo. G. Mulhern, superintendent, will soon ask for a franchise for the Denison Ave. cross-town line.

CLEVELAND.—The Cleveland & Chagrin Falls Electric Co., F. M. Stearns, president, and R. L. Palmer, manager, is now building 14 miles of track between Chagrin Falls and Burton; the work will be completed by May 1st, and the line opened by May 15th. The company

has bought a 750-h. p. Atlas engine and a 400-kw. Siemens & Halske generator.

CLEVELAND.—At a recent meeting of the Lorain & Cleveland Electric Ry. it was decided to extend the line to South Amherst, a distance of seven miles.

COLUMBUS.—The National Traction Co. has been incorporated with a capital stock of $10,000 to build an electric road from Columbus through Madison, Clark, Miami and Preble Counties.

COLUMBUS.—The Columbia Street Railway Co. is said to be considering the advisability of an extension to Dublin.

CLEVES.—It is reported that the Dayton Traction Co. will construct a road from Anderson's Ferry to this city. The necessary right of way has been obtained and it is thought that by next spring the road will be complete from Addyston to Anderson's Ferry.

CINCINNATI.—The Hamilton & Eaton Electric Railway Co. has applied to the county commissioners for a right of way through about 12 miles of the turnpike roads of thic country.

COLUMBUS.—The Westerville & Wortmington Street Railway Co. has secured the right of way between Delaware and Flint, a distance of about 15 miles. It is proposed to complete the road by July 1, 1900.

CLEVELAND.—Jacob B. Perkins, David Morrison, H. W. S. Wood and others, representing a new company, have petitioned the council for permission to build an extensive system in the west and south sides of the city.

CINCINNATI. The contract for building the 40 miles of road for the Cincinnati, Lawrenceburg & Aurora Electric Railway Co. has been awarded to the Tennis Construction Company, of Philadelphia. The Cincinnati, Lawrenceburg & Aurora Co. was incorporated last November, with a capital of $10,000, which has since been increased. There will be two power houses, each equipped with two 500-h. p. Hamilton-Corliss engines, two 400-kw. Westinghouse generators, and four 250-h. p. tubular boilers. J. C. Hooven, president of the Hamilton-Corliss Engine Works, Hamilton, O., Geo. H. Helvey and Fred D. Shaefer are among those interested in the company.

CINCINNATI.—The Cincinnati Connecting Belt Line Ry. has been incorporated by J. G. Schmidlapp, Wm. C. Proctor, Louis E. Miller, G. P. Griffiths and Thomas D. Rhoades, all of Cincinnati. The capital stock is $50,000. The proposed road is to be a double track electric line from a point near Court street and Guilbert avenue in Cincinnati, northwest through the villages of Bond Hill, Norwood, Elmwood, College Hill and Mount Healthy.

DAYTON, O.—The Dayton, Arcanum & Greenville Traction Co., capitalized at $20,000, has been incorporated to construct and operate an electric line between this city and Greenville, Darke County. The incorporators are: Edward A. Parrott, L. Disher, Charles W. Dale, Solomon Good, John W. Good, H. L. Ferneding and J. Elliot Pierce.

CANAL DOVER.—Plans are completed for a new electric road between Newcomerstown and Urichsville, and the right of way has all been secured. There is also to be another new trolley between Massillon and this town.

COLUMBUS.—The Columbus Street Railway Co., R. E. Sheldon, president, and E. K. Stewart, general manager, will rebuild 15 miles of track, and has recently contracted for one 1,000-h. p. engine and one 850-k. w. generator.

COLUMBUS.—Work has been started on the Buckeye Lake Street Ry. and the promoters claim it will be in operation by October 1st.

DAYTON.—The Oakwood Street Railway Co., Charles B. Clegg, president, and Harrie P. Clegg, manager, expects to build a new car barn with a capacity of 20 cars.

GALLIPOLIS.—The Gallipolis & Point Pleasant Railway Co., John L. Vanse, president, and F. R. Vanse, superintendent, will build an extension of two miles, commencing work June 1st.

MAGNETIC SPRINGS.—The Marysville, Richwood, Magnetic Springs & Delaware Electric Ry., W. A. Wright, president, and J. P. Eubanks, manager and secretary, is to build 30 miles of road connecting these points as soon as the surveys and estimates are made. Car barn and power house will be built.

SPRINGFIELD.—The Dayton, Springfield & Urbana Electric Railway Co., Fred Colburn, president, will build 50 miles of new track between these three cities; work has been begun and it is expected to open the line June 20th. The company will buy 20 cars and build two car barns and two power houses, the latter of 300-h. p. and 600 h. p. capacity respectively.

DAYTON.—Surveys have been completed for the Dayton & Xenia Traction Co.'s proposed line from Dayton to Xenia via Alphia and Trebeins, a distance of 16 miles, 3½ miles of which will be double tracked. J. M. Wilson, chief engineer, Dayton.

DAYTON.—The City Railway Co., which recently secured control of the Dayton & Western Traction Co., is surveying for an extension from Eaton to Richmond, Ind. D. B. Corwin, president.

EAST LIVERPOOL.—Surveys are being made for the electric line proposed by J. L. Francis, of East Liverpool, Timothy Dwight, of Chicago, and J. G. Foltz, of Herkimer, N. Y. The road will probably be 20 miles long and will be built via Lisbon.

FINDLAY.—The Findlay Street Railway Co. is making preparations to build the long contemplated line to Fostoria, via Mortimer and Van Buren. C. Smith, general manager.

HAMILTON.—The Hamilton & Eaton Electric Street Railway Co. has been incorporated with a capital of $10,000 to operate an electric railway between this city and Eaton. The incorporators are J. H. Shallenbarger, James A. Weiker, J. E. Anderson, C. F. Elliott and J. C. Unzicker.

PORTAGE.—The council has granted a franchise for the proposed electric railway which is to be built at once by Contractor Leach, of Monroe, Mich.

YOUNGSTOWN.—The Youngstown Park & Falls Street Railway Co., Samuel C. Grier, president, and A. Kennedy Ashworth, manager, will open 3.6 miles of new track between Youngstown and Mill Creek Park on May 10th. The company has bought 12 new cars. It will soon build a rotary transformer sub-station of 400-kw. capacity.

SPRINGFIELD.—The Springfield Railway Co., W. B. McKinley, president, and S. L. Nelson, manager, has contracted for building four miles of new track, rebuilding two miles, and building a new car house; this work is to be completed June 1st. Six new cars have been bought.

YOUNGSTOWN.—The Mahoning Valley Railway Co., M. A. Verner, president, and A. A. Anderson, manager, will build three miles of track between Youngstown and Struthers as an extension of its interurban line. Work will be commenced May 1st, and it is expected to open the line in July. Several new double truck cars will be bought, and sometime during the summer a new power house will be built.

PHONETON.—The National Traction Co., of this city, has been incorporated with $10,000 capital to build along the old National Road from Columbus to the state line. J. O. H. Hooker and D. P. Wyamire are the incorporators.

SANDUSKY.—A syndicate is negotiating for the purchase of the Sandusky, Milan & Norwalk Electric Railway and the People's City line. The transaction is said to be the first step in a plan to build electric railways connecting a large number of northern Ohio cities and towns with Cleveland. John McKelvey, engineer.

STEUBENVILLE.—Preliminary surveys have been completed for a new street railway line between this city and Mingo Junction, and it is said that the line will be built within the next four weeks. It is also stated that the line will be a link in the system which is to connect Pittsburg with Wheeling by way of the towns along the Ohio river.

SPRINGFIELD.—An electric railway between Springfield and Decatur is projected by a Chicago company, represented by F. L. Sparrow.

TIFFIN.—The Marblehead, Port Clinton & Northern Railway Co., of Danbury township, Ottawa County, has been incorporated with $100,000 capital. The road is to begin at Tiffin and run through the counties of Logan, Sandusky and Ottawa to Marblehead. The incorporators are: W. E. Bense, A. W. Wigene and E. W. Guerin.

XENIA.—The Xenia & Spring Valley Transit Co. has been incorporated with a capital of $5,000 to build an electric line between the cities named. The incorporators are: C. J. Ferneding, A. O. Ozier, J. M. Wilson, F. H. Ferneding and Philip A. Kemper.

XENIA.—The Xenia & Wilmington Traction Co. has been incorporated with a capital stock of $10,000 to build an electric road from Xenia to Wilmington, a distance of 18 miles. Albert Emanuel, Frank S. Breene, Samuel Price, Henry P. Bruden and Harry A. Armstrong are among the incorporators.

OREGON.

PORTLAND.—The City & Suburban Railway Co., Tyler Woodward, president, and H. C. Campbell, manager, will build an extension of three miles, commencing work May 1st.

CORVALLIS.—Thomas Welsher, A. Wilheim and Henry Elliott have petitioned for the right of way for an electric railroad between Corvallis and Eugene, via Monroe.

OREGON CITY.—A franchise has been granted by the county court to W. H. Burghardt, to build an electric line from the city limits over the county road to Highlands, a distance of about eight miles. It is proposed to extend this line to Wilhoit Springs, a total distance of 40 miles.

PENNSYLVANIA.

KITTANNING.—The Kittanning & Ford City Street Railway Co., F. A. Moesta, president, is now building five miles of new track between Kittanning, Nealton and Ford City, which will be completed May 30th.

ALLENTOWN.—The Allentown & Emaus Street Railway Co., F. J. Crilly, president, and H. E. Crilly, manager, is building an extension of four miles between Emaus and Macungie. It is expected to open this line May 15th.

ALLENTOWN.—The Inland Traction Co. has been incorporated here with a capital of $200,000 to construct a street railway to Montgomery County, 12 miles in length. Incorporators are: J. H. Pascoe, Allentown; J. B. Alderfer, president; E. S. Landis and E. H. Alderfer, of Souderton, and C. F. Hecklen, Quakertown, Pa.

ERIE.—The Erie Rapid Transit Co., W. E. Hayes, president, and L. J. Chase, manager, will build 20 miles of track, which it is expected will be completed this summer. Ten double truck vestibuled cars will be bought, and a car barn and power house built.

ERIE.—The Erie City Passenger Railway, operated by the Erie Electric Motor Co., has been given permission by the council to extend its tracks to the Behrend paper mill.

ERIE.—R. M. Campbell, of Buffalo, N. Y., has enlisted capitalists in New York City to construct a new electric railway to connect Point Albino and Fort Erie, a distance of 11 miles.

JOHNSTOWN.—The Johnstown Passenger Railway Co., T. L. Johnson, president, and S. E. Young, manager, will add sixteen new cars to its summer equipment.

LANSFORD.—The Tamaqua & Lansford Street Railway Co., L. S. Riley, president, and W. D. Zehner, manager, have bought four new summer cars.

LANSDALE.—The Freland Traction Co., J. H. Pascal, president, and H. E. Crilly, manager, will build 11 miles of new track between Lansdale and Perkasie, to be completed by August 15th. The company will buy 20 cars, 10 open and 10 closed, and will build a car house and a power house of 1,500-h. p. capacity.

LEETONIA.—The Leetonia Railway Co., C. B. Farr, president, and J. L. Snyder, general superintendent, will build 5½ miles of new track between Leetonia and Tiadaghton as an extension of an old line bought of the Tiadaghton & Fahnestalk Railway Co.; four miles of track will be rebuilt. Work was commenced April 1st and the line is to be opened July 1st.

LEBANON.—The Lebanon & Annville Street Railway Co., S. P. Light, president, and C. H. Smith, manager, will build 1¼ miles of new track between Lebanon and Avon, to be opened

July 1st. The company will buy three new cars and build a new power house.

NORRISTOWN.—The Schuylkill Valley Traction Co., C. D. Beebe, president, and R. M. Douglass, manager, will rebuild five miles of track this season, and hopes to build a new power house.

NEW CASTLE.—The Youngstown & New Castle Electric Railway Co., D. L. Miller, president, and W. H. Miller, manager, will build 24 miles of new track between New Castle and Youngstown, commencing work May 1, 1899. The company will also rebuild 24 miles of track. Thirty new cars will be bought, a car barn having a capacity for 50 cars built, and a new power house built at Bedford, Pa.

PUNXSUTAWNEY.—The Punxsutawney Street Passenger Railway Co., S. E. Wilson, president, and L. C. Meyers, manager, is to build an extension of four miles, connecting a number of small towns, and will open the line in the early part of the summer; it will also rebuild one mile of track and make additions to it car barn and power house. Two or three new cars are to be bought.

PITTSBURG.—The Monongahela Traction Co. is now building the new branch from Turtle Creek to Wilkinsburg, and cars will be running by August.

PHILADELPHIA.—The Philadelphia & West Chester Traction Co., A. M. Taylor, president, and J. H. Gibson, superintendent, will soon build an extension of three-quarters mile. A few new cars, snow plows, etc., will be bought. Other improvements will be to enlarge the company's car house, the boiler plant, and the coal storage tracks.

PHILADELPHIA.—The Northern Central Traction Co., has secured franchises for an air line of one and one-quarter miles between Nazareth and Farmersville, where it will connect with the Palmer & Bethlehem Street Ry.

QUAKERTOWN.—The Quakertown Traction Co., C. Taylor Leland, president, and W. H. Davis, manager, will build 21 miles of road between Quakertown and Doylestown, an extension of its present line; work is to be commenced May 15th. The company will buy 12 new cars.

SCOTTDALE.—The Mt. Pleasant, Scottdale & Connellsville Electric Railway Co. will build 18 miles of road connecting these towns. Work is to be commenced in May and completed in six months. Ten cars will be bought and a car house and car barn built.

WEST CHESTER.—The new trolley line between Spring City and Phoenixville is well under way and the work is to be pushed forward as rapidly as possible.

YORK.—The city council has granted permission to the York Street Railway Co. to extend its tracks in certain streets and to operate its cars on these extensions with electric or other motive power.

YORK.—The Dallastown Railroad Co., D. T. Lafeau, president, and S. M. Manefold, manager, is building 1.3 miles between Dallastown and Dallastown Junction, to be completed about May 1st.

BRADFORD.—At the annual meeting of the Bradford Street Railway Co., held on January 9, the directors authorized the purchase of 225 trolley poles, 13,000 ties and ten miles of steel rails, to be used in extending the Congress street branch to Lewis Run.

BLOOMSBURG.—It is proposed to construct an electric street railway between this city and Berwick. The company, which is composed of Philadelphia capitalists with W. McCarroll as president, has filed acceptances of franchises granted by the council. The capital stock of the company is $250,000. Work on the road will begin in about three months. Offices of the company are located at 723 Walnut street, Philadelphia.

