State and County Mental Hospitals, United States, 1979-80 and 1980-81

Richard W. Redick, Ph.D., and Michael J. Witkin, M.A.

August 1983

Introduction

Since the mid-1950s, a combination of events such as the introduction of tranquilizing drugs, the initiation of policies of deinstitutionalization, reductions in State mental health budgets, passage of Federal and/or State legislation creating new types of mental health services (e.g., CMHCs), as well as other medical, social, economic, and political factors, have interacted to bring about changes in the role of State (State and county) mental hospitals 1/ in the mental health care delivery system of United States. ATthough the resident population of State mental hospitals has declined nearly 75 percent from its peak of 559,000 in 1955, and in spite of the development and expansion of other types of facilities for the care of the mentally ill, State mental hospitals remain the primary setting for the provision of inpatient psychiatric care. As Goldman, et al., point out in a recent assessment of the functions of these hospitals, "the State and county mental hospital provides short-, intermediate-, and long-term and voluntary and involuntary (civil and criminal) custody and treatment to predominantly disadvantaged persons with the most severe chronic and acute mental disorders. It is the only inpatient mental health resource readily available (often as a last resort) for a large number of patients who have the most difficult problems, have failed in other treatment settings, or are considered 'inappropriate' (or 'unacceptable') for care elsewhere or are unable to afford it." 2/ In addition to maintaining their primacy as residential facilities, State mental hospitals in some locales have also become principal providers of outpatient and day treatment services.

The data in this Statistical Note focus primarily on documenting the current status of these hospitals with respect to such variables as settings in which services are provided (e.g., inpatient, outpatient, day treatment), patient movement, caseload, staffing, and expenditures. These data will be examined for both the United States as a whole and by State. In addition, selected trend data will be presented for the period between 1970 and 1980, not only to examine the changes for State mental hospitals, but also to show how these changes compare to those for other types of mental health facilities during this period.

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES/Public Health Service/Alcohol, Drug Abuse, and Mental Health Administration NATIONAL INSTITUTE OF MENTAL HEALTH•Division of Biometry and Epidemiology•Survey and Reports Branch Digitized by Google

Sources and Qualifications of the Data

The current report is based primarily on data from the two most recent Inventories of State Mental Hospitals (Inventory), conducted in January 1980 (1979 data) and in January 1981 (1980 data) by the Survey and Systems Research Branch (SSRB), Division of Biometry and Epidemiology (DBE), National Institute of Mental Health (NIMH), with the cooperation of the State mental health authorities 3/. The January 1981 Inventory, which utilized a shortened version of the January 1980 Inventory form, excluded information requested on the January 1980 form including age and diagnostic restrictions for inpatient and noninpatient settings, caseload data for noninpatient settings, and type of emergency services provided.

For certain basic items in the inventories, data were obtained for all hospitals including those that did not report by mail. These data items were: (1) type of control; (2) type of settings in which services were provided; (3) number of inpatient beds; (4) number of inpatient additions; (5) number of inpatients at end of year; (6) number of total staff employed and total staff hours worked during a sample week; (7) total expenditures; (8) number of outpatient additions (January 1980 Inventory only); and (9) number of day treatment additions (January 1980 Inventory only). Most hospitals provided these data on the Inventory forms which were submitted to NIMH; a smaller number provided the information when later contacted by phone. In the case of a few hospitals for which information on one or more of these items could not be obtained by phone, data from the most recent prior Inventory were used, or, if these too were unavailable, the average for State mental hospitals in the same geographic region as defined by the U.S. Department of Health and Human Services was used.

For all other items on the January 1980 and 1981 Inventory forms, the number of hospitals responding to a given item varied, (e.g., numbers of additions, inpatients and beds, types of staff employed, types of expenditures). In these cases, the estimating procedures for underreported data are indicated in footnotes to the tables in which the data appear.

For certain items on the January 1980 and 1981 Inventory forms, (e.g., staffing, types of service settings, and number of inpatient beds), the reference date is January of the respective years and is so designated in the tables. For all other data items, the reference period is the calendar year ending December 31, 1979, or 1980, or a fiscal year ending in 1979 or 1980.

