## GENEROUS NO-RISK TRIAL OFFER!

TMAGINE being able to restore l your old car to original showroom lustre in less than an hour! Imagine being able to bring back all the beauty of its original color by a few sweeps of the hand across its surface! No wonder experts say that NAVON is the most surprising auto discovery in the past ten years!
NAVON has often been called "liquid maxie" because of the speed with which it draws forth original color and makes tull surfaces gleam like burnished glass! It is not a polish-not a wax-not a paint -not a cleaner! You just put it on the car right out of the can, guiding its flow with a pad of cheese-cloth. No fussing with brushes or tireaome rubbing. (It's more like pleasure than work, especially when you see your car regaining its oriminal rich beauty and gloss right before your very eyes!)
Safe-Durable-SURE!
Results with NAVON are easy to secure. You can do it right in your own garage without the slightest difficulty.

It's almost an easy as washing-dries mooth as glase without streaks. Even a 14 year old boy who follows the printed directions can achieve a flawlees finish with NAVON!

And not only that, NAVON contains no acids, alcohol, benzol or any other injurious substance. Won't hurt metal, leather or wood. Acts bothas a protective and preservative. Not affected by zero cold, freesing snowstorms, burning sun or driving rain. Can't check, erack or peel. And retains its radiant gloss for months and months?

## TEST IT FREE OF RISK!

Right now-to gain new friends for NAVON-we are making a special trial offer to auto owners. This generous proposition givee you a chance to test this marvelous discovery and see for yourself just exactly what wonders it can perform. Iust exactly what wonders it can perform. It doesn't cost you a red cent unless it
improves the looks of your car $100 \%$ to your satisfaction. So take advantage of the opportunity by getting details at once. No obligation. Simply tear out the handy coupon below and mail it today! Why not do it now?

## MAKE \$150

## A Week or More

Make big money with NAVON? Agents, demonstrators and spare time workers are pocketing surperising proats. 9 out of every 10 motoriste want it on sight! H. Geiss of Illinols made $\$ 500$ in a single week! Other are making bie money just showing

Be the NAVON representative in your locality and get your share of the large profits that are just waiting He give you the most hoeral proposiflerful money, too. in operating a Aervice Btation-from $\$ 5000$ to $\$ 10$ 000 a year Navon-izing cars for people in your bown at $\$ 12.50$ to $\$ 30$ a job. You can start out right in your own garage, clearing as hlgh as $\$ 65$ a day !

Send for detalls of our 14 Tested Money-Making plans-ugecher with a NAVON trial offer that will amaze you! Check bottom line of coupon and mall it today

Italian Workman, Suspended in Mid-Air, Installing the Generoso Antenna Plant Where Lighening Is Collected on Long Cable; $30,000,000$ Volts from a Single Flash May Be Gathered

THE old dream of harnessing the lightning and putting it to useful work may be on the way to realization, as the result of experiments by three scientists of the University of Berlin, who have taken up the task where Benjamin Franklin left off more than a century and a half ago.

On lofty Mount Generoso, in Switzerland, they have plucked nearly $2,000,000$ volts out of the storm clouds and sent it crasling over a spark gap fifteen feet in length.

During the coming summer, when storms are frequent over the Swiss mountain, they expect, with new and better collecting apparatus, to gather in $30,000,000$ volts in each discharge. They have already
found they can collect enough static to produce a spark a second. With 30,000,000 volts to work with, they will be able to produce extremely rapid cathode rays, similar to those generated in the new Coolidge tube, and rivaling the principal rays of, radium, except that the rate of emanation will be far faster than from radium itself.

The three experimenters, Drs. A. Brasch, F. Lange and C. Urban, improved on Franklin's original kite experiment, which established for the first time the nature of lightning, by suspending their collecting antenna from a cable stretched between two mountain peaks. They used a widemeshed wire net with an area of several

Observations and mea urements were made from a lightning-proof metal house, grounded to prevent danger to the experimenters. From it they controlled the spark gap. which recorded the voltage by indicating the distance the lightning flash could jump through the air. In the initial experiments they did not achieve as much success as has already been recorded in the laboratory with artificial lightning, but by raising the net higher they expect to get at least fifteen times as much pressure.

The highest voltage ever produced by man, $5,000,000$ volts, was recently recorded at the Carnegie Institution, by Dr. Gregory Breit and Dr. M.

Spark Passing across Gap in the Small Preliminary Plant during a Thunderstorm, and Diagram of the Antenna Installation; Note the Collecting Net in the Center

SCHEMATIC VIEW OF ANTENNA SYSTEM
hundred square yards and a weight too great to be supported in a storm by either kites or balloons. To suspend it a cable was stretched over an 1,800 -foot chasm, with the net swung 250 feet above the ground, protected at either end by long chains of huge insulators, capable of checking up to $3,000,000$ volts of electricity.
To prevent so-called "brush discharges," or corona effect in the conductors leading from the net to the spark gap, cylinders were substituted for solid wire, as the carrying capacity of a conductor depends on its surface area, and a large cylinder is a better conductor than a solid wire containing the same amount of metal.
A. Tuve. They succeeded in impressing a million volts on a vacuum tube with outside electrodes.

The Carnegie scientists are aiming at the same goal as the Germans, $30,000,000$ volts, at which potential many of the moot questions of physics may be settled. Theoretically, it may be impossible to tave radiation at this high voltage, since the electron would be damped and all wavelengths would become one. If $30,000,000$ volts can be produced and handled it would make possible the production of helium atoms, each one from four atoms of hydrogen. Such conversion of matter might solve the lighter-than-air flying-craft problem.

## MOVIES SENT BY PHONE TO SPEED UP NEWS REELS

Transmitting news reels of current events from coast to coast on the day they are taken is a practical possibility, it was demonstrated recently when a movie of a film star, made in Chicago as she stepped off a west-bound train shortly before noon, was telephoned to New York in time to be shown in a theater there in the early evening. The first telephoned movie was not perfect, the enormous enlargement on the theater screen being rather hazy, but it proved that, with further development, the process may be a success. Transmission of the movie film used the same apparatus and methods which have
been in service for the last three years for telephonic transmission of ordinary "still" photographs. The telephoto machine takes five by seven-inch pictures, so the negative from the movie camera was cut into seven-inch lengths, and three strips at a time were laid down side by side in a frame and placed in the photo printer, to produce the positive film required for its transmission by telephone. At New Vork, the process was reversed to produce a movie film. Five hours after the operation of taking the pictures had begun in Chicago, enough film had been transmitted to make ten feet of movies.

At Entrance to Old Railway Tunnel Now Used by Automobiles; the Clock and Sign Help Regulate One-Way Traffic
and signs aid the motorists. At one portal, the directions are to enter only between the half hour and ten minutes to the hour, while, at the other, cars may commence the journey between the hour and ten minutes to the half hour. The tunnel is at an elevation of more than 10,000 feet and saves a rough trip, over steep hills, into the Eleven Mile carryon, one of the state's minor gorges.

## VOICE AND PICTURE CABINET GIVES LECTURES

Illustrated lectures, without a human speaker, are given by a combination stereopticon and phonograph an eastern

## ONE-WAY TUNNEL FOR AUTOS ALSO AIDS IRRIGATING

Although it is now abandoned for railroad purposes, an old tunnel of the Colorado Midland railway serves a double purpose, for it is used by automobiles and also as an irrigating flume to water more than 20,000 acres of land. The passage is but one stretch of the old railroad line which has been adapted for highway uses after the engines and cars were taken off, due to the discontinuance of the railroad. It is two miles long and has a four-per-cent grade. Because it is so straight, no artificial ventilation is necessary, but automobiles must be run through on a carefully regulated schedule, since the tunnel is wide enough for only one car at a time. Clocks at either end

Using the Telephone without the Hands; the Mouthpiece and Receiver Attachment in Service
inventor has introduced. The records are synchronized with the showing of the slides, and all an attendant has to do is to change the records and a set of slides at the proper time. The entire outfit is mounted within a compact cabinet.

## PHONE SET FREES BOTH HANDS AND INSURES PRIVACY

By attaching a special mouthpiece and a holder for the receiver, an ordinary telephone instrument is quickly converted into the "mono" typefamiliar abroad. The arrangement leaves both hands free and the mouthpiece is so shaped as to permit clear conversation with less likelihood of being overheard by others near by. Both attachments can be put on and taken off quickly.

GREAT MACHINE RULES BETTING AT FRENCH RACES
 ployed to compute the odds and the amounts each horse will pay. One of the most elaborate units of this kind has just been finished for the Longchamps course near Paris. It is housed in a building of distinctive architecture, the figures being shown in a series of slots.

## LIFE OF RACING AUTO TIRES LESS THAN FOUR MINUTES

One of the most important factors in the success of a racing automobile is the tires. When Major Segrave was assembling the car in which he attained a speed of more than 207 miles an hour at Day-
tona beach, a record later broken by Capt. Malcolm Campbell, he consulted an expert as to the best tires for his racer. After a series of elaborate tests, the man replied: "We have built tires for you and I can safely guarantee you three and one-half minutes' life at 200 miles an hour for each tire." They stood the trial as did other parts of the racing car but the guarantee period, an amazingly short time compared with the life of the average automobile tire, shows how close to the breaking point the "super-racers" are constructed and what terrific strains are exerted upon them.

Will He Find the "Lusitania"? Inventor Descending in Diving Bell Which Is Equipped for Taking Movies under the Sea

Its diameter becomes larger and then decreases. The variation of further interest for the reasot that it has a direct relation to the occurrence of spots on the sur face of the sun. Just before th period of the greatest number of spots, the diameter is greatest and smallest when spots are few To discover this, observers, on every sunny day for the last fifty years and more, have been making careful measurements of the sun at noon. Through an astronomical telescope which produced an image of known size, the sun was projected upon a white screen and there measured by means of a network of thin cobwebs. In order to insure close accuracy the measurements were taken by three scientists, each repeating his operations seven times.

## WICKS IN HUMIDIFIER SPEED EVAPORATION

Cloths dipped in water and hung on a rack in a radiator humidifier now on the market, speed

## MOTOR-DRIVEN DIVING BELL FOR DEEP-SEA MOVIES

Motion pictures under the sea at depths heretofore impossible are expected with the aid of a motor-driven diving bell recently tested. It is equipped with four powerful searchlights, can carry two persons, weighs nearly 5,000 pounds and is moved by propellers. The inventor hopes to be able to descend in it over the wreck of the "Lusitania" and take pictures.

## SIZE OF SUN KEEPS CHANGING MEASUREMENTS SHOW

That our sun is like a big fiery heart that beats at a regular rate, becoming alternately larger and smaller, is the interesting discovery of scientists at the astronomical observatory in Rome. These "beats" occur over periods of eleven years and can be measured only by the most accurate instruments and after painstaking checking. In scientific terms, the discovery means that our sun is a pulsating star.
evaporation and so insure a better moistening of the air in a room. Heated air from the back of the radiator, is caught by a protruding apron at the back of the container and is drawn through the festoons of the cloth which are hung inside. The increase in evaporation surface is what makes the unit efficient.

Cloth Wicks in This Radiator Humidifier Absorb Water from Pan and So Increase Evaporation

## LINDY'S NEW PLANE WILL CARRY FOUR PASSENGERS

Mechanics Installing the Wright Whirlwind Motor of the New Plane, Above, and, at Left, the Cockpit and Instrument Board: with Pilot and Four Passengers, the Ship Can Climb to 16,000 Feet; the Cockpit Is Comfortably Upholstered in Automobile Style with Silk Mohair ; Ten-Inch Landing Lights Are Built into the Leading Edge of the Wing Tips, Special Windows Are Low Down in the Fuselage to Give the Colonel Good Vision Below; the Tail Skid Is Fitted with a Caster Wheel; Landing Brakes, Operated by Pedals on the Rudder Bar, Are Placed on the Wheels, and a Full Set of Special Navigating Instruments Is Provided, as Well as a Release for Landing Flares in Night Flying ; the New Ship Has a Top Speed of 126 Miles an Hour, Weighs 3.600 Pounds, and Can Carry a Useful Load of 1,550 Pounds: the 115 -Gallon Gas Tank Gives It a Cruising Radius of 1,000 Miles without Refueling: a Thick Lining of Balsam Wool between the Outer Fusclage and the Cabin Upholstering Will Reduce Engine Noise to a Minimum

## AFEW months ago Ferdinand Schulz, a German flyer, spent fourteen hours and eight minutes in the air one day, gliding around in a motorless plane. He took off from a sand dune at Rossitten, near Koenigsberg, soared up on an ascending column of warm air, which was

 climbing above the heavy cold currents off the sea, and continued to soar and glide and dip through the day and into the night.Two days later, at the same place. Pilot Nehring and a friend climbed into the cockpit of a motorless monoplane, a group of friends grabbed the flying rope, took a short run through the sands, and catapulted the ship with its two passengers into the air, where they stayed for five hours and twenty minutes. Schulz, months
earlier, had taken a passenger up for nine hours and twenty-one minutes, but the record was disallowed because he not only carried a passenger along, but likewise an engine, though he didn't use the latter. He set another record ten days after Nehring's feat, however, by hopping off at Rossitten and riding a wind current across country for nearly thirty-nine miles before he came to earth.

From the first crude gliders of Otto Lilienthal, the German, Octave Chanute, of Chicago, and the Wright brothers, to the latest German motorless machines, is a far step. The early gliders, frail structures of bamboo and fabric, built sometimes like a giant box kite and again, as in Lilienthal's mode!, like an enormous glorified bat, would do, as their name im-
plies, just one thing-glide down the wind from some height, and, if the pilot was lucky, land him safely at the bottom.

The latest machines are more than gliders, for they not only glide, but soar, and therein lies the secret of their ability to remain aloft for many hours, make long journeys across country and climb, as Ferdinand Schulz did near Marienburg last October, to a height of more than half a mile. On that occasion he picked a favorable air current, rode it up to a height of 2,566 feet above the earth, and continued to float about up there for more than four hours.

All of the early glider experiments, which led eventually to the perfection of the motor-driven airplane, consisted in straight glides, never exceeding more than

 flight. He took the air from the Wasserkuppe, flew to Milseburg, and then returned to his starting point. Another German pilot, Kegel, after mastering the science of motorless flight, added a small fourteen-horsepower engine to his machine, to be used only when the wind was not favorable, and succeeded in flying entirely around the Zugspitze mountains in the Bavarian Alps at a total cost for gasoline of about \$1. He ascended more than two and a half miles under power, and then utilized the air currents most of the time to make the trip.

German Students Assembling a Glider's Tail, and Dr. Peltzner in an Early-Style Biplane Glider

One of the German pioneers, Espenlaub, introduced a novelty at the Rossitten glider meet last year when he brought out a machine that was towed aloft by a motor-driven plane. When he reached the desired height, he cast off the towrope and proceeded to glide for hours before coming down. So little power is needed to tow one of the well-designed gliders that Espenlaub's machine was taken aloft by a light airplane equipped with only twenty-five horsepower, which puts it in the class of the smallest light airplanes built in the United States. Forty horsepower is
considered a small "flivver" plane, but with fiteen horsepower less, the German pilot -ucceeds in flying not one plane, but two the motor ship and its trailer.
Most of the German gliders have been huilt by engineering students of the vations universities, who have organized glider-flying clubs, just as is now being done by several American colleges which have aviation schools. A glider can be luilt for from $\$ 75$ to $\$ 200$, the expense depending on the degree of finish and equipment desired.

The visit of the German pilots with the pick of their machines this year for exhibitions under the auspices of newly formed gliding clubs is expected to start gliding as a sport in America. A half dozen or more of the best German ships are to be flown in several meets.

Because of the low first cost, the absence of expensive engine repair and the elimination of all fuel bills,
gliding offers cheap aviation for the student. Once the flyer has mastered his machine thoroughly, the Germans have demonstrated the possibility of adding a cheap light engine as an auxiliary, just as the owner of a sailing yacht utilizes a motor auxiliary, to take him on his way when the wind fails. A well-built glider can be powered with a motorcycle or light-car engine, and still be used for gliding when the air currents are favorable.

Few airplane pilots today have had any experience with gliders. Lloyd Bertaud, who lost his life when the "Old Glory" plane disappeared at sea in an attempted flight to Rome last year, was one who got his start that way. Years ago, as a boy, Bertaud built a homemade glider from plans published in Popular Mechanics during the early days of the Wright brothers' experiments:
The knowledge of currents gained by experiments was essential to the

Who, in 1921, Made a Twenty-Five-Minute Soaring Flight, Breaking All Records ; at the Left Is the Passenger Car of the "Goetz von Berlichingen," with Pilot Wolff Hirth; Below, Men and Horses Pulling a Contestant to the Top of a Sand Dune for the Start of the Coast Gliding Contests Held by German Flyers Last Year; the Modern Machines, Which Remain in the Air for Hours at a Time, Actually Soar as a Bird on Ascending Currents of Air. Whereas, Prior to Harth's Flight in 1921, All. Motorless Planes Simply Glided Down from a Hilltop Start without Means of Controlling the Descent

 had so little engine power at their command that a moderately strong wind might be fatal, unless they knew how to utilize it to keep aloft. Modern airplanes, with enough power to fly through a sixty-mile gale and still make headway, are practically independent of the wind, so, until the Germans took it up again, kite flying and gliding languished.

Strangely enough, the credit for the revival goes to the statesmen who met at Versailles after the armistice to

Two of the Latest Types, Showing the Highly Efficient Streamlining and Perfection of Form; That Below Is a Type Used by Espenlaub
draft the peace treaty. They had no such object in view, but were merely trying to prevent Germany building up a military aviation force that might again menace the peace of Europe. To accomplish that aim they limited the engine power which could be used in German planes. Denied an outlet for their energies in building high-powered military machines, the German flyers, impoverished by the war, took up soaring flight as a cheap form of sport.

## BYRD TO FACE MANY PERILS ON SOUTH-POLE TRIP

 probability, will be infinitely harder. In the first place, the north pole is at sea level. The south is on a high plateau at an elevation of nearly 10,000 feet. If Byrd flies over, he will have to soar above this rough hurdle, besides facing the difficulties of landing and taking off where the country is a jagged jumble of forbidding ice and the perpetual snow deceives the eye. Then, there is the temperature. Byrd found the weather delightfully mild when he slid over the north pole in his humming Fokker. The mean July tempera-
greit suddenness, explorers state, sometimes attaining a velocity of $\mathbf{1 5 0}$ miles an hour in gusts. They drag a drift of snow alous with them, blotting out the landscane below, although the sun may be shining clearly just above the ice cloud. Thue are the principal hazards that face the man who would conquer the south polc. But there are bright sides to the picture. In spite of storms, periods of clear, fine weather are not uncommon. The ice cap presents a better landing surface for planes than the pack ice, such as was found over the north pole, and the speedy craft of the air will swallow up the distances and greatly diminish the time required for travel, an exceedingly important factor if the explorer goes on foot or by dog sled.

## "SAFETY CITY" SHOWS HOW TO AVOID ACCIDENTS

Miniature traffic accidents of all kinds nccur in a twenty-foot model of the city of Detroit, to illustrate the results of improper driving and disregard for safety signs. The display, which is an accurate reproduction of the main part of the city, with streets, buildings and other details built to scale, has been arranged for a tour of the state to teach safety lessons. Special lighting effects have been created, whereby darkness appears to fall upon the tiny city. Moon and stars appear, auto headlights are turned on, train and boat signals are lighted, and electric signs blaze forth. Miniature machinery runs in the tiny factory building, and the entire model reproduces the busy life and traffic.

Noise Producer in Use, and Part of the Measuring Apparatus at Bureau of Standards

## TESTS WITH MAN-MADE NOISES MEASURE INSULATION

Scientists at the bureau of standards have devised various noise-making instruments for the purpose of testing the soundproof qualities of insulating materials submitted for examination. One of the noise units is a crystal of quartz, through which an electric current is passed, producing a definite sound. The intensity of noises made in this way can be accurately determined so that the results of the tests on the samples will be far more conclusive.

Animated Model of Detroit; Small Lights Flash, Tiny Cars and Autos Glide About, and Regular Traffic Conditions Are Duplicated to Teach Safety Lessons

## RADIO BEACON TO GUIDE PLANE ELIMINATES HEADPHONES

Guiding airplanes by means of a radio control, which tells the pilot by an audible signal when he departs from the right course, is now improved in an apparatus
 Instead of listening to a signal, the pilot simply has to watch a little dial instrument in the cockpit. A pointer on the unit will tell him if he is flying in the right direction. The sensitive indicator is affected by a radio beacon anywhere within 100 miles of the moving plane. Successful tests have been made with the new guide, and several of them are in use.

## TATTOO TO MARK PET STOCK HELPS PREVENT THEFT

To identify small animals and poultry, a tattoo marker, that can be carried in the vest pocket when not in use, has space for one, two or three characters at once and is so adjusted that the units cannot be put in upside down. The instrument is especially adapted to use on rabbits, calves, sheep and poultry, the

## QUAKES AT SLEEPING VOLCANO NUMBER SEVERAL IN DAY

Mt. Lassen, America's chief active volcano, is sleeping, but its slumber is troubled, for earthquakes are constantly occurring near it, sometimes several in one day, and the peak constantly gives off clouds of steam. Within 100 miles of the volcano are hot beds of pumicestone and lava areas which were formed within recent times, geologically speaking. By digging off the surface of the pumice area, much higher temperatures are recorded. R. H. Finch, of the geological survey, whose work is to "keep his finger on the pulse" of the sleeping volcano, is making attempts to photograph the summit and to obtain accurate temperature measurements. The Indians say that a mountain near the peak has been hot for many years, and earthquakes, with attendant rattling noises, have been observed by the forest service for at least fifteen years.

## GRAPHIC RECORDER OF VOICES AIDS LANGUAGE STUDY

Persons of different nationalities pronounce the same sounds by using their speech organs in different ways, and to determine just what the difference is, the University of Chicago employs an apparatus that makes a graphic picture in waving lines, of the sound as pronounced. As the breath is expended, the lips moved and other processes in speech performed, the result is recorded on a moving cylinder.

Making a Voice Picture to Study Speech Methods; the Sound Vibrations Are Traced in Wavy Lines on Cylinder

One of the Porcelain Bells for a Chapel at Meissen, Germany; the Figures Affect the Tuning

## FORTY BELLS OF PORCELAIN TO STRIKE CHAPEL CHIMES

Instead of being cast in metal, the forty bells for chimes in a chapel at Meissen, Germany, are being fashioned of porcelain. More than twenty of them are already completed and have been tested. Since each has different decorations, it requires special tuning. This is done by grinding. The bells are to be suspended by stout straps. Other details of the chapel are to be made of porcelain. Among them are a number of human figures, some weighing as much as 600 pounds.

## MAGNETIC PENCIL FOR DOCTOR

Bits of metal are removed from the eyes and other parts of the body with a magnetic pencil of cobalt steel, one of the latest units added to the emergency kit. It is about the size of a lead pencil and has been successfully used where an operation with a knife might otherwise have been necessary.

## ManOnisot

## Guns That Aim Themselves, Giant Electrical Ears and Fingers of Light Meet Air Menace

WARS of the future will be battles between mechanized wizards, mute masses of steel energized by electricity, seemingly endowed with almost human intelligence.

Mammoth guns with "eyes," which see the enemy many miles away, and which can hurl huge projectiles with remarkable accuracy farther than the length of a Marathon race course, add new efficiency to tomorrow's wars.

Substitute suns-far-sighted search-lights-make fighting at night almost as deadly as by day. Sound recorders give notice of the rhythmic purring of enemy airplanes many miles away. Anti-aircraft
guns, in battery formation, which are sighted and directed by electricity, are fired by cannoneers with wonderful accuracy despite the fact that the targets at which they shoot are speeding airplanes rushing onward at speeds of one and onehalf to two miles or more a minute.

On a day in October, in the year 1415, a little army of English archers waited behind its improvised defenses near the village of Agincourt, while a great host of French knights rode clanking toward them. Nothing short of annihilation seemed to be in store for the English, for what could all but unarmored foot soldiery do against mailed men on horseback? But

 back has gone on. There are those who claim complete and final supremacy for the man in the plane, and say that nothing is left for the man on the ground but the choice between surrender and annililation. They are opposed by those who declare that the planes, though mighty, are still in a measure subject to the limitations of all highly mobile forces; that they have considerable striking force but no holding power, and that the advantages they gain in the first rush must be further exploited and then stabilized by the slower-moving but harder-holding ground troops. And finally, say those who still see a chance for the man on foot, his last shaft is by no means spent. Even the crude anti-aircraft weapons of the World war, they point out, were able to make the planes keep to a respectiul altitude when they were competently handled, and post-war advances in material and technique of aircraft defense have at least kept pace with the progress in airplane construction and aviation. So it may come to pass that one of the vast airplane fleets, which some journalists are always dreaming about, will some day rush to its destruction at an Agincourt of the air.

Taking little part in the heated discussions of whether weapons on the ground can strike effectively against planes, but seeking more successfully for an answer in

it has already begun to be a legendnewspaper accounts have attributed almost miraculous powers to it. One widely circulated story declared that it picks up the sound of the approaching plane and automatically trains the gun on it, without the intervention of any human direction at all.

This is a little too much of a good thing, but even the sober facts are remarkable enough. Manned by a few competent operators, the machine really will automatically compute all the firing data necessary for the handling of a battery attacking a target at any range and altitude.

The operation of the instrument is simple enough in itself; the complicated parts of the business are all mechanical and have been taken care of in advance by the ingenious inventors who constructed it. Two observers keep telescopic eyepieces difficulty with ground defense against aircraft during the war, and indeed until within the last few months, was the difficulty of getting the fire of the high-angle guns anywhere near the target. Marking down a horseman with a clothyard shaft at fourscore paces is a simple problem as compared with potting a plane high up among the clouds at a hundred times that distance. The archer had it a great deal easier than the "archie."

The practical solution of this problem, enabling the commander of an anti-aircraft battery to train all of his guns as a unit on a single target, is the greatest accomplishment of the ordnance department, greater even than the development of the several excellent guns and mounts which have become the standards for our land defenses against attack from the air. The new fire-control instrument for antiaircraft guns (it hasn't received a compact name as yet) is the sensation of the day among artillery experts. It is so good that

Portable Searchlight, Top: Sixty-Inch Aluminum-Alloy Casting for the Light, and, Below, the Army's New Anti-Aircraft Gun

trained on the attacking plane. One of them follows all horizontal movements, and the other all risings and fallings of the target. The internal mechanisms in which these telescopes are mounted actuate indicators on dials, from which the data may be read off directly. Factors other than those of horizontal and vertical position, such as timing of the shell fuse, etc., are "fed in" by other operators at appropriate dials.

The firing data can be transmitted to the guns in any one of three ways. The simplest method consists merely in telephoning the figures to the gun pointers, who then lay their weapons in the usual manner. The second method is what is called the "follow-the-pointer" system. Data dials similar to those on the fire-control instrument itself are located at the guns, with pointers that move synchronously with those of the control instrument. The task of the gunners then is to operate their handwheels so that a second pointer on each dial follows faithfully the movements of the first. The more nearly perfect they are able to make this following of the pointer, the more accurate is the training of the guns.

The third system, which is the real sen-
sation maker, is entirely automatic in its operation. Electrical connections run from the fire-control instrument to each gun in the battery, applying the mechanically computed data by means of motors geared to the training mechanism of the guns. The fuse setters, which time the burst of the projectiles, are also held to identical settings for all the guns by the same device. It is an uncanny sight to see a battery of guns, wholly deserted by their crews, following with their muzzles every movement of a speeding target in the clouds, almost as if they were alive. This automatic method places the whole work of training the guns in the hands of the battery commander, and leaves the gun crews nothing to do but shove the noses of their projectiles into the fuse setters for a moment, slam them into the breeches of their pieces and pull the lanyards. This makes for very rapid and uninterrupted fire.

The automatic training of all the guns in a battery-which can, if desired, be extended to all the guns in any number of batteries-is probably at the bottom of the extravagant stories about the superhuman powers of the new fire-control instrument. One other factor has probably contributed
to the spread of the reports. For picking up approaching planes at night, a listening instrument is the main reliance of the fire-control detail. This looks like four huge loud-speaker horns, all pointed in the same direction, with ear tubes like an exaggerated stethoscope attached at their lower ends. When the listener hears the roar of the motor at its loudest, the instrument is pointed approximately at the approaching plane, and the position, transmitted electrically to the waiting searchlights, is at once stabbed by their beams. A little feeling around by these huge antennæ of light, and the target flashes into view. Then, but not until then, do the observers at the fire-control instrument go to work.

But this is far from training the guns directly on the target merely by picking up the sound of the motor. Position finding by sound alone, even on a much less delicate footing than this, is not practicable, because sound does not proceed in straight lines as light does, but is subject to change of intensity and apparent direction by winds, layers of air of differing

The Ears of the Anti-Aircraft Gunners Are This Battery of SuperSensitive Sound Collectors
density and temperature, clouds and other reflecting surfaces, and a number of other factors. At best, the auditory position finder can only approximately locate its target. Within its limits it is a great help to the searchlights. But a performer of military miracles it certainly is not.
There are several weapons specially designed for attack on aircraft, each very worthy and well adapted for its own particular purpose. The backbone of the anti-aircraft service is the new three-inch high-angle gun. This is the type of weapon now being installed for the protection of the locks and harbor works at Panama. It can throw a fifteen-pound projectile to a height of 10,000 yards and has an extreme horizontal range of 15,000 yards. A rate of fire of twenty-eight shots per minute has been attained with this weapon. That means that a battery of four of these pieces could hurl at an enemy plane nearly a ton of steel and high explosive in a burst of fire lasting one minute. During the past year the improvements in this piece and its control have made possible a doubling of the hits scored, in half the former time and at twice the former range, concisely, an 800 -per-cent increase in efficiency.

The three-inch anti-aircraft cannon has a formidable big brother in the new 105 -millimeter, or 4.1 -inch, high-angle rifle, a very long-barreled, powerful weapon that can throw its thirty-threepound projectile to a height of 12,000 yards and an extreme range of 19,000 yards, or over ten miles. It is a slower-speaking piece than the three-inch, firing only fifteen times a minute, but the greater weight and range of its projectiles more than even up the score.

Because of the great length and considerable weight of the fixed ammunition for this gun, the operations of loading and of ejecting the empty cartridge case after firing have been made almost entirely automatic. The three-inch gun is semi-automatic ; that is, its breech block is snapped home by a strong spring as the cartridge slides into the chamber, but after firing, the breech has to be opened

Anti-Aircraft Guns Which Aim Themselves, Being Tested at Aberdeen Proving Ground; a Sensitive Sound Pick-Up Points the Weapon Directly at the Source of the Sound
by one of the cannoneers. The breech mechanism of the 105 -millimeter piece, however, is too heavy to be operated manually at the necessary speed without wearing out the cannoneer in a few rounds. Accordingly, the long cartridge is laid in a tray extending backward from the breech and a pneumatic rammer shoves it home. As it clears the breech block, the projecting rim at its base trips a trigger, which allows the spring-pulled block to slide up into place and finish seating the cartridge. The gun is now ready to fire. When it is fired, the force of the recoil is utilized by means of an ingenious cam arrangement to open the breech block and eject the empty cartridge case, and also to return the pneumatic rammer to compression position, ready to load another charge into the chamber.

The ammunition in these two guns represents a great advance over that used during the war. Then, because of the unreliability of time fuses, shrapnel was usually employed. This type of projectile fills the air with a shower of leaden pellets,
shotgun fashion, and is an ideal weapon against infantry or other scattered targets. But it isn't so good against a narrow target like an airplane, for it was practically necessary to score a hit on the aviator himself in order to bring down the plane.

Nowadays a high-explosive shell is used, for post-war development in time fuses has made it possible to make sure of bursts within fifty yards of the target. At this distance the aviator is exposed not only to the flying splinters but to the stunning concussion caused by the explosion, which may cause him to lose consciousness for a few fatal seconds.

A third gun which has been developed for anti-aircraft work is perhaps the most vicious-seeming of the whole family when it is seen in operation, though it is only a little one. This is the thirty-seven-millimeter rifle, an automatic. It fires shells weighing about one pound at the rate of ninety shots per gun per minute. During night firing, when tracer ammunition is used, the trajectory can be seen drawn against the dark like a fiery dotted line.

The Brain of the Automatically Pointed Gun Is This Instrument, Which Locates the Plane and Directs the Weapon

The light shells of the thirty-seven-millimeter gun differ from those of its larger brothers in that they are designed to burst on contact instead of by a time fuse. That is, a shell actually has to hit a plane before it can explode. But when it does, the effect is ruinous. Half a wing, or the whole of the rudder apparatus, simply vanishes. So much has been determined by trial on fabric targets, but what would happen should one of these little shells chance to hit a loaded bomb rack had better be left to the imagination.

In order to function upon contact with so slight an obstacle as the fabric of an airplane wing, the fuse of this shell, of course, has to be of almost unimaginable delicacy and quickness. This has been achieved by means of a most ingenious principle. The plunger that fires the detonating cap poises ready to strike the moment the projectile clears the gun. But it is prevented from striking by the pressure of a tiny column of air admitted through a hole bored in the nose of the shell. So long as the projectile is in flight, this pressure is maintained. But if any obstacle, however slight, closes the hole for even an instant, the restraining air pressure is removed long enough for the
plunger to strike home and detonate the explosive charge. Shells of this type, fired through a thunder shower, have exploded on striking large raindrops.

These various types of attack with shells are best adapted for the high-flying planes-bombers and observation planes. The low-flying "hedge hopper," which just skims above the tops of the trees, demoralizing columns of troops and ruining transport trains with machine-gun fire and light bombs planted neatly in rows, is difficult to find with weapons as large as these. Even the comparatively agile thir-ty-seven-millimeter automatic is hardly quick enough on the turn to catch these flyers. Yet they have to be met, for all armies now have planes designed especially for this very type of combat. One of the new Curtiss planes, for example, carries three machine guns pointing forward and one in the rear cockpit for the observer, besides racks for a large number of light bombs. Most of these ground-attack planes, moreover, carry light armor around the cockpit, to protect the crew and the vital machinery from ordinary fire.

To crack this nut, the .50 -caliber machine gun has been developed. It is the same in general construction as the $.30-$ caliber Browning heavy machine gun, except that it throws a massive cigar-shaped bullet, half an inch in diameter and weighing about two ounces. The light steel plates an airplane is able to carry cannot deny entrance to such messengers as these, and what they hit they break, whether it be an engine valve or a steering control, or human flesh and bone. To make matters doubly sure, a mount has been devised by which four of these guns can be trained on the same target by a single gunner. This quadruple weapon delivers two-ounce slugs at a rate of thirty a second -a veritable hurricane of death.

And so the man on foot stands again where he stood on the morning of Agincourt. Whether he can prevail against the chivalry that may ride to oppose him. no man is now able to say. He himself makes no boast. He only looks to his boustring and picks out the best of his lons steel-tipped hafts.

## MATTRESS OF RUBBER TUBES IS EASILY CARRIED

Rolled into a small package of little weight when not in use, an inflated mattress of rubber tules has been devised by a western physician. There are twelve tules, each in a cloth case and with a valve for inflating. The casing is washable. The entire mattress weighs but a few pounds and, since it can be carried in small space, is particularly adapted to camping and automobile trips.

## AUTO THAT FLIES ALSO SERVES AS FAST MOTORBOAT

Tourists of the future will be able to use the same conveyance for travel by land, water or air if a British craft, recently exhibited, proves successful. It is a combination automobile, motorboat and airplane, with wings that fold back, tail fin, rudder and two propellers. A sheltered cabin holds several passengers and little time is needed to change the vehicle for different modes of travel.

For Travel by Land, Air or Water; the Vehicle That Combines in One a Plane, Auto and Motorboat

## COIN-IN-SLOT BASEBALL GAME TESTS PLAYERS' SKILL

Young Woman Is Manipulating the Bat. Man at Her Left Is the Pitcher; Scoreboard at Far Corner

Many of the thrills of a real baseball game are afforded in a coin-in-the-slot playing cabinet which permits two persons to enjoy five innings at a time, and also keeps accurate score of the runs, hits and batting averages. One player acts as pitcher, delivering the balls-small steel spheres-from a slot on the field by turning a crank. His opponent, as batsman, turns a handle which swings a small steel bat, mounted on a pivot. As the balls are struck, they roll into compartments at the rear of the field or drop into holes, with the result that miniature men pop up from the home plate and are carried along for one, two or three-base hits or homeruns, according to the place where the ball landed. This action is obtained by an arrangement of gears and levers inside the cabinet. Scores are automatically registered on a board as each play is made. Since positions that will bring in runs or result in hits are marked, the batter has a chance to exercise his skill in endeavoring to send the ball into the winning areas. The machine is operated by electric current from a wall socket

It Will Tip But Won't Fall Over; the Specially Suspended Baby Carriage at a Steep Angle

## BABY CARRIAGE WON'T TIP OVER WHILE CROSSING CURB

Securely suspended from a frame of springs instead of by straps, a perambulator is so balanced that it is not likely to be tipped on end while going over street curbs or similar obstacles. The body is deep and safe and the entire vehicle durably constructed. At an exhibition in London, tests were staged to show how carefully it has been designed.

## FIREPROOF AIRPLANE DOPE INVENTED BY STUDENT

Coating the airplane wings with special materials to make them stronger and proof against moisture has an added advantage with a substance recently developed by an aviation student in 1 n diana. His preparation is claimed to be fireproof so that the wings are protected against both fire and water. Exacting tests have been successful.

Parallel-Jaw Pliers Employing Double Fulcrum to In-

## X-RAY "FINGERPRINTS" OF ROCKS TO AID INDUSTRY

By preparing thin sections of rocks and taking X-ray photographs of them, scientists of the University of Wisconsin have compiled an interesting library of mineral and other "fingerprints," to identify different specimens. More than 600 of these "autographs" are now included in the collection. According to Prof. A. N . Winchell everything solid is crystalline, and every crystal of the same kind in mineral substances produces its own characteristic autograph. By comparing the photo of an unknown specimen with that of a known substance, identification is often easily made. The method is believed to have great possibilities for various industries. For instance, if a sample of graphite paint to be used in preventing rust, is suspected of containing more shale than graphite, an X-ray exposure would reveal the true composition, although shale and graphite are much alike in outward appearance. The rays reveal that a diamond is formed of closely packed carbon. Graphite is also carbon, but loosely packed and of different pattern. Examination of cement, ores, slag and porcelain products can be accurately made by the X-ray system.

## PLIERS WITH PARALLEL JAWS GET PERFECT GRIP

Pliers which adjust themselves to any object within their range, while keeping the jaws parallel to provide a perfect grip, have been invented by a Chicago man and are now on the market. Instead of putting the strain on the connecting pin, the new pliers provide a double fulcrum between two lugs. With the jaws parallel, they can hold a piece of pipe as perfectly as a pipe wrench. A pawl is provided which can bc swung aside, or dropped into place to adjust the jaws for small work.

IONG the most ferocious of creatures i prey are numbered many insects.
In that class spiders are, of course, conspicuous. But the huge spiders called tarantulas are in turn preyed upon by an insect known in our own southwest as the tarantula killer.
The tarantulas are trapdoor spiders. They spin no webs, relying upon their strength and agility for the capture of victims, the latter including an occasional mouse or ground-nesting bird, and their homes are burrows, usually in the side of a clay bank, lined with silk. The door of the tarantula house is set on a strong silken spring, and shuts with a snap when

Giant Water Bug Attacking a Frog, and, Above, Two Collectors Coming down the Mountain with Sacks Filled with Ladybugs Which Destroy the Parasites of Cantaloupe Vines
the owner has entered or comes out. At home, the tarantula is perfectly safe, the entrance of its burrow being so artfully camouflaged as to escape even scrutinizing observation. But on its walks abroad, the giant spider is always in danger of attack by the killer, which is a species of wasp.

Against the wasp it has no adequate means of defense. Constantly turning this way and that to face the enemy, it is inevitably taken sooner or later, in flank or rear, stabbed with the killer's envenomed lance and paralyzed.

The duel invariably ends with the death or total disablement of the tarantula, in whose body the killer lays its eggs, in order that the baby wasps, when they are hatched, shall have food to eat.

Among the most famous of insects of prey are the driver ants of tropical Africa. They have no permanent homes, but are continually

on the march in armies numbering countless millions, which are systematically organized and seemingly disciplined. All living creatures flee before them, including elephants and other beasts of the jungle. Any human being who did not do the same, would be quickly destroyed, his skeleton picked clean. Monster snakes found gorged and torpid are devoured.

Yet there is one exception. These fierce ants are themselves followed and preyed upon by an insect called the Bengalia fly, a trifle larger than the common bluebottle. Being always on the march, the ants are obliged to carry with them the cocoons containing their chrysalides. The flies, darting overhead, grab the chrysalides, tearing them from the jaws of the nurse workers, and bear them away for their own food.

One of the most remarkable of oldworld insects is the Drilus beetle, whose grubs attack and devour snails. The adult male is, so to speak, just a regular beetle, but the female, much larger in size,
never gets beyond the status of a loathly worm. The grubs, very hairy, manyclawed and with powerful jaws, have a most uninviting appearance.

In Java and other islands of the Malay archipelago there is a kind of mantis which imitates a beautiful flower. Perched in the center of a flower cluster, it appears to be part of the latter. But woe to the butterfly or other unsuspecting insect that alights upon the cluster, for it will be instantly grabbed and eaten. On the ground, the mantis exactly resembles a fallen blossom of an orchid.
"Ladybird, ladybird,f1y away home!" What other insect is so enshrined in folklore? How innocent is that pretty little beetle - seemingly. Yet, in reality, it is a fierce creature of prey, its principal food being the

Long-Necked Ant Lion, Top; the Tarantula Killer, Center; and Three Hair-Snail Killers, Offspring of the Pair of Beetles in the Foreground
green bugs, or plant lice, which do so much damage tw crops and garden plant. For that reason it is rated a very beneficial insect and a friend of the farmer.
The Imperial valley in California is famous for its cantaloupes, but the fruit could hardly be grown there save for the help of ladybugs. In aring, men go up into the high sierras, where the little beetles hibernate in mossy places under the snow, usually near small streams, and dig them up. They are commonly to be found in clusters, hundreds of them bunched together. When thus collected, they are put through coarse wire sieves, to get rid of the debris mixed up with them, and are thereupon packed in sacks and carried down into the valley, sometimes on the backs of mules.
They are collected in this way literally by the ton, and are placed in cold storage, in order that they may stay asleep and inactive until they are wanted. When the green bugs have begun to appear on the cantaloupe vines, and before they have had a chance to multiply in armies, the ladybugs are sprinkled over the fields. With celerity they go after the green bugs, devouring them as fast as they are hatched, with the result that the melons grow and ripen beautifully.

