DISCOURSES,

DELIVERED BY

SIR JOHN PRINGLE, BART. KARRAR OF THE WHEL ROYA, 904 FIETY;

On occafion of Six Annual Affignments of

SIR GODFREY COPLEY'S MEDAL.

TO WHICH IS PREFIXED THE LIFE OF THE AUTHOR. By ANDREW KIPPIS, D.D. F.R.S. and S.A.

LONDON:

PRINTED FCR W. STRAHAN; AND T. CADELL, IN THE STRAND.

M.DCC,LXXXIII.

SOME time before Sir John Prin-gle's deceafe, feveral of his friends expressed a wish that he would collect into a volume the Six Difcourfes he had delivered, upon occafion of fo many annual affignments of Sir Godfrey Copley's Medal. This he declined doing, during hisown life; but was difpofed to have them published, in the manner that was requested, after his death : for which exprefs purpofe, he committed a copy of them into my hands, a few days before he fet out for Edinburgh, in 1781. But, notwithstanding my authority from Sir John Pringle, as the Difcourfes had been originally printed A 2 under

under the fanction, and by the command, of the Royal Society, I did not think myfelf justified in republifting them, without the permiffion of that learned Body. Accordingly, I applied to Sir Joseph Banks, who took up the matter with great readiness and politenefs; and, laying it before the Council, it was unanimoufly agreed that I should have their confent and approbation in the execution of my defign. For the condefcention and favour thus obligingly fhewn to me, both by the Prefident and the Council, I here defire their acceptance of my grateful acknowledgments.

Many of the materials from which the following Narrative is composed, have been furnished me by Sir John Pringle's family and friends. In this respect, 1 am particularly obliged to 2 the

ii

the attention and care of Sir James Pringle, and Dr. Hope of Edinburgh. Other circumftances have been collected from feveral gentlemen in London; and efpecially from Dr. William Watfon, Dr. Richard Saunders, and Mr. Stevenson. With the latter part of our Author's Life I was myfelf well acquainted; having been honoured with his friendship for nearly ten years before his deceafe. When the fucceeding Account of him had been most of it printed off, James Boswell Efq. was fo good as to favour me with a recital of various particulars, drawn from his own intimacy with Sir John Pringle, and from the information of his father, Lord Auchinleck. This communication did not come fo late, but that I was able to avail myself of it, in feveral respects. Two things are mentioned by Mr. Bofwell.

iii

iv PREFACĖ.

Bofwell, that I had not been informed of before; and which, therefore, could not be introduced in their proper places. One is, that Sir John Pringle, after he had fludied at the Univerfity of Edinburgh, was intended for the mercantile line, and that he went to Amfterdam for that purpofe; but that his mind was turned to Phyfic, by accidentally hearing, at Leyden, a lecture of Boerhaave's, which ftruck him in a remarkable manner. The other is, that he completed his medical fludies at Paris. This I fufpected to be the cafe; but not being affured of it, I did not choofe to infert it in my Narration. Where any circumftances are taken from books, I have referred to my authorities. It will be feen that I am under fome obligations to the Anecdotes of Mr. Bowyer, by my friend Mr.

V

Mr. Nichols; to whom Biography, and Biographers in general, are fo much indebted.

I defire the Reader to remember, that it hath been my intention to give a Life of Sir John Pringle, with plainnefs and fimplicity; and not a ftudied panegyric. The elaborate and oratorical form of the profeffed Eulogium, which, on certain occafions, has its use and its beauty, I leave to the much abler men, who will undertake it at Paris; and I shall efteem myfelf happy in having had it in my power to provide them with materials for their more elegant narratives. They may depend upon it, that Truth hath been my object; and that I have faid nothing concerning Sir John Pringle, which, I believe, will not be acknowledged to be juft, by those who were beft acquainted with his character.

Just Published,

The Seventh Edition, revised and corrected, Price 6s. bound,

OBSERVATIONS

ON THE

DISEASES OF THE ARMY.

By SIR JOHN PRINGLE, BART.

Late Prefident of the Royal Society, and Phyfician to their Majesties.

SIR JOHN PRINGLE, BART.

TIR JOHN PRINGLE was born at Stichel-House, in the county of Roxburgh, North Britain, on the 10th of April, 1707. His father was Sir John Pringle of Stichel, Bart. and his mother. whofe name was Magdalen Eliott, was fister to Sir Gilbert Eliott of Stobs, Bart. Both the families from which he defcended were very antient and honourable ones in the fouth of Scotland, and were in great efteem for their attachment to the religion and liberties of their country, and for their 2

piety

[ii]

piety and virtue in private life. He was the youngest of feveral fons, three of whom, besides himself, arrived to years of maturity*. His grammatical education he received

* Robert, the eldeft, fucceeded to the effate and title of the family, and died, not many years fince, at an advanced age. Gilbert, the fecond, was an officer in the army; and Walter, the third, who was brought up to the law, was Sheriff of the county of Roxburgh. Sir John Pringle of Stichel had alfo, by his Lady, an only daughter, Margaret, who was married to Sir James Hall, Bart. of Dunglafs. and was mother to the late Sir John, and grandmother to the prefent Sir James Hall. Robert Pringle, Efq; a brother of the first Sir John Pringle, having quitted his native country, during the tyrannical government of King James the Second, came over with the Prince of Orange at the Revolution, and was appointed Deputy Secretary of State for Scotland. He was afterwards Secretary of War for Great Britain, and, at length, Register General of the Shipping; which post he held till his decease. In Carstares's State-Papers, there are five letters written by him, which fhew that he was a fenfible and moderate man, and well versed in public affairs. He departed this life at Rotterdam, on his return to England from the Spa, on the 13th of September 1736, being eighty years of age. Another brother of the first Sir John Pringle, 2

~

received at home, under a private tutor; and after having made fuch a progrefs as qualified him for academical fludies, he was removed to the univerfity of St. Andrews, where he was put under the immediate care of Mr. Francis Pringle, profeffor of Greek in the college, and a near relation of his father. Having continued here fome years, he went to Edinburgh, in October 1727, for the purpofe of fludying phyfic, that being the profef-

Pringle, was Sir Walter Pringle, Knight, one of the fenators of the college of juffice at Edinburgh, under the title of Lord Newhall. This gentleman was eminently diftinguifhed by his abilities and virtues; having been efteemed, in his time, as an ornament to the bench and the profeffion of the law, and as the pride and boaft of his family and country. A character was drawn of him by the late Lord Prefident Arnifton, and publifhed in the Scots Magazine. He died on the 13th of December, 1736; and an epitaph was written on him by Hamilton of Bangour, which is inferted in that Author's volume of poems. There is, likewife, an engraved Portrait of Sir Walter Pringle.

2 2

fion

[iv]

fion which he was now determined to follow. At Edinburgh, however, he ftayed only one year, the reafon of which was, that he was defirous of going to Leyden. at that time the most celebrated school of medicine in Europe. Dr. Boerhaave, who had fo eminently contributed to bring that univerfity into reputation, was confiderably advanced in years; and Mr. Pringle was unwilling, by delay, to expose himself to the danger of losing the benefit of that great man's Lectures. We need not fay that he here maintained the most diligent application to his medical fludies, and that he made the beft use of the inftructions given him by the illustrious professor upon whom he attended. For Boerhaave he had a high and just respect: but it was not his dispofition and character to become the implicit and fyftematic follower of any man, however able and diftinguished. Whilft he studied at Leyden, he contracted an intimate

mate friendship with Van Swieten, who afterwards became fo famous at Vienna, both by his practice and writings. Van Swieten was not only Mr. Pringle's acquaintance and fellow student at the univerfity, but alfo his phyfician, when he happened to be feized there with a fit of fickness. Nevertheless, he did not owe his recovery to his friend's advice: for Van Swieten having refused to give him the bark, another prefcribed it, and Mr. Pringle was cured. When he had gone through his proper courfe of fludies at Leyden, he was admitted, on the 20th of July, 1730, to his Doctor of Phyfic's degree. His inaugural Differtation, which, according to cuftom, was printed, was " de marcore fenili;" and his diploma was figned, befides the other professor the univerfity, by Boerhaave, Albinus, and Gravesande; names of great celebrity, not only a 3

[vi]

only in the medical world, but among the learned in general.

Upon quitting Leyden, Dr. Pringle fettled as a phyfician at Edinburgh, where he gained the efteem of the magistrates of the city, and of the professors of the college, by his abilities and good conduct. Though his ftudies might principally be confined to his own profession, this was not fo entirely the cafe, but that he could find time for paying a confiderable degree of attention to other objects, and particularly to those highly important ones, natural religion and morality. Such, it is certain, was his known acquaintance with ethical fubjects, that, on the 28th of March, 1734, he was appointed, by the magistrates and council of the city of Edinburgh, to be joint Professor of Pneumatics and Moral Philofophy with Mr. Scott, during the faid

faid Mr. Scott's life, and fole Profeffor. thereof after his deceafe; and, in confequence of this appointment, Dr. Pringle was admitted, on the fame day, a member of the univerfity. In difcharging the duties of this new employment, his text book was PUFFENDORFF De Officio Hominis et Civis; and agreeably to the method he purfued through life, of making fact and experiment the bafis of fcience, he recommended much to his pupils Lord Bacon's works, and particularly the Novum Organum of that Father of true Philosophy. Befides this, he annually delivered feveral lectures on the immateriality and immortality of the foul; fubjects that fell properly within his province, and which were not a little difcuffed at that period.

Dr. Pringle continued in the practice of phyfic at Edinburgh, and in performing a 4 the

[viii]

the obligations of his professions for the profession of his profession of the 1742, when he was appointed physician to the Earl of Stair, who then commanded the British army. For this appointment he was chiefly indebted to his friend Dr. Stevenson, an eminent physician at Edinburgh, who had an intimate acquaintance with Lord Stair.

By the interest of this nobleman, Dr. Pringle was constituted, on the 24th of August 1742, physician to the military hospital in Flanders; and it was provided in the commission, that he should receive a falary of twenty shillings a-day, and be entitled to half pay for life. He did not, on this occasion, resign his profession of Moral Philosophy. The university permitted him to retain it, and Mess. Muirhead and Cleghorn were allowed to teach in his absence. The same indulgence was granted him,

[ix]

him, from year to year, as long as he continued to request it.

The eminent attention which Dr. Pringle paid to his duty as an army phyfician, is a matter that requires no enlargement in this place. It is a fact fo generally known, and fo univerfally acknowledged, that it cannot admit of a debate or a doubt; and were there no other teftimony, it would be amply apparent from every page of his Treatife on the Difeafes of the Army. One thing, however, deferves particularly to be mentioned, as it is highly probable that it was owing to his fuggeftion. It had hitherto been ufual, for the fecurity of the fick, when the enemy was near, to remove them a great way from the camp; the confequence of which was, that many were loft before they came under the care of phyficians. The Earl of Stair. the being fenfible of this evil, proposed to the Duke

Duke de Noailles, when the army was encamped at Afchaffenburg, in 1743, that the hospitals on both fides should be confidered as fanctuaries for the fick, and mutually protected. The French general, who was diffinguished for his humanity, readily agreed to the propofal, and took the first opportunity of shewing a proper regard to his engagement. For, after the battle of Dettingen, when the British hospital was at Feckenheim, a village upon the Maine, at a diftance from the camp, the Duke de Noailles, having occafion to fend a detachment to another village upon the opposite bank, and apprehending that this might alarm the fick, he fent to acquaint them, that he had given express orders to his troops not to difturb them. This agreement was ftrictly observed on both fides during that campaign *.

* Preface to the Observations on the Diseases of the Army, p. 8. .Seventh edition.

[xi]

At the battle of Dettingen, Dr. Pringle was in a coach with Lord Carteret during the whole time of the engagement, and the fituation they were placed in was dangerous. They had been taken at unawares, and were kept betwixt the fire of the line in front, a French battery on the left, and a wood full of huffars on the right. The coach was occafionally fhifted, to avoid being in the eye of the battery.

Soon after this event, Dr. Pringle met with no fmall affliction in the retirement of his great friend, the Earl of Stair, from the army. He offered to refign with his noble patron: but that generous and liberal minded commander not permitting him to think of it for a moment, he was obliged to content himfelf with teftifying his refpect and gratitude to his Lordship, by accompanying him forty miles on his return

[xii]

turn to England; after which he took leave of him with the utmost regret.

But though Dr. Pringle was thus deprived of the immediate protection of a nobleman who knew and effeemed his worth, his conduct in the duties of his ftation procured him effectual fupport. He attended the army, in Flanders, through the campaign of 1744, and fo powerfully recommended himfelf to the Duke of Cumberland, that, in the fpring following, on the 11th of March, he had a commission from his Royal Highness, appointing him Physician General to his Majesty's forces in the Low Countries, and parts beyond the feas: and on the next day he received a fecond commission from the Duke, by which he was conftituted Phyfician to the Royal hospitals in the fame countries.

Hitherto Dr. Pringle had not been certain whether he might not find reafon to return

[xili]

return to the duties of his flation at Edinburgh, and to his medical practice in that city. But no fooner was he affured of the promotions we have juft mentioned, than he thought proper to refign his Profefforfhip of Pneumatics and Moral Philofophy. His letter to this purpofe, addreffed to Dr. Wifhart, Principal of the college, is dated on the 5th of March, 1744-5; in which, with many expressions of gratitude, refpect, and affection to the university, he declares that he gives up his charge without condition or limitation.

In 1745, he was with the army in Flanders, but was recalled from that country, in the latter end of the year, to attend the forces which were to be fent against the Rebels in Scotland. At this time he had the honour of being chosen a Fellow of the Royal Society. The election was on the 30th of October, and the 9 Society Society had reafon to be pleafed with the addition of a member, who was earneftly devoted to the purfuit of fcience in general, and who had the reputation and intereft of natural and experimental philofophy particularly at heart. How well he merited the diffinction conferred upon him, will hereafter appear.

Dr. Pringle, at the beginning of the year 1746, accompanied, in his official capacity, the Duke of Cumberland in his expedition against the Rebels, and remained with the forces, after the battle of Culloden, till their return to England, in the middle of August. We do not find that he was in Flanders during any part of that year. In 1747 and 1748, he again attended the army abroad; and in the autumn of 1748, he embarked with the forces for England, upon the conclusion of the treaty of Aix la Chapelle. From that time

time he principally refided in London, where, from his known skill and experience, and the reputation he had acquired, he might reafonably expect to fucceed as a phyfician. It was to his knowledge, his application, and his attention alone, that he trufted for making his way in the metropolis. If any little artifices are ever made use of, in the city of London, to excite popularity, and to promote medical practice, Dr. Pringle was the laft man to adopt fuch artifices. If he could not have built his fuccefs on the safes of fubftantial merit, he would rate ave fucceeded at all. We cannot but think that fuch a conduct is highly deferving of approbation and applause. In every profession of life, there is no fatisfaction that is equal to the consciousness of inward worth, and of a mind superior to the various contrivances for obtaining the notice and favour of mankind

[xvi]

kind, to which infufficiency, vanity, or covetoufnels fometimes have recourfe.

In the month of April, 1749, Dr. Pringle was appointed Phyfician in Ordinary to his Royal Highness the Duke of Cumberland *. In 1750, he published, in a letter to Dr. Mead, " Observations on the Jail or Holpital Fever." This piece, which paffed through two editions, and was occafioned by the jail-diftemper that broke out at that time in the city of London, was well received by the medical world, though he himfelf afterwards confidered it as having been haftily written. After fupplying fome things that were omitted, and rectifying certain miftakes that were made in it, he included it in his grand work on the Difeafes of the Army, where it con-

* Gent, Mag. Vol. xix. p. 189.

stitutes

[xvii]

ftitutes the feventh chapter of the third part of that Treatife.

It was in the fame year, that Dr. Pringle began to communicate to the Royal Society his famous ' Experiments upon Septic and · Antifeptic Substances, with Remarks re-' lating to their Ufe in the Theory of ' Medicine.' Thefe Experiments, which comprehended feveral Papers, were read at different meetings of the Society; the first in June, and the two next in the November following : three more in the courfe of the year 1751; and the laft, in February, 1752. Only the three first Numbers were printed in the Philosophical Transactions; the reafon of which was, that Dr. Pringle had fubjoined the whole, by way of Appendix, to his ' Obfervations on the Dif-' eafes of the Army;' for it is a general rule with the Royal Society, to infert, in their Journals, none of those Papers which, having

been

b

[xviii]

been read before them, are afterwards publifhed by the Authors themfelves.

The Experiments upon Septic and Antifeptic Subftances, which have accompanied every fubfequent edition of the treatife juft mentioned, procured for our ingenious Phyfician the honour of Sir Godfrey Copley's gold medal. Befides this, they gained him a high and juft reputation, as an experimental philofopher; and, perhaps, have not a little contributed to promote that ardent fpirit of enquiry into the chemical powers and properties of Nature, which hath lately been productive of fuch wonderful difcoveries.

But though the Papers now fpecified were Dr. Pringle's chief communications to the Royal Society; the communications that were the most important in themfelves, and on which his philosophical fame was principally principally founded; they were not the fole evidences of his folicitude, whilft only a private member of that learned Body, to carry on the purpofes of its inflitution. Not again to refume the fubject, we fhall here mention feveral inflances befides of his attention to Natural Knowledge, which have occurred to us, in looking over the Philofophical Tranfactions, and other publications.

In February, 1753, he prefented to the Society an 'Account of feveral Perfons 'feized with the Gaol Fever by working 'in Newgate, and of the Manner by which 'the Infection was communicated to one 'entire Family.' This is a very curious Paper; and it was deemed of fuch importance by the excellent Dr. Stephen Hales, that he requefted the Author's permiffion to have it publifhed, for the common good of the kingdom, in the Gentleman's Magab 2 zine; zine; where it was accordingly printed, previoufly to its appearance in the Tranfactions *. Dr. Pringle's next communication was, ' A remarkable Cafe of Fragility, ' Flexibility, and Diffolution of the Bones †.' In the forty-ninth volume of the Tranfactions, we meet with accounts which he had given of an earthquake felt at Bruffels; of another at Glafgow and Dunbarton ‡; and of the agitation of the waters, on the first of November, 1756, in Scotland and at Hamburgh §. The fifteenth volume contains Obfervations, by him, on the Cafe of Lord Walpole, of Woolterton; and a Relation of the Virtues of Soap, in diffolving the Stone, as experienced by the Reverend

Mr.

Mr. Matthew Simfon *. The next volume is enriched with two of the Doctor's Articles, of confiderable length, as well as value. In the first, he hath collected, digested, and related the different accounts that had been given of a very extraordinary fiery meteor, which appeared on Sunday, the 26th of November 1758, between eight and nine at night; and, in the fecond, he hath made a variety of remarks upon the whole, wherein is difplayed no fmall degree of philosophical fagacity +. It would be tedious to mention the various Papers, which, both before and after he became Prefident of the Royal Society, were transmitted through his hands. The merit of these Papers must principally and diffinctively reft with the Gentlemen by whom they were drawn up; though there

[xxii]

can be no doubt, but that fome of them were prepared in confequence of his particular requeft, and might probably derive a confiderable portion of their accuracy and perfection from the hints which he had fuggefted. Befides his communications in the Philofophical Tranfactions, he wrote, in the Edinburgh Medical Effays, volume the fifth, an Account of the Succefs of the Vitrum ceratum Antimonii.

On the 14th of April, 1752, Dr. Pringle married Charlotte, the fecond daughter of Dr. Oliver, an eminent phyfician at Bath, and who had long been at the head of his profession in that city. This connection did not last long; the lady dying in the space of a few years.

Nearly about the time of his marriage, Dr. Pringle gave to the Public the first edi-7 tion

[xxiii]

tion of his ' Obfervations on the Difeafes ' of the Army.' It was reprinted, in the year following, with fome additions. To the third edition, which was greatly improved from the farther experience the Author had gained by attending the camps, for three feafons, in England, an Appendix was annexed, in anfwer to fome remarks that Professor De Haen, of Vienna, and M. Gaber, of Turin, had made on the Work. The like attention was paid to the improvement of the Treatife, in every fubfequent edition. From more mature reflection, from the additional experience afforded by his private practice, and from his intercourfe with the medical gentlemen who had been employed in the hofpitals abroad, in different climates, during the late war,-Dr. Pringle had an opportunity of expreffing, with greater confidence, fome of his former observations; and of omitting others, which he had advanced withb4. out

out fufficient foundation. The work is divided into three parts; the first of which, being principally hiftorical, may be read with pleafure by every gentleman. The latter parts lie more within the province of phyficians. They alone are the beft judges of the merit of the performance; and to its merit the most decifive and ample testimonies have been given. It hath gone through feven editions at home; and, abroad, it has been translated into the French, the German, and the Italian languages. Scarcely any medical writer hath mentioned it, without fome tribute of applaufe. Ludwig, in the fecond volume of his ' Commentarii · de Rebus in Scientia Naturali et Medicina geftis,' fpeaks of it highly; and gives an account of it, which comprehends fixteen pages. The celebrated and eminent Baron Van Haller, in his Bibliotheca Anatomica *, with a particular reference to the

* Tom. ii. p. 235.

treatife
[xxy]

treatife we are fpeaking of, ftiles the author ⁶ Vir illustris—de omnibus bonis artibus ⁶ benè meritus.'

It would be eafy to produce a number of encomiums of a fimilar kind; but it is the lefs neceffary to multiply them, as the excellence of Dr. Pringle's Work is fo generally acknowledged. It is allowed to be a claffical book in the phyfical line; and that it hath placed the Writer of it in a rank with the famous Sydenham. Like Sydenham, too, he hath become eminent, not by the quantity, but the value of his productions; and hath afforded a happy inftance of the great and deferved fame, which may fometimes arife from a fingle performance. If it would not carry us too far out of our way, it might be an amufing speculation, to confider the different paths which great men have purfued in their literary courfe; and how happily fome few, both 6

[xxvi]

both among the ancients and the moderns, have attained a high degree of glory, by only one, or, at leaft, a fmall number of compositions.

The reputation that Dr. Pringle gained by his '. Obfervations on the Difeafes of ' the Army,' was not of a kind which is ever likely to diminish. He was happy in the choice of his fubject, which, though it ought long ago to have been completely handled, had fcarcely hitherto been touched upon; and, though improvements will, no doubt, be made, and perhaps have been made, in the course of practice, as medical knowledge becomes more and more cultivated, the Work will always be held in efteem, as having been founded on the folid bafis of experience, and not of theory. Its fate will be very different from that of many fyftems, which, though they have raifed the fabricators of them to a great

[xxvii]

great temporary celebrity, have fpeedily funk into oblivion, if not into contempt. Various inftances might be mentioned of perfons, whofe hypothefes, notwithftanding their having been the applaufe and wonder of their day, are now, if not forgotten, totally difregarded. But we have no defign of exalting our Author by other men's difgrace.

The utility of Dr. Pringle's Treatife was of ftill greater importance than its reputation. From the time that he was appointed a Phyfician to the Army, it feems to have been his grand object, to leffen, as far as lay in his power, the calamities of war: nor was he without confiderable fuccefs in his noble and benevolent defign. It cannot be doubted, but that the treatment he hath recommended, from his own obfervation and experience, hath been adopted by the able and judicious practitioners who have fucceeded

[xxviii]

fucceeded him; and that hence many lives have been preferved, which would otherwife have been loft to the community.

The benefits which may be derived from our Author's Obfervations on the Difeafes of the Army, are not folely confined to gentlemen of the medical profession. Commanders may learn from them, and efpecially from the concluding chapter of the fecond part of the Treatife, to determine, with fome degree of certainty, what force may, at any time, be relied upon for fervice; the effects of fhort or long campaigns upon the health of the foldiers; the difference between taking the field early, and going late into winter quarters; with other calculations, founded upon fuch materials as are furnished by war. General Melville, a gentleman who unites with his military abilities, the fpirit of philosophy, and the spirit of humanity, was enabled, when Governor Governor of the Neutral Islands, to be fingularly ufeful, in confequence of the inftructions he had received from Dr. Pringle's book, and from perfonal conversation with him. By taking care to have his men always lodged in large, open, and airy apartments; and by rapidly fhifting their quarters from the low, damp, and marshy parts of the country, to the dry and hilly grounds, fo as never to let his forces remain long enough in the fwampy places, to be injured by the noxious air of fuch places, the General was the happy inftrument of faving the lives of feven hundred foldiers. A more honourable teftimony cannot be given to the utility of the principles and rules which had been laid down by our Author.

In 1753, Dr. Pringle was chosen one of the Council of the Royal Society. Though he had not, for some years, been called abroad,

-

abroad, he still held his place of Physician to the Army; and, in the war that began in 1755, attended the camps, in England, during three feafons. This enabled him, from farther experience, to correct fome of his former obfervations, and to give additional perfection to the third edition of his great Work. In 1758, he entirely quitted the fervice of the Army; and being now determined to fix wholly in London, he was admitted a Licentiate of the College of Phyficians, on the fifth of July, in the fame year. The reafon why this matter was fo long delayed, might probably be, his not having hitherto come to a final refolution, with regard to his fettlement in the Metropolis.

After the acceffion of King George the Third to the throne of Great Britain, Dr. Pringle was appointed, in 1761, Phyfician to the Queen's Houfehold; and this honour nour was fucceeded, by his being conftituted, in 1763, Phyfician Extraordinary to her Majefty. On the twelfth of April, in the fame year, he had been chosen a Member of the Academy of Sciences at Haarlem; and, on the twenty-fifth of June following, he was elected a Fellow of the Royal College of Phyficians, London. In the fucceeding November, he was returned on the ballot, a fecond time, one of the Council of the Royal Society; and, in 1764, on the decease of Dr. Wollaston, he was made Phyfician in Ordinary to the Queen. On the thirteenth of February 1766, he was elected a foreign member, in the phyfical line*, of the Royal Society of Sciences at Goettingen; and, on the fifth of June, in that year, his Majefty was graciously pleafed to teftify his fenfe of Dr. Pringle's abilities and merit, by raifing him to the dignity of a Baronet of Great Britain.

* Collega exterus Classis Phylicæ.

On

[xxxii]

On the eighteenth of July 1768, Sir John Pringle was appointed Phyfician in Ordinary to her late Royal Highnefs the Princefs Dowager of Wales; to which office a falary was annexed of one hundred pounds a year. In 1770, he was chofen, a third time, into the Council of the Royal Society; as he was, likewife, a fourth time, for the year 1772. Upon the thirtieth of November, in that year, in confequence of the death of James Weft Efquire *, he was elected

* James Weft Efq. had fucceeded the Earl of Morton, as Prefident of the Society. He was the fon of Richard Weft Efquire; and is underftood to have been defcended from Thomas Weft, Lord Delawar, who lived in the reign of King James the Firft. Mr. James Weft was educated at Baliol College, Oxford; where he was admitted to the degree of Mafter of Arts, on the twenty-third of June, 1726. In 1741, he was chosen Representative of the Borough of St. Albans; which borough he continued to ferve, during feveral parliaments. Being appointed one of the Joint Secretaries of the Treasfury, he remained in that office many years; having held it till 1762. When, in 1765, his old friend and patron, the Duke of Newcasftle,

[xxxiii]

elected prefident of that illustrious and learned Body. His election to this high station, though he had so respectable a

caftle, reverted to fome degree of power, by being conflituted, during the fhort period of the Rockingham administration, Lord Privy Seal, his Grace obtained for him an annual penfion of two thousand pounds. Mr. Weft was an early member of the Society of Antiquaries, and at length one of its Vice-Prefidents. Having been chosen a Fellow of the Royal Society, he became, in a course of time, Treasurer to that Body; and, at laft, as we have already feen, was raifed to the Chair. Though he was a man of general learning, we do not recollect that he was eminently diftinguished by his acquaintance with Philofophical or Natural Knowledge. It admits of no doubt, that, in this respect, he was greatly excelled by most of the Prefidents who went before him, and by those who were his fucceffors. As a Collector, he had great merit. He had a large and valuable collection of manufcripts relative to the Hiftory of England, which was fold, after his decease, to the Earl of Shelburne. His books, his prints and drawings, his coins and medals, his pictures, and other mifcellaneous articles and curiolities, were all of them disposed of by auction, in 1773: and the fale of the whole employed fifty-five days. Mr. West died on the second of July, 1772. (Nichols's Anecdotes of Mr. Bowyer, p. 101, 102.)

character,

[xxxiv]

character, as the late Sir James Porter, for his opponent, was carried by a very confiderable majority. This was undoubtedly the higheft honour that Sir John Pringle ever received; an honour with which his other literary diffinctions could not be compared. He was fully fenfible of the eminent mark of efteem which the Royal Society had conferred upon him; and he was, at the fame time, deeply convinced, that his new fituation was not only a fituation of dignity, but of the greateft truft and importance. Accordingly, it was his determination to difcharge the duties of it with all the attention, affiduity, and zeal, of which he was capable.

It was at a very aufpicious time that Sir John Pringle was called upon to prefide over the Royal Society. A wonderful ardour for philofophical fcience, and for the advancement

[xxxv]

ment of Natural Knowledge, had, of late years, difplayed itfelf through Europe, and had appeared with particular advantage in our own country. Britons, to fay the leaft of them, had had their full fhare in the difcoveries of magnetifm and electricity, in botanical enquiries and refearches, and in the pursuit of other important objects. The fpirit of experimental investigation into every part and property of Nature, was high; and nothing could be more agreeable to the genius of Sir John Pringle, than to cherish such a spirit. He endeavoured to do it by all the methods that were in his power; and he happily ftruck upon a new way to diffinction and ufefulnefs, by the difcourfes which were delivered by him on the annual affignment of Sir Godfrey Copley's Medal.

This gentleman had originally bequeathed five guineas, to be given, at each annic 2 verfary

[xxxvi]

verfary meeting of the Royal Society, L the determination of the Prefident an Council, to the perfon who had been the author of the best Paper of Experimental Obfervations for the year paft. In procef of time, this pecuniary reward, which could never be an important confideration to a man of an enlarged and philosophical mind, however narrow his circumftances might be, was changed into the more liberal form of a gold medal; in which form it is become a truly honourable mark of diffinction, and a just and laudable object of ambition. It was, no doubt, always ufual with the Prefident, on the delivery of the Medal, to pay fome compliment to the gentleman on whom it was bestowed; but the cuftom of making a fet fpeech on the occafion, and of entering into the hiftory of that part of philosophy to which the experiments related, was first introduced by Mr. Martin Folkes. The Difcourfes, however,

2

[xxxvii]

ever, which he and his fucceffors delivered, were very fhort, and were only inferted in the minute-books of the Society. None of them had ever been printed before Sir John Pringle was raifed to the Chair. The firft fpeech that was made by him being much more elaborate and extended than ufual, the publication of it was defired; and with this requeft it is faid that he was the more ready to comply, as an abfurd account of what he had delivered had appeared in a newfpaper.

Sir John Pringle was very happy in the fubject of his primary Difcourfe. The difcoveries in magnetifm and electricity had been fucceeded by the enquiries into the various fpecies of air. In thefe enquiries, Dr. Prieftley, who had already greatly diftinguifhed himfelf by his electrical experiments, and his other philofophical purfuits and labours, took the principal lead. A c 3 Paper

[xxxviii]

Paper of his, entitled, ' Obfervations on ' different Kinds of Air,' having been read before the Society in March 1772, was adjudged to be deferving of the Gold Medal; and Sir John Pringle embraced with pleafure the occafion of celebrating the important communications of his Friend, and of relating, with accuracy and fidelity, what had previoufly been difcovered upon the fubject. At the close of the speech, he earneftly requefted Dr. Prieftley to continue his liberal and valuable enquiries; and we need not fay how eminently he hath fulfilled this requeft. The aftonishing difcoveries he hath fince made, and is ftill making, have fet his name far above all praise.

It was not, we believe, intended, when Sir John Pringle's first speech was printed, that the example should be followed : but the fecond Discourse was so well received by

[xxxix]

by the Royal Society, that the publication of it was unanimoufly requefted. Both the Difcourfe itfelf, and the fubject on which it was delivered, merited fuch a diffinction. The composition of the fecond speech is evidently superior to that of the former one; Sir John having probably been animated by the favourable reception of his first effort. His account of the Torpedo, and of Mr. Walsh's ingenious and admirable experiments relative to the electrical properties of that extraordinary fifh, is fingularly curious. The whole Difcourfe abounds with ancient and modern learning, and exhibits Sir John Pringle's knowledge in Natural Hiftory, as well as in Medicine, to great advantage.

The third time that he was called upon to difplay his abilities at the delivery of Sir Godfrey Copley's Medal, was on an eminently beautiful and important occasion.

c 4

This

This was no lefs than Mr. (now Dr.) Mafkelyne's fuccefsful attempt completely to eftablish Sir Isaac Newton's system of the universe, by his ' Observations made on the Mountain Schehallien, for finding its Attraction.' Sir John Pringle laid hold of this opportunity to give a perfpicuous and accurate relation of the feveral hypothefes of the ancients, with regard to the revolutions of the heavenly bodies, and of the noble difcoveries with which Copernicus enriched the aftronomical world. He then traces the progrefs of the grand principle of Gravitation, down to Sir Ifaac's illustrious confirmation of it; to which he adds a concife narrative of Meffrs. Bouguer's and Condamine's experiment at Chimboraco, and of Mr. Maskelyne's at Schehallien. If any doubts still remained, with respect to the truth of the Newtonian Syftem, they are now totally removed. Dr. Maskelyne, who has otherwise largely contributed

[xli]

tributed to the advancement of philosophical science, hath had the singular honour of establishing so firmly the doctrine of universal attraction by this finishing step of analysis, that the most scrupulous can no longer hesitate to embrace a principle that gives life to astronomy, by accounting for the various motions and appearances of the hosts of heaven.