Definitions of terms used in this report are given in the appendix. Readers and users of the data in this Note should familiarize themselves with these definitions as an aid to interpretation.

Current Status - 1979 and 1980

Number, and type of hospitals - There were 280 State mental hospitals reported in operation during 1979 in the United States. In the subsequent reporting year, 1980, the number of hospitals dropped slightly to 276. Of this latter number, 262 hospitals were under State auspices; and the remaining 14, under county auspices (9 in Wisconsin and 5 in New Jersey). Twenty of the State mental hospitals in operation during

1980 were children's hospitals; 17, security hospitals, i.e., hospitals exclusively for the "criminally insane;" and 9, teaching hospitals. The other 230 hospitals, not limited to a special program goal or a pecific clientele, were classified as "traditional" hospitals.

<u>Inpatient beds</u> - As of January 1981, there were 148,209 inpatient beds set up and staffed for use in State mental hospitals in the United States, a rate of 65 beds per 100,000 civilian population 4/. number and rate represented decreases of 5 and 7 percent, respectively, from the corresponding January 1980 figures of 156,482 beds and a bed rate of 70 per 100,000 civilian population (see tables 1 and 2).

In both time periods, New York had the most beds (18 percent of the U.S. total), followed by Pennsylvania (8 percent of the total). Over the 1-year period January 1980-81, the number of inpatient beds in State mental hospitals showed relatively little change (i.e., increases or decreases of one percent or less) in 7 States, increased in 8 States, and decreased in the remaining 35 States and the District of In the same period, bed rates per 100,000 civilian population decreased in all but 6 States (see tables 1 and 2).

In January 1981, the bed rates per 100,000 civilian population for the 50 States, excluding the District of Columbia 5/, ranged from 13 for Arizona to 151 for New York, with 17 States exceeding the U.S. rate of 65 per 100,000 population. Six of these 17 States (Delaware, New York, North Dakota, Pennsylvania, South Carolina, Virginia) had a rate of 100 or more beds per 100,000 population (see table 2).

Inpatients at end of year - At the end of 1979, the number of inpatients in State mental hospitals in the United States totaled 140,355, a rate of 63 inpatients per 100,000 civilian population. the end of 1980, this number had decreased 6 percent, dropping to 132,164 inpatients, or a rate of 58 per 100,000 civilian population (see tables 3 and 5). Over this 1-year period, all but nine States had either shown no change or had had a decrease in the number of inpatients at end of year in their State mental hospitals (table 3).

In 1980, exclusive of the District of Columbia, New York had the largest inpatient rate (141 per 100,000 population) followed by Delaware and South Carolina with rates of 106 and 104 per 100,000 population, respectively, while Arkansas and Arizona had the smallest inpatient rates (11-12 per 100,000 population) (see table 5). Figure 1 illustrates the range of the 1980 inpatient rates for the 50 States and the District of Columbia.

Inpatient additions - There were 383,323 additions to the inpatient settings of State mental hospitals in the United States during 1979, a rate of 172 per 100,000 civilian population. In 1980, the number of inpatient additions to these hospitals had dropped to 370,344, or a rate of 163 per 100,000 population (see tables 4 and 5). Between 1979 and 1980, 31 States and the District of Columbia had decreases in inpatient additions to their State mental hospitals, which offset gains in additions reported by the other 19 States, and thereby accounted for the overall drop in additions nationwide (see table 4).

In 1980, addition rates among the States, exclusive of the District of Columbia, showed wide variation and ranged from 25 per 100,000

Digitized by Google 3

Original from CORNELL UNIVERSITY settings of State mental hospitals in the United States during 1979, a inpatient additions to their State mental hospitals, which offset gains in additions reported by the other 19 States, and thereby accounted for

population in Arizona to 519 per 100,000 population in Georgia, with 23 States and the District of Columbia exceeding the U.S. rate of 163 per 100,000 population (see table 5 and figure 2).

