milk long sweet for skim-milk cheese. Buttermilk is used more or less by the labouring classes in all parts of Scotland, and in particular in the city of Glasgow; on the authority of the secretary to the Board of Agriculture, it is adjudged to the pigs in England; but in the western counties of Scotland, as well as in Ireland, it is used to a vast extent as burnan food. It is used as drink, and is certainly far superior to the miserable table-beer generally drank in England. It serves as kitchen to pottage, brend, potatoes, &c.; and when a linen bag like a pillow-slip is filled with it, and hung utill the serum drop, and a small quantity of sweet cream is mixed with what remains in the bag, and a little sugar when the milk is too sour, it forms a dish that might be placed on the table of a peer of the realm.

7110. The method of making butter and buttermilk in Holland is somewhat different from the mode in the vicinity of Glasgow. After the milk is cold it is put into a pan or vat, and well stirred with a wooden spoon or ladle two or three times a day, to prevent the cream from separating from the milk; and this sort of stirring or partial churning is continued till the milk becomes so thick and clotted that the ladle or spoon stands erect in the milk; and this his the the till the milk share the cold water. By this method the Hollanders imagine they obtain more butter from the milk than they can do any other way. They also say, that both the butter and butternilk are better when made in that way than when churned as is done in England.

7111. Whey, when new and of a pale green colour, forms an agreeable beverage, and with oatmeal makes an excellent gruel or porridge. Left till it, gets sour, it undergoes the vinous fermentation as readily as buttermilk; and man, who in every state of civilisation feels the necessity of occasionally dissipating the cares of his mind, when he cannot find tobacco, opium, malt liquors, or ardent spirit, has recourse to sour whey.

CHAP. VI.

The Sheep. — O'vis A'ries L.; Mammàlia Pécora L, and Ruminàlea Cuv. Brébis, Fr.; Schaf, Ger.; Oveja, Span.; and Pecora, Ital.

7112. The sheep is an inhabitant of every part of the globe, from Iceland to the regions of the torrid zone. The varieties of form and clothing necessary to fit it for existing in so many climates are of course numerous. In most of these countries it is cultivated for its wool or flesh, and in many for both; but it is most cultivated in Europe, and especially in France, Spain, and Britain. In the latter country its culture has attained an astonishing degree of perfection. Besides the O. Aries, or common sheep, there are three other species; the 0. A'mmon or Siberian sheep, the Pudu or South American, and the Strepsiceros or Cretan sheep. By some these are considered mere varieties. The Cretan and Siberian are cultivated in Hungary and Siberia.

Cretan and Siberian are cultivated in Hungary and Siberia.

7113. The common sheep in a wild state prefer open plains, where they herd together in small flocks, and are in general active, swift, and easily frightened by dogs or men. When completely domesticated, the sheep appears as stupid as it is harmless. It is characterised by Buffon as one of the most timid, imbedile, and contemptible of quadrupeds. When sheep, however, have an extensive range of pasture, and are left in a considerable degree to depend on themselves for food and protection, they exhibit a more decided character. A ram has been seen in these circumstances to attack and beat off a large and formidable dog. Sheep display considerable sagacity in the selection of their food; and in the approach of storms they perceive the indications with accurate precision, and retire for shelter always to the spot which is best able to afford it. The sheep is more subject to disorders than any of the domesticated animals; gid-diness, consumption, scab, dropsy, and worms frequently seizing upon and destroying it. That popularly called the rot is the most fatal, and is supposed to arise from the existence of animals called fluke worms, of the genus Fasclola, which inhabit the vessels of the liver. Other parastic animals attack and injure them, as the hydatids within the skull, producing symptoms called sturdy, turnsick, staggers, &c. Frontal worms, deposited by the sheep fly, in some cases prove very injurious also.

7114. Of all the domestic animals of Britain, Brown observes, sheep are of the greatest consequence, both to the nation and to the farmer; because they can be reared in situations, and upon soils, where other animals would not live, and in general afford greater profit than can be obtained either from the rearing or feeding of cattle. The very fleece, shorn annually from their backs, is of itself a matter worthy of consideration, affording a partial return not to be obtained from any other kind of steck. Wool has long been a staple commodity of th

SECT. I. Varieties of Sheep.

7115. The varieties of the O. A'ries, or common sheep, dispersed over the world are, according to Linnaus, the hornless, horned, blackfaced, Spanish, many-horned, African, Guinea, broad-tailed, fat-rumped, Bucharian, long-tailed, Cape, bearded, and morvant; to which some add the Siberian sheep, cultivated in Asia, Barbary, and Corsica, and the Cretan sheep, which inhabits the Grecian islands, Hungary, and Austria; by Linnæus considered as species.

7116. The varieties of British sheep are so numerous that at first sight it appears almost impossible to reduce them into any regular classes. They may, however, be divided in two ways; first, as to the length of their wool; and secondly, as to the presence or absence of horns. A third classification might be made after the place or districts in which such species are supposed to abound, to be in greatest perfection, or to have originated.

7117. The long-woolled British sheep are chiefly the * Teeswater, the * old and * new Leicester, the * Devonshire nots, Exmoor, and the Heath sheep.

7118. The short-woolled sheep are chiefly the Dorsetshire, * Hereford or Ryeland, the * South Down, the Norfolk, the * Cheviot, the * Shetland sheep, and the * Merinos.

7119. The hornless breeds are those in the above classes marked (*), the others have horns. These breeds, and their subvarieties, may be further arranged according as they are suited to arable or enclosed lands, and to open or mountainous districts.

7120. The sheep best suited to arable land, an eminent writer observes, in addition to such properties as are common in some degree to all the different breeds, must evidently be distinguished for their quietness and docility; habits which, though gradually acquired and established by means of careful treatment, are more obvious, and may be more certainly depended on in some breeds than in others. These properties are not only valuable for the sake of the fences by which the sheep are confined, but as a proof of the aptitude of the animals to acquire flesh in proportion to the food they consume.

7121. The long-woolled large breeds are those usually preferred on good grass-lands; they differ much in form and size, and in their fatting quality as well as in the weight of their fleeces. In some instances, with the Lincolns or old Leicesters in particular, wool seems to be an object paramount even to the carcass; with the breeders of the Leicesters, on the other hand, the carcass has always engaged the greatest attention: but neither form nor fleece, separately, is a legitimate ground of preference; the most valuable sheep being that which returns, for the food it consumes, the greatest marketable value of produce.

7122. The Lincolnshire, or old Leicestershire breed, have no horns, the face is white and the carcass long and thin; the ewes weighing from 14 to 20 lbs., and the three-year-old wethers from 20 to 30 lbs. per quarter. They have thick, rough, white lcgs, bones large, pelts thick, and wool long, from ten to eighteen inches, weighing from 8 to 14 lbs. per fleece, and covering a slow-feeding, coarse-grained carcass of mutton. This kind of sheep cannot be made fat at an early age except upon the richest land, such as Romney Marsh, and the richest marshes of Lincolnshire; yet the prodigious weight of wool which is shorn from them every year, is an inducement to the occupiers of marsh-lands to give great prices to the breeders for their hogs or yearlings; and though the buyers must keep them two years more, before they get them if for market, they have three clips of wool in the mean time, which of itself pays them well in those rich marshes. Not only the midland counties, but also Yorkshire, Durham, and Northumberland, can send their long-woolled sheep to market at two years old, fatter in general than Lincolnshire can at three. Yet this breed, and its subvarieties, are spread through many of the English counties.

7123. The Tecsuater skeep (fig. 882.) differ from the Lincolnshire in their wool not being so long and heavy; in standing upon higher, though finer boned legs, supporting

2) differ from the Linconsnire in their wool not being so long and heavy; in standing upon higher, though finer boned legs, supporting a thicker, firmer, heavier carcass, much wider upon their backs and sides; and in affording a fatter and finer grained carcass of mutton: the two-year-old wethers weighing from 25 to 35 lbs. per quarter. Some particular ones, at four years old, have been fed to 55 lbs. and upwards. There is little doubt that the Teeswater sheep were originally bred from the same stock as the Linconshire; but, by ginally bred from the same stock as the Linconsinite; out, by attending to size rather than to wool, and constantly pursuing that object, they have become a different variety of the same original breed. (Culley on Live Stock, p. 192.) The present fashionable breed is considerably smaller than the original species; but they are still considerably larger and fuller of bone than the midland breed.

breed is considerably smaller than the original species; but they are still considerably larger and fuller of bone than the midland breed. They bear an analogy to the short-horned breed of cattle, as those of the midland counties do to the long-horned. They are not so complete in their form, as the Leicestershire sheep; nevertheless, the excellence of their flesh and fatting quality is not doubted, and their wool still remains of a superior staple. For the banks of the Tees, or any other rich fat-land county, they may be singularly excellent.

7124. The Dishley, or new Leicester breed (fig. 883), is distinguished from other long-woolled breeds by their clean heads, straight, broad, flat backs, round barrel-like bodies, very fine small bones, thin pelts, and inclination to make fat at an early age. This last property is most probably owing to the before-specified qualities, and which, from long experience and observation, there is reason to believe extends through every species of domestic animals. The Dishley breed is not only peculiar for its mutton being fat, but also for the fineness of the grain, and superior above all other large long, woolled sheep, so as to fetch nearly as good a price, in many markets, as the mutton of the small Highland and short-woolled breeds. The weight of ewes, three or four years old, is from 8 to 26 lbs. a quarter, and of wethers, two years old, from 20 ts 30 lb. The wool, on an average, is from 6 to 8 lbs. a fleece. (Culley, p. 106.)

7125. The Devonshire Nots (fig. 884) have white faces and legs, thick necks, narrow backs, and backment the same as the Leicesters; wool heavier, but coarser. In the same county, there is a small breed of long woolled sheep, known by the name of the Exmocry sheep, from the place where they are chiefly bred. They are horned, with white faces and legs, and peculiarly delicate in bone, neck, and head; but the form of the careass is not good, being narrow and flat-sided. The weight of the quarters, and of the fleece, about two thirds that of the former

7126. The shorter-woolled varieties, and such as, from their size and form, seem well suited to hilly and inferior pastures, are also numerous. Generally speaking, they are too restless for enclosed arable land, on the one hand; and not sufficiently hardy for heathy mountainous districts, on the

To this class belong the breeds of Dorset, Hereford, Sussex, Norfolk, and Cheviot.

7127. The Dorsetshire sheep (fig. 885.) are mostly horned, white faced, stand upon high small white legs, and are long and thin in the carcass. The wethers, three years and a half old, weigh from 16 to 20 lbs. a quarter. The wool is fine and short, from 3 to 4 lbs. a fleece. The mutton is fine grained and well flavoured. This breed has the peculiar property of producing lambs at almost any period of the year, even so early as September and October. They are particularly valued for supplying London and other markets with house lamb, which is brought to market by Christmas, or sooner if wanted, and after that a constant and regular supply is kept up all the winter.

7128. The Witishire sheep are a variety of this breed, which, by attention to size, have got considerably more weight; viz. from 20 to 28 lbs. a quarter. These, in general, have no wood upon their icins, of this breed are spread through many of the southern counties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, Worcester-ties, as well as many in the west, viz. Gloucestershire, worker of the breed are put to the vision of the

or keeping sheep of this breat are pin into coos at high, white and summer, and in winter foddered in racks with peas-straw, barley-straw, &c., and in very bad weather with hay. These cots are low buildings, quite covered over, and made to contain from one to five hundred sheep, according to the size of the farm or flock kept. The true Herefordshire breed are frequently called Ryeland sheep, from the land formerly being thought carpille of producing no better viria than type; but which now threat are frequently canea negrana sneep, from the land formerly being thought capable of producing no better grain than rye; but which now yields every kind of grain. A cross between this breed and the merinos was extensively cultivated by the late Dr. Parry, of Bath, an eminent wool-grower, and promoter of agricultural improvement.

was extensively cultivated by the late Dr. Parry, of Bath, an eminent wool-grower, and promoter of agricultural improvement.

7130. The South Down sheep (fig. 887.) are without horns: they have dark or black-grey faces and legs, fine bones, long small necks; are low before, high on the shoulder, and light in the fore quarter; the sides are good, and the loin tolerably broad, back-bone too high, the thigh full, and twist good. The fleece is very short and fine, weighing from 2½ to 3 lbs. The average weight of two years old wethers is about 18 lbs. per quarter, the mutton fine in the grain, and of an excellent flavour. These sheep have been brought to a high state of improvement by Elman, of Glynd, and other intelligent breeders. They prevail in Sussex, on very dry chalky downs, producing short fine herbage. T181. In the Norfolk sheep the face is black, horns large and spiral; the carcass is very small, long, thin, and weak, with narrow chines, weighing from 16 to 20 lbs. per quarter; and they have very long dark or grey legs, and large bones. The wool is short and fine, from 1½ to 2 lbs. per fleece. This race have a voracious appetite, and a restless and unquiet disposition, which makes it difficult to keep them in any other than the largest sheep-walks or commons. They prevail most in Norfolk and Suffolk, and seem to have been retained chiefly for the purpose of folding. As fatteners, they are not profitable; but the mutton produced is inferior to none. A three or four year old Norfolk wedder will produce a haunch, which, if kept two or three weeks, will vie with that of any animal excepting a bluck. T182. The Cheviot breed are without horns, the head bare and clean, with jaws of a good length, faces and legs white. The body is long, but the fore-quarters generally want depth in the breast, and hreadth both there and on the chine; though, in these respects, great improvement has been made of late. They have fine, clean, small-boned legs, well covered with wool to the bough. The weight of the carcass, when fat,

7133. Of those races of sheep that range over the mountainous districts of Britain, the most numerous, and the one probably best adapted to such situations, is the heath breed, distinguished by their large spiral horns, black faces and legs, fierce wild-looking eyes, and short, firm carcasses, covered with long, open, coarse shagged wool. Their weight is from 10 to 16 lbs. a quarter, and they carry from 3 to 4 lbs. of wool each. They are seldom fed until they are three, four, or five years old, when they fatten well, and give excellent mutton, and highly flavoured gravy. Different varieties of these sheep are to be found in all the western counties of England and Scotland, from Yorkshire northwards, and they want nothing but a fine fleece to render them the most valuable upland sheep in Britain.

7134. The Herdwick sheep (fig. 886.) are peculiar to that rocky mountainous district at the head of the Duddon and Esk rivers, in the county of Cumberland. They are without horns, have speckled faces and legs, wool short, weighing from 2 to 2½ lbs. per sheep, which, though coarser than that of any of the other short, woolled breeds, is yet much finer than the wool of the heath sheep. The mountains upon which the Herdwicks are bred, and also the stock itself, have, time immemorial, been farmed out to herds, and from this circumstance their name is derived.

7135. The dun-faced breed, said to have been imported into Scot-land from Denmark or Norway at a very early period, still exists in most of the counties to the north of the Frith of Forth, though only in very small flocks. Of this aucient race there are now several

varieties, produced by peculiarities of situation, and different modes of management, and by occasional intermixture with other breeds. We may, therefore, distinguish the sheep of the mainland of Scotland from those of the Hebrides, and of the northern islands of Orkney and Zetland.

7135. The Hebridean sheep is the smallest animal of its kind. It is of a thin, lank shape, and has usually straight shorn horns. The face and legs are white, the tail very short, and the wool of various colours; sometimes of a bluish grey, brown, or deep russet, and sometimes all these colours meet in the fleece of one animal. Where the pasture and management are favourable, the wool is very fine, resembling in softness that of Shetland; but, in other parts of the same islands, the wool is stunted and coarse, the animal sickly and puny, and frequently carries four, or even six horns. The average weight of this poor breed, even when fat, is only 5 or 5½ lbs. per quarter, or nearly about 20 lbs. per sheep. It is often much less, only amounting to 15 or 16 lbs.; and the price of the animal's carcass, skin and all, is from 10x to 14s. Fat wedders have been sold in the Long Island at 7s. a head, and ewes at 5x or 6x. The quantity of wool which the fleece yields is equally contemptible with the weight of the carcass. It rarely exceeds one pound weight, and is often short of even half that quantity. The quality of the wool is different on different parts of the body; and inattention to separating the fine from the coarse, renders the cloth made in the Hebridea very unequal and precarious in its texture. The average value of a fleece of this aboriginal Hebridean breed is from 8d. to 1s. sterling. From this account it is plain, that the breed in question has every chance of being speedily extirpated. (Macdonald's Report of the Hebrides, p. 447).

7137. Of the Zetland sheep it would appear that there are two varieties, one of which is considered to the the native race, and carries very fine wool; but the number of these is much diminished, a

7138. The Spanish, or Merino breed, bears the finest wool of the sheep species; the

males (fig. 889.) usually have horns of a middle size, but the females (fig. 890.) are frequently without horns; the faces and legs are white, the legs rather long, but the bones fine. The average weight per quarter of a tolerably fat ram is about seventeen pounds, and that of ewes about eleven pounds.

SECT. II.

about eleven pounds.

7139. The shape of this race is far from being perfect, according to the ideas of English breeders, with whom symmetry of proportion constitutes a principal criterion of excellence. The throatiness, or pendulous skin beneath the throat, which is usually accompanied with a sinking or hollow in the neck, presents a most offensive appearance, though it is much esteemed in Spain, as denoting both a tendency to fine wool, and a beavy fleece. Yet the Spanish sheep are level on the back, and belind the shoulders; and Lord Somerville has proved that there is no reason to conclude that deformity in shape is, in any degree, necessary to the production of fine wool.

7130. The fleece of the Merino Sheep weighs, upon an average, from three to five pounds; in colour, it is unlike that of any English breed; there is on the surface of the best Spanish fleeces a dark brown tinge, approaching almost to a black, which is formed by dust adhering to the greasy properties of its pile; and the contrast between this tinge and the rich white colour below, as well as that rosy hue of the skin which denotes high proof, at first sight excites much surprise. The harder the fleece is, the more it resists any external pressure of the hand, the more close and fine will be the wool: here and there, indeed, a fine pile may be found in an open fleece, though this occurs but rarely. Nothing, however, has tended to render the Merino sheep more unsightly to the English eye than the large tut of wool which covers the head: it is of a very inferior quality, and classes with what is produced on the hind legs; on which account it does not sort with any of the three qualities, viz. rafinos, or prime; finos, or second best; and tercenos, the inferior sort; and, consequently, is never exported from Spain.

7141. Merinos were first brought into England in 1788, but did not excite much interest before his Majesty's sales, which began in 1804: the desirable object of spreading them widely over the country, and subjecting them to the ex

Criteria of Properties in Sheep.

7142. The criteria of an excellent ram, as given by Culley, combines qualities which ought to be found in every breed of sheep cultivated for its flesh and wool. His head should be fine and small; his nostrils wide and expanded; his eyes prominent, and rather bold or daring; ears thin; his collar full from his breast and shoulders, but tapering gradually all the way to where the neck and head join, which should be very

fine and graceful, being perfectly free from any coarse leather hanging down; the shoulders broad and full, which must, at the same time, join so easy to the collar forward and chine backward as to leave not the least hollow in either place; the mutton upon his arm or fore-thigh must come quite to the knee; his legs upright, with a clean fine bone, being equally clear from superfluous skin and coarse hairy wool, from the knee and hough downwards; the breast broad and well formed, which will keep his fore-legs at a proper wideness; his girth or chest full and deep, and instead of a hollow behind the shoulders, that part, by some called the fore-flank, should be quite full; the back and loins broad, flat, and straight, from which the ribs must rise with a fine circular arch; his belly straight, the quarters long and full, with the mutton quite down to the hough, which should neither stand in nor out; his twist, or junction at the inside of the thighs, deep, wide, and full, which, with the broad breast, will keep his forur legs open and upright; the whole body covered with a thin pelt, and that with fine, bright, soft wool.

7143. The criteria of a sound healthy sheep are, a rather wild or lively briskness; a brilliant clearness in the eye; a florid ruddy colour on the inside of the eyelids, and what are termed the eyestrings, as well as in the gums; a fastness in the teeth; a sweet fragrance in the breath; a dryness of the nose and eyes, breathing easy and regular; a coolness in the feet; dung properly formed; coat or fleece firmly attached to the skin, and unbroken; the skin exhibiting a florid red appearance, especially upon the brisket. Where there are discharges from the nose and eyes; it indicates their having taken cold, and should be attended to be putting them in dry sheltered situations. This is a necessary precaution also in bringing them from one situation to another while on the road.

7144. The criteria of the age of sheep is the state of their teeth; by their having, in their second year, two broad fine and graceful, being perfectly free from any coarse leather hanging down; the shoulders broad and

in their very first year, and often at the birth, and continue to grow a ring annually to the last period of their lives.

7145. The different ages and conditions of sheep have different names in different districts. After being weaned, the ram, or wedder lamb, is sometimes termed hog, hoggit, or tag, during the whole of the first year; and the female lamb, an ewe, or gimmer lamb, and ewe tag. The second year the wedder has the title of shear hog, or a two-toothed tag; and the ewe is called a thaive, or two-toothed ewe. In the third year, a shear hog, or four-toothed wedder; and a four-toothed ewe or thus. The fourth year, a six-toothed wedder, or ewe; and in some places, from the time of lambing till that of salving, the males are called tup-lambs; and from that period, till the time of shearing, tup-hogs, and ever afterwards, tups: the females in the same order being termed, ewe-lambs, ewe-hogs, gimmers, young ewes, old ewes. The gelded male lambs, castrated wedder lambs, wedder hogs, dummonds, wedders. Crones also signify old ewes; and there are several other provincial names, which are explained in their proper places. proper places.

SECT. III. Breeding of Sheep.

7146. In the breeding of sheep a greater degree of perfection has been attained than in any other live stock; and in this branch, in particular, the breeders of England stand higher than those of any other country.

higher than those of any other country.

7147. Bakewell, by careful selection during several generations, raised his stock to a state of excellence, in regard to fattening at an early age with a moderate consumption of food, and with the smallest proportion of offial, which has been with difficulty equalled, certainly has not been exceeded, by the most skilful of his successors. It is a striking instance of the division of labour and skill, that there are breeders who devote themselves entirely to the breeding of rams for the purpose of letting out on hire. This practice originated in Lincolnshire, where, in the early part of the last century, rams were let out at from 10s. to 20s. each; but so great has been the improvement since that period, that they are now let out to common graziers at from 1 to 10 guineas, and to breeders of rams at from 20t. to 200 guineas. The breeding rams are shown for hire at certain times and places during the summer, where every one may select such as promise to maintain or improve the particular state of his flock, and at such prices as his means and experience may justify. Two or more individuals frequently join together in the hire of one ram, to which they put the best of their ewes, for the purpose of obtaining superior males for the future service of the rest of their flocks; and in particular cases, when the owner of the ram does not choose to part with him, even for a season, ewes are sent to him to be covered at a certain price per head; superior animals of this class being very seldom sold altogether. Much as this mode of doing business has been reprobated as a monopoly, and much as there sometimes may be of deception in making up rams for these shows, all intelligent practical men must agree, that there can be no better method of remunerating eminent breeders, and of spreading their improvements most widely, in the shortest period, and at the least possible expense. A single ram thus communicates its valuable properties to a number of flocks, often in distant parts of th

possible expense. A single ram thus communicates its valuable properties to a number of flocks, often in distant parts of the country, without distracting the attention of ordinary breeders from their other pursuits.

7148. The two methods of breeding common to all animals are also adopted in breeding sheep. Breeding, from different families of the same race, commonly called breeding in and in; and breeding from different races, generally called cross breeding. Bakewell, according to Sir J. Scbright (in improvements by threeding from the same family; but according to Hunt, who has written an able answer to Sir J. Scbright's pamphlet (A Letter, &c. to Sir J. Scbright, &c.), he bred from different relationships of the same family; it being out of his power to breed from different families of a race which he was at the time employed in forming, and cross breeding he did not approve of. Breeding in and in is so repugnant to human feeling, that it is difficult to avoid considering it an unnatural practice; for it does not follow that a flock of sheep in a wild state must necessarily breed in the nearest relationships, as father and daughter, &c.; on the contrary, it is more probable that remote relationships would be chiefly bred from, as these must necessarily be much more numerous. In a flock of sheep, or a herd of savage men, springing each from one pair, every parent must necessarily have many more cousins, and cousins many times removed, than he can have mothers or daughters.

7149. Breeding from different families of the same race is the more general and approved practice. When a number of families of any breed have been for some time established in a variety of situations, and have had some slight shades of difference impressed upon them, by the influence of different soils and treatment, it is found advantageous to interchange the males, for the purpose of strengthening the excellencies, or remedying the defects of each family. Of this advantage Bakewell could not avail himself; but it has been very generall

7150. In breeding from two distinct races, the object is to acquire new properties or remove defects. The mode of effecting this by cross breeding is attended with greater difficulties than in breeding from the same race. The very distinction of breeds implies a considerable difference among animals in several respects; and although the desirable property be obtained, it may be accompanied by such others as are by no means advantageous to a race, destined to occupy a situation which had excluded that property from one of its parents. To cross any mountain breed with Leicester rams, for example, with a view to obtain a propensity to fatten at an early age, would be attended with an enlargement of size, which the mountain pasture could not support; and the progeny would be a mongrel race, not suited to the pastures of either of the present breeds. If the object be to obtain an enlargement of size, as well as a propensity to fatten, as is the case when Cheviot ewes are crossed with Leicester rams, the progeny will not prosper on the hilly pastures of their dams, and will be equally unprofitable on the better pastures of their sires. But the offspring of this cross succeeds well on those intermediate situations on the skirts of the Cheviot hills, where, though the summer pasture is not rich, there is a portion of lowland for producing clover and turnips. (Supp. Energy. Brit. att. Agr. &c.)

7151. As general rules in crossing breeds, it is to be noticed that in every case where the enlargement of the carcass is the object, the cross breed must be better fed than its smaller parent. The size of the parents should also be but little disproportioned at first; and when some increase has been produced, one or more crosses afterwards may raise the breed to the required size. With these precautions, there is little reason to fear disappointment, provided both parents are well formed. (General Report of Sociland, vol. iii, p. 14. 18.)

7152. The most advantageous and proper age for ewes taking the ram in the different breed

lowland districts.

lowland districts.

7153. In regard to the season of putting the rams to the ewes, it must be directed by the period at which the fall of the lambs may be most desirable, which must depend on the nature of the keep which the particular situation affords; but the most usual time is about the beginning of October; except in the Dorsetshire ewes, where the intention is suckling for house-lamb, in which case it should be much earlier, in order that the lambs may be sufficiently forward. But, by being kept very well, any of the breeds will take the ram at a much earlier period. Where the rams are young, the number of ewes should seldom exceed sixty for each ram; but in older rams a greater number may be admitted without inconvenience, as from one to two hundred; but letting them have too many should be cautiously avoided, as by such means the farmer may sustain great loss in the number of the lambs.

means the farmer may sustain great loss in the number of the lambs.

7154. With respect to the period of gestation, the ewe goes with lamb about the space of five months, consequently the most common lambing season is March, or the early part of April; but "it has been observed that in many of the more southern districts, where sheep-husbandry is carried on to a considerable extent, some parts of the ewe-stock are put to the rams at much earlier periods, so as to lamb a month or six weeks sooner; a practice which is attended with much profit and advantage in many situations where early grass-lamb is in great demand. It is usual for the rams to remain with the ewes for a month or six weeks, and in some cases longer, in order to complete the business of impregnation, which in some districts is ascertained by smearing the fore-bows of the rams with some colouring substance."

pregnation, which in some districts is ascertained by smearing the fore-bows of the rams with some colouring substance."

7155. The practice of turning a number of rams among the flocks formerly adopted is highly exceptionable, as tending to prevent the main object and injure the rams. A better way is to let each ram have a proper number of ewes, and with very choice stock to keep the ram in an enclosed small pasture, turning a few ewes to him, and as they are served replacing them with others. By this means there is more certainty, and more ewes may be impregnated. In such sort of fine stock, it is likewise of great utility to keep the rams during this season in a high manner. In this view a little oats in the straw, or a mixture of barley and pea meal, are excellent. Where ewes are backward in taking the ram, the best means to be employed are those of good stimulating keep. The rams should always be continued with the ewes a sufficient length of time.

keep the rams during this season in a high manner. In this view a little oats in the straw, or a mixture of barley and pea meal, are excellent. Where ewes are backward in taking the ram, the best means to be employed are those of good stimulating keep. The rams should always be continued with the ewes a sufficient length of time.

7156. The ewe will breed twice a year, if it be made a point to produce such an effect by attention and high keep; since she will receive the male indifferently at any season, and, like the rabbit, very soon after bringing forth. Lisle gives an instance of three of his ewes, well kept, lambing at Christmas, tattening off their lambs at Lady-day, and producing lambs again the first week in June. It seems they stole the ram immediately after lambing, but brought the second time only single lambs, although of a breed that generally produces twins. There is no doubt but the sheep would produce young thrice a year were the bad practice resorted to, which has been so currently recommended with the rabbit, of allowing the male immediately after parturition; the ready way to render both the female and her progeny worthless. Could the lambs be advantageously weaned at two months, sufficient time would, he conceives, remain for the ewe to bring forth twice within the year. For example, suppose the young ewe tupped in August, the lamb would be dropped in the middle of January, and might be weaned in mid March, the ewe again receiving the ram on the turn of the mild, like the sow, perhaps in or before April, she would then bring forth within the twelve months or in August. This plan would, continues Lisle, at least injure the dam infinitely less than suckling during gestation.

7157. When ewes are in lamb they should be kept in the pastures, and as free from disturbance as possible, being carefully attended to in order to prevent accidents which are liable to take place at this time, such as those of their being cast in the furrows, &c. Where any of the ewes slip their lambs, it is advised by Ban

severity of the season. Whenever this is the case, they should be carefully removed into a proper degree of warmth and shelter till perfectly restored. It is likewise a necessary as well as useful practice, as they lamb down, to take them and their lambs away from the common stock, putting them into a piece of turnips or fresh dry pasture where there is shelter when necessary, as by this means much fewer lambs would be lost than would otherwise be the case. It is also found, that by a proper supply of turnips or other similar green food at this period, the milk of the ewes is much increased, and the growth of the lambs greatly promoted; which is of much future importance, as when they are stinted at this early period of their existence, they never turn out so well afterwards for the farmer. With the green and root crops and preserved after-grass, hay, straw, corn, and oil-cake are in some cases made use of in the, winter support of sheep stock. With turnips, where the soil is not sufficiently dry to admit the sheep, it is the practice to draw them and convey them to a sound firm pasture, that the ewes may be baited upon them once or twice in the day as there may be occasion, care being taken that they are eaten up clean, as the circumstance of their being thus eaten may serve as a guide to the farmer for the supply that may be daily necessary. In this way this sort of food will be consumed with the greatest economy. Where the land is perfectly dry, and the intention is to manure it for a grain crop, eating the turnips on the land, by means of portions hurdled off as wanted, is a good practice. With this sort of food, especially where it produces scouring in the ewes, green rouen hay, cut straw, or peas haulm should constantly be given, and also with rape, &c.

7160. The castrating lambs may be performed any time from the age of a fortnight or three weeks to that of a month or six weeks, and in some districts it is deferred to a considerably later period. It is, however, the safest method to have it executed ear

7161. The weaning of lambs should be effected when they are three or four months old, as about July; but it is done more early in some districts than in others. A proper reserve of some fresh pasture grass, where there may be a good bite for the lambs to feed upon, should be had recourse to, as it is of much consequence that an ample provision of this sort be had, in order that the growth of this young stock may not suffer any check on being taken from the mother. Where they have been continued so long as to graze with the dams, little check will be sustained in their separation if turned upon such good feed. Some advise clover in blossom as the most forcing sort of food in this intention, and with others saintfoin routen is highly valued for the same purpose. When good feed is not provided of some of these kinds, the lambs soon decline in flesh, or, in the technical language of the flock, are said optich; and when once this happens they never afterwards thrive so well, however good the management may be. With regard to the ever, they should be removed to such distant restures or other places as that they may not be heard this happens they never afterwards thrive so well, however good the management may be. With regard to the ewes, they should be removed to such distant pastures or other places as that they may not be heard by the lambs, which would cause them to be disturbed in their feeding; and where the ewes sustain any inconvenience from their milk, as by their udders swelling, it should be drawn once or twice, as by this means bad consequences may be prevented: and as soon as the lambs have been removed, the ewes are returned upon the pastures destined for their summer support. There is, however, one caution to be attended to in first turning the lambs upon rich keep, which is that of letting them be in some degree satisfied with food previously, that they may not be surfeited by too quick and full feeding, and heave or hove as it is termed; keeping them gently moving about the field has also been advised in this intention. In some places, where the lands are of the more poor kind, it is a custom to sent the lambs to the more rich vale or marsh districts, to be brought forward in condition or fattened. In those cases where the lands are of the male kind are reared on the home lands as wethers, they are usually restored to the flock in the latter end of the year, but which is not by any means a good practice, as they often suffer for want of proper keep in the winter, and lose what they had previously gained in growth and condition. A practice the reverse of this has long been in use among the store-masters of Scotland. They send their lambs, as soon as weaned, to some rough coarse pasture, often at a distance of several miles, where they remain for six or eight weeks. The opinion is, that this renders them more hardy. Some grounds are occupied chiefly for this purpose, being kept for summering lambs, as it is called, the owner of the lamb paying a penny or three hallpence a week for each. The practice, it is believed, is not now so common as it has been.

SECT. IV. Rearing and general Management of Sheep.

7162. In the practice of sheep husbandry different systems are had recourse to, according to the extent and nature of the farms on which they are kept, and the methods of farming that are adopted on them; but under all circumstances the best sheep-masters constantly endeavour to preserve them in as good condition as possible at all seasons.

7163. With the pasture kinds of sheep this is particularly the case; and with the view of accomplishing it in the most complete manner, it is useful to divide them into different parcels or lots in respect to their ages and sorts, as by that practice they may be kept with greater convenience and benefit than in large flocks together under a mixture of different kinds; as in this way there is not only less waste of food, but the animals thrive better, and the pastures are fed with much more ease. The advantage of this management has been fully experienced in many of the northern districts, where they usually divide the sheep stock into lambs, yearlings, wethers, and breeding ewes; and in this method it appears not improbable that a much larger proportion of stock may be kept, and the sheep be preserved in a more healthy condition. With a breeding stock the sheep-master must act according to his circumstances, situation, and capital which he possesses, either selling the lambs to go to keep, fattening them for grass lamb, suckling them for house lamb, or keeping them on to be grazed and sold as store or fat wethers; the ewes being sold lean or in store condition, or fattened, as circumstances, profit, and convenience may point out.

7164. Another practice, but which requires much capital as well as knowledge, experience, and attention, is that of breeding and fattening off all lambs, both wethers and ewes, especially where markets for their sale when fat are conveniently situated; or this system may be partially acted upon, varying the plan according to capital, circumstances, and the nature of the times. In which case, whenever store stock become extravagantly high, it is mostly a good way to sell.

7165. The sheep farming of the arable or low warm districts of the kingdom consequently differs in various particulars from that of the hilly and mountainous districts; we shall, therefore, first give a general view of the sheep management of arable lands, and next of mountainous districts.

Subsect. 1. Rearing and Management of Sheep on rich grass and grable Lands.

7166. The most general sheep husbandry on rich lands, or where turnips and other great that it is a ring on turning in the combine was breeding and feeding branches, leaning to each according to the returns of profit. viguus of

is a graditheats, down out if w frow out tober be of you wried as flow as a case to told him. The control of the province of the control of t

The treatment of the lambs is the first consideration in the mixed sheep hus-7168. bandry.

Ties. Lambs are either suchled or fattened on grass, or sold in autumn as lean stock. With regard to those that have been suckled or fattened in the house, much attention is required to have them early, to their being well, regularly, and very cleanly kept and suckled, as well as to the ewes being of the right sort, and the pest milkers that can be provided, and to their being fully supplied with food of the most nourising and succulent kinds. Their tails and udders should have the wool well clipped away from them, in order that they may be preserved, if a perfectly clean state. The lambs also require, especially towards the effect of their fattening, to have regular supplies of barley, wheat, and peas meal, ground together in combination with fine green rotten hay. When these have been sold of, the lambs which have been attended on the best drass laid, will be ready to succeed them at the markets, in the spring and sumper mostifs, and these will be followed by the sale of the store lambs, at the different autumnal fairs.

7170. The selection of setting of the lamb-stock is the first business of sheep management after the lambs have been weaned.

7171. It is generally performed in the month of July or August, at which period the fairs for the sale of lambs mostly take place, and has a titude the whole are collected together for drawing into different lots, it is, your suitable period for selecting on the soing those that are to supply such deficiencies in the breeding flocks, a has cale and of the beauty is one period to the farmence has chapter in sually to hatever the breeding be received all that manifest any departure from restaining input that the breed in this in a Norlok Bock, a white leg, and a leven of a hue sufficiently dark, while they excluded, however, well farmed; in the same manner a white tace on the South Downs; and Mathring, a planck face would be an exclusion, or a horn that does not fall back in Dorsective, a horn that does not fall back in the same manner.

on 7173. The selection of the grown stock generally takes place after the lambs are weaned, our stocklessens, before trapping season, though wethers may be drawn out of the flock A certain number of old ewes or croncs are removed every year, and these as ovell as the overhers are fed off for the butcher, either, on grass, artificial, herbage, or roots, according to the situation and circumstances of the farm, and season of the year.

d 1173. The shouring of sleep is an annual operation, which includes several preparatory measures and after processes. These are, washing, separation, catching, clipping, markmoved bodily, or one hand placed on the ngaittundishbuargui

ingrand-tail-centings of no boold band one of the boom.

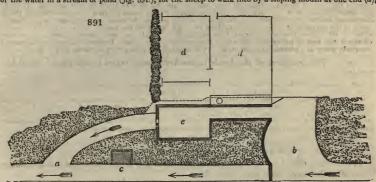

To The proper time for clapping of skearing sheep must be directed by the state of the weather and the climate in the particular district, as by this means the danger of migury by cold from depriving the sheep of their coats at too early a season, and from heat by permitting them to continue on them too long, may be evoluted in the best manifer: but another creumstance that should likewise be attended to in this business, is that of the wood being fully grown or at the state of maturity as where the clipping proceeds that period, it is said in the Annals of Agriculture to be weak and scarcely capable of being spun, and if protracted later, it is yellow, felted, and of an imperfect nature. If has been stated, that for the more warm sheltered situations in the southern parts of the singdom, the beginning or middle of June, when the weather is thus, may be in general the most proper; but in the more exposed districts in the northern parts of the island, the middle of alter end of the same month may be more suitable, provided the statem that the work at amenifies period in a futer end of the same month may be more suitable, provided the statem to the work at amenifies period in a fever situation, as the geat increase of heat from the setting in of the summer weather, added to the warmth of the fleece, becomes very oppressive and injurious to them in their feeding. There never can be any difficulty in ascertaining the proper time for shearing, because the separation of the old wood from the new is always distinctly marked in a thriving sheep; and this happens earlies on later according to the age and condition of the animal. Hence, from the beginning so May or earlier, till then first week not July, shearing goes on in different districts; beginning with the fact becoster weaklers, and ending with the smallnusing ewas of the Highland districts. From the middle of May, the middle of June, is the busiets period, as a sport of the singer shear and the owner of th

di 7.176 Clipping off the coarse soiled wood about the thighs and docks, some weeks before the usual time of washing and clipping the sheep, is an excellent practice; as by this means the sheep are kept clean and cool when the season is hot, and with ewes the udders are prevented from becoming sore of steemed

1177 Til separating for the purpose of washing, the flock is brought to the side of the washing pool, and there lambs and sheep of different kinds, fit to be washed, are put into separate fields cand such lambs as are too young to be clipped are not washed, but con-fined in a fold or enclosure of any kind, at such a distance from the washing place as that they may not disturb their mothers by their bleating. The object of washing is simply

to free the fleece from dust and dirt of various kinds. In Devonshire and Spain, the short-woolled sheep are not washed.

7178. In performing the operation of washing, it was formerly the method, and it still exists in the north, to have the washers standing up to the breast in the water; but from the inconvenience and danger of it, the men requiring a large supply of spirituous liquors, and being liable to be attacked with colds, rheumatisms, and other diseases, as well as being apt to despatch the work with too much expedition, so as to leave the wool insufficiently clean, it has been proposed by Young, in his Catendar, to rail off a portion of the water in a stream or pond (fig. 891.), for the sheep to walk into by a sloping mouth at one end (a),

and to walk out by another at the other end (b), with a depth sufficient at one part for them to swim; and to pave the whole: the breadth need not be more than six or seven feet. At one spot on each side of this passage, where the depth is just sufficient for the water to flow over the sheep's back, a cask or box (c), water tight, should be fixed, for a man to stand in dry; the sheep being in the water between them, they wash in perfection, and pushing them on, they swim through the deep part, and walk out at the other mouth, where a clean pen (a), or a very clean dry pasture, is ready to receive them; of course there is a bridge railway to the tubs, and a pen at the first mouth of the water (c), whence the sheep are turned into it, where they may be soaking for a few minutes before being driven to the washers. But other more cheap contrivances may be provided, where there is clean water at hand for the purposes.

7179. After sheep are washed, they should on no account be driven on dry or dusty roads; but should have a clean hard pasture for a few days, until they are perfectly dry and in a proper condition to be shorn.

7180. The common method of catching the sheep, in order to lay it on it on its back to be shorn, is by the hinder leg, drawing the animal backward with a crook (fig. 892. a, b, c)

892 3 C to the adjacent shearing place; the hand holding the leg to be kept low, when at the place it is turned on its back; or they are moved bodily, or one hand placed on the neck, and another behind, and in that manner walked along: the first or common mode he thinks the most safe. Sheep fed on rich pastures, and fleshy, if handled hard and bruised, the parts are liable to fatal mortifications; an accident which often happens, on which accounts pens upon some lands are obliged to be lined with woollen, or many would die from bruises.

7181. In performing the operation of shearing, the left side of the sheep is placed against the shearer's left leg, his left foot at the root of the sheep's tail, and his left knee at the sheep's left shoulder.

shoulder.

7182. The process commences with the shears at the crown of the sheep's head, with a straight cut along to the loins, returning to the shoulder, and making a circular shear around the off side to the middle of the belry; the off hinder leg next: then he left hand holding the tail, a circular shear of the rump to the near huck of the sheep's hind leg; the two fore feet are next taken in the left hand, the sheep raised, and the shears set in at the breast, when the remaining part of the belly is sheared round to the near stifle; lastly, the operator kneeling down on his right knee, and the sheep's neck being laid over his left thigh, he shears along the remaining side.

7183. The method in Northumberland, introduced by the Messra. Culley, is to begin at the back part of the head, in order to give room for the shears to make their way down the right side of the neck, to the middle of the breast. The man then sits down upon his right knee, laying the head of the sheep over his left knee bent, and beginning at the breast, clips the underside of the left shoulder. He then changes to the contrary side, and makes his way down to the open of the right fank. This done, he returns to the breast, and takes off the belty, after which in matters not which side he clips, because below able to clip with either hand, he meets his shear points exactly at the middle of the back, all the way, until be, arrive at the thighs or legs. He then places the sheep on its left side, and putting his right foot over the neck, and the other forward to the undermost hind leg, clears the right side; then turning the sheep over, finishes the whole.

7184. The fleece being removed, is wound up; that is, deprived of any clotted wool or dirty part, and lapped with the shorn side outwards, beginning at the breech and ending at the shoulders, where the neat wool serves as a bandage.

7185. Marking is performed on each sheep about a week after the fleece is removed. The object is to identify the individuals as the property of the master. Sometimes initials are impressed, and at other times other marks. They are impressed by stamps, or merely chalked or painted on. A stamp dipped in warm tar is the most durable mode. Some place the mark on different parts of the sheep, according to its age; others cut the margin of the ears in different ways.

7186. Shortening the tails of the sheep is performed in almost all the sheep districts of the kingdom except in Dorsetshire, which seems to be a useful practice, especially with long-woolled sheep, in keeping the animals more clean behind, and of course less liable

to be stricken with the fly.

7187. It has, however, been suggested in the ninth volume of Annals of Agriculture, that by this custom the sheep may be rendered less able to drive away the flies. The general prevalence of the practice would, however, seem to prove its being of advantage. There is much difference in the manner of performing the business in different districts in respect to the length, but four or five inches being left is quite sufficient. It is usually done while the animals are young. In all sheep pastures the hedges should be well cleared from briars, as their coats are often injured by being torn by them. And all sorts of pernicious reptiles should be as much as possible destroyed, and removed from such land.

7188. The mode of pasturing sheep, or of feeding them on herbage or roots having been described when treating of these crops, the more general practices of rearing and management of lowland sheep husbandry may be considered as developed. Some peculiar practices and the mode of fatting lambs will be found in subsequent sections.

7189. The practice of giving salt to sheep deserves to be generally recommended. It is given in small long troughs every day throughout the year, and in rainy weather twice a day, or under cover, that it may not be washed away. The practice is particularly recommended, when sheep are first put to turnips. As to the quantity for each sheep, it is said that any quantity may be laid before hem, and that no danger, but the reverse, will result from their having at all times as much as they will voluntary take.

Subsect. 2. Rearing and general Management of Sheep on Hilly and Mountainous Districts, or what is generally termed Store Sheep Husbandry.

7190. The best store furmers in Britain are unquestionably those on the Cheviot hills, which border the two kingdoms; and an account of their management may be considered as applicable to the mountainous districts of the whole kingdom. It is, indeed, applied by the migrations of the Cheviot and Teviotdale farmers, both in the North Highlands, on the Sutherland estate, and in Wales. No regular system of store farming, as observed by Napier (Treatise on Store Farming), appeared previously to his own; and accordingly from this work, and an excellent account published in the Supplement to the Encyclopædia Britannica, we have extracted what follows.

Encyclopædia Britannica, we have extracted what follows.

7191. A general idea of the extent and nature of a store farm may be obtained by referring to that of Thirlstane in Estrick forest, a plan of which (fig. 893) is given by Captain Napier. It contains one thousand six hundred and fifty-one acres; of which one thousand four hundred and sixty-four acres are in open hill pasture, seventy in plantation, forty in arable and meadow, about sixty in six enclosures, and the rest in shepherds' and other cottagers' houses, with their allowance of ground for a garden and cow. What distinguishes this farm from most others is the number of stells, or small circular enclosures, and the rest in shepherds' and other cottagers' houses, with their allowance of ground for a garden and cow. What distinguishes this farm from most others is the number of stells, or small circular enclosures; (O) for sheltering and feeding sheep during storms of snow, which are distributed over it; being no fewer than thirty-seven. The advantages of these stells in districts where sheep are liable to be buried by snow Captain Napier considers very great, and to promote their more general introduction seems to have been one principal inducement for publishing his book. We shall recur to the subject in the following section, when treating of cotting, folding, housing, &c. In the mean time, we are informed that Captain Napier's round stells are not generally approved of, but that one is preferred which has four concave sides. See Rairbair's Treatisc on Store Farming, Edin. 8vo. 1825.

7192. In the practice of store farming the rams are put to the ewes for the purpose of copulation in November, a little earlier or later, according to the prospect of spring food, but seldom before the eight or tent of that month. The number of rams required is more or less, according to the extent of the pasture, and their own age and condition. If the ewes are not spread over an extensive tract, one ram to sixty ewes is generally sufficient. It is usually thought adv

7194. The ewes, during winter, are seldom allowed any other food than what their summer pasture affords, except that a small part of it may sometimes be but lightly eaten, and reserved as a resource 893

against severe storms. When these occur, however, as they often do in the Cheviot district, there is little dependence on any other food than hay. When the snow is so deep as completely to cover the herbage, about two stones avoirdupois of hay are allowed to a score of sheep daily, and it is laid down, morning and evening, in small parcels on any sheltered spot near the house, or under the shelter of stells or clumps of trees, on different parts of the farm.

7195. The ewes in March, at least the gimmers or young ewes, are commonly allowed a few turnips once a day, on farms on which there is any extent of arable land; which are either carted to their pastures, or eaten on the ground, by bringing the sheep to the turnip field through the night. A part of the field, in the latter case, is cut off by nets, or by hurdles, which enclose the sheep in the same way as if they were intended for fattening. When they are ready to drop their lambs, they are no longer kept on the turnip field, and get what turnips may be left on their pastures. But it is seldom that turnips that so long, though it is desirable to have a few remaining to be given to the weakest ewes, or to such as have twins in a separate enclosure. in a separate enclosure.

though it is desirable to have a few remaining to be given to the weakest ewes, or to such as have twins in a separate enclosure.

7195. A few days before the time of lambing, the ewes are collected for the purpose of being udderlocked. The sheep are raised upon their buttocks, their backs next to the operator, who then bends forward and plucks off the locks of wool growing on or near the udders, for the uprpose of giving free access to the expected lambs. At the same time he ascertains the condition of the ewes, and marks such as do not appear to be in lamb, which may then be separated from the others. This operation is not without danger, and several premature births are usually the consequence. It is therefore not so general a practice as it was formerly, though still a common one on many, if not on most farms.

7191. The separation of the hogs from the eves, where these have been allowed to pasture promiscuously, should always take place at the commencement of the lambing season, and the lowest and finest part of the pasture be exclusively appropriated to the nursing ewes. On the Cheviot hills the hogs are generally pastured apart on the coarser herbage.

7198. The tambing season commences with the first or second week of April, according to the time at which the rains were admitted; and such as have twins, generally lamb among the first of the flock. At this season, the most constant attention is indispensable on the part of the shepherds, both to the ewes in labour and to the newly dropped lambs. Though the Cheviot ewes are not so liable to losses in parturition as some larger breeds which are in higher condition, and though they make good nurses, unless they are very lean, and their food scanty, yet, among a large flock, there are always a number that need assistance in lambing, and in a late spring not a few who have not mik sufficient for their lambs, and their food scanty, yet, among a large flock, there are always a number that need assistance in lambing, or in a late spring not a few who have not mi

such as have little milk; those that have been induced to adopt another's offspring; and generally, all that need to be frequently, inspected, and are in want of better treatment than the rest of the flock. (Supp. &c. 1781) 7199: Castra

that need to be frequently inspected, and are in want of better treatment than the rest of the flock (Supp. &c. 178) burns, should be all the should be all the flock of the flock (Supp. &c. 178). Existration is performed in the male lambs when a few days old, the ewe lambs are never payed: mild weather is chosen, and the operation performed in a fold on small quantities at a fine.

7200. The tate lambing ewes are separated from the ewes and lambs at the end of the lambing season, and kept by themselves, that they may be more under the eye of the shepherd, than if scattered over all the pasture. It is desirable to allow them fine grass for a few weeks after lambing, that their lambs may come to be nearly equal to the rest of the flock when weaned; or if they are too late for this, that they may get ready for the butcher by the month of Augusty beyond which period he ewes must be much injured by sucking them. (Supp. 3cc. art. Agr. 1734-1975. In 1787-1975.
ax or eight weeks. In the mean time the ewe logs, or gimmers, as they are denominated after shearing, have joined the ewe stock, and the lambs, when brought home, get to the plasture-which they had occupied. Wherever they may be kept in winter, it is always desirable to allow them a few turning, along with a full bite of cearse herbage.

7204: The practice of milking cives after the separation of the faints is still continued in a few places. This very objectionable management is generally continued for six or eight weeks. The value of the milk of each ewe for this time may not exceed from one shilling to one shilling and sixpence a head, and the sheep are injured to at least three times that amount, independent of accidents at the milking fold. The cream is separated from the ewe milk, and made into butter for smearing, and the milk fiself mixed with commits, and converted into cheese. The most skilful store, masters, however, have either laid aside miking, unless for a few days, or have shortened the period to two or three weeks.

7205. The selection of the crones or old cues to be sold generally takes jade in September or October, when they are so do to the feeder, and replaced by lambs of the current year. On the lower hills, even in the stations they are kept on till a year older; but when they are purchased, as they usually are, to be kept and the place of the stations they are kept on till a year older; but when they are purchased, as they usually are, to be kept and they are purchased, as they usually are, to be kept and they are the second of the se

by which the wool is rendered unfit for certain sorts of manufacture.

7207. The care of sheep during storms is a business requiring constant attention. In storms of wind and rain, or what are called black storms by the shepherds, the sheep will, in a great measure, take care of themselves, by pasturing in situations naturally sheltered. All that is required is to remove any of the more delicate into a covered fold or sheep-house; though such conveniencies are seldom to be found on mountain farms. But in a storm of snow the natural shelter to which the sheep have recourse becomes the great receptacle of drift, and the harbinger of death to the flock. It is in such situations that Captain Napier purposes to place his stalls, or circular folds (fig. 893. O.), into which the sheep should be driven, or will naturally enter on the commencement of the storm. The round form for these stalls or folds is decidedly preferable to any figure with straight lines, as these invariably harbour drift. Where no

7208. Cotting or folding is a practice more or less extensively followed with particular breeds and in particular districts, but now generally on the decline. at a sankall

breeds and in particular districts, but now generally on the decline. In a case of the particular breeds and in particular districts, but now generally on the decline. In a case of the particular districts. It was a produced by the particular districts of the particular districts of the particular districts. It was a produced by the particular cases, and it is considered as morely enriching one field at the expense of another. The practice may, however, be been got a morely enriching one field at the expense of another. The practice may however, be been got a few and the particular districts are downs, heaths, or commons. Folding has been chiefly confined to England, and a small part of Wales and Ireland. The object is to enrich the arable land; but as this is done at the expense of the pasture, it is truly, as Bakewell expressed it, "robbing Peter to pay Paul."

7310. The sheep best adapted to the fold are those of the more active, short woolled varieties, such as the Norfolk, Witshires, and South Down breeds; the heavy long-woolled kinds being less hardy, and some of them, as the Leicesters, much too valuable for a mode of treatment that converts them into dung carriers. The following calculation by Marshal will show, that though, in open lands, the practice may be in some cases tolerated on the ground of conveniency or expediency, it can possess no recommendation as a profitable mode of management in other circumstances.

7211. This morning; (September 22.1780), measured a sheep-fold, set out for six hundred sheep, consisting of ewes, wedders, and grown lambs. It measures eight by five and a half rods, which is somewhat more than seven nods to one hundred, or two yards to a sheep.

7213. August 33.1781. Last autumn made an accurate experiment, on a large scale, with different manures for wheat, an asandy loam, summer failowed. Part of an eighteen care piece was manured with filteen or sixteen loads of tolerably good farm yard dung an acre; part with three chaldrons of lime an acre; the rest folded upon with

trample the food to be caten by another. All, this points the very reverse of their, remaining perfectly quiet in small parcels.

Tells, The result of Parkinson's experience is, "that were the pasture, sheep of, Lincolashire to be got into a fold once a week, and only caught one by one, and put out again immediately, it would prevent their betoming fat." Parkinson on Live Stock, vol. i. p. 367, "The only sort of folding ever, adopted to any extent by the best breeders is on turnips, clovers, tares, and other rich food, where the sheep feed at their case, and manure the land at the same time.

Tell, Telding in littered yards is described by Thickson (Complete Farmer, art. sheep), as combining all the advantages of folding on arable lands without any of its disadvantages. By this practice the sheep are contined at hight in a yard well and regularly littered with straw, stubble, or, ferm, by which means the fields, said to be kept warm and healthy in had seasons, and at the same time a surprising quantity of manure accumulated. A great improvement on this method, it is said, would be, giving the sheep all their food (except their pasture) in such yard, wiz, hay and turnips; for which purpose they may be brought up, not only at night, but also at noon, to be batted; but if their pasture be at a distance, they should then, instead of batting at noon, come to the yard earlier in the evening, and go, out later in the morning. This is a practice, he says, that cannot be foo much recommended; for so warm a lodging is a great matter to young lambs, and will tend much to forward their growth: the sheep will also be kept in good health; and, what is a point of consequence to all farms, the quantity of dung raised will be very great. If this method is pursued through the months of December, January, February, March, and April, with plenty of litter, one bundred sheep will also the except repair of sheet sufficiency of only a raised will be yery great. If this method is pursued through the months of December, January, Februa

7218. Our opinion of this sort of folding, so warmly recommended by Sir J. Sinclair and A. Young, in the husbandry of Scotland, coincides with that of a very superior judge, who says, "that such a method may be advantageous in particular cases, it would be rash to deny; but generally it is not advisable, either on account of the sheep, or any alleged advantage from the manure they make. As to the sheep, this driving and confinement, especially in summer, would be just as hurtful as folding them in the common way, and it has been found that their wool was much injured by the broken litter mixing with the fleece in a manner not to be easily separated; besides, now that it is the great object of every skill breeder to accelerate the maturity of his sheep, as well as other live stock; among other means, by leaving them to feed at their case, and if circumstances permit, in small parcels; such a practice as this can never be admissible in their management; and with regard to manure, there can be no difficulty in converting into it any quantity of straw, stubble, and fern, by cattle fed in fold-yards, on green herbage in summer, and turnips, or other succulent food, in winter; while the soil, especially if it be of a light porous quality, is greatly benefited both by the dung and treading of sheep, allowed to consume the remainder of both sorts of food on the ground. It is true, that the dung of sheep has been generally supposed to be more valuable than that of cattle, but accurate experiments have not been made to determine the difference in this respect, among these and other polygastric animals. The greater improvement of pastures by sheep is probably owing as much to their mode of feeding, as to the richer quality of their dung."

(Sup. E. Brit. art. Agr.)

SECT. VI. Of Fatting Sheep and Lambs.

7219. The subject of fatting sheep may be considered in regard to the age at which fatting is commenced, the kind of food, and the manner of supplying it.

fatting is commenced, the kind of food, and the manner of supplying it.

7220. The age at which sheep are fatted depends upon the breed, some breeds, such as the Leicester, maturing at an earlier age than others, under the same circumstances; and also in the abundance and quality of the food on which they are reared; a disposition to early obesity, as well as a gradual tendency towards that form which indicates a propensity to fatten, being materially promoted by rich food, while the young animals are yet in a growing state. On good land, the Leicester wethers are very generally brought to a profitable state of fatness before they are eighteen months old, and are seldom kept for fatting beyond the age of two years: the Highland breeds, on the other hand, though prepared, by means of turnips, a year at least sooner than they could be in former times, usually go to the shambles when from three to four years old. The ewes of the first description are commonly fatted after having brought lambs for three seasons, that is, after they have completed their fourth year, and those of the small breeds, at from five to seven years of age, according to circumstances. (Sup. E. Brit. art. Agr.)

7221. The kinds of food on which sheep are fatted are good pastures, permanent or temporary; herbage crops, as clovers, tares, &c.; turnips and other roots; and linseed cake, grains, or other edible refuse of the oil manufactory, brewery, and distillery.

7222. The mode of feeding on rich pastures, herbage, and turnips has already been described when treating of these crops; and it remains only to notice the modes of using grains and oil cake. These, and also bran, oats, peas, and other grains and meals, whether given in winter or summer, should be given in moveable troughs, divided in the middle, so that the sheep may feed on each side, with a sloping roof over them, so as to cover the sheep's heads and necks while feeding, as wet is not only prejudicial to the sheep but spoils the food. A rack for hay, fixed over the trough, might p

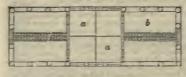

often on the after-grass of mown grounds and kept on second year's levs, and afterwards a moderate allow-ance of turnips if they are fatted on pastures. It is a common practice, in the instance of the Lelescetrs, to keep all that are not meant for breeding always in a state of fatness, and after full feeding on turnips through winter and spring, to finish them on the first year's clover early in summer, when the prices of meat are usually the highest.

7224. The fattening of lambs during summer requires nothing more than keeping their mothers and them on the richest and best pasturage, and supplying such artificial food as the situation, season, or other circumstances may require: but the fatting of lambs during winter and spring requires attention to three things; the breed, or if any breed be used indifferently, the period of dropping, the lamb-house, and the feeding.

7925. With respect to the breed, as the sheep will take the ram at any season, any variety may be so managed as to drop their lambs at any period of the year; but it is found by experience, that the Dorset-shire sheep is easiest made to yean, and therefore this is the sort generally employed in Middlesex for rearing what is called house-lamb for the metropolis. The selection of the rame for breeding the lambs to be house-fed is, according to Middleton, founded on the following circumstances: — The sucklers, salesmen, and butchered of London are aware that such lambs as have sharp barbs on the lambde of their lips are certainly of a deep colour after being butchered, and that all those whose barbs are naturally blunt do as certainly produce fair meat. This knowledge has been the occasion of many lambs of the latter kind being kept for rams, and sent into Dorsetshire expressly for the purpose of improving the colour of the flesh of house-lambs: the issue of such rams can generally he warranted fair, and such meat always sells at a higher price; hence arose the mistaken notion that Middlesex rams were necessary to procure house-lambs. house-lambs.

7225. A lamb-house may be any close shed, cow-house, or other spare house, or, even on a small scale, a roomy pigaty. But they are built on purpose by the extensive dealers in this article; and one to suckle from one hundred and sixty to one hundred and cightly lambs at a time should be seventy feet long and eighteen feet broad, with three coops of different sizes at each end, so constructed as to divide the lambs

according to their ages. A plan of a sheep house, combining also a lamb-house, is given by Kraß in his Rustic Designs. It is wholly built of unbarked ispars or young fir-trees. The plan (fig. 885.) contains four close spartnessts with doors for the lambs (a), and four others with reacks for the sheep (b). 895 896

(see 203.) It was a gallery (c), which surrounds the building, and is used as a passage for viewing the sheep, handling them with the crook, and at night for the perambulations of a watch-dog. The roof being twenty feet from the floor, the interior is also an important object. Another design

abundantly airy, which for sheep is an important object. Another design in the same work (fig. 897.) is accompanied by an elegant Indian watch-tower, with apartments therein for the shepherd.

7227. The economy of the suchline because it is a such that the same work is a such tower, with apartments therein for the shepherd.

7227. The economy of the suchling-house is as follows: — The sheep which begin to lamb about Michaelmas are kept in the close during the day, and in the house during the night, until they have broduced twenty or thirty lambs. These lambs are then put into a lamb-house, which is kept constantly well littered with clean wheat straw; and chalk, both in lump and in powder, is provided for them to lick, in order to prevent looseness, and thereby preserve the lambs in health. As a prevention against gnawing the boards or eating each other's wood, a little wheat straw is placed, with the cars downwards, in a rack within their reach, with which they amuse them.

ocards or earing each other's woor, a nate wheat solaw is pasced, with mean ears downwards, in a rack within their reach, with which they amuse them, selves, and of which they eat a small quantity. In this house they are kept, with great care and attention, until fit for the butcher.

7228. The mothers of the lambs are turned, every night at eight o'clock, into the lamb-house to their or their o

mothers of the lambs are brought to them for the night.

7229. This method of sucking is continued all the year. The breeders select such of the lambs as become fat enough, and of proper age (about eight weeks old), for slaughter, and send them to markets during December and three or four succeeding months, at prices which vary from one guinea to four, and the rest cember and three or four successing months, at prices which vary from one guines to four, and the rest of the year at about two guineas each. This is severe work for the ewes, and some of them die under excess of exhaustion. However, care is taken that they have plenty of food; for when green food (viz. turnips, cole, rye, tares, clover, &c.) begins to fail, brewer's grains are given them in troughs, and second-crop hay in racks, as well to support the ewes as to supply the lambs with plenty of milk; for if that should not be abundant, the lambs would become stunted, in which case no food could fatten them. (Middless Research of Sch.) Report, p. 355.)

Probable Improvement to be derived from Crosses of the Merino Breed of SECT. VII. Sheep.

7230. The Merino, or Spanish variety of the O'vis A'ries, is supposed by Rozier and other French writers to have been originally imported from Africa to Spain. It is, however, at least as probable that they are indigenous to that country, or, if originally imported, that they have become modified to what they are by the soil and climate.

7231. Mcrinos first altracted attention in this country in 1764, in consequence of the reports of travellers, and a letter by Don John Bowley to Peter Collinson, published in the Gentleman's Magazine for that year. A few were imported in 1788, and more in 1791, and placed on the king's farm at Windsor, under the care of Sir Joseph Banks, who was then constituted his Majesty's shepherd. The first sale of stock was made in 1860; and from these, a flock imported from Spain in 1801 by Lord Somerville, and some other importations by different persons subsequently, have sprung all the Merino and Merino rams in the empire. Since that period, a number of eminent breeders and scientific agriculturists have cultivated this breed both alone and by crossing, but especially Dr. Parry and Lord Somerville; and though the utility which its introduction may ultimately prove to the country can by no means be estimated at present, that it has already done much good by directing the public attention to the subject there can be no doubte; and many are of opinion, that by it the fleeces of our short-woolled sheep may be so improved as to render them fit substitutes for imported Spanish wool.

7232 Dr. Parry's experiments with the Merino breed were begun nearly at the same time with the king's. His farm was elevated, exposed, and unfit for any other purpose than breeding; and he fixed on the Ryeland breed, as one of the finest woolled varieties of British sheep, for crossing with Merino rams. His only object was the improvement of the fleece.

7233. The effect of the fourth cross of the Merino ram, according to the opinion of sheep cultivators on

7233. The effect of the fourth cross of the Merino ram, according to the opinion of sheep cultivators on the Continent, on any breed of ewes, however coarse and long in the fleece, will be to give progeny with short wool equal to the Spanish. Of the truth of this proposition, however, Dr. Parry justly expresses some doubts, derived from his own experience and that of others. But it is certain, he adds, that one cross more will, in most cases, effect the desired purpose. If we suppose, he says, the result of the admixture of the blood of the Merino ram to be always in an exact arithmetical proportion, and state the native blood in the ewe as 64; then the first cross would give \$\frac{32}{64}\$ of the Merino; the second \$\frac{48}{64}\$; the third \$\frac{9}{6}\$; the fourth \$\frac{9}{6}\$; the fifth \$\frac{9}{6}\$; the sixth \$\frac{9}{6}\$, and so on. In other words, the first cross would leave thirty-two parts in sixty-four, or half of the English quality; the second sixteen parts, or one fourth; the third eight parts, or one eighth; the fourth four parts, or one sixteenth; the fifth two parts, or one thirty-second; the sixth one part, or one sixty-fourth, and so on. Now, if the filaments of the Wilteline, or any other coarse wood, be in diameter double that of the Ryeland, it is obvious, that, according to the above estatement, it would require exactly one cross more to bring the hybrid wool of the former to the same fineness as that of the latter. This, he believes, very exactly corresponds with the fact. The dif-

of two or three ounces is u

capacity of that land to retain

ference between one eighth and one sixteenth is very considerable, and must certainly be easily perceived, both by a good microscope, and in the cloth which is manufactured from such wood. In the latter method, he adds, if it certainly has been perceived; but I have hitherto had no opportunity of trying the difference by the former. The fifth cross, as I have before observed, brings the Merino-Wills wood to the same standard as the fourth of the Merino Rycland." (Com. to the Board of Agr. vol. v. p. 438.)

7234. In the lambing season, the Rycland breed are usually cotted, because the new born lambs are very thinly covered with wool. As January was considered the best lambing season for the produce of the cross, Dr. Parry found, cotting was doubly necessary. Every night the flock were well sheltered; and they were allowed, in addition to the pasture which they could pick up in the day-time, linesed jelly, ground oil-cake, or grains, cabbages, rouen, winter and spring vetches, and tares. Salt, he says, I never gave to my flock but once, and that in the following way: — A small field of lattermath, cut in September, had been so often wetted, that I despaired of its ever being eaten. While it was putting into the rick, I strewed some salt between the layers; the consequence was, that cows and sheep greedily devoured it, scarcely leaving a single blade. (Com. to the Board of Agr. vol. v. p. 505.)

7235. The shearing of the sheep was performed in the second week of June, and of the lambs at the end of July. The finer fleeced lambs need not be shorn till the second season. Washing previously to shearing Dr. Parry disapproves of; because the fleece is so thick, that when thoroughly soaked with water, it is very long in drying; and if the weather prove wet and cold, the sheep are evidently much incommoded; he therefore recommends eleansing the wool, after being shorn, as in Spain.

7236. The produce of wool, considered as the result of Oth, Parry; I flay Dry and the second week of June, and of the lambs at the end of Dr

7239. The general structure of the sheep resembles that of the ox very intimately. Sheep however, like the ox, experience considerable variations in size, form, and qualities; resulting from the physical and moral agencies which they become exposed to, under various climates: and also, as whether fostered by cultivation, or left to the natural operations of nature around them. These circumstances have operated on even the bony base of the machine, as we see in the formations of the three horned breed (O'vis polycerata Lin.), natives of the north; in the spiral-horned (O. Strepsiceros Lin.), which inhabit Wallachia; and the long-horned (Capra A'mmon Lin.), which are found in the countries bordering the Mediterranean; and which have been thought to be the parents of the present cultivated British sheep.

of the present cultivated. British sheep, and the original form of the sheep has submitted to vast alterations. We see some of them wholly without horns; we also find that the bony structure is otherwise subjected to our command, by becoming much more sheader, though more compact. Accidents are also laid hold on by man to produce particular forms; thus a breed has been cultivated in America, called the ancour or otter breed, remarkable for erooked and deformed legs; which, by continued been specimens that presented this originally accidental deformity, is become now a fixed and permanent breed, valuable for their incapacity to wander or climb. (Dought.) The dunky, or wry faced breed, is another instance of accidental deformity cultivated into a permanent variety; as the monstrous rump of the Tartarian sheep, and the over-grown tails of some breeds in Turkey, and the Cape of Good Hope, are similar instances in the softer parts of the body of word or was a semblage of bones, which bears a general resemblance to that of the ox in number and direction. Like him, the head naturally is surmounted by horns springing from the frontal bones. Like him, his frontal simuses are large and open, and thus liable to the centraine of insects. The skult bones are wide and extended whis orbits are more lateral thin central; and his facial angle is about thirty degrees. His vertebral column is the same as the ox, and his rive also. The extremities descend on the same construction, ending in a divided hoof was a fall. 20 and radio climbers and wind the control of the control

extremites descend on the same construction, ending in a divided hoof who at all some are the construction, ending in a divided hoof who at all some are the construction, ending in a divided hoof who at all some two hundredth to the whole body; and his cerebellum to the brain generally, as one to five with a some two hundredth to the whole body; and his cerebellum to the brain generally, as one to five with the some two hundredth to the whole body; and those of the belly also, the stomachs being the same, and the economy of rumination not differing. The liver, pancreas, and spleen are similar. The penis is taper, vestcules esminales wanting, and prostrates two whole and the economy of the same and the economy of the economy of the same and the economy of the economy of the ec prostrates two.

7943. The wool of the sheep is but a crisped hair; and indeed in some foreign varieties; the outer covering is of long hair like that of oxen; while in others, the hair and wool are mixed. Goldson of Dallacons.

le Sect. IX. Diseases of Sheep, he seemed to

. 7244. The diseases of sheep are numerous; for these animals are now so highly cultivated that they may be regarded in some respects as artificial machines; and thus, as a natural consequence, they are subjected to a variety of artificial defects or maladies. In

7945. The rol is a popular term among shepherds, and includes within its range diseases widely different. We shall not, therefore, follow the custom of treating the different rots of sheep together; but we shall allow them to fall in their natural order, according to the plan pursued with the diseases of oxen. 7246. The inflammatory and putril fever, popularly known by the names higham striking, or blood striking, does not differ materially from the same disease in oxen and cows; and is in sheep also sometimes epidemic; appearing by panting, duliness, watery mucus from the nose and eyes; and great redness of all such parts as are usually white. 7241. The red voter: The inflammatory fever sometimes resolves itself into an universal secretion of serum throughout all the cavities; in which case, after a few days, the lymph tinged with blood will come

away from the nose and mouth in large quantities. Sometimes after death the bloody serum is found suffused throughout the skin as in the blood striking of skins.

7248. The claveau or skeep, pos. is also another variety of this disease, in which it takes on a pustular form. About the third day small variets appear, sometimes they are rather blotches than pustules. The weakness is usually extreme, and the purificity great. This form of the disease is seldom seen with us; but is still known on the Continent, where the pastures are very poor and low, and the general keep measure.

but is still known on the Continent, where the pastures are very poor and low, and the general keep meagre.

7419. The treatment of all these in nowise differs from that directed under the inflammatory putrid fever of the ox; the doses of medicine being about a third of what is directed for them? 1919.

7250. Mattignant epidemic or marriam. Sometimes an epidemic prevails, which greatly resembles the murrain of oxen; in appearances, termination, and treatment, if resembles the malignant epidemic of oxen. (6943.)

7251. Per inneumbant or inflamed lungs, vising of the lights, glandcrous rot, hose, 3c. These terms are all modifications of an inflamed state of the viscers of the chest, caught by under exposure, but pasturage, and often from over, driving. The cough, the tremblings, the reduces of the eyes and nostrile, and the distillation of a fluid from them, with the heavings and hot breath, are all slimitar to those which characterise the pneumbant of vising of the lights in oxen. We remember to have seen the disease strongly marked in the February of 1808, on a farm in the neighbourhood of Streatham; where eleven sheep were attacked almost together, after a very stormy night. They were first affected with a loss of appetite; next with a fixed stedfast look, which was common to every one. After this, they reeled about, fell backwards, and became convulsed. When seen, five were already dead, whose internal appearances fully confirmed the nature of the disease. The rest recovered by bleeding and drenelling, with drenches composed of nitre and tarter emetic. Sometimes the symptoms of pineumbane, and charge is always tard; the others may by early attention be composed on one will minediately, but degenerate find an ulceration of the lungs; which is then called the granderous year. This stage is always tard; the others may by early attention be combated by judicious treatment, as detailed under the same disease in oxen.

always fatal: the others may, by early attention, be combated by judicious freatment, as detailed finder the same disease in oxen. It is always cured by a change of pasturage, particularly into a sail marsh, the object of the same disease in oxen. It is always cured by a change of pasturage, particularly into a sail marsh, the object of the same of the

broom, burnet, elder, and melilot, as diuretics, have also been recommended; but it is necessary to obbroom, burnet, elder, and melilot, as diuretics, have also been recommended; but it is necessary to observe, that there is seldom any ventral effusion but in the latter stages of the complaint. As long as the liver is not wholly disorganised, the cure may be hoped by a simple removal of the cause, which has been shown to be a variable temperature, with excessive moisture of pasturage, which may also be aided by such remedies as assist the action of the biliary system; salt acts in this way, and thus salt mashes are good; salt may also be given in the water. Salt appears the principal ingredient in Flesh's patent restorative for sheep; for it states it to be composed of turpentine, sal ammoniac, turmeric, quicksilver, trimstone, salt, opium, alkanet root, bark, antimony, camphor, and distilled water; but of this medley none of the articles can be in sufficient quantity to prove useful but the salt. In the more advanced stages of the disease, when the liver has become materially affected, it is prudent to rul the belly of each sheen the disease, when the liver has become materially affected, it is prudent to not the belly of each sheep with half a drachm of mercurial ointment every other day for a week: give also the following, every morning: — Watery tincture of aloes, half an ounce; decoction of willow bark, four ounces; nitric acid,

morning: — watery uncertee of aloes, instant over twenty-five drops.

7264. The pett rot, hunger rot, or naked disease, is a variety of the former, but with this difference, that whereas the liver in the hydropic rot is principally affected; in this the whole of the chylopoictic viscera are injured; the mesenteric glands are always swollen and obstructed, and from thence arises the emaciation and unhealthy state of all the secretions, by which the wool becomes incapable of receiving nutriment, and false off, leaving the body bare, and in the last stages the tech and horns also loosen. In-different, unhealthy keep is a very common cause of this malady, and a contrary course of feeding is the

ment, and rats off, feaving the body bare, and in the last stages the teeth and horns also loosen. Indifferent, unhealthy keep is a very common cause of this malady, and a contrary course of feeding is the best remedy when the disease has not gone on too long.

7965. The scab, shab, ray, or rubbers, are sometimes erysipelatous cruptions, and sometimes they are psorie or mangy ones. In the former instance they are universal and very red, occasioning a great heat and itching, and are thence called the rubbers: in such cases, nitre administered quickly relieves, with change of food. The cruptive scab is seldom cured without an external application; either of those directed for mange, lowered to half the strength, will relieve it at once. (See Vct. Pharm.)

7266. Foot rot. Sheep have a secretory outlet between the claws peculiar to them, which is liable to become obstructed; for which soaking in warm water and afterwards wrapping up the foot, having first dressed it with tar, is sufficient. The feet of sheep are also sometimes injured by long travelling, when the same treatment is proper. The most serious foot rot is that which is, in some instances, simply produced by a long-continued series of humid weather, which predisposes the feet to this injury. In others it appears to be both epidemic and endemial, and has been thought contagious. When the season has been un-favourable, house and soil under cover. The medical treatment consists in removing all diseased portions, and then dressing with the thrush paste, or foot-rot application (Vet Pharm. 6554), and afterwards wrapping up from external exposure. Professor Stonig extols the following application: — Take two parts of tar, and one of oil of turpentine; which having mixed, one part of muriatic acid, known as spirit of salt, is to be added slowly, to which afterwards add four parts of blue vitriol, with which dress the affected feet. (Journ. de Mcd. Vet. et. Comp.)

7267. Staggers, gid, turnsick, goggles, norm under the horn, sturdy, watery head, and pendro, are

is to be added slowly, to which afterwards add four parts of blue vitriol, with which dress the affected fect. (Journ. de Med. Vet. et Comp.)
7267. Staggers, gid, turnsick, goggles, worm under the horn, sturdy, watery head, and pendro, are all-popular terms for hydatids, or an animal now known as the Tæ'nias gldy, usery head, and pendro, are all-popular terms for hydatids, or an animal now known as the Tæ'nias gldyulus, which, by some unaccountable means, finds its way to the brain, and settles itself there, either in some of its ventricles, or more frequently on its substance. Their size varies from the smallest speck to that of a pigeous's egg, and the sheep it attacks are usually under two years old. These animals are likewise occasionally found in all the natural cavities of the body.
7268. The appearances of cerebral hydatids are, stupidity, a disposition to sit on the rump, to turn to one side, and to incline the head to the same while at rest. The eyes glare, and from oval the pupils become round. An accurate examination will now usually discover some softness at a particular part of the skull is discernible, the hydatid usually exists in some of the ventricles, and the destruction of the sheep is certain and quick, from the greater disturbance to the functions of the brain; but when it is situated on the surface, it sometimes requires many months to destroy; an absorption of the bone taking place as the hydatid increases, which produces the thinness in the skull opposite to the affected part.
7269. This disease is not incurable, as has been supposed, but it is only relieved by a manual operation. In France it has been successfully treated by the application of the brain; the principal nicety of which is in penetrating the hydatid with the hot iron without wounding the brain itself. In England, some shep-herds are very dexterous in wiring, which they do by thrusting a wire up the nostrils till it rests against

is in penetrating the hydatid with the hot iron without wounding the brain itself. In England, some shep-herds are very dexterous in wiring, which they do by thrusting a wire up the nostrils till it rests against the skull. In the passage of the wire the hydatid is usually ruptured; others elevate the skull (by means herds are very dexterous in wiring, which they do by thrusting a wire up the nostrils fill it rests against the skull. In the passage of the wire the hydatid is usually ruptured; others elevate the skull (by means of a trephine, or even a knife) opposite to the softened portion, and extract the hostrils fill it rests against the skull. In the passage of the wire the hydatid is usually ruptured; others elevate the skull (by means of a trephine, or even a knife) opposite to the softened portion, and extract the hostril, if is partised by some shepherds with success; and if the fluid contents of the hydatid by an awk, which is practised by some shepherds with success; and if the instrument be not thrust to far, the sheep is not injured: to avoid which, it is passed obliquely. A well hardened glinict is a very proper instrument, with which the skull is easily penetrated, and an opening by the twisting of the instrument is made, sufficiently large in the hydatid itself, to discharge its contents, which is all that is sufficient to ensure its destruction, and which, if no other exists, is followed by immediate recovery. A French author states, that when he fed his sheep on cinquefoil he had less staggers than at any other time.

7270. Frontal worms. Sheep are observed to gather together, with their noses thrust inwards to avoid the attack of the Extrus ovis, or dy, that lays its eggs on the inner margin of the nose, which having become hatched, the larva creep up into the frontal and maxillary sinuses, to the torment of the sheep, and sometimes to their speedy destruction. The Continental shepherds trepan an opening into these cavitics, and effect their removal; but our shepherds have not succeeded in the operation.

7271. Pluke worms are a parasitic animal, found in the biliary sinuses, to the ormen of the sheep, but of the horse, ass, goat, deer, &c., and whose existence is rather a consequence than a cause of morbidity.

7272. Funing, the Finquish in Galloway (languishing), is a disease described by Mr. Hogg, the

of cream of tartar, and one drachm of sulphur, in four ounces of chamomile decoction. Anoint also with mild mercurial ointment and Turner's cerate in equal quantities. Lambs dropped in cold weather, or in wet situations, become paralytic: bathe in warm water, hand-rub and house, giving milk and bean meal

CHAP. VII.

The Swine. - Sús Scrofa L. Cochon, Fr.; Schwein, Ger.; Puerco, Span.; and

7274. Of swine there are several species, but none in general domestication, or muchused as food when taken wild, excepting the common sort, which includes the wild hog or wild boar, the original stock of our domestic breed, the European hog, and the

7275. The common hog is found either in a wild or domestic state, in almost all the temperate parts of Europe and Asia; but it is not met with in the most northern parts of these continents. It is found in many parts of Africa. Mr. Pennant asserts, that the wild boar was formerly a native of this country, and hunted from the middle of November to the beginning of December; and it is asserted by Fitz-Stephens, that the vast forest which in his time grew on the north side of London, was the retreat of stags, wild begin and hulls boars, and bulls.

hunted from the middle of November to the beginning of December; and it is asserted by Fitz-Stephens, that the vast forest which in his time grew on the north side of London, was the retreat of stags, wild boars, and bulls.

7276. The wild boar is still found in the forests of Germany, and in other parts of the Continent; and although now extinct in Britain, appears from ancient paintings (fig. 898.) to have been hunted by our ancestors. It feeds upon roots, acorns, and other vegetables: it is generally as large as the domestic hog, and is either dark grey or blackish, when full grown, and pale red or rusty brown when young. Between the bristles, next the skin, is a finer or softer hair of a woolly or curling nature. The sunt is somewhat longer in proportion than that of the domestic animal; but the principal difference is in the superior length and size of the freedity of the animal. Wild boars, according to Buffon, which have not passed the third year, are called by the hunters beasts of company, because previous to that age they do not separate, but follow their common parent. They never wander alone till they have acquired sufficient strength to resist the attacks of the wolf. These animals, when they have young, form themselves into flocks, and it is upon this alone that their safety depends. When attacked, the largest and strongest front the enemy, and by pressing all round against the weaker, force them into the centre.

7277. Of the tame hog, white is the most general colour; but other colours are often intermixed in various proportions. In some respects, the hog seems to form an intermediate link between the whole and the closure. Footed animals: in others he seems to occupy the same rank between the cloven-footed and digitated. Destitute of horns; furnished with teeth in both jaws; with only one stomach; incapable of runniating; and producing at one birth a numerous progeny: the union of these faculties confers on the hog a remarkable peculiarity of character. He does not, like other animals, shed his

At times they do not scruple to eat their own young; they will even mangle infants out of desperate voracity.

7279. Hogs are remarkable for the smallness of their eyes: hence a person whose eyes are very diminutive, and deep sunk in his head, is said to be pig-eyed. The form of the hog is inelegant, and his carriage is equally mean as his manners. His unwieldy shape renders him no less incapable of swithness and sprightliness, than he is of gracefulness of motion. His appearance is always drowsy and stupid, the delights to bask in the sun, and to wallow in the mire. An approaching storm seems to affect his feelings in a very singular manner. On such an occasion, he runs about in a frantic state, and utters loud shrieks of horror. Hogs are infested with lice, and are subject to many disorders, such as the scurvy, seab, and scrofula. The sow brings forth in the beginning of the fifth month after conception, and she has often two litters in a year. She generally produces a numerous progeny at a birth; but her first litter is less numerous than those that follow. Hogs, when suffered to see the natural term of life, live from fifteen to thirty years. Their size and strength continue to improve till they are five or six years old.

of life, live from intert to threy years. Then size and sacrogard strongs of the up with their shouts, and thus entirely frustrating the labours of the agriculturist. Worms, the wild carrot, and other roots, are the objects of their search. The wild boar having a longer and stronger shout than the domestic variety, digs deeper, and continues his furrow nearly in a straight line. The inhabitants of America find the hog very beneficial in clearing their lands of rattlesnakes and other serpents, upon which he constantly preys, without appearance with suffering any injury.

very beneficial in clearing their lands of rattlesnakes and other serpents, upon which he constantly preys, without apparently suffering any injury.

7251. The hog is, in a very considerable degree, beneficial to mankind. His flesh is pleasant, substantial, and nutritions. It affords numberless materials for the table of the epicure; among these is brawn, which seems peculiar to England. Pork takes salt better than the flesh of any animal, and is, in consequence, preserved longer, and always makes an important article in naval stores. The lard of the hog is essential to the cook and confectioner; it is used in various medical preparations, and is compounded by the perfumer into pomatums. The bristles are made into brushes, and are, moreover, of great use to the shoemaker. The skin is worked into coverings for pocket-books, and other articles.

7252. The hog in British farming is in general viewed as a subordinate species of live stock, and chiefly valuable as consuming what would otherwise be lost. There are, however, swine husbandmen who keep large herds to advantage, especially millers, brewers, distillers, and dairymen, to whom they are an object of importance; and return, for the offal they consume, a greater weight of meat, according to some double the weight, than could be obtained from cattle. In those parts where potatoes are raised as a fallow crop, much beyond the demand for them as human food, — as is the case in particular incland, and the west of Scotland, — the rearing and feeding of swine, the most of them sent to a distance in the state of bacon and pickled pork, is a branch of management on which great dependence is placed for the payment of their rents and other charges. The prolific nature of this animal, however, rendering it so easy to increase the supply beyond the demand, the price of swine flesh varies more than that of any other sort of butcher's

meat, and their culture can never be so much depended on by the general farmer as that of cattle or sheep. A writer in the Farmer's Magazine observes, that the swine are the only writer of grainvorous animals that can'be fed upon't the ordal of grain, or such articles as would otherwise go to waste about a firm steading. Since the erection of threshing machines, a much greater quantity of light grain is beat from the straw, than was gained when the flall was employed. To use this extra quantity to advantage becomes an important concern to the occupiers of land; and this writer thinks that the using of at in raising and supporting swine is by far the most profitable mode of consuming an article, which, in other respects, is comparatively of little value, bores right, amount of the little value, bores right, amount of the little value. ... Northamptonshire breed was form rly a handsome, light ear bone, and quick of proof. the breeders have since tried the new

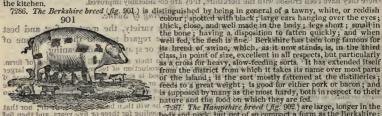

T. T. Sided, light-spotted, with Varieties of the Common Hog as has been emore at rather

7283. The domesticated European variety of the common hog (fig. 899.) is too well 900 known sto require any de-sme

scription! of ed bluow s. 7284, The Chinese hog (fig. 900.) is distinguished from the common, by having the upper part of its body almost bare, its belly hanging

by having the upper part of its pour points of the pour part of its pour pour points of the ground; its legs are very short, and its tail still more disproportionately short. The flesh of this variety is whiter and more delicate. The colour and many islands in the South Sea. The New Hebrides, the Marquesas, the Friendly and the Society Islands, possess this animal, and cultivate it with great care, as it is almost the only domestic animal of which they can boast. The varieties of hog cultivated in Britain, are partly the result of climate and keep in the European variety, and partly the effects of crossing with the Chinese. At the same time, it is only in particular districts that so much attention has been paid to this animal, sit to give rise to any acquirate distinction of breads; and nowhere has it received any considerable portion of that care in breeding, which his been so advantageously employed on the other chinais of which we have treated. Yet, among none of the varieties of those is there so great a difference as among the breeds of this species, in regard to the meat they return for the consumption of a given quantity of food. Some races can with difficulty be made far, even at an advanced age, though ted from the trough with abundance of such food as would fatten any other ainimal; while others contrive to rake a valuable carcass out of materials on which in other creature could subsist. "1785," The Chinese rice, according to Culley, has been subdivided into seven varieties or more; and it would be easy to point out twice the number of as prominent, distinctions among the sorts in the first own that the proposality is a substantial to a prominent distinction among the sorts in the third classes when it is a first all on or accuracy is as useless as it would be tedious. One general form, approaching to that of other ainmals kept for their carcass, ought certainly to be preferred; and the size which is the other species, a disposition to make fat with a moderate consumption of food; and while it may b the kitchen.

as a cross for heavy, slow-feeding sorts. It has extended itself outbulled from the district from which it takes its name over most parts to the instance over most parts. The part most parts to feeds to a great weight; is good for either port or bacon; and it is supposed by many as the most hardy, both in respect to their nature and the food on which they are feed.

The part of the island; is the sort mostly fathered at the distilleries; they are mostly of a white colour, or spotted, and are well disposed to fatten, coming up to a great weight their property managed in respect to food. Eawrence says they are generally dark spotted, some black, or disposed to fatten, coming up to a great weight when property managed in respect to food. Eawrence says they are generally dark spotted, some black, or disposed to fatten, coming up to a great weight when property managed in respect to food. Eawrence says they are generally dark spotted, some black, or disposed to fatten, coming up to a great weight when property managed in respect to food. Eawrence says they are generally dark spotted, some black, or disposed to fatten, coming up to a great weight when they are generally dark spotted, some black, or disposed to fatten, coming up to a great weight when they are generally dark spotted, some black, or disposed to fatten, coming up to a great weight when they are generally dark spotted, some black, or disposed to fatten, coming up to a great weight with the fatten of the keep is in sufficient abundance for a blue 7288. The Shropshire breed is another large breed of hogs, which they are generally dark spotted. They are not so well formed as those of the Berklashire kind, or equal to them in their disposition to fatten, or to be supported on such cheap food. The standard colour of this breed is shire kind, or equal to them in their disposition to fatten, or to be supported on such cheap food. The standard colour of this breed is shire kind to read to them in their disposition to fatten, or to be supported to them in their d

have 209. The large spotted Woburn breed is a breed introduced by the late Duke of Bedford, being large in size and of various colours. It is a hard, well formed, proline sort, rising quickly to a large weight?

7293. The Wiltshire breed is a long-bodied, low hog, hollow about the shoulder, and high on the rump, middling large pointed ears, round bone, light in colours of the superior to the sound of the rump, 7294. Yorkshire breed. This, in the old breed, was probably the worst large variety we had; extremely long-legged and weak-loined, their constitution not of the soundest, and bad sty-pigs, in the winter easen; they were yet quicker feeders than some of the superior breeds. They have been improving some years from the Berkshire cross; but are still inferior to the north-western stock, rendering a less price at

years from the Berkshire cross, but are still inferior to the north-western stock, rendering a less price at market.

The Northamptonshire breed was formerly a handsome, light-eared, white, deep-sided pig, with middling bone, and quick of proof: the breeders have since tried the new Leicester.

The Leicestershire breed is, in the original stock, large, deep, and flat-sided, light-spotted, with rather handsome head and ears. The Bakewell variety has much merit.

Tagn. The Lincolnshire breed was formerly light-coloured and white, like those of Northamptonshire, many of them having curled and wooly coats. They are middle sized, quick-proving pigs.

Tags. The Norfolk breed is a small, short, up-eared porking sort, various in colour, white, bluish, striated, generally an inferior kind, which it would be to the interest of that great corn county to improve; they are, however, of a thin-skinned, quick-proving kind. But in the vicinity of Dynn, and generally on the Lincoln side of the county, there is a larger spotted variety of very good form and quality, which should be encouraged. which should be encouraged.

which should be encouraged.

7299. Suffolk breed. (fig. 904.)

This is a small, delicate, white pig, which has for many years had great reputation; and at this time there is not only a strong oscipation in their rayour in their own county, but they have many advocates out of it. They are shorter and more pure formed than the Norfolks, and by their dish face, and pendent belly, them by the surposed that the variety proceeded originally from the white Chinese. Some of the Suffolks are very handsome, and very regularly shaped.

7300. The Essex breed are un-eared, with long, sharp heads, roach backed, carcasses flat, long, and generally high upon the leg, bone upon the great consumers, and of an unquiet disposition.

7301. The small, white, English breed is met with 10 many districts; it is of a white colour, thick, compact, and well made in, the body's short in the leg; the head and neck well formed, and the ears slouchen of the consumers of the consumers.

northern districts.

7302. Suring-tailed breed. This is a useful sort of the smaller kind of hogs, hard in its nature, and of considerable weight in proportion to its size.

7303. There are many other varieties and subvarieties in England which it is unnecessary to notice here. Donaldson remarks, that the Berkshire and Hampshire hogs are the largest; but that it is most probably from the Berkshire stock that the greatest number of the varieties of the country have sprung, of blow 7304. Of the Highland breeds, that of the Hebrides, supposed by Dr. Walker to be the original, is of the smallest size, neither white nor yellow, but of a uniform grey colour, and shaggy, with long hair and bristles; they graze on the hills like sheep; their sole food, is herbage and roots, and on these they live the whole year round, without shelter, and without receiving any other sustenance. In autumn, when they are in the best order, their meat is excellent, and without any artificial feeding; but when distrebute to the low country, they fatten readily, and rise to a considerable bulk. Walker's thebrides, vol. it. p. 173. In the Orkney islands they are commonly of a dark red or nearly black colour, and have long bristles, with a sort of coarse wool beneath them.

a sort of coarse wool beneath them. The sort of the sort of coarse wool beneath them of the sort of coarse wool beneath them of the sort of swine; but where they have been crossed with the Berkshire, they are considerably improved.

Secr. II. Breeding and Rearing of Swine.

7306. In the breeding of swine, whatever be the variety, the most perfect and best formed boar and sow should be chosen, and a due regard paid to their age, time of copulation, period of gestation, farrowing, castrating or spaying, and weaning.

copulation, period of gestation, farrowing, castrating or spaying, and weaning.

7307. In choosing the boar and sow, regard must be had to their size, as well as perfection of form. Where food is abundant, or the object of, the progeny is the production of bacon and flitches, the larger breeds, as already observed, are to be preferred: but where food is scarce of uncertain, as in the case of the cottager's stock, or rearing for suckled pork, resh pork, or pickled pork, the smaller breeds, as the Berkshire, are to be preferred. A breeding sow ought to have a large capacious belly, and not to be too much inclined to obesity. To check this tendency, some allow them to breed five times in two years.

7308. The age of the boar should not be less than a year, as he will then be at his full growth; nor that of the female less than ten months. They may be used in breeding for three rive years, and then fed off for the shambles.

7308. The period of gestation in swine is about four months, so that two litters may be easily produced in a year, five in two years, or ten in four years.

7309. The best times for, computation are November and May; because then the progeny are brought forth in mild weather, and when green food is to be had. They should not be allowed to farrow in winter, as young pigs are exceedingly tender, and can, with difficulty be preserved in very cold weather; nor at a time when food is scarce, as is generally the ease upon corn farms in summer; if the stock of them is large. When the object is suckled pigs for the shambles, copulation should be so contrived as to produce parturition at all secons.

time when food is scarce, as is generally the case upon corn farms in summer, if the stock of them is large. When the object is suckled pigs for the shambles, copulation should be so contrived as to produce parturition at all scasons. In the shambles is the shambles in the shambles in the same that the second is the same that the same of their owners, for, as already observed, it is a doubtful point whether swine will pay when all their food both in rearing and fatting is to be purchased. The cottager's pig must be contested with the same of their owners, for, as already observed, it

counties of Scotland, the hinds or married ploughmen are commonly allowed to keep a pig each, which they feed in this manner, and from which their families derive much benefit at very little expense. Near woods, acorns, mast, and other seeds, as well as some roots and vermin, afford excellent nourishment. On many corn farms, the chief, and not unfrequently the only, dependence of swine is on the straw-yards. The sweepings of the barn floor, corn left upon the straw, and oats found among the dung of horses, with a share of the turnips given to the cattle in winter, and of the clover in summer, afford ample subsistence to swine, in the proportion, perhaps, of one to every five or six acres under corn, clover, and turnips. The kitchen and dairy give some assistance to pigs newly weaned, and also to such as are soon to be slaughtered. A great many are killed when about a year old, that have never been fed at any expense that can be estimated. A few pigs, if of a good breed, will always be moderately fat at that age with the run of the straw-yard, and their flesh is of an excellent quality.

7314. To prevent swine, from digging in the soil, the best method is to cut the two strong tendons of their snouts with a sharp knife, about an inch and a half from the nose. This may be done with little pain, and no prejudice, to the animal when about two or three months old. The common practice of restraining them by rings fixed in the snout is painful and troublesome; they must be replaced as often as they give way, and that happens so frequently that rings afford but little security against this nuisance.

SECT. III. Fattening of Swine.

7315. The following system of rearing and futtening swine on an arable farm is recom-

mended by a writer in the Farmer's Magazine.

7316. Upon a tillage farm consisting of three hundred acres, whereof two hundred are kept under the plough, he is of opinion that a considerable sum nay be annually gained from keeping swine, were the management arranged in a systematic manner. One main advantage of such a branch of rural economy arises from little or no capital being required to carry it on, while the trouble and outlay attending it scarcely deserve notice. With the addition of one acre of broad clover, and one acre of tares, for the summer and autumn months, and the like extent of ground for turnips and yams during the winter and spring months, this stock of swine may be amply supported.

7317. Were two breeding sows kept on a farm of the size mentioned, and their produce reared by the farmer, it may be calculated that forty swine, weighing seven or eight stone each, would be annually fed off, in the month of January and February each year, the time when pork is most in demand. That such a number of swine can be supported and fed upon the offisis of a three-hundred-acre farm, and the other auxiliary articles specified, may be pronounced a certain fact.

7318. The breeds he recommends are the hardy smaller sized varieties; because he has found that such breeds will thrive and grow fat where larger and finer breeds would starve.

7319. The mode of management is, that a boar and two good sows of a proper age should constantly be kept, and that one young sow shall annually be reared, in order to supply the others when they pass maturity. He would cause four sows to be in hand at one time. These annually would produce more than the forty pigs which are to be held on; but the remainder might be sold as they are weanned, there being a regular and steady demand in most parts of the country for young pigs. He has for a number of years kept a stock of swine in the way recommended. They go at large in the court oryard belonging to the farm, and receive a feeding of offial grain in the morning, and of yams or

beneficial purposes.

7320. In fattening for bacon and fitches, the larger breeds are chosen; and in breweries, distilleries, oileries, and dairies, fed on grains, oil-cake, and milk; but where arable farmers keep swine of this description, as is the practice in some of the western counties, the method is to rear chiefly on raw potatoes and Swedish turnips, and to fatten on these roots, boiled or prepared by steam, with a mixture of oat barley, or bean and pea meal. Their troughs should be often replenished with a small quantity of food at a time, and kept always clean; and their food changed occasionally, and seasoned with salt. If proper care be taken, says a late writer, a feeding pig should not consume more than six Winchester bushels of oats made into meal. It ought to be shelled before it is ground, the same as for family use, but need not be sitted. (Henderson's Treatise on Swires, P. 26.)

7321. In fatting sucking pigs, all that is requisite is to keep the mother well lodged and nourished. Weaned pigs when to be fatted are kept constantly on whey, or skim-milk or buttermilk, with frequently an addition of peas or beans, or barley-meal. Such good keeping not only makes them increase rapidly in size, but renders them fit for the butcher at an early age. Swine are sold to the butcher at different ages, and under different names; as pigs when a few weeks old; as porkers at the age of five or six months; and as full grown hogs at from eighteen months to two years old. The young pigs are commonly roasted whole; the porkers are used as fresh or pickled pork; and the full grown hogs are for the most part converted into ham and bacon. The demand for porkers, which for London in particular is very great, and which continues almost throughout the year, is chiefly supplied from the dairies within reach of that metropolis. that metropolis.

SECT. IV. Curing of Pork and Bacon.

7322. The curing or pickling of pork is carried on to a considerable extent at many of

7323. The carcass is cut in pieces, and packed in cases or kits made for the purpose, containing from one to two hundred weight. Salt is dissolved in water till the mixture be strong enough to swim an egg; it is then boiled, and, when cold, poured upon the pork; when the end of the cask is fixed in, the article is ready for being sent to market. Henderson, a late writer, has given particular directions for the curing of bacon, founded upon a long course of experience, which, therefore, deserves to be more generally known.

7324. The curing of bacon is thus described by Henderson, after much experience:

7325. The curring by bacon is dissucration by refricted by fater indices experience; —
7325. After the carcass has hing all night, lay it upon a strong table, or bench, upon its back; cut off
the head close by the ears, and cut the binder feet so far below the hough as will not disfigure the hams,
and leave plenty of room to hang them by; then take a cleaving knife, and if necessary, a hand mallet,
and divide the carcass up the middle of the back-bone, laying it in two equal halves: then cut the ham
from the side by the second joint of the back-bone, which will appear on dividing the carcas; then cut the ham, by paring a little off the flash or skinny part, so as to shape it with a half round point, clearing off
any top fat that may appear; the curer will next take off the sharp edge along the back-bone with his knife
and mallet, and slice off the first rib next the shoulder, where he will perceive a bloody vein, which he
must take out; for if it is left in, that part is apt to spoil. The corners must be squared off where the ham
was cut out.

must take out; for if it is left in, that part is apt to spoil. The corners must be squared off where the ham was cut out.

7326. In killing a number of swine, what sides you may have dressed the first day lay upon some flags or boards, pilling them up across each other, and giving each pitch a powdering of saltpetre, and then covering it with salt: proceed in the same manner with the hams, by themselves, and do not omit giving them a little saltpetre, as it opens the pores of the flesh to receive the salt, and besides, gives the ham a pleasant flavour, and makes it more juicy. Let them lie in this state about a week, then turn those on the top undermost, giving them a fresh salting: after lying two or three weeks longer, they may be hung up to dry in some chimney, or smoke-house; or, if the curer chooses, he may turn them over again without giving them any more salt, in which state they may lie for a month or two without catching any harm, until he has convenience for drying them. Henderson practised for many years the custom of carting his flitches and hams through the country to farm-houses, and used to hang them in their chimneys and other parts of the house to dry, some seasons, to the amount of five hundred carcasses: this plan he soon found was attended with a number of inconveniences, and therefore he invented a smoking-house.

7327. Henderson's smoking-house is about twelve feet square, and the walls about seven feet high: one of these huts requires six joists across, one close to each wall, the other four laid asunder, at proper distances. To receive five rows of flitches, they must be laid in the top of the wall; a piece of wood strong enough to bear the weight of one flitch of bacon must be fixed across the belly end of the flitch, by two strings, as the neck end must hang downwards: the piece of wood must be longer than the flitch is wide, so that each end may rest upon a beam; they may be put so near to each other as not to touch; the width of it will hold twenty-four flitches in a row, and there little loss of weight. After the bacon is salted, it may be in the salt-house as described, until an order is received, then immediately hang it up to dry. Henderson found this smoke-house to be a great saving, not only in the expense and trouble of employing men to cart and hang it through the country, but it did not lose nearly so much weight by this process.

7328. In the disposal of bacon, whatever is shipped for the London market, or any other, both bacon and hams, must be packed into a sugar hogshead, or something similar, to hold about ten hundred weight. Bacon can only be cured from the middle of September until the middle of April. (Henderson's Treatise

on Swinc, p. 39.)

SECT. V. Diseases of Swine.

7329. Swine are subject to various diseases, but according to Lawrence they are not easily doctored.

7330. They are subject, he says, to pox or measles, blood striking, staggers, quincy, indigestion, catarrh, peripneumonia, and inflammation of the lungs called heavings. When sick, pigs will eat, and they will take medicine in their wash; when they will not eat, there is no help for them. As aperients, cleansers, and alteratives, sulphur, antimony, and madder are our grand specifics, and they are truly useful. As cordials and tonics, treacle and strong beer, in warm wash, and good peas and pollard. In the measles, sulphur, &c. and, if the patient require it, give cordials now and then; in staggers, bleeding, fresh air, and perhaps nitre; in catarrh, a warm bed, and warm cordial wash; and the same in quincy, or inflammation of the glands in the throat. If external suppuration appear likely, discharge the matter when ripe, and dress with tar and brandy, or balsam. The heavings or unsoundness of the lungs in pigs, like the unsoundness of the liver in lambs, is sometimes found to be hereditary; there is no remedy. This disease in pigs is often the consequence of colds from wet lodging, or of hasty feeling in a poor state; in a certain stage it is highly inflammatory, and without remedy. Unction with train oil, and the internal use of it, have been sometimes thought beneficial.

CHAP. VIII.

Of the Goat, Rabbit, Hare, Dormouse, Deer, and various other Animals, that are or may be subjected to British Agriculture.

7331. The goat (Capra Æ'gagrus L., fig. 905.) is a native of many mountainous parts 905 of Europe, Africa, Persia, and India: he is domes-

ticated throughout Europe, feeds on branches of shrubs, on lichens, hemlock, &c.; is seldom destitute of horns, of active habits like the deer, treacherous, petulant, roaming, and lascivious; gravid four months and a half, brings from one to two at a birth, and lives ten or twelve years. The female will allow itself to be sucked by the young of various other animals; and a foal which has lost its mother has been seen thus nourished by a goat, which, in order to facilitate the process, was placed on a barrel. The attachment between the nurse and foal appeared strong and natural: in its internal structure, it ex-

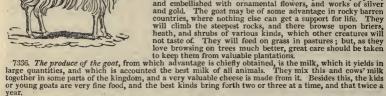

tremely resembles sheep, but is far superior to them in alertness, sentiment, and intelli-The goat approaches man without difficulty, is won by kindness, and capable of attachment. The extremely unpleasant odour attending these animals is supposed to be beneficial, and horses appear so much refreshed by it, that a goat is, on this account, often kept in the stables of the great. It is a singular local peculiarity, that in Angora only, the animals of the Capra, O'vis, and Lepus tribe, have long soft silky hair.

7332. The Angora goat, a native of Turkey, is chiefly valued for its exquisitely fine hair down, which grows under its coarse hair, and of which the Cashmere shawls are manufactured. The down is obtained by gently combing them. A considerable number of this breed were imported into France from Persia, in 1819, and stationed at St. Omers, with a view to their increase, and the establishment of the shawl manufacture. The kids of this flock are said to be abundantly covered with down and hair, and superior in strength and appearance to indigenous French kids of the same age. It is a common opinion, that the down of this goat degenerates when the animals are removed from the pasturage of Angora; but this is likely in part to arise from the neglect of cleaning and washing them, which at Angora is so assiduously attended to. By a late Report of M. Terneaux to the Paris Agricultural Society, the French Angoras have increased in number, and prosper equally with the native variety.

7333. The Syrian goat (fig. 906.) is remarkable for its pendulous ears, and is common throughout the East, in Egypt, and on the coast of Africa. It has likewise been introduced into Sicily, but can only be kept in health in very warm situations.

warm situations.

warm situations.
7334. The Chamois goat, a native of Switzerland, is a species of antelope, and will be afterwards noticed.
7335. The goats of Wales are generally white, and are both stronger and larger than those of other hilly countries. Their flesh is much used by the inhabitants, and often dried and salted, and substituted for bacon. The skins of the kids are much valued for gloves, and were formerly employed in furniture, when painted with rich colours, of which they are particularly capable, and embellished with ornamental flowers, and works

7337. Goat's hair is also valuable; it may be sheared as the wool from sheep, and is excellent for making ropes that are to be used in the water, as they will last a great while longer than those made in the common way. A sort of stuff is also made of it in some places.

ropes that are to be used in the water, and it is some places.

7338. The suct of the goat is also in great esteem, and many of the inhabitants of Caernarvonshire kill them merely for the sake of their fat, which makes candles of a superior quality to the common. Of their horns excellent handles are made for tucks and penknives. The skin is peculiarly well adapted for the glove manufactory, especially that of the kid, as it takes a dye better than any other skin. The old skin is also of great use, being preferred to that of the sheep, and the flesh affords a cheap and plentitul provision in the winter months, particularly when the kids are brought to market. The haunches of the goat are frequently salted and dried, and supply all the uses of bacon: this by the Welsh is called coch yr wden, or hung venison.

are frequently saired and direct and soppy are frequently saired and direct and soppy are frequently saired and direct and soppy are frequently saired and soppy and his legs straight and stiff; the neck should be plain and short, the head small and slender, the horns large, the eyes prominent, and the beard long. The female should have a large bedge, with large teats, and no horns, or very small ones. Goats should be kept in flocks, that they may not straggle; and they should have good shelter both in summer and in winter, the heat and cold being both prejudicial to them, and coupled in December. They should have no litter in winter, but only a paved floor kept clean. The kids are to be brought up for the table in the same manner as our lambs are.

with the first in winter, but only a paved floor kept clean. The kids are to be brought up for the table in the same manner as our lambs are.

7340. The Cashmere shawl goat has been successfully introduced into England, by C. T. Tower, Esq. of Weald Hall, Essex; and as that gentleman by this time must have some of his flock to dispose of, we think their introduction among cottagers for their wool, and also, as suggested (Gard, Mag. vol. v. p. 552.), for their milk, a fair subject for some of our female readers to speculate on. This variety of the common goat, or probably it may be a distinct species, is a fine-looking animal, and would be very ronamental in a park, on a ruin, on the roof of a cottage, or in a churchyard. It would also be very pleasant to have a home-made Cashmere shawl. We shall therefore give all the information we can on the subject from Mr. Tower's account, as published in the last volume (xlvl.) of the Transactions of the Society of Arts. The Cashmere goat was brought from Persia to France during the time of Napoleon, and under his patronage, by the celebrated M. Terneaux, in 1823. Mr. Tower, happening at that time to be in Paris, purchased four of them, two males and two females, and succeeded in conveying them safely to his residence in Essex. The soil of the park at Weald Hall, where they have been kept ever since, is moist, and the situation is much exposed. The animals have, nevertheless, continued in health and multiplied rapidly; so that his present flock consists of twenty-seven, including the four original ones. Of these latter a polled female, which was old when purchased by him, has every year produced at least one kid, and has twice had twins. Those individuals of which the horns cross are in Persia esteemed the best; and one of Mr. Tower's last year's kids has this peculiarity. They show no impatience of cold, and are very healthy, requiring only the occasional shelter of a shed, in very rough weather. In spring, summer, and autumn, they graze like sheep; and during winter have

one of which was examined by the committee of manufacturers. The yarn was spun by Messrs, Pease, of Darlington, and was woven by Messrs, Miller and Sons, of Paisley. Mr. Tower's shawl was compared with one made in Scotland, of French shawl foat wool, to which it was evidently far superfocul it was also compared with a shawl to M. Terneau's own make; and was considered by very competent judges to be superior to this also. (Trans. Soc. Arts. vol. xiv. as quoted in Gard. Mag. vol. vii.)

7341. The rabbit (Lepus Cuniculus L., fig., 907) is indigenous in most temperate

climates, but not so far to the north as the hare.

climates, but not so far to the north as the hare.

It is a wild state it forms long winding our own; keeps its hole by day; feeds monling, evening, and night on vegetables and grain; is the prey of hawks, badgers, pole-dats, and caught borb by ferrets; gravid thirty days, brings from four to eight young, five, and sometimes as many as seven times a year. The varieties common in Britain are the white, black, averageted, and silvery grey. The hare and rabbt are distinguished from each other extensily, chiefly by the proportional length of the hind legs to that of the back, and in the ears of the hare being longer, and those of the rabbit shorter than the head. The haints of rabbits are called warrens; which are most numerous in the sandy soils of knowledge that the sandy soils is less than would ultimately be obtained by planting or breaking up, and laying down with chiccory or some other suitable, herbage plant. In the mean time, as they continue to exist, and are subjected to a kind of management, we shall submit a short outline of it under the heads of extent, soil and situation, fencing, stocking, breeding, rearring, and produce. A flerwards we shall take a view of the mode of managing rabbits in hutches.

1343. Wearrens are often stocked by nature, and all that art has to do in that case is to protect the produces but in some cases they are formed on ground where a shifts.

bits have been found to swim across.

1344. Warrens are after stocked by nature, and all that art has to do in that case is to protect the produce; but in some cases they are formed on ground where tabbits do not exist naturally, or where they exist it is considered desirable to change the breed.

7345. In stocking a warren, whether the surface be flat or hilly, artificial burrows are sometimes made, to reconcile the rabbits to the ground, and to preserve them from vermin, until they have time to make their own burrows. These are bored with an anger of a diameter large enough to make a burrow of a sufficient width. In a level warren, these augers may, from time to time, be found useful in forming such holes. They, however, in most cases, are capable of, making burrows for themselves. Some warren lands are stocked in the proportion of three couple to an acre; while in others if is in a considerably larger proportion. In Lincolnshire, one buck or male rabbit is said to be sufficient for one hundred does, or females; but this is certainly a much larger proportion than in most other districts. On the wold warrens of Yorkshire, according to Marshal, one male is considered sufficient for only six or seven females, and the nearer they can be brought to that proportion the greater, the, stock of young ones that may be expected, it being the nature or economy of the males to destroy their young, especially when the proportional numbers is too great. tional number is too great.

17346. The varieties employed as stock for warrens are the common grey and silver grey breeds; the former of which is found to be considerably more hardy and much better for the purposes of food; but the latter has greatly the advantage in the value of the skin. Till lately, the common grey rabbit, probably the native wild rabbit of the island, was the only species. At present, the silver haired rabbit is sought after, and has, within the last few years, been introduced into most warrens. The skin of the grey rabbit is cut; that is, the wool is pared off the pell, as a material for bats: whereas, that of the silver-haired rabbit is dressed as fur; which, it is said, goes principally to the East Indies. The colour is a black ground, thickly interspersed with single which hairs. The skins of this variety glor about four shillings a dozen more than those of the common sort; a sufficient inducement for propagating it in preference to

round, thickly interspersed with single white hairs. The skins of this variety sell for about four shillings a dozen more than those of the common sort; a sufficient inducement for propagating it in preference to the grey breed.

7347. The rabbit begins to breed at an early age, as at eight, ten, or twelve months, going only about thirty days with young, the young being little more than three weeks old before they appear from the burrows, during which time they are suckled twice in the day by the mother. It is, therefore, evident that they may breed seven times in the course of the year under good keep, as the does take the buck almost immediately after producing their young. In warrens that are enclosed it is, however, said that they seldom breed more than two or three times in the year.

7348. The menagement of a rabbit warren is a very simple business. Birds and beasts of prey are to be kept off by taking them in traps; dogs and cats kept off, and rats, moles, mice, and other vermin destroyed if abundant or troublesome. Man himself is to be guarded against in some situations. Additional food is to be supplied in the winter season, when the weather is severe, such as fine green hay, saintfoin, clover, turnips, and others of the same sort, which must be distributed over the warrens. It is supposed that turnips answer the best in deep snows, as the rabbits can discover them by the ecent. This sort of food is given in the quantity of two or three large cartfuls to a chousand couple per day, and one load of hays in the same time during a storm. It is likewise sometimes the practice to distribute billete of new cut ash boughs, gones or whins, and other similar woods in the warrens, the bark and other, parts of which is eaten, by which the proportion of hay is lessened in a considerable degree. In great snows it is necessary to clear it away from the ditches or fences to prevent the rabbits from getting over them.

1. This sort of stock its mostly taken by nets or trops, set in the form of a fold between the places

system of management. The produce is the largest on new lands; however, much of the profit must always depend on situation, so as to be near good markets. These animals are in what is termed season from the end of October to the beginning of January, in which period the best skins are produced: of course a large proportion of them is killed in this short time. The farmer often sustains great loss in what by the purchasers are called half skins, quarter skins, and racks, sixteen of which are only considered as a whole skin. The rabbits are disposed of by the hundred, six score couple being considered as an hundred.

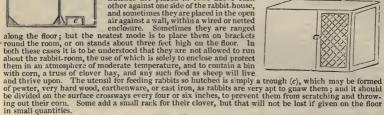

7351. The breeding and rearing of tame rabbits is carried on in hutches or stores of boxes placed in sheds or apartments of any kind secure from vermin. We shall give a view of the practice as to rabbitry

sheds or apartments of any kind secure from vermin. We shall give a view of the practice as to rabbitry and furniture, varieties, breeding, feeding, and produce.

7352. The rabbit-house should be particularly dry and well ventilated, as these quadrupeds are very subject to the rot and to liver complaints like sheep.

7353. The huts or hutches (fig. 908.) are boxes or chests, eighteen inches or more high, and from two and a half to three feet wide, generally divided in two (a and b), and the rooms the rabbits in the inner division (a), whilst the outer, which has a wire door (fig. 909.), is cleaning. Generally these hutches are placed in rows above each other against one side of the rabbit-house, and sometimes they are placed in the open

be divided on the surface crossways every four or six inches, to prevent them from scratching and throwing out their corn. Some add a small rack for their clover, but that will not be lost if given on the floor in small quantities.

7354. The rabbits of the Angora breed yield in Normandy a wool which serves as a primary material in several considerable manufactures. It is used alone, and also mixed up with sheep's wool and cotton. The rabbits are found to delight more than any thing in the leaves of the Robiniu peach Acàcia; and as this plant grows on common sandy soils, it has been proposed to cultivate it for the sake of these rabbits. (Com. to Board of Ag. vol. i, p. 259.)

7355. There are numerous varieties of tame rabbits; but the broad-chested and short-legged are the most hardy, and fatten most expeditiously. There is a large variety of the hare colour, which has high-coloured and high-flavoured flesh, more savoury than that of the common rabbit; they make a good dish cooked like the hare, which at six or eight months old they nearly equal in size. The large white and yellow and white species have whiter and more delicate flesh, and cooked in the same way will rival the turkey. The Turkish or French rabbit is esteemed by some, but differs little from the common variety. All these and other varieties are to be had from the London dealers and poultrymen.

7356. Breeding. The doe will breed at the age of six months; and her period of gestation is thirty or thirty-one days. It should be premised, that the buck and doe are by no means to be left together; but their union having been successful, the buck must be immediately withdrawn, and the doe tried again in three days: in fact, with rabbits this business is conducted on the same principle as in the stud. Like chickens, the best breeding rabbits are those kindled in March. Some days before parturition or kindling, hay is to be given to the doe, to assist in making her bed with the flue which nature has instructed her to tear from her body for that purpose. between five and ten; and it is most advantageous always to destroy the weak or sickly once as soon as their defects can be perceived; because five healthy and well grown rabbits are worth more than double the number of an opposite description, and the doe will be far less exhausted. She will admit the buck again with profit at the end of six weeks, when the young may be sparated from her and weaned: or the young may be suckled two months, the doe taken back at the end of five weeks, so that the former litter will leave her about a week before her next parturition. A notion was formerly prevalent of the necessity for giving the buck immediately after the doe had brought forth, lest she should pine, and that no time should be lost; and if it were intended that no time might be lost in destroying the doe, such indeed would be the most successful method. Great care should be taken that the doe, during her gestation, be not approached by the buck, or indeed by any other rabbit; as, from being harased about, she will almost certainly cast her young. One doe in a thousand may devour her young; the sign that she ought to be otherwise disposed of. Some does admit the buck with difficulty, although often apparently in season: such should be immediately fattened off; since it can never be worth while to keep any individual for breeding of a stock to be produced in such multitudes against which there lies an objection. Should the doe be weak on her bringing forth, from cold, cough, or other causes, she will drink beer-caudle as well as any other lady; or warm fresh grains will comfort her, a salt mash, scalded fine pollard, or barley-meal, in which may be mixed a small quantity of cordial horse ball. With due attention to keeping them warm and comfortable, and guarding against every sudden impression from cold, and more particularly moist air, and with the aid of the best and most nourishing food, rabbits may be brived in the mixed whith the aid of the best and most nourishing food, rabbits may be breat of the vear, givin

fallow.

7337. Feeding. According to Mowbray, it is better to feed three times than twice a day. The art of feeding rabbits with safety and advantage is, always to give the upper hand to dry and substantial food. Their nature is congenial with that of sheep, and the same kind of food, with little variation, agrees with both. All weeds and the refuse of vegetation should be banished from rabbit feeding. Such articles are too washy and diuretic, and can never be worth attention whilst the more solid and nutritious productions of the field may be obtained in such plenty, and will return so much greater profit. Rabbits may indeed be kept, and even fattened, upon roots, good green meat, and hay; but they will pay for corn, and this may be taken as a general rule: — Rabbits which have as much corn as they will eat can never take any heavy from being included with almost an equal notion of good substantial sensetable. However, the text may be taken as a general rule: — Rabbits which have as much corn as they will eat can never take any harm from being indulged with almost an equal portion of good substantial vegetables. However, the test of health is that their dung be not too moist. Many or most of the town feeders never allow any greens at all; the reason, I suppose, because they feed almost entirely on grains. The corn proper for rabbits is oats, peas, wheat, pollard, and some give buck-wheat: the greens and roots the same as our cattle crops; namely, carrots, Jerusalem artichokes, and if potatoes, baked or steamed; lucerne, cabbage leaves, clover, tares, furze. Mowbray has had them hoven from eating rape; and not improbably field-beet might have a similar effect. The best dried herbage is clover and meadow hay, and pea and bean straw. 7358. Rabbits are generally sold from the teat, but there is also a demand for those of larger size, which may be fattened upon corn and hay, with an allowance of the best vegetables. The better the food, the

greater weight, better quality, and more profit, which is generally the case in the feeding of all animals. Some fatton with grains and pollard. Mowbray tried wheat and potato cats comparatively, but could find no difference in the goodness of their flesh. The rabbit's flesh being dry, the allowance of succulent greens may tend to render it more juicy; and probably the old complaint of the dryness of the flesh in Devon beef, entirely fed with hay, might be remedied in the same way. Rabbits are in perfection for feeding at the fourth or sixth month; beyond which period their flesh becomes more dry and somewhat hard. It requires three months, or nearly so, to make a rabbit thoroughly fat and ripe; half the time will make them eatable, but by no means equal in the quality of the flesh: they may yet be over fattened, as appears by specimens exhibited a few years since at Lord Somerville's show, which were loaded with fat, without and within, like the best-feeding sheen. and within, like the best-feeding sheep.

7359. The flesh of the rabbit is esteemed equally digestible as that of fowls, and equally proper for the table of the invalid.

ranie of the invalid.

7360. Castrated rabbits might be fattened, no doubt, to the weight of upwards of ten pounds, at six or seven months old. It is said to be successfully practised in Sussex, near Chichester, where on the average not one in three hundred is lost by the operation, which is performed at five or six weeks old. With respect to the quantity of corn consumed in fattening, a young buck which weighed three pounds, fit for the spit, was put up in good case in Angust, and was only one month in feeding, consuming not quite four quarts of oats, with hay, cabbage, lucerne, and chicory; the skin, silver and black, worth four-

pence. 7361.

pence.

7361. In slaughtering full-grown rabbits, after the usual stroke upon the neck, the throat should be perforated upwards towards the jaws with a small-pointed knife, in order that the blood may be evacuated, which would otherwise settle in the head and neck. It is an abomination to kill poultry by the slow and torturing method of bleeding to death, hung up by the heels, the veins of the mouth being cut; but still more so the rabbit, which in that situation utters horrible screams. The entrails of the rabbit, whilst fresh, are said to be good food for fish, being thrown into ponds.

7362. The rabbit is a caressing animal, and equally fond with the cat of the head being stroked; at the same time it is not destitute of courage. A whimsical lady admitted a buck rabbit into her house, when he became her companion for upwards of a twelvemonth. He soon intimated the largest cats so much, by chasing them round the room and darting upon them, and tearing off their hair by mouthfuls, that they very seldom dared to approach. He slept in the lap by choice, or upon a chair or the hearthrug, and was as full of mischief and tricks as a monkey. He destroyed all the rush-bottomed chairs within his reach, and would refuse nothing to eat or drink which was eaten or drank by any other member of the family.

family.

7563. Diseases. No live stock is less liable to disease than the rabbit, with regular and careful attention, such as has been pointed out; so that any sudden and accidental disorder is best and most cheaply remedied by a stroke behind the ears. But want of care must be remedied, if at all, by an opposite conduct, and improper food exchanged for its contrary. Thus, if rabbits become pot-bellied, in the common phrase, from being fed on loose vegetable trash, they must be cured by good hard hay and corn, ground malt or peas, or any substantial or absorbent food. Their common liver complaints are incurable, and when such are put up to fatten, there is a certain criterion to be observed. They will not bear to be pushed beyond a moderate degree of fatness, and should be taken in time, as they are liable to drop off suddenly. The dropsy and rot must be prevented, as they are generally incurable; nor is a rabbit worth the time and pains of a probable cur. pains of a probable cure.

7364. The hare (Lèpus timidus L., fig. 910.), if taken young, may be tamed and do-

mesticated, and has occasionally been nursed by a cat. Sonnini the naturalist, and Cowper the poet, had hares in a complete state of domestication. As the fur of this animal is of greater value for hat-making than that of the rabbit, it would be a very desirable circumstance if it could be substituted for that animal in warrens. Its flesh would certainly be

deemed preferable, and in general it is a large animal. It lives on the same sort of food as the rabbit, produces generally three young ones at a time, and breeds at least three times in a year. It is not improbable that in some situations, where the soil is dry and poor, a hare warren or pack might be found to answer; the price in the metropolis being never less than ten times that of rabbits.

7365. There is a hare warren near Banstead Downs: it contains about three acres of ground: 200 brace are usually kept in it: they are fed in the summer on clover, rape, &c.; and in the winter, on hay. The warren is surrounded by a brick wall about ten feet high, with openings at regular distances, within which are wire gratings on hinges: these give way to the hares, when they enter the warren; and they are so constructed, that they immediately close after them, and so prevent their escape.

7366. The Guinea pig, or restless Cavy (Càvia Cobàya L., fig. 911.), is a native of

7867. The Guinea pig is one of the most prolific of animals, and Buffon calculates that in twelve months only 1000 might be produced from a single pair, as the female has been known to bring the content of the conten

duced from a single pair, as the female has been known to bring forth young when two months old only: the time of gestation is before they arrive at their maturity of growth, but within the short period of twelve hours from their birth are nearly as alert and active as those fully grown, and therefore require parental assiduity only for a little time. Vegetables form their food, and on a great variety of these they will flourish and fatten. They drink but little, appear after eating to ruminate, and are extremely apt to be affected by cold. They are uncommonly clean in their habitations, and are often to be seen smoothing and cleansing their fur with particular attention and perseverance.

7368. The fat dormouse (Myoxus Glis L.) is a native of the woods of Germany and Russia; and has a good deal of the habits of the squirrel. It feeds on fruits, lays up a winter store, forms its nest in hollow trees, sleeps by day, and grows very fat in autumn.

It was cultivated by the Romans, and highly prized by them as food. The body is six inches long.

7369. Of the deer (Cérvus L.) there are three species in cultivation in this country: the stag, roe, and fallow deer. The latter are now almost exclusively cultivated in parks, as articles of luxury, and, it is conceived, might answer to a small extent in farming.

7370. The stag (C. E'lephas L., fig. 912 a) is found in nearly all the temperate climates of Europe and

Asia. It is also found in North America, but attains its largest size in Siberia. From the branchiness of its antiers, the elegance of its form and movements, and the strength of its limbs, it deservedly attracts perticular admiration, and may be regarded as a principal embellishment of the forest. The stag is remarkable for a fine eye, and an acute sense of smelling. His ear also is exquisitely sensible, and musical sounds appear to possess over him the power of exciting complacency, if not rapture. His enemies not unfrequently employ the shepherd's pipe to decoy him to his destruction; and Apriord, in his Introduction to Music, states that he once met a herd of twenty stags near Royston, which readily followed the

remarkable for a fine éye, and an acute sense of smelling. His ear also is exquisitely sensible, and musical sounds appear to possess over him the power of exciting complacency, if not rapture. His enemies not unfrequently employ the shepherd's pipe to decoy him to his destruction; and Playford, in his Introduction to Music, states that he once met a herd of twenty stags near Royston, which readily followed the tones of a violin and bagpipe, played by their conductors, but stopped whenever the music was suspended. Their whole progress from Yorkshire to Hampton Court was attended, and it was supposed extremely facilitated, by these sounds. The stag is simple and unsuspicious, and employs no arts to avoid detection or pursuit, until after having received considerable molestation. His food consists in winter of moss and bark; in spring, of the catkins of willow and hazel, and the flowers and buds of cornel; in summer, of the grain of rye, and the tender shoots of the alder; in autumn, of the leaves of brambles, and the flowers of heath and broom. He eats with slowness, and ruminates with some considerable effort, in consequence of the distance between the first stomach and the mouth. In March, generally, he sheds his antlers, which are not completely renewed till August. He will live to between thirty and forty years of age, and was formerly, amidst the other vulgar errors of antiquity, supposed capable of attaining most extraordinary duration. The stag is supposed to have been introduced from France integland, where he has latterly been made to give way to the fallow deer, an animal more gentle in its manners, and more valuable as food. In some parts of Scotland he is yet to be found in his original wild state. A stag of five years old is, in hunting, termed a hart; the female, hinds; and the young, fawns.

7371. The roe (C. Gaptolus F., fig. 912. b) is the smallest of the deer tribes which are natives of Europe; it is generally of a reddish brown colour; graceful, sprightly, and courageous, particularly cleanly,

food.

7373. Deer husbandry. The author of the Agricultural Survey of the County of Hertford observes, that, "the Earl of Clarendon, justly considering that there is no more impropriety in converting one animal to profit than another, makes deer an object of husbandry. As soon as the rutting season is over, or usually about the 10th of November, his lordship selects from the herd the weak ones, some of which would probably die in the winter, and keeps them in a small yard that has a shed on one side, and a net over the whole against pigeons, &c.; the spot very warm, and well sheltered. Their antlers are immediately sawn off, the place is well littered, and they are fed at a very small expense on pea-straw, hay, &c. warmth making up for the want of better food. At times, during the winter, they have clover-hay cut into chaff, and if they do not eat it well, a little salt is added. They have always plenty of water, and are

kept perfectly clean: much attention should, he says, be paid by the keeper to make himself familiar with them, that he may enter the place without disturbing them. The first week in March he gives them oilcake, about half a cake each a day, with chaff, which fattens them so quickly that all are gone in May. Before killing they have some green meat given, to take away any ill flavour from the cake, supposing such to be the effect of the food; for it is certain that the venison is exceedingly good. As to weight, a haunch usually weighs about 24 pounds; a brace is sold for 15 guineas: the skin, worth 24. 2s., is the keeper's perquisite; so that the value of a brace amounts to 171. 17s. exclusive of some trifling articles. The purchaser sends for them." It is added, that his lordship usually fattens nine brace: his whole winter stock rises to 350 head, in a park of 250 acres, but much of it is thickly covered with timber; thirty sheep and ten cows also feed on it. The park consumption of hay amounts to thirty-two loads, being reduced to that quantity by the use of much browse; all ash, elm, and Scotch pleening brought for that purpose before faggoting, which not only saves hay, but improves the flavour of the venison.

7374. By castrating the mates of deer when newly dropped, which is not in the least dangerous, it affords the means of having good venison until Christmas, without any other sort of food than the common grass: they also fatten more quickly; the operation must, however, be performed while they are quite young. (Devonshire Report.)

(Devonshire Report.)

7375. The moose deer, or elk (Cérvus A'lces L.), is indigenous in Europe, America, and Asia, as far as Japan, and was formerly wild in this country, though now extinct. It is of the size of a horse; gentle, except when teazed by the gad-fly; feeds on twigs and branches of trees, and marsh plants; goes on its hoofs with a shambling gait at the rate of fifty miles a day; has a skin so hard as almost to resist a musket ball, but flesh tender and good. This animal might be introduced as an inhabitant of parks, where it would add to the variety of animated woody scenery and of venison.