The experimental use of ladybugs for this purpose was first attempted in the Imperial valley, but has since been extended to other parts of southern California. Shipments of the beetles are sent long distances, in boxes, so many thousands to a box, counted by a special measuring machine which delivers them to the comtainers through a hopper.

In Egypt there is an extraordinary in-

Bengalia Flies Stealing the Cocoons of Driver Ants; Warfare Is Constant and Ferocious among the Myriads of the Insect World

Malaya, the Nightmare of the Insect World, Produces This Mantis, Here Seen Waiting for Its Prey to Come within Reach
there is another tiger parasite somewhere, ready to prey on it if the two can be brought together, is being capitalized by the department of agriculture in combating insect pests. As most of the pests that menace the nation's food supplies have been innocently brought in from abroad, the search for their parasitic enemies extends all over the world. An experimental station in northern Ohio is busy growing an imported tiger insect from Europe preparatory to turning it loose on the European corn borer, in the fight for which congress has appropriated millions.

When the corn-borer menace started spreading westward after its introduction from abroad, probably in a shipment of foreign-grown broomcorn, the pest specialists of the government went to Europe to study the corn borer's habits and life on its native heath. They soon found that nature had developed a tiger parasite which lived on a corn-borer diet, so a quantity of parasites were rounded up and brought to the United States for propagation.

The list of insect wars
which attract this fly in large numbers, dispelled that notion.

The fly in question is a vampire. Nocturnal of habit, it dives in the night into ponds and streams, attacking small fishes, tadpoles and frogs. Grasping the victim with its powerful legs, it sinks its beak into the flesh and such the blood. In some places the rearing of goldfish in ponds has been made almost impossible by the depredations of this insect monster.

The fact that for every insect and worm
started by the government is a long one. Vast armies, like those of the lad bugs, are marshalled each year and turned ioose on some unsuspecting enemy of fruit, grain or vegetables.

In the list of the insect kingdoms. though, there is none so perfectly organized or so well prepared for both defense and attack, as the ant. Many of the varieties maintain a standing army of soldiers, whose sole duty is fighting. just as the worker ants do the building and
gather the food supplies. When one of the liuge colonies of driver ants starts acro.- country, no animal is big enough to stay in its path. They swarm over everything and, when they have passed, the trail is licked clean of every living thing. Exen streams do not turn them aside, for billions of them will form in a ball, often four feet or more in diameter, and launch themselves on the water, with the queen and young in the center and the workers and soldiers forming the outer layers.
In Mexico, and other lands where driver ant- are common, beds must be mounted with each leg in a can containing kerosene to protect the occupant from invasion while he sleeps. If the moving ant army arrives in the daytime, the only safe refuge is the bed. Hans Heinz Ewers, the German naturalist, who has made a life study of ants, met his first driver army in Mexico, was chased to a chair, from there to the table top, from the table he managed to step into a washbowl of water, and when the ants started forming a living bridge across the water to reach him, he finally leaped to his bed and escaped.

## RUBBER DISK REPLACES SPRING FOR AUTOMOBILE

Successful tests with a rubber-disk arrangement, instead of the usual metal springs, have been conducted on automobiles in London. A car was driven forty miles an hour over a road of furrows and holes, a foot deep, without discomfort to the occupants, and the driver had no difficulty in keeping the automobile in the road, according to reports. The spring substitute consists of three parts for each wheel. A serrated rubber disk, resemWhing a gear wheel is fitted between two metal-toothed disks, one of which is secured to the frame and the other to the end of an arm on the axle. Bumps and jars are absorbed by the rubber disk, and the need of shock absorbers is eliminated. The disks have been tested for 20,000 miles, showing little wear.

Chief Members of the Disk Substitute for Auto Springs; the Center Part Is of Rubber

## BICYCLE THAT CLIMBS POLES ALSO SERVES AS BOAT

Climbing a Pole with the Odd Bicycle That Travels on Land or Water

With slight alterations, a bicycle invented by an eastern man can be used as a climbing rig for scaling poles, or the frame may be converted into a boat by adjusting a strip of canvas and fastening it to posts. When not intended for these special uses, the outfit is pedaled in the usual way.

## ETHER MASK HOLDS PERFUME FOR QUICKER SLEEP

By sprinkling perfume on ether masks used in operations, German surgeons are reported to have spared their patients some of the unpleasant effects usually attending the administering of anæsthetics. Sleep is induced more rapidly, it is said, and the suffocating cough is usually prevented due to the elimination of the nauseating odor of this narcotic.

BATTLESHIP IS TURNED INTO AIRPLANE CARRIER

Suggesting a New Use for Old Battleships: Two Views of the British "Courageous," a Former Warship, After It Had Been Converted into an Airplane Carrier

At an expense of more than $\$ 10,000,000$, the British warship "Courageous" has been remodeled into an airplane carrier with landing decks and space for many planes. Six levels for repair shops and storage areas have been provided below the top deck. The craft recently underwent its first steam trial.

## BUMPLESS SEATS FOR AUTOS CAN BE FOLDED UP

Reading a book while going over moderately rough roads can be done with ease and comfort, it is claimed, in a special automobile seat recently introduced in
 France. It is mounted on strong spiral springs to absorb the movement that normally jogs the body, and the back may
be folded down or adjusted over a range of six inches. The seat may also be set forward or back and raised or lowered.

## ORIGIN OF COMMON PHRASES

Few persons know that the motto of America, "E Pluribus Unum," was originally taken from a poem written by Virgil about 2,000 years ago, but such is the case, according to authority. A resident of the state of Maryland is said to have chosen the phrase "In God We Trust" for American coins in 1862. It was subsequently proposed by James Pollock, director of the Philadelphia mint, and, in 1864, was first placed on an issue of two-cent piece. "He's a brick," is an everyday expression. but it is not generally known that it hal its origin nearly 3,000 years ago, whell Lycurgus, the great Spartan lawgiver, was asked if it would not be advisable to build a brick wall around Sparta and replied that the city already had a wall of men and every man was a brick.

## PHOTO CELL TO GAUGE LIGHT AT NORTH.POLE

sensitive that it will accurately measure the intensity of star light and will record sunlight faithfully, a giant photoelectric cell, developed by Dr. L. R. Koller in the laboratories of the General Electric company, will be used by General Nobile in his north-pole explorations this summer. The cell is said to be 100 times more sensitive than any of this type yet introducel, and is operated with a special recording meter, any variations in the intensity of daylight being registered on a toll of paper. The cell itself is a gas-filled bull, seven inches in diameter, coated on the inside with a thin layer of cassium, a metal extremely sensitive to light. This layer is the thickness of just one atom. How thin it is can be judged when it is known that billions upon billions of atoms could be confined within the head of an ordinary pin.

## PLAYING CARDS FOR THE BLIND HAVE RAISED FIGURES

Bridge and other games may be enjoyed by blind persons with a set of cards that have raised figures, so that the different suit- and values may be recognized by the sense of touch. In addition, a special rack is used to hold the cards so that they

Raised-Figure Playing Cards for the Blind; the Racle Provides a Convenient Way for Sorting Them
may be easily sorted and kept in convenient position for playing.

To Honor Nungesser and Coli; Sketch of Proposed Monument to Be Erected in France

## TRANSATLANTIC AIR MARTYRS TO BE HONORED

To honor the memory of Nungesser and Coli, who were lost in an attempt to fly from France across the Atlantic to America. a monument is to be erected on the cliffs at Etretat, not far north of LeHavre. It will be of unusual design, likenesses of the flyers forming the prominent part of the base.

## GASKET TAPE FOR AUTOS SAVES TIME AND WORK

As a substitute for cork or fiber material, a roll of tape, one inch wide, has been introduced for fashioning gaskets on various parts of the automobile. It sticks of itself, eliminating the use of shellac or grease: gasoline or oil does not affect it, and the heat of the engine expands it. In use on oil pans, for instance, it is torn off and lapped at the corners, and the laps when screwed up, flatten out so there is no leak from the doubling of the tape. Bolts can be pushed through the fabric.

World's Third Largest Telescope, with a Sixty-One-Inch Mirror Cast by the Bu
if Standards, Has Been Built for Ohio Wesleyan as a Memorial to Prof. Hiram M. Per...ns

By J. EARLE MILLER

AGHOSTLY, luminous visitor flashed out of the southern sky a few months ago. passed near the sun, and then dashed away to the south again, preceded, this time, by its tail.

Two hundred years ago, or even less, the dash across the sky of Skjellerup's comet-for that was the visitor's namewould have been accompanied by predictions of wars or the death of kings because, for many centuries, the arrival of a visible comet always brought forth dire prophecies of evil.
The perfection of the telescope robbed comets of their terror for the superstitious, but fears were roused again by predictions of what would happen if the earth should ever pass through the supposedly deadly gases of a comet's tail. Along came the spectroscope, and the gases were analyzed. Strange to relate, the idea that they might be of deadly type proved true, but,
for the safety of the world, it was found the gases were so attenuated that there was less of them than would be found in the most nearly perfect vacuum ever created in the laboratory.

So comets have been robbed of all their terrors, but the old idea that the stars, and particularly the planets of our own solar system, in some way affect our lives and destinies, still persists. Astrology. once the favorite science of the Middle Ages, fell into disrepute about the time the telescope began unraveling the mystery of the universe, but in recent years it has shown a tendency of coming back.

While its advocates are fond of referring to star predictions as an exact science, no one has ever yet produced proof to support any of the claims made for it. Ask an astronomer what he thinks of astrology, and the answer, according to Di. Edwin B. Frost, director of the famous

## O)wT Des 1-contempt. <br> titer granting that the moon, the sun athl, possibly, the planets combine to exert a gravitational pull that produces the tikle, of the sea and, undoubtedly, similar flows in the earth's atmosphere, though the latter are too slight in their effects to be measured, there is no further evidence. according to astronomers, that the stars exert any influence on the earth or on human life. <br> The department of agriculture has quashed all the old superstitions about planting crops in the dark of the moon or performing any other farm tasks at particular times during the moon's phases. De-pite that fact, they keep, bobbing up at regular intervals: Just recently an Englivhman suggeated, that one's hair should be cut ont the etime of a new moon because haitwas growing best and was full of "sap" it tite full moon. He cited, as his evicsice, the alleged fact that mushrooms and plants grow best during the full moon, though science long ago proved there wasn't enough moonlight reaching the earth to have any effect an growing things. <br>  <br> The Discovery of the Telescope, from an Old Print ; the Dutch. It Is Generally Agreed, Built the First Refracting Instruments of This Kind <br> The basic idea of astrology-that the position of the stars and planets at the moment of one's birth will dictate the course of one's entire life-has one fatal weakness, from the astronomer's point of view. For, if the astrologer is right and the stars in certain formations are to affect the life of a person born at that moment, then it must be some other person than the one whose horoscope is being cast, for the stars and planets were not in their apparent relationship at that moment, and never could be. If one's future is to be dictated by the position of some fairly close planet. Mercury for example, in relation to distant stars at the moment of birth, the apparent, visible relationship is

Signs of the Zodiac, the Ancient Superstition Which Forms the Basis for All Astrology Today

Astrologers Who Con the Position of Distant Stars in Casting Horoscopes Overlook the Fact the Stars Aren't Where They Are Seen
all wrong. If your astrologer casts your horoscope on the basis of Mercurys location, for example, in the zodiac house of some far away stars, here is what happens to upset his figures:
It took the light of Mercury, because of its nearness, only a few moments to reach the earth, so its apparent position at the time was virtually correct. But some of the stars may be a million or more light years away; in other words, the light received from them at that particular moment may have left them a million or more sears ago, and, therefore, they, instead of being where they are seen, are a million years or more farther along in their journey through space. When they were where you see them, a million or more years ago, the planet probably wasn't in the same place, and even if it was, no astrologer claims that that could have affected your birth. And as they aren't there now, when the planet is, then the supposed stellar influence, if it comes from their relation to each other, must affect some other person, and not you.

Astronomers do owe one debt to astrology, however, for it is out of the superstition and the groping for information in the past that modern astronomy has come, just as modern chemistry is the child of the alchemists who once sought to transmute base metals into gold. The two parted, though, when the astrologers kept on playing with superstitions, while the astronomers began to deal in facts.
Comets, more than any heavenly spectacle, were associated with superstition through the centuries, because, before the day of the telescope, the rare and splendid sight of a comet inspired awe. Nowadays, when any amateur owning a four. five or six-inch telescope, may be one of the dozen or so persons who yearly find new comets, they have lost their terrors.

The most famous comet of them all was seen by this generation when Halley's great find made its periodical return to the solar system of the earth in 1910, and furnished the rare spectacle of our planet passing through a comet's tail. Although the comet did not get a name until the early seventeen hundreds, old records have traced its periodical appearances back as far as 250 B . C., so it remains the oldest definitely identified visitor.

Around it there have grown up more superstitions, perhaps, than all the rest of the comets of history can boast, except the comet of 1680 , which Halley also observed and wrote about. The 1680 visitor actuired fame when Halley, through a nuistake in his calculations, announced it would return at intervals of about 575 years. An English minister, named Whistwin, thereupon produced a book called " A New Theory of the Earth," in which, with the aid of the comet, he sought to explain the geological records of the book of Genesis. Working backward from 1680 and using Halley's ficure of 575 years, thic writer proved, to his own satisfaction at least, that nearly everything in the Bible, including Noah's flood, could be traced to this comet, and, figuring forward, he sought to demon-

[^4]The World's Most Famous Comet on Three of Its Appearances: Above, Halley's Comet in 684 A . D., from a Drawing in the Nuremberg Chronicle; and, Center, the Sarne Comet in 1066 A. D., from the Bayeux Tapestry
strate that the prophecies of Revelation, including the eventual destruction of the world, would be fulfilled through the same source.

Unfortunately for the sale of his book, it was later found that Halley was in error, and instead of a period of 575 years, the comet of 1680 will not be due to return for 15,684 years, so, like the astrologer's horoscope, it must have been some other comet or some other world that was involved. The Halley comet, which appeared two years later, in 1682, was first discovered at that time by an observer at the Royal observatory, but wher: Halley undertook to calculate its orbit, and made his famous prediction that it would return in about seventy-five and a half years-a prediction that was fulfilled a few years after his death-his name became attached to the visitor.

His prediction was based partly on his calculation of the comet's orbit, and partly on the fact that this path was strikingly similar to that of the comets seen in the years 1456, 1531 and 1607. When 1758 rolled around, all the astronomers in the world were watching for the return of the comet. In the meantime, however, the figures had been revised, when, after

The Last Visible Comet Skjellerup's Find, Which Flashed Up Out of the Southern Sky Last Winter; at Right, Diagram Showing How the Tail of 2 Comet Always Points Away from the Sun
six months of steady figuring, it was found the attraction of Jupiter and Saturn, each time the comet had passed near them during the previous 150 years, was sufficient to retard it

fine description of the Halley comet, with minute observations covering several weeks. The Chinese were among the earliest observers of the heavens, and the Chinese annals, from the year 611 B . C. down to 1640 A. D., are filled with comet observations. In the western world one of the oldest comet reports on record is that written by Aristotle to describe one he saw in 371 B. C., when he was but thirteen years old. Pliny tells, however, of a heavenly visitor which was associated by superstition with the battle of Salamis when it appeared in 480 B . C., but whether this was a comet or not, is in doubt.

The word comet itself originated in the Greek language from a word meaning hair, as the Greeks believed comets to be bodies with hairlike streamers. Later the name of the appendage was changed to tail, but this is really a misnomer, for the tail follows the comet about twenty months, and fixed April 13, 1759, as the date of its perihelion passage, when it would reach the nearest point to the sun and again start the long journey out into space beyond telescopic range.

On Christmas night, 1758, a Bavarian farmer and amateur astronomer, saw the comet, and on March 12, 1759, just a month and a day inside the calculations, it passed perihelion, and Halley's theory had proved itself.
In the long history of the Halley comet, it has been associated in superstition with the death of the Emperor Augustus, as a result of its appearance in $12 \mathrm{~B} . \mathrm{C}$, with the destruction of Jerusalem by the Emperor Titus, because it appeared in 66 A . D., shortly before the Jewish-Roman war; with the Norman conquest of England, when it appeared in 1066, and with many other famous events. In the year 837 , the Chinese astronomer Ma-tuan-liu wrote a

Brooks' Comet as It Appeared at Yerkes Observatory, on Oct. 23. 1911, When the Tail Had Taken the Form of a Number of Beautifully Delicate Streamers

The Ancient Egyptian Conception of the Universe Was a Vast Canopy. Resting on Lofty Mountain Heights and Supporting the Stars, Hung from the Heavens like Chandeliers
at times, and at others precedes it. The reason is that the tail is always on the side of the comet opposite to the sun.

The comet of 1680 , which Halley erroneously estimated as a 575 -year visitor, would, on that basis, have been the one which appeared just after Julius Cæsar's uurder, but, as it was later found the one seen by Halley had never before been seen within recorded history, the visitor that cast such awe over the Romans must have been another comet.

A fine comet, visible to the naked eye, appeared in 1769, shortly before the birth uf Napoleon, and proved to have an orbit that would bring it back again in 2,000 years. Napoleon's life was associated by the superstitious with several comets. There was one that reached its perihelion the night the burning of Moscow forced the French army into the retreat that eventually led the Little Corporal to exile on Elba, and another appeared in the sky while he was leading his troops on the march to Paris to found the short-lived second empire.

A comet in 1264 was associated with
the battle of Lewes and another, in 1556, appeared about the time of the abdication of the Emperor Charles V and is associated also with the death of Pope Urban IV. It is possible that the two were the same one, on successive visits, but it failed to appear in 1858, when it would have been due again. Chinese records are basis for the belief, however, that the visitor; of 1264 and 1556 were one comet, for the period then would check with a comet listed in the Chinese annals in 975,683 and the year 104 .

Comets that fail to return when expected, and, in fact, that never appear again, are not unknown. One found by Montaigne, at Limoges, in 1772, was observed later by Pons, in 1805 ; Biela, in Bohemia, in 1826, and by others in 1832. Its orbit was calculated at six and a half years. In 1839, it was not seen, but in 1845 it appeared, split in two parts. Both parts returned in 1852, and since then have not been seen again. Every November, however, the earth passes through the spot where the comet may have disappeared. and there is a fine shower of meteorites-
the familiar falling stars-probably the remains of the lost comet.

The earth passes through another meteor shower in the second week of August each year, and there is evidence that it is composed of the dust left by a comet found by Swift in 1862, for both occupy the same orbit.

What comets are remains to be discovered. Some observers have believed they shone with light within themselves, and others that they only reflect light. Stars seen through them shine with undiminished brilliancy, even when behind the comet's head, so the material of which they are composed must be almost transparent. Some have tails, some haven't. and others may have a multitude of them. Comet finding is left almost exclusively to the amateur astronomers, as the bigger observatories are too busy with their regular work. The only requirements to hunt them are a moderate-priced telescope of about four, five or six inches" aperture.
a good clear view to the east and west, so that watch can be kept for them just after sunset and just before sunrise, and, in the words of one astronomer, "plenty of time to waste." They are found best when near the sun, so sunrise and sunset are the favorite hunting times.

The late E. E. Barnard, of Yerkes observatory, found nineteen new ones during his lifetime. He won a $\$ 200$ prize offered by a wealthy amateur astronomer for his first one, and, on the strength of that, invested the money as first payment on a bome, then proceeded to find enough more to win prizes and complete the payments. The "comet house," as it was named by his friends, still stands at his old home, Nashville, Tenn.

Most of the comets found each year, and the number is frequently a dozen or more, are so faint as to be visible only in a telescope. Within any one century, it is estimated, there is an average of about five bright ones visible to the naked eye.

One of the Many Island Universes in Space, a Spiral Nebula Made Up of Millions of Suns So Far Away That
Even the Most Powerful Telescopes Cannot Distinguish Individuals

POWER, LIGHT AND HEAT SENT OUT BY RADIO TUBE

time, but, when exposed too long, died. A sausage, placed in a glass tube, was hung from the end of a receiving wire, parallel to the radiating aerial. In a few minutes, it began to steam, and examination showed that it had been thoroughly cooked by the high-frequency current. An apple was baked to the

Left, Transmitting Tube: Righe, Lighting 250-Watt Lamp; Bottom, Standing Arc. Two Feet High core, eggs were fried and cookies were baked. One of the most striking effects was the production of beautiful greenishwhite arcs, a foot or more high, when the radiating aerial was touched with a metaltipped pole. When the pole was removed, the are remained. like a plume of fire, sputtering and sending out molten copper in all directions until blown out. Engineers declare that the tube involves nothing really new in principle, but its operation marks the first time that such high power and short wavelengths have been combined. "No one can safely predict or promise a utility for such new things," said Dr. W. R. Whitney, director of the research lahoratory, "but it is clear that further experiments must be carried out."

CIGAR-LIGHTER FILLING STAND RUN BY COIN IN SLOT

Drop a coin in a slot and a quantity of liquid. sufficient to fill a cigar lighter, pours out of a spout. This lighter-service station was recently introduced in Paris tobacco shops and became very popular.

## MYSTERY EXPLOSIONS IN EARTH LAID TO NATURAL GAS

Pockets of natural gas, forming under the earth in a district of northern Australia, are thought to have caused upheavals that occurred there recently. Geologists who examined the area noticed that the atmosphere, for miles around. was heavily loaded with the odor of petroleum and benzine. In some localities, the smell was so strong that it was feared an umprotected flame might cause an explosion. Apparently, pressure in the pockets had increased gradually until the overlying strata could no longer hold the gas, and it blew out.

Jointed Toy Animals and Two of the Odd Combinations That May Be Formed from Them

Horns on animals are developed from the skin and, possibly, the connective tissues, instead of from the skull, according to Prof. W. F. Dove of the University of Wisconsin, who has performed a number of interesting experiments with calves and goats. On these young animals, he was able to produce the solid horn of the deer, the sheathless horn of the giraffe, the casting and sheath renewal of the prong-horned antelope and the rhinoceros type of horn. which is composed almost entirely of a stiff substance without a bony core. The tests showed that the horn, when it begins to grow, can be taken from its normal position and transplanted to a foreign region or to another animal, where it will develop. The experiments have not indicated any method of controlling horn growth except by selective breeding. Even then, and under the most careful selection. calves occasionally will be born with horns though generations of their forebears were hornless. Dairy cattle without horns are preferred because they give considerably more milk than do the horned breeds. The horns use up lime and other materials that otherwise would go largely into the production of milk.

## DOUBLE ANIMAL TOY CIRCUS HELPS EDUCATE CHILDREN

Toy animals with interchangeable bodies have been devised by a western artist to add to children's amusement and also to aid them in becoming familiar with different spocimens. Various novel combinations can be made, as the wooden bodies are quickly separated and locked again. The idea of the odd "zoo" was inspired by idle sketches the fartist had drawn.

## Home, Sweet Home of the Future

Television, Artificial Sunlight, Pneumatic Furniture, Metal Fittings and Unique Materials Combined in Architect's Vision

THE home of the future, as an architect envisages it seventy years from nowahout the year 2000-was exhibited, full size, in London recently as a sunbeam house in a land of perpetual sunshine. "Vitaglass," to admit the sun's ultraviolet rays in fair weather, and artificial sunlight for cloudy days and night use, provided a permanent summer-day effect.
Convertible metal and pneumatic furniture, "bunk" rooms instead of bedrooms, laid out somewhat like steamer cabins, movable walls, metal furniture, a profusion of unusual electrical apparatus, a garage for a combination airplane-automohile, with folding wings, and, on the ga-
rage roof, a second-story swimming pool, gardens fitted with plants in movable containers so that new floral effects could be worked out at will, rubber-tile garden paths, wireless power and program reception masts, and banks of ultraviolet floodlights, were among the features.

The house, designed by R. A. Duncan, was severely plain, but its simplicity was relieved by futuristic plants and trees, formed of angular boards, painted in something resembling war-time camouflage designs, and a system of movable wooden wind screens along the garden wall to shut off or admit the breezes to T any degree desired.

(C) The Illustrated London News

C S. W. Clatworthy

Electricity was predominant everywhere. A sunken garden pool and the fountain feeding it were illuminated by night from under-water lights in many colors. The queer metal beds with pneumatic mattresses were equipped with electric blankets for warmth. The study wall was lined on one side with built-in radio and loud speakers, a built-in television set to see the day's events and a built-in telenewspaper for visible radio projection of the day's news. An electric writer, to transmit by radio similar written messages, and an elaborate lighting-control panel also were included.

Pneumatic armchairs, with enormous inflated cushions built up in sections, were placed in the bed and living rooms. The chairs can be deflated and folded up into a small space when not needed.

Besides the main bedroom, with twin
beds and metal furniture, there was a whole series of individual bunk rooms The walls between them could be rolled up, like awnings, to throw two rooms together as one. Pivoting windows, sun blinds, a roof garden inclosed in vitaglass and walls, specially insulated and provided with an inner surface that can be either heated or cooled, were other features. The wall was an unusual three-ply construc tion, an outer wall, an insulated space. which also contained all pipes and electric wires, and the inner wall, which took the place of radiators for winter heating, and provided a cooling system for summer.

Much of the furniture was unusual The dining-room table was built in three sections, the two side parts being interconnected through a system of levers so that the table could be folded up as a three-story tea cart and wheeled in from

(c) The Illustrated London News
the kitchen. The table is completely set, esen to the centerpiece of flowers, in the kitchen, and then folded and wheeled into the dining room, passing through a stand-ard-width door. Arrived in the dining room, it is unfolded and is ready for use. Entire sides of rooms fronting on the sarden and court yards folded back to admit air and sunlight in good weather. On the north and east sides of the house, which would be exposed to winter winds, automobile-type rising windows, moved hy the usual automobile window handle, were fitted in wind-proof frames.
The airplane-automobile in the attached karage, while not a practical flying machine, was carefully built by an airplane designer as an example of the possible car of the future. The propeller, mounted in the nose of a streamlined, glass-inclosed car body, was mounted on a movable shaft which could be elevated ninety degrees, to place the propeller in a horizontal position above the car-for straight ascent as a helicopter.
The walls of the house were made of a hornlike substance, which is still in the experimental stage in a London laboratory. It is tough, impervious to moisture and capable of being cut and welded at high temperatures. The foundations and framework of the house were of stainless tteel. The wall material can be colored or produced in any desired patterns. There was only one staircase-on the outsiderising between the main house wall and the attached garage and giving access to the flat roof. An automatic elevator was used inside, the elimination of the usual stairs in favor of an elevator shaft saving considerable space.

## LINK IN CHAIN SERVES AS LOCK AND RESISTS TAMPERING

To afford greater protection, a chain lock now on the market is link-shaped and has no shackle to offer leverage for prying apart or breaking, as has the ordinary padlock. It is made of extremely hard steel,
 the key is self-ejecting so that it cannot stick in the lock, and the unit is rust-proof.

Inventor with the Trombone Flute Which Has Sliding Plunger as Substitute for Keys

## FLUTE PLAYED LIKE TROMBONE GIVES WIDER RANGE

Sweeter music and greater simplicity in playing are the chief features claimed for a trombone an eastern inventor has devised. It saves learning the use of a number of keys and is said to have greater volume and a wider range.

## EARTH STILL BEING CREATED MYSTERY RAYS SHOW

The process of creation is still going on, and the earth, instead of disintegrating, is passing through a cycle of evolution, in the opinion of Dr. Robert A. Millikan, noted scientist, who has explored the mysteries of the so-called cosmic rays. His research indicates that atoms which form oxygen, silicon, magnesium and iron, the elements that compose about ninety-five per cent of the meteorites and a similar proportion of the earth, are constantly being created in the heavens. The cosmic rays are believed to be a form of energy which escapes during the formation of these atoms. The rays, he declares, are "announcements sent through the ether of the birth of new elements."

## PLAYING-CARD TILES PERMIT OUTDOOR GAMES

Close View of the Tile Cards and Holder, and Drawing to Show Them in Use

Durable tiles that cannot blow away or easily be defaced have been introduced as playing cards, permitting games out of doors in comfort. For bridge and other games, holders are provided, so that the tiles can be arranged in proper order and kept in position where other players cannot see them.

## TOO MUCH KINDNESS KILLS FISH AQUARIUM EXPERT SAYS

Overfeeding, changing the water too often and overcrowding the bowls, are among the common mistakes in caring for goldfish, an eastern aquarium authority declares. He says that many pet fish are killed by the kindness of their owners and urges that keepers remember that the pets have nervous systems, digestive apparatus and breathing organs which demand proper treatment in order to function effectively. If the water is changed suddenly or too cold fresh water placed in the bowl, the shock is likely to prove fatal. The water should never be heated artificially, as this drives out the oxygen, and only part of the water should be taken out of the bowl at a time. The time to change it is when the fish come to the top for air.

A round bowl should be kept only half filled, as this increases the air space above the water. In order that the fish mav thrive properly, they must have a balanced aquarium ; that is, there must be sufficient water, air and oxygen for each.

## STAGE AND AUDIENCE REVOLVE IN NOVEL GERMAN THEATER

For more rapid changes of scene, a German theater is being designed so that both the stage and the parquet floor can be turned. The latter swings around a full half circle so that the spectators can be placed quickly in front of an entirely different scene. The theater building is round and will contain many other novel improvements.

## FRONT AND REAR EXIT AUTOBUS TO SPEED SERVICE

Both the upper and lower dẹcks of a motorbus, devised by an Englishman, are served by an entrance at one end and an exit at the other, so there is less confusion in loading and getting off and considerable time is saved. The vehicle can be operated entirely by one man if necessary, as the exits from the top and from the interior of the bus are controlled by the driver,

Inventor with Model of the Double-Entrance and Exit Autobus for Rapid Loading and Unloading
who thus can prevent anyone from leaving until he has paid his fare.

## CREWLESS TRAINS SPEED MAIL IN LONDON TUNNEL

Thans of thirty-three cars, controlled hy electricity from distant stations instead of ty crews, speed the mails underground irutio collection boxes to delivery points

Views of London's Crewless Railroad Trains for the Rapid Handling of Mails; a Control Station with Its Signal Board and Switch Levers; Close View of the Cars and Endless-Belt Conveyors That Speed Loading and Unloading; the System Utilizes a Tunnel, Constructed during the War to Protect Museum Treasures
storage of treasures from the British Museum against air raids, as the excavation has been converted into part of the city's subway railroad. Approximately 23,000 hags of mail are carried daily, saving half an hour in the transit between the railroad stations and the post office. The line is eighty feet below the surface of the streets and is six and one-half miles long. The trains are controlled from dispatching "cabins" in the various subter-
ranean stations. Automatic safety cutouts prevent collisions, and indicators inform the operators where the trains are, when they leave the offices, and what track they will occupy on arrival. Speeds up to thirty-five miles an hour are developed. Nearly fourteen years were required to complete the underground system.

CMore than $2,000,000$ separately distinguishable colors are possible for man's use.

## FORTY BUNDLES TIED IN MINUTE WITH MACHINE

To Save the Busy Merchant Time and Trouble; the Package Tyer in Operation
Especially adapted to the needs of the grocer and butcher, a package-tying outfit is said to wrap as many as forty a minute. It is operated by hand and forms a compact, well-tied parcel.

## STUDY WHALES TO HELP DIVERS AVOID CAISSON DISEASE

How do whales remain submerged so long without injury? How do they adjust themselves to the tremendous pressures at great depths and how do they withstand the rapid change in pressure as they submerge or rise to the surface? Answers to these and other questions about whales and porpoises, are being sought by scientists in the belief that data gathered may be of aid in helping divers to avoid the disastrous effects of caisson disease, the malady that afflicts workers under high pressure while working in caissons, and other ailments. Like man, the whales are mammals and once lived on land.

They have organs and tissues corresponding to those of the human system; hence. it is thought that knowledge as to the manner in which they have become adapted to a life in the deep sea, may be applied to the benefit of divers. The investigators are trying to learn how the whale disposes of the carbon dioxide given off by the body through the lungs during periods of long submergence, how the mechanism of breathing is operated, how blood pressure and pressure of the spinal fluid and muscular adjustments are made to meet the conditions below the surface of the sea. In connection with the experiments on porpoises, a number of brain specimens were taken which will later be studied in the laboratory.

## GENERATOR MAKES HOT SPRAY TO SPEED CLEANING

For cutting the grease from motors, washing machinery of various kinds. removing paint, and a wide variety of similar tasks, a simple outfit that quickly generates a hot, high-pressure spray has been introduced. It operates somewhat on the principle of a flash boiler for the quick generation of steam and applies a hot cleaning solution under 100 pounds' pressure. The apparatus functions with almost any kind of cleaning fluid, may be operated by an unskilled attendant without danger and is easily mounted on a small truck for portability.

Cleaning Auto Parts with Hot Spray from Generating Unit Attached in Rear of Service Car; High Pressure Is Quickly Developed

POSTED along the American border, more than 700 alert patrol inspectors work day and night to stem the tide of lawless smugglers who devote themselves to running rum, narcotics and aliens into American terrifory. Twenty-four hours a day, every day in the year, these armed guardians of the frontier wage tireless wariare against unlawful invasion, matching wits with the shrewd, dangerous and unscrupulous outlaws who seek easy money by breaking international barriers.

Primarily organized to enforce the immigration laws, the border patrol encounters smugglers of all sorts and conditions, with contraband ranging from liquors to human beings and from diamonds to narcotics-everything that seems worth smuggling. The work of the patrol covers the Mexican and Canadian boundaries and strategic peints on both seahoards, with heavy concentration in Florida because of the inviting nearness of West Indian ports.

The smugglers are many and persistent. The bootlegging of aliens has become a big business, second only to the bootleg-
ging of alcoholic merchandise. In practical operation, the two activities travel together. Expediency and profit are the sole considerations. If money is lacking for the purchase of liquor consignments, the smugglers" alternative is a load of aliens-for human contraband requires no cash outlay: it pays in advance and finances the smugglers* activities on a generous scale, with further payment upon safe arrival at an American destination.

Smugglers are of two types. the wellorganized syndicates and the freebooters of less orderly method. The syndicates are businesslike and competent, with fixed rates, while the freebooters gauge their charges by the customers ability to pay. The unorganized smugglers are given to abandoning their cargoes at isolated spots. upon pretext of going for gasoline or food supplies, and they are not always careful to reach American territory before this takes place. Not infrequently the smuggler of this type drops all pretense of service and holds up his clients at the point of a gun, strips them of their funds and leaves them helplessly marooned.

Mexico is honeycombed with the activities of highly organized smuggling syndicates. European representatives route their alien clients to its seaports, where they are met by agents for transportation to Mexico City. At this point other agents forward them to Chihuahua for delivery to those who take them to Juarez, opposite the city of El Paso, or to some other point along the boundary line. At an appointed time, members of the organization lead a party of aliens to a crossing point where others take them in hand and pilot them to the American side. On arrival, still others are on hand to conduct the newcomers to rooming houses or to waiting automobiles, which take the immigrants to inland points beyond the reach of the border patrol and place them aboard trains for their ultimate destinations. In some cases, representatives of the syndicate accompany the strangers as far as St. Louis, Chicago or even New lork City.

Similar systematic activities are carried on in Canada and the West Indies. Can-
ada alone affords field for a hundred or more syndicates, large and small, operating fleets of power boats and automobiles.

The profits of smuggling aliens are enormous. Government observers state that half a dozen debarred foreigners delivered in Boston through the Montreal gateway may yield as much as $\$ 5,000$ in profit. The syndicates make charges ranging as high as $\$ 1,000$ for safe transport, although the usual rates appear to be between $\$ 100$ and $\$ 200$ for each delivery. One syndicate is said to use twenty high-powered sedans and touring cars i arrying foreigners into New England a $r$ their arrival at the ports of Halifax, St. John and Quebec.

In handling this problem, the border patrol has driven smugglers to constant changes of method. A few years ago, the invaders traveled in comfort on the plush cushions of railway coaches. Alert guardians forced them out of these quarters into box cars and secret compartments in Pullmans-the cramped spaces of

Some of the Trick Containers for Liquors, Top; Beach
Patrol in the Far Northwest, and a Scene on the Old Smugglers' Trail from Mexico

Caught in Texas, an Automobile with a Double Top Was Found to Contain Dozens of Bottes of Whisky Packed Away in a Space Only a Few Inches in Depth
finen closets, the hidden nooks in the ceiling of vestibule platforms, and the storage chests beneath dining cars. Discovery of the varied hiding places afforded by trains forced the smugglers to use covered wagons and automobiles, or to march their patrons across country along hidden bypaths, traveling at night and sleeping behind rocks and trees during the hours of daylight. Every form of conveyance has been employed, and now the patrol faces the problem of smuggling by air. Transport by airplane is regarded as an inevitable development because of its possibilities for secret landings.
The work of the border patrol is colorful and dramatic, with ex-service men as the predominant element in its performance. The selection of material seasoned in the army, navy and marine corps is based on the logic of physical fitness. Typical of the experience of the men on patrol duty was that which befell a group of officers awaiting a band of invaders on the Rio Grande, at a point where the stream is comparatively narrow. The unseen watchers could hear the Mexicans arguing as to the safety of attempting an invasion. Finally one of the men patted his chest with both hands, in a gesture
of bravado, and started across in a rude boat known as a "pato." On his approach to the American shore, the officers demanded his surrender, but he opened fire on them. In the ensuing exchange he was shot to death.

The fate of their comrade caused the other lawbreakers to direct an intense fire at the officers across the stream. The Americans were in a badly exposed position on a long narrow peninsula in the bend of the river. The peninsula extended close to the Mexican shore. On this 200 foot strip of land the officers were under crossfire from the front and both sides for a distance of a mile as they sought to return to the mainland at their rear. Escaping fire and going for reinforcements, the inspectors returned to find that the daring Mexicans had retrieved the body of their dead leader and had escaped to their own country.

Patrol inspectors have made successful seizures of pack trains after riding as much as eighty-five miles in a single day, following the tracks of the smugglers. A favorite trick of the outlaws is to reverse the shoes on their horses to make their progress appear to lead in the opposite direction. Another ruse of the smugglers is

Every Freight Train Entering from Mexico and Canada Is Searched by Immigration Officers for Barred Aliens
to cause their horses to leave tracks which seem to be several days old, a feat achieved by using pieces of automobile tires instead of shoes on the hoofs of the animals.

In patrolling the border, the officers lie in wait to "cut" the known trails of smugglers. For open country the patrol uses automobiles. In wild regions, where motor vehicles cannot be taken, the members employ horses. In dense underbrush where horses are barred, they go afoot.

Along the New England coast, the boat traffic lands aliens and contraband in isolated coves as far south as Long Island. In one recent case twenty-five Chinamen were captured by inspectors who intercepted the smuggling boat on its journey from Newfoundland. The aliens were deported, but three weeks later they returned over their original route and reached Boston in box cars as a consignment of "pickled fish."

The wiles employed by smugglers are numerous. One truck entered the United States by way of the international bridge

The "governor" manifested mild sur prise, and was allowed to proceed. Suhsequent investigation showed that the impersonator had been hired because of his resemblance to the chief executive and that the car bore a generous shipment of contraband whisky.

Motor cars that attempt to rush the gates at patrol stations are frequent visitors at the frontier. At some points the inspectors meet this effort by keeping spiked planks in position to cause an enforced halt for each car that tries to break through the barrier. The spikes make short work of tires and simplify capture. A car caught in this fashion is likely to have a secret compartment in the roof or under the floor for carrying contraband.

On the Canadian border the use of sleighs constitutes an accepted part of the smuggling program for aliens. Near Westville, N. Y., two sleighs came along one day, loaded with passengers. The first vehicle failed to halt when the order was given by an inspector, and made a
ruth lown the highway. Capturing the secund sleigh, the officers pursued the othe: ind arrested a notorious alien smugglet ho was in command of the expedifion This lawbreaker was given a threeyear -entence and fined $\$ 14,000$, while the Canalian farmer who owned the sleighs was fined $\$ 500$ when he made the mistake of claiming his vehicles three or four monthis later.

## LOCK BIGGER THAN PANAMA'S FOR DUTCH CANAL

A huge lock, that will dwarf even those in the Panama canal, is being constructed in Holland at the North Sea terminal of the -hip channel that connects Amsterdam with the outside world. It will be 1,312 feet long, $16+$ feet wide and between fortynine and fifty feet deep. There will be three huge gates, each weighing 2,604,500 pounds. The third is kept in reserve for emergency purposes. The lock will be ready for use next year and is expected to be adequate for generations to come in spite of the steadily increasing size of both naval and commercial ships.

## DOG MODELS CENTURIES OLD FOUND IN PALESTINE

Lead models of dogs have been found by an expedition of the University of Pennsylvania in Palestine. The figures are believed to be at least 3.300 years old and show that dogs then closely resembied some of the modern species.

[^5]
## WEARING SUIT OF FIREWORKS PRODUCES NOVEL DISPLAY

Donning His Suit of Fireworks; an Asbestos Garment Underneath Protects the Wearer

Earning his living as a fireworks model is the somewhat hazardous calling of a young man in London. Although he is entirely covered with an asbestos suit, the task of walking around with several pounds of exploding pieces attached to his person is not without its risk of burns.

## TELEVISION AIDED BY QUARTZ AND BETTER SCREEN

By the use of vibrating quartz crystals, the image from a television machine was made to stay more steadily on the screen instead of fluttering and drifting as commonly happens. The crystals served to control the electric oscillation and to synchronize the sending and receiving units more accurately. Another development consists of an improved screen, formed from a large gridlike electric-discharge tube, bent backward and forward, through which the luminescence travels so rapidly that, to the eye, the screen appears to be brilliantly and steadily illuminated. Engineers declare that many improvements must still be made before television becomes practical.

Rudder Skeleton of One of the Huge Air Liners for Service between England and Australia

## ENGLAND-AUSTRALIA AIR LINE

 TO HAVE HUGE SHIPSTwo large air liners are being constructed for the proposed flying route between England and Australia. The ships will be fitted with every modern convenience and aid to aerial navigation. Their tremendous size is evident from the accompanying photograph of part of the framework, showing the rudder skeleton.

TREE TRUNKS SWELL AT NIGHT AND SHRINK BY DAY
With the aid of an accurate measuring instrument. Dr. D. T. MacDougall, of the Carnegie Institution, has determined that the trunks of pine trees shrink in the daytime and expand at night. A reason for this is that during the day, when the sun is shining on the leaves or needles, evaporation of moisture is stimulated and the needles are stretched while the tree is drawn inward a trifle as it attempts to relieve the tension by carrying sap up from the soil. At night, the reverse of this process occurs. With the decrease of evaporation and less tension on the water
system, the trunk begins to expand. The intake of water through the roots has a chance to catch up with the outgo from the leaves. The natural elasticity of the wood comes into play and the tree goes back to its natural size. The sensitive measuring apparatus makes a record of the shrinking and expansion over a twen-ty-four-hour period.

