## FOREWORD

The Iowa Crop and Livestock Reporting Service is the Iowa unit of a nation-wide organization which is entrusted with the responsibility of operating a standard statistical service for agriculture. The Division of Agricultural Statistics is a division of the Iowa State Department of Agriculture working in cooperation with the Agricultural Marketing Service of the United States Department of Agriculture. The year 1939 marked the one-hundredth anniversary of the collection of statistics of agriculture in the United States.

The general program of the Iowa Crop and Livestock Reporting Service is to meet the public needs and demands for summary data of a historical nature and for current statistical information of agricultural production in Iowa and the United States.

In recent years, there has been an increasing demand from agricultural organizations, commercial interests, teachers, legislators, and county, state and governmental agencies for agricultural data showing the trends of change in counties. Little has been done in the past to make available data for each county over an extended period of time. So urgent is the need for county data that some organizations have assembled such information at considerable cost. It is in response to these needs that this series is being issued.

The county data herein offered have been assembled from existing State and Federal documents and reports, under the supervision of Norman V. Strand, State-wide Work Projects Administration Supervisor of Agricultural Economics and Statistics projects. This is a report of work completed on Official Project 65-1-72-155 of the Work Projects Administration. Official Project 665-72-3-36 furnished the material for Tables 21 and 23.

The Iowa Agricultural Extension Service participated in the preparation of the materials in this report. Selected data from the files of the Iowa Agricultural Experiment Station have been released for publication in this series. Special credit is given to the Iowa assessors and tax officials who collect data on crops and livestock as required under the Iowa laws. Without these data by townships and counties detailed agricultural statistics would be less accurate and less complete.

Leslie M. Carl, Director  
Division of Agricultural Statistics

Des Moines, Iowa  
September, 1940

## IOWA AGRICULTURAL STATISTICS - CHICKASAW COUNTY

Chickasaw County, originally part of old Fayette County 1/, was established on January 15, 1851, and named for a southern tribe of Indians.2/ When first established, Chickasaw extended three miles further north than its present boundary, which was fixed in 1855. It lies in the third tier of counties west of the Mississippi River and in the second tier south of the Minnesota line.

The first settlement was made by Truman Merritt in 1848, near Greenwood. John and J. A. Bird made claims near the junction of the Little Cedar and the Cedar rivers in 1852, and in 1854, James Jared took a claim where New Hampton now stands. Other settlements were made about the same time in various parts of the county. The county was attached to Fayette for judicial and administrative purposes until 1853, when it was formally organized. The county-seat was located at Bradford, a new town that had sprung up in the southwest part of the county. Later, New Hampton was laid out near the geographical center of the county and after several attempts, the seat of government was moved to New Hampton where it has remained.

The first railroad, the Milwaukee and St. Paul, reached New Hampton in 1869. This contributed greatly toward the settlement of the county, over 4,000 new homeseekers coming in 1870. 3/

Nashua, the second largest town, is located in the extreme southwest corner of the county, at the confluence of the Cedar and Little Cedar rivers. It was first called Bridgeport, and later Woodbridge. The famous Little Brown Church in the Vale is located two miles northeast of Nashua at the old town of Bradford.

## Area

The area of Chickasaw County is 497 square miles, or 318,080 acres. 4/ Of this number, 310,684 acres are listed as farm land. 5/ The county is 24 miles long by 21 miles wide, and contains 12 townships. The townships in the northern tier are 9 by 6 miles, but the others are the regulation size, 6 miles square, coinciding with the Congressional townships. It ranks fifty-first in point of size in the State.

## Topography

Chickasaw County consists of an undulating, drift-covered plain, cut by a series of small streams that cross the county in a general southeasterly direction. The larger rivers and creeks have cut the surface quite deeply. The hilly areas along the larger waterways are occasionally over a mile in width. Between the various streams, which are irregularly developed, the smooth uplands have a rather gently undulating surface. 6/

## Soils

The soils of Chickasaw County are grouped into three classes according to their origin and location: namely, drift, terrace, and swamp and bottom-land. Drift soils are formed from materials carried by glaciers and deposited on the surface of the land when the ice sheets melted. They are variable in composition and contain silt, sand, gravel, clay and rocks. Terrace soils are previous bottom-land remaining above the present levels of many of the streams. Swamp and bottom-lands occur in low, poorly drained areas along streams and are subject to more or less overflow.

Over three-fourths, 78.3 percent, of the total area of the county is covered by the drift soils. There are 10 individual types in this group which have been classified in the Carrington, Clyde, Floyd, Dickinson, Lindley and Dodgeville loam series. The terrace soils are next in total acreage, covering 12.4 percent of the whole. There are five separate types in this group, all classified in the O'Neill and Bremer loam series. Swamp and bottom-land soils make up the remaining 9.3 percent of the county. Four individual types are found, three of which come under the Cass and Wabash loams classification, and the fourth being classified as muck and peat. 7/

## Climate

The average temperature for 40 years (1890-1930) was 45 degrees. The average precipitation for 33 years (1897-1930) was 31.74 inches, and the growing season averaged 147 days between the killing frosts dates of May 8 and October 1, recorded over a period of 32 years. 8/

## Population

The population growth of this county has been similar to most other Iowa Counties. The growth became rapid after the advent of the railroads, but a slow recession began after 1900. It has a population density of 30 persons per square mile, as compared with the State density of 44. The following table shows the number of inhabitants recorded at 10-year intervals:

7/ Ibid. pp. 9-10.