Sir John Pringle had reafon to be peculiarly fatisfied with the fubject of his fourth Difcourfe; that fubject being perfectly congenial to his difposition and ftudies. His own life had been much employed in pointing out the means which tended not only to cure, but to prevent, the difeafes of mankind; and it is probable, from his intimate friendship with Captain Cook, that he might fuggest to that fagacious commander fome of the rules which he followed, in order to preferve the health of the crew crew of his Majefty's fhip the Refolution, during her voyage round the world. Whether this was the cafe, or whether the method purfued by the Captain, to attain fo falutary an end, was the refult alone of his own reflections, the fuccess of it was aftonifhing. Captain Cook, with a company of an hundred and eighteen men, performed a voyage of three years and eighteen days, throughout all the climates, from fifty-two degrees North to feventy-one degrees South, with the lofs of only one man by ficknefs. By precautions equally wife and fimple, he rendered the circumnavigation of the globe, fo far as health is concerned, quite a harmless object. It is no wonder that Sir John Pringle fhould celebrate, with affection, the conduct of his friend; who, befides his admirable fkill in preferving the lives and health of his failors, had not only difcovered, but furveyed, vaft tracts of new coafts; had difpelled the illufion

[xliii]

illusion of a Terra Australis Incognita, and fixed the bounds of the habitable earth, as well as those of the navigable ocean, in the Southern hemifphere. Indeed, no one could be more justly entitled to applaufe than that man, who, independently of his other claims to diffinction, had been able, by the practice of a few plain rules, refulting from the union of good fenfe, humanity, and experience, to render himfelf an eminent benefactor to his fellow-creatures. Captain Cook was not prefent to receive the honour of the Gold Medal. He was gone out upon the voyage from which he never returned. In this laft voyage, he was equally fuccefsful in maintaining the health of his men; and he determined the point, which had fo long been contefted, whether there is a practicable North-Weft paffage from Europe to the East Indies. But though, in these respects, he attained the objects he had in view, it must ever be reflected reflected upon with regret, that, in an unfortunate quarrel with the inhabitants of a remote ifland, the world was deprived of this great navigator, whofe excellence and fame will be transmitted to the latest posterity.

Sir John Pringle, in his next annual differtation, had an opportunity of displaying his knowledge in a way in which it had not hitherto appeared. The Discourse took its rife from the Prize Medal's being adjudged to Mr. Mudge, then an eminent furgeon at Plymouth, upon account of his valuable Paper, containing directions for making the beft composition for the metals of reflecting telescopes, together with a defcription of the process for grinding, polifiing, and giving the great fpeculum the true parabolic form. Sir John hath accurately related a variety of particulars, concerning the invention of reflecting tele-, fcopes,

fcopes, the fubfequent improvements of these instruments, and the state in which Mr. Mudge found them, when he first fet about working them to a greater perfection, till he had truly realized the expectation of Sir Ifaac Newton, who, above an hundred years ago, prefaged that the Public would one day poffess a parabolic fpeculum, not accomplifhed by mathematical rules, but by mechanical devices. From this narration our Author naturally rifes, in his thoughts, to the wonders that aftronomy prefents to our view, and to the admirable advantages which philosophical science hath derived from the methods that have been purfued for enlarging the powers of vision.

It is impoffible to pass over the fubject before us, without reflecting on the great accession which has been made to astronomical knowledge, and the honour of the Society, fince Sir John Pringle was Prefident.

[xlvi]

dent. Every reader will immediately underftand that I refer to the communications of Mr. Herfchel; who hath carried the magnifying power of telefcopes to a height far beyond what had hitherto been expected; who hath brought to light a large number of double and triple ftars; and who hath not only difcovered, but afcertained without controverfy, the exiftence of a new primary planet, beyond the orbit of Saturn, in the Solar Syftem; to which, in honour of his Royal Patron and Benefactor, he hath given the appellation of the *Georgium Sidus*.

Sir John Pringle's fixth Difcourfe, to which he was led by the affigument of the Gold Medal to Mr. (now Dr.) Hutton, on account of his curious Paper, entitled, ' The Force of fired Gun-powder, and ' the initial velocity of Cannon-balls, de-I ' termined

[xlvii]

' termined by Experiments,' was on the theory of Gunnery. Though Sir John had fo long attended the army, this was probably a fubject to which he had heretofore paid very little attention. We cannot, however, help admiring with what perfpicuity and judgment he hath flated the progress that was made, from time to time, in the knowledge of Projectiles, and the fcientific perfection to which his friend, Mr. Hutton, had carried this knowledge. As Sir John Pringle was not one of those who delighted in war, and in the shedding of human blood, he was happy in being able to fhew, that even the fludy of Artillery might be useful to mankind; and, therefore, this is a topic which he hath not forgotten to mention.

Here ended our Author's Difcourfes upon the delivery of Sir Godfrey Copley's Medal. If he had continued to prefide in the

[xlviii]

the Chair of the Royal Society, he would, no doubt, have found other occasions of difplaying his acquaintance with the hiftory of philosophy. But the opportunities which he had of fignalizing himfelf in this refpect, were important in themfelves, happily varied, and fufficient to gain him a folid and lafting reputation. Perhaps it would not be defirable that publications of fuch a nature fhould be very numerous; fince, by that means, they might lofe, by degrees, their novelty, their utility, and their acceptance. We do not, therefore, think that, in this particular view, Sir John Pringle ought to be confidered as a model to his fucceffors. It is beft that each Prefident should diftinguish himself in that way which is peculiarly fuited to his own purfuits and ftudies; for thus, every valuable object being regarded in its turn, the honour of the Society, and the interefts of philosophical and natural knowledge,

[xlix]

knowledge, will most effectually be pro-

The merit of the Papers that were communicated to the Royal Society, whilft Sir John Pringle prefided over it, was not confined to those alone which were honoured with the affignment of the Gold Medal. Many of the Members diftinguished themfelves in the fame period, as is evident from a furvey of the 'Transactions; and many names might be mentioned with applause: but it would carry us far out of our way to fpecify all of them; and it would be too delicate a tafk, to fingle out fome few, to the exclusion of others.' Indeed, the profperous fate in which the Royal Society has long fubfifted, and in which it continues to fubfift, must be reflected upon with pleafure by every lover of philosophical science.

Several

d

[1]

Several marks of literary diffinction, as we have already feen, had been conferred upon Sir John Pringle, before he was raifed to the Prefident's Chair. But, after that event, they were beftowed upon him in great abundance: and, not again to refume the fubject, I fhall here collect them together.

Previoufly, however, to thefe honours (excepting his having been chofen a Fellow of the Society of Antiquaries, London), he received the laft promotion that was given him in his medical capacity; which was, his being appointed, on the fourteenth of November, 1774, Phyfician Extraordinary to his Majefty. In the year 1776, he was enrolled in the lift of the members of no lefs than four learned Bodies. Thefe were, the Royal Academy of Sciences at Madrid; the Society, at Amfterdam, for the Promotion of Agriculture; the Royal Academy Academy of Medical Correspondence at Paris; and the Imperial Academy of Sciences at St. Petersburgh. The times of Sir John Pringle's election into these eminent focieties, according to the order in which I have mentioned them, were on the twelfth of February, in the month of September, and on the twenty-eighth and twenty-ninth of December. Upon the last occasion, he was honoured with the following Letter from Monsieur Euler; which hath been felected, out of many others of a similar nature, as an evidence of the regard and esteem wherein he was held by eminent foreigners.

' Monsieur,

L'Academie Imperiale des Sciences
vient de vous recevoir au nombre
des fes Affociés étrangers, elle a voulù
vous donner par là, Monfieur, un téd 2 ' moignage [III]

⁶ moignage public du grand cas qu'elle fait ' déja dépuis long tems des vos travaux, et ' que vous meritez à tant de titres. (Signed) 'JEAN ALBERT EULER*.' St. Peterfburgh, Jan. 10, 1777.

On

* SIR,

THE Imperial Academy of Sciences, being defirous of giving a public teftimony of the high efteem which it has for your learned labours, and of ' its fenfe of your fervices to the republic of letters, ' hath admitted you into the number of its foreign · Members. Your reception into this Body has alfo · been diftinguished by one circumstance, too remark-· able, and too honourable for you, to escape observa-' tion. Your admiffion was publicly announced on a · day of peculiar folemnity; on the day in which the · Academy celebrated its first jubilee, on account of ⁵ its having fublifted half a century; and, at the fame ' time, when the Academy had the honour of re-⁶ ceiving into the number of its Members his Majefty ' the King of Pruffia, and his Imperial Highnefs the · Grand Duke.

• I am extremely happy, Sir, to be appointed to • communicate to you this information; and gladly d 3 • embrace

[liv]

On the fifth of July, 1777, Sir John Pringle was nominated, by his Serene Highness the Landgrave of Hesse, an honorary Member of the Society of Antiquaries at Caffel. In 1778, he fucceeded the celebrated Linnæus, as one of the foreign Members of the Royal Academy of Sciences at Paris. This honour is extended by that illustrious Body only to eight perfons, on which account it is juftly effeemed a most eminent mark of distinction; and we believe there have been few. or no inftances, wherein it hath been conferred on any other than men of great and acknowledged abilities and reputation. On the eleventh of October, in the fame year, our Author was chofen a Member of the Medical Society at Hanau. In the fucceed-

cmbrace this favourable opportunity of expressing
those fentiments of the most perfect regard, with
which I have the honour to be, Sir,

St Peterhurgh	Your &c.
Ian. 10, 1777.	JEAN ALBERT EULER.
3 and 1 - 3 - 1111	<i></i>

ing

ing year, on the twenty-ninth of March, he was elected a foreign Member of the Royal Academy of Sciences and Belles Lettres at Naples. The laft teftimony of refpect which was, in this way, beftowed upon Sir John Pringle, was his being admitted, in 1781, into the number of the Fellows of the newly erected Society of Antiquaries at Edinburgh. The particular defign of the Society is to inveftigate the Hiftory and Antiquities of Scotland: and, from the known characters and literature of the gentlemen who compose it, there can be little doubt, but that the end they have in view will fuccefsfully be accomplifhed. Of this there is the greater reafon to be confident, as I understand, with pleafure, that the deftruction of the Scottifh records, by the cruel policy of king Edward the First, was not fo universal, or fo general, as hath commonly been fuppofed.

d 4

It

[lvi]

It was at a late period of life, when Sir John Pringle was in the fixty-fixth year of his age, that he was chosen to be Prefident of the Royal Society. Confidering, therefore, the extreme attention that was paid by him to the various and important duties of his office, and the great pains he took in the preparation of his Difcourfes, it was natural to expect that the burthen of his honourable station should grow heavy upon him in a course of time. This burthen was increased not only by the weight of years, but by the accident of a fall in the area of the back part of his house, from which he received confiderable hurt, and which, in its confequences, affected his health, and weakened his fpirits. Such being the flate of his body and mind, he began to entertain thoughts of refigning the Prefident's Chair. It hath been faid likewife, and believed, that he was much hurt by the difputes introduced into the Society,

[lvii]

Society, concerning the question, whether pointed or blunted electrical conductors are the most efficacious in preferving buildings from the pernicious effects of lightning. Of this matter the prefent Writer of his Life can affert nothing from perfonal knowledge : for though he was then in the habit of a strict intimacy with Sir John Pringle, he never heard from him any fuggeftion of the kind that has been mentioned. Perhaps Sir John Pringle's declining years, and the general flate of his health, will form fufficient reafons for his refignation. His intention, however, was difagreeable to many of his friends, and to many diffinguished Members of the Royal Society. Accordingly, they earneftly folicited him to continue in the Chair; but, his refolution being fixed, he refigned it at the Anniverfary Meeting in 1778. Jofeph Banks Efq. (now Sir Jofeph Banks, Bart.) was unanimoufly elected Prefident in his room;

[lviii]

room; a gentleman in the prime and vigour of his life, who had eminently diftinguifhed himfelf by his acquaintance with Natural Hiftory; who had failed round the globe, and performed other voyages, in purfuit of that branch of fcience; who is preparing, at an immenfe expence and labour, the nobleft and moft fplendid botanical Work, which hath ever been prefented to the Public; and who hath amply juftified the choice that was made of him, by his attention to every part of his duty, and his affiduous concern to promote the intereft and honour of the Society.

Though Sir John Pringle quitted his particular relation to the Royal Society, and did not attend its meetings fo conftantly as he had formerly done, he ftill retained his literary connections in general. His houfe continued to be the refort of ingenious

[lix]

ingenious and philosophical men, whether of his own country, or from abroad; and he was frequent in his vifits to his friends. He was held in particular efteem by eminent and learned foreigners, none of whom came to England without waiting upon him, and paying him the greateft refpect. He treated them, in return, with diftinguifhed civility and regard. When a number of gentlemen met at his table, foreigners were usually a part of the company; and it would have been an uncommon thing not to have feen fome of them at his Sunday evening conversations. I remember well, that, one night, the perfons prefent, being eight in number, were each of them of a different nation; if Sir John Pringle, a Scotchman, and myfelf, an Englishman, could be fo confidered. The fix others confifted of a Dutchman, a German, a Frenchman, a Spaniard, an Italian, and a Ruffian. Though we were thus diverlified

verfified in country, education, modes of life, and principles of religion, no obftructions hence arofe to mutual harmony, pleafure, and improvement.

Sir John Pringle's infirmities increasing, he hoped that he might receive an advantage from an excursion to Scotland, and fpending the fummer there; which he did in the year 1780, and principally at Edinburgh. He had probably then formed fome defign of fixing his refidence in that city. However this may have been, he was fo well pleafed with a place to which he had been habituated in his younger days, and with the respect shewn him by his friends, that he purchased a house there, whither he intended to return in the following fpring. When he came back to London, in the Autumn of the year above mentioned, he fet about preparing to put his fcheme in execution. Accordingly, having
[lxi]

having first disposed of the greatest part of his library, he fold his house in Pall-Mall, in April, 1781, and fome few days after removed to Edinburgh. In this city he was treated, by perfons of all ranks, with every mark of diffinc-But Edinburgh was not now to tion. him what it had been in early life. The vivacity of fpirits, which, in the days of youth, fpreads fuch a charm on the objects that furround us, was fled. Many, if not moft, of Sir John Pringle's old friends and contemporaries, were dead; and, though fome of them remained, they could not meet together with the fame ftrength of conftitution, the fame ardour of purfuit, the fame animation of hope, which they had formerly poffeffed. The younger men of eminence paid him the fincerest testimonics of efteem and regard; but it was too late in life for him to form new habits of close and intimate friendship. He found, likewife,

[lxii]

wife, the air of Edinburgh too fharp and cold for his frame, which had long been peculiarly fenfible to the feverities of weather. Thefe evils were exaggerated by his increafing infirmities, and, perhaps, by that reftleffnefs of mind, which, in the midft of bodily complaints, is ftill hoping to derive fome benefit from a change of place. He determined, therefore, to return once more to London, where he arrived in the beginning of September.

Before Sir John Pringle entirely quitted Edinburgh, he requefted his friend, Dr. John Hope, to prefent ten volumes, folio, of Medical and Phyfical Obfervations, in manufcript, to the Royal College of Phyficians in that city. This benefaction was conferred on two conditions; first, that the Obfervations should not be published; and fecondly, that they should not be lent out of the library on any pretence whatever.

[lxiii]

ever. A meeting of the College being fummoned upon the occafion, Sir John's donation was accepted with much gratitude; and a refolution paffed to comply with the terms on which it was beftowed. He was, at the fame time, preparing two other volumes to be given to the Univerfity, containing the formulas referred to in his annotations.

Sir John Pringle, upon his arrival at the Metropolis, found his fpirits fomewhat revived. He was greatly pleafed with revifiting his London friends; and he was received by them with equal cordiality and affection. His Sunday evening converfutions were honoured with the attendance of many refpectable men; and, on the other nights of the week, he had the pleafure of fpending a couple of hours with fuch friends as Lord Charles Cavendifh, Mr. Cavendifh, the Bifhop of Exe-2

[Ixiv]

ter (Dr. Rofs), Dr. Heberden, Dr. Watfon, Sir George Baker, Dr. Richard Saunders, Peter Holford Efquire, Ifrael Mauduit Efquire, and occafionally a few gentlemen befides. This was at a Society that had long been eftablished, of which Sir John Pringle had been many years a Member; and which had met, for fome time paft, at Mr. Watfon's, a grocer, in the Strand. Sir John's connection with this Society, and his conftant attendance upon it, formed, to the last, one of his principal entertainments. The morning was chiefly employed by him in receiving and returning the vifits of his various acquaintance; and he had frequently a fmall and felect party to dine with him, at his apartments in King's Street, St. James's Square. All this while, his ftrength declined with a rapidity which did not permit his friends to hope that his life would long be continued. On Monday evening, the fourteenth

[lxv]

folirteenth of January; 1782, being with the fociety at Watfon's, he was feized with a fit, from which he never recovered. He was accompanied home by Dr. Saunders, for whom he had the higheft regard, and in whom he had, in every refpect, juftly placed the most unreferved confidence. The Doctor afterwards attended him with unwearied affiduity, but, to any medical purpofe, entirely in vain; for he departed this life on the Friday following, being the eighteenth day of the month, in the feventy-fifth year of his age; and the account of his death was every where received, in a manner which shewed the high fense that was entertained of his merit. On the feventh of February, he was interred in St. James's church, with great funeral folemnity, and with a very honourable attendance of eminent and respectable friends. As a testimony of regard to his memory, at the first meeting of the College of Phyficians at Edinburgh C

[lxvi]

Edinburgh after his decease, all the Members appeared in deep mourning.

Sir John Pringle, by long practice, had acquired a handfome fortune, which he difpoled of with great prudence and propriety. The bulk of it, as might naturally and reafonably be expected, he bequeathed to his worthy nephew and heir, Sir James Pringle, of Stichel, Bart. whom he appointed his fole executor. But the whole was not immediately to come to Sir James; for a fum equal, I believe, to feven hundred pounds a-year, was appropriated to annuities, revertible to that gentleman, at the decease of the annuitants. By this means, Sir John exhibited an important proof of his regard and affection for feveral of his valuable relations. He provided, likewife, for two fervants, who had lived with him a confiderable time; and he left legacies to fome particular friends, among whom

[Ixvii]

whom the Writer of this Life had the honour of receiving a teftimony of his remembrance and effect.

Sir John Pringle's eminent character as a practical physician, as well as a medical author, is fo well known, and fo univerfally acknowledged, that an enlargement upon it cannot be neceffary. He was diftinguished, in this respect, by his attention and fagacity. For the recovery of his patients he was anxioufly concerned; and his anxiety might, perhaps, be increased from his conviction, that the art of Physic, though eminently useful, must ever, from unavoidable caufes, be attended with a certain degree of uncertainty. His care was rewarded with much fuccefs in the courfe of his practice. In the exercise of his profession, he was not rapacious; being ready, on various occafions, to give his advice without pecuniary views. This he

C 2

never

[lxviii]

never denied to the poor; and, from many of his friends in better circumstances, and who were well able to afford the cuftomary gratifications, he refused to accept of fees.

The turn of Sir John Pringle's mind led him chiefly to the love of fcience, which he built on the firm bafis of fact. With regard to philofophy in general, he was as averfe to theory, unsupported by experiments, as he was with respect to medicine in particular. Lord Bacon was his favourite author; and to the method of investigation, recommended by that great man, he fteadily adhered. Such being his intellectual character, it will not be thought furprifing, that he had a diflike to Plato. The fpeculations of that fublime and ingenious, that elegant and beautiful, but at the fame time fanciful writer, were by no means fuited to the fober spirit of enquiry cultivated by Sir John

[lxix]

John Pringle. Indeed, whatever attention he might have paid, in his earlier days, and when he was Profeffor of Ethics at Edinburgh, to metaphyfical difquifitions, he loft all regard for them in the latter part of his life; and, though fome of his moft valued friends had engaged in difcuffions of this kind, with very different views of things*, he did not choofe to revert to the fludies of his youth, but contented himfelf with the opinions he had then formed.

I fhall not conceal from my readers, that Sir John Pringle had not much fondnefs for poetry †. He had not even any diftinguifhed

* Dr. Price, Dr. Priestley, and Lord Monboddo.

+ That he was, however, himfelf the fubject of poetical commendation, will appear from the following fhort Latin Ode, which was addreffed to him, in 1753, by Dr. Theobald:

Ode

[lxx]

guished relish for the immortal Shakspeare; at least, he had too high a fensibility of the defects of that illustrious Bard, to give him the proper degree of estimation. The Writer of this account, who is one of the warmest admirers of our great Dramatist and Master of human nature, cannot men-

tion

[lxxi]

tion it in commendation of his Friend, that he was defective in poetical tafte; but he thinks it proper to be recorded, from a regard to truth, and to flate a fact which indicates the diverfity there is in the underftandings, purfuits, and feelings of the ableft men. The mind of Sir John Pringle was too clofely occupied by philofophical enquiries, to have much leifure or inclination for attending to the operations of the imagination. Whether this be confidered as a defect in him or not, it was certainly a lofs in point of real pleafure. A relifh for poetry, and for those other compolitions by which the fancy is amufed, affords a delightful relaxation, after more fevere investigations. It tends to produce a cheerfulnefs and hilarity of fpirits, which may poffibly not a little contribute to health, as well as to entertainment. Studies of this nature not only adolescentiam alunt, but fencetutem

e 4

[lxxii]

feuectutem oblectant. Nay, old age may derive a particular advantage from them, as they are calculated, by furnishing agreeable and lively pictures to the imagination, to foothe the infirmities, and lighten the burdens, of that period.

Sir John Pringle had not, in his youth, been neglectful of philological enquiries; and, after having omitted them for a time, he returned to them again; fo far, at leaft, as to endeavour to obtain a more exact knowledge of the Greek tongue, probably with a view to a better understanding of the New Teftament. He paid a great attention to the French language; and it is faid, that he was fond of Voltaire's critical writings. How far this might contribute to the honour of Sir John's tafte, I shall not decide. However just that eminent Frenchman's obfervations may have been on some subjects of criticism, the truly ingenious

[lxxiii]

ingenious and excellent Mrs. Montagu hath amply fhewn, that he was abfolutely unequal to the tafk of determining concerning the merit of Shakfpeare. Among all his other purfuits, Sir John Pringle never forgot the ftudy of the Englifh language. This he regarded as a matter of fo much confequence, that he took uncommon pains with refpect to the ftyle of his compofitions; and it cannot be denied, that he excels in perfpicuity, correctnefs, and propriety of expreffion.

Though our Author was not fond of Poetry, there was a fifter art for which he had a great affection, and that was Mufic. Of this art he was not merely an admirer, but became fo far a practitioner in it, as to be a performer on the violincello, at a weekly concert, given by a fociety of gentlemen at Edinburgh. Mufic, if not too eagerly purfued, or permitted to engrofs an undue

[lxxiv]

undue proportion of time, is a fine relief to the mind of a literary man. It is often neglected, as perfons advance in years; and this, I believe, was the cafe with my Friend.

Befides a close application to medical and philofophical fcience, Sir John Pringle, during the latter part of his life, devoted much time to the fludy of divinity. This was with him a very favourite and interesting object. He read many commentators on Scripture, and efpecially on the New Testament, of which he was anxious to obtain an exact and critical knowledge. In this purfuit, the learned and judicious Bifhop Pearce's Commentary and Notes gave him particular pleafure, and were greatly fuited to his tafte. He corresponded frequently with Michaelis on theological fubjects; and that celebrated Profeffor addreffed to him fome letters on Daniel's Prophecy

[lxxv]

Prophecy of the Seventy Weeks, which Sir John thought worthy of being publifhed in this country. Accordingly, he was at confiderable pains, and fome expence, in the publication, which appeared, in 1773, under the following title: 'Joannis Davi-' dis Michaelis, Prof. Ordin. Philof. et Soc. ' Reg. Scient. Goettingenfis Collegæ, Epif-' tolæ, de LXX Hebdomadibus Danielis, ad ' D. Joannem Pringle, Baronettum : pri-' mò privatim miffæ, nunc vero utriufque ' confenfu publicè editæ.' 8vo*.

Sir John Pringle was likewife a diligent and frequent reader of fermons; which form a valuable part of English literature. Indeed, taken in their full extent, they constitute a much more valuable part of English literature, than, perhaps, is commonly imagined. For, independently of

* Nichols's Biographical and Literary Anecdotes of William Bowyer, p. 446, 447. Ibid. p. 601.

their

[lxxvi]

their theological merit, in explaining the doctrines of Natural and Revealed Religion, and throwing light on paffages of Scripture, we fhall fearcely any where meet with a richer treafure of practical obfervation, or with reflections on life and manners, that are better calculated to improve the underftanding, mend the heart, and regulate the conduct.

If, from the intellectual, we pafs on to the moral character of Sir John Pringle, we fhall find that the ruling feature of it was integrity. By this principle he was uniformly actuated in the whole of his behaviour. All his acquaintance will with one voice agree, that there never was an honefter man. He was equally diftinguifhed by his fobriety. He told Mr. James Bofwell, that he had never in his life been intoxicated with liquor; which muft be allowed to have been a very laudable

[lxxvii]

ble proof of the circumfpection maintained by him, in the variety of company that he had kept, both at home and abroad.

In his friendships, Sir John Pringle was ardent and fleady. The intimacies which were formed by him, in the early part of his life, at Edinburgh, continued unbroken to the decease of the gentlemen with whom they were made; and were kept up by a regular correspondence, and by all the good offices that lay in his power. One of his oldeft and most particular friends, was Mr. Alexander Bofwell, afterwards Senator of the College of Juffice, by the title of Lord Auchinleck. Some unhappy differences having taken place between Lord Auchinleck, and his fon Mr. James Bofwell, the ingenious, worthy, and well-known author of the Account of Corfica, Sir John Pringle was the benevolent and fuccefsful mediator in procuring a reconciliation. In allution

[lxxviii]

allufion to this circumftance, he expressed himfelf, in a letter to Mr. James Boswell, written in 1773, in the following terms: I shall be glad to ferve you. But remember, in all cases of opposition, I shall be on the ministerial side; I mean, on that of your sather, my oldess and best friend. You may inherit after him (if I should furvive him) my first affections; but they cannot be alienated during his life.

With relation to Sir John Pringle's external manner of deportment, he paid a very refpectful attention to thofe who were honoured with his friendfhip and efteem, and to fuch ftrangers as came to him well recommended. Foreigners, in particular, had great reafon to be fatisfied with the uncommon pains which he took to fhew them every mark of civility and regard. He had, however, at times, fomewhat of a drynefs and referve in his behaviour, which

3

[lxxix]

had the appearance of coldnefs; and this was the cafe, when he was not perfectly pleafed with the perfons who were introduced to him, or who happened to be in his company. His fenfe of integrity and dignity would not permit him to adopt that falfe and fuperficial politenefs, which treats all men alike, though ever fo different in point of real effimation and merit, with the fame fhew of cordiality and kindnefs. He was above affuming the profeffions, without the reality of refpect.

Dr. Johnfon hath thought it proper to be recorded of Pope, that, when he wanted to fleep, he ' nodded in company;' and that he once flumbered at his own table, while the Prince of Wales was talking of poetry. Sir John Pringle had this infirmity, efpecially in the latter part of his life. It chiefly appeared in the evening, and admits of a very eafy and juftifiable folution. He

[1xxx]

He had for many years been fo remarkably troubled for want of reft, that there was fearcely a fingle night, in which he did not lie awake for feveral hours. He had this nocturnal wakefulnefs to a degree that rendered it a great affliction; and, therefore, it is not furprifing, that he fhould occafionally be overcome by drowfinefs. Neither can it be thought ftrange, that the fame caufe fhould have fome effect upon his fpirits. It was the principal, perhaps the fole reafon, of a certain wearifomenefs and reftleffnefs that hung about him, and which he fought to remove by changes of fituation.

On the religious character of Sir John Pringle it will be neceffary more particularly to enlarge; becaufe, fuch is the temper of the prefent age, that what is the greateft glory of any man, is often imputed to him as a weaknefs. The principles

[lxxxi]

ples of piety and virtue, which were early instilled into our Author by a strict education, do not appear ever to have loft their influence upon the general conduct of his life. Nevertheless, when he travelled abroad in the world, his belief of the Christian Revelation was fo far unsettled. that he became a fceptic with regard to it, if not a professed Deist. One cause of this, was the wrong notions he had formed concerning the genuine doctrines of the New Teftament; and it will eafily be fuppofed. that he was encouraged in his fcruples by the company he met with both in England and in foreign parts. But it was not in the difpolition of Sir John Pringle, to reft fatisfied in his doubts and difficulties, with respect to a matter of such high importance. He was too great a lover of truth, not to make Religion the object of his ferious enquiry. As he fcorned to be an implicit believer, he was equally averfe to f the

[lxxxii]

the being an implicit unbeliever; which is the cafe of large numbers, who reject Chriftianity with as little knowledge, and as little examination, as the most determined bigots embrace the abfurdeft fyftem that ever was invented. The refult of his investigation was, a full conviction of the divine original and authority of the Gofpel. The evidence of Revelation appeared to him to be folid and invincible; and the nature of it to be fuch, as demanded his warmest acceptance. What contributed entirely to remove the objections which had formerly lain upon his mind, was, his being perfectly fatisfied, that our holy religion did not contain fome doctrines which have commonly been thought to belong to it. There were three points that, in this view, appeared to him of great importance; and the removal of his difficulties, with regard to them, effaced every impreffion he might have received to the difadvantage of Chriftianity.

[lxxxiii]

ianity. He became fully convinced, by his fludy of the Scriptures, that the Athanafian doctrine of the Trinity made no part of them; but that they uniformly concurred in afferting the unity and fupremacy of the God and Father of Mankind. He was equally convinced, that they did not confine the mercy of the Supreme Being to a few, exclusively of others; and that they did not hold out any thing, with respect to the extent and duration of the future punishment of the wicked, which could in the leaft be confidered as an impeachment of the divine juffice, rectitude, and goodnefs. In thefe fentiments, he agreed with fome of the wifeft and best men the world hath ever produced, fome who have reflected the greatest honour on human na-He was another inftance of those ture. illustrious philosophers, who have not been ashamed of religion; and added another name to the catalogue of the excellent and f 2 judicious

[lxxxiv]

judicious perfons, who have gloried in being RATIONAL CHRISTIANS *.

As

* A late writer, whole chief praife ariles from the elegance and vivacity of his composition, hath treated the rational Christians with great contempt and feverity, and, I may add, with the higheft degree of injustice. (Difquisitions on several Subjects, p. 101-118.) He charges them with pretending to be Christians, without believing; a charge which I have no hefitation in afferting to be abfolutely contrary to truth. To accuse them, as he does, of want of fincerity, and to put them on a level with the Deifts, can only proceed from the groffelt ignorance, or from worfe motives; which I would not willingly impute to any gentleman of character. There are none who are more firmly perfuaded of the truth of the gofpel, none who are more clearly convinced of its divine original, none who are more entirely fatisfied with the weight and variety of its evidence, none who more fincerely rejoice in its invaluable contents, than rational Chriffians. To men of this character the world is indebted for the fulleft and ableft vindications of the Old and New Teftament, against the attacks of Infidelity. From the men of this character have proceeded those works in support of Natural and Revealed Religion, which will fland the teft of ages, and against which the efforts of Scepticism will be directed in vain. Locke and Clarke, Hoadly and Sykes, Butler and Jortin, Chandler and Foster, Leland and Lardner, 8

[lxxxv]

As Sir John Pringle was thus firmly perfuaded of the truth of the Gofpel, he lived under

Lardner, Abernethy and Duchal, together with various other names that might be mentioned, were all of them rational Chriftians. I prefume that few of the able defenders of Revelation, which this country has produced, would have chosen to be called irrational Christians. It is unfortunate for such an irrational Chriftian as the Author of the Difquifitions, that his mode of writing hath occafioned many perfons, who are ftrangers to his character, to imagine that he is an infidel in difguife, and that his defign is to expose our holy religion to contempt. For my own part, I have no doubt of the fincerity of his belief, and of the good intentions of his publications; but I think, at the fame time, that the manner in which these intentions have been displayed, is remarkably injudicious. With regard to rational Chriftians, if there be fome doctrines, that have commonly been received, to which they do not give their affent, this doth not arife from the pride of human reason, but from their firm perfuasion, that fuch doctrines are not to be found in the Scriptures. The Writer of the prefent Note can fincerely affert, that this is his own cafe. Being entirely convinced of the truth of Revelation, after a full, and, he trufts, a fair investigation of the matter, the fole object of his enquiry is, What does the Bible contain? what are the real dictates and declarations of our Lord and his apoftles? Those f 3 rational

[lxxxvi]

under its influence. He was animated with a ftrong fenfe of piety to the Supreme Being,

rational Christians, who are supposed to depart the most from the standards of faith generally established, uniformly agree in maintaining a high fenfe of the invaluable bleffings derived from the Gofpel. They are fatisfied that these bleffings were bestowed in a supernatural manner, by the God and Father of Mercies; that Jefus Chrift is the difpenfer of them; and that they confift of knowledge, pardon, purity, and everlafting happinefs. They believe that eternal life is not only revealed by our Saviour, but abfolutely afcertained by his death and refurrection. This is a point, the importance of which no words can express. With what justice, then, can any one degrade into the rank of Deifts, the men who are fully perfuaded, that · the gift of God is eternal life, through Jefus Chrift ' our Lord ?' Every man, who knows the world, must be fensible, that the far greater part of those who difcard Revealed Religion, have little or no expectation of a future state. But there is not a fingle perfon, among fuch as are called Rational Chriftians, who will not fay, with the warmeft gratitude, ' This s is the record, that God hath given to us eternal life, e and this life is in his Son."