7376. The rein deer (Cérvus Tarándus L., fig. 913.) is an inhabitant of the alpine

mountains of America, Europe, and Asia, and is too remarkable an animal, and too well known, to require a particular description or account of his

7377. The tame variety have been introduced more than once into this country by the Hon. Daines Barrington, Bulcock, and others, but cannot be kept in parks on account of the want of their particular lichen. As this lichen abounds on several mountains in Yorkshire, and on many in Scotland and Ireland, some partiotic and curious noblemen might attempt its cultivation. The milk and cream, as Dr. Clarke states are meet available and also the fields, and even as an attempt its cultivation. The milk and cream, as Dr. Clarke states, are most excellent, and also the flesh; and even as an article of profit, the sale of the animals as breeding stock would pay for a time. Lichen hay might no doubt be imported at an easy rate from the gulf of Bothnia; and the animal by degrees in the course of a few generations might be habituated to grsas or the spray of trees.

7378. The antelope (Antelòpe L.) is a beautiful and numerous genus of animals, partaking of the nature of the goat and deer. Two species, the A. Saiga, or scytheon, and the A. Rupícapra or chamois, are natives of Europe, but the rest of hot climates.

7379. Antelopes, Pennant observes, are animals generally of a most elegant and active make, of a restless and timid disposition, extremely watchful, of great vivacity, remarkably swift and agile, and most of their boundings so light and elastic as to strike the spectator with astonishment. What is very singular, they will stop in the midst of their course, gaze for a moment at their pursuers, and then resume their flight. As the chase of these animals is a favourite amusement with the Eastern nations, from that may be collected proofs of their rapid speed. One of the highest compliments that can be paid to female beauty in the Eastern regions is, Aine et Czazel, 'You have the eyes of an antelope.' Some species of antelopes form herits of two or three thousand, while others keep in troops of five or six. They generally reside in hilly countries, though some inhabit plains: they often browse like the goat, and feed on the tender shoots of trees, which gives their flesh an excellent flavour.
7380. The common antelope (A. Cervicapra L.) abounds in Barbary, and in all the northern parts of Africa. It is somewhat less than the fallow deer: its horns are about sixteen inches long, surrounded with prominent rings almost to the top, where they are twelve inches distant from point to point. The horns are remarkable for a beautiful double flexion, which gives them the appearance of the lyre of the ancients. The colour of the hair on the back is brown, mixed with red; the belly and inside of the thighs white; and the tail short.

ancients. The colour of the hair on the back is brown, mixed with res., and the tail short.

7881. The chamois anticipe (A. Rupicapra, fig. 914. a) was formerly considered as belonging to the genus Capra, and is generally called the chamois goat. It is found on the mountains of Switzerland, where it is very shy, and hunted both for its is very shy, and hunted both for its flesh and skin. (342).

7382. The Scythian antelope (A. Saiga L.) bears a good deal of resemblance to the common goad, and it is fully as easily tamed. They are found in immense flocks on the are found in immense flocks on the are found in immense flocks on the are found in the common goad.

banks of Borysthenes and other parts of Russia, where they are valued both for the flesh and their skin, which is equal to that of the chamois

which is equal to that of the chamois for gloves.

7383. The nilgau, or white-footed antelope (A. picta L. fig. 914 b), is a large and beautiful species, known only within the space of a few years past. Its height is four fect one and the colour a fine dark grey. The nilgau has of late years been often imported into Europe, and has bred in England. In confinement, it is generally pretty gentle, but is sometimes seized by fits of sudden caprice, when it will attack with great violence the object of its displeasure. The nilgau is said to go

with young about nine months, and to produce sometimes two at a birth: the young is of the colour of

a fawn.
7884. The above and various other species of antelopes might probably be acclimated and introduced in parks as objects of luxury. The cultivator who first succeeded in breeding them would find an ample demand at his own price if they happened to come in vogue.

7385. The camel (Camèlus L.) is a genus of which there are several species, three

of which, the dromedary, or Arabian camel (fig. 915.), the Bactrian camel, and the lama or Peruvian sheep, might certainly be partially acclimated in England, as the first is in Italy. (297.) They live upon a very little of the coarsest herbage; might have a warm house well littered to retire to in winter, or in cold nights, and would form a singular ornament to park scenery. sides their hair and skin are valuable, and they might be sold perhaps to romantic travellers or cavalier quacks.

7386. The lama (Camèlus Glama L., fig. 916.) is the camel of South America;

and appears to hold a middle place between the sheep, deer, and camel.

7887. Before the entrance of the Spaniards, lamas were the only beasts of burden known to the South Americans. Like camels, they travel slowly, but are persevering, tractable, and very sure-footed. Since the introduction of mules, they are much less cultivated; but before they were depended on to carry the ores dug out of the rich mines of Potosi. The lama is furnished as the camel with ability to abstain from water, as the came with ability to abstain from water, by keeping a quantity in its second stomach. Like the camel, its feet also divide, and spread; but by no means equal to those of the camel. It is also furnished with a singular protuberance or spur bohind, which enables it the better to lay hold on the ground. The tame are of various colours, and some of them are smooth and others rough. The height of the lama is about four feet, and its length from the neck to the tail about six feet. It has a capacity of throwing out the saliva to a considerable distance, but which is not possessed of any acrid quality.

7388. The camelopard (Camelopardalis Giráffa L.), a most singular and noble animal, seventeen feet high, and as tame and gentle as the camel, might also be naturalised. lives on the green spray of trees and grass, and frequents forests.

7389. The elephant, rhinoceros, musk ox, and a variety of other exotic domestics, might be so far acclimated as to live in Britain as they do in the Jardin des Plantes at Paris, viz., with an enclosure for each sort, and a lodge or house for protection in winter or during inclement weather. Were as much attention paid to acclimating foreign animals as there is directed to the same branch of culture in plants, we should soon possess a rich Fauna; and the public taste may in time take this direction.

7390. In acclimating the more tender animals, it might be desirable to rear a few generations, first in the south of Italy or in Spain, next in France, and afterwards in the south of England. But the camel, musk ox, zebra, quagga, and antelope might be had

at once from the acclimated stock in Italy.

7391. The dog (Canis familiaris) is an animal of universal utility and interest. From the earliest ages he has been the companion and assistant of the herdsman; and without his aid the flocks must have been confined to narrow limits, and consequently their propagation would have been greatly lessened. But hardy and bold, he watched by night, and toiled by day; securing his charge from the human thief, or the ravenous predatory beasts in the one, and collecting and organising their march during the other. Without the dog, sheep-farmers of the present day would be often at a loss to restrain the wanderings of their flocks; nor is he less useful in guarding the yard by nightly watchings.

7392. The genus Cènis includes other animals, as the wolf, the fox, the jackal, and the hyana: and many naturalists have supposed our subject, the dog, to be only a mixed animal, originating from the union of some of these. Such is the opinion of Guldenstadt, Pallas, and Pennant; while the higher names of Blumenbach and Cuvier are ranged among those who assign him a distinct and specific origin. Blaine, who has long successfully advocated the cause of the dog, has bestowed much research on this point; and appears clearly to have traced the dog through his numerous varieties, to a specific origin; but whether originating from a specific or a spurious source, the dog has descended down into such innumerable varieties, that a detail of the forms and properties of them, as they appear among us only, would be utterly impossible. The wants as well as the luxuries of man have, however, laid hold on some of these varieties, and have fixed them into permanencies, by confining the sexual intercourse to their congeners alone; and of this number there are no less than forty. It would be unnecessary to draw the character of the dog as stated at length by Linnæus and others; the outlines are the same in all.

7393. The shepherd's dog, in an agricultural point of view, ranks foremost among the numerous varieties; indeed, the fanciful Buffon makes him the father of the whole race of dogs. But did no other difficulty arise, an insuperable one would be found in the opposite characters which different breeds of this dog possess. Few animals can be more unlike than the small sheep-dog of the Highlands of Scotland and the monstrous drover's dog of Smithfield.

dog possess. Few animals can be more unlike than the small sheep-dog of the Highlands of Scotland and the monstrous drover's dog of Smithfield.

7:34. The English sheep-dog (fig. 917.) is usually larger than the northern, is longer on the legs, and has been so long accustomed to have the tail taken off nearly close to the rump, that in some instances 917

**The English sheep-dog (fig. 917.) is usually larger than the northern, is longer on the legs, and has been so long accustomed to have the tail taken off nearly close to the rump, that in some instances 917

**The English sheep-dog (fig. 917.) is usually larger than the sheep-herd sheep so the custom has operated on nature; and these dogs are sometimes pupped tailless. The sheepherd's dog is not, however, usually bred so large as the real cattle or drover's dog; but is yet sufficiently strong and fierce. Their colour is in general black and white, with half-pricked ears: they are extremely docile and intelligent, and seem almost to understand the looks of the sheepherd. Some of them are smooth-coated; but by far the greater number are rough, and have their half crisped, which enables them better to bear the effects of continued exposure. The dog very erroncously described by minor naturalists as the cur dog is nothing more than the sheepherd's dog, confined principally to the operations of the farm; and often better to bear the effects of continued exposure. The dog very erroncously described by minor naturalists as the cur dog is nothing more than the sheepherd's dog, confined principally to the operations of the farm; and often better to bear the effects of continued exposure. The dog very erroncously described by minor naturalists as the cur dog is nothing more than the sheepherd and either smooth or rough, according to circumstances. The very term cur destroys all individuality of breed; it being applied to characterise up dog of spurious origin: neither in the sheepherd and either smooth or rough, according to circumstances. The very term cur destroys al

seen ranging the wilds, without other con-trol save the shepherd and his dog, which receives his commands, executes them, and then waits for further instructions: or he often acts with great judgment and prompti-tude from the impulses of his own sagacity, in which, perhaps, these dogs never shine more than in their readiness to distinguish

more than in their readiness to distinguish the individuals of their own flocks, and their advoitness in keeping out intruders. In driving a number of sheep to any distance, a well trained dog never fails to confine the sheep to the road; he watches every avenues that leads from it, where he takes his stand, threatening every delinquent; and pursues the stragglers, forcing them into the ranks without doing them any injury. If the herdsman be at any time absent, he rests satisfied, knowing his dog will not abandon his charge, but will keep them together; and the moment he returns, the sagacious animal gives up his trust, or conducts them to his master, according

to the word or signal given.

7396. The mastiff or guard (fig. 920.) is a noble animal, derived from the Dane; but by selection and 20.) is a noble animal, derived from the Dane; but by selection and cultivation is rendered thicker and heavier, though less tall than his original. The powers of this dog are immense; and as a guard he is unrivalled; having the ferocity of a tiger to a stranger, with the gentleness of a lamb towards those he knows. His sagacity in detecting the attempts of robbers, and his fidelity in resisting all their bribes, are such, that it is to be lamented his breed has given place to that of the Newfoundland dog, whose qualities as a guard are certainly not equal to his. The mastiff is characterised by small pendulous ears, smooth cast, colour various offer reddish or brindled dilutors ears, smooth cast, colour various offer reddish or brindled.

are such, that it is to be lamented his breed has given place to that of the Newfoundland dog, whose qualities as a guard pare certainly not equal to his. The mastiff is characterised by small pendulous ears, smooth coat, colour various, often reddish or brindled. The lips are pendulous, jaws of immense strength, but seldom underhung; and his general form is symmetrical for strength. The lips are pendulous, jaws of immense strength, but seldom underhung; and his general form is symmetrical for strength. The buil-dog can no otherwise be considered as connected with agriculture, than as he is too often used in the disgraceful and inhuman sport of bull-bating; and however we may admire his invincible fortitude, and his contempt of pain and danger, we must allow him to be the most useless among the dog species. In his attack on cattle he always aims at the front, and generally fastens on the upper lip, where he will hang in spite of every effort of the animal to disengage himself.

73*8. The terrier fig. 921.) is a dog of very great utility, and of very varied form and size. His qualities have gained him the greatest care in selection, training, and continuing the numerous distinct breeds we witness. The principal varieties may be reduced into the rough and the smooth breeds. The rough breed in England has become larger, and is very often seen white. When mixed with the bull breed, this terrier becomes fierce, much inclined to combat, and forms an excellent guard. The smooth breed produces endless varieties; the principal of which is an elegant black animal with tan markings. A second variety is of varied colours, smaller, thicker, and longer; and is used for earthing foxes, badger-bating, and vermin killing in general.

For rabbit hunting, a wry-legged breed is in considerable request. Although particular varieties are often appropriated to particular purposes, yet all have a common property which renders them invaluable to the agriculturist; yet all have a common property which renders them invaluable to the agri

daily, and without any other trouble than what occurs in restraining them when a little wild. If their breed is very good, their stopping and backing will commence towards the end of the first season, and dur.

ing the periods between this and the next autumn they may be steadied and practised in fetching their game, &c., as directed in good sporting works. At the commencement of the following season, if they have been well attended to, although only fifteen months old, the whole may be sold to the London or country dealers, to average six or seven guineas each: or if sold privately, they will fetch from eight to twelve and fifteen guineas each, out of which, perhaps, not more than half a guinea can fairly be deducted for keep, &c. The trouble occasioned to the master will be trifling, because connected with a pleasing employ to him as a sportsman, and who will thus have his own sporters for nothing.

7400. Setters, as more valuable, will fetch a higher price; but they do not always command so ready a sale, and are more troublesome to break.

7401. Spaniels are commonly thought, but most erroneously, almost to break themselves. A really well broke spaniel, however, is so rare, that instead of being worth two or three guineas, which is the usual price, it will fetch from five to ten pounds. It would be even less difficult to the farmer to rear spaniels than pointers; and by following him continually about the grounds they might be taught perfect obedience, and close rangings, which are the grand requisites, without trouble or expense. In this way, four or five brace might be easily brought every season to market, and would always command a ready sale, and a price according to the perfection of their breaking.

7402. In the breeding and rearing of dogs for the above purposes, it is necessary to observe the greatest care in their original selection; that the breed be of the very best, and one which as it were breaks itself, for this shows the purity of the breed. It is likewise no less necessary that the breed be carefully preserved so; to do which, the moment the dogs begin to smell at a bitch, shut her and the intended male closely up, in a confinement inaccessible to other dogs, and there let them remain a fortnight. dog.

7403. The diseases of dogs are very numerous. The following are described by Blaine as the most prevalent, with their methods of cure.

7404. The canine asthma is hardly ever observed to attack any but either old dogs, or those who, by confinement, too full living, and want of exercise, may be supposed to have become diseased by these deviations from a state of nature. It is hardly possible to keep a dog very fat for any great length of time, without bringing it ou. This cough is frequently confounded with the cough that precedes and accompanies distemper; but it may be readily distinguished from this by an attention to circumstances, as the age of the animal, its not affecting the general health, nor producing immediate emaciation, and its less readily distinguished.

panies distemper; but it may be readily distinguished from this by an attention to circumstances, as the age of the animal, its not affecting the general health, nor producing immediate emaciation, and its less readily giving way to medicine.

7405. The cure is often very difficult, because the disease has in general been long neglected before it is sufficiently noticed by the owners. As it is usually brought on by confinement, too much warmth, and over-feeding; so it is evident the cure must be begun by a steady persevering alteration in these particulars. The mediciness most useful are alteratives, and of these occasional emetics are the best. One grain of tartarised antimony (i. e. tartar emetic), with two, three, or four grains of calomel, is a very useful and valuable emetic. This dose is sufficient for a small dog, and may be repeated twice a week with great success,—always with palliation.

7406. Of diseases of the eyes, dogs are subject to almost as great a variety as ourselves, many of which end in blindness. No treatment yet discovered will remove or prevent this complaint.

7407. Sore eyes, though not in general ending in blindness, is very common among dogs. It is an affection of the eyelids, is not unlike the scrofulous affection of the human eyelids, and is equally benefited by the same treatment: an unguent made of equal parts of nitrated quicksilver ointment, prepared tutty and lard, very lightly applied. Dropsy of the eyeball is likewise sometimes met with, but is incurable.

7408. Cancer. The virulent dreadful ulcer, that is so fatal in the human subject and is called cancer, is unknown in dogs; yet there is very commonly a large scirrhous swelling of the tests in bitches, and of the testicles (though less frequent) in dogs, that as it sometimes becomes ulcerated, so it may be characterised by this name. In the early state of the disease discutients prove useful, as vinegar with salt, and camphor and Spanish flies, with mercurial ointment, have sometimes succeeded; taking care to avoid irritat be useless

be useless. 7409. Colic. Dogs are subject to two kinds of colic; one arising from constipation of the bowels, the other is of a kind peculiar to dogs, apparently partaking of the nature of rheumatism, and also of spasm. From a sudden or violent exposure to cold, dogs become sometimes suddenly paralytic, particularly in the hinder parts; having great tenderness and pain, and every appearance of lumbago. In every instance of this kind, there is considerable affection of the bowels, generally costiveness, always great pain. A warm bath, external stimulants, but more particularly active aperients, remove the colic. Colic arising from costiveness is not in general violently acute from the pain it produces; sometimes, however, it appears accompanied with more spasm than is immediately dependent on the confinement of the bowels. In the former give active aperients, as calomed with pil. cochia, i.e. aloetic pill and glysters; in the latter castor oil with laudanum and ether.

7410. Cough. Two kinds of cough are common among dogs, one accompanying distemper, the other in an asthmatic affection of the chest. (See 7404. 7411.)

7411. Distemper. This is by far the most common and most fatal among the diseases of dogs; hardly any young dog escaping it; and of the few who do escape it in their youth, three fourths are attacked with it at some period afterwards: it being a mistake that young dogs only have it. 1t, however, generally

attacks before the animal arrives at eighteen months old. When it comes on very early, the chances of recovery are very small. It is peculiarly fatal to greyhounds, much more so than to any other kind of dog, generally carrying them off by excessive scouring. It is very contagious, but it is by no means necessary that there should be contagion present to produce it; on the contrary, the constitutional liability to it is such, that any cold taken may bring it on: and hence it is very common to date its commencement from dogs being thrown into water, or shut out on a rainy day, &c. There is no dieease which presents such varieties as this, either in its mode of attack, or during its continuance. In some cases it commences by purging, in others by fits. Some have cough only, some waste, and others have moisture from the eyes and nose, without any other active symptom. Moist eyes, dulness, wasting, with slight cough and sickness, are the common symptoms that betoken its approach. Then purging comes on, and the moisture from the eyes and nose from mere mucus becomes pus, or matter. There is also frequently sneezing, with a weakness in the loins. When the disease in this latter case is not speedily removed, universal palsy comes on. During the progress of the complaint, some dogs have fits. When one fit succeeds another quickly, the recovery is extremely doubtful. Many dogs are carried off rapidly by the fits, or by purging; others waste gradually from the running from the nose and eyes, and these cases are always accompanied with great marks of putridity.

others waste gradually from the running from the nose and eyes, and these cases are always accompanied with great marks of putridity.

7412. The cure. In the early stages of the complaint give emetics; they are peculiarly useful. A large spoonful of common salt, dissolved in three spoonfuls of warm water, has been recommended; the quantity of salt being increased according to the size of the dog, and the difficulty of making him vomit; while a dog remains strong, one every third day is not too much. The bowels should be kept open, but active purging should be avoided. In case the complaint should be accompanied with excessive looseness, it should be immediately stopped by balls made of equal parts of gum arabic, prepared chalk, and conserve of roses, with rice milk as food. Two or three grains of James's powder may be advantageously given at night, in cases where the bowels are not affected; and in the cases where the matter from the nose and eyes betokens much putridity, we have witnessed great benefits from balls made of what is termed Friar's balsam, gum guaiacum, and chamomile flowers in powder; but the most popular remedy is a powder prepared and vended under the name of distemper powder, with instructions for the use of it. Dogs, in every stage of the disease, should be particularly well fed. A seton we have not found so useful as is generally supposed: where the nose is much stopped, rubbing tar on the upper part is beneficial; and when there is much stupidity, and the head seems much affected, a blister on the top is often serviceable.

7413. Fits. Dogs are peculiarly subject to fits. These are of various kinds, and arise from various

often serviceable.

7413. Fits. Dogs are peculiarly subject to fits. These are of various kinds, and arise from various causes. In distemper, dogs are frequently attacked with convulsive fits, which begin with a champing of the mouth and shaking of the head, gradually extending over the whole body. Sometimes an active emetic will stop their progress, but more generally they prove fatal. Worms are often the cause of fits in dogs. These deprive the animal wholly of sense; he runs wild till he becomes exhausted, when he gradually recovers, and perhaps does not have one again for some weeks. Confinement produces fits and likewise costiveness. Cold water thrown over a dog will generally remove the present attack of a fit; and for the prevention of their future recurrence, it is evident that the foregoing account of causes must be attended to.

ikewise costiveness. Cold water thrown over a dog will generally remove the present attack of a fit; and for the prevention of their future recurrence, it is evident that the foregoing account of causes must be attended to the prevention of their brown over a dog will generally remove the present attack of a fit; and for the prevention of their bowls, from costiveness, from continuous the prevention of their bowls, from costiveness, from continuous their properties of the food taken, though it may be caten with apparent appetite. In these cases the principal means to be made use of are, the removal of the constitution by active purging, clysters, and the warm bath. Calcimel with aloes forms the best purge. But when the inflammation may be supposed to arise from cold, then the removing of any costiveness that may be present is but a secondary consideration. This active kind of inflammation is characterised by violent panting, total rejection of food, and constant sickness. There is great heat in the belly, and great pain; it is also accompanied with great weakness, and the eyes are very red. The bowels should be gently opened with clysters, but no aboes or calomel should be made use of. The belly should be bilstered, having first used the warm bath. When the inflammation arises from poison, there is then constant sickness; the nose, paws, and ears are cold; and there is a frequent vacuation of brown or bloody stools. Castor oil should be given, and clysters of mutton broth throw up; but it is seldom any treatment succeeds.

7416, Markmed lungs. Pleutris is not an uncommon disease among dogs. It is sometimes epidemic, carrying off great numbers. Its attack is rapid, and it generally terminates in death on the third day, by and blisters may be applied to the chest.

7416, Markmed lungs. Pleutris is not an uncommon disease among dogs. It is sometimes epidemic, carrying off great humblers. Its attack is rapid, and it generally terminates in death on the third day, by and blisters may be applied to the chest.

7416,

rabid dogs, which he says is neither a bark nor a howl, but a tone compounded of both. It has been said by some that this disorder is occasioned by heat or bad food, and by others that it never arises from any other cause but the bite. Accordingly this malady is rare in the northern parts of Turkey, more rare in the southern provinces of that empire, and totally unknown under the burning sky of Egypt. At Aleppo, where these animals perish in great numbers, for want of water and food, and by the heat of the climate, this disorder was never known. In other parts of Africa, and in the hottest zone of America, dogs are never attacked with madness. Blaine knows of no instance of the complaint being cured, although he has tried, to their fullest extent, the popular remedies of profuse bleedings, strong mercurial and arsenical doses, vinegar, partial drowning, nightshade, water plantain, &c.; the therefore recommends the attention to be principally directed towards the prevention of the malady.

7419. The preventive treatment of rabies or merdness is, according to Blaine, always an easy process in the human subject, from the immediate part bitten being easily detected; in which case the removal of the part by excision or cautery is an effectual remedy. But, unfortunately for the agriculturist, it is not easy to detect the bitten parts in cattle, nor in dogs; and it would be therefore most desirable if a certain internal preventive were generally known. Dr. Mead's powder, the Ormskirk powder, sea-bathing, and many other nostrums are deservedly in disreptute; while a few country medicines, but little known beyond their immediate precincts, have maintained some character. Conceiving that these must all possess some ingredient in common, he was at pains to discover it; and which he appears to have realised by obtaining among others the composition of Webb's Watford drink. In this mixture, which is detailed below, he considers the active ingredient to be the Būxus or box, which has been known as a prophylactic as long as t

of the fresh leaves of rue - 2 ounces, of sage - 2 ounces, of sage - 2 ounces, of sage - 2 ounces, chapter to half a pint; strain carefully, and press out the liquor very firmly; put back the ingredients into a pint of milk, and boil again to half a pint; strain as before; mix both liquors, which forms three doses for a human subject. Double this quantity is proper for a horse or cow. Two thirds of the quantity is sufficient for a large dog; half for a middling-sized, and one third for a small dog. Three doses are sufficient, given one on each of three subsequent mornings fasting; the quantity directed being that which forms these three doses. As it sometimes produces strong effects on dogs, it may be proper to begin with a small dose; but in the case of dogs we hold it always prudent to increase the dose till effects are evident, by the sickness, panting, and uneasiness of the dog. In the human subject, where this remedy appears equally efficacious, we have never witnessed any unpleasant or active effects; neither are such observed in cattle of any kind. About forty human beings have taken this remedy, and in every instance it has succeeded equally as with animals: but candour obliges us to notice, that in the major part of these, other means were used, as the actual or potential cautery; but in most of the animals other means were purposely omitted. That this remedy, therefore, has a preventive quality, is unquestionable, and now perfectly established; for there was not the smallest doubt of the animals mentioned either having been bitten, or of the dog being mad that bit them, as great pains were in every instance taken to ascertain these points.

is unquestionable, and now perfectly established; for there was not the smallest doubt of the animals mentioned either having been bitten, or of the dog being mad that bit them, as great pains were in every instance taken to ascertain these points.

7420. To prevent canine madness Pliny recommends worming of dogs; and from his time to the present it has had, most deservedly says Danle), its advocates. He tells us that he has had various opportunities of proving the usefulness of this practice, and recommends its general introduction. Blaine, on the contrary, asserts, that the practice of worming is wholly useless and founded in error; that the existence of any thing like a worm under the tongue is incontestably proved to be false; and that what has been taken for it is merely a deep ligature of the skin, placed there to restrain the tongue in its motions. He also observes, that the pendulous state of the tongue in what is termed dumb madness, with the existence of a partial paralysis of the under jaw by which they could not bite, having happened to dogs previously wormed, has made the inability to be attributed to this source, but which is wholly an accidental circumstance, and happens equally to the wormed and unwormed dog.

7421. Mange. This is a very frequent disease in dogs, and is an affection of the skin, either caught by contagion or generated by the animal. The scabby mange breaks out in blotches along the back and neck, and is common to Newfoundland dogs, terriers, pointers, and spaniels, and is the most contagious. The cure should be begun by removing the first exciting cause, if removable; such as filth or poverty, or, as more general the contrary (for both will equally produce it), too full living: then an application should be made to the parts, consisting of sulphur and sal ammoniac; tar-line-water will also assist. When there is much heat and itching, bleed and purge. Mercurials sometimes assist, but they should be used with caution; dogs do not bear them well.

7422. Worms. Dogs suffer very much

the lancet or wounded by the awl.

7424. The cat (Fèlis Càtus L.) is distinguished from the lion, tiger, leopard, and others of the genus Fèlis, by its annulate tail.

of the genus Feils, by its annulate tail.

7425. Its habits are thus given by Linnæus:—"Inhabits woods of Europe and Asia; domesticated every where; when tranquil purrs, moving the tail; when irritated is very active, climbs, spits, emits a fetid odour; eyes shine at night, the pupil by the day a perpendicular line, by night large, round; walks with its claws drawn in; drinks sparingly; urine of the male corrosive; breath fetid; buries its excrements; makes a horrid mewling in its amours; mews after and plays with its kittens; wags its tail when looking after prey; the lion of mice, birds, and the smaller quadrupeds; peaceful among its tribe; eats flesh and fish; refuses hot or salted things and vegetables; washes behind its ears before a storm; back electric in the dark; when thrown up, falls on its feet; is not infested with fleas; gravid sixty-three days; brings three to nine young, blind nine days; delights in marum, cat-mint, and valeriam."

7426. The cat is of great use in the farmery in catching mice, rats, and even birds. It is most desirable to keep males, as where females are kept the noisy gallantry of the adjoining tom-cats is exceedingly annoving.

noying.

7427. The Genet cat (Vivera Genétta) is a species of weasel, with an annulate tail and spotted blackish tawny body. It is a native of Asia, Spain, and France; is mild and easily tamed; and answers all the purposes of a cat at Constantinople and other places.

7428. The ferret (Mustèla Fùro L., fig. 923.) is an animal of the weasel and polecat kind, distinguished by its red fiery eyes.

7429. It is a native of Africa, but is tamed in Europe for the purpose of catching rabbits. It procreates twice a year, is gravid six weeks, and brings from six to eight young; smells very fetid. The ferret is very susceptible of cold, and must be kept in a box provided with wool or other warm materials, and may be fed with bread and milk. Its sleep is long and most highly gratified by the blood of small and young animals. Its enmity to rats and rabbits is unspeakable, and when either when employed to expel the rabbit from its burrows it must be muzzled, as otherwise it will suck the blood of its victim and instantly fall into a profound sleep, from which it will awake only to the work of destruction, committing in the warren, where it was introduced only for its services, the most dreadful waste and havoc. It is possessed of high irritability, and when particularly excited is attended with an odour extremely offensive. odour extremely offensive.

CHAP. IX.

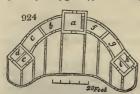

Animals of the Bird kind employed in Agriculture.

7430. Though poultry form a very insignificant part of the live stock of a farm, yet they ought not to be altogether despised. In the largest farm a few domestic fowls pick up what might escape the pigs and be lost; and on small farms and among cottagers, the breeding and rearing of early chickens and ducks, and in some situations the rearing of turkeys and the keeping of geese, are found profitable. There are few who do not relish a new egg or a pancake, not to say the flesh of fowls; and there are some of these comforts which happily can be had in as great perfection in the cottage as in the palace. The various kinds of domestic fowls and birds which are used in agriculture may be classed as gallinaceous, or with cleft feet; anserine, or web-footed; and birds of fancy or luxury. Before proceeding to the first division we shall offer some remarks on poultry hovels.

SECT. I. Poultry Houses and their Furniture and Utensils.

7431. The situation of the poultry house should be dry, and exposed either to the east or south-east, so as to enjoy the sun's rays in winter as soon as he appears above the Though in many cases all the commoner sorts of poultry are lodged in the same apartment; yet to be able to bestow on each species its proper treatment, they ought to be separated by divisions, and enter by separate doors. Apartments for aquatic fowls may be made in part under those of the gallinaceous tribe, and the peacock often prefers roosting on a tree, or on the roof of high buildings, when it forms an excellent watch bird to the poultry-yard or farmery.

7432. Where a complete set of poultry houses are intended, then a situation should be fixed on near or close to the farmery, and with ample space around for the fowls to disperse over in the day-time, and one or more ponds for the aquatic sorts. A space thirty feet by fifty feet may be made choice of for the buildings and yard (fig. 924); the building may be ranged along the north side, and the three other sides enclosed with a trellis or wire fence from six to eight feet in building and with similar fences according to the

enclosed with a trellis or wire fence from six to eight feet in height, and subdivided with similar fences according to the number of apartments. The hen-house (a) and turkey-house (b) may have their roosts (c c) in part over the low houses for ducks (d) and geese (e), and besides these there may be other apartments (f, g, h) for hatching or newly hatched broods, for fattening, to serve as an hospital, or retaining, boiling, or otherwise preparing food, killing poultry, and other purposes. A flue may pass through the whole in moist or very severe weather; the walls should be built hollow in the manuer already described (7002), which will at the same time be a saving of material; and the windows ought to have outside shutters, both for excluding excessive heats and excessive colds. In every apartment there ought to be a window opposite the door, in order to create a thorough draught when both are opened, and also a valve in the roof to admit the escape of the hottest and lightest air. Every door ought to have a small opening at bottom, for the admission of the fowls when the door is shut. The clevation (fig. 925.) should be in a simple style, and there may be a pigeonry over the central building.

7433. In ordinary cases, where poultry are kept on a farm merely to consume what would otherwise be lost, one or two compartments of the low range of buildings on the south side of the yard are usually devoted to them, or any dry convenient place, according to the general plan of the farmery.

7434. The furniture or fixtures of the poultry houses are very few; the roost is sometimes a mere floor or loft, to which the birds fly up or ascend by a ladder; at other times it is nothing more than the coupling timbers of the roof, or a series of cross battens: but the most approved mode is a series of rough polygonal or angular battens or rods rising in gradation from the floor to the roof, as already explained (8840. and 2842.); the battens placed at such a distance horizontally, as that the birds when roosting may not incommode each other by their droppings. For this purpose they should be a foot apart for hens, and eighteen inches apart for turkeys. The slope of the roost may be about 45°, and the lower part should lift up by hinges in order to admit a person beneath to remove the dung. No flying is requisite in the case of such a roost, as the birds ascend and descend by steps.

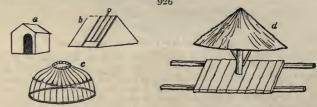

7425. Nexts are sometimes fixtures, in which case they are nitches built against the wall, not unlike

case of such a roost, as the birds ascend and descend by steps.

7435. Nests are sometimes fixtures, in which case they are nitches built against the wall, not unlike wine bins; where there is more than one tier on the ground floor, each superincumbent range must have a projecting balcony in front of about a foot in width, with stairs of ascent at convenient distances.

7436. A small boiler for preparing food may sometimes be requisite, though on a small scale this may be done in the kitchen. Watering troughs are generally fixed in the yards. In confined situations there should be a large distern of sand, in which the fowls may nestle and roll about in order to free themselves from vermin; there should also be a spot composed of gravel, sand, and soft earth, for nearly the same purpose, but more especially for exercising the young chickens. A roof for shelter and protection from the sun may very appropriately be placed over this last compartment, or a part of it.

7437. The utensils are the portable nest, (fig. 926. a), coops (b c), portable shelter (d); feeding dishes,

down into the receiver below, as the fowls pick it away; and the covers on that, which are opened by perches, and the iron cover above, which is secured by a padlock, completely keep the grain from the rain, so that the fowls get it always quite dry; and as nothing less than the weight of a hen on a perch can lift a cover on the lower receiver, perch can list a cover on the lower receiver, sparrows, and other small birds, are completely excluded, whilst the small cross bars through which the fowls pick prevent cattle and other large animals from getting at the grain. It is astonishing with what facility the fowls learn to leap upon the perch, and so open the cover of the receiver which covers the grain.

Gallinaceous Fowls, their Kinds, Breeding, Rearing, and Management.

7438. Under the order Gallineæ are included the common hen, turkey, Guinea, and peacock; and we shall here treat of each of these birds in succession.

7439. The different species of fowls, that is, of cocks and hens, inhabit in their native state the continent and islands of Asiatic India. Naturalists have not agreed whether these numerous varieties of this most useful bird, seen in a domesthese numerous varieties of this most useful bird, seen in a domesticated state, have originated from one or from two species. M. Temminck considers the Bankiva cock (Gällus Bankiva) as the origin of our domestic poultry; while others think they may have sprang from the Jungle cock (fig. 928. G. Sonnerāti), still found in the greatest plenty in the forests of India. The term chicken is applied to the female young of gallinaccous animals till they are four months old; afterwards they are called pullets, till they begin to lay, when they oecome hens. The male is a chicken till he is three months old, then he is a cock bird till the age of twelve months, when he becomes a cock; unless, indeed, he has been artificially deprived of the faculty of procreation, when he becomes a capon; and when the ovarium is taken from a pullet or hen, she is called a hen capon.

7440. The varieties of a bird so long under culture may naturally be expected to be numerous; those most esteemed in Britain, at the present time, are the following:—

7441. The common dunghill cock and hen, middle size, of every colour, and hardy.

colour, and hardy.

7442. The game cock and hen (fig. 929.), rather small in size, delicate in limb, colour generally red or brown; flesh white, and su-

perior to that of any other variety for richness and delicacy of flavour; eggs small, fine shaped, and

930

extremely delicate: chickens are difficult to rear from their pugnacity of disposition. The a bird both of cruel and curious sport in this as well as other countries; but the taste for these amusements, like that for others suited to times of comparative leisure of comparative leisure and ignorance, is now happily on the decline in Britain.

7443. The Dorking cock and hen (fig. 980.), so called from the town

in Surrey of that name, is the largest variety; shape handsome; body long and capacious; legs

short, five claws on each foot; eggs large, and lays abundantly; colour of the flesh inclining to yellowish or ivory. Both hens and cocks often made into capons.

7444. The Poland cock and hen (fig. 931.)
were originally imported from Holnd. The colour shining black, with white tops on the head of both cock and hen; head flat, surmounted by a fleshy protuberance, out of which spring the crown feathers, or top, white or black, with the fleshy king David's crown (the celestical in heraldry), consisting of four or five spikes; their form plump and deep; legs short, feet with five claws; lay abundantly; are less inclined to set than any other breed; they fatten quickly, and are more juicy and rich than the Dorking. On the whole, this is one of the most useful varieties. There is an ornamental subvariety known as the golden Poland (b), with yellow and black plumage.

7445. The every-day cock and hen is a subvariety of the above, of Dutch origin; they are of smaller size, and said to be everlasting layers. Their tops are large, and should be periodically clipped near the eyes; otherwise, according to Movbray (Thereise, according to Movbray). white tops on the head of both cock and

932

markable for having the legs and feet furnished with feathers. The other, and more scarce, variety is even smaller; and is most elegantly formed, as breed, who rear them for prizes, among which Sir John Sebright stands pre-

well as most delicately limbed. There is a so-ciety of fanciers of this eminent.

eminent.

7447. The Chittegong or Malay hen (fig. 933) is an Indian breed, and the largest variety of the species. They are in colour striated, yellow, and dark brown; long necked, scrpent-headed, and high upon the leg; their fiesh dark, coarse, and chiefly adapted to soup. They are good layers; and being well fed produce large, substantial, and nutritive eggs: but these birds are too long-legged to be steady sitters.

7448. The Shack-bag, or Duke of Leeds' breed, was formerly in great repute, but is now nearly lost. It is sometimes to be met with at Wokingham (Oakingham), in Berkshire, and is so large, and the fiesh so white, firm, and fine, as to afford a convenient substitute for the turkey.

7449. The improved Spanish cock and hen is a cross between the Dorking and Spanish breed, also to be found in and around Wokingham. It is a large bird with black plumage, white and delicate fiesh, the largest eggs of any British variety, and well adapted for capons.

otherwise, according to Mowbray (Treatise on Domestic Fouls, 24, and 115.), they will grow into the eyes of the fowls and render them

very subject to alarm.
7446. The bantam cock and hen
(fig. 932) is a small Indian breed, valued chiefly for its grotesque figure and delicate flesh. Mowbray mentions a subvariety, extremely small, and as smooth-legged as a game fowl. From their size and game fowl. From their size and delicacy they are very convenient, as they may always be used as sub-stitutes for chickens, when small ones are not otherwise to be had.

7450. Breeding. The common variety is easily procurable; but the others must either be procured from those parts of the country where they are usually bred, or from the poulterers and bird fanciers in large towns, and especially in London. It should be a general rule to breed from young stock; a two-year-old cock, or stag, and pullets in their second year. Pullets in their first year, if early birds, will, indeed, probably lay as many eggs as ever after; but the eggs are small, and such young hens are unsteady sitters. Hens are in their prime at three years of age, and decline after five, whence, generally, it is not advantageous to keep them beyond that period, with the exception of those of capital qualifications. Hens with a large comb, or which crow like the cock, are generally deemed inferior; but I have had hens with large rose combs, and also crowers, which were upon an equality with the rest of the stock. Yellow-legged fowls are often of a tender constitution, and always inferior in the quality of their flesh, which is of a loose flabby texture, and ordinary flavour.

large rose comins, and also crowers, which were upon an equality with the rest of the stock. Yellow-legged fowls are often of a tender constitution, and always inferior in the quality of their flesh, which is of a loose flabby texture, and ordinary flavour.

7451. The health of fowls is observable in the fresh and florid colour of the comb, and the brightness and dryness of the eyes; the nostrils being free from any discharge, and the healthy gloss of the plumage. The most useful cock is generally a bold, active, and savage bird, sometimes cruel and destructive in his fits of passion, if not well watched, to his hens, and even to his offspring. Hens above the common size of their respective varieties are by no meens preferable either as layers or setters. The indications of old age are paleness of the comb and gills, dulness of colour, and a sort of downy stiffness in the feathers, and length and size of talons, the scales upon the legs becoming large and prominent.

7452. The number of hens to one cock should be from four to six, the latter being the extreme number, with a view of making the utmost advantage. Ten and even twelve hens have been formerly allowed to one cock, but the produce of eggs and chickens under such an arrangement will seldom equal that to be obtained from the smaller number of hens. Every one is aware that the spring is the best food, accommodation, and attendance, under which hens may be suffered to sit in January.

7453. The conduct of the cock towards his hens is generally of the kindest description, and sometimes, as in the Polish breed, so remarkably so, as to be quite incredible to those who have not witnessed it. It is not an uncommon occurrence, however, for the cock to take an antipathy to some individual hen; when it continues for any length of time it is best to remove her, and supply her place by another, taking care that the stranger be not worried by the hens. Spare coops or houses will be found useful on such occasions.

occasions.

occasions.

7454. The change of a cock, from death or accident, is always attended with interruption and delay, as it may be some considerable time before the hens will associate kindly with their new partner; and further, a new cock may prove dull and inactive from the change, however good in nature. This frequently happens with cocks of the superior breeds, purchased from the London dealers, in whose coops they have been kept in such a high state of temperature, that they are unable to endure the open air of the country, unless in the summer season. Such being removed in autumn, winter, or early spring, if immediately turned abroad with hens, are liable to become aguish, torpid, and totally useless; perhaps, in the end, turning roupy or glandered. The only method of safety in this case is to keep such a cock in the house, upon the best and most nourishing food, turning the hens to him several times in the day, and permitting him to be abroad an hour or so, the weather being fine, until, in a few weeks, he shall be accustomed to the air. the air.

the air.

7455. In making the nests, short and soft straw is to be preferred; because, the straw being long, the hen, on leaving her nest, will be liable to draw it out with her claws, and with it the eggs. The hen, it is ascertained, will breed and lay eggs without the company of a cock; of course, such eggs are barren.

7456. Eggs for setting should never exceed the age of a month, the newer to be preferred, as nearly of a size as possible, and of the full middle size; void of the circular flaw, which indicates the double yolk, generally unproductive, nor should there be any roughness or cracks in the shell. The number of eggs, according to the size of the hen, from nine to fifteen, an odd number being preferable, on the supposition of their lying more close. The eggs to be marked with a pen and ink, and examined when the hen leaves her nest, in order to detect any fresh ones which she may have laid, and which should be immediately taken from her, as they, if at all, would be hatched too late for the brood. It is taken for granted the box and nest have been made perfectly clean for the reception of the hen, and that a new nest has not been sluggishly or sluttishly thrown upon an old one, from the filth of which vermin are propagated, to the great annoyance of the hen, and prevention of her steady sitting. Eggs broken in the nest should be cleared away the instant of discovery, and the remaining washed with warm water, and quickly replaced, lest they adhere to the hen, and be drawn out of the enest; if necessary, the hen's feathers may also be washed, but always with warm water.

be cleared away the instant of discovery, and the remaining washed with warm water, and quickly replaced, lest they adher to the hen, and be drawn out of the nest; if necessary, the hen's feathers may also be washed, but always with warm water.

7457. With respect to the capriciousness of some hens, in the article of sitting, it is a risk which must be left to the judgment of the attendant, who has to determine whether the hen which appears desirous of sitting may be safely trusted with eggs. Leaving a number of eggs in the nest is an enticement. Very frequently a hen will cluck, and appear hot for incubation, yet after sitting over her eggs a sufficient number of hours to addle them, will then desert them; and, probably, in the course of a few days will be taken with another fit of rincubation. Much useless cruelty is too often exercised to prevent the hen from sitting, when eggs, rather than chickens, are in request. A late author recommends to thrust a feather through the hen's nostrils, in order to prevent her from sitting; and to give her half a glass of gin, then swing her round until seemingly dead, and confine her in a pot during a day or two, leaving her only a small breathing hole, to force her to sit! It is full time that those and a hundred other such utterly useless and barbarous follies of former days, practised upon various animals, should be dismissed with the contempt they merit. The pamphlet alluded to is the Epicure, by Thomas Young, a publication replete with good things on the interesting subjects of eating, wines, spirits, beer, cider, &c. It is written with haut gout. (Moubray.)

7458. Moulting. Every succeeding year after the third, the hen continues to moult later in the season, and laying tewer or no eggs during the moulting period, which is sometimes protacted to two or three months. It should seem that old hens are seldom to be depended upon for eggs in the winter, such being searcely full of feather until Christmas; and then, probably, may not begin to lay till April, producing at l

autumn.

autumn. 7459. In some hens the desire of incubation is so powerful, that they will repeat it five or six times in the year; in others it is so slight, that they will probably not sit more than once or twice in the season. A skilful breeder will take advantage of these qualities, and provide abundance of eggs from the one variety, and of chickens by means of the other. Hens, when sitting, drink more than usual: and it is an advisable practice to place water constantly before them when in this state, and food (say corn) at least twice a day. The time of incubation is twenty-one days.

7460. Hatching. The chicken, hitherto rolled up like a ball, with its bill under the right wing, like a bird asleep, begins generally on the morning of the twenty-second day to break its way through the shell; neither the hen, nor can the art of man, with safety render them aid in this very interesting and wonderful operation. The parental affection of the hen, as Mowbray and Parmentier have observed, is always

intensely increased, when she first hears the voice of the chicks through the shells, and the strokes of

intensely increased, when she first hears the voice of the chicks through the shells, and the strokes of their little bills against them. The signs of a need of assistance, the former author observes, are, the egg being partly pecked, and the efforts of the chicken discontinued for five or six hours. The shell may then be broken cautiously, and the body of the chicken carefully separated from the viscous fluid which lines it. Reaumur gives it as his opinion, that no aid ought to be given to any chickens but those which have been near twenty-four hours employed without getting forward in their work.

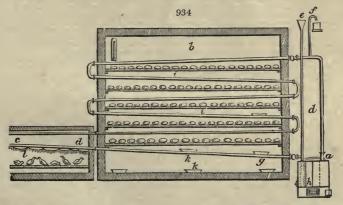

7461. The chickens first hatched should be taken from the hen, lest she be tempted to leave her task unfinished. Those removed may be secured in a basket of wool or soft hay, and kept in a moderate heat, if the weather be cold, near the fire. They will require no food for many hours, even four-and-twenty, should it be necessary to keep them so long from the hen. The whole brood being hatched, the hen is to be placed under a coop abroad, upon a dry spot, and, if possible, not within reach of another hen, since the chickens will mix, and the hens are apt to maim or destroy those which do not belong to them. Nor should they be placed near numbers of young fowls, which are likely to crush young chicks under their feet, being always eager for the chickens' meat. The first food should be split grita, sherwards tail wheat; all watery food, soaked bread, or potatoes, is improper. Eggs boiled hard, or curd chopped small, are much approved as first food. Their water should be pure and often renewed; and there are convenient pans made, in such forms that the chickens may drink without getting into the water, which often, by wetting their feet and feathers, numbs and injures them. A bason whelmed in the middle of a pan of water will answer the end, the water running round it generally; and, independently of situation, and the disposition of the hen, there is no necessity for cooping the brood beyond two or three days; but they

7462. For the period of the chickens quitting the hen, there is no general rule: the most certain is, when the hen begins to roost, leaving them; if sufficiently forward, they will follow her; if otherwise, they should be secured in a proper place, the time having arrived when they are to associate with the young poultry, as nearly of their own age and size as possible, since the larger are apt to overrun and drive from their food the younger brood.

their food the younger brood

7463. Hatching by artificial heat is an Egyptian practice, mentioned by Diodorus and Aristotle, and was brought into notice about the middle of the eighteenth century, by Réammur in his "Art de faire éclore, &c. des Oiseaux domestiques." The requisite degree of heat is 90 degrees, which is supplied by fire, steam, hot water, or fermentible substances; after hatching, the birds are placed in a cage, in which is placed a lamb-skin suspended from the roof of a box, and enclosed by a curtain of green baize; or, according to Parmentier, they may be placed under a capon, which, after being prepared for receiving pleasure from feeling the chickens under its belly, by depriving it of the greater part of the feathers and excording to eapon will become an excellent nursing mother. Excepting as matter of curiosity, however, it is not at present worth while either to hatch or rear chickens artificially in this country. Whether Réaumur's mode of hatching be adopted, or Mrs. D'Oyley's of depriving hens of their chickens as soon as hatched, and thus causing one hen to hatch five or six broods in succession, the human attention required, and the risk of failure are so great, that the surest modes, under all the present circumstances, are such as are natural. Where it is tried for experiment or curiosity, the heat of tan or dung is more likely to prove steady than that from smoke, air, or steam, probably even than that of hot water, successfully tried, however, and, we believe, still practised in the neighbourhood of Paris. An enclosure in the middle of a broad vinery or hothouse might serve at once to hatch and rear early chickens; and such a mode of rearing, at least in the winter season, certainly deserves the attention of those who are curious in having this luxury in February and March. In 1822 or 1823 some interesting experiments were exhibited by Mr. Barlowat the Egyptian Hall, London, relative to an improved method which he had invented, of hatching eggs by artificial heat. The method, and

7464. The incubation of chickens by hot water is the invention of M. Bonnemain, physician, of Paris, in 1777; and still alive when we were in that capital in 1828. Chickens hatched in this way at St. Germain's, under M. B.'s direction, it is said, supplied the table of Louis XIV. The boiler of the apparatus is called a calorifère, (calor, heat, and fero, to bear,) and consists of a small boiler (fig. 934. a), a box or

building (b) for hatching the eggs, a cage or coop (c) for rearing the chickens, tubes (d) for circulating the hot water, a supply tube and funnel (c), and a safety tube (f). Supposing the water heated in the boiler, it will rise by its specific levity through the tube (a, a), move progressively through all the tubes, and return again to the boiler by the tube (g), which is inserted in the lid like the other, but passes down to its lower part (h). This circulatory movement, once commenced, continues so long as the water is heated in the boiler, because the temperature is never equal throughout all parts of the apparatus. We may readily conceive that a perfect equality of temperature can never exist, on account of the continual loss of heat, which escapes from the exteriors of all the tubes. Meanwhile, the temperature of the air en-

closed in the box differs but little from that of the numerous tubes which traverse it; and as the bends of the tubes on the outside of the box afford but little surface to be cooled by the surrounding air, so the force of the circulation, which is always in the ratio of the difference between the temperature of the waters passing out of the calorifère and re-entering it, does not become greatly diminished, even after having expended a large portion of its heat on the outside of the box, in maintaing a gentle heat in the cage (c) adjoining to it. We see, therefore, that the more the water is cooled which passes through the last circumvolutions of the tubes, the more active is the circulation in all parts; and, consequently, the more equal is the temperature of all the tubes which heat the box, and of the air within it: indeed, to prevent the loss of heat as much as possible, the boiler, and all those parts of the tubes which are placed on the exterior of the box, are enveloped in lists of woollen cloth. M. Bonnemain having thus applied these principles with so much skill, is always enabled to maintain in these boxes an equal temperature, varying scarcely so much as half a degree of Réaumur's thermometer; but, as if it was not sufficient to have thus far resolved the problem, he contrived that this degree of temperature in all parts of the stove should be maintained at that point which was found most favourable for promoting incubation. It was by means of an apparatus for regulating the fire that he attained this desirable object. The action of this regulator is founded on the unequal dilatation of different metals by heat. A movement is communicated near to the axis of a balanced lever, which lever transmits it by an iron wire to a register in the ash-pit door of the furnace. Combustion is by these means abated or increased. The details of this piece of machinery are fully described and delineated in Gill's Technological Register (Feb. 1828, p. 70.).

7465. When we would hatch chickens by hot water, we light th

of the year.

of the year. Table 1 thickens, but which mist, intertents, be occasionally regulated by the particular examination of the year. Table 1 this is replaced by a small quantity of air, which is necessary to support the respiration of the chick; but as the atmospheric air which surrounds the eggs in the box at that degree of temperature is either completely dry, or but little humid, so the chick would greatly suffer, or finally perish, from this kind of desiccation. The aqueous vapour which exhales from the breathing of the old flowls while hatching, in some degree prevents this ill effect; but, nevertheless, in dry seasons, the vapour is hardly sufficient; and thus, in order that the eggs may be better hatched in the dry seasons, the hens cover them with the earth of the floor of the granary. In artificial incubation, to keep the air in the stove constantly humid, they place in it flat vessels, such as plates (k, k), filled with water. When the chickens are hatched, they are removed from the stove, and carried to the cage (c), where they are fed with millet, and nestle under a sheep's skin with wool on it (l), suspended over them. They also separate, by means of partitions in the cage, the chickens as they are hatched each day, in order to modify their nourishment agreeably to their age. Artificial incubation is exceedingly useful in furnishing young fowls at those seasons when the hens will not sit, and, in some situations, to produce, or, as we may say indeed, to manufacture a great number of fowls in a small space. (Gill's Technological Repository, No. viii. p. 73, as quoted in Gard. Mag. vol. iv. p. 307.) p. 307.)

7467. The products of the cock and hen are eggs, feathers, and the carcass.

7468. Eggs become desiccated, and, in consequence, lose great part of their substance and nutritive quality, by keeping; and every body knows the value of a fresh-laid egg. They will retain their moisture and goodness, however, three or four months, or more, if the pores of the shell be closed and rendered impervious to the air, by some unctuous application. We generally anoint them with mutton suct melted, and set them on end, wedged close together, in bran, stratum super stratum, the containing box being closely covered. Laid upon the side, the yolk will adhere to the shell. They thus come into use, at the end of a considerable period of time, in a state almost equal to new-laid eggs, for consumption; but ought

and set them on end, wedged close together, in bran, stratum super stratum, the containing box being closely covered. Laid upon the side, the yolk will adhere to the shell. They thus come into use, at the end of a considerable period of time, in a state almost equal to new-laid eggs, for consumption; but ought not to be trusted for incubation, excepting in the case of the imported eggs of rare birds.

7469. The largest eggs will weightwo ounces and a half, those of the Chittagong hen perhaps three ounces. To promote fecundity and great laying in the hen, nothing more is necessary than the best corn and fair water; malted or sprouted barley has occasionally a good effect, whilst the hens are kept on solid corn; but if continued too long they are apt to scour. Cordial horse-ball is good to promote laying in the cold season, and also toust and ale, as every henwife well knows. It must be noted, that nothing is more necessary towards success in the particular of obtaining plenty of eggs, than a good attendance of cocks, especially in the cold season; and it is also especially to be observed, that a cock whist moulting is generally useless. Buffon says, a hen well fed and attended will produce upwards of one hundred and fifty eggs in a year, besides two broods of chickens. Mowbray observed, that a hen generally cackled three or four days previously to laying; and that some half-bred game hens began to lay as soon as their chickens were three weeks old; the consequence of high keep and good attendance of the cocks.

7470. Feathers or down intended for use should be plucked as soon as possible after the bird is dead, and before it is cold, otherwise they are defective in that clasticity which is their most valuable property, and are liable to decay. The bird should, besides, be in good health, and not moulting, for the leathers to be in perfection; and being plucked, and a sufficient number collected, the sooner they are dried upon the oven the better, since they are less apt to heat and stick together.

7471. The fea

and slighting their food, lose instead of gaining additional flesh. Such a period, in fact, is too short for

and slighting their food, lose instead of gaining additional flesh. Such a period, in fact, is too short for them to become accustomed to confinement.

7474. Feeding-houses should be warm and airy, with earth floors well raised, and capacious enough to accommodate twenty or thirty fowls; the floor slightly littered down, and the litter often changed. Sandy gravel and a little lime rubbish should be placed in different places, and often changed. A sufficient number of troughs, for both water and food, should be placed around, that the stock may feed with as little interruption as possible from each other, and perches in the same proportion should be furnished for those birds which are inclined to perch, which few of them will desire after they are begun to fatten, but which helps to keep them easy and contented until that period. In this mode fowls may be battened to the highest nitch, and yet preserved in a healthy state, their flosh being equal in quality to the of the but which helps to keep them easy and contented until that period. In this mode fowls may be battened to the highest pitch, and yet preserved in a healthy state, their flesh being equal in quality to that of the barn-door fowl. To suffer fattening fowls to perch is contrary to the general practice, since it is supposed to bend and deform the breast-bone; but as soon as they become heavy and indolent from feeding, they will rather incline to rest in the straw; and the liberty of perching in the commencement of their cooping has a tendency to accelerate that period, when they are more inclined to rest on the floor. Fowls, moreover, of considerable growth will have many of them become already crooked breasted from perching whilst at large, although much depends upon form in this case, since we find aged cocks and hens of the best shape which have perched all their lives with the breast bone perfectly straight.

7475. The privation of light, by inclining fowls to a constant state of repose, excepting when moved by the appetite for food, promotes and accelerates obesity; but a state of obesity obtained in this way cannot be a state of health, nor can the flesh of animals so fed equal in flavour, nutriment, and salubrity, that of the same species fed in a more natural way. Economy and market interest may perhaps be best answered by the plan of darkness and close confinement; but a feeder for his own table, of delicate taste, and ambitious of furnishing his board with the choicest and most salubrious viands, will declare for the natural mode of feeding; and in that view, a feeding yard, gravelled and turfed, the room being open all day, for the fowls to retire at pleasure, will have a decided preference, as the nearest approach to the barn-door system.

system.

mode of reeding; and in that week, a feeding-yard, gravented and turred, the from open all day, for the fowls to retire at pleasure, will have a decided preference, as the nearest approach to the barn-door system.

7476. Insects and animal food form a part of the natural diet of poultry, are medicinal to them in a weakly state, and the want of such food may sometimes impede their thriving.

7477. For fattening the younger chickens, the above feeding-room and yard is well calculated. These may be put up as soon as the hen shall have quitted her charge, and before they have run off the sucking flesh; for generally, when well kept and in health, they will be in fine condition and full of flesh at that period, which flesh is afterwards expended in the exercise of foraging for food, and in the increase of stature, and it may be a work of some time afterwards to recover it, more especially in young cocks, and all those which stand high upon the leg. In fact, all those which appear to have long legs should be fattened from the hen, to make the best of them; it being extremely difficult, and often impossible, to fatten long-legged fowls in coops, which, however, are brought to a good weight at the barn-door.

7478. In the choice of pull-sized fowls for feeding, the short-legged and early hatched always deserve a preference. The green linnet is an excellent model of form for the domestic fowl, and the true Dorking breed approaches the nearest to such model. Of course the smaller breeds and the game are the most delicate and soonest ripe. The London chicken butchers as they are termed, or poulterers, are said to be of all others the most dexterous feeders, putting up a coop of fowls and making them thoroughly fat within the space of a fortnight; using so much grease, and that perhaps not of the most delicate kind, in the food. In the common way this business is often badly managed, fowls being huddled together in a small coop, tearing each other to pieces, instead of enjoying that repose which alone an ensure the wished-

renewed, fresh and clean; indeed, those which have been well kept will turn with disgust from ordinary food and foul water.

7479. Earley and wheat are the great dependence for chicken poultry; oats will do for full-grown hens and cocks, but are not so good as barley; both, when they have their fill of corn, will ead occasionally cabbage or beet leaves. Steamed potatoes and oatmeal mixed together make an excellent mess, but must not be given in great quantities, otherwise it renders the flesh soft and flabby.

7480. Cramming. Barley and wheat meal are generally the basis or chief ingredient in all fattening mixtures for chickens and fowls; but in Sussex ground oats are used, and there oats are in higher repute for fattening than elsewhere, many large hogs being fattened with them. In the report of that county, the Rev. Arthur Young says, "North Chappel and Kinsford are famous for their poultry: they are fattened there to a size and perfection unknown elsewhere. The food given them is ground oats made into gruel, mixed with hog's grease, sugar, pot-liquor, and milk; or ground oats, treacle, and suet, sheep's plucks, &c. The fowls are kept very warm, and crammed morning and night. The pot-liquor is mixed with a few handfuls of oatmeal and boiled, with which the meal is kneaded into crams or roils of a proper size. The fowls are put into the coop two or three days before they are crammed, which is continued for a fortnight; and they are then sold to the higglers. These fowls, full grown, weigh seven pounds each, the average weight five pounds; but there are instances of individuals double the weight. They were sold at the time of the survey (1809) at four to five shillings each. Turner, of North Chappel, a tenant of Lord Egremont, crams two hundred fowls per annum. Great art and attention is requisite to cut the capons, and numbers are destroyed in the operation."

7481. Oakingham in Berks is particularly famous for fatted fowls, by which many persons in that town and vicinity gain a livelihood. The fowls are sold

or nourlshing, as those fattened upon more simple and substantial food; as, for example, meal and milk, without the addition of either treacle or sugar. With respect to grease of any kind, its chief effect must be to render the flesh loose and of indelicate flavour. Nor is any advantage gained, excluding the commercial one.

mercial one.

7483. The methods of cramming by confining in a box the size of the body of the fowl, and allowing it; head and vent to project for intromission and ejection; of blinding the bird for this purpose; or of nailing it to the board; and also the mode of forcing down liquid food by a particular kind of pump, worked by the foot of the feeder; all these and other cruel practices we wish we could abolish in practice, and obliterate from the printed page.

7484. Castration is performed on cocks and hens only in some districts, and chiefly in Berkshire and Sussex. The susual time is when they have left the hen, or when the cocks begin to crow, but the earlier the better. It is a barbarous practice and better omitted. Capons are shunned both by hens and cocks, which, it is said, will not roost on the same perch with them. The Chinese mode of making capons is fully described and illustrated with cuts in the Farmer's Magazine, vol. vi. p. 46.

7485. Pinioning of fowls is often practised to restrain them from roosting too high, or from flying over fences, &c.; and is much more convenient than the cutting their wing feathers only. But in the ordinary methods of merely excising the pinion, it is frequently fatal; and almost always so to full-grown birds or fowls, by their bleeding to death. To prevent this in the longs-winged tribes, as class, geese, &c., pass a threaded needle through their wing, close by the inside of the smaller bone (fig. 935. a), and making a ligature with the thread across the larger bone, and returning it on the outside of all, the plished by a ligature with sissars or shares. In the Gallinace or short-winged tribes, as cocks, hens, &c., the operation is rendered safet by being performed on the beginning of the next joint (b), as equivalent the principal blood-vessels have been thus secured, cut off the portion of wing beyond the ligature with sissars or shares. In the Gallinace or short-winged tribes, as cocks, hens, &c., the operation is rendered safet by being performed on the beginning

7486. The turkey (Melèagris Gallipàvo L., fig. 936.) is a native of America, and was

introduced into this country from Spain soon after the discovery of the former country. The colour in the wild state is black, but domestication has produced great variety.

7487. In a state of nature they are said to parade in flocks of five hundred, feeding, in general, where abundance of nettles are to be found, the seed of which and of a small red acorn is their common food in the American woods. They get

nettles are to be found, the seed of which and of a small reacorn is their common food in the American woods. They get fat in a wild state, and are soon run down by horses and dogs. They roost on the highest trees, and since the clearing of extensive tracts in America, have become rare in many places: their antipathy to any thing of a red colour is well known. In this country they are supthy to any thing of a red colour is well demense lands of the Marquis of Bute, in Bute.

7488. The varieties are few, and chiefly the copper and white, said to be imported from Holland, the former too tender for general culture; the black Norfolk is esteemed superior to all others.

7489. Breeding. One turkey cock is sufficient for six hens or more, and a hen will cover according to her size from nine to fifteen eggs. The hon is apt to form her nest abroad in a hedge, or under a bush, or in some secure place; she lays from eighteen to twenty-five eggs or upwards, and her term of incubation is thirty days. She is a steady sitter, even to starvation, and therefore requires to be regularly supplied with food and water. Buffon says she is a most affectionate mother; but Mowbray observes, that from her natural heedlessness and stupidity, she is the most careless of mothers; and being a great traveller herself, will drag her brood over field, heath, or bog, never casting a regard behind her to call in her straggling chicks, nor stopping while she has one left to follow her. The turkey differs from the common hen in never scratching for her chicks, leaving them entirely to their own instinct and industry; neither will they fight for their brood, though vigitant in the discovery of birds of prey, when they will call their chickens together by a particular cry, and run with considerable speed. Hence, when not confined within certain limits, they require the attendance of a keeper.

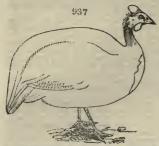

7490. Turkey chicks should be withdrawn from the nest as soon as hatched, and kept very warm by wrapping them in flannel, or putting them under an artificial

prefer roosting abroad upon high trees in the summer season, but that cannot generally be permitted with a view to their safe keeping.

7491. Fattening. Sodden barley, or barley and wheat-meal mixed, is the most approved food; and the general mode of management is the same as that of the common cock and hen. They are generally fed so as to come in at Christmas, but they may be fattened early or late. Sometimes though, but rarely, they are caponised. Buffon says, the wild turkey of America has been known to attain the weight of sixteen pounds; the Norfolk turkeys are said sometimes to weigh twenty and thirty pounds; but Mowbray says;

he never made any higher than fifteen pounds ready for the splt. The living and dead weight of a turkey are as 21 to 14.

7492. Feathers. Turkeys are sometimes plucked alive, a barbarous practice which ought to be laid aside. Parmentier proposed to multiply the breed of white turkeys in France, and to employ the feathers found on the lateral part of the thighs instead of the plumes of the ostrich.

7493. The Guinea hen (Numídia Melèagris L., fig. 937.) is found in a wild state only in Africa, from whence it has been diffused over every part, of Europe, the West Indies, and America. In a state of nature these birds associate in flocks of two or three hundred. They delight in marshy places, but always perch during the night in trees, or high situations. It is bigger than a large cock, and is active, restless, and courageous; and will even attack the turkey, though so much above its

7494. The properties of the pheasant and the turkey have been said to be united in this bird; its flesh is more like that of the pheasant than that of the common cock and hen both

for the former bird. It is also very prolific, and its eggs are nourishing and good. It assimilates perfectly with common fowls in its artificial habits and kinds of food; but it has this peculiarity — that the cocks and hens are so nearly alike, that it is difficult to distinguish them, and it has a peculiar gait, and cry, and chuckle.

7495. The peacock (Pàvo cristàtus L.) is a native of India, and found in a wild state in Java and Ceylon, where they perch on trees like the turkey in America. The age of the peacock extends to twenty years, and at three the tail of the cock is full and com-The cock requires from three to four hens; and where the country agrees with them, they are very prolific, a great ornament to the poultry yard and lawns, and useful Unfortunately, they are not easily kept for the destruction of all kinds of reptiles.

within moderate bounds, and are very destructive in gardens. They live on the same food as other domestic fowls, and prefer barley. They are in season from February till June; but though a peacock forms a very showy dish, the flesh is ill-coloured and coarse, and they are therefore kept more as birds of ornament than of use.

7496. The crested curassow (Crax Alector L. fig. 938.) is a beautiful and majestic bird, nearly the size of a turkey; it is common in some parts of tropical America, and is mentioned as being abundant in Paraguay. In those countries it is tamed, and readily associates with the other domestic poultry. Like most gallinaceous birds, it lives in flocks of about a dozen, feeds upon Indian corn, rice, and other grain during the day, and roosts on high trees at night.

Its size, disposition, and the delicacy of its flesh, all recommend our attempting to domesticate it in this country.

SECT. III. Anserine or Aquatic Fowls.

7497. The order anseres comprehends the duck, goose, swan, and buzzard. Under a regular system, Mowbray observes, it would be preferable to separate entirely the aquatic from the other poultry; the former to have their houses ranged along the banks of a piece of water, with a fence, and sufficiently capacious walks in front; access to the water by doors, to be closed at will. Should the water be of considerable extent, a small boat would be necessary, and might be also conducive to the pleasure of angling.

is originally from 7500. The Rhone duck is originally from France, an nerally of a dark-coloured plumage, large size, and sup to improve our breed. They are of darker flesh, and savoury, than the English duck; but somewhat coarse. I

7498. The duck (A nas Boschas L., fig. 939.) is a native of Britain, and found frequenting the edges and banks of lakes in most parts of Europe. The flesh of this and various other species of the duck is savory and stimulant, and said to afford preferable nourishment to stimulant, and said to afford preferable nourishment to that of the goose, being less gross, and more easily digested. The flesh of the wild duck, though more savoury than that of the tame, is reckoned still more easy of digestion. The ancients went even beyond our greatest modern epicures in their high esteem for the flesh of the duck; and Plutarch asserts, that Cato preserved his whole household in health by dieting them on duck's flesh. Taylo, Varieties and species. There are the Rhone, the Aylesbury, the canvass-backed, and the Muscony.

covy.

ducks have been so constantly imported for a great number of years, that they are very generally mixed with our native breed. The English duck, particularly the white variety, especially when they chance to have light-coloured flesh, are never of so

high and savoury flavour as the darker colours. Muscovy, and other foreign species of the duck, are kept rather out of curiosity than for the table. 7501. The while Ayledwry are a beautiful and ornamental stock, matching well in colour with the Embden geese. They are said to be early breeders.

7502. The canvass-backed, bred only on the Potowmac and Susquehanna rivers, are of very recent introduction from America, and are only to he found in a few places near Liverpool; they are said to be the best in the world, and if so will soon become better known,

7503. The Muscowy duck (A. moschata L.) is a native of Brazil, but domesticated in Europe. It is a curious dark-coloured bird, distinguished by its naked face, kept more out of curiosity than use; to be retained in any place, they must be reared there from the egg, otherwise they will fly away.

7504. Breeding. One drake is generally put to five ducks; the duck will cover from eleven to fifteen eggs, and her term of incubation is thirty days. They begin to lay in February, are very prolific, and are apt, like the Turkey, to lay abroad, and conceal their eggs, by covering them with leaves or straws. The duck generally lays by night, or early in the morning: white and light-coloured ducks produce similar eggs; and the brown and dark-coloured ducks, those of a greenish blue colour, and of the largest size. In setting ducks, it is considered safest to put light-coloured eggs under light ducks, and the contrary; as there are instances of the duck turning out with her bill those eggs which were not of the natural. there are instances of the duck turning out with her bill those eggs which were not of her natural colour.

colour.
7505. During incubation, the duck requires a secret and safe place, rather than any attendance, and will, at nature's call, cover her eggs, and seek her food, and the refreshment of the waters. On hatching, there is not often a necessity for taking away any of the brood, barring accidents; and having hatched, let the duck retain her young upon the nest her own time. On moving her with her brood, prepare a coop upon the short grass, if the weather be fine, or under a shelter, if otherwise: a wide and flat dish of water, often to be renewed, standing at hand; barley, or any meal, the first food. In rainy weather particularly, it is useful to ellp the tails of the ducklings, and the surrounding down beneath, since they are else apt to draggle and weaken themselves. The duck should be cooped at a distance from any other. The period of her confinement to the coop depends on the weather and the strength of the ducklings. A fornight seems the longest fine necessary: and they may be sometimes permitted to enjoy the nond at the end of or her confinement to the coop depends on the weather and the strength or the ducklings. A fortnight seems the longest time necessary; and they may be sometimes permitted to enjoy the pond at the end of a week, but not for too great a length at once, least of all in cold wet weather, which will affect, and cause them to scour, and appear rough and draggled. In such case they must be kept within a while, and have an allowance of bean or pea neeal mixed with their ordinary food. The meal of buck-wheat and the former is then proper. The straw beneath the duck should be often renewed, that the brood may have a dry and comfortable bed; and the mother herself be well fed with solid corn, without an ample allowance of which ducks are not to be reared or kept in perfection, although they gather so much abroad.

allowance of which ducks are not to be reared or kept in perfection, although they gather so much abroad.

7506. Duck eggs are often hatched by hens, when ducks are more in request than chickens; also as ducks, in unfavourable situations, are the more easy to rear, as more hardy; and the plan has no objection in a confined place, and with a small stock, without the advantage of a pond; but the hen is much distressed, as is sufficiently visible, and, in fact, injured, by the anxiety she suffers in witnessing the supposed perils of her children venturing upon the water.

7507. Ducks are fattened, either in confinement, with plenty of food and water, or full as well restricted to a pond, with access to as much solid food as they will eat; which last method is preferable. They fatten speedily, in this mode, mixing their hard meat with such a variety abroad as is natural to them, more particularly, if already in good case; and there is no check or impediment to thrift from pining, but every mouthful tells and weighs its due weight. A dish of mixed food is preferable to white corn, and may remain on the bank, or rather in a shed, for the ducks. Barley, in any form, should never be used to fatten ducks or geese, since it renders their flesh loose, woolly, and inspird, and deprives it of that high savory flavour of brown meat, which is its valuable distinction; in a word, rendering it chickeny, not unlike in flavour the flesh of ordinary and yellow-legged fowls. Oats, whole or bruised, are the standard fattening material for ducks and geese, to which may be added pea-meal, as it may be required. The house-wash is profitable to mix up their food under confinement; but it is obvious, whilst they have the benefit of what the pond affords, they can be in no want of loose food. Acorns in season are much affected by ducks which have a range; and they will thrive so much on that provision, that the quantity of fat will be inconvenient, both in cooking and upon the table. Ducks so fed are certainly inferior in delicacy, but th

of down and feathers should be taken from each wing.

7508, Decoys for wild ducks. Wild ducks, and other aquatic birds, are frequently taken by the device termed a decoy, which, in the low parts of Essex, and some other marshy districts, may be considered as connected with husbandry. A decoy is a canal or ditch, provincially pipe of water (fig. 940.), with a grassy

sloping margin (1) at its junction with a river or larger piece of water (8), to invite aquatic fowls to sit on and dress their plumage; but in other parts, covered with rushes and aquatic plants for concealment. Along the canal of the decoy are placed reed fences (2, 2), to conceal the decoy-man and his dogs from the sight of the ducks. There is an opening in this fence (3), where the decoy-man first shows himself to the birds to force them to take the water; and having taken it, the dog drives them up the canal, the man

looking through the fence at different places (4, 5, 6) to frighten them forward. At the end of the canal is a tunnel net (7), where the birds are finally taken. In operating with this trap, as the wild duck is a very shy bird, and delights in retirement, the first step is to endeasour to make the given water a peaceful asylum, by suffering the ducks to rest on it undisturbed. The same of the provided is the provided of the principal of the waters whose margins abound with underwood and aquatic plants; once alment leads them the principal of the waters whose margins abound with underwood and aquatic plants; once the principal of the provided; for it is not retermine the sum of the provided; for it is not retermine which leads them into these recesses, but a search after food also. At certain times of the day, when wild fowl are off their feed, they are equally delighted with a smooth grassy margin, to adjust and oil their plumage upon. On the close-pastured margins of large waters, frequented by wild fowl, hundreds may be seen amusing themselves in this way; and perhaps nothing draws them sooner to a water than a conveniency of this kind : hence it becomes essentially necessary to success, to provide a grassy, shelving, smooth-shaven bank (1) at the mouth of the decoy, in order to draw the fowl, not only to the water at large, but to the desired part of it. Having, by these means, allured them to the mouth of the decoy; the difficulties that remain are, those of getting them off the bank into the water, without taking wing, and of leading them up the canal to the sarre which is set for them in the most easy manner.

7509 In order to get them off the bank into the water, a dog is necessary (the more like a fox the better), which should steal from behind the skreen of reds, (2, 2), which is placed by the side of the canal to hide the decoy-man, who was the same and the same which is set for them in the most cases manner.

7509 In order to get them off the bank into the water, and do, the count of the control of t

7511. The goose (Anas Anser L., fig. 941.) is a native of Britain, and most parts of the north of Europe, but less common than the duck.

7512. The flesh of the common and various species of geese is highly stimulant, strong in flavour, viscous, and of a putrescent tendency. The flesh of the tame goose is more tender than that of the wild, which tastes of fish; but either kind is only adapted for good stomachs, and powerful digestion, and should be spar-inch used by the sederacy and wild or covered with the sederacy and the covered with the sederacy and the seder for good stomachs, and powerful digestion, and should be sparingly used by the sedentary and weak, or persons subject to cutaneous diseases. The fat of the goose is reckoned peculiarly
subtle, penetrating, and resolvent, and is generally carefully
preserved for domestic applications. The goose attains to a great
age, well authenticated instances being on record to the extent
of seventy and eighty years. The best geese in England are
probably to be found on the borders of Suffolk and Norfolk, and
in Berkshire; but the greatest numbers are in Lincolnshire,
whence they are sent in droves to London to be fed by the
poulterers, some of whom fatten in the vicinity of the metropolis above five thousand in a season.
7513. Of varieties and species there are several, the former

pollterers, some of whom fatten in the vicinity of the metropolis above five thousand in a season.

7513. Of varieties and species there are several, the former differing in colour, as black, white, and grey, and also in size. There is also the Spanish white goose, and large white Embden goose, the latter in most esteem. When one has seen a wild requently in their general form, they seem the mere creatures of art; and having been so long dependent upon man for support, they seem to assume forms entirely suited to his necessities.

7514. There is a Chinese species (A. eygoddes), and an American goose (A. canadénsis). The Chinese species is a domestic bird, but as yet little known in this country. It is longer and narrower in the body than the common goose, and stands higher on the legs. The Canadian goose is domesticated in several places, and is not considered uncommon in England. It is the most ornamental of the goose kind on water in pleasure-grounds, and is abundant in the Duke of Devonshire's park at Chiswick.

7515. Breeding. One gander is generally put to five geese: the goose lays from eleven to fifteen eggs; and the period of incubation is from twenty-seven to thirty days. A nest should be prepared as soon as the female begins to carry straw in her bill, and by other tokens declares her readiness to lay. This is generally in March, and sometimes two broods are produced within the season; an advantage obtainable by high feeding through the winter with sound corn, and on the commencement of the breeding season allowing them boiled barley, melt, fresh grains, and fine pollard mixed up with ale or other stimulants. A good gander sits near his geese whilst they are sitting, and vigilantly protects them. Feeding upon the nest is seldom required; and it is unnecessary to take any of the goslings from the mother as hatched; but pen the goose and her brood at once upon dry grass well sheltered, putting them out late in the morning, or not at all in severe weather, and ever taking them in early in the evening. Th

their range; and he says he has known them killed by swallowing sprigs of yew. As the young become pretty well feathered, they become also too large to be brooded beneath the mother's wing, and as they will then sleep in groups by her side, they must be well supplied with straw beds, which they will convert into excellent dung. Being able, says Mowbray, to frequent the pond and range the common at large, the young geese will obtain their living, and few people, favourably situated, allow them any thing more, excepting the vegetable produce of the garden. But it has been his constant practice always to dispense a moderate quantity of any solid corn or pulse at hand to the flocks of store geese, both morning and evening, on their going out and their return, together, in the evening more especially, with such greens as chanced to be at command: cabbage, mangel-wurzel leaves, lucerne, tarcs, and occasionally sliced carrots. By such full keeping his geese were ever in a fleshy state, and attained a large size; the young ones were also forward and valuable breeding stock. Geese managed on the above mode will be speedily fattened green, that is, at a month or six weeks old, or after the run of the corn stubbles. Two or three weeks after the latter must be sufficient to make them thoroughly fat. A goose fattened entirely on the stubbles is to be preferred to any other; since an over-fattened goose is too much in the oil-cake and greese-tub style, to admit even the ideas of delicacy, tender firmness, or true flavour; but when needful to fatten them, the feeding-houses already recommended for hens (7474.) are most convenient. With clean and renewed beds of straw, plenty of clean water, oats, crushed or otherwise, pea or bean meal (the latter, however, coarse and ordinary food), or pollard mixed up with skim-milk, geese will fatten pleasantly and speedily.

nowever, coarse and ordinary foods, or polare inter up with estimating, gees speedily.

7517. Feathers. Pennant, in describing the methods used in Lincolnshire in managing geese, says, "They are plucked five times in the year; first at Lady-day for the feathers and quills, and iour times for the feathers only, between that and Michaelmas." He says, he saw the operation performed on goslings of six weeks old, from which the feathers of the tails were plucked, and that numbers die of the operation, if the weather immediately afterwards proves cold. This seems a cruel practice, and surely would be better left off. Lean geese furnish the greatest quantity of down and feathers, and of the best quality.

7518. The mute or tame swan (Cýgnus mansuètus L., fig. 942.) has long been known

in England, but is only found wild in Russia and Siberia. It has been preserved by the severity of the laws, which have long accounted it felony to steal their eggs. Formerly they were fattened at Norwich for the city feast, and commanded a guinea each. The foot of the swan possesses nearly the same property as that of the goose; and the skin was formerly held to contain medical properties. At present swans are chiefly to be considered as ornamental in pleasuregrounds, clearing water from weeds, and

occasionally affording cygnet and some swan down feathers and quills. It is a curious circumstance that the ancients considered the swan as a high delicacy, and abstained from the flesh of the goose as impure and indigestible.

the flesh of the goose as impure and indigestible.

7519. Other species are, first, the swan goose (A. cygnfides L.). This is of an intermediate size between the tame swan and the common goose, with the last of which they will breed; and although they vary considerably in their colours, the species is always known by a knob on the bill. The two others which have been domesticated with us are the Canadian and the Egyptian species. The first is equally valuable with the common goose, and is very ornamental in ponds; the latter is now become very rare. The black swan, once considered a prodigy, is abundant in various parts of New Holland or Australia.

7520. Rearing. The swan feeds like the goose, and has the same familiarity with its keepers, kindly and eagerly receiving bread which is offered, although it is a bird of courage equal to its apparent pride, and both the cook and hen are extremely dangerous to approach during incubation, or whilst their brood is young, as they have sufficient muscular force to break a man's arm with a stroke of their wing. They both labour hard in forming a nest of water plants, long grass, and sticks, generally in some retired part or inlet of the bank of the stream or piece of water on which they are kept. The hen begins to lay in February, producing an egg every other day until she has deposited seven or eight, on which she sits six weeks, although Buffon says it is nearly two months before the young are excluded. Swans' eggs are much larger than those of a goose, white, and with a hard and sometimes tuberous shell. The cygnets are ash-coloured when they first quit the shell, and for some months after; indeed they do not change their colour, nor begin to moult their plumage, until twelve months old, nor assume their perfect glossy whiteness until advanced in their second year.

7521. Feathers and down. Where the living swan is plucked, only the ripe down should be taken from each wing, and four or five feathers. This may be repeated to the extent of three times in the course of a

a summer. 7522. The bustard (O'tis tarda L., fig. 942.) is a native of England, the largest indi-

genous land bird in Europe, the cock generally weighing from twenty-five to twenty-seven pounds. The neck a foot long; the legs a foot and a half. It flies neck a foot long; the legs a foot and a half. with some little difficulty. The head and neck of the cock ash-coloured; the back barred transversely with black and bright rust colour. The greater quill feathers black, the belly white; the tail, consisting of twenty feathers, marked with broad black bars: it has three thick toes before, and none behind.

7523. Three species of bustard are found in England; that called the little bustard (0. tetrax) differs chiefly in size, not being larger than a pheasant. Bustards were known to the ancients in Africa, and in Greece and Syria; are supposed to live about fifteen years; are gregarious, and pair in spring, laying only two eggs, nearly of the size of a goose egg, of a pale olive brown, marked with spots of a darker hue. They sit about five weeks, and the young copes run like partridges as soon as deliweeks, and the young ones run, like partridges, as soon as delivered from the shell. The cocks will fight until one is killed or falls. Their flesh has ever been held most delicious: they are efed upon the same food as the turkey. There were formerly great flocks of bustards in this country upon the wastes and in the wolds, particularly in Norfolk, Cambridgeshire, and Dorset, and in various parts of Scotland, where they were hunted with greyhounds, and were easily taken. Buffon was mistaken in his supposition that these birds are incapable of being propagated in the domestic state, chiefly on account of the difficulty of providing them with proper food, which, in their wild state, he describes to be heath-berries and large earth-worms. Probably the haw or whitethorn berruight succeed equally well. To those who aim at variety and novelty in this line, the bustard appears peculiarly an object for propagation and increase, since the flesh is of unrivalled excellence; and it is probable this fowl will render great weight of flesh for the food consumed.

SECT. IV. Diseases of Poultry.

7524. The diseases of poultry are generally the result of improper nourishment and lodging, and the best mode of cure is by the immediate adoption of such as is proper. When that will not succeed, very little help can be derived from medical assistance; at least as that art stands at present with respect to poultry. In fact, as Mowbray observes, the far greater part of that grave and plausible account of diseases to be found in our common cattle and poultry books is a farrago of absurdity, the chief ground of which is random and ignorant guess-work.

7525. Common fowls are attacked by the pip, roup or catarrh, the flux, constipation, and vermin. The pip is an outside skin or scale, growing on the tip of the tongue, and is cured by tearing off the skin with the nail and rubbing the tongue with salt. Imposthume on the rump is called the roup, which term is also applied to catarrh, to which gallinaceous fowls are very subject. The imposthume is to be opened, the core thrust out, and the part washed with salt and water. Generous food and warmth is the only cure in the catarrh. The flux is to be cured with good solid food; and its opposite, constipation, with scalded bran mixed with skim-milk or pot liquor, adding a small quantity of sulphur. Vermin appear in consequence of low keep and want of cleanliness; the simplest remedy is to allow plenty of sand and ashes for the birds to roll in, and to keep their houses and roosts sweet and clean, white-washing them two or three times a ver

the birds to roll in, and to keep their houses and roosts sweet and clean, white-washing them two or three times a year.

7526. The roup is a very common, and one of the most fatal, complaints to which chickens are subject. Those attacked by the disease are constantly coughing and gasping for breath. Upon dissection the windpipe is found almost closed up by great numbers of small red worms, which, in a certain stage of their growth, congregate into bundles large enough to stop respiration, and which, if the sufferer cannot discharge at the mouth, soon produces suffocation. Decoctions of the common yellow Linària vulgàris (Horz. Brit. 15845.) is given as drink, which, being nauseously bitter, is supposed offensive to the worms; but perhaps some mercurial preparation, taken inwardly or applied outwardly, would answer the purpose, and, if effectual, would save thousands of chickens every year. This suggestion has never been tried.

7527. But the catarrh is the chief disease to which chickens and fowls are liable; and when the malady becomes confirmed with running at the nostrils, swollen eyes, &c. they are termed roupy, and the disease is infectious. They should now be separated, and kept in a warm apartment and well feel. Roupy hens seldom lay, and their eggs are unwholesome. In chickens this disease is called the chip: they are seen shivering, pining, and dying in corners, apparently from cold, though they are in fact in a fever. Abundant warmth and rich food are the only remedies.

7528. Broken legs, wings, or toes may be set and spliced, and will recover: the head being raw and the eyes blinded from fighting, wesh the eyes with milk and water, and the head alternately with brandy in which is a few drops of laudanum, and with fresh butter. A cock's spurs being too long, impeding his walk and wounding his legs, they should be cut carefully with a sharp pen-knife, but not to near the quick, every three months.

7529. Gesse are subject to the gargle, or stoppage in the head, the consequence of cold. House the pati

equally well. 27500. All poultry, when young, are apt to be carried off by rats and other vermin, which must either be vigilantly guarded against or destroyed.

Sect. V. Birds of Luxury which are or may be cultivated by Farmers.

7531. Birds of luxury include the pigeon, pheasant, partridge, quail, grouse, singing birds, and birds kept as curious objects.

7532. Of the pigeon (Columba L.) there are three species and many varieties in culti-The species are the common, ring, and turtle doves, all natives of Britain. vation. The varieties of the common pigeon enumerated by Linnæus amount to twenty-one; but those of the pigeon-fanciers to more than double that number. The ring-dove (C. Palúmbus L.) and the turtle-dove (C. Túrtur), with the greater number of the varieties, are cultivated only by a few persons, known as pigeon-fanciers; but the common pigeon of different colours is cultivated for the table.

7533. The flesh of the young pigeon is very savoury and stimulating, and highly valued for pies; that of the full-aged pigeon is more substantial, harder of digestion, and in a considerable degree heating. Black or dark feathered pigeons are dark fleshed and of high flavour, inclining to the game bitter of the wild pigeon. Light-coloured feathers denote light and delicate fiesh. The dung of pigeons is used for tanning upper leathers for shoes; it is also an excellent manure. Pigeons are now much less cultivated than formerly, being found injurious to corn fields, and especially to fields of peas; they are, however, very ornamental. A few may be kept by most farmers, and fed with the common poultry; and some who breed domestic fowls on a large scale may, perhaps, find it worth while to add the pigeon to their number.

7534. The variety of pigeon most suitable for the common pigeon-house is the grey pigeon (fig. 944.), inclining to ash-colour and black, which generally shows fruitfulness by the redness of the eyes and feet, and by the ring of gold colour which is about the neck.

The varieties of the fancy breeders are numerous, and distopis. The varieties of the tancy breeders are numerous, and distinguished by a variety of different names, as carriers (fig. 945. a), croppers, powters, horsemen, runts, jacobines, turbits, helmets, nuns, tumblers (6), barbs, petits, owls, spots, trumpeters, shakers, turners, finikins, &c. From these, when differently paired, are bred bastard pigeons; thus from the cropper or powter and the carrier is bred the powting horsemen (c); from the tumbler and the horsemen dragoons,

7536. The stocking of pigeon-houses is best performed in May or August, as the birds are then in the best condition. Young birds called squeakers should be chosen, as the old are apt to fly away.

7537. In breeding, the pigeon lays two white eggs, which produce young ones of different sexes. When the eggs are laid, the female sits fifteen days, not including the three days she is employed in laying, and is relieved at intervals by the male. The turns are generally pretty regular. The female usually sits from about five in the evening till nine the next morning; at which time the male supplies her place, while she is seeking refreshment abroad. Thus they sit alternately till the young are hatched. If the female does not return at the expected time, the male seeks her, and drives her to the nest; and should he in his turn be neglectful, she retaliates with equal severity. When the young ones are hatched, they only require warmth for the first three days; a task which the female takes entirely upon herself, and never leaves them except for a few minutes to take a little food. After this they are fed about ten days, with what the old ones have picked up in the fields, and kept treasured in their crops, from whence they satisfy the craving appetite of their young ones, who receive it very greedily. This way of supplying the young with food from the crop, in birds of the pigeon kind, differs from all others. The pigeon has the largest crop of any bird, for its size; which is also quite peculiar to the kind. In two that were dissected by an eminent anatomist, it was found that, upon blowing the air into the windpie; it distended the crop or gullet to an enormous size. Pigeons live entirely upon grain and water; these being mixed together in the crop are digested in proportion as the bird lays in its provision. Young pigeons are very ravenous, which necessitates the old ones to lay in a more plentiful supply than ordinary, and to give it a sort of half maceration in the erop, to make it fit for their tender stomachs. The numerous glands, assisted by air and the heat of the bird's body, are the necessary apparatus for secreting a sort of pap, or milky fluid (commonly called pigeon's milk); but as the food macerat

squeakers; at that age they begin to breed, and then, or earlier, they are in the fittest state for removal to a strange situation.

7559. In respect to food, pigeons are entirely granivorous, and very delicate and cleanly in their diet; they will sometimes eat green aromatic vegetables, but are fondest of seeds; and tares, and the smallest kind of horse-beans, is the most suitable food both in point of economy and fattening qualities. Peas, wheat, buck-wheat, and even barley, oats, &c., are also eaten by pigeons, but old tares may be reckoned their very best food; new tares, peas, or beans, are reckoned scouring. Wherever pigeons are kept, the best way to keep them chiefly at home, and thereby both prevent their being lost, and their doing injury to corn-crops, is to feed them well: this is also the only way in which, in modern times, they will afford abundance of fat and delicate squabs for the table, which, well fed, they will do every month in the open air adjoining their cote or house; but in inclement weather, or to attach new pigeons to their home, both food and water should be given internally. "That this may be done without waste, and without frequently disturbing the birds, two contrivances are in use; the first is the meat-box, or hopper, from whence grain or pulse descends from the hopper as eaten out of a small shallow box; the next is the water-bottle, and ovate, loing, naked bottle, reversed in a small basin to which it serves as a reservoir. Any bottle will do, but the pigeons are agit to alight on and dirty such as when reversed present a flat top.

"T590." Pigeons being fond of said, what is called a pigeon-cad is placed in the midst of the pigeon-house, of in the open air near it." It seems these birds are fond of sait and hot substances, and constantly swallow small stones to promote digestion. "The said-cad is thus composed." Gravel or drift-sand, unctuous loam, the rubbish of an old wall, or lime, a gallon of each (should lime be substituted for rubbish, a less quantity of the former will

Total. Cleanliness is one of the first and most important considerations: the want of it in a dove-cote will soon render the place a nuisance not to be approached; and the birds, both young and old, will be so covered with vermin, and besmeared with their own excrement, that they can enjoy no health or comfort, and mortality is often so induced. Mowbray's were cleaned daily, thoroughly once a week, a tub standing at hand for the reception of the dung, the floor covered with sifted gravel, often renewed.

7542. Pigeon-houses are of three kinds, small boarded cases fixed on posts, trees, or against the ends of houses; lofts fitted up with holes or nests; and detached buildings. The first are generally too small to contain a sufficient broad, and are also too subject to variations of temperature; and the last, on the other hand, are now-a-days too, large, and therefore the most suitable for the farmer is a loft or tower rising from a building in which no noisy operation is carried on. The lofts of any of the farm-buildings at a distance from the threshing machine are suitable, or a loft or tower over any detached buildings will answer well; but the best situation of all is a tower raised from the range of poultry-buildings, where there is such a range, as the pigeons can thus be more conveniently treated, and will feed very readily with domestic poultry. For a tower of this sort, the round form should be preferred to the square; because the rats cannot so easily come at them in the former as in the latter. It is also much more commodious; as, by means of a ladder turning round upon an axis, it is possible to sist all the nests in the house, without the least difficulty; which cannot be so easily done in a house of the square form. And in order to hinder rats from climbing up the outside of it, the wall should be covered with tin-plates to a

certain height, as about a foot and a half; which should project out three or four inches at the top, to prevent their getting up more effectually. A common mode in France is to raise a boarded room on a strong post powerfully braced (fig. 946.), the interior sides of which are lined with boxes for the birds (a), and the exterior east and west sides with balconies, or sills for them to alight on and enter their boxes (b). The north and south sides are lined with boxes inside, but without openings, as being too cold on the one

front, and too warm on the other.

7543. The interior of the pigeon-house must be lined with nests or holes; subdivided either by stone, as in the ancient mural pigeon-houses; by boards; or each nest composed of a vase or vessel of earthenware fixed on its side. Horizontal shelves (fig. 947.), divided

earthenware fixed on its side. Horizontal shelves (yertically at three feet distance, are generally esteemed preferable to every other mode; the width of the shelf may be twenty inches, the height between shelf and shelf eighteen inches; and a slip of board three or four inches high is earried along the front of the partitions to keep in the nests. Sometimes, also, a partition of similar height is fixed in the middle of each three-feet division, which thus divides it into two nests. This Mowney and Gitton concur in recommending as likely bray and Girton concur in recommending, as likely to prevent the young from running to the hen when sitting over fresh eggs, and perhaps occasion-ing her to cool and addle them; for when the young are about a fortnight or three weeks old, a good hen will leave them to the care of the cock, and lay again. Some prefer breeding-holes with no board in front, for the greater convenience of cleaning the nests; but as the squabs are apt to fall out by

this practice, a good way would be to contrive the board in front to this practice, a good way would be to contrive the board in front to slip up and down in a groove, by which each nest might be cleaned at pleasure. As tame pigeons seldom take the trouble of making a nest, it is better to give them one of hay, to prevent the eggs from rolling. There are also straw buckets made in the form of nests, and also nests or pans of earthenware. Where pans are used, it is common to place a brick between them (two being placed in a breed-

common to place a brick between them (two being placed in a breeding hole), for the cock and hen to alight on jour on the whole straw ground level, or to be ascended to by a ladder, as used formerly to be the case; and the other on a rising above the roof, and consisting of small holes three or four by twelve or fourteen inches, for the entrance of the pigeons. A series of ranges of these are generally placed over each other, in a boarded front looking to the south, with a shelf to cach range, and surrounded by a row of iron spikes to protect them from cats. The elevation of pigeon-houses (fig. 948), as already described, are of endless variety.

734. The breeding holes constitute the fixtures of the pigeon-house; its utensils are the hopper and bottle already described (7539), a harrel or box for food, a step ladder to reach the nests, and some other articles not peculiar to this department of rural economy. The pigeon-trap, for enticing and entrapping the pigeons of others, we do not describe.

7345. Pigeons in new todgings are apt sometimes to forsake their habit-

7545. Pigeons in new lodgings are apt sometimes to forsake their habitations. Many nostrums have been recommended to prevent them from doing so; but if squabs be selected, cleanliness and security attended to, and a salt cot placed in or near the house, there will be little danger of this taking place. Fumigation with highly odoriferous drugs, or even assafcatida, is also said to attract pigeons to a neglected dovecote, or attach them to a new

one 7546. Diseases of pigeons. Fancy pigeons, being many of them monstrous productions, are very subject to diseases. Girton enumerates upwards of a dozen, with their cures, including the corruption of the egg in the uterus from over high feeding; a gorged crop from voracious feeding; insects from filthiness in the pigeon-house, and the eanker from cocks fighting with each other. Little can be done in the way of curing any of these diseases otherwise than by recurrence to the proper regimen: if this does not speedily take effect, it is better to put the bird hors de peine, both for humanity's sake and to prevent infection. Fortunately, the common pigeon reared for the table is little liable to diseases. table is little liable to diseases.

punishable by a fine of 20s for every bird killed or taken; and by the 2d of Geo. 111. c. xxix. the same offence may be proved by one witness, and the fine is 20s. to the prosecutor. Any lord of the manor or freeholder may build a pigeon-house upon his own land, but a tenant cannot do it without the lord's licence. Shooting or killing within a certain distance of the pigeon-house, renders the person liable to pay a forfeiture. pay a forfeiture.

7548. The common pheasant (Phasianus cólchicus L.) is a native of the old continent, but not of America, and has long been naturalised in the warmer and most woody counties of England. It is very common in France, and before the Revolution used to be a great nuisance to the farmers, even to the gates of Paris. The pheasant runs fast, but flies low and heavily; it crows not unlike the common cock, being of the same genus, and is supposed to live six or eight years.

7549. Pheasants are both granivorous and carnivorous; they feed upon all sorts of insects and vermin like the peacock, and are said to be greedy of toads, when not too large to swallow; whereas, according to report, they will not touch the frog, of which ducks are so fond. They are prized in park scenery for their beautiful plumage and showy figure, and as game for the delicacy of their flesh, which is of a high flavour and alkalescent quality. It is in season in autumn, and most esteemed when under a year old, and very fat. Every gentleman who has a well wooded, well enclosed park, and in whose woods are abundance of such evergreens as the spruce fir, holly, box, broom, &c., may stock it with pheasants; and he may preserve his stock if he will continue to supply them with abundance of food, and deter thieves, polecats, &c. The more common the pheasant becomes, the less will it be subjected to the attacks of those enemies.

7550. Varieties. Besides that which may be considered common or wild in this country, and which is generally of a brown colour, there is the gold and silver, natives of China, and very hardy in this country, and good breeders. The ring-necks, natives of Tatary, bred in China, very scarce; their plumage very beautiful. The white and pied; both sorts will intermix readily with our common bred, as will the Bohemia, one of the most beautiful of its kind, and equally scarce. The golden variety is generally of the highest price, and the common most hardy, and of the largest size.

7551. Breeding. In a wild state the hen pheasant lays from eighteen to twenty eggs in a season, but seldom more than ten in a state of confinement. As this bird has not hitherto been domesticated, and as the flesh of those brought up in the house is much inferior to that of the wild pheasant, they are chiefly bred for show, for replenishing a park, or for turning out in well enclosed recluse scenes, which they will not readily leave if well fed, and not much disturbed. Hence every propriet on any naturalise them at least on a part of his grounds; say, for example, a wood with glades of pasture enclosed by a close paling or high wall. The natural nest of the pheasant is made on the ground, and composed of dry grass and leaves, which being provided for her in confinement, she will always arrange properly. They will breed freely with the common fowl; but as neither flesh nor form are improved by the cross, this is seldom resorted to.

or high wall. The natural nest of the pheasant is made on the ground, and composed of dry grass and leaves, which being provided for their nonfinement, she will always arrange properly. They will breed freely with the common fowl; but as neither flesh nor form are improved by the cross, this is seldom resorted to.

For the provided put the peneral mode is to procure eggs from some establishment of this sort or otherwise; and the following are the directions of Castang, as given in Mowbray's Treatise on Poultry; — Eggs being provided, put them under a hen that has kept the nest three or four days; and if you set two or three hens on the same day, you will have the advantage of shifting the good eggs. At the end of ten or twelve days, throw away those that are bad, and set the same hen or hens again, setting-hens should not be plenty. The hens having set their full time, such of the young pheasants as are already hatched put into a basket, with a piece of flannel, till the hen has done hatching. The brood now come, put under a frame with a net over it, and a place for the hen, that she cannot get to the young pheasants and the put into a part of the proper of the hen, that she cannot get to the young pheasants and the put into a basket, with a piece of flannel, till the hen has done hatching. The brood now come, put under a frame with a net over it, and of one. After twell egg cut small, boiled milk and bread, alum curd, and the property of the property and the p

in close pens, and with plenty of cover, will sometimes make their nests and hatch their own eggs: but they seldom succeed in rearing their brood, being so naturally shy; whence, should this method be desired, they must be left entirely to themselves, as they feel alarm even in being looked at. Eggs for setting are generally ready in April. Period of incubation, the same in the pheasant as in the common hen. Pheasants, like the pea-fowl, will clear grounds of insects and reptiles, but will spoil all wall-trees within their reach, by picking off every bud and leaf.

7554. Feeding. Strict cleanliness to be observed, the meat not to be tainted with dung, and the water to be pure and often renewed. Ants' eggs being scarce, hog-lice, ear-wigs, or any insect may be given; or artificial ants' eggs substituted, composed of flour beaten up with an egg and shell together, the pellets rubbed between the fingers to the proper size. After the first three weeks, in a scarcity of ants' eggs, Castang gives a few gentles, procured from a good liver tied up, the gentles when ready dropping into a pan or box of bran; to be given sparingly, and not considered as common food. Food for grown pheasants, barley or wheat; generally the same as for other poultry. In a cold spring hempseed, or other warming seeds are comfortable, and will forward the breeding stock.

7555. In keeping fancy pheasants, as the gold, silver, or other breeds, the best mode is to enclose a few poles of ground containing trees and bushes with a well painted copper netting, and in some concealed part to have a house or lodge for supplying water and food. This forms by far the most elegant aviary, and is the only one that at all times appears clean. They will thrive very well, however, in an aviary on the common construction.

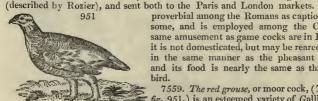

. 7556. The partridge (Tétrao Pérdrix, fig. 949.) is a native of all the temperate regions of Europe, but unable to sustain rigorous cold or intense heat.

7557. Partridges are highly valued as food on most parts of the Continent, and as a table luxury in England. In the Ukraine both partridges and pheasants are more abundant than any where else in Europe: they were formerly so common in France, that Rozier informs us that the cultivators were obliged to sow three or four times the corn that was necessary to raise a crop, and that even this had often to be done three or four times in a season. The bird feeds like the pheasant on insects and seeds, and is particularly fond of those of the wild mustard. It has not been domesticated, but may be hatched and reared in the same manner as the pheasant.

7558. The quail (Tétrao Cotúrnix, fig. 950.) is a native of the East, and abounds in Egypt, as appears from the supplies the Israelites obtained while in the wilderness, and also in the islands of the Archi-They migrate from warmer to colder pelago, and in Italy. regions. They are naturalised and breed in England, changing their residence within it on the approach of winter, from the more exposed to the more temperate districts. They are very abundant in France, and are caught in snares and nets The bird was

proverbial among the Romans as captious and quarrelsome, and is employed among the Chinese for the same amusement as game cocks are in England. Here it is not domesticated, but may be reared and preserved in the same manner as the pheasant and partridge, and its food is nearly the same as that of the latter

952

fig. 951.) is an esteemed variety of Gallinacea, pursued with avidity by sportsmen in the mountainous districts of England, Wales, and Scotland, in which latter it abounds, there feeding in plenty among the heather, its favourite food. Its beautiful plumage, and its exquisite flavour, render it an object of considerable interest.

7559. The red grouse, or moor cock, (Tétrao scóticus,

7560. The black grouse, or black cock (Tétrao Tètrix, fig. 952.), is less common than the red grouse, and is therefore more highly prized. It is also larger, weighing nearly four pounds. Its plumage is a rich mixture of black with blue, relieved by marking of white. legs are also covered with very fine minute feathers; and it draws a peculiar characteristic from the curvilinear form of the tail, which branches out at the end In wet seasons a great mortality is frequently observed

into two crooked expansions.

among the grouse from intestinal worms.

7561. The wood grouse, or cock of the wood (Tètrao Urogállus, fig. 953.), is, after the bustard, the largest bird among those we call game; it being little less than a turkey. It was originally common in the mountainous parts of Britain; but is now nearly if not wholly extinct with us; though still common in the northern parts of Europe, where it lives in pine forests, on the cones of which it is supposed to subsist, and which at some seasons gives its flesh a terebinthinated taste: at other times it is delicious eating, and is often sent to England frozen. Like the other grouse, he has the scarlet patch on his head, his legs are defended in the same manner by a feathered covering, and his whole markings are equally varied and beautiful. From the richness of the plumage in all the varieties of the Tetrao, and from the extreme delicacy of their flesh as

an article of food, it is to be lamented that attempts are not made to domesticate them in addition to our other poultry. It is thought by observant sportsmen and scientific naturalists, that this might be attended with less difficulty than the domesticating the partridge and pheasant; and the attempt is recommended to the patriotic amateur.

7562. The lark (Alaúda arvénsis L.) and other birds were reared and fatted by the Romans for the table. The lark is caught by nets and other means in some of the open districts of England, as about Dunstable, Cambridge, &c., and brought to market for the table, as are various other birds by a particular class of men known as bird-catchers. It is an idle uncertain kind of life not to be recommended.

7563. Of singing birds, a great variety are domesticated; and their breeding and rearing forms a very peculiar and curious branch of rural economy. Not only all the birds which please by the natural song are domesticated and kept in cages, as the canary, nightingale, lark, linnet, finch, thrush, &c.; but even some which do not sing in a wild state, as the sparrow, hammer, &c., are by art taught the notes of other birds.

state, as the sparrow, hammer, &c., are by art taught the notes of other birds.

7564. Wild singing birds are caught by various devices, according to the species of bird and season of the year. The pairing season in spring, generally March and April, is on the whole the best season, and the common means are an eat called a clap-trap; a bird of the species to be caught, called a call-bird, to attract the wild one; and another, a female, called a brace-bird. Bird-line is also very generally used; and for nightingales, a small hole dug in the ground covered with a perforated board, or a small round apring trap, called a nightingale trap, is resorted to. Glasses called larkers are used to call larks, and hawks are used to frighten some species, to render them more readily taken. As it is only the made birds which sing, or at least are of any value for their song, it is a very material part of the bird fancier's art to know the male from the female when they are both young; in general he is larger and longer.

7565. In breeding and reaving tame birds the chief art consists in teaching them to sing. This is frequently done by the human voice alone, but more commonly by the aid of the flagoelet or a small barrel organ. The organ is used in Germany in teaching regular tunes, as marches, waltzes, &c. to the bulfinch, which after being so taught are called piping bulfinches, and cost from 5t. to 7 or 8 guineas each in London. In tally the canary is taught various notes and tunes by the flagoelet. In France, and also in this country, one birds, each bird utters its matural active but the relief of the flagoelet. In France, and also in this country, one birds, each bird utters its matural active but very imperfectly. In general they are more ready to initiate, the note of any bird they hear, even of a hen or duck, than to utter those which are natural to the species. This certainly appears singular, but it is a well known fact.

7565. The aviary, or place for breeding and keeping singing birds, may be a long narrow apartme

7567. Foreign aquatic birds may be kept in the artificial waters of pleasure-grounds by shortening the feathers of one wing, and without

any other care than a duck-house or shelter during night.

7568. The training of hawks and other birds for hunting, of decoy birds of different sorts, as ducks, singing birds, pigeons, &c., belongs more to sportmanship than agriculture, and may be learned in Daniel's Rural Sports, and various old books, such as The Country Gentleman's Recreation, &c.

Fish and Amphibious Animals subjected to Cultivation.

7569. The cultivation of fish is carried on to a very limited extent in Britain, owing to the great superiority of the sorts obtained by fishing in rivers or the sea, and to the decline of the catholic religion, which no longer renders fish an article of importance on certain days and seasons. However, in a few places fish are bred and reared for the market, and in gentlemen's grounds in the interior of the country some attention is generally paid to stocking the ornamental pieces of water with appropriate fish. Bakewell, in his instructive Travels in the Tarantaise, suggests the idea of introducing exotic fish and naturalising them in our lakes and rivers, and he mentions some Swiss species that he thinks would be particularly valuable. In the Edinburgh Review for 1822, is a curious paper on the possibility of rearing sea-fish in our fresh water lakes. See also Brande's Quarterly Journal, Nos. xxxiii. and xxxiv. It appears that the flounder and the mullet have been naturalised to fresh water; and that it is probable the whole of the fishes of analogous habits, and particularly those of the genus Pleuronéctes, might be habituated to inland lakes.

7570. The mode of constructing ponds for retaining water for general purposes has been already described. (4467.) Ponds, expressly for the purpose of breeding and rearing fish, are formed at least expense in deep valleys, and slight depressions between hills, where there are rivers or waters; and

different ones may often be made on the same line, the head of one constituting the bottom of that above it. The extent of them must be regulated by the nature of the situation, and the supplies of water that can be procured. In situations of this nature, the principal expense consists in constructing the banks or heads across the valleys, for keeping up the waters, and providing them with suitable sluices, which, where the land is of the loamy or clay kind, may be cheaply effected in the manner that earth works are usually performed. The foundations being laid sufficiently deep, and the earthy materials well applied by proper puddling and ramming, in the way of making embankments. The heights and strength of the dams or heads being regulated by the nature of the situations, and the quantity of water that is to be idammed up. The slopes should be the greatest which are next the waters. There must also be diverting channels for taking off the superabundant waters in the time of floods, which may be formed along the sides; the sluices being placed in the lowest parts, and being well made of seasoned oak, and tightly rammed in with the earthy materials. Detailed instructions on this subject will be found in the Quarterly Journal of Agriculture, vol. 1, p. 297.

7571. Sea water fish-ponds are unknown on the Continent, and not common in England. In Scotland, however, there are several, which are stocked chiefly with turbot, cod, haddock, whiting, thornback, coal-fish, and salmon. One of the largest and best of these fish ponds is that of Macdonnel of Laggan, in Wigtonshire, which has been in existence for upwards of thirty years. (Macdiarmid's Sketches from Nature, and Highland Soc. Trans. vol. vii. p. 297.)

7572. The kinds of fish adapted for ponds are chiefly the carp, tench, perch, gudgeon, eel, and pike.

grows fast and is very long-lived; feeds on herbs, fat earth worms, and aquatic insects, and any soft substance; is extremely fertile, and the prey of larger fish, aquatic birds, and frogs; body above blue-green, the upper part of the sides greenish-yellow and blackish, beneath whitish; tail yellow; scales large, longitudinally striate; of the gall is made a green paint, and of the sounds or airbladder a fish-glue.

green paint, and of the sounds or air 1574. In raising carp, it is often the practice to have three ponds: — One for the purpose of spawning the fish in, and in which they should be left during the rest of the summer and the following winter, as they mostly spawn from the beginning of May to the latter end of July; another for the convenience of nursing up the young fry, into which they should be put about the latter end of March or the beginning of April, choosing a calm but not sunny day for the business; after which they should be carefully prevented from coming to the sides and being destroyed: in this pond they may remain two years, and become four, five, or six inches in length, and good for use. The third or main pond is destined for the reception of the grown fish, as those that measure a foot or more, including the heads and tails. The proportions in which these different ponds are advised to be stocked are these: — For each acre of the first sort, "three or four male carps, and six or eight female ones;" the most suitable sort for this use being "those of five, six, or seven years old, in good health, with full scale, fine full yes, and a long body, without any blemish or wound." The ponds should be previously cleared of all sorts of voracious fishes and other animals, as "perch, pike, eel, and trout; the water-beetle, and also the newts or lizards," Such ponds as are warm and have an open exposure, with soft water, are the most proper for this use; all kinds of water fowl being kept from them. For the nursing ponds, a thousand or twelve hundred may not be more than sufficient for an acre; and for the main ponds, one to every square of filteen feet is the proportion advised, as their growth depends greatly on the room, and quantity of food that is allowed. The best seasons for performing the business in this case are those of the spring and autumn. Some advise, in these cases, the stocking with carp or tench in the proportion of three to a square perch. In first stocking large ponds or waters, as wher

habits; flesh white, soft, and well tasted.

7376. In stocking with tench the number per acre may be more than of carp. In Berkshire, where there are many ponds for the preserving of fish, they usually stock with tench or carp in the proportion of one hundred to the acre, the fish remaining four years in them: but in the management of Sir Harry Featherstone, in Sussex, in a pond of twenty acres reduced to sixteen by the deposition of mud, the stock is generally in the proportion of twelve hundred carp and an equal number of tench; or at the rate of seventy-five brace to the acre. And in this proportion they are said to succeed well.

7577. The gudgeon (Cyprinus Gibio L., c) is a very inferior fish to the carp or tench; but being of easy culture and rapid increase, is kept in many places as food for pike and perch. It inhabits gentle streams and lakes of Northern Europe; is tenacious of life, and very fertile; about eight inches long; feeds on herbs, worms, insects, the fry of other fish, and parts of carcasses: body narrow, spotted, above livid, the sides above the line blue, beneath whitish yellow, but it varies its colours by age, the different waters it inhabits, and its food; flesh white, and very grateful.

7578. The perch (Pérca fluvitatilis L., d) is an excellent fish, and though naturally found in streams in Europe and Siberia, yet will live in large ponds or lakes, provided the water be clear. It grows to two feet long; back and part of the sides deep green, with five broad black bars, which are sometimes dark green or blue, and very rarely wanting; belly white, tinged with red; swims with great switness and amaller fish; spawns in May and June, and is very prollic; it has no real air bladder; and from its integuments may be obtained a kind of glue; fiesh very delicate.

7579. In stocking with perch, as they are great breeders, six hundred to the acre may be sufficient, 7580. The pike [Esox Lheius L., e) inhabits most lakes of Europe, Lapland, Northern Persia, and North America, and is found even in th

for its food. It will thrive in waters partaking of the chalybeate quality, in which few other fish would live,

7581. The gold fish (Cyprinus auratus L.) is an inhabitant of the rivers of China and Japan, and is naturalised almost every where on account of its elegance and vivacity; the colours vary greatly, but are naturally and mostly of a most splendid golden hue; scales large. It is bred in small ponds in gardens near London and Paris for sale, as an ornamental inhabitant of crystal vases, or garden basins

7682. The minnow (Opprinus Phóxinus L., f), the dace (C lentíscus L.), and the roach (C rùtilus L.), are very small fish, which abound, the first in gravelly streams, and the others in still waters; both are useful as affording food to other fish, and may therefore be put into fish ponds. They are also very

good to eat.

7.833. Of the trout and salmon family there are several species, as the lake trout, gilt and red charr, which inhabit Alpine lakes in northern countries, and might probably be introduced with advantage into the lakes of Cumberland, Westmoreland, and the Highlands of Scotland. The red charr is caught in Keswick lake. The salmon and salmon-trout (Sálmo Sálar, and S. Trútta,) requires alt water and a river; and the fresh water trout (S. Fario) requires too rapid a stream for art to imitate; they succeed, how-

which inhabit Alpine lakes in northern countries, and might probably be introduced with advantage into the which alpine lakes in northern countries, and might probably be introduced with advantage into Keswick lake. The salmon and salmon-trout (Silmo Silhar, and S. Trotta,) require salt water and a river; and the fresh water trout (S. Fario) requires too rapid a stream for art to imitate; they succeed, however, to a certain extent, in very slow-running waters which are clear.

7584. The salmon is a very prolific fish; both male and female are frequently fit for propagation during the first year of their age. The roe of the female is found, on an average, to contain from 17,000 to both of the male and female ealmon, have more or less completely reached maturity, at which period to both of the male and female ealmon, have more or less completely reached maturity, at which period to find a place suitable for the deposition of their spawn. They no longer, as in the winter and pring months, roam over the coast and shores, and return backwards and forwards with the flowing and ebbing of the thiely but pursue the most direct route by the mid-channel up the rivers, and make the greatest of the salmon shores and remarks of the salmon shores and remarks and forwards with the flowing and ebbing of the thiely but pursue the most direct route by the mid-channel up the rivers, and make the greatest shave reached the spawning is accomplished in the months of November, December, and January. When the parent fishes have reached the spawning ground, they play round the ground two of them together. After a turn, they begin to make a furrow, by working up the gravel with their moses rather against the stream; as the way, drowns him. When the firrow is made, the male and female return go again the stream, as the way, drowns him. When the firrow is made, the male and female return go again come together, and rubbing against each other, both shed their spawn into the furrow at the same time. This process is not completed with the sol

7556. On the subject of cultivating fishes it may be observed, that the waters of some ponds are better adapted for raising some sorts of fish than others. Thus, those where the water is rich and white are adapted for raising some sorts of fish than others. Thus, those where the water is rich and white are more adapted for carp; while such as have a thicker appearance, and where there is a greater deposition of muddy matter, are better suited to tench. Perch are capable of being raised in almost any sort of ponds. Eels succeed best where the ponds are not very large; but where fed by a spring, and there is a large portion of rich sediment. Pike should never be kept in ponds with carp or tench; but in separate, breeding-ponds, where the supplies of small fry are considerable and not wanted for stores. Carp, tench, and perch are the sorts principally cultivated with a view to profit, with a few eels occasionally. But perch and eels should not be admitted where the ponds are but thinly stocked, as they are great devourers of the young fish. Carp and tench answer best together where the extent of the ponds are pretty large; as, in other cases, the former, from being a much more powerful fish, beats and deprives the latter of his food. Carp seldom afford much profit in ponds of less extent than half an acre; but tench thrive well in those of almost every size, being often found good in ponds of only a few perches square. Carp, perch, and eels succeed well together; and also tench and eels. Carp more frequently injure themselves by breeding than tench, though it sometimes happens with the latter. It is not improbable, but that in small ponds it may be the best practice to keep the carp and tench separate. The produce or profit afforded by fish-ponds has not yet, perhaps, been sufficiently attended to in different situations to afford correct conclusions; nor is it well ascertained what is the annual increase in weight in fish of different kinds, in different periods of their growth, and under different circumstances of soil and water. Loveden (Annals of Agriculture) states, that in Berkshire a pond of three acres and a half, drawn after being stocked three years with stores of one year old, produced of carp 1951b, weight, of tench 230 ditto; together 425 lb., which sold for 201. 10s. or nearly 21. 6s. per acre per annum.

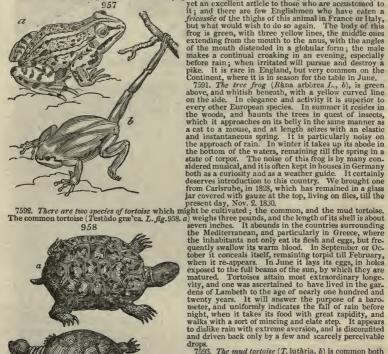

7587. The taking of cultivated fish is generally done with nets, and sometimes by emptying the pond of water. Whatever way is adopted, only those fit to be used are taken, and the rest returned to grow larger. No fish is taken, or fit to be used, for a month before and after the spaning season, which with most fresh water fish is in April, May, or June. The Marquis de Chabanes proposes to catch fish, both in fresh and salt water, by immersing a burning lamp in an air box with rairrors, and round which he has traps into which the animals are to be entangled, while approaching the light and the multiplied images of their own species. For this contrivance he has taken out a patent. Salmon are sometimes caught by torchight.

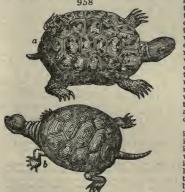

torch-light.

7588. The castration of fish has been successfully practised both in this and other countries, and both with the male and female. Castrated fish attain to a larger size, and are in season at any period of the year. The mode of performing the operation is described in Rees's Cyclopædia, art. Fish, Castration of; and in the Philosophical Transactions, vol. 48. part ii. p. 106.

7589. Of the amphibia which are or may be cultivated for food or ornament, the principal are the frog and tortoise.

7590. The esculent frog (Rana esculenta L., fig. 957. a), though generally despised in this country, is yet an excellent article to those who are accustomed to it; and there are few Englishmen who have eaten a

fricassee of the thighs of this animal in France or Italy, but what would wish to do so again. The body of this

and driven back only by a few and scarcely perceivable

and driven back only by a few and scarcely perceivable drops.

7593. The mud tortoise (T. lutària, b) is common both in Europe and Asia, and particularly in France, where it is much used for food. It is seven inches long; lays its eggs on the ground, though an aquatic animal; walks quicker than the land tortoise; and is often kept in gardens, to clear them from snails and various wingless insect. In fish ponds it evry destructive, biting the fishes, and, when they are exhausted by the loss of blood, dragging them to the bottom and devouring them. The tortoise may be fed on any vegetable refuse, milk, worms, offal, or almost any thing. Linneus says they are in all things extremely slow, and in copulation frequently adhere together a month, and live several days after the head is cut off. (Shaw's Zoology.)

CHAP. XI.

Insects and Worms which are or may be subjected to Culture.

7594. The silkworm and the honey-bee are the two most valuable insects in Europe. The first, from its great importance, has recently engaged the attention of the legislature, no less than of private individuals, who have embarked large sums in the attempts now making to introduce its culture in this country on a large scale.

7595. The silkworm is the larva or caterpillar of a moth (Bómbyx mòri F., fig. 959.):

it is a native of China, and was introduced into Europe A.D. 160. When full grown the worm is nearly three inches long, of a yellowish grey colour, with a horn-like process on the last joint of the body.

Togo. In Italy and other silk countries the eggs are carefully preserved in some place of cool and even temperature, where they remain until the new leaves of the white mulberry, which is its natural food, are produced. The object is to hatch the eggs precisely at this time, that the new-born worm may be fed on food suitable to its infant state. A grower of silk never hatches his whole stock of eggs at once, as a night's frost will frequently destroy the leaves. Lettuce answers well in this stage of the worm's existence; but if it is fed entirely upon this plant the silk is of a very inferior description, and is, indeed, perfectly useless. The pabulum of the white mulberry, in fact, is superior in nutritious matter to that of all others. The leaves in the autumn succeeding to those stripped in the spring, are commonly given to cattle and pigs, who fatten upon them exceedingly. There is an unfounded rejudice in many silk countries that the silk produced from the second leaf is inferior to the spring crop, and in France and Italy the vernal leaf only is used. In India the mulberry tree is grown in moist places, like the osier in England, and produces from three to six crops annually: the prejudice therefore of the Italian and French growers against the second erop is unfounded. The real fact seems to be, that the worms are more difficult to breed in autumn than in spring, from the great change of temperature, against which the growers in general make no artificial provision. Another reason may probably be, that the silk is reled with greater economy and advantage in the height of summer, when the length of the days, and the heat of the weather, is then sufficient to dry the thead in this operation. The native receives of these countries are entirely unaccustomed to use artificial methods for creating a regulated temperature, and the preservation of a

accustomed to use artificial methods for creating a regulated temperature in houses or manufactories, 7557. The ventilation and cleanliness of the nursery or feeding apartments, and the preservation of a regular heat within them, are highly important to the health of the worm. These points are much neglected on the Continent, where the nurseries are usually situated in the midst of the mulberry plantations, exposed to the external air, and seldom cleaned. It was eatisfactorily ascertained by M. Guyton de Morveau a few years ago, that a ruinous and unexpected mortality, which then raged among the worms, arose chiefly from want of ventilation and cleanliness. It has likewise been proved, by experiments lately made on a sufficiently large scale in Devonshire, that less mortality prevails among the worms in England than either in France or Italy.

on a sufficiently large scale in Devonshire, that less mortality prevails among the worms in England than either in France or Italy.

7598. In about six weeks the worm reaches its full size, previously casting its skin four times, and abstaining from food for some time before each change; at these periods the worms are very sickly, and a great mortality generally takes place. When full grown and about to spin, they exhibit symptoms of restlessness and uneasiness; small twigs of birch, or of other slender trees, are set up in the boxes or shelves; upon these the worms climb, each fixing upon its own berth. As it sometimes appens that two worms spin together, forming what is called a double cocoon, this must be carefully prevented by separating them; such a cocoon not only being difficult to run off when recled, but two fibres are produced injurious to the size of the thread: the double cocoons are therefore always wound off by themselves. In preparing its case or cocoon, the worm first forms a loose envelopement of silken fibres, and then proceeds to enwrap itself in a ball or case of an oval form, and finally changes into the pupa or chrysalis; and after being thus enclosed for about fifteen days, becomes a moth. This, however, is always prevented when the animal is not kept for breeding, otherwise the hole formed by the moth in effecting its escape would destroy the continuity of the silk, and prevent its recling. The chrysalides are killed by two processes, by baking in an oven, or by letting steam into a tight chest enclosing the cocoons. The latter method is preferable, as the heat can be better regulated.

7599. The cocoon, after the chrysalis is killed, is either reeled off at once, or sold to others who make

the heat can be better regulated.

7599. The cocoon, after the chrysalis is killed, is either reeled off at once, or sold to others who make this a distinct trade. The silk, as formed by the animal, is so very fine, that if each cocoon was reeled separately it would be totally unfit for use; the ends of four are therefore joined and recled together out of warm water, which softening their natural gum, makes them stick together so as to form one strong smooth thread. When the filament of any single cocoon breaks, or is exhausted, its place is supplied by a new one, so that the united thread may be wound to any length; the single filaments of the newly added cocoons are simply joined by being laid on the thread, to which they adhere by their gum. The old apparatus for recling merely consists of a large metal basin of water, under which is a fire to keep it hot, and a reel of a poor and even rude construction: some important improvements, however, have been recently made in this machine. In recling it is desirable that a round thread of equal thickness and smoothness should be produced, having the filaments of which it is composed as equal and as firmly united as possible. When the skeln is quite dry, it is taken off the reel, and a tie is made with refuse silk at its two ends; it is then doubled into a hank, and is ready for sale. In this state it arrives in England, and is called raw

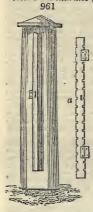

silk: the principal part is afterwards sent to a mill to be thrown, that is, to be twisted singly, or to have two or more ends of it doubled and twisted together to form singles, tram, or organzine, in order to fit it for the loom. There are, however, purposes for which a single untwisted thread is applied. We have before stated that a single thread is generally composed of the filaments from four occoons, and four of these threads compose the organzine, or that used as the warp of fabrics; each thread is first spun or twisted, and then the four are thrown together into one. The west or tram generally consists of four raw threads simply twisted together. The reason of drawing so fine a silk on the reel as that composed of four cocoons, is, that the fileuse, or attendant at the basin, cannot perfectly see more occoons in one set, so as to replace the ends when the occoons are exhausted. If a thread of sixteen occoons were to be reeled, the fileuse could not ensure regularity. Sometimes she would have only eight or ten running, and at the next moment possibly twenty; consequently a most uneven silk would thus he produced; to prevent this evil, four cocoons are only run at once, and combined as before described. The important invention of Mr. Heathcoat, which we shall hereafter notice, applies to the object of drawing off sixteen or more cocoons at once on the reel, so as to form a thread as even as that produced by four cocoons, and thus abridge the expense of the subsequent processes of throwing. We understand this invention is fully appreciated by the reclers abroad, and by the manufacturers at home, and that it produces an astonishing improvement in the quality of the silk, and a great reduction in its price. Mr. H. has obtained patents in the silk countries no less than in England for this invention, which there is every reason to think will be generally adopted.

abridge the expense of the subsequent processes of throwing. We understand this inventuous is runy appreciated by the recleive abroad, and by the manufacturers at home, and that it produces an astonishing improvement in the quality of the silk, and a great reduction in its price. Mr. H. has obtained patents in the silk countries no less than in England for this invention, which here is every reason to think will be generally adopted. He silknown in England for this invention, which here is every reason to think will be generally adopted. He silknown will breed and thrive very well in fingland, where the range and extremes of the subject, that the different method is the silknown will breed and thrive very well in fingland, where the range and extremes of the silknown will be subject. It remains, however, to be proved whether the weight of leaves produced on a given space of ground is equal to the average crop in warmer climates. This is evidently an important to as in the question, of whether England can complete with foreign-countries in the production of raw silk. The high value of land in a country so densely peopled as England, and the fact that the mulberry tree not only requires great space for its perfect expensive plantation of the silk of the provided of the provided provided in the silk of
7602. This common honey bee (Apis mellifica I..) inhabits Europe in hollow trees, but is chiefly kept in hives, being domesticated every where. Perhaps more has been written on the economy of this insect than on any other animal employed in agriculture, and certainly to very little purpose. After all that has been done in England, France, and Italy, the bee is still more successfully cultivated, and finer honey produced, in Poland, by persons who never saw a book on the subject, or heard of the mode of depriving bees of their honey without taking their lives. Much as has been written in France and England on this last part of the subject, it is still found the best mode to destroy the hive in taking the honey. Unanswerable reasons for this practice are given by La Grenée, a French apiarian, which are elsewhere quoted by us at length (Encyc. of Gard. art. Bees), and 4 B allowed to be conclusive as to profit even by Huish. The honey produced by any hive or apiary depends much more on the season, and the quantity and kind of flowers with which the neighbourhood abounds, than on the form of the hive or artificial management. Viewing the subject in this light, we shall avoid noticing the mode of operating with glass, storying, cellular, or other curious hives of recent invention, and treat only of the simplest methods. The author we shall follow is Howison.

7603. The apiary, or place where the bec-hives are placed, should in very warm situations be made to face the east, and in colder districts the south-east. It should be well protected from high winds, which not only prevent the bees from leaving the hive in quest of honey, but they also surprise them in the fields, and often kill them by dashing them against the trees and rocks or into rivers. The hives in an apiary should always be placed in a right line; but should the number of the hives be great, and the situation not capacious enough to admit of their being placed longitudinally, it is more advisable to place them over one another on shelves (fig. 417) than in double rows on the ground. A bee, on leaving the hive, generally forms an angle of about forty-five with the horizon; the elevation of the hive should therefore be about two feet from the ground, in order to protect it from hundity. The greater the elevation of the hive, the longer is the flight of the swarm; and when they are at a certain point of elevation, the swarms are lost for ever to the proprietor. It the hives are to be placed in a double row, the hinder ones should alternate with, and be placed at such a distance from, the front ones, that when the bees take their flight no obstruction is offered to their ascent. Huish recommends placing every hive upon a single pedestal, and at two or three feet distance from each other. By this means, when any thing happens to one hive, the others are less likely to be disturbed than when placed on a shelf in a bee-house; and the hive may be chained down and locked. (fig. 960.) It is usual to have three or four legs or chained down and locked. (fig. 960.) It is usual to have three or four legs or sone is a much better protection from vermin alnescts. The space in front of the apiary should be kept clear of high plants for two or three yards.

supports to the bee-boards; but those who have tried one will never resort to more, as one is a much better protection from vermin and insects. The space in front of the apiary should be kept clear of high plants for two or three yards. 7604. The variety of bees employed is a matter of some consequence. To the common observer all working bees, as to external appearance, are nearly the same; but to those who examine them with attention, the difference in size is very distinguishable; and they are, in their vicious and gentle, indolent and active natures, essentially different. Of the stock which Howison had in 1810, it requires 250, on an average, to weigh an ounce. Whether size and disposition are invariably connected, he has not yet had sufficient experience to determine.

Whether size and disposition are invariably connected, he has not yet had sufficient experience to determine.

7605. The best material and form for hives is a straw thimble or flower-pot placed in an inverted position. Hives made of straw, as now in use, have a great advantage over those made of wood and other materials, from the effectual defence they afford against the extremes of heat in summer and cold in winter.