## MAN-MADE EARTHQUAKES HELP RAILWAY SURVEY

Causing earthquakes to help the building of a railroad is one ot the tasks of engineers engaged in surveying the right of way for the proposed Turkestan-Siberian railway. Explosives are set off under the ground, and the resulting vibrations accurately traced so that the character of the underlying strata may be determined. The study is being facilitated by a special seismograph which traces the vibrations set up by the man-made quakes on photographic paper.

## COIN-IN-SLOT SHOE POLISHER GIVES BRIGHT SHINE

Both shoes are shined at once in a coin-in-the-slot polisher that requires no human attendant. It wipes off the dust, applies the polish and rubs the shoes briskly for a fimishing luster, all for a nickel, and the operation takes less than two minutes. It is designed to fit shoes of any size.

## CLEANING BIG PLANE CARRIER GIANT TASK OF THE SEA

Although the huge airplane carriers of the United States navy are expected to contribute greatly to the effectiveness of the fleets, they require much the same grooming and attention as a battleship, and barnacles are just as likely to impede their progress as that of the other fighting craft. The huge proportions of the "Lexington" were emphasized recently when the vessel was brought into drydock for cleaning and painting the hull and adjusting the propeller. The "Lexington" and the "Saratoga" were originally designed as battle cruisers of more than 43,000 tons.

## ICE AT SOUTH POLE SUFFICIENT TO COVER WHOLE WORLD

There is enough ice piled around the antarctic regions to cover the entire surface of the world to a depth of more than 100 feet, in the opinion of Prof. W. Meinardus, of the University of Goettingen. He believes that ice has been accumulating there for a quarter of a million years or so. If all the ice were melted, it would raise the ocean level approximately 100
feet. The weight of the huge ice pack is estimated at twenty quadrillion tons. Although there are elevations of 6,000 to 10,000 feet, Prof. Meinardus believes that most of the peaks consist of accumulated ice, and that the rock on which it rests is seldom over 2,000 feet above sea level.

## CITY INSTALLS VANITY MIRRORS FOR PEDESTRIANS

Mirrors installed at convenient places on the streets of Portland. Oreg., with signs directing attention to various articles of apparel, help pedestrians keep themselves neat and tidy. They have proved popular with men as well as with women.

To Help Pedestrians Keep Neat: Wayside Mirror with Its Sign on Portland, Oreg., Street

Frank Lockhart's Racer before His Plunge into the Ocean While Traveling Faster Than 200 Miles an Hour; Building Tires to Stand Such Speed Is a Fine Art

ARE automobile tires wearing out faster, and, if so, why, and what can be done about it?

They are. says Akron, rubber capital of America, and the bureau of standards at Washington agrees.

As regard the why, you can check off greater speed, lower-hung cars with smaller wheels, four-wheel brakes, and last, but not least, free air.

And. as for what can be done about it, test fleets are driving day and night, 600 miles per car every twenty-four hours : laboratories in Akron and Washington are working overtime, and inventors are racking their brains to improve the breed of tires and build longer life into them.

But the car owner himself can solve his personal tire problem by heeding the lessons the laboratories and the test drivers have already learned.
Here they are:
Lesson 1: If you want to increase your average driving speed from thirty to fortyfive miles an hour-a fifty-per-cent in-crease-you must expect your tires to last only half as long, for they will wear out twice as fast.
Lesson 2: If you want small wheels and a modish, low-hung car, the tire bill will carry 'with it a twenty-two-per-cent decrease in mileage.

Lesson 3: If you overinflate your tires because the air is free and the pressure
high, you will get forty-five per cent less wear out of them.

An automobile tire is simply a heavy rubber band, called the tread, built onto a rubber and fabric tube, designed to withstand the air pressure within it. The manufacturer tries to build enough tread to last as long as the sidewalls will stand up. If something happens to increase the rate of wear on the tread, all his calculations have gone wrong.

And within the last three or four years much has happened to make treads wear out faster. Traffic has been speeded up everywhere, on improved country roads and on city streets. Tests on the road and in the laboratory show that, for every fifteen miles of added speed above thirty or thirty-five miles an hour, the rate of wear is doubled. In other words, at fortyfive miles an hour the life of a tire is halved; at sixty miles, it is halved again, or a car driven consistently at a mile a minute would wear out four sets of tires for every set required at a speed of thirty miles an hour.

Greater speed means more braking and a heavier foot on the pedal, for with every increase in speed the number of emergency stops required goes up. This is particularly true since the widespread adoption of stop-and-go lights in cities. Engineers of the Miller Rubber company found that on tests made, speeding a car

## em Up <br> from a dead stop to thirty-five

 miles an hour then slowing down to a dead stop as quickly as possible without locking the wheels, the tread wear per 100 miles increased 2,500 per cent.Engineers of the Goodyear Tire company tested a truck by running it at thirty-five miles an hour, coming to a dead stop

every quarter of a mile, braking down as fast as possible without skidding, and discovered they wore off one-half the tread design in a little more than 100 miles. With four-wheel brakes on passenger cars, they found the car could be stopped quickly without locking the wheels, thereby spreading the wear over the entire circumference instead of acquiring flat places from abrasion, but tire wear was just as fast.

And as for free air-in the old days, when tires were pumped up with back-breaking toil by hand, an overinflated tire probably was a rarity and underinflation more or less common. Underinflation cut the life of tires by twenty-five per cent. Then came free air from power pumps and overinflation followed, with a loss of fortyfive per cent in average mileage.

The smaller wheels have brought their own troubles. Taking three inches off the diameter of the wheel decreases the circumference of the tire only nine

6 lbs UNDERINFLATED $25 \%$ LESS MILEAGE

OVERINFLATED $45 \%$ LESS MILEAGE

Courtesy Goodyear Tire Co.
Over or Underinflation, and the New Type Smaller Wheels Are Both Responsible for More Wear on Your Tires
and a half inches, but increases its wear by twenty-two per cent, the Goodyear engineers have found.

The Miller laboratory explains their tests indicate "that the increase in rate of tread wear due to decrease in tire diameter is not in direct proportion but greater than the increase in revolutions per mile." The reason is that the portion of the tire in contact with the road does not vary in proportion to the change in diameter. The deflected radius of a 31 by $51 / 4$ tire is 15.17 inches, and that of a 28 by $51 / 4$ tire is 13.88 inches. The larger tire makes 664.5 revolutions per mile and the smaller one 726a difference of nine and a quarter per cent, which indicates an increase in tread wear on the smaller wheel of between fifteen and twenty per cent, although the smaller size will have but ten per cent more road contact in a mile. One reason for the greater wear of the smaller tire is the heat generated by slippage.

With thousands of miles of improved roads being added to the nation's total of paved highways each year, car owners
have naturally looked for greater life from their tires. But, the tire makers point out, there still remain many miles of medium, poor and bad roads, and the total range of all driving surfaces shows 500 -per-cent difference in the degree of abrasiveness which causes the tire wear. Any paved highway is better than the old graded roads. A road of crushed rock, with its many sharp edges, is harder on tires than smooth, washed gravel from a creek bed. And snow is responsible for practically no wear.

A dozen years or so ago, when it was customary to lay up most cars for the winter, cold weather was popularly supposed to be bad on tires. As a matter of fact, the effect of lower temperature is just the reverse, and tires will wear longer in cold weather than they will in hot. A tire could be frozen in a solid cake of ice and left for a long time without damage, for the tensile strength of vulcan-

Courtesy Miller Rubber Co,
Chart Showing the Effect of Increased Speed and Higher Temperature on Tire Wear
zed rubber is greater at zero than it is it seventy-five or eighty-five degrees. Nor is salt, which is used in many hilly cities 10 melt snow in the streets, hard on tires, for chemists have found that it does not damage the rubber.

The effect of temperature changes ontire wear is startling. The rate of wear with a road temperature of 100 desrees is about five times as high as at forty degrees. A chart recording the results of tests at various temperatures and speeds shows that in hot weather the increase in tread wear becomes alarming at speeds above forty-five miles an hour. A car operated at ten miles an hour in a temperature of 100 degrees showed only onetenth the tire wear of a car traveling sixty miles an hour. The last five miles

Capt. Malcolm Campbell's "Bluebird," Present World-Record Holder; Above Is a Rear View Showing the Rudderlike Fin, to Prevent Skids, and the Pair of Radiators
of speed, between fifty-five and sixty miles an hour, cost a twenty-five-per-cent increase in tread wear.
There are several other causes of excessive wear, such as badly balanced brakes, misalinement of wheels, and the increased tire slippage at higher speeds. As the speed goes up, there is considerably more swerving and more axle bounce, due to rough spots in the road, and both of these mean greater tread wear.

Tires run on the test fleet of the Miller

Rubber company show that wear is greater in dry weather than in wet, while on snow wear is practically nonexistent. Highly crowned roads increase wear because they have a tendency continually to roll the tire to one side, and if such a road is rough, the wear is even greater. In a hilly or mountainous country, where there is considerable second-speed pulling and much braking going downhill, tires will wear out faster than on level roads.

The importance of proper inflation is

High-Speed Movies; Top, a Cushion Tire, Clear off the Ground; Center, a Solid Tire, and, Below, a Balloon Absorbing the Shock
stressed by all the manufacturers. Revolving at high speed, the tire is constantly being compressed and expanded as each part passes under the load. This highspeed flexing produces heat within the tire, just as a piece of metal, bent rapidly back and forth to break it, grows hot under the treatment. At the proper inflation point, however, the flexing is less than in either an overinflated or underinflated tire, and hence there is less internal heat.

Manufacturers are experimenting with a wide variety of tread designs to permit the tread to "give" under road shocks, without straining the tire or causing tread wear through its sidewise roll. At the bureau of standards laboratory, a tire is run back and forth under pressure
against a sheet of thick plate glass and the distortion of the tread photographed. At the Firestone plant, in Akron, a superspeed camera, invented by C. Francis Jenkins to photograph the flight of bullets and reduce them to slow-motion movies, is used for the same purpose. Instead of taking the usual sixteen pictures a second, stopping the film an instant for each exposure, the Jenkins camera takes 3,200 pictures each second, and uses forty-eight lenses, revolving before a constantly moving film, to make the exposure possible.

Films taken with it show a tire actually disintegrating under road wear, and when the movie is run off at the usual rate of speed, the tread wear can be studied and analyzed. Comparative pictures of hard rubber, high-pressure and balloon tires show on the film how the softer tires, when run over a rock or bump, give until they fit themselves around the object and absorb the shock. The movie films have proved useful in designing tires for highspeed racing cars.

British tire builders discovered more than a year ago, when building the tires for Maj. Seagrove"s "Sunbeam," which set up a record of more than 203 miles an hour-recently broken by Maj. Campbell, another Englishman-that they had entirely new factors to deal with. Because the tires were to be used for a few moments at a time only, and on comparatively soft sand at Daytona beach, Fla., they required less tread, but the sidewalls, or "carcass," of the tire had to be considerably strengthened to withstand the terrific centrifugal forces when revolved at such high speeds.

## CHAIN LIFT FOR SKYLIGHTS AIDS VENTILATION

Large or small skylights are easily raised or lowered by means of a chain and cogwheel arrangement which is easily installed and securely locks the skylight so that it cannot be opened further from the outside. Any degree of elevation is attained so that proper ventilation can be had with little trouble.

## HOOF-AND-MOUTH SERUM HELPS TO SAVE CATTLE

Progress in curbing the hoof-and-mouth disease is reported from Germany as a result of using a special serum prepared from animals which have been made immune to the disease by constantly increasing doses of the virus. Inoculation is practiced in three ways. The first is a protective treatment, merely temporary in effect and rendering the animal immune for ten days. The second is given simultaneously with an artificial infection of the disease virus itself, and the third is a curative inoculation given to cattle that have contracted the disease if it has not reached an advanced stage. Satisfactory results have been reported when the treatment was administered during the earlier stages.

## RUBBISH WAGON IS INCLOSED TO PREVENT DUST

Greater cleanliness in handling street rubbish is possible in Potsdam as the result of the introduction of a special truck. Its body is in the form of a cylinder. The small containers are emptied into it through a rear opening and, when the truck itself is dumped, the load pours out through the bottom. The arrangement also prevents spread of unpleasant odors.

## BOAT THAT ROLLS ON WATER LATEST IN MOTOR CRAFT

From seeing empty tin cans roll along on the surface of the water, a southern inventor obtained the idea for a novel motor craft. It consists chiefly of two galva-nized-iron drums on axles with an outboard motor between the two cylinders. While the outfit cloes not develop great speed. it is unsinkable and will support considerable weight.

## DYNAMITE DUST CURES OATS OF SMUT DISEASE

As a substitute for more laborious processes, a dynamite-dust treatment is being given oats to eradicate smut, one of the most destructive of the diseases that attack the grain. The dust is infusorial earth, a base used in dynamite manufacturing. Being porous and dry, it absorbs the formaldehyde solution that is used to kill the smutfungus spores, carrying the poison through the grain when mixed with the oats. The dust is also treated with iodine vapor to kill the pest. It cleans the grain at a cost of less than five cents a bushel.

## KIT OF PAPER SOAP AND TOWELS LATEST TRAVEL AID

A Quick but Thorough Toilet with Paper Soap and
Towels; the Entire Kit in Foreground
One of the most recent convemiences for the auto tourist, camper or picnicker is a kit of towels and soap in paper form. It comes as a small flat package that requires little space and contains sufficient materials for twelve complete washings. The soap paper is held in the hand, water applied and the paper rubbed. A thick lather quickly forms and the piece is used as a wash rag would be under ordinary conditions. The towels are of a stout, absorbent grade and may be dried and reused if desired.

## GOLF TEE HAS ARROW GUIDES TO AID CORRECT STANCE

Many poor shots in golf are due to improper stance and in order to correct this difficulty, a tee has been introduced that has two arrow guides set at right angles so that the player may take his position in a more effective relation to the line of the ball's flight.

With the tee is furnished an aluminum pin, by means of which it is held securely to the ground.

## FIRST HORSES SMALL AS CATS AND HAD FOUR TOES

In body and features, the first horses, believed to have lived about $55,000,000$ years ago, closely resembled the animals of today except that they were about the size of cats and had four toes. A cast of the skull of one of these early specimens, and a model showing the animal as it probably appeared in life, are on exhibit at the Field Museum of Natural History. The skull was found in the Wyoming "Bad Lands." Other skulls and models are displayed, showing that the horse gradually increased in size and had three, two and subsequently one toe or hoof as at present.

## SILENCE SHUTTER ON PHONES PREVENTS OVERHEARING

So that "aside" conversation cannot be heard by the person at the other end of the telephone, a silencer shutter has been devised for the mouthpiece. It acts as a hand does in covering the diaphragm and is moved into position simply by turning a little lever like that of a camera shutter. The proper adjustment is shown by the words "speak" and "silent" on the diaphragm cover.

## POULTRY-BROODER VENTILATOR SERVES AS SMOKESTACK

Designed to fit any poultry-brooder stove and to offer a protection against roof fires, a combination smokestack and ventilator has been introduced by a California man. The ventilator part is of galvanized iron, twelve inches in diameter, and the brooder pipe runs through the center. A slide at the bottom of the ventilator serves to open or close the draft.

CLeather dust is used in making fertilizer.

## RUBBER LIGHTER THAN CORK

Nomy important uses will he found for a "foam" rulber recently developel, engineers declare. It said to be one of the lighest known solid substances, having about one-fourth the specific gravity of cork. Unlike ordinary sponge rubber, which has large pores, this material is not usually permeable to fluids and is said to have excellent heat-insulating qualities. It is formed by injecting a special gas under high pressure into the rubber compound while it is being vulcanized. Life preservers, etc., may he prepared from the substance, it is predicted.

## PRISM HELPS AUTO DRIVER SEE SIGNALS

Drivers of closed cars often have considerable difficulty in seeing overhead traffic signals, but this obstacle is said to be overcome by using a special prism on the windshield. It is adjusted to deflect the rays of the beacon into the field of the vivion, so that the driver need not stoop or lean out of the car to see when the light changes. The unit is easily attached and does not interfere with driving.

Ilustrating How the Prism on Windshield Directs Rays
from Overhead Traffic Light for Drivers' Aid from Overhead Traffic Light for Drivers' Aid

Placing Tray of Insect Specimens in the Temperature Cabinet to Study Effects of Hot and Cold upon Them

## WEATHER IS MADE TO ORDER IN WAR ON INSECTS

Winter and summer temperatures are quickly produced in a testing cabinet developed at the Massachusetts Institute of Technology, to aid in the study of insect pests that damage orchard and forest trees. Today, the interior of the box may be mild and pleasant in warmth. Five days later, the thermometer will show thirty degrees below zero. While one observer keeps careful record of the temperature changes, artificially induced, another places trays of the insects into the cabinet and, after a certain length of time, the specimens are examined to determine the effect of the "made-to-order" weather.

## Tor IRON Horse

By HUBERT MALKUS

FCOR nearly a hundred years the steam locomotive grew in size alone. Mechanically it developed not at all. The "Old Iron Horse" got bigger but not better. Incredible as it may seem to the age that perfected the automobile the radio and the airplane, the "Tom Thumb" of 1830 , no bigger than a handear and weighing scarcely a ton, was as good a locomotive as many of the 250 -ton monsters in service today.
In principle, the amusing and crude little contraption that supplanted the horse as the motive power of American railroads a century ago was exactly the same as the huge steel mastodons of the present. They are just boilers on wheels, generating steam to propel themselves and a train.

The "Tom Thumb" was built by Peter Cooper for the Baltimore and Ohio railroad about 1830 . On a truck, the size and shape of a handear. was a small upright boiler, feeding steam to a tiny cylinder. The little locomotive, wood-fired, produced one and a half horsepower. In time the pioneer locomotive designers laid the boiler horizontally on a specially made truck. The cylinder was also placed horizontally: Appurtenances, such as the bell, cowcatcher and cab appeared, but none of these put added power at the drawbar.

As the demands of American railroad traffic increased, locomotives were made more powerful by increasing the size of the boiler, by increasing the size and number of cylinders, and by adding to the number of driving wheels. But fundamentally they were all just big "Tom Thumbs." For many years the steam-locomotive designers were able to keep up with the rapid growth of railroad tonnage simply by enlarging the scale of their blueprints. But this convenient method could not last forever. There is a limit to the size of a locomotive. The weight must not be more than the rails and bridges can safely support- 400 or 500 tons, Clearance in tunnels and cuts limits height to fourteen to sixteen feet and width to nine to eleven feet. Curves in the roadway make it impractical to build locomotives much longer than a hundred feet.

Nearly fifteen years ago designers of steam locomotives reached the limit of sheer size. The Baldwin locomotive works built four giant Mallet locomotives, withtwenty-four driving wheels.

The Granddaddy of All Locomotives, Stephenson's "Rocket," Was Just a Tall Smokestack Followed by a Small Boiler and a Pair of Oblique Cylinders, with Water in a Barrel

and six cylinders, three feet in diameter. The engine with tender was 106 feet in length and the weight 860.350 pounds. This giant had a tractive force, or pulling power, of 160,000 pounds. Its great strength can be understood by comparison with the new Hudson-type engines of the New York Central, which haul the twelve to fifteen coaches of the Twentieth Century Limited between New York and
was driven in disgrace from the rails Electric locomotives now pull bigger trains over the mountains, not at six or seven but at fifteen to twenty miles an hour. When the great Virginian Mallet was displaced by electric locomotives, the steam designers realized tardily that they would have to make better engines without making them bigger. They had made

Built to Carry Mail, Express, Baggage and Passengers, and Haul a Trailer or Two if Necessary, the New Gas-Electric Coaches, Capable of Making Sixty-Eight Miles an Hour, Are Displacing Accommodation Trains

Chicago at a speed at times exceeding seventy miles an hour, yet have a tractive force of only 42,000 pounds.

The Virginian railroad, which bought one of these huge Mallets, needed a still more powerful locomotive for mountain service. So, on their order, the American locomotive company built, in 1918, the most powerful locomotive the world has seen. With four cylinders, two of them thirty inches in diameter and two four feet, and twenty driving wheels, this gigantic Mallet developed a tractive force of 176,000 pounds. It weighed 898,000 pounds-nearly 450 tons.

But this giant, despite its great power, was too slow. Freight trains jammed up on both sides of the mountains like logs in, the spring drive. The Virginian abandoned its steam giant, cut it up into two locomotives, and electrified part of its line. The old iron horse, the largest ever built,
as big an engine as the track conditions would permit-but it was not big enough. The problem was to increase the boiler capacity without enlarging the boiler. In the designing room it is possible to create a locomotive of any desired speed, or any desired hauling power. It is all a matter of the size and number of driving wheels and pistons. Large driving wheels, mod-erate-sized cylinders and a short piston stroke make a fast passenger locomotive but one without tremendous ranling power. Small driving wheels, large cyl inders and a long piston stroke make the heavy, slow freight locomotive.

That is all a matter of formula. You can design a locomotive to go as fast of pull as much as you like, if at the same time you can design a boiler that will supply enough steam to feed the cylinderBut in operation, both speed and power are limited by the steaming capacity: Un-

der severe conditions, the boilers do not produce enough steam to keep the cylinders filled. Such locomotives are mus-cle-bound.

The newest locomotives embody the results of the designers' efforts to make the iron horse more powerful. Amazing increases in efficiency have been obtained by the simplest devices, which give added boiler power without increasing boiler size. They can be briefly enumerated as follows:

Increasing the locomotive boiler pressure, the of superheating devices to increase the temperature of the steam, devices to heat the tender water before it goes into the boiler, and increasing the size of the fire box and the area of the surfaces exposing water to be transformed into steam.

The capacity of a locomotive is proportional to its boiler pressure. With a pressure of 100 pounds, for example, an engine may develop 38,100 pounds tractive pull. At 200 pounds' pressure it will develop a tractive force of 76.200 pounds-twice as much. Until very recently only a few American locomotives had more than 200 pounds' boiler pressure. But recently a number have been built with boiler pressures of 250 and 265 pounds. One railroad is experimenting with two specially built designs having pressures of 350 and 400 pounds. In Germany experiments are under way with one engine with a
boiler pressure of 850 pounds, at a fuel saving of forty-five per cent. When satisfactory methods are found to strengthen the boilers to withstand the bending force of the extremely high pressures, we will have locomotives that are reduced in size. yet more powerful.

Superheaters, also developed in Giermany, are not yet generally used in America, although most of the newly built locomotives have them. It is a property of steam that the higher its temperature the more rapidly it expands. Steam under 200 pounds' pressure, when superheated 200 degrees, increases approximately onethird in volume. The importance of this is the saving in steam, as two pounds can do the work of three. The superheater can add from fifteen to fifty per cent to a boiler's capacity, depending on the pressure and the degree of superheat.

Twenty-five per cent of the heat energy created in the locomotive fire box goes up the smokestack. Part of this waste heat is used to superheat the steam before it is led into the cylinders. Another source of waste is the exhaust steam. This exhaust is used to heat the tender water
 before it flows into the boiler, where it is turned into steam more rapidly, and thus the feed-water heater also has the effect of increasing the boiler capacity of the locomotive. Yet a check-up a few months ago showed that fewer than 5,000 of the steam locomotives

Mountain-Type Passenger Locomotive, Built in Canada for the National Railways; and, Above, Three Cylinders and Their Surroundiog Parts Cast in a Single Unit

Locomotive Boiler and Fire Box Loaded on Two Flat Cars; the Mammoth Engines Used Today Require Enormous Fire Boxes, to Provide Heating Surface for Sufficient Steam Making
in use in the United States were equipped with feed-water heaters.
That further increases in boiler efficiency of locomotives will be made in the next few years, as higher pressures are made practicable and improvements are made in the superheating devices, designers are certain. In fact, they admit they must exhaust the possibilities of improving the old iron horse or see him become obsolete. Competition has forced steam-locomotive builders to make radical innovations in their engine designs.
Forty years ago when the first electric trolley line was successfully operated, the president of one of the country's largest railroads predicted that the steam locomotive would disappear within twenty-five years. The automobile has almost driven the trolley lines out of business, but the iron horse still rules the rails.
Now the steam locomotive is beset by several rivals. Between 1900 and 1920, the number of steam locomotives grew from 37,000 to 69,000 . Now there are not more than 64,000 iron horses in service. They face a real fight to survive, for the past few years have brought amazing de-
velopments. Tremendously powerful electric locomotives have supplanted steam on long stretches of roadway. Europe is developing the Diesel-type of internalcombustion locomotive which can be operated much more cheaply, and the steamturbine locomotive, which can cover 450 miles without refueling. There are gaso-line-driven locomotives, storage-battery locomotives and one that operates on a charge of live steam.

These new developments, all past the experimental stage, explain why the number of steam locomotives in service has shrunk from 69,000 to 64,000 in the last few years. In light-traffic work on American railroads, there are already in service nearly 500 gasoline-electric cars, some capable of pulling several trailers. Thousands of coaches are in operation, chiefly in suburban service, in multiple-unit trains; that is, each car receives electric power from a trolley to operate dynamos on the axles.

In the face of these remarkable developments, it does not require great courage to predict once more that steam is nearing the end of its usefulness on the rail-
 had reached the limit of its development. But, surprising as it may seem, after a hundred years of lethargy so far as real development is concerned, steam is at the threshold of infinite possibilities.
As a practical indication of what has happened, consider the fuel economies of the last few years. In 1923, the average coal consumption of passenger locomotives was 18.4 pounds for each "passenger-car-mile." In 1926, this had been reduced to 15.4 pounds, a saving of sixteen per cent. Over the same period, the fuel consumption of freight locomotives was reduced from 163 pounds to 130 pounds in hauling a $1.000-$ ton train one mile, a saving of twenty per cent.

The real significance of these figures is lost in the fact that they are averages. As the older locomotives are replaced with the modern type, with superheaters, feedwater heaters, and gradually increasing boiler pressures, the present well-founded charge of excessive cost of operation will no longer be possible. Much of the wasteful use of fuel by steam locomotives has been due to unwillingness of railroads to modernize their locomotives with the various economy devices because of the initial cost. When tender coal cost a dollar

In the three-cornered fight between steam, electricity and the internal-combustion motor, the important consideration, from a railroad standpoint, is flexibility of operation under all conditions. The great electric locomotives may be more useful on steep grades, but the electrics have this drawback. They lose power rapidly as speed is increased. While the Diesels operate cheaply, they are still too heavy for all-around work. The Diesel weighs, as a rule, around 275 pounds for each horsepower developed. The steam locomotive weighs on an average not more than 220 pounds.
Considerations such as these will determine what sort of motive power will be used on the railroads of the future. Another factor, neither mechanical nor practical, operates in favor of steam. The railroads are poor, many near bankruptcy. They cannot get the money to electrify their roads or to purchase improved types of locomotives. Therefore, of necessity, they must continue to use steam. They cannot scrap billions of dollars' worth of steam locomotives just because they are more expensive to operate.
This may not be sound economy. Then
axain it probably is, because the railroad uperators and the locomotive builders realize they must make the iron horse do more work and cut his feed bill. The field of development-higher pressures, cut-offs, feed-water heaters, superheaters and improved design-is still practically untouched. The iron horse is steaming into a marvelous age.

## EGYPT'S MUMMY FLUID USED FOR MOVIE FILMS

One of the "mystery" fluids, used by the Egyptians in preserving their mummies, is now employed in the manufacture of mo-tion-picture film. It is an acid, obtained from waste wood. Certain derivatives of the substance enter into the making of the film. Its preservative qualities are due chiefly to the presence of wood alcohol and creosote. The old Egyptians prepared it in much the same way as it is now obtained, by heating wood to a high teniperature in an inclosed chamber and condensing the vapors.

## HUMAN HEADS WARN SPEEDERS TO OBEY TRAFFIC LAWS

Motorists in certain parts of Pekin. China, are visibly reminded that the speed limit is fiiteen miles an hour, by means of grim warning signs at various street intersections. Hung with the legend, which is written in English and Chinese, are boxes

In Pekin, Heads of Chauffeurs Who Violate the Speed Laws Are Cut Off and Exhibited as a Warning
containing the heads of chauffeurs who have violated the speed laws.

## PORTABLE WADING POOL IS NEW PLAYROOM JOY

Demonstrating the Wading Pool for Playrooms; an Attractive Border Makes It Decorative
Expanding the idea of the canvas bathtub, a portable wading tank for the indoor playroom has been introduced. Water connection is made through the framework in somewhat the same manner as shower baths are attached to faucets. The tank can be stored in small space.

## MANY USES FOR COTTONSEED BOOST CROP'S VALUE

Cottonseed and its by-products are employed in the manufacture of stuffings for cushions, mattresses and upholstery, for felt, clothing, and low-grade yarns, lamp and candle wicks, twine, rope, writing paper, explosives, artificial silk and leather. and photograph films, as well as for many other purposes. The hulls provide a source of potash and are also made into fertilizer, feed and fuel. It has been estimated that the seed adds about $\$ 500,000,000$ annually to the nation's resources. Last year. more than $6.000,000$ tons were crushed, yielding $2.000,000$ pounds of crude oil. $3,500,000$ harrels of refined oil and nearly $3,000,000$ tons of cake and meal.

Testing the Square Parachute with Dummy at Lakehurst, N. J.; These Canopies Are Easily Folded

## SQUARE PARACHUTE IS TESTED FOR NAVAL AIRCRAFT

Experiments with a square-shaped parachute as a substitute for the usual type. have been conducted at Lakehurst, N. J. If the tests, which have been made with dummies instead of men, prove satisfactory, it is proposed to adopt this form for naval aircraft.

## GAS ENGINE COOLS ITSELF WITHOUT WATER

A gasoline engine with no visible means of cooling, because it uses a "refrigerating stroke" to dissipate the heat from the cylinder walls, has been demonstrated in England by a New Zealand inventor. It is claimed to recover a large part of the energy wasted in the cooling water of an ordinary engine, and to put the reclaimed heat to useful work, thereby saving fuel. The motor is a four-cycle engine, in that there is only one firing stroke per cylinder for each two revolutions of the crankshaft, but it is actually divided into five
phases, instead of four. On the intake stroke the inlet valve is open for but half of the downward stroke. The valve then closes, and the gas mixture which has been sucked into the cylinder is expanded, as the stroke continues, until a partial vacuum of ten pounds less than atmospheric pressure is reached. The gase are thereby cooled, in accordance with a well-known thermodynamic law. As their temperature drops, they absorb the heat of the previous power stroke from the cylinder walls. On the compression stroke, owing to the absorbed heat, the temperature is considerably higher than usual, and the compression ratio is also much higher. Ratios as high as twenty to one have been used in the test motor.

## RACER FOOT CAR FOR CHILDREN LATEST ROADSTER NOVELTY

Youngsters on the Riviera have been enjoying rides on racing roadster cars that they can pedal at considerable speed. Instead of the usual type of body, these have a flat board installed edgewise and painted with the characteristic lines and markings of the hood of a racing automobile. The car is equipped with a lightweight chassis and slender wheels for fast travel.

## ELEVATED SUPER-HIGHWAY TO COST SIXTY MILLION

 thirty-two cross streets, which now re-Engineer's Sketch of Elevated Super-Highway. Ten Miles Long. Planned for Chicago

 18
15

18
18
18
18年 $=:=2=0$
(4) miles long and to cost $\$ 60,000,000$, is being planned for Chicago as a superroad for automobilists entering the city from the northwest. One hundred and quire slowing down or complete stops for qupposing traffic, will be eliminated, while central ramps will accommodate twentythree feeder streets, distributed at regular intervals. The super-highway will start at the northwest corner of the down-town loop district, where it will connect with a double-decked boulevard along the north bank of the Chicago river. The roadway will be 160 feet in width throughout its length, and will cut three miles from the distance now traveled to reach the country highways which branch out fan-wise to the northwest. It will have a capacity of 250,000 vehicles a day, and will connect with 300 miles of paved highways which serve 1.100 square miles of northern Illinois and southern Wisconsin.

## FERTILIZING FISH FARMS

Just as the value of fertilization and cultivation of the soil has long been recognized, so "water farmers"-those who raise fish-are coming to realize the importance of adding fertilizing materials to the ponds. At the Fairport, Iowa, biological station, a marked increase in the yield was noted after a mixture of superphosphate and other materials was added to the water. It has also been found that certain small fish, on which such species as the black bass feed, can be grown in greater numbers by supplying them with an abundance of vegetable matter and other substances which the bass will not consume, but which the smaller fish will devour greedily.

ELECTRIC KETTLE HAS WHISTLE TO PREVENT OVERHEATING

When water boils in an electric kettle now on the market, a whistle blows as a signal that the current can be shut off and waste avoided. The device also prevents overheating the element and reducing its life.

Performance Thermometer for Training Chorus; It Shows When the Singing Is Good or Bad

## CHORUS "SONG THERMOMETER" STIMULATES SINGERS

To encourage chorus singers to hetter performances, a special "thermometer" register has been devised by an eastern conductor. It shows whether the singing is good or bad by means of a red fluid that moves up or down in a large tube. The flow is regulated by bellows operated by the foot of the leader's assistant and the gauge tells the chorus what the conductor thinks of their efforts without his speaking to them. The device is said to be especially effective in rehearsal work.

## STICKY TAPE ON ERASER LIFTS TYPEWRITER LETTERS

Sticky fabric instead of rubber is the chief feature of a typewriter eraser that literally pulls the letters off the outside page without disturbing the carbon copy below it. The fabric is held in a conveniently shaped reel which
is applied to one letter at a time. Slight pressure and then a quick jerk obliterate the typing. The tape is rolled up as it is used, so that a fresh surface is alway, available, and replacement rolls of it are supplied for the reel.

## NEW YORK-VERMONT BRIDGE TO SERVE MOTORISTS

Motor routes between the Adirondacks and the Green mountains will be shortened from fifty to 150 miles by a $\$ 000,000$ bridge to be built across Lake Champlain, linking New York and Vermont. It will also mark sites important in American history, for, at the New York end, are forts Frederick and Amherst. The former was built by the British and captured by the French in the French and Indian wars. Fort Amherst was taken from the British by Ethan Allen's Green Mountain Boys, was recaptured by the former and then abandoned after the battle of Saratoga. It was here that Benedict Arnold set forth with a fleet to defeat the British on the northern end of the lake. The bridge will be 2,190 feet in length.

## NAIL THAT WON'T SPLIT WOOD HOLDS MORE FIRMLY

With a triangular tip instead of a sharp point, a nail, devised especially for use in packing crates and boxes, will not readily split the wood and is said to bind more firmly than the usual kind. The ordinary nail acts as a wedge as it enters, often forcing the fibers apart to the extent of splitting them. The triangulartipped nail functions more like a
 punch and gives the wood more surface against which to hold. Tension is spread around the nail instead of in just two directions, as is the case with the common variety, which enters the wood like an ax.

Composite of Five Photographs of U. S. Army Planes, Looping. Rolling and Doing Immelmann Turns; "Acrobatics," or Aerial Acrobatics, Are Essential in Every Pilot's Training

GERHARD Fieseler, the German stunt flyer, recently announced the perfection of a vertical figure 8. To the non-flyer that doesn't sound exciting, but ask a skilled stunt pilot what he thinks of it. Major Reed Landis, famous war-time ace, who knows as much about aerial acrobatics as anybody in the country, exclaimed, "Marvelous!" when he heard the news of the feat.

For a vertical figure 8 is a combination of an inside and an outside loop, and it has been less than a year since Lieut. James Doolittle, U. S. A., retired, performed the first outside loop in the history of flying, and came down with his eyes popping out of his head as the result of the terrific strain. Lieut. Doolittle, who can turn vertical banks around a race pylon steeper and tighter than anyone else has been able to turn them at high speed because his "insides" seem to be peculiarly constituted to resist the terrible centrifugal force involved, declared when he landed that he would never do an outside loop again.

Lieut. Al Williams, navy race pilot, recently tested a fast Curtiss Hawk pursuit ship in inside and outside loops, barrel rolls and other "aerobatics," carrying an
accelerometer strapped to the wing to measure the strains on himself and the plane. The tests showed that, in an outside loop, the centrifugal force was so great that Williams' 200 -pound weight increased to a thousand pounds, and the entire weight of the plane, about 2.100 pounds, was converted into 13,000 pounds as the ship swept through its circles at 200 miles an hour.

In an inside loop centrifugal force tends to keep the pilot in his seat. He doesn't even need to be strapped in, for he can't fall out any more than the adventurous souls who looped the loop on amusementpark rides twenty years ago could. In fact, an inside loop is performed just like the old carnival stunt, starting usually with a swift drop to get up speed, then a quick climb up and over the top, and another drop down the backside of the loop, followed by a level flight again. Yet it wasn't until November, 1913, that the late Lincoln Beachey performed a gentuine inside loop in America, while the French flyer Pegoud did the first in the world on Sept. 13. 1913, at Issy, France.

An outside loop is just the reverse. If it is started with the plane flying right side up, the pilot first noses down, then

Trailing a Streamer of Smoke, a Cabinet Plane Dives Out of the Clouds to Start a Dog Fight with Three Enemy Ships
pulls the plane back and under, climbs straight up, and then levels out again. Fieseler does it two ways, a downward and an upward loop. In the latter, he first rolls the plane over in a half-barrel roll until he is flying upside down, then noses upward as though for the usual inside loop, except, as he started from an upsidedown position, he is on the outside of the circle instead of the inside.
It took weeks of studying of each separate movement before he perfected his vertical figure 8 , performing it sometimes with the inside loop first, and again with the outside one at the top. In upsidedown flying, the controls work in just the opposite direction from what a pilot is
normally accustomed to, so that every step must be carefully planned in advance, and then practiced until it become, automatic. Things happen so rapidly in the air that it is often difficult for an observer on the ground to say just what takes place. Before Beachey actually performed the first loop he had for months executed what, from the ground, 'looked like a loop, but, flying a mile high, he only puthis plane through a steep vertical bank in a 100 -foot circle.

When Pegoud announced his premier loop. and Beachey followed with his announcement. experienced flyers, including both Curtiss and Wright, claimed it was the same optical illusion. and it took several demonstrations to convince the doubting ones that a man really could fly upside down. The chief reason for doubting the loop was the theory that the engine would stop because the carburetor could not feed gas to the cylinders when the power plant was upside down. Beachey contended centrifugal force would carry him over the top of the loop, and the engine would then start again-and this idea proved correct.
The tail spin used to be one of the most deadly causes of flying accidents and ecnsiderable time was spent teaching new pilots how to avoid it, and how to get out of a spin if the plane should accidentally go into one. The chief requisite for getting out of a spin was plenty of altitude to maneuver in. With modern aircraft conditions have changed. Planes are built now which can't be made to spin without deliberate intent on the part of the pilot, and which will come out of a
-tin by simply setting the controls in neutral. A few years ago a failing motor was the terror of flyers, because loss of flying -peed almost invariably meant a tail spin. Similarly a dead-stick landing-one in which the motor is stopped either by accident or design-gave a real thrill. Sevcral planes are built now which will practically fly themselves even after the motor is cut off; in fact, as they lose flying speed they will "pancake" toward earth on an even keel, without a hand on the controls.
Col. Lindbergh's favorite stunt is a side slip when landing. It offers a quick and spectacular way to lose altitude. Normally, a flyer approaches a landing field at a fairly good altitude, to give opportunity to look it over before coming down. To lose the altitude a few drop one wing so low that it ceases to support the plane, and then slip downward and sideways.
Two of the most popular war-time maneuvers, which aren't used much in ordinary commercial flying, are the barrel roll and the Immelmann turn, the latter named for the famous German pilot who invented it. The Immelmann turn offered a quick way to get out of trouble or to return to the attack after passing an enemy. The pilot simply pulled the nose of his ship up as though to do an inside loop, and then, at the top of the loop, dipped one wing and rolled the ship over in a half-barrel roll, so that, instead of flying upside down, he was right side up, but reversed.

The full-barrel roll involved a double turn. Lowering one wing in a side slip, the pilot kept on until he was flying upside down, and then by side slipping again, completed the evolution, either in the same direction, to produce a letter-S effect when viewed head on, or in the opposite direction, which produced a figure 3. With wartime planes, the roll involved some loss of altitude, but modern high-speed ships can be rolled so rapidly there is practically no dip, and some even can be rolled while they are climbing.

Service Truck with Body Tilted for Handling a Tractor ; the Same Arrangement Is Useful in Towing Wrecks
body that can be tilted up until the back rests on the ground. This facilitates loading. The movement is accomplished with the aid of a hoist at the forward end. The body is quickly returned to the normal plane after filling. A tractor can climb the truck under its own power.

Suspended from a Lightship, the Submarine Bell Transmits Under-Water Warning Signals When Fog Is So
Thick That the Light Overhead Cannot Penetrate It

AGREAT liner, ablaze with lights, is ready to sail from New York, to Europe bound. The hour is midnight, when a dozen little tugs snake the towering ship out of the pier slip. Electric telegraphs, scattered over the ship, transmit orders back and forth between the chief of the tug captains and his aides, directing the operations.

Well clear of the rows of piers along the shore, the tugs back away and allow the huge ship to swing toward the sea. Engine-room telegraphs sound their warning bells to stand by, followed by slow ahead and then half speed. With hardly a sound, the big ship slips away down the river, a moving mountain of blazing lights.

On the bridge, the harbor pilot calls an occasional order to the quartermaster at the wheel. As the Narrows are reached, an officer dons a radio headset and takes over the task of conning the big vessel down the channel, guided by electric messages from a cable stretched along the sea bottom.

Outside of Sandy Hook, a boat picks up the pilot, the ship squares away for the
run to the Grand Banks, and on the bridge the course is set on "Metal Mike," the current turned on-and a mechanical man takes over the ship. His quartermaster attendant stands by to see that the electric steersman works properly and doesn't run out of oil, but Metal Mike does the work.

That's the picture of sailing day, or rather sailing night, that makes the oldtime skipper rub his eyes. In the last ten years navigation of the seas has been completely revolutionized. There is as much difference between the modern crack flyer of the north Atlantic and the fine old "St. Paul," "St. Louis" and other ships of thirty years ago, as there was between those cruiser-liners of Spanish-American war days and the sailing packets of a century earlier.
The old-time sailor who strained his eyes to pierce the murk and spray of a driving rain, snow or sleet storm is gone. His successor, warm and comfortable on a glass-inclosed bridge, glances through a whirling pane, kept free from snow and ice or raindrops by the speed at which it revolves. Or if he must go out on the
 presses a button, and an invisible electric machine starts a sound producer on the outside of the hull, far beneath the waves, to send signals to the sea bottom, while another machine catches their echoes on the rebound. As the officer starts the apparatus, an indicating hand begins to turn, and when the signal returns, it lights a tiny electric lamp, while the reading of the hand gives the exact depth.