It is an obfervation of great moment, and which, therefore, deferves to be attended to, that the believers in Christianity do not differ fo much in their fentiments

[lxxxvii]

Being, which difplayed itfelf in a regular attendance upon public worfhip, in the

ments concerning the nature and value of the bleffings derived from the Gofpel, as with refpect to fome other questions. They are all agreed, that, when mankind were ignorant and guilty, corrupt, and liable to a fentence of eternal death, the Saviour appeared, to communicate fpiritual inftruction, to beflow upon them the forgiveness of fin, to purify their hearts and regulate their conduct, and to raife them up to everlafting felicity and glory. Of the unfpeakable excellence, and immense greatness, of these benefits, Chriftians are alike fenfible, and alike afcribe them to the Revelation of Jefus, however they may vary in their opinions concerning the caules, or the effects of the caufes, which brought men into their wretched condition; and whatever ideas they may have formed concerning the dignity of the Perfon by whom the bleffings of the Gofpel are conveyed, and the peculiar operation of his fufferings. Were it, therefore, ever fo certain, that the rational Christians are mistaken in their fentiments, the charge brought against them by the Writer of the Difquifitions, would still be equally uncandid and ill-founded. He is not the only Author who has preferred against them the same accusation. Others have reprefented them'as being no better than Deifts: but fuch manifest ignorance, bigotry, and injustice, ought long ago to have been banished from this kingdom.

exercife

[lxxxviii]

exercise of private devotion, and in an endeavour to difcharge all the obligations of virtue. Such being the tenour of his life and conduct, and deriving great confolation from Christianity, as an institution of mercy, he rejoiced in a fense of the Divine favour, and in the hope of future happincfs. Neverthelefs, whether from a conftitutional timidity of temper, or from early impreffions, or from the ftate of his body, the approaches of death were met by him with fome degree of apprehenfion. This was not an apprehenfion with regard to its confequences, but a certain kind of awfulnefs with relation to the thing itfelf; a difpofition which has been experienced by many worthy perions. The wakefulnefs before mentioned, with which our Author was afflicted for fo many years, will, perhaps, fatisfactorily account for this failure of fpirits; and to the fame caufe it may be ascribed, if, in any other respect, he did not

[lxxxix]

not fuftain the infirmities of age with that full fortitude and dignity of mind, which, though always defirable, cannot, even by the beft characters, always be attained.

Sir John Pringle's literary and other connections were fo very numerous, that only a fmall part of them can here be fpecified. Several of his learned and philofophical acquaintance have already been occafionally mentioned; and if, in adding a few more names to the lift, I should be guilty of any improper omiffions, it will, I hope, be imputed to what alone it is owing, either to a want of information or recollection, or to the difficulty of choice, amidst fuch a variety of objects. In early life, our Author entered into a clofe friendfhip with the most diffinguished perfons of the city of Edinburgh; and with fome of of them he maintained a regular correfpondence *. The eminent philofopher, Maclaurin, was his intimate friend; of whofe memory he expresses himfelf, in one of his Discourses, with peculiar affection, and whom he always spoke of, in converfation, with the highest marks of esteem and regard. When he returned to Edinburgh, with the purpose of ending his days in that city, there were still living, of his old acquaintance, Dr. George Wishart, Sir Alexander Dick, Dr. Hope, Dr. Steddman,

* Sir Alexander Dick has preferved a feries of letters from Sir John Pringle, being forty-feven in number. They difplay the excellence of his character in a full light, and fhew the warmth and fteadinefs of his friendfhip. They contain, likewife, many valuable articles in Medicine and Natural Philofophy, accurately and pleafingly expreffed. His letters to Lord Auchinleck (whom he calls his firft and beft of friends), to Mr. James Bofwell, to Dr. Steddman, and other gentlemen, exhibit him in the fame advantageous point of view.

and,

[xci]

and, perhaps, fome others, of whom I have not been particularly informed. The lofs he had fuftained, in the deceafe of feveral of his former companions, was in part made up by their fons; among whom Mr. Bofwell, Mr. Wallace, Mr. Murray (then Solicitor General for Scotland, and now one of the Lords of Seffion), and Mr. Maclaurin, diftinguifhed themfelves in difplaying every proof of attachment and refpect to the man, who had been the intimate friend of each of their fathers.

Of Sir John Pringle's acquaintance in England, it would not be eafy to give a detail. Were I to attempt fuch a detail, it would include a large number of the moft worthy and eminent characters, of all profeffions. His converfation was not confined to medical gentlemen, though his 5 intercourfe

[xcii]

intercourfe with them was very great, but extended to many perfons of rank and confequence, as well as merit. He liked much to converse with the liberal-minded clergy, whether of the eftablishment, or among the Diffenters; and he was honoured with the friendship and efteem of some of the most excellent and learned prelates of the church. Among the diftinguished philofophers of the age, there were few with whom he was not clofely connected; and he had a particular intimacy with Dr. Franklin, till it was interrupted by the unfortunate public contests, which carried that celebrated man to another country, and another scene of action.

Without pretending diffinctly to fpecify Sir John Pringle's more private friends, who were numerous and highly refpectable, I must be permitted to mention Edward Mafon

[xciii]

Mafon Efq. (formerly Secretary to his Royal Highnefs William Duke of Cumberland), with whom our Author formed an acquaintance in Germany; which continued, with unbroken efteem and affection, to the end of life. To this gentleman he bequeathed a teftimony of remembrance in his laft will. For feveral years before his deceafe, there was no one in whom he placed fo unreferved a confidence, and for whom he had ftronger regard, than Dr. Richard Saunders. His fenfe of the Doctor's zealous attention and friendfhip was particularly expreffed, by leaving to him his prints and drawings.

It would be impoffible for me to do full justice to Sir John Pringle's connections with foreigners. There were no perfons who visited England, if they had any taste for philosophical science, that were not recommended

[xciv]

commended to him, and did not cultivate his acquaintance. Befides this, he correfponded with many eminent philosophers and phyficians, whom he had never feen. Whether he ever had an opportunity of being perfonally acquainted with Linnæus, Baron Van Haller, and Tiffot, I do not recollect; but he maintained an epistolary intercourfe with them, and with almost every diftinguished name in Europe, and efpecially in Germany, France, and Holland. How far, and to whom, his correfpondence extended, might have been more exactly specified, if he had not burnt all his letters before his deceafe. The celebrated Abbé Fontana, during the time of his being in England, was much in the company of Sir John Pringle: but there was no foreigner who, at the different periods of his refidence in this country, enjoyed fo great an intimacy with him as Dr. Ingenhoufz.

houfz. This gentleman was recommended by Sir John to the Empress Queen of Hungary, and to the Emperor of Germany, as a proper perfon to inoculate the Imperial and Auftrian family; in the fuccefsful performance of which, he attained to diftinguished emoluments and honours. The high fenfe which he had of his obligations to our Author, in this and in other respects, he has expressed in a very handsome dedication, prefixed to his curious ' Experi-' ments upon Vegetables.' This was not the only book dedicated to Sir John Pringle. We have already feen, that Michaelis paid him a fimilar teftimony of regard; and the fame was done by Baron Van Haller, in one of his publications. The reputation in which our Author was held abroad, was uncommonly great; and was productive of every mark of attention and esteem.

Such

[xcvi]

Such having been the character and eminence of Sir John Pringle, it was highly proper that his name fhould be recorded among the Worthies of Weftminfter Abbey. Accordingly, under the direction, and at the expence, of his Nephew and Heir, a monument is preparing, of which Mr. Nollekens is the fculptor, and for which an Englifh infeription is intended.

If it had been determined to have had a Latin infeription, there was one, written by a gentleman of the first classical knowledge and taste, which would undoubtedly have had the preference. I have obtained leave to infert it; and it gives me pleafure that I can conclude my account of Sir John Pringle with fo elegant and honourable a testimony to his memory.

SIX

DISCOURSES,

DELIVERED BY

SIR JOHN PRINGLE, BART.

BEFORE THE

ROYAL SOCIETY;

On occasion of Six Annual Affignments of SIR GODFREY COPLEY's MEDAL.

and a second second

Jacob I. Carlos de Carlos

DISCOURSE

A

ONTHE

DIFFERENT KINDS OF AIR,

DELIVERED AT THE

Anniversary Meeting of the ROYAL SOCIETY, November 30, 1773.

By Sir JOHN PRINGLE, Bart. PRESIDENT.

PUBLISHED AT THEIR REQUEST.

B

``

-

DISCOURSE

A

ON THE

DIFFERENT KINDS OF AIR.

GENTLEMEN,

T is with great fatisfaction I enter upon this part of my office—to confer, in your name, the prize-medal of the prefent year upon a Member of this Society fo worthy of that diffinction.

THE object which Sir GODFREY COP-LEY, founder of the benefaction, had in B 2 view, view, and the manner in which the original pecuniary reward was converted into this more liberal form, having been fo lately explained by my honoured predeceffor ; I need only obferve, that though your Prefident and Council have been entrufted with the fole power of adjudging this premium, yet they have now, as, I am perfuaded, they have had on former occafions, the greatest folicitude to nominate that perfon, who, in their opinion, would have obtained all your fuffrages.

IN confidence of fuch unanimity, it is with fingular pleafure I acquaint you, that the Reverend JOSEPH PRIESTLEY, Doctor of Laws, has been found at this time the beft entitled to fo public a mark of your approbation, on account of the many curious and ufeful experiments contained in his Obfervations on different Kinds of Air, read at the Society in March 1772, and 6 inferted inferted in the laft complete volume of your Tranfactions *. And indeed, GEN-TLEMEN, when you reflect on the zeal which our worthy brother has fhewn to ferve the Public, and to do credit to your Inftitution, by his numerous, learned, and valuable communications, you will, I imagine, be inclined to think, that we have been rather flow than precipitate in acknowledging fo much merit.

YOUR time will not allow me to touch on the fubjects of his former Papers \dagger : nay, I apprehend I fhall even trefpafs upon it, by recalling to your memory only a few of thofe interefting difcoveries which Doctor PRIESTLEY has made in the *Obfervations*: fince, in doing juffice to others as well as to him, it will be proper to remind you of the progrefs that had already been made in

* Vol. lxii.

† In Phil, Tranf. vol. lviii, lix, lx.

B 3

this

1 6]

this part of fcience by men of the greatest abilities in their time, and by other ingenious perfons still among us.

THERE is not perhaps any branch of Natural philosophy that has more engaged the attention of the learned, or been more fuccefsfully cultivated, than the nature of the common air. The knowledge how indifpenfable it is to the prefervation of animals, muft have been coëval with mankind : it was from the beginning, as now, the breath of life. It was found likewife to be a neceffary fupport of fire, and they faw that the vegetable creation, deprived of it, languished and died. Nor did the ancient phyficians fail to diffinguish, at least attempt to diffinguish, between the effects of an air too hot and one too cold, an air too moift and one too dry, and between an infalutary and a wholefome air .- Thus far the experience, or the theory of all ages .--But

4

But the lefs obvious properties of this element, its gravitation and its elafticity, with their long train of confequences, remained unknown, till, about the beginning of the laft century, Lord BACON and GALILEO, in that dawn of philosophy which they themfelves diffused, began the inquiry. The former, from experiments, afcertained the elafticity of the air; and upon that principle constructed his vitrum calendare, the first thermometer *. The latter discovered that air had weight; but though that ornament of Italy was not ignorant of the limited fuction of a pump, yet to account for the rife of the water fo far in it, he flill had recourfe to Nature's abhorrence of a void t.

TORRICELLI, at last, the difciple of GALILEO, by one happy and decifive ex-

+ Dialog. 1.

periment,

periment, difcovered the preffure of the atmosphere; and PASCAL observed, that this preffure varied according to the heights he carried his barometer *. Soon after followed the air-pump, the invention of the celebrated OTTO DE GUERICK; which, though at first a rude and imperfect instrument, yet, improved by himfelf +, and more by Mr. BOYLE and Dr. HOOK (two of the illustrious fathers of this fociety), it foon became, in the hands of Mr. BOYLE. the means of opening the richeft mines of natural knowledge. In this refearch, the Hiftory of the Common Air, he feemed fo far to carry his inquiries, as to leave little to be done by others who fhould come after him; those parts excepted, depending on geometry and calculation ‡. How fuccefs-

fully

[9]

fully thefe were executed by Dr. HALLEY and Sir ISAAC NEWTON, I fcarcely need to mention; nor the folid foundation on which thofe great men eftablifhed the rarefaction of the air; and in what proportion, according to its diftance from the earth *. But it was Sir ISAAC NEWTON alone, who, upon the principle of the air's being comprefied by the power of gravity, and that of its elafticity, taught that tremulous bodies would communicate their motion to the air, and thereby excite vibrations in it, fpreading every where. Thus he difcovered the efficient caufe of founds †.

BUT, before this period, Mr. BOYLE observing, as he himself informs us, how much air was concerned in many of the *phænomena* of Nature, and how necessfary

* Phil. Tranf. No. 181. p. 104. Abrid. vol. ii. p. 14. Phil. Nat. Princ. Math. lib. ii. prop. 22, 23. + Phil. Nat. Princ. Mat. lib. ii. prop. 43.

it was to the exiftence of animals, became folicitous to inquire, whether a fluid of fo great importance were not producible by art; if fo, he believed that fuch air might be ferviceable in life, particularly in the art of diving, and in *fubmarine navigation**. With thefe views that admirable Naturalift fet about making fome new experiments, and, from a variety of bodics, by different proceffes, obtained a pneumatical fluid (from ripe fruit, fermenting and effervefcing liquors, and from the putrefaction of animal and vegetable fubftances) anfwering, till then, his only criterion of air, in being of a durably elaftic nature †. Yet after all, Mr. BOYLE found that thefe new productions were effentially different from common air, as they prefently extinguished

flame, and fuffocated those animals that * An attempt of Cornelius Drebell to make a veffel

to row under water with men in it. See Boyle's Works, vol. i. p. 69; vol. iii. p. 174.

+ Boyle's Works, vol. iv. p. 236, & feq.

attempted

[11]

attempted to breathe in them. But though he miffed finding what he fo much wanted, his labour was not in vain : philofophy was enriched with the knowledge of what he called *factitious* or *artificial* air, which has in the end proved as ufeful as he could have wifhed, in explaining feveral natural appearances, and in being fubfervient to the wants of man.

BUT this difcovery, however interesting to the Naturalist, and to the Chemist in particular *, feems to have been little attended to, till, in the beginning of this century, Sir ISAAC NEWTON observed, that true permanent air arises from fixed bodies by heat and fermentation; and that those aërial particles recede from one another with the greatest force, which upon contact cohered most strongly:—and-that dense bodies by fermentation rarefy into

* Hales, Stat. Eff. vol. i. ch. 6. p. 317.

feveral

feveral forts of air; and that this air, by fermentation, and fometimes without it. returns into denfe bodies*. Excited by fuch authority, the Reverend Dr. HALES (whofe amiable as well as philofophic qualities are still fresh on the minds of several gentlemen prefent), refuming those experiments concerning the feparation of air from bodies, confirmed and extended the difcoveries of Mr. BOYLE; fhewing not only that air entered into the composition of most bodies, but the very proportion it bore to the reft of the compound, and that often to an amazing quantity †. Dr. HALES likewife examined the mineral waters, those of Pyrmont particularly; and, finding them abounding with air, to that circumftance he afcribed the fpirit and brifknefs of those fountains. But that excellent author did not feem to apprehend, that in this, as in

* Compare Newton's Optics, Quer. 30, 31.

+ Stat. Eff. vol. i. ch. 6.

other

[13]

other inftances, the air which he produced was not the common air, but, if I may be allowed the expression, the factitious air of Nature; as being of the fame kind with what Mr. BOYLE had extracted from fermenting and effervefcing liquors; nay, the fame with the *mephitis* or deadly vapour of the ancients, or the mofeta of the modern Italians, fo frequently met with in the caverns, fprings, and lakes of their country: and the fame with the *flith* or *choak-damp* in our coal-pits, fo often fatal to the miners. It must be owned it was hard to conceive, how these springs should owe their prime virtues to what, in another manner of application, Dr. HALES faw was fo deftructive of vitality.

Now this notion, concerning the impregnation of the mineral waters by the *mephitis*, was, as far as I know, originally fuggefted by a foreign Member, Dr. SEIP of · Pyrmont,

[14]

Pyrmont, first in a treatife he published in the German language, and afterwards in a communication to this Society, in the year 1736, in which he deferibes a small cavern at Pyrmont, similar to the grotta de' cani, near Naples *. But when this ingenious author calls that mephitis (which is a durably elastic fluid *fui generis*) a *fulphureous fteam*, or a *fulphureo-fpirituous vapour*, he appears to have been imperfectly acquainted with its nature; which is now found to confist of nothing inflammable or fulphureous, and to be of a density, or specific gravity, confiderably greater than that of common air.

THE fuller discovery of this principle we owe to Dr. BROWNRIGG of Whitehaven, who, about thirty years ago, began clearly to unfold this mystery. But his curious papers were not then inferted

* Phil. Tranf. No. 448. Abridg. vol. viii. p. 659.

[15]

in the Transactions, as the too modest Author had requested a delay, till he should be able to make them more worthy of that honour. In his communication he remarks, ' That a more intimate acquaintance with those noxious airs in mines, 6 • called *damps*, might lead to the difcovery • of that fubtile principle of mineral waters, ! known by the name of their *(pirit*; that the mephitic exhalations, termed the *choak-damp*, he had found to be a fluid ⁶ permanently elaftic; and from various experiments he had reafon to conclude, 6 ' that it entered the composition of the ' waters of Pyrmont, Spa, and others; imparting to them that pungent tafte, ę. from which they were denominated aci-' dula, and likewife that volatile principle, on which their virtues chiefly depend *.'

IN order to afcertain a fact of fo much confequence, Dr. BROWNRIGG took the * Vid. Phil. Tranf. vol. lv. p. 236. & feq. opportunity,

opportunity, when at Spa feveral years after, to make fome experiments for this purpose; when he had the fatisfaction to find those waters pregnant with the artificial. or factitious air of Mr. BOYLE, the fame with that of the fuffocating grotta near Naples, and the fame with the choakdamp of our coal-mines; forafmuch as this air inftantly extinguished flame, and the life of those animals he had inclosed in it*. The fuccels of this worthy Member, in thus far analyzing those waters, encouraged others to purfue the inquiry; and to inveftigate the manner in which Nature alfo furnished them with the chalybeate principle †. Mr. LANE therefore, in confequence of a conversation with Dr. WAT-SON junior (both of this Society), upon an experiment of Mr. CAVENDISH's, by which that gentleman had found the me-

+ More properly, the iron-principle.

phitic

I 17]

phitic air (fuch as Dr. BROWNRIGG had detected in Spa-water) fufficient to diffolve any calcarious earth *: in confequence, I fay, of this conversation, wherein it was furmifed, that the fame mephitic air might likewife diffolve iron in common water. Mr. LANE made the experiment with air taken from Spa water, and happily fucceeded +. By this means the nature of the metallic principle, in mineral waters, was clearly explained; and the whole analyfis of those celebrated fountains, fo often attempted by chemists and others, and still eluding their laboured refearches, was thus, in the most fimple manner, brought to light.

NOTHING now feemed to be wanting to the triumph of Art, but an easy manner of joining, as there should be occasion, one or

 \mathbf{C}

both

^{*} Phil. Tranf. vol. lvii. p. 92. & feq. + Ib. vol. lix. p. 216. & feq.

both of these principles to common water, in order to improve upon Nature, in the more extensive use of her medicine. This was effected by Dr. PRIESTLEY, after fome other important difcoveries had been made in this part of Pneumatics, first by Dr. BLACK, Professor of Chemistry at Edinburgh, and then by Mr. CAVENDISH of this Society. The former has fhewn that a particular species of factitious air (he calls it fixed) adheres to all calcarious earths, magnefia, and alcaline falts, with different degrees of force; and that this fluid can be feparated from these fubstances, and combined again with them, in the fame manner as an acid. Upon this difcovery he explained in a clear and fimple manner many appearances in chemistry, till then deemed the most unaccountable. Such was the effervescence of absorbent earths and alkaline falts with acids, and the change of the mild calcarious earths into quick lime by

[19]

by heat (in confequence of the expulsion of this fixed air which neutralizes them) *. I must add, that I have been well informed, that, for feveral years paft, the learned Profeffor has taught, that the air which unites with alkaline fubftances is of the fame nature with the mephitis, or fuffocating air of the grotta de' cani and mines; the fame with what is emitted from vegetables in fermentation; and that in fome respects it agrees with the air which has been injured by the breath of animals, or by the burning of fuel: and laftly, that the air or elaftic fluid arifing from the folution of metals by acids is very different from the former.

MR. CAVENDISH has made feveral valuable additions to thefe difcoveries, not only with regard to that fpecies of *factitious* air the Profession had denominated *fixed air*,

* Est, and Observ. Phys. & Liter. vol. ii. p. 157. & seq.

but to other elastic fluids. He has with accuracy afcertained the fpecific gravity of this fixed air, as expelled from alkaline fubftances by acids, or from vegetable matter by fermentation; and has demonftrated the fimilarity of airs produced by either of these two ways. He has con-· firmed Dr. BLACK's account of the quantity of the fixed air contained in alkaline falts and in alkaline earths. He has shewn that this fluid can be mixed with water, and in what proportion; and that it flies off again from the water, upon heating it, or expofing it to the common air. Laftly, that this fpecies of factitious air imparts to the water the power of diffolving abforbent earths; the experiment, as I obferved before, which led to the knowledge, how Nature infused the metallic principle into what are commonly called the chalybeate quaters *

20 1

* Phil. Tranf. vol. lvi. p. 141. & feq.

2

Of

OF all these facts Dr. PRIESTLEY has carefully availed himfelf. For having learned from Dr. BLACK that this fixed or mephitic air could in great abundance be procured from chalk, by means of diluted fpirit of vitriol *; from Dr. MACBRIDE, that this fluid was of a confiderable antifeptic nature +; from Mr. CAVENDISH. that it could, in a large quantity, be abforbed by water ‡; and from Dr. BROWN-RIGG, that it was this very air which gave the brifknefs and chief virtues to the Spa and Pyrmont waters §: Dr. PRIESTLEY, I fay, fo well inftructed, conceived that common water, impregnated with this fluid alone, might be useful in medicine, particularly for failors on long voyages, for curing or preventing the fea-feurvy. This,

* Eff. and Observ. Phys. & Liter. lcc, cit.

we

[22]

we know, is a putrid diftemper, requiring all the antifeptic quality of those mineral waters, without the chalybeate principle, which might injure, by over-heating the blood, too much disposed to inflammation. For this purpofe, he made a fimple apparatus, for generating this species of air from chalk, and mixing it with water, in fuch quantities, and in fo fpeedy a manner, that, having exhibited the experiment before this Society, and the College of Phyficians, it met with fo much approbation, that, in order the Public might the fooner reap the benefit of it, he was induced to detach this part of his labours, and in a feparate Paper to prefent it to the Admiralty *.

THE reft of his observations upon the different kinds of air, addreffed to the So-

ciety,

^{*} A pamphlet intitled, Directions for impregnating Water, &c.

ciety *, contain fo much matter, that I will not prefume to encroach fo far on your time, as to offer even a fhort abftract of the whole; but fhall be fatisfied to fingle out a few of thofe many difcoveries, fuch as are the moft ftriking, either for their immediate ufe in life, like that above; or for the explanation of fome of the more interefting appearances in Nature.

I COME, therefore, to another fpecies of *factitious* air, called the *inflammable*. Till within thefe few years, little more was known, than that this kind of fubtile fluid was found in mines, in neglected privies, and common fewers; but chiefly in coalpits, where it is called the *fire-damp*, making fometimes formidable explosions, and indeed often fatal to the miners. I do not recollect that Mr. BOYLE has taken any other notice of it \dagger . But, about forty years

C 4

ago,

ago, Sir JAMES LOWTHER, Baronet, favoured the Society with an account, fomewhat more particular, of this production of his coal-mines in Cumberland, accompanying it with feveral bladders filled with that fluid, which, in this houfe, burnt as readily, as at its fource a month before. Yet ftill this extraordinary fubftance was confidered more as an object of curiofity, than as one of philofophical inquiry, till Mr. CAVENDISH began to make experiments upon it; by which, and the confequences drawn from them, he has added another confiderable branch to the doctrine of aërial fluids.

FIRST, he has taught how to produce at will, and in great abundance, this other permanently elaftic fluid from three metallic bodies, Zinc, Iron, and Tin, by diffolving them in the diluted vitriolic acid, or fpirit of fea-falt. This fpecies of factitious air he has fhewn to be furprizingly light, being being no more than the tenth part of the weight of common air, and therefore totally different from the *mephitis*, that other fpecies of factitious air we have been treating of, and which, as was obferved, is heavier than the air of our atmosphere. Laftly, Mr. CAVENDISH has given feveral experiments upon the inflammability of various mixtures of this fluid with common air, which are likewife new; and, like the reft, have been made with great precision.

Now, though Dr. PRIESTLEY has alfo improved upon this enquiry, by the addition of a variety of experiments; in particular, by fhewing how this air becomes mifcible with water, and deprived of its inflammability; by comparing it with other fpecies of factitious air, in regard to conducting the electrical fluid; by enquiring how far it may be confidered as common air, air, loaded with the principle of fire, called *phlogifton* by the modern chemists; with other curious observations on this substance: yet all these, with other kinds of factitious air, as I have already too long detained you, I must with regret pass over; one other secepted, as I reckon it among the most brilliant of Dr. PRIESTLEY's discoveries *.

THIS fpecies he calls the *nitrous air*, without infifting on the propriety of the expression. It was first produced from the Walton pyrites, by means of the spirit of nitre. Dr. HALES, who made the experi-

* I might have added another new species of factitious air, which he terms *acid*, first taken notice of by Mr. CAVENDISH, and more fully investigated by Dr. PRIESTLEY. This is an elastic vapour, expelled by heat from spirit of falt, and not liable afterwards to be condensed by cold. Water readily imbibes this air, and by that means becomes a strong spirit of falt. The same acid air, or vapour, he has also discovered to be a decomposer of substances that contain *phlogiston*, and with them to form a proper inflammable air.

ment,

ment, observed that, when joined to common air, an effervescence ensued, with a turbid red colour of the mixture, and an abforption of part of the common air *. Dr. PRIESTLEY, extending the experiment to other metallic fubftances, obferved, that the fame kind of air was by the fame acid readily procured from iron, copper, brafs, tin, filver, quickfilver, bifmuth, and nickel; and that though it conftantly, when joined to common air, exhibited those appearances mentioned by Dr. HALES, and more confpicuoufly in proportion to the purity of the common air mixed with it (that is, its fitnefs for refpiration); yet it made no change with either fixed or inflammable air, or that air tainted by the breath of animals, or the corruption of their bodies. By means of this teft, he was enabled to judge of the kind, as well

* Stat. Eff. vol. ii. p. 280.

as of the degree of injury, done to common air, by candles burning in it; and to perceive a real difference in the air of his fludy, after a few perfons had been with him there. Nay, a phial of air having been fent him from the neighbourhood of a large town, it appeared, upon a comparative trial, to be inferior in quality to that taken up near Leeds, where he then refided. It was upon fuch a profpect of obtaining a criterion for diffinguishing good air from bad, that Lord BACON almost in a rapture breaks out : ' Thefe are noble experiments, that can make this difco-• very; for they ferve for a natural divina-" tion of feafons !' and again, " They teach * men to chuse their dwelling for their better health *.'

NOR is this all the use of the nitrous air: Dr. PRIESTLEY shews it to be one of the

1

* Nat. Hift. Exp. 777.

ftrongeft

ftrongest antifeptics. The fixed air has been proved by Dr. MACBRIDE, as was remarked, to be powerful in this particular; but this species of factitious air has been found to be of superior efficacy. And as our Author has discovered it to be miscible with water, he has reason to believe it may be applied to various purposes, such as the prefervation of the more delicate birds, fishes, fruits, and anatomical preparations.

I SHALL now conclude with fhewing from Dr. PRIESTLEY, what refources Nature has in ftore against the bad effects of corrupted air, which from various causes infect our atmosphere.

It is well known that flame cannot long fubfift without a renewal of common air. The quantity of that fluid, which even a fmall flame requires, is furprifing : an ordinary

nary candle confumes, as it is called, about a gallon of air in a minute. Now; confidering the vaft confumption of this vital fluid by fires of all kinds made by man, and by volcanos, it becomes an interefting enquiry, to afcertain what change is made in the air by flame; and to difcover what provision there is in Nature, to repair the injury done by this means to our atmofphere. Dr. PRIESTLEY, after relating the conjectures of others, and not finding them fatisfactory, was fortunate in falling upon a method of reftoring air, which had been vitiated by the burning of candles in it. This led the way to the difcovery of one of the great reftoratives which Nature employs for this purpofe, to wit, vegetation. See by what induction he proves his opinion.

IT was natural to imagine, that, fince the change of common air is neceffary to vegetable, as well as to animal life, both plants

plants and animals rendered it foul in the fame manner, fo as to become unfit for farther life and vegetation. But when with that expectation the Doctor had put a fprig of mint, in a growing and vigorous state, under an inverted glass jar standing in water, he was agreeably difappointed to find, that this plant not only continued to live, though in a languishing way, for two months, but that the confined air was fo little corrupted by what had iffued from the mint, that it would neither extinguish a candle, nor kill a fmall animal which he conveyed into it. What farther evinced the falutary nature of the effluvia of vegetables; he found that air, vitiated by a candle left in it till it burnt out, was perfectly reftored to its quality of fupporting flume, after another fprig of mint had for fome time vegetated in it. And to shew that the aromatic vapour of that plant had no fhare in reftoring this purity to the air, he

he obferved, that vegetables of an offenfive fmell, and even fuch as fcarcely had any fmell at all, but were of a quick growth, proved the very beft for this purpofe. Nay more, the virtue of growing vegetables was found to be an antidote to the baneful quality of air corrupted by animal refpiration and putrefaction.

WE have faid, that neither candles will burn, nor animals live, beyond a certain time in a given quantity of air; yet the caufe of either fo fpeedy a death or extinction was unknown; nor was any method difcovered for rendering that empoifoned air fit again for refpiration. Some provifion however there muft be in Nature for this purpofe, as well as for that of fupporting flame : without fuch, the whole atmofphere would in time become unfit for animal life, and the race of men, as well as beafts, would die of a peftilential diftemper. Yet
[33]

Yet we have reafon to believe, that in our day the air is not lefs proper for breathing in, than it was above two thoufand years ago; that is, as far as we go back in Natural Hiftory. Now, for this important end, the Doctor has fuggefted, to the Divine as well as to the Philofopher, two grand refources of Nature: the vegetable creation again is one, and the fea, and other great bodies of water, are the other.

As to the former, having found that plants wonderfully thrive in putrid air, he began to attempt, by means of growing vegetables, to purify air that had been injured by animal refpiration and putrefaction; nor was he lefs fuccefsful than before. Thefe plants were fure to recover the air to a degree of fitnefs for breathing in it, and that in proportion to their vigour, and the care he took to remove the rotten leaves D and

[34]

and branches; which, remaining, would have marred the operation.

WITH regard to the fecond refource of Nature, namely the ocean and other waters, Dr. PRIESTLEY having observed, that both the air corrupted by the breath of animals, and that vitiated by other putrid matter, was in a good meafure fweetened by the feptic part infufing itfelf into water, he concluded, that the fea, the great lakes and rivers, which cover fo large a proportion of the globe, must be highly useful, by abforbing what is putrid, for the farther purification of the atmosphere: thus beflowing what would be noxious to man and other animals, upon the formation of marine and other aquatic plants, or upon other purpofes yet unknown.

FROM thefe difcoveries we are affured, that no vegetable grows in vain, but that from

from the oak of the forest to the grafs of the field, every individual plant is ferviceable to mankind; if not always diftinguished by fome private virtue, yet making a part of the whole which cleanfes and purifies our atmosphere. In this the fragrant rofe and deadly nightfhade co-operate : nor is the herbage, nor the woods that flourish in the most remote and unpeopled regions. unprofitable to us, nor we to them; confidering how conftantly the winds convey to them our vitiated air, for our relief, and for their nourifhment. And if ever thefe falutary gales rife to ftorms and hurricanes, let us still trace and revere the ways of a beneficent Being; who not fortuitoully but with defign, not in wrath but in inercy, thus fhakes the waters and the air together, to bury in the deep those putrid and peftilential effluvia, which the vegetables upon the face of the earth had been infufficient to confume.