7606. The size of hives should correspond as nearly as possible with that of the swarms. This has not had that attention paid to it which the subject demands, as much of the success in the management of the bees depends on that circumstance. From blind instinct bees endeavour to fill with combs whatever hive they are put into, before they begin to gather honey. Owing to this, when the hive is too large for its inhabitants, the time for collecting their winter store is spent in unprofitable labour; and starvation is the consequence. This evil also extends to occasioning late swarning the next summer; it being long before the hive becomes so filled with young bees as to produce a necessity for emigration, from which cause the season is too far advanced for the young colonies to procure a winter stock. A full-sized straw hive will hold three pecks; a small-sized from one and a half to two pecks.

7607. The Polish hive (Pasicka Pol., fig. 961) appears to us to be the second in merits to that described, and perhaps it may deserve the preference, if the mode of using it were generally known. It is simply the trunk of a tree, of a foot or fourteen inches in diameter, and about nine feet long. It is scoped out (boring in this country would be better) for about six feet from one end, so as to form a hollow cylinder of this length, and of six or eight inches diameter within. Part of the circumstrally known. It is simply the trunk of a tree, of a foot or fourteen inches in diameter, and about nine feet long. It is scoped out (boring in this country would be better) for about six feet from one end, so as to f All that is wanting to conclete the hive is a cover at top to throw off the rain; and then it requires only to be placed upright like a strong post in the garden, so as the bottom of the inbllow cylinder may be not nearer the ground than two feet, and the opening slip look to the south. When a swarm is to be put in, the tree, with the door or slip opened, is placed obliquely over it; when the bees enter the door is closed, and the holes stopped with clay till the hive is planted or placed upright. When honey is wanted, the door is opened during the finest part of a warm day, when most of the bees are out; its entire state is seen from top to bottom, and the operator, with a segar in his mouth, or with a lighted rag, to keep off the bees from his hands, cuts out with a crooked knife as much comb as he thinks fit. In this way fresh honey is obtained during the summer, the bees are never cramped for room, nor does it become necessary to kill them.

The old comb, however, is annually cut out, to prevent or lessen the tendency

the bees are never cramped for room, nor does it become necessary to kill them. The old comb, however, is annually cut out, to prevent or lessen the tendency to swarming, which, notwithstanding this and the size of their dwelling, they generally do once a year; for the laws of nature are not to be changed. Though it be a fact that a small swarm of bees will not do well in a large hive; yet, if the hive extend in length and not in breadth, it is admitted both by Huber and not given to the abode of the bee, it may without danger be increased in the elevation; their success in the hollow trees, their natural domicile, incontestably proves the truth of this assertion. The feeding of bees is generally deferred till winter or spring; but this is a most erroneous practice. Hives should be examined in the course of the month of September, or about the time of killing the drones; and if a large hive does not weigh thirty pounds, it will be necessary to allow it half a pound of for the bees to make the deposit in their empty cells before they are rendered torpid by the cold. Sugar simply dissolved in water (which is a common practice), and sugar boiled with water into a syrup, form compounds very differently suited for the winter store of bees. When the former is wanted for their immediate nourishment, as in spring, it will answer equally as a syrup; but if to be laid up as store, the heat of the hive quickly evaporating the water, leaves the sugar in dry crystals, not to be acted upon by the trunks

of the bees. Hives may be killed with hunger while some pounds' weight of sugar remain in this state in their cells. The boiling of sugar into syrup forms a closer combination with the water, by which it is prevented from flying off, and a consistence resembling that of honey retained. Howison has had frequent experience of hives, not containing a pound of honey, preserved in perfect health through the winter with sugar so prepared, when given in proper time and in sufficient quantity.

7609. To protect hives from the cold, they are covered with straw or rushes, about the end of September, or later, according to the climate and season. This is an essential business, as well covered hives always prosper better the following season than such as have not been covered. In October, the aperture at which the bees enter should generally be narrowed, so as only one bee may pass at a time. Indeed, as a very small portion of air is necessary for bees in their torpid state, it were better, during severe frosts, to be entirely shut up, as numbers of them are often lost from being enticed to quit the hive by the sunshine of a winter day. It will, however, be proper at times to remove, by a crooked wire, or similar instrument, the dead bees and other filth, which the living at this season are unable to perform of themselves. To hives, whose stock of honey was sufficient for their maintenance, or those to which a proper quantity or sugar had been given for that purpose, no further attention will be necessary until the breeding season arrives. This, in warm situations, generally takes place about the beginning of May; and in cold, about a month after. The young bees, for a short time previous to their leaving their cells, and some after, require being fed with the same regularity that young birds are by their parents; and if the store in the hive be exhausted, and the weather such as not to admit of the working bees going abroad to collect food in sufficient quantity for themselves and their brood, the powerful principle of af

swarming, be unhavourable for the bees going out, they must be red with care dufin it clears up, otherwise the young swarm will run a great risk of dying.

7611. The honey may be taken from hives of the common construction by three modes, partial deprivation, and suffectation is performed about the beginning of September. Having ascertained the station at soon as evening sets in, by inverting he full hive, and placing an empty one over it; particular care must be taken that the two hives are of the same diameter, for if they differ in their dimensions it will not be possible to effect the driving of the bees. The hives being placed on each other, a sheet or large table-cloth must be tied round them at their point of junction, in order to prevent the bees from molesting the operator. The hives being thus arranged, beat the sides gently with a stick or the hand, but particular caution must be used to beat it on those parts to which the combs are attached, and which will be found parallel with the entrance of the hive. The ascent of the bees in the upper hive will be known by a loud humming noise, indicative of the pleasure in finding an asylum from their enemy, in a few minutes the whole community will have ascended, and the hive with the sen in it may be placed upon the pedestal from which the full hive was removed. The hive from which the bees have been driven must then be taken into the house, and the operation of cutting out the honeycomb commenced. Having extracted the requisite quantity of comb, this opportunity must be embraced of inspecting the hive, and of cleaning it from any noxious matter. In cutting the combs, however, particular attention should be paid not to cut into two or three combs at once, but having commenced the cutting of one, to pursue it to the top of the hive; and this caution is necessary for two reasons. If you begin the cutting of two or three combs at one time, were you to extract the whole of them, you would perhaps take too much; and secondly, to stop in the indice of the particul

7616. The craw or cray fish (Cancer Astacus L., fig. 962.), called sometimes the fresh 962 water lobster, inhabits still rivers, and forms holes in the banks.

7617. They are said to be nutritious and of an excellent flavour, and are prepared in cooking like lobsters or shrimps. In former times they were celebrated for sundry medicinal virtues, but these seem to be now forgotten. The flavour of these animals, nevertheless, depends entirely on the nature of their food. Like all others of their tribe, they feed principally upon flesh. They might be advantageously cultivated in ponds and marshes, but should not be put into fish ponds, as they are detrimental to the fry. A breeding stock may frequently be purchased in Covent Garden market, or procured from any of the small rivers near London; they are also said to be plentiful near Almwick in Northumberland.

7618. The edible snail (Hèlix pomàtia L., fig. 71. a), although a native of the Continent, has been long naturalised in some parts of England.

7619. It is the largest species found in Europe. The animal being fleshy, and not of an unpleasant flavour, has been used as food from early times. It owes its introduction into England to certain medicinal virtues, no less than to its repute on the Continent as an article of food; but the first of these properties has long since been forgotten, and no progress has yet been made in introducing it on our tables. It is not so abundant in Italy as the common garden snail (H. horténsis L.), which may be seen, exposed in cages, in the markets of Genoa and other cities. We have no certain information which of these species was held in repute among the Romans, who had their cochlearia or stews, where snails were bred, and fattened upon bran and sodden less of wine. The H. pomàtia is preserved near Vienna in large pits, covered with boards, and fed with cabbage leaves and other vegetables.

7620. The medicinal leech (Hirùdo medicinàlis L.) grows to the length of two or three inches. The body is of a blackish-brown colour, marked on the back with six yellow spots, and edged with a yellow line on each side; but both the spots and the lines grow faint, and almost disappear at some seasons. The head is smaller than the tail, which fixes itself very firmly on any thing the creature pleases. It is viviparous, and produces but one young at a time, which is in the month of July. It is an inhabitant of clear running water; but in winter the leech resorts to deep water, and in severe weather retires to a great depth in the ground, leaving a small aperture to its subterranean habit-It begins to make its appearance in March or April. Water alone is not the natural element of leeches, as it is supposed, but conjointly with ground or mud.

natural element of leeches, as it is supposed, but conjointly with ground or mud.

7621. The usual food of the medicinal and trout leech is derived from the suction of the spawn of fish; and leeches will not unfrequently be found adhering to the fish themselves: but frogs form the most considerable portion of their food; hence, the best leeches are found in waters much inhabited by these animals. The medicinal and trout leech do not, like the horse leech, take any sold food; nor have they the like propensity to destroy their own or any other species of the genus; but these the horse-leech will not hesitate to devour. (Newton's Journal, vol iv, p. 313.) If put into shallow clear ponds it will breed freely, and this is practised by some herbalists and apothecaries in the neighbourhood of London.

7622. The use of leeches for the purpose of local bleeding is very considerable. There are four principal importers of leeches in London alone, whose average imports are said to be 150,000 per month each; making a total of 600,000, or seven militions two hundred thousand in one year. On the Continent, where they are obtained at a much cheaper rate, the numbers employed are enormous (Ibid.) The London market is partly supplied from the lakes of Cumberland, where the leeches are caught by women, who go into the water bare-legged, and after a few have fastened, they walk out and pick them off. A good many are also brought from Holland.

CHAP. XII.

Animals noxious to Agriculture.

7623. Almost every animal may be injurious to the agriculturist in some way or other. All the cultivated live stock will, if not excluded by fences, or prevented by herding, eat or tread down corn crops or other plants in culture. Those animals, as the dog and ferret, which assist him in deterring or in catching noxious animals which would prey on others, will themselves become depredators if not attended to; and even man, the only rational, and therefore the most valuable of agricultural servants, will prove, under certain circumstances, the greatest of all enemies to the agriculturist. We shall glance at the different animals more especially noxious in the order of their usual classification.

Sect. I. Noxious Mammàlia.

7624. Of noxious Mammàlia man, in a demoralised state, is the most injurious. The remedy is furnished by the law; - the preventive is good education, and civil and kind treatment by the master.

7625. The fox (Canis Vúlpes) commits great ravages among lambs, poultry, geese, &c. To destroy it, the farmer must take a sheep's paunch and faster it to a long stick; then rub his shoes well upon the paunch, that the fox may not seent his feet. He should then draw his paunch after him as a trail, a mile

or upwards, till he gets near some large tree; then leave the paunch and ascend into the tree with a gun; and as the night comes on, he may see the fox come after the seemt of the trail, when he may shoot him. The trail should be drawn to the windward of the tree, if he can conveniently contrive so to do.—Or, set or upwards, till he gets near some large tree; then leave the paunch and ascend into the tree with a gun; and as the night comes on, he may see the fox come after the scent of the trail, when he may shoot him. The trail should be drawn to the windward of the tree, if he can conveniently contrive so to do.—Or, set a stoel-trap in the plain part of a large field, distant from paths and hedges; then open the trap, place it on the ground, cut out the exact shape thereof in a turf, and take out just so much earth to make room for it to stand, and then cover it again very nearly with the turf you cut out. As the joint of the turf will not close exactly, procure some mould of a mole-hill very thin three different ways, at the distance of ten or twelve yards from the trap; let this mould be thrown on spots fifteen or sixteen inches square; and where the trap is placed, lay three or four small pieces of cheese; and then, with a sheep's paunch, draw a trail a mile or two long to each of these three places, and from thence to the trap, that the fox may approach one of the places first; for then he will advance to the trap more boldly; and thus you will be almost always sure of catching him. You must take eare that your trap be left loose, that he may draw it to some hedge or covert, or he will otherwise bite off his leg, and so make his escape.—Or near the spot where the fox uses much to resort, fix a stick or pole, much in the same manner as for a woodcock. To explain this more exactly: tie a string to some pole set fast in the ground, and to this string fasten a small short stick, made thin on the upper side, with a notch at the lower end of it; then set another stick fast in the ground, with a nick under it; bend down the pole, and let the nicks or notches join in the slightest degree: then open the noose or string, and place it in the path or walk of the fox. By strewing flesh-meat, pieces of cheese, &c., as you pass along, you may entice the fox to take the same road.

7626. To shoot a fox, anoint the soles of the sh

dators; as also will the silent of a built or or of a similar species.

7630. The badger (Ursus Mèles L.) destroys great numbers of young pigs, lambs, and poultry, every year. Some use a steel-trap, or a spring, such as foxes are taken in, to catch them. Others sink a pit-fall, five feet in depth and four in length, forming it narrow at top and bottom, and wider in the middle; they then cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes the cover it will be a supplied to the cover it wil are sometimes taken in this manner. Others, again, pursue a badger to his hole, and dig him out: this is

the cover it with small sticks and leaves, so that the badger may fall in when he comes on it. Foxes are sometimes taken in this manner. Others, again, pursue a badger to his hole, and dig him out: this is done by moonlight.

7631. The mote (Tsipa europæ'a) is injurious by the subterraneous roads and hills of earth which it forms in grass lands. With regard to the removal of mole-hills various practices are in use; but the most effectual is that derived from the experience of a successful mole-catcher, and communicated to the public by Dr. Darwin, in his Phytologia. This man commenced his operations before sun-rising, when he carefully watched their situation; and frequently observing the motion of the earth above their walks, he struck a spade into the ground behind them, cut off their retreat, and then dug them up. As moles usually place their nests at a greater depth in the ground than their common habitation lies, and thus form an elevation or mole-hill, the next step is to destroy these nests by the spade; after which the frequented paths are to be distinguished from the bye-roads, for the purpose of setting subterraneous traps. This object may be effected by marking every new mole-hill with a slight pressure of the foot, and observing the next day whether a mole has passed over it, and destroyed such mark; and this operation should be repeated two or three mornings successively, but without making the pressure of the foot, and observing the next day whether a mole has passed over it, and destroyed such mark; and this operation should be repeated two or three mornings successively, but without making the pressure of the foot, and observing the animal, and occasion another passage to be opened. Now, the traps are to be set in frequented paths, and should be made of a hollow wooden semi-cylinder (fig. 592.), can end of which should be furnished with grooved rings, containing two newsers have a special contained to the mole passes half way through our stream of the product of the contract of the passage of th

through the section of the parchment into the vessel, than it retreats to the brick or stone, and commences its lamentations for relief. Nor are its whining notes uttered in vain; others soon follow, and share the same fate; when a dreadful conflict begins among them, to decide the possession of the dry asylum. Battles follow in rapid succession, attended with such loud and noisy shricks, that all the rats in the neighbourhood hasten to the fatal spot, where they experience similar disasters. Thus hundreds may be caught by a stratagem, which might be greatly facilitated by exposing a living rat taken in a trap, or purchased from a professional rat-catcher.

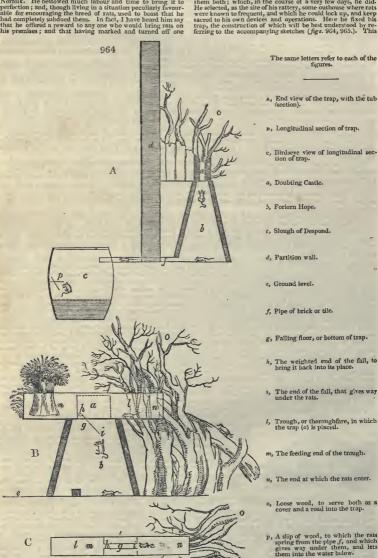

Chased from a processional rate catcher.

7633. A successful mode of enticing rats has been lately practised by Broad, a farmer at Thruxton in Herefordshire. He uses a bore trap, two feet long, eight inches wide, and nine inches deep, and little different in construction from the common one. His secret consists in scenting light-coloured malt, and also some wheat straws, with oil of caraways, and not setting the traps for a day or two till the rats have been accustomed to eat the malt without fear. (F. Mag. xiv. p. 431.)

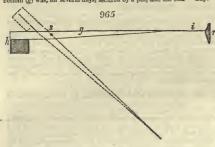

7634. Paul of Starston's rattery is thus described by S. Taylor, Esq. in the Gardener's Magazine:—

7655. This rattery was invented by Mr. R. Paul of Starston, in Norfolk. He bestowed much labour and time to bring it to perfection; and, though living in a situation peculiarry favourable for encouraging the breed of rats, used to boast that he had completely subdued them. In fact, I have heard him say that the offered a reward to any one who would bring rats on his promises; and that having marked and turned off one

Daticular pair, he betted a wager that he should soon catch them both; which, in the course of a very few days, he didthe selected, as the site of his rattery, some outhouse where rats were known to frequent, and which he could lock up, and keep sacred to his own devices and operations. Here he fixed his trap, the construction of which will be best understood by referring to the accompanying sketches (Jfg. 904, 905.). This

spot he endeavoured to make as inviting and comfortable to the animals as possible; for which purpose he placed faggots, loose wood, and even straw, with an occasional wheat sheaf, on and about the trap. His plan was, to render the trough (!) a complete thorongulare; for which purpose the trap or falling bottom (g) was, for several days, secured by a pin, and the end

7656. The beauty of Paul of Starston's trap is, that, when once set, and the catch (r) regulated to its proper pitch, it requires no further trouble. One is sufficient for the whole premises. The great object is, to give them time enough to get acquainted with it; for which purpose every thing chould be done to attract with it; for which purpose every thing chould be done to attract and it is a sufficient of the proper of the control of

(m) used as a feeding place. After the rats had got accustomed to the spot, and passed the bridge with confidence, he took out the pin which secured it, and every rat that attempted to pass thereafter was taken prisoner. I should here observe, that great care is necessary in the construction of this part of the trap. It is not enough that the floor give way under the rat, and be merely brought back into, its place again by the balance weight at the end of the caught, but you would not catch a second, and the passed of the passed of the caught, but you would not catch a second, and suspicious in their dispositions; and are in the habit of trying the bridge with their forefeet, in order to ascertain its soundness, previously to advenuing the weight of their bodies thereon. It is olvious, therefore, that unless the bridge is sufficiently fastered to be bridge is sufficiently fastered to be bridge to sufficiently fastered to be sufficiently fastered to be bridge to sufficiently fastered to be sufficiently fastered to b

the dotted lines n). It is brought back by the weight (h), and moves on pivets at a.

"doubting castle,"—for, you will observe, my friend had the Pitgrint Progress in his eye when he was thus labouring to clearly deep to prevent the rat from making any attempt to reach the bottom of the trap (g); for which purpose it should be of a conical form, and perfectly smooth inside. Once in "the forlorm hope," therefore, he has no means of egress but by the pipe or drain (f), the length of which is immaterial, and which conducts to a tub or cistern of water called, not inaptly, "the slough of despond." Against the sale of this tub is fixed impairs from the mouth of the pipe (f). It gives way under him, as shown by the dotted line, and he soon ends his career in "the slough of despond." It will be observed, that the operation of this trap is so silent, and yet so effectual, that hundreds may be caught in quick succession without any alarmabing given to the remainder; for it appears that they continue but a very short time in "the forlorn hope," leaving it almost which (it being at such a distance from the trap) is unattended with any noise: whereas, had the water been immediately under the fall (g), each rat would have occasioned more or less of disturbunce, and thus have intimidated many. Besides, the mere examination of the cistern, and taking out the captured, would have been a constant source of annoyance; whereas, in its present situation, it may be examined every day without in its present situation, it may be examined every day without in its present situation, it may be examined every day without in the praterials, which answered extremely well. The mice dropped through the trap into a little cistern of water beneath. (Gard. Mag. vol. vi. p. 585.)

7637. The long-tailed field mouse (Mús sylváticus L., fig. 966. a), and the short-tailed field mouse (b), are both rather larger than the common mouse. Of late years they have appeared in vast numbers in some parts of England, and caused incalculable damage to the agriculturist. In 1814, and the following year, the extensive plantations in Dean and New forests were nearly year, the extensive plantations in Dean and New forests were nearly destroyed, over an extent of five hundred acres: the devastation was caused by these vermin attacking the five-year-old oak and chestnut plants, which they barked round at the bottom, and consequently destroyed. Ash, larch, fir, and holly plants were served in the same way; and, in many instances, the roots were gnawed through two or three inches below the surface. Lord Glenbervie observes, that this alarming have first became apparent in 1811, and increased to such a degree in the three following years, that the greatest alarm was felt by government for the safety of the growing timber on these extensive forests. Seven or eight different sorts of traps were set, a great variety of poisons tried, cats were brought in numbers and turned loose in those enclosures most infected, and crows, magpies, and owls were impressed into the service; but the number of these animals was so prodigious that no sensible diminution was perceived. At length a vast number of pits were dug; and as this method produced the most beneficial results, ere made from eighteen to twenty inches deep at the bottom, about two

The pits were made from eighteen to twenty inches deep at the bottom, about two we shall describe it.

pits were dug; and as this method produced the most beneficial results, we shall describe it. The pits were made from eighteen to twenty inches deep at the bottom, about two feet in length, and one foot and a half in width, and, at the top, only eighteen inches long and nine wide, or, indeed, as small as the earth could be got out of a hole of that depth; for the wider they are below, and the narrower above, the better they answer their purpose. They were made twenty yards as under, or about twelve on an acre; or, where the mice were less numerous, thirty yards apart. By this method thirty thousand mice were caught in a short time, but a far greater number had been taken out of the holes, either alive or dead, by stoats, weasels, crows, and especially hawks. It was for a long time supposed that this damage had been caused by rabbits; and it is very probable that similar injuries are frequently attributed erroneously to these animals. Some years ago an extraordinary quantity of mice created similar devastation in Lord Bagot's extensive woods in Stafforshire, and in those of Lord Downes in Yorkshire (Zool. Journal, No. 4. p. 433).

7638. The field mouse, in the forest of Dean, had become so destructive in 1813, that after trying traps, baits with poison, dogs, cats, &c. with little success, at last the plan of catching them by holes was hit upon. These holes were made from eighteen inches to two feet long, sixteen or eighteen inches deep, about the width of a spade at the top, fourteen or fifteen inches wide at the bottom, and three or four inches longer at the bottom than at the top. The object was to get the bottom of the hole three or four inches longer at the bottom than at the top. The object was to get the bottom of the hole three or four inches longer at the bottom than at the top. The object was to get the bottom of the hole three or four inches longer at the bottom than at the top. The object was to get the bottom of the hole three or four inches longer at the bottom than at the top. The object was to ge

SECT. II. Birds injurious to Agriculture.

7639. Of birds, the most decidedly injurious to man are the different hawks and kites, as most of the species attack and devour young poultry.

7640. Farious methods have been proposed for remedying this evil, but they evince little acquaintance with the habits of these birds. Mr. Swainson recommends that the prevalent custom, of nailing such as have been killed against barn-doors or outhouses, be exchanged for the following:—In such parts of the country as are frequented by these birds, let two or three poles, ten or twelve feet high, be placed in the farmer's poultry yard, each pole being furnished with an iron spike six or eight inches long; pass this spike through the body of a dead hawk in the direction of the back-bone: it will hus be firmly secured, and give the bird an erect position; the wings being free will be moved by every breeze, and their unnatural motion will prove the best scarecrow either for ravenous or granivorous birds, more particularly the latter. Destruction by the gun is of course the most effectual.

7641. Whether granivorous birds are more injurious than beneficial to the farmer, is very questionable.

7642. The crow, rook, raven, sparrow, magpie, and starling are commonly called granivorous; yet this is an error, for they are all omnivorous, that is, feeding both upon animal and vegetable substances, and more particularly upon insects. We are annually told of large crops being either wholly or partially destroyed by insects of some sort or other; but we never hear that these injuries have been occasioned by birds. These complaints have certainly been more numerous of late years than formerly, and this is attributed by Mr. Swainson to the destruction of small birds (as waste lands are brought into cultivation); to the great diminution of rookeries; and to the foolish prejudice which the generality of farmers have taken up against these latter birds, which they destroy without mercy. In this instance we have been less wise than our ancestors, who protected and cultivated them, and by whom they were justly considered of the greatest benefit to mankind. Nature seems, indeed, to have pointed this out to us, for she has distributed the crow in all parts of the habitable world. Yet the farmer will enquire, "What good can these birds do me, when they come on my newly sown land, and root up the seed?" The answer is very short. The crows and rooks do not come for the express purpose of eating or destroying the seed, but for devouring the insects, snails, and grubs turned up by the plough or harrow; these are their favourite food, and while so occupied, the small quantity of seed they may eat or displace returned to the farmer ten-fold by that saved from the insects. Wallis, in speaking of the destruction caused by the hedgechafter or cockchafter, says, that "whole meadows and corn-fields were destroyed by them;" and judiciously concludes by observing, "that the many rookeries with us is the reason why we have so few of these destructive insects." (Hist. of Northumberland.)

SECT. III. Insects injurious to Agriculture.

7643. Insects, above all other animals, are by far the most injurious to the agriculturist; not only from their numbers, but from their attacking the produce of the earth in all its stages of growth and maturity. We have already pointed out the advantage, not to say the necessity, of a certain knowledge being acquired respecting insects, by all persons engaged in agricultural pursuits. We shall now explain, in popular language, the different tribes or orders into which they are divided; the changes they undergo; and the injuries they produce to man, and the animals and vegetables which he cultivates. Numerous insects, much more destructive than those we shall enumerate, are found in other climates, but from which the British agriculturist has, happily, nothing to fear, and therefore need not be acquainted with. The reader will, however, find much valuable information respecting them concentrated in Kirby and Spence's Introduction to Entomology, vol. i.

Subsect. 1. Physiology of Insects.

7644. Insects are distinguished from veorms (Vérmes L.) by always having feet in their perfect state, as the beetle, butterfly, &c. Worms crawl upon their bellies and have no feet, as the earth-worm, slug, small, &c. The generality of insects have only six feet; but some few, generally called by this name, have a great many, as the wood-louse, centipede, &c. 7645. Nearly all insects are oviparous; that is, produced from an egg. These eggs are seldom found singly; they are small in size, and do not grow. The eggs of some species are hatched in a few days, while those of others remain during the winter, and the young do not come forth until the season at which the leaves of the plants upon which they feed begin to expand.

7646. The second state of the insect is called the crica, or larva in systematic language, and is known to the vulgar by various names. Caterpillars are those larva which are exposed, and feed upon leaves and plants, as the eaterpillar of the common cabbage butterfly (fig. 971. a). The larva of beetles usually live in the earth, in the trunks of trees, or in the substance upon which they feed, they are generally of a whitish colour, thick and clumsy in form, and are called grubs. The larva of the common cockchafer (fig. 970. b), and of the nut-beetles (fig. 970. c), are of this description; while the name of maggots is usually given to the larva of flies, bees, ants, &c., all of which live in the same confined state as those of beetles. It is in this stage of existence that insects are most voracious, and consequently most destructive to plants. 7647. When the larva has attained to its full size, it changes into the papa or chrysalis state. This is done in different situations, according to the tribes to which they belong. The chrysalis of butterflies (fig. 970. c) are naked, and are either suspended or attached to trees, branches, walls, &c. Those of moths are either concealed in a case like the cocoon of the silkworm, or the caterpillar undergoes its change in the earth. The period in which i

furnished with hard winged cases) are destitute of real wings.

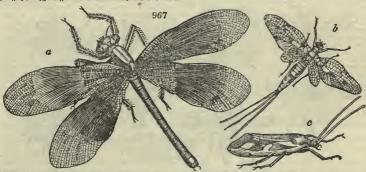

7649. The duration of insects is extremely variable; the greatest proportion appear to be annual emerging from the egg and passing through the three stages of their existence within the space of a year-But there are a great number of species, particularly among the beetles, which pass three, and even four, years in the caterpillar state; and instances are on record of beetles remaining in timber from ten to lifteen years. The greatest proportion of moths are biennial, passing the winter in the chrysalis state and closing their existence in the succeeding summer. The transitory life of the Ephémera is proverbial; the perfect insect indeed exists but for a day, and seems born only to continue its species; yet in the larva state it enjoys a life of one, two, or even three years. state it enjoys a life of one, two, or even three years.

SUBSECT. 2. Arrangement or Classification of Insects.

7650. All insects, as Macleay observes, may be divided into two groups: 1. Apterous insects, having either no metamorphosis, or only that kind of it the tendency of which is confined to the increase of the number of feet: these, as their name implies, are destitute of wings. 2. True insects, or those whose metamorphosis has a tendency to give wings to the perfect or image state, but never more than six feet.
7651. True insects are again divisible into two primary groups; the first of these are organised for mastication in their perfect state, and the second are organised for suction alone. Each of these divisions, according to the system of Macleay, contains five separate orders, the principal characters of which we shall endeavour to make intelligible in common language.
7652. The Mandibulata, or masticating insects, are furnished with jaws of a horny or membranaceous substance, infinitely diversified in their form and structure. They are divided into the following orders:—

Trichoptera. The wings are four, soft, and generally transparent; the upper pair slightly hairy, and the lower folded when at rest. The insects of this order are compar-atively few. The caddy, or cadis worm, is the larva of the spring fly (Phryganea), and lives in the water, concealed within

a tube of its own construction. There are many species in this country, well known, in their perfect state, to all lovers of angling. Phrygànea rhómbica (fig. 967. c) may serve as an example of this order.

2. Hymenoptera. The wings are four, clear and transparent. The tarsus (or outer division of the foot) is composed of five joints, and the body is armed with a sting. The bee, the ant, and the wasp, are familiar examples. The properties of the wasp, are familiar examples. The properties of the properties. They have two wings, concealed beneath a pair of hard wing-cases, which meet close together in a straight line down the back. There are many tribes of these insects, which, both in their larva and perfect state, are extensively injurious to man. 4. Orthoptera. The true wings are but two, very large when expanded, and folded lengthways when at rest. They are covered, either partially or wholly, by two wing-cases of a thin, tough, and rather opaque substance, somewhat resembling parchment, and reticulated with small newses. The leading characters of this order are exemplified in the Bista, or cock-

reach; the pest of tropical countries, and frequently troublesome in our kitchens and larders.

5. Neurophera. The wings, with very few exceptions, are four in number, clear, transparent, and reticulated with numerous arcolets, or irregularly squared trisons; the tail of the fernate considered as in fuirous: some are, indeed, beneficial; as, from their predatory habits, they attack and devour a vast number of smaller insects. This is more particularly the habit of the green dragon-fly (Agrion virgo, fig. 967. a), which every one may see, during summer, hovering over pronds, and flying about like a hawk in search of its prey. The Ephémera, or day-fly (E. vulgata, fig. 967.b), likewise belongs to this order; and, although not very numerous in this country, is so abundant on the Continent, that they are collected annually in harrows, and afford to the agriculturist a rich and valuable manure.

7653. The Haustellâta, or suctorial insects, likewise contain five orders. Although apparently destitute of jaws, there is every reason to believe, from the observations of the celebrated Savigny, that the rudiments of the masticating organs exist in these insects, but that they are so slightly developed as to be totally useless, and only discoverable under a very strong magnifier. The suctorial insects in their larva state are mostly furnished with strong and well defined jaws, and feed voraciously upon animal and vegetable bodies; yet, from the perfect insect being supported by suction alone, it is obvious that in this state they can do no injury to the agriculturist. The orders into which they have been divided are these:

bodies; yet, from the pertect insect being supported can do no injury to the agriculturist. The orders in 1. Lepidiphera. The wings are four, thin, membranaceous, and covered with a fine powdery substance, which, by the magnifying glass, is shown to consist of minute scales, lying one upon another, like those on fishes. The butterfly and moth tribes are familiar to every one, as well known examples of these insects, the larva of which are called caterpillars. The Papilio urtice, or small tortoise-shell butterfly (fig. 968.), will serve as a good example of the egg (a.d.), larva (b), and pups state (c) of most day, flying lepidopherous insects.

Methods of the common house-fly. This order is very numerous, and contains many insects which are injurious to vegatibles as larva, and troublesome to man ln a winged state; as the gnat (Chlex), whane-fly (Tabahaus), crame-fly (Tripula), &c., 5. A/pera. Entomologists of the last century arranged all insects without wings under this order; but it is now restricted, by Latreilla and Macleay, to such only as have a bivalve articuses of the common flea.

4. Hennyletra. Insects of this order are furnished with two folded wings, covered by wing-case; also crossing over each other, of a semi-corneous substance, and which are likewise useful as organs of flight. The tarsi are composed of three, two, or sometimes only of one joint, and the body is much flatemit a strong and dissects commonly called field-bugs, which emit a strong and sinsects commonly called field-bugs, which emit a strong and fissects commonly called field-bugs, which emit a strong and fissects commonly called field-bugs, which emit a strong and fissects commonly called field-bugs, which emit a strong and fissects commonly called field-bugs, which emit a strong and fissects commonly called field-bugs, which emit a strong and fissects commonly called field-bugs, which emit a strong and fissects commonly called field-bugs, which emit a strong and fissects commonly called field-bugs, which emit a strong and fissect

convex and thick; the wings also, instead of being foided over each other, are deflexed, and embrace the sides of the body. There are, comparatively, see homopterous insects in England; but the frog-hopper (Ciedda spumária L.) is a good example when in its perfect or winged state. The larva resides in a

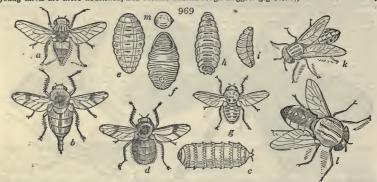

drop of froth of its own making, and is then commonly known as the euckoo-spit insect; by feeding upon the sap it causes the leaves to curl up, and the growth of young plants is thus materially checked.

7654. The different orders of insects we have now enumerated are connected by others of an inferior extent, and which are called osculent orders. But as a description of these is not essential to our present purpose, and as they do not contain any decidedly injurious insects, we shall merely refer the reader to the Horse Entomologics of Macleay, and the Entomology of Messrs. Kirby and Spence.

Insects injurious to live Stock. SUBSECT. 3.

7655. All organised beings, whether animal or vegetable, are subject to be attacked and destroyed by insects. Even man himself is not exempt from the dominion of these small but formidable creatures. For some wise but unknown purpose, there are peculiar species appropriated to receive their nourishment from man alone, and which cannot exist in any other situation. The remedies for these must be prescribed by the physician; but it is the business of the intelligent agriculturist to make himself acquainted with such as are injurious or hurtful to the animals and plants, upon which, the access of his operations mainly depends: for there are as yet no agricultural physicians, to whom the farmer can apply for advice or information when his labours are counteracted by insect devastators. We shall therefore briefly notice the domesticated animals and cultivated plants most subject to these injuries, pointing out the most efficient modes by which they may be checked.

7656. The horse. The principal foes to this noble animal are the horse-bee (Æ'strus equi) and gad-fly (Æ. hæmorrhoidàlis). The first deposits its eggs on such parts of the body as are liable to be licked by the tongue; and the animal, unconscious of what it is doing, thus conveys its enemy into its stomach; the young larvæ are there nourished, and become whitish rough maggots (fig. 969, c), which are known by

the name of bots. They attain their full size about the latter end of May, and are voided by the anus from that time until the end of June. On dropping to the ground, they find out some convenient retreat, where they change into a chrysalis; and in six or seven weeks the fly appears. The female (b) is distinguished from the male (a) by the lengthened shape of her body. The inside of the knee is chiefly selected for depositing her eggs, which will frequently amount to four or five hundred on one horse. The other species (E. hæmorrhoidalis L.) is still more troublesome; it deposits its eggs upon the lips, and causes excessive and distressing uneasiness to the animal. Mr. Bracy Clark, who has investigated the history of these insects with great ability, observes that in ordinary cases it is not improbable that they are beneficial to our cattle, by acting as perpetual stimuli or bilsters; yet, when they exceed certain limits, they produce disease, and sometimes death. (Clark in Linn. Trans. vol. iii.) The prevention of bots belongs to the farmer, the cure to the veterinary surgeon. The first may be effected by watching the animal at the season when the female deposits her eggs (usually in August and September), and should the horse appear much agitated in its pasture, there will be good reason to suspect it has been tacked by the fly; the eggs may then be removed by the brush and currycomb, or by a pair of scissors. When the disease is certain, one of the best methods to destroy the insect is to fasten a bag net on thorse, for the purpose of catching the excrement, as well as the full-fed larvæ. By throwing the dung every morning into a deep pit, any larvæ that may be enclosed in it will thus be prevented from working their way to the surface when their last transformation is about to take place, and their death will cut off a numerous progeny. There are other dipterous insects which feed upon the blood both of horses and cattle; the most formidable of these are the horse-fies (Tabani, k. f.); others, much smaller finger and thumb.

Inger and thumb.

T657. Horned cattle are likewise subject to the attacks of a peculiar species of gad-fly (E. bòvis, d, c, f), which causes them great terror and distress. The larva (e) is smooth and fat: and the chrysalis (f) opens by a lid (m) when the insect (d) emerges from it. The herdsman may know when this insect appears among his flocks, by the agitation they exhibit; the whole herd, with their tails erect, or carried in some grotesque attitude, gallop about and utter loud lowings. When oxen are employed in agriculture, the attack of this fly is often attended with danger, as they become quite unmanageable, and, whether in harness or yoked to the plough, will run directly forward. Their harness at this season should therefore be so constructed as to be easily loosened. The eggs are deposited within the skin of the animal, and in a wound made by a tube resembling an auger, with which the female is provided. These flies only attack young and healthy subjects; but, independently of the terror they create, do not appear to occasion any material injury. The cattle of Hungary and the neighbouring countries, as also those of Abyssinia, are subject to more deadly enemies, which fortunately are unknown in England.

T658. Sheep are also infested by another species of gad-fly (E. bvis L. g, h, h, which deposits its eggs in the inner margin of their nostrils. The moment the fly touches this part of the sheep, they shake their heads, and strike the ground violently with their fore feet; at the same time, holding their noses close to the earth, they run away looking about them on every side, to see if the fly pursues: they will sometimes crowd together in a rut or dusty road with their noses close to the ground. The larvae (f) are white, flat on one side and convex on the other; they inhabit the cavities of the maxillary sinuses, and crawl, when the animal is dead, into those of the herns and frontal sinuses; when full grown, they

fall through the nostrils, and change to the chrysalis (h), which produces the fly (g) in about two months. Swine, pigeons, and all kinds of poultry are subject to fleas, and lice of various kinds, but never to such

a degree as to occasion death.

76:09. Fish, in their young or fry state, are the food of the larvæ of water beetles (Dytisci). These insects are frequently seen in great numbers in ponds: they may be caught by a hand net (made of very small meshes), inserted beneath the insect, as he reposes (with his head downwards) on the surface, and then suddenly drawn upwards.

Subsect. 4. Insects injurious to Vegetables.

Subsect. 4. Insects unjurious to Vegetables.

7660. The ravages of insects upon plants commence from the time that the seed is committed to the ground, and continue until the produce is gathered into the barn. These various injuries, in one shape or other, are annually experienced; and many of them, beyond all doubt, will hereafter increase to an alarming extent, if the great body of agriculturists persevere in their mistaken prejudice against crows, rooks, and other useful birds, which Providence has kindly given us, to keep the insect tribes within dne limits. We have already noticed the destructive insects which are in a great degree peculiar to certain plants, as wheat, barley, &c. in a general way (Part III. Book VI.); we shall now enumerate those that infest the grains, clover, pastures, cabbages, and fruits, plantations, as well as those universal destroyers of all vegetables, the wire-worm, the plant lice, and the different species of crane-fly.

7661. Wheat, in every state, is subject to many insect depredators. Mr. Marsham describes a small grub (by some mistaken for the wire-worm), which eats into the young plant about a inch below its surface, devours the central part, and thus causes its immediate death. Out of fifty acres sown with wheat in 1802, ten had been destroyed in this way so early as October. At a later period this grain is attacked by a fly nearly related (according to Mr. Kirby) to the Mosfillus arculatus of Latreille. It makes a lodgement in the heart of the principal stem just above the root, which stem it invariably destroys, giving the crop at first a most unpromising appearance; but it proved ultimately that the plant, instead of being injured, derived great benefit from this circumstance: for, the main stem perishing, the root (which was not hurt) threw out fresh shoots on every side, so as to yield a more abundant crop than in other fields where the insect had not been. When first observed in England, this insect caused great alarm among agriculturists, who thought it might prove where the insect had not been. When first observed in England, this insect caused great alarm among agriculturists, who thought it might prove the Hessian fly. When the wheat bossons, it becomes exposed to the attack of a small orange-coloured gnat, which deposits its eggs in the centre of the flower; the larva or grub devours the pollen, and thus prevents the impregnation of the grain. The weevil, a small coleopterous insect (Calindra granaria F.), is extremely destructive to wheat when in the granary, where it feeds both in the larva and perfect state: against the first, we are acquainted with no remedy, as it lives in the grain; but as this is larger than the perfect bette, the latter may be in a great measure collected by means of a sieve, large enough for the insect (but not the grain) to pass through: it is often found in such numbers, that they have been collected and destroyed by bushels. The same insect, or one very near it, often infests sea biscuit; and can only be killed by baking or heating the biscuits over again in an over.

7662. Rye is subject to the attacks of a small fly (Músca pumiliònis), which introduces its eggs into the heart of the shoots, and occasions a loss of from eight to fourteen plants in a square of two feet. No remedy has yet been proposed for this pest, which, if not extensive, may be checked by plucking the injured ears, and burning them.

and burning them.
7663. Barley, besides other insect foes, has one peculiar to itself, in the shape of a small moth (Tinea hordei K). This fly deposits from twenty to thirty eggs on a single grain; when hatched, each of the larvæ disperses, and selecting a grain for itself, enters from without, and lies totally concealed: should these moths be observed in a granary, the injury may be stopped by carefully covering the grain, leaving a few handfuls exposed; upon these the moths will deposit their eggs, and by roasting or destroying this small quantity, the rest may be saved from infection.
7664. Oats are subject to few diseases; but, like all other grain, the plants are liable to be destroyed by that universal devastator the wire-worm, of which a more particular account will be found in treating of insects universally injurious to yeartables.

that universal devastator the wire worm, of which a more particular account will be found in treating of insects universally injurious to vegetables.

7605. The diseases of peas are mildew and blight, but these are only occasional; its insect enemies, however, are formidable. The principal of these is the plant louse (A'phis), one species of which is peculiar to this plant. In the year 1810, the crops of peas throughout the whole kingdom was so much destroyed by it, that the produce was not more than the quantity sown; and many farmers turned their swine into their pea-fields, not thinking them worth garbering. (Kirby and Specie, i. p. 177.) Beans are exposed to the same injury from another species of A'phis of a black colour, which begins at the top of the plant, and multiplies downwards. In both cases the most effectual remedy is to top the plants at an early period of the infection, and burn the parts so gathered; this plan is likewise advantageous, as it improves both the quality and quantity of the crop. The earlier peas are sown, the better chance they stand of escaping this pest; or if a small quantity of quick-lime is sprinkled upon them when they are a few unches high, experience has shown that the plants remain uninjured, while the A'phis is totally destroyed. stroyed.

7666. The diseases of beans are the rust, honey-dew, and mildew. The insects which infest it, and their eradication, have already been noticed. (5256.)

eradication, have already been noticed. (5256.)

7667. Turnips are subject to several peculiar diseases, and are the food of many noxious insects. On the first appearance of the cotyledon leaves, a whole host of little jumping beetles (Háltica némorum), called by farmers the fly and blackjack, attack and devour them, so that the land is often obliged to be resown. An eminent agriculturist has calculated, that from this cause alone the loss sustained in the turnip crops of Devonshire in 1786 was not less than 100,000. (Young's Annals, vii. p. 102.) Nearly as much damage is sometimes caused by a little weevil (Curchio contractus Marsham), which in the same manner pierces a hole in the cuticle; watering with lime water, &c. may serve to check both these evils.

evils.

7668. The caterpillar of a saw-fly (Tenthrèdo L.), entirely of a black colour, appears on the plants so soon as they have produced three or four rough leaves; these have sometimes many thousand acres were, on this account; plants where the caterpillars are sought after with so much avidity by crows, rooks, and magpies, that those farmers, whose good sense have led them not to destroy, but rather to encourage, these useful birds, need not fear any great damage from this insect. To destroy it in the most effectual way, watering or sprinkling with lime has been strongly recommended. 7669. The caterpillar of the turnip butterfly (Pieris paper F.) is also sometimes found on the turnip in great numbers: nearly fifty of the gruly, which so much resembles the wire-worm, and which we have before alluded to (766.), have been found just below the leaves of a single bulb. These may, in a great meable of the first hand in the first single to transport external times.

sure, he entired and destroyed, like the true wire-worm, which also does extensive highly to turnips. The small knob or tubercle, often observed on the roots, is inhabited by another kind of grub, probably the larva either of Curculio contractions M., or Rynche'sus assimilis F., two small weevils. These, however, do not seem to affect the growth of the plant.

7670. The segrabide discovery file story of the contraction of the root (known principally by the name of fingers and toes), the anbury, the canker, and gangrene, or wasting from water and frost. None of these injurious diseases, as far as is known, admit either of prevention or cure i under favourable circumstances of soil, culture, evention or cure i under favourable circumstances of soil, culture, the cultivator can do is to prepare and manute his land properly, and in the sowing season supply water when the weather is dry.

7671. The hop is liable to many external and internal diseases: by the first term we must be understood as alluding to injuries caused by insects, while those which belong to the vegetable are certainly internal. When the plants first emerge above the ground, they are infested by a small beetle, vulgarly called the flea. In a more advanced state the tops and branches are devoured by the hop A'phis, known to some by the name of the green fly, while at the same period the roots are subject to the attack of the caterpillar

of a singular species of moth, named by collectors the ghost. The vegetable diseases incident to the hop are, the hone-dew, the mould, the blight, and the fire-blast, all of which take place at different times, though mostly when the plant is full grown.

are, the honey-dew, the mould, the blight, and the though mostly when the plant is full grown.

7672. The hop issect, improperty called the flex, has no other resemblance to that animal, than that it is small, and jumps. It is, on the contrary, a beetle (Halitica conclina), of a species closely allied to that which infects young turnips. In its perfect state it commits great havoe, by eating the tender shoots of the young plants. It has been said, that this insect abounds most in seasons when the nights are cold, and the days how and the days how the same than the same plants are cold, and the days how a cold in the same plants. It has been said, that this insect abounds most in seasons when the nights are cold, and the days how covering the his has been dunged the same year, on which account it has been recommended, that the manure used for covering the hills should be previously well mixed as before directed (5019-), and applied either over all the land, or only on the hills; but this and various other plans do not appear to have originated in a due knowledge of the subject. Nothing this insect in its larva or grub state; and unless it is ascertained to live, during that period, in manure, the above plan will inevitably prove abortive. The deadly effects of line upon insects, however small, has been extensively proved, and should be resorred to in all cases where the expected value of the crop will bear the expected of its application. Mr. Samuel curt young leaves begin to appear, or on the rist's symptom of their being attacked by this from the plant; it makes its form of the plant; it makes its form

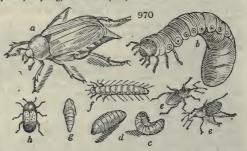

appearance towards the end of May, and during the two next nonths. These insects propagate so produptously, that whenever they have once made as estlement upon a hop plantation, they seem to have baffled every art of man, either to extripate them, or even to check their increase. It is a vulgar error to suppose that they come or are carried away by any particular wind; or that mildly warm weather will affect their removal. It is true, that on such days the perfect insects are seen on the wing; but it is only to estend their destructive race to other plantations, and to establish new colonies. Sudden and violent showers of rain, or guist of wind, causes the death of military small birds; yet these are secidental and insufficient pulliatives. It is, therefore, strongly economended, that the process described by Curtis, of throwing pulverised lime by the instruent he used, be tried on hops infected by the A phils; and we venture to predict that it would be attended with considerable success.

success.
7674. The ghost moth (Heplalus humuli F.) deposits its eggs near the roots of the hop plant, upon which the larva or caterpillar feeds, sometimes doing them considerable injury. The best preventive is to destroy the moth, and this may be done by attracting it at dust to a candle and lantern, carried done by attracting it at dust to a candle and lantern, carried with his hat. The moth is of a tolerable size; and one sex is entirely white, so that it may be seen, even at night, with ease. It hovers over a small spot of ground, so that a good catcher of insects might clear the plantation in a few evenings. In 1826 the ghost moth appeared in many parts of Warwickshire, in very considerable numbers.

7675. Clover is very subject to be injured by a very small weevil (A'pion flavifemoratum K.), which at all seasons feeds upon the seed of the purple clover, while another species of the same tribe (A. flavipes) devours that of the white or Dutch clover; the injury, unfortunately, cannot be known while the plants are growing, as they have then every appearance of being perfectly healthy. The young shoots of the purple clover are often devoured by the same little jumping beetles (Háltica F.) which attack both turnips and home.

7676. Pastures in general are often destroyed to a very great extent by the larva or grub of the cock-chafer (970. a), known in different parts of England by the following provincial names:—Brown tree-beetle, blind beetle, chafer, Jack horner, Jeffry cock, May-bug, brown-clock, dor, and miller.

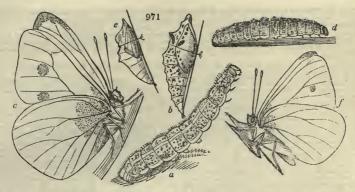

chafer (970. a), known in different parts of England by blind beetle, chafer, Jack horner, Jeffry cock, May.b 7677. The rawages of the laruw are even exceeded by those of the perfect insect, which sometimes appears in this country in prodigious multitudes, and, like a flight of locusts, dearth. The green thing on the face of the white, and are deposited in the ground, where they soon change into a soft whitish gruth with a red, head, and about an inch and a half long (b). In this state it continues four years, during which time it commits most destructured with the state it continues four years, during which time it commits most destructured with the state it continues four years, during which time it commits most destructured with the state it continues four years, during which time it commits most destructured with the state it continues four years, during which time it commits most destructured with the state of the three plants and some fire of the whole of this injury being carried on under ground, and the under the state of the state of the state of the turb will red and withered turf is mow removed, the soil underneath will appear turned into a soft moulf for about an inch in depth, like the bed of a garden; in this will be the state of th

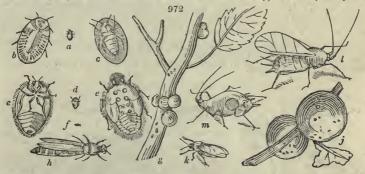

dropping, and became fat upon this unusual food: even the lower orders of the people, from these insects having eaten up the produce of the earth, adopted a mode of dressing them, and used them also as food. Towards that and the state of the analysis of the food of the state of

7679. Cabbages and other esculent vegetables are well known to be greatly injured by the caterpillars of two different kinds of white butterflies (fig. 971.), one of these (Pleris brássice, c) is much larger than the other: the caterpillar is pale yellow, with black spots (a): when full fed, it shelters itself on walls, pales, or trunks of trees, and changes into the chrysalis state (b), in which it still preserves the same cast of colouring: the perfect insect (c) appears early in spring, and continues until the end of summer. The other species of caterpillar is green (d); the chrysalis (e) is of the same colour; and the unterfly (f) is produced about the same time as the preceding. Various methods have been recommended to prevent the winged insect from depositing its eggs upon those plants which nature has given them the instinct to select; these are, however, ineffectual, and in many cases sufficiently ridiculous: handpicking the larva, and searching for the chrysalis, are the only plans we can recommend, either for these or the gooseberry and currant caterpillars. caterpillars.

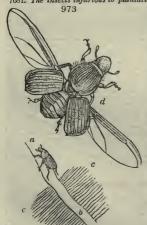

. 7680. Fruit trees of all kinds, and their produce, are attached and devoured by a great variety of insects, an enumeration of which will be found in our Encyclopædia of Gardening. We shall, however, advert to those curious minute insects (Thrips Physapus, fig. 972. f, k) so often seen in flowers and blossoms during the spring, and which, in their natural size (f), appear like short black lines. Nearly all fruit trees are liable to considerable injury from different species of Cóccus or cochineal insects. They are mostly so small

(fig. 972. a,d), that their form cannot be well distinguished without the aid of a magnifying glass; many of them resemble small scales or scabs fixed on the bark and shoots. One is entirely of a brown colour (Cóccus persicorum a): when magnifad (b) it somewhat resembles the tortoise bede (Cássida L), the legs and head being only discernible when the insect is turned on its back (c). Another (C. fol. quercus,

d, e, c' does much injury to the oak; while the C. fagi attacks the twigs of the beech (g), and causes small round excrescences to appear; these are, however, very different from the gall apples of the oak (f)s which are often found of a considerable size, and are produced by the Cynips questrous folii L. (k), or oak gall-fly, and always contain either the larva or imperfect insect. The weevis (Curculiónidae) form an exceedingly numerous family, subsisting principally upon fruit, seed, and grain. One of the largest found in this country is the nut-weevil (C. nucum, fig. 970.e, e), the larvae of which (c, d) are the maggots so frequently found in this fruit.

ions are less numerous in this country than on the Continent, yet we have two species whose devastations of late years have caused much alarm and extensive injury. The pine plantations in various parts of Britain have suffered from the great saw-fly (Urocerus gigas Lat.), the larva of which, feeding upon the heart of the tree, and boringit in all directions, soon destroys it. Another small insect of the beetle kind (Scolytus destrictor F., fig. 973. a magnified) is equally deadly to the elm; and from being more common, and propagating very rapidly, is more to be dreaded. The sudden destruction of a large proportion of the elms in St. James's and Hyde Parks has recently called the attention of government to this beetle; and at the request of the noble rangers, Mr. Macleay undertook to investigate the evil: the result of his observations have been since published (Edinb. Phil. Journal, No. 21.). It appears that the female (a) may be found upon the trunk of the elm from March to September: she first penetrates through the bark, and then proceeds to form a passage between that and the wood, depositing her eggs during her progress on each side; when these are exhausted, the parent dies, and is often found dead at the extremity of the passage (b) thus formed. When the eggs are hatched, the young larvæ immediately begin to feed by working nearly at right angles (cc) from the path of the parent, each proceeding in a parallel direction and close to his neighbour: in this state they may be found in January. To stop this mischief as much as possible, Mr. Macleay recommends that the trees should be inspected twice a year: in summer, when the perfect insect is on the wing; and again in winter, when infected trees should be cut down and burned, or subjected by fumingation to such a degree of heat as may destroy the larvæ; or the bark may be covered with a mixture of ar and train oi, in March, to a certain height from the ground, applying this composition only to such trees as there are still hopes of preserving.

7682. The A'phides or plant lice, next to locusts, are the most universal devastators of the vegetable world; almost every plant has its peculiar species; their fecundity is so prodigious, that Reaumur has calculated that in five generations one A'phis may be the progenitor of 5,904,900,000 descendants; and it is supposed that in one year there may be twenty generations! Those which attack the different kinds of grain seldom multiply so fast as to be very injurious; but those peculiar to pulse increase rapidly, and take such possession, that the plants are greatly injured and frequently destroyed before the seeds are matured.

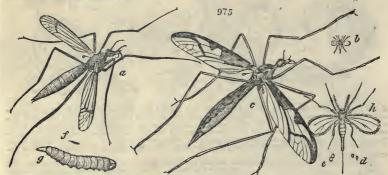

are matured.

7683. These insects are equally injurious in their winged (fig. 972. Imagnified) and in their larva or apterous state (wmsgnified); they are a favourite food of sparrows and other birds, who destroy numbers: they are likewise exposed to other deadly which deposits its egg in the body; it is there hatched, and feeds upon the intestines; in a short time the Aphis swells, becomes hard, and, from being green, changes to a dark red colour. The artful destroyer within, when he finds his victim dying, eats a hole through its belly, and fastens the A'phis, by that part, to a leaf or twig. When the parasite has thus devoured the inside, and is ready to emerge as a perfect insect, he opens a passage for himself by cutting out a round hole in the side, leaving the for himself by cutting out a round hole in the side, leaving the lady-bird or lady-cow (Coccinella L., fig. 974. 4), which, in its larva state (b), feeds entirely upon these insects; and the havoc made among them may be conceived, from the myriads upon myriads of these pretty little creatures which are usually seen in years when the plant-louse abounds; every one, probably, destroying tens of thousands of A'phides before he becomes a beetle. On this account the lady-bird is the greatest friend to the gordener and farmer; and could there will, our hot-houses, gardens, felds, and hap plantations, 7684. The wire-worm is a name that has been gi

would soon be cleared from the ravages of plant-lice. The larve of several bee-like files (Sfr-phus Fr. c) are no less useful in the complex of the complex

7684. The wire-worm is a name that has been given, without discrimination, to the larvæ or grubs of various insects, totally different from each other: hence it is, that much contion and contradiction will be found, respecting it in agricultural books. The true wire-worm is the grub of a small beetle (E/later ségetis Marsham), and it derives its name from its slender form and uncommon hardness. It lives in the segetts Marsham), and it derives its name from its slender form and uncommon hardness. It lives in the larva state nearly five years; during which time it is supported by devouring the roots of wheat, tye, oats, and grass, which it attacks indiscriminately, and causes annually a large diminution of produce: it abounds chiefly in newly broken-up land, and is particularly destructive in gardens recently converted from pasture land. In the larva state it may be decoyed by offering it more tempting food; but no method has yet been devised for destroying the perfect insect.

7685. The grub is a general name for several larva of crane flies (Tipuladæ), called by the country people long-legs, or gaffer long-legs.

7686. One of the most destructive among these insects to the roots of grass and grain is the Tipula olerhoes. The larva is said, by some authors, merely to loosen the roots by burrowing among them; but others assert, that it likewise feeds upon the fibres. However this may be, the evil produced is evident; for in many parts of England it cuts off a large proportion of the wheat crops, especially if sown upon clover-lays. Reasumur informs us, that sometimes in France, particularly in marshy lands, the grass of whole districts has been so destroyed by it, as not to produce the food necessary for the sustemance of the cuttle. No effectual remety has yet been discovered for this cuttle. No effectual remety has yet been discovered for this cuttle. You effectual remedy that yet been discovered for this prime when applied in much larger doses than usual. 7887. There are several other species of a large size, as the Tipula crockata (fig. 975. a), and Tipula rivôsa (c), which, in a less degree, are also injurious to such lands as are moist and humid. 7688. Another minute species is particularly destructive to

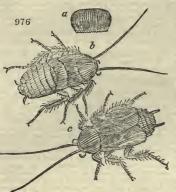

humid.

7688. Another minute species is particularly destructive to corn, and is generally known as the wheat-fly (Thyula triftic), bit is history and economy has been ably investigated by Mr. Marsham and Mr. Kirby. The Injury first appears in the ear, several of which, on being opened, will be found to contain an orange-coloured powder; in this are concealed very minute larve (f), which, on being magnified (g), are seen to be thick at one end, extending and contracting themselves at pleasure,

and frequently jumping half an inch at one spring; they take their station in the longitudinal furrow of the grain, and by sucking its milky juice causes it to shrink up, and become what the farmers call prayfiel; the last sown wheat ath ways appears the most infected. In the beginning of June the jerfect insect (5) may be seen in innumerable multitudes, dlying feet insect (5) may be seen in innumerable multitudes, dlying the day not one is to be perceived. The female lays her egg (4 magnifield) by means of a retractile tube, which encloses a very long and acute sting resembling a hair; but this can only be distinctly seen when the insect is magnified (b). The wheatfly would soon become a formidable enemy to mankind, were not its race exposed to an inveterate foe, scarcely larger than themselves; this is the Ichnehmon Tipulus, the female of which carefully searches out the grubs of the wheatfly, and deposits carefully searches on the grubs of the wheatfly, and deposits and when the same than the search of the properties of the insect has originated in Mr. Kirby; this consummate naturalist thinks originated in Mr. Kirby; this consummate naturalist thinks much benefit would be derived by fungating the corn with tobacco and sulphur, when the wind is in a favourable quarter; this must be done as soon as the ear begins to shoot from the leafly stalk. (Linn. Trens.)

Subsect. 5. Insects injurious to Food, Clothing, &c.

7689. The manufactured produce of our fields and gardens, whether as food or clothing, is still exposed to the ravages of other tribes of insects, which take up their residence in our dwellings, and on every thing about us. Fortunately, however, these domestic enemies are much less numerous and hurfull in this country than in the tropical regions of America, India, and Africa, where their devastation is atmost incredible. Amongst the few that are indigenous, or that have been naturalised in Britain, the principal are the cock-roach, the house-cricket, and the bacon-grub.

7690. The cock-roach, called by some the black beetle (Blátta orientàlis, fig. 976. c), was originally imported from India, but is now naturalised in every temperate part of Europe. Like most of its tribe, it is huns the light, both natural and artificial. In the London houses, particularly in the rooms on the ground-floor, it is very abundant, and indiscriminately devours bread, it is very abundant, and indiscriminately devours bread, and in the company of the second clights are second clights. It is very adultion, and indiscriminately devolute Dread, meat, flour, and even clothes. As soon as light appears they all scamper off as fast as they can, and vanish in an instant. It is said to be killed by devouring red wafers. The young are contained in a singular horny waters. The young are contained in a singular norny case (a), which is divided into a number of transverse partitions or chambers; it is rather flattened, and quite smooth except one side, which is toothed. The larva and pupa (b) are both without wings, and generally larger than the perfect insect (c).

7691. The house-cricket (Grifllus domésticus L.) is sometimes as abundant in farm-houses as the cock-roach

is in those of London and other large towns: both insects is in those of London and other large towns: both insects devour every kind of food, and are often found drowned in nans of water, milk, and other fluids; it is said they will even attack stockings, or linen hung out to dry. They require great warmth, and are therefore mostly found in kitchens and bakehouses. Another species is peculiar to pastures, which, in conjunction with the male cricket, feeds only upon roots: both these, however, are too local in this country to be very extensively injurious.

regreat pest to the winter provisions of the farmer, devouring hams, bacon, and all sorts of dried meats. This is principally done when the insect is in its larva or grub state (fig. 970. f). When full fed it becomes a chrysalis (g), which ultimately changes into a small beetle (h) about a thrif of an inch long, of a dusky brown colour, with the upper half of the wing-cases whitish or ash-coloured, marked with black specks. The grub, from lying concealed in the meat, cannot be effectually removed; but by watching the time when the perfect insects appear, they may then be destroyed, and a recurrence of the evil in a great measure prevented.

7693. Woollow schulder schulder is a section of the evil in a great measure prevented.

7693. Woollen duthing of every description, furs, &c. are liable to be devoured by the larvæ or caterpillars of no less than five distinct species of small moths. Most of these enclose themselves in little tubular cases of a silky texture, and are so well disguised externally by fragments of the stuff they feed upon as often to of a silky texture, and are so well disguised externally by fragments of the stuff they feed upon as often to escape immediate observation. The receipts for preventing these ravages are numerous, but few of them can be depended upon. As a preventive, pieces of Russia leather, or tobacco leaves, may be laid between the folds of garments (in drawers) which are not often used. If there is reason to fear the moths are in the house, these garments should be frequently opened, and aired by exposing hem to the sun. When furs of any kind are laid by for the summer, they may either be sprinkled with snuff or camphor, and Russia leather or tobacco leaves put in the drawer or box. Should the moth actually have got into furs, the only way of checking the evil is to put them into an oven moderately heated, and by keeping them in this situation a quarter of an hour every grub will be effectually killed; the degree of heat may be ascertained, in the first instance, by putting in some common feathers, which should come out uninjured.

7694. The principal insects injurious to the agriculturist have now been enumerated: there are many others which feed upon cultivated vegetables and domestic stores, but in a less exensive degree. Let us not suppose, however, that these little animals have been created for our punishment or annoyance. We have but taken a view of one side of the picture; the other would show us innumerable benefits, either immediate or remote, which we derive from this race of beings. The silkworm, the honey-bee, and the cochineal insect must not be forgotten; and myriads of others are created, whose sole occupation during life appears to be that of devouring and keeping within due limits those tribes that are injurious and hurtful to man,

Subsect. 6. Operations for subduing Insects.

695. The operations for destroying insects, or counteracting their injurious effects, are various, and in most cases must be regulated according to the species. These we have already pointed out in treating upon the insects themselves, or of the particular plants upon which they feed. It only remains to offer such general rules as are more or less applicable to all destructive insects; these are of three kinds, preventives reallistings and destinate.

ventives, pallilatives, and efficient processes.

7696. The preventive operations are those of the best culture as relates to the choice of seed nor plant, soil, situation, treatment, and climate: the four first are under the control of man, and an attention to them will undoubtedly lessen the risk of injured crops; but as regards weather, neither his foresight nor

care can avail any thing.

care can avail any thing.

7697. The palliative operations are numerous; and such as are eminently successful may be considered as efficient; inasmuch as it rarely if ever happens that any insect can be exterminated, even from one district; its numbers may be diminished, but the species will still remain, although in such small numbers that its operations may escape notice. Most insects will be injured, and in part destroyed, by artificial bad weather, such as excessive waterings, stormy application of water with a syringe, and violent wind produced by shaking the tree or plant: many will thus be bruised, and others that are shaken to the ground can be destroyed. Insects may be further injured by watering the plants upon which they feed, either with tobacco or lime water, or by scattering upon the leaves powdered quick-lime, soot, ashes, barley awns, &c. The smell of tar is particularly offensive to all insects, and the effects produced by the fumes of tobacco, sulphur, urine, &c. are well known. Hot water may be applied with much advantage. Water heated to 120 or 130 degrees will not injure plants whose leaves are fully expanded, and it may be increased to 200 for such as are without leaves.

increased to 200 for such as are without leaves. Tiels. Insects may be destroyed in a much more effectual manner by enticement, or placing in their way other food as a trap. The late noble and generous Sir Joseph Banks has the merit of having recommended and made known this most efficient method. It simply consists in cutting slices of potatoes or turnips, sticking them upon skewers, and then burying them near the seeds sown: the vermin will collect upon them during night, and by examining them every morning, vast numbers may be destroyed; this plan has been very advantageously tricd with the wire-worm, and no doubt would be equally beneficial in clearing all crops that are attacked by under-ground feeders. Mr. Kirby states, "that it was very successfully employed in 1813, by J. M. Rodwell, Esq. of Barham Hall, near Ipswich, one of the most skilful agriculturists in Suffolk, to preserve some of his wheat-fields from the ravages of a small grey slug, which threatened to demolish the plant. Having heard that turnips had been used with success to entice the slugs from wheat, he caused a sufficient quantity to dress eight acres to be got together; and then, the tops being divided and the apples sliced, he directed the pieces to be laid separately, dressing two stetches with them, and omitting two alternately, till the whole field of eight acres was gone over. On the folincreased to 200 for such as are without leaves.

lowing morning he employed two women to examine and free from the slugs (which they did into a measure) the tops and slices; and when cleared, they were laid upon those stetches that had been omitted the day before. It was observed invariably, that in the stetches dressed with the turnips, no slugs were to be found upon the wheat, or crawling upon the land, though they abounded upon the turnips; while, on the undressed stetches, they were to be seen in great numbers both on the wheat and on the land. The quantity of slugs thus collected was near a bushel. Mr. Rodwell is persuaded that by this plan, he asked his wheat from essential injury. (Kirby and Spence, Int. to

saved his wheat from essential injury. (Arroy and opence, Inc. to Entomology, i. p. 182, note.)
7699. The turnip net (fig. 977.) is an instrument invented by Mr. Paul of Starston in Norfolk. It is the most successful expedient that has yet been thought of for the capture and destruction of the little beetles called by farmers the black jack, and by hop-growers the fiea. It consists of two pieces of stout wood, the ends of which, at one extremity, are fixed into a handle in a forked direction: the other ends are left thick and curved upwards, for the purpose of passing the instrument smoothly and easily over the surface of the ground: towards this end, smoothly and easily over the surface of the ground; towards this end, the sticks are connected by a cross-bar formed by a thin iron rod, that may be taken on and off at pleasure; these three sides constitute the frame work for supporting a long and ample bag, made of strong glazed calico. The method of using it is by the operator shoving it before him on the ground, over the tops of the turnips or other plants; by this means the insects that are upon the leaves fall into the bag, which may be occasionally shaken during the process, so as to bring them to the bottom (which is made narrow) where they will remain. Vast quantities of insects, which from their smallness and agility defy hand-picking, will be thus captured. The turnip net may be made either large or small; perhaps two feet and a half for the side sticks Is the best length; it being obvious that the wider they are apart, the greater space will be brushed at once,

or small; pernaps two feet and a nair for the side sticks is the dest length; it being obvious that the wider they are apart, the greater 77:00. The lime-duster (fig. 978) is a recent invention by Mr. Samuel Curtis of Glazenwood, near Coggeshall, Essex, and has been used by him with great success in throwing pulverised quick-lime over apple trees infected by caterpillars and other insects. His orchard, containing many thousand fruit trees, and occupying fifty acres, had been for many years completely divested of most of their foliage and young fruit in the spring months. Washing the stems and branches with lime and water (as might have been expected) was found ineffectual for the destruction of insects which fed only on the young huds and leaves. The instrument in question consists of a canister months. Washing the stems and branches with lime and water (as might have been expected) was found ineffectual for the destruction of insects which fed only on the young buds and leaves. The instrument in question consists of a canister twelve inches long, seven inches wide at its broadest, and four inches on its narrowest part; the handle (a) is five inches and a half long. The top of the handle is fitted with a cap (b), which is put on when the lime is to be thrown on low trees; but when high trees are to be operated upon, the cap is removed, and a pole of sufficient length to reach the height required is inserted into the handle. Quick-lime pulverised (and often sitted through a fine sieve) is put into the canister, and shaken over the young foliage just as it was expanding. The time for doing this is in the dew of the morning, or whenever the leaves are damp; and if there should be a gentle breeze, sufficient to carry the dust obliquely through the head of each tree, it is the more quickly performed. Under favourable circumstances of this nature, Mr. Curtis says, "I found that three men, provided with the powder in a large box on a light wheelbarrow, could dress from two to three thousand trees in a day: when the wind changed, I had the trees dressed on the other side. Although used ever so freely, no person need fear any injury, from the caustic quality of the lime, on the most delicate and fresh expanded foliage; it is only prejudicial to insects of all kinds, and to dead vegetable matter."

(Hort. Trans. vol. vi. p. 2. page 124.) We know not whether the lime-duster has ever been tried upon hop plantations infected by the green fly or plant louse; but it appears to us equally well adapted to effect a great destruction among those insects.

Troll. Grain of all descriptions that is infected by weevils, or by the grubs of other insects, should be spread in the sun, and frequently turned: the warmth will bring the animals out of the grain, and considerable numbers may be destroyed. It has been said that they

attended to.

SECT. IV. Worm-like Animals injurious to Agriculture.

7704. Of worms (Vérmes L.) generally so called, there are but few which may be considered as injurious to agriculture. The principal of these are the various species of slug (Arlow F., Llmax L.) and the large and small snails (Helix horténsis and nemorallis L.), mostly found in garden plantations. The earth or dew worm (Lumbricus terréstris L.), unless existing in great numbers on a single spot, cannot be ranked among injurious animals, notwithstanding the prejudices of farmers and gardeners against them. Without worms the earth would soon become hard, cold, incapable of receiving moister, or of giving nourishment to roots: they are, in fact, the great promoters of vegetation, by boring, perforating, and loosening the soil beneath, and by manuring it above with their excrement, which is thrown up into lumps called worm casts. The wire-worm does not belong to this tribe, but is the larva of a small beetle already poticed. noticed.

7705. Worms of the slug kind are without shells. There are several species inhabiting Britain, all of which subsist on leaves, roots, and vegetables. The most common is the Limax agrestis (fig. 979.a), of which there are several varieties injurious to the agriculturist and gardener; they devour the young shoots of turnips, wheat, and indeed all kinds of grain, frequently to a ruinous extent: their eggs (b) are

shoots of turnips, wheat, and indeed all kinds of grain, frequently to a ruinous extent: their eggs (0) are small, round, of a semipellucid whiteness, and are deposited in the earth. The enthods of destroying or eradicating the perfect animal have been already described.

7706. The shell stug (Testacellus minus F., c) is a native of Teneriffe, and has likewise been found in several parts of France and Spain; it has recently been discovered in some gardens near Bristol, by Mr. Miller, of that city. It is a highly curious animal, remarkable for feeding upon earth worms; and may, therefore, be beneficially introduced into such gardens as are overstocked by that otherwise

useful animal. It is readily distinguished from all other slugs in this country by having a thin oval shell (d) allixed to the hinder part of its body. Slugs in general are easily enticed by cabbage leaves, scattered

near such garden vegetables as they

near such garden vegetanies as mey appear to injure most.

7707. Snails, are slugs covered by a shell. The two species most prejudicial to cultivated vegetables, are the garden snail (Helix aspersa Gm.), and the variegated snail (Helix nemoralis, e): both these seek the same description of food, and are contally injurious. as slugs; and, like equally injurious, as slugs; and, like them, may be enticed by cabbage leaves and other juicy vegetable re-

PART IV.

STATISTICS OF BRITISH AGRICULTURE.

7708. After having considered agriculture as to its history, as to the scientific principles on which it is founded, and the application of these principles to the different branches of practice; it remains only to take a statistical survey and estimate of its present state and future progress in the British isles.

BOOK I.

OF THE PRESENT STATE OF AGRICULTURE IN THE BRITISH ISLES.

7709. The present state of British Agriculture, as to knowledge and the details of practice, has been the subject of the former PARTS of this work: but its importance in the general economy of society, can only be learned by a view of the manner in which it is actually carried on; the modifications to which it has given rise in the pursuits of those who have embraced the art as a source of livelihood; of the kinds of farms cultivated by different orders of agriculturists; of the principal practices of each of the different counties of Britain and Ireland as to agriculture; of the British authors who have written on the subject; and of the professional police and public laws relative to husbandmen and agriculture.

CHAP. I.

Different Descriptions of Men engaged in the Practice or Pursuit of Agriculture.

7710. Agriculturists may be arranged as operators, or serving agriculturists; dealers, or commercial agriculturists; counsellors; professors, or artists; and patrons.

SECT. I. Operators, or serving Agriculturists.

7711. The lowest grade in the scale of this class is farm labourers, who may be either men, women, or children; and either local residents, periodical visitants for particular labours, as hay-making, reaping, &c., or itinerant workmen for taking jobs, as ditching, stocking, &c. None of this class of operators are supposed to have received any other professional instruction than what they have derived casually, or from observing others.

7718. Amprestices are little known in conjustive what they have derived casually.

from observing others.

7712. Apprentices are little known in agriculture; but they occur sometimes, either as the children of other operators, whose parents bind them a certain number of years, during which they are to work for their food and clothes, and 51. or 101. to be received at the end of the term according to conduct; or sons of richer persons, who pay a premium for the instruction to be received, and for boarding with the master. The former class of apprentices generally look forward to being plonghmen, shepherds, head ploughmen, or inferior bailliffs; the latter to being first bailiffs, stewards of estates, or to farming on their own account. Parish boys are sometimes bound apprentices of the first class, and various noblemen's sons from almost every kingdom of Europe have been included in the second.

7713. The term journeyman is as little known in agriculture as apprentice. Those who answer to that term are the professional operators of a farm, such as ploughmen, cattle herds, shepherds, and hedgers. These rank decidedly above labourers of all-work. A ploughman may not unaptly be considered as of the rank of an apprentice till he can fear or set out ridges, and after he can do this as of the rank of journeyman till he can stack and sow. He may then be considered as a master of his art, entitled to work the best pair of horses, and if twenty-five or thirty years of age, to enter into the marriage state.

7714. A hedger is a professional operator, who may be considered as ranking with a master ploughman. His business is to plant, clean, prune, cut, lay, plash, and repair hedges; prune forest and orchard trees, and effect other operations with ligneous plants on the farm. In Berwickshire hedgers are generally very intelligent men, and keep the fences on the farms in the border counties in excellent order, and the hedger ow trees handsomely bruned.

row trees handsomely pruned.

7715. A woodman is an operator employed to prune trees and manage hedges, and is of the same rank and requires the same kind and degree of professional knowledge as the hedger. Generally he is more and requires the same kind and degree of professional knowledge as the hedger. Generally he is more

7715. A woodman is an operator employed to prune trees and manage hedges, and is of the same rank and requires the same kind and degree of professional knowledge as the hedger. Generally he is more conversant with barking trees for the tanners, converting copsewood and measuring timber, than the other, being more engaged with woods than hedges.

7716. A head-ploughman, on small farms, is to be considered as the bailiff in the absence of the master. He works the best pair of horses, and assists the master in stacking and sowing. On larger farms, where a regular bailiff is kept, there is also a head ploughman, who acts as substitute for the bailiff in his temporary absence, as far as operatives and overlooking operations; but not in money matters or contracts.

7711. A farm bailiff; is, or should be, a person of tolerable education, who understands accounts, measuring of work, land, and timber, and can draw up agreements for hiring servants. He should have practised every part of farming himself, from tending poultry, swine, and sheep, to stacking and sowing. When employed by a gentleman, or one who has no skill in farming, he should not be under twenty-five apprentice, and will be directed in all leading matters by his master.

7718. A bailiff and gardener, or gardener and grieve, as they are called in some places, is a sort of hybrid upper servant, who seldom excels either as a farmer or a gardener, and is only fit for situations of limited extent, and an indifferent style of performance.

7719. The forester or head woodman is to the woods of an estate what the bailiff is to the farm lands in hand. He directs and superintends the woodmen and their labourers, in planting, rearing, and pruning plantations, and in the felling of timber or cropse, barking, charcoal making, and in short every thing connected with timber, trees, copses, or hedges.

7720. The land steward (Factor, Scotch; Facteur, Fr.; Factor, Ger.; and Fattore, Ital.) is to a whole estate what a bailiff is to the demesne or a particular farm. His bus

rents

rents.
T721. Under stewards, or steward's bailiffs, as they are called, are assistants to the main steward, or have the care of detached estates, containing a few farms or woods.
T722. Demesne stewards are such as are kept chiefly for regulating the affairs of demesne lands; that is, lands surrounding the mansion in hand, or of an estate of small size, where all the lands are in hand, but where an extensive establishment of horses, servants, a large garden, &c. are kept up. Here the steward performs the duties of bailiff, forester, and in some degree of house-steward, by his connection with the stables and game-keeper, and other domestic rural matters.
T723. Court farmer (Haffmeyer, Ger.; Grangero de la corte, Span.; Agronome de la cour, Fr.; and Faltore della corte, Ital.), may be considered the highest step, the summum bonum of agricultural servitude. The late Ramsay Robinson, Esq. was bailiff to Geo. III.; his sister, Miss Robinson, was royal dairy-woman; and Sir Joseph Banks, royal shepherd.

Sect. II. Commercial Agriculturists.

7724. The lowest grade here is the jobbing farmer, who keeps a team, a cart, plough, pair of harrows, and probably one or two hand implements. He hires himself by the day, week, or by the acre, to plough, sow, or labour, the small spots of ground of tradesmen who keep a cow but no labouring stock; or to assist farmers who are behind with their labours. The contractors for executing works devised by the agricultural engineer (7754.), though widely separated in point of wealth from the common jobber, yet belong to the same species; both agree in selling their labour and skill in a raw state, not when manufactured into produce like the other commercial agriculturists.

produce his the other commercial agriculturists.
7725. Hierardia agriculturists are of two kinds: such as take grounds for the culture of one or two crops of particular sorts of plants, as woad, flax, &c. (5963.); and such as travel with a plough and pair, &c. to teach that operation to young farmers or their servants, a practice at one time carried on in Ireland under the patronage of the Dublin Society.
7726. Catinge farmers are such as possess a cottage and an acre or two of land, which they may either keep in a ration or pasture; disposing of the corn, green crops, or dairy produce in various ways, according

to local circumstances.

to local circumstances.

7737. Poultry farmers, such as devote themselves chiefly to the breeding, rearing, and fattening of poultry, and the growing of feathers and quills.

7728. Garden farmers are such as possess lands near large towns or sea-ports; and grow the commoner garden vegetables, as peas, onions, cabbages, &c. for the market, or herbs for the distillers and druggists.

7729. Seed farmers. Small farmers who devote themselves chiefly to the growing of garden seeds for the London seedsmen, and for the distillery. They are to be found only in a few counties in the central and southern districts of England, and chiefly in Kent and Essex. (See Encyc. of Gard. 2d edit. 7390.)

7730. Orchard farmers are such as farm grass or arable orchards, sometimes joined to hop lands and garden farms; often with a small dairy; with rearing of poultry, rabbits, &c., and sometimes with the breeding and training of dogs; the latter a very lucrative branch when well understood.

7731. Hop farmers, such as make hops a principal article of cultivation, to which are sometimes joined garden and orchard farming.

garden and orchard farming.

7732. Milk or cow farmers, such as keep cows for selling their milk in an unmanufactured state. These farmers are of course limited to populous neighbourhoods. Cow-keepers differ from cow-farmers, in having their establishments in towns, and in purchasing, not growing, their cow provender.

7733. Dairy farmers, such as keep cows and manufacture their milk into butter or cheese. These are most common in rich moist flat districts, as Cheshire, part of Gloucestershire, Leicestershire, &c. 7734. Graziers, farmers whose chief business consists in buying, feeding, and selling cattle and sheep. Their farms are chiefly in old pasture, and they are more commonly feeders than breeders. The most extensive in England are in Leicestershire and Lincolnshire.

7735. Stock farmers, such as devote themselves to breeding and rearing different kinds of live stock, especially horses and cattle. They are most common in Yorkshire.

7736. Store farmers, breeders who devote themselves chiefly to the sheep and cattle families. They are common in the border counties, in Wales, and in the Highlands.

7737. Hug farmers are confined to a small district round London; where they grow chiefly natural or meadow hay for the London coach and saddle horses, and for cow-keepers.

7738. Corn-farmers, as opposed to hay, dairy, grazing, and breeding farmers, is a term employed to such as occupy lands more adapted for the plough than for pa_turage, as arable clays and loams.

7739. Wood-farme, ,, such as rent woodlands, to be periodically cut for fuel, bark, fence-wood, charcoal,

7740. Quarry-farmers, such as rent quarries of lime or other stone, gravel-pits, clay-fields, marl-pits, &c. 7741. Mine-farmers, or master miners or mine-holders, such as rent coal-mines, or mines of iron, lead, or other metals.

or other metals.

7142. Salmon or river-farmers, or fishery renters, such as rent rivers or ponds for the sake of their fish.

7143. Commercial or professional farmers, such as farm lands for profit. Those who farm an extent of good land under one hundred acres are considered small farmers; under three hundred acres, middling farmers; above and under five hundred acres, large farmers; and exceeding that quantity, extensive farmers: a very proper title, for few arable lands can be profitably cultivated to a greater extent in one farm or by one establishment than five hundred acres, and those which exceed that quantity are generally breeding or other stock farms, characterised by their extent.

7744. Gentlemen farmers, are professional farmers on a large scale, who do not associate with their minor and personally working brethren; but who affect in their style of living the habits and manners of independent men or gentlemen. It is a character extremely liable to ridicule by the vulgar yeoman and purse-proud farmer on the one hand, and those persons who are gentlemen by profession and men of family on the other.

family on the other.

7745. Yeomen Jarmers, small proprietors who farm their own lands, but yet aspire not to the manners and habits of gentlemen. 7746. Farming landlords, proprietors who farm their own lands on a large scale,

SECT. III. Agricultural Counsellors, Artists, or Professors.

7747. The land-measurer is the lowest grade of agricultural artists: he is very often the village school-master, and is called in to measure work done by the job; as mowing, reaping, hedging, trench-

ing, &c. 7748. The agricultural salesman is a person who attends at fairs, markets, &c., and acts as agent to buyers and sellers of corn and eattle. There are also salesmen purposely for hay and straw, others for

ouyers and seniers of corn and cattle. Incre are also salesmen purposely for hay and straw, others for green food, turnips, potatoes, &c., 7449. The appraiser, or valuer of farming-stock, comes next in order. This professor values the live and dead stock, and crop, tillages, manures, &c., and sometimes also the remainders of leases between outgoing and incoming tenants, or betwixt tenants and their landlords. Occasionally the appraiser is employed to value lands, but this is generally the business of the land-valuer.

7750. The land-surveyor generally confines his avocatious to the measuring and mapping of lands; or to their subdivision, or the arrangement of fences and other lines; but sometimes he joins the business of

7750. The land-surveyor generally confines his avocatious to the measuring and mapping of lands; or to their subdivision, or the arrangement of fences and other lines; but sometimes he joins the business of appraiser and valuer, and even timber-measurer.
7751. The timber surveyor and valuer confines himself in general to the measurement and valuation of fallen or standing timber; he also measures and estimates the value of bark, faggots, roots, charcoal, ashes, willows, hoops, and various other products of ligneous plants.
7752. The land-valuer not only values the rental, but the price or fee-simple of lands, buildings, woods, quarries, and waters. He does not often meddle with metallic or saline mines; but he sometimes values fisheries, stone and lime quarries, brick-earth, gravel, chalk, &c. This profession requires not only a general knowledge of agriculture in the most extensive sense of the word, but a very extensive acquaintance with the country in which the property lies, and great experience in business. There are local and generally unite the business of land-agent.
7153. The land-agent may or may not be a land-valuer, but at all events he should possess the knowledge of the valuer in an eminent degree. His business is to effect the transfer of property by purchase, sale, hiring, or letting; and also to collect rents, and often to re-let farms, and effect other business belonging to the land-valuer. Land-agents are very frequently autorneys, who know little of agriculture; but who save their employers the trouble of employing both a land-steward of superior abilities, and a lawyer to draw up agreements and leases. It is the opinion of the best informed agriculturists both of Britain and France, that the employment of attorneys as land-stewards and agents has been one of the chief causes of the retardation of agriculture throughout Europe. Chateauvieux has clearly shown how this cause has operated in France and Italy; and Dr. Henderson, Arthur Young, Marshal, and various others, have deprecated its infl

acted the tendency to change and amendration.

7754. Of agricultural engineers there are considerable variety. The drainer, for laying out drains and water-works; the irrigator, for watering the surface of grass-lands; the road engineer, for laying out roads; the mineral surveyor, for searching for, measuring, mapping, and valuing mines and minerals; the coat wever, for estimating the value of coal works; the rural architect, for designing and superintending the execution of agricultural buildings; and the hydrographical and canal engineers, for canals, between wills and the greeter water works.

tending the execution of agricultural buildings; and the hydrographical and canal engineers, for canals, harbours, mills, and the greater water-works.

7755. The veterinary surgeon, or agricultural doctor, is to be considered as a rural professor; and as subordinate grades, may be enumerated the farrier (Ferrier, Fr.; Ferrajo, Ital., a smith, from ferrum, Lat. iron), cowleech, and castrator or gelder.

7756. The agricultural draftsman, or artist by way of eminence, is employed in designing and painting live-stock, implements, plants, and cultivated scenery; the plans of farms are taken by the land surveyor, designs of buildings made by the architect, and new inventions in machinery and implements are drawn by the inventors, whether millwrights or agricultural mechanists.

7757. The eggricultural author may be considered as the most universal kind of agricultural counsellor.

The agricultural author may be considered as the most universal kind of agricultural counsellor,

7151. The agricultural author may be considered as the most universal kind of agricultural counsellor, since his province includes every branch of the art, and comprehends times and practices past, present, and to come. The simplest variety of this species is the author of single papers in magazines, or the transactions of societies; the most extensive, he who embraces the whole of the subject; and the most valuable, he who communicates original information.

7158. The professor of agricultural science (Professour d'Agriculture ou d'Economic Rural, Fr.; Hocklehrer von Ackerbau, or H. von Landwirthschaft, Ger.; Professor d'Agricultura, Span.; and Professore d'Agricultura, Ital.), when appointed by a permanent or national institution, may be reckoned the highest grade of agricultural counsellor: since he is not a self-constituted instructor, like the author; but constituted by competent judges as capable of instructing the public. The first public professor of agriculture appointed in Britain was Dr. Coventry of the University of Edinburgh, about 1790; and the next Sir Humphry Davy, Lecturer on Agricultural Chemistry to the Board of Agriculture, about 1807; both highly eminent as agricultural counsellors, independently of their other merits. There are agricultural professors in Dublin and Cork. In almost every University on the Continent there is an agricultural chair, and in some of the German and Russian Colleges there are chairs for gardening (Gärtnerey), forest-culture (Forstwissenschaft), and rural architecture (Landbaukunst).

SECT. IV. Patrons of Agriculture.

7759. Every man being a consumer of some description of agricultural produce, may be considered a promoter of the art by causing a demand for its productions. The more valuable consumers are such as

live on the best bread, butcher's meat, fowls, and dairy products; and the greatest of all patrons, both of agriculture and gardening, are such as fare sumptuously every day.

7760. Amacur agriculturists, lovers of agriculture, promote the art by the applause they bestow on its productions; of which, to a certain extent, they become purchasers, as of farming books, prints of cattle,

implements, &c.

implements, &c.

7761. Connoisseurs, critical or skilful lovers of agriculture, promote the art in the same way as the amateur, but much more powerfully, in proportion as approbation founded on knowledge is valued before that which arises chiefly from spontaneous affection. By the purchase of books, models, attendance at agricultural exhibitions, &c., connoisseurs encourage both counsellors and commercial agriculturists. Sometimes, also, by their writings, of which Sir John Sinclair is an eminent example.

7762. Employers of agriculturists, whether of the serving class, as bailiffs, stewards, &c., or of the order of professors or artists, are obvious encouragers of the art.

7763. Amateur farmers are patrons on the same principle as employers; and sometimes, also, they effect improvements, or communicate valuable information to the public. Cline, the late eminent surgeon, and the late physician, Dr. Parry, were eminent examples.

7764. Noblemen and proprietor farmers are conspicuous patrons. They render the art fashionable; and by the general attention so directed, and consequent occupation of many minds on the same subject, new ideas are elicited, and dormant talents called forth and employed. The names of Russel, Coke, Curwen, and Somerville stand preeminent among this species of patrons, and many others might be added.

7765. Noblemen and gentlemen improvers, whether by planting, building, road-making, establishing villages, canals, harbours, &c. are evidently greater patrons of agriculture than oblemen farmers, since their improvements affect society more extensively. As decidedly at the head of this species of patron may be mentioned the late Duke of Bridgewater and the present Marquess of Stafford, and to these names might be added a number of others.

might be added a number of others.

CHAP. II.

Different Kinds of Farms in Britain relatively to the different Classes of Society who are the Occupiers.

the Occupiers.

Trick. Cottage farms form the first link in the chain of temporary terrestrial possessions. They consist of one or more acres appended to a cottage, for the purpose of enabling the occupier to keep a cow: if any part of this farm is in aration, the labour is either hired of some jobbing agriculturist, or done by spade; or two or more cottagers join together and form a team of their cows, with which, and implements borrowed from the village carpenter or smith, they accomplish their labour.

Trick. Farms of working mechanics. These are larger than the former, and are rented by country black-smiths, carpenters, &c., who often keep a horse or a pair of horses. Both this and the former sort are very often injurious to the occupiers, by drawing off their attention from their principal source of income; though it must be confessed at the same time, that the idea of occupying land, and raising one's own corn, clover, milk, butter, eggs, pulse, &c. is highly gratifying; gives a sort of sense of property, and has an air of independence and liberty, highly valued by men in general.

Trick. Farms of village tradesmen and shopteepers. Many of these men, such as bakers, butchers, grocers, &c. keep a horse at any rate; by renting a few acres they are able to keep another, and add a cow, and other minor species of live stock. The attention required from the master forms a healthful recreation, and agreeable variety of occupation; and if this recreation does not therefore with main pursuits, there is a gain of health and respectability.

Trick. Farms occupied with a view to profit by town and city tradesmen. These are on a larger scale than the last, and held by stable-keepers, cow-keepers, butchers, corn-dealers, &c. They are often of considerable size, mostly under grass, and managed by balliffs. A rable farms in such hands are rarely well managed, as every thing is made to depend on manure; but as less skill and vigilance is required in managing grass-lands, hay or pasture farms of this description are genera

judicious description.

7712. Demesne farms, or such as are occupied by the landed proprietors of the country. These are of a great many different kinds; some regularly appended to the park; some comprising a part of the park separated by temporary fences; and others taken into occupation without regard to situation. Some proprietors take all the farms on their estate successively into their own hands, cultivate them for a few years, bring them into excellent order, and then let them to farmers. Much good is often done by proprietors occupying land themselves; new practices, and new kinds of vegetables and live stock, are exhibited and disseminated; and the landlord himself, being instructed by experience in the practice of farming, is better able to judge what his land should let for; and more likely to appreciate good tenants, and sympathise with the losses of his farmers in bad seasons. Add also, that a proprietor in this way procures better butcher-meat of every kind than he could generally purchase in the neighbouring markets; and, if he chooses, better legumes and roots, and even better cabbages and other culinary vegetables than ne could grow in his kitchen garden. The balliffs on such farms are, or ought to be, well educated men, prought up to farming in the best districts. They should be well paid, and have sub-balliffs under them. The establishments of Bedford, Coke, Curwen, Albemarle, &c. are or were among the most complete in this kind of farming.

farming.

7773. The farms of professional farmers. It must be obvious, that this class includes more than nine tenths of all the farms in the country. They are of every description of soil, climate, situation, &c. which the country affords; of all manner of sizes, according to the demand created by such as follow farming, as the country affords; of the general purposes of corn and cattle, or more particularly for poultry,

milking, dairying, garden crops, hops, orchard crops, grazing, breeding, hay, corn, wood, minerals, as stone quarries, &c., or to fisheries. At the origin of what we now call farming, or when the hiring of land by cultivators succeeded to cultivating them for the landlords, or in partnership with the landlords, as is still the case in Italy and most other countries, farms would of course be small, and farmers' men of scarcely any capital or consideration in society. Just emancipated from a state of bondage and villnage, the new-created independent tenant could not easily throw off the chains which formerly shackled his mind and prevented his energies from being brought into action, and he could have little or no property when he had no means of acquiring it but by plunder, or preserving it but by concealment. Hence the first tenants were assisted by their landlords; and one remnant of this practice, that of allowing farmers to have a year's rent always in hand, or, in other words, not to demand the rent till half or a whole year after it is due, still exists in some parts of Scotland and Ireland. In process of time, however, and from various direct and indirect causes, farmers at length acquired some degree of capital and respectability; and as they naturally thought of employing the former, or course farms began to be enlarged to afford security. This practice has been going on in Britain for more than two centuries past, and receives a fresh impulse whenever the prices of grain rise high, and continue so for some time. At no period have the riches and respectability of farmers so much increased. More recent political changes, however, have proved singularly disastrous to farmers; and till the corn laws are either oblitical changes, however, have proved singularly disastrous to farmers; and till the corn laws are either obliterated, or regulated on some permanent and more moderate principle, agriculture and its practisers of every description will remain liable to the extremes of profittable occupation and ruin.

CHAP. III.

Topographical Survey of the British Isles in respect to Agriculture.

7774. The British isles, as we have already observed (1280.), are, in their present state, naturally and politically more favourable to the practice of the agriculture of ale, butcher-meat, and wheat, than any other country in the world. They have their disadvantages both in climate, and in civil and political matters; but, notwithstanding, there is no country in the world where farmers or proprietors are so respectable a class of men, and where such excellent corn, herbage, roots, and hay, either raw, or in their manufactured state of bread, ale, and butcher-meat, are brought to market.

7715. The following outline of the state of agriculture in each of the different counties of the United Kingdom is taken from the Surveys published under the authority of the Board of Agriculture, or the Dublin Society; from Marshal's remarks on these surveys, and his other writings; and, in some cases, from our own observation, having at various periods, since the year 1800, been in almost every county in Britain, and in most of those in Ireland. Agricultural improvement is often of so variable and fleeting a nature, that, notwithstanding our utmost care, some things may be found here inserted as such that no longer exist; and from the period, varying from twelve to twenty years, which has elapsed since the surveys were published, many improvements may have been made deserving of insertion which are omitted. These are unavoidable defects attendant on this part of our work; but though we cannot render it perfect, yet we are of opinion we can bring together a sufficient number of facts, as to the natural and agricultural circumstances of each county, as to render it both interesting and useful to the reader. We regret much, that notwithstanding our most earnest invitation to the readers of the Gardener's Magazine to send us corrections and additions for this part of the work, yet we have received so few, that we are unavoidably obliged to send into the world the second edition of this chapter, in November, 1830, almost as imper

SECT. I. Agricultural Survey of England.

7776. The surface of England is estimated at from thirty-two to thirty-six millions of acres, with the exception of some mountains in Cumberland and Westmoreland, almost every where cultivated, and nowhere incapable of cultivation; in most places varied, gently, and beautifully in some districts, and abruptly and on a grander scale in others. The most high and mountainous districts are those of the north, and the most level those of the east. The most high and mountainous districts are those of the counties; as Cheshire and Lancashire; and the most fry those of the south-east, as Norfolk and Suffolk. The richest grass lands are in the vales of the great rivers, as the Severn, Trent, and Thames. The richest grable lands, in Worcestershire, Warwickshire, and in part of various other counties; and the best farming, in Northumberland, Durham, and Cumberland. The greatest variety of farming may be seen in the counties round London; and the greatest sameness, regularity, order, science, success, and the wealthiest farmers in Northumberland and the county of Durham. The geology and minerals of the kingdom are most ably indicated in Smith's Gootogical Maps, 1819 to 1824; and Smith's Gootogical Table of British Organised Fossils, 1819. These works are of the greatest importance to landed proprietors.

7777. MIDDLESEX is part of the north side of a vale watered by the Thames, and contains 192,000 acres, exhibiting a great variety of agriculture. (Middleton's Survey, 1806. Marshal's Review, 1818. Edin. Gaz., 1827.)

1. Geographical State and Circumstances.

Healthy; warmer near London, from the fires kept there, which consumes 800,000 chaldrons of coals annually; stationary winds-from the S. W. and N. E., those from the S. W. bow 6-18ths of the years, N. E. 8-12ths. Greatest falls of rain from a few points W. of S. and are of the longer continuance when the wind has passed through the test to the Largering, free in the holors, when none on the hill, thermometer has been as high as 35°, and as low as 6° below 250°.

thermometer has been as high as \$5°, and as low as 6° pelow zero.

Soil. By long continued manuring, the surface soil almost every where looks like loam. Sand and gravel on Hampstessd every where looks like loam. Sand and gravel on west side of Hanvell and Hounslow. Strong loam about Ryslip, Pinner, Harrow, and South Mimms; loamy clay between Uxbridge Common and Harefield. Clay of the most adhesive and ungrateful kind about Hendon and Highwood Hill; peat from Rickmansworth to Staines, on a substratum of the gravel of Hints. Marsh land or rich loam deposited from Surface. Gently waving; highest towards the north. Hampstead 400 feet above the level of the sea. One mile from London on the Kingsland Road, the surface of upwards of

1000 acres is lowered at an average five feet from the brick earth dug out, which of ordinary quality has produced 40001, per acre; and when marly, for mains or white bricks, 20,0001, per acres. Brick earth formerly 1001, per acre, now 2004, per acres. An acre at four feet deep yields four millions of bricks, 5 or 10 feet in thickness. S. Lead or blue clay, 200 or 500 feet in depth. 4. Marine settiment, 5 or 4 feet in depth. 5. Loose sand, grarel, and water, the latter arising in such quantities as to prevent digging deeper. Water. Abundant and excellent. The Thaines, from Oxford to Maidenhead, falls about 24 feet in team lies; from Maidenhead to Chertesy Bridge, 13 feet in team lies; thence to Mortiake, 15 feet per ten miles; and to Lomoto, one foot to Mortiake, 15 feet per ten miles; and to Lomoto, one foot to Mortiake, 15 feet per ten miles; and to Lomoto, one foot to Mortiake and the second of t

2. State of Property.

Estates and their management. Generally under the care of atomes, and badly managed.

Temers. Much freehold, considerable extent of copyhold, some church, college, and corporation land.

3. Buildings.

some church, countey, and corporation and.

3. Buillings.

House of propriets, repairs. Oldest built with timber lathed and patents, repairs. Oldest built with timber lathed and patents, repairs. Oldest built with timber lathed the property of the proper

mercial or professional farmers, equal in number to half the others.

Rural artificers. Bad; impossible to get any agricultural implement or machine madeon a good principle by the country artificers; but able mechanics in London; Cottam and Hallen, Wykes and Phillips, Snowden, and especially Weir, a Northumberland man, and practically acquainted with agriculture.

Rud paid in money, sometimes a small part in butter and cream at fixed prices. Varies from 10s. to 10th per acre, or higher for nurseries.

The in mary are a fixed period.

Poor, and the role for thier rolleft, average 5s. 6d. per acre.

Leases, general. Often for fourteen and twenty-one years, drawn up by lawyers—"a composition of obsolete unintelligible covenants."

Expense and profit. Expenses on entering a farm, greater

gible covenants."

Expenses on entering a farm, greater than in distant places: profits seldom more than a mere subsistence to the farmer. The increase of canals, and the prospect of steam carriages and locomotive steam-cupins on railroads, is rapidly rendering distant and near farms and farmers, profits on a level.

5. Implements.

5. Implements.
All bad; plough barbarous; threshing mills rare.

All bad; plough barbarous; threshing mills rare.
6. Enclosing.
Now mostly enclosed. Nineteen commons enclosed from 1800 to 1806, containing 20,000 acres and upwards. Old fences of a mixture of white and black thorn, maple, hazel, briar, crab, damson-plum, &c.; new of white thorn with ditch and bank; gates mostly five-barred, and of oak; enclosures too numerous.

7. Arabic Land.
About 14,000 acres; wretchedly managed, ploughed with teams of three or four horses; rotation generally fallow, wheat,

Grass Lands.

8. Grass Lands.
Meadows better managed; hay-making good.
9. Gardens and Orchards.
From Kensington through Hammersmith, Chiswick, Brentford, Isleworth, and Twickenlaun, seven miles of garden ground; may be denominated the great London fruit garden, north of the Thames. An upper and under cree taken at the learner of the Thames and upper and under cree taken at the learner of the service of the

the surface, and the water is raised from the wells by a bucket and lever, balanced by a stone. (fig, 152:) Three thousand acres of garden ground here, employing five persons, a man, his wife, and three children, per acre, during the winter half-year, and during sammer, five persons more, chiefly Welsh women. Estimated produce 1001, per acre. The performance of the per annum

Nursery grounds. About 1500 acres, producing 75,000t.

Nuterry grounds. About 1000.

Noods and Plantations.
Copses and moods decreasing for ages: still a few acres near Hampstead and Highgate.
Holge-row timber much disfigured by being pollarded or pruned to may-poles.
Willows or outers. Many islets on the Thames, rented by basket-makers, and planted with osiers; also, wet borders of the river so planted. Species Salix vitellina, amygdalina, or almond-leaved, and viminalis, or osier; willows when cat made up in bundles, or boults, forty-two inches round, at six-tande up in bundles, or bundles, forty-two inches round, at six-tande up in bundles, or bundles, forty-two inches round, at six-tande up in bundles, or bundles, forty-two inches round, at six-tande up in bundles, or sufficient in the six of the si

11. Improvements.
Draining, to carry off surface water. The mode of making surface gutters on meadows, by means of an addition to cartwheels (3979.), invented by the reporter.
Manure produced in London by 30,000 horses, 8000 cous, and 700,000 human beings, equals 500,000 loads; of which, half is carried into the Thames by the sewers, including ninetynine per cent of the night soil.
12. Live Stock.

12. Live Stock.

Loss lives took on the farms of this county than in any other: no breeding. Short horned cows of Holderness chiefly used by milkmen: number kept S500; a serage produce nine quarts per day; fed on hay, turnips, brewer's grains, linseed cake and jelly, and grass: retail dealers adulterate the milk, preferring dirty water to clean; and adulterate the cream by adding moiasses and a little salt. Very little butter made in the county. Brewer's drays supplied with horses from the Berkshire farmers, who buy them young from Northamptonshire, and work them two or three years before they self them. Not more than empty wine pipes set upon posts, fifteen or twenty tee thigh, and many kept by journeymen tradesmen, pigeon funciers in the poorer parts of London, and most other towns and villages of the county.

13. Rural Economy.

of the county,

13. Rural Economy.

Half the manual labour done by the job; labourers ruined in morals and constitution, by the public houses. Gentlemen's servants a bad and contaminating set, servants a bad and contaminating set.

14. Political Economy.

Highways of the parishes good, turnpike roads generally managed on Macadam's principle, and good; several canals terminate in or near London; and New River for supplying water; fairs on the decline. Usbridge the greatest corn market next to Mark Lane. Great cattle markets, Hounslow and Smithield. Commerce great. Manufactures not many; considering agriculture as a manufacture, and the soil as the raw material, and worth 16s. per acre, at an average of England; it is increased in value to \$0\$. or \$25\$. per cent. Distilleries and breweries numerous.

it is increased in value to \$\tilde{U}_i\$ or \$\tilde{S}\tilde{U}_i\$ per cent. Distilleries and breweries numerous.

15. \$\tilde{O}bstacles to Improvement.\$

Tithes, land-agents being attorneys, bad leases, bad rural artificers, bad and thiering servants.

16. \$\tilde{D}iscellaneous \tilde{O}bservations.\$

Society of Arts, Yetermary College, excellent institutions. Fines called heritos should be removed; weights and measures leave the service of the ser

7778. SURREY. A surface of 519,040 acres beautifully varied: poor and heathy in the west, chalky in the east, and clayey in the south. The field cultivation of clover and turnips appears to have first taken place in this country. (Stevenson's Survey, 1813. Malcolm's Survey, 1809. Marshal's Review, 1818. Smith's Geological Map, 1821. Edin. Gaz., 1827.)

Smith's Geological Map, 1821. Edin. Giez., 1827.]

1. Geogyaphical State and Circumstances. Climate. Healthy winds S.W. and W.: seldom blows from any point between N.W. and N.E. for any time. East winds in spring, and then weather cold, raw, and drizzling. Most rain falls when the wind is S.S.W. or S.

Soitt. Various and most irregularly distributed; a broad zone of tenacious clay bordering Nussex: patches of brick earth lills from Crodon to Nutfield, and thence narrowing to the western extremity of the county. A good deal of black rich land interspersed among all the soils.

Surfice. St. Annes Hill, Cooper's Hill, and Richmond Hill celebrated; Lethh Hill the highest, commands a prospect of from thirty to forty miles on every ade.

The sum admitted the dearness of the country with the sum and the control of the ciphic and the country with the forty miles of the ciphic and the country with the forty miles of the ciphic and the country with t

made.

Waler. Scarce in many places, particularly on the chalk.

Several supplies procured round London, by boring down from one hundred to five hundred fect to the chalk straum, where

the water is excellent, soft, and abundant. Artesian (from the county of Artois, where such wells were first brought into notice), wells are now so numerous in the neighbourhood of London, that in places where the water formerly rose in the bore three or four feet above the surface, it will now scarcely reach the surface. (Mag. Nat. Hist. vol. ii. and iii.)

Fish pould common on the heaths, at the western side of the county; have been used for upwards of two centuries, for breeding and rearing carp and other fish. One of the largest, containing one hundred and fifty actes, is near Hersham.

nershau. Mineral realers numerous. Epsom water is impregnated with sulphate of magnesia, and is purgative. Epsom salts originally made there, now chiefly from common salt water at Lymington in Warwickshire. The other springs are more or less impregnated with sulphate of magnesia, carbonate of lime, and long.

tess imprepated with surplate of magnesia, carronate of time, and iron.

2. State of Property.

No large estates: largest 10,000l. a year. Yeomanry not numerous; but some gentlemen round Guildford farm their own estates of from 200l. to 400l. per annum. Estates mostly managed by attorneys; so far proper as to law terms, but a farmer to draw up the covenants in technical language. Till the farmer necomes active, inquisitive, free from prejudice, and intelligent, no covenants, or care of attorneys and stewards, will prevent him from injuring himself and his landlord by bad husbandry. When he becomes active, &c. he will take care of the landlord's interest for the sake of his own; and the first step to forcing the farmer to become active and intelligent is to leave him to the exertions of his own mind. Tenures chiefly frechold.

3. Buildings.

Few counties that can vie with Surrey in the number and

that can vie with Surrey in the number and

elegance of its country seats. (Encyc. of Garden, Surrey.) Possesses a great advantage over the north and east of Middlescx and Essex, in this respect, as the prevalence of the S.W. winds drives away the smoke of London. Proprietors generally reside on their estates, and cagerly introduce improvements. Reside on their estates, and cagerly introduce includes the states and offices. Rulnous and mean in the weald, or clavey district bordering on Sussex; better in other places. Oldest of brick covered with slate, stone, or brick nogging and tills; situations seldom central or convenient to the farm, in villages. Stables not divided into stalls. Cow-houses near London, good. Cottages often large, convenient, and pictureque; with a porch, a flower-plat, and vine in front. But the control of the stables are considered to the state of the stables and the stables are stables as the stables are stables are stables as the stables are stables are stables are stables are stables are stables as the stables are stab

Britisting ponds. Great attention paid to these on the Surrey bills; generally a first pond, where the water deposits its grossest dirt and mud before it enters the second.

4. Occupation.

Parms of all sizes, but mostly small, forty and fifty acres to three hundred. Largest farm between Guildford and Farnham is Wanhorough; it contains 1,600 acres; formerly occupied hundred and seventy acres. Tendency to large farms, by which the public is unquestionably benefited, certainly by the saving of labour, and, in all probability, by the superior cultivation and increased produce. The driven out farmer may generally support or enrich himself equally well though in a different line of life. "But in every country, in all situations and circulation and all a now provided the product of the control of life. "But in every country, in all situations and circulation and all a now provided the product of the consider, whether a mere increase of wealth may not be purchased too dearly; whether it be prudent or wise to diminish the number of those whose souls are knit to their native land, by stronger ties than are known to the mere manufacturer. To the patriot, it can be little satisfaction to see his country the richest in the world, if the measures and causes country the richest in the world, if the measures and causes to consider, or by diminishing the number of those who must be its most natural and powerful defenders. To the moralist it can afford little pleasure to be told, that by the saving of agricultural labour, the manufactures of his country will be extended or increased, if the perceive that by the change of arrival and the process of the process of the spirit of commerce, that they prefer selling their grain to an old class about the clayey weals, equal enemies to improvements in agriculture, and relaxations in morals in a lover price than taking a higher from a new one. Go to market in round frocks, the dress of their foreament the reasure and communicative men. Many tradesmen have turned farmers, and occupy land

lives.

5. Implements.
Great variety of ploughs, swing ploughs, the Scotch swing plough used only in two places; bad effect of so many different sorts of ploughs on the servants. The cultivator used by Birkbeck, and highly approved of:— with six horses, goes over eight beck, and highly approved of:— with six horses, goes over eight in a few places, and found to succeed: but it threshes very slowly, and has no advantages over Melkle's, but that of not breaking the straw of wheat. This advantage is too trifling ever to render it general. Very few winnowing machines. Sowing troughs in use, the advantage of which is, that the sower flist it minself instead of having a woman, tolling through stances. (2796.)

crops for eight years. In forming a new road though a field of saintfoin, between Croydon and Godstone, the roots were found to have penetrated several yards below the surface. The culture to the property of the property o

But in small proportion to the rest; most pasture in the wolds. Paring and burning considered by Birkbeck as the best first step of breaking up old grass lands.

8. Gardens and Orchards.

and step of breaking up old grass lands.

8. Gardens and Orchards.

Asparagus grown in great quantities at Mortlake, East Sheen, and Battersea. Radish and other seeds also grown extensively at Battersea. Onions for seed at Mortlake and Barmes: though chiefly at Deptford. Three thousand five hundred acres of Surrey employed in raising vegetables for the London market. Orchards attached to many of the farms, the content of t

ince com, men stacked.

10. Heaths, Commons, and Common Fields.
Extensive heaths on south-west; surface flat, soil back sand, and gravel. A number of commons, and great extent of common-field lands.

11. Improvements.

Draining, paring, and burning. Manuring with London manure of a great variety of kinds.

12. Live Stock.

12. Live Stock.

Very inconsiderable; only six hundred and nineteen cows, kept for supplying London with milk.

Duket of Esher used to rear eatwes to a great extent; many captures to be a read of the stock of the

13. Narral Economy.

Hands scarce; servants unsettled; prejudiced, like many of their masters, against all new practices.

14. Political Economy.

Bad roads, though flints and other good materials abound a constant of the good materials abound the good materials abound the good property.

Bad roads, though flints and other good materials abound westham for general use; the first in the kingdom of that kind, the rest being confined to the carriage of goods belonging to individuals; this open to all who choose to employ the waggons; as a canal is open to all who choose to employ the boats. Though on a level, and admitting of carriage both ways, yet not found to pay. The first canal locks in England were contrivance from Bolland; and, under his direction, the Wey was rendered navigable from Guidford to Weybridge, about 1500. Numerous fairs; several dour, paper, and oil mills. An extensive iron work at Garratlane, near Wandle; a mill for staves at Stoke; a delift manufactory at Mortlake. A horizontal air-mill of a new construction at Butersea bridge; several distillers, brevers, and starch namufactures. Foor, numerous and degraded. Foor's rates enorments.

7779. SUSSEX. A maritime county of upwards of 900,000 acres; distinguished by chalk hills and extensive wealds, a rich soil, but little excellence or variety of agriculture: excels in South Down sheep. (A. Young's Sussex, 1809. Marshal's Review, 1818. Smith's Geological Map, 1819. Edin. Gaz., 1827.)

1. Geographical State and Circumstances.

Climate. Warm in western parts, bleak on South Down hills; westerly gales violent, unroof stacks, hedges injured by the spray of the sea.

Soil. Chalk nearly the universal soil of the South Down hills; clay of the wealds, which constitutes more than half the surface of the county. Rich land about Chichester, and sand and gravel in a few places.

and and gravel in a few places.

Hills. Mineraly. Success or before the soil is chalk. No high hills.

hills.

Minerals. Sussex or Petworth marble used by the statuaries, but not generally. Limestone, ironstone, sandstone, chalk, marl, and fuller's earth.

2. State of Property.

Largest estate 7500l. a year. Most proprietors hold land in their own occupation, and pay great attention to its culture.

ture, as E. of Egremont, D. of Richmond, E. of Chichester, Lord Shetfield.

Lord Shedield.

3. Buildings.
Noblement's stats plendlid, of stone; farm-buildings generally of stone; on the South Downs built of flints: houses very generally faced with tiles, which keeps the walls dry. Corn generally stacked on circular stone piers, which prevents vermin. Sheep-yards, or permanent folds walled round, and furnished with sheds and hay-racks, have been built by Elman and some other eminent sheep farmers on the Downs. Large wooden barns. Cottages of stone, and on the Downs of flints, and more comfortable than in many parts of England. Magnificent semilercular piggery, erected by E. of Egremont, at Petworth.

4. Mode of Occupation.

The most extensive farms on dry soils. Average of the

wealds 100 acres. Size on the Downs 1200 to 2000 acres. Tithe taken in kind in many places, in others compounded for. Poor's rates high.

5. Implements.
Plough with two wheels, large and significantly clumsy. The Rotherham plough introduced, and deemed a real improvement. Several excellent new implements introduced by the noblemen already mentioned.

6. English

6. Enclosing.
County enclosed from earliest antiquity; fields small; lesses very irregular and broad. White thorn fences at Goodnesses were irregular and broad, trained in a masterly manner; being like wells, or rather hogged mannes of verdure ricing from the e

ner; being like waiss or laster to be from the earth.

7. Arable land.

8. Arable land.

9. 8. Grass Land,

8. Grass Land,
Badly managed; overrun with rubbish. One person tri-d
hay olded when stacking; he olded every layer, with a watering
pan and rose, lightly with linesed oil; the hay came out moist
and clammy; and it is said that beasts, and sheep were fond
of it, but it was deemed too hot for horses. Sait sprinkled
on hay when a little damaged found a great advantage; it is
done in stacking.

9. Orchards.
Some considerable orchards, and cider made. One or two
fig orchards at Tarring, near Worthing. (See Encyc. of Gard.
Sueezs.)

fig orcharus at a sub-ps.

Sussess.)

10. Woods and Plantations, 175,000 acres.

County celebrated from the remotest antiquity for the grow h
of its timber, especially oak. County at the conquest one
continued forest, which extended from Hampshire to Kent.

Underwoods out at twelve years, for hoops and hop-poles.

Ash the most profitable underwood. Finest oak timber at

Petworth. 11. Wastes.

11. Wastes.

Of considerable extent to the north of the county. Some hundreds of acres improved by E. of Egremont answer well.

12. Improvements.

13. Improvements.

14. Improvements of Egremont sent for Elkington to find water to fill always B. undertook to do so; intel all his trails and predictions of the effect of certain borings and open cuts, which he caused

to be made, proved abortive and false; no water was found. Failed in three remarkable instances at Petworth, but drained a meadow very well. Lord Egremont considers him as not a scientific drainer, but a very good common drainer, and partitioners.

Failed in three remarkable instances at Petworth, but drained a meadow very well. Lord Egremont considers him and a scientific drainer, but a very good common drainer, and nothing more.

13. Live Stock.

Cattle and sheep among the best in the kingdom; total amount of sheep kept is about \$50,000; cattle red; little dairying; generally breeding and feeding. Oxen worked extensively by E. of Egremont and Lord Sheffield; broken to desire the state of the state

14. Rural Economy.

14. Rural Economy.

15. Political Economy.

15. Political Economy.

Roads bad on the clayey districts, good on the shalky. Rotherriver render of navigable at Lord Egrenom's expense. Pairs
numerous. Manufactures of iron, charcoal, gunpowder, paper,
pricks, and potash. Large court of poor-houses at Eastbourne,
of which a plan and elevation is given in the "Report." In
172, a society was established at Lewes for the encurage1772, a society was established at Lewes for the courage,
tholiroyd, Eq., now Lord Shieffield indured the property of the particular of the particular of the particular of the particular of the breaking out of the war in 1778, it was dropped.

1n 1797 Lord Egremout established a society at Lewes, and
gave large premiums. This society still exists. The particular
and charitable exertions of E. of Egremont are most extensite. He gives a way to proper objects immease quantities of
christmas; and keeps a surgeen, apothicary's shop, and midwite, entirely for their service; they are also inoculated, and
instructed graits, for.

7780. KENT (Cant or Angle) forms the south-east corner of the kingdom, and extends over 200,600 acres. It is diversified by chalky eminences in some places, low marshy grounds on the Thames and part of the sea-coast, and an inland, flat, and woody tract bordering on Sussex, called the Weald, or wood (Saxon). It is one of the oldest cultivated counties in England; it was noted even by Julius Cesar, as "the civilest place of all this isle, and full of riches." Viewed from the great road from Dover to London, it has, with the exception of the Downs near Dover, a more garden-like appearance than any county in Britain. Its agriculture is various; and it is celebrated for the culture of hops, fruits, barley, and various garden crops. (Boy's Kent, 1796. Marshal's Review, 1818. Smith's Geological Map, 1819. Edin. Gaz., 1817.)

1. Geographical State and Circumstances.

freeholds, and a good usal or outrol and charge issues, possed and garekind enurses previous to the hold early it.

3. Buildings.

Twenty or shrity holdemen's seats, and many seats of igentication and citizens, merchants, bunkers, &c.; few modern-built farm-houses; dolt ones of oak or chesturit, and ill consultation of the seat of the consultation of the consultat

6. Euclosing.

No common-field lands but several commons; fences o'd and broad, belts of copies more frequent than thom hedges. Water fences eight to fourteen feet wide, and from three to five fee deep in the mansh lends; joet and rail fences prevalent in Romney Marsh. Neither feners, drains, nor water furrow wanted in I Tauleit, where corn is grown, and often, for years it

Nomery March. Neither feeles, drains, nor bester fibrows wanted in Thanet, where com is grown, and often, for years i succession, without manure.

7. Arabit Lands.

Plough for all crops from five to seven inches deep. Fallow always made on poor lands. Rotations good. Pees of various kinds for podding are sown from the middle of February to the read of March. Leadman's dwarf and the early grey thought the most profile. Canary seed and radish seed much cultivated in Thanet and East Kent for, the London seed-men. Radish seed sown in March, and crop's seldom fit to reap before Octobers, and the seed sown in March, and crop's seldom fit to reap before Octobers, in Thanet and East Kent for, the London seed-men. Radish seed sown in March in Thanet is the produce from eight to twenty four bushels per aere. Sprinchs sown im March in Thanet; when in blossom the male plants (it being a dioccious plant) when the seed on the field a produce, two to five quarters per lacro. Ridney-beans much cultivated at Sandwich and in Thanet for the London seedsmen; plant from five to ting allows per acre bequiled up by roots from Argust to Ortober, tied up in lanches and hung on po'es tortipen; produce, iten to twenty bushels per acre. Cress and white mustard sown at the rate of two or three gallons per acre in March; reaped in July and threshed in the lead; produce, eight to twenty bushels per acre. Weld sown annon heatnes at the last heeing in the beginning of July! ten or twe we last, of seed per acre; pulled when in boom, which Lappens the second year, in July, and ited in single bandfuls and per acre, cress not generally bought by speculating merchants, who supply the duers with sits opportunity offers. Madder formerly rach cultivated at a supportunity offers.

vated in the eastern part of the county, now given up; first cultivated on a large scale near Feversham.

vated in the eastern part of the county, now given up; first cultivated on a large scale near Feversham.

8. Grass.

Hay chiefly produced in the marshes and the weald; pastures for dairying on every farm; but no dairy farms of any extent in the county; lands in Kent seldom changed from extent in the county; lands in Kent seldom changed from the county and the county of the scarcity of hands. In Thanet and East Kent lean sheep and cattle brought in and put on the marshes and meadows till fit for the butcher.

9. Gardens and Orchards.

Near all the great towns a considerable portion of land devoted to the cultivation of vegetables; at Deption and Gravesend are whole fields of asparagus, onions, cauliflowers, &c., it rees; applies, cherries, and filterity, raised among hops, the culture of which causes the former to grow with great luxariance; common practice to plant 800 hop hills, 200 filberts, and forty apple and cherry trees per acre; the hops stand twelveyars, filberts in thirty, and the apples and cherries in alternate among hop without any civent rees; the respirated in holes two feet square, and two spirs deep; pieces of rock taken out; trees stalked and their stems brushed over with lime and night soil, which is said to make them grow exceedingly. The golden remet apple and black heart-cherries, when a few years planted, found to gum and die; yet many old trees in full vigour: cherries do best with land laid down to grass, filleres answords of apples; golden pippin makes good cider alone; no occasion to watch the fermentation of cider in order to rack it off at any particular time, as alleged in Herefordshire; eating apples sand. The former is apples, golden pippin makes good cider alone; no occasion to watch the fermentation of cider in order to rack it off at any particular time, as alleged in Herefordshire; eating apples sand to the former of the control of the produce two to fourteen of cider in order to rack it off at any particular time, as alleged in Herefordshire; eating apples sand to the order o

Woods and Plantations.

Principal produce hop poles, fuel; husbandry wood, and some little for the dock yards; few artificial plantations.

even cwt

11. Improvements.

Open drains made between flat ridges by deepening the furrows; turf and brushwood drains in use; chalk will answer when below the reach of first; see beach and refuse bricks also

used. Several windmills which drive pumps to drain the water from marsh lands. Some bogs drained under the direction of Elkington, and now good meadows. Sea-weed used as manure; several thousand loads are sometimes thrown ashore by one yard dung, which it helps to rot; sand spread on stiff soils without being of any use; powdered kelp sown at the rate of twenty own, the rate of the rate of twenty own, of inner eleven feet. Borders of the Medway below Rochester offer great scope for embanking, and perhaps warping.

12. Live Stock.

Neither a dairying nor grazing county; little attention and

12. Live Stock.

Neither a dairying nor grazing county: little attention paid to the breed of cattle. Romney Marsh breed of sheep remarkable for fatting early. Fine teams of heavy horses kept at a great expense. A few rabbit warrens; the rabbits within these few years affected with the rot. Formerly many pigeons, now few; few poultry but for home consumption; few bees.

13. Rural Economy.

Labour generally done by job; servants, scarce, dear, and save.

Labour generally done by sory

14. Political Economy.

18. Political Economy.

Roads generally good, formed of chalk and flints; or limestone and gravel; roads in the wead'd very bad for want of materials. As clay is there abundant, if duly taken of bricks they will pave a road one mile long and nine feet wide. No canals, but one near Gravesend; I fairs and weekly markets very numerous. Agricultural commerce of county consists chiefly in exporting corn to London markets. Manufactures trifling. At Down and Maidstone paper milis; at the laie of Grain saturorks; in the Wead iron works; and at Whistable and Deptford copper works. Gunpowder made at Deptford and Eversann; calicose printed, and linens whiered; at Crafford annum, by hop picking and other rural employments for their wives and children.

15. Miscellaneous Observations.

Kent Agricultural Society, established at Canterbury in 1795, by Sir E. Knatchbull and F. Honeyman, Esq. Some potatoes dried on an oat klin were found to retain lihelr pro-perties during long voyages, as attested by letters from the vic-tualing office.

7781. ESSEX, 942,720 square acres, the greater part marshy grass lands near the Thames, and the rest arable lands of a mixed culture, chiefly of corn and herbage. It is an old cultivated county; contains many small gardens and seed-farms near the towns, and is one of the few districts in the south-east of England where the plough is drawn by only two horses. (Young's Survey, 1810. Marshal's Review, 1818. Smith's Geological Map, 1820. Ldin. Gaz. 1827.)

1. Geographical State and Circimstances.
Climate mild; north and east the prevailing winds, which bring blights to plants, and cold and horseness to animals; ague general both in the high and low lands.
Soil almost every where a loam, and more generally heavy than light. Generally well adapted for grass or corn.
Surface beautiful about Havering (Have a ring) from Romford to Lord St. Vincent's and Lord Petre's, both fine seats on the Stour; also very fine from Sharbury to Harwich.
Water abundant, in rivers, creeks, and springs.
2. State of Property.
Estates vary much in size from 51, to 20,000t. a year: in no

980

Ballin of Land

county a greater population of small and moderate-sized farms occupied by their owners. Managers of large estates sometimes large estates sometimes attorneys, capital far-mers, or private gentle-men. Farmers of all sorts; land held by far-mers on short leases, often at will, sometimes on eight, ten, or twen-

often at will,sometimes on eight, ten, or twenty-one years' leases. Some of the seed or garden farms neatly laid out (fig. 980.).

3. Builtings.
Wanstead one of the largest houses in the kingdom; in 18125 pulled down own. Milkly Hall a most striking place. Gosstield and Thorndon, the latter Hall a most striking place. Gosstield and Thorndon, the latter finely wooded by the scientific Lord Petre. Manyothers: hutsome districts of the county with very few seats. Farm houses good,outbuildings numerous and convenient; expensive rick covers and barns. Cottages not

very good; some built on a better plan (fig. 981.) by the Duke of Buckingham, with a garden of one fourth of an acre to each. Joseph French, at East Horndon, finding labour duar, and servants difficult to be got, took the plan of fixing them by building them cottages and attaching gardens.

deer, and servanis difficult to be got, took the plan of fixing the common distribution of the plan of the common distribution of the plan

6. Enclosing.
Essex for ages an enclosed county; still some waste to enclose. Hedges broad and mixed plants, and with pollard trees.
7. Arable Lands.
Cultivated better than nine in ten of the other counties; plough with two horses or three horses alreast without a driver; fallows universal; produce for a locations cultivated to a continue of the co

9. Gardens and Orchards.
Some cherry orchards at Burnham; many cottages without gardens.

• 10. Woods and Plantations.
Fifty thousand acres, chiefly natural and ornamental scenery. Some fine old elms at Gosford. At Saint Osyth the three original Lombardy poplars which Lord Rochford brought from that yabout 1758, and from which the greater part of those in the kingdom have been raised; they are seventy feet high and seven feet three inches in circumference, five feet from the ground; a Portugal laurel more than fifty-two yards in circumference, and a very large 4 rbutus. The largest abele trees in England at Belthouse, Aveley; large elms; Lord Petre has bark. Oaks at Hatthield worth 100 guineas each. Hatthield broad oak celebrated, but now in ruins. An oak at Wimbish increased in girth four and a half inches in thirteen years; a larch, two feet nine inches in the same time; the larch, however, was younger. ever, was younger.
11. Wastes.

11. Wastes.

Fifteen thousand acres; said that in James the First's time almost the whole county was waste.

12. Improvements.

A good deal of draining; a machine in use like the Flemish moullieleset (Fig. 59) for lovering the surface of ploughed lands at those places where they intend making cross-furrows to carry off the water from the regular furrows. The draining wheel (3978.) in use, inventor not mentioned. Chaik much used as a manure.

13. Live Stock.

Essex never famous for this branch. The largest dates.

Bear Lever through the control of th

birds in Mersea island, the largest in the county. Every person that approaches a decoy takes a piece of lighted tu.f stuck

983 99 annina annin a

on a table fork in his hand, to prevent the ducks from smelling man. Without this caution they will quit the pond. A decoy at Goldhanger, at which one waggon load and two cart loads of dun birds were taken at one haul of the nets; but the disturbance so frightened such as escaped, that no more were taken at one haul of the nets; but the disturbance so frightened such as escaped, that no more were taken at one of the such as escaped, that no more were taken that season. Seven fish ponds at Epishs Priory, belonging to thirty acres, once completely sluiced and carefully cultivated, now dry and neglected.

14. Rural Economy.

Labour done generally by the piece.

15. Political Economy.

Roads mostly good; few canals; various fairs; and some cattle markets. In the creeks of Crouch, Blackwater, and other rivers and estuaries, considerable quantities of systers are deposited for breeding. The produce is afterwards dredged and deposited at Wivenhoe and other places for feeding. What are called Colchester oysters are feed there, and sent to to London. Oysters are also dredged on the Hampshire coast, and fed in the Coln, or Colchester beds. No distinct account of the oyster economy, however, is given in the report. There are salt-water ponds for various sorts of sea fish in Poulness island; the fish are caught in weirs on the extensive sandy coasts, and deposited, when plentiful, in these ponds, whence they are dragged for with small nets, as wanted.

In the Control, and the plentiful, in these ponds, whence they are dragged for with small nets, as wanted.

In the control, also of sacks, hop bages, calinoes, baize, line, bricks. Much baize made at Colchester, Coggeshall, and ther places, for Spain. A society of agriculture at Chelmsford.

7782. HERTFORDSHIRE. A surface of upwards of 400,000 acres, the north part forming a chalky ridge, which extends across the kingdom in this direction; the general features are rich, woody, and the agriculture various, chiefly tillage; the corn produced equal in quality to any in the kingdom. Ellis, a well known agricultural author, farmed in this county. (Walker's Report, 1795. Arthur Young's Survey, Marshal's Review, 1818.)

1. Geographical State and Circumstances.
Climate, dry and healthy.
Sol, chiefy loam and cley loam, next chalk, and a small sold, chiefy loam and cley form, next chalk, and a small sold, chiefy loam and cley gravel; vales, rich sandy loams, chiefy under pasture, and woods very beautiful. Naturally barren, but rendered fertile by careful cultivation.

2. Property.
Much divided, the county being a favourite one for wealthy persons building villas and other retreats. 7000/. a year the largest estate; great part copyriold, which sells here at six years' purchase less than freehold.

3. Buildings.
Hatfield, Cashiobury, Ashridge (partly also in Bucks), Gerlambury, Brocket, the Hoo, the Grove, Gistone, Ware Park, one of the best in the county. Immuse barns at North Mims and Bedfordbury. Gutters to the eaves of farm buildings at Alkenham; wide fattening stalls, with conveniences for giving hay, water, and oil-cake. Cottages seldom with land attached. A moveable sheep-house at Hillhouse, a cumbrous expensive affair, of which plans, sections, &c. are given in the report.

Occupation.

4. Occupation.

Farms small, largest 500 acres; many of the very small farmers who rent 30% a year worse off than day labourers. Sir John Sebright, of Beachwood, a scientific breeder, farms 700 acres, 500 of which are in arable and well cultivated. The Earl of Bridgewater, at Ashridge, farms 500 acres, besides the park of 1080 acres. The Marchioness of Salisbury farms 200 acres, besides the park of 1080 acres, and has made many curious experiments; a prejudice against leases.