8/ United States Weather Bureau. Climatic Summary of the United States from establishment of Stations to 1930, inclusive. Section 52--Eastern Iowa. pp. 21, 26, 27. 1933.

<u>Year</u>	<u>Inhabitants</u>	<u>Urban</u>	<u>Rural</u>
1852	300	-	-
1860	4,336	-	-
1870	10,180	-	-
1880	14,534	-	-
1890	15,019	-	-
1900	17,036	5,452	11,585
1910	15,375	5,452	9,923
1920	15,431 <u>9/</u>	6,005 <u>10/</u>	9,426
1930	14,637	5,662 <u>11/</u>	9,447
1935	-	-	9,152 <u>12/</u>

In 1930, the total foreign born and native white of foreign born and mixed parentage content of Chickasaw County was 5,262, or 36 percent of the whole population. Of this number, the Germans had 58 percent, the Scandinavians 12 percent, and the Irish 10 percent. Other nationalities had small representations. 13/

#### Cooperatives

In 1937, there were 17 cooperative institutions in operation in this county--6 elevators, 9 creameries, 1 petroleum plant and 1 lumber yard.

As a whole, they had 3,007 members, of which 2,637 were active, and 6,699 persons did business with 17 of the concerns. The selling cooperatives had a business volume of \$1,664,421 and the purchasing cooperatives transacted \$274,717 worth of business.

Cooperatives may both buy and sell or they may perform one or the other function exclusively. Purchasing cooperatives buy non-farm commodities for distribution to their members and patrons, and selling cooperatives market farm commodities for their members and patrons. 14/

#### Fruits

In 1909, the peak year for apple production, 29,748 trees produced 17,541 bushels. Cherries in 1884 yielded their greatest with 589 trees and 141 bushels. The record year for plums and grapes was in 1935, when 2,170 plum trees yielded 802 bushels, and 2,207 vines bore 3,862 pounds of grapes. 15/

### Note Regarding Yields of Corn

The Crop Assessors' statistical breakdown for corn acreage is as follows: (1) all corn, (2) corn husked for grain, (3) corn cut for silage, (4) corn cut for fodder and (5) corn hogged off. A total production is given for each farm which includes only that actually husked. In getting county totals of production, the acreage other than that husked is multiplied by the yield (derived by dividing total bushels corn husked by total acres husked) and added to summations of individual farm productions shown as husked. This assumes that acreage not husked would have produced the same yield as that actually husked.

In 1934 and 1936, both poor crop years, separate estimations of corn yield on acreage not husked were made by the State assessors' office because it was felt that farmers in those years would select their best acreages for husking and cut or hog off the rest, which would have a different and lower yield. This separate yield estimation was then multiplied by the acreage not husked and the total added to that reported as husked.

This was done by counties only and not by townships. The township yields for these two years, then, are somewhat high since they are based only on acreage husked for grain and bushels husked. The total corn acreage is shown by township with this yield, and any attempt to multiply it by the acreage shown to get total production will result in a too high figure. The county summary table figures for corn yield in 1934 and 1936 have been adjusted for poorer yields on that acreage not husked and these yields may legitimately be multiplied by the acreages shown there to arrive at total productions for the county.

In all other years actual township productions may be derived from the yield and acreage figures shown in the tables since corn yield has been assumed to be equal in all utilizations. The county yield and township yields are, therefore, consistent in all years except 1934 and 1936.

1938	44,895	21,230	9,476	148	10,057	56,411
1939	45,132	21,350	9,132	155	8,950	68,445

The figures in this table for the years 1870-1935 inclusive have been derived from the Federal Censuses for Iowa. These enumerations have been made as of different dates. Some enumerations were for a base date of January 1, others for a base date of April 1, and others for June 1.

The census enumerations made in 1920, 1925 and 1935 were for January 1. For comparability the enumerations made for the base dates of April 1 and June 1 were adjusted to an equivalent January 1 base. This adjustment procedure places the livestock data of the above table on the one inventory date of January 1.

The figures for 1936, 1937, 1938 and 1939 for all cattle and milk cows are estimates of the Division of Agricultural Statistics of the Iowa Department of Agriculture and those for horses, mules, hogs and sheep are adjusted state farm assessors' figures.

The adjusted county figures for horses, mules, hogs and sheep for the last four years in the table are more nearly accurate than those in Table 17 and comparison with these figures will provide an estimate of the bias displayed by the unadjusted state farm assessors' figures.

\*Includes Milk Cows.

The statistics in this table are biased downward. They are printed only to permit inter-township and inter-annual comparisons. Unless townships are equal in size, comparisons may not be directly made. It is assumed that individual assessors are subject to approximately the same bias. Compare Table 16 for magnitude of the bias.
