PREFACE.

Few works on Intellectual Arithmetic have received more unqualified approbation, and a more extensive patronage, than this, which, for several years, was published under the title—Ray's Arithmetic, Part Second.

The numerous editions demanded have again rendered necessary a renewal of the plates; this has afforded an opportunity for remodeling the work.

Many important improvements have been introduced, with a design to impart completeness, and give a concise and progressive course of arithmetical analysis.

The volume in its present form, embraces:

1st. Exercises on the primary principles, and their applications; together with models of analysis in the shape of *solutions*.

2d. A progressive and comprehensive presentation of Fractions, intended to render the subject intelligible and attractive.

3d. General Reviews, designed to test the pupil's knowledge of principles, preparatory to the applications of mental analysis which follow.

4th. Reduction and Percentage, with the application of the latter to Profit and Loss, Commission, Insurance, Interest, and Discount.

The value of Intellectual Arithmetic is so highly appreciated, that little need be said in its commendation; when properly taught, it is one of the most useful and interesting studies in which pupils can engage. By its study, the pupil is taught to reason, to analyze, to think for himself; while it imparts confidence in his reasoning powers, and strengthens the mental faculties.

TO TEACHERS.

THE solution of an example in Mental Arithmetic is herein regarded as a direct and natural response to the requirements of the problem; it aims to be a plain and simple statement of the successive steps leading to the final result or *answer*. The data afforded by the example are repeated in the solution no further than is necessary for its clear statement.

Every different class of examples is furnished with a solution; in a few instances, more than one solution is given, the succeeding solutions offering a briefer method. No solution is repeated; and, when a solution, in whole or in part, occurs in a subsequent solution as a portion of the argument, its result is given as briefly as possible.

Of course, there is nothing to prevent the teacher from elaborating any solution, or any portion of it, to the fullest extent he sees fit; and it may often be desirable so to do. Furthermore, those who wish can, with facility, apply the "Four Step Method" for *the three step*, of which each solution will furnish a clear statement.

It is obvious, that in a text-book the publishers should not occupy space with any thing more than the essentials of a solution.

LESSON XXI.

A *fraction* is one or more equal parts of a unit.

A fraction is represented by writing two numbers, one above the other, with a line between them. Thus, one-half is written $\frac{1}{2}$; two-fifths are written $\frac{2}{5}$; five-sevenths, $\frac{5}{7}$, etc.

The lower number shows the number of parts into which the unit is divided; it is called the *denominator*.

The upper number shows how many parts of the unit are taken; it is called the *numerator*.

The numerator and denominator are styled the *terms* of the fraction.

Write the following fractions:

Two-thirds, four-fifths, six-sevenths, eight-ninths, one-tenth, three-tenths, nine-tenths, seven-elevenths, five-twelfths, seven-thirteenths, nine-fourteenths, thirteen-fifteenths, one-sixteenth, two-seventeenths, five-eighteenths, six-nineteenths, seventeen-twentieths, twenty-seven thirty-firsts, thirty-four forty-thirds, twenty-nine fifty-sixths, forty-two sixty-sevenths, fifty-seven seventy-firsts, sixty-nine eighty-seconds, seventy-one ninety-eighths, eighty-five one-hundred-and-twenty-thirds.

Read the following fractions:

$$\frac{3}{5}, \frac{4}{7}, \frac{5}{9}, \frac{7}{12}, \frac{8}{17}, \frac{17}{22}, \frac{24}{31}, \frac{35}{42}, \frac{49}{51}.$$

In the fraction $\frac{2}{3}$, the number of parts, *two*, which are taken, is *less* than the number of parts, *three*, into which the unit is divided; hence, the *value* of the fraction is *less than* 1. In the fraction $\frac{3}{3}$, the number of parts taken *equals* the number of parts into which the unit is divided;

hence the *value* of the fraction is *equal to* 1. In the fraction $\frac{4}{3}$, the number of parts taken is *greater* than the number of parts into which a single unit is divided, and hence the value of the fraction is *greater than* 1.

A *proper* fraction is one whose value is less than 1.

An *improper* fraction is one whose value is equal to or greater than 1.

Point out the proper and improper fractions in the following examples:

$$\frac{1}{2}, \frac{2}{1}, \frac{3}{4}, \frac{4}{3}, \frac{5}{6}, \frac{6}{5}, \frac{7}{8}, \frac{8}{7}, \frac{9}{10}, \frac{10}{9},$$

$$\frac{11}{12}, \frac{14}{13}, \frac{15}{16}, \frac{17}{18}, \frac{25}{21}, \frac{34}{42}, \frac{54}{45}, \frac{65}{76}.$$

A *mixed number* is composed of a whole number and a fraction. Thus, $2\frac{1}{2}$, $3\frac{1}{3}$, $5\frac{2}{7}$; read, *two and one-half*, *three and one-third*, *five and two-sevenths*.