CONNELLSVILLE.—The Coke Belt Street Railway Co. has been chartered to build a line thirty miles long connecting Uniontown, Dunbar, New Haven, Connellsville, Bradford, Everson, Scottdale, Mt. Pleasant and South Greensburg in the counties of Fayette and Westmoreland. The company is capitalized at $600,000 and the incorporators are: Wm. H. Allen, J. E. Weller, Bryan Robertson, F. S. Young and D. I. Shaw.

GREENSBURG.—The Greensburg, Jeanette & Pittsburg Electric Ry. has applied for the right of way through Irwin for an extension of its line to North Irwin and Larimer. W. F. Sadler, president.

GLEN OLDEN.—The Swarthmore Electric Street Railway Co., with a capital of $100,000, has been chartered to build a line two miles long, beginning at Collindale borough, through Darby township to this city. Henry A. Noble of Philadelphia may be addressed.

LANSDALE.—The Lansdale & Harleyville Railway Co. has applied for charter to build a trolley line from Lansdale to Harleyville. The company has a capital stock of $50,000. J. S. Geller, president.

HATBORO.—The Hatboro Railway Co. has been incorporated with a capital stock of $30,000 to construct an electric street railway from this city to Willow Grove. The incorporators are James Van Horn, James McGregg, S. J. Garner, Jas. W. Rusling and R. Ashurst, Philadelphia, Pa.

HARRISBURG.—The Harrisburg Traction Co. will soon build an extension from Progress to Linglestown and Cahoe Springs. E. C. Felton, president.

LEWISTON.—William Schwartz, George H. Seargent and J. H. Scott of Baltimore; J. C. Mosser and H. M. Vanzandt of Harrisburg, are the directors of an electric street railway to be run from Lewistown to Yeagerstown, a distance of four miles. Work on the road will begin April 1st and completed June 1st. J. I. Quigley, president.

READING.—Reports from Oley, Pa., state Davis Brothers, engineers of the Reading Traction Co., this city, will soon begin surveys for an electric railway to connect Stoneycreek Mills and Friendensburg.

NORTHAMPTON.—The Northampton Central Street Railway Co. was incorporated March 7th with a capital stock of $72,000. The directors are M. P. McGrath, Worcester, Mass.; Edward J. Fox, William O. Hay, Thomas A. H. Hay, Easton, Pa.

DOYLESTOWN.—The Doylestown Trust Co., receiver of the Doylestown & Willow Grove trolley road, has applied to the court for authority to borrow $12,000 with which to improve the road and add to its equipment.

POTTSVILLE.—The Coal Castle Electric Co. has been incorporated, with a capital stock of $30,000, to build from Beechwood Colliery to Moores Store, Schuylkill County, Pa. The incorporators are: R. Steen Martin, John M. Emery, Norman A. Saylor and others, of Philadelphia.

PHILADELPHIA. — The Lindley Avenue Railway Co. and Fischer's Lane Railway Co. have been incorporated, both with a capital of $12,000. These railways, together with tracks laid and rights which the Union Traction Co. possesses, will complete a through line from Frankfort to Germantown, and with the Germantown & Fairmount Park Ry., to the Falls of the Schuylkill. The incorporators are: Michael Ehret, David C. Golden, William Wharton, Jr., Alex. Rennick and Richard F. Bower, all of Philadelphia.

PHILADELPHIA.—The Union Traction Co. is putting down electrical feeder conduits preparatory to the introduction of electricity on Callowhill street.

POTTSVILLE.—The Schuylkill Electric Railway Co. will soon build a fifteen-mile line from Pottsville up the Hecksherville valley, a populous mining district, through Mine Hill Gap to Glen Carbon. C. P. King, president.

PITTSBURG.—The United Traction Co. will extend its California avenue line from Avalon, its present terminus, to Dixmont. J. D. Callery, president.

POTTSTOWN.—The Montgomery & Chester Electric Ry., capitalized at $300,000, has been incorporated to construct and operate an electric railway between this city, Montgomery county, and Phoenixville, Chester County, a distance of seventeen miles. The incorporators are Daniel S. Mann, 49 North 13th street; W. H. Greebe and C. S. Jarvis of Philadelphia; Geo. F. P. Wagner, Pottstown; J. C. MacPherson, Washington, D. C.

PHILADELPHIA.—The Union Traction Co. has petitioned the council for permission to lay its tracks on Fourth street from Snyder avenue to Titner street and to string wires on Island road and Eastwick avenue, also to permit the Delaware & Schuylkill Electric Railway Co. to lay tracks in the 2d and 32d wards.

PERKASIE.—The Quakertown Traction Co. has been granted a franchise by the council to build in this borough. C. Taylor Leland, president, Quakertown, Pa. Messrs. Trelly and Pascoe of the Inland Traction Co. also have franchises to build from Perkasie to Lansdowne.

PITTSBURG.—The Consolidated Traction Co. is making extensive improvements on its Sharpsburg and Etna branches, according to report, and it contemplates building several extensions up the Allegheny Valley. C. L. Magee, president, Times building.

PITTSTON.—The Pittston & Scranton Street Railway Co. has been incorporated with a capital stock of $75,000 to construct an electric street railway from Pittston to Scranton, a distance of three miles. Jas. A. Steese, president, Harrisburg, Pa.

PHILADELPHIA.—It is reported that plans for the electric railway over the Blue Ridge Mountains are being perfected. The route most likely to be decided upon will connect Penn Mar and Blue Mountain House; from that point run to Blue Ridge Summit, Monterey, Buena Vista and back again to Penn Mar. From the latter point a line will extend to Waynesboro, Pa., and other points in the Cumberland Valley.

PITTSBURG.—The Pittsburg & Allegheny River Railroad Co., capitalized at $30,000, has been chartered to build an electric railroad three miles in length from 32d street, Pittsburg, to Herr's Island. The directors are J. H. Park, C. E. Clapp, George Wright, Jr., John A. Sutton and G. M. Black, Pittsburg; D. E. Park, Allegheny, and W. G. Park, New York City.

SPRING CITY.—Surveys have been completed for the Montgomery & Chester Electric Railway Co.'s branch from Phoenixville to this city, and it is said that work will soon be commenced by the Fairmount Construction Co., 723 Walnut street, Philadelphia, Pa. George F. P. Wagner, chief engineer, Pottstown, Pa.

SCRANTON, PA.—The Nay-Aug Park Street Railway Co. has been incorporated with a capital stock of $50,000 to construct an electric street railway in this city. The incorporators are: James L. Crawford, president; Geo. F. Reynolds, Geo. E. Hill, Clarence E. Reynolds and Thos. F. Penman, all of Scranton.

SOUTH BETHLEHEM.—The Nazareth & Bethlehem Passenger Railway Co. has been granted the right of way in all places asked for and will begin surveying at once. The company proposes to build an electric road direct from Bethlehem to Nazareth. J. H. McGee, president.

FREEMANSBURG.—Pascoe & Crilly, contractors, of Allentown, Pa., have made an application for the right of way through this town. If granted it is expected to build an electric line to connect with that of the Allentown Traction Co. at South Bethlehem.

RHODE ISLAND.

PROVIDENCE.—The Tiverton & Seaconnett Railroad Co., J. A. King, manager, 42 Exchange Building, Providence, will this spring build a 15-mile road between Tiverton and Seaconnet Point.

NEWPORT.—The council has been petitioned by the Newport Street Railway Co. for permission to extend its tracks from Broadway through Marlborough street to the Old Colony Railroad station. President, G. E. Reynolds, Spring and Franklin streets.

BRISTOL.—The contract for building the road from this city to Mt. Hope Park, for the Bristol Land & Improvement Co., has been let to Bibber, White & Co., Boston, Mass., at $20,800.

CUMBERLAND.—The time for the completion of the Cumberland Street Ry.'s proposed line between Lonsdale and Cumberland Hill has been extended from April 1st to July 1st, 1899. Thomas A. Jenckes is attorney for the company.

WOONSOCKET.—The Woonsocket Street

Railway Co. is considering the advisability of an extension to Fairmount. Several bridges will be needed as railroad crossings. E. K. Ray, president and general manager.

PROVIDENCE.—The Union Traction & Electric Co. will extend its line this spring from Westcott through Apponaug and along the shore to Rocky Point.

SOUTH CAROLINA.

CONWAY.—The Conway Sea Shore Railroad Co., F. A. Burroughs, president, and D. T. McNeill, manager, is building fifteen miles of road to be completed by June 1st. Two cars will be bought and a car house built.

TENNESSEE.

CHATTANOOGA.—The Chattanooga Electric Railway Co., J. H. Warner, president, and J. W. McFarland, superintendent, is pushing the improvements of its lines started some time since and will construct a loop system with the new transfer station on Market street.

KNOXVILLE. The Knoxville Traction Co., C. C. Howell, manager, has received permission from the council to tear up the old tracks on two streets and proposes spending $100,000 in improving its lines.

CHATTANOOGA.—The Chattanooga Rapid Transit Co., Samuel W. Divine, president, has leased the belt railway and will shortly equip the Sherman Heights line with electricity and begin the work of construction on the Chickamauga line.

NASHVILLE.—According to report an electric railway from Nashville to Lebanon and Smithville is contemplated by Pittsburg capitalists. E. E. Beard of Lebanon may be addressed.

CHATTANOOGA.—The Lookout Incline Co. has decided to build an electric line on the mountain from Sunset Park to Rock City, a distance of three miles. The proposed road will cost the company about $30,000.

CLARKSVILLE.—Surveys have been completed for the proposed suburban electric car line between this city and New Providence. The distance is about three miles. J. F. Shelton, manager.

TEXAS.

FORT WORTH.—The Glenwood & Polytechnic College Street Railway Co., J. T. Voss, president, has just completed a belt line through the heart of the business and residence portions of Fort Worth, and will soon extend its main line to Tyler's Lake and Park. This company recently installed a new 350-h. p. Hamilton-Corliss engine, built by the Hooven, Owens & Rentschler Co.

The four street railways of Fort Worth have been consolidated into two, the Glenwood & Polytechnic College Street Ry. purchased the Fort Worth & Arlington Heights Street Ry., and the Fort Worth Street Ry. purchased the City Ry.

The probabilities are that each of the two companies will build a number of miles of new track during the coming season.

DALLAS. The Dallas Consolidated Electric Street Railway Co., whose property was recently sold to Mr. G. Van Ginkle of Des Moines, Ia., is to equip a six-mile line, heretofore operated by mules, for electric traction.

BEAUMONT.—The city council has passed an ordinance granting to J. C. Ward and others a 50-year franchise for an electric railway on the streets of Beaumont.

SHERMAN.—The Sherman Construction Co. has been incorporated here to build a 10-mile electric line to the city of Denison.

AUSTIN.—E. A. Ellis and associates have been granted right of way by the council to erect and operate a street railway in this city. The proposed new system will traverse several streets.

UTAH.

SALT LAKE CITY.—The Salt Lake City Railroad Co., A. W. McCune, president, and W. P. Reed, manager, will begin April 15th building two miles of new track and will buy four of Laclede cars.

SALT LAKE CITY.—The Salt Lake Rapid Transit Co., J. S. Cameron, president, is contemplating improvement, but plans are not yet fully matured.

VERMONT.

BURLINGTON.—F. C. Kennedy, president of the St. Johnsbury Street Railroad Co., advises us that he expects to build a new line between Billows Falls and Saxtons River, six miles, and ten miles in extensions to the St. Johnsbury line. Twelve cars will be bought and two small car houses and one power house of 150 h. p. capacity.

BRATTLEBORO.—The Brattleboro Street Railroad Co. will build a new car barn this season and a power house having a capacity of 450 h. p.; of this 300 h. p. is steam and 150 h. p. water power machinery.

BURLINGTON.—C. W. Blakeslee & Sons, railway and macadam road contractors, Ansonia, Conn., have been awarded the contract to construct an electric railway between Burlington and Hinesburg. The road is to be fifteen miles long, and will be used both for freight and passenger traffic. The contract price is $140,000, and the work has already begun.

SALISBURY.—W. T. Dewey, E. D. Blackwell, of Montpelier, Vt., are among the proposed incorporators of the Lake Dunmore Power & Traction Co., which contemplates the construction of a railway through Salisbury, Leicester, Brandon, Pittsfield and Proctor to Rutland.

VIRGINIA.

PETERSBURG.—The Richmond & Petersburg Electric Railway Co. has petitioned the county supervisors of Chesterfield for the right of way for the proposed electric road on Petersburg Turnpike from Manchester to Petersburg. Corbin Warwick and William S. Royal are interested.

RICHMOND.—The Virginia Electric Railway & Development Co., which was incorporated in December, has secured control by purchase of the Piedmont Traction Co. of Piedmont, Va. It is said that improvements and extensions will be made.

NORFOLK.—The Tennis Construction Co., E. A. Tennis, president, Philadelphia, Pa., has been awarded the contract for building the Norfolk & Sewell's Point Electric Railroad. The road will be eighteen miles long, extending north from Norfolk to Sewell's Point. The same company will build the power house and car sheds and furnish the equipment for the road, including ten cars, two 350-h. p. Hamilton-Corliss engines, 300 k. w. Westinghouse generators and four 200-h. p. tubular boilers. Work is to be begun in time to be completed August 1st.

NORFOLK.—The Norfolk & Atlantic Terminal Ry. has asked for a franchise to build an electric railroad in this city. The proposed road is from Norfolk to a point on Chesapeake Bay, opposite Old Point Comfort. D. Lowenburg, president.

FINCASTLE.—Work on the proposed electric railway to connect Fincastle and Cloverdale, Botetourt County, will begin at an early day. It is said that the ultimate terminus will be Roanoke.

PETERSBURG.—The Virginia Traction Co. has been organized in this city with the following officers: T. O. Roy, president, Charlottesville, Va.; Augustus Wright, vice president, Petersburg; R. J. Spartley, treasurer, Petersburg, and others.

LYNCHBURG.—The Virginia Paving Brick Co., T. R. Adams, president, Lynchburg, has been awarded the contract for the construction of the proposed street railway of the Lynchburg Railway & Light Co., to cost about $70,000. This does not include the power house nor power house equipment.

NORFOLK.—The Norfolk & Ocean View Railway Co., R. Lancaster Williams, president, and D. A. Hegarty, manager, will build one mile of new track between North Oakwood and Christians Mills, to be opened May 1st.