The seaman who served his apprenticeship in sail, or even in the best liners of a generation ago, learned to drive through fog and rain for days at a time, computing position from the course, the patent log. and dead reckoning, supplemented, in steam, by the engine revolutions. The modern sailor can do that too, but if he
is within wireless range of land, he need only don a headset, reach overhead for a handwheel that turns a loop aerial, and tune in on a couple of distant radio-compass stations. When the loop points directly at the land station, the signals come at their loudest, and it is the work of only a few moments to take the compass bearings, lay them down, with parallel rulers and pencil, on a navigation chart, and where they meet, there the ship is.

One by one the perils of the sea are succumbing to inventive genius. There were the dangers of storm, of fog and of uncharted rocks: the perils of unfriendly lee shores, of passing ships, floating, waterlogged derelicts and wandering icebergs.

Sailors Laboring on Lofty Skysail Yards, and the Slow Task of Heaving the Heavy Deep-Sea Lead, Alike Are Disappearing from the Seas

And, on one's own ship, there was the ever-present peril of fire, the most dreaded danger of them all.

Ships themselves are fireproof, since the days of wooden vessels have passed, but the possibility of fire can never be eliminated so long as they carry fuel and inflammable cargo. Now, the modern liner, and the modern merchantman and yacht, too, have eliminated the peril by making it impossible for the fire to get a real start.

From the bridge the condition of every compartment in every section of the ship is constantly under control. Delicately sensitive electrical apparatus record every change of temperature in each part of the ship, and sound a warning if the temperature begins to rise. In some ships a system of piping leads from every compartment to a hull model of the ship, mounted behind glass, so that the air in each can be tested for smoke.

If fire does break out, a turn of a valve floods the compartment with a heavy, inert gas, which smothers the flames instantly, and the gas disappears within a few hours, leaving neither trace nor damage behind, so there is no loss from water.

The international ice patrol, established after the "Titanic" disaster, has robbed the fog-shrouded reaches of the western ocean of much of the spring-time terror, for the coast-guard cutters ride herd on the southward-bound bergs and report each day the position of every one, until, in the warming influence of the Gulf Stream, it has melted down below the danger size.

Uncharted shoals and rocks, at least on all the regular courses, are things of the past. The ocean bottom is so well known that it is possible to compare the echoes returned by the "fathometer"-as the seadepth indicator is called-with a chart made for the course and tell just about where the ship is.

But it is in the aids to navigation that the greatest advance has been made. Once storms swept up over the horizon and often tore the sails away in ribbons before the crew could smother the canvas into reefs. Now the liner at sea can get the weather map each day, drawn by an automatic radio-operated pen without the help of any human hand, the governing signals coming through the air with the speed of light, just as they are trans-

Even the "Black Gang" Has Been Replaced. First by Oil-Fired Boilers, Then by Diesel-Motor-Driven Ships, and Now, on One American Vessel, by Powdered Coal, Which Is Blown through Pipes and Burned like Oil; the Coal May Be Pulverized on Board, as Shown in the Large Drawing, or by a Plant Ashore, as in the Insert Sketch, and Then Piped Aboard

The Electric Sounder, Above, Has Replaced the Lead; at Right, the Indicator Which Shows the Sea Depth
mitted from the naval station at Arlington, on the heights across the Potomac from the capital. With the weather maps for each day available, the navigator can trace the development of each cyclonic storm center as it sweeps across the country from west to east and so out to sea, or as it moves north and west across the middle Atlantic, turns northward along the coast, or up through the Atlantic states; or, in exceptional instances, circles over the middle west, before recurving out over the north Atlantic. Watching the advance of the storm, getting the daily
radio bulletins on its progress and intensity, and the reports of other ships, he knows just when and how hard it will strike.

If he runs into fog, he knows, from his radio reports, whether there are icebergs ahead. His automatic fog siren sounds its regular warnings to the fishing boats that may lie in his path along the Grand Banks. Wireless and submarine sound detectors both keep check on other large vessels in the neighborhood.

The submarine sound detector is a story in itself, and, like many of the other new devices aboard ship, is an outgrowth of the in-

The Steering Engine, Operated by a Gyro Compass, and a Typical Steering Sheet, Showing the Tremendous Yawing While under Hand Control
serve to keep them afloat. A liner speeding through the night at twenty-five land miles an hour can be badly damaged, should it strike such a mass.

Another use for the submarine bell has been found in conjunction with automatic radio apparatus on lightships marking channels off important ports. Radio waves travel through the air with the speed of light, but sound waves traveling in water advance only 4,800 feet per second. Knowing that, the navigator need only measure the elapsed time between the receipt of a radio signal and a submarine signal, sent simultaneously, to figure how far he is from the sound source, on the lightship. At the same time, the radio direction finder gives the true bearing of the lightship, so it is possible to plot the liner's position on the chart with that single bearing,

Some experiments have been made to utilize the submarine-bell and fathometer ideas to detect icebergs by reflecting back sound from them, for a big berg, with the greater part of its bulk under water, extends to depths of several hundred feet. If these experiments, which have shown some promise, meet with final success, it is possible that other ships and particularly floating derelicts may be located, too, by echo. The derelict menace is always present, though the coast-guard cutters and a world-wide system of reports on navigation menaces, serve to reduce it. The cutters scour the seas to track down every derefict reported and either sink it by gunfire, blow it up with bombs planted in the hold, or tow it to port for salvage. Some of them are hard to destroy-a dismasted lumber schooner, for examplebecause, no matter how badly waterlogged they may become, their cargoes
instead of requiring cross bearings from two radio stations to fix the distance from ship to shore.

The revolution in modern ships really started before the war, with the first application of gyroscopes to seagoing problems. Now there is the gyroscopic compass, "Metal Mike," the gyroscopic helmsman, and the gyroscopic stabilizer, that make a relatively small yacht or other ship ride as smoothly as a giant liner.

Metal Mike, because he replaced human hands and does the job better than eny man could possibly do it, is the most interesting of the three. In the old days, two, three or four men struggled with a huge wheel, fighting the kicking rudder, to hold a plunging ship on her course. Then came steam, and later electric steering engines, which reduced the labor, but, if anything, made good steering harder, for the helmsman no longer had the "feel"

Fire-Alarm Signals on a Private Yacht: the Presence of Smoke in Any Section of the Model Indicates the Location, While an Electric Bell Rings to Sound the Warning to the Officers

One of the Two Driving Motors of the Liner "California"; Everything. Even the Cooking, Is Done Electrically

Ship's Engine-Room Control Signal, beside One Built for a Small Motorboat, and, Right, the Apparatus for Launching a Liner's Lifeboats

of the rudder to guide him. In fact, the only guide he had was the normal tendency of the rudder to return to an amidships position.

Steering a speeding liner, with the bow continually trying to fall off the course every time a wave slapped it, was no easy job. Good quartermasters became famous, and men like Herbert Hartley, late commodore of the "Leviathan." and other famous captains, rose through their ability to hold the old "St. Paul," "St. Louis," "Paris" and other American liners to their proper course.

But with the introduction of Metal Mike, everything was changed. The ship's bow need only be laid on her course, the gyroscope helmsman started by closing a switch, and the machine, with more than human intelligence, will hold the vessel to that course far better than the best steersman could do, and without regard to storms, cross-seas or other circumstances.

Metal Mike and the gyroscopic compass
both utilize the same principle: the fact that a gyroscope revalving at high speed always maintains its axis in a fixed position with relation to the earth. The gyroscopic compass always points to the true north, and not to the magnetic pole, because the earth's rotation, not magnetism, is the controlling force.

With the magnetic compass every course taken from the chart must be translated into a magnetic bearing before it can be transmitted to the helmsman, and every bearing taken from the magnetic-compass card must be translated into a true compass bearing before it is applied to the chart. That would not be difficult, if the magnetic-compass error was always the same, but it not only differs for every point on the globe, but is constantly changing from year to year, so sums must either be added or subtracted from every magnetic bearing, to correspond to a carefully prepared table covering the number of years since the chart plate was engraved.

One of the Two Turbine Generators, Which Furnish the Electric Current to Run the "California," and Operate All of the Electrical Conveniences Which Make Traveling Safe and Pleasant

Nutal Mike's compass brother eliminate all that. He points constantly to the north pole, instead of the magnetic pole, no matter where on the earth's surface lie may be. Because he works on a mechanical and electrical principle, he doe-n't need to be mounted on the bridge. In fact, the master compass is usually placed below deck in some distant compartment, with a series of repeater compases hooked up to give identical readings in the chart house, on the bridge, in the captain's cabin, or any other place.
It is not difficult to see how such an uncanny instrument can be adapted to the steering itself. In its simplest form, a set of electrical contact points are mounted in the gyro compass, and, as soon as it begins to move to resist the turning of the ship, the circuit is closed, a small motor operating

Officer of an Atlantic Liner Listening In As He Turns the Loop of the Radio Direction Finder; Above, the Revolving Sleet-Proof Vision Screen as Used on an Open Bridge

the steering wheel started, and the ship brought back to position, often before the eye could have detected it was beginning to yaw. An automatic course recorder, showing the steering of Metal Mike in competition with human control, illustrates the superiority of the machine over the quartermaster.

The automatic course recorder is another of the gyro-compass developments. A simple clockwork mechanism to turn a paper-covered drum, and a pair of recording pens operated by every movement of the gyro's axis do the trick.

Electricity is doing so many things aboard ship these days that it has even supplanted the bull-like bellow of the oldtime first officer and the megaphone which sometimes aided him in transmitting orders from poop to forecastle. Nowadays a complete telephone system connects the acres and acres of space within a big ship, while engine room, chart room, bridge, and other control positions are interconnected with loud-speaking phones. There is even a specially designed telephone instrument which can be used in the noisiest engine room to transmit the
voice only and eliminate all other sounds. Small ships, tramp steamers and others that cannot afford all the latest refinements of navigation as practiced on the north Atlantic, have not been neglected in provision for safety. Automatic wireless sets are available which send out an appeal for help without the aid of an experienced operator. With their directionfinding radio, larger ships in the vicinity can take the bearing of the signal, and by its intensity and the known range of the automatic sender, compute the distance, or if two liners equipped with direction finders get the signal, they can, through an exchange of messages, compute the exact location of the vessel in distress.

And to make sure that no wireless operator, working his set on some other wavelength, misses an appeal for aid, the bigger ships are being fitted with automatic alarms which respond only to the SOS call, when they ring a bell to attract the operator's attention.

Even the lifeboat has been taken care of with a wireless set of its own. Most of the larger liners now carry several power boats to tow the other life craft in event of shipwreck at sea. The power boats, with engines and battery power available, are equipped with regular radio sets. But the smaller boats have radio, too, a small set with collapsible mast and getting its power from a generator turned by a crank, like the old-fashioned magneto telephone. And, as there aren't enough radio operators on a ship to furnish one for every lifeboat, the little sets are entirely automatic. As long as you turn the crank the machine sends out the distress call.

The same efficiency is being applied in other directions, perhaps at the expense of some of the romance of the seas, but the increased safety makes the sacrifice worth while. In the old days of oil lanterns, when the lookout on the forecastle struck the bells at night and called back, on every half hour, that the lights were

Courtesy Canallan Parllie t.fines Oil-Fired Boilers of the "Montroyal," Where Grimy Stokers Have Been Replaced by Pipes That Feed the Liquid Fuel to Jets in the Fire Box
burning bright, it was romantic. But nowadays there is an indicator in the wheelhouse carrying a number of pilot lighs, and one lights up automatically to warn the officer of the watch if any one of the running lights goes out. And if one doce, he only has to turn a rotary switch to bring another light into operation in place of the one that has failed.

Below deck the modern ship is pro-gre-sing just as fast as it has on the bridge. Oil burners have displaced coal in all the better ships, and now powdered coal, fed through pipes like oil, is threatening to supersede the black liquid. Oil, in a dozen years or so, became almost universal on the bigger ships, as well as many of the smaller ones, because it saved time, money and labor. It displaced the sweating, laboring "black gang" of stokers; it reduced the time wasted in port because it could be pumped aboard faster than coal could be loaded; it eliminated the drudgery of cleaning ship after coaling and saved much repainting, while furnishings in the passenger cabins lasted longer with less frequent cleaning, and, finally, it made better and more economical operation of the engine room possible.

The new powdered-coal system, successfully tried last year by the U. S. shipping board on the freighter "Mercer," promises to introduce to the sea the same economy which has proved a money saver in plants ashore, including the great Ford power plant at River Rouge. The pulverized coal, mixed with air; is blown through pipes, just like oil, and fed into the furnace burners in the same way. The "Mercer" installation carried a small crushing plant aboard, so that ordinary fuel was loaded in the bunkers, and powdered as needed. This system eliminated the possible danger of increased fire risk in the fine coal dust. The coal may some day be crushed ashore and piped aboard into the fuel tanks.

Its Period of Duty Done, This Old Steam Engine Serves as an Observatory in Ironworks Grounds

## OLD STEAM-ENGINE MONUMENT SERVES AS OBSERVATORY

After nearly fifty years of service, a steam engine of the heavy-duty type has been converted into a monument on the grounds of an ironworks in Germany. A circular stairway leads to the top, from which the whole plant can be seen.

## ARMLESS FLYER PLANS TRIP FROM NEW YORK TO PARIS

Loxla Thornton, an armless aviator, is making plans for a transatlantic flight this year. He has been flying for nine years and can operate any standard make of craft without extra attachments, it is said. He controls the stick by means of an iron hook and it is reported that he has had no accidents in his flying.

GIANT TRENCH DIGGER DOES WORK OF MANY MEN

Top, Cable-Laying Outfit Complete; Below, Close View of Cable-Drum Carrier and Back-Filler Spout
about one-sixth the cost of hand methods. It digs a trench, sixteen inches wide and five feet in depth, unwinds the cable from a drum, and drops it in the excavation, and as the outfit moves along, the earth is carried back and tamped down so that the entire operation is finished. A forty-five horsepower motor pulls both machines and the rig moves on endless treads so that it can traverse rugged territory. It will lay from 200 to 300 feet of cable

For laying telephone and other cables, a combination unit devised by German engineers, does the work of many men at
per hour, depending upon the character of the soil, and only five men are required to manage the entire outfit.

## BOATHOOK PUTS LINE IN RING AND HOLDS MOPS

With an improved boathook now on the market, the mooring line is automatically passed through the ring, saving work and time. This is accomplished by a spring which ejects the hook from its socket after the ring has been engaged.

Close-Up of Hook, and How Line Is Handled

Line and hook are then picked up by a grapple at the side and drawn in. The shaft and holder of the boathook may also be used for scrubs and mops.

## CATCH CROOKS BY TELEPHONE TO HELP REDUCE CRIME

Broadcasting news of a crime, with description of the criminals, to a score of towns and officers at one and the same time, has been made possible in a California county by co-operation between the telephone company and the sheriff's office. Immediately the latter receives notice of a murder, robbery or other crime. the sheriff's telephone operator calls the long-distance operator at telephone head-
quarters. All the deputy sheriffs, chiefs of police and constables, in twenty-two oulying towns and all the suburbs, are notified at once by plugging in connections to all of them. The sheriff's operator, in one message, gives all the available details of the crime with a description of the criminals and the probable direction of their flight. Tests have shown that not more than three minutes are required to inform all officers in the county to be on the lookout. Bridge tenders, ferry watchmen and others are included in the same telephone broadcast, being sworn in as special deputy sheriffs for such emergencies.

## PHONOGRAPH UNIT CHANGES ITS OWN RECORDS

An automatic phonograph unit, built to fit into standard talking-machine cabinets and designed to play any number of records up to ten, changing its own records and playing the program over and over until stopped, is now on the market. It can be used, in connection with a radio set or a radio amplifier, to convert oldstyle talking machines into the latest thing in electrical and automatic phonographs. Up to ten or twelve-
 inch records are carried above the reproducer on three supports and lowered onto the turntable, one at a time, until all have been played. A selector switch is provided so that any predetermined number of records can be played, and the machine will then stop itself.

## NATURAL GAS RUNS ENGINES IN AUSTRALIAN TOWN

Natural gas, discovered in Roma, Australia, during a search for oil, is used to operate engines as well as for lighting. There is an apparently inexhaustible supply of the fuel, which is delivered at pressures varying from 320 to 480 pounds to the square inch. Valuable products are obtained by filtering the gas and the exhaust as it comes from the engines.

Miniature Lantern-Slide Projector Used by Schools in Nature-Study Classes

## MAGIC LANTERNS ON DESKS HELP TEACHERS

Lantern slides in small boxes, containing an electric-light bulb, are employed in a New York schoolroom, to help teach the pupils about nature. Each box is like a little picture theater, the slides can easily be taken out and new ones inserted, and the children have a better opportunity to study the subject than they would, were it shown on an ordinary screen. After examining the slide, the pupil is required to write an essay about the picture it reveals.

## BALL-BEARING AUTO SHACKLES ELIMINATE SQUEAKS

To eliminate squeaks and rattles, and to make the car ride more easily, ballbearing auto spring shackles have been introduced. No adjustments are required, and a special advantage claimed for them is that no greasing is necessary, as per-
 manent lubrication is provided, good for the life of the car and eliminating grease cups and fittings.

Visors on These Spectacles Relieve the Wearer of Unpleasant Strain as They Shade the Eyes

## VISOR GLASSES FOR AUTOISTS RELIEVE EYE STRAIN

Sun visor, glare shield and driving glasses are combined in one pair of spectacles devised for the safety and comfort of automobile drivers and others who have to face bright lights. The upper part of the lenses is of a restful, transparent green shade and the lower part, a semi-smoked glass, practically clear. This portion is employed while driving. When the glare of headlights strikes the eyes, the wearer simply lowers his head and looks through the upper half of the lenses. The protectors can be worn in front of regular glasses if necessary.

## EARTH'S ROTATION CHANGES

That the rate of the earth's rotation changes from time to time and that this fluctuation may be due in part to the effect of earthquakes, are possibilities advanced by Dr. Benjamin Boss, of the Carnegie Institution. He has found evidence for the apparent variation in a long study of star positions, and the change appears to be related to the frequency of earthquakes. Further indication of the fluctuation is suggested by the fact that, when
checking clock time with the stars, there is a daily variation in the clock rate, showing that the earth may change its daily rate of rotation.

## TELEPHONES FOR PLANES

Passengers in cabin planes of a western air-transport company, may talk with the pilots through a special telephone system recently installed. Except while landing and taking off, occupants of the cabin are permitted to ask the pilot questions concerning the route and the position of the ship. It is expected that the phone will meet with the favor of the pilots, as many of them find long air journeys monotonous and welcome a call from the passengers.

## BATTLESHIP HAS FIGHTING FACE CAMERA REVEALS

That there is a sound basis for the ex. pression, "in the face of the enemy," when speaking of war vessels, is seen by the accompanying illustration of the bow of the U. S. S. "California." The hawser holes have the appearance of eyes and the anchor resembles the teeth of some large animal. The effect is not so pronounced at all times, but is frequently noticeable from certain angles.

Warship's Stern "Face" to Challenge the Enemy; Bow of the U. S. S. "California"

Musical Instruments, Connected to the Amplifier on Radio Set. Are Said to Reproduce Tones of the Original Pieces More Faithfully, for Better Reception of Orchestra and Solo Numbers

## MUSIC BY PHANTOM ORCHESTRA LATEST RADIO NOVELTY

Improved reproduction of radio and phonograph music is claimed for the "phantom orchestra" an eastern inventor has devised. It is an assembly of twelve musical instruments, each one serving as a lond speaker to reproduce the tones played by a unit of the same kind in the uriginal orchestra. The important theory of operation is that each instrument will respond to the vibrations of tones it is
made to produce, that is, the violin as a loud speaker will reconstruct the resonant tones of a violin, and the cello, piano or other pieces will function in the same way. To operate the wind instruments, a vibrating diaphragm is placed across the mouthpiece. Music from the radio set or phonograph is amplified by vacuum tubes and then transmitted to the manless orchestra. In a recent test of the plan. listeners said that the timbre and individual tone characteristics of the various pieces were rendered with remarkable fidelity.

## PRONGED BAND TO HOLD JAMBS ELIMINATES NAIL HOLES

For fastening the jambs of doors or windows, shelving and other installations, a band with spreading prongs at one end has been introduced. It eliminates hammer marks, saves puttying up nail holes and can be
 driven in without splitting the wood. The prongs spread as they are forced in, insuring a firm hold. The bands can be
more quickly applied than nails and consequently save both time and work for painters and carpenters, as well as for home mechanics.

## NEW USE FOR RICE HULLS

To facilitate the dumping of wet, sticky soils from automobile trucks, engineers, working on a grading contract in California, scattered rice hulls, a waste product, in the trucks. Being slippery, the hulls proved entirely satisfactory and a light covering of them was found sufficient to cause the soil to start slipping out when the truck bottom was raised.

Father Francis H. Tondorf, of Georgetown University. America's Most Famous Earthquake Observer, with His Exceptionally Sensitive Galitzin Vertical Seismograph

WTHERE will America's next great earthquake hit, and what will the damage be?

In seismological laboratories scattered from coast to coast, patient observers are recording on smoked paper the earth temblors of all the world in an effort to find an answer to those two problems.

The answer to the first is being slowly pieced together from the study of each year's quakes, their probable causes, and other data which may eventually solve the riddle of why and when an earthquake is to occur.

The answer to the second will depend largely on the use to which the country puts the solution of the first, for damage will be lessened in direct proportion to the precautions taken in earthquake zones to build shake-proof houses and offices.

One of the dozen greatest earthquakes of all times occurred little more than 100 years ago in the heart of the Mississippi valley, yet damage was very slight, simply because the country affected was sparsely settled. That was the New Madrid. Mo., quake of 1812 , which was responsible for the formation of Reelfoot lake, in northwestern Tennessee, and for the sinking of all northeast Arkansas and southeast Missouri, a region still known, therefore, as the Sunken Country.

Last year, at the height of the Missis-
sippi floods, the same region suffered another quake, this time a slight one, which did no particular damage. A heavy temblor in the same zone, according to E. Lester Jones, director of the United States coast and geodetic survey, might shake down old and poorly constructed buildings within that area.

That practically quake-proof building is possible was demonstrated during the great Japanese earthquake of 1923 , which did such enormous damage to Tokyo and Yokohama. Steel and concrete buildings came through the disturbance with slight damage, while more flimsy structures fell in ruins and then burst into flames which spread into a new trail of destruction.

Fire, and not the shaking, is responsible for a great part of the loss of life and property when a quake rocks a densely populated modern city. Stoves and open fires spill live coals into the ruins, broken gas mains are touched off by chance sparks, and, at the same time, the water mains are broken and rendered useless. As San Francisco found in 1906, only dynamite and back-firing can stop a conflagration under such circumstances.

The Japanese government took the lessons of that quake to heart, and rebuilt the destroyed capital along modern lines. Residential, commercial and industrial districts were segregated, six great avenues,

shaken down with ease. The number of houses totally destroyed by the quake was 128.266. while 447.128 structures were claimed by fire.
The year 1925 was notable for a numlier of fairly strong shocks in the United States and Canada, as well as another destructive quake in Japan, and out of that year's activities grew the present earthquake survey being made by the Carnegie Institution, the coast and geodetic survey and the Engineering-Economic Foundation. The same year saw earthquake insurance established in the United States, with the Woolworth building insured for $\$ 5,000,000$. The survey so far has been carried out mainly in California, with both state and federal governments co-operating. Another survey has been started in the Mississippi valley, where Dr. James B. McElwane, S. J.. president of the Seismelogical Association of America, has opened a new recording station at Floris-
sant, Mo., near the New Madrid "fault." The Jesuit fathers are the most numerous earthquake observers in the United States, and probably in the world. Their universities have seismographs scattered all over the country, with the center of activity at Washington, where Father Tondorf, of Georgetown University, is usually the first to announce each successive quake.

That there is a relation between widely scattered disturbances seems certain. The best explanation of their cause is readjustment of the earth to relieve the strains and stresses of internal pressure. The crust slips and slides, sometimes in a limited locality, and again over a wide area. The Montana quake of June 27, 1925, while severe, did not cause any vast damage, aside from loss to the railroads whose canyon tracks and tunnels were damaged to a serious extent.

Two days later, and hundreds of miles

Watching Quakes on the Pacific Coast ; Prof. J. M. Jung, S. J., at Gonzaga University, Spokane, Wash.
away to the southwest, Santa Barbara. Calif., was visited by a destructive temblor, with further shocks the following day. Santa Barbara is located on the great San Andreas fault, stretching for 600 miles through the Coastal range, passing just west of San Francisco, east of Los Angeles, and, finally, an indeterminate distance into the Gulf of Mexico. The great quake of 1906 occurred along the San Andreas rift, taking in a stretch of some 150 miles with San Francisco near the center. One side of another well-known geological fault extends approximately along the line of the Hudson river. There is the possibility that some time during the Ice Age the New York side slipped under the strain of a terrific tremor. However, today the geological position of Manhattan island and the surrounding territory is such that about the only danger of even a slight quake comes from the fact that Mother Earth may decide to do a mild
"black bottom" in the vicinity of northern New England, just as she did in February, 1925.

Late last fall, representatives of twenty-nine nations, meeting at Praha, Czechoslovakia, proposed a plan whereby the mysterious ocean canyons, or "deeps," are to be probed soon in order to trace their possible connection with earthquakes. Farreaching and deep-set are the canyons. The Aleutian deep, largest in the Pacific, extends for 1,500 miles and is five miles deep. The Nares deep, largest in the Atlantic. falls more than five miles. Other great depths are off the coasts of Mexico, Java and Sumatra. Since three-fourths of thie world's earthquakes have their cradle in the sea and particularly in the Pacific. the probe should be of great importance. New seismograph stations will be established and those on hand improved, so that, when a quake occurs, its location may be determined.

Also last fall, Prof, Akitune Imamura, of the Tokyo Imperial University, announced that Prof. Ishimito, one of his colleagues, had developed an instrument called the clinograph, which was capable of producing an earthquake warning prior

Series of Wavy Lines across the Seismograph Chart, Marking the Vibrations of a Distant Earthquake

EARTHQUAKES OF MODERATE FREQUENCY AND MAGNITUDE
EARTHQUAKES RARE OR UNKNOWN
EARTHQUAKES FREQUENT, SOMETIMES DESTRUCTIVE
QUAKE ZONES
to the shock itself. Prof. Imamura pointed out that a short time before an earth tremor occurs, a slight tilting of the earth's surface takes place. The clinograph's function is to detect this.

The movement in America in recent years urging the serious study of the art of earthquake-proof construction is, after all, an echo from the ancients. The earthquake menace has been present ever since the world begaa cooling off. Pharoah Cheops, who achieved the famous pyramid at Gizeh, without a doubt built it because he wanted a final resting place that would withstand the ravages of earth tremors. For a similar reason, the Mayas of Central America built pyramid-shaped temples of unusually thick walls.
While earthquakes are sure and inevitable as the daily rise of the sun, it is heginning to look as if man, with his ever-increasing knowledge about them, may one day win in his battle with the centuries-old menace.

Earthquake Map of the United States, and Father Tondorf Studying a Quake Record; the Black Spot at the Mississippi-Ohio River Junction Marks the Scene of the New Madrid Disturbances

## CASHIER TRAPS BANK BANDIT BY RAISING HANDS

Raising the hands at the command of a bank bandit, proves costly for the gun-
 Hands, Alarm Is Sounded; Relay Unit at Right
man, with an alarm system an eastern inventor has introduced. As the cashier lifts his arms, his hands, coming close to a rod on the wall, create a magnetic disturbance which causes electrical relays to function and operate an alarm. The signal is also repeated at police quarters to summon aid. The apparatus is hidden from the bandit, and as he cannot hear the alarm, he is not likely to molest his victim as long as his orders are obeyed.

## TELEVISION LINKS SHIP TO LAND IN SUCCESSFUL TEST

How would you like to be halfway across the ocean, perhaps a bit out of sorts, and then suddenly see the face of your best friend smiling at you from a screen? Such thrills may be the common lot of ship passengers in the near future. for television already has linked the liner "Berengaria" with land in this way. Stan-
ley Brown, chief radio operator of the ship, enjoyed the thrill of his life when he saw the face of his fiancee, Miss Dora Selvey, on the test screen with which television experiments were being conducted. She was in the broadcasting studio in London, many miles away, but he recognized her distinctly, even her special way of dressing her hair, and when she turned so that her profile came in view, others, too, identified her. According to John L. Baird, inventor of the apparatus used in the tests, it is now only a matter of time until one-half of the world will be able to see as well as hear what the other half is doing. He

believes that the day is not far distant when persons crossing the Atlantic will be able to see, in colors, all sorts of performances, such as games, parades, meetings and other events worth recording, that may be happening on land thousands of miles away.

CThose wishing further information on anything described in the editorial pages can obtain it by addressing Bureau of Information, Popular Mechanics.

## COAL MINED WITH FROZEN GAS AS POWDER SUBSTITUTE

Marked reduction in coal mining hazanls is seen in the development of a process for extracting the coal by means of frozen liquid carbonic gas instead of with dynamite. While the method is still in an experimental stage, engineers believe that it has great possibilities. The liquid gas. contained in a steel shell, is inserted in a four-inch hole, drilled in the coal. The vapor is far below the freezing point and has a pressure of 2,000 pounds to the square inch while in the shell. By means of an electric fuse, the temperature of the gas is raised to a point where the pressure is increased to 20.000 pounds to the square inch. A plug of softer metal in the shell gives way at this pressure, and the gas trwhes out, breaking up the coal. Experts point out that, if this process proves successful, it will greatly simplify the actual work of getting the coal out.

## GREENHOUSE RUNS ON WHEELS AND PROTECTS PLANTS

Patrons of a London florist are served by a traveling greenhouse which is driven to their doors and the order delivered directly from under the glass. The plan saves wrapping and handling the plants unnecessarily, keeps them fresh and protected from unfavorable weather, and the sight of the auto greenhouse attracts attention as it passes through the streets.

His Traveling Greenhouse Keeps Flowers Fresher and Is Attractive

Window in Umbrella to Make Walking Safer on Rainy Days; It Is of Unbreakable Transparent Substance

## WINDOW PANES IN UMBRELLAS TO PREVENT ACCIDENTS

Persons carrying umbrellas are protected from collisions with other pedestrians and cars by a small window in the canopy. It affords a clear view when the umbrella is opened up, even if it is held down in front.

## STUDY BOWLING BALL'S MOTION TO IMPROVE GAME

Science has been making an analysis of bowling to determine the rate of speed of the balls, how much they curve and other interesting factors about them. Dr. L. W. Taylor, of Oberlin College, has devised an apparatus whereby the passage of a ball is registered to the hundredth of a second at twenty-inch intervals down the alley. A catapult is used to propel the ball. From facts so far learned, some of the accepted theories with regard to a ball's motion have been found incorrect, but friction seems to vary with the speed.

THIS AUTOMATIC AGE AND MACHINES THAT

Football Game in Progress on the Roof Playground; the Space Is Also Used for Tennis and Cricket, and Proves a Valuable Feature of an English Settlement House

## ROOF SERVES AS PLAYGROUND FOR FOOTBALL AND TENNIS

Tennis, cricket and Rugby football are played on the roof of an English settlement house. A screen over and about the area prevents the balls from falling to the street, and the space is large enough for a number of players at one time.

## EXTENSION LIGHT CORD IS FLAT TO FIT UNDER RUGS

Longer wear for the cord, improved appearance and less wear on the rug or carpet are afforded in a rubber-insulated extension cord that is flat instead of round. There is less tendency for the wires to

Electric Cord in Form of Flat Tape Slips under Rugs with Little Trouble and Decreases Wear
break and the material is suited for connection with electrical appliances of all kinds as well as for floor lamps.

## FAULTY TESTING OF AIRPLANES ONE CAUSE OF CRASHES

Army test pilots deliberately try to wreck the planes while they are in the air. in order that the severest tests possible may be applied. By the time the trial flight is over, the tester knows practically every characteristic of the ship. England and Germany both have a special testing bureau for commercial planes as well as military ships, and the establishment of a similar institution here has been recommended. It is believed that failure to give the ship an adequate test is one explanation of some of the mysterious crashes that occur in planes thought to be entirely safe. Not long ago, a Mexican pilot, flying at high altitude, in an effort to penetrate fog and clouds, nearly fell to his death when the ship stalled and plunged into a tail spin. It fell 5,000 feet
in a few seconds, the descent being so rapid that the pilot was pinned against the side of the fuselage and almost unable to move. But at 3,000 feet, he managed to bring the plane out of the spin and continued his journey. The structural parts of the ship withstood the fall without damage, but its tendency to spin had not been discovered before the flight.

## MOTOR SAWS THAT CUT STONE SPEED CATHEDRAL WORK

Motor-driven saws, drills and planes are used in cutting stone for the modern building. How they save time and expense is illustrated in the work now being done on the Washington cathedral. The builders' specifications call for more than 260,000 blocks, weighing from 300 to 500 pounds apiece. The plain ones cost approximately $\$ 10$ each and the more elaborate $\$ 300$, while many thousands of molded and carved stones, costing from $\$ 50$ to $\$ 100$ each, will be required. As each block is cut and shaped, it is given a number to correspond with that on the blueprints. Building the stonework on the cathedral is thus simplified, the task being somewhat like that which pleases the childfitting blocks together.

## ELECTRIC DRILL POLISHES AUTO WITH SHINING DISK

By the addition of a patented disk to the electric drill, an effective polishing unit for
 the automobile is quickly formed. The disk will fit any drill chuck up to one inch, and is used in connection with a rubbing compound and water, to loosen the grime and dirt. A lustrous surface is the result of the treatment, at a minimum of hand labor.

Indian Profile Formed of Cigar Bands; a London Woman Makes This Unusual Craft Her Hobby

## PICTURES FROM CIGAR BANDS FORM UNIQUE GALLERY

One of the oddest picture gaileries in the world is to be found in the home of a London woman who has been collecting cigar bands for the last twenty-five years and making portraits and other designs from them. Her showing includes some 150 pictures, and the bands from which they are fashioned came from cigars smoked by famous Englishmen and others in all parts of the world.

## RAPID PHOTO-PRINTING PRESS ELIMINATES TRIMMING

Operated on the same principle as a job-printing press, a rapid photographprinting unit causes the negatives to register with a uniform margin on the paper so that trimming the prints is not necessary. Paper is fed on a
 platen and, with pressure of the left hand. is brought in contact with the mask and negative.

ULTRAVIOLET RAY "DETECTIVE" REVEALS FORGED CHECKS

Part of the Ultraviolet-Ray Apparatus in Which Fraudulent Checks and Other Articles Are Detected
Further practical use for the ultraviolet rays has been discovered in the field of criminal investigation. With a specially constructed instrument, the rays can be made to reveal forged checks, counterfeit money and other fraudulent articles, including adulterated liquors. This is accomplished by the peculiar reaction of the rays on foreign substances of various kinds as compared to their effect on genuine and ordinarily used materials.

## MAGIC DRAFTSMAN TRACES MAP DIRECT FROM PHOTOGRAPHS

What experts declare will be a great aid to the aerial surveyor, and others, is a drawing instrument that reproduces an accurate contour map from stereoscopic photographs. The photos are observed through special eyepieces, with the result that an apparently solid model confronts the observer. A floating mark is then manipulated, seemingly in contact with any part of the scene, and its movements are automatically registered on a sheet of paper on the drawing board. The operator, using the elevation above sea level from which the photographs were taken, as a starting point, may then adjust the floating mark to any desired elevation, say, 1,000 feet above sea level, and trace that
level along the mountain or whatever subject he is studying. The instrument works with photos taken from the ground as well as from the air.

## FOOTPRINTS TELL OF ANCIENT LIFE IN GRAND CANYON

Slabs bearing the imprint of reptile foot marks have been found in the Grand canyon of Arizona, about fourteen miles from the site of previous discoveries of thin kind. They correspond with other track, already uncovered, but further study will have to be made to determine if they match exactly. In all, some thirty-six species of animals that lived many thousands of years ago, have been identified by means of these imprints. An estimate as to their age is made by the character of the soil in which they are found.

## CONE-SHAPED ICE-CREAM STAND ATTRACTS MOTORISTS

A conspicuous roadside feature along a motor highway, near Los Angeles, is a refreshment stand shaped like a huge icecream cone. Cones exclusively are sold here and, besides affording an attractive display, the booth is well constructed for shelter and to shed rain.

To Catch the Eye of the Hungry Tourist; Refreshment Stand Shaped like Ice-Cream Cone
 ing, and the smooth ride
through the air is far less likely to injure the sufferer than other means of transport.

## SHOES OF OLD AUTO CASINGS GIVE LONG WEAR

Peasants and others in Mexico and Greece have found another practical use for old automobile-tire casings, by converting them into sandals. The demand has become so great that, last year, more
than 50,000 casings were imported at Saloniki, Greece, alone, because the local supply was insufficient. In Mexico, there are enough automobiles to provide the material. The tire shoes wear from four to six times as long as those made of hide, and also offer better protection against dampness. A durable portion of the casing is cut off, and straps attached and bound about the feet. One tire will make at least three pairs of sandals.

Where Bundles of Paper Money Are Quickly and Accurately Counted by Machine

## BANK'S PAPER-MONEY COUNTER SAVES TIME AND LOSS

To count packages of paper curidncy: sent to the federal reserve banks, mensif tive apparatus that sorts certificates with greater accuracy and speed than would be possible with human hands, has been used with great success. Since its installation, it has never made a mistake. It is so adjusted that if two bills are passed through together, the difference in thickness causes the machine to stop. At the end of each 100 count, the apparatus again locks automatically until another package is put in. Bills unfit for further use are sorted and, if there is a shortage or excess number in a package sent to the bank, the fact is always revealed. One of the machines has paid for itself, as any shortage is charged to the bank sending the money.

## MAGIC TUBE RAYS EQUAL TO TON OF RADIUM

High-voltage tubes, giving off radiations equivalent to those of a ton of radium, worth $\$ 56,000,000,000$ at present prices, may be produced
in the laboratory, according to Dr. William D. Coolidge, inventor of the X-ray tube now in general use. The prediction follows his successful development of a 900,000 -volt cathode-ray tube in which electrons are shot along at the rate of 175,000 miles a second, some 350,000 time faster than an army-rifle bullet. The racing electrons are emitted through a metal window, one ten-thousandth of an inch thick. A lead telephone booth is provided to shelter observers from the strong X-rays produced when the electrons strike a target. This "super-power" tube is ninety-five inches long and has three bulbtwelve inches in diameter. Electrons, speeding from the first, are accelerated bs the introduction of a high-voltage current into the second bulb. The process is repeated in the third, until at the end, the effect of 900,000 volts is obtained. Dr Coolidge believes that much higher voltages can be used without serious difficulty It has not been possible to imitate radium radiations with complete success, because of the use of insufficient voltages. The new tube opens a vista of alluring possibilities, Dr. Coolidge declares. He point out that the rays can be controlled, something that cannot now be done with ra dium, as scientists have no physical or chemical agency that affects either the quality or the quantity of the output of radiations from radium. Chemical, thera peutic and other uses for the rays will be developed, Dr. Coolidge believes.

View of the $900,000-$ Volt Cathode-Ray Tube; Note the Three Bulbs, Used to Step Up the Speed of the Electrons

ends. Now bend it about threesixteenths of an inch from the original point, and, with a small hammer or other weight, drive the newly sharpened end of the longer leg into the top of the pencil, about midway between the lead and the edge of the wood.

Holding the pencil in one hand. cup the other by bending the fingers upward at right angles to the palm. Push the pin point through the loose fold of skin in the palm of the hand, and you are ready for the demonstration.

So long as you keep the fingers slightly bent the pencil will lie flat along the hand, but the moment you start to straighten them out, the fold of skin is stretched taut and the pencil begins to rise.

Here is how the effect works:
"I have here a couple of ordinary pencils with which I can demonstrate the power of static electricity over graphite and wood. I will pass out one pencil and you can follow my motions and prove for yourself that it really works. Place the butt of the pencil at about the palm of the hand-soand allow the length of it to lie

After two or three experiments using this tiny hook, the performer drops the pencil on the floor and rolls his foot over it. "This," he states, "is to give the pencil more magnetic power." But, don't believe him! What it really is for is to roll the little hook out flat.

To show how magnetic the pencil now is, the performer makes it cling to his finger tips. Without the hook? Sure! Simply hold it as shown in the photo to the right on this page, pressing down with the second and third fingers and out with the fourth and first.

A variation of the magnetic pencil trick, which always mystifies, requires two pencils, exactly alike. Get a pair with plain ends-no erasers or metal caps. Sharpen them to the same length, lay one aside, and you are ready to prepare the other. Take a common pin, cut off a half inch, measuring from the point, and sharpen the cut end, so you have a piece of steel, half an inch long and pointed on both
along the fingers. Now rub the other hand briskly over your coat sleeve, just as I am doing, to gather a charge of static. Then pass the hand above the pencil and watch it come up."

Making an Unprepared Pencil Cling to the Finger Tips Is Easy, If the Fingers Are Placed Juast So

## POPULAR MECHANICS

As you pass the "charged" hand above the other, you slowly straighten the fingers and the pencil slowly and smoothly rises until it stands erect on the palm. As the charge wears out, you can let the pencil down by bending the hand, and then repeat the process. The pencil can be removed at any time, and often can be passed around for inspection without the pin point being detected.

Mr. Pencil is assisted in the next effect by a playing card, and an envelope just large enough to hold the card.

The card is placed in the envelope and the envelope is sealed. The pencil is then thrust completely through the envelope and card and pulled out on the other side. And, yet, when the envelope is torn open, the card is found intact and unharmed! Darn considerate, this fellow, Pencil!

This is simple. Beforehand you must carefully slit open the bottom of the envelope. Now you're all set to go. Place the card in the envelope, being careful not to push it through the slitopen bottom. Not yet. Seal the envelope. Hold it up for inspection. Then take it
in the left hand. Allow the card to slip halfway out of the envelope, concealing it with the hand as shown on this page. Do the "Indian Basket" jabbing feature, pushing the pencil through the envelope immediately above the card. Remove the

 pled-up envelope is, of course, tossed carelessly away out of reach of the audience.

This next one is called the "Flexible

Making One Line in the Palm Grow into Two, While Another Vanishes from the Back of the Hand
it, as shown on page 997. The loop should be about half the length of the pencil. Now, if you will put this loop of string through your buttonhole, you will see how obviously impossible it is to put the other end of the pencil through the loop and thus fasten it to your coat.

But it can be done! Turn your back to the audience. Pull a piece of your coat through the loop, then place the pencil through the buttonhole as shown in the center and bottom photos on the same page. And there you are!

Say, I'd almost forgotten. Pencil's wife, Mrs. Pen, is with him tonight and she's standing over there in the corner all by her lonesome. A wallflower! Say, we can't have this.

The performer borrows a fountain pen. He draws a line on the inside of his hand. He closes his hand. He makes a similar line on the back. Then with a handkerchief he rubs off the line on the back of his hand. But too late; the line has already gone through, and the performer shows the two lines in the palm of his hand.