Patient movement data for inpatient settings - Detailed patient movement data for the inpatient settings of State mental hospitals in the United States and in each State for 1979 and 1980 are presented in tables 6a and 6b, respectively. From these data an index of patient movement, i.e., the ratio of discontinuations plus deaths per 1,000 additions, has been computed for each State. Among the States, where transfers to and from other hospitals in the State mental hospital system are nearly equal, an index (ratio) which is greater than 1,000 indicates a decreasing patient population; and, conversely, a value less than 1,000 indicates an increasing patient population. Indexes of patient movement in State mental hospitals for 1979 and 1980, presented in table 7, show varying patterns of inpatient population increases and decreases for each State in the 2-year period. However, indicative of decreasing State hospital populations, the overall ratio of discontinuations plus deaths to additions has increased in the United States, 28 States, and D.C. and decreased in 22 States between 1979 and 1980.

Noninpatient settings and caseload - Although State mental hospitals are primarily inpatient facilities with all hospitals providing this type of setting, 40 percent of the hospitals, as of January 1981, also provided services in at least one noninpatient setting. More specifically, the combination of settings in which services were provided were as follows: 165 hospitals (60 percent) provided services in an inpatient setting only; 25 hospitals (9 percent) provided services in inpatient and outpatient settings; 17 hospitals (6 percent) provided services in inpatient and partial hospitalization settings (day, night, week-end); and 69 hospitals (25 percent) provided services in all three types of settings. These figures represented relatively little change from comparable data reported for January 1980 (see table 8).

The January 1981 data showed that in 28 States and the District of Columbia at least one or more State mental hospitals provided inpatient services in combination with outpatient and/or partial hospitalization services, whereas all hospitals in the remaining 22 States provided inpatient services only. Among these States with hospitals providing services in multiple settings, the number of such hospitals differed considerably. For example, 30 of the 32 State mental hospitals in New York provided services in more than one setting, as compared with 11 of the 15 hospitals in Illinois, 5 of 12 hospitals in Michigan, and 3 of 18 hospitals in Pennsylvania (see table 8).

Numbers of additions for outpatient and day treatment settings in State mental hospitals were available only in the January 1980 Inventory. Of the 280 State mental hospitals in operation at that time, 100 hospitals in 27 States and the District of Columbia were reported having an outpatient setting. There were 81,919 additions to these settings during 1979, a rate of 37 per 100,000 civilian population (see table 9). New York accounted for the most hospitals with outpatient settings (29) and the most additions (20,688 or 25 percent of the U.S. total). Texas ranked next with 10 hospitals and 14,983 additions followed by Missouri with 8 hospitals and 7,767 additions (see table 9).

Day treatment settings were reported in 83 State mental hospitals located in 23 States and the District of Columbia in January 1980. Of the 9,808 additions to these settings during 1979, 6,056 (61 percent) were to the day treatment settings in 29 State mental hospitals in New York (see table 9).

Staffing - During a sample week in January 1981, a total of 199,168 full-time equivalent (FTE) staff (based on a 40-hour work week) were employed in State mental hospitals in the United States. This number represented a slight decrease (1.3 percent) from the corresponding figure of 201,789 FTE staff reported for the sample week in January 1980. Over the January 1980-81 period, 33 States also showed relatively little change (a 5 percent increase or decrease) in FTE staff employed in State mental hospitals. Of the remaining 17 States and the District of Columbia where the percentage change exceeded 5 percent, 13 had decreases in FTE staff and 5 had increases (see table 10).

At both time periods, January 1980 and 1981, approximately three-fifths of the total FTE staff employed in State mental hospitals in the United States were patient care staff which included all staff disciplines other than administrative and maintenance staff. Although many of the States had proportions of patient care staff approximating the U.S. figure, there was wide variation when comparisons were made by State. For example, in January 1981, the percentage of all FTE staff that were patient care staff ranged from highs of 82 percent in Mississippi and Montana to a low of 46 percent in Arkansas (see table 10).