NORFOLK.—The Norfolk Street Railway Co., R. L. Williams, president, is building two miles of new tracks on the Lamberts Point division as an extension to its present line.

HAMPTON.—The Newport News & Old Point Railway & Electric Co., W. J. Payne, president, and H. H. Carr, superintendent, will build five miles of new track in Newport News and build a railway, lighting and refrigerating power plant of 1,800 h. p. capacity. Five Jackson & Sharp cars will be added to the equipment.

MANCHESTER.—The council committee appointed to look into the matter of the proposed electric road from Manchester to Petersburg has reported favorably, the company to put up a forfeit of $1,000.

WASHINGTON.

SEATTLE.—The Seattle City Railway Co., A. F. Haas, manager, will begin May 1st to rebuild nine miles of track and will also buy sixteen new cable and electric cars. The company will also build two new car barns to hold thirty cars and one 500-h. p. power house.

SEATTLE.—The Seattle & Tacoma Electric Railway Co. has been incorporated by John Collins and George A. Burch of Seattle, Henry Bucey and H. E. Kanatavoid of Tacoma, to build between Seattle and Tacoma; capital stock, $1,000,000.

INDEX.—N. Rudebeck of Everett, with others, proposes to build an electric railroad from Index to mines in the vicinity, and have it finished within one year.

SPOKANE.—The City Park Transit Co. has applied to the city council for a franchise to extend its Lidgerwood line from Hillyard to Coeur d'Alene Park, about two miles. Other extensions are also contemplated. Frank Neitzel, general manager.

EVERETT.—It is said that agents for John D. Rockefeller are preparing plans for a large electric lighting plant on the Pacific coast. It is proposed to furnish power to operate the Everett & Monte Cristo Railroad, a steam road sixty-five miles long, by electricity. G. Colby, 1 Broadway, New York, president.

SPOKANE.—The Washington Water Power Co., H. M. Richards, president, and D. L. Huntington, manager, is now building a new power house of 3,000 h. p. capacity.

WEST VIRGINIA.

HUNTINGTON.—The Consolidated Light & Railway Co., J. L. Caldwell, president, and W. W. Magoon, manager, will rebuild three miles of track, and it has ordered three new open cars.

CHARLESTON.—The Charleston Railway Co. is reported to have secured a charter for a street railway in this city. The capital stock of the company is $100,000, and the incorporators are J. E. Scraggs and F. W. Sweet.

HUNTINGTON.—The Huntington Connecting Ry. has been incorporated with a capital stock of $50,000 to build a street railway in this town. The incorporators are E. E. Canda, New York; Ely Ensign and W. H. Banks, Huntington.

WHEELING.—The Wheeling Railway Co., T. H. Conderman, president, is to build an undergrade crossing under the Baltimore & Ohio tracks on its Boggs Run line, and make extensions to its car barn and power house. It will buy six Jackson & Sharp summer cars.

MARION.—Permission has been granted by the county court to the new electric railroad from Fairmount to Fairview, which is to be twelve miles long and to be built at once. The final survey has been made.

WISCONSIN.

FOND DU LAC.—The Fond du Lac Electric Co., F. F. Grover, vice president and manager, expects to build four miles of new track before June 1st. It will buy six 18-foot and 26-foot cars and build a new car house.

APPLETON.—William Michelstetter is in correspondence with parties who propose to build a 20-mile electric road between Appleton and Seymour via Freedom and Osborne.

CEDARBURG.—The old Cedarburg plank road as far as the Ozaukee County line and a new electric railway will be built to connect this place and North Milwaukee.

OSHKOSH.—The Citizens Traction Co., E. E. Downs, manager, has agreed to build a street railway between here and Neenah and has deposited $5,000 with the city of Neenah as a guarantee the road will be constructed before July 1, 1899.

BARABOO.—The city council has granted a franchise to the Baraboo, Kilbourn & Devil's Lake Electric Railway Co. to use a street in

this city. The line will cover a distance of eighteen miles. J. P. Cotterell of Milwaukee is interested.

MILWAUKEE. — The Milwaukee Electric Railway & Light Co. has been granted a 50-year franchise for an extension of its Center St. line through the village of North Milwaukee. Work will be commenced as soon as the weather permits and completed by July 1st.

RACINE.—At a recent meeting of the Belle City Electric Ry. the company reorganized and the operation was turned over to the Milwaukee Co. The directors voted to expend about $75,000 on improvements, and it is proposed to extend the line to Lakeside.

KENOSHA.—John W. Wagner, in behalf of the Kenosha Traction Co., has applied for a franchise for an additional right of way. The proposed road is to connect with a road now building from Waukegan to Evanston, Ill.

EAU CLAIRE.—The Eau Claire & Chippewa Falls Electric Railway Co. is considering plans for the extension of its line ten miles north to Bloomer, and fifteen miles from Bloomer to Long Lake, a popular summer resort. H. N. Bates, president.

KENOSHA.—W. H. Schott, superintendent of the Metropolitan Electric Co. has applied to the city council for a franchise to construct and maintain an electric railway in this city.

OSHKOSH.—John Martin of Oshkosh offers to build the proposed Omro, Berlin & Oshkosh Electric railway if $13,000 is raised, $5,000 to be expended in ties and $8,000 in iron.

DEPERE.—The Fox River Electric Railroad Co. has petitioned the city council for a franchise to extend its line into this city. M Joannes, receiver, Green Bay, Wis.

Cleveland, O., street railway employes have formed a union.

The Massachusetts House Committee on Street Railways has reported against vestibules.

The Massachusetts House has refused to further consider a bill incorporating the Street Railway Mutual Insurance Co.

Business men in Davenport, Ia., Rock Island and Moline, Ill., are advocating the adoption of mail collection by the Tri-City street car service.

The Brooklyn (N. Y.) Rapid Transit Co. is said to be negotiating with the Manhattan Beach Improvement Co. for the Manhattan Beach Hotel.

The New Orleans & Carrollton Railroad Co. has purchased the Canal & Claiborne property and will issue $2,000,000 of bonds to pay for the purchase and the outstanding indebtedness of the company.

General Manager Thos. H. McLean, of the Toledo Traction Co., has granted the city permission to affix street signs to its poles. This is done to save Toledo some expense, but it is understood that the poles shall not be damaged and that the company shall in no way be liable for any injury to the signs.

A bill providing that all street cars in Buffalo be heated in winter by electricity was favorably reported by the Railroad Committee of the New York Senate on March 21st.

A conductor of one of the trolley mail cars operating in Rochester, N. Y., has been arrested upon the charge of robbing the mails; marked money from a decoy letter was found in his possession.

The Louisville (Ky.) Railway Co. is defending a $5,000 damage suit because the conductor of one of its cars in an altercation with a passenger about his fare, said: "I know you're beating your way."

The Austin (Tex.) Rapid Transit Co. was compelled to cease operating its electric cars for a time last month because of low water at the city's water power plant. Mules were substituted where possible.

April 1st the Mahoning Valley Street Railway Co., of Youngstown, O., increased wages of employes from 13½ ano 15 cents to 14, 15, 16 and 17 cents. This is an indication that the advance agent of prosperity has been able to deliver the goods.

The Superior (Wis.) Rapid Transit Railway Co. on April 1st put in effect a new wage schedule. The highest increase will amount to nearly 25 per cent and will be received by the employes oldest in service; the new men are to be paid less than the older employes.

ECHOES FROM THE TRADE

THE LACLEDE CAR CO., St. Louis, has received an order from the Brooklyn Street Ry. for 50 cars.

THE PANCOAST VENTILATOR CO., of Camden, N. J., and Philadelphia, pending action on a petition for a receiver filed by judgment creditors, was last month enjoined from contracting debts or receiving or paying out money.

SUPT. T. F. GROVER, of the Fond du Lac (Wis.) Electric Co., has placed the orders for material and equipment; the American Car Co., St. Louis, will build the cars which will be equipped with Westinghouse motors, and the Johnson Co. will furnish the rails.

E. F. DE WITT & CO., of Lansingburgh, N. Y., makers of the well known "Common Sense" sandbox for street cars, for which they have recently taken some particularly gratifying orders, have appointed the W. R. Garton Co., 603 Manhattan Building, Chicago, agent for their goods.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, has published as "Circular No. 48" copious extracts from Mr. Joseph Appleton's paper on the "Latest Progress in the Application of Storage Batteries" which he read before the New York Electrical Society in January last.

THE TURNER ENGINEERING CO., of Bucyrus, Ohio, is furnishing the "Turner" water tube boiler, 250 h. p., for the Findlay (O.) Street Ry.; two 200-h. p. for the Central Traction Co.; three 225-h. p. for the Indianapolis Ice & Cold Storage Co. Large boilers of this type recently put into service are showing excellent results.

THE BURLINGTON WOOLEN CO., maker of woolens for street railway uniforms, has been consolidated with two other mills, under the name of the Burlington, Winooski & Colchester Mills, and the goods are being sold by Dudley, Batelle & Hurd, 53 Worth St., New York. Mr. Charles Bowler remains in charge of the railroad department.

THE JOSEPH DIXON CRUCIBLE CO., Jersey City, N. J., has recently issued "Dixon's Teacher's Note Book" which contains an essay on lead pencils, giving their history and interesting details as to the methods of manufacture The Dixon Co. makes upward of 30,000,000 pencils a year. The following pages are filled with matter calculated to interest either the teacher or his pupils.

THE WESTERN ELECTRIC CO. prior to the recent rise in copper, greatly increased its stock of rubber-covered wire and is prepared to meet the demand of the spring trade with reasonable prices and prompt shipments. In addition to its handsome 40-page Fan Motor Catalog the company is issuing a series of four-page bulletins descriptive of the different styles of fans. Bulletin 16 F, on W. E. standard ceiling fans for direct current, has just been issued.

ALFRED G. HATHAWAY, 47 Cuyahoga Bldg., Cleveland, advises us that at present he is very much occupied in building the new works of the Vulcanus Forging Co., of which he is secretary and treasurer. This company will make all kinds of forgings and will give special attention to the demands of railroads; it has now orders from four of the largest railroads in the state for air brake pins, and from the Government for all the special forgings, some 90 tons, for the breakwater at Cleveland. The Hathaway transfer tables will be made at the shops and handled by Mr. Hathaway as heretofore.

THE WATERLOO STANDARD RAILWAY CLOTHS, manufactured by the Waterloo Woolen Manufacturing Co., Messrs. Patterson & Greenough, selling agents, New York and Chicago, are becoming very popular. They are specially desirable for uniforms for conductors and motormen, where strength and durability are most essential. The Waterloo Woolen Manufacturing Co. is one of the oldest and most reliable concerns and has a pride in producing the very best cloths possible. Companies who contemplate selecting uniform cloths, or changing from those now in use, should investigate these goods.

THE GREEN ENGINEERING CO., of 519 Western Union Bldg., Chicago, maker of the Green traveling link grate, and general agent for the Edgemoor Iron Co., is now installing five watertube boilers in 900-h. p. units for the Milwaukee Electric Railway & Light Co. and fitting them with Green grates. These grates are the largest that have ever been built. Among other recent contracts taken by the company, and calling for the widest chain grates built are orders from the Armour Packing Co., Swift & Co., Metropolitan Street Railway Co., Kansas City; West Chicago Street R. R.; Edison Electric Light Co., U. S. Glue Co., of Milwaukee.

ELMER P. MORRIS, 15 Cortlandt St., New York, has recently secured an order from the Elmira & Seneca Lake Electric Ry., Elmira, N. Y., for 45,000 ties, 140,000 lbs. of copper, 650 flexible brackets, 2,000 tons of rails, 900 wooden poles and all of the overhead material and bonds; included in the copper order were 17 miles of figure 8 trolley wire. Orders for iron poles have been taken by Mr. Morris from the Brooklyn Heights R. R., the Union Ry., of New York; the Columbia Ry. and the City & Suburban Ry., Washington, D. C.; the New Jersey Electric Ry., Newark. Other orders for poles were received from Plainfield, N. J., and Phoenixville, Pa.

ADAM COOK'S SONS, 313 West Street, New York, call attention to their original Albany electric motor grease for use on motors and journals. The different consistencies in which this lubricant is furnished make it effectively applicable to any motors now in use, and it is claimed, insures better lubrication, better conditions of journals, and longer wear of brasses than is possible with any other grease on the market. It also saves the burning out of armatures. This is substantiated by the testimony of the many electric street railways the manufacturers are supplying. One large corporation says: "Since using Albany electric motor grease we have had no burnt-out armatures or brasses; when using the best mineral greases we were constantly troubled."

THE CHICAGO FUSE WIRE AND MANUFACTURING CO. announces a steady and increasing demand for its trade mark line of tested fuse wire and links, and that its new method of packing in tin boxes has become very popular alike with the dealer and consumer, as it keeps the wire practically air-tight and insures against any possible danger in handling the stock. Conforming to the National Underwriters' rules, this company is placing its trade mark on each fuse link terminal, and it states that in this branch of the business it has also made great improvements, which not only enhance the appearance and accuracy of the goods, but by a special improved process, it is able to reduce the cost of making, and thus offset the recent advanced cost of material.

THE W. R. GARTON CO., manufacturer's agent, has removed to 603 and 604 Manhattan Building, 315 Dearborn St., Chicago, and has exceptionally well appointed quarters where a good stock of insulating tapes, insulating paints, carbon rheostats, railway material and repair parts is carried. The company is agent for the following manufacturers: Railway Equipment Co., Cincinnati; Massachusetts Chemical Co., Boston; Keystone Electrical Instrument Co., Philadelphia; Billings & Spencer Co., Hartford; C. S. Knowles, Boston; Graphite Lubricating Co., Bound Brook, N. J.; Raster Carbon Rheostat Co., Chicago; Miller-Knoblock Co., South Bend, Ind.; Pittsburg Steel Hollowware Co., Allegheny, Pa.; Jenny Electric Manufacturing Co., Indianapolis, and exclusive sales agent for the "America" incandescent lamp.

THE SAMPSON CORDAGE WORKS, Boston, maker of solid braided cords and cotton twines, has recently issued two small circulars descriptive of Sampson spot cord which is so called from the colored spots on it that constitute the trade mark. This cord is the standard for the suspension of arc lamps and for trolley cord. The sizes generally used for trolley cord are Nos. 8, 9 and 10, which are ¼ in., 9-32 in., 5-16 in. respectively in diameter. The life of cordage is greatly increased if it is protected from the action of the atmosphere, and this has been effectually done by the Sampson Co. by its water proofing, which also gives the cordage a smooth and pliable finish. For small sizes the waterproofing is applied at an additional cost of 5 per cent; with sizes above 3-16 in. no extra charge is made.

