弁言

本年度月報與去年度無甚差別。所不同者，南京部份刪去直行風速，因本台高處山巔，平行之風，受山之梗阻，稍有向上之趨勢，故所紀直行風速，殊不能代表空中之現狀。加入太陽輻射，此類紀錄，凡分兩項；（一）太陽輻射強度，記每分鐘太陽射輻於垂直面上每平方公分之熱量，（二）太陽輻射總量，紀每日太陽及天空輻射，達於地平面上每平方公分之熱量。南京溫度氣壓溫度之變遷，嚮來接月製爲分圖，自本卷起，各圖均集在一頁上，以便比較，在圖上刪去最高溫度，最低溫度，絕對溫度三項。加入風速，降水量，蒸發量，及太陽輻射總量四項。測風氣球，本台仍按日施放，其結果將另行刊佈之。

外埠氣象報告，本年度增加杭州，刪去龍州。新疆省內迪化及庫車二站之報告，因路途遙遠，交通不便，常不能按時寄達，故發表時期與他站常有先後參差之虞。去年新疆省政府添設之吐魯番及綏來二站報告，寄到過遲，不能編入月刊，其紀錄當摘要載入年刊中。海關各站，仍依第三卷辦法，各項紀錄均經計算刊入，惟氣壓一項僅錄上午九時一次而已。

FOREWORD

The Monthly Bulletin of the present year will not differ materially from that of last year. Few alterations and additions, however, will be made. Among the meteorological data of Nanking, the vertical velocity of wind recorded by a Richard instrument has been omitted owing to the fact that Pei-Chi-Ko Hill, on the summit of which our observatory is situated, deflects winds from every quarter upward to a certain extent, and hence no accurate registration of vertical component is possible under any exposure. One new item, the solar radiation, has been added to the Nanking data. The solar radiation is recorded by two separate instruments: (1) a pyrheliograph for registering direct radiation at normal incidence, and (2) a solarigraph for registering total radiation at a horizontal surface, in terms of gram calories per square centimeter per minute and gram calories per square centimeter per day respectively.

An alteration has also been made in presenting the monthly march of various meteorological elements of Nanking in diagrams. Instead of making diagrams for pressure, temperature, and humidity on separate pages, they are now drawn in several panels on the same page, so that the correlation of different elements or the lack of it can be seen at a glance. In these diagrams, the curves of maximum temperature, minimum temperature and absolute humidity from day to day have been omitted, while those of wind velocity, amount of precipitation, amount of evaporation, and total radiation inserted. The work of daily launching of pilot balloons continues, the result of which will appear in another serial publication, the first number of which is now under press.

Among the cooperative stations, the data of Hangchow appears for the first time in this volume, while the station of Lungchow has been omitted from our list. Owing to the difficulty of communication, the reports of Tihwa and Kuchar in Chinese Turkestan do not come regularly in time to be published in the particular issue where they belong, but we will print them at the earliest possible date. Two new stations at Turfan and Seilai have been established in that vast but practically unknown province since last year, we hope to be able to include their data in the future issues of our Annual Report.

EXPLANATORY REMARKS

Our observatory is located at the summit of Pei-Chi-Ko Hill, Latitude $32^{\circ} 3' 11''$ North, Longitude $118^{\circ} 46' 55''$ East of Greenwich, cistern of standard barometer above sea level 67.9 meters, anemocinemographs above sea level 87.5 meters.

The publication of this Bulletin began in the year 1928 as a Quarterly, since 1929 this publication has been changed from a Quarterly into a Monthly. Hourly observations are made from the daybreak to 10 o'clock in the evening, 120th degree M E G standard time, the data during the night hours are obtained from the recording instruments. No records are made of visibility, cloudiness, direction, velocity and kinds of clouds during the night.

The barometer readings published in the following tables are corrected for temperature and latitude but not for altitude. The readings during the night hours are taken from records of Fuess Sprung Barograph. The velocities of clouds are observed by a Comb-Nephoscope, expressed in 1000th of a radian per second. It can be changed into linear velocity very easily once the height of cloud is known. For instance the velocity of Nb is measured to be 10, if the height of Nb is 1 km the linear velocity will be 10 meters per second, if cloud height is 0.5 km the linear velocity will be 5 meters per second, etc. We distinguish between the maximum velocity and extreme velocity of wind recorded during a period of twenty-four hours. The latter is taken from the record of an Anemobiograph (Negretti and Zambra) which gives the instantaneous velocity, while the former is read from an Anémocinémographe (Richard), which gives the mean velocity of every 25 meters travelled. Hence the extreme velocity for each day is higher than the maximum velocity.

Radiation is recorded by two instruments, Gorczynski's Pyrheliograph (Richard) for direct solar radiation at normal incidence, and Solarigraph (Kipp and Zonen) for total thermal energy received on a horizontal surface from the sun and sky. These instruments are calibrated by the readings of a Smithsonian Silver Disk Pyrhemometer (No. 41) several times in a month. Amount of evaporation is obtained from a Kassner-Fuess self-recording evaporimeter. Readings on earth thermometers are taken at the following hours of the day:—0 depth at 9.00, 5 cm depth at 10:06, 10cm depth at 11.12, 20cm depth at 13.24, 25cm, 50cm, 75cm and 100cm depths all at 21.00.