Expenditures - Estimated total expenditures for State mental hospitals in United States amounted to almost \$3.8 billion in 1979. During the succeeding year, 1980, this expenditure figure rose to approximately \$4.1 billion, an increase of 9 percent between 1979 and 1980. However, when these figures, which are expressed in terms of current dollars, were adjusted for inflation, the expenditures, expressed in constant dollars 5/, showed a one-percent decrease between 1979 and 1980, from \$1,567 million to \$1,551 million (see table 11).

Expenditures for State mental hospitals, in terms of current dollars, increased in 43 States and the District of Columbia over the 1979-1980 period, with only 7 States (Colorado, Montana, Nebraska, New Mexico, New York, Rhode Island and West Virginia) reporting decreases in total expenditures. With the adjustment for inflation, however, one-half (25) of the States had decreases in State mental hospital expenditures in terms of constant dollars) between 1979 and 1980, and the increases in expenditures among the remaining States were considerably reduced (see table 11).

Trends in State Mental Hospitals 1971-1981

This section of the Statistical Note will examine national and some State data for State mental hospitals over the past 8-10 years, in order to illustrate the reduction in utilization of these hospitals as well as examine trends in staffing and expenditures. Additional information on these hospitals for earlier years within the past decade have been published in several prior NIMH publications 7/.

Number of hospitals and inpatient beds - The 148,209 inpatient beds set up and staffed for use in State mental hospitals as of January 1981

represented a decrease of 59 percent from the 360,178 O_{eds} in these hospitals in January 1972 (see table 1). Some of this decrease was due to a decrease in the number of hospitals, from 321 in 1971-72 to 276 in 1980-81. However, as pointed out in NIMH Statistical Note 156 7/, a substantial part of the decrease in number of beds in State mental hospitals had resulted from a reduction of beds in existing hospitals rather than to the closing of hospitals.

The number of State mental hospital beds decreased in every State except one (Utah) between January 1972 and January 1981 (see table 1); and the bed rate, i.e., the number of beds per 100,000 civilian population, declined in all States. For all but 10 States the percentage decrease in this rate equalled or exceeded 50 percent (see table 2).

From data available for January 1970 and January 1980 on number of inpatient beds in all types of mental health facilities, it can be seen from table 12, that the 48 percent decrease in all inpatient psychiatric beds, from 524,878 to an estimated 274,713 beds, between 970 and 1980 was almost wholly accounted for by the drop in number of State mental hospital beds. This latter group constituted only 57 percent of all psychiatric inpatient beds in January 1980 compared to almost 80 percent of all beds 10 years earlier.

<u>Inpatients at end of year</u> - Concomitant with the decrease in number of inpatient beds in State mental hospitals in the United States since January 1972, has been a decrease in the number of resident patients in these hospitals. At the end of 1980, there were 132,164 inpatients in State mental hospitals, a 57 percent decrease from the 308,024 inpatients at the end of 1971 (see table 3). This pattern of decrease between 1971 and 1980 extends the long succession of annual decreases in number of inpatients in State mental hospitals that has occurred since 1955, when the number of inpatients totalled 558,922.

All of the States experienced decreases in the year-end inpatient populations of their State mental hospitals between 1971 and 1980. The percentage decreases in number of inpatients ranged from a high of 89 percent in Wisconsin to a low of 4 percent in Utah (see table 3 and figure 3).

Inpatients at end of year in all mental health facilities with inpatient service settings in the United States dropped from 471,451 in 1969 to 230,216 in 1979, with State mental hospitals accounting for almost all of this decrease. As a result, although State mental hospitals continued to outrank all other types of mental health facilities in size of inpatient population, the number of inpatients at end of year resident in these hospitals decreased from 78 percent of all inpatients in mental health facilities in 1969 to 61 percent in 1979 (see table 13).

<u>Inpatient additions</u> - Between 1971 and 1980 the number of additions to State mental hospitals in the United States decreased 25 percent, from 497,299 to 370,344 (see table 4). This reversed a trend evidenced prior to 1971, wherein additions to State mental hospitals had continued to increase despite declining inpatient populations.

