CATALOGUE

OF

BULBOUS AND TUBEROUS ROOTED
FLOWERS,

OF THE MOST CHOICE AND SPLENDID VARIETIES,
CULTIVATED AT THE
LINNÆAN BOTANIC GARDEN AND NURSERIES, FLUSHING,
NEAR NEW-YORK.

William Prince & Sons, Proprietors.

In addition to the immense stock under cultivation in the establishment, comprising more than 100,000, the proprietors make very large annual importations of the choicest new varieties from Holland, Belgium, and other parts of Europe. The following have been selected with great care from the finest foreign collections, and are remarkable for their size, beauty, and peculiarity, and for the delicacy of their tints. In the selection no expense has been spared, the great exertions and disbursements having been made more on account of this being a favorite class of plants with the proprietors, than from the expectation of profit. It can therefore with the utmost confidence be asserted that this collection is unrivalled in extent and variety. The whole are cultivated under the same names by which they were imported, and *the prices are greatly reduced and lower than have ever before been offered to the public*, the great increase of our stock enabling us to tender this advantage to purchasers. Those who purchase to re-vend, will be dealt with on the most reasonable terms.

At the conclusion of the present Catalogue the necessary directions are given for their culture, &c.

Where the prices are by assortment, or by the dozen, the selection of the varieties is to be made by the proprietors.

* denotes the earliest varieties, most proper for blooming in glasses or pots.

t denotes those that are tender.

DOUBLE HYACINTHS.

		261 *Vainqueur, or Conqueror	1 00

SINGLE HYACINTHS.

In regard to Single Hyacinths an incorrect prejudice exists, arising from the fact that their peculiar merits are but little known. For *early flowering* and particularly for *glasses or pots*, they are extremely desirable; they combine the most brilliant colors, and surpass the double varieties in the profusion of their bells. It may in fact be said that they precede the double varieties, and thus in a general collection extend the period during which we may enjoy the beauties and fragrance of this delightful class of flowers.

DOUBLE DAHLIA, OR GEORGINA.

This magnificent plant bids fair to rival in splendor and in diversity the far famed Tulip and the Rose. Many of the varieties are inconceivably beautiful and interesting, and there seems a never ending variation of color and form.

The numerous varieties combine the richest shades and most varied hues of which nature is susceptible, with every diversity in shape and magnitude, from the size of a small globe an inch and a half in diameter, to an expanded disk twenty-four inches in circumference! Most persons are not aware how simple are the means necessary to their preservation during winter. When the frost has destroyed the foliage, nothing more is required than to cut off the stalks two or three inches from the ground, and to take up the roots and put them in boxes of dry sand in a cellar, or any other place free from frost, there to remain till spring without further care. Indeed the proprietors have for the two past winters kept their stock quite dry and without sand.

The collection here offered is unrivalled in extent and beauty, and combines the most magnificent varieties of each class; it being a concentration of the most choice and interesting that could be selected from the principal establishments of Europe. The inferior kinds have been rejected, and it will be perceived that the catalogue is particularly rich in the splendid Variegated, Striped, Mottled, and Shaded varieties and others of the first class and most vivid and brilliant colors.

In addition to the usual course of obtaining the newest kinds offered for sale in the catalogues of foreign Florists, the proprietors have made arrangements with several amateurs abroad to furnish them with their most interesting varieties previous to their "coming out" in Europe; and it is to this arrangement that they are indebted for a large number of the very splendid varieties comprised in their catalogues of the last and the present year, although obtainable no where else in our country. The present collection may with justice therefore be said to constitute the *acme* to which this favorite flower has yet attained. Other new varieties are continually accumulating, and Supplementary Catalogues containing the additional kinds will be published in March and October of each year.

A specimen bed comprising a thousand plants, has been planted expressly for the inspection of amateurs, which will be extended annually by additions of all the most choice new varieties that foreign countries and our own may present, thereby affording ample facility for personal examination and selection, to those who desire it.

A large stock will be constantly under culture in pots, so as to be ready for transportation at any period desired, and more than 10,000 plants will be ready for delivery on the first of October of the present year (1833.)

It may be asserted without fear of contradiction, that at no period since the era of the famed Tulipo-mania, has the attention of the votaries of Flora been so universally devoted to any flower as it now is to the Dahlia, the "Glory of the Autumn." To the varieties first cultivated the objection was justly made that the expansion of their flowers commenced too late in the season to merit much estimation, but culture and judicious propagation have removed this difficulty as regards the new varieties. These commence blooming the middle of June, and continue

until arrested by frost, our fine American autumn being particularly favorable to their development.

