ABSTRACT

This report contains a summary of EG&G fireball photography and a preliminary analysis of the results for Shot Sunset of Operation Dominic.

Sunset, a LASL-sponsored device, was detonated on 10 July 1962 at GZ-17, southwest of Christmas Island. Measured time of free fall from the B-52 delivery aircraft was 55.1905 seconds. The device was detonated at an altitude of 5000 ft \pm 25 ft above MSL. The local Christmas Island time of detonation was 0733:01.2372.

ϕ^5 scaling indicates a fireball yield of 810 kt \pm 30 kt, while Mach scaling shows a yield of 800 kt \pm 40 kt. Bhangmeters indicate a yield of 884 kt \pm 133 kt, based on an average time-to-minimum of 81.7 msec.

~~CONFIDENTIAL~~

1.0 BHANGMETER OPERATION AND DATA

Nine Bhangmeters were employed on Shot Sunset, three at the EG&G Timing Trailer at A Site, two each on the two C-130 aircraft, and two on the B-52 delivery aircraft. Table 1 summarizes Bhangmeter operation and the data obtained.

Table 1. Bhangmeter data.

Location	Type	Reading	
		No. of Pips	Time (msec)
A Site Trailer	RO-1 No. 1	10.5	84
A Site Trailer	RO-1 No. 2	20	80
A Site Trailer	RO-1 No. 3	Off scale at 40 msec - set on fast sweep	
Aircraft 298 (C-130)	MK-V, S/N 1	20.25	81
Aircraft 298 (C-130)	MK-V, S/N 2	20.5	82
Aircraft 299 (C-130)	MK-V, S/N 4	Off scale at 40 msec - set on fast sweep	
Aircraft 299 (C-130)	MK-VI, S/N 3	20.25	81
B-52 Aircraft	ASH 4	20.5	82
B-52 Aircraft	MK-VI	20.5	82

The average t_{min} , 81.7 msec, corresponds to a yield of 844 kt \pm 133 kt at an ambient air density of 1.0162 grams/liter for an altitude of 5000 feet.

2.0 CAMERA INSTRUMENTATION AND OPERATION

Photographic coverage of fireball growth was provided by land-based camera installations at Sites A, MM, and D on Christmas Island and by airborne installations on two C-130 aircraft. The B-52 drop aircraft was also instrumented to record fireball formation. The exact instrumentation of these stations is detailed in Appendix A, and an evaluation of the operation of each camera is given on the Film

Comment Sheet, Table 2. Complete survey data for the actual GZ-17 for Sunset are given in Appendix B.

2.1 Position of Burst

Six theodolite cameras were operated, two at each of the ground stations. All six obtained good records and a phototriangulation of the position of burst was performed on the basis of these records. A diagram showing the angular off-axis position of the burst from the A, MM, and D Site stations is presented in Fig. 1. The calculated position of burst was:

N 171600 } referenced to H&N Universal Transverse Mercator Grid
E 695185 }

Height: 5000 ft ± 25 ft above MSL

The resultant slant ranges from the camera stations at A and MM Sites are 92,365 feet and 88,717 feet, respectively, compared with the Sandia Corporation radar slant-range measurements of 92,550 feet and 88,980 feet from the A and MM Site radar positions.

2.2 Fireball Photography

Fireball growth was recorded and measured from all ground stations and from the two C-130 aircraft. All cameras operated as scheduled, though Photo-Sonic 4B-8 in the drop aircraft did not record the fireball, and the records from the D Site cameras showed some cloud cover. Fireball phenomena were, however, measurable from the D Site films.

At zero time, the radar mount at A Site was aimed slightly high and 1 degree to the right of the fireball. The fireball image on the films from the cameras on the MM Site radar mount was horizontally centered but was slightly high in the frame.

On the records from the fixed aiming cameras at D Site, the image was 1 degree to the left of the frame center and vertically centered. The image on the Aircraft 298 records appeared 3 degrees to the right and 2 degrees below the frame center. Aircraft 299 recorded the fireball 3 degrees below and 2 degrees to the right of the frame center.