5. Implements.

Plough large and unwieldy, with two large wheel, the same as figured in old farming books 150 years ago. One or two threshing machines of Meikle's kind. (fig. 984.)

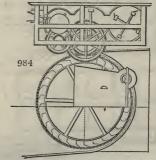

as figured in old farming books 150 years ago. One or two threshing machines of Melkie's kind. (Jfg. 984.)

6. Enclosures.
Various, but still some commons and open fields; old fences of mixed species; new ones of thorn; planting well understood, but the cut with the lill made in a direction downwards instead of upwards, as in Berwickshire, by which the stem few strong healthy shoots.
T. Arabie Land.

By far the greater part of the county in tillage: crops chiefly wheat, barley, and oats; turnips and clover supposed to have been introduced in the tilm of Oliver Cromwell: depth of ploughing generally four or five linches. Greg, who has written a tract on managing clay lands without naked fallows, one in three, five, or seven years, or drilling. Turnips cultivated broad-cast, and very poor crops produced; the introduction of turnips in this county attributed to Cromwell; who is said to have settled 1004. a year on the farmer who first green them. Cabbages grown to a large size by the Marchiouses of Salisbury, for cows; large red sort preferred. Carrots, parsneys, beets, &c. cultivated by the Marchiouses on her experimental farm. Good saintfoin on the chalks. Drilling

corn crops with Cooke's drill practised in various places. Watercress for the London market, cultivated in the streams at Rickmansworth. Sixty acres of furze for faggots at Ashridge. 8. Grass.

all, and chiefly a narrow margin near Barnet, Quantity sn

on which hay is grown for the London market; some good meadows on the Stort.

9. Orchards.

Apples and cherries abound in the S.W. corner of the county on farms of from twenty to fifty acres. In ten years after planting, cherry trees begin to hear; produce till the twentieth year, six dozen pounds; when full grown, fifty dozen pounds; price, ten-pence to three shillings a dozen. Corroon, and small black, the favourite sorts. Kenish will not thrive here. None of the apples for cider: orchards kept in great but more than the story of the story of the story of the story or the story of
Woods.

10. Woods.

The copses kind shound in the northern and in many parts of the county; produce faggot wood and hurdles; cut at twelve years; black willow, ash, and hazel, best for hurdles; alders bought by turners and patten-makers. Fine woods, natural and artificial, at the Earl of Clarendon's, the Grove, near Watford. A superh oak at Fambanger, Earl Cowper's; sevens oak in 1709; on's a soil gravelly above, but, doubtless, clay below. The timber in Moor Park of great antiquity, and in a state of decay; many immense pollaris; and, on the whole, one of the nost forest-like parks near London. Vast oaks and beeches at Adridge and Beechwood. Beech excels there; also leaches at Adridge and Beechwood. Beech excels there; also leits. Beech sold to turners, chair-unakers, and for barrel staves.

11. Improvements.

11. Improvements.

11. Improvements.

12. Improvements is underdraining clay by numerous parallel cuts filled with straw, wood, or stones general: manuring well understood; much brought from London of every sort; bones, soot, sheep riers' elippings, bone-shavings, malfetuist, bair, sticklebacks, Scc. Top dressings more frequent than in any other county. Chalk a very common nature on clayey soils; laid on unburned, and left on the surface to be polverised by heat and rains, or forest and thaws; then harrowed with a bush harrow, to spread it, and ploughed in. Some irrigated meadows at Rickmansworth and other places; but the frequency of mills is against the process.

12. Live Stocker, hay, and straw carried to London, and manure brought out in return. Sir J. Sebright prefers Suffack cows and horses, and uses the Witshire sheep. A good many house lambs suckled about Rickmansworth, fed with grains and malt-dust in winter. Folding sheep generally approved of. Soiling with clover and tares common. Grey works suffolk oxen in harness, four to a team. Hon. G. Villiers prefers the Glamorganshire oxen for work; and thinks stall-fed

oxen can hardly be kept too warn: prefers eil-crake for firitaling to every thing else; Lady Salisbury has the wild breed of his found to answer well. Stevenson, the bailiff, bred a gardener, which renders him a superior cultivator of green crops. Lord Clarendon feeds deer (7375.) and sells them. Poultry at the Grove kept in wheeled coops about rewle feet long and two and a haif wide, boarded on one side and open on, the tends them to keep away hawks. In the poultry-yard distinct houses for all sorts of fowls; the roosts so contrived that they may not dung on one another.

13. Rural Economy.
14. Political Economy.
15. Good roads; few manufactures excepting plaiting straw, which is very general in the country, especially about Dunchsly and white land, and such as grows under trees or near hedges preferred. The plaiters give from two-pence to four-pence a pound for it, and sort it themselves. Much malt made about Ware and Hertford for the London market.

7783. BUCKINGHAMSHIRE. 478,720 square acres of hilly surface, and chiefly of clayey or loamy soil; a considerable part chalky, and the agriculture nearly equally divided between tillage and grass. (Survey by St. John Priest, Secretary to the Norfolk Agricultural Society, 1810. Malcolm's Survey, 1794. Marshal's Review, 1818. Smith's Geological Map, 1820. Edin. Gaz. 1827.)

1. Geographical State and Circumstances.

Climate, cold and windy on the Chittern Hills.

Soll, chielly clay and chalk, with some gravelly loarn;

Chilterns wholly chalk; vales generally clay.

Minerula. Some ochre, used in painting; a quarry of good

narble at Newport, but too deep to be profitably worked; a

freestone quarry near Other.

Water. Numerous rivers and canals for sending produce to

market; but often filled with weeds, bushes, and other ob

and couls, with. A care respectively the reporter as a remedy.

2. Property.

2. Property.

3. Some large estates, as those of the Dukes of Bedford, Buckingham, &c.: tenures very various: a description of lands here called yard lands (wirgual terra), which entitle the holders to certain rights of common.

3. Buildings.

Stowe, and Asbridge (the latter partly in Herts), the first of Grecian, the other of Gothic architecture, the two noblest manisons in the county. Tryingham, Wycombe Abber, &c. and the county of the county of the partle with the county of the county of the county of the partle with the county of the county of the partle with the partle w

quently white-washed, to keep them free from bugs. A foot-bridge at Fawley Court, moveable upon two pivots at its ends, and being heavier on one side than the other, always hangs perpendicularly, excepting when any one walks upon its light side, when the weight of the person keeps it flat: hence it admits the passage of men, but not stock: cottages good, and mostly with gardens attached: some at Britchill worse than piggeries. Sir J. D. King gives premiums for the best cultivated gardens; also gives clothing and other rewards for good conduct in servitude.

4. Occupation.

A Occupation.

4. Occupation.

Sire of farms moderate: number in the county 2039; oneof 1000 acres, one of 900, four or five between 600 and 700
acres, ten between 600 and 600, twenty-four between 400 and
500, and the rest from 400 down to ten acres; average, 179
acres. Westcar, of Kreslow, a celebrated grazler, occupies
900 acres, of which only between sixty and seventy are arable.
Very few leases, and those given with very objectionable covernants. Lord Carrington and other more enlightened proprietors graat leases.

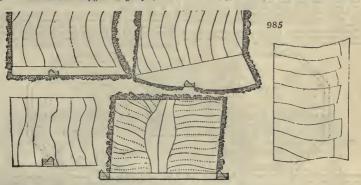

5. Implements.
Swing ploughs and four horses in a line common.

6. Enclosing.

Has gone on rapidly; old hedges mixed, and with many ash
and oak pollards.

7. Arable Land.

Ridges high, crooked, with waste spaces between, around, or
at the ends (fig. 985). Fallow in general every third year,

most common rotation fallow, wheat, beans: chief grains, wheat and barley; beans drilled and hand-hoed; some turnips on the light lands.

Grass.

on the ingit same.

A series prominent feature; those in the vale of Aylesbury, especially there to Bleester, very rich; generally fiel, but co-casionally mown. Removing authilits called banking, a piece of management to which the renters of grass lands are generally bound in their leases. They are removed by skinning, gelding, or gutting, and kept down by rolling; thistics are spudded; size of grass fields from 20 to 500 acres.

1. Cardens and Orchards.

1. Cardens and Orchards.

1. Woods and Plantations.

Willow pollards planted round the margins of fields, on soils suitable for hurdle wood. Birch, the most common timber, very abundant; chiefly used for manufacturing chairs: woods constantly full of young plants from the mast, which grow up and same soil and surface for ages. At Shardcless, a beech seventy-five feet from the ground, to the first bough: oak and beech times it was a surface for ages. At Chardcless, a beech seventy-five feet from the ground, to the first bough: oak and beech times in the process of timber: very fine beeches at Missenden; mest given to pigs.

11. Improvements.

Draining much wanted; well performed on some bogs on the Dute of Inchingham's estates by digging a well and boring in the bottom till the spring was tapped, and then leading it off in an underdrain; paring and burning in general use for bringing grass land to tillage: chalk much used as a manure, sixty or seventy loads per acre, once in twenty-one'years, or forty once in twelve years; allowed to lie on the surface for one winter at least before being plottighed in. Only one instance of irrigation worth notice, which is at Cheynies, by a tenant of the Duke of Bedford.

10. Live stock.

Cattle kept den.

Duke of Bediord.

Lot. Free stock.

Lot. Free st

generally kept in flat vessels of lead; some wooden trays, tinned, in use; skimmed every twelve hours; in some few places three times a day; cream from first two skimmings kept y itself; the third skimming makes what is called after-butter; skimming dish, if tin, circular, a foot in diameter, with holes in it, and a handle upon the top of it; butteen; yet a horse; time allowed for the butter to come, an hour and a half; butter made up in lumps of two pounds each, and sent to London in square flat baskets, eleven inches deep, holding from thirty-six to 120 pounds. They have each on three of their sides three marks, the number of pounds the basket holds; a letter, denoting the farmer's name from whom it is received, and the name and residence of the carrier. The baskets and butter cloths are the property of the carrier. The baskets and butter cloths are the property of the carrier. The baskets and butter cloths are the property of the carrier. The baskets and butter follows and the property of the carrier passes, and to make his agreement with his butter-factor in London, and receive monthly, or otherwise, the payment. Quantity of butter made, six pounds per cow per week, at an average, when in good keep, and not nearly dry. Calves generally sold to sucklers; a few suckled in the county, and a few brought up as stock.

Shep. Culture directed to the fattening of lambs, and the breeds preferred are the Dorset, and next the Gloucester and Blosses generally solied; five or six put to a plough in many laces, and never less than three. A team of assest kent by

Berkshire.

Horses generally soiled; five or six put to a plough in many places, and never less than three. A team of asses kept by the Duke of Buckingham for the use of his garden; many used at the potteries at Amersham.

Hogs, an important article on account of the milk from the diaries; breed the Berkshire, and next, the Chinese and Australia.

Suffolk.

Suffolk. Ducks, a material article at Aylesbury and places adjacent; breed white, and of an early nature. They are bred and lrought up by poor peoples, and sent to London by the weekly carriers. One poor man had before his door a small plt of water, about three yards long and one yard broad: at two corners of this pit are places of shelter for the ducks, thatched with straw; at night the ducks are taken into a house. In one room belonging to this man (the only room he had to live in) were on the l4th of January, 1808, ducks of three growths, fattening for the London market; at one corner, about

seventeen or eighteen, four weeks old; at another corner, a brood a fortnight old; and at a third corner a brood a week old. Ducks six weeks old sold at that time for twelves shillings a couple. Besides the above, there are other persons who breed many more ducks than the person now mentioned, and, as far as it was possible to discover, this person sends 400 ducks in a year to London. Allowing, then, forty persons to send only as many, at an average of five shillings per duck, the return of ducks from Aylesbury alone will amount to 40000, per annum. This return has been magnified into 20,0000, per annum.

annum.

13. Political Economy.

Bye-roads extremely bad and dangerous; difficult to be discovered from mere drift ways; turnpike-roads, not to be commended; canals various and useful; grain sent to London at the poor; no agricultural society in Bucks. Principal manufactures paper and lace.

14. Miscellaneous.

two sminngs per quarter. Box clubs generally established for the poor; no agricultural society in Bucks. Principal manufactures paper and locs.

In calculating the number of acres, Priest the Reporter tried the mode, first shown by the Bishop of Liandaff, of weighing the portion of paper containing the map; he next took an exact copy of Cary's map upon paper, by tracing its outline, after the map was strained upon a canvass blind at a window. This copy was cut out with great exactness by a sharp pointed knife, and then divided into pieces, which were so neatly laid together, as to form at the period of an assumed parallelogram of the principal parallelogram of the period of an assumed parallelogram of the period of the period of the parallelogram and that formed by the pieces of the copy were laid, and cemented by gum-water, so as to fill all parts of a right-angled parallelogram shorter than that assumed; the difference between the assumed parallelogram and that formed by the pieces of the copy of the map, was accurately measured and subtracted from the assumed parallelogram of acres in Bucks. Thus then we have the number of acres taken from Cary's map, by weight 396,015, by measure, 31,040. From which, if we take an average, we shall probably state it as accurately as it can be found to be, 395,526 statute acres; which, for the sake of round numbers, we will call 395,600 statute acres.

7784. BEDFORDSHIRE. An irregular parallelogram of 290,000 acres, not much varied in surface, and for the most part of a clayey soil. The agriculture chiefly directed to the raising of wheat, barley, and beans, but of an inferior description in many respects. Little pasturage; scarcely any market orchards, but good vegetable gardene setablished at Sandy, on the east of the county, from time immemorial. Great exertions made in every department of culture by the late and present Duke of Bedford, by whom were employed many valuable men in conducting improvements, as Farey, Smith, Salmon, and Pontey. A valuable set of experiments on grasses, conducted by Sinclair under the direction of the present Duke. (Stone's Bedfordshire, 1794. Batchelor's Bedfordshire, 1808. Marshal's Review, 1818. Smith's Geological Man 1890) Map, 1820.)

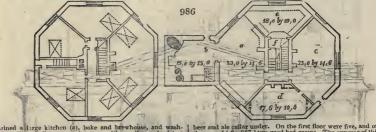

Map, 1820.)

1. Geographical State and Circumstances.
Climate, mild, genial, and favourable to the growth of vegetables; rather later than Hertfordshire; prevalent winds S.W.; coldest winds N.E.
Suil, chiefly clay, next sand, and lastly in the southern extremity embracing Herts, chalk. Some of the sands grey sites, and producing nothing but heath, others more losmy, as about Sandy, which is supposed to contain the best garden-ground in the county.

Minerals, some ironstone; limestone abounding with corma animonis and other shells, petrified wood, gryphites belemnies; freestone, chiefly lime, at Tatternhoe.

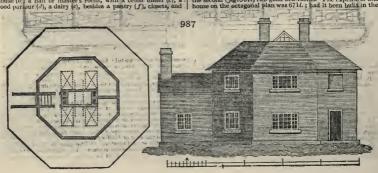

Water. Principal river the Ouse; several mineral springs.
2. State of Property.
Duke of Bedford's estates the largest, next Lord St. John's and Whithread's: united rental estimated at 40,000/c. a year, Estate managers attorneys and considerable farmers. 3. Buildings.

S. Dillittings.
Several farm-houses were formerly the seats of gentlemen who farmed their own estates. Farm-houses in general badly situated, seldom at the centre of the farms to which they belong, and generally consist of plecemeal erections. Francis, Duke of Bedford, erected an octagonal farm house, on a most commodious plan. (fig. 986.) On the ground floor it con-

tained a large kitchen (a), bake and brewhouse, and washhouse (b), a hall or master's room, with a cellar under (c), a good partour (d), a dairy (c), besides a pantry (f), closets, and

beer and ale cellar under. On the first floor were five, and on the second (fig. 987.) two good bed-rooms. The expense of this house on the octagonal plan was 6711.; had it been built in the

square form it would have cost 7534. It is built of brick, slated, and was designed by Mr. It. Salmon, a well known mechanist, resident at Wolurn. The same accommodations on a square plan forms a house more convenient for placing furniture (fig. 988.) Watte and dab, that is, clay plastered on heige-work of splinters, or on wood frame-work, and also the Pise manner of clay working, in use in some places, both the Pise manner of clay working in use in some places, both dependent of the place of t

good cottage walls.

4. Occupations.

Many farms of from 200 to 500 acres; average 150 acres; Duke of Bedford's farms generally of the average size. Farmers much improved by the example of Woburn and the annual meetings. The experiments made by Frances Duke of Bedford were to accretain covery comparison between large and annual cattle as to food; comparative value of different foods, &cc. Tithes mostly in lay hands; farms held generally from year to year, some on leases of fourteen or twenty-one cars.

Plough of the swing kind, with a wooden board and a wedge nailed on as a mould board, one fixed handle, and a loose one called a plough staff; the whole singularly rude, though in general use throughout the county. Improved forms of all machines the county, in the control of the county of the county in the county of the county three fourths of the county unenclosed, now chiefly enclosed.

7. Arable Land wretchedly ploughed.

Fallows, which occur on the clays generally once in three

Formerly three fourths or the county unencosed, now smeary enclosed.

7. Arable Land wretchedly ploughed.
Fallows, which occur on the clays generally once in three years, badly worked. Usual crops are fallow, wheat, beans, or fallow, barley, beans; turnips common on the sands and by the Duke of Bafford, who found it yield ample produce; had twelve acres which, in 1797, kept six sheep per acre from the second week in April til 12d July, and then seven per acre to end of October. Sheep thrive well and free from diseases.

8. Grass Land.
Of very limited extent, and in many places covered with sedge (Carex), and anti-fills.
9. Gardens and Orchards.
Gardens of Sandy and Cirtford long celebrated for the exgranges of Sandy and Cirtford long celebrated for the exgranges.

cellence and abundance of their culmary regetables. Soil a deep said, of a yellowish brown colour; products peas, beans, cucumbers, podatese, paraneps, and carrots, radishes, calibage plants, and turnips, sent to market in all directions to the distance of sixty miles. Cucumber chielly to London, and sold at ten and twenty shillings a bushel for picking. Ordards small. Potatoes, gooseherries, and other small fruit grown in cottage gardens.

10. Wonds and Plantations.

About 7000 acres, situated on the slopes of hills on cold marly clays. Various new plantations formed by the principal proprietors, especially the Duke of Bedford. Furze grown on some of the sandy hills, for burning lime. Some fine trees of the silver fir, and others of the genus Pinus at Woburn,

planted under the direction of the celebrated Miller; a fine beech, figured by Pontey in his Forcet Pruner.

11. Wastes.
Four thousand acres of chalky down at Dunstable, not much any where else.

12. Improvements.
A record fined by below the conceptable hours.
Filtington's mode said.

12. Improvements.
A good deal drained, especially bogs. Elkington's mode said to have been tried with very partial success. Bush and straw-draining attempted on the clavey solis, and the mole plough a good deal used in the furrows. Irrigation introduced by the Duke of Betford, and various examples are to be found in different parishes on his Grace's estates. Peat is used as fuel, and also burned for the ashes as a manure; ample experiments made on manures, by Dr. Cartwright, at Woburn; but no agricultural experiments on a small scale can be depended on. The dairy at Woburn (fig. 989.) is a fanciful structure in the Chinese style; but the plan and arrangement is not well calculated for keeping milk and butter coof- and sweet.

13. Live Stock.
Cattle a mixed breed of long and short horned Alderney, &c. Some distring conducted as in Buckinghamshire. Some distring conducted as in Buckinghamshire. Some distring conducted by the Buckinghamshire of the Bucki

county, and is very useful; fairs and markets various; manufactures chiefly plaiting of straw and lace; children of ten of twelve years of age acquire the art of plaiting, while their mothers sort and bleach the straw. Lace-making a more sedentary employment, and the women and children generally appear sicily. There are school-mistresses for teaching both straw plaiting and lace-making, Elegin to learn to make lace at straw plaiting and lace-making, Elegin to learn to make lace at straw plaiting and lace-making, Elegin to learn to make lace at earn two shillings a week, at sixteen as much as can be made by the business, or nearly its shillings a week; work in summer from six o'clock in the morning till sunset, sind in winter from mine till eleven at night; maid servants scarce in consequence, but poor rates kept down. Some rush mats made part from intended to see a supplied to the second of the men cultivate

an acre and a haif of garden-ground, and weed and keep in order twenty-five acres of sward land attached to the house. The old women spin flax to make linen for the use of the trace of the state one sixth of the earnings of the poor is paid weekly to those who work, by way of gratuity. The Governor of the House of Industry adds, that the above employments have answered the most sanguine expectations of the directors of the establishment."

Many useful henefit clubs.

shment."
Many useful benefit clubs.
16. Obstacles to Improvement.
Want of knowledge and leases. Mice generally destroyed by

Wanter knowledge and sease. A since general necroyed by 1785. HUNTINGDONSHIRE. A dull flat surface of above 200,000 acres; till Edward the First's time one continued forest. The name of the county is said to be derived from the facility it afforded for hunting. The soil is almost uniformly good, but injured by water; it is feliefly under tillage, but remarkable for no excellence in agriculture. Rape-seed and mustard are more cultivated than in most other counties, and timber more rare. (Stow's Huntingdomshire, 1793. Maxwell, 1793. Parkinson, 1811. Marshal's Review, 1813. Smith's Geological Map, 1821. Edin. Gaz. 1827.)

1. Geographical State and Circumstances.

Climate, tolerably healthy, considering that the east part is skirted by fens, and but a small part supplied by water from

skirted by tens, and but a small part supplied by water from springs.

Soil. Joan prevalent, but the county every where spotted with roundish patches of clay, sand, marl, fen, moor, or lakes, which, in the map of soils annesed to Parkinson's Report, assumes a very singular appearance.

Water chiefly supplied from ponds, surrounded by reeds and other agency to the points, and a considerable zone of marsh or bog, according as the soil may be loam or sand. Whittlesen Mere contains 1570 arcs, but is not above two feet deep. It abounds with fish and wild fowl.

State of Property.

2. State of Property.
Old enclosed lands in the hands of a few proprietors; half the county freehold, the remainder almost all copyhold.
3. Buildings.

5. Dillulings.
Farm-houses very inconveniently situated, partly owing to the want of high and dry sites on central parts of farms; some good cottages lately erected as the only means of retaining farm servants for any length of time with the same master.

Occupation. Many large farms, though small ones predominate; leas frequent; tithe in kind.
5. Implements.

Plough, with one handle, originally from Holland; one wheel, circular plate of iron which is kept sharp, acts as a coulter.

Plough, with one handle, originally from Holland; one wheel, a circular plate of iron which is kept sharp, acts as a coulter.

6. Tillage.
Plough, with a pair of horses, or three abreast; two crops and a fallow the common rotation; chief crops, wheat, oats, and bems; rape sown on the fens; lands either once ploughed out of grass, or pared and burned; also on uplands; manured and treated as turnips; seed threshed in the field; straw generall; burned, or used for yard fences; wheat succeeds well

professional rat catchers; some farmers keep ferrets for the rats. Larks destroy a great deal of new sown wheat. They, with other birds, are very abundant in Bedfordshire, especially about Dunstable, where they are caught in traps, in quantiles for the London market. Wire-worms supposed to be increased by artificial grasses.

artificial grasses.

17. Miscellaneous.

An agricultural society founded by the Duke of Bedford in 1801; various premiums offered and paid, to the extent of 1001. a year in some years. Cheap publications on agriculture, it is thought, would be a considerable means of improvement

after rape; hemp sown in a few places; mustard cultivated with great success: sometimes pays 40t. an acre on land worth not more than 50t, but very uncertain. Parkinson thinks hemp, flax rape-seed, and mustard, should be encouraged, as they enrich the farmer, and are all good preparatives for wheat. The only way, he says, to enrich the soil, is to enrich the farmer first.

7. Grass. 7. CTGSS.
Some good meadows on the Ouse and Nene; the pastures
lie remote from the farm buildings, but are in general rich,
though neglected; require to be pared and burned, and
brought under aration.

8. Woods and Plantations.
A good many pollard willows in the fens, and some osier plantations.

9. Improvements.

9. Improvements. Great want of a general county drainage, such as that of the Bedford level, in the adjoining counties of Lincoin, Cambridge, and Northampton. The advantages of such a drainage is ably pointed out by Parkinson. Embarkments very extensive, and the soil being in general a loose porous sand, puddle walls are generally made in the middle of the mound.

10. Live Stock.

10. Live Stock.
Stillon cheese, now chiefly made at Li:tle Dalby, in Leicestershire; is no longer made at Stilton, though it is supposed to have been originally made there about 1720; or, according to some, by a Mrs. Orton, in 1730. A good many horses bred, and a mixture of Lincoln and Leicester; folding sheep much practised. No fewer than 271 pigeon-houses in this county, and a few bees; one gentleman cultivates rabbits.

and a rew bees; one gentleman contivates rabbas.

1. Political Economy.

Bad roads; a lace manufactory at Kimbolton; a paper mill at St. Neols; two sacking manufactories at Standground; an agricultural society at Kimbolton.

7786. CAMBRIDGESHIRE. A flat or little varied surface of 437,040 acres, generally of good soil, and having about one third under tillage; remarkable only for the extent of its fen lands, and their embankment and drainage, both very imperfect. The valley watered by the Cam is called the Dairies, being almost entirely appropriated to dairy farms. Horses are a good deal bred in the county, and also pigeons. (Vancouver's Cambridgeshire, 1795. Gooche's Cambridgeshire, 1807. Marshal's Review, 1813. Edin. Gaz. 1827.)

1. Geographical State and Circumstances.

Climate. On the uplands dry and healthy, but in the fens the contrary there the inhabitants suffer most when the fens the contrary, there the inhabitants suffer most when the fens began to be better drafted.

Soils are very irregularly distributed; loam, clay, and rich black earth extend themselves in irregular masses, and nearly of the same extent. The soil of the fens, is rich, black and deep, and may occupy a third of the whole surface. The rich marshes in the vicinity of Wisbeach consist of a mixture of sand and clay, or slit, a sea-sand, finely pulverised by the acluding and tender clay. There are no minerals.

Rivers. The Ouse, the Granta or Cam. The Ouse and tender clay. There are no minerals.

Rivers. The Ouse, the Granta or Cam. The Ouse and tender clay. There are no minerals.

Rivers. The Ouse, the Granta or Cam. The Ouse and tender clay weather by the acluding the pen in frosty weather by the county, and the old and new Bedford rivers. All these are navigable for barges, and are kept open in frosty weather by the be bast, drawn down the stream by eight horses, four on each side.

2. Estates.

Vary much in size. Those of Lord Hardwicke, Duke of Bedford, Duke of Rutland, Sir H. Peyton, and Thorpe, are considered with the off Rutland, Sir H. Peyton, and Thorpe, are considered with the off Rutland, Sir H. Peyton, and Thorpe, on the constant of the size of the constant of the constan

3. Buildings.
Farm-houses and premises in general bad and inconvenient; lath and plastes or clay and wattle, the common materials, and church greatly valls in general use. Jenyus, of Bottisham, has adorted Arthur Young's plan of building stacks on frames, which run on an iron railway, and are pulled into the barn, where they are forked on to the platform of the threshing machine. Cottages "wretchedly bad," except a few built by Lord Hardwicke, and some other gentlemen.

4. Occupation.
Farms from 20 to 100 acres; many from 100 to 1000, but few sexced the latter number; tithes taken in kind in many places.
5. Implements.
When the party iron wheel, or running coulter, as in

5. Implements.
Ploughs, with a sharp iron wheel, or running coulter, as in fluntingdonshire. Shepherd, of Chippenham, has invented a variety of implements. Some threshing machines, and the best Lothian implements, at Lord Hardwickes. The Ety bear roller is an iron roller, with a number of pieces of iron like small spades fixed into it. It is used in the fenny districts for cutting up the weeds, which choke up the slow running rivers. The horses walk along the bank, and draw it several times up and down the river. The weeds are thus rooted up, and carried down the stream by the first flood.

6. Arable Land.

6. Arable Land.

Ploughed and cultivated in general as in Huntingdonshire; hemp is cultivated more extensively; flax is grown, and mustard, near Wisbeach and Outwell; a few lentils, as in Huntingdonshire, but are considered of less value than tares. The reporter says, a second crop of mustard is obtained by what shells from the first, and that mustard springs up in land where it has not been cultivated for upwards of a century. Woad is no cultivation, and for every forty acres a wood mile; and where it has not been cultivated for upwards of a century. Woad is not cultivated to tutting and bunching; owing to the improvement of the fens, they are now becoming scarce. Whiteseed (Pòa aquática), or fen hay, is produced on many parts of the fen lands, and even on such parts as have been dug for peat. The land is inundated till the crop appears above the water, and then, wherever it can be effected, it is let off; in other cases the grass grows to a great height in the water, is mown twice in the season, and often produces two tons per acre each time. The hay is esteemed valuable for cows; causing them to produce much milk, and, it is said, giving the particular flavour to Cottenham cheese.

7. Grass Lands.

7. Grass Lands.

Extensive; some under no management, and of little value; others very productive, both as hav and feeding lands. In the district called the Wash, they will carry from one to two bullocks, and from five to twelve sheep per acre fed the greater part of the year.

greater part of the year.

8. Gardens and Orchards.
Good market and fruit gardens at Ely, Soham, Wisbeach, & Good market and fruit gardens at Ely, Soham, Wisbeach, & Good market and various places, by water carriage, with apples, cherries, and vegetables.

9. Woods and Plantations.

Some years plantations. The Rev. G. Jenyus, of Bottisham, "does not cut off the tap roots of oaks in the usual manner, and finds they thrive faster." (That he is mistaken, see 3927.) Osiers are grown in various places for the basket makers, and found to pay as well as any crop.

Wastes and unimproved Fen.

In 1794, 158,500 acre

11. Improvements.

11. Improvements.

In no part of the island draining and embanking so much wanted as in the fens of this county.

The former state of the fen lunds, and their degradation to their present state, is given at length in the report, chiefly from a numphlet by Lord Hardwicke. It was the opinion of Atkins (a commissioner of sewers in the reign of James I., 1604) that

these fens (a space of upwards of 280,000 acres) were once "of the nature of land-meadows, fruitful, healthy, and very gain-ful to the inhaltiants, and yielded much relief to the high-ful to the property of the state of the state of the state (who was lorn 1605, and died 1686) was of the same opinion, adding as a proof, "that great numbers of timber trees (oaks, firs, &c.) formerly grew there, as is plain from many being found in digging canals and drains, some of them severed from their roots, the roots standing as they grew, in firm earth, below On determine the channel of Wisheach river, in 1635, the

their roots, the roots standing as they grew, in firm earth, below the moor."

On deepening the channel of Wisheach river, in 1635, the workmen, at cight feet below the then bottom, discovered a second bottom, which was stony, with seven boats lying in it workmen, at cight feet below, a perfect soil was found with swards of grass lying on it, as they were at first mown. Henry of fluntingdon (who lived in the reign of Stephen, 1135,) described this frany country "as pleasant and agreeable to the eye; watered by many twode of fluntingdon (who lived in the reign of Stephen, 1135,) described this frany country "as pleasant and agreeable to the eye; watered by many twode of the property of the property of the property of the land round Thorney in the most glowing colours: he says, "it is a very paradise, in pleasance and delight it resembles heaven itself; the very marshes abounding in trees, whose length without knots do emulate the stars." "The plant there is as little than the says of the property of the says, and the says of the says o

old mounds: "I first cut a gutter, eighteen inches wide, through the old bank down to the clay (the fen substratum being generally clay); the gutter is nade near the centre, but a little on the land side of the centre of the old bank. The article all the land side of the centre of the old bank. The bered clay; and to make the clay resist the water, a man betted clay; and to make the clay resist the water, a man boots always treads the clay as the gutter is filled up. This plan was tried last summer (1794), on a convenient farm, and a hundred acres of wheat were sown on the land. The wheat and grass lands on this farm are now all dry, whilst the fens around are covered with water. This practice answers so well on this farm, that all the farmers in the parish are improving their banks in the same manner, and some have begun in adjustication. The summer of the properties of the same that the ground ought to be covered by nature with samphire or other plants, or with grass, before an attempt is made to embank it; there is particular danger in being too greedy. "If the sea has not raised the salt manh to its fruit level, all expectation of benefit is vain, the soil being immature, and not rijeened for enclosure; and if, again, with a view of grasping a great extent of salt unersh, the banks or sea wall be pushed further outwards than where there is a firm and secure foundation for it to stand upon, the bank will blow and secure foundation for it to stand upon, the bank will blow ensure. The class of the salt man, in both case great lesses and disappointments will be used.

Paring and burning is every where approved of, and considered the sine qua non of the fen district, in breaking up turf.
Without it corn crops are destroyed by the grub and wire-

Without it coin crops are destroyed by the grib and wireliving to the control of the control o

12. Live Stock.

Cattle a breed peculiar to the county; but some of all sorts. Butchers give more for a Cambridge calf than a Suffolk one, francying the former whiter yeal. The Cottenham cheese ascribed to the excellence of the grass, in great part Foa

functing the former whiter veal. The Cottenham cheese ascribed to the excellence of the grass, in great part Fóa aquática.

The com system consists chiefly in suckling of calves and making of butter; there is not much cheese made, except the noted ones of Soham and Cottenham. The suckling season is from Michaelmas to Lady-day. It requires, on an average, the control of the contr

plants, artificial grasses, and roots being neglected, and no son-ing practises.

The deer in Wimpole Park attacked by a singular disease, a sort of madness; the diseased animal begins by pursuing the herd, then sequesters himself, breaks his antiers against the trees, and gnaw large pieces of flesh from his sides, &c. becomes convulsed, and soon expires.

Pigeon-houses on almost every farm; kept in a great measure because if any one were to give them up, he would be obliged to keep the pigeons of others; destroy thatched roofs, and oblige every farmer to sow more seed than he otherwise would; produce sent to London and other parts; often 100 dozen per annum from one pigeonry; dung highly prized.

13. Rural Economy.

Peat, sedge, or thin turf, and dried cow-dung used as fuel. The cow-dung is spread on grass, about an inch and a half thick, and cut into pieces, eight or twelve inches square; there it lies till dry.

14. Political Economy.

Roads miserably bad; canals or navigable cuts in the fens in all directions; a few fairs; a pottery at Ely for coarse ware; excellent white bricks made there, and at Chatteris and Cambridge; lime burned at various places.

7787. SUFFOLK. A crescent-like flat surface of 800,000 acres, the soil chiefly in patches of clay, poor sandy soil, and rich loam, and the agriculture directed to the growing of corn. The county is, however, famous for its breed of cows, horses, and hogs, and it is one of those in which carrots are a good deal grown. One of the largest sheep fairs in the kingdom is held at lpswich, where it is said as many as 150,000 or 200,000 sheep and lambs have been exposed for sale. The celebrated Arthur Young was a native yeoman of the county, and farmed his own estate near Bury. (Young's Suffolk, 1810. Smith's Geological Map, 1819.)

1. Geographical State and Circumstances. Climate. One of the driest in the kingdom; the frosts severe; and the N. E. winds in spring, sharp and prevalent. Soil. The predominating a strong loam on a clay-marl bottom in the centre of the count; chall also occurs extensively as a substratum; a zone of sand stretches along the coast; and some sand and fen land in the north-west angle; no

minerals.

2. Property.
Chiefly in the hands of rich yeomany, who cultivate their own estates of from 100t. to 400t. a year; one estate of 1500t. a year; and two or three of 10,000t.

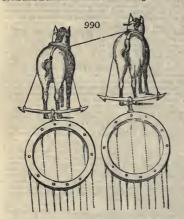

3. Buildings.

Consider the convenience of men.

3. Buildings.

Great erections have been made for the convenience of men of large fortunes but not so many for these of smaller incomes; of large fortunes over the smaller incomes; for the boussets of the large transport of the l

5. Implements.
The Suffolk awing lough, though known as one of the best of the old English swing ploughs, Is now giving way to improved forms; various threshing machines, and other improved implements introduced; circular harrows [fig. 99.0] were used on the farm of the late celebrated Arthur Young.

Enclosures,
 Suffish one of the earliest enclosed counties in England; a few recent enclosures.
 Arable Land.

7. Arable Land.
Plough, with two horses, one acre a day on stiff soils, and one and a quarter to one and a half on sands; ploughmen skifful, and subscribe prizes among themselves for such as draw the straightest furrow, &c. Besides all the common crops, a larger proportion of peas grown than is usual in most counties. Hops, few places. The culture of carrots is, of course, confined to the sandy districts, and that of rape for seed, and of hemp, to the femny angle of the county. A Young seems to have been the chief cultivator of chiccory, having had "minety acres of it for sheep." Hemp is grown both by cottagers and farmers, and is the greatest breadth to be met with.

8. Grass.
Pastures coarse and not extensive; both these and meadows

Pastures coarse and not extensive; both these and meadows badly managed, overrun with mole and ant hills, bushes, tufts of bad grasses, weeds, &c. Hay-making badly performed.

9. Gardens and Orchards.

9. Garden walls built of the width of a hrick, by making them wary. (Engelpeadie of Gardeniag, 1567.)

1. Pew, 19048 and Plantalions.

1. Improvements.

Wheat substituted for tyre. Draining much practised on the clays; bushes, straw, or stubble used for filling them; claying and marling the sands practised, but sand laid on clay found of no use, or marl on clay, according to the old adage.

Marle clays; throw all away;

Some workmen procured from Glonoestershire to execute irrigations in the manner of that county.

12. Live Stock.

13. Live Stock.

14. In cows, horses, and hogs, Suffolk excels. The Suffolk breed of cows spread over the whole county. To keep the preed polled, horned calves are never rearcd, but sold to the sucklers. Cows in prime give eight gallons of milk per day, deep the control of the control of the control of the control of the county of the control of the

folding is universal.

The sheep uses are or various breeds, and the practice of folding is universal.

Lowestoff, Woodbridge, Orford. About the middle of last century, a considerable spirit of breeding, and teams drawing against teams for large sums, existed. The old breed were ugly, with slouching ears, sill shaped head, and low in the fore end; a great carcass, short legs and short back; they could only walk and draw, and no more trot than a cow; of late, by alming at coach horses, the breed has become handsomer, and one of the best for draught in England. In the east district, horses are turned out of the stable in winter at night, about of otten and harley straw do eat, but no hay; so treated, they are found to keep free from diseases, and work several years longer than if kept constantly in stables.

The hogs fatten early and at little expense, but are not great breeders.

breeders.

Many warrens in the sand district; one at Brandom returns 40,000 rabbits in a year; twenty rabbits per acre usual produce; carcass defrays rent and taxes, and the skip the couplet of the to mode of farming can be more profitable to the couplet. Turkeys generally cultivated, but chiefly for home

Poultry. Turkeys generally cultivated, but chiefly for home us. Pigeons abound on the borders of Cambridgeshire.

13. Political Economy.

Roads very good; made with flints and gravel; some canals. Ipswich and Bury excellent markets; a good deal of fishing on the coast; spinning and combing wool, and spinning and weaving hemp, among the cottagers. Says and slik manufactures at Sudbury. Various hundreds in this county incorporated by charter for erecting for the fishers, spin, act, but and managed, and the poor live like the pensioners in Chelsea college; but these houses of industry have little effect in lowering the poor rates. The best managed are of very expensive tendency, and of equivocal effect as to comfort and morality. Those badly managed are nurseries of idleness and vice, attended with great discomfort and expense. Marshal considers them as the grave of morality and independent policy, and as we are informed, by a gentleman who has been a director of one of them for many system, with perfect truth.

14. Obstacles to Improvement.

The great abundance of game in the county is such, that instances are given of corn having been injured to the extent of which are common every where, and on the sand district more especially.

An agricultural society, called the Milford society, meets al-

which are common every where, and on the salar distribution especially.

An agricultural society, called the Milford society, meets alternately at Milford and Bury.

7788. NORFOLK. A flat surface of 1,288,000 acres, chiefly of a loamy and sandy soil, and devoted to the growth of corn, and the fattening of cattle and sheep. This county has acquired celebrity for its general culture, and especially for that of turnips and clover. It displays a great variety of practices, and abounds in wealthy farmers. It is also noted for the estate of Coke, a true and consistent patriot for upwards of half a century, the most munificent of landlords, and the greatest friend to farmers. Norfolk, in short, was formerly reckoned the finest county in England for agriculture, as Northumberland is at present. Mackie's nursery at Norwich, the property and under the direction of a lady, is one of the most extensive and best managed of provincial nurseries. (Kent's Norfolk, 1795. Young's Norfolk, 1801. Marshal's Review, 1813. Dr. Rigby's Holkham, its Agriculture, &c. 1819. Smith's Geological Map, 1819. Edin. Gaz. 1827.)

1. Geographical State and Circumstances.

Climate colder and more backward than Sulfalk; N. E. winds severely felt in spring; salubrity of the air affected by the firms of Lincolnshire and Cambridgeshire to the extent of 5 or 600,000 acres, which lie on the west side of the extent of 5 or 600,000 acres, which lie on the west side of the extent of 100,000 acres, which lie on the west side of the extent of 100,000 acres, which lie on the west side of the extent of 100,000 acres, which lie on the west side of the extent of 100,000 acres, which lie on the side of the extent of 100,000 acres, which lie on the side of the extent of 100,000 acres, which lie of 100,000 acre

fields, a large stone with a note wrough in the conserver alls from the sides.

2. Proper at the control of the conserver and the conserver at the conserver at the control of the conserver at t

4. Occupation.

Farms large on the dry soils, and smaller on the wet ones; 2000 acres arable, the largest measuring from 400 to 600. Farmers famous for their improvements, excellency of their magnetic manners are supported to the state of their manners. The farming their of the county has undergone two revolutions, one between 1730 and 1760, when great improvements were made; and the next about 1790, when drilling began to be introduced. Coke legan to promote farming; and the South Down sheep were introduced about that time. The great improvements for seventy vars past effected in consequence of twenty-one years leases. The advantages of leases ably advocated by Kent. Coke adheres steadily to this term, while some others are reducing it to seven and rine years.

5. Implements.

to seven and time years.

5. Implements.

For more than half a century these remained stationary; now improvements makin; Norfolk plough has a high-pitched beam, wheels near to the share, and is reckoned lighter than most wheeled ploughs.

Enclosures

G. Enclusives.

Many since middle of eighteenth century. In planting hedges on a loamy soil, the plants being daid in, and the bank over them raised to the usual height, the face of it, and also of the ditch, for one foot or more below the original surface is plastered over with clayer sulf taken out of the bottom of the ditch, to the thickness of two or three inches, or more about the sets. The advantage of this plan is, that this loamy puddle, from the bottom of the ditch, is without the seeds of weeds itself, and by its compactness excluding the air froin these in the mould below, it prevents them from garminating;

e consequence is, hedges planted in this manner require

the consequence is, hedges planted in this manner require little or no weeding for several years.

7. Arable Culture, in every department for when the department for when the department for the country is a surprise for the country of wheat and peas generally practiced on the sandy soils.
7. Color of the Color of

rience.

8. Grass.

Very little of natural turf in the county; transplanting turf recently introduced. (5715.)

9. Gardens and Orchards.

Orchards to most of the farm-houses; some public ones near the large towns. Norfolk beefin an excellent apple, and much used for baking dry in overa, a very particular operation known only to a few bakers. They are repeatedly taken out of the over, and pressed that with the hand, and then put in again.

10. Woods and Plantations.

10. Woods and Plantations.

Much planting his taken place on the power sands; Marsham of Stratton, the chief planter, and next Berney of Bracon, acres, with upwards of two millions of trees and shrubs, of more than fifty kinds. Bevan, of Riddlesworth, 966,000 trees. Marquess Townshend feeds cattle, sheep, and deer, with the trimmings of plantations. Sheep are found of the bark of the Scotch fir and ash. ...?

11. Improvements.

A good deal of draining done of late years; very little irrigation; among the manures are reckoned marl, line, gram, oyster siells, sea coate, sea weeks, pond weeks, burnt simply of the state of

12. Live Stock.

12. Live Stock.

Predominant cattle Scotch, bought in every year from the drovers, for feeding. Norfo k black-legged sheep gradually giving way to South Downs; fo'dning on the decline. Poultry good, especially the turkey, owing to the dryness of the soil, and great range of pesture. Decoys, and pigeon houses, formerly numerous, but now on the decline. Rabbits, hares, pheasants, partridges, and rooks abundant.

13. Political Economy.
Charles 11. observed, that Norfolk should be cut into roads for all the rest of England; few canals.

7789. OXFORDSHIRE. An irregular, inland, elevated surface, of 450,000 acres, chiefly in aration, and in a very backward state as to agriculture. There are rich grass lands, subjected to the same dairy management as in Buckinghamshire, and some natural wood lands. The principal agriculturist and patriot of the county is Fane, of Wormsley. (Dawis's Report, 1794. Arthur Young's Oxfordshire, 1809. Marshal's Review, 1813. Smith's Geological Map, 1823.)

1. Geographical State and Circumstances.
Climate cold and bleak. On the Chiltern hills, cold, moist, and foggs,
Soil in three great divisions, red land, stonebrash, and chiltern, or chalky hills; the basis of all these soils is calcareous; there is also a considerable portion of loamy soil.

2. Property.

Few large estates; church tenures very common; one estate of 20,000l. a year, one of 12,000l., one of 700l., one of 500l.,

and so on.

3. Buildings.

Blenheim, the noblest in England; Maylands' house at Broateston, recorded by Young as a model for houses, which cost about 20,000 are the analysis of the model for houses, which cost about 20,000 are the analysis of the model for house, which could gramary stems, form buildings generally of stone, covered with stone slate; wretchedly contrived, and badly executed, in most parts of the county. Gardens to most of the cottages. Bishop of Durham has built some very comfortable ones at Mungewell.

Occupation.

4. Occupation. Farms generally smaller than in most other counties; few above 500 acres. Leases of fourteen and twenty-one years not uncomnion; many of seven years. Farmers in general very ignorant, and much prejudiced against new practices.

Implements.

The phylomenus of a swing wooden-boarded Implement, that we have a swing wooden-boarded Implement, that we have to six horses, and incapable of making good work under the guidance of the best ploughman. G. Arable Land. Very badly managed in general; on heavy lands two crops and a fallow, but the fallow kept, unploughed for the sake of affording couch-grass leaves for the sheep. Davis of Bloxham, an extensive farmer and land-surveyor, "never saw any land upon which a naked fallow is necessary; not even on the stiffest commissions of enclosure at the same time! Wheat sown early and either ploughed in or folded; often both. A scaulet of lentils cultivated. Turnips in most parts seldom bigger than

apples. A good deal of saintfoin on the Chiltern, and other calcareous soils, also on the stonebrash, which is chiefly lime.

apples. A good deal of saintfoin on the Chiltern, and other calcareous soils, also on the stonebrash, which is chiefly lime.

7. Grass.

Some good meadows near Oxford, on the Tbames and Isls; very rich grass land at Thame.

8. Woods and Plantations.

9. Gronslearable extent. A great part of the forest of Whichwood belongs to the government. Great attention paid by Fane of Wormsley to pruning; many beech woods on the Chiltern hills; young wood at Blenheim neglected. The natural forests of which woods are considered to the control held of the

probable that by that time both landlord and tenants would have been ruined; for more money might have been raised by mortgage on such an estate in 1810 than it would have sold for in 1820. The depreciation of the estate has been attributed to the breaking up of old turf; a most unfounded error, as there ploughed, and, as would have been proved had the convertible system been continued a few years, greatly to the benefit of the whole. We regret that the landlord, a most amiable and patriotic man, should have suffered in this business; but he entered into it aware that he was incurring an extraordinary course he takes the result as every man ought to do. Besides he has still a very handsome fortune.

As a trait of the spirit of the Board of Agriculture at this time, we may mention that Arthur Young examined the estate a few weeks after it was sold at so high a rate, and drew up a remark-session) in favour of Scotch farming, which was published in the first edition of Sir John Sinclar's Husbandry of Scotland. In that report a disingramous attempt is made to attribute to the Board ithe merit of the introduction of Scotch farming into this and other counties; by thereas it was and is perfectly well by, late of Witshire, and our pamphlet, were the true causes, by the time a second edition of the Husbandry of Scotland was called for, Scotch farming had become unpopular, and the Report mentioned, and all the compliments to the Board of Agriculture for having introduced it, were withdrawn. A general will be found, and of Perman and Farms Buildings in the Scotch Style, adapted to England, 8c. 4to. 1812.

10. Live Stock.

There is a good deal of dairying in the county; the permanent grass lands being chiefly occupied in this way. The pracment grass hands being chiefly occupied in this way. The pracment grass hands being chiefly occupied in this way. The pracment grass hands being chiefly occupied in this way.

Souch Style adapted to England, Sc. 4ch. 1812.

10. Live Stock.

There is a good deal of dairying in the county; the permanent grass lands being chiefly occupied in this way. The practices are almost entirely the same as in Buckinghamshire. The butter is taken to London by waggons from a 1 the principal John Wilson, of that neighbourhood, if he ever fed on sitaw? Answer, "No; straw be a good thing to lay on."

Shep, the Berkshire, Gloncester, Wiltshire, Leicester, and other hardy breeds. Fahe has tried crossing the Ryelands and South Downs with Merinos. Several other proprietors of farms have also tried Down Merinos and other crosses; and some the pure breed.

11. Political Economy.

Forty years ago roads "formidable to the bones of all who travelled on wheels," now they are much changed for the protrance to Oxfordshire. A good deal of wool, formerly woven into blankets at Witney; now very little. About the beginning of the last century the manufacture of polished steel was introduced at Woodstock, and flourished for half a century; at manufacture of polished steel was introduced at Woodstock, and flourished for half a century; at resemination through the present nearly extinct. Steel chains have been made here weighing only two onness, and sold for 170%. Scissors from reaching have succeeded to the steel manufacture, and the latter thrives well; from 360 to 400 dozen of gloves are manufactured weekly.

12. Miscellaneous.

Dr. Sithhorpe, the late professor of botany at Oxford, left 2004. a year to endow a professor of sericulture and rural economics.

12. Miscettaneous.

Dr. Sibrhorpe, the late professor of botany at Oxford, left 200l. a year to endow a professor of agriculture and rural economy, to be established as soon as the Flòra Græ'ea is completed. This will not be for some years.

7790. BERKSHIRE. One of the most beautiful counties of England; occupies a surface of 474,000 acres, of which about 200,000 are enclosed, or in parks or plantations; 190,000 in common fields and downs; 40,000 in forests, wastes, and commons; and 8977 in roads. Its productions are almost equally corn and stock; it produces a good deal of butter and cheese, and the breed of swine is noted for its excellence. The celebrated Jethro Tull was a yeoman in this county. George III. and E. L. Loveden, Esq. were among its most noted farmers. On the whole it is a county much more indebted to nature than to art. (Pearce's Berkshire, 1794. Mavor's Report, 1808. Marshal's Review, 1813. Smith's Geological Map, 1831) 1821.)

1. Geographical State and Circumstances.

1. Geographical State and Circumstances.

Climate diversified, but in every part the air pure and salnting in elevated situations pure, piercing, and braces by its about in every the process of the pro

should increase with the rapidity and universality which they appear to do. Every acre of pond, properly stocked and well situated, must produce an annual increase of from eighty cone hundred pounds weight. If articlaily fed, the increase would be greater; or less, if the pond is most. By retail, the acrease would be greater; or less, if the pond is most. By retail, the particular circumstances they may sometimes be had as low as tempence.

2. State of Property.

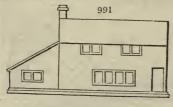

Largest estate 8000t. a year; a few of 5, 6, or 7000t. Earl Craven and E. L. Loveden, Esq. the largest proprietors; several handsome seats with land not exceeding 100 acres, and many small freeholders and yeomany. Some curious customs; at Enhorne and Caddleworth manors, belonging to Earl Craven Enhomentancy or marrying again, lost her freehench or life interest, unless he submitted to the ceremony of riding into the court on a black ram, and of repeating some well-known confessional lines. (See Addison's spectator.) In the manor of Great Farringdon the customary tenant's daughter, on being convicted of incontinency, was to forfeit the sum of forty pence to the lord, or to appear in court, carrying a black sheet, and making confession of her offence in these out of most proposed provided or her black, and making confession of her offence in these out of the summer of the pence of the court of the summer of t

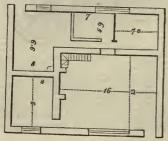

ous customs.

3. Buildings.
Windsor Castle and many fine seats; houses of the yeomany genteel and elegant: farm-houses generally comfortable. Loveden's ample but ill arranged; cottages of the poor generally in a bad state, some present erections better. (fig. 991.) Farmeries on collegiate or corporate lands generally in expair, because the fines for renewal of the leases take all the spare money, &c.

Chelegy, Farm near Wallingford, in 1800, the property of the company of the compa

tithes were deposited is yet standing, and measures 101 yards in length and eighteen in breadth. The side walls are only

eight feet high, but the roof rises to a great height, and is supported by seventeen stone pillars, each four yards in circum-ference. This construction is obviously judicious; high side walls, unless thet dugether by cross beams, would have been danger of being thrust outwards when the barn was filling with come. This, as we have seen (1788.), is the case with the hand-son. The control of t

Occupation,

some high-walled barns of Coke.

4. Occupation.

One third of the county occupied by proprietors. Farms of all sizes under 1900 or 1200 acres, but few exceeding 500 acres or under 504. a year. Character of the Berkshire farmer stands high. "A hospitable style of living, liberality of sentiment, and independence of principle, are characteristic of the Berkshire farmer; to which he unites persevering industry and integrity in his dealings, which render him worthy of the counforts of the county of the co

water abounds.

6. Arable land.
Plough generally with four er five horses at a snail's pace.
George HL had two farms, one of 800 acres, cultivated in the
Norfolk manner, and another of 450 acres, managed in the
Plemish manner; 450 of the former, and 150 of the latter,
were grable. The whole delegated to the care of N. Kent, of
Craig's Gours, land-agent, and author of "Mint to Gendemen of
craig's Gours, land-agent, and author of "Mint to Gendemen of
mear Windsor, and on the Downs. Some hops, woad, flax, and
other plants not usually cultivated; seventy acres of lavender at
Park Place, on the side of a chalty hill, originally planted by
General Conway, who distilled it himself at his coke manufactory. As the plants die they are replaced by others from a

the poorer upland grassy districts, and the breeders of sheep the Downs.

the peorer upland grassy districts, and the breeders of sheep the Downs.

8. Gardens and Orchards.

About forty acres of market garden and orchard at Reading, where onloss are raised in great quantities; asparagus for the London and Bath markets, and cabbage seeds for the London seedsmen; good apples there and at other places; some cider made, and a good many cherries grown for market. Near Advances of the Condon seedsmen; good apples there and at other places; some cider made, and a good many cherries grown for market. Near Advances, or the Condon and State of the Condon and Condon and State of the Condon and Condon

the grass.

11. Line Stock.

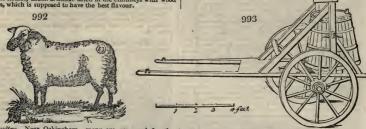

No particular breed of eattle; long horned most common. A dairying tract in the west of the vale of White Horse; much butter made, and some cheese of the single Gloucester kind. Calves a good deal suckled in some places. Buscot parish famous for cheeses, in the shape of pineapples; they are of most excellent flavour, and self higher than other cheeses. The curds are well worked with the hands, then pressed into a wooden mould in the almost of pers, in an airy spartment, in a net, whose meshes indent their surface like a pine apple. Sait is then rubbed over them, or they are steeped in brine; weight, 50hs. The milk is conveyed from the field to the dairies in what is called a tankard, drawn by a hone or ass. (Ifs. 993.)

Sheep, a strive breed known as the Berkshire polled, or notts (Ifs. 1); is now difficult to be met with pure; they are considered as very hardy, and particularly adapted for the low strong lands, and for folding.

Horses of the common heavy black race. Pearce calculated in 1794, that 12,000 horses were kept in Berkshire for the purposes of agriculture, and that one third of the number might be saved buying from the Northamptonshire breeders, the not cheek the purposes of agriculture, and that one third of the number might be saved by the properties of the best in Britain; a cross the gree, the native breed one of the best in Britain; a cross 12.

with the Chinese, now more common than the pure native breed. Wherever there is a dairy, hogs are kept, but they are not counted a profitable stock to be fed with what would fatten cattle or sheep. Carcass chiefly made into bacon; cured in the usual way, and dried in rooms heated with wood or coal. Loveden has a bacon house, heated by a stove and flues. In farm-houses, much is smoke-dried in the chimneys with wood fires, which is supposed to have the best flavour.

Rabbits kept in warrens, in one or two places; and one gen-tleman rears tame rabbits of a pure white, the skins of which sell high for trimmings.

Poultry. Near Oakingham, many are crammed for the market: they are put up in a dark place, and crammed with a paste made of barley-meal, mutton suet, and some treacle, or coarse sugar, mixed with milk, and are found to be completely ripe in a fortnight. If kept longer, the fever that is induced by this continued state of repletion renders them red and unsleable, and frequently kills them. In the eastern part of the county, many geese reared on the common.

Pigeons in considerable numbers.

Elses, not very common. Sir William East, of Hullplace, a mon. One gentleman removes his hives to a heath at the flowering season.

Deer kept in several parks; 2500 fallow, and 300 red deer, in Windsor Great Park.

12. Political Economy.

12. Political Economy.

Roads for the most part good, especially since a part has been put under the care of M*Adam. Gravel, flint, or chalk, abounds in most places. Canals and navigable rivers so interspersed, that no part of the county is further than twelve miles from water carriage. Cloth for sacking and hammocks, manufactured at Abingdon and Maidenhead, also some said, and twith matting. Cotton milis at Taplow. Cloth, and crists, and twith matting. Cotton milis at Taplow. A parchment manufacture at Oakingham County, and the part of the matter of the county of the part of

7791. GLOUCESTERSHIRE. A surface of nearly 800,000 acres, in three natural divisions; the Cotswold hills, the vale of the Severn, and the Forest Lands. Great part of the county is under meadows, Cotsward mins, the vale of the Severn, and the Forest Lands. Oreal part of an econiny is under incanaway pastures, and orchards; and cheese and cider are its known agricultural productions. It is also a manufacturing county, and its fine broad-cloths are celebrated, as well as it from tin-plates, and pins. There is no very eminent gentleman agriculturist, nor any agricultural society in the county, but Dr. Tennant farmed a small estate on the Chilterns. (Turner's Report, 1794. Rudge's Report, 1807. Marshal's Review, 1818. Smith's Geological Map, 1821.)

semilar tarmed a small estate on the Chitterns.

shal's Review, 1818. Smith's Geological Map, 1821.)

1. Geographical State and Circumstances.

Climate, cold and bleak on the Cotswold hills; mild in the
vale, which lies open to the south winds; on the sandy soils of
the forest district, the harves is sometimes cut a fortnight
earlier than in the vale.

Soil of the Cotswold is all calcareous loam or stonebrash;
Soil of the Cotswold is all calcareous loam or stonebrash;

Soil of the Cotswold is all calcareous loam or stonebrash;
Soil of the Soil of the Gotter of the Soil of the Forest of Is generally
sandy loam, sand, or peary earth.

Minerals. None in the Cotswolds, but iron and coal in the
Forest of Dean, both worked. Leaf found in the limestone
rocks of the lower part of the vale; not worked. Though
iron ore be abundant in the Forest of Dean, only a small quaniron ore be abundant in the Forest of Dean, only a small quaniron ore of Lancashire, which is burnt with
ore of Lancashire, which is burnt with
ore of Lancashire, which is burnt with
ore of Lancashire, which is burnt with
ore of Lancashire, which is burnt with
or of Lancashire, which is burnt of proper machinery
to exhaust the water; three sorts delivered, letten coal,
smith's coal, and lime coal. Claysone and freestone found in
writing a land lime coal. Claysone and freestone found in
the proper of the county of the coal for the coal
burn; it is also used as alabaster for chimney pieces, &

Water. Produce of the Severn is roach, dace, bleak, flourders, eets, etvers, club, carp, tout, and perch. The sea-rish
taken within the limits of the county, in the Severn, are
salmon, lampreys, lamprens, cod, soils, shrimps, cod, plaice,
salmo

mischier done by the use or small necessarial states as already de-samlets or fruiter made on the Cotswold hills, as already de-lende for main the vale in the common manner. The wa-ters, which rise through bets of blue clay, are often strongly saline, as at Cheltenham, &c.

2. Property.

Largest estate 8000/. a year among the nobility, and 5000/. among the gentry; tenures chiefly freehold, some copyhold, and about one fortieth corporate or ecclessistical. Estates under the see of Gloucester, leased out on lives; those of the corporation of the city the same; usual fine for renewal of a life, one year and a half of the improved annual value.

3. Buildings.

Many handsome seats; farm-houses and cottages on the Cotswolds built of freestone, and covered with stone tiles; often as many on an estate of 100/a year as are required for a farm of 500/a a year, under the correction of modern improvement; barns, however, of a moderate size; wheat stacked on stone staddless. Cottages, as in most counties, neglected, and uncomfortable; some judicious remarks on the subject by Rudge.

4. Occupation.

Farms differ much in size; few exceed 1000L or fall short of 50L a year. Some grazing farms in the vale of 50D acres, but 200 and 300 more common. Leases of three years most semmon, next of seven years, not many of four

5. Implements.
A narrow-wheeled waggon in general use among farmers.
Various ploughs; a short-beamed one-wheel plough in use

on the Cotswolds; in the vale a clumay swing plough. Lumbert's draining-plough much in use with the improved draught apparatus, and in the old way. Various improved ploughs and other implements, as well as threshing and winnowing machines, introduced. A thistle drawer [16, 221.] in use for machine of the control of the

Enclosing.

The first end of the state of t

plenty. Black thom (Prunis spinosa) hedges, he says, never suffer from the blight; a most erroneous idea.

7. Arable Land.

8. Sologous crest simch ploughing on the Cotswolds lighters the staple of the weak solds; seven horse often used in the value teams; ridges in the value so high that a person six feet high may stand in the furrows, and not be able to see the crown of the second ridge from him; to reduce them a small ridge often begun between them. Fallowing practised on the clay, then wheat and beans, or oats. Rotation on the Cotswolds — I turnips, 2 barley, 3 and 4 clover mown the first year, down with saintfoin. On crumbly soils wheat is sown and ploughed in during rather wet weather, otherwise the seedling plants are apt to be thrown out with the first frosts; the same thing attended to in Oxfordshire and various other counties; this is called seven-field husbandry. Beans either drilled or dibbled; a broad bean, the mazagan, used when the land is in the search of the

S. Grass.

Very rich meadows on the Severn, overflown during winter and syring, on which the farmers depends for a crop. When the sait water overflows, the meatlows are termed marshes, and the sait water overflows, the meatlows are termed marshes, and in general meadows are mown and past and opposite physics cepting near Gloucester, where abundance of manure is obtained. Herbage, plants, and reg grass sown on the Cotswolds, but little in the vale; saintfoin much cultivated on the stone-brash soils. Grass lands fed in general from May to the end of September, and then the cattle, unfinished, are taken in and completed with hay, oil-cake, and other artificial food, but seldom with roots. The O'rchis máscula so common in the meadows, that it has been gathered, Rudge informs us, and made into sago. (6184.)

9. Gardens and Orchards.

Most of the cottages, such as they are, have gardens, and almost every farm its orchard; but large ones, so as to admit of

making cider for sale, are found only on the sides of the hills and in the vale and forest district. The stocks are planted in the rochard when six or seven feet high, ten or twelve yards asunder on pasture, and sixteen or seventeen on arable lands. A year steep planting they are grafted. Sometimes fruit trees are safer planting they are grafted. Sometimes fruit trees are seedlings, raised from the kernels in the cider mast; and here send there the farmer of then leaves a stem to rise above the general height of the hedge, and grafts it; frequently also wildings are allowed here and there to rise into trees, and their fruit is used with that from grafted trees, in crushing for cider fruit is used with that from grafted trees, in crushing for cider fruit is used with that from grafted trees, in crushing for cider fruit is used with that from grafted trees, in crushing for cider fruit is used with that from grafted trees, in crushing for cider fruit is used with that from grafted trees, in crushing for cider fruit is used with that from grafted trees, in crushing for cider fruit is used to the graft , and direct their shoots to a proper form. The stock is next protected from cattle or the plough harmes, by four posts placed round it, with six tier of rails; by three posts and six tier of rails; by two broad posts and rails; by a bundle of thorn branches; by planting a thorn or briar along with the stock, and twisting it round the stem, is said to be found the stock, and twisting it round the stem, is said to be found the stock, and twisting it round the stem, is said to be found the stock, and twisting it round the stem, is said to be found the stock, and twisting it round the stem, is said to be found the stock, and twisting it round the stem, is

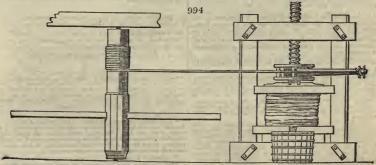

and in other cases the cylinders are set wide the first time the applies are passed through, and closer the second; the other processes as usual. Of the various applie grown, the white-styre of the Forest district makes the strongest and richest cider; it is often valued equally with foreign wine, and sold at extravagant prices. Ciders from the Hagloc crab, golden pipin, and Longner pusset, are next in esteem. The whitemust, woodcock, and half a dozen others, are fine old fruits, but now going off.

Perry from the squade paer is esteemed the best; and next fine the standard science of the cider kind; especially those of the keeping varieties, such as the golden and Moreland pippin, Longney russet, &c.

10. Woods and Plantations.

10. Woods and Plantations.

Most extensive on the Cotswolds; the sorts there beech and ash; timber sold to dealers, who convert it on the spot to scantling for gun-stocks, saddle-trees, bedsteads, chairs, and other cabinet work, and staves for sugar hogsleads. Some fine old specimens of chestnut, elm, and, and and it fill the sold specimens of chestnut, elm, and, and and it fill the sold specimens of chestnut, elm, and and it fill the sold specimens of chestnut, elm, and and it fill the sold specimens of the sold specimens

in Russia. These ropes are found to contract and expand less from moisture or drought than hempen ropes. The bark is manufactured on the spot or elsewhere. Many valunt trees in the parish of Arlingham; the fruit shipped to distant places, and the timber sent to Birmingham for gun-stocks. Artificial plantations, to a great extent, made round gentlement's seats on the Cotswold hills. The osler in beds on the

evern.
11. Improvements.

11. Improvements.

On the lands adjoining the Severn immediations were frequent; but a commission of sewers have reviced banks and pulses. In the lands adjoining the Severn immediations were frequent; but a commission of sewers have reviced banks and places private banks or floodgates on the rivers or banked ditches are placed, and operate by the alternate Influence of the tides and accumulated inland waters.

Draining much practised; both in the turf, stone, wood, straw, and with Lumber's plough; the plough drawn by twelve horses, or worked by a long lever and axie (2645.), by which one horse gains the power of thirty. Before the mole the drain in the centre of this; the sward being afterwards turned back to its place, completely covers the aperture, and protects if from the effects of a subsequent dry season. The long-continued drought of the summer of 1806 opened many drains which were cut by Lumbert's plough, so much that the bottom was clearly seen; while many that have been done by hand have formed still wider chasms, and will probably many hand have formed still wider chasms, and will probably many hand have formed still wider chasms, and will probably many hand have formed still wider chasms, and will probably many hand have formed still wider chasms, and will probably many first turned back, as recommended.

The accumulated moter of underground drains raised from low meadows in one parish by a wheel driven by the water of surface ditches.

Paring and constitution of the valleys of the Cotswolds, adjoining rivulets, and especially the Coln and Churn. Carried to greatest perfection in the parish of South Cerney; first began here under the Rev. W. Wright, who wrote several tracts on the subject.

waters down in a muddy state, it is let into the meadows. In December and January the land is kept sheltered by the waters from the severity of frosty nights; but every ten days, or thereabouts, the water is let entirely off, to give air and prevent the roots from rotting. In Pebruary great care is required. If they water now within its found to be very injurious, to the grass. On the other hand, if it be taken off, and the land exposed to a severe frosty night, without being previously dried for a whole day, much of the tender grass will be cut off. Towards the middle of this month less water is used than before, keeping the land rather wet than watered. At the beginning of March there is generally in such meadows plenty of beta the statement of the statement

Warping might be practised to a considerable extent on the banks of the Severn, if the commissioners were to direct their attention to the subject.

attention to the super.

12. Live Stock.

The duiry the principal object with most of the vale farmers.

Good milkers preferred, without much regard to perfection of shape. Gloucestershire breed resembles the Glamorganshire excepting in colour, which is rid or brown, bones fine, horns of midding length, white with a black tip at the ends, udder thin in flesh and large. In the higher vale the improved lorg

horned cows of Bakewell and Fowler in most reputehorned cows of Bakewell and Fowler in most reputehornes, Hernfords, and various others in use. The best land
does not always produce the most marketable cheese; oftentimes the reverse; if it has either been much manured with
dung, or sheep feeding, the quantity of milk will be increased,
but the quality materially altered. This is probably owing to
the introduction of plants, which did not grow there before,
or to the destruction of some that did. The cause does not
originate with the cow, but the bertage on which she feeds,
que milk of dilibrent qualities; from one shall be made fine,
rich, and close cheese; while from the other shall be made
rank, "heaving," hollow, unpleasant to the palate, and unfit
for the market. In the parish of Haresfield, two grounds adjoining each other were alternately used for the pasture of
cows: while they were on one, excellent cheese was made; but
on the other, it was difficult to make any tolerahly good. The
latter had been lately well dressed with manure, which proherself remarked, that if the farmer continued to enrich the
hershage with dung, she must give up making cheese. It is
proper, therefore, that milking-cows should not be removed
from one pasture to another indiscriminately, but that certain
grounds, in proportion to the stock, should not be removed
from one pasture to another indiscriminately, but that certain
grounds, in proportion to the stock, should not be removed
from one pasture to another indiscriminately, but that certain
grounds, in proportion to the stock, should be assigned to their
use; and this is the practice on many farms where cow
pastures have for time immemorial been appropriated exclusively to the use of the dairy. The dung of the cow, indeed;
other animals, such as colos and sheep, may occasionally be let
in to eat the refuse grass, but not more than one sheep should
be allowed to an occe. Among the plants which are useless,
or unfavourable to the making of good cheese, are white
tower (

(Ranúnculus), and garlic (A'llium). White clover is brought forward by manure and sheep stock, and is a proof of good land, at least of land in a state of high cultivation; hence it has a tendency to raise the quality of the milk, and make the

has a bendency to rate the quanty of the mins, and make the cheese heave. Cheese-making. Best cheese not attempted while the cows are on hay; generally commences about May, when the cows are turned into the pastures. Cows milked wice a day, when four in the morning, and at the same hour in the afternoon; the cheese-factor discovers the "hoved" cheese by treading on them.

on them.

Skeep. Principal breed the Cotswolds; now very much mixed by crosses with the Leicester and South Downs. The liver rot common in the vale, and therefore few bred there. Wiltshires are bought in and fed off.

common in the vale, and therefore new bred there. Wilfshires are bought in and fed off.

Horses, no particular breed.
Pigeons, formerly numerous, now on the decrease.

13. Political Economy.

On the hilly districts, where stone abounds, the roads greatly improved of late; those under M'Adam excellent; but the vale roads in many places very bad. Manufacture of woolen broad-cloths, chiefly superine from Spanish wool, extensively carried on in the district called the Bottoms. Carpe wearing from the district called the Bottoms. Carpe wearing from the control of the property of the control
7792. WORCESTERSHIRE A surface of 431,560 acres, according to the official estimates laid before parliament, though some of the calculations which have been published make it amount to 599,040 acres, distinguished by the two extensive vales of Worcester and Evesham. In the fertility of its soil, and the amenity of its situation, surface, and natural embellishments, very few districts of similar extent are equal to it—scarcely one excels it. And its agricultural products are not only more abundant, but more various, than those of other counties; not corn, cattle, and dairy produce only, but fruits, iquors, and hops, rank among its productions. (Pomeroy's Worcestershire, 1794. Pitt's Report, 1807. Marshal's Review, 1818. Edin. Gaz. 1827.)

among its productions. (Pomeroys worcesersuire, Edin. Gaz. 1887.)

1. Geographical State and Circumstances. (limate of the middle, south, and west of the county, remarkably mild, soft, and salubrious; the vales of the Severn, Avon, and Terne, with the contiguous uplands, rising to 150 feet above their level, ripen their products from a fortnight to a month earlier than what takes place in elevated counties, even with a similar soil of the morth earlier than what takes place in elevated counties, even with a similar soil of the morth; conformatic polymeroses early at Worcester, and late at Birmingham. Apparently much less rains falls here, than in counties more elevated and more inward. Soil. Ten thousand acres of deep rich sediment deposited by the Severn, and a good deal on the Avon, Terne, and Stour; half the search of the continuation of the search of the

sold for baits to the cod fishery.

2. Property.
Variously divided among all classes; many resident families of considerable opulence and fortune.

3. Buildings.
Some magnificent residences; farm-houses erected at different times, and no way remarkable, unless for being badly situated and arranged; great want of sheels for cattle. Cottages have nothing to recommend them; often built of timber and plaster, and covered with thatch. Some good stone bridges over the Severn, and an Iron one of one arch, 150 feet span and fifty feet rise, at Stourport.

4. Occupation.
Farms small from 40t. to 400t. a year, but some larger;

afty feet rise, at Stourport.

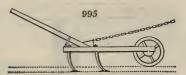

4. Occupation.

Parms small from 401. to 4002. a year, but some larger; seldom held on lease; but when a tenant takes a farm on strong seldom held on lease; but when a tenant takes a farm on strong seldom held on lease; but when a tenant takes a farm on strong seldom the seldom and takes a farm on strong sit by custom for four years. Knight, of Lea Castle, farms 530 acres in a masterly style; large farmers have a turn for improvement; small ones have seldom an opportunity; many inventions proposed and introduced, but the sensible farmer unfortunately finds few of them that will answer unfortunately finds few of them that will answer around Lea Castle, formerly in Irregular uncount divisions, with wide stovenly hedges, are now laid, or laying together, the roads better disposed both for convenience and appearance, and the hedges stocked up; but the trees, which are in abundance, rarefully preserved, to give a park-like appearance; this is diMilliary farming. The same gentleman, when the voluncer cavairy were raised, sold his heavy farm horse, and bought light ones, chiefly Clevelands, on which he mounted ten
of his own servants for military service. The horses doing all the farm work, and occasionally serving for saddle horses, or to
draw his carriage.

draw his carriage.
5. Implements.

5. Implements.
Plough two-wheeled, and drawn by three horses in a line, walking in the furrow; in the vale of Evesham, a heavy swing plough; these ploughs are seen nowhere else; they are all wood, excepting the share and coulter; very long in the tail, throat, and sideboard; a loud for a team; the four-wheeled trolley is a low waggon, used for harvest work. Knight uses improved implements, and ploughs with two horses alreast. Various drills for sowing wheat, and stirring the soil between

the rows (fig. 995.), manufactured at Evesham, and used in the neighbourhood.

Arable Land.

6. Arable Land.
Fallows ploughed four times, which is rather rare in England; rotations generally a fallow and two corn crops, with an intervening leguminous herbage, or tumip crop. Drilling in use for wheat, in the vale of Eveshian and other places; beans commonly dibiled. Turnips cultivated broad-cast; and Carpenter, author of A Turnips cultivated broad-cast; and carpenter, author of A decision be published the book that the five is to be prevented or destroyed by steeping the seed in sulphur before sown, and harrowing as soon as the five is do be prevented or destroyed by steeping the seed in sulphur before sown, and harrowing as soon as the five is do the covered; "then sow eight husbels per acre of dry lime, or fine ashes, when the dew is on the leaves, so as it may adhere to them." Carrots sown by Knight and others in the neighbourhood, where a good deal of seed is raised for the London seedsmen.

Hops grown to great perfection, and fruit trees converted.

bourhood, where a good deal of seed is raised for the London secdismen.

Hops grown to great perfection, and fruit trees generally planted among them, at the rate of forty-eight to an acre; 1000 stools of hops are considered an acre, whatever ground they may stand on, and labour is paid for accordingly. Golding-vine, mathon-white, red, nonparell, and Kentlab granel local names for varieties distinguished by very slender shades. Land stirred between the plants with the plough; only two poles to a stool; picking chiefly by Webs women. When poles to a stool; picking chiefly by Webs women. When you can be compared to the control of
Grass.

7. Grass.

The banks of the rivers chiefly under meadow of the very richest kind; employed chiefly in fatting cattle and sheep; clovers and rye grass callitated.

8. Gardens and Orchards.

S. Gardens and Orchards.

Market gardens war most of the principal towns; produce, besides local consumption, is sent to Bath, Bristol, and Birmingham. Orchards, long and successfully cultivated in the middle, south, and western parts of the county; round towns, villages, and farm-house; and all the hedge-rows of a farm often planted with fruit trees, and very productive. In a prientful, year, or what is called a "ht of fruit," it will not be got for all the juice. In 1784, cisterns were formed in the ground to receive the liquor, but they are out; in Pershore, it is said currents of perry ran into the common sewers. Large quantities of apples rot, or are devoured by hogs; cider in such a verr sold for 21s. a hogshead, in Worcester market; in the morning before five ofclock; six tons have been sold there in one morning; 2000s has been paid for the tonnage of fruit on the Trent and Severn canal in one year: canal forty-six miles long, tonnage 1½d, per ton per mile; 7000 tons must

9. Woods and Plantations.
Abundance of oak and elm. Croome, Hagley, &c. wellwooded. Forest of Wire, near Bewdley, supplies oak poles, ralls, burdles, laths, hoops, &c.
10. Improvements.

10. Improvements.
Earl of Coventry drains his park by open cuts wide, and their sides turfed to the bottom; all the attention they require is reventing the establishment of large weeds or coarse furths of grass, which would interrupt the water; some embankments on the Severn, and some meadows irrigated, but mostly by

11. Live Stock.

11. Live Stock.

No particular breeds; land too good for breeding; feeding chiefly attended reand some darying; some soiling, and a good deal of ollegae used for finding method community of the county, especially near Bewdly; rise to fifteen hands or more! Skey's carriage mules bred from grey or white mares and a white spotted foreign ass. The great age to which they attain is one of their chief advantages; at perfection at thirty, and work till seventy or upwards. Asses employed by Carpenter, of Bromsgrove, farmer and author.

12. Political Economy.

Principal roads good; cross-roads very bad. A subterranean

canal near Dudley A road club, established in the vale of Evesham in 1792, the members of which bind themselves to become road surveyon, gratis, in their turns, and strictly to enforce all and keeping good roads. Several canals, fairs, and markets. Manufactures of gloves in Worcester, and also of porcelain and achinet furniture: of woolen cloth and glass at Stourbridge; of glass and nails at Dudley; leather-making from sheep-skins at the same place; nails, needles, linen, wool-combing and spinning at the same place; and show of procelain and sheep and the same place is a straightful to the same place; and show of process at Kidderminster; various iron work on the Stour; itooking frames at Tewkesbury and Bredon.

Drintwich allt works on record from 816. The strata over the salt are, mould five feet, man chief of sail, into which the salt are, mould five feet, man chief, of sail, into which the salt are, mould five feet, man chief, of sail, into which the boring through the tale, it immediately rises and filting the place of the salt and salt and the salt and salt an

7793. MONMOUTHSHIRE. A surface of 316,800 acres varied by hills, some of which are of considerable height; more distinguished by its woods and its mineral products than its agriculture. A part of the coal basin of South Wales a fund of wealth of immense consequence to Britain, extends into Monmouthshire, and, with the iron works, forms an important source of industry and wealth. (Hassal's Report, 1811.)

1. Geographical State and Circumstances.

1. Geographical State and Circumstances.

Climate. Mild in the vales and cold on the confines of Breconshire, where the snows sometimes remain on the ground till a late period in spring; atmosphere humid, as in most Soil. Clay, loam, and grey soil on rock or marble, and beds of limestone. Caldicot and Wentlog levels on the Severn; under the court of sewers is a rich sity loam. Soil of the hills a reddish loam. No poor soil in the county.

Minerals. Coal, iron, and lime. Upwards of twenty iron works in the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district; coal not brought into general use till 1792, when the coal district is a red to the coal district into general use till 1792, when the coal district is a red to general to general to the coal district is a red to general to the coal district into
2. Property. Duke of Beaufort and Sir Chas, Morgan the chief proprie-tors; next class, 1000l, to 3000l. a year; a third class, 300l. to 1000l. a year. Many proprietors occupy a part of their estates, and cultivate them well; some very small proprietors of or-chards and grass lands.

3. Buildings.
Some fine old seats; farm-houses of the oldest date, timber thatched; new ones covered with tile stone; seldom any farm-yards; but cattle-houses and barns scattered about at random; cottages on the most frugal plan, generally with a garden.

yards; but cattle-houses and barns scatt cottages on the most frugal plan, genera 4. Occupation.

Size of farms, 60 to 300 acres; 140 acres about the average; leases not 7-erg general.

The procedure of the control of the control occupation of the control occupation of the control occupation of the control occupation
7. Grass Land,
"Some farmers insist on it that rushes shelter and protect
grass, and will not allow them to be removed by draining or
otherwise."

8. Gardens and Orchards.

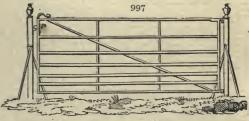

Gardens and Orchards.
 The latter very general on a small scale; apples for eating much in demand at the iron mills; best orchards and hopgrounds in the hundred of Ragland.
 Woods and Plantations.
 County long famous for the size of its oaks; stock now much diminished.
 Live Stock.

10. Live Stock.

Mixed cattle; some dairying, but feeding more general;
Hereford horses a good deal bred; asses and mules in use about
the Iron works; the mules found better than horses for carrying
charcoal from the woods to the iron works.

11. Political Economy.
Valentine Morris, Esq., of Piercefield, being examined as to
the roads of the county, before Parilament, was asked,—
Q. What sort of roads have you in Monmouthshire?
A. None
A. In ditches.
This was thirty years ago (1800); they are now (1830) improved, but still bad; various railways and canals.

12. Means of Improvement.
Leases; embanking the river meadows; drainage; knowledge.

7794. HEREFORDSHIRE. A surface of 600,000 acres, studded with hills, hillocks, and minor swells of various heights and dimensions; almost every where of a rich soil, devoted exclusively to agriculture, and highly productive in corn, cattle, fruit, cider, hops, and timber. The most distinguished cultivator in the county is T. A. Knight, Esq., known in agriculture by his Treatise on the Apple and Pear, many valuable papers in the Transactions of the Royal Society, and communications to the Board of Agriculture; and in gardening by numerous essays and improvements, and his honourable office of President of the Horticultural Society. (Clark's Herefordshire, 1794. Duncombe's Report, 1808. Marshal's Resident 1819. view, 1818.)

view, 1818.)

1. Geographical State and Circumstances. Climets, remarkably healthy; west winds the coldest; warmest and earliest part about Ross.

Soil. A marry clay of great fertility extends over most of the county. The heaviest crops of wheat produced on a clayer tract hetween Hereford and Lethury; the lightest lands in the form the Hereford and Lethury; the lightest lands in the from the prevailing produce there in former times. Minerals. I rom ore in the sandy district, but none manufactur. dat present. Red and yellow ochres, pipe-clay, and fullers' earth, but only the latter worked for.

Water abounds is salmon caught in the Wye, but, owing to the same of the same state of the same

for the Hereford market, with success and profit.

4. Uccupation

Small farms on the decline; few opportunities now by which

Small farms on the decline; few opportunities now by which

Small farms on the can devote bld. Or 1004, acquired by

personal labour, to stock a few acres, and bring up their family,

and pass their latter years in comparative independence. Hence

marrimony on the decline, and licentiousness on the increase,

thence Duncombe humandly recommends proprietors to forego

the temporary advantages of throwing the whole of their estates

into large ferms, and advises some of all sizes, from 5 to 500

across a different states and the sizes of the sizes of the sizes

culture with great hesitation, if not reluctance. When its

ntility is confirmed by repeated trials, he slowly and gradually

the county is at this moment well provided with agricultar
ists, who possess the means and the spirit to undertake the

three periods of seven years, determinable at the end of each

period by either landford or temant.

5. Implements.

Plough called the light lammas, without a wheel, and drawn

by three or four oxen generally in a line, abreast; but often the

yoke is the usual mode of barnessing. Various improved im
plements by the amateurs, but none in general use.

6. Arable Land.

Wheat principal grain cultivated, and generally sown on a

fallow. Change of seed procured from the chalk hills of Ox
fordshire; stated, hate of Eston, now of Downton Castle,

steeps in water and then envelopes in lime, and his wheat was

ser for from smut and other diseases as that of his neighbours

from changed seed. Hops a good deal cultivated, and chiefly

disposed of to Bristol deaders.

7. Grass,

Fertile meadows on the Wye, Frome, and Lug; mown and

from changed seeds. Hops a good deal cultivated, and chiefly disposed of to Bristol dealers.

7. Grass.

Pertile meadows on the Wye, Frome, and Lug; mown and fed. Not a dairy county for home consumption, seldom for exterior martes, or Smithfield. Butter supplied from Wates, and chesse from Shropshire and Gloucestershire. "The general soil of Herefordshire appears to be unfavourable to the making of chesse. T. A. Knight, with that accuracy and stip and the self-ship and chessis and and the listory, has proved by esperiment, that equal quantities of milk in Herefordshire and Cheshire will produce unequal quantities of curl, highly to the advantage of Cheshire: and farther, that better chesse has been produced in that county, from milk, half of which has been produced in that county, from milk, half of which has been produced to the want of skill in our dairy-maids; and the cause of failure is rendered more difficult of discovery, and consequently more difficult to he remedied, from an observation that the plants were nearly the same in the Herefordshire and Cheshire past-tures, on which the above—experiments were made: white clover abounded in each, with the crested of the plants the pastures of Herefordshire angenerally composed.

A mote of managing owned meadows and pastures has lately been tried, and attended with a great increase of produce. He grasses in move as soon as it is in blosom, and consequently previously to the formation of seed. The after-grass is not grazed until it begins to contract a vellow appearance, in the latter and of Actioner or benduring the winter with a portion of dead herisage, through which the young grass springs with he greatest vigour at an early period of the succeeding spring.

8. Gardens and Orchards.

Fruit trees first extensively planted in Herefordshire in the

8. Gardens and Orchards.

8. Gardens and Orchards.
Fruit trees first extensively planted in Herefordshire in the time of Charles I., by Lord Scudamore, of Home Lacy. Orchards and hedge-row trees of the apple and pear kind are found on every aspect, soil, and under every culture. The soil best adapted to most kinds of apples, is a deep rich loam when junder the culture of the plough; the Styre and golden pippin,

in particular, form exceptions, and flourish most in a hot and shallow soil, on a lime or sandstone. The best sorts of pear trees also prefer the rich loam, but inferior kinds will ever applies are divited into old and new sorts; each class comprises some called kernel fruits, namely, the fruit growing on its native roots, as a distinction from those produced by the operation of grafting. The old sorts of apples are those which have been long introduced, such as the Styre, golden pippin, hagioe-crab; several varieties of the Harvey; the brandy yellow musks; fox whelp, loan, and old pearmains; dymock red, ten commandments, and others. Some of these names are descriptive of the fruit, and others are derived from the places where they have been first found, or found in most abundance. The old pears held in most estimation are, the squash, so called from the tenderness of its pulp; the oldfield, buttley, from the quantity of fixed air contained in its ilquor; the bariand, from fields in the parish of Rosbury, called the Barlands; the sack-pear, from its richness; and the red pear, from its colour. Of more common sorts, the long-land is the most valanble, and for the general use of the farmer perhaps the best of any.

9. Woods and Plantations.
Oak very shundant, and more rapid in its growth in this county and Monmouthshire than in most parts of England, Lord Oxford's estates and Croft Castle contain the finest old trees in the county; fine woods at Foxley, U. Price, Esq.; most luxuriant oak timber and coppiese at Moccas Court and Stoke Park; a curious weeping oak at Moccas. Most productive ash coppiese at Hampion Court and Ledbury; cut every thirteen years for crate ware, hurdles, &c. and bring from 18th to 55th. per wood acre, which is to the statute acre as \$ to 5. Elm trees are interspersed in the hedge-rows with fruit trees.

10. Immountements. Woods and Plantations.

10. Improvements.

10. Improvements.
Draining much wanted, but practised chiefly by proprietors; watering little practised; though introduced in 1610 by R. Yanghan, Esq. of New Court, whose tract on the subject has been altered mentioned, 14376.) He not fit agreed the subject of the properties of the water, that gentleman is now enabled to irrigate two hundred acres of land, which were never watered before, with the assistance of the least flood; and one half of that quantity even in the driets essaon.

11. Live Stock.
Hereford cattle esteemed superior to most, if not to all, other

de pare or a att

enabled to irrigate two hundred acres of land, which were never watered before, with the assistance of the least flood; and one half of that quantity even in the driest season.

11. Live Stock.

Hereford cattle esteemed superior to most, if not to all, other breeds; those of Devon and Sussex nearest them in appearance. Large size, an athletic form, and unusual is a reddich brown, with white faces. The rearing of oxen for agricultural purposes universally prevails; nearly half the ploughing is performed by them, and they take an equal share in the labours of the harvest. They are shod with iron in situations while frequently require their exertions on hard roads. The show of exen in thriving condition at the result of the show of exen in thriving condition at the annual collection in England; on this occasion they are generally sold to the principal graziers in the counties near the metropolis, and there perfected for the London markets.

Herefordshire not being a dairying county, breeders direct their attention to producing that form of animal best adapted for feeding rather than milking.

"It is not to be supported to the improvement of his cow ; and for the use of the grazier, he has made her an excellent animal. The Herefordshire breeder, on the contrary, has sacrificed the qualities of the cow to those of the ox; he does not value his cow according to the price which the grazier would give for it, but in proportion as it possesses that form and character which experience on a. Hence the cow of Herefordshire is comparatively small, extremely delicate, and very f-minine in its characters. It is light fleshed universally in a short space of time, when fattening. Experience seems fully to have proved, that these qualities in the cow are necessary to continue in its characters, and heavily loaded with flesh, the ox will be course and brawny, and, consequently, unkind and tedlous in the process of fattening. It may here here any continue in its characters, and heavily loaded with lesh, the ox will be course and b

approach two opposite points at the same time, they will never be able to reach cither. Where the sail is sail calculated for the dairy, every attention should be paid to estain and improve the best sorts of milking cows; and where the ox is kept to a proper age as a beast of draught, nothing conducing to his excellence ought to be neglected. A cow must, however, give milk enough to keep its call fat, or It is disqualined for breeding a good ox; because the call would be spoiled before it had a good ox; because the call would be spoiled before it had some statement of the said of lambing, the store flocks are generally confined by night in a covered building, provincially termed a cot, in which more frequently with peas-haulm. Some breeders accustom them to the cot only in very severe weather, and in lambing time. The practice was derived from the Plemings, and hitto-duced into England about the year 1600. A cross has been made between the Ryelends and the new Leicester sorts, to the

advantage, perhaps, of the breeder who is situated on good land, but certainly to the detriment of the wool. A cross between the Hyeland and real Spanish seems the most probable mode of adding to its fineness and value. Dr. Parry's experiments have been already related. (7232).

ments have been aireary related. (1202.)

12. Rural Economy.

"If a certain proportion between the price of labour and the average price of wheat could be fixed by law, so as to render the applications for parochial aid necessary only in cases of a very large family, of unusual libmes, of scanty seasons, or any other real emergency; the measure, it is presumed, would be honour-real emergency; the measure, it is presumed, would be honour-based to the country, would stimulate industry and fidelity, would check dishonesty, and endear to a numerous class their native soil.

13. Political Economy.
Roads formerly bad; now improving; materials, coarse limestone. Gloves, to a small extent, manufactured in Hereford. An agricultural society established in 1797, which has given many premiums, and done much good.

7795. SHROPSHIRE. A surface of \$90,000 acres; in general flat, but with hills of considerable height on some of its margins. The soil is chiefly clay, but in part light turnip land; both are devoted to the raising of corn-crops. Breeding and dairying is also practised to a moderate extent. The greatest improver in the county is the Marquis of Stafford, whose extensive and important operations on the estate of Lilleshall are described at length by Loch, in his Improvements on the Marquis of Stafford's Estates, 1819. (Bishton's Shropshire, 1794. Ptymley's Shropshire, 1801. Marshal's Review, 1819.)

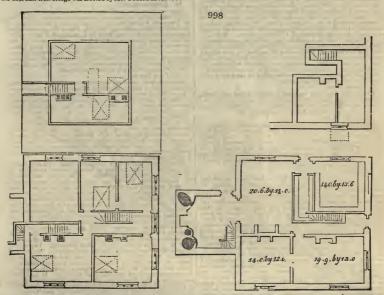

1. Geographical State and Circumstances. Climats. Considerable difference according to the soil and surface; more warm on the eastern side than in the middle of the county. E. winds prevail in spring, and W. in autumn. Soil. Nearly an equal quantity of wheat and turnip land, the former rather predominant. S.W. side of the county variable; this soil upon clay or rock; extensive tracts of hills and waste; and most sorts of soils except chalk and filmt.

Minerals. Lead in gramulated quartz very productive. Copper ore found but not worked. Coal of excellent quality on the cases of the control of the con

Walers. Twenty-two sorts of fish found in the Severn in Shropshire. Salmon in season from Michaelmas to May.

2. Property.
Estates of from 10 to 25,000 acres, and an infinite number of freehold us to 25,000 acres, and an infinite number of freehold us to the common security materials are consumer materials.

3. Buildings. Some good new mansions; above eighty of these named in old maps become farm-houses. Parm-houses generally in villages. Excellent new ones on the Marquis of Stafford's estates. (f/g. 998.)

Comfortable collages with gardens much wanted. Some puticious observations by Plymber; prescribes no particular activations of the property of making them, or andread any other object, bear an outward appearance, intended to contradict their inward use; all castellated or gothelised cottages, all churchlife barns, or fortlike pigsties, he conceives to be objectionable. They are intended to deceive, and they tell you that they are intended to deceive. It is not pleasant to encourage any thing like deectl, but in these instances imposition effected is rarely gained; it amounts only to imposition elected is rarely gained; it amounts only to imposition effected is rarely gained; it amounts only to imposition effected is rarely gained; at a mounts only to imposition effected in a rarely gained; and the first them there really effect, if properly placed and neatly executed; and what are the least ornamental, or indeed the most disquisting, of their appendages, cease to shock when supported by the relative situation they stand in, showing their necessity and their use. A dumphill in a farm-yard creates no disagreeable idea; but connected with a Gothic gateway or embattled tower, it is bad, Cattle protected by the side of a barn from a picturesque group; but sheltering under a Grecian portice, the Impropriety is

glaring. Linen hanging to dry on the hedge of a cottage garden may be passed without displeasure; but the clothes of men, women, and children surrounding the cell of an anchoite, or the oratory of a monk, but other hand, a fine-dressed lawn with miserable cottages may be compared to the laced clothes and dity linen some foreigners were formerly accused of wearing. The whole of a gentleman's estate should be his pleasure-ground: the village should be one object in the scene; not shut out from it. There may be a little more polich about the mansion, but it should not be an unnatural contrast to the surrounding objects. The face of no country is bad but as it is disjured by artificial more what offends, and to take care that the buildings or fences that are wanted are next and appropriate, exhibiting distinctly their real intention. Plymley is a friend to single cottages, because two families under one off may have more causes of contention arise between them. On the other hand, in illness poor people have frequently the merit of foregetting their differences; and then the assistance they are inclined to give each other is made more easy by near-

ness of situation. It is possible, however, where two, or even three houses are joined together, to contrive the gardens in such a manner that there may be little interference; and some-times three neighbouring families may do better together than

4. Occupation.

On the borders of Wales the farms are small, many not exceeding twenty acres; on the east side of the county from one to 500 acres: farmers in general very industrious; work along with their servants; wives brew, bake, dairy, and at spare hours spin, and get up a piece of linen cloth for sale every year. Leases for lives formerly very common. Bishton of Kilsail has taken great pains to prepare printed leases, which answer very well. The term he recommends is seven, fourteen, or twenty-one years. By being printed the farmer can read them at his leisure.

5. Implements.

Flough with two wheels, drawn by four or five horses, or six.

5. Implements.

7. Implements.

8. Plough with two wheels, drawn by four or five horses, or six or eight oxen, in the strong lands, and two horses with a boy of drive in the turnip soils. Various improved implements and threshing-machines: some excellent mills on Lord Stafford's extates, driven by steam.

6. Enclosing.

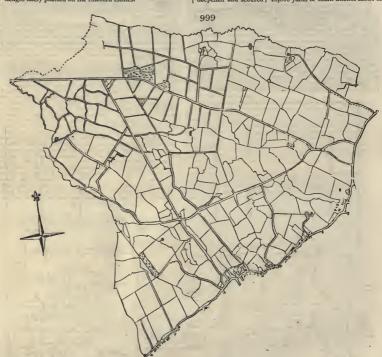

Much practised, and still going on. Plashing hedges is usually very ill done in Shropshire; it is a business which requires great nicety and judgment, and has the most ignorant operators to perform it in general, who in the first place cut expose the heart of the plant to the weather. Many miles of hedges lately planted on the Stafford estates.

7. Arable Land. Following very badly done on the strong lands. Common crops of the county wheat, barley, oats, peas, and turnips. Peas found not to bell well unless grown on a sharp gravel or sand; those grown on clay given to pigs and horses. Some hemp and hops cultivated.
8. Grass.

8. Grass.
Some natural meadows on the Severn and other rivers; not much attention paid to them. Artificial herbage and grasses grown on the turnip soils.
9. Gardens and Orchards.
Many farmers have small orchards, from whence they make a little cider for home consumption; and on the confines of Herefordshire and Worcestershire the orchards are larger, and cider is made for sale.

10. Woods and Plantations. A good deal of hedge-row timber, and some fine oak woods; also numerous young plantations. Narrow-leaved elm reckoned an excellent hedge-row tree, but the broad-leaved better timber, and less difficult as to soil and situation. In this county few persons will bury their relations in any but the best oak timber, which contributes much to its scarcity.

11. Improvements, Marl used, and some Marl used, and some irrigation. A good deal of draining done with brick, stone, and fargot wood. Some bogs drained in Elkington's manner. On the Lilleshall estate of Lord Stafford (fgr. 999.), in 1816 and 1817 there has been executed about 17,000 yards of embankment; 27,000 yards of water course deepened and scoured; 46,000 yards of main ditches made or

deepened; 315,000 yards of fence-ditches deepened, scoured, and straightened; 49,000 yards of old fences stocked; 50,000 yards of new quick fences made; 21,000 yards of turf draining; and 462,000 yards of under-ground draining, laid with tiles and ciled with stones; besteap the stones; besteap the stones; besteap the stones; but the stones; besteap the stones; but to have an adequate idea of these and other improvements effected by this munificent and patriotic nobleman, it is necessary to peruse the very interesting work of Loch already referred to.

On the Wildmoor estate of Lord Stafford (fig. 1000.) excellent roads have been formed; so that several parts, before inaccessible in winter and during wet weather, may now be approached at all times with ease. The effect, as Loch observes, has this derable work executed upon these estates is the drainage of the extensive district alluded to, called the Wildmoors. The extent and nature of this improvement is such as to deserve a particular and detailed description. Some adjoining properties have benefited by this work, and contributed to the expense of it, which was done under the authority of an act of parliament; but as almost the whole of the land belongs to the Marquis of Stafford, and the expense having been chiefly borne by him,

the direction of its progress, and its preservation hereafter, is entirely vested in a surveyor chosen by his lordship.

These moore consisted of an extensive tract, amounting, with the land similarly circumstanced, to near twelve hundred acres. The soil is composed of a fine black peat, incumbent by the upland part of these estates, and surround the parish of Kynnersley, which also belongs to it, and which is composed of some of the finest turnip and barley soil in the kingdom. They had evidently formed the bottom of an extensive lake. The different brooks from the surrounding country held their course through them. These brooks are known in the country by the name of Strines, being distinguished from each other ly the name of the places from which, or past which, they flow, this country into the Severni was devious and crooked in the extreme, injuring to a great extent the land through which they yan.

A great proportion of these moors was occupied by the tenants of the adjoining farms, who turned their stock in upon them for a portion of the summer season only. During the rest of the year it was impossible to use them. They alforded but a small quantity of food, and were in most places so wet that it

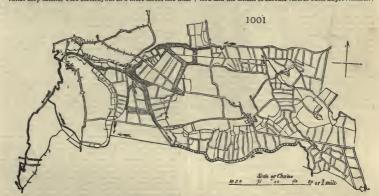

was at all times difficult to walk over them, it being necessary | inhabitants of the neighbourhood were subject to frequent to select the hardest places to step on. They were covered attacks of ague. The adjoining lands besides, to an extent with water after almost every severe rain, owing to which the | exceeding six hundred acres, were kept in nearly a state of

nature, owing to there being no level by which they could be drained while this extensive district continued subject to such inmidations.

The difficulty which occurred in draining this tract of land arose from the want of level, and from the river Tearn being pounded so high by the mill-pools as to throw the water back to a great distance upon the land. The plan for draining this laid out, in the double view of securing this object and of interfering as little as possible with private property and the existing establishments situated on the Tearn. It was suggested by John Bishton, Esq., the first commissioner under the Act. The preat object was to gain as much additional level as would create a run throughout the whole extent of the moorlands. This was to be obtained by beginning the cut which was to than the water had hitherto been discharged into that river; and a good deal below the mill-pool at Long, which occasioned this poundage. The original courses of the strines were straightened and widened, but they were still made to convey the water from the uplands, and to cut off the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution of the effects of the back poundage of the evolution

the course of the strines. Into these ditches the drainage of the moorlands is emptied. The level which was thus brought from the river Tearn, from below Long Mill, was carried in a tunnel under the Shrewsbury canal, and was conducted below the several strines in siphon culverts, and thus communicated with the ditches described as having been made behind the banks which confined the water of the several was a supervised of culverts over another, in order that the waters coming from the uplands may be kept in the several brooks through which they had constantly flowed, and that this water flowing from the uplands might not fall into the back drains; it being again explained, that the water flowing from the higher grounds is still confined to the original strines or brooks on an upper level; the drainage water alone of the moorlands being thrown into the back drains. Thus has a great additional level been off water, and such a thing as a flood has not been known for years. This district is in some instances so flat, that the old course of the Preston strine, which formerly conducted the water of that brook in one direction, has with little difficulty been made a part of the drainage, and to carry the drainage, water in exactly the contrary direction, a new channel having been cut for the strine. Taking advantage of this drainage, main ditches upon a regular system have been carried into at the neighbouring parts of the estate, thereby enabling the bandlord and the tenant to execute various other improvements.

This district has been subsequently divided into regular enclosures, by great ditches, which fall into the main drains; and who you is has been possible, these ditches we been made to serve this purpose, as well as that of a fence to the new roads which have been constructed across these moors. In one instance, one of these roads has been carried in a straight line for about two miles. On each side of this road trees have been planted, at regular distances, which will soon form one of the finest avenues in England. These moors have besides been all regularly under-drained by turf drains, which stand remarkably well. In the different ditches are placed flood-gates, to pound back the water during the summers. The water is let off it lesst once in every fourteen days, and being drawn off with as much velocity as possible, it scours and keeps clear both the ditches and the underground drains; — the mouthast have been greatly improved by very heavy and repeated rollings and top-dressings; and their value as let to a

farmer, in many instances, is fully doubled. This improve-ment has cost a very large sun of money; which was increas-ed beyond what was necessary, owing to the inefficiency of the late surveyor belonging to the commission, which is not yet closed. The drainage, however, has lately been put under a surveyor (Lewis), approved of by Lord Stafford in terms of the Act, and the expense is diminished, and the whole put in better order.

A very good improvement has taken place on these lands

hetter order.

A very rapid improvement has taken place on these lands. In place of being the very worst part of the estate, they are rapidly becoming equal to the best and finest meadows on it. In order to shelter them from the blasts which come round the Wrekin, from the Welsh mountains, they have been intersected with various plantations. A plan of the Wildmoors previous to (Fg. 1000.), and another subsequent to the property of the property of the work of the camination and inspection of an intelligent agriculturist and improver. (Loch, p. 226.)

12. Live Stock.

12. Line Stock.

Cattle of mixed breeds: some dairying, chiefly for butter to the manufacturing towns; some cheese, but not very good. Calves raised as stock, and sometimes suckled for read. Sheet stock in general neglected as to improvement in kinds. Shock in general neglected as to improvement in the content of the co

sold to highers, who drive them to Birmingham and other large towns. Markets in general well supplied with flowls. It is to be lamented that they are generally carried alive to market. Death is no misfortune to an animal that has no previous apprhension of it. But poultry, carried in bags or baskets to market, have several hours of previous suffering, and the burden and trouble of carrying them thither seem much increased thereby.

13. Political Economy.

Roads generally had; various canals; trade of Shrewsbury, flannel, and Welsh webs, used for clothing for the slaves in the county numerous douth America. Manufactures in the county numerous douth America. Manufactures in the county numerous grows, location, glass, Greing cloth, woollens, flannels, linen, gloves, &c. An agricultural society at Drayton.

7796. STAFFORDSHIRE. 765,000 acres of hill and dale, some parts rugged and others smooth, but on the whole more a mining and manufacturing than an agricultural county. The Marquis of Stafford, Lord Anson, and the Marquis of Anglesea, are the chief improvers. Excellent markets for produce within the county in consequence of the numerous manufacturing towns and villages. (Pitt's Report, 1808. Marshal's Review, 1813. Loch's Improvements, 1819. Edin. Gaz. 1827.)

1. Geographical State and Circumstances.
Climate. Air sharp and cold, and inclining to wet; annual rains thirty-six inches; those of London twenty or twenty-one inches; of Upminster, in Essex, nineteen inches and a quater; Lancashire forty-two; of Ireland forty-two to fifty. Annual rain on the west side of the kingdom double that on the east

side. Surfuce. In the north side of the county hills arise, forming the commencement of a ridge, rising gradually higher and higher into Scotland, under different names: here called Moorlands, then Peak, then Blackstone Edge, then Craven, then Sianmore; and then parting into two horns, called

then Stammer, and the stammer, for Cheviots.

Soil. Very various; about one third of the county strong loam or clay; one third mixed soils of almost all sorts, and the remainder light, calcareous or alluvial; no chalk.

Mineralt. Valuable and extensive; 50,000 acres or upwards of coal. Iron ore and lime of unknown extent.

Minerals. Valuable anu examine of unknown extent.

2. Property.

Largest estates 10,000t. a year, and many of all sizes, from that amount down to 40s. a year. Attorneys generally the managers, but some excellent examples of gentlemen of from 500t. to 5000t. a year managing their estates themselves; residing on them, and cultivating a part, and giving every encouragement to their tenants.

3. Buildings.

Same noble mansions, as Trentham, Beaudesart, Ingestree,

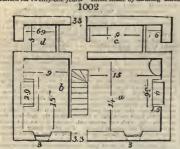

S. Buildings.

S. Buildings.

Some noble mansions, as Trentham, Beaudesart, Ingestree, &c. Excellent farm-house constructed on some estates, as Trentham, Lord Stafford's junt the majority, as in other counties, bad, and badly situated. A farm-yard has been constructed at the family seat of the Ansons, for a demesne farm of 2000 acres. It was built by S. Wyatt, of London, and consists of the farming steward's house at one end; a range of building along mere and the family seat of the Ansons, for a demesne farm of 2000 mill for the farming house at one end; a range of building along site side and end are occupied by stalls for feeding cattle, store-rooms, stables, and other appendages; and in the middle of the yard is a very complete hoggery, built of large stones set edgewars, and covered with slate, with a boiler for heating hogfood, a cold bath supplied by the mill stream, for giving an occasional swill to the young pigs. In this building a number of casional swill to the young pigs. In this building a number of youlse, ground barley or bran, supplied by the mill near at hand. At some distance above is the stack-yard and barns, where a powerful threshing-machine is worked by the same stream that afterwards supplies the garden, and turns the corn mill in the farm-yard.

4. Occupation.

Farms of all sizes, from twenty-five to 500 acres; many consolidated since 1795. Some very good cottages with gardens, and containing comfortable and commodious accommodation for agricultural orn annifacturing operatives. A specimen of our of lodging room (b), pantry, dairy, cellar, &c. (c), cow-house (d), with a water closet, and three bedrooms over. Leases generally granted for twenty-oneyears. Little made by farming unless 1002

with a combination of all, or most of the following circumstances:—First, an easy rent; second, a pretty good and extensive farm; third, econony and industry; and fourth, length of time. In the present system of farming, at a moderate rent, the writer of his knows from experience, that it requires not only the most diligent industry, but also the most prudential economy, to keep the balance on the right side. To which Marshal adds, "I have rarely found a farmer making a fortune by his profession alone, unless on fresh land; on virgin marsh, old grazing-ground, ancient sheep-walk, or well solied commen; a fortune,

I mean, any way resembling that which, with the same ability and industry, and with a small share of the outset capital, he would have been making by trade, manufacture, or commerce.

5. Implements.
Very various; double furrow-ploughs drawn by four horses, a good deal in use in the light lands. Excellent threshing machine, and various new implements introducing by proprietors, and especially by the Marquis of Stafford.
5. Arable Land.
Most annual field-crops cultivated, including hemp and flax.

Most amount field-crops cultivated, including hemp and flax. 7. Grass.
Meadow on the rivers and brooks, and artificial grasses sown; feeding in general preferred to dairying.

8. Gardens and Orchards.
Common to many farm-houses; but few or no sale orchards, and scarcely any fruit crushed for liquor.

9. Timber and Woodlands.
Best-timbered estate Blithfield Park, Lord Bagot; the park contains many hundred trees of extraordinary bulk, containing from 200 to 400 feet of timber each; much of it is mentioned by Dr. Plort as full grown in 1686. Chillington and Beaudestroets, or forest, chiefly remarkable for its beautiful hollies. On the whole the country abundantly wooded. Sneid's copplees cut once in six years to make crates and large hampers for the potteries.

10. Improvements.

10. Improvements.

note in six years to make crates and large hampers for the potteries.

10. Improvements.

11. Improvements.

12. Irrigation and draining practised, the former only to a moderate extent. Jessop, the engineer, suggests that nine part in ten of the waters of the kingdom at present run away in waste, a great part of which might be usefully employed; nay, further (putting expense out of the question), that every stream in the kingdom may be made to run equally through the whole the strategy of
dows, and for impeling the threshing-machines of the respective farms.

In consequence of the complete state of ruin in which the farm buildings on these estates were found, it was necessary to incur a serious expense in constructing new ones. In this way it has been necessary to erect thirty-seven new, and to repair throughout eight other, extensive sets of hardward throughout eight other, extensive sets of hardward throughout eight other, extensive sets of hardward throughout eight other, extensive sets of here contended throughout eight of the property of the prope

threshing-machines, driven by water or steam, a thing rare in England, excepting in Northumberland. It is believed, Loch observes, that they unite as many advantages with as few faults are the control of the control

by 50 numerous and recility a tenanty, supported by the influence of the landlord, these feelings must speedily give way.

This mode of ploughing has made rapid progress at Trentham.

The reason of which is, that it is more generally admitted, that this system is calculated to suit the stiff better than the lighter solls, inasmuch as two ploughs, drawn by two horses abreast, do much more work than a double plough, drawn by four dorse made and the much more work than a double plough, drawn by four some apparent force, that on light soils the double plough, drawn by two horses seach, and guided by one man, can do as much work as two ploughs drawn by two horses each, and guided by two men. In this way the labour of one man is saved. It must be admitted that the argument would be in favour of the must be admitted that the argument would be in favour of the two-horses system. It is remarkable that this mode of ploughing with two horses should be confined to the eastern parts of England, from which it was adopted, at no very distant period, in Scotland, where the ploughing with a number of horses poked along with oxen existed to an extent never practised in a manual ploughing-match has been instituted, at which prises are distributed to the best ploughmen. The effect this has already had is very considerable; and at the exhibition in October 1814, no fewer than fifty ploughs started for the premiums. The progress of such a system must be also slow, as it cannot be expected that the transts should at once lay aside all their mode of ploughing. In removing this inconvenience, there made the property of the construction of the more improved implements of nodern husbandry and it is strongly recomplements of nodern husbandry and it is strongly recomplements of nodern husbandry and it is strongly recomplements of the construction of the more improved implements of nodern husbandry and it is strongly recomplements.

to the value of every acre of such a farm, in addition to a fair remt being put upon the mesadow.

The attention and influence of Lord Stafford has been used in whatever way it could be employed beneficially in extending the comfort or advancing the good behaviour of his cottagers; a conduct so characteristic of the great and wealthy proprietors of these kingdoms, that it must be subject to the great and wealthy proprietors of these kingdoms, that it must be subject to the great and wealthy proprietors of these kingdoms, that it must be subject to the great and wealthy proprietors of these kingdoms, that it must be subject to the great subject to the s

strongly interrance of the benerical eriects were to the positions from the residence of the great families of England on their Trom the residence of the great families of England on their The foregoing statement would have been given with some hesiation, had not the facts been of a nature rather to exhibit and illustrate the character and extent of the chartile distributed by the great families of England in general, than as being at all peculiar to the instance to which the details belong; and these facts may help to explain to foreigners the nature of the connection which exists between the richer and poorer classes in this country.

The torne of Lance End, one of those which compose the continguous to the east end of the Trentham estate. The inhabitants being ill supplied with water, carried in barrels, they petitioned to be provided with this necessary article, which request has been complied with; and this town, after a very considerable outlay, now enjoys a regular supply of water, conveyed in iron pipes.

The character of the numerous cottagers upon the estates is also an object of great solicitude, and without any interference with the manner in which a man may choose to occupy himself, their regular and decent behaviour is made the subject of care and attention, and the steward has strict directions to watch carefully over them, and where possible to promote their improvement. Wherever a potato garden can with advantage be added to their cottage, that accommodation is afforded them. In the vicinity of Trentham the cottages are of the best sort, and with their gardens kept in the nices are also also the subject of the control of the subject of the control of the subject of

Cattle generally of the long-horned breed. The Stafford-shire cow's generally considered a tolerable milker, as well as feeder.

feeder.

Sheep. Three sorts considered native breeds: the grey-faced hornless, or Caunock heath sheep, with fine wool; the black-faced horned, with fine wool; and the white-faced hornles, with long wool.

With long wool.

The property of the sheep of t

certain starvation."

12. Political Economy.
Roads now generally good; numerous canals; several pricads now generally good; numerous canals; several pricads now generally good; numerous canals; several pricads now generally good; numerous canals; glass, toys, japanned goods, potters' ware, cotton cloth, silk fabrics, toys, japanned goods, potters' ware, cotton cloth, silk fabrics, toys, japanned goods, potters' ware, cotton cloth, silk fabrics, toys, japanned goods, potters' ware, damage groups of houses, but for the most part in towns. Many thousands both of men and women employed in making nails. An agricultural society at Newcastle, and another at Litchfield.

Experimental Farming. "It would be a wholesome plan for the Board to commence farming upon their own ideas, particularly in counties where the modes of agricultural seem lumpor Northumberland, &c.; by which ocular demonstration their plan might be imitated; for hearing or reading of any particular practice will not do for farmers in general." Such is the reporter's opinion, in ours a most erroneous one.

7797. WARWICKSHIRE. A surface of nearly 639,760 acres, mostly flat, but generally rich in soil and beautiful in appearance. It is chiefly a corn county, and produces excellent wheat; but also many fat cattle, and formerly much cheese. There are no distinguished agriculturists in the county; but it has produced more good to agriculture than many others, by giving birth to Elkington, who gave rise to much discussion on draining. (Wedge's Report, 1794. Murray's Report, 1808. Marshal's Review, 1813. Edin. Gar. 1897. Gaz. 1827.)

1. Geographical State and Circumstances.
Climate, mild and healthy. S. W. the prevailing winds:
effects of an easterly variation felt till the middle of May,
and vegetation checked; not, however, by excess of damp or

Soil, chiefly clay or sand, marl, and limestone. The portion of sandy or moorish soil very small. The tract of land called the county of Coventry is a rich, red, sandy loam, chiefly in grass. The land near Birmingham is generally either sand or

the county of Covensy agrass. The land near Birmingham is generally either some organs. The land near Birmingham is generally either some stiff clay.

Minerals, coal, limestone, freestone, iron, blue flagstone, mart, blue clay, and soapy clay, which the late Earl of Warwick attempted to prepare for sale as a soap.

2. Property.

Largest estate Stoneleigh, Chandos Leigh, Esq., 25,000 acres; but a great variety of extent, and some curlous and absurd tenures.

3. Buildings.

Warwick Castle and Ragley first-rate edifices. Old furnitions built of mud and timber, and frequently at the extremity of the farms. The Duke of Buccleugh, at Dunchurch, less of the control
4. Occupation. Support of the average size; on the increase. Farmer in general exceedingly shy and jacous; on the increase. Farmers in general exceedingly shy and jacous; one considered as at the head of his profession, told Murray the did not see any advantage the county of Warwick would instead of good; and that such being his opinion, he declined giving any information on the different heads of queries put thin? Lands generally held at will, but very low rental. Cheap farms, in general, are a drawhack on industry and impovements: farmer that have cheap farms may farm well; but those that have dear farms must farm well, or their caveer with the contraction of the contraction.

will soon terminate.

5. Implements.

Ploughs the double and single Rotherham with wheels, the double drawn by five or six horses in a line, the single plough by three and four, or five horses in a line, and in both cases with a driver. Small's plough, with two horses abreast, and no driver, the reporter remarks, would make better work, and more of it. Some winnowing and threshing machines in use

more of it. Some winnowing and threshing machines in use by proprietors.
6. Tillage.
Large crooked ridges gathered very high with a small one between; go only one yoking per day throughout the year. Fallowing general, and then two white crops.

7. Grass.

235,000 acres in meadows and pastures, and 60,000 in artificial herbage. Formerly dairying common, and Warwickshire cheeses produced in abundance; but now breeding is sta sasuming its place. Old pastures overrun with ant-hills and rubbish. Murray very prophetically observes, that if peace were to take place, grass lands would be safer for the farmer than corn lands. Dairying and feetling both in practice.

Factor were to the page, grass and a south the practice.

8. Gardens and Orchards.

The gardens of the Marquis of Hertford, at Ragley, noted for their pine applie; few sale orchards of any extent.

9. Woods and Plandations.

Oak and elm every where abundance of timber.

Oak and elm every where abundance of timber.

Much draining done in the northern part of the county; but it is rather singular that the names of Fazeley, Elkington, or their farms, are not once mentioned in Murray's report.

Joseph Elkington lived at Princethory, in Stretton on Dunsmoor, six miles S. W. of Coventry, and afterwards in Birmingham. He died in 1806. He was a mere empiric practitioner, and knew nothing of geology, and the empiric practitioner, and knew nothing of geology, so even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries, as Farey has also even than some of his contemporaries.

temporaries, as Farey has ably shown in the Derbysanre report.
Irrigation practised in a few places on a small scale.

11. Live Stock.

No particular breed of cattle; but as feeding is the prevailing practices, farmers buy in whatever breed they think will pay practices, farmers buy in whatever breed they think will pay show a constant warwickshire, now generally mixed with other breeds. The first cross of a Leicestershire ram and Warwickshire ewe produces the best sheep for the butcher.

Horses, the heavy black Leicestershire breed; a good many bred, of cart, coach, riding, and hunting horse. Pouling shounds, to Birmingham and London.

Game, as phessants, partridges, and hares, more than commonly abundant.

12. Political Economy.

Roads tolerably good; several canals; innumerable manufactures, especially at Birmingham, for iron, and others of the metal kind, and Coventry for ribands.

13. Means of Improvement.

Leases; a more economical mode of labouring; draining; drilled root, and herbage crops, and better rotations.

7798. LEICESTERSHIRE. 522,240 acres of gently varied surface and fertile soil; distinguished for its pastures, and for the progress that has been made in the improvement of cattle and sheep. It is the county of Bakewell, whose name will ever stand at the head of breeding farmers. (Monk's Report, 1794. Pitt's Report, 1809. Marshal's Review, 1813. Smith's Geological Map, 1821.)

1. Geographical State and Circumstances. Climate mild and temperate; no mountains or bogs to produce a cold or moist atmosphere.

Soil; no stiff clay or sand, no chalk; the peat bogs which existed have been long since drained, and become meadow soil; clayer loam, sandy loam, and meadow, compose the soil of the county. Dishley farm, so well known, consists of a mild friable loam, of a good depth, on a clay or marl bottom.

Minerals; coal, lime, lead, iron, slate, and freestone; all worked. A mineralspring at Burton Lazars.

2. Prancrin

2. Property.

Estates generally large; that of the Duke of Rutland has been much improved, and always managed in the most liberal and benevolent manner.

been much improved, and always managed in the brook interand benevolent manner.

3. Buildings.
Many very magnificent, as Belvoir Castle, Donnington Priory,
&c. Farm-houses not bullt since the commencement of this
century are of very inferior construction; timber and plaster
covered with thatch. In general, the modern enclosed parishes
up in the villages; in the more unclent inclosures, from houses
have been erected in the midst of the occupations, and built
with better materials. Dishley farm-houses is of ancient construction, and has probably been built at different times,
whence it wants regularity and compactness; if thas, however,
taken altogether, a style of pastoral simplicity, united with
which joins convenience with economy, so far as it can be attained without regular design; the out-buildings too seem to
have been put up at separate times, as wanted; the yards and
pavements are remarkable for next cleanliness, and the whole
farm business for being conducted with good order and system.
The houses of other principal breeders are comfortable and
taste and situation in life of the occupier.

Cottages generally in villages, and formed of mud walls and
thatch; a few good new ones of brick and native slate.

4. Occupation.

Cottages generally in villages, and formed of mud walls and thatch; a few good new ones of brick and native slate.

4. Occupation.

Farms of all sizes: a great many from 80 to 100 acres, on which the farmers work with their own hands; near marketwens, many under 100 acres, occupied by tradesmen and manufacturers; general size, 100 to 200 acres; and those of the passure for sheep, the dairy feeding cattle, breeding horses, and hay for winter use: dairy farms have also sufficient arable land to produce staw and turnips for their own use; the most inferior soils in aration. The Duke of Rutland has 2000 acres in hand, including the park, woods, gardens, &c. At Dennington, Lord Mohra had 370 acres, under a Northumbrian bailift, besides the park of 400 acres. Dishiey Farm, near bailift, besides the park of 400 acres. Dishie of the Bakewells for three generations and apalion of the family of the Bakewells for three generations and spation of the family of the Bakewells or the last Robert Bakewell, who died a bachelor, contains between 400 and 500 acres.

Irrigation is judiciously practised, and the culture of the arable uplands has been long conducted on so correct a system that few weeds now come up; the most troublesome is chickweed. Heifers of three of rour years old draw in the cart or plough; three of them form a team, and work nine hours a day.

Farmers in general intelligent. Leases not universal.

5. Inplements.

or plough; three of them form a team, and work hine hours a day. Farmers in general intelligent. Leases not universal.

5. Implements.
Flough with two wheels, and drawn by three, four, or five horses, or cattle in a line walking in the furrow. Thirty years it was found that by pitching the plought a little deman, and it was found that by pitching the plought a little deman, and setting the wheels so as to prevent its drawing in too deep, the wheels were a sufficient guide, and the plough required no one to hold it, except in places of difficulty; one person attending was therefore sufficient to drive on the tears, turn the plough in and out at the ends, or guide it in particular hard or soft in a sufficient guide, and the plough required of one of wheels, viz. one on each side, guiding the two furrows. Among the uncommon implements may be included, a rack and manager for four colts on wheels, to be drawn from one posture to another. It is square in the plan, and therefore each a break for shoeling ozen; a fastening for ewes, each others, a break for shoeling ozen; a fastening for ewes, fatigue of the ram during copulation; and also several ploughs, rakes, &c. the invention of Hanford and Co. at Hathern, near Leicester.

6. Arable Land.

Many farms have none. Drilling corn crops principally in-troduced; but not for turnips, even at Disbley; thought to lose ground; cabbages and rape a good deal cultivated on the soils too strong for turnips.

7. Grass.

I. Ortass.

Excellent meadows on the rivers and rills; fertilised by inundations; upland pastures sometimes manured. Stilton
cheese made in most villages about Melton Mowbray. On
the Trent, considerable patches of reed, which pay as well as
the best meadow land.

8. Gardens and Orchards.

Gardens much wanted to cottages; orchards rather neglect-ed, though the soil is in many places well adapted for them.

Woods and Plantations.

9. Woods that I takentons.
Few, excepting about gentlemen's seats, and in the hedgerows. Willows, as pollards, grown on Dishley and other farms,
to supply stuff for hurdles, rails, and gates.

10. Improvements.
Elkington was a good deal employed by the proprietors. Irritation more extensively practised in this county than in most others.

Live Stock.

11. Live Stock. Cattle, the long-horned breed. What was the particular breed of cattle in Leicestershire before the middle of the last century, about which time Bakewell began his exertions, it is difficult to determine; perhaps there was not any distinct difficult to determine; perhaps there was not any distinct be distinguished; although the characters, whereby they might be distinguished; although and the supply of the produce was never equal to the supply of the

county: there always was, and still is, an influx from Ireland, Wates, Scotland, Shropshire, Staffordshire, Herefordshire, Norrhumberland, and Lancashire; the latter of which were breed. His first best cows, it is believed, were arfully obtained from Webster of Canley, in Warwickshire; and his famous built, Two-penny, was bred from one of these cows, or from one procured from Phillips of Garrington, and a bull from North and attention, in a short time he reaved one great Indementand attention, in a short time he reaved and were light in their belies and offals; they were gentle and quiet in their tempers; they grew fat with a small proportion of food, but gave less they grew fat with a small proportion of food, but gave less they grew fat with a small proportion of food, but gave less they grew and one of his own breed; the Holderness at most food, and gave much the greatest quantity of milk; the Scotch at less food, and gave less milk, but produced most butter; and the produce of beef. No man, perhaps, ever made more comparisons between the different breeds of cattle than Backwell, and no one that was able to tell so much has fold us so little an unumber of dairies, from which great quantities of cheese is sent on market.

the produce of beef. No man, perhaps, ever made more comparisons between the different breeds of cattle than Bakewell, and no one that was able to tell so much has told us so little about them. Many capital herds of cattle in the county, and about them. Many capital herds of cattle in the county, and sent to market.

Shep. The present stock consists of three varieties, the old and new Leicester, and the forest she p. The old breed, which is spread over Northamptonshire, Warvick, and Lincolnshire, are an improvement on the ancient stock of the common fields, are an improvement on the ancient stock of the common fields. A ram society was formed by Bakewell and others, and still exists, the object of which was a monopoly of ram-clining. The late Bakewell bound himself, and his successor, Honeybourne, hinds himself, not to engage nor show his rams to any person lill the members of the society have seen them and are supplicated that the second of the society have seen them and are supplicated that the second his successor, Honeybourne, and the other members of the society, confine themselves not to sell, nor to let; their eves at any price, nor to show their trams at any public fair, nor at any etc. The second have been supplied to the second that only at state times, from the 8th errors have seen that only at state times, from the 8th errors have seen the old of the season; with several other regulations of a similar tendency.

Ram-detling alone has produced to Bakewell 30000.** In one year. The greatest prices were pald about 1759; since that time they have declined; still, about 1807, from sixty to one season. Much curious information on this subject will be found in the report.

Folding is not practised.** Fatting is practised as usual with grass, and in winter and spring with artificial food. Bakewell frequently fattened sheep in the second produce to the second of the second

casualties.

**Msee used in many parts of the county for carrying burdens, and lately introduced as farmer's stock; especially for clearing green crops from clayer soils, in wet weather, their step being light. The turnip panniers open at bottom, to let out the load. Lord Moira had Spanish stallion asses, fourteen hands high, which he let out to cover at two gotiness a mare.

**Mules have long been in use for the saddle, road-work, and

Mules have long been in use for the second Honeybourne's the plough. Hogs greatly improved by various breeds. Honeybourne's seem to have a cros of the wild boar. Astley is between the seem to have a factor of the wild boar, and the second boar, the bacon from whose progeny is of extraordinary sweetness and good flavour.

Bees attended to, but not so much as they deserve.

12. Political Economy.

The roads in the north-west of the county, in the neighbourhood of Loughborough and Ashby, are many of them laid out upon the concave system.

Bakewell and others were advocates for this system; but it does not appear that they are considered to be attended with

any advantages by those who live beside them, and constantly | ings; also cotton-works, hats, patent net-lace for vells, &c. use them. Various railways and canals. Manufactures, wool. The Leicestershire and Rutlandshire agricultural society esta-combing, woolen yarn, wonted, and especially worsted stock-

7790. DERBYSHIRE. A mountainous and hilly surface of 622,080 acros of great variety of soils, but more remarkable for its mining and manufacturing productions than its agriculture. It is, however, at the same time both a corn and pasture county, and noted for its cheese; it is every where full of ingenuity and interest; and the Report by Farey, in three volumes, is one of the most interesting and valuable of the county reports: it is an example of extraordinary industry, research, and excellent general views, and will be read with great profit by every class of readers. Farey, indeed, was a philosopher ahead of the age in which he lived. (Brown's Derbyshire, 1794. Farey's Agricultural and Mineral Survey, 3 vols. 1811 to 1815. Marshal's Rev. 1812.)

1. Geographical State and Circumstances.
Climate. Cold on the hills, but mild in the plains; in the vales hoar frosts often injurious, voreciling winds; rain about twenty-eight inches per annun.
Soil very various, chiefly calcareous.
Minerals. Lead and iron those chiefly worked; also some zinc, calamine, black jack, manganese, sulphur, &cc.; coal, lime, alabaster, slate, freestone, paving stone, rolling, grinding, scythe, and cutlers' stones, and a variety of others, both for use and ornament, as spar, &c. Clay in some districts, as at Overmoor, is burned by spadefuls, dried, and mixed with small coals in heaps, for the roads. E. M. Munday, Esq. of shipley, formed to avoid the duty.

*Water. When scarce, drinking ponds made by pudding and paving in the Gioucestershire manner. An artificial pond discovered in 1808, concealed under peat, the head of which was puddled in the centre; a proof that puddling is no new art. Stone elsterns, placed in the lines of neatly cut thorn hedges, serve to supply two fields: the water brought to them in thin zinc pipes, as being cheaper, and perhaps more durable than lead.

*Z. Estales.

Estates.

Of various sizes as in other counties; managed by attorneys, at a low salary, who make it up by law business, and otherwise.

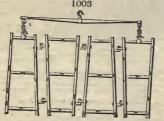

2. Lesselles.

Of various sizes as in other counties; managed by attorneys, at a low salary, who make it up by law business, and otherwise.

3. Buildings.

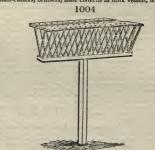

Chasworth, Keddlestone, and some other noble stone manifold the stone of the counties.

Chasworth is the same good houses, covered with cement (known in London as Atkinson's), made from clay stones found on Lord Mulgrave's estates in Yorkshire, and which Farey considers as superior to that made from the clay halls of the London clay stratum. Grotos frequent, fitted up with the spar of the county. At A shover a frize of a chimney-piece, representing a section of the strata taken across the parish. At Chasworth, and various places, the spits in the kitchens turned by water-lines, in covered boxes, placed on drying parts, and the lines wound and unwound by a handle, for drying clothes. At several houses foot lath-wheels, turning spindles, on which were other wheels, dressed with emery for cleaning knives; also brush spindles for boots and shoes, as at the Angel Inn, Oxford; boot-rack, in which boots are reversed on upright pins and taken off by a stick, which prevents dust settling inside the boar centifier of the strate of

close, or rather under ground; weeding pincers; threshing-machines; cast-iron rick stands; cattle cribs mounted on posts, which turn round on a pin, so that when the cattle have well trodden the litter on the two opposite sides, in standing to

eat from the crib, it is turned half round for them to tread and dung, &c. in the opposite direction. ($fig.\,1004$.) Turnip-slicers, chalf-cutters, bruisers, slate cisterns as milk vessels, &c.