Rivalling as they do all other plants of the garden in their majestic appearance and gorgeous display, they also combine the merit of facility of culture to such a degree, that the most ignorant can scarcely fail of success. And indeed the day is not distant when the number of varieties will surpass that of either the Hyacinth, the Tulip, the Rose, or the Carnation, and the numerous Striped, Variegated, and Mottled Dahlias, will then be designated under the various classes of Flakes, Bizarres, &c., in the same manner as the Carnation; the connoisseurs without doubt becoming quite as fastidious in regard to the formation of the petals as they now are in respect to the last named flower.

The letters annexed to the different varieties designate the height to which they usually attain: thus, A denotes those that do not exceed two feet—B those which attain to between two and three feet—C, three to four feet—D, four to five feet—E, five to six feet—F, six to seven feet—G, over 7 feet. Although the height will vary somewhat according to the soil and culture, yet by attention to this point the various kinds may be always so arranged in the garden that the dwarfs will not be hidden by the taller varieties, and when several rows are planted in a range with each other, with a due regard to their height, they will present as it were a *terrace of flowers*.

Purchasers will be furnished with a printed treatise on the requisite culture, containing the best rules as practised by intelligent cultivators in Europe and elsewhere.

A discount will be made to those who purchase largely and to Nurseries and other venders. To those who order a dozen plants or more, an abatement of 25 per cent. will be made from the stated prices which it will be perceived are much lower than usually charged, the great and increasing stock enabling us to offer them on these favorable terms, and also to select superior roots.

It seems scarcely necessary here to add that the deceptive practice of ingrafting the double varieties on roots of the single kinds is never practised by us.

Where the selection is left to us, such an assortment will be selected as will form a pleasing combination of color, form, height, &c. When packed dry, which can be done from October to May, they occupy so little space, that a great number may be comprised in a small compass, and they can be thus safely transported to any distance. During the residue of the year they can be transported in pots or by enveloping the roots in moss, and packing them properly, in accordance with the distance, &c.

N. B. In the foregoing list we have omitted about 150 of the older and inferior kinds that are enumerated in various other catalogues. About 200 other varieties will be received from foreign collections the ensuing season, and be comprised in the next catalogue, which will also include a number of very superior varieties originated by ourselves.

REMARKS.

All orders for Bulbous Flowers, Dahlias, or Seeds, must be sent *direct to us, and not through the agency of any person whatever.*—Every invoice transmitted by us will have a *printed heading and our signature, to prove it genuine, and we assume no guarantee whatever, where such an invoice cannot be produced.*—We mention these cautions for good and conclusive reasons, and we most particularly enjoin their strict observance on purchasers, *from our knowing that we have been grossly injured by deceptions practised on the public.*—Orders from a distance will always receive the utmost attention, both as to packing and forwarding, and it is only requisite for persons sending orders to specify the extent of land and water carriage, and the articles will be packed accordingly.

The Proprietors have further to state that their Fruit and Ornamental Trees, &c. are of *large size and vigorous growth*, and superior to any before offered to the public. The Establishment contains at the present period *more than a million of Trees and Plants*, and the Proprietors are willing to enter into arrangements of the most liberal description both as to prices and credit with all such persons as desire large quantities of Trees, &c. and with those proprietors of Nurseries who wish to extend their collections, and such other persons as wish to establish *new Nurseries*, they will enter into arrangements *on terms which will allow ample time for advantageous reimbursement.* Any persons who are desirous to act as agents for receiving orders for Trees, in towns where no agency at present exists, will please to communicate their views in regard thereto.

ESCULENT VEGETABLE, FIELD, AND FLOWER SEEDS.

The Proprietors also announce to all venders of Seeds, and to those who may desire to undertake such business, that they will supply every variety desirable, at very low rates and at a liberal credit. These seeds possess the advantage of being raised under our own observation, or when imported, of being tested to our satisfaction, and their *accuracy and vitality are expressly guaranteed.* The Catalogue will be found to contain many new and very choice varieties *never before offered to the public*, and it is intended to enrich this branch of the business with the same zeal which has been extended to the other departments. A Supplementary Catalogue will be speedily published, enumerating above 500 varieties of Annual, Biennial, and Perennial Flower Seeds, very many

of which are of extreme rarity; and they being mostly collected from plants in this establishment, their excellence may be relied on. The principal object in view is to furnish venders of seeds with wholesale quantities at reasonable rates, but to accommodate our correspondents we cannot object to furnishing smaller parcels for family gardens when applied for.