D 2

THIS,

[36]

THIS, GENTLEMEN, is what I had to fay upon the occafion : perhaps too much; but the fruitfulness of the subject, with my carneft defire of commemorating fome of the more important experiments and conclutions of Dr. PRIESTLEY, and of those who preceded him in thefe enquiries, will, I hope, plead my excufe. Nor can I conclude without congratulating this illustrious Body, on the pofferfion of fo many members and friends, fo capable to promote the great ends of this inftitution; and who have within thefe few years fo eminently diffinguished themselves, by the lights they have thrown, not only upon this, but upon other of the more fubtile fluids of Nature. You will understand, that to these discoveries upon factitious air, I join those amazing ones upon magnetifm and electricity, with all the uses refulting from them. Here you will recollect the prediction of him, who best taught the method of inveftigating

[37]

tigating philosophical truth, the incomparable Lord BACON, who, with that fpirit of divination peculiar to exalted genius, affured his difciples, that when men fhould ceafe to trifle in framing bypotheles, and building hafty fyftems; and fhould, by a proper induction from fober and fevere experiments, attain to the knowledge of the forms of things [their more intimate qualities and laws]; they fhould in the end command Nature, and perform works as much greater than were supposed practicable by the powers of natural magic, as the real actions of a Cafar furpassed the fictitious ones of the hero of a romance*. Some earnest, nor that inconfiderable, of this magnificent promife this Society has already obtained. Let those who doubt, view that Needle, which, untouched by any loadstone, directs the course of the British ma-

* Compare Bac. De Dignit. et Augment. Scient. lib. iii. cap. 5.

riner

riner round the world; or that apparatus, fo perfectly imitating the long fuppofed inimitable lightning; or that other, which difarms the clouds of that tremendous meteor: or (not to depart from my fubject) let them fee how Art can, from chalk only, the leaft promifing fubftance, generate, or call it unfetter, a copious elastic fluid imprifoned in it, the poifon of man, or his medicine, according to the mode of application; which, though invisible, yet diffolves earth and metals, and imparts the fpirit and virtue to the most prized of mineral waters. Yet these are but inventions of yesterday: I would strictly fay, inventions within the memory of my youngeft hearer. If to thefe late acquisitions, fo honourable to this Society, I add those in Natural Hiftory, by the zeal and unwearied attention of fome worthy members, who have extended your correspondence, and adorned your Mufeum; and by those other gentlemen. 5

gentlemen, who, animated with a noble fpirit, have, to their lafting honour, undertaken the moft dangerous and moft diftant voyages in purfuit of Natural Knowledge : I fay, when to the progrefs you are making in Experimental Philofophy, I add that in the Hiftory of Nature, every true lover of fcience will rejoice to think, that your affairs have not, perhaps, at any period, been in a more flourifhing condition.

Dr. PRIESTLEY,

IT is now time that, in the name and by the authority of the Royal Society of London, inftituted for the improvement of Natural Knowledge, I prefent you with this Medal, the palm and laurel of this Community; as a faithful and unfading D 4 teftimonial

[40]

teftimonial of their regard, and of the just fenfe they have of your merit, and of the perfevering industry with which you have promoted the views, and thereby the honour, of this Society. And, in their behalf, I must earnestly request you, to continue your liberal and valuable inquiries, whether by farther profecuting this fubject, probably not yet exhaufted, or by inveftigating the nature of fome other of the fubtile fluids of the universe. You will remember, that Fire, the great inftrument of the chemists, is but little known, even to themfelves; and that it remains a Query, what was by the most celebrated of philofophers propofed as fuch, whether there be not a certain fluid (he calls it *Æther*), the caufe of gravity, the caufe of the various attractions, and of the animal and vital motions*. Thefe, SIR, are indeed large demands: but the Royal Society have

* Newton's Optics, Quer. 18-24.

hitherto

[41]

hitherto been fortunate in their pneumatic refearches. And, were it otherwife, they have much to hope from men of your talents and application, and whofe paft labours have been crowned with fo much fucces.

DISCOURSE

A

ON THE

TORPEDO;

DELIVERED AT THE

Anniverfary Meeting of the ROYAL SOCIETY, November 30, 1774.

By Sir JOHN PRINGLE, Bart. PRESIDENT.

PUBLISHED BY THEIR ORDER.

A DISCOURSE ON THE . TORPEDO.

GENTLEMEN,

THE difpofal of the annual Prizemedal, founded on the benefaction of Sir GODFREY COPLEY, Baronet, having for fome years paft devolved upon your Prefident and Council, they have hitherto been fortunate in executing their truft in fuch a manner as to receive your approbation.

bation. Indeed, the ftrict regard for the honour of the Society, and the deference due to the opinions of the other learned Members, have been fo much the objects of their attention, that they could not well fail to be directed by them to fuch of your publications, as were most deferving of your favourable notice; and they flatter themfelves, that they fhall not now be lefs fuccessful than on former occasions. For, if you call to mind the various Papers of Experiments in the laft volume of your Tranfactions, you may remember, that though you warmly acknowledged the merit of many of them, yet it was with peculiar pleafure you liftened to that from Mr. WALSH, upon the Torpedo, on account of the new and very ftriking circumftances contained in that communication, and of the pains and time beftowed by that gentleman on this inquiry.

BUT,

[47]

BUT, in order to your more freely fealing the choice of your Council with your fuffrages, permit me, GENTLEMEN, first to lay before you a short abstract of what had been done in this branch of Natural History, antecedently to Mr. WALSH's experiments; and then to remind you of a few of his principal ones, that while we do justice to our worthy brother, none may be defrauded of the praife due to their labour.

THE Torpedo, or cramp-fifh, a fpecies of the ray, being a common inhabitant of the Mediterranean, was early known to the Greeks. We find it first mentioned in a book anciently afcribed to HIPPOCRATES, though only as an efculent fish; but the name alone $(\nu \alpha' \rho \varkappa \eta)$ is fufficient to afcertain the knowledge the ancients then had of its torporific torporific qualities. And PLATO, nearly contemporary with HIPPOCRATES, certainly knew of them, as appears by the humorous comparifon he makes of SOCRA-TES to that animal, which he puts into the mouth of MENON, in his dialogue of that name. And his celebrated difciple in phyfics, ARISTOTLE, particularly treats of it in his Hiftory of Animals. The Torpedo (fays he) hides itfelf in the fand or ooze, and, whilft the other fifhes fwim over it, and touch it, he benumbs them, fo as to catch them and feed upon them : as a proof, the mullet, the fwifteft of the watery race, is found in his ftomach.

BUT though ARISTOTLE knew that the touch of the torpedo flupified other fifnes, he feems not to have known that this extraordinary effect could be transmitted to other animals not in immediate contact with it, but by the interposition of a flick, a rope,

[49]

a rope, or water; facts too curious to have been omitted, had he ever heard of them. Poffibly he might have been informed, but rejected the accounts as fabulous (for of all the ancients none appear to have been fo much on their guard againft impofition); or he might have thrown them into fome part, that has been fince loft, of his book called Oaupásia 'Anssina', Wonderful Relations. Yet ARISTOTLE had only the testimony of fishermen for what he reports of the torpedo: indeed he expressly fays fo. In those days, and for many ages after, the pride of Man fet him above experiments; and above the fufpicion, that, by fuch low and mechanical operations, he was to difcover caufes, and learn to reason. ARISTOTLE himfelf, that admirable genius, knew not this. Had the great Stagyrite heard, that, to underftand by what principles the torpedo acted, a Naturalist from Britain had travelled through Gaul to the Atlantic E Ocean, Ocean, and on that coaft had made a hundred experiments upon that fifh, and with fuccefs; there is no doubt but he would have placed that account among the chief of his *Wonderful Relations*. Lord BACON was the firft who detected and combated this prefumptuous error, and who, by humbling the vanity of man, exalted his power over the works of Nature. He was the firft who taught, that as *our bread*, fo our fcience was to be carned by the fweat of our brow; and the works of this Society will, I truft, be an everlafting teftimony of the truth of his doctrine.

THEOPHRASTUS, the learned fcholar and fucceflor of ARISTOTLE, appears to have been better informed concerning the torpedo than his Mafter. ATHENÆUS relates, that this philofopher, in his book on venomous animals, obferved that the torpedo conveyed this benumbing fenfation 4 through through flicks and fpears into the hands of the fifhermen that held them. And fince I have quoted ATHENZEUS, though not in a chronological order, I fhall add, that he mentions DIPHILUS of Laodicea, for taking notice, in his commentary upon the *Theriaca* of NICANDER, that it was not the whole, but certain parts of the body of the torpedo, that occafioned the torpor. HERO of Alexandria, in his Pneumatics, mentions this fifh as emitting effluvia through brafs and iron, and other folid bodies.

PLINY, the laborious and ufeful compiler of ancient natural fcience, too little a philofopher himfelf, and too great a lover of the marvellous, has treated this fubject accordingly. Thus, he fays, the power of the torpedo may be felt through the length of a rod or a fpear, which is a fact; but that this fifh binds the legs of the nimbleft perfon that treads upon it, is an exaggera-E 2 tion;

[52]

tion; and that this animal is able to bind the arms of the ftrongeft, at a diftance, is falfe.

PLUTARCH, though no professed naturalift, yet furnishes us with a fuller and juster account of the torpedo. According to him, this creature not only benumbs all those that touch it, but also strikes a numbnefs through the net into'the hands of the fifhermen: nay, as fome report, if it happen to be laid on the ground, alive, those that pour water upon it fhall be fenfible of fome diminution of their feeling. Now whether this last fact has been confirmed by later experiments, I have not learnt; but I am inclined to believe it, as not inconfistent with Mr. WALSH's principles. PLUTARCH adds, that whilft the torpedo fwims around his prey, he emits certain effluvia, like darts*, that first affect the

* Gr. ώσπες βέλη διασπείζει αποβροάς.

water,

[53]

water, and then the fifhes in it; which, being thus difabled from defending themfelves, or efcaping, are held, as it were, in bonds, or frozen up.

FROM ÆLIAN, who writes a Hiftory of Animals, we might expect more information, on this fubject, than from any other author; but we are much difappointed. He has been fatisfied with reciting a few of the common reports, and adding others, too abfurd to deferve repetition. It is remarkable, that thefe two profeffed writers of Natural Hiftory, PLINY and ÆLIAN, fhould of all the ancients give us the lameft and moft fabulous accounts of this fubject of our inquiry.

PASSING from the philofophers to the phyficians, we fhall receive little more fatisfaction. Before the days of GALEN, the torpedo was applied alive to parts af-E 3 fected, [54]

fected, and particularly for the cure of an obstinate head-ach, as appears from SCRI-BONIUS LARGUS, who lived under CLAU-DIUS, and from DIOSCORIDES, who flourifhed foon after. But GALEN, always reafoning, and oppofing empirical practice, affigns a caufe for that falutary effect. His phyfiological fyftem was in a great meafure founded on the four primary qualities, cold, bot, wet, and dry. He conceived, therefore, that the torpedo acted by a frigorific principle; for as cold occafions a numbnefs in an animated body, fo does the fhock given by that fifh. Such were the theory and reafoning of that age; yet, bad as they were, they prevailed in the fchools of medicine upwards of a thousand years. GA-LEN was confirmed in his opinion, by feeing, as he himfelf teftifies, that diforder removed by the touch of a living torpedo; which, being of a cold nature, flupified or blunted the acute fenfe of pain. The followers

[55]

lowers of this medical chief improved upon their leader. A living torpedo not being always at hand, when a refrigerating medicine was indicated, the deficiency was fupplied by preparing an oil from the dead animal, which they were affured muft poffefs all the virtues of the living one. Upon this conceit, we find PAULUS of Ægina, one of the ancients of the Galenic fchool, recommending this oil for tempering the hot humour of the gout, and for other ailments that required cooling applications.

Now, confidering what little information we have received from the philofophers and phyficians among the ancients, it will fcarcely be expected, that we fhould find more among their poets. Poetry, the creature of the imagination, can feldom avail itfelf of ftrict hiftory for a fubject, whether in the natural or political world. The hiftorians of either can yet fee but E_4 parts parts of a great fystem, and these, in appearance, often crooked and deformed, from not knowing how they are to tally and to be put together, to compose the fabric of the univerfe and the hiftory of man. Such disjointed materials make therefore but indifferent themes for a bard, whole aim is to captivate the fancy with fomething beautiful and finished. In effect, OPPIAN has made no improvement in the hiftory of the torpedo, though he contrived in his Halieutica to write an elegant defeription of it, without departing much from truth. He not only commemorates the more than poetical powers with which Nature has endowed this fish ; but diffinguifhes, like DIPHILUS, the parts where they peculiarly refide. These parts he calls rayoves (the flanks), from which, as OP-PIAN imagined, the animal had a faculty of darting upon other fifnes certain fubstances, he terms zeezides, but whereof the meaning

[57]

meaning is obfcure. To the former of thefe expressions CLAUDIAN undoubtedly alludes, in a line of those verses which he copies from OPPIAN, in celebrating the properties of the torpedo :

Sed latus armavit gelido Natura veneno.

BUT, as the Roman Poet has nothing new of his own, I fhall with him clofe the relations I have been able to find of this curious fish in the monuments of antiquity. We must confess them to be all unfatisfactory; and the more, as it does not appear that there has been one, GALEN excepted, of all the above-mentioned ancient fages, who had ever feen a living torpedo, much lefs who had made experiments on it; and, leaft of all, who had diffected it. The refult of their inquiries ferved for little more than a winter's tale. Such are the accounts that I have been able to collect from the ancients, concerning this wonder of the deep; 6 omitting omitting only fuch reports as feemed to be either fuperflitious or fabulous. But of both forts, you may be affured, that, in those days of credulity, fo many were imposed on the world, that we are not to wonder, if there have been men of genius and learning, who, not taking the pains to make experiments themsfelves, or flrictly to enquire into those made by others, have prefumptuously treated the whole affair as a vulgar error.

WITH the fall of the Roman Empire, the hiftory of animals, imperfect as it was, with all other found learning, funk into the darknefs of the times; nor did it emerge before the fixteenth century, an æra ever memorable for the revival of fcience. Then lived and flourifhed BELON, RONDELET, SALVIANI, GESNER, and others, who not only reftored what was anciently known in Natural Hiftory, but greatly improved the fubject,

[59]

subject. Yet experiments were still rare and feeble, till, in the next century, HAR-VEY appeared, and began to make them on birds and quadrupeds. Nor did that famous interpreter of Nature finish his career, and clofe his eyes in death, before they beheld the rifing flate of this Society, and the Academia del Cimento, our elder but fhortlived fifter, already formed. Some of the most eminent of that academy, judging an enquiry into the truth of what had been recorded concerning the torpedo to be an object worthy their attention, availed themfelves of their vicinity to a fea, ftored with that fort of fish, to make the trials. REDI, one of the most liberal and enlightened geniuses of that age, began, and was afterwards affifted by BORELLI, and STENO the Dane, his colleagues. Laftly LORENZINI, his scholar, engaged in the fame purfuit, and published a curious treatife upon the fubject.

Redi's

[60]

REDI's first step was, by experiments, to diffinguish between the real properties of the torpedo, and fuch as had erroneoufly been afcribed to it, by the learned, as well as by the vulgar of former times. To this refearch he added the anatomy of the animal; fo that REDI was also the first, who with any accuracy defcribed those crooked fubftances, lying on each fide of the fpine, near the head, which he confidered as muscles (from thence named musculi falcati), that projected certain effluvia, occafioning the fenfation of numbnefs, more or lefs, as the animal was excited to put thefe organs into action. This hypothesis, of the transmission of effluvia, was immediately embraced by LORENZINI, and afterwards by CLAUDE PERRAULT. But the former, not understanding how effluvia could pass from the body of one animal into that of another, without immediate contact, contradicted, we may fay, the evidence

[61]

evidence of his fenfes, by denying the fenfation he muft have had upon touching the torpedo with a flick, a fpear, or the like inftrument; unlefs we fhould fuppofe that those fubjects, on which he made his trials, were too weak for exerting the full energy of their species.

FROM the like caufes alfo erred the excellent BORELLI. But his theory not admitting the emiffion of benumbing particles, affecting the hand, either in immediate contact with the fifh, or touching it with a flick, or the like, he referred the, fenfation to a certain brifk undulation of the parts touched, which the animal could excite at will. This action he compared to that of a flretched cord, put into quick vibrations.

INTO a fimilar deception, in the next generation, fell that ornament of his coun-

try

try and of his age, the excellent M. DE REAUMUR, upon refuming this fubject. For, in the year 1714, being on the coast of Poitou, he took that opportunity of making fome new experiments upon the torpedo, which, with the refult, he communicated to the Royal Academy of Sciences at Paris. His brethren of that illuftrious fociety adopted his hypothefis, as did indeed the Ingenious over all Europe; and fo natural did it appear to them, that every one wondered it had not been fallen upon before. What then was this new fystem? In effect, one not very different from that of BORELLI; for, inftead of the undefined vibrating parts of the latter, M. DE REAUMUR fubflituted muscles (the musculi falcati of REDI and LORENZINI), which, by the vivacity of their action, impreffed on the hand, that touched thefe parts, a fenfation of numbness, owing to the stoppage of the progression of the nervous

[63]

nervous fluid, or a repulsion of the fame. But, to obviate what might be objected, the celebrated investigator was bound to deny that this impreffion of numbnefs could be communicated through water, a net, or any other foft and yielding fubstance; nay, through a stick, except a very short one. In fact, M. DE REAUMUR did deny fuch transmissions; and yet it is certain, that the fhocks from the torpedo are not less conducted through fuch media, than those from a charged electrical phial. Shall we then accufe of want of candour those celebrated authors, BORELLI, LO-RENZINI, and M. DE REAUMUR? By no means: but let us lament the weakness of the human intellect, which, prepoffeffed by fyftem, will often not perceive fuch objects as would strike the fenses of any other perfon, nay most certainly their own, in a more unprejudiced ftate of mind! And let us regret that other infirmity, fo incident

to

to the beft understanding, the too great forwardness to account for every appearance in Nature, from fuch principles as are known, without confidering how many yet remain to be difcovered! There was a time, and that within the memory of many of my hearers, when thunder and lightning were thought fufficiently accounted for, from fulphureous and nitrous vapours mixing with the air. At prefent, we doubt of the existence of fuch vapours in the atmosphere, and are otherwise fure, that the electrical fluid only is concerned in the formation, of that meteor. Now it feems this very fluid is the efficient caufe of the amazing qualities of the torpedo. Nothing could be more unexpected, yet perhaps nothing more true.

THE difcovery of the Leyden Phial opened a wide and rich field for the advancement of philosophy; and to the honour

[65]

nour of this Society it will ever be remembered, how much they have availed themselves of that fortunate accident, for interpreting fome of the more intricate phænomena of Nature. A few years after that memorable event, the celebrated profeffor ALLAMAND, Fellow of this Society, hearing of a fifh, in the Dutch fettlement of Surinam, refembling a congre-eel, but with properties fimilar to those of the torpedo, engaged his friend M. 's GRAVE-SANDE, governor of Effequebo, to make the enquiry. That gentleman readily complied; and, in the year 1754, wrote M. ALLAMAND a letter on the fubject, which was foon after published in the fecond volume of the Transactions of the Society at Haerlem. M. 's GRAVESANDE fays, that the experiment was made on a fpecies of eel, the Dutch call fidder-vis (tremble-fifb), and that it produced the fame effects with electricity, with which he had been well F acquainted,

[66]

acquainted, by having, with his learned correfpondent, made many experiments with the electrical phial; nay, that the shocks from the fifh were much more violent, if it happened to be ftrong and lively of its kind; for then it would infallibly throw the perfon who touched it to the ground. But M. 's GRAVESANDE adds, that fuch exertions, in this animal, were accompanied with no fparks of fire, as in an electrical machine. Thus far I have abridged M. 's GRAVE-SANDE'S Letter. M. ALLAMAND fubjoins, that he was fatisfied that this eel must be a fpecies of the gymnotus of ARTEDI; and all our fubfequent accounts have confirmed his opinion.

IN the fecond part of the fixth volume of the fame valuable Work, we find, of the fame animal, a more ample relation extracted from fome Letters of M. VANDER LOTT, dated from Rio Effequebo, 1761. This

[67]

This gentleman makes two fpecies, the black and the reddifh, though he acknowledges, that, excepting the difference of colour and degree of ftrength, they are not materially different. In most of the experiments with thefe animals, M. VANDER LOTT remarked a wonderful fimilitude between them and an electrical apparatus: nay, he obferved, that the flock could be given to the finger of a perfon, held at fome diftance from the bubble of air, formed by this eel, when it rifes to the furface of the water in order to breathe; and he concluded, that at fuch times the electrical matter was discharged from its lungs. He mentions another characterizing circumftance; which is, that though metals, in general, were conductors to its electrical fluid, yet fome were found to be fenfibly better than others for that purpofe.

ABOUT the fame time that M.'s GRAVE-SANDE made his difcovery in America, F 2 M. ADAN- M. ADANSON, an eminent French naturalift, met with the fame, or a fimilar fifh, in the river of Senegal in Africa. He takes notice, that this animal had little relation to any of the known inhabitants of the water; that its body was round, and without fcales, like an eel, but much thicker in proportion to its length; that it was well known to the natives, and that the French called it trembleur, from the effects it produced; not fo much a numbnefs, like that arifing from the torpedo, as a very painful trembling in the limbs of those who touched it. He adds, that this effect did not fenfibly differ from the flock given by the Leyden Phial, which he had felt; and that it was communicated, in the fame manner, by fimple contact, or by the interpolition of a flick, or an iron rod (five or fix feet long), fo as to force the perfon to drop whichever of them he had in his hand.

M. FERMIN,
[69]

M. FERMIN, in his Natural Hiftory of Surinam, published at Amsterdam in 1765, observes of a fish, which the Dutch there call Beef-aal (tremble-eel), that one cannot touch it with the hands, or even with a flick, without feeling a horrible numbness in the arms, up to the fhoulders. And he farther relates, that, making fourteen perfons join each other by the hands, whilft r he grafped the hand of the laft with one of his, and with the other touched the eel with a flick, the whole number felt fo violent a fhock, that he could not prevail on them to repeat the experiment. This fifh, I believe, we may with probability fay, was the fame fpecies of gymnotus defcribed by M. 's GRAVESANDE and M. VANDER LOTT, though the Author does not compare its operations to those of the electrical phial.

F 3

THE

[70]

THE earlieft account, for a diffinct one, that I have met with of this kind of cel, in that quarter of the world, is by M. RICHER, the aftronomer, recorded by M. DU HA-MEL, in his Hiftory of the Royal Academy of Sciences, for the year 1677. In the ifland of Cayenne, where M. RICHER had made his obfervations, there is a fifh, fays M. DU HAMEL, not unlike a congrecel, which, touched with the finger, or even with the end of a flick, affects the arm with a numbnefs, nay the head with a giddinefs, and the eyes with a dimnefs of fight, which M. RICHER had himfelf felt upon making the experiment.

IF any farther evidence were wanting, to afcertain the electrical nature of this eel, in thofe parts, I would recommend the perufal of the Effay on the Natural Hiftory of Guiana, by Dr. BANCROFT, Member of of this Society, where the reader will find feveral curious experiments made on this animal by that gentleman. But, as the book is in every body's hands, I fhall only take notice, that the Author confirms M. VANDER LOTT's account, of a fhock from this animal being communicated through a confiderable fpace of air; a circumftance to which we have nothing fimilar in the torpedo, though it be a common effect in an electrical difcharge.

I SHALL not, therefore, GENTLEMEN, take up more of your time, with offering you farther accounts of thefe curious animals, given us by travellers; and the lefs, as I have met with no original ones, excepting the above, but what, from either too much brevity, or manifest figns of inaccuracy, have left much doubt to what genera of fishes those electrical ones were to be referred. I should only except that eel, F q, which

[72]

which M. DE LA CONDAMINE describes in his voyage down the River of Amazons, that was most probably the true electrical gymnotus (fo commonly found in the rivers of the adjacent country of Guiana), about which we have been just discoursing. Not fo that fifh which Mr. MOORE found in an African lake near the Gambia; nor that other, which Mr. ATKINS faw in the river Sierra-leon, likewife, in Africa. And it is pretty evident that the electrical fifh, mentioned and delineated, but fcarcely deferibed, by NIEUHOF, as taken in fome of the lakes of India, and called by the Dutch meeraal (lake-eel), is no fpecies of the gymnotus, at leaft if juftly drawn; fince we find there a long fin on the back of that creature, and none on its belly. No more fhould that fifh, provided with torporific powers, which Piso found in Brazil, have any other relation to the gymnotus, fince the Author compares it in figure to a fole: nor that other,

[73]

other, of the fame country, poffeffed of fimilar qualities, which PISO calls Piraqué (MARGRAF, Puraqué), if it at all refembled the figures given of it by thefe travellers and natural hiftorians. I would pafs the fame judgment upon the Indian congrus monstrosus of BONTIUS. And I should hefitate about that eel, the fubject of a Paper communicated to this Society in the year 1680, by Dr. GALE, from the author Mr. BATEMAN, who had been twenty years a planter in Surinam. All that I would with any degree of certainty conclude, is, that, among fifnes, the electrical properties are not confined to that fpecies of ray called the torpedo, nor to that fpecies of gymnotus called the gymnotus electricus; but that Nature has endowed with the fame powers feveral other inhabitants of the waters, though hitherto imperfectly known.

Now,

Now, in juffice to those authors who have first mentioned the electric gymnotus, and efpecially to those who have originally furmifed a fimilitude between the properties of the torpedo and those of that electrical eel, and between the properties of both and those of the Leyden Phial, I have thought proper to commemorate their names on this occafion; though, after all, I have reafon to believe that our worthy Brother has taken the hint of making his experiments from none of them, but folely from what he had read concerning the torpedo in writers, who thought of nothing lefs than referring fuch powers in animals to an electrical origin; nay, who lived, many of them, long before the laws of electricity were known. Nor had the furprizingly benumbing effects of the electric gymnotus ever been fo narrowly obferved, much less confronted with an clectrical apparatus, as that we could with any precifion

[75]

fion fay, how far Nature had carried the analogy between the two.

To Mr. WALSH, therefore, we owe not only the first, but a numerous fet of the beft chofen experiments on the torpedo, for afcertaining its electrical nature, together with fome correct and elegant drawings of the entire animal, and of fome of its principal organs that appeared upon diffection. For this latter part of the difquifition, the Society, as well as Mr. WALSH, is much beholden to another Member, Mr. JOHN HUNTER, who thereby has fupplied us with an useful addition to the anatomical examination of the animal by REDI, STENO, and LORENZINI. And I may moreover acquaint you, that, though Mr. WALSH has laid before us an account of his principal experiments, his occupations have not yet permitted him to enumerate every curious particular that occurred to him

him in the courfe of his refearch ; as I can teftify, from having been favoured with the perufal of the journal he had kept of all his transfactions.

THE very first experiment of Mr. WALSH difcovered the electrical quality of that fluid in the torpedo (which had fo long diftinguifhed this fifh), by his conveying it through the fame conductors with electricity, fuch as metals, water, and animal fluids; and by intercepting it by the fame non-conductors, namely, glafs and fealingwax. Nor in this circumflance only did the fimilitude between the electric and torpedinous fluids appear : one of the most brilliant of Mr. WALSH's discoveries was, that this animal not only could accumulate in one part a large quantity of electric matter, but was furnished with a certain organization difposed in the manner of the Levden Phial. Thus, while one furface of the

[77]

the electric part (fuppofe on the back) was charged with this matter, or, as it is called, was in a politive state, the other furface (that on the belly) was deprived of it, or was in a negative flate; fo that the equilibrium could be reftored, by making a communication between the two furfaces, by water, the fluids of the human body, or metals. A man, preffing upon one of these furfaces with one hand, could, with the other, by the mediation of his own fluids, make a circuit for the conveyance, and at ' the fame infiant receive a fhock; viz. the fame fenfation that is impreffed by the electric matter in paffing through our arms and body, from the infide of a charged Leyden Phial to its outward coating. We need but attend to the following experiment, which Mr. WALSH made at Rochelle, in prefence of the Academy there, to fee how admirable this circuit is, and how fimilar to a common electrical one. A living

living torpedo was laid on a table, upon a wet napkin; round another table flood five perfons infulated; and two brafs wires, each thirteen feet long, were fuspended from the cieling by filken ftrings. One of the wires refted by one end on the wet napkin; the other end was immerfed in a bason full of water, placed on a second table, on which flood four other basons, likewife full of water. The first perfon put a finger of one hand into the water in which the wire was immerfed, and a finger of the other hand into the fecond, and fo on fucceffively till all the five perfons communicated with one another by the water in the basons. In the last bason one end of the fecond wire was dipped, and with the other end Mr. WALSH touched the back of the torpedo, when the five perfons felt a fhock, differing in nothing from that of the Leyden experiment, except in being weaker. Mr. WALSH, who was not in the circle

[79]

circle of conduction, felt nothing. This was feveral times fuccefsfully repeated, even with eight perfons; and the experiment being related by M. DE SEIGNETTE, mayor of the city, and one of the fecretaries of the Academy of Sciences of Rochelle, and published by him in the French Garette, the account becomes the more authenticated. For though we place full confidence in the candour and veracity of our worthy Brother, yet, in the eyes of the Public, the evidence must be strengthened by the testimony of those, who, but for the fake of truth and fcience, were no wife interested in the matter. We are therefore the more obliged to Mr. WALSH, for having made thefe experiments not in a corner, but I may fay, before the world; and in that very country which gave birth to the celebrated M. DE REAUMUR, whole reputation as a philosopher could not but fuffer fome diminution, in proportion to the

[80]

the credit gained at this time by the fortunate ftranger. And indeed the whole behaviour of the learned academicians, first at Rochelle, and afterwards at Paris (when the experiments became known there) was fuch to their guess, as shewed them to be on this, as on other occasions, the true lovers of science, emulous, not envious, of the reputation of their neighbours.

BUT though no farther evidence be wanting to authenticate the experiments of Mr. WALSH, yet, for the confirmation of the conclusions he draws from them, it is with pleafure that I can join the testimony of our learned and candid Brother, Dr. INGENHOUSZ, physician to their Imperial Majesties at Vienna, who, being in Italy when he received a general account of Mr. WALSH's fuccess, at my request repaired to Leghorn, to make some experiments himfelf upon the torpedo. How far they agreed agreed with, and corroborated those of Mr. WALSH, I need not mention, as you have fo lately heard the Doctor's Letter to me on that fubject.

NOR shall I return to enter into any farther detail of Mr. WALSH's experiments, confidering what encroachment I have already made on your time, and how fenfible you must be, that those which I have already reminded you of, have merited the honours you are now conferring upon him. I fhall only obferve, that our ingenious Brother having traced the fimilitude between the operations of the torpedo and those of an electrical apparatus, he found it fo ftrong, as to perfuade him that it was the identical fluid that actuated both the animal and the machine. Yet he remarks, that, though the charged phial occafions attraction and repulfion in fuch light bodies as the pith-balls, placed near it, and its G difcharge discharge is obtained through a space of air, and accompanied with light and found; nothing of this occurs with refpect to the torpedo. But to these objections against a perfect agreement between the electrical and torpedinous fluids, Mr. WALSH anfwers, that, upon charging a number of large jars with a fmall quantity of electric matter, and then difcharging them, that matter will yield the appearances of the torpedo only. It will not now pafs the hundredth part of that inch of air, which in its collected flate it would run through with eafe; the fpark and fnap and the attraction and repulsion of the balls will alfo be wanting; nor will a point, brought however near, if not just in contact, be able to draw off the charge; and yet this diffused electric matter, to effect its equilibrium, will inftantaneoufly pafs through a confiderable circuit of different conductors properly connected, and give a fenfible fhock

4

[83]

Thock to fuch perfons as compose the circle. But where is that large furface of diffufed electricity to be found in the torpedo? Mr. WALSH replies, that from a minute divifion of parts a large furface will arife; and that even our naked eye will tell us, that shofe fingular tubulated organs of the torpedo confift, like our electric batteries, of many bodies of a prifmatic form, whole furfaces, taken together, compose a confiderable area. To this argument we may add, that hitherto no difference has been found, excepting with regard to more and lefs, between the electric matter which is drawn from the clouds, and that other which pervades all terreftrial bodies, and is collected by every apparatus. If therefore between lightning itfelf, and the charge of a Leyden Phial, there is no fpecific difference, nay scarcely a variety, as far as is known, why then fhould we unneceffarily multiply fpecies, and fuppose the torpedo G 2 provided

...

[84]

provided with one different from that which is every where elfe to be found? But leaving this queftion to be more thoroughly handled by fubfequent experiments, let us conclude, that fuch has been the fimilitude eftablifhed between the electrical fluid of the torpedo, and that of Nature at large, that, in a phyfical fenfe, they may be confidered as precifely the fame.

MR. HUNTER has well obferved, and I think he is the first who has made the obfervation, that the magnitude and number of the nerves bestowed on these electric organs, in proportion to their fize, must appear as extraordinary as their effects; and that, if we except the important organs of our fenses, there is no part even of the most perfect animal, which, for its fize, is more liberally supplied with nerves; nor yet do these nerves of the electric organs feem necession of the fense of the the transfermation of the them.

[85]

them. And with refpect to action, he obferves, that there is no part of any animal, however ftrong and conftant its action may be, which enjoys fo large a proportion of them. If then it be probable, that thefe nerves are unneceffary for the purpofe either of fenfation or action, may we not conclude that they are fubfervient to the formation, collection, and management of the electrical fluid, efpecially as it appears, from Mr. WALSH's experiments, that the will of the animal commands the electric powers of its body?

IF thefe reflections be juft, we may with fome probability foretell, that no difcovery of confequence will ever be made by future phyfiologifts, concerning the nature of the nervous fluid, without acknowledging the lights they have borrowed from the experiments of Mr. WALSH upon the living torpedo, and the diffection of the dead animal <u>G 3</u> by

[86]

by Mr. HUNTER. But whether this will be the individual effect or not, philofophy, by these curious and fuccessful researches, has made a valuable acquisition; fince we may be affured, that whatever tends to disclose the *caufæ rerum*, the secret laws of Nature, cannot ultimately fail of subjecting her, more or less, to the uses of life; and of manifesting, more and more, the wisdom and power of the Creator in all his works.