J. W. GORMAN'S ATTRACTIONS for the season of 1899 are presented in a 20-page pamphlet recently mailed to street railway companies which will make vaudeville and other theatrical attractions a feature during the coming season. J. W. Gorman, makes his headquarters at 180 Tremont St., Boston, and will be pleased to correspond with street railways, give terms and arrange for appointments; he will meet interested parties at his own expense anywhere in New England.

THE H. W. JOHNS CO. reports the most active street railway trade since it has been in business. The Chicago office reports among its large sales, an order for 10,000 No. 2 "Giant" strain insulators for the Milwaukee street railway company. This makes 19,000 of this special design of strain insulators furnished to that company.

JOHNSON & MORTON, 31-37 Catherine St., Utica, N. Y., are the makers of new type slate lined, fire proof junction boxes, switchboards and panels. They have recently issued a circular description of their standard junction box, and giving directions as to the information desired when making estimates on boxes.

THE DUPLEX CAR CO., Postal Telegraph building, New York, reports that it is every day taking street railway men to see one of its latest duplex cars which is now operating on the line of the Safety Third Rail Co., between Manhattan Beach Hotel and Oriental Hotel. A great many of those who have made an inspection of the car express the opinion that this is the coming car, and many compliments have been received on the construction and finish of the cars of this type that have been built.

THE WESTERN BRONZE TROLLEY WIRE which is handled extensively by the Western Electrical Supply Co., of St. Louis, Mo., is said to be meeting with universal favor for general street railway construction. The company makes numerous claims of superiority for this wire over the standard grades of trolley wire which have heretofore been in general use; the tensile strength is given at about twice that of the ordinary wire, and the life of this wire is also said to be very great as compared with other wires because of the wear being slow and uniform; it has fully the carrying capacity of the copper trolley wire, and is made in all shapes and sizes for any equipment desired. The Western Electrical Supply Co. bases its claims for superiority upon the statements of practical street railway men, who report a saving in both construction and maintenance.

THE WESTINGHOUSE ELECTRICAL & MANUFACTURING COMPANY has been awarded the contract to furnish the power transmission plant to operate a new electric railway between Toronto and the town of Aurora which is the creation of the Imperial Lumber Co. The central power house will be located in Toronto, and current will be transmitted to a sub-station at Aurora, 15 miles distant, at 15,000 volts.

"Q & C CO. SPECIALTIES" is the title of a 50-page illustrated pamphlet recently published by the Q & C Co., of Chicago, New York, San Francisco, Philadelphia, St. Paul, Montreal and St. Louis. It is devoted to the department of engineering and maintenance of way and contains illustrations and descriptions of many of the company's well-known specialties for steam and electric

railways. Among those in which an electric railway manager will be most interested are bridges and viaducts, bolts, car replacers, cold sawing machine, frogs and switches, portable rail saws, jacks, pneumatic tools, rail drills, tie plates and braces, rails and trolley poles. The Q & C Co. has for years carefully investigated new appliances as they appeared on the market and selected the best of each kind, building up in this way a business in nearly all the principal lines of railway supplies. The company's catalog for Department A, as stated comprehends only the specialties falling under the head engineering and maintenance of way; the subdivison into departments with a catalog for each was adopted in order to issue catalogs of convenient size more suited for ready reference wherein were described the machinery and appliances which naturally fall under one head; the company's other publications are issued in a similar attractive style and may be had on application. Among the specialties in machinery handled by the company are the pneumatic oil feeding and saving system and the Q & C-Scott boiler feeder, both of which have been fully described and illustrated in the "Review." The Q & C Co. is special agent the Pennsylvania Steel Co., and for steam and street railway equipment, structural material, steel castings, etc.

THE J. G. BRILL CO. recently received from a railroad official of Bristol, England, a letter telling what Englishmen think of a palace car shipped by the Brill Co. not long ago. The following is an extract: "The car we purchased from you is, I am prepared to say without fear of contradiction, the handsomest car in Europe, and I have repainted it cream and white, with gold lining and decorations, renewed curtains, cushioned the outside seats, india rubber to steps and turkey carpeted the interior. The car is kept for use by the directors and for special festival occasions."

EUGENE MUNSELL & CO., of New York and Chicago, are prepared to separate street railways and electrical manufacturers from their money by giving them in return good India and amber mica for electrical insulation. This firm has recently decided to establish a Canadian factory, and concerning this the Ottawa Citizen, under date of Feb. 9, 1899, says in part: "Yesterday a large building on Wellington street was leased for a term of years, and an agent will be appointed to look after the firm's business at once. It is their intention to forward the mica direct from the mines to their factory here, where it will be looked over and prepared for shipment to New York. Mr. Munsell has not yet decided upon an agent, but the choice will, in all probability be made in Ottawa.

"Ottawa as a mica center is perhaps the best known in Canada across the border, and during the past couple of years an immense business has been carried on between parties in this city and firms in all the large cities of the United States. Of the heaviest buyers from this section last year were Eugene Munsell, whose big factory at New York is the most extensive in America."

THE PAILLARD NON-MAGNETIC WATCHES have been perfected to satisfy the demand of the watch carrying public for a perfect timepiece, one that besides having all the skilful adjustments to various influences of other watches, is also unaffected by magnetism. The present ubiquity of electrical machinery and appliances makes it difficult to protect an ordinary watch against magnetic influences, which act principally upon the balance and hairspring. Carl A. Paillard, an expert adjustor of Geneva, Switzerland, after 14 years of scientific experimenting, has perfected a palladium hairspring and a compensation balance that entirely overcome the difficulties heretofore experienced. The Paillard non-magnetic watches are made by A. C. Becken, of Chicago, in all sizes and grades, and each watch is warranted to give satisfaction as regards durability, workmanship and accuracy, and the price is stated to be no more than for other watches of the same finish which do not have these improvements. The desirability of such watches for street railway men is apparent.

SWART S METAL REFINING CO., Chicago, reports a large and very satisfactory business with street railways. The company always pays the highest market price for old metals, and during the past three months has purchased tons of old copper wire. It also manufactures a high grade babbitt which is meeting with a steadily growing demand.

THE LOMBARD WATER-WHEEL GOVERNOR COMPANY has received an order for three additional type "B" governors for the plant of the St. Anthony Falls Water Power Co., of Minneapolis. These governors are for the three additional units of four Victor turbines each, which are now to be installed. This will make in all 10 Lombard governors in this plant, regulating 40 water wheels. These governors were illustrated in the "Review" for February, 1899.

THE GARTON-DANIELS ELECTRIC CO., of Keokuk, Ia., is every spring rushed with orders for its lightning arresters, and knowing what to expect each year, it endeavors, during the winter months, to prepare as large a stock as possible. This spring the company had twice as large a stock on hand as ever before, but has just doubled the force in order to keep pace with the demand for goods, and still finds that it is shipping faster than it is making them. Additional force will be employed, however, and all orders shipped with the usual promptness, as it is thoroughly appreciated that when a man wants lightning arresters, he wants them badly. This company's new catalog, No. 22, is in great demand, and may require a second edition.

MESSRS. D. L. BATES & CO., of Dayton, O., are among the best known of makers of electric fans, and as the season will soon be at hand when a fan is a necessity for an office man and a greatly appreciated luxury for everyone, this firm has issued an attractive catalog and price list of its ceiling, desk and pedestal fans. They are made in all sizes and wound for any voltage and either direct or alterating current. The designs are attractive, and the high reputation of this firm gives assurance that the fans are as good as they look.

THE STAR LUBRICATING OIL CO., of Cleveland, O., has issued to the trade a neat little pamphlet calling attention to a number of its leading brands. In its compilation care has been taken not to encroach upon a dealer's or user's valuable time rehashing the history of oils. In clearly printed and well displayed marginal notes the important oils and lubricants are given, to be seen at a glance.. Accompanying them are a few words emphasizing the merits of the various oils and relating how and where the best results can be obtained from use. The booklet also contains some excellent testimonials, all from large and prominent manufacturing concerns, who have found it advisable to use the product of this company.

THE ELECTRICAL INSTALLATION CO., Chicago, has closed a contract for its overhead construction for the Northeast Electric Ry., Kansas City, and for the Grand Avenue Division of the Brooklyn Avenue Ry., Kansas City, and also has the contract for furnishing about a thousand iron poles to the Metropolitan Street Railway Co., Kansas City. The company has recently secured a contract for an extension to the Vicksburg (Miss.) Electric Ry., and is now building three miles.

MERCHANT & CO., INCORP., of Philadelphia, New York and Chicago, have recently received an order from the War Department for 786 of their galvanized "Star" ventilators, for use on the official quarters and barracks to be erected at Havana and Matanzas, Cuba. There will be 587 "Star" ventilators 24-in. in diameter, and 199 of 14-in. diameter. Great promptness is necessary in the delivery, which the exceptional facilities possessed will enable them to accomplish. Some idea of the size of the order can be had when it is stated that if these ventilators were placed in a line with their edges touching they would cover a distance of nearly half a mile. Within the last few months this company has also supplied 500 13-in ventilators for the new Government Hospital at Fortress Monroe and Savannah.

The motormen of the Beaver Valley Traction Co., Beaver Falls, Pa., went on a strike March 13th, because of the discharge of four of their number.

The Rome (N. Y.) Street Ry. has been sold to a New York syndicate headed by A. W. Soper, and it is reported that it will be operated by compressed air.

EASTERN OFFICE, 100 WILLIAMS STREET, NEW YORK.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. IX. MAY 15, 1899. NO. 5.

We are seldom allowed to go unreminded of alleged failure by companies to keep promises made the public or the city, but when the shoe is on the other foot the papers seem to think it is a good joke. An instance of this comes from Montreal where the city and company agreed to divide equally for five years the cost of removing snow from streets, the city being the party to decide how much it was necessary to take away. The result has been that while some $393,000 has been spent in this work, the company has been charged with $255,000 of the amount, or two-thirds of the whole.

In our April issue it was noted that a number of street railways in different parts of the country had announced an increase in the wages of their employes; among these were roads in Minneapolis; Leavenworth, Kas.; Superior, Wis.; Marietta, O., and the Mahoning Valley at Youngstown, O. We have this month to add that the DesMoines (Ia.) City Ry. made an advance of 10 per cent on May 1st, the Parkersburg (W. Va.) Electric Light & Street R. R., and advance of 20 per cent, and the Consolidated Traction, of Pittsburg, an advance of 11 per cent.

In every instance the increase was stated to be due to an increase in traffic, and it may be taken as an indication of the fact that whenever a company can do so it will gladly advance the wages of its employes.

In discussing the "franchise tax" bill passed at the last session of the New York Legislature and at the present writing in the hands of the governor, Senator Ford is quoted as follows:

"The main virtue of the bill is that it proposes to tax these properties as real estate instead of personalty—that means that whatever tax the assessors levy must be paid. It cannot be sworn off nor indebtedness be offset against it. In other words the possessor of the public franchise is placed in the same position so far as the tax laws are concerned, as the owner of a house and lot whose property is taxed, regardless of whether it is producing revenue or not, and without regard to the mortgage that may be upon it, even though that mortgage covers 80 per cent of the value of the property."

Senator Ford is reported as saying that a simple plan is to add the market value of the stock and bonds of the corporation, then subtract the valuation of real estate and other tangible property upon which the corporation is now assessed. The result in his opinion shows the value of the grant or franchise that the corporation has received from the city. This can be assessed at 60 or 70 per cent, as is other real property.

This is truly admirable for its simplicity, but we cannot say so much for justice of the plan to tax a company on its debts.

One of the questions that is just at present greatly interesting the general public is the extent to which liquid air may be used for propelling machinery in the near future. In the April number of McClure's Magazine, Mr. Charles E. Tripler, of New York, was quoted by Mr. Ray Stannard Baker as saying: "I have actually made about ten gallons of air in my liquifier by the use of about three gallons in my engine. There is, therefore, a surplus of seven gallons that has cost me nothing, and which I can use elsewhere as power." We do not doubt but that the great majority of engineers who read this merely expressed a desire to know whether Mr. Tripler had been correctly quoted, and placed no faith in the claim that power may be had for nothing. Others who did not take the statement at its face value thought, that since so much was claimed, that there might be some advantage in using liquid air for driving machinery. Closely following this article came the announcement from Zurich, Switzerland, that a street car propelled by a liquid air motor had been tested, and that if the reports were satisfactory the new power would be adopted.

On another page will be found an article on the production of liquid air and the economy of using it for a working fluid in power machinery, which will prove of especial interest at this time Some of the conclusions there reached, stated in a general way, are as follows:

Up to the present liquid air has been made only by compressing and cooling atmospheric air. With the best apparatus about 40 per cent of the work done in the steam cylinder of the compressing engine is lost in friction and in heating the jacket water of the air cylinders. When the air has been compressed it is carried to the liquefier where a loss of about 95 per cent ensues in the process of liquefaction, the net result being that 97 per cent of the energy of the steam has been lost, and one horse-power-hour gives us about one-third of a pound of liquid air.

Using liquid air in a boiler and engine with the atmosphere as a source of heat, it is shown that what has cost us

one horse-power-hour can not theoretically give us back more than 2.8 per cent of a horse-power-hour. The enormous pressure, over 11,000 pounds per square inch, with which we must deal to get even 2.8 per cent efficiency is too high for practical working, and in practice the re-evaporated air would be used in a motor at a smaller pressure, and probably at a lower efficiency. It would doubtless prove economical to reheat the air before it enters the motor, as is done in some compressed air motors; that is it would be used as compressed air that has never been liquefied would be used. This being true, it should never have been liquefied.

Where air is compressed and then used as the working fluid in a motor any excess of pressure over that at which it is to be used results in a loss. The reason for compressing to the higher pressure is to enable the air to be transmitted through pipes or to be more conveniently stored in tanks. It will only be used when the economy of air at high pressures is greater than other methods of transmitting power.

Liquid air offers no advantage over compressed air, save that when evaporated it will render available four or five times as much energy as may be stored in the same bulk if the air is only compressed to 2,500 lb. per sq. in. But this advantage is only for temporary storage, as the liquid must be open to the atmosphere because of the high pressures resulting if it be kept closed; if kept so exposed it slowly evaporates.