Every person desirous to engage in the sale of the above named articles, will, on application, receive all the information requisite to the object, and such an establishment ought to exist in every town in the Union. The present period (July) is particularly eligible for forming arrangements for business, preparatory to the autumnal sales. Bulbous roots, Dahlias, &c. being usually vended in a dry state, can with perfect convenience be made objects of sale in Seed stores.

The following distinct catalogues and publications relative to the different departments of the establishment may be obtained of the different agents, or by direct application to the proprietors, the six first mentioned being distributed *gratis* :—

- No. 1. Fruit and Hardy Ornamental Trees, Shrubs, and Plants, pp. 93.
- No. 2. Bulbous and Tuberous Rooted Plants, pp. 30.
- No. 3. Green-house Trees, Shrubs, and Plants, pp. 48.
- No. 4. American Indigenous Trees, Shrubs, and Plants, pp. 52.
- No. 5. Catalogue of Esculent Vegetable, Field, and Flower Seeds.
- No. 6. Catalogue of Annual, Biennial, and Perennial Flower Seeds, comprising above 500 varieties.

These Catalogues can be transmitted by mail, at a postage of $1\frac{1}{2}$ to $2\frac{1}{2}$ cents per sheet, as well as the books below named.

BOOKS—Prince's Treatise on Horticulture	- - -	75 cents
“ Treatise on the Vine	- - -	\$1 50
“ Treatise on Fruits, or Pomological Manual, containing accurate descriptions in detail of about 800 varieties of Fruits, in 2 vols.	- - -	\$2

DIRECTIONS

For the Culture of Bulbous and Tuberous Roots.

Situation.—A southern aspect, dry and airy, and sheltered from the north winds, is preferable for most bulbs; but Anemones and Ranunculuses will do better in a situation commanding a southern aspect, and which can be protected from the heat of noonday.

Soil.—The following compost is most suitable for the Hyacinth, Tulip, Crown Imperial, Narcissus, Crocus, Snow Flake, Iris, Lily, Colchicum, Anemone, Ranunculus, Snow Drop, and most other bulbs :—One third sand, one third well-rotted cow-dung, and one third good garden mould. Let the beds thus formed be well dug over to the depth of fifteen or eighteen inches, that the materials may be well mixed together; a fourth part of rotten wood or vegetable mould from a swamp, may be added to the above, if conveniently to be obtained, which will at all times be beneficial in giving additional lightness to the soil.

The various species of the Amaryllis succeed best in a rich sandy loam, and the families of the Ixia, Oxalis, Feraria, Gladiolus, Antholyza, Lachenalia, and most other Cape and Tropical bulbs require the soil to be more sandy than for the generality of other bulbs.

Forming the Beds.—The beds should be raised about 4 inches above the level of the walks, and moderately arched, which will afford an opportunity for the superfluous moisture to run off. Sand (either sea or fresh) strewed in the trenches, before and after placing the roots will be beneficial.

Time of Planting.—For the Hyacinth, Tulip, Crown Imperial, Squill, Lily, Polyanthus Narcissus, Double Narcissus, Jonquil, Iris, Crocus, Colchicum, Star of Bethlehem, Snowdrop, Snowflake, Gladiolus, Allium, and most other hardy bulbs, the preferable season for planting is the months of October and November—and it is well to observe that the species of bulbs above named (Tulips excepted) will thrive best if not taken from the ground oftener than every second or third year. The different species of the Feraria, Antholyza, Ixia, Crinum, Hæmanthus, Eucomis, the tender species of Amaryllis, Pancratium, and Gladiolus, and most other delicate bulbs, may be planted during the months of November and December, in pots, when intended to be sheltered during the winter, or they can be kept in dry sand until April or May, and then be planted in pots, or in the open ground when it has become free from frost, and perfectly settled.

Depth and Distance.—Hyacinths, Persian Fritillary, Martagon, and other Lilies, and Pæonies, should be planted at the depth of four inches; Crown Imperials and Polyanthus Narcissus, five inches; Tulips, Double and Single Narcissus, Jonquils, Colchicums, Snowflakes, Bulbous Iris, and Gladiolus, three inches; Crocus, Arums, small Fritillaries, and Snowdrops, two inches; Ranunculus and Anemone, one and a half inches; Dogstooth Violet, one inch, always measuring from the top of the bulb. The rows should be ten inches apart, and the roots be placed from four to six inches apart in the rows, according to their size.