This one is almost too easy. Make the line on your palm across one of the large creases, as shown on this page. Use plenty of ink. When you close your hand, the line will automatically

Different Applications of the Clamp and Block, Showing How It Is Adapted to Many Tasks suitable for home, bench or machine use and is adapted to a wide variety of articles. For instance, it may be employed to hold smal! pieces of iron for bending, lengths of pipe, rods, flat pieces for drilling holes, and for many other purposes. The unit is of steel and occupies little space in the tool box.

## EGYPTIANS BEST GLASS MAKERS OF ANCIENT CRAFTSMEN

Glass makers of Tut-ankh-Amen's time and before, were the most skillful of all the ancient craftsmen, according to a German professor. Hè has made a number of tests and analyses of samples of old glass manufactured by the Egyptians and the Romans, down to about 850 A. D., and has found that most varieties had one common fault. There was too much alkali in the mix, resulting in a product somewhat too soft, with lower resistance to corrosion. One reason for this was that the wood-fired furnaces did not develop a sufficiently high temperature without adding high alkali content to get the ingredients to melt together. From early times until the beginning of the Christian era, much glass was used for ornamental purposes and for jewelry. A wide range of colors was available, but the ancients could not make clear glass because they did not know how to remove the impurities.

## DISK GRINDER CATCHES DUST AND PROMOTES SAFETY

For grinding a wide variety of small metal or wooden parts, a horizontal disk unit that is portable and operated by an electric motor
 through a lighting socket, is equipped with a bag at the side to catch the dust. In addition, it has a convenient support for the arm to expedite feeding, and the edge of the disk is inclosed in a housing for the purpose of safety.

## LETTER BOX SINGS AND TALKS TO ADVERTISE AIR MAIL

Equipped with a radio loud speaker, a letter box in Cincinnati sings and talks the praises of the air mail to encourage persons to use the service. The box is placed in a conspicuous position in a public square and attracts hundreds daily.

Ringing Bell to Announce That the Golf Course Is Clear; High Trees Make the Signal Necessary

## RING BIG BELL ON GOLF COURSE WHEN GREEN IS CLEAR

Players on the golf links in Jasper national park, among the Canadian rockies, are required to use a big-gong signal to inform others when the green is clear at a "blind hole." This is necessary because of the trees that hide the green.

## SUNSHINE HOOD FOR AUTO TOPS ADDS PLEASURE TO DRIVING

Fitted to the top of the touring car, a special frame unit has been devised which allows the driver to throw the front part of the canopy back to admit the
 sunshine. It can be closed as easily, making it unnecessary to shift the entire top. It fits almost any movable top.

Spraying Mold with Compressed-Air Gun ; a More Even Dusting Is Accomplished in This Way

## SPRAY GUN FOR DUSTING MOLDS AIDS FOUNDRY PROCESSES

Economy of time and materials is the chief advantage claimed for a spray gun to apply dust to molds in foundry operations. It is similar to the units employed for liquids, being run by compressed air, and
is controlled by a squeeze-trigger valve. It is effective at practically any angle, uses various kinds of dust and prevents the formation of defective castings, as it reaches every part of the mold so that burning on of sand is less likely to occur.

## FIVE-MOTORED TANDEM PLANE TO CARRY TWO HUNDRED

Tests are being made with a model of a tandem airplane, planned to carry 200 passengers besides the crew, and to make nonstop flights of 13,000 miles and more. It is to be equipped with two sets of wings, five motors, three in front and two on the rear set of wings, and will weigh 72,000 pounds. Tanks for 7,500 gallons of fuel are to be provided. A cruising speed of 100 miles an hour is expected with the five 400 -horsepower motors. The inventor has arranged the craft so that it can be converted into a bombing plane in a few hours. As such, it would carry 35,000 pounds in bombs, he declares. An experimental ship to cost $\$ 250,000$ is proposed, and a trip to Tokyo and Paris from Los Angeles in eight days with a crew of eight men is anticipated. The craft would have a fuselage 116 feet long, and a wing spread of ninety-six feet.

Model of the Tandem Plane, Which, the Inventor Hopes, Will Be Able to Make Long Flights and Carry 200 Passengers; Three Motors Are in Front and Two Behind

## Filament Control for A. C. Tubes Eliminates Power Rheostats

An automatic filament-control device, for a.c. tubes of the 226 and 227-types, is now on the market. These tubes are extremely critical as to filament voltage and the control unit will greatly prolong their life. It is designed to compensate for any voltage or current fluctuations, due to inaccuracy in transformer windings, line surge, or overload, that are likely to shorten the life of the tube filaments. Automatic control devices for the standard d.c. tubes are now in general use because of their convenience in eliminating rheostats where possible; the new a.c. unit is required more as an actual protective device. No cumbersome power rheostats, lieretofore considered essential for these tubes, are needed with the new device.

## Midget Speaker Is Five Inches High

An interesting radio novelty in the form of a midget loud speaker, weighing only a few ounces, has appeared on the market. It is handy whenever small volume is desired and takes the place of headphones in such cases. The speaker also has many
 possibilities as a means of amusement: being so small, it may be concealed in lamp shades or drawers, under tables and in other places where unexpected talking will puzzle those present.

## New Clip-Mounting Resistors Are Wire-Wound

Wire-wound resistors of the clip-mounting type, in values up to 5 megohms, are now available for the set builder. Of sturdy construction, unerring accuracy and ample current-carrying capacity, these units are especially suited for plate-voltage regulation. The fine wire necessary to produce these calibrated units is one-third the diameter of human hair. It is claimed that the resistor cannot possibly break down and will outlive the receiving apparatus in which it is used.

Free-Edge Cone Speaker Installed in Cabinet Designed in Gothic Style

## New Cone Has Free Edge

The new speaker shown in the photo employs a free-edge cone or floating periphery, eliminating "nodal" or dead areas. The driver or connecting rod is very short and high efficiency over a wide range of frequencies is claimed for the instrument. Many of the low notes usually lost in speakers of the older types are brought out by the newer types now available, such as those produced by the bass horn, the bass viol and the cello.

## Preventing Charger Hum

The usual bulb-type charger sometimes produces a slight hum, especially for the first half hour it is in operation. This may be eliminated by the simple method shown in the illustration. Four wooden spools are placed against the sides as shown, and a wire is drawn tightly around the case over
 the ends of the spools. This will reduce vibration to a minimum.

SOME UNAVOIDABLE TROUBLES

ALIGHTNING discharge in the immediate vicinity of a radio receiver produces a loud crash in the speaker. More distant discharges produce irregular, frying sounds. This is static. Sometimes the air appears to be entirely void of signals, although no abnormal noises are evident in the receiver. Static, then, intercepts radio signals and prevents them from reaching the receiver. This may be likened to the interception of a light beam by high waves, as shown in the sketch on page 1003. Such conditions may be local, existing in a small territory of a few square miles, or they may cover an area of several thousand square miles. Static is usually more troublesome during the summer months than during the winter, and it is also more evident in tropical and semitropical regions than farther north.

Long aerials pick up more static disturbances than

short or indoor aerials, or loops. There is really no method of eliminating static at present, although some devices on the market are supposed to do this. However, the effects of static in a receiver can be reduced to some extent by shortening the aerial and connecting a small-capacity condenser in series with the aerial or ground lead. It is also a good idea to use a fixed resistor and condenser across the aerial and ground, as shown in Fig. 1, which will tend to by-pass severe static discharges.

You may have noticed, when a distant station is tuned in on a receiver, that the signal varies in volume, sometimes becoming almost or entirely inaudible, but finally coming back again to its original volume. This is called "fading," and is caused by varying atmospheric conditions between the receiver and the broadcast-

ing station. Sometimes the signal strength of the station varies, and this is mistaken for fading. When this trouble is noticed, (1) not attempt to increase the filament current of the tubes beyond the proper operating point or to retune the dials, for the signal may then be lost entirely.
Certain spots on the earth's surface are apparently impervious to radio signals, and these are called "dead spots." About fifty of these have been charted in North America. and they have usually been found accidentally, so that it is probable that there are many more. One of the largest dead spots is located a little south of Hudson bay in Canada; another is over the ocean off Atlantic City, and a third is in the vicinity of Camden, N. J. There are numerous dead spots in Mexico and the southwestern states. A map giving the approximate location of dead spots in California is shown on this page. Radio signals can be received all around these, but the dead areas cannot be penetrated, even when receivers are placed close to their boundaries. These phenomena exist both on land and sea, but the cause of them has not yet been determined.
Sometimes it is impossible, in a certain location, to get reception on a radio set which has been found to work elsewhere, and in such cases it is possible that the particular location of the instrument is shieded from external electrical impulses, and hence the receiver cannot pick up radio signals. This is usually the case when a loop-operated set is installed in a steel-skeleton building. The steel absorbs most of the energy and grounds it. Like effects are often evidenced in receivers located in the vicinity of large deposits of metal in the earth.

One of the most frequent interference
troubles is that experienced from reradiation of regenerative receivers. All receivers, which feed back some of the plate current from one or more tubes into the aerial, either directly, as is the case with the ultra-audion hookup, or indirectly, as is the case with three-circuit tuners, are regenerative. When these receivers are operated improperly, the tubes oscillate and the aerial is charged with a high-frequency current, which is radiated in the air for many miles, and is picked up and amplified by all receivers in the vicinity. This interference causes either a steady howl or a whistle ; or, if the tuning dial on the offending receiver is being rotated, "mocking-bird" whistles of varying intensity will be heard in other receivers.

The trouble cannot be eliminated at the receiving end, although it can be reduced to some extent, but it can usually be effectively counteracted at its source.

As a general rule, it is caused by turning up the tubes too high. The use of a nonreradiating unit on the offending receiver is an effective cure.

## Homemade Ground Clamp That Grips

Most radio ground clamps are adjustable by means of a screw or bolt, and, in time, will slip or loosen. But the one
 shown in the sketch, which can be made in a few minutes by anyone familiar with tools, is so designed, that, once in position on the water pipe, it will stay put, insuring a good, tight ground connection. If the clamp is to be used around the usual $3 / 4$ or 1 -in. pipe, cut a strip of fairly heavy sheet copper or brass, the size and shape indicated in the drawing. The main portion is 1 in . wide and the distance between the two end lugs is slightly more than 1 in . Drill four holes in this part, as shown, and fasten a binding post in the center. When completed, double over the lugs and rivet them together to form loops. Wrap the clamp about the pipe and pass a large steel cotter pin through the loops. Then push the pointed end of the strip through the slot in the pin and turn it down. Push a nail through the eye of the cotter and twist until the metal strap is pulled tight about the pipe. Wire the nail to the pipe to retain the tension, and the result is a permanent ground connection.

## Inexpensive Radio Panels

Ten cents is surely a low price to pay for a good 7 by $16-\mathrm{in}$. radio panel. Such a panel can be cut from an asbestos shingle, and has been found to answer the purpose nicely. The shingle can be bought from any large lumber dealer, who usually will be willing to cut it to any size wanted. While this panel will require careful handling, it can be drilled easily even in critical places. Shingles may be obtained in several colors, and in contrast to black
dials give the panel a pleasing appearance. The dielectric effect is, perhaps, no better than wood for many radio purposes, but as a front panel for experimental sets, asbestos shingles offer a good substitute.

## Aerial Kinks

Fading of weak DX-signals is often caused by a swaying lead-in wire from the aerial. It is not a good idea to pull the lead-in wire tight to prevent this, as the strain on the horizontal part of the aerial would be too great, but if an additional insulator is placed as shown in the sketch, the lead-in wire may be strung as tight as the horizontal section without causing any strain on the aerial. The lower sketch shows a simple method of bringing in the lead-in wire without drilling holes in the building. Carefully untwist a few inches of the aerial wire, separate the strands and lay them out flat. Wrap an insulating sleeve made of a thin strip of rubber from an old hot-water bottle, or section of inner-tube, around the wires and fasten it with adhesive tape as shown. The
 insulated section is then placed on the window sill and the lower sash closed down tight over it. If not too bulky, the strip will not interfere with the closing of the window. Another advantage of bringing in the lead-in in this manner is that no soldered connections are needed. Note that the horizontal portion of the wire in the aerial proper, shown in the upper sketch, is looped through the end of the insulator and the lead-in wire is brought down to the set without cutting it. One continuous wire for the entire aerial eliminates high-resistance soldered connections; good reception of weak distant signals will depend largely on an efficient aerial and ground.

## Facts and Fads for Radio Fans

# Building a Perfect-Tone Amplifier 

## Ultra-Modern Power Amplifier Furnishes Undistorted Volume for Radio Sets and Phonographs

PERFECT tone, at power-amplifier volume, is now available to all owners who are looking for a means of improving their receivers or wish to provide amplifier volume sufficient to take the place of an orchestra for dancing parties. New developments in a.f. amplifiers and efficient socket-power devices have placed this source of reserve power within the reach of every owner. The combination resist-ance-coupled and push-pull power amplifier, as well as the power-supply and Beliminator unit, described and illustrated in this article, are the latest ideas in this line for the man who likes to build his

own. The power amplifier combines the advantages of a resistance-coupled amplifier unit, used as a voltage amplifier (giving the most uniform response over the a.f. range), with the excellent qualities of a push-pull transformer-coupled power stage. In this circuit the troublesome harmonics generated in the ordinary stage of this type are neutralized and cancel themselves, the two popular types of a.f. amplification being employed in the manner in which each is most efficient.
It goes without saying that, in a device such as this, any old resistor, condenser or transformer cannot be used; these instruments must be the best obtainable, noiseless, accurate and permanent. The coupling condensers must be of suitable capacity with a leakage resistance of several thousand megohms, and the push-pull transformer of proper design; of several types tried, those named in the material list gave the best results. The resistancecoupled a.f.-amplifier units are of the com-
plete-unit type with the fixed condenser already installed. All resistors used in the amplifier are specially selected for their purposes, some being of the wire-wound type; therefore, in this particular item, the builder should follow the material-list specifications closely. The power ampli-
and 18 in . long. If a bakelite panel is selected for this flat layout, use the subpanel brackets suggested, or short wooden dowel pins, to raise the panel so that most of the wiring may be hidden underneath. If the builder desires a cabinet type, the top bakelite panel will be $3 / 16$ by 7 by 18 in. Two side panels, $3 / 16$ by 3 by $173 / 4$ in., two end panels, $3 / 16$ by 3 by 7 in ., and six pieces of hardwood, $1 / 2 \mathrm{in}$. square and 3 in. long, are required. All instruments, except the five $1-\mathrm{mfd}$. condensers and the volume-control unit, are mounted on the top panel exactly as before. The photo of the

Top, Under View, Showing Simple Method of Construction; Below, Top-Panel Layout and Schematic Circuit Diagram
fier may be built in flat, or "breadboard," type, or as a cabinet unit such as the one shown in the photo on page 1007. In either case, the instrument layout is practically the same. The blueprint layout and wiring diagram show the instruments assembled on either a board or a bakelite panel, $91 / 2 \mathrm{in}$. wide

To 2. Complete Assembly, with All Tubes in Position Ready for Final Connections; Lower Left, Power-Supply Unit and B-Eliminator, Showing Arrangement of Parts; Right, Diagram of Connections
completed cabinet unit shows the volume control on the panel at the input end. The $1-\mathrm{mfd}$. condensers are mounted under the top panel, as shown in the underside view on page 1008 , but the circuit is wired just as shown in the blueprint in either case. A schematic diagram is also given on the same page for those who prefer it.
The construction of the cabinet as well as of the layout is so clear in the photos and diagrams that little further comment is necessary.
No. 14 round tinned-copper busbar is wed for the circuit with the exception of the filament leads, which are standard flexible rubber-covered hookup wire, twisted as shown in the diagram. Tape connections carefully to prevent shorts, and use spaghetti tubing to insulate any of the busbar wiring likely to cause a short.
Now that the wiring of the amplifier unit has been completed, we are ready to give our attention to the power supply. The designer has given a wide range of Alexibility to the power-amplifier unit, as it can be used with any radio set, either hattery-operated or of the latest a.c. socket-power types, as well as with phono-
graphs. The first two heater-type tubes require 2.5 volts a.c. for the filaments: if the receiver is of the kind using similar tubes, this voltage is already available, but if it is of the battery-operated type, a fila-ment-heating transformer such as shown on page 1010 must be provided. Note that transformers of this type also have terminals for $11 / 2$-volt and 5 -volt filament supply, so that it is a simple matter to use one of the standard harness arrangements and convert the receiver into the a.c. type if desired.
Any good power pack designed for the UX-210 or CX-310 tubes may be used; the high plate voltage necessary is 400 volts d.c., and a filament supply of 7.5 volts a.c. Ordinarily such power packs are designed for use with only one tube of the 310-type; the one specified in the material list, however, will handle the filament supply for both 310 tubes in parallel without undue heating. The power-supply unit is shown in the photo at the lower left on this page. and the simple wiring diagram is given at the right. The diagram is self-explanatory, as all specifications are given. This unit provides ample
power and is also a B-eliminator, supplying any other plate voltages required in the receiver.

A block of wood is placed between the power pack and the condenser bank as a support, the large, flat condensers being

Filament-Heating Transformer: Pencils Point to the Terminals Supplying 2.5 Volts
bolted upright to this block. When building this power supply, use wire sufficiently heavy to carry the current, and wherever busbar wire or bare wire of any kind is employed, cover it with suitable spaghetti insulation.

Remember that all tubes must be in the sockets before the house current is turned on, and the power-supply unit must not be touched without first disconnecting the house current. Never take a tube out of either amplifier or power-supply units unless the current is turned off : this also applies to the loud-speaker connections, as a very uncomfortable shock may result. The best rule to follow is to make all connections and adjustments while the current is off, and keep the device where small children cannot get at it. A double-output choke is used in the amplifier unit in place of the usual output transformer. Referring to the blueprint diagram, note that the B-negative of the power-supply unit is connected to A-negative of the radio set and also to the ground. Be sure to connect the $1-\mathrm{mfd}$. by-pass condenser just as shown in the diagram, so that the direct ground is only on the points stated. The
ground lead from the receiver must have the $1-\mathrm{mfd}$. by-pass condenser in series with it as a protection against short circuits, which may occur if both sides of the A-battery are grounded, or when a potentiometer is used for volume control. All necessary negative C -bias for the tubes in the power-amplifier unit are supplied by the resistors, and the plate circuits of stages one and two, being isolated, prevent feedback, oscillation and motorboating. An additional resistor shunts the push-pull-transformer primary, preventing howling, while the CX-327 heater tubes in the first two stages are coming up to operating temperature. The amplifier unit is free from a.c. hum except where the power transformer of the B-eliminator or the filament-heater transformer is located very close to the push-pull transformer; so, keep the fields of these transformers at right angles to each other.

To use this power amplifier proceed as follows: Take the audio tubes out of your set and disconnect the detector B-positive wire from the B-battery or the eliminator. Run a wire from the plate of the detectortube socket to the binding post, marked detector P , on the amplifier unit. Now run a wire from the B-battery or B-eliminator, using positive 90 volts on the detector $B$ positive post of the amplifier, and run a lead from the B-positive 135 volts to the 135 -volt post on the amplifier. Make the other connections, such as ground, a.c. filament-voltages, and 400 -volt supply as shown. Keep the speaker cord away from the input; if it is possible easily to disconnect the P-side of the transformer in the set from the detector plate, it is advisable. A spade soldering terminal under the P-binding post of the detector-tube socket will make a quickly detachable connection for the flexible lead going to the detector P-post on the amplifier unit. Note that when connecting the powersupply unit and filament-heating iransformer to the 110 -volt, 60 -cycle, a.c. houselighting supply, only one plug connection is necessary. Plug the power-supply unit into the socket provided at the rear of the small filament-lighting transformer and then take the lead from this transformer and connect it to the wall plug.

When the power amplifier is to be used for phonographic reproduction, the B-
positive detector and detector P-posts on the unit are not connected to the set or to the li-supply, but all other posts are left comnected just as shown. Place a magnetic pick-up device on your phonograph and connect it to the posts marked phonograph pick-up on the amplifier. The needle of this unit is placed on the record in the same manner as the usual tonearm. Keep the cord of the magnetic pick-up away from the loud speaker, or distortion will result, caused by feedback between the input and output.
Surprisingly little trouble will be encountered in building this power-amplifier device, if the wiring is carefully spaced to prevent interaction between the various circuits. One important point to watch is the socket contacts, which should make periect connection with the tube prongs. It is a good idea to bend the socket contacts together slightly before mounting the sockets on the panel, as a poor high-resistance contact will cause no end of trouhie and is hard to locate. Poor contacts caure oscillation and ruin quality.
The builder will feel well repaid when he hears the tone quality and volume delivered. and the designer believes that he is safe in saying that the amplifier will not lie out of date for several years to come, as probably the only important improvements will be in better tubes and speakers. While on the subject of speakers it is well to mention that a power-amplifier device of this type will give the best results on horns of the exponential type, with an air column of 5 ft . or more, or when used with the new small type power-speaker cones. If the builder is not interested in obtaining quite as much volume and power, the 171A-type of power tube may be substituted for the 310-type, and the only change necessary is to supply 5 volts a.c. instead of 7.5 volts for the 171 -tube filaments and use B-batteries or a B-eliminator delivering from 180 to 200 volts.

The complete list of materials used in the original model will be mailed to any address without charge. a postal will bring it to you. A large blueprint of the circuit diagrams and layouts may be obtained for 25 cents, to cover cost of mailing and packing. Address Popular Mechanics radio department, 200 E. Ontario st., Chicago. Specify blueprint No. 133.

Radio Console Showing Battery-Compartment Doot Open and the Location of the Safety Lock

## Hidden Lock for Radio Console

The use of B-eliminators and power amplifiers requiring high voltage and exposed wiring, often leads to severe shocks to the uninitiated who tamper with them. Small children especially almost always will investigate what they do not understand, and therefore I devised the hidden lock shown in the sketch. It is merely a wooden turnbutton screwed to the back of the power-compartment door, so that, when rotated, it will extend behind the center brace. To open or close this door, the hand is inserted through the other door as shown.-Harry G. Schultz, Astoria, Long Island, N. Y.

## Comfort Pads for Headsets

Radio listeners who use headphones often experience sore ears caused by the pressure of the hard bakelite surfaces
 when the phones are used over long periods. Soft cloth pads, fitted over the phones, as shown in the illustration, and held in place with rubber bands, offer a simple relief and absorb moisture that might otherwise corrode the metal diaphragm.

THESE valuable kinks have been written especially for Popular Mechanics Magazine by prominent radio experts. They represent not merely ideas, but practical advice from the best technicians in the profession on methods that will help make your set more efficient in operation, more convenient to handle or easier to build.

## Cone-Speaker Kinks

Most speakers of the cone type employ a holder or setscrew, with a small driving wire which runs from the actuating member to the cone through a bushing. If this rod or wire is not in the exact center, the cone will not reproduce as it should. Tune in a good loud signal and loosen the setscrew; if the wire centers, there will be little or no rattling of the cone diaphragm. If it is out of line, as indicated by the heavy vibration against the bushing, it may be centered by removing the screws holding the speaker unit and turning the latter until the rod centers, as shown by the cessation of the vibration; the screws are then retightened. The setscrew at the front is also tightened, and the result will be a much better reproduction. An output transformer between the set and speaker will greatly increase the handling range of the latter, as well as protect its delicate windings from the high-voltage d.c. current of the B-supply. There are times when a damping effect will prove desirable. This may be obtained by wrapping several layers of tape
on the driving rod. An easier method is to tape a small weight on the end of the driving rod, at the point of the speaker.-Peter Gioga, engineer, Station KSMR, Santa Maria, Calif.

## Forms for Low-Loss Coils

When winding coils on bakelite tubes, greater efficiency can be obtained by cutting slots in the tubes. These slots are $1 / 2 \mathrm{in}$. wide and may be cut with a sharp knife, razor blade or a scrollsaw. No
 binder is then necessary, as the edges of the slots hold the vire in position. Space the slots about $1 / 4$ or $1 / 2$ in. apart and make them as long as the coil to be wound; if two coils are to be wound on the same tube, two sets of slots are cut.-Herman R. Wallin, commercial radio operator, Brooklyn, N. Y.

## Spreaders for Cage Aerials

Quite often the radio listener is tempted to make a cage aerial but does not know what rings to use. I have discovered that Forfon-tractor transmission oil rings mav be used for this purpose, and they are avalable even in the smallest towns. The part number is S-345. They are thin steel plates. 5 in . in diameter, easily drilled and very light in weight. If the aerial is to be very long, the rings ma; be doubled at the ends, where the greatest strain will be. The rings are spaced 10 ft . apart, and each ring is drilled for the number of wires decided on by the builder. If a three-wire cage is desired, space the holes 51. in. apart around the circumference of the rings ; for a six-wire cage, the holes are spaced $21 / 2 \mathrm{in}$. apart.-E. Dale Trout, director, Station WLBQ, Atwood, III.

## Increasing Sensitivity in Tuned R. F. Sets

Many of the tuned r.f. receivers now in the hands of radio fans are extremely sen-
 sitive at the lower end of the wavelength scale and often squeal so hard that it is necessary to turn the sensitivity control far down. These sets, above 350 or 400 meters, are apt to lose sensitivity so that they are almost useless. This latter condition may be corrected by connecting a small variahe condenser with a maximum capacity of 40 or 50 mm . from the grid to the plate of the second r.f. tube. This will cause the receiver to oscillate more easily, and, therefore, can be used only as a regeneration control at long wavelengths.Bert E. Smith, engineer, Allen D. Cardwell Mig. Corp., Brooklyn, N. Y.

CPopular Mechanics' radio department offers its information service free to all readers of our magazine.

Above, Circuit Diagram; Below, Bakelite or Wood Bos for Instruments with Pin Jacks for Connections

## Homemade Volume Control

The sketch and diagram show a volumecontrol device that can be built by any amateur; the principle is that of a voltage divider, and it will introduce no distortion in the receiver. The tubes work at their specified voltages and are in no way disturbed by the control unit. The diagram above shows the simple circuit required and the sketch below indicates the suggested method of inclosing the device and providing jacks for quick connections to the set. The switch is of the push-pull type and is required when DXsignals are desired. For distant stations the switch is opened and the potentiometer arm is moved to the aerial side. In this position, the volume control has no effect upon the receiver. With the switch closed, the operator can control the reception from a whisper to full volume by adjusting the potentiometer arm.-E. Stuart Capron, engineer, De Luxe Radio and Equipment Co., Buffalo, N. Y.

## Battery Supply from Farm-Lighting Plant

The practice of using a six-volt block of the farm-lighting battery as the radio A-supply is not good unless the cells are shifted from time to time. If the same cells are used continuously, the block will
either be undercharged or the remainder of the battery overcharged. This systematic shifting is a tedious procedure and is seldom attended to. The diagram shows how it is possible to provide the same dis-

charge rate on all the cells and at the same time obtain approximately 26 volts of B-battery supply. If five standard $1 / 4-$ amp. tubes are used in the set, the variable resistance should be 50 ohms, of $1.5-\mathrm{amp}$. capacity. The filament rheostat in the set is then cut out entirely and the variable resistance is used to control the tube filaments. Additional B-battery units may be connected, as shown in the diagram, if desired. The energy consumed by the use of this method is only 40 watts, and the entire light-plant battery unit is discharged at the same rate. H. F. Olson, State University of Iowa, Iowa City.

## Caring for the A-Battery

While the possession of a trickle charger is of advantage, it does not mean that the storage battery may be neglected. In fact, it should have more attention, as most low-rate chargers have no provision for varying the rate of charge. As a result, the battery is often overcharged, or, in a few cases, slightly undercharged. A case where the battery was overcharged came to my attention when a trickle charger was hooked up to a battery supplying a standard five-tube set and then left unattended in a remote corner of the basement. The battery was continuously overcharged for weeks, and the result was

A Neat Tester Is Easily Made from a Flashlight Case, a Burned-Out Bulb and Some Scrap Parts
that the battery had to be sent to the shop for a new set of separators and some plates. A storage battery reaches full charge at a specific gravity around 1.300 , and at this point the acid becomes active and begins to attack the plates and separators. For best results, the battery should be alternately charged and discharged; in other words, it should not retain the same gravity reading over a long period of time. This may be avoided by hydrometer checking and charging periods so regulated that the battery is kept at a regular charge and discharge rate within a good operating range for the set. Disconnect the trickle charger for a short time each day or week, increasing the time that it is left disconnected until you find that you are occasionally bringing the battery down to about 1,150 , below which the operation of the set will be impaired. Attention to the storage battery will save repair bills and lengthen its life.-John B. Eccles, chief engineer, Station WJR, Detroit, Mich.

## Flashlamp Makes Pocket Tester

A neat little tester for condensers and transformers can be made as shown in the accompanying illustration. All that is needed is an old flashlight and a few parts that can usually be picked up about the bench. Remove the lens and its ferrule from the flashlight and take out the bulb. Break the glass from a burned-out bulb and dig out the wax around the filament posts. Then find the one connected to the tip in the center of the tube base and solder a flexible lead to it. Cut a disk of hard rubber the same size as the lens. Drill a hole near the center and fasten a double Fahnestock clip at one side. Run the bulb-base lead through the hole and then reassembe the flashlight as before but with the rubber disk in place of the len s . Lastly,
soliter a single-contact Fahnestock clip to the metal shell of the flashlight, ahead of the switch. Fasten a spring clip to the flexible lead from the disk and another to a second wire attached to the double clip. Then attach the phone cords to the two spring clips as indicated. With batteries in the shell, the tester is completed and ready for use. Simply attach the spring clip to the transformer or condenser ports, put on the headset and press the switch. The absence or presence of a click in the phones will indicate the condition of the part.-L. B. Robbins, Harwich, Mass.

## Twin Cone-Speaker Unit

The twin cone-speaker unit shown in the photo is now available for use in cone and balsa-wood speakers. In construction it differs from the usual speaker unit in that it employs a balanced armature. It is claimed to be unusually sensitive and to work well un-
 der the heaviest loads without any adjustment or attention. The unit is easy to mount in any speaker of the large cone or similar type. A $6-\mathrm{ft}$. cord is provided terminating in the usual cordtip plugs; only two small wood screws are required to mount the unit in the speaker frame. This simple type of mounting provides an easy method of adjusting the thrust pin of the unit in order to obtain the best results.

## Simple Wire-Tinning Device

It is often necessary to tin the ends of wires when building a radio set, and this is rather awkward with the usual tools. The simple device shown in the sketch provides a quick method of doing the job and costs practically nothing. A piece of sheet metal is cut as shown, then crimped and bent to form a small cup. This cup is mounted either on a block of wood or on short metal brackets. The wire stand

Left, Completed Device; Right, Details of Cup and of for holding the soldering iron is made of No. 12 gauge wire and screwed to the wooden base, supporting the iron so that the tip rests in the metal cup, the wire bracket being pinched at the bend so that it is a snap fit for the iron. Pieces of solder are dropped in the cup and melted by the iron, and the wire ends to be tinned are then sparingly coated with paste and dipped in the hot solder.-Robert J. Williams, Chicago, III.

## Dry Rectifier Replacement Units

Dry rectifiers for replacing tungar bulbs and electrolytic units are now available, and the simple method of using them is illustrated in the photos. At the right, the unit is shown clamped to a charger of the tungar type, the bulb being removed and the plug screwed into the socket instead. The unit at the left is designed to replace electrolytic-rectifier jars and takes up no more room than the latter. The unit is made of a number of disks and requires little or no attention after installation.

Simple Methods of Improving the Set by Means of Variable-Resistance Units

## Variable Resistance Improves Set

As a means of control, a variable resistance is an important part of any radio set, but many owners do not realize that they can use these in several positions for the improvement of their receivers. The accompanying diagrams give a few suggestions in this respect. The sensitivity control, Fig. 1, prevents excessive signal pick-up, which broadens tuning where sets are located near powerful stations. The variable resistance may be used in series with the antenna or shunted across the aerial and ground binding posts of the set. Try both methods and retain the best. Fig. 2 shows a simple oscillation
control by means of which the plate volt. age of the r.f. tubes may be regulated to operate the tubes at their maximum efficiency. Increase the plate voltage on these tubes from 90 to 135 volts and insert the variable resistance, shunted by a $.5-\mathrm{mfd}$. condenser, in the 135 -volt $B$-positive lead. In Fig. 3 we have a simple volume-control resistance, shunted across the secondary of the first a.f. transformer, which serves to iron out resonance peaks or causes of distortion in the usual transformer. Regeneration control is possible with a variable resistance shunted across the tickler or feedback coil of a three-circuit tuner, as in Fig. 4, and Fig. 5 indicates a method of tone control for bringing out the low notes and removing harshness from the speaker output. In this case, the variable resistance is placed in series with a .25mid. fixed condenser and shunted across the loud-speaker terminals. Many of the special detector tubes now in use require a micrometric plate-voltage control for best results; this is obtained by the method shown in Fig. 6. Resistance and impe-dance-coupled a.f. amplifiers are improved by a variable grid resistance in place of the usual fixed gridleak employed in such stages, and the position of the resistance in the circuit is given in Fig. 7. This method is particularly good in the powertube stage, but is useful in all resistancecoupled stages. As a loud-speaker control, to regulate volume, the variable-resistance unit is shunted across the speaker terminals, as shown in Fig. 8. This procedure is not to be confused with the tonecontrol method previously described. If two loud speakers are used, one of high and the other of low pitch, each may be shunted with a volume control and the relative output of both controlled for the most desirable blending.

## The Latest in Super-Power Tukes

A new super-power tube, to be known as the UX-250 or CX-350, has been announced. This tube is a larger and more powerful amplifier than the UX-210 type. It provides a far greater loud-speaker volume, without distortion, than has heretofore been possible. It may be used at a fraction of its full capacity, thus making possible undistorted output at all times.
for the sake of appearance than because it will be of any service.

Get an ordinary keyless light socket, remove the cap and wire the socket. Remove the black fiber from the cap and slip it over the wires and up against the bottom of the socket, to insulate the wiring. Set the socket in place and run the wires back through the opening and into the box. Shape a piece of cardboard to

cover the opening under the socket. and glue and tack this in place. Drill a $7 / 6-\mathrm{in}$. hole up through the side of the body of the lamp and insert a fiber bushing of the kind used in fixtures.

The lamp is now ready for a coating of gesso. Pour about $1 / 2$ pt. of liquid glue into a receptacle and into this stir enough ordinary whiting to make a thick putty. Add 3 or 4 spoonfuls of linseed oil, and then stir in more of the whiting to make a good workable putty. With an ordinary pocketknife, pack sufficient putty around the socket to hold it firmly in place. Then cover the entire lamp with the putty, with a more or less rotary movement, to produce a rough effect. When completed, let it set for a day or so to dry, then go over with bronze and, after this has dried thoroughly, paint with antique red ground in japan. Rub up the high lights with a soft piece of cloth. Then with a piece of cloth dipped in antique green, ground in japan, rub over the entire surface lightly, or just sufficiently to give it the appearance of old bronze. Pull the light cord out through the fiber bushing and attach a

Patterns and Dimensions of the Various Pieces of $7 / \mathrm{sin}$. Wood. Which Are Glued and Nailed Together to Make the Body and Cover of the Lamp, the Edges Being Rounded and Gesso Applied over the Entire Surface
plug for connecting it to the house-lighting supply at a wall socket.

A bulb in the semblance of an ordinary candle flame should be screwed into the socket in order that the idea of an ancient oil lamp may be carried out as realistically as possible.

## Cleaning Hot-Water Reservoir of Silt and Dirt

Where we live in the west, the water supply comes from the mountains and carries adobe to a marked degree, especially during the spring of the year and after a rain, which occurs almost every afternoon at our altitude of $8,000 \mathrm{ft}$. We use considerable water, and the reservoir of the kitchen range has to be filled four or five times a day. After every emptying there is about 2 in . of dirty water that has to be removed. The range is used all day and sometimes also during the night, so that the reservoir is always hot. Taking out the dirty water was therefore a painful task, until one day when the car was being washed, it occurred to me that a big sponge would be useful to soak up the boiling water in the dirty reservoir. I got a pie-tin lifter and proceeded to drop the sponge into the boiling, silty water, removed it and submerged it in a
pail of cold water. Then I -queezed all the water out of the sponge and repeated the operathon a few times until the reserwir was empty.-Winifred McMillen, Ridgway, Colo.

## Foot Brake for the Scooter

Nowadays, homemade soap-box -cooters have found particular favor among the kiddies, but their we has certain disadvantages. They help wear out shoe leather remarkably fast. as the feet are used both for braking and propulsion. To avoid some of this unnecessary wear, the brake shown in the drawing may be provided. It consists of a strip of wood, fastened to the underside of the scooter by means of a leather hinge. An old rubber heel is nailed to the other end of the brake, a section of inner tube is provided to keep the brake off the ground, an old valve stem is used as a pedal to press the brake down, and two suide nails are driven on each side of the brake to hold it in position. In use, the child presses on the pedal, which causes the brake to bear down against the sidewalk. This stops the scooter in a short distance, depending on the speed and the pressure on the brake.-Earl E. Moffat, Los Angeles, Calif.

Addition of a Brake
Children's Soap-Box Scooter Can Be Improved by the
Addition of a Brake
 tric Fan Make Good Air-Cooling Device for the Kitchen

## Device for Cooling Kitchen Air

During summer, the kitchen is usually a warm place and, although a ventilating fan will remove hot vapors, it does not cool the air. This, however, can be accomplished by means of a set of cooling coils placed in front of an electric fan, as shown in the drawing. The coils are made of water pipe and fittings, and the device is cut into the cold-water main so that the water flows through the coils before it gets to the faucet. This practically insures a supply of fresh, cool vater in the coils. The fan circulates air between the coils and in the room, moderating the heat considerably. It is, of course, advisable to inclose both the coils and the fan in a box with two screened sides.Kenneth Coggeshall. Webster Groves. Mo.

## Improving the Bread Knife

Few bread knives cut fresh bread well and with regularity. This trouble can be overcome quickly in the following manner: Place the knife near an open stoveburner flame, not on the fire but close to it so that the blade will get warm. Then try it on the fresh bread.

Dirt Chute Installed in the Kitchen Dispenses with the Usual Dustpan and Waste-Paper Basket

## Dirt Chute for the Kitchen

Keeping the kitchen floor clean is greatly facilitated by the installation of a dirt chute as shown in the drawing. It is similar to the common type of clothes chute, except that the opening is made in the baseboard between two studs, so that all the sweepings are readily brushed into it. When the chute is not in use, the opening is covered by a portion of the baseboard, which has been carefully cutoout and hinged to swing upward as indicated. A similar opening between the same studs is provided in the basement, the lower edge of the opening being flush with the basement floor so that a shovel can be used to scoop up the dirt when disposing of it in the furnace. It is advisable to make the chute of sheet-

Wooden Bracket Attached to Front End of Auto Holds Outboard Motor Securely
metal as this material will not catch or retain dirt and also as a safety measure.Gleun O. Wilson, Denver, Colo.

## Electric Heater for the Thermos Bottle

To avoid the necessity of preheating a lunch-box thermos bottle, the annoyance of heating extra water, and the danger of breaking the glass lining in doing this, I have used an electric curling iron from which the hinged member was removed so that only the rod containing the element remained. By its use coffee can be made at night, the grounds strained out, and the clear liquid allowed to cool overnight. In the morning the coffee is poured into the thermos bottle cold, the iron is inserted into the bottle and the cord plugged into the light socket. The coffee will then be heated without cracking the bottle.-Thayer Beckwith, Tiffin, Ohio.

## Bracket Holds Outboard Motor on Auto

Many campers pass up the pleasures of an outboard motor because they have no space to carry it. The drawing shows a convenient method of disposing of the motor without sacrificing any space. A wooden bracket is attached to the front end of the car as indicated. A 1 by 7 by 12 -in. oak board is supported on $1 / 4$ by $11 / 2-\mathrm{in}$. iron brackets bolted to the frame of the car. Two $1 / 4$ by $11 / 2$-in. bars extend from the board to the front spring bolts, to give rigidity to the bracket. The length of these bars varies with each particular make of car, but if the top edge of the board is located about 3 in. below the top of the radiator, the height will usually be suitable. The outboard motor is attached to the bracket as indicated, and it will not obstruct the air circulation to any appreciable extent.

## Better Labels for Fruit Jars

Labels pasted on fruit jars often come off, which makes it more or less difficult for one to identify the contents. A better method is to etch or grind a frosted patch on the side of the jar. Thus you can write on the rough surface with a lead pencil. and this writing will only come off by washing. The etching is done by forming a small "dam" of putty around the portion to be frosted, and pouring a little hydrofluoric acid on the glass thus inclosed. Stir the acid with a brush, and in a few minutes the glass will be found to be sufficiently etched. Pour off the acid, remove the putty and give the jar a thorough washing to remove all traces of the acid and putty. Another method is to rub the glass with a small piece of flat marble dipped in glass-cutters' sand moistened with water. If the sand is too coarse, use fine emery powder and water.

## Tape for Temporary Signs

Electricians' friction tape can be used to make temporary signs, which are often
 necessary during the construction of a building. Cut lengths of the tape to form letters, as indicated in the drawing, and apply them to the wall, door or window, wherever a sign is needed. The tape will adhere securely but can readily be pulled off. If some of the adhesive remains after this, remove it with a cloth saturated with gasoline.-Frank W. Bentley, Jr., Missouri Valley, Iowa.

## Hat Holder for Sedan

When on an auto tour and wishing to remove one's hat, a satisfactory place to put it, out of danger of being crushed, is hard to find, especially if the sedan is crowded, or considerable luggage is carried along. However, a simple hat holder

can be made from a wire clothes hanger. It is bent to the shape shown in the drawing, two eyes being formed so that it can be screwed to the side of the car near the top. It must, of course, be of such size that the crown of almost any hat can be slipped through without being pinched.Adolph Lonk, Chicago, IIl.

## Handle on Screen-Door Hook Permits Opening from Outside

It is often desired to lock or unlock a screen door from the outside and this is, of course, impossible, unless a regular latch or a specially made hook of the type shown in the drawing is used. The hook is made of No. 10 or 12-gauge galvanizediron wire. A hole to receive this size of wire is first drilled through the door at the proper point and the wire
 then bent to the shape shown.-John Swayze, Newark, New Jersey.

the eye of the hook and wrapped on the shank, leaving a single prong or tine projecting downward and bearing against the lower part of the hook. The end of the tine is ground to a point To bait the hook, the tine is raised and the insect is slipped on. Wheil the tine is released, it resumes its position against the hook and prevents the bait from coming off.G. E. Hendrickson, Argyle, Wis

## Adjustable Measuring Cup

The novel cup shown in the illustration facilitates the measuring of fixed quantities of material. For instance, in sowing seed beds. a certain quantity of seed is usually weighed out for each bed. Instead of weighing the desired quantity for each bed, the seed is weighed out once, and the meauring cup is then adjusted to hold

## Automatic Control for Lamps Installed Inside of Cupboard

The lower cupboards in the pantry usually have solid doors, making them dark inside so that it is difficult to find utensils. To provide light, get an eight-lamp Christ-mas-tree cord, equipped with white lamps. Such a cord can be plugged into the $110-$ volt house-lighting circuit. To control these lamps automatically so that they are lighted when the door is opened, arrange a spring switch, as indicated in the detail. A switch of this kind can be fitted to each door.-W. Saul, Lexington, Mass.