There is no present danger of liquid air relegating electric generators and motors, or even air motors, to the scrap heap.

We all admit that the laborer is worthy of his hire, and would like to see everyone who works for his living get twice as much for his labor as he does now; in fact we would greatly appreciate it were our own income increased. Yet it will not do to overlook the fact that labor is helpless without capital and that the capitalist also is worthy of his hire, and justly entitled to compensation for the use of his money. At the present time when a question as to wages arises between employer and employe the popular sympathy is generally with the employe, and invariably so if the employer is a corporation, regardless of the merits of the case. The familiar expression, "a corporation has no soul," (which probably few but lawyers know is only a statement of the reason why corporations were not subject to the ecclesiastical courts) to the people who use it most means that a corporation is grasping and grinding in all its dealings and deserving of no favorable consideration.

Further, if the employer happens to be a public service corporation, the public, while rendering every aid it can to striking employes who demand higher wages, strikes at the ability of the company to meet the demand by placing burdens upon it in the way of more taxes, and enforced reductions of rates.

On April 8th the employes of the Wheeling (W. Va.) Ry. struck for an advance of 25 per cent in wages, rejecting all offers of compromise. The strikers had the sympathy of the public, and the company could not secure adequate protection from the city and state officials. This road happens to be an interstate line, and also carries the mails, and as a last resort an appeal was made to the federal courts for protection. On April 18th four men were sentenced to 30 days imprisonment and fined $50 each for violating an injunction order. Before passing sentence the court delivered a lecture to the public upon the matter of labor strikes, which will be found on another page. A short extract on the effect of the misguided sympathy of the public is as follows:

> I understand from the public press that this community is in sympathy with what are now known as the strikers. Let me say now that this is a mistaken sympathy upon their part. No community can decide, as such, between the rights of the employer and the employe. They cannot be familiar with the circumstances that have influenced the employer to refuse to accede to the demand of the employe on this occasion.
>
> This misguided sympathy is often a wrongful sympathy, and operates not only to the prejudice of the parties for whom the sympathy is expressed, but to the injury and detriment of the public at large. * * * Whenever any community undertakes to set up for itself a standard and to enforce it by mob violence, communistic orders or by efforts upon their part which are conceived in a spirit of anarchy, and which lead to and end in anarchy, then the time has come when the laws of the land must be enforced to control that spirit of anarchy.

At Bay City, Mich., was another strike which resulted because the company would not reinstate a man who had flatly refused to obey the company's order in a matter which was part of his duty until it was in effect countersigned by the labor union. The strikers here, also, had the sympathy of the community, but this sympathy was not evidenced by mobbing the cars and obstructing the tracks

That the same scenes were not enacted in Bay City as in Wheeling is altogether due to the good sense of the employes who refused to countenance violence of any kind and preserved the most friendly relations with the company during the entire period of the strike.

We would call especial attention of those of our readers who are connected with the management of large electric railway systems to the account on another page of this issue, of the school for motormen, which the Metropolitan Street Railway Company of New York City conducts. The object of this school is not to give motormen theoretical instruction in electricity or mechanics, but is to teach new men their duties in a more thorough manner than is the case where new men are merely "broken in" on the cars.

Instruction is given by means of recitations, lectures and laboratory practice in conjunction with work on the cars in service. The advantages which have resulted from employing as instructors men who are skilled as teachers, is that more competent and better drilled motormen are secured. This is stated to be a great gain to the company in two directions; there are fewer accidents and, therefore, the damage claims account is less, and the wear and tear on the car equipment is less.

ACCOUNTANT'S ASSOCIATION.

The Street Railway Accountants' Association of America has issued its Circular No. 10, dated April 15, 1899. This circular is entitled "An Explanation," and it certainly gives many reasons why street railway companies should be enrolled upon its membership list. The importance of such an association must be apparent to every officer of a street railway company. The whole business of a street railway revolves around the accountant's office and the more ideas the accountant has, the more he rubs up against other accountants, and effects an interchange of views regarding systems and the ways of keeping accounts to the best advantage, the

more efficient does he become, and consequently the more valuable to his company.

In the matter of "blanks and forms" this association has been instrumental in affording great assistance to its members and the exhibition made of such ones as individuals have devised has been one of the chief benefits. The plan of distributing them among members on the principle of a circulating library, members being entitled to keep the documents for one month, has been found practical and helpful. There is no department coming within the accountant's scope which is not fully discussed at the meetings.

The presidents and managers of the street railway companies recognize the value of this association, and speak the most encouraging words in its favor.

WHY SOME PARK AMUSEMENTS FAIL.

Editor "Review": The writer has made a very careful study of the question of parks and amusements operated by street railway companies with a view to increasing travel. Why is it that some of these operations prove such a big success, while others are equally disappointing? Of course there are some localities where it seems impossible to do anything of the kind, just as there are cities where the local theater always loses money. But in the great majority of cases, and with conditions fairly favorable I am satisfied that it is a most valuable adjunct to the summer business. The trouble with nine out of ten of the failures to make such theatrical entertainments profitable or even self-sustaining is that they are not properly managed. The manager of the street railway may be ever so good a man in the work for which he has been trained and in which he is experienced, and yet when he undertakes to run a show may not know the first rudiments of the business, even though he thinks he does. For instance when he charges 25 cents for a 10-cent performance he makes a fatal mistake. If he wants to charge that much he must provide an attraction that is worth it; that is, one equally as good or even better than can be seen for the same money on the vaudeville stage of his own town. Many of the vaudeville theaters stage a program for 25 cents a seat which costs $1,000 a week to produce, and when the park offers one for the same seat price, that only costs $200 a week, the public are not going to pay freely for it.

If you are going to put on a cheap production, which may be as good as is required under the circumstances, why then make a correspondingly low admission, say 10 cents. If you want to go into the work extensively and handle first-class productions and expect to make them profitable, you should employ a thoroughly competent and experienced manager for the work, just as you would do if you were offering the same production in an opera house. When a theatrical manager expects to maintain good admission prices he knows he has got to keep up the standard of his productions, hence when he books, he does it with the special idea in view of the price he intends to make on his house for the season. The price charged at parks can be more variable than is possible when running a theater, and it may be 10 cents one week and 25 the next, but whatever the price, give a production which is worth the money and always endeavor to give the public just as much for their money as you can possibly afford. I am satisfied, however, that where it is desired to go into the amusement line to any considerable extent that the railway manager makes a mistake in trying to look after it himself, and that unless he has had a good deal of experience in the work he will make more money at the end of the season, and give far better satisfaction to his patrons if he will employ some experienced theatrical manager to run it for him. It is not difficult to do this as theaters generally are closed during the season of out door performances, and competent men can be had at a reasonable price who would be glad to fill in time otherwise on their hands. Professional.

SIX-MINUTE HEADWAY ON SINGLE TRACK.

Editor "Review": I would very greatly appreciate any information your readers may be able to give me through your columns, as to their experience in operating a 6-minute headway on a single track line, and how they work it. I have thus far been unable to learn of any road doing this, and it may be none are operating under such conditions; but we have a line in contemplation where during the summer we should want a frequent headway, but during the remainder of the year should not need to run a car more frequently than 20 or 30 minutes each way. Our line is a suburban one to a lake. Single Track.

DAYTON & GERMANTOWN CO.

The Dayton (O.) & Germantown Traction Co. has been granted a franchise and has begun the construction of a new line into Dayton. The officers of the company are J. A. Arnold, president; T. C. Lindsey, secretary, and B. F. Douglas, treasurer. It is promised by the company that the road will be in running order by October of this year and as the men connected with it have had considerable experience in such ventures it is safe to conclude the promise will be kept. The franchise is to be forfeited if the road is not run continuously for a period of six months.

The company intends erecting a large hotel at the Germantown end of the line and it is expected the mineral springs located there in connection with the hotel will develop the terminus into a popular health resort. The road has the advantage of a number of interesting points on its line, such as the Soldiers' Home and the Miami Military Institute, all of which will be benefited as well as affording patronage for the road.

BOSTON ELEVATED BANDS.

Mr. W. M. Perkins, of Somerville, Mass., a conductor on the Union Square line in Boston and a brass band leader, has organized two bands from among the employes of the Boston Elevated Railway Co. The company has provided a band room on Tremont Row, where the members meet for practice. One band has been chosen from the day force and one from the night force; all members are to be uniformed. Mr. Perkins is the leader of the Somerville band, which has become very popular. He studied harmony under the instruction of John K. Paine and has been an organist, choir director and an orchestra leader.

The Rapid Transit Railway Co., of Syracuse, N. Y., has moved its offices from the Snow Building into the Gridley Building, where it occupies the entire third floor.

The Omaha & Council Bluffs Railway & Bridge Co.

The Omaha & Council Bluffs Railway & Bridge Co. is one of the oldest electric railways, having been equipped for electric working in 1888, when the present company was organized to build a bridge over the Missouri River and operate an electric line between Council Bluffs and Omaha; the company succeeded the Council Bluffs Street Railway Co. in the ownership of the street railway lines in that city. The company's lines aggregate 25 miles, measured as single track and are shown diagrammatically in the accompanying map. The arrangement of the lines is peculiar. From the loop A in Omaha (the company has about one mile track in Omaha) to the approach of the bridge at J, the track is double; from J to K, which includes the bridge and its approaches, .6 mile, the track is single; from K to the power house, P, 1.3 miles, and from P to Y, 2.3 miles, it is double; from Y to Z, .4 mile, the track is double; from Z to B is a loop one block wide and .6 mile long. At Z a single track line runs to Fairmount Park at C, about 1 mile. From Y to the C., R. I. & P. Depot at D is another branch about 1 mile, two-thirds of which is double track; on this branch is the C., B. & Q. Depot. At M is a branch running to the Union Pacific Transfer Station. On the main line at the point L is the passenger station of the C. & N. W., and the Illinois Central is soon to build a new station which will make five trunk line stations reached by the interurban line for Omaha. From F to G is a cross line about two miles long connecting the Union Pacific Transfer and the Fair Grounds. There is but one grade, about three per cent for one mile, aside from the approaches to the bridge.

In winter a 10-minute service is maintained on all except the last mentioned line; one-half the cars leaving A at intervals of 10 minutes run around the loop from Z to A, and the other half run from Y to D. From E to C there is a 10-minute service and cars also alternate with the Omaha cars on the loop and the line to D, giving a 10-minute service here. In summer the headway is reduced to five and seven minutes.

The track construction in the improved streets is of 45-lb. girder rails 4 in. deep; it is expected to rebuild all these lines within the next two years. On the bridge strap rails are used. From the river to the point marked L on the map the rails are 40-lb. T laid on 6 x 8 in. x 8 ft. white oak ties spaced 2 ft. center to center; the T rails are above ground. The gage is 4 ft. 8½ in. The track bonding consists of a No. 00 copper wire under each rail to which the rails are bonded, and Benedict & Barnum bonds connecting the rails.

The trolley wire is all No. 00 copper and has never been renewed; the span wires, hangers and poles were renewed last year. Northern pine poles 25 ft. long, with 8-in. tops are used except at railroad crossings, where the poles are 35 ft. long. The company makes its hangers and uses porcelain insulators.

SUBWAY. POWER HOUSE. BOILER ROOM.

The line is divided into four sections, each having a No. 00 feeder. The sections are from A to the power house, from the power house to Y, the loop in Council Bluffs and the Fairmount Park line, and the U. P. and C., B. & Q. branches.

The power house used from 1888 until Nov. 9, 1898, is located two blocks due south of the new one and is equipped with one 150-h. p. and three 200-h. p. compound Westinghouse engines belted to four D-62 T. H. and two 100-kw. Edison dynamos.

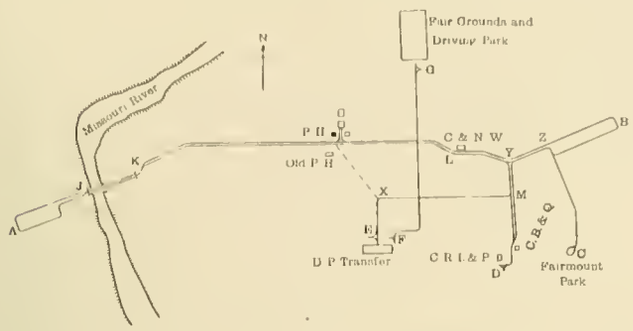
This power station has a good record, not having been shut down a whole day during the 10 years.

The new power house of the company is located on the interurban line adjacent to the office building and car shed and shops. Work on the power house was begun June 10, 1898, and it was completed and the old one shut down on Nov. 9, 1898.

It is a one-story building, 60 x 101 ft., not including the coal shed, with exterior of red pressed brick with sand stone trimmings. The building was designed by Messrs. Fisher & Lawrie, architects, of Omaha. The outside walls are 17 in. thick with pilasters and windows as shown in the half-tone

engravings. The roof is of slate laid on wood and is carried on steel trusses. The engine room occupies the eastern portion of the building; the floor level is at grade along the east front. The boiler room is back of the engine room and the floor is 2 ft. 6 in. lower. It is reached by stairs in the northwest corner of the engine room.

All the upper windows are pivoted and operated from the



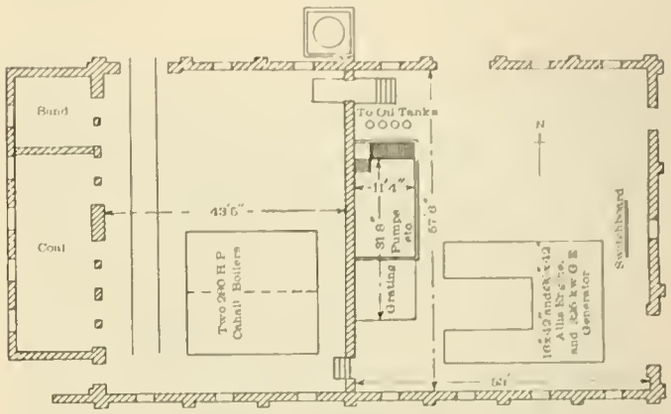
SKETCH OF COUNCIL BLUFFS LINES.

floor by ropes; all windows are provided with screens to prevent the entrance of birds.

For handling heavy weights in the engine room beams have been suspended from the roof trusses so as to permit cross beams mounted on rollers to move from east to west. There are three of these traveling beams required to cover the length of the engine room. From each beam a 5,000-lb. differential chain block, made by Moore & Chisholm, of Cleveland, is suspended on a trolley so as to move from north to south and thus any point in the room may be reached.

