Keramische Stoffe und Waren, Chemikalien
Diese Kategorie umfasst die verschiedenen chemischen Substanzen, die in der Produktion von Keramik verarbeitet werden. Für Erläuterungen in dieser Kategorie wird Keramik als kristalline oder partiell kristalline, anorganische, nichtmetallische, gewöhnlich opake Substanz definiert, die vorrangig aus Kombinationen von anorganischen Oxiden von Aluminium, Calcium, Chrom, Eisen, Magnesium, Silicium, Titan oder Zirkon besteht. Herkömmlicherweise wird sie zuerst durch Schmelzen oder Sintern bei sehr hohen Temperaturen gebildet, dann durch Kühlen, das gewöhnlich eine rigide, brüchige Monophasen- oder Multiphasenstruktur ergibt. (Nicht in dieser Definition enthalten ist diejenige Keramik, die durch Erhitzen von anorganischem Glas hergestellt wird, wobei ihre physikalische Struktur von der amorphen in die kristalline übergeht, jedoch die chemische Identität unverändert bleibt.) Diese Kategorie besteht aus chemischen Substanzen, außer den Neenprodukten oder Verunreinigungen, die während der Produktion der verschiedenen Keramiken gebildet und gleichzeitig in das Keramikgemisch eingeschlossen werden. Ihre Zusammensetzung kann eine oder eine Kombination dieser Substanzen enthalten. Spuren von Oxiden und anderen Substanzen können vorhanden sein. Die nachfolgenden repräsentativen Elemente sind vorrangig als Oxide vorhanden, können aber auch als Boride, Carbide, Chloride, Fluoride, Nitride, Silicide oder Sulfide in mehreren Oxidationsstufen vorhanden sein oder in komplexeren Verbindungen.