G. Enclostres.

In setting out fences, less attention paid to separating the different kinds of soils than is requisite; wails frequent; and holes often made in them for passing sheep; to be closed when doles often made in them for passing sheep; to be closed when doles often made in them for passing sheep; to be closed when doles often made in them for passing sheep; to decode when the control of the sheep control of the she

Roses formerly cultivated for the flowers, but not at present.

8. Grass.

Three fifths of the county under permanent grasses (though it appears by the marks of ridges to have been formerly every where arable), and the application chiefly cheese-making. Droppings of cattle and horses on pastures spread by rakes, which proppings of cattle and horses on pastures spread by rakes, which their shes made into balls, and laid aside, to be used as ley for washing. This practice declines with the frequency of enclosures. When worms are engaged forming worm-casts in fields, scatter barley chaff, fresh and dry from the winnowing machine, which, sticking to the worms when they come out, sec. devour them.

9. Gardens and Orchards.

9. Gardens and Orchards.

9. Gardens and Orchards. Good market-gardens at all the principal towns, and few of the farm-houses and cottages without gardens. "Samuel Oldatnow, Esq. of Mellor keeps a professed gardener, on three acres of rich sheltered land, by the river Goyte, on the Cheshire side of it, who cultivates, gathers, prepares, and delivers all the useful vegetables and common garden fruits in season to hiscotton mill work-people and tenants, and renders and account once a fortnight to the mill-agent, who deducts what they have purchased from the garden from their several wages; a have purchased from the garden from their several wages; cannot but prove highly gratifying to those who wish to see cannot but prove highly gratifying to those who wish to see the labouring classes well and comfortably provided for from the fruits of their industry. Proper rooms, for drying, cleaning, and preserving garden-seeds and finitis, and his wool-chamber and other like offices, are attached to the gardener's house, and

placed under his care." A most productive garden at Belper, on a very poor soil, but irrigated in winter from a cesspool, in which centres the liquid manure of fifty cottages, belonging to Messrs. Strutt's cotton mills.

Orchards seddom planued, though the soil is well adapted for them in many places.

10. Woods and Plantations

Orchards seldom planted, though the soll is well adapted for them in many places.

10. Woods and Plantations

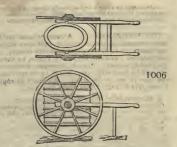

A good many copieces, the produce of which is much in demand both for mining and agricultural purposes. Sir Joseph Banks, at Ashover, has planted some exposed sites in the distance of 100 yards, then intersecting them by others, so as to leave the surface checkered; after the Soctoth first are grown a few years, it is the intension to fill the intervening patches with arches, at such a distance as that they will never require any thinning. This plan, as Farey justly litted, so more injective and thinning. This plan, as Farey justly litted, is more injective and Scotch first, with a proper attention to thinning, would lie a more effectual, speedy, and economical mode of producing timber. Some judicious observations on pruning trees, and the propriety of Pontey's mode, pointed out by various examples. Helge row trees, sparringly introduced not contribute to the national stock of timber. Key-bearing ash trees, or any forest tree much given to bearing seeds, no longer increases much in timber, and therefore ought to be cut down; hence male ashes prefable to females, or such as have both male and female flowers on the same tree.—The use of qualities in Christine and South Wales; when collected, they should be immediately sent to a mill and crushed. A most complete seasoning kiln for timber at Belper. Timber often sold by ticket sale,—thus described it the vender meets the proposed purchasers, writes his price in an investigation of the contribute of the same tree.—Birch wine the shoots are expected is the vender meets the proposed purchasers, writes his price in an investigation of the proposed purchasers, writes his price in an anvelope, and puts it in a giass; a tho offerers do the same; the vender must show his price, if mone as men; the tender of the same tree to the better the wavers thrive. Larch trees the proposed purchasers, writes his price in an envelope, and puts if in a giass; a few offerers do t

is then driven into the bark below the hole, which conducts the sap a bottle (c). In warm weather the holes soon grow up, and will cease to run in four or five days; but in windy weather gallows in twenty-four hours, others not half a pint. The water is sold at sixpence a gallom, to those who make small wine as a substitute for small beer. If the water is solded (not boiled), it may be kept a month before it is made into wine; if not, it will not keep above a day or two. For making the wine, two pounds of coarse sugar, and a quarter of a pound of Malaga raisins, are added to every gallon of birth water, when cold: it is then boiled shout an hour, mutil it is observed, when cold: that beer is set to work, a toast of bread, spread with yeast, is put into it, and for four days suffered to work freely, when it is barrelled, and the same quantity of raisins as before, and about an ounce of singlass to every twenty gallons is added. It seldom works out of the barrel, and it two or three weeks is ready for close hunging down, to remain for three months, when it should be bottle off, and in two or three weeks after it is fit for drinking, but is the better for keping longs.

11. In proponement.

three weeks strengt or decomposition and in two or three weeks at all months, when it should be bottled off, and in two or three weeks at all months, and in the strength of t

Asses in considerable number used by the smaller manufacturers, and in the coal-works, potteries, &c.; also on the iron

Asic in considerable number used by the smaller manufacturers, and in the coal-works, potteries, &c.; also on the iron rail ways. The Earl of Chesterfield supplies his table with delicious sucking pigs, of a fortnight old, from his Otaheite sow; plan of shaving off the gristly or horny projection of the snow; he present digging, recommended. Tethering by the meck also suggested for enting down stury hertage crops. A harmless man-traps. (Prens. Soc. Arts, vol. xxvii. p. 183.)

Poullry. The Earl of Chesterfield's poultry yards at Bretby, perhaps as complete as any in the kingdom. The roosting-house is well contrived, with covered places for the ducks and geese under the fowls, and the whole is constantly kept streverd for laying, is furnished with fuse, to preserve an equal temperature in frosts. In the feeding-houses, the fronts, partition, and floors of the pens, are all of lattice-work, which readily take out in order to wash them thoroughly shallow drawers with fresh sawduss pass under each pen to catch the dung. The fatting poultry are fed twice a day, and after each the control of the daylight excluded for them to rest and sleep.

A breed ob brown American twickys at Brailsford; they roost upon trees or the high parts of buildings; cocks weight twenty pounds when fat, but the hens much smaller.

Geese when let out have a sitck about two feets of them to catch the receiping through hedges, &c.; freed on Feetica furtings. &c. when let out have a sitck about two feets of prevent them creeping through hedges, &c.; freed on Feetica furtings. &c. when let out have a sitck about two feets of prevent them creeping through hedges, &c.; freed on Feetica furtings. &c. when yet and winger-worth many game fowls kept for cocking. In Tanady the worth many game fowls kept for cocking. In Tanady the worth many game fowls kept for cocking. In Tanady the worth many game fowls kept for cocking. In Tanady the worth many game fowls kept for

the shells on the lower side, when rottenness amoust minimated ately commences.

Beek kept in various places.

Fish. Certain ponds in Sir Thomas Windsor Hunlocke's Park, in Wingerworth, are appropriated to the feeding of castrated male carp and tenth, which are found very superior in size and flavour to other fish; the late Sir Windsor Hunlocke saw this practiced in Italy, many years ago, and had one of his servants, who was with him, instructed in performing the operation; which is less difficult or dangerous than might be supposed, and in consequence of which, not more than one in four-tenth of the fish of the single permitted at Comis-brook reservoir of forty-five administration of the fish taken. Salmon pass and trap on the Derwent, at Belper bridge.

31. Rural Economy.

Angling permitted at Comts-brook reservoir of forty-five acres, the angler paying sixpence per pound for the fish taken salmon pass and turp on the Derwent, at Belper bridge.

31. Rural Economy.

Rewards are offered by the Agricultural Society at Derby, as by most others in the kingdom, for long and meriorious lired or day service, but seldom for having performed, the greatest fair prices. At the beginning of the present century, it was calculated, taking the labourer's wages at two shillings and sixpence per day, that he must work four and a haif times as many days to earn't be same quantity of food, as from three to five contuctes back he could, when his daily wages was from four-cioused by the namy side sained days which the church of Rome imposed on the people at the earlier periods.

14. Political Economity.

Various concave roads formerly, made through the influence of Joseph Wilks, Esq. of Measham; these in a very indifferent state, and illustrate the abandity of the principles on which they are constituted. To level across a food a string level used. It could do and one and a quarter deep, into the top of which a privicely that was deeply sunk, and to the top, at each end of this level, several yards of strong whipcord was fastened. In using this instrument, i labourer was placed on each side of the road, having the cold in his hand, which they pulse the higher than the other.

Some remains of wavy roads (5551.), but hothing to justify any deviation from the general form of slightly convex roads, with straight or even surfaces as to length. The road between the proper surface and before the condition of a significance of the condition of a most of the condition of the c

Notwithstanding that many of the manufactures and productions above mentioned are separately of small importance and may contribute little or nothing towards an export trade from the county, yet, taken in the aggregate, they must be admitted to present a most flattering picture of the varied and great manufacturing industry of the county; showing it to contribute far beyond most other count: stowards the supply of all its own wants, and contributing at the same time, in no amall degree, towards the supply and general trade of the kingdom at large.

Education,

contribute far beyond most other country stowards the supply of all its own wants, and contributing at the same time, in no small degrees, towards the supply and general trade of the kingdom at large.

Education

**Among the abouring classes, the reporter observes, is better than the supply and general trade of the kingdom at large.

**Mong the abouring classes, the reporter observes, is better than the supply and the bringing up children in abits of frigality and industry; and contemplates, as "the great and desirable end, their complete emancipation from the moral slavery of poor-law dependence, and its attended vices and misery." There are some persons, no doubt, who may not approve of all than Mr. Farey has advanced on this subject; for where is the writer that can please every reader his sincere and ardent desire for the more general and universal happiness of the British poor. Though we are of opinion that very little amelioration of that division of society which constitutes the agricultural or labouring class can be effected without an alteration in the laws; yet we are equally convinced, that no great alteration of what are called the poor laws would be advisable, till the poor are prepared for it, by the subject of the subject of the move them to meet the consequences with advantage, or at least without an increase of misery.

We agree with the reporter, that the case is somewhat different with the operative manufacturers, and mechanics congregated together in towns; for the wages of their labour depends, in most cases, as the wages of all labour ought to do, on the demand and the supply; whereas the weekly wages on of the parochial vestry. The consequences of this state of things are rulinous to the rustic labourer, and call loudly for the parochial vestry. The consequences of this state of things are rulinous to the rustic labourer, and call loudly for the parochial vestry. The consequences of this state of things are rulinous to the rustic labourer, and call loudly for the parochial vestry. The

7800. NOTTINGHAMSHIRE. 495,000 acres of uneven or hilly surface, in great part a sandy soil, and more a corn than a pasture county. It contains the Forest of Sherwood, the only one belonging to the Grown north of the Trent. This forest was once celebrated as being the scene of the adventures of the famous Robin Hood. Very little wood, however, now remains. The report is one of the most defective and least interesting which the board have published, and is, besides, above a fourth of a century old. (Lowe's Report, 1798. Marshal's Review, 1812. Smith's Geological Map, 1821. Edin. Gaz. 1827.)

1. Geographical State and Circumstances.

Climate, remarkably dry.
Soil, chiefly sandy, great part clayey, and the remainder a lime and coal district.
Minerals. Stone, lime, coal, gypsum, and marl.

2. Property. Estates from 12,000l. a year, downwards.

3. Buildings.

3. Buildings.
Few countries contain more gentlemen's seats in proportion to its size. Alston Grove, a noble residence; the gardens formerly in the ancient style, but lately modernised. Clumber Park contains four thousand acres. Newstead Abbey, celebrated as having been the residence of the Lyron family; but now sold and divided. Thorsely park, thirteen miles round. Webeck Abbey, als seems of the local clustural improvements of the contained the season of the date of Queen Elizabeth, by Thorpe, the same architect who built Holland House, near London. Farmhouses "not very spacious," of brick and tile, sometimes

thatched; now and then of stud and mud. Good farmeries, and centrical on the new enclosures.

4. Occupation.
Few farms exceed 500l. per annum: generally from 100l. to 20ll. Few lesses.

5. Implements. Rotheram plough general; waggons have wide frames move-ble for harvest use.

6. Various. G. Various.
Enclosing going on rapidly; in arable culture, rotations good, but no remarkable practice mentioned; various hop-grounds and orchards, many woods and plantations; extensive woods raised from seed on the Welbeck and Clumber estates; the ground is first cleared of surface incumbrances, then cropped with corn two years, and turnips one year; the fourth year acorns, at the rate of four or six bushels, ash keys four, havehorn berries one, and Spanish chesinuts one bushel, are sown thorn because of the control of the property of the pro

LINCOLNSHIRE. 1,848,320 acres of uplands, vale and water formed lands. The soil in most places rich, and chiefly devoted to grazing; yielding on an average more beef and mutton per acre than any county in the island. Examples of embanking, draining, and warping, are numerous along the seacoast and the Humber. (Stone's Report, 1799. Arthur Young's, 1799. Marshad's Review, 1812.)

coast and the Humber. (Stone's Report, 1799. Arth.

1. Geographical State and Circumstances. Climate, formerly unhealthy in the low parts, now the ague nuch less frequent. N. E. winds prevail in spring; much of the rain in summer from the northern and eastern quarters.

Surface, a great extent of low land, once marsh, and nicements and drainage, which have been going on for nearly two centuries. Adjoining the lowlands are the wolds or acclareous hills, and the mainland part of the country is in general flat and uninteresting. Some parts of the country is in general flat and uninteresting. Some parts of the country however, as about Dalby, Spilsby, Stainton, &c. are varied and wooded, and command fine views of the low country. Soil. There are large districts of clay, sand, loam, chalk, peat, and considerable extent of mixed soils.

2. The properties of the low country is in general flat country of the low country is the properties of the flat of of t

49.00.0. a year, others of 14, 11, 10, 8, 7, &cc. and six of 2000. a year. Lacely, a pretty village, "where each man lives on his own."

In the management of a great estate, "I remarked a circumstance at Reevesby, the use of which I experienced in a multi-ude of instances. The liberality of SN: Joseph Banks opened every document for my inspection; and admiring the singular facility with which he laid has not account in the method that proved of such sovereign efficacy to prevent confusion. His office, of two rooms, is contained in the space of thirty feet by sixteen; there is a brick partition between, with an iron plated door, so that the room in which a fire is a laways burning might be burnt down without affecting the inner one; where he has 156 drawers of the size of an ordinary conveyance, the inside deep, all numbered. There is a catalogue of names and subjects, and a list of every paper in every drawer; so that whether the enquiry concerned a man, or a drainage, or an enclosure, or a farm, or a wood, the request was scarcely named before a mass of information was in a moment before me. Fixed talles are before the windows (to the south), on which are apread ranged against the wall. The first room contains desks, talles, and book-case, with measures, levels, &cc. and a wooden case, which when open forms a book-case, and joining in the carrier's waggon, containing forty felio papter-cases in the form of books; a repository of such papers as are wanted equally in ratus, must be of incomparable use in the management of any great estate, or, indeed, of any considerable business. At Wintringham, Lord Carrington has a man employed, whose only business is to be constantly walking over every part of the estate in succession, in order to see if the fences are in order: if a post or rail is wanting, and the quick expeed, he gives in the found of the paper of the estate in succession, in order to see if the defect is remedied." (Young, and the quick expeed, he gives in the found of the paper of the second of the pape

Several good new farm-houses; old cottages of stud and mud, thatched; but new ones of brick, and tiled.

4. Occupation.

4. Occupation.
Farms on the Wolds from 500 to 1500 acres, on the rich lands 400 and 500 acres, downwards; many very small. The late Sir Joseph Banks declined throwing his farms together, because he would not distress the occupiers, though he lost considerably in rental by it. Farmers met win at ordinaries, and expensive though or pretence to emulate the gentry; they will be supported by the comfortably and hospitably, as good farmers ought to live; and in my opinion, are remarkally void of those rooted prejudices which sometimes abound among this race of men. "I met with many who had mounted their pasts, and quitted their homes, purposely to examine other parts of the kingdom; as a similar double of the support of the standard of the string of the support of the standard of the string of the support of the standard their support of the standard them." I measure the standard of the standard them are supported to the standard of the standard them are supported to the standard of the standard them.

5. Implements.

Plough with wheel coulter used in the fen tract as in other fens; the wheel coulter being considered as better adapted for ploughing among stubble and couch grass than the sword one. Plans given of a cover of canwas and boards for ricks, and a boat with a net fence round for conveying sheep; at best, we fear, but an expensive broundrance on agriculture.

Arable Land.

Near Market Deeping the common fields in alternate ridges of pasture and arable, the latter gathered high; three to five house used in both plough and cart teams; wood extensively cultivated by Cartwright, at Brotherstott farm, near Boston. Parsley sown along with clover to prevent therm.

7. Various.

"Rich graving land the glory of Lincolnshire." In some places will carry six sheep per acre, or four bullocks to ten acres. One of the most extensive graviers was T. Pydell, Esq., M.P. at Boston. Very few orchards; some considerable young planatations on the Wolds, but not much old timber.

Improvements.

8. Improvements.

Most extensive drainages and embankments. Deeping Fendrained, which extends eleven miles to Spalding. 10,000 acres taxable, for maintaining the drains and banks, which are managed by a commission. Through all the fiens what is called the soak exists vize. water, supposed to be that of the sea, rising and falling in a subtratum of silt: hence low-lying land always charged with moisture to a certain height. Sticklebacks sometimes sold at a half-penny a bushel, and used as manured in the Woldstonenstern of the strength of

Molland Fen is a country that absolutely exists but by the security of its banks; they are under commissioners, and very well
attended to.

At Humberstone there is a large piece taken in from the sea
by a low bank, which is well sloped to the sea, but too steep to
the land; so that if the sed by the secustance of the land; so that if the sed by the secution of the land; so that if the sed by the sea, but too steep to
the land; so that if the sed by the sea, but too steep to
the land; so that if the sed by the land in the sea
about North Someroots, and other places on that coast;
but "I do not find that any experiments have been made in Nir
Hyde Page's method of making hedges or gore facines, and
leaving the sand to accumulate of itself into a bank. Mentioning this to Neve, he informed me, that he had observed at least
a hundred times, that if a grose bush, or any the secretary
and the sea of the sea
a first the sea of the se

rough to Lincoln, afforded a navigation of the utmost consequence to this fertile country.

Some irrigation; and marping, on the Humber, where, as already described (4444), it was invented.

9. Live stock.

More attended to in this county than the culture of corn. The Durham short-horned cattle are preferred, but any sort when the country are fitted darying a consequence of the country are fitted darying and an half per acre at an average. Lincoln breed preferred; Leicester nuch tried, and crosses between them frequent; upon inferior land the Leicester preferred, as fatting easier; since the enclosure no folding; several ram societies.

Horses, of the heavy black kind a good deal bred both for carts and coaches; in various places sadile horses also; some farmers keep their horses all the winter in open sheds, with littered yards for them to go out and in at pleasure. Ground-sel eaten, said to cure the grease; oats malted in salt water

given for three weeks or a month, found preferable to spring

physic.

Rabbits. Several warrens on the wolds.

Geste formerly much kept in the fens, and plucked four or five times a year. "The feathers of a dead goose worth sixpence, three giving a pound. But plucking alive does not yield more than three-pence per head, per annum. Some wing them only every quarter, taking ten feathers from each goose, which sell at five shillings a thousand. Plucked geese pay in feathers one shilling a head in Wildmoor fen.

10. Political Economy.

Roads in many places made of sit; "dreasfielly dusty and heavy in dry worther; on a thaw or day's rain like mortar." A number of canals, and, as already observed (3502.), the first in England, made from Lincoln to the sea. A fabric of brushes and sacking at Giinsborough; flax spun in various places. An agricultural society at Falkingham, established in 1792.

7802. RUTLANDSHIRE. 91,000 acres, resembling in soil and surface the uplands of the adjoining county of Lincolnshire. The western part of the county is under grass, and the eastern chiefly in aration. The soil is almost every where loamy and rich; and the agriculture partaking of that of Lincolnshire and Leicestershire. The operative classes seem more comfortable in this county, and more humanely treated by the proprietors and farmers, than in many others. The Earl of Winchelsea has made great exertions to this effect. (Crutchley's Report, 1794. Parkinson's General Review, 1808. Marshal's Review, 1812.)

1. Buildings.
Some combriable cottages built by the Earl of Winchelses, containing a kitchen, parlour, dairy, and cow-house, &c. with two bed-rooms over.

two bed-rooms over.

Others for three cows, and with a calf-house, piggery, dairy, kitchen, living-room, and two bed-rooms over.

A third sort for operatives without a cow, containing a kitchen, pantry, closet in the stair over, and two bed-rooms, one with a fire. Several with small farms of from five to twenty acres attached. (fig. 1007.)

1007

2. Arable Lands.

Generally better managed than in Lincolnshire, and very productive. The barley said to be of very superior quality.

3. Pasture. The bartey said to be of very superior quanty.

3. Pasture. The custom of letting part of it to labourers, and also of taking in labourers' cows at so much per head, prevails, and is encouraged by the Earl of Winchelsea.

4. Sciental Orchards.

4. Several Orchards.
In several places the cottagers take small portions of fields from the farmers to use as gardens. At one place, three acres and a half is divided into fourteen gardens; and at Oakham, a field of three acres is divided into twenty-four gardens, and let at five shillings per garden.
5. Improvements.
Parkinson, one of the reporters, and a man of sound judgment, has altered the opinion on the subject of irrigation, and says, it is now in conformity with that of a correspondent who

As General Review, 1808. Marshal's Review, 1812.)
thus writes to him: — "In my opinion watering renders the quality of the herbage and the land the worse for the process. Where land is tolerably productive, and in a situation where a quantity of grass food is not required, I should certainly not advise it. I think the land may be turned to better account without it. But I think there are many situations, particularly on gravel, sand, or open soils, where it may be very advantage—and, in some instances, rendered larger when very little otherwise would be produced. Though the produce is increased, yet it becomes in time, in a few years, of so coarse a nature, and mixed with rushes and plants, that cattle frequently refuse to eatil; and when it is eaten, the appearance of the cattle procure is the standard of the control of the control of the cattle procured in the standard of the control of the cattle procured in the standard of the cattle procures for the cattle procured in the standard of the cattle procured to the cattle procured of the cattle procured to the cattle procured to the procured of the procured to the cattle procured to the procured of the procured to the disadvantage of both the herbage and land, I have been obliged, in a great measure, to alter my opinion."

6. Live Stock. 6. Live Stock.

6. Live Stock.
Not much breeding, but chiefly feeding. P. considers that much depends on the application to fallow, and is of opinion, that the large Durham or did not eat more food to raise him to that enormous size, than some others would to bring them to that enormous size, than some others would to bring them to that cambert, of Leicester, who arrived at such an astonishing weight, had eaten more food than Powell, the celebrated pedestrian, who was a very thin man. An animal for the shambles is seldom too large if he has an aptitude to fatten: and much depends on the constitution of an animal in this respect.

respect.

A good plan for washing sheep at Burleigh; but not so simple as the Duke of Bedford's.

Horses of a very heavy, slow, unprofitable sort are raised in

the county.

Of bees, 1176 hives kept by the cottagers.

7. Political Economy.

The Leicestershire and Rutlandshire Agricultural Society established in 1806, meet at Melton Mowbray and Oakham alternately. Less want of knowledge in this county than in

7803. NORTHAMPTONSHIRE. 617,600 acres of billowy surface, rich in wood lands and pasture lands, but much behind in the culture of corn. The soil is almost every where excellent; and by the introduction of good husbandry, the marketable produce of the county might be amazingly increased. (Donaldson's Report, 1794. Pitt's Report, 1806. Marshal's Review, 1812.)

Geographical State and Circumstances

1. Geographical State and Circumstances. Climats. Favourable both to health and vegetation; exempted from deep falls of snow and long-continued rains; highest point in the county supposed about 800 feet above the level of the sra, and there is neither mountain nor bog. Donaldson found that wheat harvest generally commences here about a fortnight earlier than in Perrishitre. Soid. Great part on a calcaceous bottom, limestone, schlstus, Soid. Great part on a calcaceous bottom, limestone, schlstus, but the strength of the strength of the strength of the support of a substone. The surface earths may be classed as strong and deep loam, light thin reddish soil, thin light clay, and fer and meadow. Minerals. Clay, limestone, marl, freestone, and slate. 2. Property.

Minerata. Clay, limestone, marl, freestone, and slate.

2. Property.

Almost wholly in large estates; thirty-seven of or above 3000l. a year, half of which are from 5000l. to 10,000l.; managed by stewards.

Buildings

Althorpe, Burleigh, and Castle Ashby, noble mansions. Farm-houses "a shadly constructed as improperly placed;" built of stone or brick, and covered with slate or straw if armers cottages of mod and thatch.

4. Occupation.

No large farms; 150 acres the average of open fields, and 200 the average of inland farms; few or no leases.

5. Implements.

"Plough a clums viece of work, with a long massy beam

200 the average of inland farms; few or no leases.

5. Implements.

"Plough a clumsy piece of work, with a long massy beam and timber mould, being drawn by four or five horses in a line." Donaldson says, a small plough, with two horses abreast, will make better work; but Pitt (who seems to know very little of the matter) Joins with Smith of Tuchmarsh, who says, "I have heard and read much on the subject, and tried a great variety of ploughs; but it is ridiculous to assert that two horses can plough abreast in almost any part of this county. I have met with no ploughs which serve so well(!) or run so easy as the ploughs in common uses." So much for the ignorance and presumption of Farmer Smith, and the prejudiced

opinions of Pitt the reporter. A ribbed or plated roller, formed by letting in sixteen bars of iron lengthways of the roller, is found preferable either to a spiky or smooth roller for breaking clods.

roller, is found preferable either to a spiky or smooth roller for breaking clods.

6. Arable Land.
Fallow, wheat, and beans, the common rotation, but others, which include turnips and clovers, beginning to be introduced on the light lands. Most of the other plants in cultivation tried by the control of t

Tokacoo cultivated by some farmers for the purpose of dressing sheep for the scab.

Furze in a few places for oven-fuel.

7. Grass.

Supposed to cover 375,000 acres; 40,000 acres in meadow, on the borders of the Nen and other rivers. One farmer says, "A great improvement on all mowing meadows, incapable of

being watered, is to graze, once in two or three years as bare as possible, and finish with store sheep; shut it up at Christmas for mowing; it this is as good as a top-dressing." Feeding sheep and cattle the chief application of the grass lands, and next, dairying and breedung horses.

8. Gardens and Orchards. Good market gardens and orchards about Northampton: all common articles grown there well, but melons, grapes, peaches, and pine-apples to be had from London cheaper than they can be grown in the county.

be grown in the county.

9. Woods and Plantations.
Very extensive; there are forests, chases, puritieu woods, and woods and plantations buy exheld property. Rockingham forest the most considerable, nearly twenty miles in length, and covering 8 or 10,000 acres. Whittlewood eleven miles, and 7000 acres, with Salcey forest, making in all 20,000 acres the chases and other classes are supposed to amount to 20,000 acres more, making in all 40,000 acres of woodland in the county. The forest lands are in general very unprofitably managed; the Crown has a right to the timber, the Duke of Gration and others to the underwood, and the township to the pasturage, &c.; woods which are private and entire property are better managed.

Live Stock.

10. Live Stock.
Cattle of the county, the long-horned breed: but various others introduced for fatting and the dairy.
Sheep of various breeds; a good many new Leicesters.
Horses of the strong black breed, bred for the coach, the off, is the least blenish renders them unsaleable.
Hogs, a breed between the Berkshire and the Tonquin.
11. Political Economy.
Bad roads, but many handsome bridges; some canals. Manufactures; — shoes for the army and navy, and exportation; bone lace, woollen stuffs, as tampies, callimances, and everlastings. Several small friendly societies for the promotion of agriculture, consisting chiefly of farmers. The Lamport Society is one of those which was founded in 1797, meets at and domestic consony, and seems to be a description of association very commendable. A great source of improvement would be the breaking up of the inferior grass lands, and the temporary laying down of the continually cropped tillage lands. Donaldson has drawn an able comparison between the management of lands in the Carse of Govrie, in Perthshire, and those of Northamptonshire, which shows how very far behind the latter county is in arable culture.

7804. YORKSHIRE, 3,698,580 acres divided into three Ridings, each of which is as extensive as the generality of other counties.

7805. West Riding of Yorkshire. 1,563,000 acres of irregular country, hilly and mountainous towards the north, and more level on the east. It contains a great extent of surface well adapted for husbandry, and is the seat of large and extensive manufactures. A survey of his Riding, of singular ability and interest, was made by three Scotch farmers; and the reprinted copy, as it contains the notes of several gentlemen of the county, will in future times be considered as a curious document; displaying as it does local opinions so different from those considered as liberal and enlightened. (Brown's West Riding, 1799. Marshal's Review, 1818. Smith's Geological Map, 1821.)

1. Geographical State and Circumstances.
Climate, moderate and healthy, excepting on the low surface
near the Ouse; rain at Sheffield about thirty-three inches in

near the Ouse; rain at Sheffield about thirty-three inches in the year.

Surface irregular, but the middle and eastern parts nearly level; a rable lands generally enclosed with walls and hedges.

Soil various, from deep strong clay to peat.

Minerula. Coal, lime, irrossone, lead and some copper, which have been wrought for ages past.

Rivers. Ouse, Don, Calder, Aire, and Wharfe, all considerable, besides others of lesser importance.

2. Property.

able, besides others of lesser importance.
2. Property,
Much divided, but some large estates, as those of the Duke of
Norfolk, E. Fitzwilliam, E. Harewood, &c.
3. Buildings.
Wentworth flouse one of the largest and most magnificent
in the kingdom; farm-houses bad and badly situated as in
most English counties; Lord Hawke has erected a commocottages for farm operative.
4. Occumation.

dious and elegant farmery for his own use. Great want of cottages for farm operatives.

4. **Occupation.**

Farms small; for one of 400 acres a dozen under fifty; occupier of 100 acres styled a great farmer; few leases; the tenants on one state warned off clause they had become methodists; no one to the warned of clause they had become methodists; must have business or make it.

5. **Implements.**
Rotheram plough general over the whole district, but onborse carts and other improved implements, as well as better ploughs, are wanning.

6. **Arable Land.**
Round manufacturing towns great part of the land held by manufacturers, that by farmers not well managed compared with Scotland, but tolerable compared with other districts of elevation of 800 feet; but on the calcarcous solds of the East Ridding it ripens considerably higher, and at 500 feet better than bere at 800. Such is the effect of a calcarcous solds. Besides the usual crops, some flax, rape, liquorice, rhubarb, and weld, cultivated. Some excellent remarks on failows.

7. **Grass.**
Great part of the county under old pastures, including some meadows, chiefly applied to the feeding of horned cattle: cattle

generally made fat on grass, and finished by stall feeding on turnips; sheep sometimes fed on turnips, by hurdling. Grazing much better understood than aration.

8. Gardens and Orchards.

8. Gardens and Orchards.

A particular species of plum grows at Sherborne and in the neighbourhood, called the winesour. It grows well both upon gravel and limestone, is hardy, a good bearer, and answers upon any soil; but does not bear so well, nor is its flavour so good, on any so on limestone or gravel. On a strong deep land, the trees run too much to wood, and do not bear fruit in proportion. These plums blossom better than any other sort, and are produced from suckers. The fruit sells from 21a per peck, the proposed properties of the proposed properties of the properties of th

Much oak and ash wood grown, and a ready market found at the shipping and manufacturing towns.

10. Waste Lands.
Two hundred and sixty-five thousand acres capable of culti-

vation.

11. Improvements.
Warping the most remarkable; ably described by Lord Hawke, and Day of Doncaster.

12. Live Stock.
A great variety of breeds of cattle and sheep in use, but no one generally preferred. Near Leeds, when milk tastes of turnips, a tea-cup full of dissolved nitre is put among eight gallons of milk, which entirely removes the flavour. Horses generally used in draught; not many bred excepting in the email bardy race.

13. Political Economy.

small bardy race.

13. Political Economy.

Many good and many bad roads; various canals. Numerous manufactures of shalloons, callimancoes, flannels, and every branch of woollen goods. At Sheffield every kind of cutlery, since Chaucer's time; at Rotherbam, iron-works. These and other manufactures the cause of the wealth of the West Riding.

14. Means of Improvement.

Leases, division of commons, enclosing of wastes, better rotations, &c.

7806. NORTH RIDING OF YORKSHIRE. 1,311,187 acres of bold hilly country, with some fertile vales and extensive moor lands, chiefly remarkable for breeding horses, and especially the sort known as Cleveland bays. (Tuke's Report, 1799. Marshal's Review, 1808. Smith's Geological Map, 1821.)

bays. (Tuke's Report, 1799. Marshal's Review, 180.

1. Geographical State and Circumstances. Climate dry, like that of other districts bordering on the German Ocean. Cold east winds during the first half of the year. Milder in June, when west winds begin to prevail, vegetation not vigorous fill June.

Soil and surface: on the consequent all some valleys west of frace hilly; vale of York generally a rich as one valleys west of frace hilly; vale of York generally a rich works in the sland carried on there; pyrites being found in the alum mines, sulphur was formerly extracted from them; but as it required a good was formerly extracted from them; but as it required a good New castle, the manufactory of sulphur was transferred to the latter place. Some coal and ironstone in the moors, but not much worked; also copper, lead, freestone, slate, marble, mari, &c. little worked or abandoned.

2. Property.

One third off, to 18,000, per annum; many gentlemen's scats, and the propeletors reside most part of the year on them; tenures mostly freehold.

3. Buildings.

Mansjons and farm-houses, as in the West Richard.

3. Buildings.
Mansions and farm-houses, as in the West Riding, but rather inferior; cottages decidedly inferior; small and low,

rarely with two rooms; damp and unwholesome hovels. Close wainscoted beds used, as in the poorer parts of Scotland, which are sources of insects and infection, and every way unwholesome.

**A Coupalion.

**A Coupalion.

**A Coupalion.

**Parms on the whole small, many very small: farmers sober, industrious, and orderly; most of them have been educated, and educate their children. Few leases.

S. Implements.

**Rotheram or Dutch plough: hay sweep for drawing hay together with a horse and a simple sort of cart (fig. 1008. a) in use, formed almost wholly of timber, and to be drawn by one, two or three horses abreats (b); wheels entirely of wood (c); when to be empitted, the shaft horse is taken out, but not the others. Another variety for harvest work (fig. 1008.)

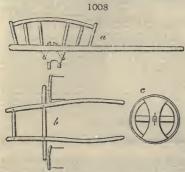

6. Arable Land.

**7. Ara

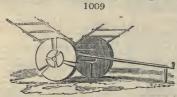

called Meslin.

Tobacco much cultivated a few years prior to 1782 in the vale of York and Ryedale. In the latter district it did not excite the notice of regal authority; and was cured and manufactured by a man who had formerly been employed upon the tobacco plantations in America; who not only cured it prey.

perly, but gave it the proper cut, and finally prepared it for the pipe. But in the vale of York the cultivators of it met with less favourable circumstances: their tobacco was pub-

licly burnt, and themselves severely fined and imprisoned. Penalties, it was said, were paid to the amount of thirty thousand pounds. This was enough to put a stop to the illegal cultiva-

tion of tobacco; but, perhaps rather unfortunately, it has likewise put a stop to the cultivation of that limited quantity, half a rod, which the law allows to be planted for the purpose of physic and chirurgery, or destro ing insects.

Mustard grown in considerable quantities in the neighbour-off of the limited of the purpose of the Riding. It is prepared for use in the city of York, where there are mills and machinery for the purpose; and it is afterwards sold under the name of Durham mustard; sown either on land pared and burned, or prepared and manured as for turnips. Seed, one to two pecks per aree broadcast, in the early part of Max. No culture whilst growing, except handwesting; if necessary. Shorn with the sickle in Septembers, cloth, at the convenience of the farmer. Two quarters per acre is thought a good crop;

Teasel grown on strong soils; seed, two pecks a little before acre is thought a good crop;

Teasel grown on strong soils; seed, two pecks a little before and Lady-day; reaped in August; 10 pecks an acre a good crop; each pack 1550 bunches, of ten teasles each; price, 3 to 5 guiness per pack.

T. Grass.

7 Grass.
Odd pastures and meadows very badly managed; uplands overrun with moss and ant-hills; meadows with rushes; and so neglected, that what would be worth 2001, under a proper course of husbandry, is dear at 7s; chiefly devoted to the

course of managements and Orchards.

8. Gardens and Orchards.

Have made but little progress, in this Riding owing to the want of manufacturing towns to create a demand; farmers' gardens, as in most places, much neglected.

9. Woodlands.

10. small extent; a good deal of timber in hedge-rows in va-

rious places.
10. Live Stock. 10. Live Stock.
Short-horned cattle chiefly prevalent. Stall feeding carried to less extent than dairying. Cows taken in at Martinmas, and did on turnips, and straw or bay if there are no turnips; butter did not the stall of the

7807. East Riding of Yorkshire. 819,200 acres of moderately wavy surface, intersected with numerous, deep, winding valleys; not remarkable either for its arable lands or pasturage; but productive of horses for the coach and saddle, and of the excellent Holderness breed of cows. (Leatham's General View, 1794. Strickland's View, 1812. Marshal's Review, 1812. Smith's Geological Map, 1821.)

1. Geographical State and Circumstances.
Climate of the wolds severe and variable; N. and N.E. winds
prevail in winter and spring; In the vales milder; mild, but
ches and a half yearly at an average.
Soil of the wolds calcareous loam; of Holderness fertile clay
and stiff retentive clay. On the banks of the Humber, from
l'aul nearly to Sperm Point, there are 13 or 14,000 acres of
warp-land, of a strong clayer loam, the productiveness of which
can hardly be equalled.

Horses. This Riding long famed for its horses, particularly those of Clevelands. In the northern purt of the vale of York ilght breed for saddle and coach; in Civerlands, a fuller-homed horses, very strong, and actives, and well adapted for either bred; on the western morolands Scotch galloways are; put to the stallions of the country, "and rear a hardy and strong age in proportion to their size." Before the war mules were bred, and sent to the West Indies. Some farmers do not breed; but buy colts and work them till four or five years old, and then since them for the first time, and sell them to the London. The firmers who bred horses, generally breed from those mares which are employed in the business of the farm; these are often worked until the very time of foaling, after which they have usually two or three weeks' rest, before they are significant to work; it he foal, during the time the dam is working, especially whilst it is young, is shut up in a stable the foal, after returning from work; to hathe her uddier with cold water, and to draw most of the milk from it, to prevent the milk, which may have been heated by labour, from having any hurtful effect upon the foal. Some continue this practice as long as the toal sucks: others, after the foal has got sufficient strength to travel along with the mare, take it along with her into the fields, and frequently suffer it to suck, danger arises of its being heated, or of possessing any quality prejudicial to the foal. The general time of foaling is about May-day (from which day the age of all horses is reckoned), and that of weaning about Michaelmas, when the foals are put into good after-grass, or the best possure the furner possesses: they remain there as long as the weather permits (if each of the property of the strong of th

11. Political Economy.

Reads in an improving state; bridges better attended to than in most counties; but guide-posts neglected, which an annotator on Tuke's report justly remarks, is a sort of reverting to barbarism; as an attention to these sort of minuties one of the most striking marks of civilisation. Various canals.

canais.

Manufactures of sail-cloth and cordage at Whithy and
Scarborough; at various places in its neighbourhood, alum
works; 4000 tons of this article anually shipped from Whithy;
linears, cottons, woollen, and paper manufactured in various

Sunk Island on the Humber is a modern creation by that estuary. It first began to show itself about 1667, at 6th tide, and as no man pretended tile to it (it being a decended in 1787 1600 acres of the land were embanked and under tillage, producing a rental of 9000; a year, with a chapel and several farmhouses erected on it. That part of Sunk Island which was first embanked was originally about two miles from the shore, and many persons are till living who recollect vessels passing the vecen it and the mainland, to which it is now united by a

bridge across a narrow channel, serving as a drain to the adjacent country. It contains at present within the banks about 4700 acres and twenty-four families, and is continually increased with a probability of its being still further enlarged.

Binerals. Chalk and a very hard shelly limestone, producing a lime little valued either by the farmer or builder. Chalk of the wolds much harder than that of the southern counties. Mari in many places. Supsum in some places, but no mineral veins or coal, and in many places not even clay for bricks.

2. Property.

2. Property.

2. Property.

3. Example of the county: one half of wolds where land is held in little estimation, and occupied in larger tracts; the other a flat low country, partly rich and clayer, and partly sandy and barren. Most of the families have possessed their estates for many centuries, and some from the Norman conquest: largest 15,0004 a year; ten at 10,0004.

3. Buildings.

Seventy-four manorial houses, of which twelve are going to decay; in interem let the tenants. or vermain nearties intores.

a year. Only three nomemen have seesain the strong.

3. Buildings.

Seventy-four macric houses, of which twelve are going to Seventy-four macric to tenants, or remain empty; forty-one cocupied by their owners (Penp. Elis.); innety-two families bearing arms resident in the county.

Farm-houses generally good, excepting on the wolds, where they are built of chair, thatched, and miscrably bad; generally in villages, excepting those built lately.

Farm-houses generally good, excepting those penerally two rooms below and two bedrooms over them: a disposition in the proprietors to let their cottages go to decay.

Village con club. A plan for insuring cows having been attempted on an extensive scale, and with striking success, in the north of Lincolnshire, from which it appears that an average payment of about three halfpence per cow per week (or average of cows by death, it is proposed to institute a similar club on the contiguous parts of the East and North Ridings of Yorkshire, with a view of securing to the labourer and his family, at a trifling expenses, the great benefits of that useful animal, without his tisking more than one sixth part of her value, upon certain conditions. certain conditions

4. Occupation.

4. Occupation.
Farms in general small; one or two of 1200l, per annum, but from 200l. to 20l. more common. Leases so rare that the surveyor could not recollect of one, unless under suspicious circumstances, where something incorrect is aimed at, some advantage intended to be given or taken; where either the landlord wanted something more than customary from the tenant, or the tenant was disinclined to trust his landlord: great estates are let in full confidence in this Riding, where a clase was never asked for, probably never wished for; because than with one. Many estates have been occupied by the progenitors of the present tenants, during two, three, or four generations.
5. Implements.

Implements.

generations.

5. Implements.
Waggons here of a had construction; but well yoked in the German manner. The four horses are yoked two abreast, in the same manner as they are put to a coach, two drawing by the splinter-har and two by the pole; those at the wheel drawing also by swinging har, which the wheel horses of the case in their draft, and are less liable to be galled by the collar than those which draw by a fixed bar; the driver then, being mounted on the near-side wheel horse, directs the two leaders by a rein fixed to the outside of each of their bridles, they being coupled together by a strap passing from the inside of each of their bridles to the collar of the other horse. In this manner, when empty, they trot along the roads with safety and expedition; and when loaded, he horses being with much greater ease and effect than when placed at length-were the waggon, indeed, of a better construction, the team would be excellent.

The peas-hook and the bean-hook, both made out of old scythe-blades, and used in resping peess and beans, are peculiar to this liding; as was the lime-burner's fork till lately. The moulding sledge, an ansed in resping peess and beans, are peculiar to this liding; as a useful implement for levelling the small inequalities of meadow and pasture land, and spreading the dung dropped by the cattle. It is a frame of wood about

five feet square (the sides of which are about four inches thick to give it weight and strength), having three bars of iron fixed to the lower side, the points of which are thinned to sharp edges. When in use, some thorns are drawn under the hinder wooden bar, and above the middle one, to which they are fixed by cords. If it is wanted to be removed from one field to be compared to the state of the state o

The taste for this has been carried too far, and land enclosed hich has not and probably never will repay the expense.

7. Arable Land.

Two thirds of the wolds, and one third of the rest of the Riding, under the plough; fallow, wheat, oats, or fallow, barley, beans, common rotations.

8. Grass.

8. Grass.

The marshy meadows adjoining the Derwent, a few grazing pastures in Holderness and Howdenshire, and the small garths or paddocks in the immediate vicinity of the towns and villages, form the principal part of the control of the towns and villages, form the principal part of control of the embarkments are of no great extent. Unless the mud is so elevated as to be constantly above water for a few days at near tides, no plants take possession of the surface; but when vegetation can go on, the tirst plant which takes possession is the Salicomia or samphire, and next the Poa maritima, which in a short time covers the surface with a close short sward. A few sheep are occasionally put on it when not too much distiled by the mud of the spring In the times.

In laying land to grass, caraway and parsley sown among it some, to preserve the health of the sheep.

9. Gardens and Orchards.
Almost unknown, excepting among the higher classes; farm ers rarely use any other vegetable than potatoes and turnips cottagers cultivate their gardens with more care than the

10. Woodlands.

 Woodlands.
 Of no great extent in proportion to the Riding; extensive plantations made on the wolds.
 Inprovements.
 Holderness drainage an extensive work of the kind, on the east side of the river Hull; it extends over nearly 19,000 acres, and in managed by commissioners. Various other extensive drainages. drainages.
12. Live Stock.

12. Live Stock.

Holderness cattle, remarkable for their large size and abundant supply of milk, prevail universally. This breed is supposed to have been introduced from Holland about a century ago, and improved by attentive management. He district. Breeding a principal object in most parts of the Riding, and feeding in Holderness when the pastures are rich. Skeep formerly the Holderness breed, resembling that of Lie. Skeep formerly the Holderness breed, resembling that of Lie. Skeep formerly the Holderness breed, resembling that of Lie. Skeep formerly the Holderness breed, resembling that of Lie. Skeep formerly the Holderness breed, resembling that of Lie obnishire and the Wold sheep; now the Leicester and various other breeds. In this Riding, and as many or more produced, in proportion to its extent, than in any other. But it is allowed by all that the breed has of late much degenerated, owing to the inattention of the farmers. About twenty years ago, a cross of blood was introduced, by which, though good sadde horses were produced, the coach horse was lost. This error duced by the introduction of heavy black stallions from Lincolnshire. These produced a mongrel breed, which will not be got rid of for several generations. In breeding, some castrate the feal while sucking, and think it a preferable practice to that of the North Riding.

Holderness and the Wold screen.

Rabbits.

10,000 acres.

13. Political Economy.

Not more than 140 miles of turnpike road in the whole Riding; few of these good, and the cross roads and lanes very bat; manufactures few; white lead, glue, glass, iron-foundry, oil-mills, cordage, sailcoth, patent whalebone, brick, tile, pottery, &c. at Hull. White-lead and Spanish-white for whitening prepared from chalk, at Hessel. Howether coarse canvass for mail bags; near Driftield spinning and wearing tow; other manufactures near York. Several agricultural societies; one for books and implements at Howden.

7808. DURHAM. 582,400 acres of surface, in some places mountainous, and in most places hilly; the soil in great part poor; the agriculture generally approaching the best model, that of Northumberland; and the county distinguished by the Durham or Teeswater breed of cattle, and by its lead and coal mines. The celebrated farmer and breeder Culley was a native of this county, and farmed here as well as in Northumberland. (Granger's General View, 1794. Bailey's General View, 1810. Marshal's Review, 1818. Smith's Geological Map, 1824.)

Smith's Geological Map, 1824.)

1. Geographical State and Circumstances. Climate ine and mild in the lower districts; but on Crossfell, the highest land in England, heling 3000 feet above the level of the highest land in England, heling 3000 feet above the level or end of June. General time of harvest from the beginning of September to the middle of October.

Soils principally clay loam and peat; the latter prevails in the western part of the county or lead-mine district; there is a tract of calcareous soil in the interior of the county. Minerals: coals found over a considerable portion of the northern parts of the county wrought for exportation, in the western and southern parts for land sale only. In various parts of the coal districts are dyles or fractures (Fig. 1010. a, b), and consequent derangement of the strata, which throw the beds of coal (c) on one side of the dyle often many feet up or down. The fissure between being commonly filled with the dyles.

Milatones, including the coals.

Lead-miner numerous in the western district; the ore mostly in vertical fissures of limestone and other rocks like the dyles.

Milatones, grindstones, freestones, slates of the grey or free-

stone kind, silver sand, limestone, whinstone, clay stone or black metal stone, and yellow ochre, also found.

Water. Salmon fishery on the Tyne has greatly declined, owing to the building of wears, which prevent their getting up. Bailey remarks, that if dams of this description were nut across the river dams of this description were put across the river Tweed, a revenue of nearly 16,7000. Per year, received for vents of fish-received for tents of fish-received for the state of the state

or salt sulphur spring near Durham, and another on Lord Durham's estate, with public baths and dressing-rooms. Various others of less note.

2. Property.

Largest estates, 20,000l. to 22,000l. a year; several from 1000l. to 5000l., from which they descend by regular gradations to the smallest sums. Some estates let by proposal; but the general mode is to ask a rent, and treat with tenants six or seven months before the existing leases expire.

3. Buildings.

Generally of stone and slate; cottages of one story, covered with thatch or tiles.

4. Occupation.

4. Occupation.
Largest farm about 1000 acres, greatest number from 150 to 50 acres. The larger farmers almost only those who have made improvements; among these, Messrs. Culley and Charge first led the way, and have been followed by Messrs. Collins, Mason, Taylor, Trotter, Nesham, Seymour, and many others, by whose exertions and judicious selection of stock this district will be lastingly benefited.
Greatest number of small labouring farmers greater slaves. Greatest number of small labouring farmers greater slaves the summer, in some kind of work or other, from four cyclock in the morning till eight at night; and in every other season of the year from ivillight to twilight; and may truly be said "to rise early, take rest late, and eat the bread of carefulness."

carefulness."

Lease, three, five, and seven years, excepting church and corporation leases for 21 years, and lives. Those farms let for short terms remain stationary, as no prudent man will lay out his money in improvements, for which, when completed, he will be rewarded by an advance of rent, proportioned to the improvement he has made.

Implements.
 Swing p'oughs of the Rotherham kind; of late the Small's plough; v-roius other good implements, and in many parts now (1830) the improved forms of Northumberland and Berwickshire.

6. Enclosing.

6. Enclosing.
On dry soils hedges are frequently planted on a raised mound, forty inches broad, and the height twelve inches; a small ditch is cut on each side to make it, and the quicks are planted in the middle. In this mode the land may be joughed nearly to the mound, and when the thorns are poughed nearly to the mound, and when the thorns are When they are five or six years old, every other stem is cut clean oil, within two or three inches of the surface, and the remaining ones stripped of their principal branches; then stakes of thirty inches high are driven in at proper distances, and the splashing stems, having a slight cut on one side to make them bend easiers are wound amongst the stakes at an wound round the top to keep the stakes tight.

7809. NORTHUMBERLAND, including those detached parts of the county of Durham, called Northamshire, Islandshire, and Beddingtonshire, comprehends a surface of 1,267,209 acres, chiefly mountainous or breeding districts, but including 450,000 acres proper for tillage. The celebrity of this county both for its tillage and breeding is well known. Here turnips were first extensively cultivated in the drill manner, and the best principles of breeding practised by Culley. To this gentleman and Bailey agriculture owes much: the latter was, perhaps, one of the most enlightened and accomplished of modern agriculturists. (Bailey and Culley's General View, 1805. Marshal's Review, 1808. Smith's General View, 1805. Geological Map, 1824.)

of modern agriculturists. (Bailey and Cuiley's Ger Geological Map, 1824.)

1. Geographical State and Circumstances.
Climate subject to great variation of temperature; snow to a considerable depth on the mountains, when there is none in the lower districts; weather runs in extremes; very cold in spring, and seidom mild before June in the lower districts; weather runs in extremes; very cold in spring, and seidom mild before June.

The record of the streng ferrite oran dome Newborn to Halt-whistle, on the Coquet about Rothbury; on the Aln, from Alnwick to the sea; down Tweedside, but chiefly in the vales of Breamish Hill and Beaumont. The hills surrounding the Cheviot mountains are mostly a dry sharp gravelly loam. Moist loam occupies a large portion of the county, valls in the mountainous districts.

The aspect of the surface is marked with great variety; along the sea-coast it is nearly level; towards the middle more diversified, and thrown into large swelling ridges, formed by the principal rivers. These parts are well enclosed; in some places enriched with wood and recent plantations, formed by the principal rivers. These parts are well enclosed; in some places enriched with wood and recent plantations, formed by the principal rivers. These parts are well enclosed; in some places enriched with wood and recent plantations, formed by the principal rivers. These parts are well enclosed; in some places enriched with wood and recent plantations, for the surface of the surface of the mountainous districts, those around Cheviot are the most valuable, being in general fine green hills, thrown into numberless variety experted, chiefly for the London market, 356, 250 London chatters. Coal in abundance in the greatest part of the county; it is like that of Durham of the caking kind, and is found in the south-east quarter of the best quality; quartity exported, chiefly for the London market, 356, 250 London chatters. Calculated that the whole coal of the counties of some stone-enart, clay-mar, lead-ore, and ore of zine in

7. Arable lands.
Ploughing generally well executed, but in some places the subsoil prevents sufficient depth of furrow, i.e. six inches. The turnip culture, rotations, and general management of arable land, the same as in Northumberland; that is, of the most improved kind; seventeen tons of Rûten bâga are equal to thirty-one tons of white turnip in feeding cattle or sheep.

Muslard was formerly much grown in this county, and Dutham mustard was proverhald for its excellence. At present a crop of mustard is rarely met with. It is generally sown upon pared and burned land it April, one pound per from eight to sixteen shillings per bushel.

Potatoes in the village of Hanstely have been the principal article of trade, and the principal employment of several armilles for eighty years; they are very particular in having good sets, each with two eyes; use reddish or pink sorts, plant in March and April, and both horse and hand-hoe; no curl appears among them, but sometimes they "run wild, or tend to that state, producing more flowers than usual, and continuing flowering much later, sometimes till Michaelmas, and producing few tubers and slender stems. Whenever this for propagation.

8. Grass.

Not much old surface, what there is chiefly upland.

8. Grass.
Not much old surface, what there is chiefly upland.
9. Woods and Plantations.
Scampston elm, from a place of that name in Yorkshire, but supposed originally from America, will make shoots from grafts, in one year, of 5 or 6 feet; introduced in young plattations by Messrs. Falla, eminent nurserymen of Gate-head, valie of Derwent well wooded; Sir J. Eden a great

ations by Messrs. Falla, eminent nurserymen of Gateshead; vale of Derwent well wooded; Sir J. Eden a great planner.

10. Embankments.
Begun on the Tees in 1740, and about 1500 acres secured
11. Live Stock.
Short-horned cattle. The famous Durbam ox bred by Charles Colling of Kellan, in 1796.
Sheep. Teeswater and Leicester breed; stock bred, reared, and feld nt he most scientific manner, especially by the larger farmers mentioned above (4).
12. Political Economy.
Turnylic roads first made in 1742; materials, whinstone, imestone, river gravel, and freestone. Roads excellent where mestically in the stock of the stock of the stock of cast-iron, with projecting letters and figures. They are two and a half feet high, and fixed on an oak post, four and half feet long, sunk two and a half feet in the earth. Guideposts much wanted. No iron railways, and no public roads of canals.

or canals. Manufictures. Wrought iron foundries, glass-houses, pot-teries, salt, copperas, sal ammoniac, coal tar, paper, woollen, cotton, and linen cloth. Several articultural societies; the first established at Darlington in 1783.

and keeping up a constant and regular supply, vessels called smacks sail three times a week, and being purposely constructed for swift sailing, frequently make their run in forty-eight hours. These vessels are from 70 to 120 tons burden; on an average twelve men are employed in each vessel, and make about fourteen voyages in a year; and not less than 75 boats and 300 fishermen are employed in taking the fish in the River Tweed.

the River Tweed.

2. Property.

One estate upwards of 40,000 acres, the rest vary from 10 to 20,000; small estates rare in the northern part of the county. Few counties have been so rapidly county. Few counties of the value trebled in forty years; principal cause letting large farms on twenty-one years; principal cause letting large farms on twenty-one years; cases. Usual mode of letting farms is to fix a rent six or twelve months before the expuration of the lease; but upon one of the largest estates in the county (the Earl of Tank-erville's), the tenants have an offer of their farms two years and a half or three years before the expiration of the lease, which is a mutual benefit to both landlord and tenant, and is attended with so many advantages, that it is in a fair way of being generally adopted.

3. Ravillatings.

3. Buildings.

or being generary acoptect.

3. Buildings.

Fameries formerly very shably and ill contrived, now totally different. The most approved form of distributing the various offices is, on the east, west, and north sides of a rectangular parallelogram (figs. 1011.) which is penerally divided into two told-yards for cattle of different ages, the south being left open to admit the sun; and five the same reason, and also for the sake of cleanliness and health, the farm-house (of its short wall of the fold is a small court for cools and young poultry; the barn (b) is 18 feet by 60, with threshing-machine driven by horses, water, wind, or steam on each side are sheds (c c), over which are granaries; beyond these, as wings to the main square, are sheds (d d), upon which are built corn-stacks. One of these sheds is for wintering yearling calves, the other for holding implements of the larger kind. On the east of the and fatting exen (f), each 16 feet by 48 feet. Over the pigsites (g) are poultry houses which open into the court-yard of the house, as the piggeries do into the fold-yards for wintering young cattle (h h).

Collages of stone and lime and tiled; floor of lime and sand; the living room fifteen feet by sixteen, and the cow-house nine feet by sixteen.

useful implements.

5. Implements.

Of the most approved kind; and some of these, as the plough, drill, horse-hoe, &c. owe their chief merits to the improvements of Balley. A pair of those in common use for cutting hedges. They consist of a strong sharp knife, six inches long, moving betwit two square-edged cheeks; the upper handle is two feet six inches long, and the other two feet three inches. (See Exclosures.)

Of Condensing, 2d ed. 1354, Ig., 122.)

of careening, at each 10.5s./gg, "at the farms; in some parts like Inclosures."

Six Data Construction with the size of the farms; in some parts from the farms are large, from 20 to 100 acres. The quicks should never be planted nearer each other than nine inches, and, upon good land, a foot. Quicks four of rive years old, with strong clean stems, are always to be preferred to those that are younger and smaller. It is a custom in some parts to clip younger and smaller is a custom in some parts to clip the same of the strong stems and single the same in the stem, and, when they grow old, open at bottom; while those that are left to nature get strong stems and side branches, which, by interweaving one with another, make a thick and impenetrable hedge, and if out at proper intervals (of nine or ten years), will always maintain its superiority over howe that and of labour saved, there is no comparison; and for beauty, we prefer nature, and think a luxuriant hawthorn, in full bloom, or laden with its ripened fruit, is a more pleasing, entirening, and gratifying object, than the stiff, formal sameness PCA stable Land.

2. Arable Land.

preming, and gratifying object, than the stiff, formal sameness produced by the shears.

7. Arable Land.

Trench ploughing practised by a few in breaking up grass lands. About 1795, when horses were scarce and dear, a good many oxen were used for ploughing and carting about the farm; butafter a few years' trial, they were given up: they were fiven up: they were the state of the s

4. Occupation.

Farms generally large in the north, some from 2001 to 4001.

Farms generally large in the north, some from 2001 to 4001.

The april of 10001 or 15001 a year. The capital necessary for such farms entitles the farmers to a good education, and gives them a spirit of independence and enterprise, that is rarely found amongst the occupiers of small farms and short leases. Their minds being open to small farms and short leases. Their minds being open to small farms and short leases. Their minds being open that can be learned in other districts; for this purpose, many of them have traversed the most distant parts of the kingdom to obtain agricultural knowledge, and have transplanted every acquainted without some of them making extensive agricultural torus, for the sole purpose of examining the modes of culture, of purchasing or hiring the most improved breeds of stock, and seeing the operations of new invented and more useful implements.

5. Implements.

100 feet 1 1 1 1 1 1 1 1 1 1

1756 or 1757. William Dawson, who was well acquainted with the turnip culture in England, having been purposely sent to reside in those districts for six or seem years, where the best cultivation was pursued, with an intention, not only of seeing but of making himself master of the manual operations, and of all the minutiee in the practice, was convinced of the superiority of Pringle's mode over every other he had seen, either in Norfolk or elsewhere; and in 1763, when he entered to Frogden farm, near Kelso, in Rothurghshire, he immediately adopted the practice upon a large scale, he immediately adopted the practice upon a large scale, he immediately adopted the practice upon a large scale of the control of the contr

8. Grass. Not much old grass in the county.

Not much out gress to the considerable demand for small wood by the proprietors of the collieries and lead mines. Artificial plantations rising in every part of the county.

10. Improvements.
Embanking and irrigation practised in a few places which require or admit of these operations.

11. Live Stock.
Cattle the short-horned, long-horned, Devonshire, and wild

to Woofer in the summer season.

12. Political Economy.

Roads of whin or limestone, and mostly good. Manufactures, gloves at Hexham, plait straw for cottagers' and labourers' hats, and also for those of the higher classes. Woollens in a few places; and a variety of works connected with the coal trade and mines at Newcastle. No agricultural societies, these Bailey holds in little estimation; but thinks if public farms were established in each county, and supported by a rate on the income of its proprietors, they would be the most effectual means of promoting agricultural improvement.

7810. CUMBERLAND. 970,240 acres of mountainous district, remarkable for its picturesque beauty, and also of late greatly improved in its agriculture. The exertions of the late Bishop of Llandaff in planting, and of J. C. Curwen, Esq. in field culture, have contributed much to the improvement of this county, which, as far as its soil and climate permit, may be considered as on a par with Northumberland. (Pringle's General Review, 1794. General View, by J. Bailey and G. Culley, 1804. Marshal's Review, 1808. Smith's Geological Map, 1824.)

Introductory Observations

1. Introductory Observations.

Pringle informs us that "trees and plants, being altogether passive, accommodate themselves very slowly to a change of climate: but the idea has been already thrown out, that even those of the torrid zone may be made to flourish in the northern regions; may be even gradually inured to the climate; that the climate itself may be changed for the better; and that some thousands of years hence, reposing under their own olive trees, future Britons may qualf their own nice, or siy their own tea, sweetened with the juice of their own sugar-cane."

Pringle "found it impossible" not to mention to the Board that he was remarkably well treated when he surveyed the county, which "filled for these feelings he voids on Sir John Sirclair; in the following terms:—"What gratitude is due to him () who first called the attention of the nation to its most important interests, and whose unremitted efforts are directed to promote the good of his country! How well does he deserve, and what a sure road has he chosen to, immortal fame that will survive the ravages of time, and smile at the fleeting celebrity

of martial achievements!" "This," Marshal observes, "most assuredly means, not him, but me.'
In some preliminary observations to this report by Watson, Bishop of Llandati, are suggestions for settling poor people in cottages on the wastes, as has been done in Syaln, and on the advantages which would result from planting them, especially with the larch and oak.

with the larch and oak.

2. Geographical State and Circumstances.
Climate. Healthy, though subject to great and frequent falls of rain, especially in autumn, which renders harvest late and precarious: snow on the mountains for six or eight months. Average rain at Keswick seventy inches.

Average rain at Keswick seventy inches.

Average rain at Keswick seventy inches.

Surface. Beautifully and greatly diversified, chiefly mountainous, and incapable of being improved by the plough; but part of the valley and plains are cultivatable soils.

Minerals. Chiefly coal, lime, and lead ore; there are also black lead, copper, gspsum, lapis calaminaris, and excellent Walters. Sixty-seven miles of sea-coast, several large and small rivers, and the lakes well known for their beauty, and the excellent char, trout, and other fish which some of them produce.

3. Property.

produce.

3. Property.

Few counties where land is in such small parce's, and these occupied by their owners. The annual value of these tenements vary from 36, to 504, a year; generally from 15t, to 504, some few 100t. Largest estate in the county 15,0004 a year. The product of the county of the

to fines, heriots, and various services to the lords of manors. A good deal has been enfranchised. Copyhold and leasehold are rarely met with; what is not customary is freehold.

4. Buildings, Implements, Arable Land, &c.
Approaching to that of Northumberland. A great many young plantations rising on the sides of the mountains.

young piantations rising on the sides of the mountains.

5. Live Stock.
Cattle of various kinds; breed of the county a small long-horned kind; but the most improved varieties are now introduced.

Sheep bred in the county the Herdwicks, a hardy mountain sheep. Some horses bred by the farmer, and bees very common. In every parish the taking of moles is let at a certain will soon eradicate this animal from the county.

6. Invacious and the sound of the county.

will soon eradicate this animal from the county.

6. Improvements.
Various kinds, as draining, watering, planting, &c. made by Watson, Bishop of Llandarf; at Colgarath Park. Those of J. C. Curwen, Esq. of Workington, especially in feeding and atting stock, have made a distinguished figure in agricultural writings; but their practical ments have been questioned. We paid a high compliment to Curwen in the first edition of this Encyclopædia, on which a scientific and practical man, who was personally acquainted with him, made the following who was the proposal propos

7811. WESTMORELAND. 540,160 acres, chiefly of mountain and moor, but with some few tracts of vale lands, cultivated or capable of cultivation. On the whole it is naturally the most infavourable county to agriculture or comfortable living in England, owing to its wet and cold climate, ungrateful soil, and rugged surface. (Pringle's General View, 1794. Marshal's Review, 1808. Smith's Geological Map, 1824. Edin. Gaz. 1827.)

1. Geographical State and Circumstances.
Climate. S. W. winds and rains prevail for eight months in the year: in 1792 eighty-three inches, medium forty-five or fifty inches, which is twenty inches above the medium quantity that falls in Europe. Air pure and healthy; winters long and severe. In 17912 thirty-six pounds were paid for cutting in the snow ten miles of borse tract between Shap and Kendal.

The self most prevalent on the low lands is a dry gravely specified. Mountainous and hilly, and in most pleaces incapable of cultivation by the plough. Large tracts of black barren moors, called the Fells.

Minerals. Some trifling veins of lend; limestone in abundance in most parts of the county; excellent hiue slates; gypsum used for laying floors; freestone, and marble near Kendal.

Water. Several rivers and some lakes, corresponding in beauty and products with those of Cumberland.

2. Property.

As in Cumberland; land-owners called statesmen (for estatesmen), as in Ireland.

3. Buildings.
Very indifferent; few mere cottages; the labourer and mechanic generally reside in a small farm-house, and occupy more or less land.

Occupation.

4. Occupation.
Farms small; and farmers, who are generally proprietors, "live poorly and labour hard," in the fields in summer, and weaving in winter; wear clogs, the upper part of leather, and the soles of birch, alder, or sycamore. The culture of arable land is very imitted, and, like that of grass land, was in a very backward state at the time the reporter wrote, but gradually improving. Dairying in a small way is generally practised, but little attention to the sort of cow or breeding. The Earl of Lonsdale, and Watson, Bishop of Llandalf, were among the first to set the example as to planting.

insic to set the example as to planting.

5. Manufactures.

Woollen cloth, or Kendal coatings, stockings, silk, gunpowder, &c. A private carpet manufactory at Lowther, by the Earl of Lonsdale.

7812. LANCASHIRE 1,150,000 acres; (1,155,840, Brook's Gaz. 1809, 12,000,000! Edin. Gaz. 1827), included in a very irregular outline, extending above a degree, or about seventy-four miles from north to south, containing mountainous and moory surface, and a large portion of low, flat, or moderately varied lands, of good quality. The soil in great part sandy, and chiefly in pasture. The early introduction and successful culture of the potato distinguishes this county, and also the immense extent of its cotton manufactures, and very considerable foreign commerce from Liverpool. It is also the country of Brindley, the engineer. (Holt's General View, 1795. Dickson's General View, prepared by Stevenson, 1815. Marshal's Review, 1808.)

Geographical State and Circumstances. 1. Geographical State and Circumstances. Climate. Air every where pure and salubrious, but on the elevated parts cold and sharp; protected, however, by the northern and enstern ranges of mountains form the N. and E. whids; not much snow or long continued severe freest. I reliable the probability of the property of the probability and the probability and the probability along the probability along the probability along the probability and to try-two inches: in 1799, sixty-five; and in some years fifty. From a register of the times during a series of years, at which potatoes, saparagus, and gooseberries were first brought to the Liverpool market, it appears that the difference of the property
weeks.

Soil. On the mountains and moors rocky and peaty; on the northern part of the lowlands moist, cold, and rushy silt; on the rest chiefly sandy loan.

Minerals. Principally coal, copper, lead, and iron; the first and last very abundant; there is also siate, grey-slate, and flagstones, freestone, and limestone.

Waters. Seventy-five miles and upwards of sea-coast, and several rivers and meres.

2. Property.

Very variously divided; a considerable number of yeomany from 10t. to 70t. per annum; a general spirit for possessing land and agricultural improvement; tenures, as usual, chiefly freehold.

freehold.

3. Buildings.
Old farmeries the work of chance and random; houses often there formerly occupied by proprietors, and offices without order or design, but various new exections on the most approach plans; cottages in many places comfortable, with good gardens, especially those occupied by operative manufacturers and mechanisms of the plant of the plant of the provincially "eat and clay."

4. Occumation.

A. Occupation.

Farms in general small; education and knowledge of most of the small occupiers very circumscribed; larger farmers more enlightened, and having more command of capital, are improving the culture of their farms.

Implements.

15. Implements.
Little improvement, but the Northumberland plough and Meikle's threshing-machine introduced; horse pattens are

almost peculiar to this county, and are used in cultivating light peaty soils.

6. Arable Land.

Less prevalent than grass; but great attention paid to the culture of potatoes, both by farmers and cottagers; the former generally cultivated in drills, and horse-hoed; the latter in beds or dibbled in pows, and hand-hoed. The method of growing early potatoes, and several crops on the same soil in one season, has already been given. Generally continued in the same soil in one season and the same soil in one season and the same soil in one season tried, and grown to very great perfection, but not so easily dried and prepared for sale as to induce a continuance of the practice.

7. Grass Lands.

7. Grass Lands.
Extensive, but chiefly coarse upland pastures; some good meadows and productive marsh lands. Application chiefly for the dairy for home consumption of milk and butter; not much cheese made, excepting on the Cheshire side of the county.

Gardens and Orchards.

8. Gardens and Orchards.

Excellent market gardens near most of the large towns. Liverpool remarkably well supplied; great quantities of cabbages and onions exported; the dried herbs sent to Africa. "There is a certain farmin Kirkby, about eight miles north-east from Liverand onions exported; the dried herbs sent to Africa." There is a certain farmin Kirkby, about eight miles north-east from Liverand which produces great quantities of early and strong asparagus, and another farm, a part of which is of the same nature at a place called Orrel, about four miles north-west of Liverpool: both which produce this plant with less attention and less dung than requisite in the rich vale of Kirkdale, about two miles from Liverpool, where the greatest quantity of land any place of this neighbourhood is appropriated solely to horticulture. Mechanics. "A small patch of ground appended to his cottage furnishes the veaver, smith, or carpenter with health and pleasure, and contributes to his solviety; intemperance not unfrequently proceeding from want of recreation to fill up a vacant hour. This small space is devoted to nurturing his young seedlings, trimming his more matured plants, contemplating new varieties, in expectation of honours through the medium of promised premiums. Thus, starting at intervals from his more toilsome labours, the mechanic finds his stagnating fluids put in motion, and his lungs refereshed with the fragrant breeze, whilst he has been raising new flowers

of the auricula, carnation, polyanthus, or pink, of the most approved qualities in their several kinds; and which, after being raised here, have been dispersed over the whole kingdom. But not only flowers, but fruit, have been objects of their attention. The best gooseberries now under cultivation had their origin in the county of Lancaster; and, to promote this split; meetings are animally appointed at different places, at which are public minums adjudged. These meetings are encouraged by master tradesmen and gentlemen of the county, as tending to promote a spirit which may occasionally be diverted into a more important channel. Those little societies for promoting the important channel. They have unquestionably had much in many law of the county. They have unquestionably had much in most places are applied for the red and white kind, is now in most places grown to a very considerable size, in some situations as large as a pigeon's egg. This is chiefly effected by keeping the plants much cut in their branches, and having well rotted rich manure applied frequently about their roots, culled The Minchester Bousterry-book, and The Manchester Homer-book, contain the names of the principal societies, and of the prizes awarded each year, and a variety of other information." (Dickson, p. 428.)

An orchard of sixty-iour acres on the banks of the Irwell, next Manchester, and some others in seltered places near the their increase.

before the second and Plantations.

9. Woods and Plantations.
A good deal of planting going forward in most parts of the county, but not inch old imber or copse.

10. Improvements.
Of moss bogs and marshes there is great extent, and we have already noticed the principal modes of improving them. (4535.)
A good deal of diaming, paring, and burning, and liming of loss of the control of the contro

expense of 150,0001, or according to some much less; but owing to the difficulty of getting the small proprietors of fisheries and and not resumed. The proposed modes of procedure for this, and other intended embankments, are given in the report. Bog lauds have been extensively cultivated by the celebrated Roscoe, of which some account has been already given. (4549.) 11. Live Stock.

Récoce, of which some account has been already given. (4549.)
11. Live Stock.
Cattle, the Lancaslure, or long-horned, made the basis obred, when the dairy is the object.
Larger grass farms near the populous towns furnish milt, the smaller ones butter, the populous towns furnish milt. Larger grass farms near the populous towns furnish milt, the smaller ones butter, dairy near Liverpool. Cheese made resembles that of Chessive, and chiefly from the long-horned, or native breed.
Sheep not very common in this district.
Horses very generally brd of the strong team kind, stout compact saddie horses, and middling size and hone for the strong team that the strong team kind, stout compact saddie horses, and middling size and hone for the strong team that the strong team kind, stout compact saddie horses, and middling size and hone for the strong team that the strong team kind, stout compact saddie horses, and middling size and hone for the strong team that the strong team kind, stout compact saddie horses, and made the most climate. In the coal tracts about Manchester, Bolton, and Wigan, the roads are all paved, as it was thought no other would stand the heavy traffic or them. These paved roads are said to be the most expensive, and most disagreesable of any but they have been no other kind of manchester, and the strong team of the

laden waggons were exposed to much danger of being over-turned.

Various canals and iron railways; those of the Earl of Bridg-water the most celebrated, but others of recent date more extensive. Many different manufactures; cotton in its differ-ent branches the most important; also, woollen, flax, iron, and, in short, almost as great at variety as in Dethyshire. Seve-ral agricultural societies; that of Manchester established in 1767.

7813. The ISLE OF MAN contains about 220 square miles. (Edin. Gaz. 1827.)

General View. The interior is mountainous, ridges of hills being separated by high table lands; the climate is moist, with frequent fogs; and the soil is chiefly loam, on a bottom of stiff clay. No initerals of any consequence are found on the island, except lead, and some copper, and iron. Limestone, thin blue slate, greywacke, and granite are found in several places; in immense tract called the Churngh, which was formerly a bog, in the companies of the compan

which all lie in one direction, as it overturned or deposited a common impulse.

The Duke of Athol was formerly lord proprietor of the whole Island, but the sovereignty was purchased from him by the English government, 1765.

English government, 1765.

The property of the property of the property of the property was third of the Island still termin in a state of nature, and are only used for grazing; there is a good deal of wood in

the north part of the island; wheat was formerly not cultivated on account of a prejudice which prevailed respecting its liability to be infected with the smurt; large crops are, however, are raised in great quantities, as are also turnips and poetages. Flax and hemp are prown in rich enclosures. Many of the lines rosts of fruit, however, cannot be reared. The sheep are small and hardy, and their flesh is excellent; the wool of a particular breed, called the Loughton, is thought of a very superior quality. Great numbers of cattle are fattened here for exportation; and 30,400 hogs-kades of butter are sent to England analysis. Thin noteakes are the usual bread of the inhabitants. Political Economy. The roads to the principal towns are tolerably good, but the by-ways are almost impassable. The island is considered healthy, and the inhabitants generally attain a great age.

7814. CHESHIRE. 665,600 acres of verdant surface, exclusive of upwards of 10,000 acres of naked sands in the estuary of the river Dee. It is one of the most productive grass-land districts in the kingdom, the grass retaining its growth and verdure, in a great degree, during the whole year, owing to the moisture and mildness of the climate. The department of husbandry in which it excels is cheese-making; and it is also noted for its salt-works from brine springs and rock. (Medges' General View, 1794. Holland's General View, 1896. Meaglet British 1890) and it is also noted for its salt-works from brine springs and rock. land's General View, 1806. Marshal's Review, 1809.

1. Geographical State and Circumstances. Climate, supposed the most rainy in the kingdom. General surface an extended plane, apparently thickly covered with wood. Barren hills on the eastern margin of the

desired surface an extended plane, apparently thichly covered with wood. Barren hills on the easiern margin of the county.

Soils chiefly clayer or sandy; clay prevails, but very generally the two earths blended together, producing clayer loam and sandy loam.

Sulsond chiefly clay, or marl; but also rammel, foxbench, gravely, or red rock. Hammel is a composition of clay, sand, gravely inches, on white-coloured sand, or clay marl. Foxbench is iron ore or oxide, which crumbles to pieces when exposed to the air; but is hard and rocky when under the soil, and is more injurious to trees than rammel, as it cannot be penetrated by their roots.

Minerals. Fossi salt and coal both extensively worked. There is also copper, lead, and freestone, but very little lime. The summer is a summer of the soil of the summer of th

a view, and often a more enlightened view, of its advantages and resources, he brings with him the means and the disposition to try experiments, and to give to his new acquisition its greatest value. He feels the want of comforts and conveniences, which custom had rendered familiar to a former occupier; he builds, drains, and plants; and, by his spirit and example, stimulates all around him to increased exertions.

Buildings.

Many noble mansions, especially that of the Earl Grosvenor, Eaton.

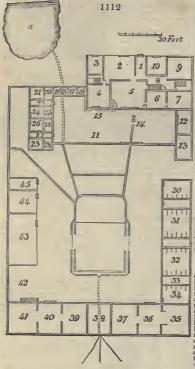

3. Buildings.

May noble mansions, especially that of the Earl Grosvenor, at Eston.

All the country and the convenient in other places the reverse, and crowded in villages; old huildings of shed-work, wattled work, and clay, and covered with thatch; new of brick and slate. An excellent set of buildings (fig. 1112.) has been receted at Bromfield, near Warrington, on the estate of Sir P. Warburton.

A gentle descent from the ground as firm, the opportunity of croweing from a pond (a) a small stream through the farm-yard, with which he irrigates the meadows below the buildings. The superior richness of vegetation in these meadows furnishes abundant proof of the advantage which Beckett derives from avalling himself of this assistance.

Beginner with the directions and subseption of the same state
consist of a cow-house (30), double cow-house (31), double cow-house (32), fodder-bin (33), cow-house (34), com-bag (35), the com-bag (37), com-bag (38), corn-bag (37), com-bag (38), corn-bag (37), com-bag (31), cart-house, with grand and above it (42), stable (43), stable or calf-cot (44), calf-cot (45).

Collages much the same as in other counties; improving with the age. All the intelligent persons whom Dr. Holland conversed with have invariably found, that the attachment of a small portion of land to the cottage of the labourer has been the direct means of rendering his situation in life more comfortance, of temperance and of these habits of honest independence, of temperance and of these habits of honest independence, of temperance and of these habits of honest independence, of temperance and of these habits of honest independence, of temperance and of these habits of honest independence, of temperance and of the individuals, and, consequently, the general interests of society.

Lord Perinnia's poultry-houses, at Winnington, are supposed the most magnificent that have ever been built. They are united in a building, which consists of a handsome regular united to the centre of the design by a colonnade of small castion pillars, painted white, which support a cornice and a state roof, covering a paved walk and a variety of different conveniences for the poultry, for keeping eggs, corn, &c. The close into these are all of lattice-work, also painted white, and coornic and a state roof, covering a paved walk and a variety of different conveniences for the poultry, for keeping eggs, corn, &c. The coornic and a state roof, under which and between the columns is a beautiful mosati from gate; on one side of this gate is an cornice and a state roof, under which and between the columns is a beautiful mosati from gate; on one side of this gate is an elegant little parlour, houter which and between the columns is a beautiful mosati from gate; on one side of this gate is an even and the other end of the colonnade a very neat kitchen, so oview it. This front is the diameter or chord of a large semi-circular court behind, round which there is also a colonnade, and agreen variety of conveniences for the poultry this court is neatly paved, and has a circular pond and pump in the middle of it. The whole fronts towards a rich li

nails, on small spars fixed to the brick; they are afterwards painted, and fine white sand thrown on while the paint is wet, which gives the whole an appearance of the most beautiful

Occupation

4. Uccupation.
Farms very small; a great many under ten acres; only one or two at 550 or 400 acres; excluding all those under ten acres, the average of the county may be seventy acres. 5. Implements.

Rotherham plough and other good implements. A short strong seythe, with a blade twenty inches in length, and concave in the middle, is used for scooping out the crowns of rush

6 Arable Lands.

In small proportion to the pastures. Cabbages a good deal cultivated for cattle. Carrots near Altringham for the Manchester matket, and also seed for the London seedsmen. Onions also for the Lancashire markets. The soil about Altringham dry and loamy; the carrots large, coarse, and fit only for horses and cattle. 7. Grass.

only for horses and cattle.

7. Grass.

Natural meadows numerous, rich, and fertile. They are situated on rivers, which, from the frequency of heavy rains, overflow and enrich them. Extent of upland pasture very considerable; that on a toterably stiff clay soil, especially with milk may be had from cover on the best for the dairy; more milk may be had from cover of the dairy; more milk may be had from cover of the dairy. May farmers complain that their land is too rich for the dairy, by which the adserver properties of the cheese is diminished; feeding of cattle little practised.

8. Gardens and Orchards.

Good gardens to most of the farm-houses. "All the varieties of raspherries, currants, strawherries, and gooseborries are to be met with in the farm and cottage gardens in Cheshire. Of the county, where small premiums are adjudged to of late years; and the truth has been particularly attended to of late years; and the of their own gardens, goose-derries of the greatest weight. The common fruit trees, such as the apple, pear, cherry, and plum, are likewise grown in almost every garden. Of the latter kind, the damascene plum is by much the meat common; and is an article of considerable profit to the cottager.

Orchards not numerous, and rather on the decline.

Orchards not numerous, and rather on the decline.

9. Woods and Plantations.

Few of large extent, yet the quantity of timber very greatly exceeds what would be a fair average for the kingdom at large. In the northern and middle parts the number of trees in the hedge-rows and coppiecs is so considerable, that, from some points of view, the whole county has the appearance of accretion for forest. The most considerable ancient woods in the hedge-forest. The most considerable ancient woods in the case of the control of the control of the control of the case of the ca 9. Woods and Plantations.

10. Improvements.

10. Improvements.

Draining a good deal practised, especially with bricks and storeness. Paring and burning, marling, sanding, claying, and llining, also practised to different degrees of extent. Sand of advantage, chiefly by altering the texture of the soil, as that used contains no calcarcous matter.

11. Live Stock.

used contains no calcareous matter.

11. Live Stock.

Present stock of dairy cows a mixture of the long and short horned, the Derbyshire, Shropshire, Statfordshire, Welsh, Irish, Scotch, and New Leicestershire cattle. Those cows reckned best which are bred on the farm. Calves reared from the best milkers, and at two years old put to the hull. Cows housed about the middle of November; permitted to go dry ten weeks before their time of calving; usual dry foods, wheat which are bred their time of calving; usual dry foods, wheat which are bred to the state of th

usually given to the cows when the after-grass is consumed; it is sometimes given in the spring to cows that have newly as consumed; it is sometimes given in the spring to cows that have newly as circumstance which frequently happens, especially in dry weather. Turnips are given to the cattle in the winter, while they are feeding on straw; and as, at this time, no cheese is made, any objection to their use, from the flavour they give to the milk; so flate cow with a view of ascertaining whether the stall-feeding of their mile cows might not be continued during the whole year, but he found the general opinion to be against this practice; though it did not appear that any experiments, sufficient for the decision of the point, had intherto been made. It was suggested to him, however, and the continued during the whole year, but he found the general opinion to be against this practice; though it did not appear that any experiments, sufficient for the decision of the point, had intherto been made. It was suggested to him, however, and the summer of the day in summer, where, by giving them a few cabbages or tares, the milk would continue forming, and the cattle be defended from the gad-fly, which, by tormenting them in the fields, frequently up two of three times in the course of a night, to see whether any thing is amiss. The racks and mangers are every day well cleaned out, while due attention is paid to the appetites of the different beasts, and the quantity of food is governed accordingly. After this is done, the properties of the different beasts, and the quantity of food is governed accordingly. After this is done, the properties of the different beasts, and the quantity of food is governed accordingly. After this is done, the properties of the different beasts, and the quantity of food is governed accordingly. After this is done, the properties of the different beasts, and the quantity of food is governed accordingly. After this is done, the food of the different beasts, and the quantity of food is governed ac

all put into the cheese-tub, it is then ready to receive the remet and colouring, or, in the terms of the art, to be set together. The remet and colouring being put into the tub, the whole is well stirred together, a wooden cover is put over the tub, and over that is thrown a linen cloth. The usual time of coming is one hour and a half, during which time is before the coming takes place, as it often does, the whole must be stirred together so as to mix again the milk and cream, and this as often as it rises, until the coagulation commences. A few smart strokes on different sides of the tub, with the cheese ladder, fee, will forward the coagulation, if it is found to be too long in forming.

In the ment place broke by the knife and hands, and then left half an hour to subside; then it is gently presed, the curd broken by the hand, and the whey ladled out of the tub, sit drains from the curd. Afterwards, the curd is broken in a brass pan and salted, and next put into the cheese-vat, and presed with a sixty pound weight, till all the whige is removed. It is the regular of the property of the curd in the salting tub, where it remains three days covered with a stry pound weight, till all the whige is the strength of the curd and placed on the salting benches, where it is turned once a diy; it is then washed in warm water with a brush, and wiped dry with a cloth; in two hours it is successful to the cheese-room. In the cheese-room water with a brush, and wiped dry with a cloth; in two hours it is supposed to the cheese room. In the cheese-room are the substantial of the cheese-room. In the cheese-room are considered to the cheese room. In the cheese-room are considered to the cheese room of female and which will be a cloth the cheese room and the substantial which takes place in cheese for a certain time after it is made, and turned daily for seven days, and smeared with whey butter; afterwards it is turned only and an arabbed three times a week in summer, and wice in winter.

The deser-room are the name of the court

Bres to be found at many of the farm-houses, and at some the cottages.

12. Political Economy. 12. Foltiteat Economy.
Roads bad; various canals; an extensive commerce of coal and sait, and manufactures of silk, woollen, linen, and cotton. An experimental farm established at Waverham, near Northwich, by some gentlemen and farmers of the neighbourhood, but it was soon found so expensive and losing a concern as to be abandoned. Those on the plan suggested by Bailey (7809.) seem the most likely to be effective and permanent.

7815. HAMPSHIRE. A maritime county, which includes also the Isle of Wight: the latter contains 94,000 acres, and the continental part of the county 968,150 acres. The climate of this county being remarkably mild, and the soil in many places being calcareous, and consequently warm, very early arable crops are produced in some places, and peas grown better than in many districts. The culture of the county, however, has little to recommend it, either in its tillage or pasturage. Its woods are extensive, (A. and W. Driver's General View, 1794. Vancouver's General View, 1808. Warner's Isle of Wight, 1794. Marshal's Review, 1817.)

Geographical State and Circumstances.

1. Geographical Sector Climate generally mild.

Soil in the central parts a strong flinty calcareous loam: in

The

Soil in the central parts a strong flinty calcareous loam: in other parts generally arravelly, or sandy and calcareous. The soil of the Isie of Wight is partly a clayey and calcareous loam, and in part lighter.

Minerals: none of any consequence; potter's clay, sand, and building-stone in different places.

Water scarce in dry seasons in the chalk districts, where it is preserved in tanks, and care a long dry autumn, here has been more strong beer than water. A good deal of fishing on the coast; of cels after floods in the smaller streams; and some fish ponds on Bagshot Heath.

2. Property.

Property.

Largest estates on the chalky districts; largest 8000L per annum. Great bulk of the lands held and cultivated by yeomany; tenures, copyhold and leasehold, from the superior lords or freeholders.

Buildings

3. Buildings.
Houses of proprietors numerous: farm-houses mostly of great antiquity; those of the larger kind were formerly grange or manor-houses; out-buildings numerous, and generally ruinous; cottages often of mud (provin. cd) walls, but better on the whole than in some other counties. Some faurchir ruits extructures as alreleers or temporary lodges for cattle, in the forest 4. Occupation.

Parms various, rather small.

5. Innieuments.

Farms various, rather small.

5. Implements.

Hampshire plough, an extraordinary bulky clumsy structure; the Suffok plough is used in the southern parts of the county, and in the Isle of Wight. The patent Hampshire waggon is formed by uniting two carts, corresponding with the fore and hind parts of a waggon, by boiting them together. The thrill of the hind part passes under the bed, and rests on the pillow of the fore-cart. The union is simple, yet so complete as to render this waggon as strong as the conumon kind,

plete as to render this waggon as strong as the common kind, if not stronger.
6. Arable Land.
Tillage difficult and expensive in the chalk district, light and easy in the vale of Avon. Peas a good deal cultivated on

the chalks, especially the Marlborough grey or partridge, the charlton and pearl; in warm situations they are drilled and often sown before Christmas, or in January. "A considerable

1113

mystery still seems to hang over certain properties of these peas, with regard to their boiling well for soap or porridge; good with regard to their boiling well for soap or porridge; good been the pease of the pe

Saintfoin cultivated with success on the chalky soils, and very productive. Hops on the borders of Surrey. A vineyard was planted at Undercilif; in the Isle of Wight, by the late Sir Richard Worsley, in 1792, and an Anjou vine-dresser brought over to attend it; the extent was about two and a half acres, and a light wine was made; but in 1808, when M. Vancouver called to see it, he found the vines had been grubbed up, and the ground changed to a lawn of turf.

7. Gras: Lands.
The county famous for water meadows, which are well managed, and productive; they are chiefly in the neighbourhood of Winchester, on the Itchen; but there are instances on most of the other rivers and streams.

8. Gardens and Orchards.

of Winchester, on the Itchen; but they in the content of the other rivers and streams.

8. Gardens and Orchards.

8. Gardens and Orchards.

8. Gardens and Orchards.

8. Excellent market gardens near Gesport and Portsmouth; Portsea island noted for its broccoli; white-washed mud walls, with copings of thatch used as fences, and for wall fruit in some cases; and fruit walls only half a brick thick, and waving at the rate of one foot in twenty in use. In other cases angular walls are in use, the angles being right angles, and the sides ten feet each. The advantage in both cases is the saving of bricks; but it is evident they cannot be carried very high, nor, subbe of great duration. (See Engelophordia of Cardenia, 1, 167;)

Orchards in various places, and cider made both in the county and in the Isle of Wight.

9. Woods and Plantations.

Extensive beechvoods on the chalk district, those of Ditcham grove very fine; elm scarce in the count; but abundant in the New Forest district, and many young plantations there, and throughout the county. Co bett raised a great atoms there, and throughout the county. Co bett raised a great several considerable forests, viz. the New Forest, Alice Holt, Woolner, and Bero.

The New Forest is situated on the south side of Hamphire; twas formerly bounded on the east by Southampton river, and on the south by the British Channel, being near thirty miles in length, and minety in circumference; but, since the disalforestations by Henry the Third and Elward the First; its bount on the north west, to the sea, on the south-east, about twenty miles; and from Hardley, on the east, to Kingwood, on the west, about fifteen miles; containing within those limits about \$2,365 acres, the whole of which does not now leelong to the crown, as several manors and freehold estates, to the amount of \$24,797 acres, are private property; about 625 acres are hall by the master keepers and groom keepers, attached to their respective lodges; and the remaining 63,444 acres are the woods and waste lands of the fore

earnest in supporting. After a verdict obtained in the Court of Exchequer against the gentlemen of the island, Gibbs sold his chamler, who admitted the through the sold his development of the ground did not answer the expect-tions of the understates; for though that part of it adjoining Brading proved tolerably good, nearly one half of it was found to be a light running said; nevertheless, an incontestable evidence appeared, by the discovery of a well, cased with stone, near the sir Hugh Middleton tried a variety of experience to discourage in the sold his share; sowing it with wheat, larley, oats, cabbage, and finally with rapessed, which had been taken in, before he sold his share; sowing it with wheat, larley, oats, cabbage, and finally with rapessed, which last was alone successful: but the greatest discouragement was, that the sea brought up so much ouze, weeds, and sand, which choked up the passage for the discharge of the off the haven was full of fresh water, and high spring ide, the waters met under the bank, and unade a breach. Thus ended this expensive project; and though Sit John Oglander, who lived in the neighbourhood, confessed himself a friend to the understaing, which, besides its principal object, tended to render that part of the country more healthy, he declared its expensive project; and though Sit John Oglander, who lived in the neighbourhood, confused himself a friend to the understain, which how the passage for the large, and profitable purpose.

11. Live Stock.

No exclusive breed of cattle. The Sussex, Suffolk, Leicester, Hereford, Devon, &c. are indiscriminately met with. Several

7816. WILTSHIRE. 870,000 acres of varied surface, partly chalky downs, and partly rich vale land; and both a corn and grass county. It produces excellent cheese and butter, fat cattle, pigs, and store sheep. The agricultural report of this county was drawn up by T. Davis, steward to the Marquess of Bath, at Longleat, a man of great experience as a land steward, surveyor, and farmer, and universally respected. He divides the county into two districts, the south-east and north-west; a very judicious plan for giving correct agricultural information. (Davis's Wiltshire, 1794. Marshal's Review, 1809. Edin. Gaz. 1829.)

Gaz. 1829.)

7817. SOUTH WILTSHIRE.
Witshire downs contain about 500,000 acres of hilly surface, mostly unenclosed and in common pasture; the atmosphere cold and sharp with a chairs. There is carcely a river or brook in this district that Is not applied in some way or other to the purposes of irrigation.

1. Property.
Near large towns property is generally subdivided when sold; in this district, when any is sold it is generally bought up by such as are considerable proprietors: hence estates generally large. Shape of the manors shows that many of them were the property of one lord; each borders on or contains a rivulet to supply water and the accompaniment of rivulets in that district, meadow land, with hill for wood; or, where these were wanting, they were supplied by a grant of those articles from other property. Proprietors generally resident on their estates.

2. Buildings.
Farm-house generally crowded together in villages, for constains

other property. Proprietors generally resident on their estates.

2. Buildings.

Farm-houses generally crowded together in villages, for convenience of water. Some of late years erected centrical to their farms, by the Earl of Pembroke, and other proprietors; wells and ponds an important article in these erections.

3. Occupation.

3. Occupation.

3. Occupation, the property of t

modes have been introduced to prevent this evil, by giving a sufficient texture and firmness to the land previous to a wheat crop. The best farmers have made a point of getting their lands clean yloughed by midsummer, and treading it as firm as possible with the sheep-fold a long time before sowing; while the slovently farmers have invented, and remerally precise, a possible with the sheep-fold a long time before sowing; while the slovently farmers have invented, and remerally precise, a They rafter the land (as they cell it), that is, they plough half of the land, and turn the grass side of the ploughed furrow on the land that is left unploughed. They do this as soon as the van spare the feed of the summer-field, and leave it in that state fill near seed-time, when they harrow it down and plough as the state of
must give the quality.

The course of crops was formerly fallow, wheat, barley, oats; but now, even on the common fields, is wheat, barley, clover, now-ced one year, and fed two years, till it is necessary to plough for wheat. Turnips, Swedes, and rape grown for winter food for sheep, though less necessary than in districts less amply provided with water meadows. Error that of sowing too much control of the
corn. Gardens near Devizes, Lavington, Warminster, Westbury, &c. Many families subsist by this kind of husbandry, occupying from two to five acres each as garden ground. The produce supplies the adjacent towns in the district, and Frome and Bath, in the county of Somerset, with cabbage-plants, peas, beans, carrots, turnips, and vast quantities of potatoes.

Orchards in some places, and eider made; but as the district

is famous for its barley and ale, the predilection for this beverage renders the want of cider little felt. Woods not numerous, but a great spirit for forming plantations; and some excellent remarks on the subject in the

Report.

Irrigation introduced into this district the end of the seventeenth, or the beginning of the eighteenth century. Many of the most valuable and best-formed meadows, particularly those in the Wyley Bourne, were made under the directions of one Farmer Baverstock of Stockton, between the years 1700 mg transparence.

Between 15,000 and 20,000 acres watered; its great value in April between "hay and grass," by which the farmer is enabled to breed early lambs. "As soon as the lambs are able to travel with the eves (perhaps about the middle of March), the lambs are able to travel with the eves (perhaps about the middle of March), the lambs are the lambs are able to travel with the eves (perhaps about the middle of March), the lambs are the lambs are able to travel with the eves (perhaps about the middle of March), the lambs are the lambs are the grass. It is not usual to allow the eves sand lambs to go into them with empty bellies, nor before the morning dew is gone. The general hours of feeding are from the revening, when the sheet has the morning, till four or five in the evening, when the sheet has the down; but a few spaces are left in the hurdles for the lambs to get through and feed forward in the rich grass. One acre of good grass will be sufficient for 500 couples for a day; the great in this heat; the meadow is then laid up for hay.

The nutler meadows of Orcheston, a vilage six miles N. W. of Amesbury, have been long celebrated. What is called the long grass of these meadows is said by Davis to be the agrissis stolonifora, or black couch; but it has been subsequently sentenced on the following perhaps the subsequently sentenced on the following the propagation of the farmer, for other reasons besides its botanical information. It appears probable from it that the following very interesting extract descreyes the attention and reflection of the farmer, for other reasons besides its botanical information. It appears probable from it that following the propagation of the farmer, for other reasons besides its botanical information. It appears probable from it that following the propagation of the farmer, for other reasons besides its botanical information. It appears probable from it that following the propagation of the farmer, so the following the following the following the following the following the following the fol

ness or dryness of the winter, is equally just. The most probable way of accounting for it is, that it is almost the only grass common to water-meads that will stand wet and dry; for though it nourishes most when under water, yet no dry weather with the work of the work of the work of the weather water wa

ing a consequence rather than a cause of keeping sheep. Horses a heavy, very unsuitable breed; great error in principle of larging the size of the animal.

7818. NORTH WILTSHIRE.

Climate milder than that of the S. E. district; soil not so uniform; under stratum broken stones, and surface reddish calcateous loam.

Property more divided than in the east side of the county.

Buildings. Charlton, a noble pile, by Inigo Jones. Farms generally enclosed, and chiefly under grass, and applied to the making of cheese; lesses from towards and surface reddish calcateous loam.

Property more divided than in the east side of the county.

Buildings. Charlton, a noble pile, by Inigo Jones. Farms generally enclosed, and chiefly under grass, and applied to the making of cheese; lesses from towards and the property of the great landholders in Wiltshire have introduced into this district Scotch farmers, who, from a supposed superior skill in the science of agriculture, have leases for twenty-one years, with scarcely any restrictions as to husbandry. The ancient pastures are allowed to be broken up; buildings are cretcted for their accommodation at a low rate of interest; and a claptee of country and the state of t

for the cattle in the spring, and thereby, in fact, to shorten the winter.

The cheese of this district was many years sold in the London market by the n.me of Gloucester cheese; but it is now perfectly well known by the name of "North Wiltshire Cheese." It was at first, doubtless, an imitation, and perhaps an humble one, of that made in the vale of Gloucester, but it is now allowed by many to be at least equal, if not superior, to the cheese of the favourite district of Gloucestershire, the hundred of Herkeley.

The superior of the favourite district of Coloucestershire, the hundred of Herkeley.

Orbitards frequent so some near Wootton Bassets, for supplying the markets of Crickiade, Cirencester, &c.

Orchards frequent us an appendage to farm-houses, but no cider made.

Wood frequent in hedgerows, but not in masses.

cider made.

Wood frequent in hedgerows, but not in masses.

Irrigation not common; springs scanty, and land too absorbent; alleged they produce coarse grass, but this is owing to its not being mown in time.

to its not being mown in time.

6. Live Stock.

Cattle of the long-horned breed; Devons bred, and found better for fatting, but it is questionable if they are so good for the dairy. Breedling cattle not the fashion. "The dairy means the fatting, but it is questionable if they are so good for the dairy. Breedling cattle cattle for the fashion." The dairy means the fatting the fatting the fatting fatting fatting the fatting fatt

7. Political Economy.

As applicable to both districts it is observed, that the tumpike roads are numerous and good in most places; three canals; extensive woollen manufactures at Salisbury; also cutlery of superior excellence there; carpets at Wilton, and fancy woollens; and of superior broad-cloths at a great many places. No agricultural society, but many farmers and others are members of the Bath and West of England Society.

7819. DORSETSHIRE. 711,250 acres of undulating surface, in great part chalky soil, and celebrated from the time of the Romans for its pleasantness and fertility. Like Berkshire and some other counties, it is called by the inhabitants the garden of England. It is chiefly under grass, and is celebrated for its

breed of sheep, which bring three lambs in two years; and for its watered meadows, of which Boswell, of this county, has given a valuable account. (Claridge's General View, 1793. Stevenson's General View, 1812. Marshal's Review, 1817. Edin. Gaz. 1829.)

1. Geographical State and Circumstances.
Climate dry and salubrious rather than mild and bland;
supposed cannot have beelevated Downs were douded of their
native forests.
Soil chiefly chalk, next leay, then sand, and of loan, gravel,
&c. nearly equal and moderate portions. Chalky and sandy
suits of the uplands very thin.
No metallic mines or cauls, but the peninsula of Portland, form
rules and a half in length by two in breadth, one entire quarry
of Portland stone, so extensively used, especially in London.
Patters' clay found in various parts of the county.
2. Property.
Estates large compared with those of other counties; some
of the principal under the care of land-surveyors, others of
lawyers. Tenures chiefly freehold and leasehold.
3. Buildings.
Farm buildings as in other counties; generally Ill situated,

Farm buildings as in other counties; generally lll situated, built of stone, and covered with reeds or thatch.

4. Occupation.

Farms very large, 1500 or 2000 acres of sheep farm being frequenty to be met with. Many of the proprietors great farmers. Leases of twenty-one years common till the beginning of the present century, now for shorter periods.

Leases of twenty-one years common till the beginning of the present century, now for shorter periods.

5. Implements.
Two sorts of uncooth wheel-plough in use. Small's plough tried in one or two places; from the difficulty of ploughing flinty oils, wheels are deemed an advantageous appendage to whatever sort is adopted. Threshing, winnowing, and various other watted hurtles of Dorselshire consist almost invariably of ten stakes, which the hurdle-makers drive into augur holes, that are made for that purpose in a piece of timber, which is supported at a convenient height from the ground by other pleces of timber, and then the stakes are watted. Stones set on edge, and rublestone walls used as fences in various parts.

6. Arable Land.
Deep ploughing generally less approved of on the chalky soils, and cross ploughing never practised, even for turrips; two or three horses form a team. Fallowing general all along the coast; but what is here termed a summer fallow is, in most cases, no other than a preparation of ley ground for a crop on thest, by ploughing it three or four times, the first ploughing to this chalk place in the coast; but that is here termed a summer fallow is, in most cases, no other than a preparation of ley ground for a crop on thest, by ploughing it three or four times, the first ploughing to the coast; but that is here termed a summer fallow is, in most cases, no other than a preparation of ley ground for a crop or thest, by ploughing it three or four times, the first ploughing the thin chalky soils around Blandford, and non the

of wheat, by ploughing it three or four times, the first plough in June or July, and sometimes as late as A. Host.

Hypothe thin chalky soils around Blandford, and upon the hills in the neighbourhood of Abbey Milton, the course of crops with the best farmers is as follows: viz. one seventh of the land is in saintfoin, and the rest of the arable is cultivated in the rotation of one, wheat; two, rye, winter barley, or winter vetches, to be fed with sheep in the spring, and the whole followed by turnips, rape, &c.; three, barley or oats; and four and five, artificial grasses, to be followed by wheat as before.

Upon the thin chalks and shallow flinty loans, wheat is generally sown on the back of a two years' clover fey that, even on off with sheep early enough to sow it in the sample. On the better sorts of chalky and gravelly soils, the same practice of most of the same practice of the proposed of the sample. On the better sorts of chalky and gravelly soils, the same practice prevails, except upon the ley-ground, which continues in grass but one year instead of two; the wheat is taken after the first year's ley, and is supposed to answer better than it would in the second year, upon the latter description of soils. Old saintfolinely should be a supplied on the second year, upon the latter description. Hemp and flax a good deal cultivated.

T. Grass.

Grass.

Ctruss.
 300,000 acres, or about three fifths of the county; 6000 acres of meadow in the chalky district irrigated. Application of the meadows; fatting cattle, and of the uplands the dairy.

meadows; fatting cattle, and of the uplands the dairy.

8. Gardens and Orchards.

Both are frequent appendages to farm-houses and cottages; some of the cottage gardens are small enclosures taken from the sides of the highways. The goosefoot (Chenopodium bonus Henricus) cultivated by a few persons here, as in Lincolnshire and elsewhere, and calculations made by Batchelor, to show what would be the expenses and profits of an acre for the properties of the control of th

farmers.

Orchards to the extent of 10,000 acres; application cider, in making which hops are sometimes added to make it keep; proportion one pound to a hogshead. Twenty bushels of apples will make a hogshead of cider.

9. Woods and Plantations,
Timber scarce, and chiefly to be found in parks and hedgews. Many young plantations lately made on the heath rows.

10. Improvements.

Irrigation carried to considerable extent and great perfection,

and one of the best books on the subject is by Boswell of Priddictown. A day meadow of good quality is worth forty watered, at any meadow of good quality is worth forty two loads per acre. The streams in Dorset are in general abeliance of the streams of the process of the process of the process of the process of the present of the process of the pro

the arable land, but it has reduced the Downs to a state of poverty.

Ewes are generally kept till they are four years and a half old, when they are sold to the dealers. A singular custom prevails of colouring them with ochre, for which no other reason is given than that of being able to distinguish them from the Somerset sheep.

Asses were formerly kept by some farmers, but are now given up, having been found destructive to bedges, &c. 'It appears to the state of the

to destroy all hives under twenty pounds weight.

11. Political Economy.

Roads of flint, and in general good: an iron railway, of three miles and a half, for conveying potters' clay from Norden to a place opposite Poole, where it is shipped for Liverpool. No canals. Manufactures of Idax and henp at Bridport and Beaminster; upwards of 2000 people employed in making sail-coth, cordage, sacking, trapaulin, &cc.; flamen at Shaftesbury, and woollens at Lyme Regis; twisting and making up raw all knot selins at Sherbourne and other places; shire buttons with the sail of
7820. SOMERSETSHIRE. About one million of acres, chiefly of meadow and pasture land, hilly and mountainous in some places, and with marshes and bogs in others, but on the whole, though far behind in artificial culture, celebrated for its natural fertility. The climate is various, in general cold and boisterous on the elevated parts, but almost without a winter near the sea. The county is divided into the north-cast, middle, and south-west districts, by its very able reporter, J. Billingsley, Esq. of Ashwick Grove. (Billingsley's General View, 1797. Marshal's Review, 1817.)

7821. NORTH-EAST DISTRICT.

Surface very irregular, intermixed with lofty fills and rich fertile plains: climate various; soil chiefly clay, and in part paat; application chiefly pasturage; several thousands of acres overflown by the tide in the river Yeo; 4000 acres protected by a wall of stone and lime, elevated ten feet above the level of the land within, but high tides frequently break over it and make

Minerals. Lead and calomine in the Mendip hills, but little worked, for want of a proper level to carry off the water. Coal abounds, and is worked for the supply of Bath, Wiltshire, and Somersetshire; from 800 to 1000 tons raised weekly. Property, Many large proprietors from 20004. to 60004. per annum, but the greater part in the possession of respectable yeomanny, from 504 to 500.4 a year.

Buildings. There are many splendid gentlemen's seats,

ornamented with extensive plantations, in this district, and the farm homes and cottages are for the most part commodious and comfortable; but, on all the dairy forms, a homeful instention prevails in respect to outhouses and shods for their stock to relize to in the winter months. Cattle are almost universally served with their provender in the field; and many a dairy farmer, with twenty cows, scarcely makes, in the whole winter, a quantity of dung sufficient to manure one acre

of canaction. Farms seldom exceed 2004, a year; some of the dairy farms were so small as not to exceed 6004 or 700, per year; and many instances can be produced of such little farmers bringing up a large family in a very respectable way. In such instances, it is generally found that the wife undertakes the whole management of the cows, and the husband goes to daily

whole management of the cows, and the husband goes to daily albour.

Implements. Plough with a foot or wheel; spade with the clade curved in its breadth, to prevent adhesion of soil; it is much narrower and longer than those used in other counties, and the country of the coun

cettle.

Market Gardens for the supply of Bristoland Bath. A clergyran has eight or ten acres of nursery ground, the labour of
which amounts to 23, per acre.

Orchards abound throughout the whole district; the favourite
apple, both as a table and cider fruit; is the court of wick pipim, a seedling from the golden pippin.

Woods and Planatations not numerous.

Live Stock. Cattle mostly short-horned; the long-horned
treed of North Wittshire have been tried, but the customary
treed preferred. Both cheese and butter made.

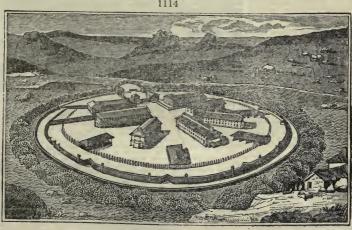

Roads pretty good; some cana's; woolien manufacture ex-

Roads pretty good; some canals; woollen manufacture extensive, and that of thit worsted stockings considerable.

7822. MIDDLE DISTRICT.

Between 4 and 500,000 acres of varied surface and soil, and mild climate; including a great event of marsh and f in land, great part of which has been drained and embanked. Half this district occupied by the owners. Grass the chief product; farms from 40L to 600L per annum, partly grazed with hefers, but chiefly to costs for the datry: the cows let can be considered to the considerable of the considerable

7824. DEVONSHIRE. 1,595,809 acres of strongly marked hilly surface, including the vale of Exeter, "the garden of the west;" the Forest of Dartmoor, a barren waste; and North, West, South, and East Devonshire, each with distinct features. The county is celebrated for its breed of cattle, its dairy, and its orchards, and of late years for extensive improvements undertaken in Dartmoor, where is also the immense depot for 10,000 prisoners of war. (fig.1114.) (Tyrwhit's Tracts on the Improvements at Dartmoor, 1819. Fraser's General View, 1794. Vancouver's View, 1807. Marshai's Review, 1817.)

1. Geographical State and Circumstances.

Cimule in North Devon less mild than in South Devon, but it it myttles are used as garden hedges; in South Devon the climate is supposed more mild and salmbrious than in any other is of England.

And the state of the state

an estate, the landlord agreed to discharge tithes and all paro-ci lal paymer ts. About the years 1800 and 1801, the rent of several estate in this county was abolutely insufficient to meet such disfursements, and consequently all the estates so circum-stanced brought their proprietors in debt.

3. Buildings.

Houses of proprietors too generally going to ruin from non-residence. "We defy ingenuity to plan and place farm-houses worse than they are." "Garden-walls, farm-houses, barns, stables, time-kilns, village fences, and cottages, are all built

with mnd, and left without rough-cast, or whitewash, to conceal the native colour of the loam."

4. Occupation.

6. Arable Land.

6. Arable Land.

Much less than the grass land; not much to be learned from its culture; a rifficial herbage not generally sown, and rotations bad.

7. Grass Lands.

In the low tracts of good quality; application, breeding and the dairy; butter good, cheese indifferent, and generally consumed in the county.

8. Orchards, Woods, and Plantations.
Very abundant in most parts of the county, and excellent cider made in the Herefordshire manner. Fruit trees rather neglected than otherwise; generally pasture beneath; often in the hedgerows.

neglected that was generally pasture persent; often the The Forest of Darkmoor is parcel of the Duchy of Cornwall; extensive improvements have lately been proposed, and in part carried into execution, under the direction of Sir J. Tywshitt, the steward of the Duchy. Extensive salt marshes on some parts of the coast.

parts of the coast.

9. Improvements.
Draining and irrigation not much practised. The Rev. M. Froude, of Darlington parsonage, communicated to Vancouver another of the strength of the water from a pond without the network of the strength of the strength of the strength of curiosity than ingenuity or use. The water, is nor manifest of curiosity than ingenuity or use. The water, is nor the strength of the strengt

10. Live Stock.
The North Devon cattle well known for their superior adaptation, both for feeding and draught. For the uses of the dary of ror milk, it is a breed by no means held in general estimation, as their aptitude to look well (without being fleshy) is derived from the peculiar nature of the animal, which disposes its secretions in the accumulation of fat, rather than in the production of milk. For the purposes of labour, this breed can nowhere be excelled for docility, activity, or hardshood, in proof which no stronger circumstance can be adduced, than that of which we acres with a double-furrow plough; and that a general use is thus made of them, and for most of the other purposes of draught in the county where they were originally bound, and in others to which they have been since transplanted.
The rules generally pursued in breeding and raising this va-

general usets trus made or them, and for most of the other purposes of draught in the county where they were originally found, and in others to which they have been since transplanted.

It is a specially purposed of the problem of

Sheep, the Exmoor breed, a horned animal, with a moderately long staple of wool, which heretofore, and before the cloth manufacture fled from this county into Yorkshiee, was much manufacture fled from this county into Yorkshiee, was much the property of the property of the property of the property of the desired property. The sheep most approved in the division of Tivetton are the Bampton Notts. The first cross of this breed with the New Leicoster is growing greatly in esteem, from its improving the form, and bringing the animal three months sooner to market. The sheep generally depastured on the mooriands are the mooran and commons in the county. The autumnal rains frequently inundating the cold clay lands, are very any to occasion the caw, or rot, among them, and which has been sometimes experienced to an alarming extent.

The Merinos, Ryelands, Downs, and other fashionable breeds have been tried by amateurs; but Devon is less a sheep than a heave been tried by amateurs; but Devon is less a sheep than a heart of the state of th

agricultural societies, but both ill attended and on the dedecidence.

Line Line And of the Poor, or Lower Classes. Vancouver concludes
his report by some pages of observations which, happily, are
seldom equaled in liliberality; and, viewing the subject as we
do, they compel us to look on him as an enemy to human nature, and to turn from his book, his name, and memory, with
feelings of dislike. "It is an incontrovertible truth," he says,
"that the restless disposition of the Irish, and their emigration
to America, is owing to their being generally instructed to read
emigrate arises from the same reason, and the English peasant
under the same influence will be acted on in the same maner." He "respectfully submits to the consideration of the
Honourable Board, the propriety of opposing any measure that
may rationally be supposed to lead to such a fatal issue." This
man, lite Charles X. and his ordomances of 1850, and Wer.

Marshal, whose considerate and humane spirit justly objects
to the term peasantry, as at all applicable to the operative
classes of Britain, has the following excellent remarks on this
subject:—

to the term peasantry, as at all applicable to the operative classes of Britain, has the following excellent remarks on this subject:—

With respect to the emigration of the Irish, "well it is," he says, "for Ireland and America, that they do so. The one is overstocked with the class that furnishes work-people; the has enow. The unlettered Irish stay at home, to riot, plot, and murder; to commit acts of treason, stratagem, and spoil; or emigrate to England, to revel awhile in outrage, and be hanged."

On Vancouver's ideas on education, Marshal observes, "After some other groundless arguments, the reporter sums up in Italics, and with the sid of foreign tongues, into mind the end of the state of the

increasing."

"In a civilised nation, early schooling tends to reclaim the control of the contro

preservation."

"Attendance in a school inures children to a requisite degree of restraint; and a division of time employs their minds, and prevents idleness, and other viclous habits, from taking root; thus tending to raise them to the rank of this tending to raise them to the rank of the read of the rea

consequent, perseverance; and thus habituates them to receive instructions."
Where V ancouver is at present we do not know; we hope he may long live to witness the extension of education which is now taking place, not only in this, but in almost every country

in the world; and we hope all those whom he designates pea-santry, who may ever happen to read the above extracts, will see the necessity of forthying themselves, by knowledge and good conduct, against the degradation attendant upon ignor-ance and vice.

7825. CORNWALL. A peninsular hilly surface, of 758,484 acres, remarkable for its mines, and of late greatly improved in its agriculture, the object of which is chiefly corn. It is the country of Sir H. Davy, who may be considered as having eminently contributed to agricultural science by his agricultural chemistry. The inhabitants have been remarkable from the time of the Romans for their mildness and complacency of temper, urbanity, hospitality, courteousness, and liberality. (Frazer's Cornwall, 179£. Worgan's Cornwall, 1810. Marshal's Review, 1817. Edin. Gaz. abridged, 1829.)

1. Geographical State and Circumstances.

Climale, like that of other pesinsular situations tying far to the control of the co

rapid succession; some nuis very steep.

Soil generally staty and loamy, mixed in a manner that renders it almost impossible to designate the boundaries and extent

Mineral chiefly the and copper; for the former Cornwall has been famous from the remotest antiquity, as some think, from the days of the Pitomicians.

2. Property.

Very much divided, subdivided, and vexatiously intermixed. Estates from twenty arres to 500 acres, very few exceeding 4000, per annum. Many gentlemen and elergymen in this grounds in a very superior state of cultivation. The management of great estates is generally given to attorneys.

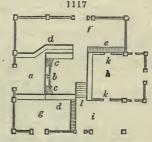

Entailed estates. "I was in hopes that I had been a singular sufferer in Cornwall, from this kind of deceptive tenure; it would then not have been worthy of notice; but in my excursions through the county I have met with fellow sufferers, have occurred, and may occur again, it behoves every man who is about to occupy a firm for a term by lesse, to make enquiry whether it be an entailed estate or not; because the possessor having the power of letting for his own life only, in case of his death, the occupier is, left entirely at the mercy of his successive in the sufficient of the curry.

Old farm-houses of mud and thatch; the lower divisions consist of a kitchen, and an apartment dignified with the name of parlon, but these latter are f

being completed again soon as any are sold (g); fodder hou used as a barn (h); open shed for tools (i); hanging doors with

bolt inside, and through which the fodder is handed to supply

the cattle, and is thus kept always dry(k); door and staircase leading up to the wool chamber (l). The stairs rise quick, so as to be quite out of the way of the ox feeding in that side of the

house. "I had occasion often, in my dreary walks during my survey, to take shelter in some of these miserable dwellings, and found the poor inhabitants busy in placing their bowls, crocks, and pans, to eatch the water pouring in at the root. However, the meanest octage generally has that great source of comfort, a garden, attached to it." Some very comfortable plans of cottage, by Captain Penson of Elty, are described by the Cocupation.

4. Occupation.
Farms from three or four to three or four hundred acres, mostly from 30. to 50l. a year. Leases on rack-rented farms generally from fourteen to twenty-one years.
5. Implements.
No county affords a greater variety of wheel and other carriages. The harvest waggon (fig. 1118.) has a lade before and

behind, and is open in the middle; it carries about 300 sheave of corn. When drawn by horses, shafts are applied; when by oxen, a pole. An arch of boards over the hind wheels prevents the corn from bearing on them.

The moin is another light useful carriage for carrying corn

A delega for corn, hay, or faggots (fig. 1193.4); slide butt (b);

1119 1 d

quarry butt for earth or stones (c); dung-pots or dung-panniers (d) for dung or stones; and panniers with hooks, for faggot wood and sheafed corn (e), are also in use.

Box hand-barrows and grass barrows (fig. 1120.) are also used on a few farms.

1120

The Cornish plough is a small swing plough with a straight piece of wood as a mould board.

Barn boards for threshing on are four or five planks laid across beams, but about one third of an inch asunder; so that the corn as it is threshed may fall through and not be bruised. In some places wheat is separated from the straw by beating it on a barriel or inclined plane, usually by women. Fences generally made of stone, or raised banks of stone, slate, and earth, sometimes planked.

6. Arable Land.

The rijke or raised out; cultivated on woment ground: its

The piler, or naked oat, cultivated on worn-out ground; its straw very fine, and reckoned nearly as good as hay. A quantity of potatoes exported yearly, but not enough of wheat grown for home consumption. Grass.

Chlefly near towns and villages, on sheltered slopes, and the uncultivated lands known as moors, downs, crofts, and wastes; some meadows watered. Gardens.

Common to cottages and farms, and better attended to than in most counties; orchards also attached to many farms.

9. Woods and Plantations not abundant.

9. Woods and Plantations not abundant.
10. Improvements.
Draining practised to a considerable extent, and one or two examples of embanking.
The practised to a considerable extent, and one or two examples of embanking.
The provides of the provides of the proper of the provides and seawed a large way and opportunity of buying the bruised and small plichards; which being deemed unfit for market, are rejected and called "coff;" four cart-loads of twelve bushels are considered as the proper quantity for an acre. The usual mode of management is to bury the coff in a pile of earth, deep enough to secure it from dogs and hogs, adding to the pile a sufficient quantity of small, well mixing and turning all topether after having Isin sufficiently for perhaps a year or two. The ish are sometimes used alone; they are then spread thinly over the ground before the plough, and turned under furrow. One pilchard cut upsmall will amply dress one square foot of ground.

The old salt which has been used to cure the pilchard, and judged to be no longer fit for that purpose, is advantageously applied for a barley or a turnip crop; twenty to thirty bushels

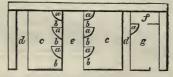

per acre. It is commonly hand-sown, in the manner of corn; and it should remain on the land five or six days before the seed is sown. It is best adapted to light lands, particularly furze crops. Twenty bashels per acre have been streved over grass lands, and over a wheat crop, in the month of March, with evident advantage.

Another article of manure obtained from this useful fish is the liquor which drains from it while under the process of euring, consisting of blood, brine, and some oil which escapes, and which is caught in pits; the diligent furner carts this away in casks, for the purpose of pouring over and mixing with his piles of earth and sand, which it greatly enriches.

11. Live Stock. 11. Live Stock.

Devonshire cattle prevail; but it is only among the more enlightened and spirited breeders that the genuine North Devon are to be met with. Cows are kept in winter in sheds open to the south; one of which for seven cows and a fatting calf (fig. 1121.), described by the surveyor, contains cribs for hay or straw in winter, and lucern, vetches, &c. in summer (a); troughs for unrise, potatoes, cabage, &c. (a); belos or platforms for the cows to stand and lie on (c); gutters unit two or three inches place for fatting a calf (f); the division outside (g) for a cow that has, or is near having, a calf. She is not tied up.

1121

The cows are tied to posts by means of a strong chain and rope, which by means of a ring rms on a long staple.

Oxen very generally worked both in plough and cart; shod in the control of
7826. The islands of JERSEY, GUERNSEY, ALDERNEY, and SARK, which lie in the Bay of St. Michel, and form the remnant of the ancient Duchy of Normandy, though naturally belonging to the continent of France, have yet for nine centuries been subject to the British Government. The agriculture of all of them is nearly the same; but we shall follow the Reporter to the Board of Agriculture in considering first that of Jersey, and next Guernsey. These islands are chiefly remarkable for their breed of cattle, their parsneps, and the degree of perfection to which many plants arrive in the open air, which are kept in England under glass. (Quayle's General View, &c. of the Norman Islands, 1812.) 7827. Jersey, 39,580 acres of warm and rather moist climate, diversified soil, and features; the soil is for the most part light, on granite or schictus, and there is some peat and marsh. No calcareous soil or rocks; granite and gneiss quarries worked; and granite pillars of fifteen feet in length extracted. Water abounds; and belief is still entertained in the efficacy of the divining rod for discovering springs.

1. Property.

Minutely divided, and mostly in the hands of a resident yeomany. Some singular laws and customs as to tenures, as, for example, the retrail lignager and retrait seigneurial on footing also the legitimation of children not born in wellock, by the marriage of their parents, as in Scotland, and most other countries of Flarope except England.

countries of Europe except England.

2. Buildings.

Those of all classes substantially built of stone, sometimes rough-cast, neatly lined in initiation of squared stone-work. Farm houses generally covered with thatch or panilies. Cottages generally of stone, with a vine in front.

3. Occupation

4. Implements.

4. Implements.

Plough with wheels, resembling that of Hampshire; some-

To imprements.

Plough with wheels, resembling that of Hampshire; sometimes drawn by two bullocks, and six or eight horses; a sort of large plough used for ploughing deep, for paraneps, and held in partnership by several farmers; instances of this plough being drawn by six ogen, and sixteen horses. (p. 64.)

5. Enclosing.
Fields very small and irregularly shaped, and the fences of high earthen mounds, often twelve feet wide at least, and six feet high, crowned with a hedge, or timber trees and pollards.

6. Arable Land.

6. Arable Land.
Soil deep, and deep ploughing generally practised, but no improvement in it for ages; no naked fallows. The speit wheat (L'Atticum Spéta), here eaciled be termais, framentum trimestre, here enters into rotation; it is sown in February, properties, here enters into rotation; it is sown in February, properties, here enters into rotation; it is sown in February, properties, here enters are grown by every farmer, and either by the spade great plough; any soil in good heart and title suits them, but peculiarly a deep loam; and in the same spot generally are raised beams, pens, enbages, and occasionally potatoes.
When the ploughing or diagring is completed, the field is once harvowed; straight lines are they drawn across, by means

of a gradener's rake, usually from north to south; women then proceed with dibbles, and set the beans in rows, at a distance of four inches or five inches from bean to bean; in four, three, and sometimes in two ranks of beans, leaving intervals of five or six feet between each of the sown rows. In the use of the dibble, and in dropping the beans, the women have acquired considerable desterity. In many instances, they are followed by children, who drop into each hole made by the dibble, sher the bean; three or direct control of the dibble, sher the bean; three or direct control of the dibble, sher the bean; three or direct control of the dibble, sher the bean; three or direct control of the dibble, sher the part of the dibble, sher the bean; three or direct control of the dibble, sher the dibble of the state of the dibble of the di

to that arising from any other food, and does not waste in boiling.

Bullocks are also fatted with parsneps, in about three months their flesh is here considered of superior flavour to any other beef, and commands, on that account, an additional half penny in the pound on the price. To miloth-cows they are also usually given; on this diet the cream assumes when are also usually given; on this diet the cream assumes when a period of the price of the price. To miloth-cow they are also usually given; on this diet the cream assumes when a period on the milk, the account of the produces at the rate of thirty-five pounds per day with hay, seven quarts, all-emeasure, of the milk produce seventeen ounces of butter. It is generally allowed, that the flavour of the butter is superior to any other produced in winter.

Grees are sometimes shat up with the hogs, to fatten on Grees are sometimes shat up with the hogs, to fatten on

produced in winter.

Geese are sometimes shut up with the hogs, to fatten on parsneps, which they will eat traw. The root is also given boiled, and for a week before killing they are fed with oats or barley only. Horses eat this root greedily; but in this island it is never given them, as it is alleged, that when on this food,

their eyes are injured. About Morlais, horses are not only ordinarily field on paraneps, but they are considered as the best of all food, superior even to cats.

Lecern a good deal cultivated, and found productive.

**Lega to a moderate extent; the reporter could not find that Heya to a moderate extent; the reporter could not find that could be compared to the country of the

Of very limited extent, but meadows very productive 8. Gardens and Orchards.

8. Gardens and Orchards.
Very productive, and in general carefully attended to. Chaumontalle pductive, and in general carefully attended to. Chaumontalle pductive, and in general perfection, and with grapes, bulbs of the Chemey lily, parsep seed, and some flower seeds, sent to the London fruiterers and seedsmen.
Orchards generally attached to all farms. Jersey cider in much esteem, and a principal article of export. Most of the farm-houses have large arched doors, made wide on purpose for the passage of cider-casts. A valuable work on the subject of cider by the Rev. F. Le Conteur, entitled Apercus art a Culture des Pommes, Jersey, 1806. The pomeril, lamme, noir-toit, and gros-amer, the cider-apples at present in vogue.

9. Woods and Plantations.
Very limited extent, and the waste ground a little more so; only about 300 acres of rocky summits of hills; these might be planted.

Very limited extent, and the waste ground a little more so; only about 300 acres of rocky summits of hills; these reight be planted.

No calcorprovements.

No calcorprovements.

No calcoresus summires found on any of the Norman islands. Sea shells tried on clay with great advantage; and sea week structs on clay with great advantage; and sea week in the narrow valleys from time immemorial. Sea encroaching in some places, and jetties and embankments proposed, but nothing done.

11. Live Stock.

Alderney cattle well known. Though there can be no doubt that the breed was derived from the contiguous Continuous Con

mercy on the spot, and its flesh distributed among the poor. The same act of the States directs, that when cattle of the state directs, that when cattle of the distribution are expreted, a certificate of their being natives of the island is to accompany them. On the vessel's return, another certificate is required, that the same identical number, and no more, have been landed. There is, indeed, at present, little danger of the occurrence of that evil which the Jerseyman so much deprecates, as he will not speedily become a convert to any heretical opinions which he may happen to hear from an Englishman; for in this, as in every thing else, it may be observed, that the rooted opinions of a people are more powerful than any law.

which he may happen to lear from an beginshinan; lot in this, as in every thing else, it may be observed, that have considered opinions of a people are more powerful than any are to come and a people are more powerful than any are to come and a people are more powerful than any are to come and a people are more powerful than any other than Alderney cows, would be surprised to winness the size attained by some oxen of the same breed, which may be seen in the Jersey carts. In the same property of the same breed, which may be seen in the Jersey carts. In the same property of the same breed, which may be seen in the Jersey carts. In the same property of the same breed, which may be seen in the Jersey carts the seen in the Jersey carts the seen in the Jersey cart the seen in the Jersey cart the middle of July, and twice a day during the rest of the year; the milk is kept in glazed earthenware dishes till it throws up the cream, which separated, they first the seen and the cream, which is separated, they first the power of the power of the power of the power of the Jersey carts the reporter observes, if the palm can be contested with them by any, it will be by a breed little known in the south, the Dunlop (in Ayrshire) cattle, cross between the short-horned and the Alderney.

Sheep a bad-shouldered coarse-bond breed, small horned, and between a black and brown colour; largest flock in the sland forty weight of careas of posts; in the winter shand power of the same power of the same power of the same surface of comony, and also to prevent the grazing ground being injured. It is also thought a relief to the animal.

Piccoss. Here, as in France, the bord of Colombia is attained to the case in France, to those held by a noble tenure.

Bees. The flavour of Jersey honey highly vaunted, probably from the numerous flowering plants, legumes, fruit-trees, garden plants left to seed, &cc.

12. Political Economy.

19. Political Economy.

Roads numerous, narrow, winding, crossing each other, and consequently intricate; flanked by high sertion fences overconsequently intricate; flanked by high sertion fences overconsequently intricate; flanked by high sertion for multi-more and the sertion of the control of the pass; one or the other must back till it reached the nearest field, gateway, or some other recess, to which it might retreat during the passage of the other. To this little circumstance in their internal economy, and the disputes which it engendered, may, perhaps, in part, be attributed the remarkable proficiency of the Jersey populace in swearing.

an oyster fishery to the east of the island. English law as to poor-rates exists; but as the poor are few, it is not necessary to act on it. Dialect of Jersey a corrupted French, and a bad English.

7828. Guernsey. A rocky hilly surface, of which 8000 acres are under cultivation; the climate rather moister than that of Jersey, and the soil generally light, on granite, gneiss, or schistus. The operative classes resemble those of England more than those of Jersey.