The engine room is 53 ft. by 57 ft. 6 in. inside, from the floor to the eaves is 22 ft. 6 in. and to the ridge 40 ft. 6 in. The interior walls are of yellow enamelled brick for about 5 ft. and then plastered. The floor is of Grant slag stone supported on I-beams and brick arches. The design con-

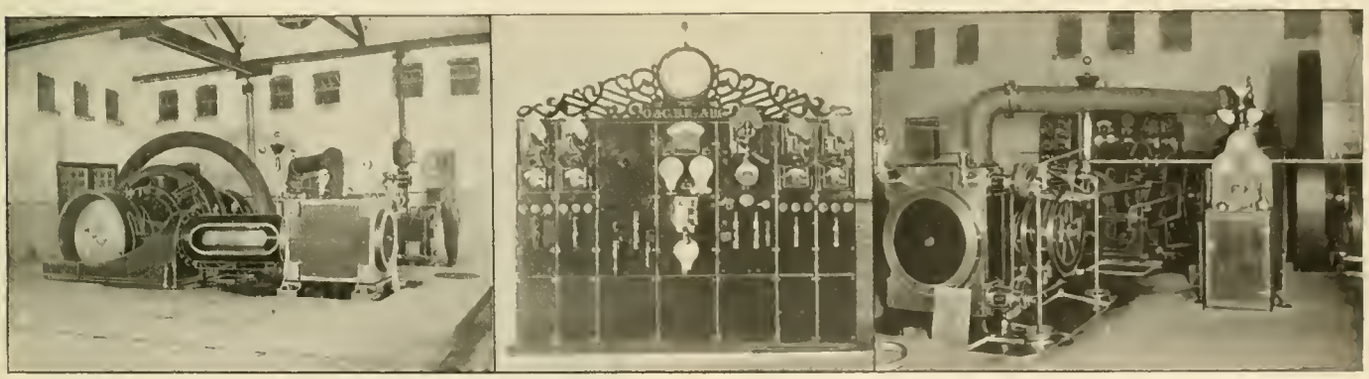
board to which have been piped both engine and cylinder oil from the lubricating system. A push button on this board summons the fireman when wanted. In the engine room only the steam main is carried overhead, the exhaust is under the floor.



PLAN OF POWER HOUSE.

The switchboard stands at the east side of the engine room in the center of the building and is of polished slate with seven panels. It was made in the company's shops. The four outside panels are for the four line sections and each has mounted on it a General Electric magnetic blowout circuit breaker, a Weston ammeter and a knife switch; these four panels also carry the switches for the lighting circuits of the power house. On the center panel is the voltmeter, a recording wattmeter, and three Bristol recording gages, one for the voltage, one for the current and one for the steam pressure. To the right of this panel is the generator panel with an ammeter, circuit breaker, and switches. To the left of the center panel are the terminals leading to the old power house, not now in use. The center panel is surmounted by a clock and a cluster of lamps.

The board stands well out from the wall and has a window



ENGINE AND SWITCHBOARD.

templated two 325-kw. units, and as one only is now installed but half the floor space is occupied.

The unit installed is at the south end of the room and comprises a cross-compound, condensing, corliss engine, with cylinders 16 and 30 by 42 in., made by the E. P. Allis Co., direct connected to a 325-kw. multipolar General Electric generator. The generator is wound for 591 amperes at 550 volts when loaded and 500 volts when running light. The speed is 100 r. p. m. and the steam pressure 150 lb.

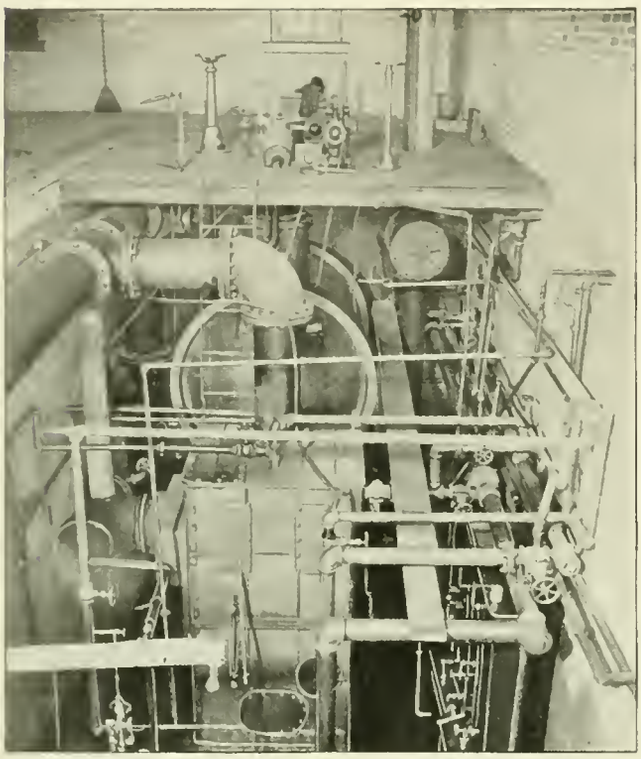
Between the high and low pressure engines is a gage

behind it, giving ample room for working at the back of the board and insuring a good light. On the back of the board all the positive wires and bars are painted red and the negative ones black. From the switchboard all the mains pass down through the floor to the subway; where the wires go through the floor they pass through porcelain tubes into whch sulphur has been poured.

In connection with the switchboard equipment should be mentioned an ingenious device designed by the electrician, Mr. Lovett, to sound an alarm when any of the circuit

breakers open. Two pieces of spring brass, slightly separated, are placed on the lower right hand corner of each circuit breaker so that when it opens the handle will strike them and press them together completing a bell circuit; the bell is mounted just behind the clock.

Under the entire engine room floor where not occupied by walls or engine foundations the earth has been excavated to a depth of about four feet and this cellar is whitewashed throughout and provided with electric lights. The cellar is reached through two circular hatchways, ordinarily kept covered with iron plates, one of which is located in front of the switchboard and the other near the pump pit.



PUMP PIT.

Along the east side of the engine room the excavation is made deeper, so that a man may walk erect, and is paved with brick; at the south wall of the building the passageway thus made is continued to the building line as a subway, an interior vew of which is shown in one of the illustrations. The roof of the subway is high enough for a man to walk erect, and the leads from the switchboard are carried along it as shown. By this arrangement all of the power circuits are placed where the wires can be reached without a ladder. At the other end of the subway is planted a large pole up which the leads are carried. No wires enter the power house save through the subway. The cellar and subway are by no means the least attractive features of this power station.

In addition to the lights at the switchboard the engine room is lighted by four clusters of six 16-c. p. lamps on the walls and by a spherical cluster of 42 lamps suspended in the center of the room; this large cluster was part of an electrical exhibit at the Omaha Exposition, and it serves admirably here.

In the middle of the west side of the engine room is a pit 31 ft. 8 in. long, 11 ft. 4 in. wide and 12 ft. 6 in. deep; it is lined with pressed brick and has a cement floor. Here are located the condenser, feed pumps, water heater, oil filter, oil pumps and practically all the piping of the plant. The piping system has been very carefully designed with a view to providing against stoppage in case a particular line should fail from any cause; the pipes are in plain sight and the valves conveniently located.

Along the east side of the pit are four 8-in. wells sunk to a depth of 75 ft., the bed rock of the Missouri River; the water level in these wells varies with the river level and is never more than 10 ft. below the floor of the pit. In the pit is installed a jet condensor with a steam driven air pump having a pump cylinder 24 x 12 in. Water from the wells flows into the condenser, the lift being small, as stated before. City water is provided for emergency.

A portion of the discharge from the condenser pump goes to a Cochran feed heater, where it is heated to a temperature of 200° F. by the exhaust from the condenser pump. The water level in the heater is regulated by an automatic valve. The discharge not so needed is wasted through a 15-in. tile sewer put in by the company, and running two miles to the river.

Ordinarily the boilers are fed by a pump connected to the condenser pump shaft, but a 7½ x 5 x 6 in. Worthington pump is placed in the pit for feeding the boilers if for any reason the other is out of service.

A small Worthington pump is provided for draining a sump into which any water spilled in the pit drains.

STANDARD OPEN CAR.

An exhaust pipe is carried outside the building and rises outside the wall near the stack; this is for use when the engine has to be run non-condensing. An automatic valve made by the Allis Co. turns the exhaust into this from the condenser in event of the vacuum being lost.

The foundation is in place at the north end of the pit for a duplicate condensing engine, which will be installed when the second unit is added.

The oiling system is very complete and convenient. Oil storage tanks are provided in the cellar at a point just north of the north wall of the pump pit; pipes lead up and terminate in funnels in the engine room floor so that barrels of oil may be rolled in and emptied into the tanks with the greatest ease; from these tanks small Worthington pumps force the oil to two cylindrical tanks 18 in. x 60 in., suspended on the east wall of the boiler room at a height of 30 ft. above the engine room floor. From here the oil feeds by gravity to the cylinder lubricators and the engine bearings (sight feed oil cups are of course provided); from the engine the used oil is returned to a Turner oil filter in the pump pit and after filtration again used. From the tanks on the boiler room wall, which are always warm, pipes are led to faucets in the pump pit and at the engine gage stand previously mentioned, so that oil may be readily drawn when needed for any purpose.

A view of the pump pit and machinery is shown and it will be remarked that the condenser engine is covered by a grating. Rods are carried up from the water and steam valves and terminate in hand wheels as shown. For lubricating this engine, pipes are carried up and arranged around the pipe at the right of the engraving, and the sight feed oil cups placed at the height of a man's shoulder.

The boiler room is 43 ft. 5 in. by 57 ft. 6 in. inside; the height from floor to the eaves is 25 ft., and to roof ridge 43 ft. The floor is of cement. At the south end of the boiler room is now installed one battery of two Cahall boilers, each having 5,608 sq. ft. of heating surface and 119 sq. ft. of grate surface, and rated at 280 h. p. each; one boiler only is used habitually. There is space for two more boilers. Each boiler has in connection with it a Garrigus mechanical skimmer which is reported to give the best satisfaction, as its use results in keeping the boilers free from scale. This device has a floating funnel inside the boiler at the water level and the muddy water is carried down to a precipitating tank where the sediment settles and is blown out from time to time. This discharge is carried to a cistern outside the power house, from which an overflow pipe leads to the sewer.

The steam from both boilers is piped to a wrought iron header. The high pressure steam valves used were made by the Crane Co.

Along the west side of the boiler room are the coal storage and the sand rooms. This extension has a shed roof; it is 13½ ft. wide and at the outer edge is 15 ft. from the floor to the roof.

A switch from the railroad on which the old power station was located to the new power station was built by the company on land bought by it for the purpose and runs just outside the coal room, into which the coal is unloaded directly from the cars. Arrangements will be made for chutes to deliver coal into small cars on a track in the boiler room.

Ashes are to be loaded into a motor car which is kept in the boiler room until full and then run out over the line and used for ballast.

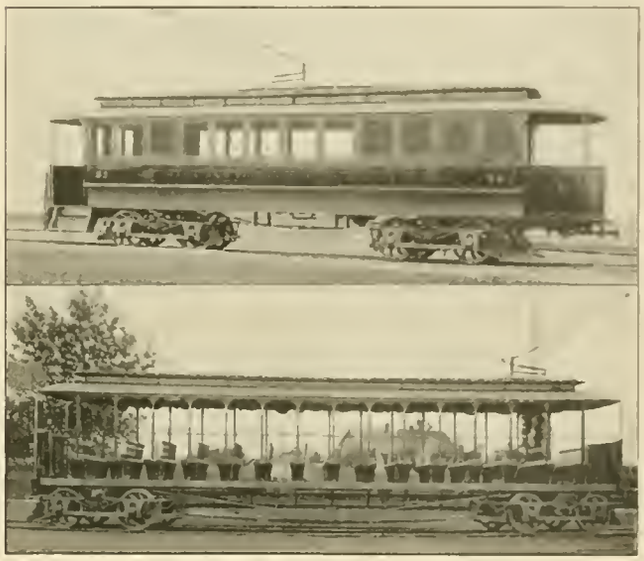
The sand room is about square, occupying the north end of the coal storage space. In this room old rails were placed about 2 ft. from the floor and covered with scrap sheet iron perforated with holes; on this were placed steam pipes a few inches apart. Wet sand is unloaded from the car on to this heater and as it dries out it falls through onto the floor, from where it is taken and sifted for use as needed.

The stack is of steel and unlined. It is erected north of the building with the center line 6 ft. 6 in. from the inside of the wall of the boiler room. It is of uniform diameter throughout, 5½ ft., and 155 ft. high above the grates. The breeching is made of No. 10 steel and is carried along the east wall of the boiler room at a height of 6 ft. 3 in. above the floor.

During the day one engineer, one fireman and one coal passer are all that are needed for the operation of the plant. The night force comprises one engineer and one fireman.

A second switch track with overhead wiring has been built so it is at one point parallel to the steam road switch mentioned and supplies for immediate use may thus readily be loaded onto the construction car from the freight cars.

The rolling stock comprises 18 large and 20 small cars, half of each kind being open and half closed. The long cars



OMAHA & COUNCIL BLUFFS CARS.

were rebuilt in 1896 using two old short open cars, cutting off the ends and splicing the bodies; by using steel angles for side sills and using truss rods cars which have given perfect satisfaction were secured.

The interurban cars are 43 ft. over all; the closed cars seat 44, and the open cars 75 passengers. The long cars are mounted on Peckham 14 B swing bolster, and Taylor trucks; they are each equipped with two G. E. 57 motors, K 11 controllers, Meaker fare registers and Consolidated Car Heating Co.'s electric heaters. Push buttons to signal the conductor are placed on all cars both open and closed.

The small cars are 25 ft. over all and each has two G. E. 52 motors.

The company has just completed equipping its cars with new motors; both summer and winter cars have motors so that no change of motors or trucks is necessary.

As the partition between the car and the vestibule should be covered at night to prevent the lights from shining back of the motorman a spring roller curtain has been ingeniously placed beside the door with the roller vertical and the curtain edge may be buttoned to the sliding door. Then when the door is closed the curtain is drawn, when the door is opened the curtain is rolled up and cannot flap in any draft there may be through the vestibule.

The cars are run one way only and Y's or loops placed at terminal points with a turn table at the car shed. The reasons for running one way only are the saving in car wiring, controllers, gongs, headlights, fenders, sand box mechanism, etc., by having to place them on one end only; the necessity of providing only one vestibule; the ease with which safety gates can be arranged and manipulated.