## Fishhook Improved to Hold Insect Bait

Anglers who prefer to use grasshoppers and other insects as bait for trout and similar game fish, find that it is rather difficult to fasten them to an ordinary hook so that they will appear lifelike and will not come off easily. One fisherman improved his hook by adding a length of small-gauge spring wire to it as shown. The wire is inserted through
just this amount. Thereafter the container is filled brimful each time. The cup consists of two parts, one telescoping inside of the other. The inner one is shallow, and has no handle. The outside cup is slotted to permit its diameter to be made smaller by tightening a thumbscrew, which is threaded through two lips soldered beside the slot as indicated. A handle is, of course. also provided. The inner cup can be slid up or down when the thumbnut is loosened, to enable the user to obtain various meas-ures.-D. S. Olson, Missoula, Mont.

## Gray Finish for Polished Brass

Unlacquered brass articles can be given a beautiful gray finish without the use of paint in the following manner: Mix 1 oz . of tartar emetic with just enough muriatic acid to dissolve it. Add water equal to one-third of the mixture. Apply the solution to the brass and the color will soon change to a pleasing gray.

## STUNTS Or the by Robert Gregg

gun is set in place five feet behind the sheet, as shown in Fig. 1. With the flash, sheet, subject, and camera all placed in their respective positions, you are all set to make the shot.

Just before the exposure is made all lights in both rooms must be extinguished and the blinds drawn, if any outside light penetrates. When the room is in total darkness, the shutter of the camera is opened and the flashlight ignited, after which the shutter should be im-

TO many amateur photographers, and that includes practically everyone at some time or other, the camera represents a mere snapshot-taking device, while the more puzzling phases of camera craft, the trick photograph and the silhouette, are almost unknown arts. The popular impression that trick photography demands the skill and knowledge of the professional is entirely erroneous, for excellent results can be obtained at the first trial, even with the most inexpensive camera.

Take the silhouette. Here we have a two-tone product in black and white which affords a pleasant relief from the monotonous gray of the ordinary print. Two rooms, with an open doorway between, are needed in making these pictures. The doorway should be entirely covered with a white bedsheet, stretched smooth so that no wrinkles can be seen.

The person to be silhouetted takes his pose two feet in front of the sheet, and in such a position that the face will be in full profile and not even the lashes of the eyes can be seen when the subject is viewed from the location of the camera. A flash
mediately closed and the light in the rooms turned on again. That's all there is to it.

Diagram Illustrating How the Silhouette Portrait Shown Above Was Made with Simple Apparatus
 Happened to Adonis
dow, with the top of the door leaning back so that it reflected the light of the sky. All other light, except that coming through the window, was shut off. A vest-pocket kodak, with the lens stopped down to f . 11, was used, the exposure time being about $1 / 2$ minute.

So much for the silhouette. Another form of camera craft especially suited to the amateur is the "cartoonette." This is a combination of a cartooned pen-and-ink sketch, Fig. 3, called a "comic foreground," with an actual head, the result being as shown at the head of this article. Comic foregrounds can be purchased quite cheaply from any large photographic-supply house, or you can make your own by enlarging Fig. 4 to five times the size indicated. Do this on a white sheet of cardboard, about 18 by 30 in ., making the squares on the cardboard about $21 / 2 \mathrm{in}$. on the side. Sketch in the figure lightly with pencil, and then outline and black in with a good grade of India ink, as in Fig. 3.

The manner of using the foreground is illustrated in Fig. 4. The sheet of cardboard containing the cartoon is held on the subject's knees, and arranged by the photographer so that his head rests just above the neck of the cartooned body. A
white background is placed behind and the picture taken.
|ill you ever go fishing? And eatch wothing but little dinky sunfish? Yes? Well you can still save the day if you have frumght along the li"l old camera. Here's the how of it: You simply attach the aforeaid "little dinky sunfish" to the end it your line, pose in the manner shown in Fig. 5, and let your brother fisherman take the picture. Due to the simple principle of angles, the resultant picture will be something like the one shown in Fig. (6-a perfect example of fisherman's luck!

Another wide-angle study is pictured in Figs. 7 and 8. Fig. 7 shows how the camera was arranged in relation to the hooly in taking the picture, and Fig. 8 how the finished picture turned out. No we arguing-it's some "feat"!
Kemember the last time you went to the carnival? And saw your perfectly proportioned anatomy and physiognomy distwited by the convex and concave mirrors?

Funny, wasn't it? The clever amateur photographer can produce the same ludicrous effects, and what's more-they're permanent! The method is simple. You take a photograph of any prize beauty and crease it lightly down the center. That's all. A snapshot of this photo, when developed, will assume the grotesque proportions shown in Fig. 9. Other effects can be produced by creasing the photograph across or by bending it diagonally, as shown in Figs. 10 and 11 respectively.

Perhaps one of the oldest of camera tricks is "The Man in the Bottle." In the illustration. Fig. 13, it is "The Girl in the Bottle," but in any case the method is identical, and good results can be obtained out of doors with any ordinary vestpocket camera.

Have the subject stand on a box which has been covered with a black cloth, and take a snap of him, or her, from a dis-

CAMERA

Fig. 2. Another Silhouette: Fig. 3. Sketch for Cartoonette: Figs. 4 and 5. Methods of Posing Subjects for Cartoonette and for "Fish Story"
 Examples of Simple Distortion; Fig. 12, "The Girl in the Bottle," or "Canned Peach," If You Prefer to Call Her That
tance of 15 ft ., resting your camera on some solid object. Then obtain a large clear bottle and place it in such a position that the outline of the bottle will be sure to extend all around the subject's picture. Snap the bottle on the same film. Make this exposure a trifle longer than when

taking the picture of the subject. With a little experimenting you will be able to produce this quaint effect as easily as taking an ordinary snapshot.

The example shown in Fig. 13 is an advanced double-exposure stunt but, while this demands somewhat more skill than the previous tricks, the procedure is still simple. The photograph of the girl was taken first, using a black background. The picture of the man was then taken, full size, on the same plate.

The making of stunt pictures like these will add greater interest to the possession of a small camera, for sooner or later the amateur photographer becomes tired of

the cternal sameness of his snapshots, and twok - for other worlds to conquer. Stunt pictures afford a new world of pleasure, not only for himself, but for his friends alow and mean the reanimation of interest in a worth-while hobby.

## Rain Cap for the Gasoline Hose

Most gasoline pumps provide a holder for the hose, which keeps the open end of the nozzle upward. The objectionable feature of this position is that heavy rains fill the hose with water. with the result that some cutomer gets a liberal portion in his gasoline. To prevent this, one gasstation owner made a special cap for the hose nozzle to keep out the rains. It was made of hrass, with a slight taper to match that of the nozzle. The small end was closed by sollering on a disk of the same metal. A -mall chain was fastened to the open end and to the nozzle base. When the cap was removed, it hung from the nozzle ly the chain. After use of the hose the cap was placed over the nozzle and the latter hooked on the hose rack of the pump. No water from rains has entered the hose since the cap was provided

## Cork Holds Razor Blade for Ripping

An old safety-razor blade is a handy tool for ripping seams and other similar jobs. However, the thin blades are ratlier hard to hold with the fingers. To provide a suitable handle sink one end of the blade into a cork as shown in the photo. This wakes it much eacier to manipulate the blade.-Frank W. Bentley, Jr., Missouri Valley, Ia.

Two cranks were provided instead of one, so that both hands and feet could be used, which was found to be less tiresome than $\mathbf{u}$ sing either alone. The chain drive is connected to a small propeller.

## Paraffin Used for Waterproofing Canvas

For waterproofing canvas, paint it with a solution of paraffin and gasoline. The solution is prepared by dissolving as much paraffin. cut into small, thin shavings, as the gasoline will absorb. When applied to the canvas, the gasoline carries the paraffin into the pores of the cloth, after which it evaporates, leaving a
 sediment of paraffin that waterproofs the cloth effectively. The solution can be applied by means of an old whiskbroom. If it is let stand for any length of time, more gasoline will have to be added to replace that lost by evaporation, and the solution must be stirred thoroughly.

Washer Laid over Tack to Be Pulled Provides Leverage and Prevents Objectionable Marks

## Easy Method of Removing Tacks

The screwdriver is an ever-ready tool for the average house owrier to dig out tacks. Its efficiency at this job can be improved considerably by using a small washer as shown in the illustration. The washer is put over the tack and provides a good fulcrum, holds the screwdriver in place, and makes it possible to pull out a stubborn tack without marring or nicking the wood.

## Rubber Cap on Broom Handle Protects Varnished Surfaces

Rubber caps of the kind used on the ends of crutches can be obtained in va-
 rious sizes at almost any drug store. It is a good idea to provide the broom and mop handles with these caps in order to avoid marring papered walls and varnished woodwork, for, when one is busy working, it often happens that the end of the handle hits a piece of furniture or the broom is inadvertently placed against the wall.-W. W. Snypp, Lakewood, Ohio.

## Oiling the Doormat

After some use, coco and other fiber doormats collect dust, which is naturally tracked into the house. This nuisance can be entirely avoided by spraying the mat with cedar oil, using a fine garden or fly-poison sprayer. Apply just enough oil to barely cover the surface of the mat. If this is done properly, you need have no fear of the oil being tracked into the house. By giving the mat an occasional shake, all dirt and dust can be removed. and it will always be clean.-L, B. Robbins, Harwich, Mass.

## Collapsible Tent Pole

In order to economize on space when touring, a collapsible tent pole of the kind shown in the drawing will be found of considerable utility. If the pole length is 6 ft ., only one joint is necessary, and a length of hardwood, 1 in . square, will be satisfactory. The pole is cut in two equal pieces which are hinged together by means of ordinary flat-iron angles adapted to this purpose as indicated. Four of these angles are required. They are attached securely by means of wood screws so that the ends project and are in alinement. A machine screw can then be inserted to serve as a pivot. A short chain and a cotter pin are attached by means of a staple or screweye, the pin being used to hold the hinges together when the pole is set up at full length.-Claude $P$. Fordyce, Falls City, Nebraska.

## Method of Preserving Paint and Enamel

Everyone who has used paint and enamel knows that, if the can is not emptied but the rest put away for the future, the paint in time becomes hard and useless. A good method of preventing this trouble is to melt some paraffin and pour it over the paint as soon as one has finished using it. This hardens over the surface of the
paiut but provides an effective seal against the air, thus keeping the paint in good condition indefinitely.-Charles Latour, If. Plattsburg, N. Y.

## How to Make an Ornamental Box with Button Design

A useful box ornamented with pearl buttons can be made from a wooden cigar bux. a mint container of the $1-\mathrm{lb}$. size or a coffee tin. Cover the outside surface with a sizing coat of glue, and after this is dry, apply gesso or Egyptian clay to the top and sides to a thickness of about is in. While the clay is still soft press a row of flat pearl buttons of uniform size into it around the edge of the lid. If desired, you may make a simple design of buttons, such as a four-leaf clover, in the center of the lid. With a stiff brush stipple or swirl the clay in the spaces between the trimming, both on top and on the sides. After the clay has set, apply gold bronze to the stippled spaces with gold paint and give the button border and central figure any colors desired with paint. Green or red buttons make a very lively trimming against the gold-bronze hackground. Also paint the inside of the hox with gold-bronze paint.-Hilda Ellyson Allen, Onawa, Iowa.

## Camper's Cot Made Comfortable with Rubber Bands

Two long rubber bands, about 2 in . wide, cut from an old inner tube and stretched diagonally underneath the canvas of a folding cot, as indicated in the illustration, will add greatly to its comfort. Smaller bands, about $3 / 4 \mathrm{in}$. wide. run crosswise under the cot and over the bedding at the ankles and the waist. will prevent an uneasy sleeper from throwing off his covering. When the cot is folded, these bands can be used t.) hold the cot in a compact bundle.

Rubber Bands Cut from Inner Tubes Increase Comfort of a Camp Cot and Hold the Bedding in Place welding. Such a pair of handles occupy very little space in the tool box. When the motor has to be lifted and carried or handled in any other way, all that is necessary is to remove the spark plugs and screw in the handles in the sparkplug holes.-John Edwin Hoag, Los Angeles, Calif.

 model from 516 by $13 / 4$ by $6-\mathrm{in}$. stuff, marking them off from body molds Nos. 7 and 15. Run a simple molding around the edge of the base and mark the holes for the chock screws at the proper points; then drill, counterbore and screw the chocks in place. When

ONE more item, small but essential, should be added to the model to make it complete: the guys for the main-brace bumpkins. From a point 1/8 in. inside the end of the bumpkin on each side, fit a short length of 22 -link chain, running down to the center of the lower molding. Fit a similar chain from the end of the bumpkin, on the after side, to a point $3 / 4 \mathrm{in}$. straight aft on the hull. Paint black. These guys help the bumpkins take the strain on the main braces.
Make the stand for the model of mahogany or walnut, the base being $3 / 4 \mathrm{in}$. thick, 16 in . long and $63 / 4 \mathrm{in}$. wide. Cut the

shaping the insides of the chocks to fit the hull, allow about $1 / 18 \mathrm{in}$. on each side for the thickness of the thin-felt lining. Stain the wood light-brown mahogany or light walnut and finish with several coats of wax, rubbing to a hard, dull polish.

It is not essential that the pattern given for the stand be followed exactly, but it is advised that the lines of the stand be kept simple. An overelaborate stand, highly varnished or polished, merely calls undue attention to itself and detracts from the appearance of the model rather than adding to it. The simpler the stand is, the better the ensemble will look.

Whether or not a case should be built for the model is largely a matter of taste. There is no doubt that, in the home, an "open" model is decidedly more attractive than one inclosed in a glass case, but, on the other hand, ship models are marvelous dust catchers and hard to clean, and there is always the risk of the enthusiastic maid or housewife cloing a lot of damage when dusting around a valuable model. If a case is made, the same advice applies as for the stand; make it simple and avoid heavy, overelaborate moldings.
The two full-page photos accompanying this article illustrate how the photos for the contest should be taken. Here, again, it is not essential that contestants' photos be exactly like these, but the two views show best the points on which models will be judged, and thus are best from the point of view of the contestant, as well as of the judges.

One hint in connection with the taking of these photos will be useful. Use a black background, and illuminate the model from the same side as that on which the camera is placed. In the photo on page

1030, the camera was pointing at the starboard bow, and the light was coming over the starboard quarter. The black background shows up the running rigging, and

the reflected light on the standing rigging makes the black cords stand out also. The pictures lose somewhat in printing. but, on the original photographs taken by this method, every line was as sharp and distinct as though etched on the plate.

According to the rules, the contest closes two months after the date upon which the final article appears in the magazine. Consequently the deadline is Aug. 1, 1928, and all photos and negatives must be in our hands on or before that date.

## Cooking on a "Tin Heater"

Here is a method Manitoba cordwood cutters use for cooking on a light sheet-

Container Installed in Heating Stove Permits Cooking without Smoke and Soot
metal stove, called a "tin heater." A heavy tin or sheet-metal container, such as an
ice-cream can, is hung in the stove through a hole in the top, as shown, the upper edge of the can being cut in sections, which are bent over at right angles to form a shoulder. A sheet-metal disk is cut to fit on the container, four small brackets being provided to hold it in place. If a ready-made container is not available for this purpose, one can be made from a piece of sheet metal of suitable size. It is bent to a cylindrical form, the edges being overlapped about 1 in . and fastened with copper rivets. The bottom is a disk held in place by right-angle brackets fastened to it and to the side of the container. A hole should be made in the cover to facilitate its removal. Baking can be done in the container, frying and cooking on top. There will be no trouble from smoke or soot.-H. Webster, Winnipeg. Can.

## How to Fold a Tent Single-Handed

By R. R. CARRYL

WHEN out camping, there is usually more than one person to help in breaking camp, taking down the tent and packing up the provisions and accessories. Sometimes, however, it is necessary to fold the tent single-handed: this is often considered quite a difficult job, but anyone can do it without trouble by carefully following the instructions contained in this article and proceeding along the lines indicated in the accompanying photographs. Although this method may require a little longer time to do the work than it would with the help of an assistant, the job can nevertheless be done just as well.

The first step in taking the tent down is to loosen all the guy ropes except the corner ones. Fig. 1. The butts of all the ridgepoles are then moved over toward one side, for instance, the right side as you are facing the opening of the tent, and the two corner ropes on the left side are then loosened. As the poles are set at an angle their weight will prevent the tent from falling over until the corner rope on the right side are loosened, and the

[^6] the Steps in Taking Down and Folding the Tent, in Proper Sequence
(ent allowed to tip and fall over to the left. One side of the tent is then carried wer so that the inner side of the tent is ontirely exposed and the outside and all the guy ropes underneath. The poles are removed and packed separately. The tent sides, which include all the material up to the edge of the roof where the guy ropes are attached, are folded over toward the inside, care being taken to straighten out the ends and the flaps of the opening, Figs. 2 and 3. Keep all the guy ropes outside. Fold the tent over again, as shown in Fig. 4, so that the width is a little less than the length of the carrying bag. If you have no carrying bag, the width should correspond to the space allowed for storing the tent. All the ropes now project from one side. Bring both ends over toward the center, as shown in Fig. 5, and after folding all the ropes in, start rolling the tent to form a tight bundle, Fig. 6. Stop just as the roll is finished so that its own weight will hold it in place while you get the carrying bag. Then, holding the rolled tent under one arm, proceed to slip on the cover, as shown in Fig. 7. After this is done, draw a rope through the brass eyes to close the bag tightly. If the bag is placed where rain can get at it, be sure to set it in such a position that the opening is underneath, in order to prevent the rain from penetrating to the inside.

To waterproof the bag or the tent, dissolve paraffin in gasoline and apply to the canvas. The paraffin fills the pores and effectively waterproofs the fabric.

## Fastening Screen-Door Hook Securely

Most screen-door hooks can readily be opened by merely striking the door, the jar causing the hook to jump up out of the screweye. To prevent this from occurring, as is often desired, especially when the doors are left open all night during the summer months, it is only nec-
 essary to turn the screweye over a little, forcing it over the end of the hook. When this has been done, the hook cannot be opened until the screweye is turned back to its original position.

Rake Made from Discarded Magnets Is Useful for Picking Up Nails and Tacks

## Magnetic Rake Picks Up Nails

I had numerous tire punctures caused by nails picked up in the alley, outside my garage, and decided to eliminate this trouble by the use of a magnetic rake. This was made from discarded Ford magneto magnets, which anyone can obtain from a junk yard for a few cents, and the photo clearly shows its construction. In a few minutes, I picked up over two quarts of spikes, nails and tacks from a small space. -C. H. Rise, Rapid City, S. Dak.

## Aluminum Paint for Auto Rims

Auto rims become rusty after having been in use for some time. Graphite paint is often applied to the rim to prevent the accumulation of rust, but this does not always prove effective. It is better to scrape as much of the rust off as possible, clean the rim thoroughly and then apply a coating of aluminum paint. This covers well and adheres to the metal for a considerable length of time.-Thomas Blaine, Evanston, IIl.

## Hanger on Stove Keeps Teakettle Out of the Way

On a small gas range it often happens that the teakettle is in the way when cooking, and it is rather difficult to find another place to put it. Two hooks, made of heavy galvanized-iron wire and bent as shown, are attached to the side of the stove. Hung on these, the kettle is out of the way entirely, yet readily accessible. -C. D. Paterson, Worcester, Mass.

## Effective Ant Exterminator

The best ant exterminator I have ever used consists of the following ingredients: arsenate of soda, $1 / 4 \mathrm{oz}$.; white sugar, 1 cupful; cream of tartar, $1 / 4$ teaspoonful; hot water, 1 pt. Mix and stir these ingredients until the sugar and soda are completely dissolved. Then take three baking-powder cans with tight-fitting lids, and punch several small holes below the covers so that the ants can get in. Put some of the poison in each can and mark the cans conspicuously to indicate that they contain poison. Set the cans near the path of the ants, and in three days they will have disappeared.-William B. Stone, San Jose, Calif.

## Beaded Hook Attracts Fish

There are innumerable kinds of trolling hooks, spoons and spinners on the market, but one that should prove just as good as any of these, can be made in a few moments from an ordinary hook. Heat the eye of the hook and open it up. String as many glass beads, of various colors, as possible on the shank. Use a bead with a small hole for the first one so that it will bind at the sharp bend of the hook, and not go to the barb. Heat the eye again and bend it back to its former shape. It can be hardened by plunging it in cold water. The colored beads will prove an attractive lure for bass, and other fish.

## Increasing the Voltage of Run-Down Dry Cells

When three or four dry cells, hooked up in parallel, have run down so that their combined output is less than $11 / 2$ volts, their power can be increased temporarily by reversing the connections of one end cell, as shown in the lower detail of the illustration. This is done by connecting the center post or positive terminal of the end cell to the side or negative terminal of the next cell, which is connected in parallel with the rest of the cells. Then the negative terminal of the end cell is connected to the positive terminal of the next cell. This arrangement adds to the voltage of all the cells without increasing their amperage, permitting them to be used for a longer period of time.

USUAL PARALLEL HOOKUP

Reversing Connections on End Cell Increases the Voltage of Entire Bank

## Hints for the Painter

When using white or red lead, or any paint in paste form, the worker often has trouble in keeping the contents moist, as the lids on such cans are not generally air-tight. A satisfactory method of keeping the material from hardening is to spread a piece of ordinary wax paper over it. pressing it down smoothly over the entire exposed surface. I have found that a wire strainer of the kind used in the kitchen is useful for straining paint. It will hook across the top of almost any can, leaving the worker's hands free to attend to the pouring.-Eric B. Roberts, Regina, Sask.. Can.

## Protecting Lawns

Ordinarily the public is kept from walking on a lawn or freshly seeded places by the simple method of driving a few stakes around the space and running wires between them. Such barriers, although effective, soon lose their rigidity and then detract from the neat appearance. This is because there is no "give" to the wires and at the first contact the stakes are
 pulled loose and the wires sag. speedily rendering the barrier ineffective and more or less dangerous. A noticeable departure from the conventional method is shown in the illustration, coil springs being arranged at each corner post. The springs keep the wire stretched taut and there is sufficient give to prevent the wire from pulling the posts loose under ordinary conditions.

## Cheap Balcony a Substitute for Porch

When building a small home, where the appropriation does not allow for an upstairs porch, an airing balcony of the kind shown in the drawing will be found an ideal substitute. It is narrow and can be

This Airing Balcony Is a Good Substitute for a Porch and Costs Much Less to Build
built after the house is completed, if desired. A railing of some kind should, of course, be provided for safety. For the airing of bedding and mattresses, shaking rugs and brushing clothes, such a balcony will be of considerable utility. Poles, held by suitable wooden brackets, fastened to the side of the house, may be provided for hanging rugs.

## Photo Holder on Manuscript

I have found it very handy, when mailing a photo with a short manuscript or letter, to attach an envelope to the manuscript.as shown in the accompanying illustration. Simply apply a little glue or library paste to the four corners on the face of the envelope and attach it to the sheet. This
 forms a convenient pocket for the photo, preventing it from being lost and protecting it from damage while en route.-Thomas Blaine, Evanston, III.

## Improving Camper's Bed

The camper's stretcher bed is usually made of a piece of canvas with a hem in
 Canvas, Which Provides Dead-Air Space
each side to fit the supporting poles. A good bed of this type consists of a doubled piece of canvas about 7 ft . long. This enables the user to insert the poles without any trouble and permits the use of poles that would perhaps be too large or too rough to be inserted in the hem. When set up, the top and bottom surfaces of the canvas inclose a layer of air, which acts as insulation to keep the sleeper's back warm. Leaves, grass or extra clothing may be inserted in the open ends of the canvas to make a dead-air space.-J. F. Hayes, Chicago, Ill.

## Remedy for Squeaky Auto Brakes

Auto brake linings often become glazed, which causes them to squeak and operate unsatisfactorily. This fault can be easily overcome by treating the brakes in the following manner: Apply kerosene to the brake lining by means of an oilcan. After this, fill the can with neat's-foot oil, and apply in a similar way. Such attention, once a month, will keep the brakes in a dependable condition and silent. Of course, brakes treated in this manner will not be fit for use immediately afterward, especially if the kerosene and oil have
been applied quite liberally. The surfaces of both drum and lining are then covered with oil, reducing the friction and allowing the brake to slip.

## How to Waterproof Matches

On camping trips I often had considerable trouble in keeping matches dry, until I waterproofed them in the following way: I obtained a small plug-tobacco tin, the kind that has a wide cover and is large enough to hold a layer of matches. After these were put in, they were covered with melted paraffin. Another row of matches was laid down in the soft paraffin, and more paraffin was added, the process being repeated until the box was full. You will find this method entirely satisfactory, and you will have bone-dry matches. They can be readily removed by means of a penknife or other sharp-pointed tool. digging them out carefully to prevent breaking them.-E. J. Cutting, Marilla, New York.

## Starting a Siphon

In starting the siphoning of liquids with the mouth carelessly, one may get a mouthful, which is rather unpleasant if not dangerous, especially in case of gasoline or other oil. This risk can be overcome by inserting a length of glass tubing in the siphon hose. The tube enables you to see the liquid as it rises and you
 can stop sucking before it reaches the mouth. Pinch the tube to prevent back flow. place your finger over the open end of the glass tube to hold the vacuum, insert the free end in the vessel that is to receive the liquid and no trouble whatever will be ex-perienced.-W. F. Schaphorst, Newark, New Jersey.

All Shop Notes published in 1927, in book form-Fifty Cents-from our Book Department

## Mantel Clock Made from Old Alarm

By R. W. MADDEN

MANY an alarm clock that has been discarded as worn out can readily be restored to useful life by a gasoline bath and a little oiling, and may be converted into an attractive mantel clock by making
-

Those Who Like to Make Useful Things around the House Will Find Pleasure in Renewing an Old Alarm Clock and Mounting It in an Attractive Wooden Mantel Case
used for the case. and the greater the care taken in doing the work, the better will be the finished appearance of the clock. The writer made one of these clock cases of white pine and stained it with mahogany wood dye.

Using $1 / 4-\mathrm{in}$, wood, first make a rectangular box, $51 / 2 \mathrm{in}$. wide, $21 / 4 \mathrm{in}$. deep and $73 / 8 \mathrm{in}$. high. The front and back should overlap the sides so that no joints will be visible from the front. The edges should be glued and nailed together with small brads. Carefully scribe the circles on the front and back. where the clock is to be located, and cut them out with a coping saw. These circles should be smaller than the face of the clock, so that they will hold it securely. The curved top is formed by steaming a piece of thin wood, $53 / 4 \mathrm{in}$. long and $13 / 4 \mathrm{in}$. wide. Boiling the wood in water will also make it pliable, but has a tendency to cause it to become spongy. The wood can be bent around a large tin can, tying or clamping it in position until thoroughly dry. Next, cut out the front section, which fits under the curved top. This piece should be $1 / 2 \mathrm{in}$. thick. $11 / 16 \mathrm{in}$. wide and 6 in . long. A piece of $1 / 4-\mathrm{in}$. wood, 1 in . wide and $21 / 4 \mathrm{in}$. long, is then laid on each side of the curved section, flat on the top of the casc. Care should be taken to join all the edges well. The top molding is now applied. It is $3 / 8$ in . by $1 / 2 \mathrm{in}$. wide. This can be either purchased or made. In the latter case, take a piece of white pine of the required dimensions and burn in the round or concave part with a heated rod or carve with a gouge of proper sweep. The charred surface is removed by rubbing with sandpaper wrapped around a rod. To bend the molding for the top curve in front, it is necessary to cut slots every $3 / 4 \mathrm{in}$. on
the back side. The base, made of $1 / 2$-in wood, is then cut as indicated in Fig. 3. If a lathe is available, turn down the front pilasters or columns, A disk of thin wood is hinged on the back of the case to close the opening and a small turn latch can be provided to hold it closed.

All joints must be thoroughly sandpapered, as a small dent or depression will show up distinctly after the case has been finished, and a filler should be used before stain is applied. This is particularly necessary on end grain. Apply as many coats of filler as the wood will hold, or until a waxlike deposit cover, the surface. Scrape off the surplus and stain the case with wood dye. Then give the case an application of white shellac. After letting this dry for 24 hours, three coats of varnish are applied, each coat being left to dry thoroughly and then rubbed down with powdered pumicestone and water before applying the next. Use a large brush with stiff bristles for this purpose. dipping it first in water and then in the pumicestone.

It may be necessary to provide a new face for the clock, if the old one is soiled. Remove the hands and then the face, which can be traced on a similar disk of good manila paper. With black India ink, make the numerals, using a fine lettering pen, such as a Gillot 303. Om't the small alarm dial on the face. The method of attaching the clock in the case depends on the construction of the clock used. After fitting the works in the case, the front ring around the face can be either gilded or gold-leafed. To apply gold leaf it is necessary first to brush on a coat of japan gold size. This is allowed to set for about five minutes until it becomes sticky, so that you can hear a slight snap-
ping sound when pulling the finger away after touching it. The leaf, which comes backed on sheets of tissue paper, can then be put on, after cutting it into strips of the most suitable size for the purpose. After the leaf, with the tissue paper still attached to the back, is applied as evenly as possible, smooth it out with a camel'shair brush, about 1 in . wide. Burnish the paper with the back of your finger nail, and then remove the paper. If there are any rough edges of leaf, press them down carefully with the brush. After the size has dried overnight, give the leaf a coating of transparent lacquer, which will prevent tarnishing.

## Turntable Dispenses Poultry Netting

In a hardware store where floor space was rather limited, considerable inconvenience was experienced in the sale of poultry netting, as there was not enough space to lay the rolls down for measuring off to the desired length. To facilitate the work, the owner made the revolving rack shown in the drawing. The base was made of oak, two pieces being used as indicated. A hole was drilled at the point of their intersection to receive the stub of a buggy axle, with a small wheel mounted on it. The rack could then be revolved so that the netting could be unrolled, measured and cut off without any trouble.-G. E. Hendrickson, Argyle, Wis.

Turntable in Small Store Found Convenient for Storing and Dispensing Poultry Netting

Device Made from Hacksaw Blades Is Useful for Stripping Insulation from Wire

## Wire Stripper Made from Hacksaw Blade

Anyone doing electrical work will appreciate this wire stripper. It is made from two pieces of fine-toothed hacksaw blade, and will quickly remove the insulation from small or large-gauge wire. A blade is cut in half and a hole drilled in each at the cut. This may mean annealing the steel to do the job, after which it should be rehardened. Bolt the original ends together tightly and link the other two with a small rod of steel, using machine screws and nuts. This link should separate them at about the angle shown and the points of the teeth should point toward the crosspiece. In use, the stripper is clamped in a vise and the wire then pulled through the jaws. The saw teeth will remove the insulation quickly and neatly.

【An ordinary wooden clothespin will serve as insulating pliers when automobile spark plugs are tested; a detached spark-plug wire is pushed into the slot in the pin, so that its end can be held close to the spark-plug binding post without danger of shock.

Sliding Scraper Improves Sand Screen
Using the blade of a shovel to scrape damp sand through a sifter will soon ruin the screen. A much better method is shown in the drawing. A bar of $1 / 2-\mathrm{in}$. round steel is bent to a U -shape to fit inside of the sifter. Both ends are threaded so that a length of flat steel, drilled to fit on them, can be held by nuts. In use, the sliding device is moved back and forth, causing the sand to pass through quickly and with less wear on the screen.-G. E. Hendrickson, Argyle, Wis.

## Guard for the Cellar Trapdoor

During summer it is often necessary to open cellar trapdonrs in order to provide proper ventilation, but this involves a cer-
 tain degree of danger to children. Accidents caused by falling down an unguarded cellar way can be prevented by the use of a guard rail, as shown in the drawing. It consists of two lengths of 1 by $5-\mathrm{in}$. wood, the edges of which are nailed together at right angles, and two 1 by $4-\mathrm{in}$. blocks at each end, with space between
them to fit over the edges of the cellar doors. The way of using the rail is clearly shown.-Frank Harazim, New York City.

## Eyelets for Paper Fasteners Protect Paper

Paper fasteners of the kind that are pushed through holes in the paper and then bent over, are rather sharp and the sheets are torn easily, especially when they are frequently handled. Paper eyelets are obtainable to overcome this trouble, one being placed under the head of the fastener before it is inserted, and the other slipped over the shank of the fastener before it is spread. A good substitute for these eyelets, in case they cannot be obtained, is those found on shipping tags. It is an easy matter to cut them out.

## Homemade Facing Tool for Bibcock Seat

Small, flat composition washers used in hot-water bibcocks are very often dented by obstructions catching and lodging under them as the spindle is screwed down to the seat, andthis causes them toleak. Trimming or facing them down with a pocketknife blade is not
 satisfactory, as a perfectly smooth face cannot be obtained in this way. A simple homemade facing device is shown in the illustration. Whittle a stick down so that it can just be slipped through the screw hole of the washer. Force an old safetyrazor blade on the end of the stick projecting through the hole as indicated, and then turn the washer against it. The face will be trued squarely and evenly.F. W. Bentley, Jr., Missouri Valley, Iowa.

Machinists, mechanics, airmen, and others who wear goggles, are often bothered by grease collecting on the lenses; carbon tetrachloride removes it instantly.

THE vogue for gesso and plastic paints has brought back into popularity that most ancient of the arts, modeling. Done in low relief, it is surprisingly easy, and very pleasing results can be obtained with limited skill if a plastic compound is used. This material can be obtained at any art store for a small sum, or even from the 10 -cent stores. Its advantage over clay is that it does not require experience in mixing to the proper consistency, nor does it dry hard, but remains in the same condition indefinitely, and may be used over and over again. Of course, the modeling compound is only a means to an end and you will want to preserve your work in a permanent form. This can be accomplished with plaster of paris or a marblelike cement used by dentists. For many purposes, such as plaques, a plaster cast is entirely satisfactory and less expensive than
cement. Plaster is used in either case for making the mold. The cast may be painted or enameled to obtain very beatutiful effects. However, for articles that require greater strength and durability, the cement is recommended. This cement, which goes under such trade names as Weinstein artificial stone, Healy stone and clover rock, may be purchased from dentalsupply houses or from your local dentist. It dries very hard and close-grained and looks much like marble. It is commonly used for casting so-called "marble" statuary.
Many beautiful articles can be made by the use of these materials at small cost of time and money. As the scope of this article is necessarily limited, I am describing only the modeling and casting of plaques of the type shown by the photographs. You need not confine yourself to these, however, for there are many other

candlesticks, jars, vases and even copies of statuary and art pieces.

The first step in the making of a plaque is the selection of a design. If you have skill with a pencil, this will not be much of a problem. Assuming that you have not, I would suggest selecting some rather conventionalized drawing in a magazine illustration or advertisement, or perhaps you will prefer to use one of the drawings shown in this article. Modeling compound has certain limitations which must be recognized at the outset. Fine detail must be avoided and care must be taken that no backdraft or undercutting, which would prevent the separation of the cast and the mold, is present. Of course, if provision is made for dividing the mold into sections, as is done with statuary, you need not guard against undercutting, although it is best avoided at the start.
from slivers of wood that may be cut in a variety of shapes that will suggest themselves to you. They

After you have selected a design of suitable size, or enlarged one to the size required, you are ready to begin. A piece of sheet iron or glass, somewhat larger than the size of the finished plaque, is used to do the modeling on, as any absorbent material, such as wood, soaks up the oil from the compound. Roll the material out smoothly and to an even thickness of about $1 / 4 \mathrm{in}$. An olive bottle or glass rolling pin is convenient for this purpose. Fig. 1 shows this stage of the process.

The next step is the cutting of the background to size by the use of a cardboard pattern, as shown in Fig. 2. An ordinary vegetable knife is suitable for this. Modeling tools can be made
 should be sanded so that they will leave the model smooth.

The actual building up of the design is largely a matter of patience and care. The drawing is placed on the surface of the compound and traced with a sharp pencil point to make an impression on the compound. Pieces of the material are then cut to the approximate size and shape of the raised portions of the design and put in their proper positions, and tools are used to work the material into place and to the exact size and shape desired. Parts

that are to be raised are built up to height above the background. Some detail may be attained by cutting into the raised portions or even into the background. If greater contrast or an appearance of greater depth is desired, a roughening of the background will give this effect. Raised edges are formed by building on strips of the compound. The finished model must look as you wish the casting to be. Fig. 3 shows a model completed.
Now we come to the casting of the mold in plaster of paris. A band of cardboard or tin, about 1 in . high, is shaped to fit around the outside of the model and fastened with a wire or strong rubber band. (See Figs. 4 and 5.) A dam of the compound is forced against the band on all sides to keep the plaster confined. The latter is mixed as follows: Estimate the quantity of liquid plaster required, and fill a bowl with clean water to that amount. Take a handful of plaster and sift it into the water slowly. Keep adding plaster while stirring gently, until little deposits or islands of plaster appear above the surface. This is the saturation point, and orily a small amount of plaster should be added after that has been reached. The mixture will then be about the consistency of rich cream. In stirring, the spoon or paddle must be kept below the
surface of the water, as raising it out of the water produces bubbles and results in a spongy mold.

The plaster should be poured into the mold slowly. It is best to cover the design only $1 / 8 \mathrm{in}$. deep at first, then rap the table sharply to break any bubbles which may have formed from pouring. Fill the mold even with the top of the band and allow the plaster to set. This re-

with plaster while still damp; in fact, better results are usually obtained this way.

In order to remove the cast from the mold, it is necessary to employ some separating material. A soap paste is often used for this purpose, but you will have better results with "liquid glass" and oil, sandarac varnish and oil, or collodion. All of them are satisfactory and easily obtained. Cover the entire surface of the mold with the separating fluid, applied with a camel's-hair brush. After it has dried, which will be within a few minutes, a thin coating of oil is applied. Almost any kind of oil will do, but it must be a thin coating so that it does not make bubbles or discolor the cast.

A band and dam are placed around the mold just as they were around the model.
cast will be the desired thickness. If the cast is to be of plaster, the mixing should be done in the same manner as for the mold. Care must be taken to get the plaster into every corner and crevice, and to avoid forming bubbles. A small piece of wire, for a hanger, should be placed in the plaster when it is partly set. In case you overlook this, another method is to drill small holes diagonally from the top edge through the back, so that a light wire may be twisted in for a hanger.

The cast is ready to separate from the mold as soon as the plaster has set. You can tell when it is set by the fact that it will feel quite warm to the touch, because of the chemical action that has taken place. Scrape the edges of both the mold and the cast until the separation line is
visible all the way around. Gently insert the edge of a case-knife blade along this line to a depth of about $1 / 18 \mathrm{in}$., as in Fig. 6 , and all the way around again. Now. with the full length of the blade in this cut. gently pry the mold from the cast. If it does not yield readily, insert the knife on the opposite side and repeat. The cast should part from the mold cleanly if you have applied the separating material over the entire surface. After the cast is separated, it is ready to be smoothed and decorated. Do the touching up and smoothing while the cast is still damp, as it is more difficult after it is dry and hard.
If the casting is to be made with dental cement, estimate the amount you will need to fill your mold and mix the powder with water to the consistency of thin paste. This material is less liable to form bubbles, so does not require as great care in the mixing as plaster does, but it must be mixed thoroughly.
All dental plasters set slowly ; about 24 hours are usually required before they set hard enough to be separated. This depends on the grade of cement used, however, as it can be obtained in quick-setting, medium and slow grades. Awire hanger should be inserted into the plaster when it is only partly solidified, as it is difficult to drill this material later. It may be necessary to tap the mold gently with a small wood block to start the separation. I found sandarac varnish better than the other materials for separating cement. This material can be obtained at the same place you get the cement.

The cement castings are pure white and resemble marble very closely, but may be painted or enameled as desired when thoroughly dry. A bit of dry color is sometimes added to the dry cement, to give an
ivory tint. which has a very pleasing effect.
Various shades of bronze, such as rose, fire, green, lilac, blue sitver and old gold produce beautiful effects on plaques of either material. They may be bought in small quantities, at most paint stores, in dry form to be mixed with a bronzing liquid. It is important that the plaques or other castings to be decorated be thoroughly dry before bronze paints or enamels are applied, as the slightest bit of moisture will cause the paint to flake off in spots. Brushing lacquers are also suitable for this work and give very pleasing velvetlike results in combination with the above-mentioned bronzes.

Showeard or poster colors may be applied to casts of either material while still damp, and are particularly suitable where brilliant color effects are desired. Painting the entire plaque in a solid color, such as blue or red, and then high-lighting or touching up the raised portions with one of the bronzes, is one of the simplest, but not the least pleasing, treatments. Fig. 7 shows a conventional flower plaque completed, and, though it is impossible to do justice to the coloring with black and white, some idea of the possibilities is suggested.

The plaque in which the windmill is the central figure was painted in shades of blue and old gold with a border of black and stippled gold. The Venetian boatman is effective in itrilliant orange with red-gold high lights, while the ship proved to be most attractive in a simple treatment of shades of sepia with the high lights rubbed somewhat lighter. The border was done in dull gold.

A mold can be used repeatedly, but it is then advisable to repeat the oiling for each casting and add a coat of separating fluid also, if many duplicates are to be made.

## Guard for Stationary Ladder

Children often unthinkingly risk hurting themselves by climbing ladders that are permanently attached to tanks, barns and other buildings. To prevent this, a guard of the kind shown in the drawing may be provided. It is simply a wooden door of the same width as the ladder, hinged to one side and with a hasp on the other so that it can be secured with a padlock. The guard should extend over three or four rungs at least, so that a boy would not be able to climb over it, even if, in spite of its presence, he should attempt to do so--F. G. Rempe, Oakland, Calif.