Agriculture much the same as in Jersey; Guernsey figs much esteemed. Some land embanked and sold with permission of government, and the produce applied to improving the roads. Line stock. Guernsey cattle are larger-boned, taller, in every respect more stout and coarsely made than bose of Jersey, expect more stout and coarsely made than bose of Jersey cattle, and in the short-horned breed. The dewlap is also coarse and pendant. They are deep-cheeted, and the carcass, compared with their neighbours, more bulky. Their coat is also not so fine: and the colours, though varying as in Jersey, are found cream-coloured, and the breed may safely be pronunced more stout and hardy. In one respect, a similarity appears in the best milkers in each island: these are observed to have a yellow circle round the eye; the hide yellowish; and, in particular, the skin of the tail at its extremity appears of a deep yellow, approaching and to exist in good milkers of other breeds; but in Guernsey at least, on examination, this yellow-ness is general and striking. The butter produced by the milk of each breed is also naturally of a rich yellow colour.

As to the question of superiority between the cattle of either island, it is settled most decidedly by the inhabitants of each, have gone furthest in support of their opinion. By the third

section of their law of 1789, respecting cattle, they expressly apply "aux fles voicines" the same penalties and restriction on importation of cows, heifers, and bulls, as on importation from any other quarter. Into Guernsey, where no similar restrictions exist, Jersey cows have occasionally been imported. The comparison between cows of each breed, as milkers, leads to that result which, in the place where it is made, might be an Next it may be noticeed, that though the exportation of Guernsey cows, compared with that of the same animals in Jersey, is not extensive; yet that their price in Guernsey is higher. One was noticed for which a farmer had offered a price of thirty guineas, for his own use, and had the offer refused. As to the quality of the butter also, in each island, it may be observed, that the preference is usually given to that of Guernsey. In this article, indeed, in some degree the difference may have a supplied to the control of the comparison of the co

SECT. II. Agricultural Survey of Wales.

7829. A hilly mountainous surface of 5,206,900 acres, with a climate colder than that of England, and more most in the proportion of thirty-four, the average number of the inches of rain which falls in Wales, to twenty-two, the number for England. The soil is generally of an inferior description, and the great proportion of mountainous surface is fit only for pasturage and planting. Little exertion was made in cultivation till the middle of the eighteenth century; from that period to the present agriculture has been gradually improving. A general view of it, as in 1809, has been published by the Rev. W. Davis of Montgomeryshire, whose work we shall adopt as our guide.

7830. NORTH WALES. 1,574,510 acres, chiefly of mountainous surface, in six counties, including the Isle of Anglesea. The climate humid and cold in elevated situations, but warmer in the vales and near the sea. The soil moory, coarse, clayey, and otherwise unfavourable in most places, excepting in the vales on the banks of streams. Minerals chiefly copper, lead, and iron. The famous Mona and Paris Copper mines in Anglesea have been worked sine 1768; lead is chiefly worked in Flintshire. Excellent slate

is found in various parts of Caernaryonshire, and worked to a great extent, especially on Lord Penrhyn's estate. Marble is worked in Anglesea; and limestone, freestone, and other stones and minerals abound estate. Marble is in different places.

in different places.

1. Property.

Estates from thirty shillings to 30,000l. The effect of the custom of gavelkind, which prevailed all over Wales, was a too munte division of property. Equality and poverty went hand in hand. But when the custom was abolished, and alienation permitted, an accumulation of property was the necessary consequence, which became very pervalent in the two last central control of the state of greater property commit the whole care of rents, repairs, and contracts of sale or purchase, to the management of agents; who, in general, are persons well qualified for the undertaking, brought up solely to the business, and make it a point of honour and intomotion of the state of t

wile of Inligation in the people, uccessing the profile of their successors.

Only two copyhoid temenents have been noticed in the whole district. All the other estates are held either mediately or immediately in capite of the king, by a kind of mixed tenure, between the fendal and allodial, going under the common appellation of freehold.

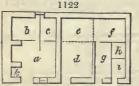

2. Buildings.

Some fine castles, as Powys, Penrhyn, and Chirk. Of farms.

Some fine castles, as Powys. Penrhyn, and Chirk. Of farmeries, about seven in ten are in a very wretched state; good new ones in Anglesea, and Caernarvonshire, Flintshire, and Merionethshire.

new ones in Anglesea, and Caernarvonshire, Flintshire, and Merionethshire hees and other counties are truly the habitGottages in these and other counties are truly the habitGottages in these and one damy litter-cell (for it should not
estyled a kitchen), and one damy litter-cell (for it cannot be
called a bedroom), are frequently all the space allotted to a
labourer, his wife, and four or rive children. The consequences
are obvious; filth, disease, and, frequently, premature death:
and they would be more obvious, had not these evils an almost
unsubduable vigour of constitution to encounter. Three

some exceptions in different places, and especially on Lord
Some exceptions in different places, and especially on Lord
Penrhyn's estate. The reporter gives an excellent plan of a
cottage for a cottage farm, and also plans of farms of different
sizes, adapted to such cottages.

The cottage farm-house (fig-1122) contains a kitchen (a), bed-

room or parlour (b), pantry (c), barn-floor (d), two bays (c and f), cow-house (g), calving place and calf-house (h), pigsty (i), and stairs (k) to garret and bedrooms.

One cottage farm for the same house, and nine acres of land, contains seven small enclosures (f.g. 1125.4) including the garden. One for six acres, contains six enclosures (b) including the garden.

3. Occupation.

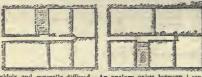

a

3. Occapitation.

Largest farm of cultivatable land about 600 acres, on the mountains 1000 acres and upwards, at one shilling, or one stilling and sixpence per acre: size on the increase, and admitted to be favourable to wealth by the reporter, who adds, 'yet that wealth should be valued, not in proportion to its national aggregate, or quantity in the abstract, but as it is

1123

b

widely and generally diffused. An analogy exists between monopoly in all its forms and a macrocephalous constitution, which never can possess the energy of a hody symmetrically proportionate.

Farmers, properly so called, are, as we may naturally expect them to be, rather too tenacious of old customs. It is, nowever, illiberal to charge them with obstinacy, in delaying the adoption of pretended improvements; for, as it is not all gold that gilters, neither are one half of the paven implements and machines, nor one tenth of the writings of visionary theorists, better than lumber and trash; for which the farmer should not throw away his hard-earned money, before they are put to the test of experience, by those who have opulence enough to bear disappointment; and who, from the advantage

of superior education, may be better qualified to form a judg-ment of the probable effects. Show the farmers their true in-terest, and, in general, their minds are as open to conviction, and as susceptible to reason, as any other class of men what-

and as susceptible to reason, as any other class of men whatever. set out of requise. It cannot be denied that leases have
done good in Scotland. We are, therefore, driven to the
mocessity of supposing, that the control of the processity of supposing, that the
are very different kinds of beings. The circumstance that renders tile Welsh leases inelicitual, is the want of capital; and
what enhances the evil of this want is, the ignorance of many
yarmers in the right application of what small capital they have.
By filling too many acres, they, as well as the public, suffer
loss in every acre. Many a farmer, who has means barely sufficient to manage a farm of 500, a year tolerably well, thinks
a farm under 1000, or 1500, beneath his notice; and granting a
lease to such a tenant, who has not one fourth of the capita
Lord Penrhyn cream, who has not one fourth of the capita

4. Implements.
The original Welsh plough, a clumsy wooden fabric, still in use in Caernarvonshire, and a few places in other counties; about 1660, Lammas's variety of the Rotheram introduced, and now common; Scotch plough now generally known and approved; the other improved implements tried by the amateurs. nateurs

Arable Land.

3. Arable Land.

3. Arable Land.

5. Arable Land.

7. That farmers convert too much of the lands which were formerly in tiliage, into pasture, is but a groundless cause of alarm. Farmers should, and always will, consult their own alarm. Farmers should, and always will, consult their own tiliage or into pasture be found the most profitable to humselves, the same will eventually be found most beneficial also to the public.

7. The corn raised in North Welso not equal to its consumption: fallows general and defended as necessary. In Anglese, a rotation of five white crops in succession; most of them bardly return the expenses. Very little wheat grown, main corn-crop oats, and next barley. Scarcely any flax of hemp grown; potaces beginning to become a general crop. On the whole, the management of arable land wretched, excepting by the amietans or proprietors. the amateurs or proprietors.

6. Grass.

the ameteurs or proprietors.

6. Grass.

Land well adapted for tillage; is commonly left too long in pasture; by which neglect it becomes mossy, and in some instances covered with anti-hills. It has been said of some meadow-lands in Wales, that a man may mow in them all day, and carry home his day's work at night. This may appear hyperbolical; but it is so lat true, that in some meadow stem and of the swath newer disappears; and a mower may be extremely a state of the swath newer disappears; and a mower may be extremely of the swath newer disappears; and a mower may be extremely of the same line, to a half-linh width, for twenty or any numer the same line, to a half-linh width, for twenty or any numer the same line, to a half-linh width, for twenty or any numer to convert their hay and grass, as much as possible, into butter and cheese.

In the hilly parts of the afore-named counties, and in Anglesea, Caernarvon, and Meryonydd, their peculiar province is to react cattle, to be so'd lean to the graziers of other districts. There are but few acres of land that will fatten cattle; the of the Dee in Flinathy, any in Monumouthshire, the banks of the Dee in Flinathy, any in Monumouthshire, the banks of the Dee in Flinathy, any in Monumouthshire, the banks of the Dee in Flinathy, the contragers, especially in Caernaryon, March wanted for the property of the Caernaryon.

sufficient nutriment for that purpose.

7. Gardens.

Much wanted for the cottagers, especially in Caernarvon and Merionethshire. Too many poor cottagers have not as much as a leek or a potatoe, except what they either beg or buy. In the greater part of the district, the planting of orchards would be thought a very wrong application of the soil. On the borders of England are some orchards; and in plentiful years, a few farmers make either cider or perry for their own beverage.

8. Woods.

Have been abundant in former times, especially in Anglesea:

own beverage.

8. Woods.

Have been abundant in former times, especially in Anglesea; now very scarce there and in Caernarvonshire; more in Denovery scarce there and in Caernarvonshire; more in Denovery scarce there would have been planned by the control of Clwyle Clo.

Vale of Clwyle Clo.

A great deal of wood; various young plantations in Meritons hinse, and much timber, wood lands, and plantations in Monigomeryshire, which will long be the best wood control of North Wales.

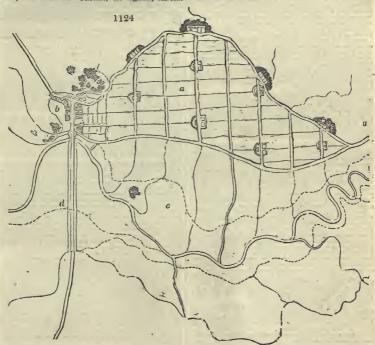

Froprietors planting the control of the Close
9. Improvements.

3.1 Implocements,
A marsh of 3000 acres in the southern corner of the island of Anglesca attempted to be embanked in 1790. The embankand was intended to be joined in the middle of the marsh, where the force of the tide was greatest; when within about twenty roods of a complete junction, owing to some of the proprietors withholding their dividends, the work was described, after expending nearly 12,0000, and when a few pounds

more would have completed the whole, as the materials were already carried on the spot. On the 23d of January, 1796, an uncommonly high tide added twenty roods more to the breich, in which state it now lies. The bank was made of fuze faginary that the state of the

down by the Duke of Ancaster, and two estimates were made. The lake Dr. Worthington was peculiarly active in forwarding the work. He had gone so far as to procure subscriptions to the amount of 29,000. and upwards, when the whole scheme was frustrated by the mean spirit and refractoriness of some neighbouring proprietors.

In 1809, W.A. Madocks, Esq. M.P., having a considerable estate on the Caernaroushire side, and having there embedded to the standard of the standard the standard the standard the standard the village of Trendace the produce of 184, a), and the stands of Thaeth-Mawr (c), by carrying out from both shores an immense bank (d) of stony materials deposited and left to find their own slope by the washing of the tides. The two banks were within less than a furlong of being joined in the middle; but owing to the force of the tides, and the embarrassment of the very spirited proprietor, it was not combarrassment of the very spirited proprietor, it was not combarrassment in the property fell brought it to a successful conclusion; and its proprietor, who had settled in the neighbourhood, and is lately dead, yet lived long enough to see realised by others all that he had anticipated, and for which he had sacrificed a very considerable fortune.

The River Dec Company, established by Act of Parliament in 1740; by several embankments made in the years 1754, 1765, 1763, and 1790, on the river Dec, in Flintshire, to keep out the tide and land-loods, they have been enabled to gain of lucern, and of artificial grasses; and the whole redeemed waste is incorporated into a township, bearing the very appropriate name of Sealand.

"In various parts of the coast of Annual Company of the coast of the coast of Annual Company of the coast of the coast of Annual Company of the coast of Annual Company of the coast of the coast of Annual Company of the coast of Annual Company of the coast of th

of incern, and of artificial grasses; and the whole redeemed waste is incorporated into a township, bearing the very appro"In various parts of the coast of Anglesca, and the other maritime counties of North Wales, there is still much to be done by embanking. Caernaryonshire has been eminently fortunate in the acquisition of W. A. Madocks among its leading improvers. Indeed his improvements are of such magnitude and wartety, designed with such taste, and executed with such a minute report of them would appear, to reveries of romance, than the narrative of grawing description. In harbours, embankments, canals, buildings, roads, plantations, and rural and commercial improvements in general, nothing less than a Tremadoc Guide pamphlet can do justice to the founder."

10. Live Stock.

Cattle and copper the staple exports of Anglesea. When numerous herois are bought in the Island for the English market of the state of the start of

perfection in shape, than any other he ever saw; his own improved breed excepted. Some farmers aspiring at a select stock, by having their he-calves gelt under their dams, their horns become of a yellower colour, longer, and finer than common; and, upon the whole, nearer the present idea of symmetry. The average weight of their quarters, when fat, at three or four years old, is from eight to eleven score pounds. The promontory of Llepa and Evionydd, in Caernarvonshire, having the same kind of undulated surface, though not altogether so good a soil as Anglesea, has likewise a breed of earlie similar in several of their characteristics. Good and the standard of their characteristics, the standard in several of their characteristics, on the standard in the whole of the county of Matrionydd, some few select stocks excepted, seem to be diminutives of the above breeds of Anglesea, Lleyn, and Evionydd; having nothing to recommend them, save their extreme bardiness, and consequent cheepness of rearing. The highlands of the counties of Denibly and Montgomery abound with the same puny race. In the vales, and in the county of Flint, the cattle are of a superior kind, larger, and of all varieties of colours. The natives of the seconds from Abergelen to Holywell, and thence along the Dea Neither good butter nor cheese are made in North Wales by ordinary farmers.

Sheep. The largest of the native breeds is that of Anglesea; they have white legs and faces, and are generally without horns.

The second kind of sheep in North Wales is that peculiar to

horns.

The second kind of sheep in North Wales is that peculiar to the mountains. They have generally white faces and legs some have horns, and others none. The smaller sort of them weigh from seven to nine pounds per quarter; and give wool from three quarters of a pound to one pound and a half.

The third kind is peculiar to the Kerry hills in Montgomeryshire; being, perhaps, the only species in North Wales which produces perfect wool: that of every other Weish

breed being more or less mixed with coarse long hairs, called by the manufacturers kemps, making the articles in which they appear of much less value. The characteristics of this breed are, large woolly cheeks, white bunchy foreheads, white less covered with wool, no horns, and a broad beaver-like tail. They are very hardy, and comparatively tame; being not so much disposed to rainfule as most other wild sheep. In shape, this defect insproved by the care and attention error, and were this defect insproved by the care and attention error, and the control to found the pounds per quarter. The average of wool, including the whole flock; is ten stone, of fifteen pounds, each, from ten formation pounds per quarter. The average of wool, including the whole flock; is ten stone, of fifteen pounds, each, from every 100 sheep.

The sheep. It is the black-faced and fine-woolled sheep, bred on the Long Mountain, near Weish Pool; and on other bills, on the borders of England, in a line from thence to Wrexham.

The flavour of the mutton of the sheep feeding upon the Islamyuneich and Porthywaen lime-rocks is reckoned very delicious, by the nice palated pupils of the Epicurean school: and their wool is as fine as any in England; that of the Ryest the country may observe several other kinds of sheep; being crosses from some or other of the above four distinct breeds: but they are in general the offspring of chance and instinct, without being directed by any choice or system.

The Merinos with their different crosses; the Leicester, Downs, and others, bred by annexement, which is the sheep, and others, bred by annexement, which is the sheep, and others, bred by annexement, which is the sheep and the state of th

earthle, or furze, bruised with mallets or ground in mills erected for the purpose, was formerly a great article of folder in the counties of Anglesea and Caernarvon. Farmers were then accustomed to sow furze for their horses, and sometimes to let the crop at a certain price per acre, which was frequently found to pay better than a crop of wheat; but Ceres at length seems to

have grown ashamed of such husl andry, and the lands are in general converted to bear more useful crops.

Hogs. The original Weish breed had small ears, which, probably by a cross with the Berkshires, produced the slouch-eared hogs, which were lately general through the country. They are slow feeders, and the rearing of them is now upon the decidency and gring place to that of more improved breeds, especially and the state of the single state

bees. The respective prices of different swams were ascertianed by law.

Early swams were reckoned of fu'l value by the first of August; such as swammed after that day were not valued above quest; such as swammed after that day were not valued above in the prices of other articles at the time to the Welsh laws were framed, bees seen to have been very dear, and consequently scarce; but the price set upon them by law as much above the real price in commerce between buyer and seller. This was owing to the veneration they were he'd in by the legislature, and intended to deter the subject from offendation of this opinion, every thing that belonged to bees had its value exaggerated in law; even a bee-hive was appraised at two shillings, when a new plongh without irons was valued only at twopence, a cow forty-ength tence, a yearling calf fourteen pence, and a suckling calf one penny.

The were the sweet gradually reduced to their present fewness of number. However, several persons still execrate the profine act of disposing of their bees for money; but will nevertheless let them out tor one half share of the honey and wax when they are killed annually in autumn, and the whole live stock to be parted equally between them at the each of the fourth. In Wales, as in Poland, when spirits and beer became more

let hem out for one half share of the honey and wax when the them out for one half share of the honey and wax when to be parted equally between them at the end of the fourth year.

In Wales, as in Polond, when spirits and beer became more common, the use of metheglin declined, and bees were neglected. Hence it may be inferred, that the veneration low the state of the

7831. SOUTH WALES. Six counties, and some islets, comprising together 2,470,400 acres of hilly and mountainous surface; generally of a salubrious climate; cold on the mountains; but, on the whole, more temperate than the air of North Wales. The soil argulaceous red loam, or calcareous, but generally rich in the vales and declivities. Of minerals there is abundance of iron, coal, lime, and a good deal

1. Property and Buildings.

As in North Wales. In South Wales the custom of whitewashing cottages is prevalent. In Giamorganshire, not
only the inside and outside of houses, but barns and stables
also, walls of yards and gardens, the stone banks of quickset
hedges, and even solitary stones of large dimensions, house

blocks, &c. near the houses, are white-washed. This practice is traced to a very remote antiquity. Diodorus Siculus is quoted as mentioning the Bittish custom of white-washing houses. Gentlemen's seats are distinguishable from cottages, not only by their size and plans, but also by their colours. In Glamorganshire gentlemen mix ochre with lime, to make their

seats of Isabella yellow. In the north of Pembrokeshire, &c. the taste is reversed; the cottages are of a very dingy colour, and gentlemer's houses are white washed; the maxim is—not to be what the lower classes are; not to coincide with the rulgar in their practices.

2. Occupation.

2. Occupation.
Farms of all sizes; two mountain farms of 1400 acres each; general run from thirty to one hundred acres; average of the district between fifty and sixty acres. In the uplands rearing of stock is the main object, without neglecting the produce of the dairy; whilst they find convenience, though without profit, in a scanty and precarious tillage. In the lowlands, or moist loans, especially in the more humled climature of the western counties, grazing is considered, and generally recommended, at the most profit table. The whole, the district may be said to be one of the dairy with the said to be one of the dairy with the said to be one of the dairy in the proportion of each in different places, according to the imperiousness of easting circumstances, which will be hereafter more fully explained.
Farmers may be classed as proprictors farming a part of their farmers may be classed as proprictors farming a part of their contents.

each in different places, according to the imperiousness existing circumstances, which will be hereafter more fully executing the properties of the properties of the content of the conte

but ploughing and stirring. With A. Imm: tevery thing; with his brother II, only a few miles distant, and on the same kind tool, the stockers of soil, from its orders, which is nothing."

The Welsh plough is in common use; and perhaps a more awkward, unmenning tool is not to be found in any civilised country. It is not calculated to cut a furrow, but to tear it open by main force. The share is like a large wedge; the coulter comes before the point of the share sometimes, and sometimes stands above it; the earth-board is a thing never thought of, but a stick (a hedge-stake or any thing) is fastered that the stands are sticked to the share sometimes, and sometimes that the property of the stands and the stands are sticked to the stands are stands ar

The paper of the content of the content of the people when the content of the people with the

of a different description are frequently under the necessity of doing it; and, generally, it can only tend to hasten their total failure. Then the teaching of the natives, as recommended doctrines of the new schools, than the introduction of any strangers into the country.

The sand banks checking the progress of the tides into a flat tract in Glamorganshire, in order to render them more firm, they are matted with the roots of the sea mat-weed Afrindo arenària). The Hon. T. Mansell Talbot binds each of his tenants, who rents land in the adjoining maybes, to give yearly the labour of a day or more, in proportion to his holding, as a kind of statute duty, for the planting of this reed; and experience has proved its good effects.

5. Grass?

5. Grass.

5. Grass.

By a correct map of the rivers of a district, with a scale of their fall in a given number of furlongs or niles, and of the heir fall in a given number of furlongs or niles, and of the heir fall in a given number of furlongs or niles, and of the first of the quality colours," a geologist might give a fair estimate of the quality of the soils and grasses of the respective valleys intersecting that district, though anomalies frequently form exceutions in valleys as well as on sideland places.

The practice of fogging pastures, almost peculiar to Cardiganshire, has been already described. (5837.) The reporter saw a piece that had been fogged successively for sixteen years; and according to the tenant's information, was improving annually. When land has been mowed too long, one year's fogging is suprepliciables the soil with seeds, that by this means are suffered to ripen and shed on the ground; and it is said that two years fogging will recover lands, let them be ever so run out by tillage or mowing. Cattle used to fag will quit hay that may be given them, and clear away the snow with their feet to get at the fog. The fields proper to be kept in fog must be of a dry, sound, and close soil; the argillacenus rather than the sillicous earths should prevail in it; but not so much as to be over-retentive of witer.

should prevail in it is used. See, of Hafed, observes, "Fog-writer.

The ate Thomas Johnes, Esq., of Hafed, observes, "Fog-ging is getting out of repute: it must have originated in formation of the seed of a summer stock of cattle."

Clover is grown in some few places for seed, which is separ-ated from the heads in a common com mill, the upper mill-stone being replaced for a time with a square piece of oak furnished with eight wings studded with nails on their upper surfaces. These spokes, by their rapid motion, soon beat out

Gardens.

the seed.

8. Gardens.
On the maritime coast of South Wales generally very productive; those of the cottagers better attended to than in other parts of the district; a pleasing mixture of flowers, small fultry.

Orbitard in Badnorshite and Brecknockshite thrive well in the valleys, but more especially in the vales of Wye and Usk.
Not much cider made, except on the Wye.

7. Woods and Plantations.

"It appears from old deeds, that estates were formerly sold at an inferior price, in consequence of their being crowded with timber. Times are now changed."

There are a great many oak woods and coppies in hilly parts of the state of the stat

8. Improvements.

8. Improvements.
Numerous enclosures have been made, and fencing, draining, and, in some cases, watering practised as in other counties. There are nearly 15,000 acres of fen and sands on the coast of Cardiganshire, which are considered highly improvable, and which it has been at different times in contemplation to embank. Of one of the worst parts of this land, the late agriculturist Dr. Anderson, who was much with Johnes of Hafod, said he could make it carry wheat in five years.

9. Live Stock.

9. Live Stock

From ancient records it appears that the colours of Welsh cattle ancient records it appears that the colours of Welsh cattle with red ears, like the wild treed at Chilingham (6504-); they appear to have been in a wild state so late as the time of king John. The present stock are of four kinds: the coal-blacks of Pembrokeshire; the brownish blacks, or dark browns, of Glamorgan; the black runts of Cardiganshire, Caermerthenshire, and the western parts of the counties, of Brecon and Radmor; introduced breeds, from Herefordshire and Shrepshire, into the castern and more fertile parts of Brecon and Radmor.

Cows as Cybridge, and making butter and skim-milk reconstance will so nearly resembling Parmesan, Stilton, Gloucester, or Cheshire, that the difference cannot be perceived by good judges; and that the whole mystery consists in various modes of producing it from the milk.

The sheep of South Wales are of four kinds: mountaineers, Glamorgan vale sheep, Glamorgan Down sheep, and crossed and intermixed breeds.

Mountainers occupy the hills in the several counties of the

Mountaineers occupy the hills in the several counties of the

district.
The Glamorgan vale sheep is the only breed in Wales, not introduced within memory of man, that produces combing

introduced within memory or man, that produces combing word.

Manorgan Down sheep is a beautiful and excellent anall breed. Feeding upon the oldest and sweetest pastures of the limestone tract, their mutton is superior in quality to most, and inferior to none; their wool is of the short clothing kind, and fine. They are generally polled. With crossed and intermixed breeds many experiments have been tried within the district, and most of them confessedly without the expected success. I articular breeds of sheep have their precular discovering the superior of the produced and the superior of the super

of diseases never heard of before in Wales; these are to be ranked among the profits of commerce.

Horses. The small Welsh merlins or palfreys are now in many parts nearly extinct: they are a pigmy race, and may now and then be found in the hilly walks of the interior of the district. There were formerly a very good breed of hardy strong punches, fit for riding and walking upon the farm, being a cross between a good-sized horse and the small merlins; and very useful they were; but the breed has almost been totally neglected and leart-horsey cross now too much with the large and sluggish cart-horsey cross now too much with the large and sluggish cart-horsey cross now too.

carchorses.

10. Political Economy.
Roads as in North Wales, or worse. Road ploughs in use; a characteristic both of their state and of the nature of the materials. Good limestone, however, in the coal districts, and especially in Glamorganshire. Manufactures of woollen in many places; and, owing to the abundance of oak copses, many hides tanned. Potteries or a large scale at Swanses, Cardiff, and alsafe quarry in Cardigamonia and on the works, line works, and a slate quarry in Cardigamonia commissed, the stone of a bluish or greyish colour,) though found in many parts of

England, is nowhere so valuable as that at Aberthaw. When burnt into lime, it is of a buff colour, the characteristic, according to the engineer Smoaton, of all limes setting in water conditions to the engineer Smoaton, of all limes setting in water and exterior character, so that a rock of it may statisfication and exterior character, so that a rock of it may statisfication inches to a few feet; and those commonly separated by a few inches to a few feet; and those commonly separated by a few inches thickness of marley clay. The ferruginous ingredient seems to be concentrated in the interior part of each stratum; the outer sides thereof being more porous, and of a paler colour. In inland places the strata are burnt altogether, the argillaceous as well as the formylnous calcites. Here, at Aberthaw, or other tides, are broken and rolled about, town, within reach of the rounded pebbles or nodules, from a few ounces to many pounds weight; and these consist only of the nucleus or kernel part, the more useless shell being worn off by the abration of the furious tides. These rounded lias pebbles are driven on shore in inexhausitble quantities.

Of agricultural societies there are several; that of Brecon instituted in 1755, the earliest in Britain after that of Edinburgh.

SECT. III. Agricultural Survey of Scotland.

SECT. III. Agricultural Survey of Scotland.

78:32. The surface of this country is estimated at 18,944,600 acres, in three natural divisions. The first lies north of the chain of Highland lakes, which stretches from Murray to Mull, and consists of little else than dreary mountains and some moors: the second, or middle division, extends from this chain of lakes to the rivers Forth and Clyde; it is mountainous, but cultivated in the valleys, and no the casterns shore to a considerable extent: the remaining division is covered by hills with some mountains, but almost every where cultivated or improvable, and highly favourable for most branches of agriculture. Though Scotland, as elsewhere observed (770.), was far behind England in cultivation till the middle of the last century, it has now greatly outstripped that country, especially in arable husbandry; a proof that this is the general opinion of enlightened men may be deduced from the notices just given of the English and Welsh counties, in which it appears that the improvements introduced or attempted to be introduced on arable land are, with few exceptions, the implements and practices of Scotland. In the management of meadows or old pasture, Scotland cannot be conspicuous; as the climate is not naturally calculated for that kind of husbandry. The winters are too long and severe, and the surface but though there is not that enthusiasm in Scotland, nor such large prices given for capital specimens, it may be safely asserted that breeding and feeding are conducted as systematically and successfully there as in England. We shall glance at the different counties in the order of their proximity, beginning with that containing the capital. It may be sufficient to mention here that leases are universal in Scotland, generally for nineteer years, often for twenty-one, sometimes for fourteen, but seldom for a shorter period. The poor are supported by voluntary contributions at the church doors; though an assessment on property, half paid by the proprietors and half by t

Geographical State and Circumstances. Climate free from extreme heats or colds; snow seldom falls on the low parts of the country before December, lies from three to ten weeks. In eight years, the greatest quantity of rain that fell in any year was 56.8 inches, and the least quantity

9.6 inches.
Soil much diversified; lands hanging to the north always

Soit much diversified; tames nangung to the north analysis.

Minerula. Abord of coal extends across the county from S. W. to N. E. from seven to eight miles in breadth; worked for two centuries. Limestone, freestone, grantes, and whinstone marble. Some copper and iron ore, marl, and jasper pebbles on Arthur-seat.

Water. Steams inconsiderable. Esk (Usk, Gael.) the largest

Water. Streams inconsiderable. Esk (Usk, Gael.) the largest river; few fish from the rivers or streams, but abundance from the firth or sea.

2. Property.

About 540 estates in the county, divided by the reporter into seven classes; first class from 2 to 3000l. or upwards; fifth class 100l. and upwards; sixth class, least properties; seventh class, properties of corporate bodies. Total rental in 1795, 191,000t.; Duke of Buccleugh the first proprietor.

191,0001. j Duke of Buccleugh the first proprietor.

3. Buildings.

Many gentlement's seats, and some fine ruins of castles and religious houses.

A farmer's mains, as it is here called, consisted formerly of a set of low buildings, in the form of a square; one side was occupied by the master himself, whose habitation was composed of two or three dismal apruments, on an earthen floor, having a low c-ling and a few diminutive lights. On muchter side show the barn, in which the roof timbers, from the idea of giving

more strength, were built into the well from the foundation; the wall itself not being more than five feet in height. Opposite to the barn were the stables and the byre, or cow-louse. The stables were totally without division, and the horses fed in common; but the neat-cattle, less passive, were each confined to their stakes. The cottages occupied the remaining side; in the midst of all lay the dunghill. These buildings were made of turf and stone alternately, or with stone, and or sods) intermixed. Further details of the district of the stable of the stab

enabled to afford more rent; and in fact give more than an actual farmer, whose sole dependence is upon husbandry, is able to pay while their enclopies, commonly end in disappointment to themselves, for want of that unceasing attention which is indispensable to good cultivation, but which their other avocations prevent them from bestowing."

The more hand farmers, as if in conformity to the soil, which has undergone very little melioration, and to the cilimate, which is naturally severe, seem still to retain a strong cast of the mame and the strong control of the mane and the strong control of the mane are comfortable circumstances. Their houses are damp, smoky, and diminutive; their fare simple and limited; and their laxation, in which they eighy themselves at fairs and markets; their marriage festivities are almost houndless, and their characteristic of the strong control of the comman. The circumstances are capital town, who are likely to better their condition. Being inured to the practice of the most rigid economy, they will, when translated to a warmer climate and more genial sol, very forcibly feel a melioration in their circumstances; and if they have fortude enough (as the first race of them generally will) to persevere in their original habits of frucality, they may, by dint of more avenue, at the rate, permittee, in a lifetime, a sum that may be esterned considerable. But this thriving state will only last during the first generation. Their sons habituated in time to an easier mode of life, will, and the great usury with which they are surrounded, lose their primitive simplicity of manners, and with it the faculty of saving, on which alone their prosperity depends.

4. Implements.

which alone their prosperity depends.

4. Implements.

Old Scotch plough, long and heavy, and drawn by four or six horses or oxen, and till about 1768, when Drs. Crieve and Carlisle, clergymen, tried wheel ploughs of a lighter construction, which they had seen in use in Dalketth Park. Soon afterwards Small's improved plough came in the totales. See the construction of the constructio

5. Enclosing.
No commons or common-fields. Hedges first planted about

1760. Arable Land.

O. Arabic Lama. When ridges are raised high, they should not be laid south and north, as the crop on the east side of such ridge is com-monly found very defective. The same thing holds in the county of Lancaster.
7. Gross.

monly found very defective. The same thing holds in the county of Lancaster.

7. Grass.
Very little permanent grass exclusive of the hills and moormands. Alluvial lands on the banks of streams so liable to immense floods, bringing down soil, &c. that if in grass it would often be much injured; considered therefore move that the productive meadow land near Edinburgh, irrigated by the water which flows from town, carrying along with it night-soil, &c. The produce of twelve or fifteen acres of this meadow so'd in 1826 at an average of 42l, per acre; part of it reached nearly off,, the purchaser cutting and carrying it off, and incurring it will yield four or five cuttings and carrying it off, and incurring it will yield four or five cuttings during that sea on, or rather between the end of spring and the beginning of winter.

8. Gardens and Orchards.

Henry Pentice, who died about 1786, was the first who cultivated white peas, potatoes, turnips, and sundry other cultivary plants, on an extensive scale, for the Edinburgh market, about the vear 1746. Before that period, the supply was interest that appeared with kitchen stuff in the streets. He even rised encumbers in the fields; but his cart-load of these met with so little sale, as not to encourage a repetition. Though he died a pensioner on the poor's funds of the Canongate, his mane deserves to be noticed with respect, not only as having from his practice as a cultivator, which was spritted and judicious, however little it turned out to his own account.

Stramberries About 200 acres on the banks of the Esk, and cheldy near Roslin. Crop continued on the same ground without end; but digging down and replanting every fourth pour, and hotwails of his invention, figured and described. The hothouse heated by steam. Mawer was a Lancashire man, and formerly gardener and steward to the Earl of Abe

for want of shelter; belts do no good unless evenly to at least.

10. Wastes.
None: but extensive tracts very poor.
11. Improvements.
Draining well understood and extensively practised. Johnston, who wrote an account of Ekington's mode of draining, a native of the county. Edinburgh and Leith afford about 40,000 cubic yards of sireet dung annually, which is commonly laid on the lands within five miles of town. Horse dung, however, carried twelve miles or further.

More need for weeding on the arable lands of this county than in those of any other in Scotland; supposed from more town manure being used. The town manure contains the seeds brought in from the country in hay and straw, which are o'various kinds; but chiefly wild mustard, wild radish, dock, thistie, poppy, conclusarious, Scc. 12. Live Stock.

12. Live Stock.

Little attention was formerly paid to this department; but it is now conducted on improved principles. A great many cows are kept in Edinburgh, and well kept as well as judiciously selected. See the art. Dairy in Sup. to Ency. And the Company of the Company o

quagga (E-quus Quagga) on his park at Morton Hall for the same purpose. Bees a very popular species of lives tock with all classes.

13. Rural Economy.

selves oppressed, and enjoy a state of health which is very seldom interrupted. At an average, they are not above two days sick in a year.

What is above stated refers chiefly to the condition of farm servants, who are hired by the year, and whose principal employment is about another class of work-people attached to a farm, who are hired by the day, or by the week, and whose employment is usually in jobbing about the barns, the fences, or the water furrows. These are called labourers, and in their crumstances and mode of living here is a considerable difference between them and in peccal at a higher rate than the hired tervants, yet they make not such a good appearance in their dress, nor are so well seen to in their victuals, as these. They are generally, as we term it, from hand to moth, always in want; which seems to arise principally from gettich was the continuity of the cont

altered. The use of wheaten bread is general; nutherly standard much more common, and cottages more commoditions.

14. Political Economy.
Roads so bad previously produced the purposes of agriculture were very little used; even fill 1760 hay and straw carter same divising how horseback, and the purposes of agriculture were very little used; even fill 1760 hay and straw carter same divising how horseback, and the employed in those times: they are mentioned in the tumpike et of 1751, but unnoficed in that of 1755, which shows they had been disused; a proof of the extraordinary progress of demand or desire for it. Forced improvement goes on very differently. The roads of this county are not all-roads have been formed. The roads of this county are not all-roads have been formed. One Editioner had the provided that a little, which has added greatly to the value of property on a carb side of its line. See Editioner, had, and Recollections. Gropes, and soap the chief manufactures. Iron works at Cramond, where nails, spades, files, &c. are extensively fairitacted. Several paper mills, four mills, and various minor manufactures and works for local consumption.

15. Obstacles to Improvement.

Obstacles to Improvement. Illiberality of landlords, game, thirlage, the dogs of Edin-urgh, who greatly harass the sheep, the chief obstacles.

16. Miscellaneous Observations.

The Farmers' Society of Dalkeith, for the prosecution of thieves and encouragement of agriculture, instituted in 1760, still exists, and has done much good. It is composed almost entirely of practical farmers. Small's plough, the winnowing

and threshing machines early noticed and recommended by this society. The farmers in this county have long had in contemplation to get instituted by legal authority a society for the creation and management of a pensionary fund for the wildows and orphans of farmers, on principles similar to those wildows from the wildows fund of the ministers of the Church of Sociand.

An appendix to the report contains thrireen papers, some of which are curious in an historical point of view; and as showing

how soon, in a rapidly improving age, a man's best ideas and remarks are distanced by those of a few years afterwards. One of these papers describes the origin and progess of the British Wool Society, which was begun in this county by Sir John Sinclair, in 1791. The economy of Johnston's dairy is deserving of notice for accuracy in the details, and for new practices, such as making butter from whey, feeding cows on whins, &c. Markinghi, another amateur, and Hepburn, an ingenious landlord and cultivator, are also worth reading.

7834. EAST LOTHIAN. 190,363 acres of surface, under an exceedingly variable climate, the greater part of excellent soil, and well adapted for cultivation; but the southern district, Lammermuir, hilly and mountainous, with a moory soil, severe climate, and chiefly under native grass and herbage. Some of the most distinguished Scotch agricultural patriots, authors, and mechanics belong to this county, as Cockburn of Ormiston, Thomas sixth Earl of Haddington, Fletcher of Salton, Adam Dickson, Robert Brown of Markle, the projector, and for a long time editor, of the Farmer's Magazine, Somerville, author of the agricultural Report, Mcikle, inventor of the threshing machine, and various others. (Somerville's General View, 1805.)

1. Property.

3. Grass.

S. Grass.

Natural meadows and pastures are not admitted into the East Lothian system of husbandry, as they are found only where nature, or certain local circumstances, render them, in some measure, unavoidable, and are never kept voluntarily, or from an idea of profit. Many farmers fallow land to lie for a few pears in grass, especially where it has been exhausted by long and imperfect tillage; but fields of this description are not to them, as soon as possible, to a state capable of bearing corncrops to advantage.

**Clovers introduced by the sixth Earl of Haddington and Cockburn, about 1720 or 1722, but made little progress till 1740; now generally sown with rye-grass. Application, grazing, soiling, and hay, but this fly soiling.

A. Gardens and Orchards.

Some few market gardens and me very are. Every cottage has a garden anneaed, safficient to produce the various common kitchen vegetables for the cottager's family. This class of people are remarkably attentive to the cultivation of their little spots, and derive great advantage from them, at small cost; the labour is entirely performed after their ordinary work is finished.

S. Woods and Plantations.

is finished.

5. Woods and Plantations.
Scarcely any of the former, and none of the latter, of any extent, excepting in gentlemen's parks. 800 acres on Tynningham demesne planted by the sixth Earl of Haddington, who wrote a treatise on planting, about 1715. Oslers cultivated by the late Mr. Shierrief, of Captain Head, for which, in 1803, he received the gold medial of the Society of Arts.

6 Wastes and Commons.

Are in this as in other Scotch counties generally enclosed, which is here an easy matter in comparison to what it is in England, in consequence of a general Act of Enclosure by the Scottish Parliament, in 1695.

7. Improvements.
Paring and burning little known, and not wanted, because very little ground is kept long in pasture that can be profitably employed in tillage, and new grass lands do not require these operations.

One attempt at irrigation on a sandy waste near Dunbar, the levels of which were taken by, and the water turned on under the direction of, the compiler of this work, in 1805.

A fire Social Compare on the work in 1900.

Live Social Compare on the work in 1900.

The present much that can be generally interesting. Grazing, in ninc cases out of ten, is carried on only as subserient to tillace, and therefore held a secondary object by cultivators. Many cattle are fed, but very few reared, in the county. Almost

every person who practises the sheep husbandry, in the lower districts, buys and self-swithin the year. Some recent attempts have been made to keep flocks of full bred sheep, and, there is reason to believe, with considerable success; but, taking the country generally, such attempts are of little importance. Cat.le. Every farmer keeps a small number of milch cows, but few keep more than are sufficient to furnish a regular supply through the whole year, of milk, butter, and cheese, for their own families. The same attention accordingly is not paid to the kinds of cattle, as in other districts, where they form a more important object of farm management. Important object of farm management. Cattle are purchased annually at fairs and markets, to be wintered in the fold-yard, or fed on turnips in the house. Cattle kept for the dairy, or fed for the butcher-market, comprehend all that are to be found in the country i none are employed in abour. Every part of farm-labour, in which beasts are employed, is executed by horses.

amnually at fairs and markets, to be wintered in the fold-yard, or fed on turnips in the house. Cattle kept for the dairy, or fed for the butcher-market, comprehend all that are to be found for the butcher-market, comprehend all that are to be found for the butcher-market, comprehend all that are to be found for the butcher. Prove part of horses.

Shep. Permanent flocks, and regular sheep management, may be said to be almost confined to the higher parts of the county. In the low country they are kept chiefly to eat the turnips, and sometimes sown grass, which is permitted to income, and sometimes sown grass, which is permitted to like the turnips, and sometimes sown grass, which is permitted to like turnips, and sometimes sown grass, which is permitted to like the turnips, and sometimes sown grass, which is permitted to like turnips, and sometimes sown grass, which is permitted to like turnips, and sometimes are rearred, only so far, however, as to render them fit for the butcher.

As the great object in the lower districts is feeding, little attention is paid to particular kinds; every farmer keeps those consume. The black-faced, or Tweed-dule breed, are most generally preferred for feeding on turnips, because they are most settlemed in the market; but many of the Cheviot breed are likewise kept, and even some of the improved Leicester.

The kind of sheep bred, and most generally kept, in Lannemuit, is the black-faced, or more properly what is called white; they are for the most part horned; when they are fed the wedders weight from ten to twelve pounds per quarter, and the ewes from eight to ten on an average.

The Bakewell bred has been tried, but not extensively till lately. Leicesters are now nuch more common in East Location of the provided of the common of the provided of the common of the provided of the provided provided the provided of the provided of the provided provided the provided of the provided provided provided the provided provided provided provided provided provided provided provided provide

units or any uning our taken.

9. Rural Economy.

There are not, perhaps, in the island more active or correct labourers than the farm servants here, and certainly none mosober and respectable; and this may, in a great measure, le ascribed to the terms on which they serve. Those servants, who lodge in the houses of their masters, are, generally speaking, on the same footing here as in other places; there is no-

thing, with respect to them, which merits particular notice. A small proportion of firm severants, however, belong to this small proportion of firm severants, however, belong to this resident in their master's house are, hi many cases, not employed in regular labour, but perform that sort of extra work, and kind of household drudgery, which requires some hands on every considerable farm.

The far greater part of the regular labour is performed by nevery considerable farm.

The far greater part of the regular labour is performed by their masters, and receive their wages wholly or chiefly in hind; the circumstances are so comfortable under which they are generally placed, as to secure a full supply of such servants at all times. They are more steady perserally than young means at all times. They are more steady perserally than young means them, a sort of interest in their situations, and afford some security for their continuing longer in their places.

The hind occupies a house provided by his master, for which his wife works in harvest; he has a cow kept all the year round, generally ten bolls of oats, three bolls of barley, two bolls of pets, all of the best quality upon the farm, seed-corn as a stream of the pets, and of the best quality upon the farm, seed-corn as a stream of the pets, and the pets of the stream of the servants of the stream of the servants of the servants of the servants of the stream of the servants of the se

decently lothed, and exhibiting every appearance of being well f.d. Not an instance occurs of any of these people soliciting relief from the public, unless they are by some accident dispersion of the property of the proper

7835. BERWICKSHIRE. 285,440 acres (Edin. Gaz. abridged, 1829.), chiefly of gently varied surface, but partly of hilly and mountainous pasture. The soil, in the cultivatable part of the county, is chiefly clay; the mountainous part, which occupies fully one third of it, is a continuation of the Lammermuir hills. Climate of the higher parts comparatively dry, but cold and late; of the lower parts, which stretch down to the Tweed, comparatively warm and early. There are no metals or coal in the county; very little lime, but some stone quarries of the trap, and other coarse stones. Every one knows that this county is one of the best cultivated and most systematically managed in the island, and that its products are nearly equally stock and corn. It is the county of Lord Kaimes, one of the greatest patriots and best agricultural authors, and the first to propose a board of agriculture. It is also that of Small, well known as the improver of the plough. (Kerr's Berwickshire, 1808.)

1. Property.

No very large estates; largest from \$000l. to 10,000l. a year. Many of the owners reside on their estates; some farmers have of late years become respectable proprietors. Resident proprietors usually draw their own rents; and those who live at a distance employ an agent, or, if only temporarily absent, have it sent in a bank bill. Proprietors and tenants live in harmony and mutual good will, the rents of the former progressively advancing with the improvements of the country, and the fortunes of the latter augmenting continually, by industrious and judicious attention to improved agricultural practices, and to the action of the latter augmenting continually. Such as the continual of the second
the amelioration of live stock.

2. Buildings.

Farm-houses formerly of rough stone, clay, and thatch, now greatly superior to the houses that were occupied by the middling gentry, forty or fifty years ago. An excellent plan of a farmery given; but the cottages of the hinds appear uncounded the control of the plan of a calculated for close-pameled beds. The control of the plan of a calculated for close-pameled beds. These cottages contain only one apartment, and a sort of dark lumber place, formed by the position of the pameled beds. We much wonder that the reporter, who talks so much of the commodiousness of the houses of farmers, should not have displayed a little more feeling on the subject of the characteristic plants of the commodiousness of the houses of farmers, should not have displayed a little more feeling on the subject of the classification of the commodiousness of the houses of farmers, should not have displayed a little more feeling on the subject of the classification of the commodiousness of the houses of farmers, the plants of the commodiousness of the house of farmers, (PL facing p. 97-). A detached plan of a cottage (fig. 1125.) is given, rather better arranged than these double ones, but still, in our opinion, highly objectionable. It has frow windows, whereas the commodiousness of the plants

3. Occupation.

Parms generally large, and held on lesse for different periods, from the plants of the plants of the plants.

3. Occupation.

much grain as one of equal size entirely under perpetual tillage, and will produce in addition as much heaf, and mutton, and wool, as a separate farm of 200 or 300 acres under 1125

6 c C w 0

permanent grass. If this estimation be well founded, of which the rejurter has no doubt, this alternate system is obviously of superior profit to the tenancy in the first place, to the landed interest secondarily, by increased rents, and to the public ullimately and always, in the proportion of at least

twenty-five per cent beyond what can be produced from the two branches separately pursued on the same extent of equal

twenty-five per cent beyond what can be produced from the two branches separately pursued on the same extent of equal land.

In the hill district, the lands are mostly occupied as breadto the produced of and advantage of all the favourable pieces of land, susceptible of entitivations of all the favourable pieces of land, susceptible of entitivations and the favourable pieces of land, susceptible of entitivations are supply the farmer's family, servants, and horses; to afford litter and fodder from the straw during winter, by which dung is produced; to apply that dung to raise turnips, to carry on their sheep stock during winter, and, finally, to produce cross of artificial or sown grasses, for hay and early pastures, and to the great amelioration of pernanent grass lands.

Dossessions, from two or three arres or less, to twenty or more, are let on leases of various endurance, but mostly for short periods to villagers who keep one or two horses, which they chiefly occupy in le king materials for road makers, coals to the other villagers, lime, or any such employment as may occur. The great mass of the land throughout the county is let in or more, to a warder of size, from 40 to 30 acres, up to 1000 or more, to a warder of size, from 40 to 30 acres, up to 1000 or more, to a warder of size, from 40 to 30 acres, up to 1000 or more, to be and the light, and the services has been deservedly proportional. They have almost universally risenoupletely above the operative class in knowledge, education, country gentlemen. In every corner of the county they are obe seen carrying on extensive and costly improvements, by draining, enclosing, liming, and marling; and by careful and even horses, with all the eagerness and intelligence of commercial speculators. They trust to the certain profits of future profit, which they are enabled to de through the sufficiency of their capitals, and the security and success of their treasts.

A. Implements.

No waggoons or wheel poughs, and, though delling turning the country and the suff

4. Implements.

No waggons or wheel ploughs, and, though drilling turnips is universal, only one or two sorts of drills in use. Few implements, and those of a simple construction, suffice for the best practicans; in every art.

practicians in every art.

5. Enclosing.

The cultivatable lands are universally enclosed, and subdivided into regular fields, generally by hedges; but sometimes by stone walls. In the mountain district, the farms are neither enclosed nor subdivided. The boundaries of each farm are indicated by landmarks, and round each farmery there are generally two or three small fields for convenience or cultivation. Trees very generally planted in hedge-rows; hedges always cut with a bill in the wedge shape; never clipped and rounded, or broader at top than bottom; the sure means of hindering the production of side shoots, and in time producing naked places and gaps in that part of the hedge.

6. Arable Land.

naked places and gaps in that part of the hedge.
6. Arable Land.
Ample details of the turnip culture in drills is given.
7. Orchards. Woods.
None of the former worth notice. Some native copses and woods, and artificial plantations, but not much woodiness, excepting round gentlements seats.
8. Improvements.
In this county were begun about 1730, when Swinton of Swinton drained, marled, and completely enclosed his whole

estate. Nearly about the same time, Hume of Eccles effected similar improvements. Both of these gentlemen were actuated by the example and acquantance of Cockburn, of Ormiston. Henry Home, Lord Kaimes, was one of the early improvers of this county about 1746, at Kaimes, now Besborough. About 1750, the ardour of enclosing and Improving the land spread generally among the Berwickshire proprietors.

Paring and burning, irrigation and embanking, not practised or required.

Q. Line Cleak.

generally among the Berwickshire proprietors.

Paring and burning, irrigation and embanking, not practised or required.

9. Live Stock.

The cattle of Berwickshire are so much mixed by crossing, as scarcely to admit of any particular description. Upon the whole, they are short horned, thin hided, and kindly feeders, as scarcely to admit of any particular description. Upon the whole, they are short horned, thin hided, and kindly feeders, Teeswater breed, which is the kind chiefly admired in this district. Generally speaking the ozen are not carried on to any age, and they are never worked. They are well Fed from their youth up, and are generally fed off for market in their fourth year, very few reaching five years old, Cows, on the contrary, are generally old before they are fid off. Great are disposed of to graziers in the few country for freeding, either on grass or turnips, or by a succession of both; and many Highland cattle of various descriptions are bought in yearly for consuming straw, or for feeding, either on grass or turnips, or by a succession of both; and many Highland cattle of various descriptions are bought in yearly for consuming straw, or for feeding on turnips during winter, and on grass in spring and summer.

The skeep bred in Ber wickshire are of several kinds. In the Chief of the country, could be so profitable to the farmer. They require, once the expectation, now universally prevails; and it is believed that no other known breed, in the peculiar circumstances of this country, could be so profitable to the farmer. They require, curved; for, being alsord-legged, heavy food, as a singular circumstances of this country, could be so profitable to the farmer. They require, a great weight of wool, they are unable to underso much providing. On some of the best interior hills, and upon the judge of the district and Leiscett, and the providing of the set interior hills, and upon the best of these situations. As a singular circumstance, the reporter records the case of a ewe of this country, which p

land.

10. Rural Economy.
Farm servants managed as in East Lothian, and, indeed, almost every where in the low country of Scotland.

11. Political Economy.
Commerce chiefly grain, wool, and salmon; scarcely any manufactures, excepting the paper-mills. The salmon fishery including Berwick bounds and the English side of the river, employs about seventy small boats, and nearly 300 fishermen. All their fish are sold to a very respectable fraternity of traders in Berwick, named coopers, from their former business of making kits, and boiling the fish, which is now entirely discontinued. By them the salmon are packed in ice, and sent to reforme to of ice was first easied by Mests. Richardson, of Perth, on the suggestion of George Dempster, of Dunnichen, Esq. who had accidentally read that such a practice was not unusual in China.

7836. ROXBURGHSHIRE or TEVIOTDALE contains 448,000 acres, of which about three fifths are in sheep pasture, and the remaining two fifths, are occasionally under the plough, except about 8000 acres' occupied in woods, pleasure-grounds, and the sites of towns and villages. The surface is exceedingly irregular, being in some places ninety, and in others 2000 feet above the level of the sea. The climate is equally various, and excessive rains, winds, frosts, and even hall and snow are by no means uncommon in spring and harvest. There is a good deal of moss and peat soil in detached portions over the county; but the general character of the district is, that the low or arable part consists chiefly of a light or turnip soil, and the hilly division of dry green pastures. There is a good deal of high, wet, barren land; but this is by no means the character of the county at large. Limestone abounds in most parts of the district, and coal has been found, but is not worked. The agriculture of the arable lands is in all respects the same as that of Berwickshire, and that of the pastures resembles the store farming of the latter county and East Lothian. Dawson, of Frogden, belongs to this county, and may be looked on as one of the greatest improvers of British agriculture. (Douglas's Rozburghshire, 1794. Edin. Gaz. abridged, 1829.)

provers of British agriculture. (Douglas's Roxburgh.

1. Property.
Generally in large estates, and little change of proprietorship has taken place for many years. The largest between 25,000.
and 55,000.1 a year.

2. Implements. Arable Land.
Fanners, the reporter states, were first made in this county by one Rogers, a farmer, of a mechanical turn, near Hawlet, in 1735, or at least before 1737, who is said either to have seen a model, or a description of one, which had been brought from 1810 and 1811. The state of the second with an old farmer, the late Mr. Thomas Shiells, at Grothill near Edinburgh, who with his own hands made the first winnowing machine in the Lothians, from a model of one imported from Holland. Arable land enclosed, partly by hedges and partly by walls of loose stones, without mortar.

Ploughing with two horars.
Ploughing with two horars in the Lothians, from a model of one imported from Holland. Ploughing with two horars. Arable land enclosed, partly by hedges and partly by walls of loose stones, without mortar.

Ploughing with two horars. Introduced the drill culture, to James Macdougal, farmer, at Linton, in Tweeddale, alive at the time of making up Douglas's report: it spread rapidly afterwards through the county, and the neighbouring ones of Northumberland, Berwickshire, East Lothian, and Tweeddale. Potatoes first planted in large beds about 1754; in 1768, in drills in the fields. Tohacoo, during the American war, was cultivated to a considerable extent in the neighbourhood of Keise and drive thirteen acres at Cralling fetched 10 st. at the low vate of four-pence per pound and would have brought more than three

times as much, had not an Act of Parliament obliged the cultivator to dispose of it to Government at that price. This county lost about 1500th sterling by that Act, which passed while the tobacco was growing; yet it excited not so much murmuring and clamour among the sufferers as have been elsewhere repartedly rollsed, with less reason, against other Acts in no respect so arthrary and oppressive.

3. Gardens and Orchards.

3. Gardens and Orchards.
Thrive better in the lower parts of this county than in those on the east coast. At Melrose, Jedburgh, and Kelso, are the remains of orchards planted by the priests several centuries ago, the pear-trees of which are very productive. Wonderful stories are told of their fertility. A single tree of the Thorle pear at Melrose has for these filty years past yielded the interest of the money paid for the garden where it stands, and for a house let for seven pounds sterling yearly. Another tree there has carried fruit to the amount of three pounds annually, at an excenge for the same period of the pounds annually, at an excenge for the same period 60,000 years, which were sold for eight guiness. These facts are well authenticated. There are also several more recent orchards near the same places, and 120 acres of nurseries. Of these one of the oldest and largest in Scotland is that of Mesars, Dicksons, of Hawick.

4. Woods and Plantations.

4. Woods and Plantations.
To the extent of 5290 acres; nearly two thirds artificial.

5. Live Stock.
Cattle, a mixed breed, as in Berwickshire. Sheep of the Choviot kind said to be greatly improved by a cross with the

Dishley breed, introduced about 1765, by Robson, a pupil of Culley; but this is stoutly denied by most of the Cheviot breeders. Merinos and other sorts have been tried, but sufficient time has not elapsed to ascertain the result

6. Rural and Political Economy.
Farm servants on the same plan as in East Lothian. Roads improving; no canals; little commerce, and almost no manufactures.

7837. SELKIRKSHIRE. 172,160 acres, almost wholly of mountainous surface, the lowest part 300 feet above the level of the sea; many houses are 600 and some more than 1000 feet above its level. The highest mountain is 2370 feet. These mountains are generally of granite or whinstone, and the surface soil is commonly gravelly and dry. In the valleys are clay, peat, morass, and lakes. The climate is cold and rather moist. There are no metals, nor coal, lime, or freestone. The most remarkable thing attending this county is, that its hills and mountains are almost every where clothed to their summits with sound sheep pasture, of which there are estimated to be 148,000 acres; 3800 acres in aration, 2000 in wood, and the rest in gardens, houses, roads, lakes, &c. (Douglas's General View, 1796. Edin. Gaz. abridged, 1829.)

Property in few hands, and in large estates. The farms are large, and the leases generally shorter than on arable farms. The sheep are a variety of the Cheviot produced by repeated crosses with the native mountain black-faced breed. In all respects the husbandry of this county may be considered the same as that of the mountainous districts of the preceding

counties. There is a woollen cloth manufactory, and an ex-cellent porter brewery, by a pupil of Menx, at Galashiels. Some spritcultural societies were attempted in this and the adjoining counties about 1793, but they were of very short duration.

7838. PEEBLESHIRE or TWEEDDALE. 229,778 acres, mostly of mountain, moor, and bog, but with about one tenth part arable. The lowest part of the county is 400 feet above sea-level, and grain is cultivated to the height of 1000 feet. The climate is late, cold, and moist, and the soil moory, clayey, or sandy, according as the water is pent up; the rocks of the mountains are freestone, granite, trap, or claystone. The only minerals worth notice are lime, whinstone, and freestone. The general appearance of the country is wild, and rather dull and dreary, than romantic or sublime. The agricultural survey of this county is by the Rev. Charles Findlater, and it abounds with more valuable matter on political agriculture, on leases, prices, restrictions, markets, &c., than any survey that has been published, without a single exception. In fact, it was found to take such a masterly view of the moral incitements to agricultural industry; to expose the system of tithes, entails, lawyer's leases, &c., that it was rejected by the Board, as likely to offend the English clergy and higher classes, and the author was reduced to publish it binself. It has certainly, through the medium of the extracts from it published in the Farmer's Magazine, been the means of enlightening thousands, both of farmers and landlords. The fundamental principle which Findlater lays down and illustrates under the heads of leases, size of farms, usury, capital, dearth, monopoly, forestalling, government interference, tithes, poor, and other topics, is. That the best demo of ensuring the invention and prosecution of the most advantageous measures is, an arrangement which shall communicate to these on whom their execution is devolved a sufficient personal interest in their invention and execution." To some he doubts not such views will be considered as foreign to the report of a county, whilst to others they will constitute its most essential value.

The state of property and husbandry of the country may be considered as the same as that of the other mount

The state of property and husbandry of the country may be considered as the same as that of the other mountainous districts. The black faced sheep are in almost universal use, except in milder situations, where the Cheyiot has been introduced. There is no commerce but by retail, and only some very trifling

where the Cheviot has been introduced. There is no commerce but by retail, and only some very trifling woollen manufactures in the county.

In the Appendix an account is given of the improvement of the Whim, a flow-moss of 100 acres, twenty feet deep, and at an elevation of 700 feet above the level of the sea. It was begun to be drained in 1731, and in ten years a mansion was built, and surrounded by woods and pleasure-grounds, which show, as the Duke of Buccleugh, the proprietor, intended, the wonderful influence of art over nature. "The plantations (originally extensive) have been improved and enlarged since the property came into possession of the Lord Chief Baron; and he has also greatly enlarged the house, adding a court of offices upon a large scale, and ornamented in front, extending also the lawn. The place has, upon the whole, an air of magnificence. In the pleasure-grounds there are several artificial pieces of water. East of the house (where the soil is dry and covered with sweet grasses) the surface is agreeably diversified by gentle swells, tufted with trees. A wild wilderness walk, through a small wood, lands you upon the banks of an artificial lake, with islands, covering an extent of six or seven acres of surface. What chiefly strikes the visitor at Whim is the strongly marked contrast betwixt the improvements of human art, and nature in her wildest form, here found in immediate contact. Your cars are at once saluted with the warblings of the blackbird and thrush from the plantations, and the wild notes of the plover, the curlew, the grouse, and other moss birds from the flow-moss." (Findlater's Report, &c. 1804.)

7839. DUMFRIESSHIRE. 644,855 acres of maritime, vale, and mountain lands, in the proportion of one, four, and seven. The climate is variable, comparatively mild, but moist. The soil of the martime district is light, and generally on sand, gravel, or rock; that of the vale or midland district is gravelly, sandy, or moory. The mountains are of schist, whinstone, or red freestone, and thinly covered with corresponding soils or moss. In some places they are covered with dry pasture, but more frequently with a mixture of grass and heath. The principal metallic ore found in the county is lead; but several others, as iron, copper, antimony, &c. exist, and the latter has been worked. Coal has been found, but not in strata sufficiently thick to be workable. Marble also and slate have been worked, and lime, freestone, and whinstone in abundance. There are several mineral springs in the mountain district, the principal of which is the spaw at Moffat. Fish, and especially salmon, are caught in moderate quantities in the Nith and Annan. The celebrated improver Craik was a proprietor in this county, at Ardbigland, near Dumfries, now the property of his son. (The Rev. Dr. Singer's General View, 1812.) 644,385 acres of maritime, vale, and mountain lands, in the proportion of mate is variable, comparatively mild, but moist. The soil of the maritime 7839. DUMFRIESSHIRE.

1. Minerals.

The lead mines occupy very barren grounds, remarkably bleak and elevated; but they are a great fund of industry and riches, and they furnish a part of the county with an excellent market for the surplus grain praduced in that part Lead hills, with the mines, are in the county of Lamark and Lead hills, with the mines, are in the county of Lamark and Lead hills, with the mines, are in the county of Lamark and Lead hills, with the mines, are in the county of Lamark and Florence to the Late of Hopetons, who draws about 70000, and for the heart Queensbury, and returns to the proprietor near 50000, a year.

Demonstry.

2. Property.
In large estates, owned by 453 persons. The Duke of Buccleuph's estate of very great extent. Some estates are managed by their owners, and others by commissioners having power to rents, and arrangements relative to leases, buildings, fences, and courses of crops, to factors residing on or near the lands, who represent their constituents (if not personally present) in county and parish meetings. Millar of Dalswinton has gone over an estate of 5000 acres in twenty-five years, and improved the whole of it, with the exception of a portion which, in 1819, was under process and promised to be soon completed. His plan was not to farm his lands himself, but to prepare them, by improvement, for being let to farmers.
3. Buildings.
While the reporter expatiates on the ample accommodations

While the reporter expatiates on the ample accommodations of the modern farm-houses in this and other counties, he gives the following information as to cottages, which, we regret to find, seem by no means improved, either in this or in other

was a proprietor in this county, at Ardbigiand, near r. Singer's General View, 1812.)

parts of Scotland, in the same ratio as the habitations of inferior animals. "A common, and not inconvenient, cottage is put up as follows, viz.: stone and time walls, seven feet high, thirty-six feet long, and fourteen to sixteen feet wide within, the roof of Scots fir, which is preserved from the worm by smoke, and covered with thatch; a chimney at one end, and an open passage for smoke in the other; affording two apartments below, one of them a kitchen, and a central apartment open. Such a cottage may be described as a central apartment open, such a cottage may be described by the other core, and the other core, seconding to its finishing." Doubtless the reverend generateman made but short prayers when he visited the sick in such smoky cottages: the surgeon need not dismount from his horse; he may speak to his patient through the window, and feel his pulse with the butt end of his whip.

carts, to Berwick, for the London market. In one or two instances the Hölcus lauhtus has been cultivated on reclaimance the Hölcus lauhtus has been cultivated on reclaimances the Hölcus lauhtus has been cultivated on reclaimance the received the second of the second second they will bear them. The drill culture of inraips was introduced by Craik about 1745. Draining has been extensively practised, irrigation in a few places, and some embankments made on the Solway Firth, and the Nith and Annan. There are few orchards. Some remains of copplec and forest, which, according to appearance or great part of the county; and numerous young plantations. Some years ago many young Scotch firs died from the attacks of the Teredo pinorum, as some suppose; but the cause does not seem clearly known. Some very large oaks, beeches, elms, ashes, and larch firs are described in the Heport.

5. Improvements.

5. Improvements.

6. Improvements.

6. Improvements.

8. Improvements.

8. Improvements.

8. Improvements in 1793, and planted, before 1819, 198 acres. Assisted in laying out a considerable extent of public road and building bridges, the road passing through the estate. Made an improvement in the construction of lime kilns, since per did dried by means of a small stream from more elevated lands; this stream being made to turn an overshot wheel, which works two pumps. The village of Bridekirk began in 1800 (S550.) on the new road, and where the river Annan affords ample falls for machinery. Farms arranged of different sizes, sample falls for machinery. Farms arranged of different sizes, sample falls for machinery. Farms arranged of different sizes, stone quarries opened, others drained and improved. This parties of the control of the same of the small stream from more elevated lands; this stream being made to turn an overshot wheel, which works two pumps. The village of Bridekirk began in 1800 (S550.) on the new road, and where the river Annan affords ample falls for machinery. Farms arranged of different sizes, stone quarries

the whole of the exterior circle of two small broad wheels, and as they go round the knives cut the furrows across. The axe and frame of a roller are used for these wheels, so that the weight may be increased by loading the box of the frame, if it should be necessary to make the knives cut through the furrows. It is dragged with great ease arross the ploughed moor by one horse; and when it is moist the furrows are cut through with the greatest facility, in pieces of any length, according to with the greatest facility, in pieces of any length, according to a little dry, are then turned over by the brake (break) harrow, and being all cut into small pieces, are in the best state for being reduced by repeated harrowing, or for being thrown together in heaps and burnt.

6. Weekly Reports.

"In carrying on the improvements which have been mentioned, at a considerable distance from my general residence, they have been greatly facilitated by requiring my overseer, or manager, to send me a weekly report of what was doing upon have been employed during erever day; contains a journal of the weather, and of the progress of different works; and a state of his receipts and disbursements during the week. These reports, besides enabling one to judge of what is doing, and to give any directions that may be necessary, are extremely useful to refer to, and excite the overseer and servants to be diligent in my alsence, population on the extate in fifteen years, 396; Increase of the control of the first population on the extate in fifteen years, 397; Increase of the control of the progress of the first population of the transition of the control of the first population of the control of the progress of different works; and a state of the manual rentral at that time, 2000t, a year, exclusive of the value of timber, and of the manual rentral at that time, 2000t, a year, exclusive of the value of timber, and of the manual rentral at that time, 20

residence.
7. Political Economy.
Improving roads, and some canals and railways; some commerce by see with the pert of Dumfries; manufactures inconsiderable; paper, steekpt of prames, mushis wavers. A small incon-work at Kirkconned, in which from three to four dozen spades daily are made. Cutton spinning and weaving in a few places. Carp evening, &c. (* Salt, from the riches harts of the sea sleech, collected with horse drags in dry weather in summer, and then placed so es to be washed and filtered, and the brine that runs out of it boiled."

deep in the blade, with a blunt edge fixed upon and embracing 1829, possessing great similarity of agricultural character, have been included in one report, as the district of Galloway. The climate moist but rather warm; in some parts of Wigtonshire, in genial seasons, figs ripen on the open garden walls. The soil and surface of Galloway is exceedingly various. Almost the whole of Wigtonshire is very little elevated above the surface of the sea, but great part of Kircudbrightshire is hilly and mountainous. The better soils are for the most part light, and of this and hazel loam there is a considerable portion in Wigtonshire, In some places in Kircudbrightshire it is clayey or alluvial; and there is a great deal of peat-moss, and bog, as well as improved, or grass-bearing peat. The rocks of the county are argillaceous, granite, or whinstone, with some freestone. Some mineral veins have been found; and one of lead, near Gate House of Fleet, was worked at the expense of the compiler of this work for some time, but without success. In an agricultural point of view, Galloway is chiefly remarkable for its breed of cattle. Gladstone, a millwright, who has invented a reaping machine, and proposed some improvements on the threshing machine, and other implements, is of this district. (Smith's General View, 1810.)

1. Property.

More divided than in most of the counties of Scotland. Largest estate, 30,0001. a year, Earl of Galloways, in Wigtonshire. Estates in general well managed: landlords in general advance money at five, six, or seven and a half per cent, for buildings, fences, drains, mineral manures, roads, &c. Dunbar Earl of Seklirk; a disciple of Craik's, one of the first who set the example of improvement, which has been persevered in by the same family to the present time.

2. Occupation.

In the moors, where breeding cattle and sheep is the object,

2. Occupation.
In the moors, where breeding cattle and sheep is the object, farms sometimes seven or eight miles square, some ten or vewleve. Arable farms 300 to 600 acres; 200 acres perhaps the average. Leases mineteen or twenty-one years, to which the late Earl of Galloway superadded the tenant's life. "From this two good effects were supposed to result; 1st. That the indiord was freed from the expenses of buildings and repairs. 2dly. That the tenant presuming (as we always do) on the continuance of life, would be disposed to go on with his improvements to the last. There is certainly, however, much 1st. "Revolutions."

3. Enclosing.
Galloway dykes (3060.) very generally in use; some useful remarks on the necessity of bonding them sufficiently, and working the coping stones to a flat under-surface.

remarks on the necessity of tooling them same enaby, and working the coping stones to a flat under-surface.

4. Arable Land.

Till the middle of the eighteenth century, four and sometimes six horses yoked abreast in the old Scotch plough, and the control of the six horses yoked abreast in the old Scotch plough, and the improved implements; the husbandry of East Lothian on the alluvial lands and loams, too heavy for on the mountains and moors; carrots cultivated in some places, and found to answer well; from trid on bogs; some irrigation; embanking near Wigton and at Kirket-dhright, and much draining; also garing and barning, and various other means of improving the same morning, and spread first with playing and the same form the late districts gaited. (5176) Earley is a good deal cultivated, and thin hot barley cakes, from dough, baked the same morning, and spread first with butter, and then with honey, and folded or rolled up (like the teff of the Abyssinians), form a part of the breakfast bread of all who can afford it in Wigtonshire.

5. Orchards.

5. Orchards.
Rare. "Some proprietors furnish their tenants with fruit-trees for their gardens, when they are willing to be at the trouble of cultivating them. But, from the scarcity of fruit in the country, and the idea that the plundering of an orchard is a very venial trespass, such as do cultivate them, frequently do not gather the fruits. In this we believe there is nothing peculiar to Galloway. There are a few market gardens and several nurseries."

Woods and Plantations.

Of a very limited extent, but rapidly increasing. John Earl of Stair planted extensively at Mount Kennedy, in the beginning of the eighteenth century; and Douglas Farl of Selkirk soon afterwards. The Earl of Galloway, the present Earl of Selkirk Murray of Boughton, and various others, are great

kirk soon afterwards. The Eard of Galloway, the present Earl of Selkirk, Murray of Boughton, and various others, are great planters.

7. Live Stock.

The Galloway bread of cattle is well known. The breeders per the present that the stock of the cattle is replaced to the present of the stock. The Galloway breaders and the management of cattle as well as you in the cattle in most others in the kingdom. They all know how to distinguish a good bull or a good cow from a bad one: and fail not to select from their own stock such as are best adapted for the improvement of the breed; and from this general attention, it no doubt arises, that the cattle in Galloway are pretty uniformly good. But among them have arisen no clifically, or dedicated their talents almost exclusively to this one object. No fair test has yet been given, of what might be done by a proper selection of the choicest inelviduals of both sexes for breeders, and uniting them in such a manner, as seemed best calculated to diminish their fulls and heighten their properties, by crossing the progeny of these from time to line approved males with the finest females, till the improvement was carried to the greatest perfection of which the breed is susceptible. No Bakewells, no Culleys, no Collings have yet appeared in Galloway; who, with a skill, the result of long study and experience, have united sufficient capital, and by intensity of the control of the choices of the hispidom. Few of the Galloway cattle (comparatively) are fed for home consumption. Dairying with Aprahire cows has lately been introduced, and very good Dunlop cheese made.

The shrep for the low districts are of various breeds, those of the hispidands the same as in the mountain districts of the kingdom. Few of the Galloway cattle (comparatively) are fed for home consumption. Dairying with Aprahire cows has lately been introduced, and very good Dunlop cheese made.

The shrep for the low districts are of various breeds, those of the hispidand horses, which escaped from a vessel of the Armada

draught; and from the little value attached, in times of tranquility, to horses well calculated for predatory excursions. As the soil and climate of Galloway are peculiarly adapted for rearing horses, there cannot be a doubt that under proper management, they would in general become excellent, and add much to the value of its produce. Hitherto few more have been bred than what were necessary to supply the demands of the district. Sprine increasing since the introduction of postatoes; and edistricts of sociated gradually declaring. Ringing one districts of Sociated gradually declaring. Ringing one state of the the two strong tendons of the anout cut by a slight

inclision, about an inch and a half above the nose, when the animal is about two months old.

Bese of this district produce home equal, if not superior, to any in the world; its excellence supposed to depend on the profusion of wild flowers, especially white clover and heath.

Game abundant; a few plarmigans in the highest moun-

8. Political Economy.
Reads greatly improved of late; and some cotton, woollen, paper, and other manufactures introduced.

7841. AYRSHIRE. 664,960 acres of rregular but not mountainous surface, and clayey or mossy soil, under a moist climate; half the county bog, hilly pasture, or waste, and the rest chiefly under alternate grass and corn. The agriculture followed is in great part the dairy system; Dunlop cheese, already described (7063.), being chiefly produced in this county. (Aiton's General View, 1811.)

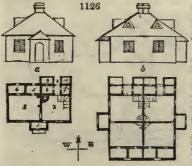

Minerals.

1. Minerals.

Coal and limestone are to be found in most parts of the county, and there are several kinds of building stone, but no metallic ores worth working, excepting fron. Coal is the staple mineral, and is exported in large quantities to Glasgow and other towns, along the west coast, northward and southward.

2. Buildings.

Some good castles and mansions, as Culzean, Loudon, Eginton, &c. Farm buildings are improving, though but slowly. Some neat elevations, and comfortable interiors on Lord Eglinton's estates; single (fig. 1126. a), and double (b).

Each of such cottages is surrounded by a neat garden, containing a pigsty, pump, and bee-house; and the house containing a porton [14], kitchen, oven, and stair to bed-rooms [2], parlour [3], store closet [4], bed closet [5], pantry [6], coal closet [7], but we garret bed-rooms over.

3. Occupation.

3. Occupation.

5. The sum small from the out 150 acres, and their culture imperforms the output of the manufacturing towns.

4. Live Stock.

Hores are bred and sold under the general name of Lanark-Hores are bred and sold under the general name of Lanark-

4. Live Mock.
Horses are bred and sold under the general name of Lanarkshire or Clydesdale, and are in great demand; as are the Ayrshire cows for the Edinburgh and Glasgow dairymen. Indeed these cows, as we have seen (6789.), are preferred to all others in most parts of the low country of Scotland. The native horses began to be improved by crosses shout 1740. In thay year Robert Woodburn, in Mains of Loudoun, sold what was then considered the best stallion in the country, at the price of the guliness. The common price of draught horses did of the guiness.

ty. (Allon's General View, 1811.)

not then average mere than 3L each. Tell about 1780, the work usually done by farm-horses was not more than one half of what they now perform. Four horses were then yoled horses. (Allon's Daily Sussiandy, p. 180-3)

5. Woods and Plantations.

5. Woods and Plantations.

6. However, the sussiand planters. On the Chiese of the proteions are been yellow the west winds; most of the trees lean to the east, excepting the common maple, which is generally erect, or nearly so, and is one of the best trees for an exposed sea-coast. There are a few native coppies-woods, and some fine old birch, ash, and oak trees round Eglinton Castle.

6. Improvements.

Captain Smith, the proprietor of a small place abounding with peat bogs, about 1790, began to drain end dig, and time the surface, and succeeded in reducing the peat to a black mould, and rearing tolerable crops of oats, potatoes, and clover. After five or six years, he was able to venture horses and cattle on these bogs; but a first every operation was manual.

7. Political Economy.

After five or six years, he was able to venture horses and cattle on these bogs; but at first every operation was manual.

7. Political Economy.

Carpet and other woollen manufactures at Kilmarnock; thread at Beith, cotton at Catharine, iron at Muirkirk, sale and kelp on the shores, and earthenware and the usual minor manufactures, as leather, hats, set, as various places.

Manufactures, as leather, hats, set, as various places.

The state of the state of

tent hath, which draw to it a number of visitors at the proper season.

The harbour at Ardrossan was only a part of the general plan, and that from which, viewed by itself, the smallest advantages perhaps were to be expected. The feading idea was to open a direct communication between Glasgow, Pesiley, and other large towns in the vicinity and the west coast, instead of the present circuitous passage by the Frith of Clydensend of the present circuitous passage by the Frith of the present circuitous passage

7842. LANARKSHIRE or CLYDESDALE. 556,800 acres, in great part mountain, moor, and peat-bog, with a portion of friable loam, and some retentive clays. The climate is cold, moist, and unfavourable, excepting in the low vales, where vegetable is chiefly injured by spring and autumn frosts. Average of the rain which falls at Glasgow, 308 inches. The minerals are lead, irrostone, coal, limestone, freestone, and whinstone, all worked to a considerable extent. The lead mines at Leachills have been already noticed under Dumfriesshire. The husbandry of the county is chiefly distinguished for its breed of horses, and for orchards, the latter a rare production in Scotland. John Naismith, the author of a work on Industry, another on the Elements of Agriculture, and also of the Report, seems to have been a native of this county. (Naismith's General View, 1803.)

1. Property.

Three fourths of the surface the property of great land-holders; the rest much divided. Farm-houses and offices were formerly very indifferent; but in this as in other adjoining counties, where the lesses of farms fall in, the landford generally enlarges or renews the buildings, as a necessary step to ground feued out to operative mechanics, weavers, &c. for building cottages.

2. Occupation.

Much the same as in Galloway. Breeding farms are large, Much the same as in Galloway.

2. Occupation.
Much the same as in Galloway. Breeding farms are large, and corn farms molerate. The mountainous district is occupied mostly with flocks of sheep: upon the ridges on the E. and W. sides, where the ground is marshy, and less proper for sheep, and the exposure too bleak to encourage the cultivation of corn, cattle are mostly pastured, and those generally miles cows and their young, many of which are reased; a small cows and their young, many of which are reased; a small of which the country of the same of white of corn only being cultivated, principally for the sake of white of corn only being cultivated, principally for the sake of white of the country of the Clyde, between Hamilton and Lanark, with orchards.

3. Gardens and Orchards.

Glasgow is abundantly supplied with the common culinary vegetables from market gardens. Orchards are chiefly found in two districts in Scotland, in Clydeadles, and the vene of the control of

been found to succeed better than on plains, as subterraneous water flows most quickly away. Most of them stand on soils greatly coheslve, and on such the trees have been supposed to stances of orchards, on fitthle and greatly state that the stances of orchards, on fitthle and greatly state that the productive. Plum trees are generally planted round the verge of the orchard, and are profitable, not only for the fruit fley bear, but for sheltering the other trees. The depredations committed on the orchards are become more frequent and daring, as the manufactures of the county have increased, and are a great discouragement to this species of cultivation, particularly that of smill orchards, which cannot defray the extinction of the standard of the standard of the standard of the standard or the standard o

Bothwell Castle. Many new plantations are forming in every part of the county.

4. Live Stock.
Cattle a mixed breed; the Ayrshire beginning to become general. Oxen formerly employed in labour, and still used by a few of the anisetum is spite of the better sense of their tenants where the black-faced sort prevails.
The daught horses of Clydesdale have long been in high estimation. Dealers from different parts of England come to the Clasgow and Rutherglen markets to purchase them, and prefer them to the Derbyshire blacks. Those of the upper ward, where the greatest number are bred, are esteemed the best. The native breed began to be about 1760.

The Lanarkehire breed of horses vary in height from 12 to 18 hands; but from 14 to 16 hands is considered the proper size. "His general aspect [fig. 1127.] is stately, handsome, and dignified. He is round, fleshy, well proportioned, strong, and heavy, without being coarse or clumys. His countenance is sweet and agreeable, yet lively and spirited; and his motions is in due proportion to his body, rather small than large, no way clumsy, and not so full and prominent below the eyes as some of the English breeds. His nostrils are wide, his eyes full and animated, and his ears serect. His neck is neither long nor slender, but strong, thick, and fleshy, with a good curvature, and the mance strong and bushy. He is broad in the breast, thick in the abouldery, the blacks nearly as wards as those of road borses. The arm appears to the knee. The leg rather short; bone oval and strong, but solid and clean. The hoof round, of a black colour, tough and firm, with the heels wide, and no long hair on the legs, except a tuff at the heel. The body round and heavy; the belly of a proportional size, neither small not large, and the finish full.

The back straight and broad, but not too long; the loin broad and raised a little. Hucks visible, but not prom.nent, and but a short space between them and the ribs. The sides, from the shoulders to the hip, nearly straight; the sides, from the shoulders to the hip, nearly straight; the sides, from the shoulders to the hip, nearly straight; the thighs thick, and meeting each other so close under the fundament, as to leave only a small groove for the tail to rest on. The tail strong, stiff, beary to lift, and well haired. A large sheath (vagina) is considered to be one of the marks of a good horse, and a small one the reverse." Alton. They have been much improved of late, and are still improving, especially in Hogy. "A kind of Jewish abhorence of swine seems to have taken place, about the rigid times of the Reformation, in the western counties of Scotland. They were unclean beasts; it was sinful to eat their flesh, and neither creditable not profitable to keep then; and though these prejudices are now pretty much worn out, pork is not yet, in general, a favourite food, and, of course, the number of hogs kept and fed are not considerable."

5. Political Economu.

5. Political Economy.

The roads are in many places bad, but have lately been improved; though the materials be good and abundant, the we'd climate is much against them. There are several canals, tha river Clyde, navigable to Glasgow, and some railways. The manufactures and commerce of Glasgow are of great extent and well known. There is a corresponding agricultural society there, and some minor societies.

1127

7843. DUNBARTONSHIRE. 147,300 acres of exceedingly irregular surface, in two parts, distant from each other six miles; possessing little agricultural interest. The arable lands are of very limited extent, and lie chiefly on the banks of the Clyde and Leven: the greatest part of the county consisting of lofty mountains incapable of cultivation. Coal, lime, freestone, and ironstone abound, and are extensively worked. There is also ochre, schistus abounding in alum pyrites, which are made into copperas, and a large quarry of blue slate. Lochlomond is well known for its scenery. (Whyte and Macfarlane's Report, 1811.)

1. Property.
Two large estates; one exceeds 3000l. a year. One third of the county under entail, which greatly retards its improve-

Two large existes; one exceeds 5000t. a year. One third of the county under entail, which greatly retards its improvement.

2. Buildings.

More than a common share of elegant villas and gentlemen's houses. The most magnificent is Roseneath, the Duke of Argyle, built by Bonomi, in 1805 et seq. It is 184 feet long, and 121 in breadth, with two magnificent fronts, both ornamented with columns of the lonic order. On his Grace's farm, while its cultivated in a very superior style, there is also a large set of farm offices, surmounted with a high tower. Common farm-houses and cottages formerly very wretched, beginning to inlength, and twenty-five feet high in the centre.

3. Occupation.

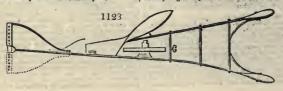

A verage extent of arable farms fifty acres; sheep, or mountain farms, average 600 acres. Farmers men of himted education, without capital, and implicitly following the practices of their forefathers. There exists among the labouring class in this district an inveterate attachment to the possession of land. When a young man is disposed to marry, he looks out for a small farm, takes it at an extravagant rent, stocks it on credit, and draws from it a scanty subsistence, while at the end of his lease his effects are often unequal to pay the debt which has accumulated until its farmery. In fact the fendal state of a communication of the
4. Implements.

4. Implements.

Curved harrows of a semicircular form are used by the best farmers for dressing their potato ridges. The diameter is equal to the distance between the result of the distance between the result of the distance between the result of the res

5. Enclosing.

D. EMCLOSING.
Gentlemen who pay particular attention to their hedges never allow them to be cut with shears. In place of that implement a hedge-knife is used, with a thort and slightly curved blade, thick in the middle, and tapering to a thin and very sharp edge on each side. By cutting always upwards, the twigs are cut clean over without being glaves upwards, and the hedge is kept, of what is to be the best shape, broad and bushy at the bottom, and contracting to a thurp ridge at top.

6. Arable Land.
Potatoes cultivated better than any other crop in the county, and with the greatest success. They are planted on every variety of soil, and this even on the stillest clays where there is sufficient declivity to carry off the surface water; but a gravelly loam suits them best: about twenty tons of manure per acre is the common dressing. Drilling and dibbling are the common modes in the lowlands, and by large beds in the uplands; average produce twelve tons, but eighteen are frequently obtained.
7. Grages Land.

T. Grass Land.
Some bog meadows, but no others; some pasture fields round gentlemen's houses, but none on lowland farms; mountains wholly in natural pasture; moss, heath, bog, and moor.

8. Woods and Plantations.

Solvent in the state of the sta

1821, 47,000 trees, and recovery thight. See. vol. vi. p. 258.)

The finest tree in the county is an ash in Bonhill churchyard. Its trunk is about nine feet high, and, where smallest, upwards of eighteen feet in circumference. Of the three principal arms into which it branches, the largest is eleven, and the smallest near ten feet in circumference. The branches spread in every direction with uncommon regularity, covering an area of near

100 feet in diameter, and the general aspect is singularly renerable and majestic. There are no data from which its age cm be conjectured. Nearly 100 years age it was remarked by Marsham of Stratton, near Norwich, a celebrated planter, as one of the first abase he had seen; and a tendency to decay in some of the boughs seems to indicate that it has stood there for several centuries. Yew trees and hollies abound on the banks of Loch Lomond, A yew at Roscole is twelve feet round, and very high; one at Stockintibbert twenty-eight feet round, and the top spreading in proportion.

Stockintibbert twenty-eight feet round, and the top spreading in proportion.

9. Improvements.

Some proprietors have drained bogs, and rendered there tolerable meadows; and drained and planted moors. Mosses sometimes burned, the sakes ploughed in, sud the land cropped with oats, &c.

Arrigation, by means of the rills on the bill sides, tried in some places with success.

Embankment have been made on a small scale, and some of co.

10. Live Stock.
Highland cattle from Argyleshire in general use; but little feeding, dairying, or breeding of this species of stock. Sheep of a small black-faced kind bred in the county, to the extent admitted by the upland pastures. Horses, a small hardy breed. Hogs increase as the prejudice against pork disappears. 300 fallow deer occupy two of the largest islands of Loch Lomond. The stag, or red deer of the mountains, has disappeared since the introduction of the property of the production of the production of the production.

lands.

Bees common.

11. Political Economy.

Manufactures of iron, glass, cotton, paper, alkali; printing and bleaching works, &c.

Window glass manufactured extensively, and equal in quality to any in the kingdom. Pay 50,000. a year of excise duties; employ 10,000 tons of shipping, and consume 1200 tons of kelp. The distillery of prolignous acid at Milburn employs about seven hands, and consumes daily a ton of small timber, chiefly call, from thich the liquor, a kind of coarse vinegar, is exceed to the control of the control of the liquor, a kind of coarse vinegar, is exceeded to the control of the control of the liquor, a kind of coarse vinegar, is exceeded to the control of the control of the control of the liquor. A kind of coarse vinegar, is exceeded to the control of t

7844. STIRLINGSHIRE. 450,560 acres, much diversified by rivers, mountains, woods, and valleys, containing some rich alluvial soil, extensive peat-bogs or mosses, and some bleak hilly districts. The culture of wheat and beans is the chief agricultural feature. Potatoes first cultivated in the fields in this county by Prentice, a farming gardener at Kilsyth. (Belsche's General View, 1796.)

Principal river the Forth, and meantain Benlomond; the latter a cone, upwards of 3262 feet liigh, of sheep-walk, belonging to the Duke of Montrose.

Lime, coal, ironstone, granite, whinstone, and freestone abundant.

The carse lands constitute one of the most remarkable soils in the county. They lie in a low situation on the banks of the first the county. They lie in a low situation on the banks of the readth, at an everage. They are elevated from ten to twenty-live feet above high-water mark, and a small portion of them in some places is overflowed at times by the river. The soil is universally allowed to be the alluvion deposited by the Forth and its tributary streams, and consequently to be the spoils of the higher grounds, through which the river takes its course, sand, and a pretty large mixture of once organised matter. In some places are patches of till of various colours; but not a stone, so large as to obstruct the plough, is to be found. The

soil of the best quality, when dug first from the natural bed is of a bright blue colour, and of a substance resembling the sichest soan, and sometimes even serves as a substitute for fuller's earth. In many places the clay is excellently fitted for naking bricks, tiles, and a coarse kind of crockery ware. The depths are from five to fifty feet. The subsoils are various, as These beds of the clay like the plant of the subsoil is an exterious to thickness; they are chiefly large oysters, with a mixture of ceckles, whelks, and some other shells at present found in the fifth. These lands are in farms from fifteen to 100 acres each. In the higher parts of the county the extent is from xenty to 1000 acres.

1000 acres.

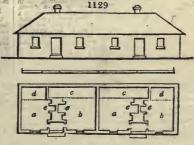

Coppler woods extensive, and plantations considerable. Carron from works of great extent, and well known. Large cettle fairs held at Fakirk. Chief commerge the shipping of Carron articles for London and other places.

7845. WEST LOTHIAN or LINLITHGOWSHIRE. 71,550 acres of gently varied surface, without hills or mountains; clayey soil, and rather cold and variable climate. The minerals are coal and lime in abundance; freestone, whintsone, and some lead and iron, but the latter are not now worked. The coal at Borrowstonness has been worked upwards of five centuries. In an agricultural view, the county may be considered on a par with Mid-Lothian. (Trotter's General View, 1811.)

Property is in the hands of aboatt forty proprietors. Lord Stair is supposed to have introduced the culture of clover, turnips, and cabbages at Newliston, in this county, as early as 1720; and also the Rotheram plough, for which purpose he sent a mechanic to England, to acquire the art of constructing them. A hay drag, of a very simple but convenient construction, is used, in this county. Plans of a more decent form of cottages [fig. 1122-), are given, than are to be found in some reports. Each as a titchen has a space for two press or one bed [4]; in each room is a cupboard (e), but no closet, which is a great defect.

defect.

The contrivance for making horses draw equally in the contrivance of the contribution of the cont

7846. CLACKMANNANSHIRE. 30,720 acres, principally of carse land, on the north bank of the river Forth; but partly of hilly district, belonging to the Ochills. (Erskine's General View, 1795.)

The carse lands are very fertile; but part of the hilly and moory district of little or no value. The agriculture is similar to that of Stirlingshire. After the invention of the threshing-machine, one of the first was creeted at Kilbagie, by George Meikle, in 1787; it is driven by water, manure is found to the stirling of the stirli

small proportion of stable dung; or the farmers spread it over their cattle-yards, and it forms most excellent manure. Thus what is a complete hinderance to improvement forty miles distant, is brought here by the river at no cost, and forms a most valuable addition to the resources of the cultivator. Till 1760, no wheat was grown in this county, though it appears by old abbey rentals that wheat was paid as rent at Cambus Keumeth so early as 1147. Now wheat enters into almost every rotation.

7847. KINROSS-SHIRE. 47,642 acres, of varied surface, but generally low. There are extensive mosses and muirs, and not much rich soil. Their agriculture is mixed, and of no great interest. (*Ure's General View*, 1795.)

Lochleven occupies 3508 acres; three small streamlets run into it, and the difference between its highest and lowest surface, at different seasons, is three feet. The trouts of this lake in high esteem; those of the river Leven larger, weighting five pounds and upwards. Professor of Agriculture in the University of Edinburgh, possesses an estate in this county,

where he sets an example of knowledge, industry, and good management to all his neighbours."

Adam, of Blair Adam, the son of the celebrated architect, the most extensive improver in the county; draining, enclosing, planting, more especially the larch and Scotch pine, and building commodious cottages, extensively and judiciously pursued.

7343. FIFESHIRE. 322,560 acres, exhibiting almost every variety of surface and soil, from the mountain to the plain, and from gravel to moss. The climate is generally mild, owing to the surrounding waters; and what adds to the value of the county, both for culture and for the formation of country-seats, it is rather drier than that of other counties equally far north. The agriculture is mixed, and may be said to excel both in the corn and cattle department. The reverend reporter displays more than the usual share of adulatory phraseology for that "highly patriotic individual, Sir John Sinclair," our "gracious Sovereign," the Board of Agriculture, and the Government, "chalking out to the people a path by which they may rise to opulence and consideration." (Thomson's General View, 1800.)

Geographical State and Circumstances.

1. Geographical State and Circumstances. Coal, lime, and the usual rocks abound; ironstone and lead and copper ore abound, but none worked. Nearer Burntisland, upon the shore, and also in some other parts of the county, there are quarries of hard stone, of a dark colour, with the peculiar property of resisting the force of fire. It will endure for many years, without being wasted or broken, though exposed to the most intense heat. On this account it is used for the soles of ovens, and for the sides of chimney grates. Cominon and fire bricks manufactured of an excellent quality. (Thomson's General View, 1800.)

2. Property.
Estates moderate; largest, 8000l. a year.

Estates moderate; largest, 5000t. a year.

3. Buildings.

Few counties so richly studded with noblemen and gentlemen's houses; about a hundred enumerated as deserving of
notice. Many magnificent buildings in ruins. Religious
house, castles, and Falkland Palace. Farm-houses and cottages formerly very bad, now greatly improved, and superior to
those in most counties.

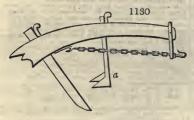

4. Occupation.

Farms from 50 to 500 acres of arable lands, and some of mountain pasture twice as large. Some of the largest and best farmers are men who have emigrated from other counties to this less improved district; but the greater number are sons of local farmers, and not a few farms have been in the same family for several generations. The reporter is an advocate for corn-rents, a mode first revived in this county with the improvement of not taking the corn, but paying in money, according to the average prices. Leases for nineteen years, some formerly for one or more repetitions of the period; in general the restrictions reasonable, for the managers of estates in this county are generally resident factors, and not Edinburgh lawyers.

5. Immements.

5. Implements.

Ploughs with convex mould boards preferred for loose soils, especially when in a wes state; they free themselves more readily of the earth, and make a neater furrow. An addition to the plough, called a ridder (fig. 1150. a.), adopted in some places, and found to clear away the stubble from the coulter.

One fifth of the county inaccessible to the plough, and in store sheep and cattle pasture; some bog or coarse rushy meadows on peat, and a few spots of good alluvial meadow.

7. Gardens and Orchards.

T. Gardens and Orchards.

The remains of an orchards.

The remains of an orchard at Lindores, but none of modern formation. Some market-gardens near the towns, but most of the inhabitants have gardens of their own. Some good nurseries. Sang, an eminent nurseryman, and manager of gentlemen's plantations,—a valuable man to the county,—has introduced an excellent system of planting, pruning, and draining. Some of the first private gardens in Scotland are in this county, as that of Keith, Wempsa Castle, &c.

Not extensive, but young plantations very numerous and well managed. More cedars and rare sorts of trees in this county than in any other.

9. Live Stock.

well managed. More cedars and rare sorts of trees in this county than in any other.

9. Live Stock.

Black cattle of Fife long distinguished. The reporter has heard an English dealer say, that a Fife bullock of forty stone will bring an equal, and often a higher, price at the London market than an English bullock ten stone heavier, and equally flat. A good Fife cow will give from five to seven gallons of milk per day, from seven to nine pounds of butter, and from months after calving.

The Fife Farming Society and the Inverkeithing Club, supported chiefly by farmers, are considered useful institutions. The first was formed about six years ago, and at present consists of nearly 200 members. The principal objects aimed at by this Institution are, a munual communication of disconsignation of the sea of the s

7849. PERTHSHIRE. 4,068,640 acres, almost every where mountainous, but with intervening vales of strong clayey soils, fertile in corn; some gravelly tracts, and many mosses, bogs, and moors. The mountains on the southern side of the country, where they are less high, are covered with pasture to the summits; those in the northern parts with pasture, heath, and coppe. The minerals are coal, lime, free-stone, slate, whinstone, granite, &c. the metallic ores, iron, lead, and copper, neither of which are at present worked. This county serves to divide that part of Scotland on the south, which is generally adapted to the raising of grain, from that of the north, which, with few exceptions, is more fitted for pasture. It also divides those parts of the kingdom on the north, where firs abounded in former times, and are still found in the mosses, from those in the south, which carried oaks and a variety of other wood, but no natural firs. It is also the general boundary, in regard to coal and granite, though both are found to a moderate extent, the former in the north, and the latter in the south. The husbandry of Perthshire is noted for its clay, or carse land culture, and for its plantations of larch trees. Its great improvers

have been, or are, Lord Kaimes, the Duke of Athol, and Lord Breadalbane. (Dr. Robertson's Genera. View, 1813.)

have been, or are, Lord Kaimes, the Duke of Athol View, 1813.)

1. Property.

Estates are of all sizes, but the greater number large. The management of the great estates was uniformly committed in former times to the factor or chamberlain; but agriculture has become so much the amusement of the country gentlemen, since the middle of the last centary, that many of the proprietors, besides the general superintendence of their estates, have a farm in their own possession, which they manage by an overall one of their estates, have a farm in their own possession, which they manage by an overall one of the latter, and their own possession, which they manage by an overall of the latter of the management of the law of the practice of other countries. The gentlemen of the law during the recess of their courts of judicature, turn much of their attention to the cultivation of their estates; and their habits of application to the former study, quickens their ardour, and ensures their success in pursuit of the latter, and ensures their success in pursuit of the latter, and ensures their success in pursuit of the state. On the land of the factor, and the state in the sease, unless the landford have a turn for business, he is apt to lose sight of the detail of his own attains; and if he be indoined, the has a good apology for neglecting his interest, because he pays another person for taking that charge off his hand. The prosperity of the estate, and the disposition of the factor.

The boundaries of estates are marked according to the nature of the country. In the valleys of the highlands, different properties are separated either by substantial stone-walls without mortar (provincially dry stone dykes), or by a river, or a disposition of the factor.

The boundaries of estates are marked according to the natural brook, or a range of rocks, or some other natural limit. The lower hills too are sometimes bisected by these walls, but surely in the state of the surely surely surely and the surely surely and the surely surely surely

2. Occupation.

Arable farms from 30 to 500 acres. Farms in the mountains large, and their extent generally defined by miles. Leases seldom shorter than nineteen years' endurance. Rent, in a few instances, partly in money and partly in the money value flow in the standard and average of two or three by-gone years, according to the and average of two or three by-gone years, according to the standard average of two or three by-gone years, according to the standard average of two or three by-gone years, according to the standard that of the clay soils of East Lothian, in which a fallow and alternate corn and green crops are introduced; and that of Berwickshire, which substitutes turnips for fallow, and allows from two to five years of pasture, according as the soil is weaker or stronger as resting crops. A full account of the clay-inad culture has been given by Donaldson. In the monntainous region, cattle chiefly, and sheep to a certain extent, are bred and sold for feeding in the low arable districts, and sent to the south of Scotland and England.

3. Gardens and Orchards.

the south of Scottand and England.

3. Gardens and Orchards.

In the Carse of Gowrie, a number (perhapsthirty) of orchards of apples and pears, the fruit of which is sold to the neighbouring towns. A few other parts of the county adapted to open orchards, as the banks of the Tay, Earn, &c. In the valleys of the highlands, geans and cherries abound. The trees thrive well, live long, and carry fruit of the finest flavour and most savoury taste. The cream-coloured cherry of Ardvorlich, and the black gean of Castlemenzies, are highly esteemed in respect of beauty and relish.

4. Would and Disputations.

4. Woods and Plantations.

spect of beauty and relish.

A. Woods and Plantations.

The Highlands of Scotland formerly covered with wood, as the trunks of eaks and firs in the mosses, from that of Moss-Hunders, near stirling, to the bogs of Sutherland and Caith-less decidedly prove. Planting did not become general in Perthshire till after the middle of the eighteenth century. The county is now distinguished by its extensive tracts of larch, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of oah, common pine, and other trees, and by the enclosure of the tree of the oah, and the pine of
Its growth of any tree we have, and the most valuable species of the pine. It is closer in the pores, has fewer knots, and the wood is more durable than the common pine, and withal it increases double the number of cubical feet, in any given time; which is a singular property. It may vie in growth and profit with the Huntington willow, which has been said to buy the hone, before any other tree could buy the saddle. When the said with the Huntington willow, which has been said to buy the hone, before any other tree could buy the saddle. When the said with t

5. Wastes.
The mosses and moors of this county are very extensive, and great and successful efforts have been made for their improvement. The most remarkable is that of Kincardine moss, commenced by the late Lord Kaimes, and already described. (213-3.) Drahming, paring and burning, tringating, embanking, and all the different modes of improving land, have been practiced; and some, as draining and burning, to a very considerable extent.

and all the different modes of improving tands, have been practiced; and some, as draining and burning, to a very considerable extent.

6. Live Stock.

Breeds of cartle very various; none peculiar to the country. Agroup, Fig. and Argyle herds common among the farmers, Angus, Fig. and Argyle herds common among the farmers, and the butter dairy.

Shep. The ancient breed of sheep in this country were the white-faced. They were few in number, compared to the flocks at present; and in the highlands were boused in cots every night in winter and spring. About forty years ago, the black-faced or mountain breed was introduced from the south, and supply the state of the

There is a wibbit warren at Dunkeld, and sed deer and rose in one or two places. There are also three or more kinds of fallow deer in the county.

Beer much attended to, and found profitable. Paterson of Castle Huntley sows mignonette for his bees, which gives the honey a most delicate flavour. Rosemany does the same. The honey of beans is pale; the honey of heath brown. Their flavour is also different.

7. Political Economy.

Roads wretched before 1745: still only bridle roads in many Packet of the profit of the sum of 70000. A year. There are five others, which produce from 100 to 2004, a year.

7850. ANGUS or FORFARSHIRE. 532,243 acres, one half, or more, of clayey and alluvial lowlands, and the remainder mountain pasture, moor, and bog. The climate cold, moist, and variable. It is both an agricultural and manufacturing county, and in respect to antiquities, facilities of further improvement, natural productions, &c. of great interest. The botanic family of Don are of this county. A most valuable report has been furnished by the Rev. James Headrick, and is the last of the Scotch reports which has been published. (Headrick's General View, 1813.)

1. Geographical State and Circumstances.

The Grampius mountains abound in granite, which contains topazes, or rock crystals. Quartz, mica, porcelain stone, lead, limestone, slate, jasper, pomptry, precia, and shell mari occur in various places. The Loch of Foriar abounds with shell rain various places. The Loch of Foriar abounds with shell rain various places. The Loch of Foriar abounds with shell rain which it is conveyed to the chry. The content of the which it is conveyed to the chry. The content of the chry which it can be a been as a long wooden handle fastened into it, and a bag, of strong leather fastened by whipedra around its rim. The bag is performed by a ship of the content discharged into the boat. After the boat is firmly presses down the scoop to the bottom, by means of a long pole at the stern of the boat, while another man, by means of a long pole at the stern of the boat, while another man, by means of a long pole at the stern of the boat, while another man, by means of a long pole at the stern of the boat, while another man, by means of a long pole at the stern of the boat, while another man, by means of a long pole at the stern of the boat, while another man, by means of a long pole at the stern of the boat, while another man, by means of a long pole at the stern of the man is thrown out upon a wooden. The standard of the long are emptied into the boats side, where the contents of the bag are emptied into the boat. When the boat has received her load, the mari is thrown out upon a wooden. Standard out the standard out

shoot now wasles them into the sea; and they are generally swept from our rivers before the middle of May.

Salmon front, or grilses, which ascend the rivers towards the submon front, or grilses, which ascend the rivers towards the submon front, or grilses, which ascend the rivers towards the species of fish; but some Cathines fishers seas from the species of fish; but some Cathines fishers seas only salmon of one year's growth. (Rep. p. 103.) The sea trout resembles the salmon, and frequents all the streams where it abounds.

Proposity to deposit their spawn in the sea.

The observations of the reporter on various other species of sha, and on salmon and other fisheries, are, like every thing which flows from this pen, new and interesting.

which flows from his pen, new and interesting.

2. Property.

Much divided, largest estate 12,0001. a year: property, at an average, changes his prophetor every forty years. During the superstance of the property of his ool, and the security of his property, or his domestic concerns, without heating half so does not a score of priests to advise him: and he was obliged to compound for the safety of his sool, and the security of his property, by ample domacions to the church. When a man died without granting these domations, it was presumed to be his intention to do so; and what was originally an alms, or returne upon any stee grint. In our days, a man can hardly returne upon any stee grint. In our days, a more an hardly or lawyers at his elbow; and, after all, often finds himself as far from his purpose as if he had not employed them.

3. Buildings.

Sixty gentlemen's seats enumerated; not many with handsome buildings. Farm-houses and cottages most wretched, and slover of improvement than in most other counters.

4. Occupation.

Farms of all sizes, but chiefly small. On the Gramplans,

Farms of all sizes, but chiefly small. On the Gramplans, estimated by the number of sheep they will maintain.

Implements.

Stillmaten by the number of sneep they will maintain.

5. Implements.

5. Implements.

Old Scotch plough still used in a few remote places, and found an instrument well adapted for breaking up waste land found an instrument well adapted for breaking up waste land found at instrument well adapted for breaking up with stones. At no remote period, it was usual to yoke four a with stone abreast in this plough. The driver walked backwards before the horses, and struck them in the face to make them come forward. At present this plough, is commonly drawn by four sometimes by six horses, which are yoked in pairs, and there was the plough which was first invented by tile large driver walks beside them. But, except for the purposes already specified, the plough which was first invented by tile large in universally used.

A threshing-machine, of a very peculiar construction, adapted to very high falls of water, erected at Howmuri, by Stiffing, an ingenious man; but is not yet perfected, and if it were, could never become general, used in the same manner as a fork or spadie, for loosening hard earth or gravel in fact it may be a first or proper force.

Tillage.

sork of space, so recogning mare earn or gravel: in kick it may be called a one-pronged fork.

6. Tilinge.
Fallowing general. Seed-wheat washed with a ley of soft soap, to remove the smut. Potatoes introduced to the gardens in 1745, but not to the fields for many years afterwards. The late Dr. Walker, Professor of Natural History in the University of Edinburgh, was in the habit, especially during years of the cut them into thin slices, and either boiled them over the fire, or dressed them in the frying-pro with as much butter as prevented the pan from burning. When dressed in this way, their taste was very pleasant; and they were used in all cases where bread is commonly used.
7. Gardens and Orchards,
A great prejudice in favour of covering wall trees with aest, to preserve the blossoms from the frost; woollen nets preferred.

8. Woods and Plantations. Pew woods, but many plantations. In the mosses the tranks

Few woods, but many plantations. In the mosses the tranks of large trees found.

9. Rural Economy.

Farm-servants live chiefy on catrueal, and printees and Farm-servants live chiefy or catrueal, and printees and the post of the printees and the printees are sufficient and the little salt; and when it cools it is eaten with milk. Or they use brose, which is made by pouring warm water upon meal, in a wooden dish, with a little salt; a king care to stir it well. This too is eaten with milk, or with beer which is furnished in place of milk, when the latter is, acroe, Sometimes, when cald safe. Their usual dinner is out-cake, with sometimes butter or skim-milk cheese, and milk. Their supper is the same with breakfast, except that sometimes they use sowens or potatoes, in the place of porriging or brose. Rutcher's meat is only used on particular occasions; and fish by those means and the place of porriging or brose. Rutcher's meat is only used on particular occasions; and fish by those sowens or potatoes, in the place of porriging or brose. Rutcher's meat is only used on particular occasions; and fish by those sevens or potatoes, in the place of porriging or brose. Rutcher's meat is only used to predict the place of porriging or brose. Rutcher's meat is only used to predict the place of porriging or brose. Rutcher's meat is only used to predict the place of porriging or brose properties and fish by those sevens or producing their favourite disease called the Scotch, fiddle, and other cutaneous eruptions. In any part of Scotland; and cutaneous eruptions are much

more frequent in some of these districts than they are here, where they are seldom or never heard of. The latter ought rather to be ascribed to dirty linen or clothing, than to ost-meal, or any particular species of food. Oatmeal, when it is sufficiently diluted with any sort of liquid, is known to be a laxative aperient, wholesome, and at the same time a strengthening food for those engaged in hard labour. Engineers, who superintend the excavation of canals, have assured meal and milk did a third more work than those who used butcher's meat, beer, and spirits. All of the former saved onney, while many of the latter involved themselves in debt. As this sort of work is done by the piece, it affords a fair

comparison, not only of the wholesomeness of oatmeal in promoting health, but of its power in supplying labour. All families that have a house of their own use tea and wheaten bread; but among cottagers this is a rare and always occasions. One entertainment, at christenings and other solemn Serveral agrantations.

occasions. Several agricultural societies: the first founded by Dempster of Dunnichen, an eminent improver. An account of the native plants and animals of the county by Don, the celebrated Scotch botanist, who resided at Forfar, possesses great interest for the naturalist. Indeed the whole survey ranks, in this respect, with that of Farey of Derbyshire.

7851. KINCARDINESHIRE or MEARNS. 243,444 acres, chiefly of mountain, but containing about one third of culturable surface. The climate is severe and hilly. The soil is gravelly, mossy, or clayey, and scarcely any where naturally fertile. The only minerals are lime, found in a few parts, and granite, whin, and freestone. Improvements commenced in this county about the middle of the eighteenth century, and have since been carried on with great spirit, (Robertson's General View, 1795.)

Property.
 In few hands: largest estate 40,715 acres, the rest in eighty or ninety estates.
 When the states is a state of the state of t

In few hands? largest estate 40,715 acres, the rest in eighty or ninety estates.

2. **Buildings**
Some old farm-houses still remain, built of stone and turf, and in all respects wretched; but as leases are renewed, new farmeries are erected on the most improved plans, with commodious dwelling-houses. So such cannot be said of the armeries are erected on the most improved plans, with commodious dwelling-houses. The life afteration in structure, for a long space ording.

The property of the content of the armeries of the armeries are did of the content of

It seems to be gentle species of ebriety, which sets the imagination and the tangue at work, without incurring the imputation of drunkenness, or breaking any one precept, human or divine. Wherever it is once introduced, it keeps its ground as certainly as smuff or tobacco, and becomes nearly as inveterate a habit; but happily its erves as an article of food, at the same time that it is a luxurious gratification. The value of the furniture of a cottage may be estimated at from ten to twenty

ture of a cottage may be estimated at from ten to twenty pounds.

The cottagers are moderate and plain in their food; but they are not so in their clothing. Hardly any thing but English manufacture will serve them. At kirk and at market, it is difficult to distinguish the man from the master, and still more so, the maid-servant from her mistress. Either the one or the other have seldom less than five pounds worth of clothes, The rillage of Laurence-kirk was founded by the late Lord Gardenstone, about 1760, and in 1781 he procured a charter by which it was declared a burgh of barony. There is an excellent inn here, with a library and muscum for the use of the traveller. There is a manufactory of sycamore smift-boxes; and the lands in the neighbourhood have been raised in value from ten shillings to three and four pounds per acre.

S. Occumation.

3. Occupation.

Arable farms of various sizes; many small; some 400 or 500 acres. Hill pastures let in tracts by the thousand acres. One farm occupies 50,000 acres. Leases formerly let on periods of two, three, and four times nineteen years, with sometimes a life-rent after; of late the term seldom exceeds nineteen or twenty-one years, unless when great improvements are expected to be made by the tenants. The arable land is cuitiful to the series of the series of the series of the fallow enters, according as the soil is light or clayer. The mountains are devoted to the breeding of cattle. There are few or no public gardens or orchards, but great extent of young plantations, and some patches of native birch and hazel copice. The cattle are a small, hardy, kindly feeding breed, those of the Clydesdale variety are reaved by many farmers, generally kept. There is a good deal of sea-fishing, and some valuable salmon shisteries; but excepting ropes, nets, canvass, &c. there are no manufactures of any consequence.

7852. ABERDEENSHIRE. 1,270,744 acres, one sixteenth of Scotland, and one fiftieth of the area of Great Britain. The surface for the greater part not very irregular, but hilly and mountainous in the district adjoining Inverness-shire: the soil in general clayey and moory; the climate milder in winter than that of Middlesex, owing to the circumambient sea, but the summers short and cold; the agriculture assiduously pursued, and the products chiefly corn and cattle; — great part planted with trees. The report of the county is more than usually intelligent, and contains two preliminary sections, on the lessons which other counties may derive from Aberdeenshire, and on the improvements which this county may derive from others. Aberdeen exhibits a successful example of spade and plough culture combined, in the small holdings of tradespace mechanics conv. keepers and gardeness, and may profit from other counties. small holdings of tradesmen, mechanics, cox-keepers, and gardeners; and may profit from other countries southwards, by greater attention to collecting manure, employing women and children in the lighter operations of husbandry, and limiting tenants to a certain number of subtenants. The celebrated Dr. James Anderson farmed extensively in this county at Mounie, now the property of his eldest son, Alexander Anderson Seaton, a distinguished horticulturist. (Keith's General View, 1811. Edin. Gaz. 1827.)

A. Geographical State and Circumstances.

No metals of coal, and very little limestone, but abundance of excellent grantic, which is used for every out of building at home, and exported to London in great quantities. Heades the durability, there is one other excellence attending the use of this stone; the expense of carving it has simplified the style of architecture. The Braemar mountains abound with cairngorms and other precious stones; some topazes and berjis and the style of th

25,000 waste.

3 Buildings.
A number of vulned castes and religious buildings, and a few handsone modern houses. An ample descriptive list of gentlemen's seats, which are very numerous. Farm-houses, formerly wetched structures of clay, turf, and thatch, are now greatly improved; cottages improving. Decent farm-houses for the began to be thought of about 1760. In 1794, Dr. Anderson observes in his report of the county on which the your Tibis is, The adds, "highly impositive for the proor. This is," he adds, "highly impositive for the proor. This is," he adds, "highly impositive for the proor. This is," he adds, "highly impositive for the proor. The proor of the state of the proor. The proor of the proor. The proor of the proor. The proor of the proor. the proof. The proor of the proof. The proor of the proof of the proor of the proof of the proor of the pro

the mone expended upon them Nothing will prove such an allurement as good buildings, and long leases on equitable terms." Since 1794, when Dr. Anderson wrote the above paragraph, we have got farmers from Berwickshire, Angus, Meanus, and other southern districts, who have taken farms in Aberdeenshire, and many of whom have shown excellent examples in agriculture, as well as improved their own capital; and the native farmers of the county, in consequence of their example, both in requiring good houses, and in raising good crops, are now in a much more flourishing situation.

4. Occupation. Occupation.

4. Uccupation.
The greatest diversity in the size of farms; from six acres to thousands; scarcely a mechanic, journeyman, or master, who has not a farm of one acre or two, or a garden; besides the produce, they find the labour highly conductive to health, by counteracting the effect of in-door confinement; and prolonged unfavourable bedily possures, or contaminating respirations. The property says from a small in how nine broken.

3. Implements.

and the number of concentric circles near its root, viz. 229, showed it to have grown and increased in size for 229 years, besides the time that it continued stationary. Its wood was declared, by all who saw it, to be much superior in quality to any that had ever been imported from the north of Europe. There are thousand of pine trees in Braemar, some of which are userly six feet in diameter, which are superior, in point of point of the demonstration that was ever imported into any place in Great Britain.

ported into any place in Great Britain,

10. Improvements.

Trenching has been already mentioned: within three milesof Aberdeen, above 5000 acres trenched; some acres paid 501per acre for granite bowlders for exportation. Practice of
trenching very general throughout the county.

Trenching very general throughout the county.

Practice of trenching very general throughout the county.

Practice of the county of the c

rator brought from Gloucester, by Ferguson of Pitfour.

11. Live Stock.

More cattle bred than in any other county. Scotch cattle first improved by crossing some English cows sent down by Henry VII. to his eldest daughter, queen of James IV. The produce was known as the Fakikand bred. Williamson's three produce was known as the Fakikand bred. Williamson's three breeds, in the south-rountry markets. They decidedly prefer the true native, annixed, and raised by good keeping, to the mixture of the Fakikand, or Fifeshire breed, with that of this sountry; and consider both these to be much superior to the English, or to any foreign breeds. They justly remark, that the food, or keep, should be always above the breed, and not cattle, which are generally borget statement of the control of the contr

ought to be kitled whenever he loaths his food, or appears to be sickly, or not thirlying.

The sheep few, and of a mixed breed. Horses are native poncies, or purchased from Clydesdale. Poultry very common; great demand for eggs, both for the Aberdeen and London markets. Red deer in great numbers in Braemar, and roes on the bills of Cromar.

the hills of Cromar.

12. Manufactures. About
12. Manufactures. About
1600, Garden of Gilconeston, a wealthy sheep Farmer and manufacturer, had a daughter, who married Lieutenant Cadogan
of Cromwell's army, who afterwards was made a peer, and
from whom sprang the Duke of Richmond, Earl of Leicester,
Lords Cadogan, Vermey, Holland, C. J. Pox, and the heads of
other eminent English families.

Woollen, linen, and cotton, now extensively manufactured.
Knitting of stockings and spinning lint formerly common, but
little attended to since the introduction of machinery.

7853, NAIRNSHIRE and MORAYSHIRE, forming together 512,000 acres of mountainous surface, and some narrow arable vales, are included in one survey. The climate along the Moray Frith has always been noted for its mildness, which is partly owing to its localities, and partly to the general prevalence of a dry sandy soil. On the mountains the climate is more severe. Lead, iron, lime, marl, freestone, slate, &c. are found, but the first two are not worked at all, and of the others, only the freestone, to any extent. (Leslie's General View, 1810.)

1. Property.

In very large estates; as, for example, those of the Duke of Gordon, and Earls of Findiater, Moray, Fife, and Lord Cawdor.

Gordon, and Earls of Findlater, Moray, Fife, and Lord Cawdor.

2. Buildings.

Considerable as has been the alterations in the houses of proprietors, it is nothing to that which has taken place in those of farmers. Prior to the year 1760, in the dwellings of enants there were neither floors, cellings, nor chimneys. In a few of them, the flow wall was ratedly raised of stoom and few and them, the flow wall was ratedly raised of stoom and few apartments was any plaster, and it was raked over the walls in the most ardees mamer; a loft, on which the roof rested without any side wall, distinguished a very few of the most respectable habitations. There was in general but one fire (which served all domestic occasions) in the apartment, where the servants and master, with his wife and maid aughters, lived and fed together. In the higher parts of the district, matters were much worse. Now, upon every farm of any consideration, the buildings are substantial, commodious, and neat.

3. Occumation.

3. Occupation.

3. Uccupation.
As in Kineardineshire; but the arable lands being generally light, the turnip husbandry is more prevalent. It is a singular fact, that in an island in a lake, Loughnadurb; in this country, the turnip is found more plentfully in a wife state than any reporter conjectures that turnips being introduced at an early period from the Continent, the small plot of ground within the walls could not be occupied by any crop more convenient for its temporary inhabitants than that of turnips and coleworts. It may be conjectured that the last crop, probably sown from 500 to 400 years ago, had never been gathered. Until of late te turnips in this island oppung up a numuly in a thick bed,

without culture. The root, in some favoured situations, it is said, had been found of one pound weight; but they resemble in general the wild kind, having a long root like a small radish, of acid juice, and a rough pointed ked. Some plants of redcabbage were also distinguished among them. Both were used as pot-herbs at the tables of the country people, on which account they were sometimes raised in their gardens. When they have been dead to the family of Creigyara, from which account they were sometimes raised in their gardens. When they have been applied as food for eartle. By the famine which unfortunately took place at that period, how, they have they have been applied as food for eartle. By the famine which unfortunately took place at that period, how, that this important object, instead of being extended, was, even there, wholly abandoned.

The cultivation of turnips, as a food for cattle, was, rein the county of Norfolk, by the late Earl of Findiater, about the year 1750.

When the artificial grasses and berbage plants were introduced, only regular gardeners were employed to sow them; orchards; apples imported from England; a few natural woods, and extensive artificial plantations. In general it may be observed, that in this, as in the other counties of the north, every description of improvement has been tried, and such as are found to answer, as draining, burning, irrigation, planting, read-making, &c. carried to a great extent. All the improved addition to them, in the form of circular barrows; the circle of east iron, and the times of wrought ron, screwed in or fastened with nuts and screws. (See fig. 7787.) There is a good deal of fishing carried on along the coast, and the Moray Frith.

7854. The shires of ROSS, NAIRN, and CROMARTY are three adjoining mountainous districts, containing 2,204,800 acres. The soil is in general light, sandy, or peaty. Minerals of various kinds have been found, but only building-stones and lime are worked. (Mackenzie's General Fieur, 1810.)

1. Property.

Is in few hands, and till of late underwent but few changes.
There are no sources of information from which a precise

knowledge of the state of agriculture in these and other northern counties, previously to the rebellion in the year 1745, can be derived; but from what it has been since that time, until about

1760, it may safely be concluded, that agricultural knowledge was neither south for nor desired. The mode of management which has been practised in these counties, and in other parts of the highlands, and which has been handed down from father to son for many generations, is still to be found in the midst of the most improved districts. We still see the arable land divided into small crofts, and many of the hils occupied as commons. On the west coast particularly, the ground is seen covered with heaps of stones, and large quantities are collected on the divisions between the fields; so that a considerable portion of the land, capable of cultivation, is thus rendered unseless, by the indulgence of the most unpardonable sloth. The management of the native farmers is most destructive, and crop succeeds crop, until the land refuses to yield any thing. It is then allowed to rest for a season, and the weeds get time to multiply. Such, we must suppose, was the system for farming before the rebellion; we cannot imagine it to have

2. Buildings.

The old highland tenantry are universally ill accommodated. Thry live in the midst of fifth and smoke; that is their choice. But wherever farms have been laid out on a proper scale, and are occupied by substantial and well-educated men, we find the farm-houses and offices handsome and commodious. Every proprietor who wishes to see his estate rapidly improved, will erect suitable buildings, at his own expense, before he invites a good tenant to settle upon it. The interest of his money will erect suitable buildings, at his own expense, before he invites a good tenant to settle upon it. The interest of his money will erect suitable buildings, at his own expense, before he invites a training shall be made at the mutual expense of himself and his tenant, the latter will thrive, and the former will never have to demand his rent twice. The present race of highland tenants will yet find themselves much happier, and more comtenants will yet find themselves much happier, and more comtenants will yet find themselves much happier, and more com-

fortable, in the capacity of servants to substantial tenants, than in their present situation. The dwellings of cottagers are not worse than those of the native farmers. The same roof cowrs men, women, children, cattel, edge, plags, poultry, &c. It must afford great pleasure to every lover of his country to observe the neat cottages that are erecting in every part of the country; but it will be long ere the people will learn the comforts of cleanlie have been constructed, the people do not use them, hat tyrefee bra sking a hole in the roof of the house, and lightling their fire on the floor. Smoke, they say, keeps them warm.

The occupation and management of land is the same as in other mountain districts. Some grain, chiefly oats, is raised in the low grounds, with root and herbage crops, and the pastures are devosed to the bit sting of cattle and sheep. Every limited the control of the contr

7855. CAITHNESS. 895,680 acres, three eighths of which is deep, mossy, and flat moors, covered with heath; three eighths mountain, moor, and some hilly pasture; and the remainder in cultivatable land, lakes, &c. There is very little wood, either natural or artificial; but excellent lime and frestone. On the whole it is one of the coliest, wettest, and most dreary counties of Scotland; and is in no way remarkable, unless for being the scene of Sir John Sinclair's practical attempts at improvement. Of these the chief seems to have been the enlargement of the town of Thurso; of which, and of various other schemes, ample information is given in the report, and in a number of appendices to it, by Sir John himself. (Henderson's General View 1819) General View, 1812.)

General View, 1812.)

1. Property.

1. Is in a few hands, and the Irish practice of tacksmen tenants exists, and has existed from time immemorial in the county. These tacksmen, as they are called, generally occupy a part of the land themselves, and sub-let the remainder to the same and service (the latter in many cases unlimited); so as to have, upon the whole, a surplus rent for the trouble and risk of recovering their rack-rents from the sub-tenants.

A few young men from the south of Scotland have been frought to this county, to superintend the proprietors farms or domains, for the purpose of introducing the practice of modern husbandry. These, from time to time, have taken farms in this county; but whether their agricultural skill was superficial, or that they did not understand the mode of farming bestereased the crops, nor improved the landlords farms placed under their direction; nor has their industry or skill produced better crops on their own farms than what is raised by a similar class of the county farmers, who have never been out of it.

The principal farmers in the county under review are intelligent gentlemen, who have been for some time in the army, or followed other avocations, either in the southern counties of Scotland or in England, who work their farms upon the principles of modern agriculture, as practised in the southern counties of Scotland, as far as the state of the county, as to climate, roads, the means of improvement, markets, &c. will admit, but at a course, much less benefit to themselves. In general they have other sources of income, which enable them to live in a social and comfortable state in society; they are better educated than farmers paying a similar rent in England; agricultural knowledge, therefore, is soon circulated amongst them.

The smaller class of farmers, with but few exceptions, are in. The principle class of farmers, with our few exceptions, are in. The smaller class of farmers, with our few exceptions, are income; then the class of farmers, with the few exceptions, are income; then the class of farmers, with the few exceptions, are more than the operation of the property of the country of the c

7856. SUTHERLAND. 1,872,000 acres, chiefly of mountain and moor; and a climate about a forfnight later than that of Edinburgh. The greater part of the county is the property of the Marquess of Stafford, whose astonishing, masterly, and successful improvements have been amply detailed in Loch's work, from which we derived so much information for Staffordshire and Shropshire, and to which we again recur. (Henderson's General View, &c. Loch's Improvements of the Marquess of Stafford, &c. 1819.)

again recur. (Henderson's General View, 5c. Loch's The estates of Sutherland have only lately undergone that change which began to operate in England as far back as the reign of Henry VII. This change had for its object the creation of a middle class, by the depression of the barons and the raising up of the next class of the community. This object the creation of a middle class, by the depression of the barons and the raising up of the next class of the community. This object time of Queen Elizabeth, and in the south of Scodland soon after the union of the two kingdoms: but the highlands, or most northerly counties, underwent no change till the discomfiture of the pretender, and the abolition of the heritable jurisdictions then existing in the north, in 1747. This invaluable clicking the existing the heavy and placed them on the same footing as the other gentlemen of the land, they began rapidly to acquire the same tastes, to be occupied with the same pursuits, to feel the same desires, and to have the same wants as their brethrem in the south. In order, however, to include these propensities, and cessary that they should convert their estates to that mode of occupation most suited to their circumstances, and from which they could derive the greatest income. Luckly in this, as in every other instance in political economy, the interest of the individual and the prosperity of the state went hand in hand. And the demand for the two material of wood by the English or quadruple the amount they ever before produced to him. These arrangements continued to be carried into effect from time to time, in the southern and certral highlands, up to about the commencement of the French revolution war; not always, however, without userious resistance on the part of the land which the rest of the island had alweady adopted. In this district

alw ays, however, without serious resistance on the part or tange people.

The northern highlands still remained to undergo that change which the rest of the island had alweady adopted. In this district in naturally Legan to be followed in the counties situated nearest to those into which it had already been introduced. In Ross-shire, accordingly, it was undertaken on a great scale, in 1792. The dissastisation produced was so great, that the most serious affrays took place, and the military had to act, and blood was shed before quiet was restored. Between that time and 1816, the greater portion of the county of Sutherland, time and 1816, the greater portion of the county of Sutherland, to those plans out all Landy Scafford, was arranged according to those plans out all Landy Scafford, was arranged according to those plans out all Landy tenford, was arranged according of society prevailed longer on the estate of Sutherland thain any other part of the island, on account of its difficult access

for Staffordshire and Shropshire, and to which we Improvements of the Marquess of Stafford, &c. 1819.) across the Dornoch and other friths, and the total want of roads in the county till 1809. The estate of Sutherland (fig. 1131. a, a, a), including the barony of Assynt (b, b, b), and the late purchases made by the Marquess of Stafford, up to 1819, was computed to contain more than 800,000 acres. The estate of Lord Resy (c) is more than half that extent; it was purchased some time ago by the Marquess of Stafford, and another across the stafford of the

must be formed of the most durable materials, and the best workmanship, to resist the impetuosity of the torrents. Nothing will set this in so striking a point of view, as to state, that upon the projected road to Assynt, a distance of forty-six miles, of inferior dimensions, would be required. On the Stafford

estate excellent inns, often combining farmeries, have been built in a number of places at an enormous expense. As an example, we may refer to one (fig. 1132.) containing an outer kitchen and servants' stair (d), with a panty (b), two best parlours, with movable partition for great occasions (c), principal enterther (e), a small pariour (e), small room (f), kitchen (e), and nine garrets for beds.

Thus, in the course of twelve years, has the courty of Sutherland been intersected, in some of its most important districts, with roads, in point of execution superior to most roads in England. And owing to the equally praiseworthy exertions of the counties of Ross and Inverness, on the one hand, and of Gaithness on the equally praiseworthy exertions of the counties of Ross and Inverness, on the one hand, and of Gaithness on the equally praiseworthy exertions of the counties of Ross and Inverness, on the one hand, and of Gaithness on the equally praiseworthy exertions of the counties of Ross and Inverness, on the one hand, and of Gaithness on the extensive the exercises of the town of Thurro upon the North Sca.

For districts of Scotland possess so wantle a proportion of land fit for cultivation, compared with its extent, as Sutherland; and previously to the year 1511 but even a small portion of that was brought into cultivation. Each shore is fringed (if the expression may be used) with a narrow border of arable land, which, on the about one make extends from a few hundred yards to about one mission of the more consists entirely of mountains.

The lands were let to tacksmen, as in Ireland, till in

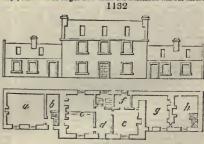

about one mile in breadth: the interior consists entirely of mountains.

The lands were let to tacksmen, as in Ireland, till in latter times, when a certain district was let to the whole body of tennatr seisdent in each "town or township," who bound themselves, conjointly and severally, for the parment of the whole rent. This land was sometimed to the mountains of the mountains who can be more more field land in England.

The effect of this arrangement was to scatter thickly a hardy, but not an industrious race of people up the glens, and over the sides of the various mountains; who, taking advantage of every spot which could be cultivated, and which could with any chance of success be applied to raising a precarious crop of interior oats, of which they baked their cakes, and of here, industry, and contributed nothing to the weeth, of the empire. Impatient of regular and constant work, all the heavy labour was abandoned to the women, who were employed, occasionally, even in dragging the harrow to cover in the seed.