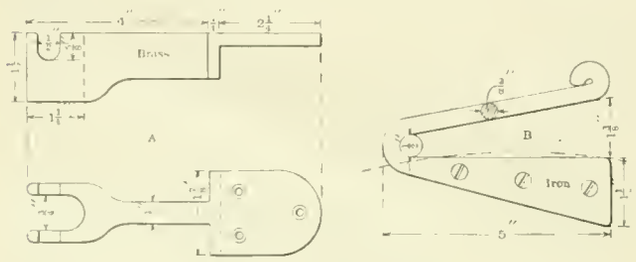
The front ends of closed cars are vestibuled, and a side door provided for the motorman. The glass in the vestibule is double with rubber packing placed between the two pieces of glass; by this arrangement the difficulty usually experienced with frosted glass in winter has been avoided. On

THE MISSOURI RIVER BRIDGE.

open cars a bulkhead with glass is placed back of the motorman.

Ratchet gongs, made by J. H. Graham, and electric headlights made by the company are used. The sand boxes used were designed by Mr. Dimmock and Mr. Tarkington; they are operated by a lever which gives four rates of sanding, sanding either one or both rails as desired, and sanding curves perfectly.

The open cars have wire screens on the left hand side and curtains have been provided so that protection against rain



SWITCH BAR HOLDER.

in summer can be given. As will be noted in one of the illustrations the floor of the open car is high and three steps are provided. A novelty is the grab handle placed on each seat-end panel on the step side of the cars.

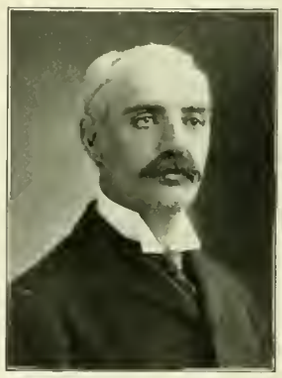
To prevent the iron rod for turning switch points from rattling against the dash and knocking the paint off the holders shown in the figure are placed at each end of the car.

The brass casting A is for vestibuled cars and is screwed to the dash rail; on open cars a casting with a different end is used and is secured to the hood standard. The handle of the switch bar rests in the casting and below it is slipped in the V-shaped forging B screwed to the rounded buffer. On closed cars the switch bar hangs just to the left of the center window of the vestibule on the front end and at the right hand standard on the conductor's end. Each car carries two switch bars.

For operating the section of single track crossing the bridge a block signal system is used.

The Omaha & Council Bluffs Railway & Bridge Co. is capitalized at $1,500,000 and has $600,000 of bonds outstanding. It serves to connect Council Bluffs, with 30,000 inhabitants, and Omaha, which has a population of 140,000. The road now carries about 10,000 passengers per day; during the Omaha Exposition the average was 25,000 per day. In summer the pleasure riding traffic is very heavy.

The officers of the company and heads of departments are: President, N. W. Wells; vice-president, J. J. Brown; secretary, C. T. Stewart; treasurer, J. H. Millard; general superintendent, W. S. Dimmock; master mechanic, W. B. Tarkington; electrician, Israel Lovett; cashier, F. E. Clark; roadmaster and superintendent of bridge, John Cronin.



W. S. DIMMOCK.

The entire direction of the road is in charge of Mr. Dimmock, who is an old steam road man and has held his present position since January, 1894, when the road was very much disorganized, and the company greatly antagonized by the public, and during this time he has introduced many economics and effected many improvements, until at the present time the road is on a dividend paying basis. Comparing the accidents from 1894 to date with those for the previous years they are found to be 80 per cent fewer, which itself speaks volumes for the present management.

TURNTABLE VICTORY IN SAN FRANCISCO.

For several months past legal proceedings have been in progress to secure the removal of a turn table at the down town terminus of the Kearney St. line in San Francisco. The Board of Supervisors and Superintendent of Streets ordered it removed, but the company maintained it was necessary to the operation of its road and refused to do so. The courts have now decided that while the authorities may refuse to grant permission for additional tables that they have no right to remove one for which permission has been granted, during the term of the franchise under which the table, as a part of the road, was installed. The city tried to prove the table was a "nuisance" but failed in its case.

Accounting System of the Omaha & Council Bluffs Railway & Bridge Co.

By the courtesy of Mr. W. S. Dimmock, general superintendent of the Omaha & Council Bluffs Railway & Bridge Co., we are permitted to describe the elaborate monthly report and comparative statement blanks designed by him for the use of this company. In preparing the various forms the object has been to present the accounts in such a manner that the items may be separated, classified and compared and be of value as a guide to those in charge of the operating department as well as a convenient source of information for the directors.

LABOR ACCOUNTS.

In order to classify the items for labor most conveniently two forms are employed for keeping records of the men's time.

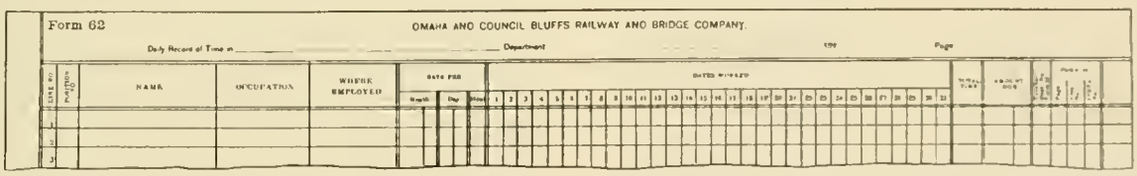
Form 62 is for keeping the time record of men who are employed all the time in one occupation; it measures 17¼ x 11½ in., and has the usual rulings for such forms—name, occupation, where employed, rate of pay, time worked each day, total time, and amount due. At the right hand of the blank is a column for the Department No. of the pay voucher (all payments are made by check and when the man receives his check he signs the voucher; this voucher is Form 52, but is not shown here) and also three volumns for the page and line of Form 54, to which the man's time record is transfered, and the classification number.

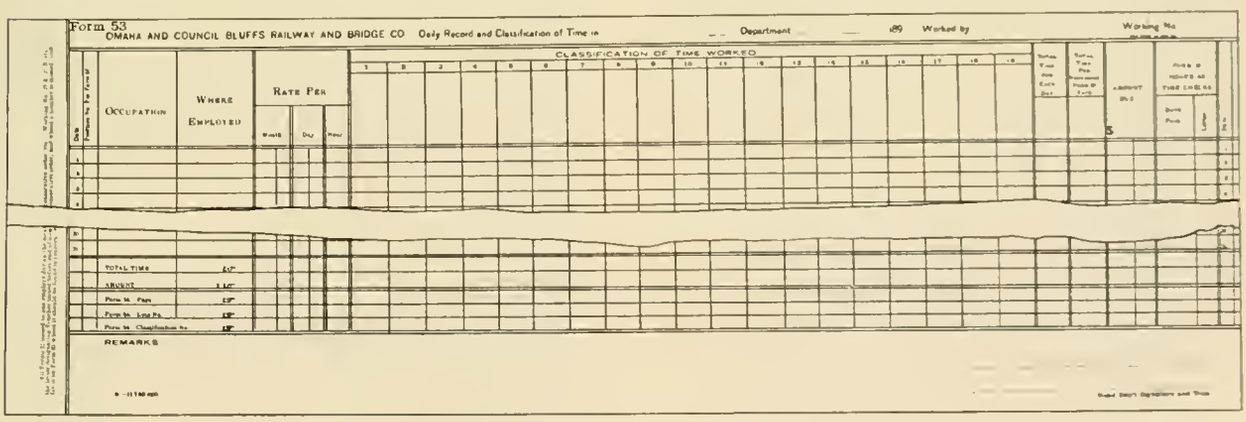
Form 53 is for keeping the time record of one man who is employed in different occupations; there are 19 vertical columns with blank headings for the classification of the time worked, which are filled out by the head of department or foreman with a brief statement as to the work done. At the bottom of this form are spaces for cross references to the page, line, and classification number on Form 54, to which the several totals on Form 53 are transferred. Form 53 is 11½ x 19 in.

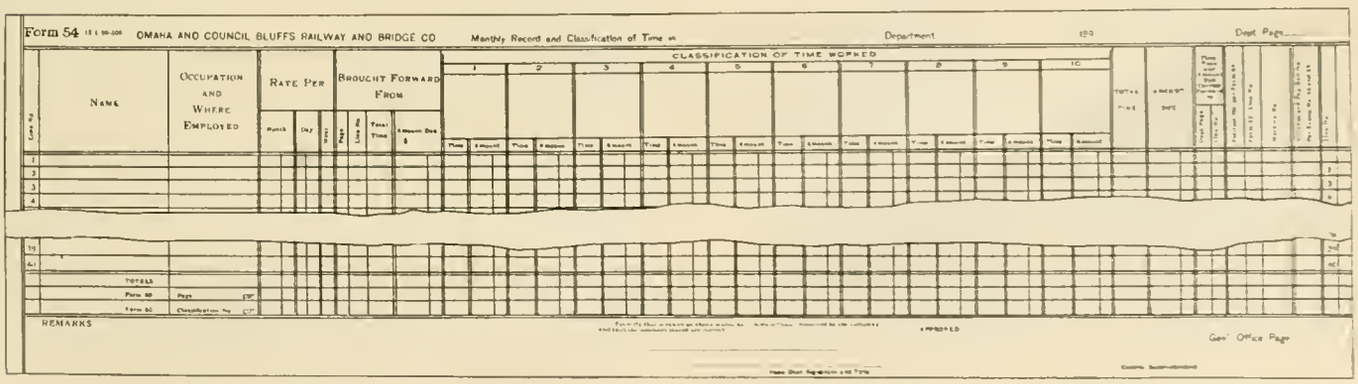
From the several blanks, Forms 62 and 53, the blank Form 54 is filled out, and thus the totals from the several time records assembled and classified. At the right of this form are columns for cross references to the form from which each item was taken, and for references to the vouchers and an abstract of the pay roll, made out on a blank, Form 55, which we do not show. At the bottom are references to the page and classification number on Form 60 (to be described later) to which the classified time totals are carried for the purpose of combining them with the corresponding classified material totals. Form 54 is 12 x 21 in.

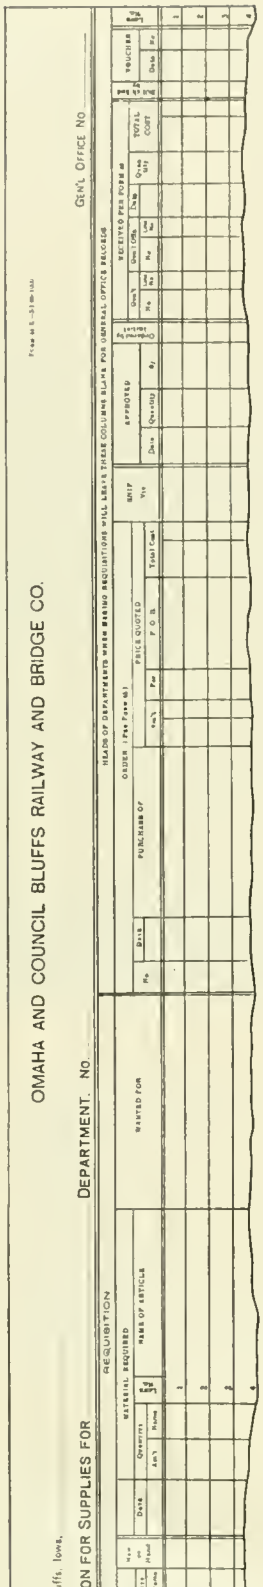
KEEPING MATERIAL ACCOUNTS.

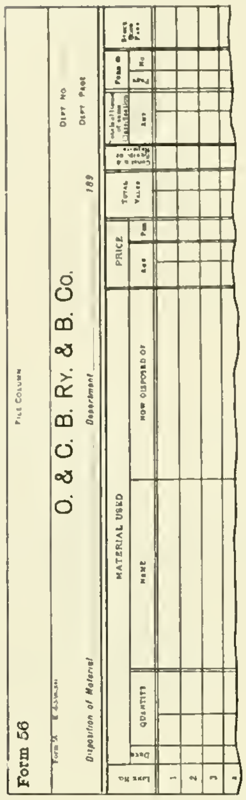
Form 44 is the requisition for supplies. This blank is 22½ x 12 in. Under no circumstances will supplies be furnished except through a requisition made on this blank, and after a requisition is approved no one has authority to

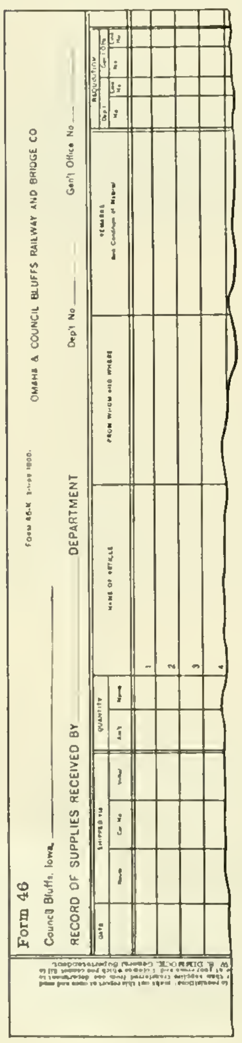












order or purchase supplies, except when authorized by the general superintendent. On the first of each month the head of each department examines the stock of supplies on hand, and orders such as are necessary. When the requisition is filled out a carbon copy is made which serves as a department record. At the same time the head of the department notes the Department No. of the requisition under the name of each supply required in an index book provided for the purpose, and in the front of the index book notes the date or dates of the requisition blank. This index is for the purpose of enabling one to quickly tell when a given supply was last asked for.

When making a requisition the head of the department fills out only the left hand portion of Form 44, leaving the rest blank for general office records. If the heads of departments wish to make a copy of the rest of the blank they may secure it from the general superintendent, if in his opinion it should be of record on their copies.

When prices are secured and approved, and the supplies ordered, the blanks to the right of the column "Wanted for" on Form 44, are filled out up to the column "Ordered by, Initial."

When supplies are received they are to be immediately examined, and if ordered by the person receiving them (which is readily determined from the index book kept by each department) the Form 46 is filled out, after filling out the "Received" columns in the department copy of Form 44. It is optional with the department whether it keeps copies of Form 46. A system of cross-references between the files of Form 44 and Form 46 is made by entering under each item on Form 44 the "DepartmentNo." and "General Office No." of the blank Form 46 on which the record of the receipt is made, and vice versa for each item on Form 46.