MR. WALSH,

IN confequence of the approbation of the choice made by the Council, fo unfeignedly expressed in the countenance of every gentleman present, it remains that, in the name and by the authority of the Royal Society of London, formed for the improvement improvement of Natural Knowledge, I deliver into your hand this Medal, the prize you have fo meritorioully obtained; not doubting, SIR, of your grateful acceptance of fo honourable and unperifhing a memorial of their efteem, and of the fenfe of their obligations to a perfon, who, in fo aftinguished a manner, has contributed to promote the great ends of their inftitution. And, in the fame refpectable name, let me add, that they are fo much perfuaded of your abilities to affift in their grand work, the Interpretation of Nature, that they earneftly call upon you to continue your liberal and fpirited labours. With pleafure they understand that you have already turned your views to the electric gymnotus, that other wonder of the waters, an animal poffeffed of powers fimilar to those of the torpedo, but of fuperior energy; and the Society flatter themfelves, that fo much light will be gained by that inquiry, G 4. that that you will be enabled foon to make a farther difcovery of the mysteries of Nature. Her veil fear not, SIR, to approach *. Animated with the prefence of this illustrious and fuccessful Body, I will venture to affirm, that Nature has no veil, but what time and perfevering experiments may remove. In the inftance before us, view the progrefs of the powers of the mind; view the philosophers of the early ages, like the " children of the world +," amufed and fatisfied with the ftories of the torpedo; as incurious about their authenticity, as about the caufes of fuch extraordinary effects. This animal ferved them for an emblem, or an hieroglyphic, for a figure of fpeech, or an allufion of pleafantry; at beft as a theme for a copy of verfes. But the

* Alluding to that paffage in Mr. WALSH's Paper, "We here approach to that veil of Nature, which "Man cannot remove."

+ Lord BACON.

World,

World, rifing in years and in wifdom, rejects fuch trifles. The Interpreters of Nature, in the adult ftate of Time, make experiments and inductions, diftruft their intellects, confide in facts and in their fenfes: and by thefe arts drawing afide the veil of Nature, find a mean and groveling animal armed with lightning, that awful and celeftial fire, revered by the ancients as the peculiar attribute of the father of their gods.

DISCOURSE

ON THE

ATTRACTION OF MOUNTAINS;

DELIVERED AT THE

Anniverfary Meeting of the ROYAL SOCIETY, November 30, 1775.

By Sir JOHN PRINGLE, Bart. PRESIDENT.

PUBLISHED BY THEIR ORDER.

DISCOURSE

A

ON THE

ATTRACTION OF MOUNTAINS.

GENTLEMEN,

THE fatisfaction you difcovered when a propofal was laid before you, for meafuring the attraction of mountains, and the manner in which you received the account of what had been done to fulfil that view, were fuch indications of your applaufe, that your Council, ever attentive to your

[94]

your fentiments, have adjudged the Prizemedal of this year to the Reverend NEVIL MASKELYNE, his Majefty's Aftronomer at Greenwich, the author and conductor of that experiment. The many and valuable communications of our worthy Brother, preceding this inquiry, you have never failed to diftinguish : but these his late labours, undertaken at your requeft, with their fuccefsful refult, related in his Paper, intitled, Observations made on the Mountain Schehallien for finding its Attraction, and inferted in the fecond part of the volume of your Transactions for this year, seemed to lay the Society under fuch obligations, as your Council prefumed you could not otherwife express than by the highest mark of your approbation. In confequence of this reflection, I have, by their authority, caufed Mr. MASKELYNE's name, with the date of the prefent year, to be engraven on the Medal, in order to perpetuate to him the

[95]

the honour you were this day to confer upon him; if, after allowing me to recal to your remembrance fome of the more interesting particulars of this disquisition, and his operations, you should not refuse your fanction to the judgment of your Council.

I SHALL not confider the fubject of attraction at large, nor touch upon any fpecies of it, excepting what in latter times, by the effects, has been diftinguished by the name of gravity or gravitation; a property of bodies, perceptible to the vulgar; when things fall to the ground, but long acknowledged by this Society; to be a quality imprefied by the Creator on all matter; whether of the earth or of the heavens, whether at reft or in motion: *He commanded, and it was created.*

THE discovery of this extensive principle, the physics of astronomy, depended upon

upon a just notion of the arrangement and motions of the fpheres; for, to understand their œconomy, it was neceffary previoufly to know, which of the ftars were quiefcent, which moved, and in what manner. Whoever therefore found out the true celeftial fystem, might be faid to have paved the way to the knowledge of that fublime truth, the law by which the natural world is governed. But who were the inventors here? Were they Chaldeans or Ægyptians? Was it PYTHAGORAS, or PHILOLAUS, or any other Greek, either in their own country, or transplanted to the mathematical schools of Alexandria? I shall not enter upon that enquiry, as fruitless as obscure. All that is clear and to our purpofe, is, that fome of the ancient Greeks conjectured rightly about the stability of the Sun, and the circular motion of the earth; but this was never a general perfuafion, nor does it feem to have been mentioned any more after the

age

[97]

age of PTOLEMY, who in the fecond century did not fo much invent a new fyftem, as adopt that which now goes under his name, the prevailing one of his time, and nearly the fame with that of ARISTOTLE. This, though erroneous, was not, perhaps, ineapable of improvements from celeftial obfervations; but when the philofophy of the fchools was united with the Ptolemaic hypothefis, and both were fubjected to judicial aftrology, then was aftronomy debafed to the level of the pretended learning of the dark ages that enfued, and increafed their darknefs.

BUT at the appointed time, when it pleafed the Supreme Difpenfer of every good gift to reftore light to a bewildered world, and more particularly to manifeft his wifdom in the fimplicity as well as in the grandeur of his works, he opened the glorious fcene with the revival of a found H aftronomy.

[98]

aftronomy. COPERNICUS of Thorn (a Polifh city in the Regal Pruffia), endowed by Nature with excellent talents, improved by a fuperior degree of mathematics, and by travelling, became, carly in life, difgusted with the contradictions about the caufe of the celeftial phænomena. He had recourfe, as he himfelf informs us*, to every author upon the fubject, to fee whether any had been more confistent in explaining the irregular motions of the ftars, than the mathematical schools; but received no fatisfaction, till first, from CICERO, he found that NICETAS had maintained the motion of the earth; and next, from PLU-TARCH, that others of the ancients had been of the fame opinion. CICERO had faid that 'NICETAS the Syracufan (accord-' ing to THEOPHRASTUS) held that the ' heavens, the fun, the moon, the ftars, in

* Præf. ad Lib. de Revolutionibus Orbium Cœlestium.

⁴ a word,

[99]

a word, all the celeftial bodies, flood flil,
and that, excepting the earth, nothing
moved in the world; but that, whilft
the earth with the greateft celerity turned
round its axis, the fame phænomena
were produced as if it flood flill, and the
heavens moved. And this fome thought
was alfo PLATO's notion, but fomewhat
obfcurely expreffed *.'

PLUTARCH's words were, 'Others fup-' pofe the earth to be at reft; but PHILO-' LAUS, the Pythagorean, that it is carried ' in the ecliptic round the fire, like the ' fun and the moon. HERACLIDES of ' Pontus, and ECPHANTUS the Pythago-' rean, make the earth move like a wheel ' about its centre, from weft to eaft, but ' not to change its place †.

> * Cicer. Quæft. Academic. † Placit. Philof. lib. iii. cap. 3.

> > H 2

FROM

FROM these quotations, and what Co-PERNICUS farther fays*, we find how little difpofed that great man was to plume himfelf with the inventions of others: nay, he was rather anxious not only to do juftice to those who had gone before him, but by their authority to fcreen himfelf from the cenfure of innovation, abfurdity, and impiety, that awaited the publication of his doctrine. After all, the original genius of COPERNICUS was but little beholden, for the difcovery of those fublime truths, to either NICETAS or PLATO, fince it appears, from CICERO, that thefe two believed both the moon and the planets to be motionlefs. Nor could he be more affisted by PHILOLAUS, who taught that the earth turned round a fire ; but this fire could not be the fun, becaufe that Ancient compares the motion of the earth about the fire, to the revolution of the fun

* Placit. Philof. lib. iii. cap. 3.

and

and moon about the earth. Laftly, what little light COPERNICUS could draw from HERACLIDES and ECPHANTUS, I fearcely need fay, fince they, though admitting the diurnal motion of the earth, denied the annual.

BUT if COPERNICUS fought to do juftice, why did he not rather cite a clear and express paffage in the Arenarius of Ar-CHIMEDES, for the fixed flate of the fun, and for the motion of the earth in a circle round his body? ' What most philosophers • call the world,' fays that famous Ancient, • is a fphere, of which the centre is that of [•] the earth, and whereof the femi-diameter • is equal to a right line joining the centers of the earth and the fun. But ARIS-* TARCHUS the Samian, refuting this opi-" nion, has advanced an hypothefis, where-• by the world fhould be many times ' greater than what is here faid; for he · fuppofes H_{3}

[102]

fuppofes that the fixed ftars and the fun
remain immoveable, and that the earth
is carried in a circle round the fun, placed
in the middle of its courfe *.'

THUS far ARCHIMEDES, who feems not to difapprove the fyftem, but who explains it no farther, as what he had quoted was fufficient for his purpofe. It is probable that the penetrating genius of ARISTAR-CHUS had difeovered the true arrangement of all the celeftial bodies, and thereby totally anticipated COPERNICUS; but that circumftance is no where, that I know of, recorded; and otherwife, we fhould acquit our illustrious Reformer of plagiarism, with regard to ARISTARCHUS, fince neither the Arenarius of ARCHIMEDES, where that paffage is found, nor indeed any other of his valuable remains, had feen the light before the death of COPERNICUS. This

* Archimed. Arenar. ed. Oxon. 1676.

extraordinary

extraordinary perfon had, even before the meridian of life, completed his difcoveries, and comprised them in his book De Revolutionibus Orbium Cæleftium, his only work; but which he had prudently suppressed, till he had maturely confidered his fubject, and had found a neceffary and powerful patron, the pope himfelf, PAUL III., a lover of aftronomy, to protect him. Alluding to the admonition of the Poet, he tells the Pontiff, ' he had fuffered that fruit of ' his labours to ripen, not nine years only, ' but four times nine *.' Confenting at last to the publication, he committed the care of the impreffion to fome friends in a diftant city, from whom he received the finished copy a few hours before he expired †.

Few compositions have deftroyed more riveted errors, or established more import-

H 4

ant

[104]

ant truths. Here, inftead of an abfolute ftate of reft for the earth, its triple motion is afcertained, the diurnal about its axis, the annual about the fun, and that other, known by the term preceffion of the equinoxes; all which, till then, had been referred to the motion of the heavens. He likewife demonstrated the double orbit of the moon; that is, her menstrual motion about the earth, and her annual about the fun. Nor did the wife COPERNICUS ftop here: for, after laying this folid foundation of the celeftial phyfics, he began the fuperftructure, by furmifing a principle of attraction to be inherent in all matter. Thus, in refuting the peripatetic notion, that bodies fall to the ground, becaufe, by a law of Nature, every thing heavy tends to the centre of the universe (which they supposed to be in the centre of the earth), he obferved that ' the earth could not be the ⁶ centre of the orbits of feveral of the pla-· nets,
* nets, becaufe of the apparent irregulari-⁴ ties of their motions, and therefore could not be the centre of the universe. Hence, Ç. according to thefe philosophers, there ٤. ' must be more centres than one; and if ⁶ fo, who could tell the true centre, toward • which all bodies were to gravitate? As for gravity (fays he), I confider it as • nothing more than a certain natural ap-• petence (appetentia), that the Creator • has imprefied upon all the parts of mat-' ter, in order to their uniting and coa-· lescing into a globular form, for their ⁶ better prefervation; and it is credible ' that the fame power is also inherent in the fun, and moon, and planets, that those bodies likewife may constantly re-' tain that round figure in which we be-• hold them *.' Farther, COPERNICUS looked upon the fun as the chief governing power of the earth and all the other pla-

* De Revolut. Orb. Cœlest. lib. i. cap. 9.

nets;

[106]

nets; for, after placing the great luminary in the centre, he cries out with rapture, · Profectò tanquam in solio regali sol residens · circumagentem gubernat astrorum fami-· liam *.' Nor was this government underftood to be exercifed by any other power than that of attraction; as may be inferred from fome of the last words of the celebrated TYCHO BRAHE, who, perceiving the approach of death, called for the famous KEPLER (then a young man, and his afliftant in his observatory at Prague), and after charging him with completing and publishing the aftronomical tables which he was leaving unfinished, thus addreffed him : ' My friend, although what ' I afcribe to a voluntary, and, as it were, an oblequious motion of the planets ' round the fun, you attribute to an at-" tractive energy of that body; yet I muft ⁶ entreat you, that, in the publication of * De Revolut. Orb. Coeleft. lib. i. cap. 10.

• my

[107]

⁶ my obfervations, you would explain all
⁶ the celeftial motions by my hypothefis,
⁶ rather than by that of COPERNICUS,
⁶ which I know you would otherwife in⁶ cline to follow *.

FROM this paffage, which I have taken from the life of TYCHO BRAHE, it would feem, that though that other excellent aftronomer was not infenfible of fome influencing power of the fun over the planets, he would not however express it by fo ftrong a term as *attraction*. But in what manner KEPLER complied with the requeft of his dying patron, it is not our prefent purpofe to mention, and therefore we fhall only obferve, that in his own works he conftantly maintains the doctrine of attraction, and carries it even farther than ever COPERNICUS had done. Thus he calls gravity *a corporeal and mutual affection*

* Gaffend. in Vit. Tych. Brah. cap. 5.

[108]

between similar bodies, in order to their union *. Again he remarks with COPER-NICUS, against the peripatetics, that ' hea-• vy bodies do not tend to the centre of ' the universe, but to the centre of those · larger round bodies, of which they make • a part; fo that, if the earth were not ' fpherical, things would not fall from all points towards its centre. If a ftone ' were to be placed at a diftance from ano-' ther ftone, in any part of the univerfe, ' without the fphere of action of a third body, like two magnets, they would · come together in fome intermediate point, each advancing, in fpace, in the inverfe · proportion of their quantities of matter. ' Hence, if the moon and the earth were ^c not by fome power kept afunder in their ' refpective orbits, they would move to-' wards one another; the moon making ' fifty-three parts of the way, while the

* Aftron. Nov. in Introduct.

earth 6

[109]

⁶ earth made one, fuppofing their denfities
⁶ equal *.'

FROM the fame principle KEPLER accounted for the general motion of the tides; to wit, by the attraction of the moon, and expressly calls it virtus tractoria quæ in luna est †. He adds, that if the earth did not exert an attractive power over its own waters, they would rife and rush to the moon ‡. Farther, we find him fuspecting certain irregularities in the motion of the moon to be owing to the combined action of the earth and fun upon its body §. Thefe, and other reflections concerning the univerfality of attraction, he accompanies with an ingenious anticipation of a law of Nature, from conjecture only, but which was afterwards made out by experiments. The fchools had taught, that

* Aftron, Nov. in Introduct. + Ibid.
‡ Ibid. § Aftron, Nov. cap. xxxvii.

' fome

[110]

fome bodies were by their nature heavy,
and fo fell to the ground, and that others
were by their nature light, and therefore
mounted upwards:' but KEPLER pronounced that ' no bodies whatfoever were
abfolutely light, but only relatively fo;
and, confequently, that all matter was
fubjected to the law of gravitation *.'

HITHERTO the genius of KEPLER had been fortunate, in tracing out that great principle, which hindered the planets from flying off from the fun: But what kept them from falling into that mass of fire, and what power perpetuated their motion in their orbits? Here his fagacity had failed him, and left his imagination to furnish the idea of a system of vortices for DESCARTES.

BUT howfoever incomplete these notions were concerning gravitation, yet, in justice

* Aftron. Nov. in Introduct.

to

to their diffinguished authors, COPERNIcus and KEPLER, I thought proper to commemorate them on this occasion, as none before them had expressed themfelves fo fully, and with fo much truth, on that curious fubject : and as none, from their days to those of Dr. HOOKE, made any fuch improvement, as would apologize for my taking up fo much more of your time in recalling their fentiments to your remembrance, let it fuffice to mention, that the first who, in this country, embraced that doctrine, was Dr. GILBERT *, but who did not properly diffinguish between attraction and magnetifm; and that the next was Lord BACON', who, though not a convert to the *Copernican* fyftem, yet acknowledged an attractive power in matter †. In France, we find FERMAT and

* De Magnete.

+ Nov. Organ. lib. ii, aphor. 36. 45. 48. Sylv. Sylvar. cent. i. exp. 33.

ROBERVAL,

[112]

ROBERVAL, mathematicians of great eminence, of the fame opinion *; and in Italy, BORELLI, after GALILEO †, who was the first in that country who conceived that idea, but far from that precision and extenfion we find it in his contemporaries BA-CON and KEPLER.

BEFORE we pass from KEPLER, it will be proper to observe, that this great improver of astronomy did not, perhaps, after all, contribute fo much to the advancement of this theory, by those conjectures which I have related, as by fome astronomical deductions from TYCHO BRAHE's observations, fince known by the name of KEP-LER'S Laws. The first was, that the planets move not in circular, but in elliptical orbits, of a small eccentricity, whereof the centre of the fun makes one of its foci.

The

^{*} Montucla Hift. des Mathem. part iv. liv. viii.

⁺ Syft. Cofmic.

The fecond, that the fame planet deferibes about the fun equal areas in equal times. The third, that in different planets, the fquares of the periodic times are as the cubes of their mean diffances from the fun.

SUCH were the preparatives to the true philofophy, and indeed excellent materials for the architect then unborn. But till Sir ISAAC NEWTON appeared, notwithftanding the numerous and momentous difcoveries that had been made in the heavens, by COPERNICUS, TYCHO BRAHE, GALI-LEO, KEPLER, and others, yet aftronomy, as Lord BACON complained, ftill remained but a mathematical fludy. The paffage to which I allude is long; but, as tending to illustrate more than one particular relating to my fubject, I cannot forbear trefpaffing on your indulgence by the citation. . . Al-' though aftronomy,' fays BACON, ' has Τ not

[114]

[•] not been founded amifs upon obfervation ' of the phænomena, yet the fuperftructure • has hitherto kept low and weakly. In truth that fcience prefents to the human • understanding fuch an object as PROME-' THEUS did of old to JUPITER, when, ' meaning to impofe upon that deity, he ' offered upon his altar, inftead of a live · victim, the hide of a large bullock, · stuffed with straw, leaves, and ofier · branches. In like manner, aftronomy ' exhibits the externals of the celeftial · bodies, as the cuticular part of heaven, · fair, indeed, and artificially formed into • a fyftem; but the entrails and the foun-' tains of life are wanting, that is, the ' phyfical caufes and reafons; from which, ' and from aftronomical hypothefes, a the-• ory fhould be drawn, not adequate only • to account for all the phænomena, but ' for the fubftance, the motion, and influx f of the heavens, as they are in Nature.- Scarcely 6

Scarcely is there one to be found, who has enquired into the natural caufes, ٢. · either of the fubftance of celeftial matter. ' or into the reafon of the fwiftness or ' flownefs of the heavenly bodies acting ' upon one another; or into the various ' degrees of motion of the fame planet, or ' into the motion from east to west, or of ' the contrary direction; nor into the pro-' greffions, flations, and retrogradations of ' those bodies; nor into the causes of the ' apogæum and perigæum.-I fay, inqui-' ries of this kind have fcarcely been attempted, nor indeed any labour bestowed 6 ' upon the fubject, excepting in the way · of mathematical obfervations and demon-' ftrations. So that aftronomy, fuch as it ' now is, can only be reckoned among the ٤. mathematical arts; not without confider-6 able diminution of its dignity, fince, were ' it to maintain its rights, it might rank ' itfelf as the nobleft branch of philosophy. 1 2 For

[116]

• For he that shall reject the fictitious di-' vorces between the fuperlunary and fub-' lunary bodies, and shall duly attend to • the appetences and moft general affections ' of matter (which both in the earth and • in the heavens are exceedingly powerful, ' and indeed pervade the univerfe), will [•] receive, from what he fees paffing on the earth, clear information concerning the ' nature of celeftial bodies; and contrari-• wife, from motions which he fhall difco-' ver in the heavens, will learn many par-' ticulars relating to the things below, that · now lie concealed from us. Wherefore ' the phyfical part of aftronomy we mark ' as wanting, and call it the aftronomia · viva, the animated aftronomy, in oppo-' fition to the fluffed bullock of PROME-• THEUS *.'

THE great *desideratum* was fupplied, and from the bofom of this Society, in the * De Dign. & Augm. Scient. l. iii. c. 4. 5 publication

publication of the Principia, the immortal work of NEWTON. There the illustrious author evinces truths that had been only furmifed before; and, after eftablishing by a just analysis the laws of attraction, in a fynthetical method proceeds to explain by them the motions and appearances of the heavenly bodies. Had not NEWTON lived, BACON might have paffed for a visionary fpeculator; but fince the demands of that noble author upon the human intellects have been fo fully answered in the productions of Sir ISAAC NEWTON, shall we not revere those powers of his own mind, that could, in that dawn of philosophy in which he lived, fo well defery what parts were wanting, and what were the means of attaining them ?

NEWTON, in a posthumous treatife, de Systemate Mundi, composed before the I 3 publication

publication of the Principia, and mentioned there, has faid, that ' fome of the latter ' philosophers had fought to account for ' the courfe of the planets in their orbits ' by the action of certain vortices, as KEP-· LER and DESCARTES; or by fome other · principle of impulse or attraction, as Bo-' RELLI, HOOKE, and others of our na-' tion.' From this paffage it would feem that, in those times, there had been more conjectures formed concerning attraction, than what were published; for, excepting GILBERT, who vainly attempted to explain the mundane fyftem by magnetifm, and Lord BACON, who never acceded to the Copernican hypothefis*, I have found none of our nation, HOOKE excepted, who, in this way, have left any thing on record

* Atque harum suppositionum absurditas, in motum terræ diurnum, (quod nobis constat falsissimum
esse) homines impegit.'—Bac. de Dign. & Augm.
Scient. lib. iii. cap. iv.

worthy

worthy of your notice. He, indeed, theearly, the ingenious, and most useful member of this Society, advanced, in this refearch, far beyond all that had gone before him. But I shall not enlarge upon his improvements, as you have in your hands his Cutlerian Lectures, which contain them, and as I have already but too long dwelt on this part of my fubject. It will ever redound to the praife of HOOKE, that NEWTON has affociated him with himfelf in maintaining the true regulating caufe of the courfe of the planets*. As to Bo-RELLI, though I have found in one of the pieces (a fcarce one) of that learned Italian, a paffage that certainly favours attraction; yet as it is neither fo full nor fo explicit, upon that point, as feveral others which I have cited, I must fuspect that those parts,

* M. MONTUCLA has done great justice to Dr: HOOKE, in this and other particulars, in his excellent work, *Hist. de Mathem.* part iv. liv. 8.

which

[120]

which Sir IsAAC had in his eye, have efcaped my obfervation *.

THE great completer of the doctrine of univerfal gravitation had the fatisfaction to find, from the reception it met with in this Society, that he had not laboured in vain: nay, perhaps no philofophical author was ever more admired and followed, in his own time and in his own country, than NEWTON was in these kingdoms. With regard to others, ' we are not to wonder,'

* This is the paffage alluded to: ' Præterea manifeftum eft, quemlibet five primarium five fecundarium planetam aliquere infignem mundi globum, quafi virtutis fontem, circumdare, qui ita eos ftringit atque conglutinat, ut ab ipfo nullo pacto abftrahi poffint; fed ipfum, quacunque contendentem, perpetuis continuifque orbibus cogantur confequi; videmus enim Saturnum, Jovem, Martem, Venerem, atque Mercurium, Solem ipfum,-Medicæa Sidera, Jovem,-Hugenianumque Sidus, Saturnum circumire, non fecus, ac circa Telluris Globum Luna ipfa revolvitur.'-Joa. Alph. Borelli Theor. Medic. Planetar. ex Caufis Phyficis deductæ, lib. i, çap. ii. p. 5. Florent. 1666, 4to.

28

as remarked by his eloquent Eulogift, ' if • philosophers, upon the first publication • of the Principia, took the alarm at the • term attraction, as fearing the return of • the occult qualities; or if, confidering the ' difficulty of the fubject, and the few " words employed in explaining it, they • wanted time fully to comprehend it *.' Thefe obstacles have been removing by degrees, and the way at laft has been fo effectually cleared, that the name of NEW-TON is not perhaps held in more effimation here, nor his principles more cordially embraced, than in those very focieties of the learned abroad, which at first shewed most unbelief, and at whose conversion, therefore, we ought most to rejoice.

THE Royal Academy of Sciences, whilft in an uncertain flate between the old and new fyftem of philofophy, having, for one

* Eloge de Newton, par M. de Fontenelle.

of the decifive experiments, meafured fome degrees of latitude upon an arch of a meridian paffing through Paris, and compared this menfuration with others, inferred the earth to be a fpheroid, with the longeft diameter passing through its poles; but, fenfible that this operation had not been fo unexceptionably conducted as to fatisfy either the followers of NEWTON or those of HUYGENS, who both required a fpheroid flattened at the poles, refolved upon a farther and more accurate trial. With this view, in the year 1735, fome chofen members from that illustrious Body were fent to the polar circle, and others to the equator; at which places the differences of degrees being g' ter, the point in difpute might be determined with lefs danger of error. How much to the honour of New-TON and HUYGENS the refult was, is fufficiently known. All that is neceffary to be mentioned here, is, that, in the year 1738,

1738, whilft the academicians were still in Peru, it occurred to M. BOUGUER, one of that number, to put the Newtonian fystem to another teft, by enquiring into the attraction of mountains. This idea, which was originally from NEWTON himfelf, M. BOUGUER communicated to his colleague M. DE LA CONDAMINE, who readily affifted in making the trial *. Those gentlemen were perfuaded, that if the whole mafs of the earth were really poffeffed of fuch a property, a high mountain, fuch as Nature had abundantly provided in that country, would fhew fome proportionable degree of it; and that the largest of the Andes was indeed but a fmall object in comparison of the earth : nevertheless they reekoned, by a rough computation, that the attraction of Chimboraço, which they deemed the best for their purpose, would

* BOUGUER, Figure de la Terre, fect. 7. DE LA CONDAMINE, Journal du Voyage à l'Equateur.

be equal to about the 2000th part of the attraction of the whole earth. Now, here the mountain acting as one, whilf the earth acted as 2000, the direction of gravity would be vifibly turned out of the vertical line, for as much as this direction would be 1' and 43'' towards the mountain. But how was this deflexion to be effimated ? Only by finding the quantity of deviation of the plumb-line from a vertical polition, by means of ftars. In order to attain this point, they found it most convenient, in their prefent circumstances, to take the diftance of feveral ftars from the zenith, at two stations, one on the fouth fide of Chimboraço, and the other a league and a half to the weft; that is, at fuch a diftance from the first station, as that the plumbline should be but little affected by the mountain. This difposition being made, they proceeded to their operations, of which we have a full and clear account by M. BOUGUER,

BOUGUER, in his valuable treatife entitled Figure de la Terre; but of M. DE LA CONDAMINE, we have only a fhort abftract of the narrative he prefented to the Academy; which abftract is contained in his curious Journal of a Voyage to the Equator.

FROM both it appears, that though thefe learned perfons, during the time employed in this experiment (which the inclemency of the air, at that height in the atmosphere, forced them to make very fhort),—I fay, though during this time they spared no pains, yet their observations not only varied from one another, but seemed to be little fatisfactory to themsfelves. M. Bou-GUER fays, that, instead of 1' 43'', which the plumb-line ought to have declined from the true vertical line, the total declension amounted only to seven seconds and a half: an effect that fell far short of the expecta-

[126]

expectations of a Newtonian. But those candid gentlemen take notice, that, ' as on • one hand we are ignorant of the denfity ' of the internal parts of the earth, which ' may be confiderably greater than what ' appears by its furface; fo, on the other, · Chimboraço, which they believed likely ' to be as folid as any other parts of the furface of the earth, might neverthelefs, ' in many places, be hollow.' Nay, M. DE LA CONDAMINE tells us, that ' he was ' afterwards informed of a tradition in the ' country, that this very monntain had ' once been a volcano;' and adds, that ' whilft he and his colleague were about their experiment, they had actually found ' fome calcined ftones upon it :' from which circumstances he infers, that ' if one cannot ' just draw from this trial an absolute proof ' of the Newtonian attraction, one can far ' lefs form any conclusion against it.' M. BOUGUER goes farther, and obferves, that · if

[127]

' if we will be fatisfied with the bare fact, ' it is certain, from this experiment, that · mountains do act at a diftance, but that • their action is much lefs than what might ' be expected from their bulk.' He concludes his account in the true spirit of a philosopher, by faying, that ' as in France, or in England, a hill may be found of a ' fufficient height for the purpofe, and * efpecially if the obferver would double ' the action, by making a flation on each ' fide; he fhould be happy to hear, on his ' return to Europe, that the experiment ' had been repeated, whether the refult ' tended to confirm his obfervations, or to • throw fome better light upon that en-' quiry.' If the Society have fulfilled the views of that worthy man, who thus called upon them, we have to regret that he did not live long enough to fhare the fatisfaction with us.

I COME

I COME now to Mr. MASKELYNE's la= bours, upon which I fhall not expatiate, as I have already taken up too much of your time, and as I judge it unneceffary to dwell long upon that part of my fubject, which you have fo lately heard in his own words, and which you will have in a few days publifhed at large in your Tranfactions.

I NEED only remind you, that the zenith diftance of a flar on the meridian being obferved at two flations under the fame meridian, one on the fouth fide of a mountain, the other on the north ; if the plumbline of the inftrument be attracted by the mountain out of its vertical polition, the flar will appear too much to the north, by the obfervation at the fouthern flation, and too much to the fouth, by that at the northern flation; and confequently the difference of the latitudes of the two flations will be found, by thefe obfervations, greater greater than it really is. And if the true difference of their latitudes be determined by meafuring the diftance between the two ftations on the ground, the excefs of the difference, found by the obfervations of the ftar, above that found by this meafurement, must have been produced by the attraction of the mountain, and its half will be the effect of fuch attraction on the plumb-line at each obfervation, fuppofing the mountain attracts equally on both fides.

To perform this experiment, Mr. MAS-KELYNE made choice of the mountain Schehallien, in Perthfhire in North Britain, of which the direction in length is nearly eaft and weft; its height above the furrounding valley, at a medium, is about 2000 feet; and its higheft part, above the level of the fea, is 3550 feet. As the greateft attraction of the mountain was to K be be expected about half way up its fides (which happened, conveniently for the purpole of the experiment, to be pretty fteep), two ftations for an obfervatory were accordingly chosen, one on the north, the other on the fouth fide of Schehallien. The inftrument, with which he observed the flars, was an excellent fector made by Mr. SISSON; and Mr. MASKELYNE has related at large all the precautions he took both for adjusting this instrument in the meridian at each flation, and for fatisfying himfelf that the line of collimation remained unaltered. From observations of ten ftars near the zenith, he found the apparent difference of the latitudes of the two stations to be 54"; 6; and from a measurement by triangles, formed from two bafes on different fides of the mountain, he found the diftance of their parallels to be 4364 feet, which, in the latitude of Schehallien, viz. 56° 40', answer to an arch of the meridian 4

[131]

ridian of 43": this is 11", 6 lefs than that found by the fector. Its half, therefore; 5", 8, is the mean effect of the attraction of the mountain : and from its magnitude, compared with the bulk of the whole earth, Mr. MASKELYNE difcovered the mean denfity of the earth to be about double that of the mountain.

In the execution of this interefting experiment, our worthy brother has not only exerted a patience and perfeverance, but a fagacity and judgment, which muft ever redound to his honour. All doubts about an univerfal attraction muft at laft beterminated, and every philofopher, in that refpect, muft now become a Nervitonian.

IF I have related but two experiments that have been made, the first by the French academicians, and the other by K 2 Mr.

[132]

Mr. MASKELYNE, it is becaufe no more have come to our knowledge; nor do I believe that more have actually been executed. For if, in occafional menfurations of degrees of the meridian in different parts of Europe, those employed have found varieties arife in their measures, that they could not otherwife account for, than from the attraction of the mountains among which they carried on their operations, and accordingly have referred those irregularities to that very caufe; fuch conjectures we admit may be well founded, but the meafurements whence they arife we cannot reckon among the experiments we now treat of.

BUT was not the doctrine of an univerfal attraction fo fully demonstrated by NEWTON, as not to require any farther proofs from experiments? Demonstrated it was, but not to the conviction of every 8 individual. individual. True Philosophy condescends to adapt her instructions to different capacities, and is as willing to inform by palpable experiments as by geometrical demonstrations. But to fay the truth, fomething feemed wanting here for the fatisfaction of even the more enlightened minds. Such we reckon those were, who first made the trial. And did not HUYGENS himfelf, one of the greatest philosophers and geometricians of his age, find difficulties about this principle, even after the publication of NEWTON's Principia? Nor do we learn that the doubts of that great man were ever removed *. To fay nothing of the celebrated LEIBNITZ, and his numerous followers, who to this day are either wholly unbelievers in attraction, or at best but fceptics on that article.

You have, therefore, GENTLEMEN, the fatisfaction to think that you have com-

* Vid. Huygen, Differt. de Cauf. Gravitat. K 3 pleted pleted a great and acceptable work to the fcientific world; and that, though this has been a coftly experiment, your gracious PATRON, who fo liberally furnished the means, will highly approve your expending his benefaction fo much for the advancement of Natural Knowledge and for the benefit of the Public; and will fo much the more be disposed to shew you the like favour on future occasions.