To build their hut, or get in their peats for fuel, or to perform any other occasional labour of the kind, the men were when not a besist; but the great proportion of their time, spent in Indolence and sloth. Their huts were of the most valuable portions of the mountain side. Their roof consisted of the same material, which was supported upon a rude

wooden frame, constructed of crooked timber, taken from the natural woods belonging to the proprietor, and of moss-fir dug from the peat bogs. The situation they selected was uniformly on the edge of the cultivated land, and of the mountain pastures. They were placed lengthways, and sloping with the declination of the hill. This position was chosen, in order that all the fills might flow from the habitation without further

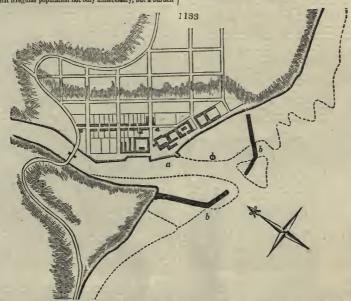

exertion upon the part of the owner. Under the same roof, and entering at the same door, were kept all the domestic animals belonging to the establishment. The upper portion of the hut was appropriated to the use of the family. In the centre of this upper division was placed the fire, the smoke from which was made to circulate throughout the whole but, for the purpose of conveying heat into its farthest extremities. The effect being to cover every thing with a black glossy soot, and to produce the most evident hijury to the appearance and eyesight of those most exposed to its influence. The floor was a recommendation of the state of the respective soils of which it was rudely care, and it soon wore into every sort of incumility, according to the hardness of the respective soils of which it was composed. Every hollow formed a receptacle for whatever fluid happened to fall near it, where it remained until absorbed by the earth. It was impossible that it should ever be swept; and when the accumulation of filth rendered the place uninabiliable, another hut was erected in the vicinity of the old one. The old

rafters were used in the construction of the new cottage, and that which was abandoned, formed a valuable collection of manure for the next crop.

The introduction of the petado, in the first instance, proved no manure for the next crop.

The introduction of the petado, in the first instance, proved no considerable that the petado in th

to the proprietor to whom the land belonged, the people were removed, and the mountains were covered with sheep. So that it had been for a length of time proved by the experience of the stock farmers of those mountain tracts which comprise the northern districts of England, and the southern parts o Sootland, that under structures were peculiarly suited for the main-guide, experience had still further proved, that the central and western highlands of Southard were equally well calculated for the same end. Reasoning from this success, and observing that the climate of Sutherland, owing to its vicinity to the ocean, and to its being considerably intersected by arms of the sea, and much more moderate than this latter district, it was fairly concluded that this county was even better fitted for this fliveness-shie. The inferior elevation of its mountains contributed still further to this effect, and held out every encouragement to adopt the same course which had been pursued with such success in both parts of the kingdom. The propriety of converting the mountainous parts of the county into inceptually as in this way rendered evident, provided the people could be at the same time settled in-situations, where, people could be at the same time settled in-situations, where, decent livelihood, and add to the general mass of national wealth, and where they should not be exposed to the recurrence of those privations, which so frequently and so terribly afflicted them, when situated among the mountains.

settle there. Such is the policy of Lord Stafford's opera-tions, in which he has expended, and continues to ex-pend, independently of the cost of improvements on the mansion (fig. 1134.) and park of Dunrobin, Immense sums. Happily the success has equalled the most sanguine expecta-tions; but for the very interesting details of execution, our limits chilge us to refer to the work of Loch, which, as already observed (7795.), we consider of very singular agricultural interest.

7857. INVERNESS-SHIRE. Upwards of 7,000,000 of by far the most mountainous region in Scotland. It reaches from sea to sea on the main land, and comprehends many islands, which are scattered far and wide. The hills and moors were formerly covered with fir woods, the remains of which are dug up in all the moors in abundance. The climate is rainy, mild on the west coast, but less so on the east. The soil of the vales is loamy or gravelly. The principal economical minerals are granite, lime, stone, and slate; but lead, iron, marble, &c. have been found in different places. The county is remarkable for its native fir woods, and for that stupendous national work, the Caledonian Canal. Improvements were first commenced about Inverness by Cromwell's soldiers. (Robertson's General View, 1810.)

1. Property.

In few hands; largest, Lord Macdonald, of the Isle of Skye, the only nobleman who resides in the county. The mountain farms are large, and, as in similar cases, reckon by miles, or by the number of sheep they are supposed to carry.

2. Gardens and Orchards.
To be found in a few places; and some old pear trees, planted by the monks, are still in a bearing state at Beauly, and one or mursery at Inverness.

3. Woods and Plantations.

The Scort nine, for the most part, took possession of the

nursery at Inverness.

3. Woods and Plantations.

The Scotch pine, for the most part, took possession of the south side of the valley, and made choice of a northern exposure; the birch, the hazel, and the oak, occupied the warmstep of the part of

for tanning.

4. Live Stock.

Cattle are of the Skye or Ky'oe breed, usually, however, known as the highland breed, and aiready described. (6796.) The cows yield only half the quantity of milk of the breeds of the low counties; generally from two to two gallons and a half; but it is rich, and productive of butter of excellent flavour. The control of the stock, and productive of butter of excellent flavour. The of cattle is as follows: When the drovers, from the south and interior of Scotland, make their appearance in the highlands, which always happens during the latter end of April, or the beginning of May, they give intimation at the churches, that upon a particular day, and in a central place of the district, they are ready to purchase cattle from any who offer them for sale. The drovers are of two descriptions: either those who buy by commission for persons of capital, who, being difficient home; or those who purchase cattle on their own account. Much address is used on both sides, to feel the pulse of the market at these parochial meetings, before the price of the season is mutually settled; and it may happen, that many such small trysts or meetings uske place in different parts of the highlands, before the price be finally determined. The anxiety on both sides is sometimes so great, that if the price rises within 1000 places.

a limited time, the seller will receive so much more; but if the lean cattle fall in value, the drover will get a reduction. Sheep are extensively reared, and generally of the Linton or Lammerrauir black-faced sort. The Cheviots are also very

Prevalent.

Horses either the native pony or improved breeds from the low countries farther south.

Ross are frequent in a wild state in all the woody and warm

5. Political Economy.

Solution 1 Economy.

Roads and bridges have been going forward at the expense of Government ever since 1745, and earlier; and the Caledonian Canal is well known for its magnitude and the excelence of its execution. There are various fisheries on the lakes and coasts; but few manufactures.

There are various fisheries on the lakes and coasts; but few manufactures.

And the other highland counties, and indeed to every counts, the reporter mentions the stubbornness of the common people, in adhering obstinately to old and slovenly habits. As men rise in years, the reluctance to make any uncommon exertions, and particularly to introduce change into any thing, which relates to their personal accommodation, gradually grows upon them ment, of gratification, of lodging, of dress, and of food, they resist strenuously the relinquishment of any of these habits; they move on in the current of human life mechanically, like a wheel, without any apparent alteration in their motion, unless the accomplished by some external force; and, if left to themomenate the same men, and to retain the same customs, is more meaning the learned or enlightened part of mankind. By means of society, of conversation, and of readings, the latter acquire an enlargement of the mind, to which the former are strangers; and if they be accustomed to reflect on what they hear and see, has a constant of the disposition, which, whether in the rich or the poor, the uncultivated or the refined, is still the child of ignorance, takes fast hold of the mind, it becomes so obstinate, that it can be provided the property of the world would effect of imitation.

The reporter, not withstanding the above sentiments, goes to state that the considers that the property of the world would to state that the considers that the property of the world would

causers and such things before them, would imply that it is the effect of imitation.

The reporter, notwithstanding the above sentiments, goes on to state that he considers that the prosperity of the world would be more promoted by the steadiness and obstinacy of men living in error, that it would be by a spirit of fickleness, and a desire of change. It might easily be shown that the real meaning of such a sentiment is, that those who are already prosperous, that is, those who have altered a unification and the term of the goes, while things remains as the season of the prosperity of the season of the world, it unfortunately happens, has hitherto been too frequently understood to mean the prosperity of those only who are already prosperous. This state of things is in the natural course of the progress of society from darkness to light: but it will pass away in its turn, and the time will come when the prosperity of a people will really mean what the words import. When this time arrives, what the reporter would probably call fickleness, and a desire of change, will be found to have had some share in bringing it to pass.

7858. ARGYLESHIRE. 2,433,000 acres; the eleventh part of Scotland, and the thirtieth of Great Britain, and nearly the whole of the Scotlish kingdom from A. D. 503 to the subjugation of the Picts in 843. The surface of the country is rough and mountainous: in the northern parts "Alps piled on Alps hide their heads in the clouds." The climate is moderately mild, very moist in the vales and on the coast, but cold and severe on the elevations. The soil of the vales is generally light; the minerals are copper, lead, iron, coal, strontian, freestone, granite, limestone, marble of several different colours, slates, &c. but the two first are not worked at present. There are numerous bays, inlets, and lakes, in some of which excellent fish is caught. The county is in no respects remarkable in an agricultural point of view; it furnishes immense quantities of cattle and sheep to the graziers and feeders of the south; and there are some oak coppices and artificial plantations. (Smith's General View, 1810. Edin. Gaz. 1827.)

1. Property.

In the hands of 156 owners. Farms of the smaller size rectomed by nere, the largest by miles. One, supposed to be the largest in Britain, is eighteen or twenty in length, by three or four miles in breadth; several contain from two to six square miles: object, as in Inverness-shire, the breeding of cattle chiefly, and next sheep.

2. Improvements.

Have been made by most of the proprietors: some plans of farmeries are given by the reporter. One is circular, and consists chiefly of cattle sheds; but the elevation is of that mongred thateaus. The displayed are good for modern highland chattenins. There are about 30,000 acres of coppiec, chiefly oak, birch, and hazel, which, being now valuable for the harky, and the poles to be used as spokes for wheels, is beginning to be en-

closed from the sheen by stone walls. The Duke of Argyle is the chief planter, and his larch plantations are of great extent, and contain an immense quantity of valuable timber. The oldest and largest of the trees at Inverary are supposed to have been plunted by the Marquess of Argyle between the years 1650 and 1660. Those of the next largest size and age were raised from the seed by Archibald Duke of Argyle (called a tree-monger by Walpole), in 1746 or 1747. These consist chiefly of larches, New England pines, spruce and silver firs.

4. Live Stock.

Cattle, the west highland breed; the best in the districts of Argyle, Lorn, Ilay, Colonsay, and Mull.

Shep, till lately, much neglected.

Horses, a hardy native breed, larger than the pony.

5. Political Economics

S. Political Economy.

Roads as in Inverness-shire. A canal from the coal works in Campbelton to the sea: few manufactures. An agricultural society at Kintyre.

7859. The HEBRIDES, including BUTESHIRE, consist of nearly 300 islands, eighty-six of which are inhabited, and contain 2,057,760 acres of rocky, hilly, and, in some islands, mountainous country, with a severe, unsteady, moist climate, and a soil generally light. Almost all the minerals are found with which the continental part of Scotland is furnished. Slate, lime, granite, marble, and freestone, are in great abundance; and coal has been found in various places, though it has not been successfully worked. Steatite, or soapstone, from which porcelain is manufactured; fullers' earth, and a great variety of other

economical minerals, besides rare and curious species, are found in different islands. (Headrick's Survey, 1796. Macdonald's General View, 1811. Edin. Gaz. 1827.)

1. Property.

In the hands of forty-nine proprietors; highest rental 18,000t. and acres 512,000. A great many tacksmen. Those of Ilay are said to "combine with the spirit and elegant hospitality indigenous to this country, the actif qualifications of first rate low country farmers. It must not be forgotten, in mentioning the order of tacksmen, that they are exceedingly useful, and often necessary for maintaining good order and government in the country. Without their aid, the efforts of the clergy and officers of justice would be painful and unavailing: and thereviewed in nother light then nearly as subsidiary to the police and moral administration of the Isles.

efficers of justice would be painful and unavailing: and therefore they ought not to be rashly banished, were they to be viewed in no other light than merely as subsidiary to the police and moral administration of the lates.

2. Buildings.

2. Buildings.

2. Parm-houses throughout the Hebrides are either houses of tacksmen, of tenants, or subtenants. Tacksmen's houses, though still far behind those of considerable farmers in the principal ever, in general, beginning to be tolerably decent and comfortable; and on all the large estates they have been very much improved within the last twenty-five years. Most of them are now built of stone and lime, and roofed with blue states; two stories high, and furnished with kitchens and other accommodations. In many instances, indeed, the office-houses are still; and should this order of farmers exist for half a century longer, their houses will, probably, be as commodious, and their office-houses as judiciously planned, as those of the subrenants nasty and minerable houses as the substance of the subrenants nasty and minerable houses of the occupying tenants are, generally speaking, wretched hovels, and those of the subrenants nasty and minerable houses of the occupying tenants are, generally speaking, wretched hovels, and those of the subrenants nasty and minerables and the substances of the subrenants nasty and minerable houses of the occupying tenants are, generally speaking, wretched hovels, and those of the subrenants nasty and minerable houses of the occupying tenants are generally speaking, wretched hovels, and those of the subrenants nasty and minerable house of the subrenants nasty and minerable houses of the occupying tenants are generally speaking, wretched hovels, and those of the subrenants nasty and minerable houses of the subrenants nasty and minerable houses of the substances of the subrenants nasty and minerable houses of the subrenants nasty and minerable houses of the substances of t

Implements.

4. Implements.

Some are nearly peculiar to the Hebrides, as the caschrom or crooked spade (fig. 1137.), which, in two parishes in the Isle of Lewis, entirely supersedes the use of ploughs in the raising of corn and potatoes. The great advantage of this intellegence of the control of the co

the norizontal clod which its powerful lever enables him to turn over.

The ristle, or sickle plough (a sort of paring plough), is used for cutting the strong sward of old land, or the tough roots of plants, which would otherwise greatly impede the passage of the plough.

The clow-maik, or wooden tongs, for drawing thistles, &c. iffers little from those in use in England.

Arable I.and.

5. Arable Land.
Tillage is in its infancy over the Hebrides, in all the isles northward of Mull; excepting half a dozen farms in Skye, a part of M²(eod, of Rasay's estate, two farms in Uist, and a little lately done in Lewis, near Stornaway, and by Campbell, of Islay, on a small island between North Uist and Harris. These improvements have been carried on within the last fifteen wars.

These improvements have been carried on witum uses then years.

It would be rather Indicrous than useful to describe the tillage generally practised in the Hebrides; and, accordingly, we shall not dwell upon it, or insult the common sense of the natives, by scriously requesting them to ahandon the many harbarous customs which have so long disgraced their country. A nam walking backwards, with his face towards four horses abreast, brandishing his cudgel in their noses and yes, to make them advance to their enemy, followed by a ristle-plongh employing a horse and two men, the three commonly altogether superfluous, still followed by four horses, dragging climps; and their spinal marrows, fixed by hair ropes to their tails, and a ristle plant of their spinal marrow at every ug and writhing of their tortwed carcasses. All this cavalcade on ground unenclosed, undrained,

and yielding at an average little returns for the seed sown, and sometimes lost altogether by the depredations of cattle, or by accident in a late harvest, is a barbarous spectacle, which must gradually vanish. It will soon grive way, as it has altered done in Islay, Colonsay, and part of Skye, to improved systems of tillage.

tillage.

6. Gardens and Orchards.

It is not to be expected that much should be done in gardening, in a district of which by far the greater part of the proprietors are non-resident, nor is the climate suitable for that The winds are too violent, so the suitable for the The winds are too violent, anorts of shelter become, therefore, more general, the gardens and orchards of the Hebrides will probably be juited more than an empty name.

7. Woods and Plantations.

In the sixteenth century it appears most of these lales were

8. Live Stock

8. Live Stock.
The anclent Hebridean breed of cattle is now no longer to be found. Some persons imagine it to be the Skye, others the Mull, and others again the Lewis or Long Island variety. A person habituated to accurate observations on cattle, can easily distinguish those different breeds from one another, and all of them from the larger breed now introduced into Islay, Colonary.

say, and some parts of the Long Island, especially Barray, by persons who pay attention to so important a department of

asy, and some parts of the Long Island, especially Barray, by persons who pay attention to so important a department of agrestic economy.

Shep. Only lated with in almost all the larger islands, viz.

1. The native abortignal breed, common to the whole Heirifales forty years ago, and still more numerous than the other two breeds taken together; 2. The Linton, or black-faced sheep of the south of Scotland; and, 3. The well known, fine-woolled, Chevior breed. The historian Laing has a large flock of Merinos in the Orthers.

1. The native abortignal breed, to make see seembles that which the state and surface. It is small, active, and remarkably durable and hardy. It possesses the prominent marks of perfection in this sort of animal, i. e. it is strong and namble, of a good form and proper size for its work, healthy, patient, good-tempered, and very easily kept in good condition. It is found in the Highlands of Scotland, in Wales, Norway, Sweden, Switzer-riation in shape and size, in all the hilly districts of Europe. The average height of what are deemed sizeable horses is from twelve to thirteen hands; but that of the lower tenants' horses in Mull, Jura, and the northern isles, rarely exceeds sleewn or twelve hands. They are handsomely shaped, have small legs, large manes, little near heads, and manifest every river, bay, and back; the last-mentioned colour is thefavouritie. Excepting in Islay, and in a few gentlemen's farms, not exceeding two dozen in number in all the Hebrides, very little has hitherto been done for bringing this breed to perfection, or reventing it from degenerating.

The breeding of horses for sale is not carried on to a considerable extent in the Hebrides, nor does any of them export and perhaps Arran and Eige.

Hogs. Considerable numbers of hogs are now reard in the Hebrides, where the ancient prejudice against pork has gradually vanished, since their more intimate connection with the lowlands of Scotland and England.

Good still maintain their ground on several islands, and in Good still

to crop twigs and plants of every description, and is a mortal enemy to every species of growing woods.

New species, or varieties of stock. Excepting the ass, and perhaps the mule, it is not clear that this extensive region would gain by introducing any new sorts of domesticated animals; indeed, the great want felt by the Hebrides is not that of animals, but of food in winter and spring for those which they in the very best possible for the cows and horses are, perhaps, the very best possible for the foods and horses are, perhaps, the very best possible for the cows and horses are, perhaps, the very best possible for the region of the compact and handsomest pairs as breeders, be improved to an indefinite pitch of excellence. The breeds of sheep already recommended and described may be improved, and reared to five times their present numbers, without seriously injuring the agriculture or other interests of the country; and a vast accession of wealth hongs, for which these kidns breeding a competent number of hogs, for which these kidns breeding a competent number of hogs, for which these kidns breeding a competent number of non-progressively and slowly, and they must advance in the train of other agricultural and economical improvements.

9. Political Economy.

Roads much wanted, and, excepting in Bute, Islay, and Skye, in a very wetched state. No iron railways or canals. No equal portion of European population, not even excepting the Russians, and most uncivilised Poles and Croatians, possesses for a supplication of the control of European population, not even excepting the Russians, and most uncivilised Poles and Croatians, possesses for a supplication of the control of European population, of even excepting the Pusians and most uncivilised Poles and Croatians, possesses for a supplication of the control of European population, of even excepting the frame of the population of the district, continually flow out of it, and prevents that gradual advancement in wealth, comfort, and agricultural and economical imp

7860. The ORKNEY ISLANDS are thirty in number, and contain about 384,000 acres.

7860. The ORKNEY ISLANDS are thirty in nu Many of them are unlohabited, and only afford pasture for sheep. The soil is generally peat moss or bog, but sand, clay, and gravel are found in some of the valleys. The soil is seldom more than one or two feet h depth, lying on a bed of rock. Husbandry is in a very backward state. The plough used is and on the quantity procured the farmer slidely see weed, and on the quantity procured the farmer slidely see weed, and on the quantity procured the farmer slidely see weed and on the quantity procured the farmer slidely see weed, and the procured the farmer slidely see weed and on the quantity procured the farmer slidely see weed and on the quantity procured the farmer slidely see weed and on the quantity procured the farmer slidely see weed and on the quantity procured the farmer slidely see weed and on the quantity procured the farmer slidely see weed to a state of the slidely shade the slidely s

agreeable flavour. Till within the present century, the Orkney sheep were suffered to run wild about the hills, without any care being taken of them; when in this state, the weight of the entire cercass rarely exceeds twenty-five or thirty pounds, and the wool seldom one pound and a haf's when carefully treated, however, they grow much larger, and the flesh becomes very good.

and the woos section one pound and a nat'r when carefully rested, however, they grow much larger, and the flesh becomes the presence of the greatest curiosities in these islands is the circumstance of large seeds being frequently washed on shore by the Atlantic. They are called Molucca or Orkney beans, and are supposed to be of American and West Indian origin. Pods of the Mimòsa scándens are the most common. Strange fishes, marine shells, and even exotic fowls, are also sometimes cast on shore in violent weather. There are many varieties of wild flowl in the Orkneys, and eagles are not only common, but so large as to make great havoc among the lambs. The islanders have a law, by which every man who kills an eagle is entitled have a law, by which every man who kills an eagle is entitled. The corby (Cérvus Cént) is dee and the proposed in the corby (Cérvus Cént) is dee and the corby (Cérvus Cént) is dee the part of the sistence of the islands, is wool, which used formerly to be torn from the sheep by the fingers; the sheep are now shorn, and as they are never smeared (except when actually ill of the scab), the wool is remarkable for its softness. (Edin. Gez. 1827 Elakiet on Sheep Husbandry in Orkney, in Trans. Highl. Soc. vol. iv. p. 599.1

7861. The SHETLAND ISLES are about eighty-six in number, of which forty are inhabited; the whole contain about 48,000 acres, nearly equally divided between pasture land and arable.

whose contain about 48,000 acres, nearly equally div The climate is very humid, and cold northern and easterly winds are extremely prevalent. Winter may be sald to occupy full six months in every year, and if the harvest is not over in There is a great diversity of soil; often deep moss on a bottom of sand, though sometimes the moss or peal is only a foot thick on a bed of olay. There are scarcely any trees or shrubs, excepting juniper, and occasionally a few mountain ash; the roots of large trees are, however, often discovered on digging deep into the ground. Turf and peat are used for fuel. The Shetland horses are well known; they are very small, rarely exceeding ten hands in height, and are celebrated for their very small, though they feed well, and weigh astonishingly heavy, in proportion to the size of their homes; they give generally about three English quarts of milk a day, though in rich pastures they sometimes produce double that quantity. The number of sheep kept in the Shetland Islae is calculated to be between 70,000 and 80,000. The wool is very short, and though enerally fine, is sometimes nearly as coarse and hairy as that of a goat. The Islands are well supplied with fish, and have

multitudes of amazic birds; the shabitutes are much amoyed by eagles and other birds of prey; there are no rivers, but alumdance of lakes and rivulents, which afford an ample supply of fresh water. The chief employment of the inhabitants is in the manufacture of woollen stockings and gloves of extraordinary fineness, and in their fisheries, from the produce of which they also export annually export about 1000 tons of cod, task, and ling; they also export annually about 500 tons of kelp. Agriculture is at sible description, and of the rudest construction; the farmhouses are wretched hovels, and the roads mere foot-paths. The small portion of land, however, which is tolerably well cultivated, is very fertile. Granite, freestone, and limestone are abundant, as is the beautiful and comparatively rare stone, called diallage rock. Bog from or abounds: a copper mine called diallage rock. Bog from or abounds: a copper mine chromate of irom has been fine meen than the continuation of the mine cartily but no potteries have as yet been established. (Edis. Gax. 1829.)

SECT. IV. Agricultural Survey of Ireland.

7862. IRELAND, the largest island in Europe next to Britain, contains above 20,000,000 of acres, much less varied in surface, soil, and climate than the latter island. There are several mountainous or hilly districts, chiefly in Ulster in the north, and Munster in the south, and very extensive flat bogs in the middle districts, and upland bogs or moors wherever there are hills or mountains. All these bogs, whether low or high, are on good soil, which, indeed, may be considered in connection with the moist warm climate as their chief cause. Nine tenths of the soil is a loam on a limestone bottom, fertile, or capable of being rendered so at little expense; the remainder is chiefly thin clay or limestone. The bogs are here considered as mere coverings to soils; their surface exceeds 1,000,000 of acres. The climate is

milder and more equable than that of England; and with the dry soil, as Wakefield remarks, is admi-rably adapted for pasturage and occasional aration.

rably adapted for pasturage and occasional aration.

7863. Of the agricultural circumstances of Ircland generally, we have already given a condensed account (807), and shall here submit some brief notices as to each county. These unavoidably present a degree of sameness incompatible with much interest or instruction. There are agricultural surveys of but a few of the Irish counties; so that we have drawn our resources principally from the copious and highly interesting work of Wakefield, and some more recent statistical writers and tourists. When the first edition of this Encyclopædia appeared, the statistical portion, as far as respect Ireland, was objected to in the Irish Farmer's Journal, as representing the agriculture of Ireland as being in the same state in 1823 as that in which it was in 1816, the date of Wakefield's Ireland. We have noticed this in the Gardener's Magazine (vol. iii. p. 229.), and have, since then, used every exertion in our power to procure later information from books or correspondents, but without much success. In fact, from all that we have been able to learn, we are compelled to conclude, that even now (1830) agriculture in Ireland is not materially different to what it was in the time when our text-book (Wakefield) was first published.

7864. DUBLIN. 228,211 acres; one eighth in mountain and waste, a tenth in buildings, roads, rivers, &c., and the remainder in arable and pasture. (Archer's Statistical Survey, &c. 1801. Sup. Eucyc. Brit. Edin. Gaz. 1827.)

Brit. Edin. Gaz. 1827.)

The climate of this county is drier than that of some others; east and north-east winds are less frequent than in England, but storms from the south-west and west are more frequent. Average number of dry days in Dublin flor ten years, 179; or nearly half the year wet, and half dry.

The soft is generally shalf they be substratum almost. The soft is generally shalf they are the substratum almost in the south. Presentine, Irish slate, othres, potter's clay, mart, beautiful pebbles, porphyry, crystals, limestone, and limestone gravel, abound in various parts.

Landed property in this county is a much more marketable commodity than in most other districts of Ireland. There are here no large territorial duffich other districts of Ireland. There are here no large territorial duffich of the purpose of creating a vote. Furms are in general very small near the city, seldom more than twenty or thirty acres; but at a distance, from 50 to 160 acres. The farm buildings are, for the most part, very insufficient. Near the city, the fences are of white thorn; but in the remote parts, they are nothing more than a bank and ditch. Lime, limestone gravel, and marl are used as manures. The city of Dublin might afford the means of enriching a truct of everal miles around it; but its street dung is so little valued, that it is

sometimes brought to Scotland by coasting vessels as ballast, and much of it is thrown into the Liffey.

On the arable lands, two crops of wheat in succession, and after these two of oats, without fallow or green crop, are frequently taken, according to Archer. Osts and potatoes are the standard patterns are, with five exceptions, of an inferior quality. There are few or no flocks of sheep in the possession of farmers. In the city, and within four miles of it, about 1600 cows were kept in May, 1801, according to Archer, where there were formerly mear 7600. The old Irish breed of cows is almost extinct, and their place is supplied by the short-horns and other breeds from England. Fuel is scarce and dear; pear and bog often cannot be procured, and the tenant is obliged to substitute straw, or There is a considerable sealow, flathery on the Liffey, in which also abundance of eel and pike are caught. There are as fisheries of herrings, white fish of different kinds, and oysters both in natural and artificial beds; the shells of some of the fed oysters have been found as large as a horse-shoe.

The manufacture of the county are chiefly of linen of different kinds, but they are of little importance. The colonial commerce with Dubln is considerable.

7865. WICKLOW. 500,000 acres, in great part mountains and bogs, and without inhabitants. (Frazer's Survey of Wicklow, 1801. Sup. Encyc. Brit.)

The climate so mild, that the myrde flourishes in such profusion, as to have been sometimes used for making stable brooms. The common laurel, Fortugal laurel, and Arbutus same shrubs. Dublin is supplied with early potatoes and house-lamb from the sea-coast of Wicklow, the climate of which, according to Mr. Wakefield, is decidedly different from that of the rest of Ireland. This is the only part of that country where he ever saw grapes growing out of doors.

Metallic ores are supposed to abound; copper and lead have been worked, and gold has been found.

There are no navigable rivers or extensive lakes. Some of the streams precipitate themselves from considerable heights, forming beautiful cascades; the most remarkable one is at Powerscourt, whete the water fails from a height of 500 feet.

Landed property in the centre of the county in large estates:

Earl Fitzwilliam's nearly 100,000 acres. The sea-coast is much divided, and abounds with villas, the temporary residence of the wealthy citizens of Dublin. "It appears to me," says Wakefield, "to contain more gentlemen's seats than the same space in the vicinity of London." The common period of leases is twenty-one years and a life. Potatoes, and all the usual kinds of corn, are cultivated; but turnips, clovers, and other ameliorating crops, only partially. Mari and limestone gravel are the principal manures. Irrigation is practised. A county, exhibit the only traces of a distinct race of short-woolied sheep in Ireland.

The herring fishery in the bay of Wicklow is the best in Ireland after Galway. Flannels are extensively manufactured, but scarcely any linen.

7866. WEXFORD. 597,760 acres, mountainous on the north and west, a light soil and tolerable cultiva-tion on the east, and in other parts a cold stiff clay, unimproved by culture. (Wakefield. Frazer's Survey of Wexford, 1807. Sup. Encyc. Brit.)

The climate is mild and favourable to the growth of timber, which abounds here more than in most counties. There are some large myrtles in the open gardens.

The landed estates are large, from 2000.t to 10,0001. a year, and farms of various sizes; but there is little of that minute division which is common in other parts of Ireland; nor are there any rich grazing farms. Dairies, at which the principal article is butter, are numerous; but generally under bad marticle is butter, are numerous; but generally under bad marticle is butter, are numerous; but generally under bad marticle is butter, are numerous; but generally under describing a string of the s

of Forth and Bargie have been long noted for their great crops of barley; beans, too, are cultivated with success, as well as clover and turnips; the drill estem is common for potatoes, and preferred to any other method; and lime, though brought from a distance at a great expense, and also marl, are very extensively employed as manure. The tenantry, including the cottars, are accordingly in a much better condition, industrious, provident, and many of them comparatively wealthy. Here, as in Cork and Waterford, whole fields are kept under fairze, which, in this mild climate, is pretty much used as fuel. The standard of the comparatively wealthy in the comparative of the conditions of the comparatively wealthy. The conditions are comparatively over the conditions of the conditio

7867. KILKENNY. 510,000 acres, mountainous, but with some rich and beautiful vales on the banks of the Barrow, Suir, and Noire, and a climate so mild that in winter the thermometer seldom falls below the freezing point, while in summer it ranges between seventy and seventy-five degrees. There is less humidity than in Dublin and Wicklow, as well as less of the east and north winds. (Tighe's Survey of Kilkenny, 1802. Sup. Encyc. Brit. Edin. Gaz. 1827.)

This county has many romantic situations, ornamented with country seats; and its flat districts, where the tillage farms are more extensive than in most parts of Ireland, present a prospect of the property of the solid present a prospect of the solid present a prospect of the solid present and the solid present a prospect of the solid present and the solid present and the solid present a prospect of the solid present and the solid prese

Property in land is in several large estates, and many of a moderate extent, not exceeding a rental of 20001. a year. The produced properties are Lords Beckerough, Cliffon, and properties are common, though prohibited on one of the largest properties. On this estate the tenant is allowed to transfer his lease to one individual, but not to divide his farm.

Of the hubandry the most important department is the dairy, which extends over the greater part of it. The most considerable dairies are in the district called the Welsh, or Walsh Mountains; a tract of dry gressy land fit for tiliage, but well as the considerable dairies are in the district called the Welsh, or Walsh Mountains; a tract of dry gressy land fit for tiliage, but with the considerable dairies are not for the most part housed in winter, and only those that are about the time of callving get a little hay on the fields, where the horses also are kept all the year. They fatten pigs to the weight of five hundred weight. The produce of the best dairies is one hundred weight and a half, or three fiftins of butter per cow, and each cow requires from one and a half to three Irich acres. The practice of letting cows to

dairymen, which is common in Munster, is but little known in Kültenny, the cows belonging to the dairymen themselves, who, in some situations, breed them on their own farms, and in others prefer buying them at a proper age. Too little attention is paid to cleanlines in their dairnes, especially in the northern district; and for this reason, according to Wakefield, though Irish butter, when fresh, is preferable to any in Europe, yet it "is in the lowest estimation in the London market, as it is almost always heavily salted, and very frequently tastes smoky, fishy, and tailowy." The cattle of this county are a mixed race from the native breed and the English long-horned, and their sheep have been, in some parts, improved by the Leicesters. The Merinos have been introduced within these few years by Messrs. Nowlan, the proprietors of a woollen

factory, who have now 600 of the pure race; and they find that both the quality and the weight of the fleece have improved since the sheep were imported. The usual corn crops are raised here, but clover and other green crops not in a suitable raised here, but clover and other green crops not in a suitable raised here, but clover and other green crops not in a suitable horses, in teams of six, or three pair deep, the mean condition of the fallows are better managed here than in any other part of Ireland. Irrigation has been practised for many years, but not extensively. Supp. Engle, Brit. Kilkenny.)
Salmon are caught in the rivers, and sent to Dublin packed in boxes of ice. Woollen is the chief manufacture. Messrs. Nowlan and Shaw produce excellent superine cloths, from an establishment as celebrated in Ireland as that of Owen at Lanark is in Scotland.

7868. KILDARE. 392,397 acres, four fifths arable, meadow, and pasture, and the rest bog. (Rawson's Survey of Kildare, 1807. Sup. Encyc. Brit.)

Part of the Bag of Allen and other similar tracts occupy a large portion of the western ade of this county. The surface is waried by a number of small hills and gentle declivities; but for the most part it is flat and nearly level; and when viewed from a commanding station, presents a rich, and, on the banks of its rivers, a beautiful landscape. The Curragh of Kildare, exceeding to about 5000 acres, has been long celebrated for the softness of its turf and the lineness of its past that of any other part of Ireland, which, if the statement be correct, is a very unfavourable circumstance, as a clay soil prevails very generally, and much of it is exceedingly tenacious of moisture.

There are a few large estates in Kildare, particularly the Duke of Leinster's, which extends over a third of the county; and several proprietors, according to Wakefield, have from property seems to be more divided here than in most of the other districts in Ireland.

The common size of farms is from ten Irish acres to 200; and these farms are frequently held in partnership. Large farms, however, are less rare here than in the arable tracts of the other counties. The leases were formerly for thirty-one years, but are now mostly for twenty-one years and one life. All parish and county taxes are paid by the tenant. With few exceptions, the course of cropping is the same as it has been for a century, viz., fallow, wheat, outs. Potatocs are universally cultivated. Oxen are employed in ploughing, and horses for carriages; but in many instances oxen and horses are mixed together in the plough team, which sometimes consists of six, and never less than four animals. A number of mules are also kept on the farms.

There are several streams and two canals. A woollen manufactory at Celbridge; and a catholic seminary at Maynooth for above 200 students.

Table, meadow, and pasture, of a medium quality, arable, meadow, and pasture, of a medium quality, arable, meadow, and pasture, of a medium quality, and the mountains are on the side of Queen's County. The soil of the arable land is either moorish or gravelly; the former productive in dry, and the latter in moist seasons, but neither of them naturally fertile. Limestone and limestone gravel, the means of their improvement, abound every where. The pastures, though in many parts fine, are not luxuriant; better adapted for sheep than cattle, and very favourable to the growth of fine wool. Much of the mountain of the control of the mountain of the control of the season of their improvement, and were favourable to the growth of fine wool. Much of the mountain best of the season of the season of the season of the season of the mountain of the season of corn.

Landed property is in large estates, and many of their owners do not reside; but much of the land is held on leases in perpentilty, and the holders of these form a respectable class. The Farms were formerly very large, not unfrequently of the extent of 2000 acres; but their size has been diminished, and sure as are considered large do not now exceed, on an average, 400 English acres. Many are as small as twenty acres, though the medium size of the smaller class may be double this. Most of the arable land is tolerably enclosed; chiefly with hedges of whitethorn, which grows here to a great size. Partnership leases and sub-tenantly are less common than in some other heads of the smaller of the state of the smaller of the state of the smaller of the materially more improved. The farm-buildings of every description are generally very bad; the cottages in particular; and yet those who have been long accustomed to these miserable cabins are said to prefer them to more confortable dwelling (fig. 1138.), which, after having

7869. KING'S COUNTY. 457,000 acres, half of it bog, mountain, and waste; and the remainder arable, meadow, and pasture, of a medium quality. (Coote's Agricultural Survey, 1801. Sup. Encyc. Brit.)

heen erected by some of the proprietors, were for some time allowed to stand unoccupied.

1138 8

Wheat, oats, barley, and potatoes are the most common crops. The average produce of wheat is no more than sixteen hushels; of barley and oats it is about thirty-two bushels; and of potatoes the common of the comm a few instances by two heifers; yet this and their other implements are not generally of a ut twenty year.

good construction. The threshing-machine has been in use in this district for about twenty years.

The leases were formerly for thirty-one years, or three lives; but the more common petiod procession at the end of it is frequently added. Some tenants hold for lives renewable for ever, paying a renewal fine equal to half a year's tent, or more, on the fall of every life. Modern leases often contain a prohibition against alienating. Nothing is so much complained of among the tenantry as the mode in which titles are collected.

There are no considerable manufactures, no fisheries, and no minerals worked.

7870. QUEEN'S COUNTY. 384,000 acres, generally of a level surface, three fourths of which is of a productive soil cultivated, and the rest bog and waste. (Coote's Agricultural Survey, 1801. Sup. Encyc. Brit.)

Coal of the Kilkenny kind (7867.) is the only mineral worked; but there is from ore, freestone, marble, &c. in different parts. The Barrow and Nore are navigable rivers.

Estates are from 5000L to 15,000L a year, and upwards. Some of the most valuable, having been let on perpetual leases, atlord a large income to the lessees. It is these lessees who from the middle class of gentry, with clear incomes of from 100L to 500L per annum, obtained from tenants to whom their lands are sublet at rack-rent, and commonly in very small farms. Here, and in King's County, Wakefield observed some of the

best farming in Ireland, with much more attention to a sys-tematic course of cropping, and to keeping the land in good heart. Ozen and horses are used for the plough, the f.rmer generally preceding the latter. A good deal of cheese is made here for the Dublin market. In other respects the rural eco-nomy of this district does not differ materially from that of the Irish counties stready described.

The manufactures are linen and coarse woollens, but to no great extent.

7871. CARLOW. 220,098 acres, of undulating surface, with some hills and mountains; the lowlands a fertile loam, and the uplands a light gravel; one tenth in mountains and bogs. (Wakefield's Statistical Account, &c. Young's Tour, &c. Sup. Encyc. Brit.)

Account, &c. Young's Your, &c. Sup. Encyc. Brit.,
The sninerul are various, but little haron.
There are no large ettate in this county; and very little
initude description of property. The hiring tenant is generally
the occupier, except of small pieces. There are some excellent
flocks of long-woolled sheep. Four sheep of the Irish breed
and five of the English are called a "coilop," and three collops
are allotted to two acres of the best land. For its dairies, Carlow is not excelled by any county in Ireland. The farmers
spare no trouble or expense to procure good cows. From
twenty to fifty are generally kept; and during the season each
composition, and are appeared to the produces, on an average, about one hundred weight and a
sethite, and some of the start of the start of the season except of the start of the season except of the season of t

It is highly esteemed in the London market, where it is often sold as Cambridge butter. That of the second quality is exported to Spaln, and the worst to Fortugal. It is all packed in Large casks, weighing upwards of three highest in the Large casks, weighing upwards of three highest is not of a bright. There is not much wheat the barley of Carlow is excellent; according to Young, but the barley of Carlow is excellent; according to Young, but the barley of Carlow is excellent; according to Young, the best in Ireland. At the time of his tour it was the only interior county which produced it; and at present more is grown here than In any other part of the kingdom. It is principally consumed by the illicit distilleries in the north of Ireland, by the Dreweries at Cork, or by the malting houses at Wexford. The potatoes grown in Carlow are excellent. There is little or no flax. The county is tolerably wooded. In the vicinity of Carlow a great many onions are grown, which are sold all over Ireland.

In Carlow, coarse cloth, reaping hooks, scythes, shears, &c. are made. At Leighlinbridge is one of the largest corn mills in Ireland, capable of grinding more than 15,000 barrels a year.

7872. EAST MEATH. 526,700 acres, of low, flat, rich surface; a clayey or loamy soil on limestone or gravel, with little wood, few mansions, and only one twelfth of bogs. (Curwen's Observations, 1818. Thomson's Survey of Meath, 1802. Sup. Encyc. Brit. Edin. Gaz. 1827.)

ann's Survey of Meath, 1802. Sup. Encyc. Brit. Ed.
The landed property of Meath is divided into large estates, a

year. These are for the most part let out on leases of twentyone years and a life; jou on some of them there are leases in
perpetuity, which have now become more valuable than the
Grazing was, till very lately, a more important object in this
county than tiliage. Many persons fattened from 500 to 500
cows in a season, besides bullocks and sheep. These they
purchase at the beginning of the grass season, and dispose of
during the aummer and autumn, as they are ready, instead
during the aummer and autumn, as they are ready, instead
during the aummer and autumn, as they are ready, instead
sidered too valuable to be applied to the rearing of stock. Dairying is not carried to any extent, and the butter made here is
said to be held in little estimation. In some instances, where
farms are let out for the dairy, the landord supplies a successloon of cows in milk, horses, and land, and the tenant furnishes
labour, utensils, &c., paying at the rate of from 61 to 71. 10s.
were introduced many years ago into this district, which now
contains some of the best specimens of the breed. Some
marshes on the Moynalty river feed an immense number of
horses in the summer season; and the Kilcrew hills, in the
western angle adjoining Cavan, are remarkable for fattening
after. The summer season; and refer counties, and, like
the cattle, the same stock is kept only for a season.

n. Gaz. 1827.)

Tillage farms are larger here than in most parts of Ireland; but, according to Curwen, the system of management is little better than on the small farms of other districts. The houses pecialty the cabins of the farm labourers, which are miserable mud-walled hovels, sunk below the level of the ground adjoining, and occupied by cows and pigs, in common with the family. The principal food of this class is potatoes with churnilit, and occasionally catmeal; butcher's meat being rarely used even among the farmers; and, to add to their privations, precupied succession of oats and other corn crops for everal vears is common; in a few instances even for twenty years. The common rotation is wheat, cats, fallow, potatoes, clover, all without the application of manure. It is customary to work horses intermixed with oxen, of which six are generally yoked together, three pair deep, to avery ill-constructed plought, or, not withstanding this management, he wheat crops are in very much, and at present nearly three fourths of the county are under tiliage.

Manufactures do not afford employment to any considerable part of the population, though here, as in most parts of Ireland, that of linen is carried on to some extent; and also the weaving of cotton. On the Blackwater and the Boyne there are several extensive flour mills.

7873. WESTMEATH. 378,880 acres of surface. The surface of this district is exceedingly diversified with woods, lakes, streams, bogs, and rich grazing lands; in no parts mountainous or flat, but gently undulating, or rising into hills of no great elevation. Some of these are cultivated to their summits, and others covered with wood, presenting, in several parts, some of the finest scenery in Ireland. (Wakefield's Statistical Survey of Ireland. Sup. Encyc. Brit. Edin. Gaz. 1827.)

The principal river is the Shannon; and there are a number of beautiful lakes well stocked with fish; the trout in Lough Dim are said to have an emetic quality. One of the largest of the lakes is full of wooded islands.

There are few large estates, but many gentlemen of moderate fortunes, from 2000l. to 5000l. a year, most of whom are resident. The leases are commonly for twenty-one years and the resident of the lease are commonly for twenty-one years and three lives. A great many fine long-horned cattle and long-woolled

sheep occupy the grazing grounds, which extend over much of the best part of the district. Tillage is accordingly upon a limited scale, though more corn is raised than the inhabitants consume; and besides the crops common in other places, tax, hemp, and rape are cultivated, with clover and tumips; the two latter, however, not generally. The soil is mostly light, but in some parts it is rich and deep. Few or no manufactures.

7874. LONGFORD. 234,240 acres, in great part bog, mountains, and waste; the climate on an average giving 140 dry days in the year. (Wakefield, &c. Sup. Encyc. Brit.)

Leaded property is in estates of from 3000l. to 7000l. a year.
Leases are commonly for twenty-one years and a life. Farms are, for the most part, very small, where tillage is the principle dient gentry almost exclusively employ the farms which they retain in their own hands. Some linen manufacture-object; but only a small proportion of the district is under the

7875. LOUTH. 177,926 acres, mountainous towards the north, but in other parts undulating and fertile, with little waste land, no considerable lakes, and a great number of gentlemen's seats, of which Collon is the chief. (Wakefield. Edin. Gaz. 1827.)

Landed property is in estates from 15001. to 8000l, per annum. Farms are, in general, larger than in most other parts of Ire-land; but there are still many very small; in some parishes, scarcely one above twenty-five acres, and in others they do seldom extend to eighty acres. As the land is chiefly occupied in tillage, little attention is paid to the improvement of catted and sheep; of the latter, though a few are kept on most farms, the number is inconsiderable. Wheat and oats are the principal corn crops, barley being very little cultivated. The other crops are potatoes, flax, and a little hemp. Clover and turnips are almost confined to the farms of proprietors. It is only on these that the general management is good; that of the common farmers being, for the most part, slovenly; and their lands requiring heavy dressings of lime and marl to keep them

productive. Yet a spirit for agricultural improvement has lately happily appeared in this county, and many of the tenants are in easy circumstances, well clothed, use ment in their families, and in every thing but their houses and farm buildings are in a condition superior to that of their brethren in most time before the old ones expire, so that the tenants are not often changed; but fines are frequently paid on these renewals, which carry away much of the capital that should be applied to the soil. Tithes are very seldom taken in kind; their value is ascertained about the end of harvest, and the tenants grant their cotes for the amount, which, though payable in November, is, in some cases, not exacted till almost twelve months after. The linen manufacture is carried on to a considerable extent.

7876. WATERFORD. 454,400 acres, the greater part hilly and mountainous, but rich and productive on the south-east; the climate so mild, that cattle sometimes graze all the year round. (Wakefield, Curwen, &c. Sup. Encyc. Brit.)

soen, &c. Sup. Encyc. Ertt.)

Some very large estates, of which the most extensive belongs to the Duke of Devonshire. Leases are commonly for twenty-one years and a life; and on the banks of the rivers, where the land is most valuable, farms are small. A ecording to Wake-land is most valuable, farms are small. A ecording to Wake-land is most valuable, farms are small. A ecording to Wake-land is constructed to the state of a farmer more with the construction of a farmer more set of the second like of the second divides his farm between himself and his construction with the second divides his farm between himself and his construction of the divides his farm between hong as there are daughters to be disposed of. In regard to male children, they are turned out into the world, and left to shift for themselves the best way they can." The rent is chiefly paid from the produce of the dairy, which is conducted on a greater or smaller scale over all the county, and from the pigs, which are partly fed upon its offais. Some of the dairy farmers, most of whom are in easy circumstances, pay 1000f. a year of rent; and a great deal of butter is

made, even among the mountains, where small cows, suited to the nature of the pastures, form the principal stock. In the neighbourhood of Waterford, cows were left or sixteen pounds, eighteen pounds, and even twenty pounds, for the eighteen comparatively, but a small portion is nid comparatively, but a small portion is nilliage. Where lime is used as a manure, it must be brought from a distance, as there is no limestone to the east of Blackwater, and it costs upwards of five pounds for an acre. Orchards are numerous on the banks of this river, and extensive plantations of timber-trees hanks of this river, and extensive plantations of timber-trees fuel, that whole fields are kept under this shrub for the purpose.

Pose. Hogs are an important branch of trade at Milford Haven; glass and salt the principal manufactures.

7377. CORK. 1,048,799 acres of Irish plantation measure of greatly varied surface; bold, rocky, and mountainous on the west, rich and fertile on the south and east, romantic and sublime in many places, and one fourth part waste. (Wakefield. Townsend's Survey of Cork, 1810. Sup. Encyc. Brit. Edin. Gaz. 1827.)

The climate is mild; but a very general opinion exists that it is changing for the worse.

The rivers of this county flow with rapidity for the most part; a circumstance unfavourable to their being rendered navigable, but presenting many eligible situations for the erection of machinery.

The most useful fossile are limestone, marble, and slate; coal and ironstone have been discovered, but not worked to any extent.

tent.

Estates are generally large; tillage farms are very small, seldom above thirty acres: and, when they are larger, often held

in parinership, and the shares of each further diminished by the common practice of dividing the paternal possessions among the sons. The leases used to be for thirty-one years, or three lives; but of late the term has been reduced to twenty-one years, or one life; and the farms, instead of being let out to middlemen, who used to relet the land in small portions to occupiers on short leases or at will, are now held in most cases by the occupier from the proprietor himself. There is here the usual minute division of thiage lands, cultivated by the spade in preference to the plough; the usual dependence on potatogs as the common and almost exclusive article of God; with misers

able cabins, crowded with filth, poverty, and Indolence. The crops are potathes, in favourable situations, succeeded by wheat and cats, for one or more years; sometimes barley follows the wheat. Plax is cultivated in many small patches. Hemp very rarely. Turnlips and clover are seldom to be seen on tenanted lands. Sea sand, sea-weed, and lime, form a useful addition to the stable and finin-yard maurier, which is, however, in many dived in value by careless management. Paring and burning is practised in every part of the county, as an established mode of preparation for the first crop in the course. The implements of husbandry are generally bad: the common Irish plough and harrows, seldom furnished with iron tines, drawn by horse mules, and, in a few instances, by occur is wheel carriages have unues, and, in a few instances, by occur is wheel carriages have in the vicinity of the city of Cork, where the produce, in the shape of butter and skim—nill, finds a ready market. In general the cows, which are chiefly of the half Holderness breed, are

let out to a dairyman, at a certain rate for each, by the year; yet many farmers conduct the business of the dairy themselves. The average number of cows in a dairy may be from thirty to forty. A few sheep are kept on every farm, commonly in fetters, and upon the most worthless postures. Proprietors have introduced stranger breeds, and find them to answer; but sheep can never become an object of importance in a district where farms are so small.

Tithes, of which no inconsiderable part are lay property, are generally paid by a composition with the farmers. The usual mode is to have them valued before harvest, and to appoint days of meeting with the parishioners, for the purpose of letting them.

The principal manufactures are sail-cloth, duck, canvass, and drilling; osnaburgs for negro clothing; coarse woolens; spirits at several large distilleries in Cork; and gunpowder in the neighbourhood of the same city, the only manufactory of that article in Ireland; It belongs to Government.

7878, TIPPERARY. 882, '98 acres, diversified with heaths, mountains, and fertile vales; of which the Golden Vale is among the richest land in the kingdom. The climate so mild, that cattle graze out all the year. There are \$6,000 acres of bog in this county, including part of the Great Bog of Allen. From the survey made by Mr. Ather, under the direction of the commissioners for enquiring into the nature and extent of Irish bogs, it appears that this waste land might be easily drained. (Wakefield, &c. Sup. Encyc. Brit. Edin. Gaz.)

Minerals. State, lead, and coal are worked.

Estates are of various sizes, some of them very large, but a
greater number of a medium extent, worth from 4000t to 6000t.

a year. Of the proprietors, the influence of Lord Li undaif is by
far the most considerable, though several others have estates
worth from 10,000t. to 15,000t. a year and upwards. The
grazlers here, as in Roscommon, have leashfold properties, frequently of much greater value than the freeholds, of which,
also, they often become the purchasers. Properties of this descriptor, which was the properties of the demetry light acres being thought large; ye the management is,
in many instances, more respectable than in most other parts
of Ireland. But the principal business is grazing, every variety
of this kind of land being found here. The exemption of graz-

ing land from every kind of tithe operates as an encouragement to persevere in this system. Leaves are commonly for twenty-one ever and a life. The cattle, which are long-ho-med, may, of long-would the persent persent and the control of long-would sheep are not inferior, in Wakefield's opinion, to those of Leicestershire. The rich lands produce a kind of lax, very different from that which is raised in the north; it grows to a great height, and appears to be exceedingly well adopted for suit-loth.

The mamufacture of broad-cloth is carried on to some extent at Carrick; and that of linen, worsted, and coarse woollens, as branches of domestic industry. But the wealth of this extensive district chiefly consists in its cattle and sheep, corn, and other land produce.

. 7879. LIMERICK. 622,975 acres, of low-lying fertile lands, surrounded by higher grounds. (Wake-field, &c. Sup. Encyc. Brit. Edin. Gaz. 1827.)

Landed property is in large masses, generally let to tacksmen, on long leases, and sub-let almost ad infinitum. The land seem to be of greater yearly value than in most parts of Britain at a distance from large towns; for, according to Wakefield's information, the green acres would have let, in 1808, for three guineas the Irish acre, or almost forty shillings the English-Considerable farms brought five guineas the Irish acre, and in some instances more. The rent of the mountain land had increased in a still greater proportion than the grazing and com farms. One grazier held land of the value of 10,000k, a year; Many of the best long-horned eattle of the United Kingdom are fattened here, and also a considerable number of sheep. Two-rear-old wethers sold then, without their fleece, at from 21, 10s, to 3l.

Only a small proportion of the land is in lillage; the produce of this, and some of the adjacent counties, in proportion to the seed, is started by the same author to be at a medium: of wheat ten, bere seveneen, barley twelve, oats nine, and potatoes ten, there was formerly cultivated extensively on the rich low-grounds, called the Carcasses, on the banks of the Shannon; but this tract is now occupied in grazing. Flax of an excellent quality for sail-cloth is still grown in several parts. The common term of leases is thirty-one years and three lives. Great part of the provision and corn trade is possessed by the city of Limcrick.

The soil is remarkably fertile, and consists chiefly of fine mould covering a light limestone gravelly soil; it produces all kinds of grain in abundance.

7880. CLARE. 962,560 acres, nearly half productive land, and the remainder moors, mountains, and bogs, with more than 100 lakes interspersed. The climate, though moist, is not unfavourable to health and longevity; fevers, which sometimes prevail to a great extent here, being occasioned chiefly by the dampness of the houses, and inattention to domestic and personal cleanliness. (Dutton's Survey of Clare, 1808. Sup. Encyc. Brit. Edin. Gaz. 1827.)

Limestone abounds, and col., ironstone, black marble, lead, &c., have heen found, but not worked.

Landed property is in a few large estates, of which the most noted was that belonging to the Marquess of Thomond's heirs, lately sold and divided.

The size of Jurms varies greatly. Those under tillage are from one or two acres to fifty, but of the latter size there are few. Grazing farms extend from 100 to 800 acres, several of which, and sometimes in distant situations, are held by one individual. Frequently several persons join in the occupation of the form of leases from proprietors is for three lives or thirty-one years, one life, and twenty-one years or one life, and twenty-one years and a life. The tenure of under tonants is variable, and often arbitrary.

years; twenty-one years or one life, and twenty-one years and a life. The tenure of under tonants is variable, and often arbitrary.

All the different species of grain are cultivated with considerable meters. Eape and flag, the former chelly for its seed, extent. Potatos occupy a part of every farm, and their culture is conducted with more care and judgment than that of any other crop, though at a greater expense of time and labour than would be thought necessary in most other places. In regard to the kinds of crops cultivated, the greatest defect is involved that the control of the c

structed, and imperfect as well as expensive in their operation; in many parts, even where the soil is light and dry, the plough is drawn by four horses abreast, with traces of rope, and collar of straw. But hom the roughness of the surface, the poverty of is much more extensively employed than the plough, over all the arable land of this county.

The pastures of the Carcasses or low grounds, on the rivers Shannon and Pergus, are equal to the futnening of the largest ozen. This rich tract extends from Paradise to Limerick, about twenty miles, and is computed to contain about a clay, or moory substratum; producing, owing to the indolence of its occupiers, along with the most valuable herbage, a great quantity of rushes and other useless weeds. The rent of this land for grazing was, several years ago, as high as 5.P. per a cre, equal to about 5½, 2x. per English acre, and for meadow, in produce at the rate of more than four tons of hay the English acre. The cattle of this county are almost all long-horned, good milkers, and very hardy. The sheep have been greatly improved in shape, by crosses with Leicester rams; but there is a general complaint that the quality of the native wool has been deteriorated. A vast number of mules are bred here; is a general complaint that the quality of the native wool has been deteriorated. A vast number of mules are bred here; it is a general complaint that the quality of the native wool has been deteriorated. A vast number of mules are bred here; it is general to in part of the bred of horses, which has degenerated.

Clare was formerly noted for its orchards, and for cider of a

ittle attention is paid to the breed of horses, when me we nerated.

Clare was formerly noted for its orchards, and for eider of a very fine quality, made from the celebrated cockagee apple, which is still found near the small town called Six Mile Bridge. "An acre of trees," says Young, "yields from four to ten hogsheads per annum, werage at a vields a crop every year." It does not appear from the latest accounts, that any considerable quantity of this cider is now produced here, though what there is seems to maintain its former character, and is held in great estimation.

Mamifactures are yet in their infancy. All the linen made in the county is used for home consumption.

7881. KERRY. 1,128,320 acres, more than three fifths mountainous and waste; the sea-coast and islands being the most westerly land in Europe. Some of the mountains 3000 feet high. (Smith's History of Kerry. Wakefield. Sup. Encyc. Brit. Bicheno's Ireland, 1830, &c.)

The mountains are chiefly occupied with young cattle and goats; sheep, apparently the most profitable animal in such situations, are neither numerous nor of a valuable kind; and the little cultivation to be found here is so generally performed with the spade, that, in some entire parishes, as Young assures us, there was not a single plough. The prevailing soil in the low a species of pipe-lay, and other sorts might be converted into bricks and eartherware. Estates are very large, both in extent and value; some of them, according to Wakefield, worth 30,000L a year. Leases are in general for thirty-one years and three lives, and a considerable portion of the whole county is let to partnership tenants. Even of the tenants in the north quarter about Kerrytenants, and the state of the partnership cannot be the provided of the provided for farmers to hire large tracts, which they stock with cows, and these cows

are then let out to dalrymen upon such terms as leave them but a very small return for their labour. The best corn land is about Trailee, and towards Dingle, where more flax is raised than in any other part of the county.

The principal articles which Kerry affords for export are its raw produce, beef, butter, hides, and tallow. It does not raise more corn than is necessary for its hem consumption, and carries on no manufacture for sale but that of coarse linen, which is only on a small sele; and the general face of the country gives the impression of the general face of the country gives the impression or the area and discomfort. In the country gives the impression or the area and discomfort. Serve where to be seen; and as these allord but a slight protection against the trepssessing of cattle, it is customary to the telegs of each quadruped together with wisps of straw, and sometimes to yoke two together; even fowls and turkeys are thus bound. (Bicheno.)

7882. ROSCOMMON. 556,847 acres of flat surface, in some places sprinkled with rocks, and in many interrupted by extensive bogs; the richest land on limestone, and adapted either for aration or pasture. (Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.)

Coal and iron works were formerly carried on, but are now

Coal and iron works were rormers, casses on, medicated.

Estates were once very large; but they have been broken down in some instances, by the granting of leases in perpetuity; a practice which has given rise to a class of landholders, international control of the control of

peace, both here and in other parts of Ireland; and the soil of such rich grazing lands, requiring nothing more than the common operations of tiliage to yield large crops, the growth of corn throughout Ireland has been greatly increased; yet, within "In Roccommon," says Watchield, "I heard of horses being yoked to the plough by the tail, but I had not an opportunity of seeing this curious practice. I was, however, assured by Dean French, that it is still common with two-year-old colts in the spring," Potatose, oats, and fix are the principal crops. There are several fine lakes, and the Shanhon runs along nearly the whole of the eastern boundary.

7883. GALWAY. 1,659,520 acres of varied surface; above a third part bogs, mountains, and lakes, and very unproductive, and thinly inhabited. (Dutton's Survey of Galway, 1824. Wakefield. Sup. Engs. Brit., &c.)

Encyc. Brit., &c.)

The east part of the county is flat, warm, and fertile, with many cests, though none of note. Rivers and lakes alcound. Lough Reagh and Lough Courts are fine pieces of water; the latter Is said to possess all the beauties that hills, woods, and islands can impart to that feature of landscape. Several large estates, affording an income of from 5000l. to 10,000l. a very and upwards. One of these, the most extensive in the British Isles, stretches along the sea-coast for seventy of the land which originally beinged farm, or take, as it is styled, is appropriated for tillage, and this portion is then divided into lots, perhaps twenty or thirty. These lots are again subdivided into felds, which are partitioned into small lots, each partner obtaining one or two ridges; but these ridges do not continue in the hands of the

same occupier longer than the time they are in tillage. The pasture is held in common; and the elders of the village are proper for their community, and settle all disputes that arise among them. Their houses stand close to each other, and form what is here called a village."

The cottle of Galaway are long-horned and of an excellent description, fully equal, in the opinion of Wakefield, to any in England. Elus sheep form the most valuable part of their live writer, "are to be found in this county." The crops are the same as in other parts of Ireland, but potatoes are not cultivated to so great an extent. They plant potatoes on an oat stubble, or on ley that has been burned or manured, and follow with wheat, bere or barley, or osts; the latter kind of grain is not unfrequently taken after wheat and barley. Faring and of some of the estates on the shore is pald from kelp, which is prepared in large quantities.

In common with the greater part of Ireland, Galway employs some of Its people in the limen manufacture, and it seems to be the only manufacture in it worth notice.

7884. MAYO. 1,270,144 acres, in great part mountains, bogs, and lakes; half-heathy mountains, with valleys very fertile, but neither woods nor plantations, excepting on one or two estates. (M'Parlan's Survey of Mayo, 1802. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.)

Many valuable fossils; iron formerly made, but discontinued for want of fuel. Excellent slate; and petro-sitex semilucidus, similar to what is used in the English poteries. The low grounds of the county are composed of limestone, or limestone gravel, and are equally well adapted to tillage or pastrue their extent, wing to their containing a great proportion of waste.

The size of farms varies with the nature of the soil and surface; but, though several hundred acres are sometimes let out in one farm, yet, as the farms are commonly held in partnership, the space allotted to each tenant is generally only a few acres. As each of them keeps a horse, it is computed that the difference of the compared the containing as the farms are commonly head in partnership, the space allotted to each tenant is generally only a few acres. As each of them keeps a horse, it is computed that the compared that the containing the c

tion, and the harrows are often furnished with tines of wood, instead of iron. It is still the practice, in the mountain district, to yoke the horses by the tail. But in some of the haronies, the plough is seldom or never employed at all, the tillage being performed by the spade; and in others they use the spade in cultivating potatoes, and the plough only for corn. Yet potatoes, oats, and on the sea-coast burley, are sown to a considerable extent, and also flax. Wheat is cultivated only in particular spots, and chiefly by proprietors, a few of whom have also introduced turnips, peas, beans, rape, and cabbage. Then is some excellent grazing land for cattle in the barony of Tybol 5000 Irish acres. The English long-horned cattle, which were imported by the principal proprietors, have greatly improved the native breed.

The habitations of the labourers, or cottars, are in general very wretched, and shared by them with their cow and pig.

7885. LEITRIM. 407,260 acres, one half bog, waste, and water, and the remainder dark fertile soil, incumbent on limestone. (M'Parlan's Survey of Leitrim, 1802. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.)

Coal, ironstone, lead, copper, &c. are found, but not worked.

Estates large, and nearly all the great proprietors are absentess. The leases are commonly for three lives or thirty-one
years. Agriculture is here in a very low state. The filiage
farms are small, seldom exceeding fifty or skty acres, and these
are almost always occupied in common by a number of tenants.

The plough is very little used. The most common implement is
broad, at the bottom, and five or six inches at the top, where it
is furnished with a wooden handle about five feet long. The
first two crops are potatoes, which are followed by flax, and
then oats for one or more years. Clovers and other green crops
are unknown to the practice of the tenantry. The county
arises grain and potatoes sufficient for its own consumption,
the proposed of the control
butter is made throughout the district. The sheep are of the native race, small, and but few in number.

said to have been almost a continued forest. There is now lister wood in it, and no considerable plantations. The proprietors, however, have of late paid some attention to this method improvement, and several large nurseries have been established for the sale of forest and other trees.

There are several blesch-fields, and on weening. But the ground a number of people are employed in weening. But the for the use of the inhabitants themselves. The houses of the lower classes are of the worst description; even the more recently erected farm buildings, including a little barn and cowhouse, do not cost more than ten or twelve pounds. Turf is their only fuel, and potatoes and oaten breed the chief articles of food, meat being used on extraordinary occasions only.

7886. SLIGO. £97,0f0 acres, a third part bogs, mountains, and waters, and the remainder fit for tillage or grazing. (M*Parlan's Survey of Sligo, 1802. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.)

The soil is generally of a light, sandy, gravelly loam, or moory; in some parts the lands are rich and firtile, but the alboil of a considerable tract is a revenue and lakes; the wooded islands and scenery around Lough Gill very striking. On the Sligo and Moy, considerable salmon fisheries; trouts abound, and white fish on the shores.

Estates of almost every size. A few are worth from 500t. no 900t. a year; yet a considerable proportion of the county is divided into small properties. The principal proprietors are absentees. Farms vary in size, not held by individual tenants, but in partnership. The leases are for thirty-one years and three lives; and, in some instances, for sixty-one years and three lives; and, in some instances, for sixty-one years and three lives; and, in some instances, for sixty-one years and three lives; and, in some instances, for sixty-one years and three lives; is being, in general, longer here than in other parts of Treland. Tillage-farming is still in a very backward state. The plough is worked by three or four horses yoked abreast,

directed by a man who walks backward before them. Oats, barley, and potatoes are the principal crops. Of the two former, a great proportion is consumed in illidit distillation, which, within these few years, was carried on in almost every part of the county. It was to the sale of these spirits that many of the small tenants looked as the means of paying their rents. In some parts, both 'cattle and sheep are kept in considerable numbers, and a great deal of butter is exported from the town of Silgo; but the land occupied in this way bears but a small proportion to the whole; to grow corn, being the principal object. Limestone and limestone-grave, which are in abundand, on the coast, sea-weeds. Among the hills are several large lakes, and abundance of rivers.

The manufactures for export are linen, salt, and kelp. The cabins, food, fuel, and clothing of the lower classes, seem to be as uncomfortable as in any of the Irish counties.

7887. CAVAN. 499,957 acres, almost entirely covered with hills; the surface, soil, and climate, being alike bleak and uncomfortable. There are no fewer than 91 bogs, occupying 17,000 acres. (Coote's Statistical Account. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.)

tistical Account. Wakefield. Sup. Energe. Brit. E.
Near Farnham, the appearance of the country is favourable; the lakes there are picturesque, and communicate with each other by a river. The fossils are various, but neglected.
Two estates are of 50,000 and 28,000 ares exhole of the land is under tillage, but the agriculture in every respect is very bad. The size of the farms is from 50 to 100 acres; but these are generally subdivided into farms of from two to twenty acres, which are re-let to the manufacturers or "cottars," who pay a high rent for them, by means of their other employments. Their principal object is to raise a sufficient quantity of eass and potatoes to feed their families, and of flax to give employment to the women and children. Most ough such they put three or four horses to it; and when Young visited the county, he found that all over it the horses were yoked to the ploughs and harrows by the tail; that practice, however, is now disused. Almost the only grain sown is oats, which are recknod to be in the proportion of seventy to one, to all other grain; there is scarcely any wheat. In 1809, there were 4300 acres of flax, from which 6500 bushels of seed were saved.

Though the very tops of the hills are tilled, yet it does not appear that this county produces more grain than is necessary for its home consumption; nor has the bounty on the inland carriage of corn to Dublin, increased the very trilling quantity brought to that market. From the coldness and moisture of the climate, all the corn of Cavan is obliged to be kin-dried. The stock-furne generally consist of about 100 or 150 acres, the farmers buy young cattle, and sell them again without fattening; a few, however, fatten bullecks or sheep, but the latter are very poor. There are very few dairy farms, though from the control of the co

the heids.

Cavan was formerly celebrated for its extensive woods, and trees of an immense size; but at present it is, in general, hare of timber, except near Kilmore, Farnham, and a few other places. Wakefield remarks, that the ash is confined to parts of the county, and to Tyrone and Fermanagh.

The linen manufacture is the staple.

7888. FERMANAGH. 450,000 acres, in great part covered by water, and much of the rest of the surface rugged and mountainous, but better wooded than other parts of Ireland. (Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.)

The ash grows in the hedge-rows; beeches come to a large size, and also the yew, near Lough Erne; and fir, oak, and wew are found in the bogs. The grand feature in the natural scenery of this county is Lough Erne, which occupies about one eighth of the surface, and contains more than three hundred islands. It contains most of the fish that are found in other fresh water lakes, and is noted for its sulmon and cells, particularly the latter. Four of the cell weits near the falls of Beeleck afford a zent to Control of the cell weits near the falls of

Isoeneck amora a rent of 100t, each.

Estates are large; three proprietors mentioned by Wakefield have 15,000t, a year each, and other three from 6000t, to 7000t.

The leases are most commonly for twenty-one years and a life. In the northern part of the county, the farms are larger and

more productive than in most other parts of Ulster. Oats, barley, potatoes, and flax are the principal crops: very little wheat,
clover, or turnips being cultivated, except in small patches
clover, or turnips being cultivated, except in small patches
rearing cattle, and much of the better passures with dairy
stock. There are no large flocks of sheep, and their breed of this
animal is of a very inferior description. Agriculture is in a very
backward state, and as lately as the year 1808 the peasantry
were accustomed to faster their ploughs to the horse's tails.

Linen, seven eighths wide, manufactured to some extent;
and the or are everal bleach-fields, which finish for sale the
general.

7889. MONAGHAN. 288,500 acres of low grounds, with detached hills, and a considerable space occupied by bogs and small lakes. (Coote's Survey of Monaghan, 1801. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.

There are a firm large étalete, but the greater part small ones, many of which do not even yield a free income equal to the ordinary wages of labour. A few years ago, there were only 172 freeholders of 50t. and upwards, out of nearly 6000; most of the considerable proprietors are absentees; and very little of the landed property is in the hands of Catholics.

Farms were so small a few years ago, act to a verage ten Irish arcre over the whole counting and a management as the country of the consideration of the property of the country of the

general term of leases is twenty-one years and a life, or some-times three lives. The principal crops are oats, potatoes, and flax, with wheat and barley in a small proportion; these last, however, extend over a much greater tract now than they did a few years ago. They make a good deal of butter, but there are no large dairies. Goats are in greater numbers than sheep, which is of itself a sufficient proof of the low state of its agri-

which is to local a same lent proof of the low state of its agri-culture.

The linen manufacture is said to have averaged, twenty years ago, about 200,000lt, a year. It is carried on by the greater portion of the inhabitants of both sexes, all the small farmers being also weavers.

7890. TYRONE. 813,440 acres in great part mountainous, and containing, among other mountains, Bessy Bell and Mary Gray, celebrated in song. The territorial value of this inland and northern district is much inferior to that of most others. (M'Evog's Survey of Tyrone, 1802. Sup. Encyc. Brit.)

Various valuable fossils found, but not worked: the best pot-tery in Ireland, near Dungannon. Lough Neagh, the largest lake in Ireland, covers 110,000 acres, but is not celebrated for

lake in Ireland, covers 110,000 acres, but is not celebrated for its scenery.

Estate: or every great extent, many of them worth from 50001, every and the productive or arable land divided into very small farms, not often exceeding twenty Irish views. The chief proprietors are the Marquess of Abercom, Lords Beimore, Northland, and Mountjoy. The leases are for various periods, thirty-one years and three lives, three lives, and twenty-one years and a life. On some estates the land passes through the hands of middlemen, in portions of various sizes, till it reaches the actual cultivator, for the most part, in very minute usubdivisions. It is customary for several persons to be concerned in one townland, which is held in what is called rundale; the cultivated land being divided into shares, which are changed every year, and the cattle pasturing in common—a system utterfy inconsistent with profitable occupation, or the amelioration of the soil and live stock. The cattle

and sheep are accordingly of a very inferior description; and the latter, which are not numerous, may frequently be seen tethered upon the small patches of herbage which are interspersed among the shares of these partnership concerns. The tillage land, too, is more frequently stirred with the spade than the plough; and where a plough is used, the team, consisting of horses, bullocks, and even mileh cows, must be supplied by the contributions of three or four neighbours, who unite their means for the purpose, each attending the operation, lest his poor animal should have not seen that the plough; the properties of the latest the standard of the seen of the se

7891. DONEGAL. 1,100,000 acres of ragged, boggy, and mountainous surface, with a cold, wet climate, and neither woods nor plantations to shelter from the blast. (M'Parlan's Survey of Donegal, 1802. Wakefield. Sup. Encyc. Brit.)

Lauled preperty is in few hands.

Agriculture is in a very backward state in Donegal. The use of the plough is confined to a small proportion of the cultivated land, and is generally of a bad construction; spade labour is preferred in most places. Barley is the chief grain crop, and it is almost all used in distillation; cats are only grown for home consumption, and wheat is confined to a few favourite spots. There are only two flour milis in the county. The culture of flax is considerable in the barony of Ntaphoe, and is extending even in the mountain districts. Potatoes are cultivated every where; turnips, clovers, and other green crops, are affarms still abound, but farms now begin to be fet to individuals as separate holdings. In the low country they are from ten to fifty acres in extent, and from 40 to 500 in the mountains. The fences are commonly nothing better than ditches, with banks of turf or clay, so that the cattle require, to be herded while

the crops are growing; and in many parts they are allowed to graze promiscuously as soon as the crops are removed. Sen-wed and shell-sand are used as manures, but very little lime-stone, or limestone gravel. The practice of paring and burning, so common in many parts of Ireland, is seldom secorted to in this county. Leases are granted for twenty-one years and a life. life

life. The staple manufacture of Donegal is linen. Women are much employed in knitting stockings. Kelp is prepared along the north-west coast; and, during the fishing season, three or four salt-pans used to be kept in full work. But whisky, says Dr. M. Parlan, particularly in the mountain region, and all around the coast, is the chief manufacture. "It is by running their bariey into this beverage that they provide for one helf-year's rent. This is, therefore, a tax raised by the rich on the morals and industry of the poor."

7892. LONDONDERRY. 510,720 acres, generally mountainous, fertile and beautiful in the valleys, and containing every variety of soil. (Sampson's Survey of Londonderry, 1802. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.)

Landed property. With the exception of lands belonging to the church, and the towns of Londondeury and Coleraine, and cretain partitions reserved by the crown to be afterwards erected into freeholds, the whole of Londondeury was granted by James I. to the twelve companies or guilds of London. The estates are, therefore, held from these companies, either in permitty, or on determinable leases. The principal proprietors or leaseholders are Lords Waterford and Londondeury, Conolly, Ogliby, and the families of Beresford and Ponsonby.

The average size of farms is from five to twenty Irish acres, or at a medium little more than fifteen acress English. Whole or at a medium little more than fifteen acress English. Whole but in a few situations there are farms of upwards of 300 acres. The leases, though most commonly for twenty-one years and one life, are frequently for such very short periods, as to be a great drawback upon agriculture. The practice of letting land upon short leases is, however, only recently introduced.

The principal crops are potatoes, barley, oats, and flax. Wheat is not in general cultivation. Turnips are very rand sown grasses and clovers far from being common. No analysis of the control of the co

warrens.
The principal manufacture is linen; the value exceeds half a million sterling, besides brown or unbleached linens.
Granite, freestone, sandstone, and those beautiful rock crystals, which, when cut, are termed Irish diamonds, are found in various parts. Iroo, copper, lead, and coal have also been found.

7893. ARMAGH. 293,871 acres of varied and rather interesting surface of mountain, plain, and bog; with rivers, streams, and lakes, and a climate mild for the latitude; 244,000 acres are esteemed fit for cultivation. The celebrated George Ensor is a native of this county, and resides on his own estate at Loughgall, near Armagh. (Coote's Survey of Armagh, 1804. Wakefield. Sup. Encyc. Brit. Edin. Gaz. 1827.)

Markle of an excellent quality, and of great hearty, is wrought in Armogh. The chain of mountains called the Fews, of a transparent for the control of the few of sublime and picturesque scenes.

Eduder in this county are not large, there being only seven or eight proprietors who possess them of the annual value of from 60001, to 10,0001. The farms also are small, being commonly from five to twenty acres, and seldom exceeding forty or fifty. Neither the arable not the pasture hazbaday of this county present much that is worthy of notice. Potatocs, flax, and cats are the chief produce of the arable districts; and thuse county of the cou

per cow is considered as the average produce. The proportion of the milch cows to the size of the farms is, on small farms under five acres, one cow; on farms exceeding five, and under ten acres, perhaps two cows, seldom more. A considerable number of cattle are learned. From the low country they are sent to the mountain farms, and frequently afterwards soid in the Scotch market. They are in general of a small sunted breed. The native sheep are an awkward breed; the wool coarse, and in small quantity; very little of it is exposed to sale, there being hardly sufficient for domestic use. Gosta, and several other species of aquatic birds, are indigenous to the lakes and rivers. Formerly bees were much attended to, but at present they are neglected.

The roads in general are bad; and, what is extraordinary, the turnpikes are the worst, and the cross roads the best.

The principal manufacture is that of linen.

7894. DOWN. 559,095 acres, of which one eighth are mountainous and waste, the remainder hilly and productive, cultivated by small manufacturers, and embellished by plantations, bleaching grounds, and neat white-washed habitations. The climate is variable, but not subject to extremes. (Dubourdiew's Survey of Down, 1802. Sup. Encyc. Brit. Edin. Gaz. 1827.)

Survey of Down, 1802. Sup. Encyc. Brit. Edin. G.

Landed property. There are some large estates, though in
general it is much divided, and has all the different gradations,
from the most opulent nobleman to the tenant in perpetuity
who farms his own land. Most of it is freehold. The rental
was above the average rental of the best counties in Scotland,
as returned to the commissioners of the property-text in 1811.

The farms may be divided into two kinds or the open of the rental
sea that the state of the sea of the sea of indistry; the second, such as are held by weavers and other
tradesmen. The former run from twenty to fifty, and, in
some instances, so far as 100 acres; the latter are of every size,
from one to twenty acres. It has been remarked that the
divisions of the farms are so minute, as to be extremely prejudicial to agriculture. The rent is always paid in money;
personal services are never extent is always paid in money;
for a first provide the second of
There are celestive measures on the banks of the Bann and the Laggan; but the soil, except on the mountains, is thought to be better adapted to tillage than pasture. A good many leasts are fatted, but cows are the prevailing stock, kept in small numbers on every farm. They are long-horned, thin in the sides, and deep in the belly, but yield much milk when well fed, and each of them from 60 to as much as 120 pounds of butter in the year, or about two thirds of the medium produce of the butter dairies of England. Numerous horses are reared in the mountainous districts; and goots, furnishing the inhabitants with milk are confined to the mountain districts. They are very small, many of them, when fat, not weighing more than seven or eight pounds a quarter. On the low ground there are a few, scidlom exceeding half a score, on almost every farm. A great number of hoes are fattened; many of them bred in the county, but not a few brought from the west of Ireland. The dry hills of this county, covered with heath and odoriferous herbs, are well adapted to bees, but the number of hives has greatly decreased.

The principal manufacture is linen, which is carried on in all its branches. Kelp is also an article of commerce.

Copper and lead are found within the precincts of Down, and marine extuyie among the hills at a great distance from the sea. There is also black marble susceptible of a high degree of polish; state, coal, freestone, and crystals. Natural woods are seen 13 some parts, but plantations are ascare; there are a good many orchards, a small one being restals.

7895. ANTRIM. 622,059 acres; on the east and north mountainous, destitute of plantations, and abounding in bogs; the other parts more level and fruitful, and the climate drier than in some other counties. (Newcnham's Statistical Survey. Wakefield. Dubourdieu's Survey of Antrim, 1812. Sap. counties. (. Encyc. Brit.)

Minerale. Besides basalt, limestone, gypsum, coals, fossilwood, or wood-coal, sandstone, &cc. are found. The fossilwood, or wood-coal, in most places, is covered with columns of basalt, and is curious as explanatory of the origin of coal. Notwithstanding the compressed state in which it is found, the bark and knots are quibe distinct, and the rings denoting the annual growth of the wood may be counted. In some instance mines which are wrought in the province of bister, there is one in Antrim, at Bally Castle. The coals are bituminous, and of a bad quality; a great part of them are exported. Landed Property. Estates are in general freehold, being either immediate grants from the Crown, or held under those grants. The exceptions are the properties under the see Gonnor. Some of the estates are very large. The Marquess of Horrford and the Antrim family posses the fee of the major of Herrford and the Antrim family posses the fee of the major is, land capable of tiliage, and independently of bog and mountain. Most of the Antrim estate is let on perpetuity, in farms worth 20000. or 20000, per annum. The other great proprietors are the Marquess of Donegal, Lord Templeton, and Lord O'Neil. The estate of Lord Templeton, wever, is only leasehold under the Marquess of Donegal, who lets his land or sixty-one years and a life, but renews at the end of a few years for a price.

In the tillage system is the potot fallow. The small size of the farms, and, in some places, the rockiness of the soil, precludes the use of the ordinary means of culture, and therefore a part

of the land is dug with the spade. The quantity of patato-land is regulated by the quantity of maiure that can be collected. After potatoes, flax is sown, and the quantity of flax ground is regulated by the ability to purchase the seed. A crop of oats finishes the regular rotation. When the ground is exhausted, it is turned to rest, that is, it is suffered to lie till it is covered with natural grass. Such is the most general plan of husbandry pursued in Antrim. In those parts shere the farms are too four neighbours unting their strength; one supplying the plough, and the others bringing a horse, hullock, or even a milech cow. Wheat is a plant of very modern introduction in Antrim, and very little of it is sown.

The most important crop is flax.

The cattle consist chiefly of milch cows, belonging to small occupiers, of a small stunted breed. Sheep are very little encoded of a small stunted breed. Sheep are very little encoded on the strength of the county. Pigs also are kept in great numbers.

This county by no means abounds with wood; nor are fruit-trees cultivated in great abundance, or with very much success. Of the apple, however, several new and valuable varieties have lately been introduced, and advantageously cultivated.

Antrim has long been distinguished for its sinen managhature; but latterly the manufacture of cotton has, in some measure, the supplied of the supple and the county. The suppendous assemblage of basaltic columns, called "the Giant's Causeway," lies on the maritime confines of Antrim.

CHAP. IV.

Literature and Bibliography of Agriculture.

7896. The first books on agriculture were written by the Greeks before the Christian æra, and by the Romans about the commencement of that period. Hesiod is the only writer of the former people exclusively devoted to husbandry: the earliest Roman author is Cato; and the latest, Palladius, in the fourth century A.D. The works of these and the other agricultural writers of antiquity have been already enumerated (25. and 44.), and the most interesting have lately been re-translated (7110. anno 1800).

The first author 7897. In the dark ages few books were written except on religion. that appeared on the revival of the arts was Crescentius in Italy, in the fifteenth century; and soon after, in the sixteenth, Fitzherbert in England, Olivier des Serres in France, Heresbach in Germany, and Herrera in Spain. Since these works appeared, many others have been published in every country in Europe, especially in England, France, and Germany. Though our business is chiefly with the works which have appeared in Britain: yet we shall, after enumerating the chief of them, notice also what has been done in other countries; many foreign works, especially of France, Germany, and Italy, being familiar, either in the original or by translations, to the reading agriculturists of this country. All the works of importance, whether foreign or domestic, published or to be published since 1825, will be found noticed or reviewed in the Gardener's Magazine, commenced in that year, and in continuation,

Bibliography of British Agriculture.

Sect. I. Bibliography of British Agriculture.

7898, A general view of the literature of British agriculture having been already given (801.), we have here only to supply the bibliographical enumeration confirmatory of that view. Of agricultural books very few at the present day are worth reading for their scientific information; they are chiefly to be considered as historical documents of the progress of opinions and practices; and this is the reason we have arranged them in the order of their appearance, instead of classing them according to the subjects treated of. Those who wish to see them so classed will be amply gratified by Watt's Bibliographia Británnica. In our list we have omitted many works on subjects belonging to political agriculture, as the corn laws, tithes, poor-rates, &c.; and also most of those on veterinary surgery, horsemanship, bees, hunting, planting, &c., as not strictly belonging to the subject, and as being for the greater part, those on the veterinary art in particular, worse than useless. In short, the improvements in chemistry, animal and vegetable physiology, and the comparatively clear views of political economy which have taken place chiefly since the commencement of the present century, have rendered most books on agriculture, whether political or professional, not published within the last ten years, of very little value, and a number of them more injurious than useful. This second edition of British authors on agriculture is considerably reduced, in order to render it more select; and, through the obliging disposition of Mr. Forsyth, perhaps the only man in existence thoroughly acquainted with the bibliography of British agriculture and gardening, it is rendered much more accurate. rendered much more accurate.

1500. Groshede, Bishop of Lincoln.
Here begyneth a Treatyse of Husbandry, which Mayster Groshede, sotyme Bysshop of Lyncolne, made and translated out of Frensshe into Englyshe. Lond. 4to.

1523. Fitzherbert, or Fitzherbarde, Sir Anthony, a very learned lawyer, and also known as the father of English husbandry, was born at Norbury, in Derbyshire, and died there in 1538. He was made judge of the Common Pleas in the 15th of Henry VIII., and wrote several bedie on law. and wrote several books on law.

1. The Book of Husbandry, very profitable and necessary for all persons. Lond. 1525, 4to; 1535, 16mo.

25, 4to; 1539, 16mo.

3. De Extense Lond. 1525, 4to; 1539, 16mo.

3. De Extense Lond. 1539, 4to; 1539, 16mo.

1538, Beneze, Sir Richard, Canon of Marton Abbey, near London.

The Manner of Messuryng all Maner of Land. 16mo.

1557. Tusser, Thomas, styled the British Varro, was born near Witham, in Essex, 1515; received a liberal education at Eton School, and at Trinity Hall, Cambridge; lived many years as a farmer in Suffolk, and afterwards removed to London, and published his experience in agriculture and gardening. He died in 1580.

1. A hundreth good Pointes of Husbandrie. Lond. 4to.
2. Five Hundreth Points of Good Husbandry, suited to as many of Good Huswitze; with divers approved lessons concerning Hops and Gardening. Lond. 4to. 1675.

1581. Mascall, Leonard, author of a work on Sowing, planting, and grafting trees, &c. 1572.

1. The Husbandiye Ordering and Government of Poultrie, &c. Lond. 5vo.
2. The Pirst Book of Cattel, &c. Lond. 1587. 4to.
3. A Flock of Fishing with Hooke and Line, and all other Instruments thereunto belonging: another of Sundrie Engines

and Trappes to take Polecats, Burards, Rats, Mice, and all other kindes of Vermin and Beasts whatsoever; moste profitable for all Warriners, and suche as delight in this kinde of sporte and passime. Lond. 1590. 4to. 1601. Anon.

1601. Anon.
God speede the Plough. Lond. 4to.
1601. Plat, Hugh.
The new and admirable Arte of setting of Corne, with all the necessarie Tooles; and other Circumstances belonging to the same. Lond. 4to.
1610. Faugham, Rowland.
Most approved and long experienced Water Works: containing the Manner of Summer and Winter drowning of Meadow and Pasture by the Advantage of the least Liver, Brocks, Fount, or Water Trill adjacent. Lond. 4to.
1613. Markham, Gerwase, Jarvise, or Gerwas. An author who wrote on a great variety of subjects during the reigns of James I. and Charles I., and died about 1685. He appears, says Harte (Esdied about 1685. He appears, says Harte (Essays, ii. 32.) to be the first Englishman who deserves

Says, 11. 32.) to be the first Engishinan who deserves to be called a hacking writer.

1. The English Husbandman; 2 Parts. Lond. 1613. 4to.

2. Farewell to Husbandry, Lond. 1620. 4to.

3. Cheap and Good Husbandry, for the well ordering of all Beasts and Fowls, &c. Lond. 1616, 1631. 4to.

4. Enrichment of the Weald of Kent, &c. Lond. 1620, 1631. 4to.

1631.4to.

1631. 4to.

1616. Stevens and Liebautt.
Maison Rusique, or the Country Farm; translated into English by Richard Surflet, Practitioner in Physicke, newly reviewed, &c.; and the Husbandrie of France, Itair, and Spaine reconciled and made to agree with any here in England. By Gerrase Markham. Lond. fol.

1635. Calthorpe, Charles.

The Relation between a Lord of a Manor and the Copybolder, bit Franat. Lond. 4to.

1639. Plattes, Gabriel, author of some tracts on Gardening; a poor man but a useful writer. Harte says, he had a bold adventurous cast of mind, and preferred the faulty sublime to faulty mediocrity.

preferred the faulty sublime to faulty mediocrity. As great a genius as he was, he was allowed to drop down dead in London streets with hunger; nor had be a shirt upon his back when he died. He be-

as great a genius as ne was, ne was anowed to drop down dead in London streets with hunger; nor had he a shirt upon his back when he died. He bequeathed his papers to Hartlib, who seems to have published but few of them.

1. Dheovery of infinite Treasure, hidden since the World's beginning, in the Way of Hushandry. 4to.

2. Discoverie of Subterraneal Treasure, viz. all manner of Mines and Minerals, from the Gold to the Coal, &c., with directions for the finding them. Lond. 1653. 4to.

3. Observations and Improvements in Hushandry, with Twenty Experiments. Lond. 1653. 4to.

1642. Ferningden, Sir C., a native of Holland, and a colonel in Cromwell's army.

Discourse touching the Drenning the great Penns lying within the several Counties of Lincolne, Northampton, Huntingdon, Norfolke, Suffolke, Cambridge, and the laie of Ely.

The Gentleman's Steward and Tenants of Manors instructed Lond. 8vo.

1790. Ryc, George.
Observations on Agriculture. Dub. 8vo.
1731. Tull, Jethro, was born in Oxfordshire; he was a barrister, and made the tour of Europe; after which he settled on his paternal estate, which he cultivated with so much attention as brought on a disorder in his breast. He then went abroad, and, on his return, fixed his residence on a farm in Berkshire, where he renewed his experiments in Berkshire, where he renewed his experiments in horse-hoeing husbandry: he died in 1740. His son, John Tull, was an officer in the army, but ruined himself by projects, and died in the Fleet in 1764. (Gent. Mag.) Mr. Tull's farm was "situated at a place called Prosecome (republic and leaf of the first farm). himself by projects, and died in the Fleet in 170s. (Gent. Mag.) Mr. Tull's farm was "situated at a place called Prosperous (probably so called from his great success), in a tract of very indifferent land, lying on the north side of the Hampshire hills, near the borders of Wiltshire, but being itself in the county of Berks. It is, I believe, in the parish of Ink-pen. I visited it in the company of Mr. Budd of Newbury, who had visited it long, before with Arthur Young, who, like me, visited it in the character of a pilgrim, and in honour of the memory of the real founder of every recent improvement that has been made in the agriculture of England." (Cabbett's Treatise on Cobbett's Corn, chap. vi) (Cobbett's Treatise on Cobbett's Corn, chap. vi.)
1. Specimen of a Work on Horse-hoeing Husbandry.

2. New Horse-hoeing Husbandry; or an Essay on the Principles of Tillage and Vegetation; wherein is shown a Method of introducing a sort of Vineyard Culture into the Corn Fields, in order to increase their Product, and diminish the comment Expense by the use of Instruments, described in Cuts. 1735.

Supplement to the New Horse-hoeing, &c. Lond. 1739.

The Complete Farmer: or a General Dictionary of Husbardy; in all its branches, &c., by a Society of Gentlemen, Members of the Society of Arts, Manufactures, &c. London. 1761. Young, Arthur, F.R.S., a memment agriculturist, secretary to the Board of Agriculture, was the son of Arthur Young, a prebendary of Canterbury, and author of An Historical Dissertation of Corruptions in Religion. He was born in 1741. He served his apprenticeship to a wine merchant; but on entering into the possession of his paternal estate, near Bury St. Edmunds, he became a farmer, and impoverished himself by experiments. After this he set up as a teacher of others, and in 1771 published a volume called The Farmer's Calendar, which was followed in 1784 by The Annals of Agriculture, in which he had falled The Farmer's Lacendar, which was followed in 1784 by The Annals of Agriculture, with the set up as a teacher of others, and in 1771 published a volume called The Farmer's Calendar, which was followed in 1784 by The Annals farming bailiff, for a correspondent. Young also made excursions through the British islands and on the Continent, to collect information on subjects of the Continent, to collect information on subjects of rural economy. At length a Board of Agriculture was established, of which he was appointed secretary, with a salary of six hundred a year. He became blind some years before his death, which happened February 20, 1820. His works are numerous, and his travels amusing. (Annual Biography.)

1775. Anderson, James, LL.D., an eminent agricultural writer, was born at Hermiston, a village near Edinburgh, in 1730, on a farm which his parents had possessed for some generations, and which he was intended to inherit and to cultivate. which he was intended to inherit and to cutivate. He lost his parents at an early age, but his education was not neglected; he studied chemistry under Dr. Cullen, and soon leaving his farm near Edinburgh, took one in Aberdeenshire of 1300 acres, which, after improving and cultivating for twenty years, he let, and enjoyed an annuity from it during his life. He settled, after leaving Aberdeenshire, in the neighbourhoad of Edinburgh, where he pubthe neighbourhood of Edinburgh, where he published the *Bee*, in weekly sixpenny numbers, till it extended to 18 volumes. In 1797 he removed to Isleworth, near London, where he published Recreations in Agriculture, in six volumes, and his Description of a Patent Hothouse. Here he enjoyed his garden, and died of a decline in 1808, aged 69. Besides the works which bear his name, he wrote the various of healths. reviews of books on rural matters for the Monthly Review for many years.

Monthly Review for many years.

1778. Marshall, William, Esq., a native of Yorkshire, brought up to trade; he was some years in the West Indies, as a planter; returned about 1775, and took a farm in Surrey; went down into Norfolk as agent to Sir Harbord Harbord's estate in 1780; as agent to Sir Harbord Harbord's estate in 1780; he left this situation in 1784, and went and resided at Stafford, near the junction of the four counties of Leicester, Warwick, Stafford, and Derby, where he remained till 1786, occupied in collecting materials for his Economical Surreys, and in printing some of his works. From this time till about 1808, he resided of the contract of the staff for his Economical viviles, and in possible to his works. From this time till about 1808, he resided chiefly in Clement's Inn, London, in winter, and visited different parts of the country during summer. He spent one summer in Perthshire, chiefly on the Earl of Breadalbane's estates at Taymouth; and partly also on the Earl of Mansfield's accountry to the country of the country o at Scone. He proposed arrangements for the tenant-able land, and also the park and woody scenery on various estates; and finally retired to a considerable various estates; and finally retired to a considerable property he purchased in his native country, in the vale of Cleveland, in 1808, where he died at an advanced age in 1819. He was a man of little education, but of a strong and steady mind; and pursued in the most consistent manner, from the year 1780 to his death, the plan he originally laid down; that of collecting and condensing the agricultural practices of the different counties in England, with a view to a general work on Landed Property, which he published; another on Agriculture, which he did not live to complete; and a Ilural Institute, in which he was supplanted by the Board of Agriculture.

Observations on the Disease which has lately been so destructive to Sheep, called Bane or Coath; particularising the Causes, and minutely describing the Modes of effecting its Cure; and pointing out those Means which ought to be adopted to prevent its Recurrence. Bath, pamph. 8vo.

SECT. II. Bibliography of Agriculture in Foreign Countries.

7899. Numerous works on agriculture are published in the French and German languages, and a considerable number in the Italian; but a great proportion of these are translations from British authors. Very few agricultural books have been printed in the Dutch, Flemish, Danish, Swedish, Polish, Spanish, or Dartunges, languages, and scarcely any in those of Russia or Hungary. We shall notice the principal or Portuguese languages, and scarcely any in those of Russia or Hungary. We shall notice the French, German, and Italian works, exclusive of translations, and add a few American books.

Subsect. 1. Bibliography of French Agriculture.

7900. Of French books on agriculture we have given a selection only: those who wish to see a complete list are referred to the Bibliographie Agronomique, Paris, 8vo; in which are given the titles of upwards of 2000 works, including translations and books on gardening. A general idea of French culture in all its branches may be obtained from the Nouveau Cours Complet d'Agriculture, 16 vols. 8vo (edition of 1821.), compiled by the members of the Section of Agriculture of the French Institute, each of whose names are given to the articles he contribute. given to the articles he contributed,

1529. Etienne, Charles, et J. Liébault, physicians. Etienne, i.e. Stephanus or Stephens, in the beginning of the sixteenth century published various small tracts on Gardening and other rural topics; and in 1529 he collected them together and published them, under the title of Prædium Rusticum, treating of gardens, trees, vines, fields, meadows, lakes, forests, orchards, &c. Having married his daughter to Liébault, they afterwards studied agriculture conjointly, and published the Maison Rustique, the modern editions of which are still the most popular jointly, and published the Maison Rustique, the modern editions of which are still the most popular agricultural works in France.

1770. Rozier, François, born in Lyons, 1734, and killed there on the 29th September 1793, during the siege of that city, by a bombshell, which buried his shactered remains in the ruins of the apartment which he occupied; he began his career as an author, by writing in the Journal de Physique et d'Histoire Naturelle, of which Gauthier Dagoty was editor. He next occupied himself with his Agricultural or Ravad Dictionary, the work by which he is chiefly known. He cultivated a farm near Bezières, which Arthur Young went to see when on his tour in France in 1787; but the Abbe had left it on account of the Bishop of Bezières, who kept a mistress somewhere near, and for his more commodiously visiting her, got a road made across the farm at the expense of the province. This occasioned a quarrel between the Abbé and the Bishop, which ended in the former being obliged to quit his farm. The Abbé, like all other men who depart. farm. The Abbé, like all other men who depart from common practices, was looked on as a fanciful and wild cultivator; and, because he paved his stables and cow-houses, it was reported by his neighbours that he paved his vineyard. He wrote a great many works, chiefly on agriculture.

Subsect. 2. Bibliography of German Agriculture

7901. The German agricultural works are as numerous as those of the French, but chiefly translations, and these, for the most part, from the English. We have given a very limited selection, the German language being less generally understood than either the French or Italian. In forest management (Forst. wissenschaff) the German bibliography is very rich; and it is chiefly these books, and descriptions of local practices, which can be of any interest to the British cultivator. The older German works in rural affairs are enumerated in Haller's Bibliography; and the modern ones, and new editions in Ersch's Handbuck der Deutschen Litteratur, and the Leipsic Catalogues, published annually. Thäer of Moeglin is decidedly the highest in repute as an author, and Sickler's Deutsche Landwirthschaft, a voluminous work, will give a general idea of every part of German husbandry.

1578. Heresbachius, Conradus, counsellor to the Duke of Cleve; was born in 1508, died in 1576. He wrote various theological works, besides his Rei Rusticæ, libri iv., which was published in 1570, and his Legum rusticarum et Operarum per singulos Menses digestæ, in 1595. The former was translated by Barnaby Googe, of Lincolnshire, with the

fatted by Barriany Googe, of Entromsmire, with the following title:—
Four Bookes of his Grudening, Graffing, and Planting, with the Antiquitie and Commendation thereof. Newly Englished and increased by Barnebe Googe, Esquire. At London, 4to. 1578. Leaves 194, besides the Dedication, Djistle and Table at the beginning; and Olde English Rules in Verse for purchasing Lande, at the end.

His authorities extend from the Bible and doctors of the church, through the Greek and Roman writers, Homer, Cato, &c., to the moderns as low as Ruelhus, Fuchsius, Matthiolus, Cardanus, and Tragus. He subjoins a list of his friends and others who assisted him. S. Nich. Malbee, M. Cap Byngham, M. John Somer, M. Nicas. Yetzwert, M. Fitzherbert, M. Willi. Lambert, M. Tusser, M. Tho. Whetenhall, M. Ri. Deering, M. Hen. Brookhu 1 M. Franklin, H. King, Richard Andrews, Henry Denys, William Pratte, John Hatche, Philip Partridge, Kenworth Daforth.

The work is in dialogue. The persons are Cono. a gentleman retired into the country; Rego, a courtier; Metella, wife of Cono; and Hermes, a servant. His authorities extend from the Bible and doctors

servant.

Bibliography of Italian Agriculture. SUBSECT. 3.

7902. A number of Italian agricultural works have been published; such as they are, perhaps more of them are original than of the books of the French or Germans, because the culture of other parts of Europe is but ill adapted for Italy. The vine, olive, mulberry, orange, and the irrigation of lands, have a good deal occupied the Italian writers. Ré may be reckoned their general and popular author, and his Nuovi Elementi, 4 vols. 8vo, 1815, and Annali del Agricultura, &c. 22 vols. 8vo 1814, will give a good idea of Italian hisbandry and gardening, the two arts in that country being for the most part combined.

Bibliography of the Agriculture of the other Countries of Europe. Subsect. 4.

Germany and Britain are the only countries in Europe in which it answers to print agricultural books for the sake of the indigenous readers. In Britain, education is so general among the middling and lower orders, that reading among them is a necessary convenience of life; in Germany, education and reading are equally general and essential: and consequently, in either of these two countries a book will pay by its sale within the country. But this is not the case in any other European country. In France the mass of the people do not read, but books printed there pay, because they are in a language more universal than any other, and perfectly understood by all men of education in Europe. Italian books pay, because they are enquired for by the agriculturists of the south of France, all Spain, and in part of Spanish America.

7904. Spanish and Portuguese books on agriculture are in much too limited a demand for production.

7904. Spanish and Portuguese books on agriculture are in much too limited a demand for production. The earliest Spanish author is Herrera, in 1596; and there are scarcely half a dozen since. After the most particular researches of a book agent at Madrid, he was only able to send a list of translations, and the transactions of the Economical Society of Madrid; who have also published Herrera's work with notes within the present century. In 1815, a professor at Madrid published Lecciones de Agricultura explicadas en el Jarden Botanico, 2 tomes 4to. An anonymous author, Disertaciones sobre varios Piantos Agronomicos, 1 tom. 4to. Of Portuguese books we could hear of none.

7905. Of Flemish and Dutch books on agriculture there are scarcely any. These languages are very limited, and every reader in Holland or Flanders understands French or German. Many works have been published in the Low Countries in Latin and French, but these cannot be considered indigenous. The few Dutch works on culture belong almost all to gardening (Enge. of Gar. 7695). The result of our correspondence with Amsterdam is a Nieuwe Naamilyst van Bocken, &c., from which we see little worth taking. There are several translations from British works on culture, and French veterinary books, and the following seem the latest on husbandry.

Cale's, M. F. M., M.D. at Liege: Instructions sur le Parcage des Moutons; ou, Moyen d'engraisser les Campagnes en faisant coucher les Moutons dans les Champs. Liège. Pamph, 8vo.

7306. Of Swedish and Danish books on agriculture, there are necessarily very few; these languages being of very limited use, and the mass of the people too poor to be able to afford to read about ordinary matters, or what they consider as already well known to them. The time such a people give to reading will be devoted to religious subjects, heroic and romantic poetry, or history. The universities of Stockholm and Upsal, every one knows, have produced some useful naturalists: some of these have

written tracts on agricultural improvements, especially on planting fruit-trees (Frukt-Träd.) and cultivating culinary vegetables (Köcks-och Krydd). A few of such works we have enumerated in our Bibliotagraphy of Gardening (1986), but we can scarcely find any fit to be inserted here agricultural. The Natural and Chemical Elements of Agriculture, by Count Gustavus Adolphus Gyllenborg, a learned Swedish statesman, were translated by John Mills in 1770, and may be considered as the prototype of Davy's Agricultural Chemistry. There are several treatises on the cultivate of the potatoe in the Swedish Transactions; also on tobacco, on the management of sandy soils, on the cultivation of the Cerealia; and on the box and plants for fodder. on the hop and plants for fodder.

1826. Winstrup, M., machinist to the king at Fredericksberg, near Copenhagen: Afbildwinger af de bedste og nyeste Agerdyrkningsredskuber, &c. Copenhagen, 4to.
7907. Of Polish and Russian books on agriculture; it may be easily conceived, there are very few. Some translations from French works were made into the Polish language under Fred. Augustus II.; but few or none since that time, the German or French being universally understood by the reading class. Books of agriculture in the Russian language could be of little use. The only things printed in that way there are in the transactions of the Economical Society of St. Petersburgh, by foreigners resident there, and in Latin or German. The best informed Russian nobles read French or German like the Poles. There is an agricultural society at Warsaw, which occasionally prints its transactions; and another has lately been established at Moscow, which publishes an agricultural newspaper. (See Gard. Mag. vols. i. and ii.)

Subsect. 5. Agricultural Bibliography of North America.

7908. There are a few American books of agriculture, and republications there of most of our best works on the subject. Dean's New England Farmer's Dictionary and Dwight's Travels may be considered as giving an idea of the husbandry of that part of the country, and Roughley's Jamaica Planter of the agriculture of the West India Islands. A number of interesting papers on the subject will be found in the transactions of the American, New York, Philadelphia, and other societies.

CHAP. V.

Professional Police and Public Laws relative to Agriculturists and Agricultures.

7909. By professional police we mean those associations which agriculturists have formed, at different times and in different manners, for mutual benefit or instruction; and also those institutions for the same purpose established by the legislature, or of such a nature as to be considered public or national. By laws we allude to those special legislative enactments which affect more particularly agriculture. These are so numerous that we must refer the reader to his lawyer or law dictionary.

7910. There are few or no agricultural lodges of the nature of those of masonry or gardening. In Scotland it would appear something of this kind had existed among ploughmen at one time, as the passwords and initiatory ceremonies are talked of in some of the counties by old men. In Forfar, Kincardine, Banff,

&c. it is not uncommon for ploughmen, as well as various descriptions of operatives, to belong to gardeners' lodges. In the southern districts where sheep farming is followed there are some shepherd's societies, for mutual interchange of experience, and aid in case of losses of such sheep as are the shepherd's perquisite. There are some ploughmen's clubs in different places, and various associations among them of the nature of benefit societies; but these do not come under the description of professional.

7911. Agricultural societies for interchange of knowledge are of modern date, but they have increased rapidly since 1794: the number at present or lately existing in the British isless is at least equal to the number of the counties. Societies of this description are either general, as the Board of Agriculture and Society of Arts; national, as the Highland Society and Dublin Institution; particular, as the Bath and West of England Society; provincial, as county societies; or parochial, as being limited to a few individuals within one parish. Of this kind are farmers' chus, ploughing societies, c. In regard to the end in view, these societies either embrace the arts in general; the rural arts in general; some branch of the rural art, as agriculture; or some department in that branch, as live stock, sheep, wool, &c.

7912. All these societies hold meetings at stated periods. Most of them offer premiums for particular objects,—specimens of vegetable or animal culture or produce, agricultural operations, moral and professional merits as servants, &c.; some of them form a library and museum of models or full-sized implements; a few publish transactions; and one or two, as the Dublin Society, send out titnerant ploughmen and agricultural mechanics to instruct practical farmers. These societies are almost wholly supported, and the funds for premiums raised, by the subscriptions of members, and by voluntary domations, legacies, &c.; but some, as the Board of Agriculture and the Dublin Society, have received assistanc

7913 '0f English agricultural societies the oldest is the Society of Arts, founded in 1754 by Lord Folkstone, Lord Romney, Dr. Hales, and Shepley. They have published many volumes of transactions, awarded immense sums in premiums, and on the whole done much good. (See Rees's Cyc. art. Society.)

7914. The Bath and West of England Society was founded in 1977, for purposes similar to those of the London Society of Arts. They have published some valuable volumes of transactions, and distributed various rewards, &c. (Ree's Gyc. &c.) 1915. The Both of Agriculture was bounded, under the nutries of government, in 1795. Much was expected from this Board; but except the publication of the country reports, and the general attention which it called to agriculture; it reports, and the general attention which it called to agriculture; it reports, and the general attention which it called to agriculture; it reports, and the general attention which it called to agriculture; it may be considered to the country of a second of the country reports, and the general attention which it called to agriculture; it must good by a national "experimental farm. The worth of the country of the count

7916. Of Welsh societies there are only two or three, of inferior note, which have been already noticed in the topography of the country. THE FUTURE PROGRESS OF AGRICULTURE IN BRITAIN.

7925. THE improvement of agriculture, like that of every art, manufacture, or commodity, necessarily depends on demand and production: a powerful or effectual de-mand will ensure produce, and excellent produce will, to a certain extent, create demand. A general nicety of taste in coach or saddle horses will call forth a superior description of these animals, and superior animals will tempt purchasers; if the inhabitants of any district who live chiefly on barley or oats indicate a preference for wheat, and a willingness to pay for that grain, wheat will be produced, and so on. Again, as the object of every individual who engages in art or trade is to acquire gain, the advancement of an art will depend mainly on the profits it affords; an art or occupation which affords less than the average profits on capital will only be followed by such as, from habit or other reasons, cannot apply themselves to any thing better, but extra-profits

view, the sessite aboren to atherst

will command both capital and skill. From these considerations it is obvious, that the improvement of agriculture depends on the profits on capital employed in it, on the taste of those who purchase its products, and on the knowledge of those who are engaged in agriculture as a profession. The first subject would lead us further into political economy than would be of much use in a work of this kind, and therefore we shall limit ourselves to a few remarks on the other topsics; and the state of the

o CHAP. I.

Improvement of Agriculture, by refining the Taste of the Purchasers of its Products, and increasing the Knowledge of Agricultural Patrons.

7926. The desire of being comfortable is the first step towards improvement; but before any thing can be desired, we must know what it is. "Men, when they know of nothing better, rest satisfied with what they have; and therefore one of the main sources of improving the taste both of those who purchase agricultural produce from necessity, and of those patrons of agriculture who purchase from the conjoined impulses of necessity and choice, is the increase of knowledge. However paradoxical it may seem, discontent is the parent of all improvement, as certainly as the acorn is the germ of the future oak, or the time present that of all future times. The grand achievement of the present age, an eminent writer observes (Examiner, Jan. 9. 1831.), " is the diffusion of superficial knowledge;" and on this diffusion, superficial though it may be, the progress of agriculture and of every other art depends far more than on any thing else.

7927. In Scotland and Ireland, could a taste for wheaten bread and butcher's meat be introduced generally among the operative classes, the advantages to agriculture would be immense. Could the same persons be taught to desire a greater degree of cleanliness, light, and warmth in their cottages, a greater variety of potherbs, salads, fruits, and flowers in their gardens; and handsome dresses for their wives and daughters, how great the general benefit! Much may be done to bring about this gardenge, by the opulent who are willing to reside on their estates and to take a little trouble. Building good and comfortable

persons be taught to desire a greater degree of cleanliness, light, and warmth in their cottages; a greater variety of potherbs, salacis, fruits, and flowers in their gardens; and handsome dresses for their wise and daughters, how great the general benefit! Much may be done to bring about this change, by the opulent who are willing to reside on their estates and to take a little trouble. Building good and comfortable cottages; attaching proper gardens stocked! with trees and plants from the demesne garden; and offering little prenums, or marks of distinction for keeping them in the nicest order, and for deently clothed well-bred children, would soon have a sensible effect. Attending to that kind of education which consists in teaching infants civility and politeness, with mutat respect and restraint as occasion, requires; and interacting grown children how to work at almost every thing likely to work the degree of the control of the property of the control of the con

the two but stoogles off of as a constant of a same of a constant of a c Improvement of Agriculture, by the better Education of those who are engaged in it as a Profession.

7930. By education is generally understood that portion of knowledge which is obtained at schools; but in a more extended sense (as Mills observes), it may be defined the means which are employed to render man competent for pursuing the part which he undertakes to perform in life, with increased satisfaction to himself and others. Education may thus be considered as extending to every thing which operates on the body or mind, from the earliest periods of our existence to the final extinction of life. It is unnecessary here to embrace the subject in its full extent; but we shall offer some remarks on the education of practical men in general, on the professional education of an agriculturist, and on the general conduct and economy

of his life. It is stationally a state of the state of th

Serg. I. Degree of Knowledge which may be attained by Practical Men, and general Powers of the kunian Mind as to Attainments.

7931. The kind and degree of clucation that we think ought to be given to every human being in this and in every country, and in every state of civilisation, may be this defined;—All the knowledge and accomplishments that a child's body or mind, and the state of knowledge and the art of teaching at the time, will admit, previously to the age of buetry; giving preterence to those branches of knowledge continue, will admit, previously to the age of buetry; giving preterence to those branches of knowledge continue, will admit, previously to that age, by the season of the state of knowledge and the art of teaching, all that is worth knowing may be the age of pubetry. Previously to that age, by means of infant schools, and of the adoption of the various improvements that have been recently made in modes of teaching, all that is worth knowing may be that given the centre of the cathing, and that is worth knowing may be taught more effectually than common reading, writing, and arithmetic are, during the same time, by the common methods. Man, so frained and the its of present, even in Britafn, as the most enightened motern moralis, and pinisopher of Durope is from an African savage. "It is not necessary," says Lequinio, writing in 1792, "to render an agricultural labourer a learned man," but I am nost enightened motern moralis and pinisopher of Durope is from an African savage. "It is not necessary," says Lequinio, writing in 1792, "to render an agricultural labourer a learned man," but I am well assured, from my own experience, that the knowledge of every thing useful, and of much that is agreeable, both in knowledge and manners, is perfectly consistent with a life of abourin the fields. But hitherto the education of the labouring classes in the country has proved the same and t

therefore, exist in society who have not their minds matured by the care and culture of pubne teachers, as their bodies are by the nourishment and clothing of their parents. The religious and humane owe this the enlightened, in order to raise them to their rank in the scale of creation; the rich, to give them a greater chance of possessing property, in order that they may respect the property of others; the prudent, that they also may become prudent; and government, that they may not be made the tools of action, foreign or domestic. (Parochial Institutions, 6x).

1334. Kaondorige gives power; and if one part of society has the degree of cultivation decired, and the continual tendency of the powerful in wealth or in skill to oppress the weak; and the continual tendency of the powerful in wealth or in skill to oppress the weak; and the continual tendency of the powerful in wealth or in skill to oppress the weak; and the continual tendency of the powerful in wealth or in skill to oppress the weak; and the continual tendency of the weak to react by personal force, by cunning, or by numbers, on the strong. Materials so discordant can never form the basis of a sound, healthy, and permanent state of society the poor and ignorant becoming, under such circumstances, little better than slaves to the rich and enlightened, regard them as their enemies, and often finding them to be such, must and will redel; and harmony of society to moderate this action and reaction, by a more equal distribution of power; and, happings of, which shuran nature, under any given circumstances, as knowledge gives power, the most obvious and effectual way of attaining the end proposed is, by diffusing such a high and equal degree of elucation as we have defined. It must be evident, we highly the state of society which this segree of education will sooner or later produce, will include in it. every amelioration and, happings of, which shuran nature, under any given circumstances, as the such as a submission of the power of the power of the power

progress of society. It is only those who have to dread this progress that fear the diffusion of education and liberal principles.

7939. Education in all countries, in as far as it has been carried, has had the effect of rendering the poor content. Compare the poor of Sweden and Germany with those of England. The uneducated are prone to consider wealth and happiness as synonymous, a delusion which knowledge quickly dispels; philosophy teaches its fallacy, and history exemplifies it. For our own part, we can see nothing in education but increased security to the rich, and increased happiness to the poor. One of the great evils which at present afflict society in this country is over-production; not only of manufactured goods, but also of human beings. We are apt to believe that even this calamity might be remedied, every labourer in the country considered a high and equal degree of education as a necessary of life, and no more to be dispensed with in a child than food or clothing; as in that case he would not think of marrying till he could bestow this degree of education on his children. If any labourer acted otherwise, he would bring himself into disgrace among his own class; he would suffer a loss of reputation for good sense and good taste; and his wife and himself would no longer be able to associate with their neighbours, either from the extraordinary exertions which they must make, in order to educate their children up to the general level, or in consequence of not being able to do so, and having it done for them by the parish as papers. The dread of the reflections and neglect of the children when they arrived at maturity, and found that they were indebted to the parish more than to their parents for their education, and that they had, in fact, to pay the parish for this education themselves, would also act as a powerful inducement to prudential conduct. Besides, when parents themselves have one enjoyed the degree of education dethe they had, in fact, to pay the parish for this education themselves, wou

The miners at Leadhills have a regular library and reading society; and the works they make choice of are not only histories, voyages, travels, &c. but even works of taste, such as the British classies, and best novels and romances. The degree to which knowledge will prevail among any class of labouring men will depend jointly on their ewn ambition, on the demand for knowledge, or the reputation in which it is held, and on the opportunities of acquiring it. A dull, stupid person, with little native activity, will never desire to know more than what enables him to supply the ordinary wants of life; but where the workmen of any art are required to have technical knowledge of any particular kind, they will be found invariably to posses it. Thus carpenters and masons require some knowledge of the mechanical principles of architecture, and working engineers of the strength of materials; and these kinds of knowledge are acquired by them without an hour's interruption of their daily labour: on the contrary, the habit of evening study renders them more steady, sober, and industrious than other workmen: than bricklayers and paper-hangers, for example, whose employments require much less intellectual skill. If every cook-maid, before she could obtain a first-rate place, were required to be able to read Apicius in the original tongue, there would be no want of learned cooks; and if no bailiff could obtain a first-trate place, were required to be able to read Apicius in the original tongue, there would so under the contrary, the contrary, soon acquires the English tongue, and, if he has been taught Latin, thus knows three languages. The servants at the inns on some parts of the Continent, frequented by different nations, often acquire a moderate knowledge of three or four languages: a late custom-house officer on the island of Cronstatt spoke and wrote ten languages; and the bar-maid at the hotel de Londres, at which we lodged in Moscow, in 1814, could make herself intelligible in Swedish, Russian, Polish, German, French,

proportion to the application.

Professional Education of Agriculturists. SECT. II.

7943. In order that a professional man should excel as such, every other acquirement must be kept subservient to that of his profession. No branch of knowledge should be pursued to any extent that, either reservient to that of his profession. No branch of knowledge should be pursued any extent that, either of itself, or by the habits of thinking to which it gives rise, tends to divert the mind from the main object of pursuit; something, it is true, is due to relaxation in eyery species of acquirement; but judicious relaxation only serves to whet the appetite for the vigorous pursuit of the main object. By the professional education of agriculturists, we mean that, direction of their faculties by which they will best acquire the science and manual operations of agriculture, and we shall suppose agricultural pupils generally to have no other scholastic education than some knowledge of reading, writing, and arithmetic.

pest acquire the Science and manual operations of agriculture, and we shall suppose agricultural pupils generally to have no other scholastic, education than some knowledge of reading, writing, and arithmetic.

7914. All young men who intend embracing agricultura as a profession, whether as ploughmen, bailiffs, stewards, land-valuers, or rest paying farmers, ought to undergo a course of manual labour for one year or more, in order to acquire the mechanism, of all agricultural operations. When the pupil is not destined for any particular county, then he should be sent to a farmer in a district of mixed agriculture; as, for example, East Lothian, where he would, if placed in a wheat and bean culture farm, see at no great distance the turnip system and feeding, and a few miles off, the mountain sheep-farming or breeding re when the pupil is intended to be settled in any particular county, he ought to be sent to a county as near as possible of similar soil and climate, where the best practices are in use; as from all the turnip counties, a pupils should go to Northumberland or Berwickshire; from the clay counties to East Lothian, or the Carse of Gowrie; from a mountainous district to the Cheviot hills, and Tweeddale, &c. and the counties of the unit of the ultimate object in view; if he is intended for a ploughman, shepher or hedger, perhaps to introduce new practices in other counties, he may remain for a year or two longer with other masters in the same district, in order not merely to acquire but to habituate himself to all the improved operations and practices. If he is intended for a bailiff, then, after having been two years on one character of farming her him engage himself for a second two years in a district of, an opposite or at least of a different character; and for a third two years, on a third character. There are, as already shown, only three describes to the turnip farming, which includes feeding both by soling and pasturage; and the hill, or mountain, or pasture farming, which includes feeding both

The condition of many estates and remarks, after two years' labour as common servants, after two years' labour as common servants, should be kept as assistant bailiffs on other farms, till they are at least 25 years of age: no young man, in our opinion, ought to be put in a farm on his own account, or employed as a master bailiff, at in carlier period.

79.8. In all cases when young men are destined for particular purposes, they should be sent chiefly to particular districts; as, for example, young men intended for road-surveyors, to where roads are best managed, drainers to a draining country, embankers to Lincolnshire, warpers to the Humber, irrigators to South Cerney, hedgers to Berwickshire, woodmen and foresters to Dunkeld, or Blair in Athol, &c. It

would contribute much to the improvement of agriculture in the backward counties, if landed gentlemen would prevail on their tenants to send their sons as apprentices, or even as ploughmen or farm labourers, to the improved counties; or if lads brought up by the parish were sent there with a view to their acquiring the use of the improved implements.

[7949. Whatever is the kind of professional knowledge to be acquired, the means of attainment is the pupil's paying such attention to what he sees and hears as to fix it in his memory. One of the first things, therefore, that a young man should do is to cultivate the faculty of attention, which he may do every hour of the day, by first looking at an object and then shutting his eyes, and trying whether he recollects its magnitude, form, colour, &c.; whether he would know it when he saw it again, and by what special mark or marks he would know it or describe it. When he goes from one part of the farm to another, or is on a walk or journey, let him pay that degree of attention to every thing he sees and hears, which will enable him to give some account of them when returned from his walk or journey; and let him try next day, or some days afterwards, if he can recollect what he had seen then, or at any particular time and place.

next day, or some days afterwards, if he can recollect what he had seen then, or at any particular time and place.

7950. The attention to be exercised in such a way as to impress the memory, and enable the observer or hearer, not only to recollect objects, but to describe them, must be exercised systematically. A thing or a discourse must be attended to, not only as a whole, but as a composition of parts; and these parts must be considered not only as to their qualities of dimension, colour, consistency, &c., but as to their relative situation and position. To be able to give an account of a town or village, for example, the first thing is to get a general idea of the outline of its ground-plan, which may be done by looking from a church tower or adjoining hill; next, its relative situation to surrounding objects, as what hills, or woods, or waters join it, and in what quarters; next, the direction of the leading street or streets must be noticed; then the intersecting or secondary streets, the principal public buildings, the principal private ones, where he lowes thouses and narrowest streets are sit atted, and what is the character of the greatest number of houses composing the whole assemblage.

7951. To treasure up in the mind the characteristic marks of particular varieties and subvarieties of stock is a most important part of an agriculturist's professional education. To do this effectually, some knowledge of sketching is of great use, and, if possible, ought to be acquired by every person intending to fill the situation of bailliff or steward. The knowledge of soils, plants, and their culture is a very simple business compared with the knowledge of stock, which is not only of difficult and tedious acquirement, but easily lorgotten or lost: for one gentleman's bailliff that knows any thing of stock there are at least a score that know nothing.

secre that know nothing. 1
7952. In connection with professional studies, the pupil may find it necessary, if his education has been neglected, to go on at his leisure hours with all the usual branches of education, either assisted by books alone, or by books and the best assistance he can procure. If his school education has extended to arith metic, mensuration, mathematics, and drawing, he should occupy himself in acquiring a knowledge of botany, zoology, geology, and mineralogy; without a tolerable knowledge of each of which lie will, ever be in the dark among modern agriculturists, and in reading books on the subject. Next, let him study the various arts and manufactures that have any relation to agriculture, and store his mind with all he can acquire from one of the best general Encyclopadias, as that of Rees, or the Encyclopadia Britannica, with its excellent supplementary volumes. If he will go farther, and if he wishes to know the extent to which he may go, he may consult what we have advanced on the subject of education in the Encyclopadia of Gardening. of Gardening. nevt to that of he prefesse No. the flat treat, or by the habits of thinks. To when a term

SECT. III. Conduct and Economy of an Agriculturist's Life.

SECT. III. Conduct and Economy of an Agriculturist's Life, we have at manhood, and steadily pursued for the time to come: most commonly such a plan is formed by the parents soon after the child's birth, and, at the latest, when the boy is taken from school: The boy arrived at manhood, however, is entitled to examine this plan, and amend it, or devise another more congenial to his own notions; but the risk of any change of this sort by persons so young and inexperienced is so great, that no youth ought to venture on it without the utmost consideration, and the firmest persuasion in his own mind: where the parent has done his duty, such changes of plan will not often be attempted; for, by the early infusion into the mind of a child of ideas relative to the pursuit that is intended for him, a taste for that pursuit or employment will grow up with him, and become as it were his own intural inclination. This will happen in most cases, but in some children the bias or force of nature for some particular purpose is so strong, that by no parental intreaties or reasoning can it be overcome; even where a sense of duty induced compliance with a parent's wishes for a time, the dornant inclination has at last broke out and taken the lead. In such cases, the parent may generally conclude; that where the pursuit or purpose is not bad, the force of natural inclination will be more likely to command success than the influence of parental authority; and that a pursuit or business, commonly of little profit or repute, will be more profitable and respectable when followed by a genius powerfully impelled to it, than a profitable and respectable when followed by a genius powerfully impelled to it, than a profitable and respectable when followed by a genius powerfully impelled to it, than a profitable and respectable when followed by a genius powerfully impelled to it, than a profitable and respectable when followed by a genius powerfully impelled to it, than a profitable and respectable when followed by a genius powerfully impelled

discover the want of one and form a good plan. The young man who is just setting out in life may well tremble at the consequences of proceeding on the journey without the guide of a judicious plan; this plan he must form himself, because he alone feels what he wants, and what he can do to gratify them; all that

we can do is to offer a few hints.

we can do is to offer a few hints.

7957. In order to be able to form a plan it is previously necessary to determine the object to be attained by it. Happiness is the object of every action of human life, and consists in the gratification of certain wants and desires; some of these desiderate are peculiar to youth, and others to old age; but many, as clothing, food, rest, relaxation, entertainment, &c.; begin with the earliest, and continue to the latest period of life. All these gratifications are procured by labour; in savage life, by hunting, fishing, and gathering fruits, till the man, no longer possessing strength enough for these labours, is obliged to lie down and die of want: in civilised society, they are also obtained by labour; but here what is called property exists, and man, in the vigour of his days, when the supplies of his labour are greater than the demands of his wants and desires, or when he chooses not to gratify the latter to the full extent admitted by the former, can, as it were, embody a part of his labour, to be made use of when he is no longer able to perform it with ease: a man in this case is said to arrive at independence, instead of want, as in the case of the savage, or of beggary, as in the case of the improvident.

form it with ease: a man in this case is said to arrive at independence, instead of want, as in the case of the savage, or of beggary, as in the case of the improvident.

7958. Independence is the grand object which every man destined to live by the exercise of his labour or talents ought to have in view. At certain periods of life, when the imagination is vivid, and health and animal spirits in their utmost vigour, some may prefer present enjoyment, mere animal gratifications, or imaginary distinctions, amatory conquests, titles, rank, military glory, and high literary or professional reputation: it is a noble attribute of our nature to prefer some of these to the mere accumulation of money; but a great warrior, poet, or painter, arrived at old age and want, if the latter be brought on by common improvidence, will not find himself surrounded by many marks of distinction; and though it may possibly be some consolation to him that the three or four letters composing his name will be sometimes represented together after he is dead, vet it will not be much.

possibly be some consolation to him that the three or four letters composing his name will be sometimes pronounced together after he is dead, yet it will not he much.

7959. The exercise of his profession is the most rational mode in which an agriculturist, of whatever grade, can pursue independence. Only extraordinary circumstances can justify a change of profession; in common cases it indicates a want of steadiness of character, or a want of success, and the latter is commonly attributed to want of skill; it is better, therefore, to pursue unremittingly the profession to which we have been educated, even though we should not be very successful in it, than to risk an infringement on character by adopting another. The practice of agriculture, as we have already seen, (7710.) Is carried on by three different classes, serving, commercial, and artia griculturists; on each of these classes we submit a few hints to aid them in forming a plan of life, and regulating their

expectations

expectations.

7960. The greater number of agriculturists must ever belong to the lower grades of the serving class; and act as ploughmen, herdsmen, shepherds, hedgers, woodmen, and labourers of all-work. These form the greater proportion of mankind in every civilised country, and must ever remain the bulkiest material in the social fabric. Comparing one age and country with another, however, there may be the greatest difference in their intellectual and physical condition. The ploughman of Russia is but a remove from the base of the properties. difference in their intellectual and physical condition. The ploughman of Russia is but a remove from his horse. The ploughmen in different parts of Britain are as intelligent as their employers; in Scotland they have the Bible by heart, are familiar with the history of their country, and not ignorant of its literature; they lead a laborious life, but they enjoy the inestimable blessings of health, sound sleep, and peace of mind, till the latest period; they are almost always independent, either from their labour, their savings, or, in old age or sickness, from the assistance they receive of their children in return for what was laid out on their education. These men are as happy, relatively to their capacity for happiness, as any other class whatever: if their measure is smaller, it is as full as the largest; for the essential materials of comfort and happiness are the same in all classes, and in all classes a man's wants and wishes accommodate themselves to the means of gratifying them. The rich was no wants, and their desires for the most part are no sooner expressed than gratified; the pains and pleasures of life are neutralised into a kind of insipidity, till ennui brings on disease, which to this class becomes a blessing, by procuring for them the occupation of taking medicine, the duty of attending to the doctor's regulations, and the pleasures of convalescence.

7961. Constant thour, even that of the humblest description in the country, when it is not oppressive,

by procuring for them the occupation of taking medicine, the duty of attending to the doctor's regulations, and the pleasures of convidescence.

7961. Constant labour, even that of the humblest description in the country, when it is not oppressive, and where it is accompanied with abundance of food, sufficient clothing, and good health, is by no means inconsistent with happiness. It is a common but most erroneous idea, that happiness is confined either to the rich or the independent. Health and activity are the woods, and a rich man who has nothing to do is unquestionably more miserable than any ploughman in the empire. "Happiness," says one who has thought much on the subject, "is the full and vivid satisfaction of the mind; and it consists in content and uninjurious enjoyment, that is, enjoyment not injurious either to oneself or to any other. Among the very first requisites to this satisfaction, it will readily be perceived, is employment, either bodily or mental; and the more energetic, without exhaustion, is the employment, the more full and vivid will be the satisfaction. The human mind is naturally active; and, except in sleep, if even then, cannot with impunity be motionless or torpid. Occupation is as necessary to its health as circulation of the blood is to the body's. Employed it must be, to know content or feel enjoyment; for, by any want productive of pain, either bodily or mental, especially the latter, content and enjoyment are, according to the degree of the pain, destroyed or diminished; and the want, which the unemployed mind invariably feels, is as invariably productive of uneasiness, of listlessness, and lassitude, and their inseparable attendant, mental pain. Indeed this pain is, not unfrequently, altogether unendable. "All the importunities and perplexities of business," says Dr. Johnson, 'are softness and luxury compared with the incessant cravings of vacancy and the unsatisfactory expedients of idleness.' 'It is this intoterable vacuity of mind,' says Paley,' which carries the rich and g

Employment to the mind and exercise to the body are in some degree substitutes for each other; but, for the full content and enjoyment which constitute happiness, they both, in due proportion, are necessary."

(Co-operative Magazine, vol.i. p. 6.)

7962. The plan of life suitable for the operative agriculturist may very well be founded on the condition of this class of men in the northern counties of Northumberland, Berwickshire, East Lothian, and others. We have already (7809. and 7834.) described in general terms the manner in which farm servants are hired, lodged, and paid in these counties; and details by an eminent Northumberland farmer will be found in the sixth volume of the Gardener's Magazine (p. 589.). The essence of the mode consists in the employer providing the employed with comfortable cottages and gardens, and paying them chiefly in the necessaries of life, in so much meal or four, so much ground to grow potatoes and flax or hemp, a cow's keep, the run of a pig, if a shepherd so much wool or so many sheep, the loan of a team to fring home coal or other fuel, and a certain proportion of money. By this mode of payment the operative countryman is always sure of a comfortable home and food, sure of milk, butter, meal, bread, and potatoes, the produce of a pig, poultry, and bees, and of the produce of his garden; and this, however high may be the prices of these articles in the public market. These good things can only be rendered angatory by the evil of a bad wife. All country servants hired by the year night be accommodated and paid more or less in this manner; and to this mode of life and payment they ought to look forward as the ultimatum of their grade in the scale of operative agriculturists. By prudent conduct, in regard to the increase of their family, and by frugality, they may live in decency and comfort, educate one or two children, and save something for old age, or unforeseen occurrences.