Of the 50 States and the District of Columbia, 39 experienced decreases in inpatient additions to State mental hospitals in the 1971-1980

period, ranging from 4 percent in the District of Columbia and in Michigan to 68 percent in Massachusetts. For the 12 States showing ains in inpatient additions over this time period, the percentage increases ranged from one percent in North Dakota to 117 percent in Alaska (see table 4 and figure 4).

Inpatient additions to all mental health facilities with inpatient settings in the United States increased 20 percent between 1969 and 1979, from 1,282,698 to 1,541,659 additions. All of the various types of mental health facilities shared in this increase with the exception of State mental hospitals. Inpatient additions to these hospitals dropped from 38 percent of all inpatient additions in 1969 to 25 percent of the total in 1979 (see table 14).

Deaths - Along with the decreases in inpatient population and inpatient additions, the number of deaths occurring in State mental hospitals or on short-term leave from these hospitals over the 1970-1980 decade also decreased. From 30,804 deaths in 1970, the number decreased annually to 6,800 in 1980, a decrease of 78 percent. The death rate, expressed as the number of deaths per 1,000 average resident patients, showed a 40

expenditures, expressed in constant dollars, was considerably smaller, with the 1980 figure of \$31.66 being only about 3 1/2 times higher than its 1967 counterpart. Thus, in 1980, \$51.72 of the \$83.38 daily maintenance expenditure figure (\$83.38 minus \$31.66) was the amount due

the number of deaths per 1,000 average resident patients, showed a 40 percent decrease, dropping from 87 deaths per 1,000 average resident patients in 1970 to 52 per 1,000 in 1980 (see table 15).

Maintenance expenditures per patient day 8/ - Table 16 examines trends in daily maintenance expenditures per resident patient for inpatient treatment in State mental hospitals in the United States for the slightly longer time period 1967-1980, and illustrates the effects of inflation on these expenditures incurred in the specific years as represented by the constant dollar figures 6/.

Expressed in terms of current dollars, daily maintenance expenditures per resident patient experienced an almost 10-fold increase between 1967 and 1980, rising from \$8.84 to \$83.38. However, when the posting expenditure figures were adjusted for inflation, the increase in expenditures, expressed in constant dollars, was considerably smaller, with the 1980 figure of \$31.66 being only about 3 1/2 times higher than its 1967 counterpart. Thus, in 1980, \$51.72 of the \$83.38 daily maintenance expenditure figure (\$83.38 minus \$31.66) was the amount due to inflation.

Staffing - As might be expected, a resultant of the above noted decreases in number of State mental hospitals as well as in the number of persons utilizing the inpatient treatment settings of these hospital staff. Between January 1972 and January 1981, the number of hospital staff. Between January 1972 and January 1981, the number of full-time equivalent (FIE) staff employed in State mental hospitals in the united States decreased 11 percent, from 223,886 to 199,168 (see table 17). This pattern of decrease, however was not consistent with united States decreased 11 percent, from 223,886 to 199,168 (see table 17). Woreover, while the number of other patient care staff increases occurred in the outber of or FIE professional patient care staff increases occurred in the other four staff disciplines (psychologists, vincreases occurred in the other four staff disciplines (psychologists, respect to all of the various staff groupings. For example, during the social workers, registered nurses, and other mental and physical health

percent for other mental and physical health profess j $_{Onals}$ (see table 17). As a result, these latter four staff disciplines comprised a higher proportion of total FTE staff in January 1981 (see table 17).

Factors, other than the reduction in number and utilization of State mental hospitals, which may also have accounted for the aforementioned patterns of change in the staffing of these hospitals are: (1) budgetary restrictions resulting in fewer staff, expecially those in the higher salaried disciplines (e.g., psychiatrists, other physicians) and greater utilization of other core disciplines (e.g., psychologists and social workers) in their place; (2) changes in treatment programs and policies, as, e.g., greater emphasis on noninpatient rather than inpatient treatment programs; (3) changes in the types of patient population coming under care in terms of age, diagnosis, severity of illness of condition, etc.; (4) increased use of patients as paid employees rather than nonpatients in areas of hospital maintenance.