But even those who wanted no fresh proofs of the universality of attraction, must still partake of the advantages accruing from this experiment, as being not only the first that has been made, but the best that could be devised, for estimating the mean density of the earth. The operation in Peru was too imperfect for that purpose; and had the circumstances of that trial been more favourable, yet the suppose of the mountain's having been once

[I35]

once a volcano, was a fufficient reafon for admitting no evidence from it in this part of our inquiry. But for Schehallien, as its appearance was particularly rocky, and as feveral fpecimens of its rocks have been prefented to the Society, and acknowledged to be mineral fubftances that had never paffed through fire, we may confider that mountain as one of the proper patterns of the denfity of the furface of the earth.

THESE, GENTLEMEN, are the fruits of the operations of Mr. MASKELYNE, during a refidence of four months in a mean hut, on the fide of a bleak mountain, and in a climate little favourable to celeftial obfervations. To thefe inconveniences, however, he fubmitted with patience and complacency, as he went at your requeft, and in purfuit of fcience. You have heard his chief conclusions; but permit me add, that, as this is a new mine opened in the K 4 field field of Nature, I am confident that thefe will not be the only productions; but that, as in all great and fuccefsful experiments, there will be, in the profecution of this fubject, fome valuable truths brought to light, of which at prefent we can form no particular conjecture. Mean while we have the pleafure to find the doctrine of *univerfal gravitation* fo firmly eftablifhed by this finifhing ftep of analyfis, that the moft fcrupulous now can no longer hefitate to embrace a principle, that gives life to Aftronomy, by accounting for the various motions and appearances of the Hofts of Heaven.

MR. MASKELYNE,

THE judgment, SIR, of the Council, in awarding you the Prize, having received the the fanction of the Royal Society, I do, in. the name and by the authority of that illustrious Body, prefent you, their most worthy Brother, with this fincere pledge of their affection; as the lafting token of their acknowledgment for your feveral ingenious and useful communications, and more particularly for this laft painful and capital experiment, which adds no fmall lustre to their Transactions. And after expressing their grateful sentiments for what you have already done for their fervice, I would farther fay, that they perfuade themfelves, from your talents, your love of your profession, and your happy period of life, you will continue fleadily to purfue that path which you have fo early entered upon, and which fo furely leads to great and ufeful difcoveries. You have, SIR, in charge the nebleft branch of Natural Philosophy: fuch it has ever been held by this Society, and

and as fuch it ever has been cherished and cultivated by them. And they flatter themfelves that their cares and folicitude have not been fruitless; fince, from their first institution to this day, there have never been wanting fome excellent men in that line, to promote the fcience, and do honour to this Community. But fo transcendently great is that part of the creation, that though the Divine Author has vouchfafed, in these latter days, to open, to the humble and patient inquirers into Nature, the Caufes of Things; yet we must still cry with the ancient fage, Lo, thefe are part of His ways, but bow little a portion is heard of them ! As much then remains to be explored in the celeftial regions, you are encouraged, SIR, by what has been already attained, to perfevere in thefe hallowed labours, from which have been derived the greatest improvements in the most useful arts, and

and the loudeft declarations of the power, the wifdom, and the goodness of the Supreme Architect, in the spacious and beautiful fabric of the World.

DISCOURSE

V PON

SOME LATE IMPROVEMENTS

OF THE MEANS FOR

PRESERVING THE HEALTH OF MARINERS;

DELIVERED AT THE

Anniversary Meeting of the ROYAL SOCIETY, November 30, 1775.

By Sir JOHN PRINGLE, Bart. PRESIDENT.

PUBLISHED BY THEIR ORDER.

DISCOURSE

UPON

A

SOME LATE IMPROVEMENTS

OF THE MEANS FOR

PRESERVING THE HEALTH OF MARINERS.

GENTLEMEN,

BEFORE we proceed farther in the bulinefs of this day, permit me to acquaint you with the judgment of your Council in the difpofal of Sir GODFREY COPLEY'S Medal; an office I have undertaken at their requeft, and with the greater fatisfaction, as I am confident you will be no

less unanimous in giving your approbation, than they have been in addreffing you for it upon this occasion. For though they were not infenfible of the just title that feveral of the Papers, composing the prefent volume of your Transactions, had to your particular notice, yet they did not hefitate in preferring that which I prefented to you from Captain COOK, giving An Account of the Method he had taken to preferve the Health of the Crew of his Majefty's Ship, the Refolution, during her late Voyage round the World. Indeed, I imagine that the name alone of fo worthy a Member of this Society would have inclined you to depart from the ftrictness of your rules, by conferring upon him that honour, though you had received no direct communication from him; confidering how meritorious in your eyes that perfon muft appear, who hath not only made the most extensive, but the most instructive voyages;

ages; who hath not only difcovered, but furveyed, vaft tracts of new coafts; who hath difpelled the illufion of a *terra auftralis incognita*, and fixed the bounds of the habitable earth, as well as those of the navigable ocean, in the fouthern hemisphere.

I SHALL not; however, expatiate on that ample field of praife, but confine my difcourfe to what was the intention of this honorary premium, namely, to crown that Paper of the year, which should contain the most useful and most fuccessful experimental enquiry. Now what enquiry can be fo ufeful as that, which hath for its object the faving the lives of men? And when shall we find one more fuccessful than that before us? Here are no vain boaftings of the empiric, nor ingenious and delusive theories of the dogmatist; but a concife, and artlefs, and an incontested relation of the means; by which, ' under the ⁶ divine L

7

[146]

divine favour, Captain COOK, with a
company of an hundred and eighteen
men*, performed a voyage of three years
and eighteen days, throughout all the
climates, from fifty-two degrees north to
feventy-one degrees fouth, with the lofs
of only one man by ficknefs †.' What muft enhance to us the value of thefe falutary obfervations, is, to fee that the practice hath been no lefs fimple than efficacious.

I WOULD now enquire of the most conversant in the study of bills of mortality, whether, in the most healthful climate, and

* There were on board, in all, one hundred and eighteen men, including M. Sparrman and his fervant, but whom they took in at the Cape of Good Hope, and left there upon their return to that place.

+ This was a confumption terminating in a dropfy. Mr. Patten, furgeon to the Refolution, who mentioned to me this cafe, obferved that this man began fo early to complain of a cough and other confumptive fymptoms, which had never left him, that his lungs must have been affected before he came on board.

in

in the beft condition of life, they have ever found fo fmall a number of deaths, in fuch a number of men, within that fpace of time? How great and agreeable then muft our furprife be, after perufing the hiftories of long navigations in former days, when fo many perifhed by marine difeafes, to find the air of the fea acquitted of all malignity, and, in fine, that a voyage round the world may be undertaken with lefs danger, perhaps, to health, than a common tour in Europe !

But the better to fee the contraft between the old and the prefent times, allow me to recal to your memory what you have read of the first voyage for the establishment of the East India Company *. The equipment confisting of four ships,

* This fquadron, under the command of LANCAS-TER (who was called the General), fet out in the year 1601. See PURCHAS'S Pilgr. vol. i. p. 147, & feq.

L 2

with

with four hundred and eighty men on board, three of thefe veffels were fo weakened by the fcurvy, by the time they had got only three degrees beyond the Line, that the merchants, who had embarked on this adventure, were obliged to do duty as common failors; and there died, in all, at fea, and on shore at Soldania, a place of refreshment on this fide the Cape of Good Hope, one hundred and five men, which was nearly a fourth part of their complement, before they got farther on their voyage. And hath not Sir RICHARD HAWKINS, who lived in that age, an intelligent as well as brave officer, recorded, that ' in twenty years, during which he ' had ufed the fea, he could give an ac-' count of ten thousand mariners, who had * been confumed by the fcurvy alone *? Yet fo far was this author from miltaking the difeafe, that I have perufed few who

* PURCHAS's Pilgr. vol. iv. p. 1373, & feq.

have

have fo well defcribed it. If, then, in those early times, the infancy, I may call them, of the commerce and naval power of England, fo many were carried off by that bane of fea-faring people, what must have been the deftruction afterwards, upon the great augmentation of the fleet, and the opening of fo many new ports to the trade of this country, whilst fuch little advancement was made in the nautical part of medicine !

But paffing from thefe old dates to one within the remembrance of many here prefent, when it might have been expected that whatever tended to aggrandize the naval power of Great Britain, and to extend her commerce, would have received the higheft improvement; yet we fhall find that, even at that late period, few measures had been taken to preferve the health of feamen, more than had been known to our L 3 uninftructed

uninstructed ancestors. Of this affertion, the victorious but mournful expedition of Commodore Anson affords too convincing a proof. It is well known that, foon after paffing the Straits of Le Maire, the fcurvy began to appear in his fquadron; that, by the time the Centurion had advanced but a little way into the South Sea, forty-feven had died of it in that thip; and that there were few on board who had not, in fome degree, been affected with the diftemper, though they had not been quite eight months from England : that, in the ninth month, when ftanding for the island of Juan Fernandez, the Centurion loft double that number; and that the mortality went on at fo great a rate (I still speak of the Commodore's ship) that, before they arrived there, fhe had buried two hundred; and at last could muster no more than two quarter-masters and fix of the foremastmen, in a watch, capable of doing duty. This

This was the condition of one of the three fhips which reached that island; the other two fuffered in proportion.

NOR did the tragedy end here: for after a few months respite, the same fatal sicknefs broke out afresh, and made such havock, that, before the Centurion (which now contained the whole furviving crew of the three fhips) had got to the island of Tinian, there died fometimes eight or ten in a day; infomuch that, when they had been only two years on their voyage, they had loft a larger proportion than of four in five of their original number; and, by the account of the hiftorian, all of them, after their entering the South Sea, of the fcurvy. I fay, by the account of the elegant writer of that voyage; for, as he neither was in the medical line himfelf, nor hath authenticated this part of his narrative by appealing to the furgeons of the ship, or to their journals, LA

[152]

journals, I should doubt that this was not frictly the cafe; but rather that, in producing this great mortality, a peftilential kind of diftemper was joined to the fcurvy, which, from the places where it most frequently occurs, hath been diffinguished by the name of the jail or hofpital fever*. But whether the fcurvy alone, or this fever combined with it, were the caufe, it is not at prefent material to enquire; fince both, arifing from foul air and other fources of putrefaction, may now in a great meafure be obviated by the various means fallen upon fince Lord ANSON's expedition. For, in juffice to that prudent as well as brave Commander, it must be observed, that the arrangements, preparatory to his voyage, were not made by himfelf; that his fhip

* Dr. MEAD, who had feen the original obfervations of two of Commodore Anson's furgeons, fays, that the feurvy, at that time, was accompanied with *putrid fevers*, &c. See his Treatife on the Scurvy, p. 98, & feq. was fo deeply laden, as not, except in the calmeft weather, to admit of opening the gun-ports for the benefit of air; and that nothing appears to have been neglected by him, for preferving the health of his men, that was then known and practifed in the navy.

I SHOULD now proceed to enumerate the chief improvements made fince that time, and which have enabled our fhips to make fo many fuccefsful circumnavigations, as in a manner to efface the impreffion of former difafters; but as I have mentioned the ficknefs moft deftructive to failors, and againft the ravages of which thofe prefervatives have been mainly contrived, it may be proper briefly to explain its nature, and the rather as, excepting among mariners, it is little underftood. Firft, then, I would obferve, that the fourvy is not the difeafe which goes by that that name on shore. The distemper commonly, but erroneoufly, in this country, called the *fcurvy*, belongs to a clafs of difeafes totally different from what we are now treating of; and fo far is the common received opinion, that that there are few constitutions altogether free from a Scorbutic taint, from being true, that, unlefs among failors and others circumftanced like them, more particularly with refpect to those who ule a falt and putrid diet, and efpecially if they live in foul air and uncleanlinefs, I have reafon to believe there are few diforders less frequent. This opinion I fubmitted to the judgment of the Society feveral years ago, and I have had no reafon fince to alter it. I then faid, contrary to what was generally believed, but feemingly on the best grounds, that the fea-air was never the caufe of the fcurvy, fince, on board a ship on the longest voyages, cleanlines, ventilation, and fresh provisions, would preferve

preferve from it; and that upon a feacoaft, free from marshes, the inhabitants were not liable to that indifpolition, though frequently breathing the air from the fea*. I concluded with joining in fentiment with thofe, who aféribed the fcurvy to a feptic refolution, that is, a beginning corruption of the whole habit, fimilar to that of every animal fubstance when deprived of life †. This account feemed to be fufficiently verified by the examination of the fymptoms in the fcorbutic fick, and by the appearances in their bodies after death t. On that occafion I remarked, that falted meats, after fome time, become in reality putrid, though they may contine long palatable by

* Difeafes of the Army, part i. ch. 2. Append Pap. 7.

+ Ibid.

[†] WOODALL'S Surgeon'S Mate, p. 163. POU-PART. Mem. de l'Acad. R. des Sc. A. 1699. PETIT, Mal. des Os, tom. ii. p. 446. MEAD on the Scurvy, p. 104.

means

means of the falt; and that common falt, fuppofed to be one of the ftrongeft prefervatives from corruption, is at beft but an indifferent one, even in a large quantity; and in a fmall one, fuch as we use at table with fresh meats, or fwallow in meats that have been falted, fo far from impeding putrefaction, it rather promotes that process in the body.

THIS position concerning the putrefying quality of fea-falt, in certain proportions, hath been fince confirmed by the experiments of the late Mr. CANTON, Fellow of this Society, in a Paper on the *Caufe of the Luminous Appearance of Sea-Water**.

IT hath been alleged, that the fcurvy is much owing to the coldness of the air, which checks perspiration, and on that account is the endemic distemper of the

* Phil. Tranfa&. vol. lix. p. 446.

northern

northern nations, particularly of those around the Baltic *. The fact is partly true, but, I doubt, not fo the caufe. In those regions, by the long and fevere winters, the cattle, destitute of pasture, can barely live, and are therefore unfit for ufe; fo that the people, for their provision during that feafon, are obliged to flaughter them by the end of autumn, and to falt them for above half the year. This putrid diet, then, on which they must fo long fubfift, and to which the inhabitants of the South are not reduced, feems to be the chief caufe of the difeafe. And if we reflect that the lower people of the North have few or no greens nor fruit in the winter, little or no fermented liquors, and often live in damp, foul, and ill-aired houfes, it is eafy to conceive how they fhould become liable to the fame diforder with feamen; whilft others,

^{*} BARTHOLIN. Med. Danor. Domeftic. p. 98.

of as high a latitude, but who live in a different manner, keep free from it. Thus we are informed, by LINNÆUS, that the Laplanders, one of the moft hyperborean nations, know nothing of the feurvy*; for which no other reafon can be affigned than their never eating putrid and falted meats, nor indeed falt with any thing, but their ufing all the winter the fresh flesh of their rein-deer.

THIS exemption of the Laplanders from the general diftemper of the North, is the more obfervable, as they feldom tafte vegetables, bread never, as we farther learn from that celebrated author. Yet, in the very provinces which border on Lapland, where they ufe bread, but fcarcely any other vegetable, and eat falted meats, they are as much troubled with the fcurvy as in

* LINNÆI Flora Lapponica, p. 8, 9.

any

any other country *. But let us incidentally remark, that the late improvements in agriculture, gardening, and in the other arts of life, by extending their influence to the remoteft parts of Europe, and to the loweft people, begin fenfibly to leffen the frequency of that complaint, even in thofe climates that have been once the moft afflicted with it.

IT hath alfo been afferted, that men living on fhore will be affected with the fcurvy, though they have never been confined to falted meats; but of this I have known no inftance, except in thofe who breathed a marfhy air, or what was otherwife putrid, and who wanted exercife, fruits, and the common herbs: under fuch circumftances, it must be owned that the humours

* LINNÆUS, in feveral parts of his work, confirms what is here faid of falted meats, as one of the chief caufes of the fourvy. See Amœnitat. Acad. vol. v. p. 6. & feq. p. 42.

[160]

will corrupt in the fame manner, though not in the fame degree, with those of feamen. Thus, in the late war, when Sifinghurft Caftle in Kent was filled with French prifoners, the fcurvy broke out among them, notwithstanding they had never been ferved with falted victuals in England, but had daily had an allowance of fresh meat, and of bread in proportion, though without greens or other vegetables. The country furgeon who attended them, and from whom I received this information, having formerly been employed in the navy, was the better able to judge of the diforder, and to cure it. Befides the deficiency of herbs, he observed that the wards were foul and crowded, the house damp (from a moat that furrounded it), and that the bounds allotted for taking the air were fo fmall, and in wet weather fo floughy, that the men feldom cared to go out. He added, that a reprefentation having been made, he had 2

had been empowered to furnish the prifoners with roots and greens for boiling in their foup, and to quarter the fick in a neighbouring village, in a dry fituation, with liberty to go out for air and exercife; and that by these means they had all quickly recovered. It is probable, that the fcurvy fooner appeared among thefe ftrangers, from their having been taken at fea, and being, from their diet, more difpofed to the diseafe. My informer farther acquainted me, that, in the lower and wetter parts of that county, where fome of his practice lay, he had now and then met with flighter cafes of the fcurvy among the common people; fuch, he faid, as lived the whole winter on falted bacon, without fermented liquors, greens, or fruit, a few apples excepted; but he remarked, that, in the winters following a plentiful growth of apples, these peasants were manifestly lefs liable to the complaint.

I HAVE

[162]

I HAVE dwelt the longer on this part of my fubject, as I look upon the knowledge of the nature and caufe of the feurvy to be an effential flep towards improving the means of prevention and cure. And I am perfunded, after mature reflection, and the opportunities I have had of converfing with thofe, who to much fagacity had joined no finall experience in nautical practice, that, upon an examination of the feveral articles, which have either been of old approved, or have of late been introduced into the navy, it will be found, that, though thefe means may vary in form, and in their mode of operating; yet that they all fome way contribute towards preventing or correcting putrefaction, whether of the air in the clofer parts of a ship, of the meats, of the water, of the clothes and bedding, or of the body itfelf. And, if in this inquiry (which may be made by the way, whilft we take a review of the principal articles of provision, and

and other methods ufed by Captain COOK to guard againft the fcurvy), I fay, if in this inquiry it fhall appear, that the notion of a feptic or putrid origin, is not without foundation, it will be no finall encouragement to proceed on that principle, in order farther to improve this important branch of medicine.

CAPTAIN COOK begins his lift of his prefervative flores with *malt*: 'Of this,' he fays, 'was made *fweet wort*, and given not 'only to those men who had manifest 'fymptoms of the fcurvy, but to fuch also 'as were judged to be most liable to it.' Dr. MACBRIDE, who first fuggested this preparation, was led (as he observes) to the discovery by fome experiments that had been laid before this Society, by which it appeared that the air produced by alimentary fermentation was endowed with a M 2 power [164]

power of correcting putrefaction *. The fact he confirmed by numerous trials; and, finding this fluid to be the *fixed air*, he juftly concluded, that whatever fubftance, proper for food, abounded with it, and which could be conveniently carried to fea, would make one of the fureft remedies against the fcurvy; which he then confidered as a putrid difeafe, and, as fuch, to be prevented or cured by that powerful kind of antifeptic †. Beer, for inftance, had always been efteemed one of the beft antifcorbutics; but, as that derived all its fixed air from the malt of which it was made, he inferred that malt itfelf was preferable in long voyages, as it took up lefs room than the brewed liquor, and would keep longer found. Experience hath fince verified this

* Append. to my Observations on the Discases of the Army.

* MACBRIDE's Exper. Eff. paffim.

ingenious

ngenious theory; and the malt hath now gained fo much credit in the navy, that there only wanted fo long, fo healthful, and fo celebrated a voyage as this, to rank it among the most indispensable articles of provision. For though Captain COOK remarks, that ' a proper attention to other ' things must be joined, and that he is not ^e altogether of opinion that the wort will • be able to cure the fcurvy, in an advanced ftate, at fea; yet he is perfuaded that it ' is fufficient to prevent that diftemper ' from making any great progrefs, for a ' confiderable time;' and therefore he doth not hefitate to pronounce it ' one of the ' best antifcorbutic medicines yet found • out*.'

THIS

* Having been favoured with a fight of the medical journal of Mr. PATTEN, furgeon to the Refolution, I read the following paffage in it, not a little ftrengthening the above testimony:
• I have found the wort
• of the utmost fervice, in all feorbutic cafes, during M 3
• the

[166]

THIS falutary gas (or fixed air) is contained, more or lefs, in all fermentable liquors, and begins to oppofe putrefaction, as foon as the working or inteffine motion commences.

IN wine, it abounds; and perhaps no vegetable fubflance is more replete with it than the juice of the grape. If we join the grateful tafte of wine, we must rank it the first in the list of antifcorbutic liquors. Cyder is likewife excellent, with other vinous productions from fruit; as also the

the voyage. As many took it by way of prevention, few cafes occurred where it had a fair trial;
but thefe, however, I flatter myfelf, will be fufficient to convince every impartial perfon, that it is
the beft remedy hitherto found out for the cure of
the fea-fcurvy : and I am well convinced, from
what I have feen the wort perform, and from its
mode of operation, that, if aided by portable foup,
four krout, fugar, fago, and courants, the fcurvy,
that maritime peftilence, will feldom or never make
its alarming appearance among a fhip's crew, on the
longeft voyages; proper care with regard to cleanlinefs and provisions being observed.'

various

[167]

various kinds of beer. It hath been a eonfant observation, that, in long cruifes or diftant voyages, the fcurvy is never feen whilft the fmall-beer holds out at a full allowance; but that, when it is all expended, the diftemper foon prevails. It were therefore to be wilhed, that this most wholefome beverage could be renewed at fea; but our ships afford not fusicient eonvenience. The Ruffians, however, make a fhift to prepare on board, as well as at land, fomething of a middle quality between wort and finall-beer, in the following manner: They take ground malt and ryemeal, in a certain proportion, which they knead into finall loaves, and bake in the oven. These they oceasionally infuse in a proper quantity of warm water, which begins fo foon to ferment, that, in the space of twenty-four hours, their brewage is completed, in the production of a fmall, brifk, and acidulous liquor, they call quas, M 4 palatable

[168]

palatable to themfelves, and not difagreeable to the tafte of flrangers. The late Dr. MOUNSEY, fellow of this Society, who had lived long in Ruffia, and had been Archiater under two fucceffive fovereigns, acquainted me, that the guas was the common and falutary drink both of the fleets and armies of that empire, and that it was particularly good against the fcurvy. He added, that, happening to be at Mofcow when he perufed my Obfervations on the Jail and Hofpital Fever, then lately publifhed *, he had been induced to compare what he read in that treatife with what he fhould fee in the feveral prifons of that large city. But, to his furprife, after vifiting them all, and finding them full of malefactors (for the late Empress at that time fuffered none who were convicted of capi-

* That treatife was first published by itself, and afterwards incorporated with the Observations on the Diseases of the Army.

tal

tal crimes to be put to death), he could difcover no fever among them, nor learn that any acute diftemper, peculiar to jails, had ever been known there. He observed, that fome of these places of confinement had a yard, into which the prifoners were allowed to come for the air; but that there were others without that advantage, yet not fickly. So that he could affign no other reafon for the healthful condition of thefe men than the kind of diet they ufed, which was the fame with that of the common people of the country; who, not being able to purchase flesh-meat, live mostly on rye-bread (the most acefcent of any bread), and drink quas. He concluded with faying, that, upon his return to St. Petersburg, he had made the fame enquiry there, and with the fame refult.

THUS far Dr. MOUNSEY; from whofe account it would feem, that the rye-meal affifted affifted both in quickening the fermentation and adding more fixed air, fince the malt alone could not fo readily produce fo tart and brifk a liquor. And there is little doubt, but that, whenever the other grains can be brought to a proper degree of fermentation, they will, more or lefs, in the fame way, become ufeful. That oats will, I am fatisfied, from what I have been told by one of the intelligent friends of Captain COOK. This gentleman being on a cruize in a large ship *, in the beginning of the late war, and the fcurvy breaking out among his crew, he bethought himfelf of a kind of food he had feen ufed in fome parts of the country, as the most proper on that occasion. Some oat-meal is put into a wooden vessel, hot water is poured upon it, and the infusion continues until the liquor begins to tafte fourith, that is, till a fermentation comes on, which, in a place

* The Effex, a feventy gun ship.

moderately

moderately warm, may be in the fpace of two days. The water is then poured off from the grounds, and boiled down to the confiftence of a jelly *. This he ordered to be made and dealt out in meffes, being first fweetened with fugar, and feasoned with fome prize French wine, which, though turned four, yet improved the taste, and made this aliment not less palatable than medicinal.

HE affured me, that, upon this diet chiefly, and by abflaining from falted meats, his *fcorbutic* fick had quite recovered on board; and not in that voyage only, but, by the fame means, in his fubfequent cruizes during the war, without his being obliged to fend one of them on fhore becaufe they could not get well at fea. Yet oat-meal unfermented, like barley unmalted, hath no fenfible effect in curing the

* This rural food, in the North, is called *fooins*. fcurvy; fcurvy; as if the *fixed air*, which is incorporated with thefe grains, could mix with the chyle which they produce, enter the lacteals with it, and make part of the nourifhment of the body, without manifefting any elaftic or antifeptic quality, when not loofened by a previous fermentation.

BEFORE the power of the *fixed air*, in fubduing putrefaction, was known, the efficacy of fruits, greens, and fermented liquors, was commonly afcribed to the acid in their composition; and we have fill reafon to believe that the acid concurs in producing that effect. If it be alleged that mineral acids, which contain little or no *fixed air*, have been ufed in the fcurvy with little fuccefs; I would anfwer, that I doubt that, in those trials, they have never been fufficiently diluted; for it is eafy to conceive, that, in the finall quantity of water the elixir of vitriol, for inflance, is commonly monly given, that auftere acid can fcarcely get beyond the first paffages; confidering the delicate fensibility of the mouths of the lacteals, which must force them to contract, and exclude fo pungent a liquor. It were therefore a proper experiment to be made, in a deficiency of malt, or when that grain shall happen to be spoiled by keeping *, to use distilled water, acidulated with the spirit of fea-falt, in the proportion of only ten drops to a quart; or with the weak spirit of vitriol, thirteen drops to the same meafure †; and to give to those that are threatened with the fcurvy at least three quarts of

* Captain COOK told me, that the malt held out fufficiently good for the two first years; but that in the third, having lost much of its taste, he doubted whether it retained any of its virtues. Mr. PATTEN, however, observed, that, though the malt at that time was fensibly decayed, yet nevertheles he had still found it useful, when he employed a larger proportion of it to make the infusion.

+ In these proportions I found the water taste just acidulous and pleasant.

[174]

this liquor daily, to be confumed as they fhall think proper.

BUT if the fixed air and acids are fuch prefervatives against the feurvy, why should Captain COOK make fo little account of the rob of lemons and of oranges (for fo they have called the extracts or infpifiated juices of those fruits) in treating that distemper? This, I found, was the reafon: Thefe preparations being only fent out upon trial, the furgeon of the fhip was told, at a conjecture, how much he might give for a dofe, but without ftrictly limiting it. The experiment was made with the quantity fpecified, but with fo little advantage, that, judging it not adviseable to lofe more time, he fet about the cure with the wort alone, of the efficacy of which he was certain; whilft he referved these robs for other purpofes; more particularly for colds, when, to a large draught of warm water, with with fome fpirits and fugar, he added a spoonful of one of them, and with this composition made a grateful sudorific that answered his intention. No wonder, then, if Captain COOK, not knowing how much to order of these concentrated juices for the fcurvy, but feeing them fail as they were given at this time, fhould entertain no great opinion of their antifcorbutic virtue. It may be alfo proper to take notice, that, as they had been reduced to a fmall proportion of their bulk by evaporation upon fire, it is probable they were much weakened by that process, and that, with their aqueous parts, they had loft not a little of their aërial, on which fo much of their antifeptic power depended. If, therefore, a farther trial of these excellent fruits were to be made, it would feem more adviseable to fend to fea the purified juices entire in cafks; agreeably to a propofal which I find hath been prefented to the Admiralty, fome б years years ago, by an ingenious and experienced furgeon of the navy. For, in truth, the teftimonies in favour of the falutary qualities of thefe acids are fo numerous, and fo ftrong, that I fhould look upon fome failures, even in cafes where their want of fuccefs cannot fo well be accounted for as in this voyage, as not a fufficient reafon for ftriking them out of the lift of the moft powerful prefervatives againft the confuming malady of failors.

IT may be obferved, that Captain COOK fays not more in praife of vinegar than of the *robs*; yet I would not thence infer that he made no account of that acid; but only that, as he happened in this voyage to be fparingly provided with it, and yet did well, he could not confider a large ftore of vinegar to be fo material an article of provifion as was commonly imagined. And, though he fupplied its place in the meffes of
[177]

of the men with the acid of the four krout, and trufted chiefly to fire for purifying his decks, yet it is to be hoped that future navigators will not therefore omit it. Vinegar will ferve at leaft for a wholefome vari- . ety in the feafoning of falted meats, and may be fometimes fuccefsfully ufed as a medicine, efpecially in the afperfions of the berths of the fick. It is observable, that, though the finell be little grateful to a perfon in health, yet it is often agreeable to those who are fick, at least to fuch as are confined to a foul and crowded ward. There the phyfician himfelf will fmell to vinegar, as much for pleafure, as for guarding against infection.

Now the wort and the acid juices were only difpenfed as medicines; but the next article was of more extensive ufe. This was the *four krout* (four cabbage), a food of universal request in Germany. The N acidity acidity is acquired by its fpontaneous fermentation, and it was that very tafte which made it the more acceptable to all who ate it. To its farther commendation we may add, that it held out good to the laft of the voyage.

IT may feem ftrange, that though cabbage hath had fo high encomiums beftowed upon it by the ancients (witnefs what CA-TO the elder and PLINY the naturalift fay on the fubject), and hath had the fanction of the experience of nations for ages, it should yet be disapproved of by some of the diffinguished medical writers of our times. One finds it yield a rank fmell in decoction, which he confounds with that of putrefaction. Another analyzes it, and difcovers fo much grofs air in the compofition, as to render it indigeftible; yet this flatulence, fo much decried, must now be acknowledged to be the fixed air, which makes

makes the cabbage fo wholefome when fermented. Nay it hath been traduced by one of the most celebrated physicians of our age, as partaking of a poifonous nature : nor much better founded was that notion of the fame learned professor, that, cabbage being an alcalefcent plant, and therefore difpoling to putrefaction, it could never be ufed in the fcurvy, excepting when the difeafe proceeded from an acid. But the experiments, which I formerly laid before the Society, evinced this vegetable, with the reft of the fuppofed alcalefcents, to be really acefcent; and proved that the fcurvy is never owing to acidity, but, much otherwife, to a fpecies of putrefaction; that very caufe, of which the ill-grounded clafs of alcalefcents was fuppofed to be a promoter *.

* See this remark more at large, in my Observations on the Diseases of the Army, App. Pap. 7.

N 2 AMONG

[180]

AMONG other of the late improvements of the naval ftores, we have heard much of the portable foup, and accordingly we find that Captain COOK hath not a little availed himfelf of it in his voyage. This concentrated broth, being freed from all fat, and having by long boiling evaporated the moft putrefcent parts of the meat, is reduced to the confiftence of a glue, which in effect it is, and will, like other glues, in a dry place, keep found for years together. It hath been faid, that broths turn four on keeping, though made without any vegetable *. Now, whether any real acid can be thus formed or not, I incline at least to believe, that the gelatinous parts of animal fubstances, fuch as compose these cakes, are not of a nature much difposed to putrefy. But, however that may be, fince

* · La feule matiere qui s'agriffe dans le fang eft la · matiere gelatineuse, &c.' SENAC, Structure du Cœur, l. iii. ch. iv. § 5.

Captain

Captain COOK obferves, that this foup was the means of making his people eat a greater quantity of greens than they would have done otherwife, fo far we must allow it to have been virtually antifeptic.

So much for thofe articles that have of late been fupplied to all the King's fhips on long voyages, and in which, therefore, our worthy brother claims no other merit than the prudent difpenfation of them; but what follows, being regulations either wholly new, or improved hints from fome of his experienced friends, we may juftly appropriate them to himfelf.

FIRST, then, he put his people at three watches, inftead of two, which laft is the general practice at fea; that is, he divided the whole crew into three companies, and, by ordering each company upon the watch by turns, four hours at a time, every man N 3 had

[182]

had eight hours free, for four of duty: whereas, at watch and watch, the half of the men being on duty at once, with returns of it every four hours, they can have but broken fleep, and, when expofed to wet, they have not time to get dry before they lie down. When the fervice requires them, fuch hardfhips muft be endured; but when there is no preffing call, ought not a mariner to be refrefhed with as much uninterrupted reft as a common labourer?

I AM well informed, that an officer diftinguifhes himfelf in nothing more than in preferving his men from wet, and the other injuries of the weather. Thefe were moft effential points with this humane Commander. In the torrid zone, he fhaded his people from the feorching fun by an awning over his deck; and, in his courfe under the antarctic circle, he had a coat provided for each man, of a fubftantial woollen len ftuff, with the addition of a hood for covering their heads. This garb (which the failors called their *Magellan jacket*) they occafionally wore, and found it most comfortable for working in rain and fnow, and among the broken ice in the high latitudes of the South.