Read the following examples:

$$4\frac{1}{2}, 6\frac{1}{4}, 7\frac{3}{8}, 9\frac{5}{12}, 18\frac{6}{7}, 22\frac{8}{9}, 35\frac{7}{11}, 48\frac{3}{10}, 69\frac{5}{20}, 75\frac{16}{8}.$$

II.—FRACTIONAL PARTS OF 100.

$$\begin{array}{ll} 12\frac{1}{2} = \frac{1}{8} & 37\frac{1}{2} = \frac{3}{8}. \\ 16\frac{2}{3} = \frac{1}{6} & 50 = \frac{1}{2}. \\ 20 = \frac{1}{5} & 62\frac{1}{2} = \frac{5}{8}. \\ 25 = \frac{1}{4} & 66\frac{2}{3} = \frac{2}{3}. \\ 33\frac{1}{3} = \frac{1}{3} & 75 = \frac{3}{4}. \\ & 87\frac{1}{2} = \frac{7}{8}. \end{array}$$

LESSON LVII.

1. Divide 15 into two parts, so that the less part may be $\frac{2}{3}$ of the greater.

SOLUTION. $\frac{2}{3} + \frac{1}{3} = \frac{3}{3}$; $\frac{1}{3}$ of the greater part = 15: then, $\frac{1}{3}$ of the greater part is $\frac{1}{3}$ of 15 = 3, and the greater part is 3 times 3 = 9; the less part is 15 - 9 = 6.

2. Thomas and John have \$60 to pay; John has $\frac{3}{7}$ as much to pay as Thomas: what must each pay?

3. I had 56 mi. to travel in 2 da.; the second da. I went $\frac{3}{4}$ as far as the first: how far did I travel each da.?

5. Divide the number 45 into three such parts, that the second shall be $\frac{1}{2}$, and the third $\frac{3}{4}$ of the first part.

6. A, B, and C, together have 40 ct.; B has $\frac{3}{5}$ as many as A, and C $\frac{2}{3}$ as many as B: how many cents has each?

SOLUTION. C has $\frac{2}{3}$ of $\frac{3}{5} = \frac{2}{5}$ as many as A; then, $\frac{5}{5} + \frac{2}{5} + \frac{2}{5} = \frac{10}{5}$; and $\frac{10}{5}$, or twice as many as A, = 40 ct. Then, A has $\frac{1}{2}$ of 40 ct. = 20 ct., B has $\frac{3}{5}$ of 20 ct. = 12 ct., and C has $\frac{2}{3}$ of 20 ct. = 8 ct.

9. Divide 38 ct. between A and B, so that $\frac{2}{3}$ of A's share may be equal to $\frac{3}{5}$ of B's.

SOLUTION. $\frac{1}{3}$ of A's share is $\frac{1}{2}$ of $\frac{3}{5} = \frac{3}{10}$ of B's, and A's share is 3 times $\frac{3}{10} = \frac{9}{10}$ of B's; then, $\frac{1}{10} + \frac{9}{10} = \frac{10}{10}$ of B's share, or 38 ct. $\frac{1}{10}$ of B's share is $\frac{1}{9}$ of 38 ct. = 2 ct., and B's share is 10 times 2 ct. = 20 ct. A's share is $\frac{9}{10}$ of 20 ct. = 18 ct.

SOLUTION.—6 mo 15 da. are $\frac{1}{2}\frac{3}{4}$ yr; the interest for $\frac{1}{2}\frac{3}{4}$ yr. is $\frac{1}{2}\frac{3}{4}$ of 6 per cent = $\frac{1}{4}$ per cent; $\frac{1}{4}$ per cent is $\frac{1}{400}$; $\frac{1}{400}$ of \$120 = \$3.90.

LESSON LXXVII.

1. At what per cent will \$200, in 2 yr., give \$24 interest?

SOLUTION.—The interest for 1 yr. is $\frac{1}{2}$ of \$24 = \$12; this is $\frac{12}{200} = \frac{3}{50}$ of the principal; $\frac{3}{50}$ are 6 per cent.

1. What is the present worth and discount, at 5 per cent, of a note for \$72, due 4 yr. hence?

SOLUTION.—The discount is 20 per cent = $\frac{1}{5}$; $\frac{1}{5} + \frac{1}{5} = \frac{2}{5}$; then, $\frac{2}{5}$ of the present worth = \$72; whence the present worth is \$60, and the discount \$12.

PROBLEMS

LESSON LXXX.