## Precautions to Be Taken When Soldering Gasoline Tanks

Numerous serious accidents have occurred from attempts to stop leaks in gasoline tanks by soldering, brazing or similar processes. The use of an open-flame torch for work of this kind involves great danger, but under certain conditions even a soldering iron may cause an explosion. The danger is due to the inflammable fumes left in a tank after the gasoline has been drained out, and these fumes are
really more dangerous than the gasoline itself. If one is not certain that all the explosive fumes can be removed from a repair job, it should not be undertaken, for the loss of the job is preferable to the loss of a hand, eye, or life itself. The best method of removing the fumes is as follows: First drain all the gasoline, providing a vent to allow the free entrance of air to replace the gasoline. Most tanks have a petcock or plug at the bottom, which can be opened for this purpose. After the tank has been thoroughly drained, it should be flushed by means of a water hose, making sure that the tank is filled with water all the time, the water entering the upper hole and escaping through the lower one. After the tank has been flushed for about 15 minutes, all the water is drained out, the inside dried by means of compressed air, and the tank is then placed on a hot-water or steam radiator, or other fireless heating device. When placed on the radiator, the tank should be set so that the largest hole is at the top to permit the free escape of fumes, and the smaller hole at the bottom to allow the entrance of air. These precautions may appear to be exaggerated, but the number of accidents that arise from attempts to solder gasoline tanks warrant them.

## Non-Slip Holder for the Oilstone

When using an oilstone, inconvenience is often experienced due to the lack of steady support forit. Of course, it can be held in a vise, but when the latter is in use or is net available, a non-slip holder will be found handy. It can be made from a piece of sheet metal, cut and bent to the shape indicated. Such a holder provides pointed feet which grip the surface of the workbench tightly when pressure is applied to the stone.-Fred E. Hake, Cincinnati, Ohio.

## Sal-Ammoniac Stops Casting Leaks

Small leaks or flaws in castings, that show seepage of liquid when filled, can be temporarily repaired with common salammoniac. Dissolve $1 / 4 \mathrm{lb}$. of this in warm water and let it cool. Pour the mixture into the casting and allow it to remain undisturbed for 24 hours. If it leaks through too fast, place a bucket underneath to catch it. Refill the casting whenever necessary. The leak will gradually become filled with a deposit of rust and it should be water-tight in 24 hours. Of course, this repair will stand no pressure, and a permanent one should be made as soon as possible.

## Vise Helps Pipe Laying

Laying a long stretch of piping involves the difficulty of screwing new lengths onto those already laid. It is necessary to hold the end of the pipe that is placed with one wrench, and turn a coupling and a new length with another. The job is usually done by two men, but it can be made so simple that one man can do it without being handicapped in the least. All that is necessary is a pipe vise securely clamped to a plank, which is long enough to be laid across the ditch as shown. The end of the piping is securely clamped in the vise, and a new length can readily be screwed in. The worker can usually do most of this by hand, grasping one end of the pipe while the other end is supported by a second plank. The tightening is, of course, done with a pipe wrench.-James H. Brundage, Katonah, N. Y.

Simple and Easily Made Device Which Helps Amateur Stripers Do a Good Job

## Device for Painting Stripes

Most people who paint their cars have considerable difficulty with the striping, which under ordinary conditions is an expert's job. With the aid of the simple device shown in the drawing, anyone who is careful can do the work satisfactorily. It is merely a rest for the brush and consists of a nail, pencil clip and two typewriter erasers of the disk type, assembled as indicated. The nail must be a sliding fit in the holes of the erasers, which are kept in place by means of a few drops of solder applied to the nail. In use, the brush is held by the pencil clip which is also soldered to the nail. It will be found, with this device, that a straight line of the same width throughout can be drawn even on curved and irregular surfaces. S. A. Marshall. Jr., Rome, Ga.

TAn easy way to clean a pipe is to hold the end of the stem against the valve of a compressed-air tube, such as is to be found in nearly every garage.

## Rope Dispenser for Hardware Store

A Wisconsin hardware dealer who had been in the habit of storing his supply

of rope in the basement, where it would be out of the way, arranged to dispense it by threading the strands through holes drilled in the floor, so that any desired length might be drawn up and measured out. This, however, necessitated tying a knot in the end of each rope to prevent it from dropping down through the hole. The simple pipe arrangement shown in the drawing prevented this trouble. Lengths of $13 / 4-\mathrm{in}$. pipe and fittings were used as standards. They were attached to the floor over the holes and the rope was threaded through as indicated. Into the upper end of each, a short piece of 1 -in. pipe, equipped with a cap, was inserted to drop down past the opening of the tee. In use, the rope is pulled out to any desired length and is prevented from dropping back into the basement by the 1 -in. pipe, which rests on it.-G. E. Hendrickson, Argyle, Wis.

## Extension Die Holder

We often had some small job where an extension die holder was needed, as, for example, in the threading of auto-spring clips. To facilitate this kind of work, we improvised a holder which cost us nothing to make and saved considerable time. It consisted of an old auto-wheel hub, obtained from the junk pile. The flange was
cut off, and a setscrew was threaded into the side to hold the die securely in the end. A handle was, of course, also pro-vided.-H. W. Swope, Danville, Pa.

## Calculating Number of Studs Required in a Wall

Studs, rafters and joists in frame buildings are usually spaced 16 in . from center to center. To calculate exactly how many of these are required in a wall of known length, divide the total length of the wall by 4, multiply by 3 and then deduct 1 . For example, if the length is 20 ft ., it will be found that 14 studs are required. In cases where one-fourth of the total distance is not even, the last space will be less than 16 in .. and then you do not deduct 1. For example, if the wall length is 21 ft ., which gives $153 / 4$ studs, 15 studs are used. The fraction represents exactly 12 in . in this case. Where you have fractions of an inch. forget them. With rafters you do not deduct one, as you start and finish with a rafter. The same is true of joists.-T. E. Jeffries, Charleston, W. Va.

## Phone Directory Saves Time

Busy executives who use their telephones considerably every day, will find
 the phone directory shown in the photo a real timesaver. In one factory a number of these directories were made by photographing a typewritten original and printing as many copies as were necessary. Each print was glued to a piece of fiber boarl, in which a hole was cut at one end to fit the threaded section of the telephone mouthpiece. This was screwed up tight to hold the card. If desired, the card can be made to extend both above and below the mouthpiece so that a list of approximately 100 names will be in view.-E. H. Flaharty, Paroo, Wyo.

## Covering Ignition Wires

High-tension cables and other insulated wiring on automobiles may be short-circuited after they have been in use for some time, causing the current to jump through the insulation instead of jumping across the gaps in the spark plugs. This is very annoying, as spark plugs will work well when they are out of the cylinders, but will not spark under compression. The trouble can be remedied by covering the cables with old rubber hose, which is much cheaper than buying new cables.

## Reversible Box Lid

A reversible box lid, which can be locked as securely as one of the hinged type, is convenient for boxes which are used to carry material to distant points and then returned to the sender. Instead of a full hinged lid, only one board of it is hinged, as shown in the drawing. The remaining part, which is loose, is provided with extending cleats that straddle the hinged section.

A staple is, of course, driven into the edge of the lid and another on the box to permit locking. When locked, the lid is securely fastened, side movement being prevented by the snug fit of the under cleats against the sides of the box. To render the use of the box simpler, the address of the receiver is painted on one side of the

Revervible Box Lid Bearing Addresses Facilitates Return Shipments
lid and that of the sender on the other.Harry Moore, Montreal, Can.

Convenient Mask for the Bee Keeper, Made from a Hat, Screen and Cloth

## Face Protector for Bee Keepers

A simple face protector or mask for bee keepers can be made from an old broad-brimmed hat, a piece of fine-mesh screen, a light metal hoop and a piece of netting or cloth. The screen must be long enough to reach around the rim of the hat to which it is sewed. The other edge is attached to the hoop and the overlapping edges of the screen are sewed together. It will be found most convenient to have the seened section about 6 in . wide. The piece of netting or cloth is sewed onto the hoop and the overlapping edges stitched together. The cloth part must be sufficiently large to cover the user's shoulders and chest. It extends down to the waist. If the bees are not docile, cotton gloves should be worn, especially by persons unfamiliar with bees. When handling bees one should move about slowly and quietly, and refrain from noises or sudden, jerky movements, for the bees are easily excited and are then more likely to sting. -Milton A. Ayers, San Francisco, Cal.

Automatically Closing All Doors of a Six-Compartment Locker by Locking Only One

## Finishing Wood Patterns

The finish on a pattern has a distinct effect on the finish of the casting produced. A rough pattern cannot leave a smooth mold in the sand. The dampness of the molding sand and the cleaning of a pattern by washing with water from a hose bring out all the "hair" from the surface of the wood, leaving it covered with small raised particles. Cleaning patterns by the use of water is, therefore, poor practice, as is also drying them near steam pipes. Places where the end wood appears on the surface of the patterns are most difficult to get smooth and keep smooth. After once smoothing the pattern, the least dampness brings out the roughness again to a greater degree than on portions with the grain. To prevent this, prepare some glue water and with a brush apply two coats to the end grain of the wood. This fills up the pores and effectively prevents "pulling out." Over this apply finishing paint as usual. This kink is also often applied to hardwood furniture.

## One Lock for Six Doors

Most shops are equipped with metal clothes lockers for the convenience of employes, each of whom holds a key for his locker. One shop did not find this in-dividual-key system satisfactory, mainly because of the frequent loss of keys which gradually resulted in most of the lockers being left open. To overcome this, a mul-tiple-locking system was devised whereby six lockers are secured with one lock. Hinges were attached to both ends of a wooden bar, and fastened to the first and last doors of the set of lockers as shown
in the illustration. In the shop where this idea has been adopted, it is the duty of one man to lock and unlock the last door in each set at certain times. This gives satisfaction to everyone, and it is impossible to tamper with any of the lockers during working hours.

## Safety Guard for Friction Drill

By ALBERT A. BAILLEY

HAVING a friction-driven drill fitted with a sliding head, we found it advisable to guard the spindle to eliminate danger of accident to the operator.

The problem involved was the design of a type of guard that would automatically rise and descend with the spindle. Attaching a metal shield to the sliding head in the usual way was impossible in this particular case, as it would have to project out too far, in order to provide sufficient clearance for the large cone. The guard we finally devised, which proved to he entirely satisfactory, is shown in the photos. It was made from an old inner tube, an old clock spring and tin can. A bracket, supporting a short shaft to which the clock spring was attached, was provided on the frame of the drill, just in front of the revolving cone. The inner
tube was cut open to make a flat length of rubber, one end being attached to the short shaft and the other to the spindle bracket, as indicated in the side views. The inner tube is always kept under tension by the clock spring, which is anchored to the inside of the tin can. The latter, which, of course, has to be covered to keep the spring safely confined, is rigidly attached to the bracket. With this arrangement, the spindle can be raised or lowered at will and the inner tube always remains taut in front of the spindle. The inner tube will effectively prevent the operator from accidentally coming in contact with the revolving spindle.

This device, of course, is adaptable to many other types of drill press where the same danger exists, and is especially suited to the school shop.

Bending a Strip of Thin Wood over a Polished Axle or Pipe Heated with an Alcohol Lamp

## Simple Way of Bending Thin Wood

It is often necessary to bend a thin piece of seasoned wood to conform to some shape or pattern, as in violin making or repairing. This can be done easily in the following manner: Take a polished shaft, such as the axle of an automobile, and drill a hole in the end, about 4 in . deep, so that the wall will be about $1 / 8$ or $1 / 4 \mathrm{in}$. thick. Drill a counterhole, $1 / 2 \mathrm{in}$. in diameter, through the shell, about 2 in . from the end. Clamp the shaft in a vise or fasten it securely to the workbench in any manner you choose. and put an alcohol lamp under the counterhole so that the flame goes inside of the hole. When the shaft is heated, dip the strip of wood in water for a moment and then slowly draw it over the polished surface of the hot shaft, as shown in the drawing, until the desired curvature is obtained. Wood bent in this way will hold the curve permanently,

It is often necessary to erect a chain block in various positions in a shop for temporary work. Sometimes a bar is thrown across two beams and the block is suspended from this, or the chain is simply wrapped around one beam. In the first case the bar may slide out of position with disastrous results, and in the second, the chain may slide on a diagonal pull, unless care is taken to wrap it well. To avoid both of these hazards, a support can be made that tightens itself under load and is consequently rigid and safe. Use $11 / 2$ by $5 / 8$ in. bar stock. Three
lengths are needed, one solid piece, bent over at each end, and two pieces, half as long as the solid one. These are bent over at the outer ends only, and the inner ends are slotted and drilled for a pin, then hinged to the first piece by means of a cross pin. The pull of the chain tightens the device.-Harry Moore, Hamilton, Can.

## Determining If Armature Shaft Is Bent

The armature shaft of the Ford starting motor often becomes bent from a severe backfire when starting. This causes the spring or setscrew to strike inside of the Bendix cover, and the motor turns so rapidly with the Bendix removed that the eye cannot be trusted to determine whether or not the shaft is straight. A good method of determining this is to hold a nail or a sharp-pointed punch in the center mark at the end of the armature shaft. The motor is then started and stopped several times by pressing and releasing the switch. As the motor starts and stops, a severe vibration can be felt in the nail or punch if the armature shaft is not straight.-E. T. Gunderson, Jr., Humboldt, Iowa.

## How to Nail Roofing Paper

Roofing paper is usually applied as shown in the upper detail. This method is not entirely satisfactory, as the paper contracts and expands,
 which in course of time will pull the nails loose or enlarge the nail holes, permitting leakage. To prevent this, drive the nails in a zigzag manner, as indicated in the lower detail. The edge of the paper may then buckle to some extent but will not leak.

## Removable Feed Box

"Stationary feed boxes, generally used in horse barns, are decidedly unsanitary and cause many diseases," says a veteran horseman. Removal of the trash from the box is not sufficient, but a thorough clean-

ing and airing in the sunlight is essential. Accordingly, the feed boxes must be made so that they can readily be removed, yet securely held in place while in use. A good arrangement is shown in the drawing. In this case, two 1 by $6-\mathrm{in}$. boards, 12 in . long, were nailed to two opposite sides of the box to project underneath. Two $12-\mathrm{in}$. lengths of flat iron were bent to the shape shown and fastened to the sides of the manger, providing slots into which the extending boards on the box could be inserted. Thus the box was held securely, yet was easily removable.

## Safeguard for Railroad Crossings

Many serious accidents have occurred to people getting their feet caught between the planking and the rail at railroad crossings. A method of reducing this danger is shown in the drawing. It is very simply contrived, the edge of the plank adjacent to the rail being merely beveled. This affords plenty of clearance for the flanges of the car wheels and at the same time makes
 it easy for a person to pull his foot out, in case it is accidentally caught.-F. N. Hollingsworth, Boston, Mass.

## Is This Your Home?

Copyright, Architects' 8mall House Service Bureatu
Plan No. 4A35
Q
ESTIONS regarding home building addressed to this magazine will be answered by The Architects
Small House Service Bureau of the United States, Inc., controlled by the American Institute of Archi-
tects and indorsed by the United States department of commerce. Blueprints, specification forms, and ma-
terial lists for the house shown here may be obtained from the Architects' Small House Service Bureau
for a small fee. If further information is desired, literature describing the plan service and publications of
The Architects' Small House, Service Bureau will be sent you upon request. A booklet entitled " 50 Ways to
Lower Home Service Costs." illustrated by ten Bureau homes actually lived in and showing how as much
as $\$ 1,000$ can be saved on a home, may be obtained for 20 c .

THIS is a vivid type of house, with a romantic history, and, though naturally more suited to warm climates, it is found in artistic settings throughout the northeast and northwest. The walls are a cool shade of stucco-white, gray or with just a suggestion of pink. The tiles of the roof are variegated reds, and the iron work of the porch and entrance may be either black or verde.
This Spanish bungalow should be of special interest to younger people getting started in life, or to older folks who have given up the larger house and want less room. It is a home for a small family. It provides nearly every comfort and convenience demanded by the modern housewife. Among its many advantages are those of reasonable building costs and adaptability to a narrow lot.

At the side is an open porch of generous dimensions, restful and inviting. This porch is a particular advantage, for its convenience to the kitchen permits its use as an outdoor dining room. On cooler days, the table may be set either before the open
fire in the living room or in a bright corner of the kitchen.

Consider the vista. When you enter this house from the end, the whole living room lies before you. At the far end is the fireplace, beyond it a glimpse of the sunny dining corner, and through the door at the left you look out upon the open porch. There is a full basement beneath the house.

## Home Builders' Questions

Q. Can you build a fireplace in the second story if there is not one below? A. Not if the floors are of frame construction. In all types of frame buildings chinmey stacks should start from the basement.
Q. Is there any quick way to find out exactly how much a house will cost? A. There is no quick way. The approximate price is sometimes found by earning the cubic contents of the house and using this with the prevailing cost per cubic foot that applies in the locality. For small houses this is an unsatisfactory method, though a very close figure may sometimes be computed for larger buildings, such as schools, warecomputed for Targer buildings, such as schools, warehouses, etc.
the cost of the small house is to have a contractor make an estimate based on the working drawings and specifications.
Q. Our roof leaks. We have held out money from the contractor until he fixes it. Can I force him to make the necessary repairs? A. Lour contractor will repair your roof. You are justified in holding out on him until he does.

The most famous and popular watch in the world! Over sixty million people in the last thirtyfive years have had dependable time and sturdy service from their Ingersoll Yankee Watches. A handful of value at a pinch of cost.
Radiolite \$2.25

## cracirsag? <br> TYPE-T ALARM CLOCK

It's going to be just as popular in the alarm clock field as the Yankee is in the watch world. It is priced the same and it has the Yankee qualities of reliability and sturdiness. A half dozen good looks features such as heavy rolled edge case; mat finish metal dial; antique handle. Knob alarm switch for convenience.

Height $5 \%^{\prime \prime}$. Radiolite $\$ \mathbf{2} 25$.

# "Were You Born a Money-Maker? 

 I have learned the secret of making money-and here it is -IM going to let you in on a little secret, Tom. It ought to be worth at least $\$ 5,000$ a year to you, and I'm not going to charge you a single penny-
"When I was your age, I was always wondering why the boss never seemed to take much interest in me. Every six months or so I would hit him for a 'raise' - and once in a great while I would get an extra $\$ 5$ a week. But the big jobs-the jobs that paid real money-always went to someone else.
"Then something happened that set methinking-
"'Bob Harris, who had started at the same time 1 did, was promoted to the very job 1 had picked for myself-salary $\$ 6,500$. I knew Bob didn't have any more natural ability than I had-yet the fact remained that he got the place. And I had to admit he was better able to swing it!
"Well, I took myself aside, and for the first time in my life I looked the situation squarely in the face. That night I clipped and mailed a LaSalle coupon.

## How He Landed the Big Job

"And now came the big surprise-for me, at least.
"I had always looked upon home-study business training as drudgery. Inside of three weeks, however, I actually got to looking forward to those different lesson assignments. You see, instead of reading a lot of heavy, theoretical stuff, I took up case after case that represented actual business problems. I was shown the principles that governed them; then $I$ worked them out for myself. It fascinated me, because I could actually see myself grow.
"First thing I knew, I received my first real 'raise' - then a better job-and a better one yet-
"I told you I was going to let you in on a little secret. Well-the secret is this: Always give a little more than you're paid for. And-so that you can be sure to give more, first get more to give!"

Send for These Free Books-They Tell You How
You want to make more money-as soon as possible-with the least lost effort.

Then there's one thing you should do immediately-you should send to LaSalle Extension University and find out bow you can turn that secret into cash.

During only six months' time-as a direct result of putting that secret into practice-as many as 1,248 LaSalle members reported definite salary-increases totalling $\$ 1,399,507$-an average increase per man of 89 per cent. Find out how you can duplicate or even exceed this record.

To aid you in this purpose, LaSalle bas prepared two very interesting and helpful books and will send them to you wittout cost or obligation. One is a 64 - page book outlining the opportunities in the business field that most appeals to you-telling you exactly how you can turn them to your own advantage. The other has marked the turning point for thousands. It is entitled, "Ten Years' Promotion in One."

Face your problem-decide the field in which you want to make a big success-then fill in, clip and mail the coupon NOW.

# A pair of greasy OVERALLS DOESN’T MAKE A MECHANIC 

Lots of fellows seem to think that all they need to do to qualify as a good mechanic is to put on a pair of greasy overalls and sort of bluff things through. Then along comes a man with real mechanical training and the first thing you know he's the boss of the shop. Take, for instance, the career of O. C. Anderson, of Lincoln, Nebraska. He writes:
"I took up a course in automobiles with the International Correspondence Schools, while living in a small town. When 1 came to Lincoln, 1 applied for a job at the Cushman Motor Works and showed Mr. Hildreth, the superintendent, my lesson papers. He had taken a course himself at one time, and on the strength of my course, he put me on over the heads of about 200 applicants.
"After working there a short time I was put in the Testing Department 'shooting trouble.' By hard studying, in one year from the time I went there, I secured a place in a garage which I handled satisfactorily and in six weeks' time had an increase in salary of 35 per cent. Later I became foreman in the service station of Franklin and Stutz cars, at a salary increase of $300 \%$.
"I find in hiring men that the mas who will study, in place of taking in all the late shows and dances, is the man who will be on the job after the 'get it from experience' mechanics are out."

Mr. Anderson is just one of thousands of men who have made good as a result of I. C. S. training.

Jesse G. Vincent, Vice-president of the Packard Motor Car Co., is a former I. C. S. student. So are Walter P. Chrysler, President of the Chrysler Corporation; E. V. ("Eddie") Rickenbacker, famous Air Ace and Director of Sales for the La Salle car; and Hiram Walker, Chief Engineer of the Chandler Motor Car Co.

The first step they took was to mark and mail an I. C. S. coupon similar to the one printed below. Make your start the same way and make it right now. We'll gladly send you complete information about the I. C. S. Automobile Courses or any other course in which you are interested.

## THEN CHOOSE AVIATION!

ARE you a redblooded, daring he-man? Are you eager for a life of constant thrills, constant excitement and fascinating events? Do you crave adventure, popularity, admiration, and the applause of great crowds? Then why not get into the Aviation Industry-the greatest adventure since time began-the greatest thrill ever offered to man?

Think what Aviation offers you. Thrills such as you never had before! The praise and plaudits of the multitude. And a chance to get in on the ground floor where rewards will be unlimited!

Aviation is growing so swiftly that one can hardly keep track of all the astonishing new developments. Airmail routes have just been extended to form a vast aerial network over the entire U.S. Airlines and airplane factories are springing up all over the country. Men like Henry Ford are investing millions in the future of commercial Aeronautics in America! The possibilities are so tremendous that they stagger imagination!

Everything is set for the greatest boom in history. The fortunes that came out of the automobile industry and out of motion pictures will be nothing compared to the fortunes that will come out of Aviation! There is just one thing holding it up:-lack of trained men! Even in the beginning thousands will be needed-and generously paid. The opportunities open to them cannot be over-

ARE you sitting on the anxious bench wondering what will happen to you if business slacks up? Are you one of the many small-salaried, untrained workers who are always the first to go when employers start cutting the salary list?

Why have this spectre of unemployment hanging over you all the time? Why not decide today that you are going to make yourself so valuable to your employer that he can't get along without you?
You can do it if you really want to, right at home in spare time, through the International Correspondence Schools. In just an hour a day you can get the special training that you must have if you are ever going to get - and keep-a real job at a real salary.

You're ambitious, aren't you? And you want to get ahead? Then don't turn this page until you have clipped the coupon, marked the line of work you want to follow and mailed it to Scranton for full particulars.
Surely it is worth at least a two-cent stamp to find out all about the I. C. S. and what it can do for you.
This coupon has helped thousands of men to earn more money

## PREPARE FOR AN ART career

 -thru the only art school operated as a department of a large art organization, who have actually produced over a quarter million drawelse or leading advertise an experielse can you get so wide an experiWrite for illustrated book telling of our successful students.MEYER BOTH COMPANY
Michigan Ave, at 20th St. Dept. 1 6. Chicago, Ill.

If You Were Dying and I offered something that would give you ten years more to live, would you take it? You'd grab it. Well, fellows, I've got it, but don't wait till you're dying or it won't do you a bit of good. It will then be too late. Right now is the time. Tomorrow or any day, some disease will get you and if you have not equipped yourself to fight it gif, you're gone. I don't claim to cure disease. I am not a medical doctor, but I'll put you in such condition that a medical dor will starve to death waiting for you to take the doctor will starve to death waiting for you to take brick wall? A fine chance.

## A RE-BUILT MAN

Ilike to get the weak ones, I delight in getting hold of a man who has been turned down as hopeless by others. It's easy cnough to finish a task that's more than half done. But give me the weak, sickly chap and watch him stow stronger. That's what I like. It's fun to me because I know I can do it and I like to give the other fellow the laugh. I don't just give you a veneer of muscle that the laugsond to others. I work on you both inside and out. I not only put big, massive arms and legs on you, but I I not only put big, massive arms and lhose inner muscles that surround your vital organs. The kind that give you real pep and energy, the kind that fire you with ambition and the courage to tackle anything set before you.

## ALLIASK IS NINETY DAYS

Who says it takes years to get in shape? Show me the man who makes any such claims and I'll make him eat his words. I'll put one full inch on your arm in just 30 days. Yes, and two full inches on your chest in the same length of time. Meanwhile I'm putting life and pep into your old back-bone. And from then on, just watch em grow, At the end of thirty days you won't know yourself. Your Athele body will take on an entirely different appearance. whole body will take on an entirely difterent appearance.
But you've only started. Now comes the real works. I've But you've only started. Now comes the real works. ( 90 in all) and you'l3 make those friends of yours who think they're strong look like something the cat dragged in.

## A REAL MAN

When I'm through with you you're a real man. The kind that can prove it. You will be able to do things you had thought imposeible. And the beauty of it is you keep on foing. Your deep, full chest breathes in rich, pure air, etimulating your bioed and making you juat bubble over with vim muscular arms have that craving for the exercise of a regular he-man. You have the flash to your eye and the pep to your step that will make you admired and sought after in both the business and social world.
This is no idle prattle, fellows. If you doubt me, make me prove it. Go ahead, I like it. I have already done this for thousands of others and my records are unchallenged. What fies and every day counts. Let this very day be the beginning of new life for you.

EARLE E. LIEDERMAN, The Muscle Builder Author of "Science, of Wrestling," "Mruscle Building,"
"Secrets of Strength," "Here's Health," "Endurance," etc.

## Send For My New GEPage Book 11 <br> IT IS FREE

It contains over four dozen full-page photographs of myself and some of the many prize-winning pupils I have trained. Some of these came to me as piuful weaklings, imploring me to help them. Look them over now and you will marvel at their pr seent physiques. This book will prove to be an impetus and a real inspiration to you. It will thrill you through and through. And it's all yours. Idon't ask a cent. This will not obligate you at all, but for the sake of your future health and happiness do not put it off. Send today, -right now before you turn this page.

TTHIS is the electrical age, with unlimited opportunities for the man who has educated himself in the finer points of electrical practice.
Fit yourself for one of the really big jobs by knowing electrical practice complete, including inside and outside work, central atations, and the whole subject. With the aid of the Croft books you can know electricity as experts know it and put yourself in line for an expert's pay.

## The Croft Library of Practical Electricity

A reference library and self-training
course in eight volumes. 3000 pages -2100 illustrations
In these volumes Croft teaches you electrical practice complete. He takes you in quick, easy steps from the simplest principles to the complete and economical operation of a great central station. He tells you all that he has learned in twenty years of shirt-sleeves practice.
With these books at his elbow a man can learn as much about electricity in silx months-good pracordinarily learn in a lifetime of practice. would
 ordinarily learn in a lifetime of practice.

And you will not be satisfied unless you earn steady pro. motion. But are you prepared for the job ahead of you? Do you measure up to the standard that insures success? For a more responsible position a fairly good education is necessary. To write a sensible business letter, to prepare estimates, to figure cost and to compute interest, you must have a certain amount of preparation. All this you must be able to do before you will earn promotion,
Many business houses hire no men whose general knowledge is not equal to a high school course. Why? Because big business refuses to burden itself with men who are barred from promotion by the lack of elementary education.

## Can You Qualify for a Better Position

We have a plan whereby you can. Wecan give you a complete but simplified high school course in two years, giving you all the essentials that form the foundation of practical business. It will prepare you to hold your own where competition is keen and exacting. Do not doubt your ability, but make up your mind to it and you will soon have the requirements that will bring you success and big money. YOU CAN DO IT
Let us show you how to get on the road to success. It will not cost you a single working hour. Write today. It costs you nothing but a stamp.

## If You Can Do This Step

Arthur Murray will make you a finished dancer in 10 days.

"Who said these things were necessary?"
"Well, aren't they?" Now I was becoming curious.
"Of course not. I learned to dance right in my own room without music or partner. And it only cost me a few cents a day."
"You're kidding me," II scoffed.
"I'm not fooling. And to prove it I'm going to write to Arthur Murray, who made it so easy for me to become a good dancer, and ask him to send you 5 lessons from his famous set of home instructions. I'll wager at the next party you won't want to sit out a single dance. teps. But I was so clumsy. hopped. I knew that I continually fell out of step. No girl ever accepted me for a partner twice. And I never Hlamed her.
But Ray's remark struck a sore spot. So 1 blurted out my whole tale of woe to lim. "If I could only dance like you, Ray, I'd be a happy fellow. But what's the use? It would take months for me to learn the latest steps correctly and think of the expensive fees that private teachers charge."

## A Short Cut to Popularity

Ray was right. When the five lessons arrived $I$ was enthusiastic. Arthur Murray's simple instructions worked marvels for me. In a few short evenings I had learned many of the very latest dance steps and within a month every one admitted that I could hold my own with the best of the dancers.

Arthur Murray certainly took me out of the wallflower class and put me in the whirl of things.
This story is typical and it shows you just the chance you ve been looking fora chance to become an accomplished dancer right in your home at a small cost.
No matter how poorly you dance now -no matter ' you've never been on a dance floor in your life-Arthur Murray's new method makes you a finistled dancer in ten davs or you don't have to pay a penny for the lessons. You can learn rizht in your own room without music or partner.
Just think! In ten days' time you'll be able to do the French Tango, the Fox Trot. the Waltz and all the other smart new steps.

## Five Lessons FREE

To prove that Arthur Murray can make you a finished dancer in ten days ${ }^{\text {a }}$ time, he is willing to send you five lessons from his remarkable course absolutely free! Just send the coupon (with 10 c to cover cost of printing and mailing) and these valuable lessons will be forwarded at once. Also a free copy of his new book, "The Short Cut to Popularity." Mail coupon NOW. Arthur Murray, Studio 822, 7 East 43rd Street, New York City.

## Your "Big Chance" Calls for Complete Practical Training

Get It from a Company Actually Engaged in Air Transport Service
Only men who complete the necessary training now will be in a position to take advantage of the present tremendous demand for aviators, ground men, etc., in this fastgrowing, potentially greatest of all industries.
Prepare yourself for Aviation's wonderful opportunities by securing training that is PRACTICAL and COMPLETE. If you are going to make the most of your "Big Chance" YOUR COURSE MUST INCLUDE:

Aerodynamics
Aerial Navigation
including
Meteorology
Flying
Commercial Phases

Airplane Shop
Mechanics
Aircraft Motor Mechanics

Simply learning to fly is not enough. Even to secure a transport pilot's license you must pass satisfactory government tests in the first four subjects above, as well as know how to fly.
The A. S. T. Course covers all of the above training-simple ethough for the common school graduate and sumelent for the
college man-in the shortest posalble safe time from the largest responsible transport-training company in Chicago.

## Home Study and Actual Flight Training

You can learn the fundamental principles and practical phases In a short time at home, finishing the entire ground work under our simphned home study plan, and then come to Chicago for your shop practice and might training in day or might classes here at our great city airbort, the hub of the naton's aerial will see army, mall, transport, sport and training planes coming and going every few minutes.
A. S. T. Itself, renders eontract alr eransport, air photography and air advertising service, operating planez for commercial
and pleasure purposes to and from sll polnts radsting from Chicago.

## Modern Planes-Famous Aces Teach You

The A. S. T. fleet includes Ryan Monoplane (Wright-Whirlwind Motor) Swallow and Laird-Commerelal planes. Only modern air-mall pilots, mechanics and instructors train you. Famous aces teach you to fly.
Complete army and navy corpe courses adapted to commercial needs Over $25,000 \mathrm{sq}$. ft . of floor space devoted to ground training alone Course covers full 450 hours practical training
required by Department of Commerce. Everything necessary required by Denartment of Con
to fit you for the big-pay jobs.
A. S. T. is constantly making records-soloing 6 to 11 men per week-placing 10 to 20 and even more men in positions each
Yaับ werk, thus helping pay tuition and living expenses-rendering

# They gave me the "ha-hä when I offered to play 

 but I was the life of the party after that

TWHI first day of Dorothy's house party at the shore had been a huge success. After swimming, boating and golfing all were ready for the wonderful dinner that followed.
Well, folks," said Bill an we left the table " 1 'm all set for a good dance,
"Fine." cried Dorothy " Diek can make the banjo hum. Who'll play the piano?" "oked at one another foolishly
All lood "Jim, you play, don't you?" asked ${ }^{\text {Dot. }}$
Yes, TIll play 'Far, Far Away', "Well then, Mabel, will you help us "Honestly, Dot, I hate to admit it, but can't play a note," she answered.
It certainly looked as if the party were going flat.

## Then I Offered to Play

"If you folkm can stand it," I offered shyly, "I'll play for you
The crowd instanily burst out into lsughter.
"You may be able to play football, Jark, but you can't tackle a piano.
"I've never heart you plav a note and I've known you all your life," cut in another.
As I strode to the piano I chuckled to myself: I had a surprise in store for them.
No one knew what to expect. They thought I was about to make a fool f myself.
Then-I struck the first snappy chords of that foot-loosing fox-trot, "st. Iouis Blues., "Dick, dumfounded, almoert dropped his banjo. But in a flash he had picked up the thythm and was strumming away like mad.
The crowd was all

Andirese - $x$ lor

JOINING the Radio Association enables you to cash in on Radio nowl Follow its successJroven plans and you can earn $\$ 3$ an hour, in your spare time, from the very first. Over $\$ 600,000$, 000 is being spent yearly for sets, supplies, service. You can get your share of this business and, at the same time, fit yourself for the big-pay opportunities in Radio.
Founded on a New Idea Members of the Association do not wait for months before they. make money out of Radio. Without quitting their jobs, our members are earning $\$ 25$ to $\$ 75$ a week spare time by building "tailored" radio sets, serving as "radio doctors," selling ready built sets and accessories, or following one of the many profit-making plans of the Association.

## Earned $\$ 500$ in Spare Hours

 Hundreds earn $\$ 3$ an hour as "radio doctors." Lyle Follick, Lansing, Mich., has already made $\$ 500$ in spare time. Werner Eichler, Rochester, N. Y., is earning $\$ 50$ a week for spare time. F. J. Buckley, Sedalia, Mo., is earning as much in spare time as he receives from his employer.We will start you in business. Our cooperative plan gives the ambitious man his opportunity to establish himself. Many have followed this plan and established radio stores. Membership in the Association has increased the salaries of many. Scores are now connected with big radio organizations. Others have prosperous stores.
A year ago Claude De Grave knew nothing about Radio. Today be is on the staff of a famous radio manufacturer and an associate member of the Institute of Radio Engineers. He attributes his success to joining the Association. His income now is $350 \%$ more than when he joined.

## Doubled Income in Six Months

"I attribute my success entirely to the Radio Association," writes W. E. Thon, Chicago, who was clerk in a hardware store before joining. We helped him secure the managership of a large store at a $220 \%$ increased salary.
" In 1922 I was a clerk," writes K. O. Benzing, McGregor, la. "when 1 enrolled. Since then I have built hundreds of setsfrom 1-tube Regencrative to Superheterodynes. I am now operating my own store and my income is $200 \%$ greater than when 1 joined the Association. My entire success is due to the splendid help it gave."

## Easiest Way Into Radio

If ambitious to become a Radio Engineer, to fit yourself for the $\$ 3,000$ to $\$ 10,000$ opportunities in Radio, join the Association. It gives you a comprehensive, practical and theoretical training and the benefit of our Employment Service. You earn while you learn. You have the privilege of buying radio supplies at wholesale. You have the Aesociation behind you in Yourryave the Aesociation be
carry your ambitions.

## ACT N0W-if you wish Special Membership Plan

To a limited number of ambitious men, may not-need not-cost you a cent. To secure one, write today. We will send you details and also our book, "Your Opportunity in the Radio Industry." It will open your eyes to the money-making possibilities of Radio. Write today,

#### Abstract

Thousands of Men From All Walks of Life Have Discovered an Altogether New Way to Double and Triple Their Incomes! Surprising, Yes-But True! Almost Over Night They Have Taken Their Choice of 9 Interesting, Big-Pay Jobs-Become Foremen, Superintendents, Estimators, Real Estate Experts-or Are Making Blg Money in Business for Themselves. The Same Wonderful Opportunity Is Now Offer You. Don't Send One Penny. Just Mail the

 Coupon for Full Set of Valuable Blue-Print Plans, Big Free Book, and Complete Details.BIG pay jobs by the score, yes, by the hundreds, B are waiting for you in the world's richest indus-try-Building. There is a constant never-ending call for trained men-and still more trained men-men who have practical headwork training and can read Blue Prints and run jobs.
Many men think the only way they can get this practical "headwork" training is on the job. But thousands of Chicago Tech. eraduates have proved that the dea is all wrong. In fact, a man can spend 5 or 10 years working with his tools and never get a real chance to learn the things he must know, if he is ever to get into the big-pay class. Anyhow, it's a long, hard, slow process- on the job.

## Amazing, New Kind of Training

## READ!

## "Since starting the

 Builders' Course have been raised to Superintendent and my pay raised $100 \%$"I owe a lot of credit to your course. Am
now listed as a Brick now listed as a Brick Contractor and made
about 83,800 clear about 83,800 ciear money thissummer.

But it's all differentthe new Chicago Tech. Builders' Course way-amazingly different! It's quick, easy, certain. Right at home you get real Blue Prints used on actual jobs to examine and keep for reference. In language you can understand, as plain as A-B-C, everything is told you and worked out for you in concise, practical home lessons-no textbooks to

## CHICAGO TECHNICAL SCHOOL FOR BUILDERS <br> Dept. G-141

study - you are taken by experts right through every step of Plan Reading, Estimating, and Superintendence so simply and easily it is just like play. You don't need even a grade school education to understand every word and absorb every fact.

## Big Pay in 3 Months

Consider what thls quiek, practical Chicago Tech. training has done for others. Woodside, in leos than three month, rises to foreman, then makees big money In contracting busineas for himselt, in a few months in charge at a big increase in pay. Marchand says in cenarge at a big increase in pary. Marchaad bays $100 \%$.'. Hundreds--yes thoussands of others say the same, Chleago Teeh has helped them to bigger Jobs or a busicuess of their own. ft is ready right now to help you.

## Let Air Mail Pilots Teach You to Fly

The regular pilots of the U. S. Air Mail are the most capable, loyal, dependable flyers in the world. They KNOW flying. They HAVE to, The very success of the Air Mail depends upon them.
These are the men who teach the advanced students at the Robertson Aviation School - the very same pilots who fly the mail between St. Louis and Chicago every day-in every kind of weather-and do it $98 \%$ on time. Col. Chas. A. Lindbergh was our Chief Air Mail Pilot and Instructor before he obtained his release to perfect plans for his epochal trans-Atlantic flight.
The Robertson School of Aviation is one of the oldest and largest in this country. Going into its tenth year with over 500 graduates. Courses are thorough and complete - flying, ground work, lectures, text book study. Airplane factories right here at the field offer exceptional facilities for gaining practical mechanical knowledge and experience.
The combination of all these advantages is something you should consider seriously. They are important.
The demand for well trained pilots is growing by leaps and bounds. Get in on the ground floor of this great, new, thrilling industry by getting the right kind of training NOW, from regular Air Mail Pilots. They teach you so well that we require no bond and make no charge for breakage.

Complete catalog on request. Write today.

## Here Is Where to Find What IVu Want $^{\text {Wou }}$

REALIZING the difficulty one frequently encounters in locating information that may be sorely needed in pursuit of a line of work or study, we have adopted a plan that we believe will be of real service to our readers. To a greater extent than ever before knowledge pertaining to practically every kind of human endeavor is made available through the medium of books. Each month, therefore, we will give descriptions of new and outstanding books that we think will be of the greatest interest.

We suggest that you send for our catalog of over 5000 books listed alphabetically under 2000 subject headings. If the subject you are interested in is not covered, write us about it, and we will try to find something that will be helpful.

## AWorld Famous Trans-AtlanticPilot

Aviation is waiting for no one! Too many millions of eapital are already invested-the demand for air service of every kind is increasing too fast. Aviation demands men who KNOW. Men who can DO. Men who can step into the real jobs and command the real alarics. Plane production today is ten fimes what it was a year ago. And a year from now it will be twenty times what it is today! Landing fields, municipal airports, plane and equipment factories, air mail and passenger lines, service and sales organizations-all are leaping ahead in the fastest, most amazing development that any industry has ever known. In such racing, feverish activity, where is there any room for a man who has nothing to offer? An empty pocketbook is no drawback-but Aviation has no place, no patience, no time for

## Walter Hinton

The man who ts ready to help YOU get into Aviation is the man who has four times been one Walter Hinton was pilot of the famous NC-4, first plane to fly the Attantic; he piloted the first plane from North to South
America: he was first to fy to the headwaters of the Amazon: fie was the hero of the runaway Cayy balloon that was swept in addition to Nelng Poie. But pioneer and aviator, Hinton also has the rare ability to teach othere the knowledse he has genined. During the
War he was a crack fying inatruin War he was a crack flying instructor for
the Nuvy. Todny-with o courne that experts agree is the most complete and
 empty hands or empty heads! Aviation is taking off for the greatest non-stop flight in history-and the men who will go along and climb to the top are the men with a foundation of FACTS under them.

## You Don't Have to Fiy; 40 Different Jobs On

## the Ground PAY BIG Too!

 To succeed in Aviation-make BIG MONEY must be many thousands of pilots, certainly But for every plane that flies, there's an immediate need for trained men in more than forty different important jobs on the ground. Construction, motor and instrument expertsairport managers, service foremen, salesmen-ail make real money. Come of them even bigger pay than pilots earn. But every last bigger pay than pilots earn. But every last
one of them must have the FACTS. Today's one of them must have the FACTS. Today's Aviation guict. And right there is where Waiter Hinton is achleving the blggest success of his career.

## Get Your Ground Work NOW Right at Home-Hinton Is Ready to Train You

You can train at home in spare-time for the best paid jobs in the Industry. Hinton's proved course starts you at the beginning. trains you fast. You get all the facts about construction, rigging, motors, repairs, instruments, theory of tight, navigation, commeretal Aviation-facts that erery man must have to Intelligently and proftably fill $A N X$ iob in the Industry. With this Instituce's training you'll have your foundation, your sart, for real ac--men are reading and netting on the Yree Rook shown below. I Want You to have a copy toot

## Tobacco Is Hurting You

Look at the facts square in the face, Mr. Tobacco User. You may think tobacco is not hurting you.