In contrast to the decrease in number of full-time equivalent (FTE) staff employed in State mental hospitals since 1972, the number of FTE staff employed in all mental health facilities had increased substantially between January 1972 and January 1980, from 380,978 to 436,356. As a result, State menal hospital staffing represented only 46 percent of FTE staff employed in all mental health facilities in January 1980 compared to 59 percent in January 1972 (see table 18).

FOOTNOTES

- Since county mental hospitals exist in only two States (New Jersey, 1/ and Wisconsin) and function as though they were part of the State mental hospital system, the shorter term "State mental hospitals" will be used throughout the remainder of this report. St. Elizabeth's Hospital in the District of Columbia is also counted as a State hospital even though it is operated by the Federal Government.
- 2/ Goldman, Howard H., et al. The multiple functions of the State Mental Hospital. American Journal of Psychiatry 140:3, March 1983, p.299.
- 3/ In addition to the Inventory of Mental Health Facilities (Inventory), the Survey and Systems Research Branch, NIMH, also conducts an Annual Census of State and County Mental Hospitals in which information is collected on resident patients and additions by age, sex, and diagnosis. The number of additions and resident patients reported in the Inventory are reconciled within a certain tolerance (10 percent) with the corresponding numbers obtained in the Annual Census.
 - The base population used in the calculation of rates was derived from unpublished U.S. Bureau of the Census estimates of the civilian population by State, obtained by averaging the estimates for July 1, 1979 and July 1, 1980 for the January 1980 rates. For January 1981 rates, estimates for July 1, 1980 and July 1, 1981 were averaged.
 - The District of Columbia is somewhat atypical in comparison to the States, inasmuch as approximately 10-15 percent of the patients coming under care in St. Elizabeth's Hospital are nonresidents of the District of Columbia.
 - Constant dollars are the expenditures that would have occurred if inflation were eliminated completely or, in other words, expenditures that would have resulted if equivalent goods and services that were purchased for \$100 in the base year 1967 could be purchased for the same amount in subsequent years. It has been assumed that the rate of inflation for State mental hospital expenditures was the same as that for services included in the medical care component of the consumer price index. subsequent years are shown in table 16 of the text.

Maintenance expenditures per patient day for 1979 and 1980 in current dollars are somewhat overestimated, since the numerator reflects maintenance expenditures for the entire hospital while the denominator reflects data for inpatient settings only. Therefore they cannot be considered entirely comparable to per patient day expendiures for prior years, since maintenance expenditures for 1976 and 1977 were adjusted to provide an estimate for inpatient settings only; and prior to 1976, the maintenance expenditure figures had been reported only for inpatient settings.

APPENDIX DEFINITION OF TERMS

- Ι. Hospital Subtype
 - Children's Hospitals.--Hospitals exclusively for persons 18 years of age and under.
 - Security Hospitals. -- Hospitals exclusively for the "criminally В.
 - County Hospitals.--Hospitals operated by county governments in С. New Jersey and Wisconsin.
 - Teaching Hospitals.--Hospitals specializing in the development D. of innovative treatment programs for the care of the mentally ill and/or in the training of personnel for work in the mental
- - Inpatient Treatment.--Provision of mental health treatment to
 - Outpatient Treatment.--Provision of mental health treatment on an outpatient basis to persons who do not require either full-
 - Day Treatment.--Provision of planned therapeutic program during most or all of the day to persons who need broader programs than are possible through outpatient visits.
 - Other Partial Hospitalization. -- Provision of planned therapeutic settings during the evening, night or weekend to persons who do not require full-time hospitalization but who need broader settings than are possible through outpatient visits.
- of innovative treatment programs for the ca
 ill and/or in the training of personnel for
 health field.

 II. Types of Service Settings

 A. Inpatient Treatment.--Provision of mental h
 persons requiring 24-hour supervision.

 B. Outpatient Treatment.--Provision of mental
 an outpatient basis to persons who do not r
 time or partial hospitalization.