The abbreviations for kinds of cloud and state of weather, and the scale of visibility are all according to the international system save a few exception. For instance, ☀ indicates clear weather with a cloudiness of 0-2.9, ☁ signifies partly cloudy with a cloudiness of 3-7.9, while ☁ means cloudy weather with a cloudiness of 8-10 inclusive.

The meteorological elements recorded in other observatories, colleges and experimental stations, and the meteorological registers of the Chinese Maritime Customs stations have also been published in this issue. The stations are divided in two categories (1) those maintained by universities, etc., and (2) those maintained by the Customs. In each category the stations are arranged according to their latitudes from south to north, a list of the names of stations is inserted at the end of Nanking report of this Bulletin. For all Customs stations the rainfall is for 24 hours ending at 9 a.m.

二十二年二月份中國天氣概況

本月天氣之可值注意者，長江下游雨量特別多，上二旬幾無日不在雨雪連綿之中，有許多地方開二月份雨量最多之新紀錄。本月長江下游因雨澤過多之故，蔬菜豆麥大受損害。

氣壓

本月亞東氣壓大概分佈，大致與一月份相近，西伯利亞高氣壓繼續強烈，南方低氣壓仍沿其南緣而行，唯北方低氣壓不從西伯利亞東南來，而自中國西北橫斷高氣壓而東行，西伯利亞高氣壓不南下至長江流域，而其前端被低氣壓所切斷，席住來於長江流域。

溫度

本月天氣繼續寒冷，本月全國各地平均溫度，均仍在準平均之下，不過不及一月份之劇烈耳。

本月各地溫度之變遷，滿州及中國北部，全月幾乎全在準平均之下，與準平均相差在攝氏五度至十度之間，祇最後一星期較高，與準平均不相上下，偶有高出於準平均之上者。長江流域溫度，一月中頗有上下。本月開始之時，頗為溫和，較之準平均約高攝氏五度左右，至第一星期之末，溫度驟降，較之準平均反低攝氏五度至十度之間，為本月中最冷時期。第三星期繼續寒冷，均較準平均低攝氏五度左右。第四星期開始時與第三星期相近，至第四星期之末，溫度升高，有時略高出於準平均。東海沿岸及中國南部於本月開始時，亦非常溫和，高出準平均在攝氏五度至攝氏十度之間，但第一星期之末二日，溫度驟降，至準平均之下，第二星期至第四星期之初，繼續寒冷，至第四星期之末，復行升高。

降水量

本月雨量以長江下游為最豐富，大部份雨量均在準平均一倍以上，而南京鎮江二處開二月份雨量之最多新紀錄。其次為中國北部與準平均不相上下。是江上游雨量，分佈殊不平均，多者約準平均之一倍，少者不及準平均之半數。東海沿岸雨量，大致較準平均為少，然鎮海一隅，在準平均一半以上。雨量最少之處在中國南部及西南，多者不過準平均二分之一，而少者不及準平均之半。

**A Résumé of Weather Conditions in China during the Month of
February, 1931.**

The leading feature of February weather was the abnormally rich precipitation recorded in the Lower Yangtze valley, especially in Chinkiang and Nanking, where the precipitation of the month was the greatest on record for the month of February. The result of the superabundant precipitation was that the spring garden crop to be a failure.

The general pressure distribution of eastern Asia during the month did not differ greatly from that of last month. An intense anticyclone still made its way over Siberia, the moving cyclones travelled to the east instead of toward north-western China as did in the last month, but the southern cyclones still advanced along the south edge of the anticyclone.

The temperature of the month continued to be very cold, even though not so severity as last month and no region in the country had a mean temperature above the normal of the month of February.

In Manchuria and north China, not only the mean monthly was below the normal, but also no diurnal temperature rose above it, except a few days in the last decade of the month. The average departure of these region during the month was 5°-10°C. lower than the normal. The temperature of the Yangtze valley, although below the normal in average, but was not so throughout the month: In the beginning of the month, the mild weather prevailed in the Yangtze valley, continued from that of last month, the temperature was about 5°C above the normal, but in the last two days of the first week, the temperature decreased abruptly, reading to a point about 5°-10°C below the normal, hence the coldest period of the month; thereafter, the cold weather, about 5°C below the normal, continued about 20 days until the end of the month when the temperature rose little above the normal. In the coast of Eastern sea and southern China, the oscillation of the temperature during the month was similar to that of the Yangtze valley, but the departure was smaller

The distribution of precipitation in China during the month was uneven. The Lower Yangtze valley had the greatest amount, where the precipitation was as much as two times the normal. The next was north China, which region received approximately its normal share. In the coast of Eastern sea, the rainfall was mainly below the normal. The most deficient region were the south and southwestern China where some districts received only one half of the normal and some districts even less than that.
