The world is changing around us
How dare it!

“I really wonder whether there is a way of simplifying the whole work of detecting mismatch, because it is tedious and energy consuming.”

“People are really frustrated spending time looking for mismatches in a non-structured way.”

“The work I do finding mismatches is rarely reusable, so I cannot always teach it to other people.”

Reusers wanna help but don't really know how

Mismatch Finder to the rescue!

How Mismatch Finder works

1. Someone has a way to automatically and at scale compare Wikidata's data against another database/website/...
2. They prepare a CSV file with these mismatches
3. They upload the file to Mismatch Finder
4. Others can review these mismatches in Mismatch Finder and figure out whether the issue is in Wikidata or the other data source and make edits accordingly or report the error to the other data source

Examples

More conventional:

- Date of birth statements for German authors between Wikidata and German National Library
- Band member names between Wikidata and MusicBrainz

Less conventional but still <3:

- Local infobox data from English Wikipedia and Wikidata
- User reported errors from a website using data from Wikidata

Better data quality for Wikidata, clearer ways for re-users to give back and a more robust Linked Open Data web for everyone

Demo

Mismatch finder website, gadget and API

How you can help

Wanna review?

- Enable the user script
- Use the Mismatch Finder website

Got a way to find issues in Wikidata's data?

- Work with us to get them into the Mismatch Finder

Find documentation for everything at
[Wikidata:Mismatch Finder](#)

Thanks for your attention!