 C. Day Treatment.--Provision of planned therap
 during most or all of the day to persons wh
 programs than are possible through outpatie

 D. Other Partial Hospitalization.--Provision of
 peutic settings during the evening, night o
 who do not require full-time hospitalizatio
 broader settings than are possible through

 E. Halfway House.--Provision of services which
 previously hospitalized patient for return
 community environment by providing transiti
 and assistance in the activities of daily I
 possible hospitalization.

 F. Emergency Settings.--Services (exclusive of
 only beds and those primarily for drug and
 purpose of which is to provide psychiatric
 situations by staff specifically assigned f

 III. Patient Movement and Beds Inpatient Treatment

 A. Inpatients at Beginning of Year, --Includes
 were physically present for 24 hours in the
 at the beginning of the year, or who were a
 as long as they were expected to return to
 service, or who were on unauthorized absence Halfway House. -- Provision of services which prepare a previously hospitalized patient for return to home and community environment by providing transitional living quarters and assistance in the activities of daily living or to prevent
 - Emergency Settings. -- Services (exclusive of those providing only beds and those primarily for drug and alcohol abuse), the purpose of which is to provide psychiatric care in emergency situations by staff specifically assigned for this purpose.
 - - Inpatients at Beginning of Year.--Includes all persons who were physically present for 24 hours in the inpatient service at the beginning of the year, or who were away on short visits as long as they were expected to return to the inpatient service, or who were on unauthorized absence, AWOL, or escape.

APPENDIX (Continued)

- B. Additions During Year. -- Includes admissions and readmissions, as well as returns from long-term leave and transfers from noninpatient components of the same hospital.
- C. Transfers In. -- Transfers to a given State hospital from other hospitals in the State mental health system.
- D. <u>Transfers Out.--Transfers from a given State hospital to other hospitals in the State mental health system.</u>
- E. <u>Deaths in Hospital During Year.</u>—Includes those persons who died while under inpatient care or while away on short-term visits.
- F. Discontinuations During Year.--Includes persons discharged (excluding deaths) as well as those placed on long-term leave and transferred to noninpatient components of the same hospital.
- G. Inpatients at End of Year.--Includes all persons who were physically present for 24 hours in the inpatient service at the end of the year, or who were away on short visits as long as they were expected to return to the inpatient service, or who were on unauthorized absence, AWOL, or escape.
- H. Inpatient Care Episodes. -- Includes all persons who were physically present for 24 hours in the inpatient service at the end of the year, or who were away on short visits as long as they were expected to return to the inpatient service, or who were on unauthorized absence, AWOL or escape.
- I. <u>Inpatient Beds.--The number of inpatient beds in a given</u> hospital set up and staffed for use as of December 31st of the reporting year.
- IV. Utilization Indices Inpatient Treatment Setting
 - A. Average Daily Census (ADC).--Average daily inpatient census is calculated in this report by taking the total annual inpatient days and dividing by the number of days in the year.
 - B. Addition and Inpatient Rates per 100,000 Civilian Population.

 --The rate of additions per 100,000 civilian population provides an index of the proportion of people coming under care during the year. This rate is based on a duplicated count as the same person may have been admitted two or more times during the same year. The number of inpatients at the end of the year per 100,000 civilian population provides an estimate of the proportion of the population under care at one point in time.

APPENDIX (Continued)

- C. Patient Movement Ratios per 1,000 Average Daily Census.--These ratios provide indexes of the amount and type of patient movement activity that occurred during the year by relating the average resident population to three movement categories: total additions, discontinuations, and deaths.
- V. Additions Noninpatient Settings
 - A. Outpatient Additions.--Any person admitted to this outpatient program or transferred to this setting from another program of this facility during the year.
 - B. <u>Day Treatment Additions.--Any person admitted to the day treatment program or transferred to this program from another program of this facility during the year.</u>