1231

7963. The Northumberland ploughman is the happiest of labourers, and never feels a bad season. His wages are certain; and with frugality and care, his wife-may bring up a large family upon this income. The reverse is sometimes the case; but this is attributed to a bad wife, who wastes the produce of the cow. The small stock of the hind being always his own, and the cow generally so, makes him prudent and careful during single service to save as much of his wages as will set him up for himself. To this, and the fact that the wages of labour are never paid out of the poor's rate, the envisible state of the Northumbrian labourer is to be attributed. It appears to operate as a preventive check upon population, and beautifully illustrates Mr. Malthus's theory; or, in the words of Burns, it teaches them to "know that prudent cautious self-control is wisdom's root." They are all anxious to give their children such education as they can command. When they are within the reach of a charity-school they thankfully avail themselves of it, and we find in every hamlet some person who teaches the younger children the rudiments; and several of these, when they get older, work and save the wages of summer to pay for putting themselves to schools in winter. (J. C. in Gard. Mag. vol. v. p. 591. See also Denson's Peasant's Voice.).

7964. The day labourer who has no particular employer, and probably no fixed residence, is much less comfortable than the yearly servant; in England more especially, under the present system of poor laws and parish management, which is calculated to degrade him, and effectually to prevent any attempt at improving his condition. If, as Slaney observes, "by unremitted industry, he has been enabled to do without parochial relief, and bring up his children decently, it is as much as could be expected; for an attack of illness, or the temporary loss of employment, he is in general totally uprepared; he thinks not much of the morrow, and, as it stands, it is perhaps well for him that he does not anticipate e

restriction of the production of the major part of the agreements a bootened to the continue, not to better their existence." (Essago on the brace, ficial Direction of Bural Expenditure, p. 170.; see also the succeeding chapters of these judicious and intelligent essays.)

The condition of the labouring classes has lately been considered by the editor of the Scotoman, in the continue of the cont

7973. A reasonable degree of security against the casualties of life may be afforded to a working man about to enter into the married state and his family for the sum of 1000., which it is shown he might save by the age of twenty-eight. That sum would be disposed of thus:

Furniture, exclusive of what was provided by the wife Annuity for himself in old age of 200, per annum Annuity of 100, per annum for his widow Provision for four children	:	£30 17 33 20
		£100

Therefore, let no man whatever, not even the most humble country labourer, think of marrying before he has saved 100%; and let him beware of spending any part of this sum, even that part which is allotted for

Therefore, let no man whatever, not even the most humble country labourer, think of marrying before he has saved 1001, and let him beware of spending any part of this sum, even that part which is allotted for his furniture, before he has provided for the four casualties of the married state.

7974. To carry this scheme: tato QPct, mutual assurance societies by the working classes themselves, or benefit societies, would probably be the best mode, and government and the more wealthy members of society ought to lose no time in assisting in their formation. It is justly observed, however, that it cannot be desired to the working classes, that the improvement of their condition must be their own work. Were theel show the working classes, that the improvement of their condition must be their own work. Were theel show the working classes, that the improvement of their condition must be their own work. Were the short of the short of the short of the short of the condition must be their own work. Were the short of the short o

the farmer of Russia and Poland has the advantage of the British farmer; for the lands of the former being from five to eight months under snow, all root-weeds are destroyed, and the ground so loosened by the frosts and thaws, as to require very little stirring for the seed; the rapid summer which suceeds ripens all annual plants that will grow there, nearly as well as in England, and better than in many parts of Scotland and Ireland. The British farmers, however, have the great advantage of perpetual pastures, owing to the mildness of our winters; but still no art of man will shorten the period of animal gestation, and originate a lamb or a calf in shorter periods than five months and forty weeks. How often does the tradesman or manufacturer turn his capital in that time! There are three varieties of professional farmers, however, who occasionally realise some property: the grazier who feeds with oil-cake, grains, and other artificial foods; the dealer in corn or cattle, who has the art to buy at a falling and sell at a rising market; and the dealer or jobber in farms, who sublets or sells his lease, or in purchases of land, who subdivides and sells estates. The profits of the first are not great, and those of the last two are attended with great risk: the only farmer whose lot is to be envied, lives under a landlord who does not take the full marketable price for his lands: such as Burdett, Coke, Bedford, Northumberland, and many others in the south; but few in the north, or in the west.

CALENDARIAL INDEX.

AND THE PROPERTY OF THE PROPERTY OF THE PARTY OF THE PART

Though agricultural operations, in general, require less nicety as to the exact time of performing them than many of those of gardening, yet there are exceptions in respect to some field crops; for example, beans and turnips. It is proper to observe, therefore, that the almanac time in this Calendar is calculated for the meridian of London; but as a Calendar of nature is given for the metropolitan district, the almanac time may, in every part of the empire, be varied to suit the local climate and vegetation.

In general, other circumstances being alike, four days may be allowed for every degree, or every 70 miles north or south of London; in spring, operations may be commenced earlier in that proportion southwards, and later northwards; but in autumn the reverse, and operations deferred as we advance southwards, and accelerated as we proceed to the north. In every case allowing a due weight to local circumstances.

Our notices under each month extend only to a few of the leading features of countrywork; — to attempt to insert every thing, or even most of the things that require attending to, we conceive impossible; and, if it could be done, quite useless. A man will always act better when guided by his own judgment, than when following implicitly that of another. Calendars should only be considered as remembrancers, never as directories.

JANUARY.

ecoasionally come and examine each lad, and costors some mark of approbation on the most described, for a 30 of the Line Stock. (62)6.)

Stare firm (7191.) whether of sheep or cattle, require considerable attention during the winter and spring months to apply straw and hay, with such green food as can be spared, to stock on scartey pastures; and to shelter during storms, specially of snow.

Lambé are dropped during the month by the Borsetchern, and hear London are generally kept in the house and feed (1224.)

These returns graph of the storm of the sheep control of the storm of the s

son their Hying about, they should be examined to assect in if feeding be requisite, (7602), and 18 of assect in if feeding be requisite, (7602), and 18 of assect in 16. Grass Lands. (5643).

They sells and selends should alone be stocked with cattle or young borses at this season, (5539), Sheep should not, be allowed to graze either on wet marshy meadows or on young clivers (35453, Grass Hands, under a system of hrighalth, may mow be kept covered (4587.) Clayer soils and others not propry drained should now have that operation, effectually performed on the surface (4293,) or under it (4202.), according to Worms (7548, on come soils do considerable injury to grass, Where the labour is not considered too much, and there is a water barrel at any rate, they may be killed by mixing powder of lime with the water, at the rate of one pint to ten gallons. On lawns, and in small paddocks, or in the case of fermes or read in the consideration of the operation.

11 (6. Arable Lands. (4925.)

Plough when the soil is not too wet. Lead out dung and form field dunpfills, also compost heaps, with peat or other matters. See that drains, ditches, and, water-furrows run freely, and answer their respective ends.

Boans (5222.) are in some dry situations planted in the last week of the month; and also peas, and sometimes cats, are sown. On the whole, however, it is better to defer the beans and peas till the first and second weeks of February, and the cast till the two last weeks of that month. Spring wheat of the common kind (5025.) may be sown where the soil is suitable.

Fences (2960.), Roads (3523.), and Drains. (4213.)

Hamthorns may be planted in fence-lines, in any of the dif-ferent modes. (2972.) Ditches, walls, palings, and all other fences of the common kind may be formed; but none where hollies or other evergreens are to be used. Repair by the dif-ferent modes. (2987.) Roads and drains may be formed at all times and seasons.

8. Orchards (4079.) and Hop-grounds. (5997.)
Prune tre s and free them of moss. Where digging round
each tree is practised, this is a good season. Stake and tre
plantations. (6007.) Hant orchards. Trench ground for hop
plantations. (6007.)
9. Wood-lands and Plantations. (3996.)
Prepare the soil for planting. Plant decidenous hard-wooded
trees in mild weather. Flant and sow the larger tree seeds,
whether in places where they are finally to remain, or in
nursery-grounds.
Felt timber and coppier not valuable on account of its bark.
Stock up roots, stack them, and char them.
Prune decidious trees; fill up vacancies. Cut hawthorn
hedges. (2985.) Gather any tree seeds not before gathered.
Drain wood-lands and cut paths or other openings required
through them, the leaves being now off the deciduous sorts.

FEBRUARY.

Weather at	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	
London - Edinburgh Dublin -	42 3 36 6 43 78	5	29 94 29 556 30 091	0.873 inch. 1.269 2.21	

REMARKS. This month (the spring or sprout kale month of the Saxons) is usually subject to much rain or snow; either is accounted seasonable: the old proverb being, "Pebruary fill dike with either black or white." Round London, the sap in vegetables shows evident symptoms of motion about the middle of the month, and sometimes a week earlier. The animal calendar, and inflorescence of native trees for this month, will generally be found very correct. correct.

1. Calendar of Animated Nature round London. In the first neek: bees (A'pis mellifica) come out of their hives, gnats (Gilvs) play about, insects (Insecta) swarm under sunny hedges, and the earth-worm (Lumbricus terrestris) lies out; ben-chaffinches (Fringfila) flock, and the song-thrush, or throstle (Tùrdus mùsicus), and common lark (Alaüda arvénsis) sing.

Second week: the buntings (Emberlza álba), and linnets [Fringfila Linota), appear in flocks; sheep (O'ris A'ries) drop their lambs; geese (A'nas A'nser) begin to lay.

Third week: rooks: (Córvus frugflegus) begin to pair, and resort to their nest-trees; house-sparrows (Fringfila doméstica) chirp, and begin to build; the chaffinch (Fringfila cœ'lcbs) sines.

sings.

Fourth week: the partridge (Tétrao Pérdix) begins to pair,
the blackbird (Túrdus Mérula) whistles, and the wood-lark
(Alaúda arvénsis et arbórea) sings; the hen (Phasiànus Gállus) sits.

2. Calendar of Vegetable Nature round London. In the first neek: the snowdrop (Galánthus nivális), whin (U'lex europeal), white deadnettle (Lâminu filum), polyanthus (Primula veris) flowers; and the elder (Sambdeus nigra), and some roses and honeysuckles, begin to expand their leaves.

leaves. Second neck: common crowfoot (Ranánculus rèpeus), dande-lisecond neck: common crowfoot (Ranánculus rèpeus), dande-lisecond teck: common crowfoot (Ranánculus rèpeus), dande-lisecond (Léonicia argréstis in flower; many of the poplar and willow tribe show their catkins; and also the yew (Taxus baccata), alder (A'lnus communis), the tully (Tulipa), crown imperial (Fritillaria imperialis), and various other bulbs, boldly emerging from the ground.

Fourth neck: the Erica carnes, wood strawberry (Fragària vésca), some speedwells (Fritillaria), the groundsel, and some-sorts of gooseberries, apriotos, and peaches, beginning to open their buds.

open their buds.

3. Form...gard. (2902.)

See last mouth. In taking in stacks to thresh, destroy vermin as much as possible. (6652.) Clear away the bottoming of straw, faggots, or other temporary matter, and leave the site perfectly near and clean: the poultry will pick up what grains may have dropped. Be vigilant in keeping stock of every description in order; wintering cattle by frequent supplies of fresh straw and turnips, or other roots; horses by sound corn, and good peas-straw, or clover-hay, dispensing as much as possible with wheat and cat straw. The evening food should, Poultry now hap freely; and if some income a desire to incubate, so much the better where an early brood is an object. Mark todge. There are still a good many hours for mental improvement.

4. Live Stock. (6216.)

quire unremitting attention from the shepherd. (7112.) Attend to feeding lambs as before (7224.), and to milch cows (6803.) and fattening calves. (6843.)
5. Grass Lands. (5613.)
See last month. Manures, where applied to grass lands, may be laid on at this season; and such old mossy lands as are to be broken up may now be pared with a view to hurding

See last month. Manures, where applied to grass lands, may be laid on at this season; and such old mossy lands as are to be broken up may now be pared with a view to burning mext month.

The watering of meadows in warm situations may be pared the growth of the grass. (3553.)

Proceedings of the Stock. (6216.)

4. Live Stock. (6216.)

Sheep generally begin to lamb during this month, and rekeep like stock. (6216.)

MARCH.

-	Weather	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS. The beginning of March usually concludes the winter; and the end of the month is generally indicative of the succeeding spring; according to the proverly. "March comes in like a lion, and goes out like a lamb." The
-	London - Edinburgh Dublin -	46 4 41 7 44 09	4 :	30 20 28 886 29 707	0.716 inch. 1.455 2.364	Saxons called this month the lengthening month, in allusion to the increasing of the days. This is a laborious and trying month, both for men and cattle engaged in field operations.

1. Calendar of Animated Nature round London.

In the first neek: the ring-dove (Colúmba Palúmbus) coos; the white wastail (Motacilia liba) sings, and the yellow was tail (Motacilia libava) appears. The carthworm (Lumbricus terréstris), and the snati Helix) and slug (Limax) engender. Second neek: the jackdaw (Corus Monédula) begins to come

to churches; the tomtit Parus cæruleus) makes its spring note; brown wood-owls (Strix U'ula) hoot; and the small tortoise-shell butterfly (Paplio urtice L.) appears.

Third week: the marsh titmouse (Parus palustris) begins his notes. Various flies (Musec) appear. The fox (Canis Vilpes) smells rank. The turkey-cock (Melèagris Gallo-Pavo) struts and cobblies. notes. Vario smells rank. and gobbles.

Powrth rook: the yellowhammer (Embertza Citrinélia) and green wood-pecker (I'heus viridia) sing; rooks, ravens (Gōrul), and house pigeons (tolumbae) hails: the goldinent (Fringia), and house pigeons (tolumbae) hails: the goldinent (Fringia), and the common flea (Philes tritans) appears.

2. Calendar of Fegetable Nature round London. In the first week: various species of the pine, larch, and fir tribe in full tlower; the rosemary (Rosmarinus officinalis), the willow (Sails) and bay (Laurus nobils) in blossom; various trees and shrubs beginning to open their buds.

mum), and some voses in leaf; Grous vérmus, and other subspecies, and some voses in leaf; Grous vérmus, and other subspecies, and some voses in leaf; Grous vérmus, and other subspecies, and some voses in leaf; Grous vérmus, and elder (Sambacus nigra), sometimes in leaf.

Third neek: Saxifraga oppositifolia, Driha vérma, Déphne, Sarima or verment propositions, principe de la comment of the common stream of the common stream of the propositions of the propositions, principe de la common stream, and the plants, in warm situations, in flower, or just advancing to that state.

3. Farm-gard. (2002.)

Wintering cattle should be liberally supplied with food from this time, till they can be wholly turned to grass: as straw and supply of turning, or other roots, rather increased than diminished. Where oil cake, brewers' grains, and similar articles can be obtained, they are valuable auxiliaries. Fatting cattle (6552.) and milch cows (6563.) require continued attention to food, cleaniness, and moderate exercises. Working brees and other cover themselves for several months. Potatoes may now be cut into ests preparatory for next month.

4. Live Stock. (6216.)

Sheep now drop their lambs freely; and none pay better than such as are turnip fed at this time, and finished off in April, on forward pasture. As turnips begin to run to flower about this time, they are apt to prove more than usually laxame extra supply of Pay.

5. Grass Lands. (5643.)

Meadows intended for

Clover and rye grass (5521.) may now be sown anison young wheats after naked fallows, or among spring corn in lands in sood bacteria and not that fallows, or among spring corn in lands in Field beet (5482.), carrots (5443.), paragrap (5471.), and Swedish turnips should be sown the last formight of the month, provided the land is dry enough to be sufficiently cleaned, and sulverised to the depth of at least a foot. It more frequently happens that this cannot be got done till the beginning of April, and hence this class of seeds is seldom got in before the middle of that month. The carrots should be first sown, and the Swedish turnip will bear to be the latest. Lands intended for potators, carriages, turnips, transplanted Swedish turnip, and such plunglings, cross ploughings, and workings with the graibber, as their nature and state may require. It is one great advantage of the common white turnip, that It admits of two months more time for preparing the soil than other root or Brissica crops. Summer or wheat fallows require at least one furrow in course of the month.

7. Fonces (2966) Rands (3593.), and Drains. (4213.)

farrow in course of the month.

7. Fences (2960.) Roads (3523.), and Drains. (4213.)

Thorns and other hedge plants may be put in, but the earlier in the month the business is completed the better. This is an excellent soans for making or repairing roads (3727.), drains, ponds, embankments, &c., the ground being still moles, and the control of the state of the control of the proximity of hay-time and harvest.

8. Orchards (4079.) and Hop Grounds. (5997.)

Finish pruning fruit-trees (4111.), and also digging round their stems, if that is practised. (4119.) Where young orchards are grazed, see that the guards or fences to the single trees are in repair.

Form plantations of hops (5997.), and open up and dress the bills of established plants, returning the mould to their roogs. (6025.)

Form plantations of hops (5997.), and open up and dress the hills of established plants, returning the mould to their roots. (6995.)

9. Wood-lands and Plantations. (3906.)

In the tree nursery, finish sowing acoms, keys, nuts, mast, berries, stones, Sow also the lighter trees, as peptar seed plant from the seed bed, or from narrow to broader intervals, and attend to other parts of the usual routine culture. New plantations may still be planted, endeavouring if possible to finish putting in decidnous trees with the month; using the puddle in dry weather (3940.), and fixing by water. (3952.) Where large trees are introduced, the latter generally require to the property of the practice. Evil up blants (3958.5) in young plantations and hedges, and as in last month. When plantations are to be rised from seed where they are to remain for timber (3926.), this is the month or most seed, but April is better for the pine and fit tribe. Sow the others in the second or third week of the month; and freshous trees are to be mixed, a sprinkling of their seeds can be sown over the others in April.

APRIL.

-	Weather	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS. The weather of this month is distinguished by the rapidity of its changes. It is generally stormy, interspersed with gleams of sunshine, hall, snow, some frost,
-	London - Edinburgh Dublin -	49 9 46 3 51 125		29 77 29 673 52 909	1·460 inch. 2·414 2·561	and occasionally violent storms of wind. It is a month of the utmost activity to the cultivator of arable land, who during its course finishes the sowing of spring corns and grasses, and begins that of roots and leaves.

1. Calendar of Animated Nature round London.

In the first meek: the viper (Cótuber bèrus) and woodlouse (In the first meek: the viper (Cótuber bèrus) and woodlouse (In the first meek) the misselve thrush (Tárdia visef-vorus) pairs; frogs (Rane) croak and spawn, and moths (Phatavus) pairs; the stone curlew (Charkdius & Cdiremous) clamours; young frogs (Rana temporaria) appear. The pheasant (Arahnec) abound.

Third neek: the crested wren (Motacilla Régulus) sings; the blackbird (Tùrdus Merula), raven (Córvus Còrax), pigeon (Coitmha domèstica), hen (Phasianus Gallus, and duck (Arasbodol) (Motacilla Merula), raven (Córvus Còrax), pigeon (Coitmha domèstica), hen (Phasianus Gallus, and duck (Arasbodol) (Motacilla Luschia) sings; the bittern (Ardea rotellaria) makes a noise; the house martin (Hirándo árbica) appears; the blackcap (Motacilla Atricapilla) whisties; and the common snake (Cótuber Nitrix) appears.

2. Calendar of Vegetable Nature round London.

In the first neek: the daffold (Narcsan Feedon-narcissus), the common snake (Cótuber Nitrix) appears.

C. Calendar of Vegetable Nature round London.

In the first neek: the daffold (Narcsan Feedon-narcissus), the common snake (Cótuber Nitrix) appears.

C. Calendar of Vegetable Nature round London.

In the first neek: the daffold (Narcsan Feedon-narcissus), the common snake (Cótuber), the cowsily (Primula officinalis), the periwinkle (Viron), sloe (Primus spinosa), and various other herbs and trees in flower.

Second neek: the ground-ivy (Glechoma hederacea) gentianella (Gentiana acaulis), Pulmonaria virginica, the auricula, Their sempervirens, Omphabides verina, and most of the com-Third neek: sume Roltinie, Andromeder, Kalmie, and other American shrubs: Daphon Lauvola, C'Imus campestris, Chrysooplenium oppositifolium, Mercurialis perennis, and other plants in flower.

Fourth week: the beech (Fagus) and elm (U'Imus) in flower; ivy-berries drop from the racemes; the larch in leaf, and the tulip and some white narcissi and fritillaries in flower.

S. Farm-yard. (2902)

This month will in most situations terminate the wintering of cattle in the straw-yard. Straw is now very dry, therefore turnips, or other green food or roofs, should be added in proportion.

Horses should be kept in high order, on account of the hardwork and extra exertion often required of them during this month. If there are carrots or potatoes to steam for them once a day, that will greatly aid hay and corn; if uoi, steam a part of the hard supplies of food for store pigs and poultry are less abundant during this month, because less time can be spared for threshing. There are fewer wintering cattle, and hills.

4. Live Stork. (6916.)

4. Live Stock. (6216.)

4. Live Stock. (6216.)

The end of this month is a good time for mares to foal (6629.), and they should have the horse accordingly. (6631.) Attend at the proper periods, first to moderate working, and then to entire ease before foaling time. (6641.)

The stock of the stock of the stock of the stock of the stock of the stock of the stock of the stock of the month. (6863.)

Sheep and lambs generally require a good deal of artificial food during the first half of this month. When the turnips are expended, clover hux, grains of barley which have been malted, rape cate, or linsed cate, are the next excources. (6904) turnes, and then it is that mutton generally drops in price :—a hint to the farmer to sell all he can in the early part of April.

Where there are water-meadows, the sheep and lambs will have been fattening on these during the whole of the month, —an immense advantage to a farmer.

Poultry of most kinds have now hatched their broods, and require looking after, to see they do not injure one another, nor are attacked by stronger enemies.

5. Grass Lands. (5643.)

b. Grass Lands. (5643.)
See that the fences are kept up, and the gates regularly shut and fastened; as cattle newly let out are very apt to wander, and more ready to break through fences than when the herbage is more abundant.
6. Water-meadons (4571.) are generally shut up for hay about the end of the month, the ewes and lambs being then turned a sufficiently for sard state.
Monting-meadons of the common index (5768.), and clovers, and mixed grasses for hay, should be hand-picked, bush-harrowed, and rolled, early in the month, and then shut up for the scythe.

6. Arable Lands. (4925.)

6. Arable Lands. (4925.)

Flinish somiar all the spring corns (5080.), peas, tares, lucerne (5574.), saintfuin, and all other herbage, plants, and grasses. (5674.) saintfuin, and all other herbage, plants, and grasses. (5674.) sharley in late stituations (5095.), peas for late podding, and under peculiar circumstances, tares for cutting green in October and November.

**Manufuclorial plants, as wad, madder, flax, hemp, mustard, &c.; oil plants, as rape, poppy, and such plants as are grown for medicinal purposes or peculiar uses in domestic economy, as rhulard, plantics, back or beston best, cress, &c., may all and the state of seasons, soils, and situations, suit the most of them.
Carrot (5445.), field beet (5482.), parsney (5417.), and Swedish turnip (5409.), if not sown the last week of March, should be finished during the first ten days of April. A bed of Swedish

turnips should be sown in the garden for transplanting in the field by the end of the month, or the first week in May. The last fortright of the month is the best season for planting. The last fortright of the month is the best season for planting to the service of the structure of the service of the structure of the service of the se

7. Fences (2960.), Roads (3523.), and Drains. (4213.)

All these should have been put in order before, so as to leave the hedger of the farm (7714), and the labourer of all work (7711), time to assist in getting in planted crops, as potatoes, cabbages, &c. in the fields, cropping the garden, mowing, or otherwise dressing the ordered, shrubbery, lawn, or such orna-mental or enjoyment ground as the farmer indulges in round his house.

8. Orchards (4079.) and Hop-grounds. (5997.)
In some cases fruit-trees may be so over-run with insects towards the end of the month as to make it worth while to burn wet straw under them; but this rarely happens before the middle of May, and even then farm orchards may almost always be left to the birds and vigour of the trees. Hops are generally poled in this month, and the ground between the hils afterwards stirred with the cultivator or nidget as it is called in Rent. (6026).

Wood-lands and Plantations. (3906.)

9. Wood-lands and Plantations. (5905.)
All planting and pruning of deciduous trees should be finished the first week of the month. Afterwards the planting and pruning of evergreens may commence; first the common of the common of the planting of

MAY.

Weather	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.
London - Edinburgh Dublin .	56 61 50 4 52 193	2 5	30 02 29 585 30 061	0·794 inch. 1·945 1·812

REMARKS.

Vegetation now goes on with great vigour, though there are often very cold and even frosty nights, which materially injure the blossoms of fruit-trees, and sometimes the young shoots of the hop and potato. Man, in common with other animals, being now full of life and vigour, the consummation of animal desire is frequent; but marriage is better deferred till September, when the offspring will be born in the May or June following, a the expenses of an acconchement than in the cold month respondent to marriages in May.

3. Farm-yard. (2902.)

3. Farm-gard. (2902.)
Feeding and wintering on straw and roots generally ends, and soiling (5542.) or pasturage (5562.) commences, in the first fortnight. Where high-flavoured milk and butter are preferred to quantity, then pasturage on dry-bottomed uplands is to be preferred; but where quantity and richness is the object, solling with clover and tares, and two or three hours' pasturage per day, for the sake of exercise, is the preferable system. Even on farms where there is nothing to move but old meadow, solling with that will be found more economical than pasturing it. A field of meadow in good heart, mown and eather that will be found more economical than pasturing it. A field of meadow in good heart, mown and eather and the second of the property of the pasture of the pa

clean during the summer, excepting what room is required for the dung of the few stock which are there constantly, as pigs and poultry, or occasionally, as horses while harnessing, &c.

4. Live Stock. (6216.)

In turning eattle to grass, consider the different systems of pasturing (6316.); adopt what suits your circumstances, and pursue it regularly. See that water is not wanting to each leid (4465.); in or shade, rubbing posts, and shelter. (5385.)

Lean stock are generally dear during this month, from the number of persons who buy in and feed off on grass. When cattle or sheep are very numerous, they are found to feed better and do less lutury to the grease, in small herst or flocks, than in large ones.

Mares may have the horse during the first week, but not later considering the season of parturition. (6637.)

considering the season of parturition. (6637.)

5. Grass Lands. (5643.)

As most grasses send up their flower-stalks during this most grasses send up their flower-stalks during this meaning their stalks during the stalks during the stalks of the stalks have long before shed their seed and become dry, and so shrivelled as to built for food, the stalks of the stalks have long before shed their seed and become dry, and so shrivelled as to built for food, the stalks have long before shed their seed and berning are wanted, this is a favourable season (5309.)

Water-meadows, having been eaten down in April, are generally watered for the first three or four weeks of this month, to bring forward the crop of hay (4429.)

6 Arable Lands. (4925.)

6. Arable Lands. (4925.)

6. Arable Lands, (4925.)
Summer wheat (5004) and grass seeds (5875.) may still be sown, but not profitably after the first week or ten days. Swedish turnip (5409.), margeold, and yellow turnip may be profitably sown, and also early crops of common white turnip where the soil is clean and duly prepared. (5994.)
The preparation of turnip fallows is the great business of this month, and next the string of maket fallows (4944.), and the culture, by horse and hand hoes, of corns.
In late fallows, and the string of the control of the culture, and the late fallows (1941.)

7. Fences (2960.), Roads (3523.), and Drains. (4213.)
Clean young hedge-rows. (2982.) Drains may now be advantageously designed, as the springs show themselves more conspicuously during winter. The rest in this department is mere routine.

8. Orchards (4079.) and Hop-grounds. (5997.)

Graph three should be looked over occasionally, and any that the cloth of the control of the cloth of the control of the cloth of the c

the stool or centre of the plant with a small hill of soil, to prevent it from sending up more shoots.

9. Wood-lands and Plantations. (3906.)
Continue to bark cak tree, and also the larch, and such others as are adapted for the farmer (4944.), but finish, if possible, by the middle of the month. Keep newly planted large trees properly staked, and all kinds of cultivated ground clear of weeds.

JUNE.

Weather	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS. The weather is sometimes cold at the beginning, but is generally agreeable and steady towards the middle of the month. By observing the columns indicating the greatest variation of the thermometer in each month, it
London - Edinburgh Dublin -	63 22 57 2 58 76	2	29 93 29 666 30 06	0·332 incli- 1·935 0·860	will be seen that it varies, in London, only two degrees in June, which is less than in any of the preceding months. In July and August the variation is the same; but in March and October it is twice as much.

Calendar of Animated Nature round London. 1. Calendar of Animatoa Nature vount London.
In the first week: the sedge-sparrow (Passer arundinaca), the
fly-catcher (Muscicapa Atricapilla), the wasp (Vespa vulgaris),
and several species of the bee and butterfly appear.
Second neck: the burnet moth (Sphūnx filipéndulæ), and
forest-fly (Hippobósca cquina) appear; bees swarm.
Third neck: several files, butterfiles, moths, beetles, and other
leagets amage.

insects appear.

Fourth week: insects abound; and singing-birds begin to retire to the woods, and leave off singing.

retire to the woods, and leave off singing.

2. Calculard of Fegetable Nature round London.

In the first reek: water-illies (Nymphe's et Niphar) flower;
also Pris Besud-ácorus, Africhemis Cottus, Polygonum Persicària, Málva rotundifolia, and numerous other piants.

Scood neek: the vine, raspherry, and elder in full flower;
also various Scotch roses (Rōsā spinosássima), broom (Spártium),
nettle (Urtus), and wheat in the ear.

Third neek: the O'rchis, Epilobium, Pris Xiphium as disphiloides, the hardy Prise and Gladioli, and a great variety of garden and field plants in flower; also the wheat and many of the pasture grasses.

Black and red currants Yipe, strawberries in abundance; young shoots of trees and shrabs have nearly attained their length. Oats and barley in flower; blue-bottle, scalious (Centaurèa Cyànus), and numerous others in bloom.

3. Farm-yard. (2002.)
Sailing is the principal operation now going forward (5542.), and requires the utnost attention to the cleanliness of the animals, whether fatting cattle, feeding milch cows, or horses.

4. Live Stock. (6216.)
Wash and shear sheep (7201.); examine flocks individually as to the fly (7173.); see to shade for every description of stock when the weather is hot. Bees swarm during this and next month.

Grass Lands. (5648.)
 Hay-making is now a principal business (5544. and 5792.)
 Any tussocks or flower-stalks (bents) which appear, notwith-

standing the close feeding of April and May, should now be mown (3772.); thistles and similar weeds cut out close by the root (6202.); pare and burn as in May (3209.); clean out ponds, water-courses, wells, &c. See that clovers, lares, or other soiling crops are mova close to the soil.

6. Arable Lands. (4925.)
Great part of the turnip process goes on during the three first weeks of this month and the latter half of May. (5375.)
Dung fallows and otherwise bring them forward (4568.), draining (4215.), levelling, altering ridges, &c. as the case may require; weed broad-cast crops, and stir the soil between such as are in rows. Warping, where it can be practised, may now be commenced (4460.); thin out the first sown turnips. (5406.)

7. Fences (2960.), Roads (3523.), and Drains. (4213.)
Weed hedges, but avoid clipping them, which only creates a close surface of feeble shoots, that in the end becomes so thick as to exclude light and air from the central stems, and occasions their languishing and death. (2955.)
Dig and otherwise prepare materials for roads (3635.) and drains. (4284.)

Grans. (4284.)

8. Opchards (4079.) and Hop-grounds. (5997.)
Luctt, or other effects of what are called blights, can seldom
be destroyed on so large a scale as that of the farm-orchard or
hop-garden. Burning weeds or wet straw, litter, &c. will do
something; and on a small scale, washing with lime-water,
sony-suds, tobacco-water, or a mixture of these, will prove
effectual. (6056.) Those who tie the bluds or vine of the hop
to the poles, instead of leaving them to nature, have generally
completed the operation by the middle of the month. In some
effect of the superfluous shoots are cut off about the end of
the month.

9. Wood-lands and Plantations. (3906.)

9. Wood-Lanas and Plantations. (2000.)
The woodman is now chiefly employed in trussing up the branches of barked trees, and otherwise disposing of what until for timber purposes. (4091.)
Old copses or stools of trees, woods, or hedges, may now be advantageously stocked up, stacked, and when dry, charred for fuel. (4003.)

JULY.

Weather at	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS. This was called hay month by the Saxons; and though hay-making near London is generally finished in June,
London - Edinburgh Dublin -	66 3 60 6 61 13	2	29 89 29 445 29 929	2·194 inch. 2·546 2·614	yet in places where manure is less abundant, it is chiefly made in this month. The farmer's prospects as to crop may now be determined as to almost every article cultivated.

1. Calendar of Animated Nature round London. In the first week: the cuckoo (Choulus canbrus leaves off singing; the stone-cucker (Chardrius Cedicnemus) whistles occasionally late at night, and the golden-crested wren (Motacilla Régulus) now and then childry golden-crested wren (Motacilla Régulus) now and then child spumbarla, abounds.

**Scond week: the quall (Tetrao ferrugíneus) calls; the cuckoossit, or froje-hopper (Gichad spumbarla), abounds.

**Third week: young frogs migrate. Hens moult.

**Fourth week: the great horse-fly (Tabhuus bovinus) appears; and partridges fly.

Onlendars of Vacatable Nature round London.

and neartridees by:

2. Calcular of Fegetable Nature round London,

In the first week: enchanter's nightshade (Greac's latetima)
and lavender (Lawándula spica) in flower, and pinks and carnations in full bloom.

Scood week: the fallen star (Tremélia Nóstoc) appears; also
puff-balis (Lycopérion Bevista), and sometimes the common
makmoun (Jagáricus campelseris), cosseberries ripe, potatoes in
flower, asparagus in betry, the Illiums in perfection.

Fourth week: the truffle (Tuber cibatriam) now hunted or dug
up in commons and forests; nightshade (Solahum nigrum),

devil'sbit (Seabiosa succisa), burnetsaxifrage (Pimpinélia Saxifeaga), and a great number of plants in flower.

3. Farm-gard. (2902.)

As in June; between hay and com harvest is generally a

controlled the controlled of t

4, 5. Live Stock (6216.) and Grass Lands. (5648.)

Lambs are now weared (7161.) when not fattened off; at first they require the richest keep, a farm that can live and thrive abundant rest and by the soling system, should be so treated. The weather being hot, cattle or sheep in fields must be frequently looked to, as to shade, water, and abundant keep. Suffering from thirst, or a want of food, they are very apt to break through fences, which at this season is more than usually injurious, on account of the state of the corn crops.

6. Arable Lands. (4925.)

6. Arable Lands. (49%).
Attend to weeding, hoeing, and otherwise moving the soil between rowed crops, more especially potatoes and turnips. Towards the end of the month, the first-sown white turnips will be in a state to thin out; and a farther thinning may be advantageously given to field heet, carrots, &c., at this season. Where peas are sown to well distinctions sooner. Buck-wheet may now be sown for autumnal food for game. (6111.)
Fences (2960.), Roads (3523.), and Drains.

(4213.)

As in ounce.

8. Orchards (4079.) and Hop-grounds. (5997.)
Cherries, strawberries, gooseberries, &c., where grown as field-crops, are now in gathering, and towards the end of the month, fallen applies and piums for taxts. Hop-grounds are looked over, and the superfluous vine pruned off, &c. I Kent

and other places, these prunings are often a perquisite of the prun.r., who lays them aside as folder for cows.

9. Wood-lands and Plantations. (3906.)

As in June; and prune the gean, which at other seasons is apt to bleed. (3995.) This season answers perfectly for pruning

AUGUST.

Weather	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS. This is the barn or harvest month of the Saxons; and, a every body knows, the busiest month of the agriculturist
London - Edinburgh Dublin -	65 85 60 6 62 82	2	30 06 29 828 30 172	0-824 inch- 1-996 5-858	It is, in consequence, the most profitable season for the labourer and his family, who are generally in full employ, and at an increase of wages, or perquisites, for four or six weeks at this season.

1. Calendar of Animated Nature round London. In the first week: flying ants (Form)ca) appear; bees kill their rones; and the swallow-tailed butterfly (Papilio Machaon)

appears.

Second week: young martins (Hirándo úrbica) and swallows
(Hirándo rústica, begin to congregate, and swifts (Hirándo
Apus) to depart; the whame, or burrel-fly (E'strus bovis), lays

Apus to ucpart, the manner, eggs on horses.

Third neck: the black-eyed marble butterfly (Papfilo Sémele) appears. Various birds re-assume their spring notes.

Fourth meck: the muthatch (Sitta europe'a) chatters, the stone-curlew (Chardrius Ecklimemus) whisfles at night, the goat-sucker (Caprimulgus europe'a) and young owls (Strix U'nla) make a noise in the evening; robin-rethreats (Robacilla Rubicola) sings; and rooks roost on their nest-trees.

Autocoin) sings; and rooks roost on their nest-trees.

2. Calendar of Vegetable Nature round London,
In the first meek: meiltot (Trifolium officinale), rue (Rata
rraveletna), yellow succory (Peris hierachides), burdock (Aresecond week: with clary (Salvia Perbankaa), meadow-rue
(Thalictrum flavum), plonghman's spikenard (Conyza squarroosa), and various other natives in llower.
Third week: the mallow (Malva Lavatera), holyhock (Alceàrboea), and lobelias, among the garden-tlowers; and the polygonums and potamogetons among the wild plants now in
blossom.

conums and potamogetons among the wind plants now in blossom. Fourth neck: the autumnal crocus (Cólchicum autumnale), A'ster Solidago, Senê-no pa'udòsus, teasel (Dipsacus fullònum), and various o'her plants in flower. The carrier varieties of all the hardy kernel fruits ripe.

3. Furm-yard. (2002.)

The rick-yard should now be attended to (2006.); stack-stards repaired or put in order: bottoming of faggots, and strads repaired by the pot together; thatch in readiness, and example (3184).

At any spare period the teams may be employed carting out the summer made dung to the wheat fallows, or to form field dunghills for spring crojs, &c.

dungtims for spring crops, vec.

4. Live Stock. (6216.)
Select the stock of lambs to be kept as breeders. (7170.)
Swine commonly bring their second litter of pigs in this month;
which, owing to the dropping corn, is generally one of abundant keep, both for them and poultry. Farmers in some places
look to the stubbles as a source of good food for their cows, as

others do to the fallows for keep for their sheep. Where either is the case, the culture must be of a very inferior description.

5. Grass Lands. (5643.)
Where meadows are manured, that operation generally goes on after the lay is removed, or during winter; the surface in the former case being hard with drought, and in the later by frost. After gress should in general be shut up and tracter by frost. After gress should in general be shut up and tracter by weeds, tussocks, ant-hills, &c. Turn the water on meadow-lands as soon as the hay is removed, and let it remain till a third crop is in forwardness. (4387.)

6. Arable Lands. (4925.)

6. Arable Lands. (4925).
Wed sad it's among green crops, earth up potatoes (5556), but by no means tumips, unless the seil is very dry indeed, as that operation only prevents them from attaining a full size. Reaping commences in all the southern districts in the first week of this month, and in some bythe middle of July. When the operation is executed by day work, the most unremitting inspection of the master is necessary; and even when the greatly preferable mode of reaping by the are is adopted, he should be premitted in the properties of the propertie

Naked fallows in late situations receive the seed turrow during this month, excepting in cases where the seed is ploughed in, an operation generally deterted to the middle of September 50 or cabbage-seeds (4497.) for plants to put out in April next. Sow turnips after early peas which have been podded (5299.), or early cut wheat, tares, cabbages, &c., or after hemp and flax, which are generally pulled by the middle of this month of the seed of the

- Fences (2960.), Roads (3523.), and Drains. (4213.)
- As in the two preceding months.
- 8. Orchards (4099.) and Hop-grounds. (5997.)
 Apples and plums of some sorts are now ripe. Grafts may in
 general be untied. Budding performed, and pruning, if desirable, as observed last month under woods and plantations.
- 9. Wood-lands and Plantations. (3906.)

SEPTEMBER.

-	Weather	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS. The temperature Legins now to decline and to vary; the nights begins to lengthen, and heavy dews and diminished transpiration and evaporation promote the growth of grass, herbage, plants, and especially turniss. This is still a busy month with the agriculturists.
The same of	London - Edinburgh Dublin -	59 63 54 3 59 35	3 5	30 09 29 739 30 239	0 482 inch. 3·470 3·021	This is still a busy month with the agriculturist; in the warmed situations he is finishing harvest-work, and in the latest commencing it. Animals of most sorts are now fat; fruits are ripe; honey abundant; and most products of the earth in perfection and plenty.

1. Calendar of Animated Nature round London.

I. Auctimar by Anamatou Nature Found London.

In the first week: young broods of goldinches [Fringfill a Carduchis] appear. The linnet [Fringfila Linda] congregates. The bull [this Tadrus) makes his shrill antumal noise; and swallows (Hirándo rastica) sing.

Second neek: common (Stark fishmens) hoot. The Second neek: common by the start of the start of the second neek: common beautiful to the second neek of t

moth (Phala'na picta) appear. Herrings (Giupea Harengus) are now cheap.

Third neek: the ring ouzle (Túrdus torquitus) appears. The Ry-ca:cher (Muscicapa Atricapfila) withdraws.

Fourth meek: the stare (Sturnus vulgàris) congregates. The wood-lark (Alanda arbbreas) sings. The woodcock (Scolopax russico) and fieldiare (Turdus pilaris) appear; and the swallow (Hirundo rústica) departs.

2. Calendar of Vegetable Nature round London.

In the first meet: some fungi and Ballota filanppear, traveller's Joy (Clematis álba) and Parnássia palástris in flower.

Second meet: catkins of the haze and birch formed; blossoms,
and green, red, and black berries found on the bramble at the
same time. Lewes of the sycamone, birch, lime, mountainact and time begin to change colour.

Third meet: the ivy (Hedera Helix), laurel (Prànus Laurocerasus and furze 'U was cure, a...) in flower.

The state of the s

Fourth speck: hips, haws, and muts ripe. Leaves of plane-tuse (Platamus) tunny; of the hazel, yellow; of the oak, yellow-ish-green; of the sycamore, dirty brown; of the maple, pale yellow; of the ash, fine lemon; of the elm, orange; of the hawthorn, tawny yellow; of the cherry, red; of the hornbeam, bright yellow; of the willow, hoary.

3. Farm-yard. (2902.)

The rick-yard is now the chief scene of operations, in getting earlier crops thatched (3185.) and later ones stacked (3476.) In all operations in this department attend, as far as circumstances will permit, to neatness. In the case of a proprietor or anateur, neatness, order, and high keeping are essential in every department.

4. Live Stock. (6216.)

There is generally abundance of fat cattle and sheep in the market during this and next month. Lean stock, especially come as wedlesser for one brought in, and wintered or fed off on turnips. Wintering cattle (6855.) also about the end of the month. Fouriery and pigs are now fat, and honey may be taken from bee-hives.

5. Grass Lands. (5643.)

As in August. Newly sown grass lands should now be sparingly fed, in order to strengthen the plants for the winter.

6. Arable Lands. (4925.)

This is the chief season for sowing winter wheat, whether on naked fallows or after clover, tares, rape, or early crops of peas and beans. Potatees are generally not taken up till the end of the month, in which case the sowing after that crop is later. (5015.) Sow tares to stand the winter (5257.), and grass seed, for permanent pasture; or a hay crop next senson will succeed on good soils, if sown before the middle of the month. (5053.)

7. Fences (2960.), Roads (3523.), and Drains. (4213.)

Routine operations of mending, &c. as before.

8. Orchards (4079.) and Hop-grounds. (5997.)

Gather fruits for immediate sale, the keeping sorts not being yet ripe. (4055.) Walnuts for pickling not later than the first week. (4102.) Hop-picking and drying, in the districts where this plant is much cultivated, is the great business of the month. (6036.)

9. Wood-lands and Plantations. (3906.)

Routine operations as in the two or three preceding months Plant evergreens during the three last weeks, and decidnous trees the last ten days. (3937.)

OCTOBER.

Weather at	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS. The weather of this month is very uncertain. Before those rains, snows, or frosts which constitute the practical commencement of winter, there is generally two or
London - Edinburgh Dublin -	52 81 49 7 51	4 :	29 69 29 339 29 76	2·027 inch. 3·334 2·798	three weeks of settled weather; sometimes these weeks are in October, sometimes partly in November. These weeks afford a last resource for bringing forward neg- lected operations.

1. Calendar of Animated Nature round London.

In the first week: the red-wing (Tkirdus illacus) arrives. Snakes and vipers bury themselves. Scoond week: hooded crows (Córrus Córnix) and woodpigeons (Columba Palámbus) arrive; hen-chaffinches (Fringilla coc'des) congregate, and prepare for migration, leaving their males in this country.

Third week: the snipe (Scolopax Gallinàgo) appears in the meadows. Wild-geese (A'nas sylvéstris) leave the feus, and go to the rve-lands.

meadows. Wild-geese (A'nas sjivéstris) leave the fens, and go to the rye-lands. Fourth neek: the tortoise (Testido gree'a) begins to bur phinself in the ground; and rooks visit their nest-trees. Some larks (Aladdae) sing, and the woodcock (Scolopax rusticola) returns. Spiders' webs abound.

returns. Spiders' webs abound.

2. Calcandar of Fegetable Nature round London.

In the first week; strawberry-tree (A'rintus U'nedo), holy
(Piex Aquifolium), China holyhock (Aleca chinensis), and
China aster (A'ster chinensis), in bloom.

Second meek; catkins of some species of Salix formed; leaves
of the asp almost all off; of the Spanish chestmit, yellow; of
the supar-maple (A'cer saccharium) scalet; of the common
bright clow and gold; and of the weeping-birch, gold and
right clow and gold; and of the weeping-birch, gold and
Third meek: Clématic salcylena in flower. Some horse-chestnuts and acacias quite demuded of leaves.

Fourth week: various plants, especially annuals, continue
in flower. Leaves of marsh-eder (Sambheus E'bulus), of a
fine pink; of stag's-horn sunach, of a purplish-red; of the
American oaks, of fine shades of yellow, orange, red, and
purple.

3. Farm-yard. (2002.)
This is the season of rural plenty, affording an opportunity, both to men and animals, for laying in a large stock of health, to enable them to support the severity of the coming winter. Operatives should now buy in their winter stores of potatoes, fuel, &c. and ridge up their garden ground, not under crop, for the winter.

neet, ecc. and ridge up their garden ground, not under crop, for the winter.

Corn crops being generally in the rick-yard by Michaelmas, and the root and herbage crops not taken being at or near maturity, the first of October is the most suitable season for a farmer to take stock and ascertain his annual profit or loss. Michaelmas being also the most general term of entry and removal, especially in the case of arable farms, is another reason why agricultural accounts are conveniently made up to this period, (488.3). Examine your household accounts, and if your cryenses have exceeded your income, or even come up to all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for all who would proceed in life with any thirp ill process for the particular sections. (4921.) Remember that very small indeed is the net income of a rent-paying agriculturist.

Michaelmas is also the general term for biring farm-servants by the year; but the seldomer agricultural operatives are changed the better, unless in the case of senseless, indolent, or viciously inclined persons, who degenerate unless frequently removed.

4. Live Stock. (6216.)

Cattle and skeep not sufficiently fatted on grass or herbage, whether by pasturage or soiling, should now be put on other food, to complete them for the butcher. Oll-cake, grains, tur-The same observations and these, bruised com may be used. The same observations are difficult to applied to nogs, which are generally in good condition at this season. (7315.)

Hog porridge. A mixture of oatmeal and water, or any other meal and water, left till it becomes sour, as practised by the millers in the northern counties, will feed hogs rapidly; but milk and peas meal make the finest pork in the world.

The teams which have been solied during summer, may now be put on hay, straw, and carrots, or other roots, by degrees. (6702.)

5. Grass Lands. (5643.)

Where these are manured, this is a good season for the operation (5782.); choose dry weather.

6. Arable Lands. (4925.)

6. Arable Lands. (4925.)
Potatoes (5920.), carrate (54413.), field beet (5452.), parsneps (5471.), and Swedish turnips, may now be taken up and housed, and the ground sown with wheat. This grain (5001.), rge (5069.), barley (5080.) in some situations, and tares (5957.) may still be sown in the milder districts. Embrace every opportunity to give the first furrow to fallows (4944.), whether or green crops or otherwise. In general all lands that are to have two or more furrows before they are sown or planted, should be ploughed as soon as possible after harvest; but not so lands that are to be sown on one furrow, which are better ploughed in January and February. It is a greet mistake to allow of the properties of insects (7095.), or the seeds of weeds; on the contrary, it may often, by giving them a deeper covering, preserve them better from the winter's frost, or what is much more destructive, from being decoured by brids. There are few subjects less generally understood than the conomy of nature in regard to the eggs of insects and worms. Turn to 7444. and 7704.) See that water furrows and drains run freely, and that fences and gets are in require. fences and gates are in repair.

Fences (2960:), Roads (3523.), and Drains.

(421.3.)
Hedges may now be advantageously planted (2978.), grown ones pruned (2983.), old ones plashed (2989.), and imperfect ones repaired. (2993.) The Northumberland practice as to bedges (7899.) well deserves the study of the more southern agriculturalist. Roads and drains may be made or repaired at this season, and in spring, with better effect than during the heat and drought of summer. Road materials now bind better, and land-springs show themselves more distinctly.

8. Orchards (4079.) and Hop-grounds. (5997.)

The minter fruits may now be gathered, and either spread in an airy loft or upper floor, there to remain till used, or sweated in heaps, to extract a part of their moisture, and then buried in dry sand, or packed in close boxes or casks, to be kept in a coal and dry cellar (1854 and Encye. of Gardening, 2d Edit-228)

2289.)
Fruits trees of every kind may now be planted (4105.) and prumed. (4111.)
Hop-picking is generally completed the first week of the month; and as soon afterwards as convenient, the vine and poles removed, and the later stacked till next spring. (6047.)
Young hop plantations may be formed (6005.), and the soil among established grounds manured and ploughed. (6019.)

9. Wood-lands and Plantations. (3906.)

Heiges and plandations of geogram there may be made during the first week of the month; and no period of the year is better tr stemplanting all kinds of hardy shahes. Thinks and expire may be felled, and in general every ope-ration preparatory to planting, as well as the operation itself, may go forward.

NOVEMBER.

Weather	Average of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Raine	REMARKS. This is the <i>mindy month</i> of the Saxons; it is generally also cold and moist, and one of the most disagreeable for the labouring agriculturists; but he may console himself with the sbortness of the day, and hail the approach
London - Edinburgh Dublin -	44 44 41 1 43		29 68 29 638 29 71	2·597 inch. 4·514 0·394	of evening, when he may lay salde his wet dress and forify his mind by converse with books, or enjoy the comforts of his fire-side, and the solace of his wife and children; reading to or otherwise instructing them, or mending his boots or shoes.

1. Calendar of Animated Nature round London. In the first week: the buck (Cérvus Caprèolus) grunts. Second week: the golden plover (Charàdrius pluviàlis) ap-

Third week: snails (Limax) and slugs (Hèlix) bury them-

Fourth week: smain Linux and stugs (retar) but themselves, the winter moth (Geometra brumāria Sam.) and the common flat-body moth (Geometra applana Sam.) appear in gardens about the end of the month.

2. Calendar of Vegetable Nature round London.
In the first week: a few plants in flower, by accident, chiefly
nnuals, according to the season.
Second week: the fungus Helvella mitra appears. Laurus-

Stema recent the tanges of the tangent in flower.

Third reck. Chimomathus fragrams in flower.

Third reck come printroses show flowers at this season; and some plants, unmaturally in flower, still continue if the weather is temperate.

3. Furm-yard. (2902.)
Wintering cuttle are now introduced to the straw-yards (2902.)
Wintering cuttle are now introduced to the straw-yards (2902.)
or hammels (2831.), and others to stalls for feeding or fatting.
Live stock in general ought to be kept in good condition at this
season, otherwise they are apt to fall off towards spring.
Threshing goes on at intervals to supply straw. (3198. and 2773.)

4. Live Stock. (6216.) .

See Farm-yard.

5. Grass Lands. (5643.)

Manure in dry weather (578%), turn the water on meadows adapted for irrigation (4857); destroy ant-hills (6775), drain by surface gutters, or other means, where that operation is requisite; ocar out water furrows for the same purpose; admit cattle and, horses only on the driest pastures; see that sheep have shelter, and especially Dorset ewes likely to lamb next month

6. Arable Lands. (4925.)

See that water furrows and drains run unobstructed; plough and cart out manure, as weather and other circumstances permit.

Fences (2960.), Roads (3523.), and Drains. (4213.)

As in last month; and see that they are in effectual repair, and fairly used.

8. Orchards (4079.) and Hop-grounds. (5997.) Complete the operations of last month, where interrupted, deferred, or neglected.

9. Wood-lands and Plantations. (3906.) As in last month, excepting when the weather is unfavourable. Felling all kinds of timber and coppiee not adapted for barking for the tanner, may now go on freely. (4014.) Willows for baskets may be cut over (4042.), and baskets, hampers, crates, and hurdles, made by the woodman and hedger.

DECEMBER.

-	Weather at	A verage of the Ther- mometer.	Greatest Variation from the Average.	Average of the Barometer.	Quantity of Rain.	REMARKS. Winter month, Sax. Cold but dry. T ations are chiefly of the laborious ki short and the nights long. In the operator should examine himself a and intellectual progress during it form plans for further improving h come. Knowledge is a lever by w! himself as high as he desires.
	London - Edinburgh Dublin -	41 4 38 9 36 34	3	29 64 29 66 29 723	1·124 inch. 2·598 2·916	

I but dry. The agricultural oper-blaborious kind; but the days are long. In the last week the young ine himself as to his professional ess during the bve-past year, and improving himself for the year to a lever by which a man may raise esires.

- 1. Calendar of Animated Nature round London.
 The mole (Taipa europea's) throws up hillocks. The December moth (Eriogdster populi Sam,1 appears about the beginning, and the vellow-line quaker (Notua davilinea Sam,1 about the end of the month.
- 2. Calendar of Vegetable Nature round London Some of the last month's plants continue in flower, according to the weather.
- Farm-Yard (2902.), and Live Stock. (6216.)

3. 4. Farm-Yard (2902.), and Live Stock. (6216.) Threshing, and otherwise preparing corn and straw for the market, and the use of the working, fattening, wintering, and store stock are the main operations. Next, the regular supply of live stock with food, and cleaning and littering them. Fating stock should be particularly attended to, especially house lamb (7227.) and calves. (6855.)
The supply of turnips for cattle and sheep is liable to be interrupted by severe frosts, if the precaution of housing a quantity (5420.), or setting them (5421.) is not taken distillers' grains (5112.) are used, supplies must be secured; and where hogs or cattle are fed on meal and water mixed and soured, a quantity must always be kept in mixture; as a week or ten days in temperate weather, and a longer period during frost, is requisite to induce the fermentation.
5. Grass Lands. (5643.)

quaste to mance in sermemanon.

5. Grass Lands. (5643.)

See that they are not poached; that water furrows, gutters, drains, and ditches are in repair; and where manuring is practised, carrit out in frosty weather where there is no danger of injury from the feet of horse or cart, wheels. Unless labour is very cheap, carring earths or earthy composts on grass lands will not pay the expenses; they produce more effect on arable

lands.
6. Arable Lands. (4925.)
See that all the modes of drainage are effective. (4278.)
Plough and cart our manure according to weather and other circumstances.
7. Fences (2960.), Roads (3523.), and Drains. (4213.)
Plant hedges (2971.) and build walls only in temperate weather, as frosty air injures the roots of plants, and freezes humid mortar, thereby effectually preventing its setting. Roads and drains may be made and mended in all weathers that admit these operations.

8. Orchards (4079.) and Hop-grounds. (5997.) Clear old trees of moss or misletoe; but prune only in mild eather. Dig and dung at any time.

9. Wood-lands and Plantations.

9. Wood-tanus and Plantations. (9906.) Fell timber or copes of sorts not adapted for barking. (4044.) Stock or grub up tree roots, stacking them for fuel or charcoal, 4(608.) Trench, dig, or otherwise prepare ground for planting; but lift plants from the nursery, and re-insert them in plantations only in mild weather, and when the soil does not poach by treading, &c. The rest as in November.

Evergreens, as Mr. M'Nab has ably shown and proved by experience, may be planted at any period during winter, when the weather is mild. He says, "I have planted evergreens is the middle of June to the middle of August, and even during this period I have planted some: but unless the weather is the middle of June to the middle of August, and even during this period I have planted some: but unless the weather, its very dull and moist, and even with such weather, it is difficult to prevent the plants suffering considerably, and in many cases it is years before they recover. Although, however, I have planted evergreens ten months out of the twelve, with little difference in the success, yet one season has a preference choice, I would recommend late in auturn, winter, or early in spring; that is, any time from the middle of Oteber to the middle of Pebraary, and in general the beginning of this period is the best; that is, from the middle of Oteber to the middle of December, always providing that the weather and the ground are favourable; that is, supposing there is no frost, no drying wind, nor much sunshine, and that the ground is or from the nature of the soil. One of the principal things to be attended to in planting evergreens is, to fix on a dull day for winter planting, and a moist day for spring and auturn planting. There can be no secret in the proper treatment of evergreens; if there were, I should say, that it is in preventing their roots becoming dry when out of the earth; to choose moist and cloudy weather for planting; and still better. I continuance of such weather some time after they have been planted." (M'Nab's Hints on the Planting and General Treatment of Hardy Evergreens in the Climate of Scalland, &c. p. 17.) Mr. Cruikehank has shown that poor waste ground, which, if trenched or ploughed would not bear a crop of grain, will, after being planted and kept nuder wood for some years, become if for every village of Ellon a piece of ground of a dry gravelly nature, which has lately been cleared of a cr

GLOSSARIAL INDEX.

*** In this Index both Pages and Paragraphs are referred to; the letter p. is prefixed to the former, to the latter the letter s.

A BRADING earth, earth crumbing down from the effects of frost, page 483.

Absorbent soil, soil so constituted as to absorb moisture from the atmosphere, 772.

Absorbent system, explained in s. 6352. p. 968.

Acclimatising vegetables or animats, inuring them to a climate in which they are not indigenous. The term naturalising is sometimes substituted, but erroneously. See Naturalising.

Accevent, entering a state of acid fermentation, s. 6978, p. 1036.

Abration, exposing the soil to the air, p. 507.

Aëration, exposing the soil to the air, p. 507. Aëreometric beads, hollow beads of glass containing air, for ascertaining the specific gravity of milk, s. 7008. p. 1039.

After-grass, the second crop of grass from lands which have been previously moved the same

year, p. 905.

Aftermath, the second mowing of perennial meadow lands in the same season, p. 515.

Agriculture is used in its most extensive sense in igriculture is used in its most extensive sense in the third line of the title-page, and generally in the historical part of the work (Part I.), as including territorial economy and husbandry. In most parts of this work, for example, in the words of the title-page, "animal and vegetable productions of agriculture," as synonymous with husbandry. In several places as synonymous with aration; that is, the culture of arable lands, as convesed to masterage or what may be called acriaration; that is, the culture of arable lands, as opposed to pasturage, or what may be called agriculture proper. In every case the reader will be able to gather, from the scope of the sentence or paragraph containing this term, in which of these three senses it is meant to be understood.

Aligertles, tufts of feathers, p. 1088.

Aits, small islands, or islets, in streams.

Alburnous parts, soft woody parts, p. 661.

Alburnum, the soft sappy wood just under the inner bark, p. 646. See Lindley's Outlines of the Principles of Bolgan, p. 17

ner bark, p. 646. See Lindley's Outlines of the Principles of Botany, p. 17.

Alien waters, a brook or stream passing from one area through another, which has been embanked from a river or the sea, p. 715.

Allodially, independently of any superior, p. 552.

Allowial soil, soil deposited by streams, p. 747.

Aloetic purge, a purge composed of the socotorine aloes, p. 1055.

Alterative, alterative medicines are those which

Alterative, alterative medicines are those which induce a change in the blood and juices for the better, without any manifest operation or evacuation, p. 977

Atteotary sockets, sockets like the cells in a honeycomb, p. 972.

Ambling, explained, s. 6666. p. 1002.

Amerciament, a pecuniary punishment arbitrarily imposed, p. 769.

Ammoniacal gases, s. 6701.

Amorphous stones, without regular shape, s. 3005.
p. 483.

Animy, an excrescence in some plants of the natural order Crucifere, and chiefly in the turnip, produced by the puncture and depositing of the eggs of an insect, s. 5437, p. 861.

Anime, a chemical product obtained from plants,

Animé, 2 s. 1468.

Anomalous, irregular, p. 682.
Airta, the great artery of the heart, p. 967.
Airta ascendens, the ascending great artery of the

heart, p. 967.

Aórta descéndens, the descending great artery of the heart, p. 967.

Appui, a reciprocal action between the mouth of the horse and the hand of the rider; the bit and rein forming the line of communication. Thus a

horse with a sensitive mouth has a good appui, and the same may be said of the rider if his hand be good, s. 6563, p. 1002.

Ageous kumour, the watery humour of the eye; the first or outermost, and thinnest of its three

humours, p. 970.

Aration, ploughing or tillage, s. 3562. p. 573.

Arenarious grasses, grasses suitable for sandy soils, p. 749.

p. 749.

Averruncator, a pruning instrument, consisting of two blades fixed on the end of a rod, acting like scissors, by means of a line fixed to one of them, and pulled by the operator, s. 3155. p. 512.

Awns, the beards or long bristles which project from the chaffs; they are plentiful on spring wheat, and on barley, p. 812.

Axillaries, explained, s. 6344. p. 967.

Azote, the radical principle of the atmospheric air, p. 814.

B

Backing a horse, explained, s. 6657. p. 1000.
Back-raking, an operation in farriery, by which
hardened faces are withdrawn from the rectum,

s. 6543. p. 990.

Back-rents, rents paid subsequently to reaping, p. 768.

100.3.

Bagging, explained, s. 3173. p. 575.

Bails, a substitute for fixed standings or stall divisions, s. 6799. p. 1006.

Band-win ridges, ridges formed of such a width as to be reaped by what in Seotland is called a band of sheares or reapers. s. 392.0 p. 506.

of shearers or reapers, s. 3250, p. 526, Barbs, explained, s. 6382, p. 972.

Bastard-cocks, small preparatory haycocks, s. 5797. p. 904.

p. 904.

Battering, as applied to fences, leaning inward, s. 4594. p. 754.

Bauli, in Scotland, ground left unturned between the furrow-slices in ploughing, p. 711.; in England the same thing, and also strips of ground usually in cross between ploughed ridges, as in company. in grass between ploughed ridges, as in common field lands.

Bavins, brush-faggots, s. 3626. p. 584.
Bear, an iron instrument used in the Isle of Ely to Bear, an iron instrument used in the 1ste of Lay or eradicate weeds in water-courses, s. 5686, p. 892. Bents, the dead stems of grass in pasture grounds which have borne seeds.

Bigg, a variety of winter barley, s. 5085. p. 823.

Billet, a term variously employed. A wooden billet is often used in docking a horse, and often forms a separation between carriage horses, s. 6733 p. 1009.

s. 6733. p. 1009.
s. 6733. p. 1009.
Binding and stocking, binding sheaves of corn, and placing them in shocks or stocks, s. 3175. p. 515.
Binot, a variety of double mould-boarded plough, s. 2620. p. 396.
Blanch holding, a mode of legal tenure in Scotland, s. 3401. p. 552.
Blast, a disease in the stomach of sheep and oxen from wind; also a term for the mildew in wheat, p. 1665.

n 1065.

p. 1005. Blinding, filling up interstices between stones on roads with gravel, &c. s. 3654. p. 589. Blood spavin in horses, 961. Blowing lands, lands whose surface-soil is so light as to be liable, when dry, to be blown away by the wind n. 87. wind, p. 870.

wind, p. 870.

Blowing sand, p. 749. See Blowing lands.

Boles of trees, the trunks of trees, p. 656.

Boll, a measure for corn in Scotland; in wheat and beans, equivalent to four Winchester bushels; in oats, barley, and potatoes, to six bushels, p. 842.

Bone spawin, explained, s. 6507, p. 986.

Boulder stones, large round stones, p. 481.

Bout of the plough, the going and returning with the plough along a land or ridge under ploughing,

the plough along a land or ridge under ploughing, s. 3265. p. 529.

Box drains, explained, s. 3607. p. 581.

Boyn, a vat or tub, s. 7064. p. 1045.

Brairds, from braird, to spring up, s. 5397. p. 857.

Brake, a large harrow, s. 2664. p. 405. In machinerry, a constraining wheel divided into joints, which stops when needed another wheel that revolves within it. within it,

within it.

Bramble bonds, bands made of the long shoots of the bramble or blackberry, s. 3191, p. 518.

Brazy, explained, s. 7258, p. 1065.

Break-share, explained, s. 7259, 7260, p. 1065.

Break-share, explained, s. 7259, 7260, p. 1065.

Break-share, explained, s. 7259, 7260, p. 1065.

Break-share, that part of the borse's harness attached to the state of the borse's harness a

to the saddle, and hooked on the shafts, which enables him to push back the cart or other machine to which he is harnessed.

precaing in the line, or in the same line, explained, p. 301.

Breeding in and in, explained, p. 301.

Breeding, cross, explained, p. 301.

Brochen ligger, a quarter-cleft rod, as thick as the finger, and four feet in length, used in thatching, p. 518.

p. 518.

Brose, a Scotch dish made by pouring boiling water on oatmeal, and sometimes on the meal of peas, and immediately mixing them by stirring; leaving the meal in small knots or lumps about the size of marbles. It is afterwards eaten with milk or butter, s. 5217. p. 837.

Burgage-holding, explained, s. 3404. p. 552.

Butts, short angular ridges, short irregularly shaped lands or ridges in the corners of fields, s. 3253. p. 597.

Byre, cow-shed, s. 6777. p. 1015.

Cadence, as applied to horsemanship, an equal measure or proportion observed by a horse in all his motions when he is thoroughly managed, and works justly at a gallop, terra a terra, so that his motions or times have an equal regard to each other, s. 6672. p. 1003. See Crabb's Technological Dictionary.

Caissons, temporary chests in which foundations in

Caissons, temporary chests in which foundations in deep water are built, s. 4357, p. 718. Calcarcous soil, soil abounding with lime, p. 775. Callipers, or calbers, explained, s. 4475. p. 663. Calorifere, from calor, heat, and fero, to bear, explained, s. 7464. p. 1087. Camping potatoes, explained, s. 5345, p. 851. Canon of the horse, explained, s. 6232. p. 959. Cantle, the protuberant part of the saddle behind, s. 6575, p. 1093. Capillaries, the hair-like extremities of the arteries and veins, s. 6352, p. 968. Cap of straw, explained, s. 1915, p. 518. Caprolets, leaps made in one and the same place without advancing forward, s. 6672. p. 1003. See Crabb's Tech. Dict. Capulct, explained, s. 6512, p. 997.

Capulet, explained, s. 6512. p. 997.

Crabb's Tech. Diel.
Capulet, explained, s. 6512. p. 997.
Carotid arteries, two principal arteries which carry the blood to the head, s. 6598. p. 972.
Carotids, 967. See Carotid arteries.
Carpus, explained, s. 6317. p. 965.
Carriage in irrigation, explained, s. 4408. p. 726.
Carse, explained, s. 4554. p. 747.
Carseous, of the nature of cheese, s. 6979. p. 1036.
Castrate, to incapacitate male animals from engendering offspring, s. 7306. p. 1069. See Spay.
Catch-work meadows, explained, s. 4428. p. 727.
Catch-work meadows, explained, s. 726. p. 106.
Cevelular membrane, an important membrane in animals in which the fat is lodged, p. 735.
Cerebral kyaitás, explained, s. 7267, 7268. p. 1066.
Cervical figament, an aponeurosis or strong bandage of packwax, which runs along the neck and upholds the head, p. 972.
Chambrière, a kind of long whip used in riding houses, s. 6662. p. 1001.
Chambrière, a kind of long whip used in riding houses, s. 6662. p. 1001.
Chambrière, a kind of long whip used in riding houses, s. 6662. p. 1001.
Chambrière, a kind of long whip used in riding houses, the simplified and the second of the mustard family, p. 880.

Chloride of calcium, quicklime, s. 4988. p. 810.
Chyte, a milky fluid secreted from the aliments in the lacteal vessels.

Chyme, that poultice-like mass to which the food is reduced in the stomach of every animal, s. 6404.

p. 9.70. Cicatrise, to heal over with a scar, p. 513. Cilia, eyelashes, p. 970. Claveau, explained, s. 7248. p. 1065. Clinches, cramps or holdfasts; to clinch, to turn the points of nails which have been driven, as in

the points of nails which have been driven, as in the shoeing of horses, s. 6710. p. 1007. Clough, explained, s. 4455. p. 732. Cob, a kind of wicker basket, made so as to be carried on the arm; hence a seed-cob, or seed-lip, is a basket for sowing from, p. 378. Cockle oast, a kind of kiln for drying hops upon, s. 6043. p. 927. Caff, a Cornish term for offal pilchards, p. 1172. Caffin bone, a bone in the foot of the horse, s. 6417. p. 976.

Coherent soil, a soil whose parts stick together, p. 772.

Collar-blade or haims, short segments of wood or metal, embracing the neck of the horse, to which

the traces are attached, s. 3235, p. 524.
Collop, explained, s. 7871, p. 1200.
Commutation of tithes, the substituting a fixed money payment, or a portion of land, instead of a tenth of the produce.

Concha cartilages, the gristles of the ear, s. 6764. p. 1013.

Condition of a horse, the state of health and strength, p. 977.

Consecutive, following, p. 525.

Coyndod, explained, s. 3395. p. 552.

Corde vocales, or chordse vocales, tendons called into action by braying in the ass, s. 6765. p. 1013.

Corneti, the first or outer coat of the eye, s. 6371.

p. 970.

Cornetic a work.

Cornetti, a mode of riding, s. 6672, p. 1003. Corollary, a consequent truth gained from some

preceding truth or demonstration, s. 4961. p. 804.

preceding truth or demonstration, s. 4961. p. 804. Coronal roots, explained, s. 4983. p. 808. Coronary, explained s. 6417. p. 976. Cotyledon, the first or seed lear or seed lobe of a plant. Couples, chains, collars, or mechanical contrivances, by which dogs, &c. are coupled together. Courses, explained, s. 3189. p. 518. Crest, upper part of a hedge-bank, p. 483. Croppers, a variety of pigeon, p. 1095. Cross-breeding, explained, s. 2023. p. 301. Crown and furrow-ploughing, explained, s. 3256. p. 557.

Crown scab, a disease in the horse, p. 1007. Crystalline humour, explained, s. 6574. p. 970. Culmi, stems of grasses, p. 1167.

Culmi, stems of grasses, p. 1167.
Cubniferous crops, crops of plants whose stems yield straw, as wheat, barley, &c., p. 768.
Curb, explained, s. 6518, p. 987.
Curvlinear, formed of curved lines.
Cutour, to cut off the top crop, s. 4043, p. 658.
Cutting in horses, explained, s. 6529, p. 988.
Cut-water of a bridge, the projecting part of the pier of a bridge, which is opposed to the current, and divides it, s. 3612, p. 582.

Dandriff, scurf, s. 6738, p. 1006.
Dashing, or dashed. See Lipped and harled.
Dead hedges, hedges made with the prunings of trees, or with the tops of old hedges which have been cut down.
Dead timber, any timber not growing, p. 502.
Decidious, shedding the leaves in autumn.

Decorticated, deprived of the bark, p. 655.

Decorticated, deprived of the bark, p. 655.

Defecation, explained, s. 4591. p. 867.

Dendrometer, an implement invented to ascertain the quantity of timber in standing trees, p. 663.

Deportation, carrying away, removal, p. 519.

Dew-retting, spreading hemp or flax on grass to expose it to the action of the dews, which expedite the separation of the fibre from the feculent matter, s. 5904. p. 916.

Dewstone, the name of a species of limestone in Nottinghamshire, s. 3639. p. 587.

Diagram, an explanatory sketch, p. 757.

Diarrhæa, explained, s. 6473, p. 983;

Diastole, explained, s. 6331. p. 963.

Dieging his toes, in horses, explained, s. 6289. p. 960.

Dike, explained, p. 496. In Cambridgeshire a ditch is called a dike.

is called a dike.

Directors plant, a plant bearing its male blossoms on one plant and its female on another, s. 3181 p. 517. Disbarked timber, timber deprived of its bark, s. 4053. p. 660.

Dished, applied to a wheel, explained, s. 3732. p. 605. Dishes, in farming, hollow places in the fields, in which the water lies, p. 802. Dishers, food or drink causing a copious dis-

Distriction, 1000 or drink causing a copious dis-charge of urine, s. 6410, p. 975.

Docking and nicking, cutting off part of a horse's tail, and cutting a notch or nick on the under side of what remains, for the alleged purpose of making him carry it well; now almost obsolete, s. 6669. p. 1002

Domical, shaped like a dome or an arch, s. 4507. p. 740. Dorsal vertebræ, joints of the back bone, s. 6764. p. 1013.

Double broaches, broaches or splits are two-feet lengths of split hazel branches, employed in that cbing, p. 578.

Double wind-rows, double ranges of new-made hay,

Double wind-rows, double ranges of new-made hay, s. 5797. p. 904.

Dowel together, to join so closely as to form a smooth surface, s. 5710. p. 600.

Down shares, breast ploughs to pare off the turf on downs, s. 3215. p. 521.

Dragoon, a variety of pigeon, p. 1095.

Drain sluice, explained, s. 4409. p. 726.

Draw cut, explained, s. 3151, 3152. p. 512.

Droscheys, the name of a four-wheeled carriage in Russia, s. 6741. p. 1010.

Dry stone walls, walls built without mortar; a common practice in stony countries, s. 3065. p. 497.

Duodenum, the first of the intestines, and connected with the stomach, s. 6405. p. 975.

Duct, a passage through which any thing is conducted.

ducted

Dynamometer, or draught machine, explained, 6, 2563-2565. p. 385.

E

Earth, as applied to the surface of the globe, one or more of the earths, as lime, clay, sand, &c., in a friable or divided state, and either alone or mixed; but without the addition of much organic

matter.

Emphysematous swellings, swellings filled with a windy humour, s. 6946. p. 1033.

Enterhits, explained, s. 6466. p. 982.

Ergot of rye, spur of rye; a disease in the kernels of that grain, p. 822.

Eràca, the larva state of insects, p. 1112.

Estuary, an arm of the sea, the mouth of a lake or river in which the tide ebbs and flows, s. 3425.

Etiolated, drawn out into a weak state, p. 808. Eustachian tube, explained, s. 6385. p. 972. Evolue, to unfold, disentangle, develope, or separate. Eye in plants, a bud.

Eyes in cheese, explained, s. 7067. p. 1046.

Fagri, or shagreen, ass's skin, a 6757. p. 1012
False ribs, explained, a 6312. p. 964.
Farcy, explained, a 6495. p. 985.
Farmer (from fermier, Fr.), farming agriculturist, farming cultivator, professional farmer, commercial fearner, rent saying farmer feet a proprietor

Farmer (from fermier, Fr.), farming agriculturist, farming cultivator, professional farmer, commercial farmer, tent-paying farmer, &c.; a proprietor cultivating his own estate is not correctly speaking a farmer; to be such he must pay a rent. A proprietor who cultivates his own soil may be a gentleman or yeoman agriculturist or husbandman, a proprietaire cultivateur, but not a farmer. Farmery, the homestall or farm-yard, p. 677. Farming, renting land and cultivating it, or employing it for the purposes of husbandry. Feather boarding, sometimes called weather boarding, boarding, in which the edge of one board overlaps a small portion of the board next it. Feculence of cider, the lees or dregs, p. 673. Fee farmhold, explained, s. 394. p. 551. Feeding pastures, pastures used for feeding stock, p. 905.

Ferrugineous waters, water impregnated with iron, p. 724. Feeu, a disease in cattle, explained, s. 6942. p. 1082. Ferrugineous waters, water impregnated with iron, p. 724. Feeu, bodding, explained, s. 3402. p. 552. Feru a house, to hold a house on a feu right, s. 3861. p. 624. Fibinda, explained, s. 6727. p. 905. Fibrace, explained, s. 6727. p. 905. Fibrace, explained, s. 6727. p. 905. Fibrace, explained, s. 6729. p. 1105.

Finched, explained, s. 6779. p. 1015. Fingers and toes, explained, p. 861. Finikins, a variety of pigeon, p. 1095. Finos, the second best wool off Merino sheep, s. 7140.

p. 1052.

Firlot of tares, a measure used in Scotland, in wheat and beans, equivalent to the English bushel,

s. 5268. p. 842. **Rakes*, hurdles or portable pales for fencing, s. 3046. p. 493.

Fleaking, explained, s. 3190. p. 518. Flecked cattle, explained, s. 6780. p. 1015. Flight. See Glume.

Flooders, explained, s. 4449. p. 731.

Flow bog, or flow moss, a peat bog, the surface of which is liable to rise and fall with every increase witten is liable to rise and fall with every increase or diminution of water, whether from rains or internal springs, s. 3628, p. 585.

Flowing meadows, explained, s. 4427. p. 727.

Fluke, a disease in sheep, p. 1049.

Fluke worms, animals of the genus Fasclola, s. 7271.
p. 1066.

Fluke worms, animals of the genus Fasclola, s. 7271. p. 1063.

Festus, a young animal in the womb, p. 976.
Fogging pasture lands, explained, s. 5837. p. 908.
Foliage crops, plants cultivated for their leaves to be used green, and which will not make into hay, as the cabbage tribe.
Foot rol, explained, s. 7236. p. 1066.
Forage plants. See Herbage plants.
Fore-rents, rents paid previously to the first crop being reaped, p. 767.
Fors and scudda, explained, s. 7137. p. 1052.
Forning, explained, s. 7137. p. 1052.
Forning, explained, s. 7137. p. 1052.
Forning, explained, s. 3338. p. 551.
Free martin, explained, s. 6384. p. 1021.
Fretchold, explained, s. 3338. p. 551.
Fret, colic, gripes, or gullion.
Friable soits, crumbling soils, p. 802.
Frontal worms, explained, s. 757. p. 1065.
Frontal worms, explained, s. 757. p. 1065.
Frontal worms, explained, s. 757. p. 1065.
Frustum, a piece cut off from a regular figure, s. 3732. p. 605.
Furnished, explained, s. 6247. p. 955.
Fusiform rool, shaped like a spindle, as the carrot, parsnep, &c. p. 855.

parsnep, &c. p. 865.

G.
Gaites, single sheaves tied in a particular manner, p. 516.
Gaiting, explained, s. 3176. p. 516.
Gangs, courses or slips in thatching, p. 518.
Gangs, courses or slips in thatching, p. 518.
Gastric juice, the juice of the stomach of any animal, p. 174.
Gaw furrows, explained, s. 4956. p. 803.
Gelding ant-hills, explained, s. 5778. p. 902.
Gean, wild cherry, s. 5994. p. 650.
Gibbons, protuberant, bearing excrescences, s. 6775.
p. 1014.
Gid, explained, p. 1066.
Glair, the mucous evacuation in the scouring of horses, s. 6950.
Glarders, explained, p. 985.
Glenoid, the hollow or socket in one bone at a joint which receives the knob, boss, or head of the approximate bone, p. 965.
Glumes, the husks or chaff of corn. Oat flights are the glumes of the oat, p. 888.
Gluten, a tenacious, duettle, and elastic substance, forming a constituent part in wheat flour and other vegetable bodies, p. 771.
Go-downs, explained, s. 6736. p. 1010.
Goggles, explained, s. 7267. p. 1066.
Grass-cocks, hay-cocks, p. 904.
Grasses, all the natural order of Gramfnew, of Linneus and Jussieu. Cercal grasses, those grown for bread corn. Pasture grasses, those grown chiefly for pasturage. Feneous or femilierous grasses, those disease in horses, explained, s. 6514. 6516. p. 987.
Grassing flax, bleaching it on the ground, p. 915.
Great rot, explained, s. 7261. p. 1065.
Green aces, land capable of tillage, p. 1206.

p. 951.
Great rot, explained, s. 7261. p. 1065.
Green acres, land capable of tillage, p. 1206.
Grouting, filling up, s. 3711. p. 600.
Gutta serèma, explained, s. 6441. p. 980.
Gutter, a furrow-channel or drain, s. 4418. p. 726.
Guneum, a genus of calcarone earths, consisti

Gypsum, a genus of calcareous earths, consisting of carbonate of lime, and united with sulphuric acid. The principal species is the Gypsum Alabástrum, plaster of Paris, or alabaster. See Crabb's Tech. Dict.

Ha-ha, a sunk fence, p. 474.
Hacking and picking. See Picking.
Hainault mowing, explained, s. 3172. p. 515.
Hannuel, a small shed, with a yard for feeding one, or at most two animals, p. 469.
Hands of tobacco, leaves tied up by their footstalks, so that the leaves spread out like the hand, s. 7015. p. 41

so that the leaves spread out like the hand, s. 3945. p. 641.

Hangs, slopes, s. 3945. p. 641.

Harled, p. 497. See Lipped.

Hash, explained, s. 716. p. 419.

Hatches, flood-gates, p. 726.

Hattocks, shocks, s. 3173. p. 515.

Hattocks, shocks, s. 3173. p. 515.

Haulm, the base of the stalks or stems of all crops, after the seeds are reaped or gathered. The haulm of peas is in some places called pea ryse.

Head and heel of gates, explained, p. 500.

Heading down trees, lopping or cutting off the heads of trees, p. 651.

Head and heel of gates, explained, p. 500.

Heading down trees, lopping or cutting off the heads of trees, p. 651.

Heading sheaves, the hood sheaf or sheaves of shocks of corn, p. 515.

Headmain, explained, s. 4411, p. 726.

Heckles, iron combs, p. 923.

Heckles, iron combs, p. 926.

Helmets, a variety of pigeon, p. 1095.

Hepatic affections, affections of the liver, p. 1037.

Herbage plants, forage plants, such as clover and other plants cuttivated chiefly for the herb, to be used either green or made into hay.

Hide-bound, a disease in horses and cattle when the skin cleaves to the sides, s. 6425, p. 977.

Hink, explained s. 5171, p. 832.

Hinny, explained s. 5171, p. 832.

Hinny, explained s. 5763, p. 1015.

Hoars, thick mists, p. 772.

Holmes, small islands, but larger than aits.

Hood-sheaf, a sheaf placed on the summit of other sheaves for a covering, p. 516.

Hook bones, bones in the hind quarter of cattle, s. 6799, p. 1018.

sneaves not a covering, p. 705.

Hook bones, bones in the hind quarter of cattle, s. 6799. p. 1018.

Horny frog of the horse, the prominence in the hollow of a horse's foot, p. 976.

Horsecan, a variety of pigeon, p. 1095.

Horses, pieces of wood used in barking trees, p. 650

Horses, pieces of wood used in barking trees, p. 659.

Hot fur, explained, s. 5906. p. 824.

Hot yellows, explained, s. 7256. p. 1065.

Howe, explained, s. 7256. p. 1065.

Huekaback, a kind of cloth, s. 5933. p.917.

Humnerus, the arm bone, p. 953.

Humnedling machine, explained, p. 440.

Hunger rof, explained, s. 7264. p. 1066.

Hungry soit, barren soil needing much manure, p. 773.

Husbandman, one who farms generally; that is,

Husbandman, one who farms generally; that is, who both produces corn and cattle, and attends to the dairy, the poultry, the woodlands, and the orchard. A farmer may confine himself to grazing, or to breeding or haymaking, or milking or raising green crops for the market, &c., but in none of these cases can he with propriety be called a husbandman. This term husbandman, therefore, is

bandman. This term husbandman, therefore, is not exactly synonymous with farmer.

Husbandry, the culture of arable grass and woodlands, the management of live stock, the dairy, poultry, &c., and, in general, what constitutes the business of the head of a family living by agricultural industry in the country.

Hybrid, bastard or spurious, p. 1013.

Hydatid, the Termia globulus, an insect occurring in the skull of the sheep, p. 1049.

Hydropic rof, explained, \$7.261. p. 1065.

Hygrometer, an instrument for ascertaining the degree of moisture in the atmosphere, p. 773.

Inàgo, the perfect state of insects, p. 1112.

Impinge, to strike against, s. 4361, p. 719.

In and in system of breeding, p. 301.

Incision of objects on roads, the marks, traces, tracks, or ruts made, s. 3571, p. 575.

Increments, proportional rates of increase, s. 3552.

p. 572.

p. 5/2.

Indigence, peculiar to, springing out of the nature of, p. 1012.

Indirection, hardening, p. 717.

Infield, an obsolete Scottish term for enclosed lands near the farmstead, as opposed to such as are at a distance from it, and uninclosed, s. 802. p. 130. Ings. See Saltings.

Iris, the coloured circle in the eyes of animals, s. 6371, p. 970.

Isometrical perspective, explained, p. 472.

Isosecles triangle, a triangle which has only two of its sides equal, p. 503.

Itinerating libraries, the books of which

Linerating libraries, libraries, the books of which are carried from one place of deposit to another, and thence issued, p. 756.
Jacobines, a variety of pigeon, p. 1095.
Jamper, a tool used by masons for boring holes in land stones to be reft by gunpowder, p. 743.
Jumping pole, a long stiff pole, by which persons in the fens are enabled to jump across ditches or drains twenty feet wide, by planting the pole towards the middle of the drain, and springing from bank to bank: a small piece of board, called a quant, is fastened to the bottom of the pole to prevent its sinking into the mud. See Quant.

K.

Kelp, the ashes of any description of Fuci or other

Actp, the asses of any description of Fuci of other seaweed, p. 1905.

Knees for ship-building, crooked pieces of timber, having two branches or arms, and generally used to connect the beams of a ship with her sides, s. 3034. p. 491.

Knuckering, explained, s. 6387. p. 972.

Kyloes, the name given to the cattle of the Hebrides, s. 6796. p. 1018.

L.

Lachrymal gland, the gland which secretes or supplies the lachrymæ or tears, p. 970.

Lacteals, the absorbents of the mesentery, which originate in the small intestines, and convey the chyle from thence to the thoracic duct, p. 968, See Crabb's Tech. Dict.

Lactometer, explained, s. 7008, p. 1037.

Lampas, a swelling of the wrinkles or ribs in the roof of the horse's mouth; analogous to the gumboils in man, p. 980.

Land, a term employed in Cambridgeshire and other counties, to designate what more generally is termed a ridge; that is, one of those compartments which lie between gutter and gutter in arable fields. The ridge, in Cambridgeshire, is the highest part or central line of the lands, just as the ridge of a house is the highest part of its roof. In Scotland, a ridge includes the whole of the surface between gutter and gutter. Land-appears the fitter term. pears the fitter term.

Land, ground, earthy surface in opposition to wa-ter or rocks. The term ground is generally ap-plied to a comparatively limited extent of surface, pued to a comparatively limited extent of surface, as garden grounds, hop grounds, &c. in opposition to arable lands, wood lands, &c. Land_fast stones, stones fixed or imbedded in the soil, p. 483. Land-reeve, explained, s. 4638. p. 760. Layvæ, the grubs, maggots, or caterpillars of insects, 803

Laryngeal sonorous sacs, hollows in the windpipe which modulate the voice of animals, s. 6764. p. 1013.

p. 1013.

Larynz, the windpipe or trachea, p. 972.

Lateral shoots, shoots emitted on the sides of branches; laterally; quite distinct from latter shoots, with which they are occasionally confounded, p. 478.

Laying in hedge-planting, laying down the sets or plants horizontally on the bed prepared for

or plants horizontally on the bed prepared for them, s. 3944. p. 640.

Laying an old hedge, explained, s. 3026. p. 490.

Leaping ill, explained, s. 7253. p. 1065.

Leasehold, property held on lease, p. 552.

Legget, explained, s. 3193. p. 518.

Leguminous crops, crops of the various kinds of pulse, as peas, beans, tares, saintfoin, lucern, clover, &c., p. 800.

Lewelling, explained, p. 535.

Leverage, the act of using levers, or the power acquired by the use of them, p. 575.

Light-lycred, the dew-lap of a light colour, s. 6798. p. 1018.

p. 1018. Ligneous plants, woody plants, as trees or shrubs,

Ligacous plants, woody plants, as trees or shrubs, p. 476.
Lipped and harled, a wall built of stones without mortar, but which has the joints afterwards filled with mortar, and the whole wall plastered over with what is called rough-cast, or harling in Scotland. The mixture used for harling is lime, sand, and small stones about the size of peas. Dashing in Eugland is the forcible casting of small stones

like the above, only washed quite clean, into the soft recent plaster of exterior walls, in order to resist the action of rain.

Loam, any soil in which clay and organic matter exist in considerable proportions, and so as to render it neither very adhesive or hard, nor soft and

loose.

Lock spit, explained, s. 3823. p. 620.

Longe, a long leather thong, used in the process of longing or lunging horses, p. 1001.

Lymph, a clear, colourless, rather viscid humour, separated from the blood, and specifically heavier than water, s. 6350. p. 967.

Lymphatics, lymphatic vessels, are the absorbent vessels that convey the lymph into the thoracic duct, and form, with the lacteals, what is called the absorbent system. The use of these vessels is to draw in by a capillary attraction the fluids contained in the circumjacent cavities, p. 968. See Crab. Tech. Dict.

Lymphatic absorbents, 908. See Lymphatics, and

Lymphatic absorbents, 968. See Lymphatics, and Lacteals.

Maceration, the act of steeping or soaking in water,

Malic acid, an acid obtained from apples, by satu-Malic acid, an acid obtained from applies, by saturating the juice with alkali, and pouring in the acetous solution of lead, until it occasions no more precipitate. See Crabb's Tech. Dict. Mallinders, a disease in horses, s. 6710, p. 1007. Manege riding, explained, s. 6672, p. 1003. Martingal, a thong of leather, fastened at one end to the girths under the belly, and at the other to the noseband of the bridle, to prevent a horse from rearing n. 1001

rearing, p. 1001.

Maturation, the process of ripening, p. 816.

Maxillary glands, the glands belonging to the jaw

bones, p. 972.

Meal of milk, the quantity yielded at one time of milking: thus, the morning meal, the evening meal, s. 7103. p. 1048.

Medilla, marrow, p. 967. In plants it signifies the

pith.

Meers or mercs, cattle ponds in Derbyshire, p. 735.

Memel timber, fir timber from the port of Memel in Prussia, in the Baltic, p. 504.

Merc, a lake, pool, or pond.

Mesentery, a membrane in the cavity of the abdomen attached to the vertebræ of the loins, and to which the intestines adhere, p. 975.

Mestin, a union of flocks, s. 736. p. 118.

Mestin, mesting, mescetin, mastin, or mescledine, corn that is mixed, as wheat, rye, &c., to nake bread. This term occurs in old acts of parliament for the regulation of rivers, as that of the Cam; mescelin being in former days a frequent lading mescelin being in former days a frequent lading in that neighbourhood.

Mesta, explained, s. 736. p. 118. Metacárpus, the shank, p. 965. Metal bed of a road, explained, s. 3630. p. 585.

Metaltiferous ores, ores which contain metals, p.

Metals of a road, the material of which a road is formed, as broken quarry stone, boulder stones, and other kinds, p. 612.

Metayer system, the system of farming lands in many parts of the Continent, in which the produce is equally divided between landlord and tenant,

184. "The midden is the mi-

Midden, dunghill, p. 807. ther o' the meal kist."

ther o' the meal kist."

Milsey, a provincial term for a sieve, in which milk is strained, s. 7064. p. 1045.

Mortices, holes, cells, or receptacles made in posts, &c. to receive the tenons of rails, &c., p. 493.

Mould, organic matter in a finely divided and decomposed state, with a little earth mixed, as vegetable mould, leaf mould, peat mould, &c.

Mourat, explained, s. 7137. p. 1052.

Mou, a compartment in a barn, into which corn in the straw is stacked or packed.

Mov-bura. to heat by fermentation in the mow, p.

Mow-burn, to heat by fermentation in the mow, p. 825.

Murrain, a wasting, contagious, and disorder among cattle, s. 6943. 7250. and most fatal

Naked disease, explained, s. 7264. p. 1066.
Naturalising animats and vegetables, introducing them to a new climate, in such a manner that they shall in future perpetuate themselves in that climate without the aid of man. See Acclimatising.

Navicular or nut bone of the horse, explained, s. 6417. p. 976. Nicking, See Docking. Nicitidating membrane, explained, s. 6370. p. 970. Nuns, a variety of pigcon, p. 1095. Nurses for young plants, plants of an inferior and rapidly growing kind, planted round those which are choicer and of slower growth, both to shelter them and expedite their growth, p. 653. them and expedite their growth, p. 653.

O.

Obstetrics, considerations appertaining to the foaling, calving, yeaning, &c., of animals, s. 6969. p. 1035. Odometer, from odos, a way, and metroo, to measure, an instrument by which the quantity of

sure, an instrument by which the quantity of space passed over on foot, or in a conveyance, may be ascertained, s. 2506. p. 376.

Csophagus, the weasand or gullet, p. 972.

One bout stitch, a ridgelet formed by the going and returning of the plough, s. 5235. p. 839.

One bout stitch, an inflammation in the coats of the eye, proceeding from arterious blood got out of the eye, proceeding from arterious blood got out of the eyes and cathered together between the coats.

vessels, and gathered together between the coats, s. Gibs. p. 1012.
Optic nerve, a nerve which perforates the bulb of the eye, and communicates with the brain; so that every sensation derived from sight depends on the optic nerve, p. 970.

Outfall, the lower end of a water-course, p. 714.

Outfield, uninclosed farm lands at a distance from the farmstead, s. 802. p. 130. Owls, a variety of pigeon, 1095.

Pacing, one of the motions taught the horse, s. 6672, p. 1003.

8. 60/2. p. 1003.
Pancreas, the sweet bread. It is composed of innumerable small glands, the excretory ducts of which unite and form one duct, called the pancreatic duct, that conveys a fluid very similar to saliva into the intestines, called the pancreatic juice, which mixes with the chyle in the duodenum. Craft

num.—Crabb.

Pane of ground, a four-sided compartment of grass ground, adapted for irrigation, p. 726.

Panicle, an irregularly divided branch of flowers, as in the oat, p. 826.

as in the oat, p. 826.

Pantile, a gutter tile, p. 708.

Papier maché, mashed paper, which, when mixed up with glutinous substances, may be moulded into various shapes, p. 810.

Paring and burning, taking off the turf or surface of grass or waste lands, and incinerating it by means of fire, in order to prepare the soil for aration, p. 520.

Parstaging, one of the motions taught the horso, s. 6672. p. 1003.

Pastern, explained, s. 6319. p. 965.

s. 6672. p. 1003.

Pastern, explained, s. 6319. p. 965.

Pastern, explained, s. 6325. p. 965.

Paucity, fewness, p. 784.

Peclers, the same as barkers. Persons employed to deprive trees of their peel or bark, p. 662.

Pellicie, little skin or coat, p. 822.

Pelt rot, explained, s. 7364. p. 1066.

Penattrade, the last but one, p. 801.

Percolate, to strain, or trickle through, p. 581.

Percolate, the sat of straining, purification or separation by straining, p. 522.

Perforans of the horse's foot, explained, s. 6420. p. 976.

separation of statining, p. 322.

Perforans of the horse's foot, explained, s. 6420.
p. 976.

Quadrant, a mathematical instrument; the fourth part of a circle, s. 3350, p. 544.
Quant, a small piece of board at the bottom of a jumping pole to prevent the pole sinking into the mud by the weight of the jumper's body.
Quarter-cleft rod, a measuring staff having four sides, s. 3195, p. 518.
Quartering, the division of planks of wood lengthwise into small four-sided pieces.
Quarters of the horse's hoof, explained, s. 6420, p. 976.
Quick, a live fence or hedge formed of some growing plant, usually hawthorn.

ing plant, usually hawthorn. Quick bends, sharp turns, p. 573. Quicken tree. See Roan tree.

Quickset hedge, a hedge formed of sets or plants that are quick; that is, alive. Quincunx, trees planted in rows, at the same dis-tance between the rows that the trees are in the rows, and the trees of one row opposite the vacan-

cies in the other, s. 3928, p. 638.

Quit-rent, a small rent or acknowledgement payable by the tenants of most manors, s. 1117. p. 179.

Quittor, explained, p. 988.

Rabbet, a moulding, s. 4334, p. 715.
Rabbinos, explained, s. 7140, p. 1052.
Rafter, a piece of four-sided timber used in roofs.
Raftering land, ploughing half of the land, and turning the grass side of the ploughed furrow on the land that is left unploughed, p. 1166, j as applied to timber, sawing up planks of trees into pieces of greater depth than width for rafters to roof buildings.

Rake hot, to steam or reek hot, s. 6723. p. 1008. Ramose-headed trees, trees whose heads abound in

namose-neaded trees, trees whose heads abound in branches, p. 649.

Ramose-rooted trees, trees whose roots are much branched, p. 634.

Rath ripe, the property of being early ripe, s. 5082.
p. 833.

Rat's tail, a disease in horses, which causes the hair of the tail to fall off, and not be again produced,

of the tail to fall off, and not be again produced, s. 6710. p. 1007.

Ray, a disease in sheep, explained, s. 7625. p. 1066.

Rectangular fields, fields whose angles are right angles, p. 680.

Rectangular parallelogram, a figure of four sides, whose opposite sides are equal, and all its angles right angles, p. 443.

Red roan, explained, s. 5106. p. 825.

Reduater, explained, s. 5106. p. 1064.

Rète nucosum, p. 963. A nucous membrane deposited in a net-like form, between the epidermis and the cutis: it covers the sensible cutaneous papillae, connects the epidermis with the cutis, and gives the colour to the body.— Crabb.

Rètina, the true organ of vision, formed by a net-like expansion of the pulp of the optic nerve, p. 970.

p. 970.

p. 970.

Rhomboid, a figure whose opposite sides are parallel and equal, but all its sides are not equal, neither are its angles right angles, p. 414.

Ribbing, explained, s. 3255, p. 527.

Ricking, explained, s. 3176. p. 516.

Riddle, a large coarse sieve, s. 3655, p. 589.

Ridging, laying the soil up in ridges, p. 508.

Rifting by gunpowder, riving, splitting, or dividing, s. 4055, p. 661.

Ribht angles, where a room is exactly square, each

s. 4000. p. 001.

Right angles, where a room is exactly square, each of the corners of it is called a right angle: in scientific language it is thus defined, as the fourth of a circle; or thus, when one straight line, standing on another straight line, makes the adjacent angles or corners equal to one another, each of the angles or corners is called a right

each of the angles or corners is called a right angle,

Ring-bone in horses, a disease in the feet of the

Aing-one in norses, a disease in the feet of the horse, p. 960.

Rippling of flax or hemp, the operation of separating the boles or seed pods, by striking them against a board, or piece of iron, p. 915.

Ristle-plough, explained, p. 1197.

River-meadows, explained, s. 5769. p. 901.

Roan tree, the mountain ash.
Roguish plants, spurious varieties, s. 5220. p. 838.

Rooftet, explained, s. 3195. p. 519.
Root crops, esculent plants cultivated for their tubers, bulbs, or other enlarged parts produced under or immediately on the ground, and chiefly connected with the root, as the potato, turnip,

connected with the root, as the potato, string, carrot, &c.

Roots, the fibres and other ramifications of a plant under ground, and by which it imbibes ncurishment. Tubers, bulbs, and other fleshy protuberances under ground, are employed by nature for the purposes of propagation or continuation, and therefore ought never to be confounded with common roots, which serve to nourish these tubers, bulbs, &c., in common with other parts of the plant.

the plant.

Rot, explained, s. 7245. p. 1064.

Rouen, the aftermath, the lattermath, or second crop of hay cut off the same ground in one year, s. 3169. p. 515.

Rough pile in eattle, coarse hair or wool, p. 784.

Roup, explained, s. 7526. p. 1095.

Rottels, explained, s. 6538.

Rubbers, a disease in sheep, explained, s. 7265. p. 1066.

Rubble stones, loose stones, brick-bats, and the like, which are put together to conduct water; so called

because they are rubbed together.

pecause they are rubbed together.

Rumbling drains, drains formed of a stratum of rubble stones, p. 581.

Rumner, explained, s. 4140. p. 675.

Runts, a variety of pigeon, p. 1095.

Rural economy, rural affairs, geoponics, agronomics, terms considered as synonymous with husbandry.

Russ. a disease to which the cereal and other.

Rust, a disease to which the cereal and other grasses are subject, and which occasions their herbage to be of a rusty colour, s. 5741. p. 899.
Rut, to cut a line on the soil with a spade, p. 482.; also the copulation of deer in the rutting season; also the track of a cat whed

also the track of a cart-wheel.

Rutting Sec Rut.

Saccharo-saline, partaking the properties both of sugar and salt, p. 1039.
Saddle-grafting, explained by figures, p. 1143.
Salin, explained, a. 5300, p. 853.
Salina, the spittle of animals.

Saturat, a mixture given to pigeons to promote their digestion, p. 1096.
Satlirats, or ings, salt-water marshes, p. 747.
Sanderacks, explained, s. 6525. p. 988.
Sauer kraut, explained, s. 5507. p. 868.
Scab, explained, s. 7505. p. 1066.
Scalene triangle, a triangle with three unequal sides. s. 4343.

sides, s. 4343.

Scanting, all quartered timber under five inches square, s. 4002. p. 652. In masonry, a term expressive of the size of stones.

pressive of the size of stones.

Scarcement, a rebate or set-back in the building of walls, or in raising banks of earth, p. 481.

Scarification, cutting through the bark and soft wood of a thick branch with an edge tool, previously to sawing through the hard wood, s. 3164. P. 513.

Scápula, the shoulder blade, p. 964.

Scarifier, a machine to excoriate and disturb the surface of soil, p. 528.

Sclerotic coat, a coat of hard consistence, p. 970. Scoop wheel, a large wheel with numerous scoops fastened in its periphery, s. 4277. p. 706. Scoria of founderies, the refuse or dross of the metals of the coats.

tals, s. 3643, p. 588.

Screening, the act of sifting earth or seeds through a large oblong sieve or riddle, called a screen, p.

Soudda. See Fors and Scudda. Scuffler, a kind of horse-hoc, p. 528. Scutching flax, breaking the woody part of it pre-paratory to separating it from the fibrous parts, p. 915.

ea-ooze, the alluvial deposit, the mud or slime left by the sea where its waters have subsided, p. 746. Sea-ooze,

Secd-tobes, the cotyledons, or very first leaves displayed on a seedling plant.

played on a seedling plant.

Sellenders, in horses, explained, s. 6293, p. 961.

Sellenders, in horses, explained, s. 6293, p. 961.

Seminal roots, the first roots, those emitted from the seed itself, p. 808.

Sensible from of the horse, explained, s. 6420, p. 976.

Sensible liminæ, explained, s. 6421, p. 976.

Septic, causing putridity, producing putrescence, s. 6844, p. 1023.

Serum, whey, or the remainder of milk after its better parts have been taken away; also, the yellow and greenish fluid which separates from the blood when cold and at rost, s. 6380, p. 1036.

Scsamoids, little bones found at the articulation of the toes (in man); so called from their supposed resemblance to the seeds of the plant called sesamum, s. 6310, p. 965.

resemblance to the seeds of the plant called sesamum, s. 6319, p. 965.
Setons, explained, s. 6537, p. 990.
Set-sod, explained, s. 3014, p. 436.
Sets and eyes of potatoes, slices of the tubers of the potato, each slice being furnished with at least one eye or bud, p. 848.
Shab, explained, s. 7265, p. 1066.
Shagreen, or fagri, the prepared skin of the ass, s. 6757, p. 1012.
Shakes in the boles of trees, fissures, clefts, or rents, p. 656.

p. 656. Shakers, a variety of pigeon, p. 1095. Shaking quags, shaking bogs; wet spongy soil, p.

Obs. Shaley soil, explained, s. 4750. p. 774. Sheaver, a reaper, s. 3250. p. 526. Shearing, reaping, p. 515. Sheath, land guard of embankments, s. 4362, 4366. p. 713, 720.

Shearing rivers, the process of mowing the plants which abound in rivers; the instrument with which this is effected is formed of a line of scytleblades, rivetted together by their extremities, and which line of scythe-blades is worked or moved along over the surface of the mud by levers at-

along over the surface of the mud by levers at-tached to the line, operated upon by men in boats, s. 3171. p. 515. Shift of crops, an alternation or variation in the succession of crops, p. 814. Shifting beach, a beach of gravel liable to be shifted or moved by the action of the sea, or the current of rivers 2, 4339. p. 713

of rivers, s. 4332, p. 714.

Shingles, pieces of thin board used as tiles, a common practice in timber countries on the Continent and in America, s. 3051, p. 495.

Shocks, stooks or hattocks, assemblages of sheaves, never of more than ten sheaves in those places where the tithe is paid in kind, as this arrangement facilitates the taking of the tithe; in Scotland, from six to twelve, independently of the two or four hood or roof sheaves, p. 515.

Shoughed, earthed in, p. 640.

Siddow peas, such as boil freely, s. 7791. p. 1140.

Sideowas, of the nature of sand or fiint, p. 587.

Sides, repositories, explained, s. 4988. p. 810.

Sitieting of peat turning, explained, s. 3210. p. 520.

Skirting or peat turning, explained, s. 3210. p. 520.

Skirting or peat turning, explained, s. 3210. p. 520.

Skroca plantations, plantations made for the purpose of skreening or sheltering, p. 753.

Slab, the outer board sawed from the trunk of a tree, Sleepers, explained, s. 3785. p. 613. In Suffolk the root stocks, when left in the soil, of such trees as are sawed off level with the surface.

are sawed on level with the surface.

Stip-coat cheese, explained, s. 7085. p. 1047.

Stit planting, explained, s. 3933. p. 642.

Stob farrow, explained, s. 3913. p. 591.

Studger, explained, s. 2518. p. 578.

Studger, explained, s. 2518. p. 378.

Studger, explained, s. 2518. p. 378.

Studger, explained, s. 2518. p. 378.

Snag pruning, pruning or cutting off branches so as to leave snags, s. 4027, p. 655.
Snags, stumpy bases of branches left in pruning, s. 3993, p. 650.

S. 555., a convulsive spasm of the air passages to re-lieve congestion, s. 6723, p. 1008. Soil, earth, either of one or of several sorts, mixed with decomposed organic matters.

with decomposed organic matters.
Solling, feeding horses or cattle in houses or sheds
with clover or other herbage in a green state, p. 874.
Sough, a box-drain, s. 4254, p. 700.
Soverns, explained, s. 5146, p. 828.
Spay, to incapacitate a female animal for producing young, s. 7306, p. 1069. See Castrate.
Sphacetated, withered, blasted, mortified, gangrened, s. 6945, p. 1032.
Spinous processes, projections resembling spines or

s. 6949. p. 1032.
Spinous processes, projections resembling spines or prickles, s. 6764. p. 1013.
Spired, grown, shot out into spires, s. 5108, p. 825.
Spittyl of carth, a spadeful of earth, p. 507.
Spittyl in horses, a preternatural excrescence of bone, or a bard tumour, s. 6293. p. 961.

Spots, a variety of pigeon, p. 1095.
Spray drain, a drain formed by burying the spray of wood in the earth, which keeps open a channel, s. 4294. p. 708.
Spray of a tree, the twigs of the branches of a tree, p. 649.

p. 649.

Spring feed, herbage produced in the spring, p. 905.

Squeakers, pigeons under six months of age, p. 1096.

Squeakers, pigeons under six months of age, p. 1096.

Stacking stage, explained, s. 3298. p. 553.

Stacking stage, explained, s. 3298. p. 532.

Staddles, explained, s. 5796, p. 903.

Stake and rice, a fence composed of stakes driven into the ground and interwoven with branches retaining their spray, or with rods without their spray; the latter is frequently called a wattled fence, p. 487.

fence, p. 487.

fence, p. 487.

Staggers, a disease of the horse, explained, p. 978.

Straw mow, a stack or rick of straw formed in a barn, s. 5945. p. 818.

Steining a well, lining it with stone or brick, s. 4479. p. 735.

Stiffe of the horse, explained, s. 6276. p. 959.

Stire, a sort of cyder apple, s. 4082, p. 665.

Stock, the animals of agriculture called live stock; also, the implements and other lifeless articles of property on a farm, called dead stock.

asso, the implements and other lifeless articles or property on a farm, called dead stock.

Stocking a pasture, putting in as many head of cattle as the pasture will maintain, s. 5285. p. 906. Stotoacs, the creeping rooting shoots of some grasses, and other plants, by which they increase, p. 904. Stotoacjerous grasses, grasses producing stolones, p. 887.

p. 857.

Stone-brash, a sub-soil composed of shattered rock or stone, s. 4519. p. 742.

Stooks, shocks or hattocks, p. 817.

Stooks, shocks or hattocks, p. 817.

Stooks of a coppice, the stumpy root-stocks of trees previously cut down, p. 662.

Stover of rape, the pods and points broken off in threshing, p. 932.

Strull, a bar so placed as to resist weight, p. 498.

Stubs, stocky stumpy portions of the stems of trees and shrubs, p. 1009.

Stud, a post, a stake, an upright, in a building, p. 500.; a collection of breeding horses and mares.

3/00

Stumming, explained, s. 4132, p. 674.
Sturdy, explained, s. 7257. p. 1066.
Subcarbonate of soda, a salt in which soda predominates, p. 837.
Sublingwal, under the tongue, s. 6388. p. 972.
Succedaneum, a substitute, p. 846.
Swath, the bands or ridges produced by mowing with the scythe, p. 903.
Swath balk, the line between two swaths where the stubble is cut least closely, presenting a little ridge of stubble p. 514.

of stubble, p. 514.
Sways, long bramble rods used in thatching with reeds, p. 518.

reeds, p. 31s. Sweating of hay, a slight fermentation, p. 904. Swing plough, any plough without wheels, p. 390. Switching bill, an instrument used in pruning hedges, p. 485. Switching hedges, cutting off the one year's growth which protrudes from the sides of hedges, s. 4005.

p. 652. Synchronous, at one time, at the same time, con-

Syncuronous, at one time, at the same time, contemporary, p. 1002.
Synopsis, the seeing all at once, or at one view; a comprehensive volume, p. 881.
Syndoia, joint oil, p. 965, 967.
Systole, explained, s. 6351, p. 963.

T.

Tag-bell, a disease in sheep, explained, s. 7260. p. 1065.

Tail drain, explained, s. 4414. p. 726.

Tapeltum, explained, s. 6373. p. 970.

Tarsus, explained, s. 6328. p. 963.

Teathing, explained, s. 6324. p. 966.

Tecernos, explained, s. 7141. p. 1052.

Tedding hay, scattering, spreading, turning, and, in short, making hay, p. 903.

Tenon, a projection in a rail, &c., made to fit a mortice.

Tenon init. a joint formed by a tenon and mortice.

Tenon joint, a joint formed by a tenon and mortice,

Tenon joint, a joint formed by a tenon and mortice, p. 598.

Tenure, a holding or occupying, p. 179.

Territorial economy, whatever relates to the valuation, purchase, sale, exchange, arrangement, improvement by roads, canals, drainage, &c., of territorial surface, including interposing waters, as rivers, lakes, and also mines and minerals.

Territorial improvements are mostly effected by the proprietors of lands or their agents and stewards, and not to any great extent by renters stewards, and not to any great extent by renters of land, or farmers.

of land, or farmers.

Tétanus, a spasmodic affection, accompanied by rigidity, one species of which is known by the popular name of a locked jaw, s. 6370. p. 970.; s. 6432. p. 978; s. 6965. p. 1035.

Tethering, restraining grazing animals by a rope or chain, fastened to the animal at one end, and to

Tethering, restraining grazing animas by a tope of chain, fastened to the animal at one end, and to the earth at the other, s. 5560, p. 876.

The line of draught, the direction in which an animal is pulling or drawing, s. 2592, p. 390.

Theodolide, an instrument used in surveying, and chiefly in taking angles, p. 544.

Thill, the beam or draught tree of a cart or waggon. Thiller or Thill horse, the horse that is put under the thill, or into the shafts or draughts, p. 1139.

Thoracic duct, the trunk of the absorbent vessels, so called from its being placed in the thorax or chest, p. 968.

chest, p. 968.
Thorough.pin, explained, s. 6293 p. 961.
Threave, twenty-four sheaves of straw or corn, s. 3168. p. 517.

s. 5105. [k. 511.]

Thrush paste, explained, s. 6554. p. 968.

Tibia, the leg bone, p. 965.

Ticks, a variety of bean, called the tick bean, s. 5225, 5226 p. 838.

Tic, a bar so placed as to resist a drawing or twisting

power, p. 498. Till, coarse obdurate land, p. 746.

Tute, coarse obdurate land, p. 746.

Titter, to send forth numerous stems from the root; applied only to culmiferous plants, s. 4984. p. 808.

Tittering. See Titter, s. 5130. p. 826.

Titth, the degree or depth of soil turned by the plough or spade, that available soil on the earth's surface, into which the roots of crops strike, p. 803.

Timpling, as amplied to hex-making evaluated.

Tippling, as applied to hay-making, explained, s. 5549. p. 875.

Tithe, the tenth of the produce of the soil, paid to

the clergy of England. Tithing-man, a person employed by the clergyman in a village to set out and collect his tithes.

Torrefled earth, earth subjected to the action of fire, p. 522.

fire, p. 522.

Trackea, the windpipe, p. 972.

Tracking flax, breaking the woody part in the stems of flax, s. 5912. p. 915.

Tramp, an instrument used in making hedges, p 431.

Tramp, an instrument used in making nedges, p. 4.31. Trampoad, explained, s. 3795 p. 615. Translucent, transparent, diaphanous, allowing light to shine through, p. 811. Tremblings, explained, s. 7253. p. 1065. Trench, explained, s. 4412. p. 726. To trench, to turn over and mix soil to the depth of two, three, or more syndam or suits.

or more spades, or spits.

Trench drain, explained, s. 4413. p. 726.

Trindle, to allow to trickle or run down in small

streams, p. 641.

streams, p. 64l.

Trochar, an instrument resembling a pipe, used for making incisions, when water or air is received out of the incision through the trochar, p. 1034.

Truncheons, large sets, stakes, or poles, of willow, poplar, &c. planted to form trees speedily, p. 749.

Trunpeters, a variety of pigeon, p. 1095.

Tubers, knobs, fleshy bodies at the roots of plants, as in potato, yam, pignut, &c., p. 511.

Tumblers, a variety of pigeon, p. 1095.

Turners, a variety of pigeon, p. 1095.

Urinàrium, a receptacle for urine, s. 6998. p. 1038.

Velum palùtı, explained, s. 6382. p. 972.. Vena càva, explained, s. 6348. p. 967. Vena càva ascēndens, explained, s. 6348. p. 967. Vena càva descéndens, explained, s. 6348. p. 967. Vena portæ, explained, s. 6349. p. 967. Vinquish. See Pining.

Viscid, thick, glutinous, gummy, p. 1086.
Viscacions, living, sprouting, very lively, very free
of growth, p. 803.
Vives, explained, s. 6388. p. 972.

W.

Wads, explained, s. 5208, p. 836.

Walls dashed with time. See Harled.

Walls en pisé, walls built of mud rammed in between a frame of boards, p. 457.

Warbles, explained, s. 6489, p. 984.

Ward-holding, explained, s. 3402, p. 552.

Watering of hemp, the maceration, steeping, or immersion of the stems of the hemp plant, in water, s. 677, p. 107, 917.

Water-retted, watered, s. 5929, p. 917.

Water-retted, watered, s. 5929, p. 918.

Water tables across a road, sunk pannels, which conduct the surface water into drains, p. 582.

Watery head, explained, s. 3014, p. 486.

Wattle, to weave, to interlace, or plat branches or rods.

Wattled fence. See Stake and Rice.
Wattled hurdles, hurdles wattled with rods.
Way pane, explained, s. 4416, p. 726.
Wear, a dam made with stakes and osier twigs in-

terwoven, as a fence against water, p. 722.

Well-bred, explained, s. 2064. p. 305.

Whethering, explained, s. 6971. p. 1035.

Whethering, explained, s. 6971. p. 1035.
Whin, furze, gorz, gorse, or goss, p. 510.
Whinstone, explained, s. 3654. p. 589.
Whipping out grain, striking the ears against a stone or the edge of a board, till the corn is separated from the straw, p. 510.
Whipping in plants, to bruise, abrade, or injure, by rubbing or striking against another, as the competing branches of neighbouring trees, s. 4014. n. 653. 4014. p. 653.

4014. p. 603. Whirlbone of the horse, the articulation of the thigh bone with the pelvis, 959. Whiten, the small-leaved lime, p. 1141. Wilding, trees sprung up from seeds naturally distributed, i.e. by winds, birds, running waters, &c., p. 675.

Winlestraws, the withered flower stalks of grasses standing in the fields; in English, bents, s. 5058.

Wornals or puckeridge, explained, s. 6968. p. 1035. Woodward, a land-reeve or ground officer, s. 4638. p. 760.

Yellows, explained, s. 6480. p. 984. Yerking, one of the motions taught to horses, s. 6672. p. 1(03.

GENERAL INDEX.

*** The Numbers refer to the Paragraphs, not to the Pages, except in the case of the List of Authors, where they refer to the page and the year in which the Author published: in such cases the word page and letters A.D. are prefixed.

SUPPLEMENT.

2789 a and 7790 a. Threshing machines. One of the most complete in England has been erected at the Duke of Gloucester's farmery at Bagshot Park; for the following description and drawings of which we are indebted to Mr. Anderson, an experienced agricultural engineer. This machine threshes the corn, hummels barley, winnows, sifts, and cleans corn, grinds it into flour, cuts the straw into chaff, and grinds bones for manure; and any one of these operations can be performed without the other. different parts of this apparatus are chiefly taken from machines already in existence, but some also are original. It may be mentioned as a singular and melancholy sign of the times, that the parties who have the chief merit are afraid of giving their names to the public. The agriculturists of a future and, we trust, no distant day will hardly believe it possible that the destruction of threshing machines should have been popular in England in 1830. It is worthy of notice as an argument in favour of the diffusion of knowledge among the labouring classes, that, so far from threshing machines being destroyed in Scotland, they are so much in repute among the labourers of that country, that a farmer who is without one is obliged to pay higher wages to his servants. This fact is well authenticated by a correspondent in the Examiner newspaper of February 13. See the examination of Joseph Forster in No. 1. of The Working Man's Companion, and also in Mech. Mag. vol. xiv. p. 323.

The mechanical part of the machinery was executed and erected chiefly by Mr. George Miller, now residing near Bagshot. Fig. 1139. is partly a section, and partly a side view; fig. 1140. is partly a cross section, and partly an end view; and fig. 1141. is partly a vertical section, and partly a vertical profile. The same letters are applied to the same

parts in all the figures.

Description of the machinery. (figs. 1139. 1140. 1141.) a is an overshot water wheel 15 feet diameter, which makes from six to eight revolutions per minute according to the supply of water; on the arms of the water wheel is fixed a bevel wheel b of 128 cogs (seven feet four inches diameter), working into the pinion c of 26 cogs (twenty inches diameter), on the upright shaft d: these wheels are below the ground floor, and entirely hid from the view.

On the shaft d are two driving wheels g and f: g is a spur wheel of 119 cogs (six feet two inches diameter), driving the pinion e of 22 cogs (14 inches diameter) on the shaft h, which leads to the floor above, and turns the upper millstone; f is a mitre wheel of 40 cogs (two feet diameter), working into two wheels i and k of the same

dimensions.

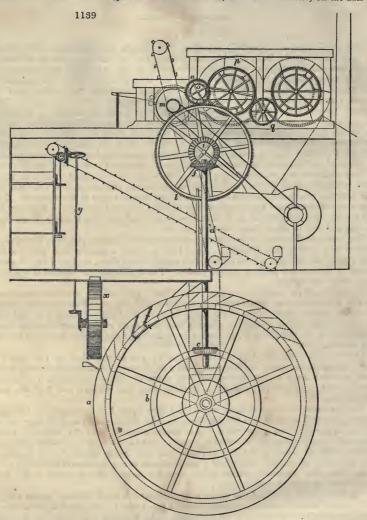

On the same shaft as the mitre wheel i is a spur wheel l of 200 cogs (six feet eight inches diameter) working into the threshing machine drum pinion m of 20 cogs (eleven inches diameter); the spur wheel l also drives a wheel n of 39 cogs (22 inches diameter), on the same axis of which is a small wheel l of 26 cogs (ten inches diameter), working into the wheel l of 121 cogs (three feet four inches diameter), on the axis of the first rake or shaker: the wheel l gives motion to the intermediate wheel l of 72 cogs (two feet diameter), which works into the second shaker wheel of the same

dimensions as the first shaker wheel p.

On the spindle on which the wheel n is mounted is a small shifting pinion r of 17 cogs (seven inches diameter), working into the faced wheel s, on which are two rows of cogs, one of 20 and the other of 30 cogs each. On the same axis as the faced wheel s is a bevel wheel t of 20 cogs (eight inches diameter), working into the wheels u and v of 40 cogs (sixteen inches diameter), on the lower feeding roller spindle; these two wheels are not fixed on the spindle, but revolve freely on turned parts of the shaft, and give motion to it by means of the clutch and handle v. When the machine is at work the clutch is in the wheel v, giving to the feeding rollers the required motion; should it be necessary to stop the rollers, the handle v is moved from the feeding board, and the clutch disengaged from the wheel v. Should the handle be moved farther from the feeding board, the clutch is thrown into the wheel v, and the rollers turn the reverse way.

The winnowing machine under the shakers is driven by a sheave on the drum axis, and a rope leading to a sheave on the fanner spindle; to dress the grain thoroughly, it is conveyed from this machine, and passes through two winnowing machines, one placed above the other: this is effected by means of a canvass cloth on which are strips of wood half an inch in thickness; the cloth revolves on two rollers, and is set in motion by a rope leading from a sheave on the shaft i to a sheave on the upper roller spindle.

As it is absolutely necessary to have a steady and uniform motion to produce the best possible sample from a winnowing machine, and as the velocity of the threshing machine is subject to vary, from irregular feeding and other causes, the winnowing or dressing machines are set in motion by a small water-wheel x, five feet diameter, on the axis of

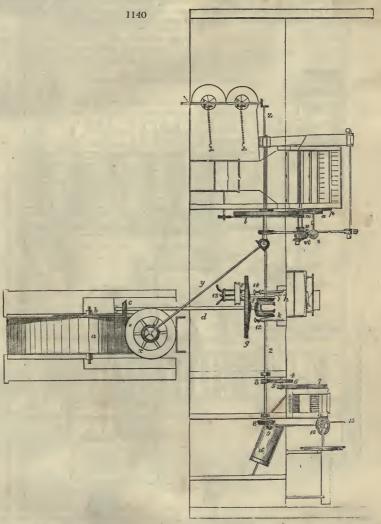

which is a bevel wheel twenty inches in diameter, working into a pinion on an inclined shaft y. On the upper end of the shaft y is a bevel wheel working into a pinion, on the axis of which is another bevel wheel giving motion to the shaft z, which turns the fanners

by means of small mitre wheels.

The bone-mill and chaff-cutting machine are driven by the mitre wheels f and k. On the shaft 2 is a shifting pinion 3 of sixteen cogs (ten inches diameter), working into the wheel 4 of 49 cogs (two feet four inches diameter), on the axis of which is a pinion 5 of 16 cogs (ten inches diameter), driving the wheel 6 of 49 cogs (two feet four inches diameter), in the axis of one of the lower crushers: the upper pair of crushers are driven by the wheel 6 working into a wheel 7 in the upper crush or spindle. The crushing rollers are set to or from each other as the nature of the work may require. When the bones are large, the upper pair of crushers only are used in passing the bones the first time through, an inclined board being placed to prevent them from falling into the lower set; this board is removed at the second time of grinding, and the bones pass

through the two sets and fall into the revolving circular screen 16: any bones that wlli not pass through the mash of the screen are again put into the mill. The screen is set in motion by the wheel 6 working into a pinion, not shown in the drawing, and by a shaft and universal joint connecting with the axis of the screen.

On the shaft 2 is a bevel wheel 8 of 46 cogs (21 inches diameter), driving the pinion 9 of 19 cogs (nine inches diameter), on an inclined shaft leading to the floor above; on the upper end of this shaft is a bevel wheel 10 of 52 cogs (twenty inches diameter), driving a pinion 11 of 17 cogs (nine inches diameter,) on the spindle of the chaff-cutting machine.

When the threshing machine only is at work, the mitre wheel k is thrown out of geer by the lifting screw 12; the pinion on the flour mill spindle is raised above the spur wheel g by the screw 13.

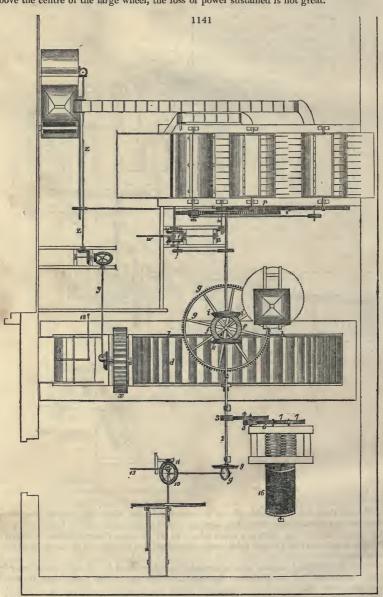

When the threshing machine is not at work, the mitre wheel i is thrown out of geer by the lifting screw 14.

The pinion 3 is kept in its place on the shaft 2 by a key; when the bone-mill is not at work, the pinion is slided along the shaft clear of the wheel 4.

There are three cogs dovetailed into the pinion 9; when the chaff-cutting machine is

not at work these cogs are removed, and the vacant part turned towards the bevel wheel 8; the person attending the chaff-machine can also stop it by the clutch and handle 15.

To stop the water wheel the ring and lever 18 is raised by means of a chain leading over a pully at the upper part of the building; this raises the sluice board 17, and allows the water to escape clear of the wheel. The water which drives the small wheel *\vec{x}\$ is also conveyed by a dash-board under it on to the large water wheel; as this water falls above the centre of the large wheel, the loss of power sustained is not great.

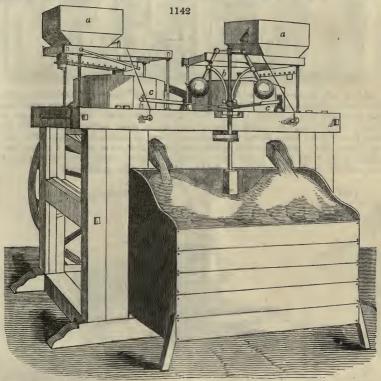

The velocity of the particular parts is found by dividing the product of the number of cogs in the driving wheels by the product of the number of cogs in the driven wheels, and the quotient will be the number of revolutions made by the last moved part, for one of the first moving part. The drum will, therefore, make 49.2 revolutions for one of

the water wheel; which, multiplied by 7, the medium revolutions of the water wheel per minute, will give 344.4 revolutions of the drum per minute; as the diameter of the drum is three feet, the circumference will be 9.42 feet, which, multiplied by 344.4, will give 3244 feet, the velocity of the beaters or switchers on the drum per minute. By following the same rule

The operative part of erecting the machine was done by a Mr. George Millar, now

residing near Bagshot.

2551 a. A flour mill for a parish workhouse, upon a new and improved principle, (figs. 1142. and 1143.) has lately been erected at the Islington parish workhouse, by

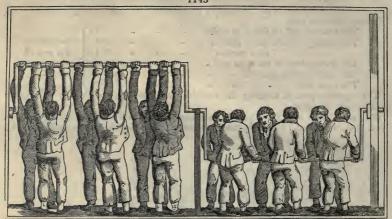

Weir, Oxford street; and as it is admirably calculated for the purpose in view, and may be adopted in many similar cases, we have deemed it well worth a place in this Supplement. It consists of two pairs of stones; one pair of which can be worked separately by six men, or both together by twelve men. The moving power is a crank (fig. 1143.), on the spindle of which is a large fly wheel; and beyond which is a pinion, working into a spur wheel on an upright shaft: this last wheel works into the pinions on the spindles that set the stones in motion. Either of the pinions is of course easily thrown out of gear by a lever.

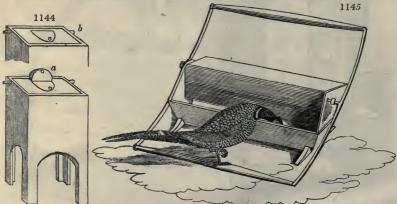

There is a hopper (a, a) to each pair of stones, and one governor (b) which, by means of steel yard bars (c, c) reaching to each pair of stones, regulates their motion. Each pair of stones grinds a bushel and a half of wheat an hour, and the work is performed in as perfect a manner as by any water mill whatever. There is a bolting machine, (see 2552.) worked by a crank and fly wheel, and set in motion by four men. The expense of a flour mill of the above description depends chiefly upon the size of the burr stones; these when large being very expensive. The improvements in this machine are the invention of Mr. Malpas, the foreman at Weir's establishment, a very intelligent

mechanic, and the author of various improvements on the implements and machinery manufactured there, which do him the highest credit.

1149

3088 a. A fall-down gate-stop (fig. 1144.) has lately been invented, which deserves adoption wherever double gates are fastened in the middle by a bolt, attached to the lower bar, and entering a hole in a stone or other body fixed in the road. This gate-stopper is formed of cast iron, and is sunk in the ground till its upper surface is level with the road, its lower end being placed on a stone to prevent its sinking too deep. The gate stop has an ear (a) which is raised up when the gate is shut, so as to form a stopper and a hole for the bolt; and it is put down (b) when the gate is open, so as not to present an obstruction to the feet of horses. Sold by Messrs. Cottam and Hallen.

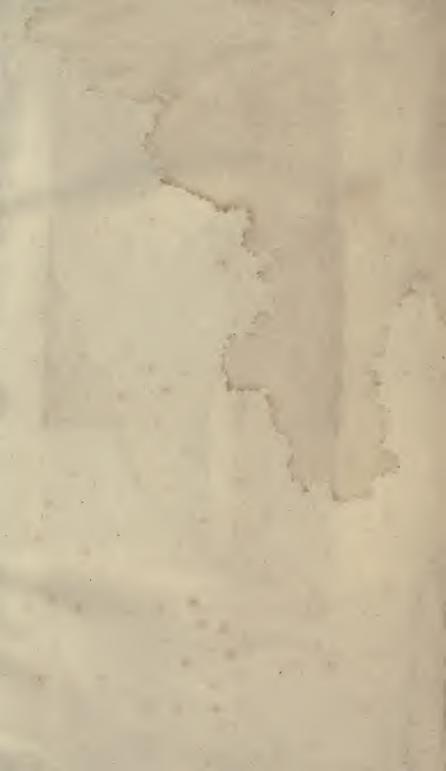

7548 a. The pheasant-feeder. (fig. 1145.) This ingenious invention is manufactured of iron by Messrs. Cottam and Hallen, and seems the best utensil of the kind that we have seen. There is one of tin, lighter and cheaper (see Gard. Mag. vol. v. p. 589.), sold by Messrs. Bailey, 272. High Holborn, and by Weir in Oxford street, but it is by no means so durable.

THE END.