LET us proceed to another article, one of the moft material, the care to guard againft putrefaction, by keeping clean the perfons, the clothes, the bedding, and berths of the failors. The Captain acquainted me, that regularly, one morning in the week, he paffed his fhip's company in review, and faw that every man had changed his linen, and was in other points as clean and neat as circumftances would permit. It is well known how much *cleanlinefs* is conducive to health, but it is not fo obvious how much it alfo tends to N 4 regularity regularity and other virtues. That diligent officer was perfuaded, that fuch men as he could induce to be more cleanly than they were difpofed to be of themfelves, became at the fame time more fober, more orderly, and more attentive to their duty. It must be acknowledged that a feaman has but indifferent means to keep himfelf clean, had he the greatest inclination to do it; for I have not heard that commanders of ships have yet availed themselves of the still for providing fresh water for washing; and it is well known that fea-water doth not mix with foap, and that linen wet with brine never thoroughly dries. But for Captain COOK, the frequent opportunities he had of taking in water among the iflands of the South-Sea, enabled him in that tract to difpense to his ship's company fome fresh water for every use; and when he navigated in the high latitudes of the fouthern

[185]

fouthern oceans, he ftill more abundantly provided them with it, as you will find by the fequel of this difcourfe.

OF the hammocks and bedding I need fay little, as all officers are now feufible, how much it concerns the health of their people to have this part of a fhip's furniture kept dry and well aired; as by the breath and perfpiration of fo many men, every thing below, even in the fpace of twenty-four hours, is apt to contract an offenfive moifture. But Captain COOK was not fatisfied with ordering upon deck the hammocks and bedding every day that was fair (the common practice), but took care that every bundle fhould be unlafhed, and fo fpread out, that every part of it might be expofed to the air,

His next concern was to fee to the purity of the fhip itfelf, without which attention

tention all the reft would have profited little. I fhall not however detain you with his orders about washing and fcraping the decks, as I do not understand that in this kind of cleanfing he excelled others; but fince our author has laid fo great a ftress upon fire, as a purifier, I shall endeavour to explain his way of using it, more fully than he has done in his Paper. Some wood, and that not fparingly, being put into a proper flove or grate, was lighted, and carried fucceffively to every part below deck. Wherever fire is, the air nearest to it being heated becomes specifically lighter, and by being lighter rifes, and paffes through the hatchways into the atmosphere. The vacant space is filled with the cold air around, and that being heated in its turn, in like manner afcends, and is replaced by other air as before. Thus, by continuing the fire for fome time, in any of the lower apartments, the foul air

[187]

air is in a good meafure driven out, and the fresh admitted. This is not all: I apprehend that the acid steams of the wood, in burning, act here as an antiseptic, and correct the corrupted air that remains.

AN officer of diffinguished rank, another of Captain COOK's experienced friends, mentioned to me a common and just obfervation in the fleet, which was, that all the old twenty-gun ships were remarkably less fickly than those of the fame fize of a modern construction. This, he faid, was a circumstance he could not otherwise account for, than by the former having their galley * in the fore-part of the orlop \dagger , the chimney vented fo ill, that it was fure to fill every part with some whenever the wind was a-stern. This was a nuisance for the time, but, as he thought, abun-

* Their fire-place or kitchen.

† The deck immediately above the hold.

dantly

dantly compenfated by the extraordinary good health of the feveral crews. Poffibly thefe fire-places were alfo beneficial, by drying and ventilating the lower decks, more when they were below, than they can do now that they are placed under the forecaftle upon the upper deck.

But the moft obvious use of the portable fires was their drying up the moifture, and especially in those places where there was the least circulation of air. This humidity, composed of the breath and perspirable matter of a multitude of men, and often of animals (kept for a live-stock), and of the steams of the bilge water from the well, where the corruption is the greatest; this putrid moifture, I fay, being one of the main causes of the feurvy, was therefore more particularly attended to, in order to its removal. The fires were the powerful instrument for that purpose; and whilst they they burned, fome men were employed in rubbing hard, with canvafs or oakhum, every part of the infide of the ship that was damp and acceffible. But the advantage of fire appears no where fo manifest as in cleanfing the well; for this being in the lowest part of the hold, the whole leakage runs into it, whether of the fhip itfelf, or of the cafks of fpoilt meats or corrupted water. The mephitic vapours from this fink alone have often been the caufe of inftantaneous death to those who have unwarily approached to clean it; and not to one only, but to feveral fucceffively, when they have gone down to fuccour their unfortunate companions. Yet this very place hath not only been rendered fafe but fweet, by means of an iron pot filled with fire and let down to burn in it.

WHEN, from the circumftances of the weather, this falutary operation could not take take place, the fhip was fumigated with gun-powder, as defcribed in Captain COOK's Paper; though that fmoke could have little or no effect in drying, but only in remedying the corruption of the air, by means of the acid fpirits from the fulphur and nitre, aided perhaps by fome fpecies of an aërial fluid, then difengaged from the fuel, to counteract putrefaction. But as thefe purifications by gun-powder, as well as by burning tar and other refinous fubftances, are fufficiently known, I fhall not infift longer on them here.

AMONG the feveral means of fweetening or renewing the air, we fhould expect to hear of Dr. HALES's ventilator. I muft confefs it was my expectation, and therefore, perfuaded as I was of the excellence of the invention, it was not without much regret that I faw fo good an opportunity loft, of giving the fame favourable impreffion

4

fion of it to the Public. If a degree of fuccefs, exceeding our most fanguine hopes, is not fufficient for juftifying the omiffion of a measure, deemed one of the most effential for attaining an end, I would plead in fayour of our worthy brother, that by a humiliating fatality, fo often accompanying the most useful discoveries, the credit of this ventilator is yet far from being eftablifhed in the navy. What wonder then, if Captain COOK, being fo much otherwife taken up, fhould not have had time to examine it, and therefore avoided the encumbering his ship with an apparatus he had poffibly never feen ufed, and of which he had at beft received but a doubtful character? Nor was he altogether unprovided with a machine for ventilation. He had the wind-fails, though he hath not mentioned them in his Paper; and he told me that he had found them at times very ferviceable, and particularly between the Tropics.

-

Tropics. They have the merit of taking up little room, they require no labour in working, and the contrivance is fo fimple that they can fail in no hands. But their powers are finall in comparifon with thofe of Dr. HALES'S ventilator : they cannot be put up in hard gales of wind, and are of no efficacy in dead calms, when a refrefhment of the air is most wanted. Should there be any objection to the having them both ?

SUCH were the measures taken by our fagacious Navigator for procuring a purity of air. It remains only to fee in what manner he fupplied pure water; another article of fo great moment, that the thirfty voyager, upon his falt and putrid diet, with a short allowance of that element, and that in a corrupted state, must account a plentiful provision of fresh water to be indeed the best of things.

CAPTAIN

CAPTAIN COOK was not without an apparatus for diffilling fea-water, and though he could not obtain nearly fo much as was expected from the invention, yet he fometimes availed himfelf of it; but for the most of his voyage he was otherwife provided. Within the fouthern tropic, in the Pacific Ocean, he found fo many islands, and those fo well stored with fprings, that, as I have hinted before, he feldom was without a fufficiency of water for every useful purpofe. Yet, not fatisfied with plenty, he would have the pureft; and therefore, whenever an opportunity offered, he emptied what he had taken in only a few days before, and filled his cafks anew. But was he not above four months in his paffage from the Cape of Good Hope to New Zealand, in the frozen zone of the South, without once feeing land? and did he not actually complete his courfes in the other high latitudes, without the benefit \cap

[194]

benefit of a fingle fountain? Here was indeed a wonder of the deep! I may call it the romance of his voyage! Those very fhoals, fields, and floating mountains of ice, among which he fteered his perilous courfe, and which prefented fuch terrifying prospects of deftruction; those, I fay, were the very means of his fupport, by supplying him abundantly with what he most wanted. It had been faid that those vaft maffes of ice, called iflands or mountains, melted into fresh water; though CRANTZ, the relator of that paradox, did not imagine they originated from the fea, but that they were first formed in the great rivers of the North, and, being carried down into the ocean, were afterwards increafed to that amazing height by the fnow that fell upon them *. But that all frozen sea-water would thaw into fresh,

* Hift. of Greenland, b. i. ch. ii. § 11, 12.

had

5

had either never been afferted, or had met with little credit. This is certain, that Captain COOK expected no fuch transmutation, and therefore was agreeably furprifed to find he had one difficulty lefs to encounter, that of preferving the health of his men fo long on falt and putrid provifions, with a fcanty allowance of corrupted water, or what he could procure by diffillation. The melted ice of the fea was not only fresh, but soft; and so wholesome, as to fhew the fallacy of human reafon unfupported by experiments. An ancient, of great authority, had affigned, from theory, bad qualities to melted fnow; and, from that period to the prefent times, this prejudice, extending to ice, had not been quite removed.

IN this circumnavigation, amidft fleets and falls of fnow, fogs, and much moift weather, the Refolution enjoyed nearly the O 2 fame

[196]

fame state of health she had done in the temperate and torrid zones. It appears only from the journal of the furgeon, that, towards the end of the feveral courfes, fome of the crew began to complain of the fcurvy; but the difeafe made little progrefs, excepting in one who had become early an invalid from another caufe. The other diforders were likewife neither numerous nor fatal, fuch as colds in various forms, flight diarrhœas, and intermittents that readily yielded to the Bark. There were alfo fome continued fevers, but which, by timely care, never rofe to an alarming height. Much commendation is therefore due to the attention and abilities of Mr. PATTEN, the furgeon of the Refolution, for having fo well feconded his captain in the difcharge of his duty. For it must be allowed, that, in defpite of the best regulations and the best provisions, there will always be, among a numerous crew, during a long voyage, fome

[197]

fome cafualties more or lefs productive of ficknefs; and, unlefs there be an intelligent medical affiftant on board, many, under the wifeft commander, will perifh, that otherwife might have been faved.

THESE, GENTLEMEN, are the reflections I had to lay before you on this interefting fubject; and, if I have encreached on your time, you will recollect that much of my difcourfe hath been employed in explaining fome things but just mentioned by Captain COOK, and in adding other materials, which I had procured partly in converfation with himfelf, and partly, after his departure, with those intelligent friends he alludes to in his Paper. This was my plan; which, as I have now executed, you will pleafe to return your thanks to those gentlemen, who, on your account, fo cheerfully communicated to me their observations.

0 3

[198]

As to your acknowledgments to Captain COOK, and your high opinion of his deferts, you will best testify them by the honourable diffinction fuggefted by your Council, in prefenting him with this Medal: for I need not gather your fuffrages, fince the attention, with which you have favoured me, hath abundantly expressed your approbation. My fatisfaction, thereforc, had been complete, had he himfelf been prefent to receive the honours you now confer upon him. But you are apprifed that our brave and indefatigable Brother is at this inftant far removed from us, anticipating, I may fay, your wonted request on these occasions, by continuing his labours for the advancement of Natural Knowledge, and for the honour of this Society; as you may be affured, that the object of his new enterprize is not lefs great, perhaps still greater, than either of the former.

Allow

[199]

ALLOW me then, GENTLEMEN, to deliver this Medal, with his unperifling name engraven upon it, into the hands of one who will be happy to receive that truft, and to know that this refpectable Body never more cordially nor more meritorioufly beftowed that faithful fymbol of their efteem and affection. For if Rome decreed the *Civic Crown* to him who faved the life of a fingle citizen, what wreaths are due to that Man, who, having himfelf faved many, perpetuates in your Tranfactions the means by which Britain may now, on the most diftant voyages, preferve numbers of her intrepid fons, her Mariners; who, braving every danger, have fo liberally contributed to the fame, to the opulence, and to the maritime empire, of their country*!

* Here followed Captain COOK's Paper, which was prefented to the Society, and is inferted in part ii. vol. lxvi. of the Philosophical Transactions; but, as O 4. the the fubftance of that publication is now contained in the laft pages of Captain COOK's Voyage, it was judged unneceffary to repeat it here. The only material circumftance of Captain COOK's communication to the Society, omitted in his Journal, is the following extract of a letter which he wrote to the Prefident, just before his late embarkation, dated Plymouth Sound, July 7, 1776; and is as follows:

I entirely agree with you, that the dearnefs of the
rob of lemons and of oranges will hinder them from
being furnifhed in large quantities; but I do not
think this to neceffary; for, though they may affift
other things, I have no great opinion of them alone.
Nor have I a higher opinion of vinegar : my people
had it very fparingly during the late voyage, and,
towards the latter part, none at all; and yet we
experienced no ill effects from the want of it. The
cuftom of wafhing the infide of the fhip with vinegar, I feldom obferved; thinking that fire and
fmoke anfwered the purpofe much better.'

DISCOURSE

A.

ONTHE

INVENTION AND IMPROVEMENTS

REFLECTING TELESCOPE;

DELIVERED AT THE

Anniverfary Meeting of the ROYAL SOCIETY, November 30, 1777.

By Sir JOHN PRINGLE, Bart. PRESIDENT.

PUBLISHED AT THEIR REQUEST.

DISCOURSE

A

ON THE

INVENTION AND IMPROVEMENTS.

OFTHE

REFLECTING TELESCOPE,

GENTLEMEN,

T was with equal truth and modefty obferved by our moft worthy Brother, the Reverend Dr. BRADLEY, in his celebrated Paper concerning the apparent motion of the fixed ftars, and the caufes of that deception, that the great exactnefs with which inftruments are now conftructed hath enabled bled the aftronomers of the prefent age to
difcover feveral changes in the polition of
the heavenly bodies; which, by reafon of
their fmallnefs, had efcaped the notice of
their predeceffors*.' And indeed it was
upon this liberal principle, the embracing
of every affiftance which could be advantageous to their inflitution, that this Society, from their foundation to this day,
have cherifhed the mechanical arts; nay,
have often affociated thofe artifts that had
invented or perfected inftruments eminently
conducive to the advancement of Natural
Knowledge.

It is a merit of this kind, I would fay a fignal mechanical improvement, which your Council have thought proper at this time to diffinguish; and they have accordingly empowered me to announce to you, on this day of your annual folemnity, that

they

^{*} Phil. Tranf. vol. xlv.

[205]

they have adjudged the Prize Medal, founded on the benefaction of Sir Gon-FREY COPLEY, Baronet, to Mr. JOHN MUDGE of Plymouth, Fellow of this Society, on account of his valuable Paper, ' containing directions for making the beft ⁶ composition for the metals of reflecting ' telefcopes, together with a defcription of • the process for grinding, polishing, and ' giving the great fpeculum the true para-• bolic form *.' Nor do they doubt (confcious as they are of their zeal for the honour of the Society, and of their attention to their duty) of obtaining your wonted approbation, when they shall have laid before you the reafons which moved them to put this mark of diffinction upon that communication, amidst a number of others very deferving of praise †.

* Phil. Tranf. vol. lxvii. part i.

+ The encouragement of *experimental* improvements, it may be observed, was the main object of the institution of Sir GODFREY COPLEY'S Medal.

Bur,

[206]

BUT, before I enter upon these considerations, allow me briefly to recal to your memory fome particulars concerning the invention of reflecting telescopes, the fubfequent improvements of these instruments, and the ftate in which Mr. MUDGE found them, when he first fet about working them to a greater perfection, than was attainable either by the methods which the artificers thought proper to divulge, or the directions that had been given by learned writers on that fubject. Thus you will have under your view fufficient materials to judge of the merits of his performance, and of the equity of your Council in decreeing thefe honours to him.

It must be acknowledged,' fays Dr.
SMITH in his Complete System of Optics,
that Mr. JAMES GREGORY of Aberdeen
was the first inventor of the reflecting
telescope; but his construction is quite
different

[207]

different from Sir ISAAC NEWTON's,
and not nearly fo advantageous*.'

BUT, with much deference to fo refpectable an author, and with all regard to the fame of GREGORY, let us not forget to do justice to MERSENNUS, by acknowledging him to be the man who is entitled to the credit of having entertained the *firft* thought of a reflector. A telescope with *specula* he certainly proposed to the celebrated DESCARTES, many years before GREGORY's invention; though indeed in a manner fo very unfatisfactory, that DESCARTES, who had given particular attention to the improvement of the telescope, was fo far from approving the propofal, that he endeavoured to convince MERSENNUS of its fallacy †. Dr. SMITH, it

F + Lettres de DESCARTES, tom. ii. printed at Paris in 1657, lett. 29. and 32. See this point difcussed by two

[208]

it appears, had never perufed the two let³ ters of DESCARTES to MERSENNUS which briefly touch on that fubject.

AGAIN, as to his affertion, ' that GRE-" CORY's conftruction was not nearly fo ' advantageous as NEWTON's,' it may be accounted for from his having fet it down early in the composition of his work, and forgetting to qualify it afterwards, when, before the publication, he had received pretty fure information to the contrary. Or perhaps he was influenced by the example of Dr. BRADLEY, who had been a most fuccefsful obferver, and yet had always preferred the Newtonian telescope to the other. But if long experience is allowed to be the final arbiter in fuch matters, we must adjudge the fuperiority to the latter, as that is now, and has been for feveral years paft, the only inftrument of the kind in requeft.

two learned and candid authors, M. LE ROI in the Encyclopedie, under the article *Telefcope*; and M. MONTUCLA in Hift. des Mathem. tom. ii. p. 643. GREGORY,

GREGORY, a young man of an uncommon genius, was led to the invention, in feeking to correct two imperfections of the common telescope; the first was, its too great length, which made it lefs manageable; the fecond, the incorrectnefs of the image. Mathematicians had demonstrated, that a pencil of rays could not be collected in a fingle point by a fpherical lens; and alfo, that the image transmitted by fuch a lens would be in fome degree incurvated. Thefe inconveniences, he believed, would be obviated, by fubflituting for the object glafs a metallic fpeculum, of a parabolic figure, to receive the image, and to reflect it towards a fmall fpeculum of the fame metal: this again was to return the image to an eye glafs placed behind the great fpeculum, which, for that purpofe, was to be perforated in its centre. This conftruction he published in 1663, in his Optica Promota, a work which in every refpect doth P honour

210

honour to the author. But as GREGORY, as he himfelf declares, was endowed with no mechanical dexterity, nor could find any workman capable of realizing his invention; after fome fruitlefs attempts in that way, he was obliged to give up the purfuit : and, probably, had not fome new difcoveries been made in light and colours, a reflecting telefcope would never more have been thought of, confidering the difficulty of the execution, and the finall advantages that could accrue from it, deducible from the principles of optics that were then known.

BUT NEWTON, whofe happy genius for experimental knowledge was equal to that for geometry, and who to thefe talents, in a fupreme degree, joined patience and mechanical abilities; NEWTON, I fay, thus accomplifhed, happily interpofed, and faved this noble invention from well-nigh perifhing 4

ing in its infant state. He likewife, at an early period of life, had applied himfelf to the improvement of the telescope; but, imagining that GREGORY's *science* were neither very neceffary, nor likely to be executed, he began with profecuting the views of DESCARTES, who aimed at making a more perfect image of an object, by grinding lenfes, not to the figure of a fphere; but to that of one of the conic fections. Now, whilft he was thus employed, three years after GREGORY's publication, he happened to take to the examination of the colours formed by a prifm; and having, by the means of that fimple inftrument, made the ever memorable difcovery of the different refrangibility of the rays of light; he then perceived that the errors of telescopes, arising from that cause alone, were fome hundred times greater than fuch as were occafioned by the fpherical figure of lenfes. This circumstance forced, as it P 2 were,

[212]

were, NEWTON to fall into GREGORY'S track, and to turn his thoughts to reflectors. ' The different refrangibility of the ' rays of light,' fays he, in a letter to Mr. OLDENBURG, Secretary to this Society, dated in February 1672, ' made me take ' reflections into confideration, and finding • them regular, fo that the angle of reflec-' tion of all forts of rays was equal to the ' angle of incidence, I underftood that, by ⁶ their mediation, optic inftruments might • be brought to any degree of perfection ' imaginable, provided a reflecting fubftance could be found, which would po-' lifh as finely as glafs, and reflect as much · light as glafs transmits, and the art of ^c communicating to it a parabolic figure be ' alfo obtained.----Amidft thefe thoughts, ' I was forced from Cambridge by the ' intervening plague; and it was more than , two years before I proceeded farther *.'

* Phil. Tranf. n. 80.
IT appears, then, that, if NEWTON was not the first inventor of the reflecting telefcope, he was the main and effectual inventor. By the force of his admirable genius, he fell upon this new property of light, and thereby found that all lenfes, of whatever figure, would be affected more or lefs with fuch prifmatic aberrations of the rays, as would be an infuperable obftacle to the perfection of a dioptric telescope. Here was (if I may use the fimilitude) a diforder inherent in the conflictution of this instrument, which NEWTON, like a wife phyfician, penetrated into, and, by underftanding the nature of the difeafe, was led to the remedy; one indeed that had been devifed before, but for a different and a flighter ailment, and withal of fuch difficult composition, that the contriver of it himfelf had not been able to prepare it.

IT was towards the end of 1668, or in the beginning of the following year, when P 3 NEWTON, NEWTON, being thus obliged to have recourfe to reflectors, and not relying on any artificer for making his specula, fet about the work himfelf, and, early in the year 1672, completed two fmall reflecting telefcopes. In these he ground the great speculum into a fpherical concave; not but that he approved of the parabolic form proposed by GREGORY, though he found himfelf unable to accomplifh it. In a letter that accompanied one of these instruments, which he prefented to the Society, he writes, 5 that though he then defpaired of ' performing that work (to wit, the para-⁶ bolic figure of the great fpeculum) by ' geometrical rules, yet he doubted not but ⁶ that the thing might in fome meafure be ^e accomplished by mechanical devices*.'

Nor lefs did the difficulty appear to find a metallic fubftance that would be of a

* Phil. Tranf. n. 81.

proper

proper hardnefs, have the feweft pores, and receive the finootheft polifh : a difficulty, in truth, which he deemed almost infurmountable, when he confidered that every irregularity in a reflecting furface would make the rays of light ftray five or fix times more out of their due course, than the like irregularities in a refracting one. In another letter, written foon after, he tells the Secretary, ' that he was very · fenfible that metal reflects lefs light than glafs tranfmits;-but as he had found ' fome metalline fubftances to be more ⁴ ftrongly reflective than others, to polifh ' better, and to be freer from tarnishing ' than others, fo he hoped that there might ' in time be found out fome fubstances ⁶ much freer from these inconveniences ' than any yet known *.' Meanwhile here was, as I faid, another ftop; and the more difcouraging, as it was not, like the former,

* Phil. Tranf. n. 82.

P 4.

to

to be removed by ' mechanical devices,' nor even by any chemical principle that had been difcovered. That want could only be fupplied by making repeated trials; nay, I may fay, as it were, fortuitoufly. NEWTON therefore laboured till he found a composition that answered in some degree, and left it to those who should come after him to find a better. The industry of Mr. MUDGE has been aiding to that of Sir ISAAC NEWTON; and the happy affiftant of that great man has been fo candid as to acknowledge, that chance did fave him much trouble, by furnishing him with a metallic mixture, which he had reafon to believe was fitter for the purpofe than any that had been ufed before, either published or concealed from the public.

NEWTON having, with his telescope, communicated to the Society a full and fatisfactory account of its construction and performance, performance, he received from your illuftrious predeceffors fuch thanks as were due to fo curious and valuable a prefent. And HUYGENS, one of the greatest geniuses of the age, and himfelf a diffinguished improver of the refractor, no sooner was informed by Mr. OLDENBURG of the difcovery, than he wrote in anfwer, ' that it ' was an admirable telefcope; and that Mr. ' NEWTON had well confidered the advan-⁶ tage which a concave fpeculum had above ' convex glaffes in collecting the parallel ' rays, which, according to his own calcu-⁶ lation, was very great. Hence that Mr. ⁵ NEWTON could give a far greater aper-' ture to that fpeculum than to an object ' glafs of the fame diftance of focus, and ^e confequently much more magnify in his • way than by an ordinary telescope. Be-' fides, that by the reflector he avoided an · inconvenience infeparable from object glaffes, which was the obliquity of both their

-

[218]

* their furfaces, which vitiated the refraction ⁶ of the rays that pafs towards the fides of the f glafs, and did more hurt than men were ' aware of. Again, that by the mere re-· flection of the metalline fpeculum there " were not fo many rays loft as in glaffes, • which reflected a confiderable quantity by each of their furfaces, and befides inter-• cepted many of them by the obfcurity of ' their matter.----That the main bufinefs " would be, to find a matter for this fpecu-' lum, that would bear as good and even a ' polifh as glafs. Laftly, he believed that ' Mr. NEWTON had not been without ⁶ confidering the advantage which a para-· bolic fpeculum would have above a fphe-' rical one in this conftruction; but had ' despaired, as he himself had done, of "working other furfaces than fpherical * ones with due exactnefs*.' HUYGENS was not fatisfied with thus expreffing to

* Phil. Tranf. n. 81.

the

the Society his high approbation of the late invention, but drew up a favourable account of the new telefcope, which he caufed to be publifhed in the *Journal des Sçavans*, of the year 1672, and by that channel it was foon known over Europe.

But how excellent foever the contrivance was, how well foever fupported and announced to the public, yet, whether it was that the artifts were deterred by the difficulty and labour of the work, or that the difcoverics even of a NEWTON were not to be exempted from the general fatality attending great and uleful inventions, the making a flow and vexatious progress to the authors; the fact is, that, excepting an unfuccefsful attempt which the Society made by employing an artificer to imitate the Newtonian confiruction, but upon a larger fcale, and a difguifed Gregorian telefcope, fet up by CASSEGRAIN abroad as a rival rival to NEWTON's, and that in theory only (for it never was put in execution by the author*), no reflector was heard of for nearly half a century after. But, when that period was elapfed, a reflecting telefcope was at laft produced to the world of the *Newtonian* conftruction, which the venerable author, ere yet he had finished his much distinguished course, had the fatisfaction to find executed in such a manner, as left no room to fear that the invention would longer continue in obscurity.

THIS memorable event was owing to the genius, dexterity, and application of a gentleman of this Society, Mr. HADLEY, the inventor of the reflecting quadrant, another most valuable instrument. The two telescopes which NEWTON had made were but fix inches long, were held in the

* Compare MONTUCLA, Hift. de Mathem. tom. ii. p. 647.

hand

hand for viewing objects, and in power were compared to a fix feet refractor; whereas HADLEY's was above five fect long, was provided with a well-contrived apparatus for managing it, and equalled in performance the famous aërial telefcope of HUYGENS, of 123 feet in length. Excepting as to the manner of making the specula, we have, in the Transactions of 1723, a complete defcription, with a figure, of this telescope, together with that of the machine for moving it; but, by a ftrange omiffion, NEWTON's name is not once mentioned in that Paper, fo that any perfon, not acquainted with the hiftory of the invention, and reading that account only, might be apt to conclude that HADLEY had been the fole contriver of it. But other Papers in the fame volume, befides the Minutes of the Society, clearly fhew that this worthy Member meant nothing lefs than

E

[222]

than to arrogate to himfelf any merit in this performance that properly belonged to NEWTON.

IT is known that the fame celebrated artift, after finishing two telescopes of the Newtonian conftruction, accomplished a third in the Gregorian way; but, I should judge, lefs fuccefsfully, by Dr. SMITH's declaring fo ftrongly in favour of the other. Mr. HADLEY was not lefs communicative than he was ingenious, being ever ready to impart his lights to others: in particular we are informed, ' that he fpared no pains • to inftruct Mr. MOLYNEUX and the Re-' verend Dr. BRADLEY; and that when • those gentlemen had made a fufficient · proficiency in the art, being defirous that • thefe telefcopes fhould become more pub-· lic, they liberally communicated to fome · of the principal inftrument-makers of this · city the knowledge they had acquired • from

' from him *.' Now fuch fcholars, as it is eafy to imagine, foon advanced beyond their mafters, and completed reflectors by other and better methods than what had been taught them.

CERTAIN it is, at leaft, that Mr. JAMES SHORT, as early as the year 1734, had fignalized himfelf at Edinburgh by his work of this kind. The excellent MAC-LAURIN, my dear departed friend, wrote that year to Dr. JURIN, ' that Mr. SHORT, ' who had begun with making glafs *fpecula*, ' was then applying himfelf to improve the ' metallic ; and that, by taking care of the ' figure, he was enabled to give them ' larger apertures than others had done ; ' and that, upon the whole, they furpaffed ' in perfection all that he had feen of ' other workmen.' He added, ' that Mr. ' SHORT's telefcopes were all of the *Grego*-

* SMITH's Syft. of Opt. b. iii, ch. 2.

· rian

[224]

* rian conftruction; and that he had much • improved that excellent invention *.' This character of excellence Mr. SHORT maintained to the laft, and with the more facility, as he had been well grounded both in the geometrical and philosophical principles of optics, and upon the whole was a most intelligent perfon in whatever related to his profession. It was supposed he had fallen upon a method of giving the parabolic figure to his great fpeculum; a point of perfection that GREGORY and NEWTON had wifhed for, but defpaired of attaining; and that HADLEY had never, as far as we know, attempted, either in his Newtonian or Gregorian telescope. Mr. SHORT, I am well informed, faid he had acquired that faculty, but never would tell by what peculiar means he effected it; fo that the fecret of working that configuration, what-

* SMITH's Syft. of Opt. b. iii. ch. 2. Rem. on art. 489.

ever

[22⁵]

ever it was, as far as it then appeared, died with that ingenious artift.

IT is Mr. MUDGE, therefore, who hath truly realized the expectation of Sir ISAAC NEWTON, who, above an hundred years ago, prefaged that the public would one day poffefs a parabolic fpeculum, ' not ac-' complified by mathematical rules, but by ' mechanical devices.'

THIS was a *defideratum*, but it was not the only want fupplied by our worthy brother: he has taught us likewife a better composition of metals for the *fpecula*, how to grind them better, and how to give them a finer poliss ; and this last part (namely the poliss), he remarks, was the most difficult and effential of the whole operation. In a word, I am of opinion, there is no optician in this great city (which hath been to long and fo justly renowned for ingenious [226]

nious and dexterous makers of every kind of mathematical inffruments), fo partial to his own abilities as not to acknowledge, that however fome parts of the mechanical procefs now difclofed might have been known before by individuals of the profeffion, yet that Mr. MUDGE hath opened to them all fome new and important lights, and upon the whole hath greatly improved the art of making reflecting telefcopes.

To enter into the detail of the ' devices' (to ufe NEWTON's expression), by which Mr. MUDGE hath arrived at the true parabolic figure, as well as at the other perfections of this inftrument, would encroach too much on your time; and, I may add, would not be altogether fuitable to the prefent occasion. I have laid before you the fum of what he hath performed, and declared to you the opinion of your Council, that without his interposition the nicety of

Ą

the art was in danger of being loft; or, at beft, of being kept in the hands of those who were not likely to make it public. The character which Mr. MUDGE bears for integrity; would leave us no room to doubt of his being himfelf perfuaded, that he hath in every point brought the great fpeculum of reflecting telefcopes to that degree of perfection which he professes but as authors and improvers, like parents and preceptors, can rarely divest themselves of too partial a fondness for what is their own, or amended by them, it will be fatiffactory for you to know, that fome of our brethren, the most intelligent in these matters, have frequently difcourfed with Mr. MUDGE upon this fubject; have feen him at work upon the *fpecula*; nay, have examined two reflecting telescopes (the one of 18 inches, the other of 22) completed by him; and that they are confident he hath by no means exaggerated either what he hath O_2

[227]

hath recovered to the body of arts, or what he hath added to it.

228]

NEED-I now fet forth the merit of afcertaining and advancing the conftruction of the reflecting telescope, to an audience fo well apprized of its value? To you, who know that of all inventions there are none fo juftly entitled to our admiration as those which have been fallen upon for enlarging the powers of vision; and that the difcovery of optical inftruments may be effeemed among the most noble, as well as among the most useful gifts, which the Supreme Artift hath conferred on Man? For all admirable as the eye came out of the hands of Him who made it, yet no organ of the animal frame hath He permitted fo much to be affifted by human contrivance, not only for the uses and comfort of common life, but for the advancement of natural feience ; whether by giving form and proportion 2

portion to the minute parts of bodies (as it were to the atoms of Nature) imperceptible before; or by contracting fpace, and, as by magic art, bringing to view the grander objects of the univerfe, the immenfe diftances of which had either difguifed their afpect, or rendered them quite invifible !

IF PLINY, in regard to HIPPARCHUS, could extravagantly fay, ' *Anfus rem Deo* ' *improbam annumerare pofleris ftellas* !' what would that pompous hiftorian of Nature have faid, had it been foretold him, that in the latter days a man would arife, who fhould enable pofterity to enumerate more new ftars than HIPPARCHUS had counted of the old; nay, who fhould in a manner verify the vulgar notion of their being innumerable! who fhould affign four Moons to Jupiter, and in our Moon (fuppofed by many to have a fmooth and polifhed furface) point out higher mountains

 Q_3

than

[230]

than any here below ! who fhould, in the Sun, the fountain of light, difcover dark fpots as broad as two quarters of the earth, and by thefe fpots afcertain his motion round his axis! who, by the varying *phafes* of the planets, fhould compose the fhortest and plainest demonstration of the truth of that fyftem, till then the greatest of paradoxes, which fuppofed that the earth and planets revolved about that luminary *! Yet thefe were but a part of the annunciations to the world of a fingle perfon, of GALI-LEO of unperifhing memory! To him his contemporary, and rival in fame Lord BACON, afcribed the invention of the per*fpicilla* (for fo they called at first the telefcopes), and in a figurative strain thus exprefied himfelf concerning them : ' With ' thefe (perspicilla), which GALILEO by a memorable effort of genius hath difcogyered, we are enabled, as with fome

* GALILEI Sidereus Nuncius, sparsim.

fmall !

[231]

fmall failing veffels, to open and keep up
a nearer commerce with the ftars *.'