By means of these two forms, 44 and 46, a record of the materials is secured up to the time they are put in stock. From Form 44, or the original bills, the items are transferred to a large book known as the "Stock Ledger," where each supply used is carried as an account. On the left hand side are entered the supplies received, entries being made in columns headed as follows:

Form 44. Requisition General Office No.—
Date received.
From whom and where.
Quantity.
Value, price and amount.
Remarks.
Location (i. e., in whose charge the supply is placed).

On the right hand side of the "Stock Ledger" are entered the supply as expended, under heads as follows:

Form 56. Material Used, Date, Page and Line.
How disposed of.
Quantity.
Value, price and amount.
Remarks.
Inventory, Page and Line.

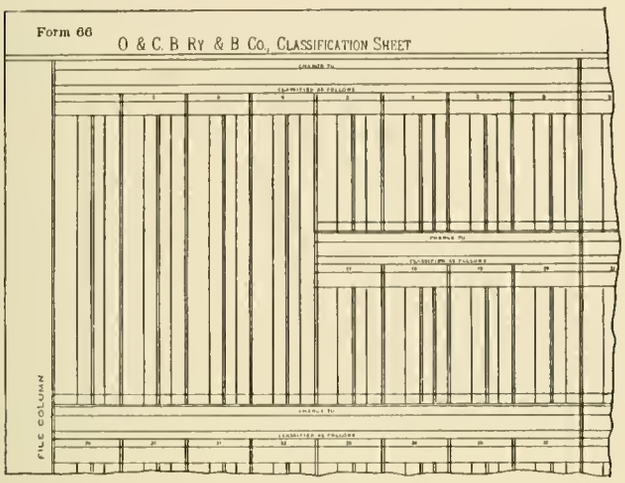
When an inventory is taken, the amount of the supply on hand should balance the account in the stock ledger.

Having got the supply in stock we will now show how the record of the expenditures is made. When material is drawn from stock the workman makes a requisition on a blank, Form 63, 4¼ x 6¼ in., in which he gives on one side the materials wanted and the disposition; on the reverse side is a memorandum of his time. From these forms the

time records mentioned later (Form 53) are made, and the materials expended are carried to a blank, Form 56, on which the prices and values are entered after reference to the stock ledger and the page in that book. The totals on Form 56 are transferred to Form 60, and the page and line to which each item was carried entered in the proper columns. Form 56 measures 10 x 17 in.

MATERIALS AND LABOR COMBINED.

We have now traced the material and labor to Forms 56 and 54, where it is shown what was expended and for what purpose. Mr. Dimmock's experience has shown that there are from 1,000 to 1,200 different things for which an electric railway may have use, and the names of them all are entered



in an index book, where under each item is given the particular classified account to which the supply is to be charged. When Forms 56 and 54 have been completed the material and labor are assembled on Form 60. This form is 12 x 18 in., and is ruled for 10 accounts with 4 subdivisions each, and 2 accounts with 8 subdivisions each, experience having shown this arrangement to be convenient. Cross references showing whence the item was taken (page and line, Form 56 or 54) are made alongside each amount, and names or numbers following the heading "Charge to" and "Classified as follows" show where the total was entered in the monthly report.

MONTHLY REPORT.

The monthly report compiled by Mr. Dimmock after more than two years of hard work and thoughtful consideration is designed to exhibit in the greatest detail the earnings, expenses and statistics for the month; to contain a full and complete answer to any question that may be asked concerning the operation of the road; and above all to present the data in such form that they can be readily found.

This report is a book 13½ in. on the binding edge by 13 in. wide, and contains all told 36 pages of these dimensions. Of these 29 pages are numbered, and suitably ruled for the special objects in view. Preceding the ruled forms is an index of nearly a hundred of the more important headings for which one will have occasion to look, and the numbers of the pages where the items will be found. Thus "Wire" is followed in this index by the numbers 7, 12, 13, 16, 20. On page 7 we find "Wire" as a sub-head under "Maintenance of Electric Lines"; on page 12, it is a sub-head under "Maintenance of Power Circuit"; on page 13 it is a sub-head under "Repairs of Electric Line (Special, i. e., Extraordinary, Charges)"; on page 16 it is a sub-head under "Repairs of Power Circuit (Special Charges)"; on page 20 it is a sub-head under "Power Circuit, Fixed Property Accounts." Other items are similarly treated.

The "Monthly Report" is principally to show three things: 1. The earnings of the road, and the cost of labor and supplies required to operate it; this has nothing to do with the actual receipts and expenditures of money for the month, as the earnings or expenses may have accrued, but not been paid. 2. The monies paid out. 3. The balance sheet showing assets and liabilities.

1. EARNINGS AND EXPENSES.

This statement is found on pages 1 and 2 of the report, and covers the following heads:

Earnings from the operation:
- Passenger.
- Miscellaneous.

Operating expenses:
- Maintenance.
- Transportation.

Income from other sources:
- Missouri River Bridge.
- Power.
- Miscellaneous.

Fixed charges.

Property accounts.

These several heads are subdivided to some extent, but not in great detail on this page. Numbers are placed after each item giving the page where a detailed analysis is to be found.

2. CASH EXPENDITURES.

On pages 3 and 4 of the report are listed the vouchers for bills authorized to be paid, giving name and amount and what for, and the total of the pay rolls. The grand total is the cash expenditure authorized.

3. BALANCE SHEET.

On pages 5 and 6 are the assets and liabilities thus:

Assets:
- Fixed Property Accounts.
- Open Property Accounts.
- Cash Assets.
- Debt Balances.
- Income Charges.

Liabilities:
- Capital Stock.
- Funded Debt.
- Floating Debt.
- Credit Balances.
- Income Credits.
- Earnings.

Each subdivision under these sub-heads has its reference number to a page where the detailed analysis is given, if such analysis is necessary or desirable.

COMPARATIVE STATEMENT AND CLASSIFICATION OF OPERATING EXPENSES.

Pages 7 to 12, inclusive, of the report are devoted to the classification and comparison of the "Operating Expense Accounts." The book is ruled to show the amount of each item for the month for the current year and for the previous

year, and for the increase or decrease; and for ..... months of the current year and of the previous year and for the increase or decrease.

In classifying accounts the general scheme outlined by the Accountants' Association and shown in the "Review" (Sept., 1898, p. 654 et seq.) was followed, but with some modifications rendered desirable by the local conditions which Mr. Dimmock wanted to meet. Thus Mr. Dimmock divides his operating expenses into "RAILWAY," "MISSOURI RIVER BRIDGE" and "POWER CIRCUIT."

Under "RAILWAY" we find 10 sub-heads of "Maintenance" instead of 9 as shown in the accountant's report. They are:

Maintenance of Track and Roadway.
Maintenance of Electric Lines.
Maintenance of Buildings and Fixtures.
Maintenance of Power Plant No. 1.
Maintenance of Power Plant No. 2.
Maintenance of Rolling Stock.
Maintenance of Tools.
Maintenance of Heating Apparatus.
Maintenance of Miscellaneous Construction.
Maintenance of Miscellaneous Equipment.

While the heads here given differ in name the items under them reach virtually the same place as in the Association accounts. The classification is made to conform to that of the Association except in a few cases where local conditions require a change or where the point is debatable.

Each of these sub-heads has under it spaces for 10 items, which spaces are filled out as experience shows most desirable with the names arranged alphabetically. For example under the sub-head "Maintenance of Electric Lines" are:

260. Bonding.
261. Miscellaneous Labor.
262. Miscellaneous Material.
263. Poles.
264. Signal Apparatus.
265. Telephone Lines (private).
266. Wire.

(267, 268 and 269 are left blank for the present.)

The numbers of the items are for convenience in making references, each item having its own number; for "Operating Expenses" the numbers run from 250 to 489. The general head "RAILWAY" includes those from 250 to 449, in which are perhaps 50 spaces that are not named as yet.

Following "Maintenance" naturally come "Transportation" and "General" under which we find:

Operation of Power Plant, No. 1.
Operation of Power Plant, No. 2.
Operation of Rolling Stock.
Train Service.
General Office Expenses.
General Expenses.
Claims.
(Three blank sub-heads.)

These are each followed by 10 numbered items, 351 to 449 inclusive.

Next follow the "MISSOURI RIVER BRIDGE" and "POWER CIRCUIT" each divided into "Maintenance" and "Operation" and the sub-heads divided into 10 items each, 450 to 489.

Following the "Operating Expenses" just mentioned and which, as before stated, fill pages 7 to 12 inclusive, of the report is the head "Special Charges," pages 13 to 16, inclusive, sub-divided exactly as "Maintenance" is sub-divided, except that the word "Repairs" is used instead of "Maintenance" in the headings. The object of having "Special Charges" accounts is to provide a place for unusual operating expenses such as would tend to confusion were they placed in the ordinary "Maintenance" accounts. Examples of special charges would be such operating expenses as are incurred by reason of the bursting of a fly-wheel in the power house, the destruction of lines and tracks by floods or storms, etc. The items under "Special Charges" are 490 to 619, inclusive.

On page 16 the totals from proceding pages are brought forward and a balance struck.

On pages 17 to 23, inclusive, are rulings occupying approximately three-fifths of the page, for the "Fixed Property" accounts, which are at present 19 in number, and each is sub-divided into 10 heads. Including the blank spaces for possible future additions to the property accounts the numbers of the items under these are from 1 to 249.

In designing the ruling for this book Mr. Dimmock carefully considered details and arranged the footing lines so that the bookeeper is saved a great deal of work in looking up what items should be included in any given footing. The footing rulings are single red lines, double purple lines and double green lines. When the bookkeeper meets a single red line, he foots the items immediately preceding it; at a purple line the totals between it and the next preceding purple line are combined; at a green line all the purple totals between it and the next preceding green line are combined.

STATISTICS.

On pages 17 to 23, the space not used for the fixed property accounts is ruled for tabulating various statistics, among which are: Railway Earnings, Bridge Earning, Passengers Carried, Free Passengers Carried, Receipts per Passenger, Cost of Service per Passenger, Expenses and Earnings per Car-Mile, Cost of Power per Kilowatt-Hour, etc. These are all for the month covered by the report and are compared with the corresponding month of the previous years.

On pages 24 and 25 of the report is a detailed comparative exhibit of Passengers Carried and of Bridge Tolls, in numbers and in dollars; Track Mileage, Car-Mileage, Cost of Power, etc.

On page 26 is a statement of the earnings classified under the heads: Trolley Parties and Chartered Cars, Power Rentals, Bridge-Rights-of-Way, Miscellaneous, Operating Expense Credits, Tickets Sold.

On page 27 are miscellaneous accounts as: Bills Receivable, Accounts Receivable, Unpaid Vouchers, Unpaid Pay Rolls, Bills Payable, Accrued Damages, Accrued Track Rentals, Outstanding Tickets.

Pages 28 and 29 are for general remarks and the certificates of the auditing committee.

In order to further explain the methods without reproducing the book it may be well to consider in detail some of the points that would naturally arise.

1. TICKETS.

The company sells books of tickets and the proceeds of course appear as cash on the balance sheet of the month. The item is partially offset by the footing from the "Out-

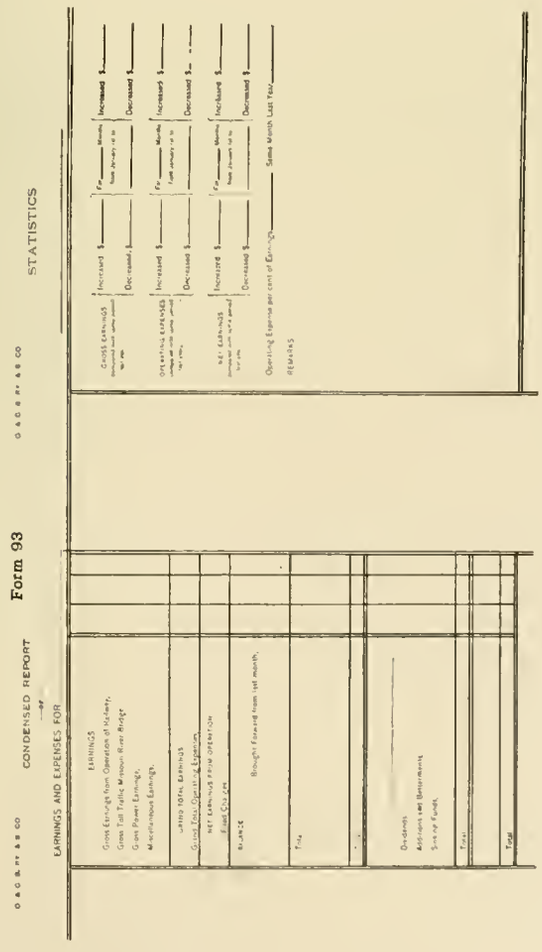
standing Tickets" account. The tickets which were collected during the month appear in the monthly earnings statements on pages 1 and 2 of the report.

2. ACCRUED EARNINGS.

Assume that five persons have chartered special trains during the month for which the charge was $100 each; and that only two have paid for the service. The road has evidently earned $500 from this source, and $500 will be credited to "Chartered Cars" on page 1. A reference to page 26 is made and there appear the names of five persons who used chartered cars. The $200 paid will appear in the cash book, the cash balance being carried to the balance sheet on pages 5 and 6 of the reports as a cash asset. The $300 from chartered cars as yet unpaid constitutes a portion of the cash asset "Accounts Receivable," and a reference to page 27 of the report where the Accounts Receivable are set out shows among other things that Messrs. A., B. and C. each owe $100 for chartered cars.

3. DEPRECIATION.

The company does not make general depreciation charges, but it has some heavy expenses of this nature to meet, notably the paving and painting of the bridge over the Missouri River. About every five years approximately $20,000 has to be spent in putting down a new paving and in



repainting. Accordingly this sum is divided into 60 equal parts and each month charges are made for bridge paving and for painting against the bridge as an operating expense, and the "Bridge Paving Fund" and "Bridge Painting Fund" given proper credits; these credit balances show on the monthly balance sheets as liabilities.

In order to appreciate the completeness and convenience of this report one should be placed in the position of the directors for whose benefit it is made, ask questions, and see how easily and quickly they can be answered by a reference to the report.

CONDENSED REPORT.

Form 93 is a blank 10 x 5 in., and is submitted to the directors with the request that they ask for further information regarding the special questions in which they are most interested. The information asked for is to be found in the "Monthly Report."