VI. Staffing

- A. Full-time Employees.--Full-time employees include persons employed 35 hours or more a week (excluding trainees). Schoolteachers are counted as full-time if they are employed 30 hours or more a week.
- B. <u>Part-time Employees.--Part-time employees include persons employed less than 35 hours a week (excluding trainees).</u>
- C. <u>Trainees.--</u>"Trainees" include trainees, residents, and interns, regardless of the number of hours worked in a week.
- D. Professional Patient Care Staff.--Professional patient care staff includes psychiatrists, nonpsychiatric physicians, psychologists, social workers, registered nurses, other mental health professionals (e.g., occupational therapists, vocational rehabilitation counselors, and other mental health professionals at the B.A. level and above), and other health professionals (e.g., dieticians, dentists, dental technicians, and pharmacists).
- E. Other Patient Care Staff.--Other patient care staff includes licensed practical and vocational nurses, and mental health workers with less than a B.A. degree.
- F. Administrative and Maintenance Staff.--Administrative and maintenance staff includes administrative and other professional (nonhealth) staff (e.g., accountants, business administrator) as well as clerical and maintenance staff.
- G. Patient Care Staff. -- Patient care staff includes all staff with the exception of administrative and maintenance staff (see definition above).
- H. Staff Hour.--A staff hour is a unit of one hour's work by one employee.

APPENDIX (Continued)

I. Full-time Equivalent Staff.--Full-time equivalents are calculated by taking the total person hours worked by full-time employees, part-time employees, and trainees in each staff discipline, divided by 40 hours, to indicate the number of persons working a 40-hour week to provide this many person hours.

VII. Expenditures and Expenditure Indices

- A. Total Expenditures. -- Total expenditures are expenditures for the entire hospital and not just the inpatient programs. Included in total expenditures are personnel expenditures, other operating expenditures and capital expenditures.
- B. <u>Maintenance Expenditures.--Maintenance expenditures are total</u> expenditures (see above definition) minus capital expenditures

Table 1. Number of hospitals, number and percent change in number of inpatient beds, State and county mental hospitals, by State: United States, January 1972, 1980 and 1981

Table 6a Footnotes

- * States in which not all hospitals reported selected patient movement data (see footnote c below).
- a/ Data for 1979 on number of additions, inpatients end of year, inpatient days, average daily census, number of resident patients under care during year (inpatient episodes) were obtained from tabulations presented in the NIMH publication Mental Health, United States 1983 currently in press.
- <u>b</u>/ Data on inpatients at beginning of year were obtained by subtracting the number of additions from the number of inpatient episodes.
- C/ Data on transfers and deaths were obtained from unpublished NIMH tabulations. For States in which transfers and deaths were not reported for all hospitals (denoted by asterisks*), estimated total transfers and deaths were obtained by applying the following ratio to the reported transfers and deaths:

No. of additions to

all hospitals in State

X (deaths) = Estimated Total

No. of additions to

No. of Transfers (deaths)

No. of reported transfers

only hospitals reporting transfers (deaths)

<u>d</u>/ Discontinuations = sum of inpatients beginning of year, plus additions during year plus transfers in minus sum of transfers out, minus deaths, and minus inpatients end of year.

Footnotes to Table 6b

- * States in which not all hospitals reported selected patient movement data (see footnote b through e below).
- a/ Data on additions and inpatients end of year were obtained from unpublished NIMH tabulation, and were reported for all hospitals in each State.
- b/ Data on inpatients beginning of year, transfers, deaths, and annual number of inpatient days were obtained from unpublished NIMH tabulations. For States in which these specific patient movement categories were not reported for all hospitals (denoted by asterisks*), estimated totals were obtained by applying the following ratio to the reported number in each category:

No. of additions to all hospitals in State No. of additions to only hospitals reporting specific category

Reported No. in specific X category = Estimated Total No. in specific category

- <u>c</u>/ Discontinuations = sum of inpatients beginning of year, additions during year and transfers in minus sum of transfers out, deaths, and inpatients end of year.
- daily = Annual No. of inpatient days census 365
- e/ No. of resident inpatients under care during year = sum of inpatient beginning of year and additions during year.