Nor did this celeftial commerce ceafe with the acquifitions of GALILEO, but hath been extending ever fince the time that that great man first turned his glaffes to the heavens. The famous KEPLER, on the first notice, embraced the difcovery, and, in 1611, the year following the Sidereus Nuncius of GALILEO, published a treatife of dioptrics, geometrically explaining the performance of the perspicilta, and proposing fome proper improvements of them. Then came SNELLIUS, DESCARTES, and other celebrated geometricians abroad, who applied themfelves to optics, and fuccefsfully cultivated that fruitful branch of fcience. But whilft, at that period, in different parts of Europe, men of the first

* Quæ (perfpicilla) memorabili conatu adinvenit GALILEUS, &c. Nov. Organ. l. ii. aphor. 39.

Q 4

rank

rank in mathematical studies feemed to vie with each other in promoting not only the theory of vision, but the mechanical practice of the inftruments appertaining to it, and particularly the telefcope; how did it happen, that, in this country, in the laft century, which had fo aufpicioully begun with the lights derived from Lord BACON and Dr. HARVEY, we fhould afterwards find few traces of any attempt in that way earlier than the eftablishment of this Society? Of this paufe in the courfe of your philosophical difcoveries, the diffracted state of these kingdoms, under a long civil war, was indubitably the occafion. For no fooner had we fheathed the bloody fword, and difplayed the peaceful olive, than arts and fciences again fprang forth, and with so much vigour, that the advancement made, in thefe lands, fince that epoch, in optics alone, may be confidered as one of the nobleft

[232]

nobleft exertions of the human genius. Not to contend for a general fuperiority in the publications here on that fubject, fince the time that GREGORY entered first into that grand career, to filence all competition, I need but mention the Theory of Light and Colours; a piece fo excellent for invention, for judgment in conducting experiments, and for drawing the proper conclusions from them, that, had it been NEWTON's fingle work, it would not only have done lafting honour to himfelf, but to the country that gave him birth. And as to the inftruments, which of them, let me ask, hath not been either found out, or fignally improved, among you? Or what nation is there that hath embraced the arts, and doth not value itself on possessing every piece of this kind of British workmanfhip? The reflecting telescope I may call wholly yours, both as to the original contrivance.

contrivance, and every ftep of its advancement: nay, from its revival by Mr. HADLEY to this day, a fpace of nearly threefcore years, we have heard of no artift, out of this ifland, who hath been able tolerably to copy, much lefs to add to, this fplendid invention.

WHAT acknowledgements, then, GEN-TLEMEN, do we not owe to our worthy Brother, who, for above twenty years paft, in the uncertain intervals of a toilfome and anxious profession, hath unbent his mind, not in the perissing recreations of the world, but in investigating, with unremitting diligence, what had been done but concealed by others, and in making many fuccessful experiments towards perfecting this inimitable inftrument! A liberal account of these leifure hours he hath laid before you in his inftructive Paper: a communication, I am perfuaded, that

[235]

that will not only preferve, but fignalize his name in your records, among the very intelligent and ingenuous promoters of the great ends of your inftitution.

DISCOURSE

A

ON THE

THEORY OF GUNNERY;

DELIVERED AT THE

Anniverfary Meeting of the ROYAL SOCIETY; November 30, 1778.

By Sir JOHN PRINGLE, Baronet.

PUBLISHED BY THEIR ORDER.

A DISCOURSE ON THE THEORY OF GUNNERY.

GENTLEMEN,

MONG the feveral experiments communicated to the Society, during the courfe of the preceding year, none feeming fo much to engage your attention, as those contained in the Paper, intitled, The Force of fired Gun-powder, and the initial Velocity of Cannon-balls, determined by

[240]

by Experiments : with much pleafure therefore I acquaint you, that, on account of the pre-eminence of that communication, your Council have judged the author, Mr. CHARLES HUTTON, worthy of the honour of the annual Medal, inftituted on the bequeft of Sir GODFREY COPLEY, Baronet, for raifing a laudable emulation among men of genius, in making experimental enquiries. But, as on former occafions, fo now, your Council, waving their privilege of determining the choice, have acted only as a felect number deputed by you, to prepare matters for your final decifion. I come, then, on their part, briefly to lay before you the state of the Theory of Gunnery, from its rife to the time when its true foundation was laid, in order to evince how conducive those experiments may be to the improvement of an art of public concern, as well as to the advancement of Natural Knowledge, the great object of your

your inflitution. And if, upon a review of the fubject, you fhall entertain no lefs favourable an opinion of Mr. HUTTON's performance, than what your Council have done, it is their earneft requeft that you would enhance the value of this Prize, by authorizing your Prefident to prefent it to eur ingenious Brother in your name.

A R TILLERY (in the large acceptation of the term) took place long before the invention of gun-powder. We trace the art to the remoteft antiquity, fince the Sacred Records acquaint us, that one of the kings of Judah, eight hundred years before the Chriftian æra, erected on the towers and bulwarks of Jerufalem engines of war, the contrivance of ingenious men, for fhooting arrows and great ftones for the defence of that city^{*}. Such machines were afterwards known to the Greeks and Ro-

* 2 Chron. xxvi.-15.

R

mans

[242]

mans by the names of balista, catapulta, and others, which had amazing powers, and were not less terrible in their effects than the cannon and mortars of the moderns. It appears that the balifta was contrived to fhower volleys of darts and arrows of a very large fize upon the enemy; whilft the catapulta, or onagra (as it was otherwife called), was fitted not only for that purpose, but for discharging stones of an enormous weight; I might fay rocks, fince fome of them are reported to have weighed feveral hundred pounds. Batteries compofed of numerous pieces of that kind of artillery, nothing could withftand. Yet, if we are rightly informed, their fole principle of motion confifted in the fpring of a ftrongly-twifted cordage, made of animal fubstances fingularly tough and elastic. Thefe warlike inftruments continued, not only during the time of the Roman empire, but to the twelfth and thirteenth centuries,

Ŀ

[243]

turies, as we find from hiftory; nor indeed is it probable that they were totally laid afide, till gun-powder and the modern ordnance, attaining a good degree of perfection, fuperseded their use. The very intelligent commentator of POLYBIUS* is. of opinion, that the military art rather loft than gained by the exchange of the catapulta for the mortar: but, however that point may be determined in fpeculation, it is not likely that the ancient tormenta militaria will ever be revived; but that all nations will keep to the art of gunnery, and fludy how to improve it; that is, they will adhere to a fystem of artillery, wherein the moving power depends on the expanfive force of gun-powder, or of fome other fubstance of a fimilar nature.

UPON the first application of this principle to the purposes of war, nothing per-

R 2

haps

^{*} M. Folard,

[244]

haps was lefs thought of than to affift fo empirical a practice by fcientific rules; for, however aiding in thefe matters the ancient mechanicians might have been, who, like ARCHIMEDES, had invented or perfected fome of the *baliflic* machines, no praife feemed now due to the mathematicians for either the difcovery or improvement of the new artillery. In fact, we find the practice of the art had fubfifted about 200 years, before any geometer confidered it as one that admitted a theory, or at leaft fuch a theory as was grounded on geometry.

IT feems but just to trace and commemorate the inventors of the ingenious arts which furnish matter for discours on these occasions; and not only the main inventors, but even those who first turned their thoughts upon the subject: for, though such men may not have produced any thing perfect, yet they may have suggested gested ideas to others of a less inventive, but of a more executive genius, and who, unprovided with thefe hints, would never have made any notable difcovery. I muft therefore obferve, that the Italians were the first who emerged out of those thick clouds of ignorance and barbarifm which had fo long overfpread this quarter of the world. They profited by the unhappy fate of Conftantinople; for, by liberally receiving the learned emigrants on that diffrefsful occafion, they were largely repaid by their arts and fciences, and ftill more abundantly by their language, whereby they were enabled to read and to tranflate those ancient manufcripts, which the Greeks had faved out of the wreck of their country. The art of printing, which was established soon after, was the means of quickly diffeminating those treasures of knowledge, and concurred with the fall of the eaftern empire, to form an epoch for the advancement of R 3 learning,

learning, unparalleled in the annals of letters.

THE end of the fifteenth century, and the whole of the fixteenth, were chiefly employed by the Italians in the fludy and in the translation of the old Greek authors. The geometry of the ancient Greeks, as well as the arithmetic in numbers and fpecies of the Arabians, was cultivated; but both remained, as it were, fciences by themfelves, unaffifting to, or at best but weak and reluctant auxiliaries to, the philofophy of the fchools: and indeed how could the abstracted doctrines of numbers and quantities be ftrained to co-operate with a fystem, in which neither the laws of motion, nor any but the fuperficial, and often delusive properties of matter, were to be met with? The genius of the Greeks, all acute and brilliant as it was, had never been properly directed to the interpretation of

of Nature, and was indeed unfit (as Lord Bacon pronounced) for a fludy that made fo flow and painful a progrefs, by reiterated and varied experiments and obfervations. It was no wonder, then, if the Mixed Mathematics, as they are called, defcended to the moderns in a ftate no wife corresponding to the elegance and certainty of those parts of the science which were elementary and pure ; and that those mixed parts should have been found defective and erroneous, in proportion (if I may fo express myself) to the physical confiderations that were to be taken into the enquiry. The imperfection of the ancients. with regard to natural philosophy, was not perceived at that time : nay, at the period we are treating of, the learned were firmly perfuaded of the contrary, and that all that was wanting to be known concerning the laws of Nature, and the properties of matter, was to be taken, either directly or by R. 4. deduction,

[248]

deduction, from the phyfics of ARISTOTLE. It was not till the feventeenth century was fomewhat advanced, that men of fcience began to liften to Lord BACON and GALI-LEO, the great founders of the experimental and the true philofophy.

MEAN while, in the beginning of the fixteenth century, unqualified as the Italians then were for entering upon phyficomathematical enquiries*, they neverthelefs made the attempt, and in particular took the theory of projectiles into confideration. Some imagined that a body impelled with violence, fuch as a ball difcharged from a cannon, moved in a right line till the force was fpent, and that then it fell in another

* The chief exception that occurs to this general remark, is the rapid progrefs which in that age Co-PERNICUS made in aftronomy; who was not indeed an Italian, but was fuppofed to have profited by his early travels into Italy, which he enlightened afterwards by his admirable difcoveries,

right
[249]

right line perpendicularly to the earth. Upon this principle, abfurd as it was, we find one of the earlieft authors grounding his whole theory of gunnery*; whilft others, diffenting from his hypothesis, admitted only the ftraight line, in which the ball moved for fome time after coming out of the piece, and that other ftraight line in which it fell to the ground; but afferted that thefe two were connected by a curve line, and that this curve was the fegment of a circle. NICOLAS TARTAGLIA of Brefcia, a mathematician of the first rank in those days, and still celebrated for his improvements in algebra, hath been fuppofed to be the author of this doctrine, no lefs erroneous than the former, and for which two of his books have been quoted †.

* See MONTUCLA, Hift. des Mathem. vol. i. p. 623.

Thofe

3

These I have never seen; but, from another of his works, professedly written on this fubject, and translated into English under the title of Colloquies concerning the Art of Shooting in great and fmall Pieces of Artillery*, I find him, contrary to the opinion of his contemporaries, maintaining that no part of the track of a cannon-ball is in a right line, though the curvature in the ' first part of its flight be fo fmall, that it needeth not to be attended to. But TAR-TAGLIA is far from fuppoling, that the line in queftion hath any relation to a parabola, or to any regular curve. It would feem, then, that if this mathematician had at first been so far mistaken, as to fancy that fome part of the course of a projectile was in a ftraight line, he had afterwards changed his opinion, and was perhaps fingular in what he finally embraced.

* Published at London, A. 1588.

FROM

FROM numerous inflances one would imagine, that, in those days, so far were men of science from making experiments themselves, that they even shut their eyes against what chance would have prefented to their sight. For, whoever had minded the roving shot of an arrow, the slight of a stone from a sling, or had attended to a ftream of water issuing from the spout of a cistern, might have been convinced, that the path of every projectile was in a continued curve, whatever little he otherwise knew concerning the properties of that one.

But had the obfervation of the philofophers gone fo far, they had ftill been at a diftance from the truth. They might have perceived a likenefs between the track of thofe bodies in motion and a parabola, and concluded, from analogy, that all projectiles delineated that curve in the air; but they

they could never have realized their conjectures by mathematical demonstration, without previously knowing the law of *acceleration* in falling bodies : a difcovery referved for the next century, and for GA-LILEO*, one of the greatest ornaments of it.

IT was he who first investigated the effects of gravity on falling bodies, and upon that foundation demonstrated, that all projectiles would move in a parabola in a nonreassing medium. And, as he made little account of the resistance of the air, the properties of which were then imperfectly known, he proved that a ball shot horizontally would, in its stight, describe half a parabola; and, when the piece had an elevation above the horizon, the ball would de-

* He was born in the year 1564; but few if any of his works were publifhed till after the year 1600, and his Dialogues on Motion not before 1638.

fcribe

feribe a whole parabola, fuppofing it to fall on the plane of the battery. By the fame method of reafoning he fhewed, that whatever the ranges of the projected body, or the elevations of the piece, were, the ball would ftill trace that curve line, of a greater or leffer amplitude, by the time it defcended to the level of the place from whence it came.

THUS far went GALILEO, confining his projections to the horizontal plane of the battery: but TORRICELLI, his difciple, foon after carried the theory farther, by tracing the fhot to its fall, whether that place was above or below the plane; and ftill found, by geometrical deductions, that it flew in a parabola of a larger or a fmaller amplitude, according to the angle of elevation of the piece, and the ftrength of the powder.

VARIOUS

[254]

VARIOUS and numerous had been the difputes in Italy about the laws of motion' in general, and efpecially about those of projectiles, from the time the mathematicians had begun the enquiry, till the publication of the Dialogues of GALILEO on that fubject (a fpace of upwards of a hundred years); but, from that period, fo evident did his demonstrations appear, that all contest ceafed, and every man of fcience was convinced, that all projectiles moved in the track which he had difcovered. For, as to the refistance of the air, which he had not paffed unnoticed (as GALILEO himfelf had been the first, at least of the moderns, who ftarted the notion of the weight of the air and the preffure of the atmosphere), yet fo thin and fo yielding did they effeem that fluid to be, that they were affured it could occafion no fenfible; at leaft no material, deviation from that curve. As they had the principle from GALILEO,

GALILEO, fo they believed themfelves warranted by that refpectable author, not to fear, from that caufe, any objection which he himfelf had fuggefted, but had removed. 'Among thefe projectiles,' fays he, 'which we make ufe of, if they are of 'a heavy matter and a round form; nay, 'if they are of a lighter matter, and have 'a cylindrical form, fuch as arrows fhot ' from bows, their track or path will not ' fenfibly decline from the curve of a para-' bola *.'

HERE then was the theory of gunnery laid, in appearance, on the most folid foundation. And thus far the Italians having proceeded, they feemed to have taken leave, and to have committed the fubject to other nations, whose greater power, or greater ambition, was more likely to make them avail themselves of the perfection of

* See his fourth Dialogue on Motion.

a mili-

[256]

a military art, than their inftructors. We had reafon, therefore, to expect, that a neighbouring state, intent upon the advancement of the arts and fciences in general, would not fail to give particular attention to those that should appear most fubfervient to its grandeur. Accordingly we find, that our fifter Society of that kingdom had not been many years eftablished, when an ingenious Member of that illustrious Body, not queftioning the foundness of the Galilean principle in regard to projectiles, in the year 1677 propofed to the academy, as a problem for the improvement of artillery, how to direct a piece (fuppole a mortar) fo as to make the fhot fall where one had a mind; or, in the common expression, to hit a mark, the strength of the powder being given*. This thought met with general approbation, and fo far

* See Hift. de l'Academ. Roy. des Sciences, A. 1707.

were

[257]

were the academy from raifing any difficulty about the obstruction which the air might occafion to a body moving with fo much velocity in it, that we do not find the making experiments on that head was confidered by them as an effential ftep to the folution; but that their principal geometers straightway fet about folving the problem as it had been announced to them, fome following one method, fome anothers and all upon the fuppolition of a projectile moving in the line of a parabola. But M. BLONDEL, who had been the propofer, and who more particularly had fludied the queftion, composed a large volume on the fubject, which he published a few years after*, under the title of L'Art de Jetter les Bombes; a performance much celebrated at the time, and that continued in no fmall request long after, as containing, besides

S

his

[258]

his own, the labours of feveral other Members of that Society of the moft diftinguished merit. So many and fuch hands concurring in framing this work, it was no wonder that the learned throughout Europe were confirmed by it in the Galilean theory; and the more, as M. BLONDEL had obviated the only objection they fuppofed could be made to it, the refifance of the air, which he had taken care expressly to mention, and fo to combat as to perfuade the reader, that the retardation arifing from that caufe was fo inconfiderable as to be of no account in the practice.

THIS illufion about the fmall or nonrefiftance of the air to bodies rapidly moving in it, was fo prevalent at the end of the laft century, and in the beginning of the prefent, that, in the hiftory of the Royal Academy for the year 1707, we find their worthy and most accomplished Secretary, Secretary, after taking notice of the joint labours of fo many able mathematicians concerned in BLONDEL's publication, venturing to fay, ' it did not appear that any ' thing was then wanting for the practice ' of the art (of Gunnery), except perhaps ' perfecting the inftruments for pointing a ' cannon or mortar but that geo-' metry had done its part, fo to fpeak, with ' regard to practice, &c*.'

But far be it from our intention to relate the imperfections of others, in order to raife ourfelves by the comparison. Candour requires of us not only to acknowledge that, in this country, as to the point in question, we did not surpass our neighbours; but ingenuously to own that, on the contrary, we were perhaps more liable to exception. For, some years before

* Hift. de l'Acad. R. des Sc. A. 1707, under the article Mechanique.

BLONDEL'9

[260]

BLONDEL's work appeared *, a treatife was published by one of our own artillerifts, ANDERSON (a perfon of eminence in his profession), intitled The genuine Use and Effects of the Cun, in which the author ftrenuoufly fupports the Galilean theory; nor do we learn that he was ever contradicted among us, although he undertook to anfwer all those who should make objections to it. Nay, when he had an opportunity afterwards of making experiments on the ranges of bombs, and by thefe trials was affured that their flight was not in a parabola; yet fo far was he from afcribing the deviation from that figure to the refiftance of the air, that he had recourse to an hypothefis, repugnant to all the laws of motion, to falve appearances, and to reconcile those experiments with his former doctrine †.

* Viz. in 1674.

+ See his treatife To Hit a Mark, published in 1690.

AND

[261]

AND did not Dr. HALLEY, fo long the ornament of this Society, communicate, in in the year 1686, a Paper, which he calls A Difcourfe concerning Gravity, in which, treating of the motion of projectiles, he fays, that being aware of the deflection from the parabolic curve that might be occafioned by the refiftance of the air, he had made fome experiments, even with cannon-balls, to effimate the force of that refiftance; yet conclude, ' that in large " fhot of metal, whole weight many thou-' fand times furpaffed that of air, and ' whole force is very great, in proportion • to the furface wherewith they prefs there-' upon, this opposition was not differn-' ible.' And again, ' though in finall and • light fhot, the opposition of the air ought • and must be accounted for ; yet in shoot-' ing great and weighty bombs, there need ⁶ be very little allowance made; and fo. 6 thefe rules (thofe, to wit, grounded on the S 3

[262]

the principle of GALILEO) may be put
in practice to all intents and purpoles, as
if this impediment (the refiftance of the
air) were abfolutely removed*.' Such conclusions, which we now find to be erroneous, were the lefs to be expected from fo eminent a perfor, as they argued too much hafte to finish a theory, that was to be made fubfervient to prefent use.

IT might indeed have been expected, that men of feience, applying themfelves to this fludy, would have been fooner awaleened to the confideration of the great oppolition of the air, by the *Principia* of NEWTON, published a little after this Paper of HALLEY's[†]. For in that excellent work the illustrious author had demonflrated, that the curve deferibed by a projectile, in a ftrongly refifting medium, dif-

> * Philof. Tranf. No. 179, p. 20. + In the year 1687.

> > fered

fered much from a parabola, and that the refiftance of the air was great enough to make the difference between the curve of projection of heavy bodies and a parabola far from being infenfible, and therefore too confiderable to be neglected.

HAVE we not then lefs to plead for not attending to the *Principia* of NEWTON in this article*, than the mathematicians of other nations, who, as M. DE FONTE-NELLE obferves †, partly from the difficulty of undertaking that concife and profound work, and partly from a mifapprehenfion of its tendency (which they fancied was to revive the exploded doctrine of *occult qualities*), were late in becoming acquainted with it? But it is not fo eafy to account for their inattention to HUYGENS, a known and even then a much efteemed author,

* NEWTON, Princip. Mathem. lib. ii. fect. 7.

+ Eloge de NEWTON.

and

[264]

and who indeed was fecond to NEWTON alone in fcience and in genius. For he, in the year 1690, had publifhed a treatife on *Gravity*, written in a popular manner, wherein he gave an account of fome experiments he had made at Paris, and in the academy, by which, as well as by mathematical inveftigations, he was convinced of the truth of NEWTON's conclusions, in regard to the great opposition of the air to bodies moving fwiftly in it; and, by confequence, believed that the track of all projectiles was very different from the line of a parabola^{*}.

BUT, excepting NEWTON and HUY-GENS, the learned feemed univerfally to acquiefce in the juftnefs and fufficiency of the principles of gunnery invented by GA-LILEO, enlarged by TORRICELLI, con-

* Difcours de la Cause de la Pesanteur. Leide, 1690.

firmed

firmed and reduced to fyftem by ANDER-SON, BLONDEL, HALLEY, and others; and fo far were the theorifts, in that branch of fcience, from fufpecting any defect or fallacy in these principles, that they seemed rather to reproach the practical artillerifts, for not profiting more by the inftructions which they had fo liberally imparted to them. Nor do we find that an apology was made for the empirical exercise of the art, by any author of note in that line, earlier than the fixteenth year of this century, when M. DE RESSONS, a French officer of artillery, diffinguished by the number of fieges at which he had ferved, by his high military rank, and by his abilities in his profession; when he, I fay, thus qualified to bear teftimony, prefented a Memoire to the Royal Academy (of which he was a Member), importing, that ^e although it was agreed that theory joined 6 to practice did conflitute the perfection • of

[266]

of every art, yet experience had taught
him, that theory was of very little fervice in the ufe of mortars: that the work
of M. BLONDEL had juftly enough deferibed the feveral parabolic lines, according to the different degrees of the clevation of the piece; but that practice had
convinced him there was no theory in
the effects of gun-powder: for that, having endeavoured, with the greateft precifion, to point a mortar agreeably to thofe
calculations, he had never been able
to eftablifh any folid foundation upon

THUS, after the theory of gunnery had excreifed the genius of the learned for nearly two hundred years, and for almost fourfcore of that time had rested on fundamentals which had never been contested, it was pronounced at once to be almost en-

> * Mem. de l'Acad. R. des Sc. A. 1716. tirely

[267]

tirely useless, and that by one of the most competent judges. Now, whether it were owing to the deference due to the authority of that experienced artillerift, or to fome other caufe, I shall not determine, but obferve, that it appears not from the hiftory of the Academy, that the fentiments of M. DE RESSONS were at this time controverted, or any reafon offered afterwards for the failure of the theory of projectiles, when applied to ufe. Nor can I pafs unnoticed the paufe that enfued before any farther attempts were made to improve the theory of the art, either upon the old principles or upon new ones, excepting by fuch authors as feemed ignorant of this transaction, and who of course were not fufficiently apprifed of the inefficacy of the properties of the parabola, for directing practice : or by those who were employed in fpeculatively inveftigating the nature of the curve traced by a ball in the air; a curve

[268]

curve which began at laft to be confidered as one deviating much from the line of a parabola : or, finally, by fuch as, having taken notice that NEWTON's ideas had not been duly attended to, endeavoured to avail themfelves of them, and of fome experiments that had been made by others, for proving the great oppolition of the air to bodies of fwift motion; but without afcertaining the degree of that refiftance, or enriching the art by any practical rules *.

SUCH was the unhinged flate of this, part of the mixed mathematics, when, within our memory, Mr. BENJAMIN Ro-BINS took cognizance of it: nor could the fubject have fallen into abler hands, endowed as he was by Nature with a fuperior genius and unwearied application. Mr. * DAN. BERNOULLI, Comment. Acad. Petropol. T. 2. & 3.

ROBINS

ROBINS was deeply verfed in geometry and the doctrine of numbers; but he knew the limits as well as the powers of both, and how infufficient they were for eftablishing any theory where matter was concerned, without preparing the way, by finding out the phyfical properties of that matter, by many and varied experiments and attentive obfervation. Those who had hitherto treated of the foundation of gunnery, by being too forward in the application of their mathematics, had in a manner hurt the credit of that admirable fcience. They ought to have feen the neceffity of minutely examining every circumstance which could affect the course of a projectile, befides that of gravity. Mr. Ro-BINS perceived the error of his predeceffors in that enquiry, and corrected it. Perfuaded as he was, from Sir ISAAC NEW-TON's Principia, of the great refiftance of the air to bodies moving in it, and alfo of 6 the

the uncertainty of the force of gun-powder, and of the variations in the flight of fhot, occafioned by the unavoidable varieties in the make of it, and in the make of the pieces of artillery which difcharged it; apprifed, I fay, of fo many caufes of aberration, he justly concluded, that the foundation here was at least as much an affair of phyfics as of geometry, and that if the art of throwing bombs had not been advanced by theory, it was not becaufe the art admitted of none, but becaufe the theory which had hitherto been devifed had been both defective and erroneous. He fuspected that most of the writers on gunnery had been deceived, in fuppofing the refiftance of the air to be inconfiderable, and thence afferting the track of all fhot to be nearly in the curve of a parabola, by which means it came to pafs that all their determinations about the flight of projectiles of violent motion, had declined confiderably from the truth.

truth. But in order to clear this point from every doubt, he found it neceffary to afcertain the force of gun-powder, and by that flep to effimate the velocity of the flot impelled by its explosion. That being done, he proceeded to measure the quicknefs of a mufket-bullet, fhot out of a given barrel, with a given quantity of powder; and to confirm the truth of his conclusions, he contrived a machine, by which the velocity of a bullet might be diminished in any given ratio, by being made to ftrike on a large body of a weight juftly proportioned to it; whereby the fwifteft motions, which otherwife would efcape our examination, were to be exactly determined by those flower motions that had a given relation to them. The machine was a large wooden pendulum, which fwung freely, but in fo flow a manner, that its vibrations could eafily be counted, whatever was the celerity of the bullet discharged against it. The [272]

The thought was fimple, ingenious, and incontestably his own.

He next enquired into the refistance made by the air to projectiles of rapid motion, and which he difcovered to be much greater than had been fuppofed by any writer on the fubject; and indeed fo great; that it was manifest the curve described by any fhot was very different from a parabola, and confequently that all the applications of the properties of that conic fection to gunnery were fo erroneous as to be totally useless. For, by means of this pendulum, placed at different diftances front the mouth of the piece, he clearly demonftrated how much a bullet, flying with a given velocity, would gradually lofe of that motion by the opposition of the air: therein furnishing to the learned a fignal and inftructive inftance of the fallacy of the most specious theories, that do

[273]

do not proceed hand in hand with experiments.

I SHOULD too much exceed the juft bounds of a difcourfe of this kind, were I to enter more minutely into the fyftem founded by Mr. ROBINS, confirmed and improved, as I find, by the labours of feveral of the learned, in foreign parts, of great celebrity*. I fhall only add, that his performance well deferves the title he gives it of *The New Principles of Gunnery*, fince the author may more properly be faid to have invented a new fcience than to have added to an old one. And I believe I may venture to fay, that no phyfico-mathematical difquifition hath done more honour to this country, or to the age, than the writ-

* It is much to the honour of Mr. ROBINS, that his writings on this fubject have been translated into foreign languages by men that were the beft judges of their merit. I need only name M. M. EU-LER and LE ROY.

T

ings

[274]

ings of Mr. ROBINS on this fubject, which have been published, partly by this Society, partly by himself, and partly fince his death (in the collection of his whole mathematical tracts) by his learned friend.

BUT though our worthy Brother will ever be celebrated for having been the inventor of the true principles of gunnery, yet it would be too flattering to his memory, to fay he had carried the theory of this art to perfection. He himfelf was far from entertaining fo high an opinion of his labours : nay, he expreisly declared, that he left fome material points to be enquired into at more leifure (which other occupations, and his immature death, deprived him of); and he much regretted that he wanted conveniency and opportunities for making experiments on balls of a greater weight, than what he had used for afcertaining the initial velocity of them.

Мисн

MUCH therefore are we indebted to Mr. HUTTON, who, treading in the footfleps of the deceased, hath refumed and prosecuted this last *defideratum*, and hath shewn himself not unequal to fo difficult an enterprize.

MR. ROBINS, for determining the initial velocity of fhot, arifing from different quantities of powder, made use of balls of about an ounce weight; whereas Mr. HUTTON, for the fame purpofe, hath employed those of different weights, from one pound to nearly three; or, in other words. Mr. ROBINS made trial with mufket fhot only, Mr. HUTTON with cannonballs from 20 to about 50 times heavier. This was a confiderable ftep gained in a difquifition on that part of the fcience, in which the refiftance of the air, and other circumftances, were not concerned; and where neither analogy alone, nor mathe-T 2 matical

[276]

matical deductions alone, nor the two combined, were fufficient for eftablifhing principles applicable to the motion of cannonballs, without making a new feries of experiments : and with what labour and judgment thefe have been performed, you underftood by the account which Mr. HUT-TON gave of them in his Paper.

BUT fhould it now be enquired, what advantages may be derived from Mr. HUT-TON'S experiments, for the advancement of the art of gunnery, and of philofophy in general? I would reply, that, as to the former, it may be fufficient to obferve, that though the improvements be only fuch as can be deduced from the force of fired gunpowder; yet they are in a higher, more certain, and in a more general manner, than what refulted from the labours of Mr. ROBINS; who indeed led the way, but who made, as it were in miniature, thofe experiments experiments which Mr. HUTTON hath executed at large, and which Mr. ROBINS himfelf wished to have made, as well as others who have confidered the fubject fince his time. Now thefe experiments, though made by Mr. HUTTON with cannon-balls of a fmall fize, may neverthelefs form just conclusions when applied to cannon-fhot of the largeft fize. And fuch conclusions inform us of the real force of ' powder, when fired, either in a cannon or a mortar, impelling a ball or bomb of a given weight; that is, they difcover with what velocity a given quantity of powder drives those projectiles in a fecond, or in any other affigned portion of time. They allo fhew the law of variation in the velocity, arifing from different quantities of powder, with the fame weight of metal, and likewife that law which takes place upon using balls of different weights. Farther, they point out the advantage obtained

T 3

by

[278]

by diminishing the windage in cannon, and teach us how we may increase the weight of the shot in the same piece, by making it of a cylindrical form, instead of a spherical: by this device, a smaller ship may be enabled to do the execution of a larger one. And experiments of the same kind will also determine the just length of cannon for shooting farthest with the same charge of powder.

LASTLY, it is from these experiments, or from others that may be made after the like manner, we are inftructed how to anfwer every question relative to military projectiles, excepting fuch as depend on the refistance of the air to bodies moving fwiftly in it. This indeed is a confideration which leaves room for greater improvement in the art, and for conferring fresh honours on those, who, like Mr. HUTTON, shall have opportunities and abilities abilities for continuing and perfecting this very curious and useful enquiry.

As to the advantages accruing to philofophy from the labours both of Mr. Ro-BINS and Mr. HUTTON, fpeak they not for themfelves? The fciences of motion and pneumatics are promoted by them; and of what avail their perfection would be for the farther interpretation of Nature, you need not be informed. In fine, we have here before us, in thefe experiments, the fureft teft of our advancement in true knowledge, which is, the improvement of a liberal art, and the enlargement of the powers of Man over the works of creation.

SOME, however, may think, that the objects of this Society are the arts of peace alone, not those of war; and that, considering how numerous and how keen the instruments

inftruments of death already are, it would better become us to difcourage than to countenance their farther improvement. These naturally will be the first thoughts of the best disposed minds. But when, upon a clofer examination, we find that, fince the invention of arms of the quickeft execution, neither battles nor fieges have been more frequent nor more deftructive, indeed apparently otherwife; may we not thence infer, that fuch means as have been employed to fharpen the fword, have tended more to diminish than to increafe the number of its victims, by fhortening contefts, and making them more decifive. I shall not however infift on maintaining fo great a paradox; but only furmife, that whatever State would adopt the Utopian maxims, and proferibe the study of arms, would foon, I fear, become a prey to those who best know how to use them. For yet, alas, far feem we to be removed

[281]

removed from those promised times, when nation shall not list up sword against nation, neither shall they learn war any more !

MR. HUTTON,

YOU have heard, SIR, the account I have given of the rife and progress of the *Theory of Gunnery*, and of your improvement of it; a recital, which by no means would have done either you or the fubject juftice, had it been addreffed to any other audience than to the prefent. But, as my intention was only briefly to recal to the memory of these gentlemen what they knew of this fubject, antecedently to your Paper, and to remind them of the refult of your experiments, I flatter myself I have faid what was fufficient on the occasion: being now authorifed by them to deliver into into your hand this Medal, as the perpetual memorial of their approbation. And let me add, SIR, that they make you this prefent with the more cordial affection, as by your other ingenious and valuable communications they are affured, not only of your talents, but of your zeal, for promoting the interefts and honour of their inflitution.

FINIS,

ERRATUM,

In the title of the Discourse, On the Means of Preserving the Héalth of Mariners, for 1775, read 1776.