Protection during Winter.—In the Middle and Northern States it will on the approach of winter be beneficial, though not absolutely necessary, to cover the beds with straw, tanner's bark, withered leaves, or light earth from the woods, such as is formed by the decay of foliage, to the depth of two or three inches, as it prevents any ill effects which a very severe season might have upon the roots. This covering must be carefully raked off early in the spring. The Polyanthus Narcissus, Hoop Petticoat Narcissus, and Arum dracuncululus being more tender than other species require a covering of five or six inches of straw or leaves in the manner above detailed.

Taking up Bulbs after flowering.—About a month after the bloom is passed, the foliage puts on a yellow decayed appearance. This is the proper season for taking up the roots, on doing which, the stem and foliage should be cut off within an inch of the bulb, leaving the fibrous roots attached to it. After this preparation, spread them singly in an airy room to dry for 2 or 3 weeks, then wrap each root carefully in paper, (the air being injurious,) or put them in dry sand until replanted.

Anemone and Ranunculus.—The soil should be compact and rich, not light or sandy. A stiff loamy soil suits them very well, and with it there should be mixed one fourth part of rotten manure, and in doing this the

earth ought to be well pulverized. In England they are planted about the 10th of February, and here they may with success be planted as early in the spring as the ground can be worked. We have had them to succeed well when planted at the end of October or early in November, and protected during winter with a covering of straw or leaves, which was removed early in the spring. They will bear a considerable degree of cold, but our intense frosts destroy them when not protected as above. They require a moist soil, but not over much so. Heavy rains injure and rot them, and the ground selected should be such as does not retain water and become sodden. In dry weather they will require frequent waterings. When the roots are taken up after blooming they should be preserved in dry sand till replanted.

Culture of tender Bulbs in pots, comprising the Oxalis, Lachenalia, Ixia, Gladiolus, Anthoiza, &c. &c.—The management of these is extremely simple. They should have as much light, sun, and air, as possible, and be kept free from frost. When the foliage is past and the roots consequently in a dormant state they can be either left in the pots in a dry situation without any watering, or be taken out and wrapped in paper or packed in sand till the ensuing season, at which period they will require to be repotted in fresh soil composed as already detailed.

Culture of the Amaryllis and Tuberoses.—The *Amaryllis longifolia*, (both rose colored and white,) is extremely magnificent, and will support our winters by planting the roots at a depth of 6 inches from the extremity of the neck of the bulb. A southern exposure is much to be preferred, the warmer the better. They will also flourish admirably if planted in a pond below the point of congelation. The *Amaryllis formosissima*, *vitata*, *aurea*, *belladonna*, *equestris*, double and single; *reginæ*, *psittacina*, *Johnsoni*, *gigantea*, *ignescens*, and all the other spring, summer, and autumn flowering species may, if preferred, be preserved during winter in boxes of dry sand, and planted out in the open garden at the end of April, or beginning of May in a rich sandy loam, where they bloom with the utmost splendor. The different species of *Zephyranthes*, *Crinum*, and *Pancratium*, will succeed admirably by the same course of culture. In planting the above named roots, place the bulb so that one third of its diameter will be above the surface of the ground. This is to apply to all except the *Amaryllis formosissima* or Jacobean Lily, which should have the bulb covered, leaving the neck only to project above the surface of the ground. Tuberoses, and the *Feraria tygridia*, or Tiger flower, should be planted at the depth of one inch, the numerous offsets on the former being first broken off to prevent their impoverishing the main root and arresting the bloom. The double and striped leaved Tuberoses are greatly admired; the latter of these and the Common Single flowering are more certain in their bloom than the double variety. The *Feraria tygridia* is exceeding beautiful, and therefore much admired.

Hyacinths and other Bulbs in pots or glasses for winter blooming.—For this purpose Single Hyacinths, and those designated as earliest among the double are to be preferred. The *Polyanthus Narcissus*, Italian or Roman *Narcissus*, Double *Narcissus*, Double and Single Jonquils, Persian *Iris*, *Crocus*, the winter and spring flowering varieties of the *Cyclamen*, and the Double and Single Duke van Thol Tulips make also a fine appearance during the winter season. Bulbs intended for blooming in pots during the winter should be planted during the months of October and November, and left exposed to the open air until the ground begins

to freeze, when they should be removed to the Greenhouse or to a warm room. They will need occasionally moderate waterings before they begin to vegetate, and when they attain to a growing state should receive a plentiful supply by pouring it into the saucers. They should at all times be exposed as much as possible to the sun, air, and light, to prevent their foliage from growing too long, or becoming of a yellow hue. Bulbs cultivated after this manner will mostly bloom in January, and next to the Hyacinth, the Polyanthus Narcissus, and Double Italian, or Roman Narcissus, may be ranked among the most desirable for beauty fragrance, and easy culture.