That is because you haven't as yet, perhaps, felt the effects of the nicotine poison in YOUR system. For you know that nicotine, as absorbed into the system through smoking and chewing tobacco, is a slow working poison. Slow, yes-but sure.

Tobacco is lowering your efficiency. It slows a man down. Makes it harder for you to concentrate your mind on your work. You haven't near the amount of "pep" and energy you would have if you stopped using it. There's many a man twice as old as you in years who's twice as young in energy, aimply because he lets tobacco alone.

Some day you will realize to what an alarming extent tobacco has undermined your system.

## When your hands begin to trembleand your appetite begins to fail-

 and your heart seema to "skip a beat" now and thenand slight exertion makes you short of breaththen you have a right to suspect that TOBACCO is getting the upper hand.Any well-informed doctor will tell you that these are only a few of many symptoms of tobacco poisoning.

And YOU know that the une of tobaceo in any form is an expensive, utterly useless habit. You know you ought to quit.

## Tobacco Habit Banished Let Us Help You <br> It doenn't make a particle of difference whether you've been a user of tobacco for a single month or 50 years, or how much you use, or in what form you use itwhether you smoke cigars, cigarettes, pipe, chew plug or fine cut or use snuffTobacco Redeemer will positively remove all craving for tobacco in any form in a very few days. Not the slightest shock to the nervous mystem. Your tobacco craving will usually begin to decrease after the very first dose-there's no long waiting for results. <br> Tobacco Redeemer contains no habit-forming drugs of any kind and is marvelously quick, scientific and thoroughly reliable. <br> It is in no sense a substitute for tobacco. After finishing

 the treatment you have absolutely no desire to une tobacco again or to continue the use of the remedy. It helps to quiet the nerves and make you feel better in every way.Results Guaranteed Amaination winn ine goes with each full treatment. We will refund every cent you guarantee treatment if after taking it according to the easy-to-follow directions, it should fail to banish the tobacco habit completely.

> SEND
> Coupon for the deadly effects of tobacco, toFree Proof gether with testimonial letters from they have been absolutely freed from the tobacco habit by this simple home treatment. ## ELECTRICITY ~The Big Pay Field~ NEEDS YOU NOW

## Send Coupon Now

It's your own fault if you don't earn more. Send the coupon and I'll prove it to you. Blame yourself if you stick to your small pay job when I have made it so easy for you to learn to earn $\$ 3,000$ to $\$ 5,000$ a year in Electricity. One billion dollars a year is being spent in electrical work. Electrical Experts are badly needed. Just send the coupon. Thousands of men are needed-trained as I train them. They can practically name their own salaries. Everything is ready but the men. Will you answer the call of this big-pay field? Get ready now for the big job I will help you get. The biggest money of your life is waiting for you. Send the coupon.

## You Can Do It Too!

Let me show you that I can train you just like I trained the four men whose pictures you see here. Just like I have trained thousands of other men-ordinarv every-day sort of fellows-lifting them un from starvation wages and starting them on the road to jobs that pay $\$ 60.00$ to $\$ 100.00$ a week. With my easily learned, spare-time course, I can fit you for one of the biggest jobs in electricity. Send the coupon and I'll tell you how.

## Dinck and Dasy to Learn

Don't have any doubt about your being able to do what these other men have done. McNabb and Schreck and these other fellows didn't have a thing on you when they started. You can easily duplicate their success. Age, lack of experience or limited education do not bar you. Start just as you are and I will guarantee to train you at home with a signed money back aireement. If you are
not 100 per cent satisfed with my course it wontcost you a cent. Mail coupon to metoday.

IWill Train You at Home -Spare time Only Needed 5 Outfits-Tools and Apparatus Included

## - No Extra Charge

In addition to giving my students employment service and consultation service, I give them also 5 complete working outfits without extra charge. These include tools measuring instruments, material and a real electrical motor-among the finest outfits ever put together. You do practical Work right from the start. After the first few leswons it enables you to make extra money every Soeme students make as high in 205 to 35 a week in spare-time woric while learning.

## EVEN ON DEALERS SALES-The Only Proposition of Its Kind in the Worid

 Selling-to-Dealer Plan Puts You in a Big Paying Repeat BusinessThis plan enables you to build a steady income by distributing the Ash Re-
 Ftores: in fact, nearly every store along the street is a grood prospect. Every dozen Ash Feceivers in assorted colors is packed in a handsome self-selling counter display box-a powerful silent salesman which catches the attention of everyone who comes into the store. It is so attractively lllustrated as to make any person see at once where several can be used convenlently for either the Auto, Home or Omice. Keen merchants are always on the lookout for fast-seling speclalties, and they reallize at a glance that this product $/ 8$ a self-seller, and is so
attractively displayed that it will sell over the counter with no attention from the clerk. Any dealer will be glad to place it on his counter and make a handsome pront. This is a genuine opportunity to enter a big-paying repeat buainese of your own. Our other plans outline a sure way of making big money selling to

# Brand New Money Maker 

AUTOMOBILE TYPE
This type of the Dispensador is designed to clamp on the steering post of any automoblle. No proVislon has heretorore been made for amokes. Now he has one alway at hand. No pockaze to open, no reaching for pockets, but a whole package available, one at a time.

## "Sell Every

 Smoker"Millions of cigarettes are smoked daily. Practically everybody uses them. This is proof of the biggest market for salesmen in the country. Something new for smokers is bound to win and while it's new and whils there is nothing else like it, the Dispensador, a brand new device, is selling like hot cakes. Don't miss the opportunity to learn more about it. Get your share of the business which is coming in . Be one of a hundred men who should make $\$ 10,000$ this year.

## Twenty Dollars a Day

The average man, the casual salesman, the man who only wants to make a little extra money, can easily make $\$ 20$ a day selling this newest of all smokers' devices. The Dispensador is a combination humidor (keeping cigarettes always fresh and moist) and dispenser. A turn of the knob gives you one cigarette, no wrinkling, no breaking, no loss of tobacco. It is an ideal smoker's accessory that will commend itself to anyone, and any man who has the tiniest ability as a salesman can make a lot of money showing them. No sales talk necessary, no arguments are needed. Just show the Dispensador and take your profits.

## Holds Full Package of Cigarettes And Delivers ONE At a TIME

The advantages of this newest smokers' accessory are so apparent that a salesman never need do more than show it. It is beautifully finished in colors. You have your choice of Chinese Red, Apple Green, French Blue, Grey, Bronze, Roman Gold. In it ciga-
rettes are always kept fresh by the patented moistener in one end. They can't break, and a touch on the knob delivers them, one at a time.
Even if you are not interested in selling them, order two for your own use, one for your car and one for your deak. Simply send the your desk. Simply send the coupon and take advantage of
the sample offer made to the sample offer made to
agenta. Almost everyone has agents. Almost everyone has a little time to spare and can make extra dollars this easy way.

## AGENTS Cash In

Cash in on this great offer! Be the first in your territory to present this lightning seller to the people of your town or your county. Smokers buy it on sight and the liberal profit guarantees you i bie income. Take advantage of the free sample offer, end in the coupon today. Don't wait for someone elee to get the cream of this business.
COMPANY
568 W. Congress St.
Chicago, Itinols

## Biggest Opportunity in Years

Not once in ten years does an agent have an opportunity to grab bomething new, something startingly different, with a practically
 beauty.

To Drove the value of the Dispensador and its quick selling gualities, we give you a balesman's sample free, if you send for one for your own use.

The Dispensador sells regularly for only 82.95 , but you need not send a penny, just your hame and addreas and we will mall you promptly TWO Dispensiors and you deposit with the postman, to take orders the day you get yours. We are sure of this. Begin making money now, send in the coupon today.

## They make <br> 1 1 10 (1) a year

## The facts prove that YOU can achieve Success in Radio

Radio News writes us: "In looking over the dealer mail received in the last three months, we find that the average income of all dealers who gave us their income figures, 38 in number, averages more than \$6,000 a year."
(Signed) C. W. Emerson
RADIO NEWS
Why don't you think this over and say to yourself "These dealers are no smarter than I am. If I knew radio thoroughly, I could make that much and more. I know that Radio Institute of America is America's oldest radio school - gives the finest radio instruction obtainable and school- gives the finest radio instruction
the finest and fullest radio equipmeat.
"I know that RIA is sponsored by the Radio Corporation of America, G-E and Westinghouse-that their course covers operating, broadcasting, in fact everything in radio. I can get this instruction at home, and prepare for success in radio withouk giving up my present job. I can study when I please and as long as I please. I certainly can't pass up this opportunity tolearn more about the RIA course. Here's one coupon I will clip. I want the full facts.'

Tear out the coupon and mail it now.

FITS ANY CAR IN FIVE MINUTES
Anybody can Install a Stransky Vaporizer. Stmply oosen one connection to the intake manifold with do with your angers.
car owners have bought after testing it. Stransky Vaporizers are sold and used all over the world. Read the letters from Stransky representatives. Learn how thousands of enthusiastic car owners who have installed a Stransky praise it. We have over ten thousand letters like these-and new ones pour in every day! EASY TO INSTALL

The Stransky Vaporizer attaches to the intake manifold. There is a special model for every make of car. It is based on the principle of creating more thoroughly vaporized gasoline. Thus you get more compression out of less gasoline and a cleaner, sharper explosion. Thus pickup is faster, power and speed are noticeably increased. Starting is not interfered with-the vaporizer automatically

## Wins A Chrysler

8. E. Herrick, Portland, Oremon, writes: "I am very much pleased with my sucfor two vaporisers in December, 1923. Now I am ordering in lots of 400 to 800 at a time. The largest one day sale 1 have made netted mea proat of $8157.000^{\prime \prime} \mathrm{Mr}$. Herrick also won a bonus of a new

## \$2,500 Reward For the Capture of An Unknown Man

TWICE he had enternd the St. Clair Mansion. 1 What was he after? Who? What was in danger? Berteau, the famous detective, had warned St. Clair that the mysterious marauder spould come again. And now-a noise in the passage 1 . The creak of an opening door. A shot in the dark! A capture ! Is this wounded stranger the mysterious intruder? Who could tell? Yet Berteau identified the man without hesitation and won the $\$ 2500$ reward.
How did hedo it? Easy enough for the Finger Print Expert. He is the specialist, the leader, the cream of detectives. Every day's paper tells of their wonderful exploits in solving myaterions crimes and convicting dangerous criminals.

## More Trained Men Needed

The demend for irained men by governments, states, elties, detective agencies, corporations, and private buranas is be coming greater every day. Here is a real opportuaity for than this? # Button Rupture Newest Way [Without Pressure] 

- CIENCE now advises discarding cruel steel springs, barbarous leg straps, and other harness that press against the rupture and thus prevent nature from healing it. A new sensible method has been perfected, after thousands of test cases, called Magic Dotentirely different from any other way. Instead of "presaing" it "seals" rupture, and of course allows users to run, jump, bend and cough in perfect safety.

## Breathes Air

With this 1-25th or. device is a new kind of pad, air-porous and washable. It actually breathes air, and cannot slip off the rupture feature, you'll frankly admit, that is lackdng in your present appliance. In fact, it is so superior and different that it is praised by physicians as "an entirely new departure." Users report they have forgotten they are wearing it. But don't buy it yet.

## See It First

By a epecial arrangement you can now have it sent to your home without obligation to wear it. Don't send a penny or order it now. Just mail the coupon for full description of "Magic Dot" and details of this unusual offer. Act now for quick relief. Write your name and address on the coupon and mail it today!

Before this lad learned shout Titus Trafning he was as noft as butter, fat-cheated, undeveloped. Heag along half-allve. Then he wrote to Titus.
-ROWING - Growing - Growing! LOOK at those muscles grow! You almost need a moving picture camera to keep up with the speed of their development! You think it takes years to build up a powerful body? Boy, it only takes DAYS!

Take a good look at these two pictures. First you see a lad who scarcely has pep enough to raise his arms. He doesn't seem very proud of them, does he? And no wonder! Those soft, skinny chicken wings aren't much to brag about. But now for the next picture. Holy smokes! Is that the same boy? Sure enough, and see how he's changed! Why, his arms have doubled in size. He's got a pair of biceps that stand out like carved granite. His forearms are sheathed in great wads of muscle. And note how his chest has broadened and deepened! Say! He never knew he had so many muscles. But I know where they are, and I know how to develop them.

Look what happened when Titus got on the jobi In an amazingly short time this man was completely rebullt, his whole body
covered with big, powrerful covered with blg, powerful,
PANTHER muscleel

Now Watch YOUR Muscles Grow!

You've seen what I've done for one man. That's just a sample of what I've done for thousands. Now I want to get to work on YOU! How would YOU like to add INCHES of tough, powerful muscles to your arms, your body,

beef, but magnificent PANTHER muscles-smooth, rippling, fast as lightning, strong as steel. Those are CHAMPION muscles-the kind of muscles that make Titus Trained men the most perfect fighting machines that science can develop.

Don't think I'm going to make you work like a slave. Say! All I want is a few minutes a day. Just follow my personal directions and watch results! I work fast. My methods are scientific. 'They'll accomplish more in 30 days than ordinary exercise will do for you in a year! You see the proof in the pictures shown here. Now let me prove that I can do the same for YOU.

I don't care what your present condition may be. I've made over fellows who were actually cripples. And I've trained champion strong men of the world. Strong or weak, I'll give you just what you need to make you a perfect specimen of MAN POWER.

## New American Eagles

The Porterfield Flying School is operated under the management of the American Eagle Aircraft Corporation, Kansas City, Mo., the third largest aircraft factory in the United States.
Unlimited opportunities in all departments of Aviation are waiting for properly trained men. More than one hundred airplane factories are turning out thousands of planes. The American Eagle Company alone is now producing ten ships per week. It is impossible to keep up with the tremendous demand for aircraft. Only the great shortage of pilots, airplane riggers, mechanics and builders is holding up the faster development of Aviation.
Porterfield graduates have fine opportunities to accept big paying jobs with new American Eagle distributors and dealers that are being appointed every week all over the country. All instructors are army trained licensed transport pilots. Your individual training is on modern equipment and government approved American Eagle airplanes.

Send for illustrated catalog describing complete ground school and flying course. State age and occupation.

"So you want to get married!"
"That's fine! I'm glad to hear it. But you know, Tom, fust wanting to get married is not enough to justify an increase in salary.
"Don't depend on sentiment, or on eny man's favor, to bring you the salary increases you need so badly. Build on a firmer foundation than that, Tom. Study your work -learn to know more about it than the other men in your department-and you won't have to come to me for an increase in salary.
"Why don't you take up a home study course with the International Correspondence Schools? It's been the making of Joe Browning and Dick Roberts and some of the other men around here, and I'm eure it will help you, too."
Employers in every line of business are begging for men with ambition, men who really want to get ahead in the world and are willing to prove it by training themselves in spare time to do some one thing well.

You must study for promotion sometime! Isn't it better to start now than to wait a year or five years and then realize what the delay has cost you?

One hour a day, spent with the I. C. S. in the quiet of your own home, will prepare you for the position you want in the work you like best.

Yes, it will! Put it up to us to prove it. Mark and mail the coupon to-day.

"Yankee" Tool Book

Shows how "Yankee" Tools make work easier: Spiral Screw-drivers; Plain Screw-drivers, Ratchet Bit Braces, Automatic Push Drills, Automatic Feed Bench Drills, Ratchet Tap Wrenches, Vises with removable base, etc

Dealers Everywhere
Sell "Yankee" Tools
"Yankee" on the tool you buy means the utmost in quality, efficiency and durability

## Guaranteed by the

## name "YANKEE"

SEE this wonderful "Yankee" Ratchet Brace at your hardware dealer's. Like all "Yankee" Tools it saves time and labor. Try it and you will appreciate the economy of paying a little more to own the finest tool of its kind.
For No. 2100 is made and finished like a precision tool. The famous "Yankee" Ratchet is smooth, powerful, silent; as smooth-working as the stem-wind of a watch-yet unbreakable. No need to hold chuck to keep it from turning back on ratchet movement.
A finger touch on easy-acting Ratchet Shifter gives right or left ratchet, or rigid. Positive visible adjustment. Dustproof. Moisture-proof.

New "Yankee" Chuck-most efficient ever made. Ball-bearing, quick centering, and accurate. Holds any bit (round, square, any taper) in vise-like grip. Yet chuck releases bit at a turn of wrist.
Handles are hard rubber and indestructible. Top handle, steel clad, ball-bearing. Sweep handle caps held by patented "Yankee" method, preventing excessive handle play. Brace is finished beautifully in keeping with its perfect mechanism.
" Yankee" Bit Extension No. 2150

## Price ( $\mathbf{1 8}$-inch) $\$ 2.30$

Stands abuse and follows through. Bit held by socket. No jaws to break. No loosening and pulling out of bit in work. And bit in "Yankee" Socket can't jam. Fits any brace. Lengths: $15,18,21,24$ inches. Holds large range of bit shanks.

Try This Test Put Auger Bit into chuck of "Yanke"
Brace. Bore deep intotough wood. Then pull upward with all your strength. Bit will not come out of chuck.

# A home town enterprise backed by national experience 

An Advertisement of the American Telephone and Telegraph Company

The Bell System is a home town enterprise in operation so that each community may have service that suits its needs. It is a national enterprise in research, engineering and manufacture so that every telephone user may have the best that concentration and quantity production can achieve.
There are twenty-four operating companies devoting their energies to telephone problems throughout the United Statesfor example, the Northwestern Bell Telephone Company operating throughout Iowa, Minnesota, Nebraska, North Dakota and South Dakota. It has 11,000 men and womenfriends and neighbors of the other people in their towns - working to maintain in its

territory the best standards in telephony now known.
In New York, in the American Telephone and Telegraph Company and the Bell Laboratories, are 5000 persons, including scientists, engineers and consultantsin management, engaged in inventing better apparatus and discovering better ways to do things.

The Northwestern Company with its 11,000 employees has the use of all that this group of 5000 in New York discover and perfect. Likewise the other twenty-three operating companies. They are regional organizations adapted to local conditions, but behind every telephone in city or hamlet is the national organization for the develon ment of the telephone art.

# The best gasolines become better when ETHYL. is added 

Racing car drivers can't take a chance with their engines.
Before a race they test their cars with the best gasoline obtainable. Then they add "Ethyl" fluid-the anti-knock com-pound-to develop the last ounce of power for speed and safety.
Similarly, leading oil companies are adding "Ethyl" fluid to the gasoline produced for the general motoring public,
so that your car too may increase its performance under all driving conditions.
This fuel is called Ethyl Gasoline and is sold at pumps which display the emblem shown below.

Read the facts about Ethyl Gasoline given below. Remember that even the best gasolines become better when "Ethyl" fluid is added.
ETHYL GASOLINE CORPORATION 25 Broadway, New York City 56 Church St., Toronto, Can.

## What Ethyl Gasoline is

 FTHYL GASOLINE was deE veloped by General Motors research to provide a more efficient fuel tor internal combustion engines.It is formed by adding Ethyl brand of anti-knock compound ("Ethyl" fluid) to selected motor gasoline in an amount sufficient to utilize the higher compression created by carbon deposits or advanced engine bon de
design.
"Ethyl" fluid is a concentrated liquidcontaining tetraethyllead which has the property of controlling the combustion rate of gasoline. It is a patented product.
Ethyl Gasoline is colored red for identification. The color has nothing whatever to do with its periormance. It takes more than dye to make "anti-knock" easoline.
Ethyl Gasoline is sold only at pumps which display the "Ethy!" trademark.
Eshyl Gasoline is the gardstick by which other gaselimes are measwred.

## What Ethyl Gasoline does

If your car is designed to operate on ordinary gasoline, the use of Ethyl Gasoline will:
Eliminate "that kneck" and power loss. Make carben detesifs a sesrce of extra power. Fer carbow increases compression and Ethyl Gasoline is the Righ compression fuel.
Give a smoother and better pulling entine.
Reduce gear-shifting and increase acceleration, shareby making traffic driving easier.
Cut doten vibration, thereby redwcing engine wear and fear and depraciation. Save you the explense of carben removal and other rrpaifs cassed by "knocking" and carben formation.
Gios more power per gallow for your fuel bills-and more mileage as com. pression is incruased by carlon dopesifs.
If your car is a high compression car, just remember that Ethyl made it possible and is necessary to obtain maximum performance.

## Users of Tools Are Good Judges of Value

Men who use precision tools have the mechanical training that enables them to judge mechanics' tools fairly.
They appreciate that fine finish, clean cut graduations, and good design indicate tools of high quality. They know that accuracy and reliability can come only from the most exacting standards of workmanship. That's why mechanics everywhere respect Brown \& Sharpe Tools so highly when they judge tool values.

Ask your dealer for Small Tool Catalog No. 30 listing over 5,000 items. If he cannot supply you, write us direct. Dept P. M., Brown \& Sharpe Mfg. Co., Providence, R. I., U. S. A.

C \& L 32
This is ase of the most popular blow-torches we have over made. It is designed for the man who wses a blow-torch in his daily business and demands wot only excellent performance but rwgged ability to stand rowph handling. 32 contains the most advanced, patented C \& L improvements. It has a red handle. Sure sign of satisfaction.

## We've put a red handle

 on it to be sure
## you get Clayton \&

## Lambert

Next time you're in a hardware store or electrical shop, if you happen to look over the line-up of blow-torches you'll see some with red handles. They're Clayton \& Lambert torches. We put the red handle on so you could tell at a glance that you were getting the best value you can buy in a blow-torch.
The red handle doesn't make it work any better. The insides you can't see do that. But the red handle tells you the insides are right.

It's too bad you can't see what a lot of improvements we've made in blowtorches. Improvements that make them burn hotter, burn longer, and last longer too. But they're there, all right. And they give such definitely better service that users have made Clayton \& Lambert the largest selling blow-torch in the world.
Here's an example. The little hole the gas comes out of must be fifteen-thou-

THE coyote of the Western plains is one of the swiftest of American animals. He has to be fast in order to eat. For the other beasts of the prairies that he must catch for his meals are likewise swift runners.

Read Trapper Evans' account of his unusual experience with a coyote:
"One morning I was out hunting geese with my brother. We had placed the decoys around us and were sitting waiting for the geese to arrive. They did not come, but off in the distance we heard a coyote howl. As day commenced to break we noticed the coyote sitting on a nearby hill about half a mile away. I thought I would have some fun So, picking up one of the decoys which had a bullet hole through it, my gun in hand, I crawled through the grass, holding the decoy just above the top of the grass. I had gone about 50 yards when I looked back and noticed my brother waving me to lie down. I lay down quickly and looking through the hole in the decoy beheld a strange

"THE GLADIATOR"
This popular Keds model for all around use has a distinctive non-skid sole. In brown, white or gray.

Copyright, 1928, by United States Rubber Company
sight. The coyote, thinking that one of the geese had strayed from the flock, was crawling slowly towards me, every once in a while rising to look at his supposed prey. I lay perfectly still and waited until he approached within 50 feet, and then rising quickly I shot him before he had recovered from his surprise.
"The coyote's feet are very much like the wolf's, only smaller. He is a cunning fellow and very swift."

KEDS special models for boys give your feet much of the springiness of the coyote's paws. Keds soles are tough and springy. They grip surely on ground or floor. The uppers are light, yet strong. And the special Feltex innersole keeps your feet comfortable.

Ask for Keds by name. But be sure the name "Keds" is on. the shoes you buy. That name is your guarantee of getting the best dollar for dollar value in rubber soled footwear.

Write for our free booklet containing all kinds of information on games, sports, camping, vacation suggestions and other interesting subjects. Dept. 2270, 1790 broadway, New York City.

# A better used car for fewer dollars 

> This valuable free book tells how to save money -send for it!

SHREWD buyers are taking advantage of today's low used car prices to enjoy a quality " 6 "' for less than the cost of a new " 4 ."

You can buy a used car safely with the information pictured and explained in our valuable book, "How to Judge. a Used Car." The coupon below brings you this fund of facts without cost. Experts who buy thousands of used cars for dealers tell you what to look for and what to avoid. Much of this trade information has never before been made public.

Since its first printing a few months ago, 125,000 motorists have sent for this time and money-saving buyer's guide. The coupon below will bring a copy of the second edition of "How to Judge a Used Car" to you without cost. A 2c stamp may save you $\$ 200$. Send the coupon NOW!

## Pledge to the Public on Used Car Sales

1 Everyused car is conspıcuously matked withits price in plain figures, and that price, just as the price of our new cars, is rigidly maintained.

2 All Srudebaker automobiles which are sold as CERTIFIED CARS have been properly reconditioned, and carry a 30-day guarantee for replacement of defective parts and free service on adjustments.

3 Every purchaser of a used car may drive it for five days, and then, if not satisfied for any reason, turn it back and apply the money paid as a credit on the purchase of any other car in stock-new or used. (lt is assumed that the car has not been damaged in the meantime.)

Is YourSet a 60 Percenter?

T
00 many sets are delivering only $60 \%$ of the tones broadcast by the studio. Most of the audio systems choke off or distort the very tones which give that fullness and roundness which makes the difference bet ween ordinary and Natural Reproduction. Link up your Tuner to Natural Reproduction with the companion units, The Amer Tran Push-Pull Power Amplifier and the AmerTran ADC Hi-Power Box.
You must hear it to appreciate it. Even your imagination will not exaggerate the difference. Write for full information or ask us to arrange a demonstration at your dealer's store, no obligation of course.

> Back to camp with a handsome string

We had fished far up the lake and were loath to stop, for how those trout were rising. But the cook's grim warning-why are cooks always grim? - to be back before six, persuaded us to head the "Old Town" back toward camp. As we glided easily over the water, we were grateful to this fleet canoe which brought us back with time to spare.

An "Old Town" is the ideal canoe for every fishing trip. Light in weight and perfect in balance. Strong and durable too. Priced as low as $\$ 67$. From dealer or factory.

## Keep Your Money

-till you're convinced. We offer a free 10-day test of this amazing shaving cream to prove our case. You risk nothing

## Gentlemen:

When we first told you of the remarkable delights of Palmolive Shaving Cream, we advanced our claims modestly, leaving it to the product itself to "sell" you.

We told you "Don't buy-yet." We asked you first to let us prove our case at our expense.
Eighty-five per cent of men, we find, who once give Palmolive Shaving Cream a trial, become wedded to it. And these boosters have spread our fame in every city and town. Today we make the fastest selling shaving cream in the world.

## These 5 unique features

1. Multiplies itself in lather 250 times.
2. Softens the beard in one minute.
3. Maintains its creamy fullness for 10 min utes on the face.
4. Strong bubbles hold the hairs erect for cutting.
5. Fine after-effects due to palm and olive oil content.

## Now mail the coupon

We take the risk-not you. We undertake to please you . . . to win you in ten shaves. The coupon is for your convenience. Won't you use it, please?

## "KNIVES THAT BITE"

## NEW!

## A Remington Knife for

 Electricians and Radio FansTHIS new Remington Knife is just what electricians and radio tinkers have been waiting for. A knife for real work, yet light and good-looking. Can't be beat for scraping insulation from wires, making connections, tightening up, doing odd jobs., Has one 3 -inch sheepfoot blade, and a $21 / 2$-inch screw-driver. The blade is forged from high carbon steel, razor sharp, and holds its edge a long time. One side of the screw driver is ground to a cutting edge. Safety catch prevents screw-driver from closing when in use. Nickel silver bolsters, brass linings.
Although designed specially for electricians, it will appeal to engineers, mechanics, workingmen. A dandy general utility knife, handy around shop, factory, or in the house. It's the kind of knife that stands up-that lasts. Hand-honed and tested at factory.
We cannot do justice to this knife in an advertisement. So ask your dealer to show you the Remington Radio Electrician's Knife. Note its hard, handsome, cocobolo handle. Test its razor-sharp blade. Note the screw-driver. see how strong it is. You wouldn't sell this knife for ten times what you paid for it if you couldn't get another. Knife No. R 4548 is a wonderful value for $\$ 2.00$. If your dealer hasn't it in stock, send us his name and the price. The knife will be forwarded at once, postpaid.

# Protect Your Ideas 

## Take the First Step Today

If you have a useful, practical, novel idea for any new article or for an improvement on an old one, you should communicate with a competent Registered Patent Attorney AT ONCE. Every year thousands of applications for patents are filed in the U. S. Patent Office. Frequently two or more applications are made for the same or substantially the same idea (even though the inventors may live in different sections of the country and be entirely unknown to one another). In such a case, the burden of proof rests upon the last application filed. Delays of even a few days in filing the application sometimes mean the loss of a patent. So lose no time. Get in touch with me at once by mailing the coupon on the opposite page.

## Prompt, Careful, Efficient Service

This large, experienced organization devotes its entire time and attention to patent and trade mark cases. Our offices are directly across the street from the U. S. Patent Office. We understand the technicalities of patent law. We know the rules and requirements of the Patent Office. We can proceed in the quickest, safest and best ways in preparing an application for a patent covering your idea. Our success has been built on the strength of careful, efficient, satisfactory service to inventors and trademark owners located in every state in the Union.

> NO CHARGE for Information On How to Proceed

The booklet shown here contains valuable information relating to patent procedure that every inventor should have. And with it I will also send you my "Record of Invention" form on which you can sketch your idea and establish its date before a witness. Such evidence may later prove valuable to you. Simply mail the coupon and I will send you the booklet, and the "Record of Invention" form, together with detailed information on how to proceed and the costs involved. Do this NOW. No need to lose a minute's time. The coupon will bring you complete information entirely without charge or obligation.

Uy Patent Law Offices Just Across
Street From
U.S.Pat.Office

Above is a view of my drafting and specification offices here a large staff of exoy experts are in All drawings and specifications are prepared under my personal supervision.

## Strict Secrecy Preserved

All communications, sketches, drawings, etc., are held in strictest confidence in strong, steel, fireproof files, which are accessible only to authorized members of my staff. Feel free to write me fully and frankly. Your case will have my personal attention. It is probable that I can help you. Highest references. But FIRST-clip the coupon and get my free book. Do THAT right now.

 an AmazingNew Business ${ }^{\text {rup }}$ $\$ 1,000$ моیттн
## Big Money Everywhere:

T
HREE Chinago food experts have created a new kind of busincess in which any honest. industriou man or woman can make from $\$ 50$ to $\$ 250$ a week the easiest way you ever heard of. They have worked out a simple, complete and proven plan by which you can immediately become the owner and operator of a big food business. You start making money the very first hour.

## Works Like Magic!

Part of the complete plan that will be sent you is a wonderful invention of one of the experts-a machine that oooks greaseless doughnuts by electricity. Everything you need to make as much as $\$ 1,000$ a month.

## A Remarkable New Food!

The greaseless doughnut is an entirely new food. Not a drop of oil or grease is used. It is a crispy, fragrant, appetizing doughnut cooked by electricity. More captivating than old-style doughnuts-rich as pie or cake-yet easily digested as bread
People literally fall over one another to buy these new dainties. That's why Minch made $\$ 3,000$ is 3 months. Costopolis, Illinois, takes in $\$ 6$ to $\$ 7$ an hour in the evening. Mrs. Jane Statts, Chicago, becomes the owner of a big shop in less than 2 months-All kinds of people have coined money in this amazing new business.

## The Secret of Big Money

Mail coupon now for complete details of plan through which many make enough money the first few days to pay for the machine-with protits up to $\$ 1,000$ a month waiting for you. If you are intereated in a steady income of $\$ 50$ to $\$ 250$ a week mail the coupon today.

We'll pay you for your old razor bladest NOT NEW ONES-we want them old, the older and duller the better! We want the kind you'd think no sharpener could possibly give a keen shaving edge. Our representatives use them to demonstrate an amazing new in-vention-absolutely nothing like it-an AUTOMATIC sharpener with a flexible Hone-Stropactually gives the TRUE barber stroke and instantly blesses dullest blades with the keenent poesible edge. Read this big offer.
New'MechanicalWrist' Sharpens Blades Like Magic?
Fere's a light, handy deviee as different from ordinary sharpeners as Lindy's "WE" from Langley's first crude flying machine. In
the first place, it's the one sharpener that both hones and strops. the first place, it's the one sharpener that both hones and strops,
The FLINKER sharpens all makes (Iarger size for DurhamDuplex). And it's automaffc-turns blade on strop exactly the the master barber gives hls razor its super-sharp edgel No "threadIng" of strop through holder-clever guldes hold it! Can't cut the strop! A few pressure strokes, a few light ones-2 seconds and your blade is marvelously keen. One blade will give you smiling shaves 365 days! We guarantee these things! The amazing new FLINKER BARBER STROKE SHARPENER offers the strongest money back guarantee ever devised. No matter what you've
tried-or what you now think-here's a sharpener that will positively give you a antlsfylng answer to every safety blade problem! IT DOER ACTUALLY MAKE NEW BIADEA FAR SHARPER, AND YOUR OLDEST BLADES SHARPER THAN NEW!

## Here's An Amazing Offer!

Do this: Run an old blade over a hard surface, or cut wood, to bend the edge! Then give it s few strokee with this device. You'll positively find it keener than newl You're so sure to be amazed and delighted the nrst time you use the FLINKER BARBITR
STROKE SHARPENER that we make you this astounding offer. We will give you 10 cents each for your old razor blades-limit for each person 10 blades-which you subtract from the retail price- 83.90 . send balance for the sharpener. Try 5
daym. Test it thoroughly. Then if you don't say it's the most wonderful sharpener you ever saw-If it doesn't give you your greatest shaving joysend it right back. WE WILL REPRICE, \$3.90! Whether you've, sent us one or ten blades, we'll pay you the Will pricet Could anything be fairer? without risk? This offer is limited. FLINKER SALES CO.

# Selling "Red-Hots" 

## Always a Money-Making Business -And NOW a Regular Gold Mine!

There has always been good money in selling "red-hots." Now here is a NEW way of cooking them, that means more money-liberal chunks of it-selling clean, sanitary, delicious, roasted "red-hots" from the SAVORY Electric Wiener Roaster. With this machine you can turn out a vastly better product- - with all the flavory juices cooked in-and get the trade from the stands selling the flavorless boiled "dog"' or a dried, shriveled, fried product.

No stove or
muss, fuss or
the nearest elect
constantly mov
deliciously bro
enameled mac
and makes the Small, complete and easily moved, this new and better method of roasting "redElectric Wiener Roaster Eliectric Wiener Roaster
will prove a regular gold mine for you.

## SAVORY Electric Rotisserie

Juicy roasts, delicious broilers, meats of any kind-all roasted to perfection in this SAVORY Electrio Rotisserie. Portable, compact, sanitary and perfect in operation, it gets the crowds and brings in big money.

## Send for Details of These Machines

At fairs, picnics, ball games, roadside stands, beaches-any place in a crowd these machines will draw the trade. Both have distinctive features that make them regular "gold mine" profit makers-and the price is right. Write for full details.

## WANTED

 More Men to Earn $\$ 25$ to $\$ 75$Per Day

Moremenare neededright NOW to do the work Clarke FlorKraftsmen are doing. You don't need training-nor experience to make this big money. Others like you are making it. They acted. It's your turn now.
Be a FlorKraftsman - own your own busi-ness-make $\$ 25$ to $\$ 75$ per day. It's easy with the Clarke Vacuum Portable Sander - the floor sander that does the work of many men working by hand - and does better work. The only sander with a definite written guarantee of performance.
THINK of the opportunity. No school-no tuition -no experience necessary. Millions of dollars are spent yearly surfacing new floors-resurfacing old ones. Every one wants beautiful floors. Every building in America needs Clarke Florkraftemen servicenot only once but every few years.
Hand work and big cumbersome machinery is out of date. Built into the Clarke is the skill and power you need. It does the work-quality and quantity. You get the profit. Think of surfacing 800 to 1600 ft , of floors in eight hours-so satiny smooth that you get from $21 / 2$ to 5 cents a foot for it. Or resurfacing 300 to 800 ft . of old varnish floor a day at from 10 to 15 cente a foot. Think of making school desk tope like new- 120 to 200 a day. Think of renewing the surface on office desks, store counters, etc. The Clarke does it all-better, quicker and at less cost. Plenty of big profit work for you everywhere, just waiting for you.
Many who have seen our previous announcements are now making big money. The results are certain. It's a sure pay business. Get the facto-send the coupon. And do it now.

Our Salesmen-Agents, many of whom have had no previous sales experience, are making a "clean-up" on Dickinson Cord Tires. No tire, in years, has met with such phenomenal success. Its astounding performance, under severe stress, strain and excessive load both in the laboratory and on the road has convinced even the most skeptical. Big Profits are easily made on the orders that automatically roll in from business already established in your locality by our National Advertising and through Consumer Recommendation.
Dickinson Cord Tires appeal to the reason and sound judgment of every car owner because they are built along scientific lines by the Dickinson Automatic Tire Building Machine of which we are the exclusive users. The economies they effect, to say nothing of the satisfaction they give, save the Motoring Public millions of dollars.
These are the tires that our Salesmen-Agents are finding a ready sale for. Tires which users, all over the country are commenting on as marking a new era in Automotive Progress.
Every Dickinson Tire is Perfect and a Racing Tire. Its cabled-cord construction, correct motor-traction principles, resiliency, quick "get-a-way" and absence of "tire-lag" make it a tire for the classes, those who want only the best. Yet it costs no more than the ordinary tire; practically pays for itself, as savings in fuel consumption range from $10 \%$ to $17 \%$.
Whether you have ever sold before or not you can easily make $\$ 40.00$ a day selling Dickinson Cord Tires because they render Service, deliver Speed, provide Comfort and supply Economy. Customer satisfaction and repeat sales are assured. Every tire guaranteed against all road hazards regardless of mileage.

Gets Winter Reception in Summer!
© Clearer GroundWave Reception Allows Greater Distance
Hundreds of satisfled users of the sensational Ground Antenna-Aer-O-Liminator-are wondering how they ever got along without faction in freedom from radio owners are inding marvelous satiolutionary improvement of reception comes from hooking your receiver to Ground Wave Reception. Radio eagineers tell you that the broadcast wave through the ground is in most cases almost static-free and with rare exception carries no noise interference. njoy and sppreciate the natural human tone and clarity of this Ground Wave Reception. If you haven't tried it you can't imagine the diference

Another advantage users have found with Aer-O-Liminator is the surprising $D$ X they get. Distant stations formerly drowned out by static or noise interference of air waves now come in ciear Ws a bell. selectivity is improved because, with pure clear Ground Wave Reception, you can pick up and log signals that before were through if waves Yroush shouldn't
round wave reception gourself of the new thritl of pure, cicar prove it for yourself.

## Take advantage of the most amazing offer ever made in all Radio History!

Try this remarkable new Crosley Radio with Crosley new type D Muscone without cost or obligation. Just phone a Crosley dealer-tell him you want to test the new Crosley Jewelbox.
Home is really the place to buy radio!

Home is where you can decide leisurely and surely. Crosley dealers are suthorized to home demonstrate this new radio. Antenna unnecessary for such demonstrations- 30 feet of wire on the floor of the room will do nicely.

Put the Jewelbox to any test!
Compare it with your old set. Try it with any other! Learn what radio reception can be. Note how easy it will be to break through any surrounding wall of local stations-to bring in diatant programs quickly, clearly and in fuil volume. Be sure you test the Jewelbor with the Croaley new type D Musicone that you may fully realize, if you own an old set or have not heard a Crosley, how far radio has progressed.
Remember-you do this all in your own home-at no coat and no obligation to you!

## The New

 GROSLEY JEWELBOX

Try it in your home -that's the only way to buy a Radio!
Every Crosley Dealer is now authorized to give you this FREE trial!

## THE CROSLEY RADIO CORPORATION

PowelCrosley, Jr, Pres., Cincinnati,Ohio

Licensad only for Radio Amateur, Experimental and Broadcant Reception. Montana, Wyoming, Colorado, New Mexico and Weat prices stightly higher.

## Feray

The Musicone finished to match the Jewelbox, $\$ 15$

The new Crosley Jewelbox is self-contained to operate from light socket.

All in one beautiful case. Add tubes and it's ready to operate! It is powerful. Supplying 180 volts to power output tube it gives full undistorte-i volume. Other sets supplying 110 to 135 volts result in poor quality, distortion and lese volume.
The Acuminators, an exclusive Crosley feature, enable you to tune sharply on distant stations increasing signil strength and volume to a surprising degree.
The new Crosley Jewelbox is up-to-date. The dial is illuminated-a modern necessary feature. The set is com pletely shielded as ali high grade radios should be. The rich brown finish high-lighted with gold makes it an ornament to grace the finest room. The beauty of the Jewelbox will charm you.
The price of the new Jewelbox is a triumph of manufacturing genius!

Crosley engineers designed this tuw Croeley Jewelbox under explicit instructions to make first a perfeet radio. It the production of their ninal design had been persons could have afronded them. persons could have afforded them. But ods, faclitiles to manufacture parts in milition quantities and a faith in the enormous demand such valuea would create, this splendid radio recelver is priced at 895 .

# Heres <br> <br> the new improved <br> <br> the new improved UBANTENNA 

## Easily Installed in a Few Minutes - Guaranteed to

 Bring in Loud, Clear DX Right Through Summer StaticHere it is-the new, improved and perfected SUBANTENNA - even better than its amazingly efficient predecessor which brought forth volumes of enthusiastic praise from thousands of critical fans. Now it's ready-the new SUBANT ENNA - ready to prove its DX ability - ready to challenge any type of loop or up-in-the-air aerial -ready to challenge those who have tried to produce an underground antenna of comparable efficiency, but who can't because the features of the new SUBANTENNA which make it so superior to anything else are patented. In short, here's the ideal antenna. Loud, clear DX regardless of the seasonregardless of weather-regardless of how much static there is in the air. derground Antenna Works

It is a known fact that radio waves travel through the ground just as they fo thru the air. Ground waves, nowever are much clearer than air waves, because air waves are more or lesc cut-up with statie and other disturbances, while the kround interference. The new. imInterference The new, im-
proved subancena - a real. scientilie device completely en: close. In a small, compact sealed and molsture-proof can. is buried in the ground in a vertical
nositrati It intercepts the clear, strons.

 Tested and Proved Tremendously Successful on Every Type of Set
Subantenna was put to count 'pas tests before being ollered to sou It was tried out on as many types of recelvers as it was possible to ohtain. In every teat the new all proved Subantenna exceeded all previous standards for antenha performance, it is sure to
work on your set. It is certain work on your set. It is certain
t) so greatly improve your recrptioa and to so greatly increave your radio enjoyment that you would not part with tals new, better antenna for twice its price if you could not get another.
Users Agree It Is the Greatest New Thing in Radio
"I haven owitch on my enbinet by which I ean throw from
en secrial to the Subantennai For example, I tume in WEAF en acrial to the subantenna. For example. I tune in UEAF
on the 8 Subantenns and find I hiave to turn down my volume eintral to stmont a fuit quarter awny from "OFF" Then. feverise to the perial I con hear harely a sound, and this is Gnly the same nisht I inatalled the Subastenna. If it it