Results from the six cameras which used experimental XR film are not yet known. Because of its special processing requirements, the film will have to be processed at a later date. The records concerned are those from Mitchell No. 43 and Rapatronic 106 at D Site, Fastax WF8 No. 2 from Aircraft 298, Fastax WF8 No. 3 from Aircraft 299, Rapatronic No. 116 from A Site, and Rapatronic No. 108 from MM Site.

AFSWC furnished slant ranges between the aircraft and the device of 52,700 ft \pm 800 ft for the B-52 delivery aircraft, 87,910 ft \pm 130 ft for Aircraft 299, and 89,290 ft \pm 350 ft for Aircraft 298.

The Dynafax cameras at A and MM Sites obtained good fireball records. These will be read and included in the final report on Sunset.

The zero-frame time corrections for Sunset were made utilizing eight Rapatronic records, three from A Site, three from D Site, and two from MM Site. Figure 12 is a plot of the Rapatronic results. The diameter measurements for these records are contained in Appendix C.

3.0 YIELD DETERMINATION

The yield measured by the \emptyset^5 scaling technique is 810 kt \pm 30 kt. This yield figure is based on the extensive analysis of six high-speed records from the three ground stations.

The Mach-scaling technique, whereby diameter-time behavior is scaled to a theoretical 1-kt diameter-time curve, indicates a yield of 800 kt \pm 40 kt. The Mach-scaling yield is also based on six of the high-speed records from the ground stations.

The PS4B records from Aircraft 298 and 299 were analyzed for yield, utilizing the DME (Distance Measuring Equipment) data provided by AFSWC. Evaluation of these records, excluding all ground-station photography, indicates a ϕ^5 fireball yield of $845 \text{ kt} \pm 30 \text{ kt}$ for Aircraft 299 and $885 \text{ kt} \pm 20 \text{ kt}$ for Aircraft 298, representing variations of +4.3% and +9.3% respectively from the yield determined from the ground-station records. The aircraft yield figures are quoted here only for comparison; they were not incorporated into the calculation of the ground-station ϕ^5 yield reported above, which is considered to be the best figure.

A summary of the ϕ^5 yield calculations for each film read is presented in Table 3. Detailed ϕ^5 yield calculations for each film are given on the IBM printout sheets in Appendix D. The time interval of the ϕ^5 scaling represents the time over which all values were averaged to determine the yield reported for each film. The time limits indicated in Table 3 correspond to the selected constant- ϕ region where the ϕ^5 technique is valid. This region is noted on each data printout sheet by marks outside the yield column.

Plots of diameter vs time for the data from each station and phi vs time from each ground station are shown in Figs. 2 through 9. Composite plots for the complete sets of data from the three ground stations are given in Figs. 10 and 11. Diameter measurements and camera data calculation sheets for each film are included in Appendix C.

The Mach-scaling method was applied to the diameter-time data from each film individually, as well as to the data from the six ground-station records combined (Appendix E). In this method of yield determination, a polynomial fit is made on all the data, and the resultant diameter-time curve, which represents the characteristic diameter-time behavior for this shot, is scaled to a theoretical 1-kt curve. It should be noted that the limits (DW(KT)) stated on the composite

~~CONFIDENTIAL~~

yield tabulation apply only to the particular fit which was made to the combined diameter-time data and do not represent the scatter which appears in the results from individual films. The limits quoted above, however, do include this scatter. The coefficients of the polynomial to which the diameter-time data were fitted by least squares are given below each tabulation, along with ambient pressure (mb), temperature ($^{\circ}$ K), ambient sound velocity (m/msec), and the time interval over which the fit was made.

An air density of 1.0162 grams/liter was calculated for an altitude of 5000 feet above MSL, based on an H+15 minute observation by JTF-8 Weather Central, which reported a pressure of 849 mb, a temperature of 16° C, and a relative humidity of 80% at that altitude.

Examples of fireball photography and the photo-theodolite records are included in Appendix F. Prints of the fireball at various times are shown from each of the photographic stations.