Those intended for glasses should be placed in them about the middle of November, the glasses being previously filled with pure water, so that the bottom of the bulb may just touch the water; then place them for the first ten days in a dark room, to promote the shooting of the roots, after which expose them to the sun and light as much as possible. They will bloom however with but little or no sun, but the flowers will be inferior in color. The water should be changed as often as it becomes impure, at which period the roots ought to be drawn entirely out of the glasses and rinsed in clean water, the glasses being at the same time well washed inside. Rain or soft water is preferable to that termed hard, but either will answer the purpose, provided it be perfectly clear. Bulbs that have been forced are of but little value, and require a considerable period to regain their natural vigor. When removed from the pots or glasses, they should be immersed in water for a week, and then planted in a soil properly prepared, where they will usually commence flowering again the second year.

Dahlia, or Georgina.—Few of our most rustic plants exact less care than this splendid native of Mexico. Indeed so simple is its culture that it is already widely disseminated in every part of Europe, as well as in the West Indies, South America, &c. in all of which it has been found to succeed. It will thrive in any good soil, but as is the case with other plants held in great estimation, amateurs bestow more care to its culture than is absolutely required, and have adopted particular rules for that object. The roots are tuberous, and towards the last of April they begin to push out young shoots at the base of the stem of the previous year. At this period, or rather earlier, they should be planted; they will however succeed perfectly well if this is deferred till June, but will not come so soon into flowering. In England they usually from choice plant the Dahlia in poor gravelly soil, in order to render it more dwarf in stature, and this course may have its advantages in a humid atmosphere. In our own country, however, where the heat of summer is excessive, and where we are sometimes visited with a severe drought, the Dahlia would often be absolutely blighted, unless the soil were sufficiently rich and retentive of moisture. When planted in a generous soil, our climate is so extremely congenial to its habits that it expands with the utmost luxuriance, attaining a degree of beauty in its development, if not unequalled, at least not to be surpassed.

The course we have adopted for its culture, although extremely simple, has been eminently successful, and the directions we shall now give are in accordance therewith.—Make the ground mellow to the depth of eighteen inches, digging in at the same time a liberal supply of manure. Plant the dwarf kinds at three, and the tall ones at four feet distant; and before placing the roots, dig in a shovel full of manure at the top of each hole destined to receive them. The root should be placed two inch-

as beneath the surface—measuring from the base of the old stem. Most persons allow but one stalk to grow, and of course select the strongest—cutting away the weaker ones. When planted along a walk or avenue, a triple range presents a very beautiful appearance, the most dwarf being selected for the first row, those of greater stature for the second, and the tallest for the third row—indeed this manner of arrangement may be extended to five or six rows. Another mode is to plant them in clumps, either circular, square, or as the taste may suggest, the tallest varieties being selected for the center. In either of these arrangements, a judicious selection of the various colors is requisite, in order to unite to their brilliant display, the advantage of a tasteful combination.

When the plants are about a foot high, a pole should be placed by each, proportioned to the usual height it attains, which should be driven into the ground about a foot from the stalk, so as not to interfere with the roots. The poles or stakes will necessarily vary from three to eight feet in height above the surface; and to be firmly placed should penetrate the ground from twelve to eighteen inches. Those for the taller plants will require of course to be of greater thickness and strength than such as are designed for the more dwarf varieties. The work of driving the poles may be more easily effected immediately after a rain, when the ground is moist.

As the plants advance in growth, it will become necessary to tie the stalks firmly to the poles to guard against the effects of winds and storms. For this purpose common bass matting, or any other soft ligature is to be preferred. The branches being extremely brittle are subject to be broken in severe gales when not well supported. Some persons train their Dahlias on a trellis, which affords security to every branch, and presents at the same time a fine effect. It is only in very exposed situations that the extreme caution is required of tying every branch; and in cities and other well sheltered locations far less care will suffice in this respect. It is deemed beneficial to trim off the lateral shoots nearest the ground, to a certain height in proportion to the growth of the plant; say for dwarfs twelve inches, and for other varieties eighteen, increasing to twenty-four inches for the tallest. Some cultivators thin out about half the number of upper branches, in order to add to the strength of the remaining ones, and to increase the size and beauty of the flowers.

Omission.—Common white lily, or *Lilium candidum*, \$6,00 per 100.
