Glas, nicht oxidisch, Chemikalien
Diese Kategorie beinhaltet die verschiedenen chemischen Substanzen, die in der Produktion von nicht-oxidischen anorganischen Gläsern verarbeitet werden. Für Aussagen in dieser Kategorie wird "Glas" als amorphe, anorganische, gewöhnlich opake Substanz definiert, die aus einem Gemisch von Elementen besteht, die durch Schmelzen in eine Masse überführt wird, die ohne Kristallisation in einen rigiden Zustand abkühlt. Diese Kategorie enthält die verschiedenen chemischen Substanzen, außer den Nebenprodukten oder Verunreinigungen, die sich in den Schmelzöfen während der Produktion verschiedener Gläser bilden, und die gleichzeitig in eine Glasmischung eingebunden werden. Jedes Glas enthält eines oder mehrere dieser Substanzen, jedoch wenige, wenn überhaupt, enthalten all diese Substanzen. Die unten angeführten Elemente sind normalerweise als Elemente vorhanden, können aber auch als Halogenide, Sulfide, Selenide oder in komplexeren Substanzn vorhanden sein. Spurenbeträge von Oxiden oder anderen chemischen Verbindungen können vorhanden sein. Aluminium, Antimon, Arsen, Bismut, Cadmium, Gallium, Germanium, Selen, Silicium, Schwefel, Tellur, Zink.