1. If 12 peaches are worth 84 apples, and 8 apples are worth 24 plums, how many plums shall I give for 5 peaches?

2. Divide 32 peaches among Mary, James, and Lucy, giving Mary 2 more than Lucy, and Lucy 3 more than James.

3. Five times a certain number is 16 more than 3 times the same number: what is the number?

4. A has $\frac{1}{2}$ as much money as B; B has $\frac{1}{3}$ as much as C; C has \$15 more than A: how much has each?

5. If $\frac{3}{4}$ of James's money be increased by \$6, the sum will equal what Thomas has; both together have \$34: how much has each?

6. A farmer sold $\frac{3}{8}$ of his sheep, but soon afterward purchased $\frac{4}{5}$ as many as he had left; he then had 65 sheep: how many sheep had he at first?

7. If 3 men can perform a piece of work in 4 days, working 10 hours a day, in how many days can 8 men perform the same job, working 6 hours a day?

8. Thomas bought a number of apples, at 2 for 3 ct., and as many more at 2 for 5 ct.; he sold all at the rate of 3 for 7 ct.: how much per dozen did he gain?

9. A, B and C rent a pasture for \$92; A puts in 4 horses for 2 mo.; B, 9 cows for 3 mo.; and C, 20 sheep

for 5 mo.: what should each pay, if 2 horses eat as much as 3 cows, or as much as 10 sheep?

10. A father who had as many sons as daughters, divided \$20 among them, giving to each daughter \$2, and to each son \$3: how many children had he?

11. A gentleman meeting some beggars, found that if he gave each of them 3 ct. he would have 12 ct. left, but if he gave each of them 5 ct. he would not have money enough by 8 ct.: how many beggars were there?

SOLUTION.—To give each beggar 5 ct. took $5 - 3 = 2$ ct. more than to give him 3 ct.; to give all the beggars 5 ct. each took $12 + 8 = 20$ ct. more than to give them 3 ct. each; then, there were as many beggars as 2 ct. are contained times in 20 ct., which are 10.

12. A father wishes to distribute some peaches among his children; if he give each of them 2 peaches he will have 9 left, but if he give each 4 peaches he will have 3 left: how many children has he?

13. A hare is 10 leaps before a hound, and takes 4 leaps while the hound takes 3; but 2 of the hound's leaps equal 3 of the hare's: how many leaps must the hound take to catch the hare?

SOLUTION.—One of the hound's leaps $= \frac{3}{2}$ of the hare's, and 3 of them $= 4\frac{1}{2}$ leaps of the hare; then, in taking 3 leaps, the hound gains on the hare $4\frac{1}{2} - 4 = \frac{1}{2}$ a leap. Since the hound gains $\frac{1}{2}$ a leap in taking 3 leaps, he gains 1 leap in taking 2 times $3 = 6$ leaps, and he gains 10 leaps in taking 10 times $6 = 60$ leaps.

14. Henry is 7 steps ahead of John, and takes 6 steps while John takes 5; but 4 of John's steps equal 5 of Henry's: how many steps must John take to overtake Henry?

15. If 1 ox is worth 8 sheep, and 3 oxen are worth 2 horses, what is the value of 1 horse, if a sheep is worth \$5?

24. A can do a piece of work in $4\frac{1}{2}$ days; A and B together in $2\frac{4}{7}$ days: in what time can B do it alone?

25. I bought a number of pears at 2 for 1 ct., and as many more at 4 for 1 ct.; by selling 5 for 3 ct. I gained 18 ct.: how many pears did I buy?

37. A, B, and C can do a piece of work in 4 days, A and B in 8 days, B and C in 6 days: in what time can each do it alone?

38. A provision dealer bought a number of ducks, at the rate of 6 for \$1; and twice as many chickens, at the rate of 8 for \$1; by selling them at the rate of 2 chickens and 1 duck for $\$1\frac{1}{2}$, he gained $\$2\frac{1}{2}$: how many of each did he buy?

47. A and B together can do a piece of work in 16 days; they work 4 days, when A leaves, and B finishes the work in 36 days more: in how many days can each do it?

48. A man bought 84 eggs, which he intended to sell as follows: 3 dozen, at 1 ct. apiece; 2 dozen, at 4 eggs for 3 ct.; and the rest at 4 eggs for 5 ct.: but, having mixed them, how must he sell them per dozen to get the intended price?

49. A man agreed to pay a laborer \$2 for every day he worked; the laborer, for every day he was idle, was to forfeit \$1; at the expiration of 20 days he received \$25: how many days was he idle?

SOLUTION.—If the laborer had worked every day he would have received 20 times \$2 = \$40; then, he lost by being idle \$40 — \$25 = \$15. Every day he was idle he lost $\$2 \div \$1 = \$3$; then, he was idle as many days as \$3 are contained times in \$15, which are 5.
